Xi urges more efforts to boost basic research

Realizing sci-tech strength through groundbreaking innovations stressed

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

President Xi Jinping has called for greater efforts and more solid measures to strengthen basic research, enhance China's capacity for original innovation, and further solidify the foundation for building the nation's strength in science and technology.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made the remarks on Thursday in Shanghai when attending a symposium on strengthening basic research.

A new round of sci-tech revolution and industrial transformation is rapidly evolving and global technological competition is increasingly focusing on fundamental cutting-edge fields, he said, adding that the importance of developing original and groundbreaking innovations is becoming more prominent.

Xi emphasized the need to seize opportunities, rise to the challenges, prioritize basic research and make consistent efforts to make new achievements.

The symposium took place as China has been paying greater attention to boosting basic research in recent years, in order to realize the nation's scientific and technological self-reliance and strength amid intensifying global competition.

By optimizing research layout, increasing investment and innovating institutional framework, China has significantly improved its basic research. The new whole-nation innovation model has paid dividends, enabling the country to funnel vast resources into key sectors such as artificial intelligence, quantum technologies and semiconductors.

While addressing the symposium, Xi underlined the need for coordinated planning and top-level design to optimize the systematic layout of basic research, and to further identify the main directions and key areas of basic research.

It is important to strengthen the leading role of national research institutions and high-level research universities as well as encourage and regulate the development of new type of research and development institutions, he said.

Xi highlighted the importance of promoting the deep integration of industry and academia, led by enterprises, thereby linking the innovation chain — from basic research to application development — until research achievements are fully transformed into industrial applications.

It is essential to strengthen the construction of basic disciplines and promote the coordinated development of applied and basic disciplines, he said.

While emphasizing the need to strengthen support for basic research, Xi said that the nation will allocate a greater proportion of its science and technology expenditures toward basic research and also shape a diversified investment pattern.

It is also necessary to plan and build major sci-tech infrastructure in a systematic way, he said, calling for building intelligent research platforms.

This year's Government Work Report, which was adopted at the annual session of the National People's Congress, China's top legislature, in March, indicates a strategic shift in funding allocation for basic research, which aligns with the nation's long-term goals of becoming a global leader in science and technology.

According to data from the Ministry of Science and Technology, China's total R&D investment exceeded 3.92 trillion yuan ($574 billion) in 2025, accounting for 2.8 percent of its GDP. Basic research funding last year hit nearly 280 billion yuan, accounting for 7.08 percent of total R&D spending, making it the first time the funding surpassed the 7 percent threshold.

Government officials noted that investing in basic research is vital for addressing both current and future challenges, particularly in fields such as renewable energy, AI, biotechnology and materials science.

Analysts said this strategic shift underscores a commitment to building a robust research ecosystem that supports not only academic research, but also promotes collaboration between universities, research institutions and the private sector.

Book acts as window on China's governance philosophy

By **MO JINGXI**
mojingxi@chinadaily.com.cn

"A book holds a house of gold," said Johari Abdul, speaker of Malaysia's House of Representatives, quoting an old Chinese saying at a readers' forum on Thursday in Kuala Lumpur, where the book under discussion was the English edition of the fifth volume of *Xi Jinping: The Governance of China*.

For Johari and other Malaysian attendees at the event, the saying pointed to the broader value of the book, which offers readers a window on China's governance philosophy, development priorities and approach to international cooperation.

Against the backdrop of an evolving geopolitical landscape and profound changes in the global governance system, deeper exchanges between China and Malaysia on governance experience are of great significance to deepening bilateral friendship, mutual trust and win-win cooperation, they said.

Published in both Chinese and English last year, the fifth volume of *Xi Jinping: The Governance of China* contains 91 spoken and written works of Xi from May 27, 2022, to Dec 20, 2024. Thursday's forum brought together about 200 participants from publishing, media and other sectors in China and Malaysia.

Johari said that all the five volumes of the book represent an effort to articulate a governance philosophy — one that explains how a nation understands its development priorities and role in the world.

Engaging with such a book, Johari said, allows readers to better understand the thinking behind China's policy directions. For Malaysia, this is important not simply as an observer, but also as a long-standing partner that seeks to engage with China thoughtfully and constructively, he added.

Anwar Ridhwan, chairman of the board of directors of the Institute of Language and Literature of Malaysia, said the book represents more than a translation of language — it is also "a translation of ideas, perspectives and aspirations across cultures".

In an increasingly interconnected world, understanding one another is not a luxury but a necessity, Anwar said, adding that the book is expected to help Malaysian readers gain a clearer view of China's development goals, governance philosophy and its place in the global community.

Malaysian Transport Minister Anthony Loke Siew Fook said the book's discussions on the Belt and Road Initiative, new quality productive forces, green and coordinated development, scientific and technological innovation, and the integration of the digital and real economies respond to key issues in global development.

These ideas also provide inspiration for Malaysia as it considers its own modernization path, he said, noting that Malaysia's Madani vision — a national development framework introduced by Prime Minister Anwar Ibrahim — and China's governance philosophy share highly consistent development aspirations.

Ngeow Chow Bing, director of the Institute of China Studies at Universiti Malaya in Kuala Lumpur, said that China's development journey over the past several decades represents one of the most remarkable transformations in modern history.

China's approach, he said, is not purely economic in a narrow sense, but multidimensional, integrating industrial upgrading, infrastructure development, technological innovation and social improvement.

Chinese, US officials exchange views on ties

By **ZHAO JIA** and **ZHANG CHENXU**

Foreign Minister Wang Yi urged the United States on Thursday to work with China to prepare for key high-level engagement, broaden cooperation and keep differences under control.

He made the remarks in a phone conversation with US Secretary of State Marco Rubio.

Head-of-state diplomacy has always served as the anchor of China-US relations, Wang said, noting that under the strategic guidance of President Xi Jinping and US President Donald Trump, bilateral relations have remained generally stable.

Such stability serves the fundamental interests of both peoples and meets the broad expectations of the international community, Wang added.

He called on the two sides to safeguard the hard-won stability in bilateral ties and explore building a relationship that is strategic, constructive and stable, in order to realize mutual respect, peaceful coexistence and win-win cooperation.

Regarding the Taiwan question, Wang emphasized that it concerns China's core interests and remains the biggest risk in China-US relations. Washington should honor its commitments, make the right choices, open up new space for China-US cooperation and make due efforts to achieve world peace, he said.

Rubio told Wang that the US-China relationship is the most important bilateral relationship in the world, and that head-of-state diplomacy lies at the core of this relationship.

Both sides should maintain communication and coordination, respect each other, properly manage differences, build up outcomes for high-level engagement and seek strategic stability in bilateral ties, Rubio added.

Also on Thursday, He Lifeng, China's vice-premier and lead for China-US economic and trade affairs, held a video call with US Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer.

The Chinese side expressed serious concerns over the recent US economic and trade restrictive measures against China. Both sides agreed to continue to make good use of the China-US economic and trade consultation mechanism, build consensus, manage differences and strengthen cooperation, in order to promote the healthy, stable and sustainable development of China-US ties.

President sends festive greetings to working people

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

President Xi Jinping has extended festive greetings and best wishes to the country's working people ahead of the International Workers' Day, which falls on Friday.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, sent the greetings on behalf of the CPC Central Committee.

This year marks the 105th anniversary of the founding of the CPC and the first year of the 15th Five-Year Plan (2026-30) period, Xi said, praising the important contributions made by the working people to the cause of the Party and the country.

He expressed hope that working people across the country will vigorously carry forward the spirit of model workers, the working spirit and craftsmanship, work diligently, dedicate themselves to their posts, and demonstrate their role as the main force and their sense of ownership in promoting high-quality economic and social development.

Xi asked Party committees and governments at all levels to earnestly safeguard the lawful rights and interests of workers, make greater efforts to address their most pressing concerns, and encourage them to strive unremittingly for the country's grand goals.

HANDS-ON EXPERIENCE INSTILLS STEEL, EMPATHY IN STUDENTS

Enthusiastic response to labor-intensive programs teaching respect, value of physical work

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

On a crisp autumn afternoon, Chen Yijie, a 20-year-old finance major at Renmin University of China, found herself in a baking class learning how to make a chiffon cake. On three consecutive Wednesdays, with each session lasting two to three hours, she measured flour, whipped egg whites and watched the oven with anticipation.

"It was really fun," Chen said. "I personally enjoy baking, so I chose this course. We worked in groups of three, helping each other — one stirring, one preparing ingredients. It really developed team cooperation."

When the cake came out of the oven, the sense of achievement was immediate. Chen and her group shared their creation with their peers. "It was a very happy experience," she said.

Chen is among a growing number of Chinese university students now required to complete labor education credits before graduation. Under a national guideline issued in 2020 by the Ministry of Education, undergraduate students must complete at least 32 class hours of labor education as a compulsory requirement. The policy aims to integrate labor into the broader framework of moral, intellectual, physical, and aesthetic education, alongside traditional academic subjects.

The ministry has since called for universities to build systematic labor education curricula, emphasizing hands-on experience, teamwork and respect for workers.

Across campuses, that mandate has given rise to a remarkable range of courses: baking cakes, fixing leaky faucets, pruning trees, and harvesting bamboo fungus. And students are lining up for spots.

At Beijing University of Posts and Telecommunications, Zhao Xiaoye, deputy Party secretary of the university's logistics department, has witnessed the enthusiasm firsthand.

Manufacturing defies Mideast energy shock

Chinese factories continue growth spurt for second consecutive month

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China's manufacturing sector maintained its expansion streak for a second month in April, signaling sustained growth momentum despite a global energy shock triggered by tensions in the Middle East.

Inside
See more, **page 4**

The official manufacturing Purchasing Managers' Index was 50.3 in April, according to National Bureau of Statistics data released on Thursday. While a marginal 0.1-point dip from March, the figure remains above the critical 50-point threshold that separates expansion from contraction.

The data revealed a substantial recovery for the backbone of the country's private sector. The PMI for small and medium-sized enterprises stood at 50.1 and 50.5, respectively, up 0.8 and 1.5 percentage points from March, with both returning to expansion territory, the NBS said.

Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International, attributed the rebound to the continued application of supportive macro policies targeting the real economy.

"The improvement was likely supported by a package of structural monetary and fiscal policy measures introduced earlier this year to strengthen financing support for private SMEs," Wang said.

The rapid development of "new quality productive forces", Wang said, is playing an increasingly stronger role in supporting overall macroeconomic growth.

Notably, high-tech manufacturing posted a PMI of 52.2 in April, up 0.1 percentage point from March, while equipment manufacturing recorded a PMI of 51.8, up 0.3 percentage points from the previous month.

Despite the escalation of tensions in the Middle East threatening global supply chains, analysts suggest China is uniquely buffered.

"Although Middle East tensions continue to disrupt global supply chains, China has maintained strong competitiveness in foreign trade markets," said Wen Tao, an analyst at China Logistics Information Center.

Jeremy Zook, lead analyst for China at Fitch Ratings, added that the country is relatively well positioned to withstand the energy shock, thanks to its sizable oil reserves, strong refining capacity and current energy mix.

Near-term risks of energy shortages remain limited, Zook said, adding that China's export outlook is expected to stay resilient, though growth may moderate over the coming year.

Despite the overall expansion in manufacturing, nonmanufacturing activity softened in April, with the construction sector remaining under pressure.

The construction PMI came in at 48.0, down 1.3 percentage points from March and staying in contraction territory, according to the NBS.

Wang, the analyst, said the weaker reading reflected the continued drag from the ongoing adjustment in the real estate market, and pointed to the need to further strengthen investment momentum.

Wang said there remains ample policy room to further stabilize the real estate market and to better cope with external uncertainties.

Buffalo tide

A herd of buffaloes swims across the Jialing River to reach the lush shores of Taiyang Island in Peng'an county, Sichuan province, as onlookers gather to witness the spectacle on Thursday. This unique ecological phenomenon began in the 1990s following the construction of the Mahui Hydropower Station. As water levels rose, the local buffaloes adapted, evolving from waders into skilled swimmers to reach the rich forage on the island. JIANG HONGJING / XINHUA

Forum: Nations aligned on many key issues, says expert

From page 1

"Such a holistic approach resonates with many developing countries, including Malaysia, which also prioritize balanced and inclusive growth," Bing said.

Neo Chee Hua, CEO of the Southeast Asia Research Centre for Humanities, said the fifth volume of the book focuses on high-quality development, high-level opening-up, win-win cooperation and building a community with a shared future for humanity.

Many of the important concepts in the book are reflected in China's 15th Five-Year Plan (2026-30), while the 13th Malaysia Plan also emphasizes economic resilience, supply chain security and structural reform in response to a more uncertain global environment, he noted.

The two countries are therefore highly aligned on many key issues, which lays an important foundation for deeper and more substantive Malaysia-China cooperation, he added.

Dato' Abdul Majid Ahmad Khan, president of the Malaysia-China Friendship Association and former Malaysian ambassador to China, said the forum provided an important opportunity for intellectual exchange and mutual understanding, particularly in appreciating China's governance philosophy and its broader vision for global cooperation.

Greeting the future

Maxime Prevot, Belgium's deputy prime minister and minister of foreign affairs, waves to greet a humanoid robot during his visit to Deep Robotics Co in Hangzhou, Zhejiang province, on Wednesday. Prevot is on a five-day visit to China that started on Monday. WANG GANG / CHINA NEWS SERVICE

Sanya praised for sports venues, hospitality

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

As the flame of the 6th Asian Beach Games flickered out on Thursday in Sanya, etching memories in the hearts and minds of athletes and officials, the tropical tourism paradise in South China's Hainan province added a feather in its cap as a fitting stage for international sporting events.

Inside
See more, **pages 6-7**

A grand closing ceremony capped off 10 days of intense competition in 15 disciplines across sand and sea, which recorded the participation of more than 1,700 athletes from 45 countries and regions. Host China dominated the final tally with 14 gold medals, as well as two new world records in speed climbing, to cement the nation's status as a sporting power in Asia.

The games, which showcased some niche disciplines such as beach kabaddi, teqball and dragon boat race, stole the international spotlight not only for Sanya's breathtaking landscapes and vibrant culture, but also for the quality and organization of its competition venues.

The sun-drenched coastal city tested and honed the skills of emerging young talent for the 20th Asian Games scheduled to take place in Nagoya, Japan, in the fall.

The beach games highlighted Sanya's capability to integrate sports, tourism, culture and lifestyle activities into the development of the Hainan Free Trade Port, with a visa-free policy applicable for 86 countries further facilitating the city's opening-up.

> "The people are very warm and friendly — all very welcoming. ... I would love to come back with my family to Sanya."
>
> **Saphna Ravichandran,** legal counsel for the Asian Football Confederation

Athletes and officials gave the thumbs-up for Sanya's warm hospitality and great organizational capability, expressing the hope to be able to visit again.

"The games have been very well organized, and I'm thankful for the chance to compete here," said Cherif Samba, a beach volleyball player from Qatar, who along with partner Ahmed Janko retained the men's title on Wednesday with a straight-sets win over an Iranian pair.

"I haven't had the time to explore Sanya properly yet, because we've spent most of our time in the athletes' village. But I've seen many interesting spots, and maybe one day I will come back for a visit," he added.

Saphna Ravichandran, a legal counsel for the Asian Football Confederation from Malaysia, said the Sanya event has helped many people, including her, to see the true picture of China.

Noting that this is her first visit to the country, Ravichandran said China is very different than what "the outside world" makes it to be. "Coming to Sanya has really changed my perspective of ... what China really is," she said.

"The people are very warm and friendly — all very welcoming. In Malaysia, we do have similar areas, like beaches and stuff, but it's always different to go out to another country to see what they can offer. So yes, I would love to come back with my family to Sanya," she added.

Raven Faith Alcoseba, a triathlete from the Philippines, praised Sanya for its easy accessibility, modern infrastructure and laid-back vibe, calling the city a must-visit destination.

"The visa-free policy made my trip so smooth. I could just arrive with my passport and then focus entirely on the competition," she said. "After the race, I even had time to go shopping at a duty-free mall, which is a wonderful bonus of being here."

Already popular for its 264 kilometers of pristine coastline and wide sandy beaches, Sanya has now earned the confidence of top officials and further established itself as an ideal host for future international sporting events.

Thomas Bach, former chief of the International Olympic Committee, hailed the beach games as a compelling example of the unifying power of sports and lauded Sanya as a competent host following his visit to the city.

"Hainan, I think, has the intention to attract even more international sports events," said Bach, who is now IOC honorary president for life.

Xing Wen in Sanya contributed to this story.

Revision to Prison Law helps protect inmate rights, improve rehabilitation

By **CAO YIN**
caoyin@chinadaily.com.cn

China's top legislature has adopted a significant revision to the nation's Prison Law, guaranteeing better protection of prisoners' rights and more professional measures aimed at rehabilitation.

The revision to the law, comprising 121 articles across eight chapters, was adopted by the Standing Committee of the 14th National People's Congress in a session that concluded on Thursday. The updated law will take effect on Nov 1.

The NPC Standing Committee's Legislative Affairs Commission said the amended law places greater emphasis on safeguarding inmates' rights, noting that respect for and protection of human rights were introduced as a general principle in the first chapter.

The revised law emphasizes that inmates' personal dignity, life, health and physical safety must remain inviolable. It also clearly stipulates that their rights to defense and to receive legal assistance while serving sentences should be protected.

Prisons are allowed to reasonably schedule the frequency and duration of inmates' phone calls and family in-person visits, based on rehabilitation needs, security classifications and custody levels. Video calls can also be arranged if necessary.

The amended law focuses on enhancing the quality of inmate education and rehabilitation, requiring innovative measures to help them reintegrate into society.

The law encourages legal, education, psychology and social work professionals to support inmate rehabilitation, while prison management staff are urged to strengthen communication and collaboration with various sectors, including government agencies, social organizations, military authorities and enterprises, to create opportunities and provide support for former inmates returning to normal life.

While maintaining prison security as a fundamental priority, the revised law also mandates stronger oversight by procuratorial agencies over the execution of prison sentences. Specialized attention is also directed toward juvenile offenders, with mandates for tailored facilities and professional personnel to support their physical and mental health.

Justice Minister He Rong said the update — the first comprehensive revision since 1994 — is a necessary response to public demand for fairness, justice and security.

She added that improvements in law enforcement institutions and mechanisms have created new circumstances and higher demands placed on prison work. Therefore, it is necessary to revise the law to incorporate the experiences, practices and mechanisms developed over the past 30 years, ensuring that prison work progresses in an orderly manner under the rule of law.

Originally enacted in 1994, the current Prison Law underwent some updates in 2012. In 2023, a comprehensive revision to the law was added to the legislative agenda of the 14th NPC Standing Committee.

Research: Country set to hike R&D spending

From page 1

China estimates an annual average increase of at least 7 percent in nationwide R&D spending during the 15th Five-Year Plan (2026-30) period, and Chinese companies and entrepreneurs are becoming increasingly important for the nation's research system.

During the symposium, Xi pointed out the importance of actively integrating into the global innovation network, deepening international exchanges and cooperation in basic research, jointly tackling major scientific issues such as climate change, energy, environment, life science and health, and actively participating in global science and technology governance.

While emphasizing the need to advance talent development in the field of science and technology, he called for improving the working and living conditions of professionals who engage in basic research and fostering an open, inclusive and failure-tolerant innovation environment.

Briefly

Appointment of new ministers approved

The top legislature on Thursday approved the appointment of two new ministers.

At a session of the Standing Committee of the 14th National People's Congress, lawmakers voted to appoint Zhang Zhu as minister of agriculture and rural affairs and Zhang Chengzhong as minister of emergency management.

Zhang Zhu, born in February 1968, previously served as deputy Party secretary of the Xinjiang Uygur autonomous region and Party secretary of its capital, Urumqi, according to public information.

Zhang Chengzhong, born in October 1970, previously served as a member of the Standing Committee of the CPC Hebei Provincial Committee and Party secretary of Tangshan.

Senior official expelled from CPC, public office

Yi Huiman, a member of the 20th Central Committee of the Communist Party of China, has been expelled from the CPC and dismissed from public office over serious violations of discipline and laws, China's top anti-graft agency announced on Thursday.

Yi previously served as deputy director of the Committee of Economy of the 14th National Committee of the Chinese People's Political Consultative Conference and as chairman of the China Securities Regulatory Commission.

Major carrier orders 137 Airbus A320neos

China Southern Airlines and its subsidiary, Xiamen Airlines, have signed agreements to purchase 137 Airbus A320neo family aircraft. The deal is valued at approximately $21.4 billion at list prices, though substantial discounts are expected. Deliveries are scheduled between 2028 and 2032.

The carrier said late on Wednesday that it and Xiamen Airlines had signed separate agreements with Airbus to purchase 102 and 35 A320neo jets, respectively.

This order aims to accelerate fleet renewal and meet rising travel demand.

Seven killed, 12 injured in traffic accident

Seven people were killed and 12 others injured in a traffic accident on Thursday in Yunnan province, local public security bureau said.

The accident occurred on Thursday morning in Yuanyang county, when a vehicle carrying 19 people overturned.

An investigation into the cause of the accident is underway.

Courses: Fulfillment, relaxation behind popularity

From page 1

"Every time we announce our cooking micro-classroom spots disappear within seconds," she said. "Just recently, we offered a *qingtuan* (sweet green rice ball) class for 70 students. They (places) were gone in less than three minutes."

But the cooking classes are about more than just food.

Zhao explained that before students start mixing ingredients, she teaches the cultural story behind the Cold Food Festival, which is traditionally observed the day before Qingming Festival, where no fire is lit and only cold food is eaten.

Many students have never had the chance to cook at home, she said. Through this process, they not only learn to make a dish but also experience the joy of labor, the inheritance of Chinese culture, and develop empathy for kitchen staff.

That empathy, Zhao stressed, is a crucial outcome.

"When a student finds a hair in their cafeteria food, they get very angry. But after they've gone through the entire process of making a dish themselves — even if they find two hairs in their own cooking — their reaction is completely different. They understand how much work goes into each dish."

Zhao believes labor education also addresses deeper needs, including mental well-being.

Science and engineering students, for example, have very tight schedules and their course loads are heavy.

Labor education helps them decompress. When they're stuck on a research problem or feeling down, getting their hands dirty outdoors can open their minds and lift their spirits, she said.

Zhao pointed to a recent outdoor labor session where students were asked to clear stones from a field before planting flowers and vegetables. Within five minutes, over 100 students had signed up.

"They're curious, they want to learn, and they also get labor hours and credits. It's a win-win," she said.

For Zhao, the old slogan "labor is the most glorious" only truly takes root through experience. The university has a persimmon harvest festival on campus every year, she said.

The fruit grows high on the trees and is not easy to pick. But when students work hard to harvest them themselves, they find the persimmons beautiful, sweet and fragrant. They show them off to friends and say they picked them. If a persimmon simply fell to the ground, they might not even pick it up, she said.

"That self-directed growth and personal experience — that's what makes them truly feel the glory of labor."

Students from Beijing University of Posts and Telecommunications learn to identify meat patterns during a culinary class on campus in Beijing. PROVIDED TO CHINA DAILY

> "I used to think labor was far away from me. Now I feel it's right beside me. I learned not just to cherish food, but to respect every person who lives by their own hands."
>
> **Li Junjie,** student at Beijing International Studies University

Connecting to the land

On a spring morning in Handan, Hebei province, Zhi Ying, a first-year law student at Beijing University of Posts and Telecommunications, knelt in the freshly tilled soil of a cornfield.

Under the guidance of agricultural experts, Zhi and her classmates learned to open furrows, sow seeds and cover them with earth. Weeks later, when the mature corn was harvested and sent back to campus, she tasted the fruit of her own labor.

"The sweetness lingered not just on my tongue but also brought a complete sense of achievement, from sowing to harvest," she said. "I went from being a bystander of agricultural production to someone who truly got their hands dirty."

Wang Xinyi, a second-year undergraduate majoring in artificial intelligence at BUPT participated in a spring pomegranate tree planting event on campus as part of labor classes, working alongside university leaders and fellow students.

"We dug soil, watered, and carefully planted the saplings," she said. Afterward, those who toiled sat together and listened to classmates share their stories.

Wang said labor education helped her "connect more deeply with the land and real life". She added: "As young people in the new era, we not only need to master skills like coding and technology — we also need to grow into well-rounded individuals with responsibility, teamwork skills, and an understanding of life."

"Planting a tree and waiting for it to grow teaches you patience and helps fight the anxiety of today's fast-paced world. Making food by hand shows you that technology should serve life, not the other way around. And clearing snow in winter toughens your will and deepens your respect for every ordinary worker," she said.

Zhi, who planted corn in Handan, found that the experience reshaped her understanding of time and reward.

Most of our daily learning gives immediate feedback, she said. But farming follows the unchangeable rhythm of nature — after spring planting, you have to wait through a long growing season before you can harvest in autumn, she said.

"Now, when I have three meals a day, I carry a deep sense of awe and gratitude. That kind of conservation mindset, born from firsthand experience, is something classroom lectures alone can never give."

She also noted the different mental state.

"Classroom learning is all about rational thinking and abstract knowledge — a mental drain," Zhi said. "Working in the fields is immersive: the feel of soil under your feet, the shape of seeds in your hand, the warmth of sunlight on your face. Away from complex theories, your mind actually relaxes, and you find a rare sense of peace."

Reviving 'Red memories'

Miao Hanzhe, a master's student in integrated circuit science and engineering at BUPT, led a team deep into the Jinggangshan revolutionary area in Jiangxi province for a labor practice project.

There, he identified a problem: outdated exhibition boards and monotonous explanations were failing to engage young people with the region's revolutionary heritage.

So Miao and his team designed an NFC chip-based "Red memory trigger device". Visitors can tap their phones against the device to instantly play micro-lectures and revolutionary stories, bringing static exhibits to life.

They also developed a digital study tour mini-program, putting Jinggangshan's historical sites and stories in the cloud.

The experience helped Miao see that true learning means rooting professional knowledge in the needs of the country and society. He is about to graduate and join a tech company focused on communications and chips, and is determined to tackle key technological bottlenecks and serve the nation through science.

At Beijing International Studies University, labor education is taking students into rural villages.

Zhao Mingzhuang, an undergraduate student majoring in international economics and trade, recalled spending over two hours bent over, sowing seeds in a village in Beijing's Yanqing district.

"By the time I straightened up, my back ached so much I could barely stand. That's when I truly understood what 'labor' means," she said. At lunch that day, she finished every grain of rice in her bowl. "Not a single grain left. I've learned to cherish things."

Li Junjie, a Japanese major at BISU, took part in corn-threshing. Watching the farmers, it looked easy. But when he tried, his hands hurt and his back ached within minutes, he said.

"Thanks to the local farmers who taught us their techniques, we got through it. I used to think labor was far away from me. Now I feel it's right beside me. I learned not just to cherish food, but to respect every person who lives by their own hands."

RUC has made labor education a one-credit compulsory course totaling 32 hours — eight hours of theory and 24 hours of practical work. In 2025 alone, the university offered 20 campus-wide courses, from coffee-making and traditional printing to auto repair and plumbing maintenance, plus 55 college-level courses. A Song Dynasty (960-1279) brocade accessory-making workshop attracted over 200 students within one minute of registration.

RUC English major Zhuang Zhanwang took a plumbing course. Over two days, he learned to install faucets and fix leaks, then shadowed maintenance staff on actual campus repair calls.

"I learned basic skills that will be really helpful for independent living," he said. "But equally important, I got to understand the work that maintenance staff does every day. I have a lot more respect for them now."

He also spent a full day at RUC's Tongzhou campus woodland, building insect enclosures, pruning branches, turning soil and planting vegetables.

"It was a bit tiring, but I was very happy," he said. "Seeing everyone work together and seeing the finished products — it felt very rewarding."

Exertion, sweat give students 'real rewards'

By **ZOU SHUO**

As China's universities place greater emphasis on holistic development, Beijing International Studies University has embedded labor education as a compulsory component of its undergraduate curriculum to foster respect for labor and enhance students' sense of social responsibility.

According to Zhang Xihua, head of the university's academic affairs office, the labor education program includes no fewer than 32 class hours, consisting of eight hours of theoretical instruction and 24 hours of practical work.

Practical activities take students beyond campus cleaning or routine volunteering. In Beijing's Yanqing district, for example, students work alongside agricultural technicians to clear old seedlings and plow fields in autumn. In a forest farm in Shunyi district, they learn about and harvest bamboo fungus. Other popular activities include tea-picking, tea-making, and community gardening.

"We want students to truly work, exert themselves, sweat, and gain real rewards," Zhang said.

These hands-on activities not only build practical skills but also teach students to respect labor and value its fruits, she said.

Working in the fields, they realize that farm work is far from easy and come to understand that "every grain comes from hard work". They also develop a stronger belief that labor creates a better future, she said.

Meanwhile, labor education strengthens teamwork and problem-solving abilities and also boosts physical and mental health, she added.

Students from Beijing International Studies University learn to plant trees in Beijing's Yanqing district. PROVIDED TO CHINA DAILY

Students have responded positively.

Qiu Sijing, a first-year French major at the university, said the most memorable session was cutting down dried eggplant stalks in the university's labor education base in Yanqing. Those dry stalks were hard and tough.

Cutting them with a sickle required the right angle and real effort, she said. After cutting, the students had to tie them into bundles and carry them away, and their hands were soon marked with red prints.

The experience taught her that farming is a full cycle. "It's not just sowing in spring and harvesting at the peak moment. The unnoticed cleanup work is just as essential," she said. "As a young person, I've come to appreciate the complete effort behind every achievement — including the repetitive, not so glamorous tasks."

Han Xinyu, a first-year trade economics student at the university, recalled an October labor course that took her class to a village history museum, a revolutionary memorial, and then into farm fields.

For the first time, she truly got her hands dirty from picking vegetables and shelling corn, she said. "I felt in my bones that every grain of rice comes from hard work. Labor taught me patience and groundedness, and helped me shed my previous restlessness."

Han also noted the benefits of working alongside classmates. "Unlike lectures that can make you drowsy, labor lessons — though physically tiring — lift your spirits. Working outdoors, talking and helping each other, we drew much closer as classmates."

UN chief warns of recession as Hormuz disruptions continue

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

UN Secretary-General Antonio Guterres on Thursday warned that ongoing restrictions to navigation in the Strait of Hormuz could tip the world into recession, stating that navigational rights and freedoms "must be restored immediately".

Speaking at a news conference hosted at UN headquarters in New York, the UN chief listed three scenarios tied to the duration of the Middle East crisis, which is entering its third month.

In the best case, if the restrictions are lifted today, global growth would still fall from 3.4 to 3.1 percent this year, with inflation rising to 4.4 percent, Guterres said.

If the crisis extends through midyear, 32 million people could be pushed into poverty and 45 million more could face extreme hunger, said Guterres. And if it persists through year-end, global growth could collapse to 2 percent and inflation surpass 6 percent, he said.

"These consequences are not cumulative. They are exponential," said Guterres, adding that developing countries will be hit the hardest.

The secretary-general called on all parties to comply with Security Council Resolution 2817. "Open the Strait. Let all ships pass," he said.

"Now is the time for dialogue, for solutions that pull us back from the brink, and for measures that can open a pathway to peace," Guterres said. "The world is waiting."

The warning comes amid escalating tensions following a breakdown in post-ceasefire talks between the United States and Iran earlier this month.

Two months into the US-Israeli war with Iran, the vital sea channel remains closed, choking off 20 percent of the world's oil and gas supplies. That has sent global energy prices surging and heightened concerns about the risks of an economic downturn, Reuters reported on Thursday.

Iran said on Thursday it would respond with "long and painful strikes" on US positions if Washington renewed attacks, and also restated its claim to the Strait of Hormuz, complicating US plans for a coalition to reopen the waterway.

US President Donald Trump was slated to receive a briefing on Thursday on plans for a series of fresh military strikes on Iran to compel it to negotiate an end to the conflict, a US official told Reuters.

Such options have long been part of US planning but reports of the proposed briefing, first issued by news site Axios late on Wednesday, initially spurred big gains in oil prices, with the benchmark Brent crude contract hitting more than $126 a barrel at one point. It later slipped back to around $114.

Negotiations held in Islamabad, Pakistan on April 11 and 12 failed to produce an agreement, after which Washington imposed a blockade on Iranian ports, while Iran threatened maritime traffic, preventing tankers from transiting through the Strait of Hormuz.

A ceasefire between Iran, the US and Israel took effect on April 8 after 40 days of fighting that began on Feb 28 with strikes on Tehran and other Iranian cities.

Iranian officials said the attacks killed senior leadership figures, including then-Supreme Leader Ali Khamenei, as well as civilians. Iran responded with missile and drone strikes targeting Israel and US assets in the region and later moved to restrict traffic through the Strait.

Iranian President Masoud Pezeshkian on Thursday said any attempt by the US to impose a naval blockade would be "doomed to failure," according to a statement published on his office's website, Xinhua reported.

In a statement marking Persian Gulf National Day, Pezeshkian said regional waterways should not be subject to "unilateral foreign will", and called instead for collective security based on mutual respect among coastal states.

Xinhua and Reuters contributed to the story.

Briefly

UNITED STATES

Fed holds rates steady amid high energy prices

The Federal Reserve kept interest rates unchanged on Wednesday, but in its most divided decision since 1992, noted rising concerns about inflation in a policy statement that drew three dissents from officials who no longer feel the US central bank should communicate a bias toward lowering borrowing costs. A fourth dissent at the meeting favored a quarter-percentage-point rate cut. "Inflation is elevated, in part reflecting the recent increase in global energy prices," the Fed said in its policy statement, a shift from previous language saying that inflation was just "somewhat" elevated. "Developments in the Middle East are contributing to a high level of uncertainty about the economic outlook," it said. "In support of its goals, the Committee decided to maintain the target range for the federal funds rate at 3-1/2 to 3-3/4 percent," the statement said.

LIBYA

17 killed, 7 rescued after week at sea

The Libyan Red Crescent said on Wednesday that a patrol boat recovered 17 bodies and rescued seven people during an operation to assist a stranded vessel off the North African country. The organization shared photos on its Facebook page showing aid workers hauling black body bags from a boat. It did not give information about the nationality of those killed or those rescued, but said it provided humanitarian assistance to survivors along with the United Nations High Commissioner for Refugees, which suggests they were migrants. "After eight days of distress, the *Almarqab* patrol boat, attached to the naval base, successfully rescued a stranded vessel. The operation resulted in the rescue of seven survivors and the recovery of 17 bodies," the Red Crescent said on Facebook.

Terror probe

Forensic officers comb a cordoned-off street in Golders Green, London, on Wednesday after two people were stabbed in what authorities have declared a terrorist attack. The neighborhood, home to a large Jewish community, has seen a series of targeted assaults. British Prime Minister Keir Starmer said he was "deeply concerned". KIN CHEUNG / AP

Japan condemned for rash advances in military agenda

Moves seen as stirring regional unease, trigger Beijing's call for global scrutiny

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

China's diplomacy and defense authorities have spoken out to slam Japan's "dangerous" military, espionage and nuclear policy drives that have reminded other Asian countries of its atrocities over 80 years ago during World War II.

Foreign Ministry spokesman Lin Jian warned on Thursday that Japan's neo-militarism is "becoming a serious concern" and "has posed a clear threat to world peace and stability".

Lin was responding to Japan's latest legislative drive to restore the military ranks used by the Imperial Japanese Army prior to the end of World War II.

According to Japanese media reports, the country has finalized a plan to revise the titles of Self-Defense Forces officers and plans to submit a draft amendment to the Japanese Diet within the year.

The reports also noted that senior government officials described the move as aimed at "creating a work environment that fosters a sense of honor" to attract and retain talent.

Lin said this "amounts to a breakthrough at both institutional and cognitive levels", and "is tantamount to rubbing salt into the wounds of the people of the victimized nations".

He noted that after World War II, Japan disbanded its military as a defeated country, and when the Japan Self-Defense Forces were established in 1954, the titles from the former military were abolished.

"The forces of justice in the international community, including the Chinese people, should remain highly vigilant about this, resolutely defend the outcomes of the victory in World War II, and ensure that the tragedies of history are not repeated," Lin said.

On Tuesday, the Japanese government revised the operational guidelines for the Three Principles on Transfer of Defense Equipment and Technology and scrapped a ban on lethal weapons exports.

Last week, the Japanese Diet passed a bill establishing the National Intelligence Council.

In response, China's National Defense Ministry spokesman Zhang Xiaogang said at a news conference on Thursday that Japan is "racing headlong" down the path of remilitarization.

"Japan's recent frequent dangerous and rash advances, testing and provocative moves in the military and security fields have directly debunked its self-proclaimed labels of a 'peace-loving nation' and a country committed to 'exclusive defense'," Zhang said.

The planned National Intelligence Council reminds people of the notorious Special Higher Police, Japan's brutal policing and espionage organization torturing people in the war, he said.

This "seriously offends the sentiments of the people of Asian countries", he added.

Retrograde actions

"All peace-loving people must remain highly vigilant against this, resolutely curb Japan's retrograde actions, and absolutely not allow it to undermine peace and wreak havoc on the world," Zhang said.

Also on Thursday, the Foreign Ministry released a working paper regarding Japan's pursuit of nuclear weapons.

In the document, China called on countries that have signed the Treaty on the Non-Proliferation of Nuclear Weapons to "remain highly vigilant and firmly oppose Japan's possessing nuclear weapons".

The paper urged the countries to "carefully consider Japan's strong motivation to acquire nuclear weapons and other related developments, exercise caution in nuclear cooperation with Japan, and effectively safeguard the international nuclear nonproliferation regime".

In the document published on the Foreign Ministry's website, Beijing urged Tokyo not to seek nuclear weapons in any form, not to develop nuclear submarines, and not to seek to introduce or deploy nuclear weapons within Japan.

The document urged the Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons to attach great importance to Japan's dangerous tendency to seek nuclear weapons and its immediate and long-term negative effect on the treaty, and to treat this as a key issue for thorough discussion and consideration.

The document called on the International Atomic Energy Agency to specifically strengthen the scope, intensity and frequency of comprehensive safeguards and verification activities regarding Japan to ensure the timely detection of any non-peaceful nuclear activities conducted by Japan.

China urges restraint, dialogue to steady intl security

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China on Wednesday urged all parties to exercise restraint and uphold international law, as military strikes on Iranian nuclear facilities raised global concern.

Addressing the Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons, Sun Xiaobo, director-general of the Department of Arms Control of China's Foreign Ministry, said the world faces "increasing uncertainty and instability", with certain countries pursuing unilateral policies, imposing sanctions and provoking conflicts.

"They frequently impose sanctions and blockades on other countries, provoke conflicts and wars around the world, and arbitrarily trample on the sovereignty and territorial integrity of others, seriously threatening the national security and even the basic right to survival of small and medium-sized countries," Sun said.

Such actions severely undermine the international system with the United Nations at its core, the international order based on international law, and the basic norms governing international relations founded on the purposes and principles of the UN Charter, he said.

Hegemonism, power politics and unilateralism pose real threats to the global nonproliferation policy, he said, warning that the pursuit of "absolute strategic advantage" and strengthened military alliances have fueled the risk of an arms race and eroded strategic stability.

"Military strikes against nuclear facilities under safeguards, without authorization from the UN Security Council, seriously violate international law," he said, adding that such actions, carried out under the pretext of nonproliferation, risk accelerating proliferation and destabilizing entire regions.

His remarks came as the situation surrounding Iran has intensified in recent weeks, with military actions reportedly targeting nuclear facilities under safeguards of the International Atomic Energy Agency.

Sun called on all parties to resolve disputes through dialogue, saying preventing nuclear war and maintaining global strategic stability must remain the top priority.

China reiterated support for nuclear disarmament in a fair and orderly manner, urging states with the largest nuclear arsenals to take the lead. It called for early negotiations on a no-first-use treaty among nuclear-weapon states and a legal instrument providing security assurances to non-nuclear-weapon states.

Under safeguards

Regarding regional issues, Sun said China renewed its call for the establishment of a nuclear-weapon-free zone in the Middle East and urged Israel to join the Treaty on the Non-Proliferation of Nuclear Weapons as a non-nuclear-weapon state and place all its nuclear facilities under international safeguards.

Sun also warned against moves by certain countries to seek nuclear capabilities, and pointed to recent developments in Japan.

"Senior officials of certain countries have openly advocated pursuing nuclear weapons, seriously undermining the authority and credibility of the treaty," he said.

"As a country defeated in World War II, Japan refuses to acknowledge this status, is promoting revisions to its pacifist constitution and its Three Non-Nuclear Principles, expanding long-range strike capabilities, and seeking the deployment of nuclear weapons by allies on its territory."

The international community should prevent Japan from acquiring nuclear weapons, he added.

Responding to the United States delegation, the Chinese delegation on Wednesday rejected what it called "groundless smears", saying Washington was misrepresenting China's nuclear policy and shifting attention from its own disarmament responsibilities.

"The so-called 'multilateral nuclear arms control dialogue' proposed by the US is more political show than substantive engagement," the Chinese representative said, adding that it is based on "erroneous narratives" and distracts from US obligations as a major nuclear power.

China also criticized US withdrawals from key arms control agreements, including the Intermediate-Range Nuclear Forces Treaty and the Open Skies Treaty, saying these developments have weakened the global arms control framework.

Left: A view of the production line is a highlight during a tour of China YTO, a leading agricultural and construction machinery manufacturer founded in 1955 in Henan province.
Right: Students enjoy a virtual reality experience at Longmen Grottoes in Luoyang, Henan province. PHOTOS PROVIDED TO CHINA DAILY

Immersive lessons taught by Luoyang

As study tours trend, new courses share extensive information and hands-on experiences, **Yang Feiyue** reports.

In the early 1950s, Peking Opera master Mei Lanfang stood before a niche on the southern wall of the Ten Thousand Buddhas Cave at the Longmen Grottoes in Luoyang, Henan province.

For a long moment, he gazed at a statue of a bodhisattva whose face had long been destroyed. Yet, what he saw was not ruin, but a spirit of grace that reminded him of the line "Startled swan, roaming dragon" from Cao Zhi's (192-232) *Ode to the Goddess of the Luo River*.

That year, the statue inspired Mei's opera, *The Goddess of the Luo River*.

Today, more than seven decades later, groups of young students make their way to the grottoes site, where they wear virtual reality headsets and enter the cave where the statue stands. They see not only the fragmented beauty that moved Mei, but also a digital restoration of a face erased by time.

These experiences are just a glimpse of what awaits study tour participants at Longmen Grottoes, one of China's largest cave temple complexes and a UNESCO World Heritage site that represents "the pinnacle of Chinese stone carving art".

"We don't just bring cultural relics to life," says Ma Jialun, a representative of the cave site. "We want every participant to become a carrier of civilization."

Under professional guidance, visitors shape their own clay Buddha figures in art workshops and paint patterns from the grottoes' lotus-flower ceilings onto silk fans, brushstroke by brushstroke.

The programs at Longmen Grottoes are part of Luoyang's broader efforts to immerse visitors in a tangible experience of its history and culture hidden in its abundant museums and UNESCO World Heritage sites.

In late March in Beijing, Luoyang unveiled five study tours focused on archaeological exploration, Yellow River culture, and the preservation of intangible cultural heritage, aiming to appeal to travelers' cultural curiosity and enthusiasm.

"Beijing and Luoyang are both among the eight great ancient capitals of China," says Zhang Xu, an official from the Luoyang municipal bureau of culture, radio, television, and tourism.

Luoyang encourages travelers to explore the roots of Chinese civilization across the ruins of five ancient capital cities, explore 112 museums, and witness three UNESCO World Heritage sites.

"The city is a living museum of Chinese history," he notes.

Luoyang has established more than 100 study bases offering over 1,600 courses covering a wide range of topics, forming a comprehensive spectrum of information from the dawn of civilization to modern technology.

For the upcoming season, the city has prepared 900 tour routes tailored to meet the diverse needs of study travelers.

With multiple ancient emperors having paid homage here, the Longmen Grottoes have been systematically developing study tour activities since September 2021, transforming the weight of history into hands-on educational programs.

Top: At the Sui-Tang Dynasties Grand Canal Cultural Museum, visitors become part of the waterway in an immersive theater program where they are cast as merchants or boatmen traveling the artificial waterway that once connected Beijing to Hangzhou, Zhejiang province.
Left: A girl engages in an art project during her visit to Luoyang Museum. **Right:** Visitors learn about history at the Han-Wei Luoyang Ancient City Site Museum, in which the displays bear witness to the exchange and mutual learning between Eastern and Western civilizations along the ancient Silk Road.

For adults, the site invites scholars to lead participants into the caves for on-site academic exchanges alongside its own experts, while senior guides provide up-close art appreciation. "Visitors find it unforgettable and immersive when they watch experts engage in live scholarly debate," Ma notes.

For younger students, experience and creation are emphasized. Thirteen original courses cover areas including technology and intangible cultural heritage. One particularly inventive program uses 3D-printing technology to create 1:1 replicas of relief carvings and inscribed stelae, allowing students to experience traditional rubbing techniques firsthand.

"As students brush and press, they capture the details of the Longmen Grottoes' content," he explains.

If the Longmen Grottoes are a brilliant jewel in Luoyang's historical crown, the city's museums form a three-dimensional narrative of "what makes China".

At the Erlitou Site Museum of the Xia Capital, visitors can explore the origins of Chinese civilization through more than 30 courses.

A course on the path of technological innovation in Xia Dynasty (c. 21st century-16th century BC) handicrafts is offered for visitors to vicariously feel what it's like to be Xia artisans, as they try their hand at pottery, bronze casting, and turquoise inlay, recommends Yang Kexin, a representative from Luoyang's cultural and museum system.

"Visitors can gain an intuitive understanding of the innovative spirit that has been part of the Chinese nation since ancient times," Yang says.

At the Luoyang Museum, the summer Little Museum Specialist series turns students into docents, restorers, cultural creative designers, and curators.

"Through immersive, task-driven activities, they evolve from visitors into inheritors," Yang explains.

For those interested in ancient mystic sacrificial rituals, the Luoyang Museum of Ancient Tombs takes them underground, with courses on murals and brick carvings that reveal ancient views on life and death.

The relatively new Han-Wei Luoyang Ancient City Site Museum, which opened last year, allows students to walk the Silk Road through a specially designed study guide that evokes a time when Luoyang was a Silk Road's eastern terminus.

It leads them through the museum's galleries with a series of tasks: locating artifacts that traveled from distant lands, including a Byzantine gold coin, Persian silverware and Western glassware; tracing trade routes on a map; and imagining the crowded streets of Tongtuo (copper camel) Street, the city's main boulevard, where foreign merchants once gathered.

Inside the museum, a digital exhibition brings that lost world into view. Developed by Harvard University's CAMLab, the immersive installation uses holographic projection and 3D modeling to reconstruct the ancient capital. The museum also offers hands-on experiences beyond the screen. Participants can try their hand at simulated archaeological digs or piece together replica eave tiles.

Beyond these core venues, specialized museums offer their own experiences. At the Sui-Tang Dynasties Grand Canal Cultural Museum, visitors become part of the waterway in an immersive theater program where they are cast as merchants or boatmen traveling the artificial waterway that once connected Beijing to Hangzhou, Zhejiang province.

Visitors can also try their hand at Tang Dynasty (618-907) three-color glazed pottery at the Luoyang Sancai Art Museum, where skilled craftsmen guide them through the entire production process.

"A museum is a great school," Yang says, encouraging visitors to measure history with their footsteps in Luoyang.

For those who want to understand not just how China's civilization was shaped but how its modern industry was built, there is China YTO. Founded in 1955, this leading agricultural and construction machinery manufacturer exposes visitors to a grittier side of the city's story.

"Young people can understand the struggle and pride of an era among gears and steel," says Guo Yushi, from the company's Dongfanghong industrial tourism program.

Stories about the first female tractor driver in China and the major pioneers who built the industry from nothing will be shared. A bus tour then passes the well-preserved Soviet-style buildings before arriving at the advanced assembly line for large-wheel tractors, where one tractor rolls off every three minutes.

Thirty percent of China's tractors are produced here, and they have been exported to more than 150 countries, Guo notes.

Hands-on activities include a clay tractor workshop and a tractor assembly model class, she recommends.

Zhang Nan, a representative of Beijing's travel industry, observes that a rising number of students across the country have opted for study tours.

Experts attribute the trend to a shift in expectations, as parents and educators no longer want passive sightseeing; they seek destinations where young people can touch, make and ask.

"The universal feedback is that the destinations that truly move people are those that explain culture thoroughly and make the experience profound," Zhang Nan explains.

Luoyang has stood out as a top destination, she adds.

"Luoyang's history is not a cold display but a living scene in which you can participate," she says.

Cultural links leave lasting memories

Asian Beach Games' athletes touched by hospitality and traditional craft experiences in Sanya, Hainan province

Members of Team China celebrate at the medal ceremony on Saturday after winning the aquathlon mixed relay at the Asian Beach Games. WEI XIAOHAO / CHINA DAILY

By WANG YUCHEN
in Sanya, Hainan province
wangyuchen@chinadaily.com.cn

The sixth Asian Beach Games Sanya 2026 brought its curtain down on Thursday in the Hainan province city, yet for many athletes, the most enduring memories may lie not in medals or ceremonies, but in quiet moments away from the spotlight.

They may be found in a sheet of calligraphy, a conversation at a craft booth, a shared meal or a photo taken with volunteers before departure. In that sense, Sanya 2026 offered athletes from across Asia not only a place to compete, but a place to meet, learn and leave with memories of the host city.

Held from April 22, the Games brought together more than 1,600 athletes from 45 Asian countries and regions.

Much of that experience unfolded at the athletes' village in Sanya Bay. Alongside accommodation, dining, transport and medical support, the village gave athletes space to unwind between events, visit cultural booths and interact with other delegations.

More than 5,100 service personnel worked in and around the village, covering catering, transport, security, cleaning and village operations. Their work kept daily life running smoothly, making room for the cultural activities and everyday exchanges that gave the village its warmth.

At the village's intangible cultural heritage exhibition area, athletes tried hands-on activities ranging from calligraphy, paper-cutting and kite-making to Li brocade, coconut carving and other Hainan crafts, guided by local artisans who explained the techniques and stories behind the works.

One participant followed a paper-cutting pattern to make a lantern, while another used a brush to write Arabic script alongside Chinese calligraphy on a sheet of paper. In such moments, the heritage displays became hands-on experiences shaped by face-to-face exchanges with local artisans.

For Magdalene Lau Ing Siew, a Malaysian open water swimmer whose family has roots in Fujian province, the visit had personal resonance. It was her first trip to China, and she was especially drawn to the coconut-carving area. "From my grandfather's stories, I learned that China is a very beautiful country and also his hometown. That was why I had been looking forward to coming here," she said.

Other members of visiting delegations also found familiar elements in Hainan's traditions.

A doctor with the Sri Lankan delegation said Li brocade patterns reminded him of similar handicrafts back home. "There are similar handicrafts in Sri Lanka, so it was easy for me to get started," he said.

During a calligraphy activity, a doctor with the Thai delegation tried Chinese calligraphy for the first time. "Chinese calligraphy is very beautiful and artistic," the doctor said, adding that he wanted to take the work home to his family.

Together, these encounters helped the village become more than a service base. For many athletes, it felt like a temporary home during the Games. A piece of calligraphy, a handmade craft or a photo with volunteers became a reminder for some of their time in Sanya beyond the competition schedule.

Traditional Chinese medicine added another dimension to the village experience. At the village's traditional Chinese medicine clinic, athletes could try massage, acupuncture, cupping and moxibustion. Medical staff provided services to delegations including those from Singapore, the United Arab Emirates and Pakistan, with translation devices helping them communicate. The clinic offered athletes another form of care as well as a glimpse of Chinese wellness traditions.

Everyday interactions also shaped life in the village. Volunteers helped athletes with transport arrangements, schedules and village services, offering practical support and a welcoming presence throughout the Games. As athletes from Nepal prepared to return home, they presented gifts to volunteers and posed for photos together.

In dining areas and other shared spaces, athletes sampled dishes such as Hainan rice noodles, Indian curry shrimp and Korean kimchi, while talking about training, food from home and their customs.

For some athletes, the experience extended to Sanya itself. Marc Alexander Lim, a jujitsu athlete from the Philippines, described the organization of the Games as "super smooth" and said he hoped to return to the city to enjoy its seafood and night markets.

Hadi El Chabib, a Lebanese beach volleyball player, said the Games combined high-level competition with cultural discovery. "It's a beautiful country, beautiful people, very nice culture," he said, adding that the competition was well organized and that his team had enjoyed its time in China.

Nations find peace and solidarity through sport

By XING WEN and **CHEN BOWEN**
in Sanya, Hainan province

> "I think all the people in Iran are very happy about this achievement in Sanya. Sports can heal our pain."
>
> **Mahdi Alinejad,** secretary-general of the Iranian National Olympic Committee

No cleats. No hard ground. No room for reckless slides or brute force. Instead, beach soccer rewards barefoot artistry on soft sand: delicate footwork, razor-sharp turns, and tiny passing combinations that carve open defenses.

Most captivating of all, stunts like diving headers, scissor kicks and bicycle kicks hang in the air just long enough for the crowd to erupt.

To play barefoot could somehow lower one's guard. It means shedding disguises, leaving behind identities and pretenses, so that the soles can feel the sand's warmth directly; skin to earth, body to nature.

Under a warm sea breeze and orange sunset, the recently concluded sixth Asian Beach Games in Sanya, Hainan province, brought players and spectators together to share in the laid-back, respectful and peaceful vibe of beach soccer matches.

Now look at the four best beach soccer teams in the Games: Iran, Oman, Saudi Arabia and Palestine.

Caught in active conflict, shaken by regional turmoil, or burdened by unresolved, long-standing strife; all are facing uncertainties. Not one is truly at peace.

Take Iran for example, a nation still bleeding from war. It sent a 57-athlete delegation to contest 10 out of the total 14 sports disciplines in Sanya, and ended up third on the medal table with nine golds and one silver.

"It was a historic placing for our team," said Mahdi Alinejad, secretary-general of the Iranian National Olympic Committee.

He said the war had destroyed some of their sports training bases and there were no flights from Tehran. They had to start their journey with several bus rides that took more than 20 hours to reach Ashgabat, the capital of neighboring Turkmenistan, from which they could finally take a plane. The whole journey took them 52 hours.

"We tried to make up for the lack of training, as we didn't have much time to prepare because of the war," Alinejad told China Daily after Iran beat Oman 6-2 to clinch the gold medal in beach soccer on Wednesday night.

"I think all the people in Iran are very happy about this achievement in Sanya. Sports can heal our pain," he said, adding that they received a warm welcome in Sanya, as they constantly heard support and cheers from the stands. "We want to show that we support the peace and unity on our continent."

Talib Al-Thanawi, head coach of Oman's beach soccer team, said that they have a good relationship with Iran in sports. They invite each other to exchange and play matches, and they often meet in the finals of major tournaments.

When asked if he believed that sports can make the world a better place, he responded with an immediate yes. "In a sporting gala like this, you meet people, you get connected, and you find new friends," he said. "You see (that in) the world, war's often happening. But here? Not one makes a difference."

Mundhir Al-Barwani, team doctor of Oman's beach soccer team, shares the same sentiment. A beach soccer lover since the age of 6, he said he enjoyed watching the games and soaking up the atmosphere. He was often seen smiling broadly while dancing to the music on the sidelines.

"I also live in the athletes' village, where athletes from different countries interact very frequently, and I talked a lot with medical team members from countries including Kuwait and Saudi Arabia," he said.

"Sport is loved by everyone, and that really brings everyone together, regardless of where you are in the world. So I think that's something you can see through every aspect of sports," said Saphna Ravichandran, a legal counsel at the Asian Football Confederation.

Reflecting on the Games, Husain Al-Musallam, director-general of the Olympic Council of Asia, highlighted that the presence alone of these conflict-ridden countries demonstrates that this is a game of peace — and that, he said, is the core value of the Games.

"You saw the athletes living in one place under one roof, in one restaurant, in one competition venue, in one training venue. And they are happy with each other. They are hugging each other," said Al-Musallam. "The future Games will follow in the footsteps of the Sanya Asian Beach Games."

Airfield lighting staff conduct routine inspections and maintenance on March 26 to ensure safe aircraft takeoff and landing. PHOTOS BY CHEN SONG / FOR CHINA DAILY

Airfield lighting staff inspect taxiway guidance signs to ensure clear and accurate guidance for night taxiing operations on March 26.

Senior technicians offer hands-on guidance to junior staff, explaining the functions and layout of airfield lights on March 26.

Daily tools, instruments and equipments used by airfield lighting staff are displayed.

GUARDING THE SKIES

Shenyang airport's team behind the lights

As night falls over Shenyang Taoxian International Airport, its airfield lighting system guides aircraft takeoff and landing, backed by the 24/7 dedication of the Ruijie Chuangxin Team from the Airfield Lighting Supporting Office. Dubbed the "guardians of the airport's eyes", the team stands firm at their posts, wielding professional skills to ensure the safety of flight operations.

Airfield lighting is the "lifeline" for aircraft movements. The team undertakes a full range of tasks including inspection, maintenance, emergency repairs and upgrades of runways, taxiways, lighting systems and signage. Operating on round-the-clock standby, the team adheres to a "second-level response and minute-level disposal" principle to ensure uninterrupted facility performance.

During the winter-spring transition period, sharp temperature fluctuations pose severe challenges. Working only during flight gaps, team members must carry tools, climb towers, and calibrate, repair and replace lights one by one on icy runways, strictly complying with civil aviation standards to eliminate hazards.

Beyond routine work, the team has made notable strides in innovation. It has independently developed rapid maintenance tools, boosting lamp replacement efficiency by 30 percent, established a closed-loop "prediction-inspection-rectification" mechanism to prevent risks at the source, and promoted technical continuity through a mentor-apprentice system.

Through harsh winters and scorching summers, the team members steadfastly adhere to their posts. With their commitment, they embody civil aviation spirit, providing a reliable "air beacon" for airport safety and passengers' peaceful journeys.

BIZ LIFE

Healthcare, rehab applications account for largest share of demand

BCI tech moves beyond research labs

Top: An employee from BrainCo showcases using intelligent bionic hands to practice calligraphy during the 135th China Import and Export Fair in Guangzhou, Guangdong province on April 15, 2024. LIU DAWEI / XINHUA **Left:** A staff member with a disabled right hand from BrainCo takes off glasses with the company's intelligent bionic hand during the third China International Supply Chain Expo in Beijing on July 17. JU HUANZONG / XINHUA

By **LI JING**
lijing2009@chinadaily.com.cn

On a weekday afternoon, Cai Yuqingyan waits outside a kindergarten gate. For most parents, the moment a child runs into their arms is entirely unremarkable. For Cai, it is a hard-won triumph.

A world champion in para swimming and canoeing, Cai lost her leg in a traffic accident before her third birthday. For decades, navigating life on crutches meant that even a simple, spontaneous embrace required careful physical calculation.

That changed after she was fitted with an intelligent bionic leg developed by Chinese neurotech firm BrainCo.

"Now when my daughter runs toward me, I can stand steady and catch her," Cai said. "It used to be something I had to consciously prepare for. Now, it's just everyday life."

Her experience reflects a broader shift as brain-computer interface (BCI) technologies begin moving beyond research laboratories into commercial medical devices aimed at rehabilitation and assistive care.

Industry researchers say the market remains small but is expanding rapidly. Global BCI revenue could grow from about $562 million in 2024 to more than $2.2 billion by 2032, market research firm Kings Research estimates, with healthcare and rehabilitation applications accounting for the largest share of current demand.

For BrainCo, the move from academic theory to commercial hardware was sparked by a chance encounter.

During the company's early days, its researchers met a student at the Massachusetts Institute of Technology who had lost his right hand in a laboratory accident. The engineering team began to wonder if their ongoing research into neural signals could be applied to control a prosthetic limb. That single question birthed the company's first neural-controlled prototype.

As development continued, the potential market became clearer. China is home to about 85 million people with disabilities, according to the China Disabled Persons' Federation, including 24 million living with limb impairments. Many advanced assistive devices remain expensive or difficult to access, limiting their use among potential users.

That gap helped shape BrainCo's commercial strategy, which the company says focuses on usability and affordability. Engineers focused on improving neural signal decoding to enable more precise movement control. The company says its prosthetic hands can move individual fingers independently, allowing users to perform tasks such as typing or writing.

Globally, much of the attention around BCI technology has focused on invasive brain implants developed by companies such as Elon Musk's Neuralink. These systems implant electrodes directly into the brain to capture high-resolution neural signals, but they involve neurosurgery and lengthy and stringent regulatory approval.

BrainCo has instead focused on noninvasive wearable devices designed to interpret neural signals through external sensors. The approach avoids surgical procedures and could potentially reach a broader range of rehabilitation and consumer health applications, the company said.

> "The purpose of technology is ... whether it can help people rebuild their lives."
>
> A spokesperson for BrainCo

The technology relies on proprietary hydrogel electrodes designed to capture neural signals without conductive gels.

According to the company, the sensors can achieve about 95 percent of medical-grade signal quality while decoding motor intentions in roughly 200 milliseconds.

BrainCo said its products are now sold in more than 35 countries and regions, with overseas markets accounting for about 30 percent of its revenue.

Despite the technological progress, wider adoption of BCI-based rehabilitation devices still faces challenges. Healthcare systems and insurance providers remain cautious about emerging neuro-technology, while procurement processes for assistive devices can move slowly.

Policy support is beginning to emerge. In 2025, the National Healthcare Security Administration issued pricing guidelines for neurological medical services that, for the first time, created dedicated reimbursement categories for BCI procedures, including fees for implanting and removing invasive BCI devices as well as adaptation services for noninvasive systems.

The move signaled growing policy recognition of BCI technology as it begins moving toward clinical application. The regulator has released 39 batches of medical service pricing guidelines covering about 180 new technology categories to help speed up the clinical adoption of emerging medical technologies, according to official data.

"The policy framework could help accelerate adoption of rehabilitation devices by clarifying how neurotech services may be priced and integrated into healthcare systems," said a spokesperson for BrainCo.

To expand access, BrainCo says it has focused on reducing manufacturing costs by developing core components in-house and using domestic supply chains.

The company says the retail price of its intelligent prosthetic limbs is roughly one-fifth to one-seventh that of comparable products in some Western markets.

Local governments have also begun testing the technology. In Zhejiang province, a government-backed program has already helped fit around 2,000 people with intelligent prosthetic limbs.

For some users, the changes are felt in everyday milestones. Hou Yunyan, a snowboard athlete who lost her left leg in a car crash at age 9, had never climbed stairs independently even after joining a sports team years later.

That changed after she began using a neural-controlled prosthetic leg.

"I felt calm and steady," she recalled of the first time she climbed a staircase on her own. "It was the first time I experienced what it feels like to walk upstairs."

"The purpose of technology is not how futuristic it looks," a BrainCo spokesperson said. "It's whether it can help people rebuild their lives."

Policy, venture capital powering commercial rollouts

By **LI JING**

Inside a quiet rehabilitation ward in eastern China, a paralyzed patient stares intently at a plastic cup. He doesn't move a muscle, yet a robotic, pneumatic glove encasing his paralyzed hand suddenly hums to life, smoothly closing its fingers around the cup.

The invisible trigger? His sheer intention.

By decoding neural signals and bypassing severed spinal cords entirely, brain-computer interface (BCI) technology is performing what looks like medical magic. But behind this clinical breakthrough lies a rapidly maturing business ecosystem. Driven by a strategic influx of venture capital and robust policy tailwinds, BCI is fast graduating from academic curiosity to early commercial deployment.

For years, the BCI sector was a pure-play scientific endeavor confined to university labs. Today, it is arguably the hottest frontier in venture capital.

Data from a recent report by the Beijing-based Fourth Wave Technology Think Tank and Zhongguancun Tiancheng Innovation Research Center paint a staggering picture. Throughout 2025, Chinese BCI startups recorded at least 24 financing events, raising more than 1.45 billion yuan ($212.1 million). In stark contrast, the first three months of 2026 alone saw at least 17 funding rounds, with the total capital raised already eclipsing the entirety of 2025.

The report projects China's BCI market could breach the 5-billion-yuan mark in 2026, on track to reach 15 billion yuan by 2030.

The deal flow reflects this bullish sentiment. Hangzhou-based BrainCo closed a massive 2-billion-yuan funding round in January. More recently, Shanghai-based medical neurotech firm StairMed secured 500 million yuan, bringing its total funding to more than 1.1 billion yuan within a single year.

"The technology is at an inflection point, transitioning from experimental verification to early clinical implementation," Gu Xiaosong, an academician of the Chinese Academy of Engineering, said at a BCI developer conference in Tianjin. He attributes this shift to breakthroughs in artificial intelligence, machine learning algorithms, and high-performance computing, which are finally transforming laboratory prototypes into clinical-grade medical systems.

In July 2025, China issued BCI industry development guidelines, urging breakthroughs in core hardware/software, high-performance products and real-world applications. Beijing, Shanghai, Shandong province and others introduced supportive policies.

In the 2026 Government Work Report, BCI was formally designated as a future industry, prioritized alongside strategic sectors such as advanced robotics and embodied AI. This alignment underscores BCI's role not only as a medical tool, but also as a critical control component for the next generation of intelligent machines.

The true catalyst for the current market exuberance was a recent regulatory breakthrough. China's National Medical Products Administration approved the world's first implantable BCI medical device for clinical use.

Dubbed the NEO system, the semi-invasive device acts as a wireless translator between the brain and the body, specifically designed to help patients with cervical spinal cord injuries regain hand-grasping functions.

Developed by a Tsinghua University research team led by professor Hong Bo from the School of Biomedical Engineering in collaboration with Neuracle, the NEO system represents a different technological approach from some Western competitors.

In the United States, Elon Musk's Neuralink is pursuing a fully invasive route, implanting electrodes directly into brain tissue. While this can yield high-resolution signals, it involves more invasive surgery and associated risks.

Tsinghua's NEO, by contrast, is implanted with its main device embedded in the skull, while electrodes are placed over the dura mater between the skull and the cerebral cortex, without penetrating brain tissue.

A patient undergoes rehabilitation treatment through mental control using a brain-computer interface device at a hospital in Chongqing on April 10. CHEN CHENG / XINHUA

"For quadriplegic patients with cervical spinal injuries who can't grasp objects, we implant a coin-sized device outside the dura mater using minimal invasive surgery," Wang Yujing, Neuracle product director, told People's Daily.

"The system decodes brain signals in real time, enabling them to control a pneumatic glove with their thoughts to grasp objects or drink water," she added.

The clinical data are highly promising. In trials conducted across 11 Chinese hospitals, all participants achieved brain-controlled grasping. The system boasted a decoding accuracy exceeding 90 percent, with a response delay of mere milliseconds. Furthermore, the implant is powered wirelessly through near-field communication, eliminating the need for internal batteries and risky replacement surgeries.

Despite the hype surrounding surgical implants, the reality of today's commercial landscape is far less invasive.

According to the China Academy of Information and Communications Technology, noninvasive systems — such as wearable EEG headsets — currently account for more than 80 percent of China's BCI market. Because they require no surgery, companies are already monetizing these devices, rolling out products ranging from neurofeedback headbands for gamers and students, to advanced sleep-monitoring systems.

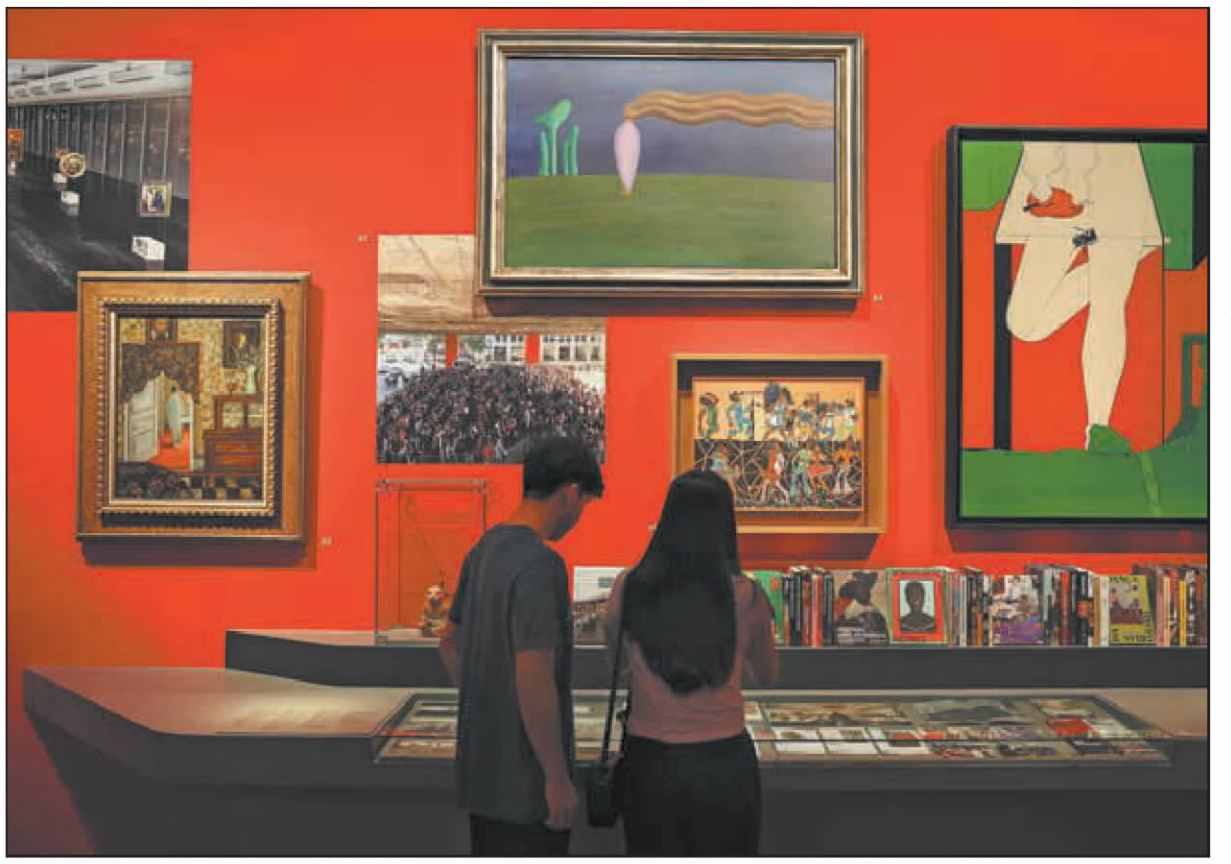
Yet, beneath the soaring valuations, sobering technical and ethical hurdles remain.

For implantable devices, the human body's immune system is a formidable opponent. Over time, the body forms scar tissue around implanted electrodes, which can degrade signal quality.

Data scarcity is another major bottleneck. Unlike generative AI models that are trained on billions of readily available internet texts, BCI algorithms require highly sensitive neural data, which is exceedingly difficult and expensive to collect.

Then there is the issue of cognitive privacy. Recognizing the profound ethical implications of "reading minds", China's Ministry of Science and Technology issued the country's first national ethical guidelines for BCI research in February 2024, ensuring the technology remains "tech for good" and prioritizing patient autonomy.

"The approval of the first product is just the beginning," noted Hong of Tsinghua University. Scientists are still grappling with deep biological mysteries, such as how these interfaces interact with the brain's natural plasticity, and whether they can actually help heal the nervous system rather than just act as a high-tech crutch.



For now, medical rehabilitation will be the industry's most viable cash cow. But the ultimate ceiling of the BCI market remains unknown.

Translating the silent symphony of human thought into code remains one of the most complex engineering challenges in modern history. As one researcher put it: decoding any conventional computer system is child's play compared to understanding the human brain.

Beyond the beaches Brazil's urban giant beckons

Sao Paulo entices more travelers to rediscover city with deep cultural density

By **ALFRED ROMANN**
in Sao Paulo, Brazil
For China Daily

At first glance, Sao Paulo can seem hard to read.

Brazil's main financial center does not offer itself in the postcard language of Rio de Janeiro. There is no single defining vista, no instantly digestible icon that explains the whole place. It is too large, too layered and too restless for that.

But after a few days, another city emerges: one of deep cultural density, where heavy tropical rain can give way to a blazing sunset, where dense greenery presses up against office towers, and where a walk at dusk can lead from formal avenues and modernist landmarks to streets alive with bars, food and conversation.

On a recent visit, the city revealed itself in fragments: a skyline glowing orange after a storm, late-night crowds spilling onto the pavement under strings of lights, buses moving beside protected bike lanes, and a sense of dense urban life. Sao Paulo does not feel curated for tourists.

That may be precisely why it is beginning to resonate with Chinese travelers.

For years, Latin America sat outside the mainstream imagination of China's outbound tourism market, except for a handful of marquee destinations. Brazil, though admired from afar, often remained more of an aspiration than an actual itinerary. The fact that China is very far away may have played into it — it can take a full day or more to get there from many cities in China.

Still, this appears to be changing.

Official Brazilian figures show that the country received 94,400 visitors from China from January to November 2025, surpassing the total recorded for all of 2024.

The growth validates a premeditated strategy by Brazil's tourism authorities.

"Attracting Chinese tourists is a strategic opportunity for Brazil," said Marcelo Freixo, the then president of Embratur, the country's international tourism promotion agency, last May. "This rapprochement is essential to paving the way toward new connections and, potentially, allowing more Chinese people to discover the attractions of Brazil."

A few months later, in January 2026, Brazilian President Luiz Inacio Lula da Silva announced that Brazil would exempt certain categories of short-term visas for Chinese citizens, in reciprocity for the exemption China had granted Brazilians.

Travel interest spiked. According to Qunar, a major Chinese online travel platform, searches for flights to Sao Paulo jumped 22 percent hour by hour right after the announcement.

The timing is significant because Brazil is in the middle of a tourism boom.

The country closed 2025 with more than 9.2 million international visitors, a record. Sao Paulo led the country for foreign arrivals, receiving 2,753,869 international visitors throughout the year, ahead of Rio de Janeiro and Rio Grande do Sul, the southern state that borders Uruguay and Argentina. That makes the city not just Brazil's financial capital, but its main gateway for foreign visitors.

Gateway to country

Sao Paulo is often the point of arrival, the place where a continent-scale trip often begins, but it is also a place worth lingering in.

What visitors find is not a city organized around a single landmark or feature, but one built on accumulation with the closest beaches sitting more than an hour away.

Sao Paulo rewards appetite: for museums, for architecture, for food, for neighborhoods and for the pleasure of noticing how many different histories have been compressed into one metropolis.

Italian, Japanese, Portuguese and many other immigrant communities have shaped the city's cuisine, traditions and public life over generations, helping create one of the world's most varied urban food scenes. Official Brazilian tourism material highlights that multicultural layering is one of the city's defining traits.

That diversity is one of Sao Paulo's most appealing aspects for travelers from China, and anywhere else.

Meals can become a kind of map.

A day might begin with strong Brazilian coffee and pao de queijo (a pastry with cheese), move on to ramen or sushi in Liberdade, continue with an Italian lunch in Bixiga or Jardins, and end the day with cocktails and plates to share in a crowded neighborhood bar.

This is a place where Michelin-starred restaurants sit not far from old markets, corner bakeries and family-run eateries. The range is staggering, but what stands out even more is the way food here reflects migration, adaptation and urban confidence.

Liberdade may be one of the city's most immediately legible neighborhoods for Chinese visitors. Liberdade remains the neighborhood most associated with the city's large Japanese population, but the district today also carries broader East Asian influences, including Chinese and Korean, visible in its shops, grocery stores and restaurants.

For Chinese travelers, that can create moments of recognition in a city that is otherwise unmistakably Brazilian. The lanterns, the signs, the food and the foot traffic may feel familiar in fragments, yet the atmosphere is entirely local, shaped by Sao Paulo rather than transplanted into it.

Still, Sao Paulo's strongest case as a destination may be its cultural infrastructure.

Paulista Avenue remains the city's symbolic spine, and the Sao Paulo Museum of Art, known as MASP, is one of its essential stops. The museum, founded in 1947, became the first modern museum in Brazil. Its building, designed by Lina Bo Bardi, is among the most recognizable pieces of modern architecture in Latin America: suspended, severe and unforgettable. And its collection is impressive.

Even travelers with little prior knowledge of Brazilian art are likely to feel the force of the place. MASP is not simply a museum to visit; it is one of the structures that seems to explain Sao Paulo's ambitions back to itself.

"Sao Paulo surprised me," said Karina Rubio, a visitor from Chile who was in the city for the first time attending a conference and had just stepped out of the MASP. "It feels very alive. There is music, a lot of culture and a lot of good food ... the museum was one of the highlights for me."

Another highlight for Rubio was the city's famous churrascarias (or steakhouses), typically all-you-can-eat-style restaurants serving a variety of cuts of beef.

"Of course I had to try them!" she said.

Not far away, Ibirapuera Park offers another version of the city.

Often described as Sao Paulo's "green lung", the park brings together open lawns, dense trees, lakes, museums and performance spaces in one vast urban expanse. It is where many visitors understand that Sao Paulo, for all its scale and density, also knows how to make room for clean air, shade and peace.

An attendee visits the *Arts of Africa* exhibition during the official inauguration of the new building of the Sao Paulo Museum of Art on March 28, 2025. ISAAC FONTANA / EPA-EFE

People enjoy walking, running, cycling and strolling in Ibirapuera Park, in the southern part of Sao Paulo, one of the main outdoor leisure spots in the city. LECO VIANA / THENEWS2

> "This is the year of Brazil in China and we have a plan of action that will further boost the interest in knowing our culture and our natural destinations, which today are the ones that most attract the Chinese."
>
> **Marcelo Freixo,** former president of Embratur, an international tourism promotion agency in Brazil

The park also says something important about the city's character. In many global metropolises, cultural life is scattered. In Sao Paulo, it can feel concentrated, almost insistently available. Art, performance, architecture and public life are not tucked away from one another. They overlap.

And that overlap is part of what makes the city so compelling.

Sao Paulo is a megacity, but not a sealed one. It does not feel like a glass box of towers and highways, even though it has plenty of both. Trees soften vast stretches of it. Neighborhoods break up the scale. Street life keeps reasserting itself.

From a window overlooking one of the city's greener central areas, the skyline after rain can look almost theatrical, with towers fading into haze and an orange band of sunset setting the horizon on fire. Later, the city reassembles itself in lights, traffic and silhouettes.

At ground level, it often feels more intimate than its size should allow.

During a recent evening, tables spilled out into the street outside a bar, and office workers and younger drinkers stood shoulder to shoulder under strands of yellow lights. The scene felt easy, social and dense with energy.

Traffic, however, can be brutal at rush hour. TomTom's 2025 data showed that a 10-kilometer drive in Sao Paulo took about 34 minutes in the morning rush and more than 37 minutes in the evening. The saving grace is public transport: the subway and rail map spreads across the city and deep into the wider metropolitan area, giving visitors a practical way to avoid the worst road congestion.

These details help explain the kind of traveler Sao Paulo is likely to attract.

New strategy

This is not primarily a city of passive sightseeing. It is a city for people who like urban texture, who enjoy moving through neighborhoods, who want to eat well, who do not mind a little ambiguity and who understand that some of the world's best travel experiences arrive not in one grand reveal but in layers.

That also helps explain why Sao Paulo fits Brazil's new strategy for engaging Chinese travelers.

Brazil has been working to make itself more visible and more bookable in China.

Embratur returned to ITB China, the largest B2B travel trade show focused on the Chinese market, in 2025 after a six-year absence.

The agency said at the time that it was making a strategic push into China with a variety of efforts, including launching a "Brazil Travel Specialist" platform in Mandarin to train Chinese travel agents and operators, an official tourism website in Mandarin and opening a public relations office in China.

Brazil also moved to expand its presence through Chinese-language promotion and partnerships with major travel companies. Reports on those efforts said agreements were signed with Trip.com Group and Tongcheng Travel.

"We are very optimistic about the growth that we will continue to see in the Chinese market," said Freixo in February. He credited the visa exemptions announced in January with much of the growth.

"This is the year of Brazil in China and we have a plan of action that will further boost the interest in knowing our culture and our natural destinations, which today are the ones that most attract the Chinese," said Freixo.

Long-haul tourism depends not only on desire, but on visibility, language access and booking infrastructure. The easier Brazil becomes to search, compare and book in Chinese, the more likely Sao Paulo is to shift from an abstract possibility to a real itinerary.

Sao Paulo has long had the substance to attract international leisure travelers, but abroad it was often overshadowed by Brazil's beach imagery and by its own reputation as a city of business first. That reputation is not wrong. Sao Paulo is a commercial powerhouse. But it is also incomplete.

The same city that hosts major corporations and trade fairs also offers one of the richest urban experiences in the Americas. It is a place where migration shaped cuisine, where culture remains publicly visible, where modernism still feels alive and where the city's immense scale generates not sterility but variety.

For Chinese travelers who are increasingly willing to go beyond the most established long-haul routes, Sao Paulo offers something more substantial than easy fantasy. It offers a real metropolis.

That may be why the city feels newly timely.

Chinese visitors looking at Sao Paulo now are not simply looking at another faraway destination. They are looking at a city that broadens the map of what Brazil means: not only beaches and samba, but museums, immigration histories, high culture, nightlife, architecture and one of the world's most exciting food scenes.

It is the cumulative force of the place: the food, the art, the greenery, the sense of scale, the energy after dark, the neighborhoods that keep shifting register from block to block, and the feeling that the city is always revealing another version of itself.

Sao Paulo asks for curiosity more than certainty. It does not hand itself over all at once.

For travelers willing to meet it on those terms, it may prove to be not only Brazil's main gateway, but also one of Latin America's great city breaks.

Rising to the challenges of unique locale

Powdery sand and expansive arena combine to create a jump in difficulty

By **XING WEN**
in Sanya, Hainan province
xingwen@chinadaily.com.cn

On a sunny Sunday on Sanya's Phoenix Island in the tropical island province of Hainan, the women's high jump final of the just-concluded 2026 Asian Beach Games drew a packed house at the athletics venue, and for good reason.

China's Shao Yuqi and Hu Linpeng, the respective gold and bronze medalists from November's 15th National Games, were both expected to add another medal for their country.

But the open-air setting, with swaying coconut trees and an expanse of azure sea dwarfing the competition mats, along with a sand-covered run-up area, would test them in ways a traditional stadium high jump setup never could.

"When you compete indoors, the mats and the bar look quite large. In a 400-meter open-air stadium, they shrink a bit. But, today, on the sand, they seem tiny. The sky and the background stretch out endlessly, so it's a very wide-open view," said Hu.

While spectators can enjoy a unique and picturesque experience — watching athletes arch their backs and float over the bar with the sea breeze — for the jumpers, adapting to this environment is a real challenge, because the vast, open setting messes with their ingrained spatial awareness, making technical mistakes more likely.

"The sand saps some of your energy, so you don't build up as much speed on the run-up. That means we have to rely more on vertical explosive power," Hu said.

The run-up takes place on soft sand, while the takeoff zone features a standard rubber surface, creating an abrupt shift in underfoot conditions. Compounding the challenge, sand inevitably spreads across the rubber.

"The surface is slippery when you take off, and there is a risk of injury. I tried to control my speed during my approach and adjust my steps. It was so hard," said Filipino men's high jump athlete Leonard Grospe in an interview following the first competition day.

During the competition, both Shao and Hu missed twice at 1.83 meters, before finally clearing it on their third attempts. After Uzbekistan's Barnokhon Sayfullayeva successfully made 1.85m, the two Chinese jumpers decided to skip their remaining tries at that height and moved straight to 1.87m. Unfortunately, they failed all three attempts, and both had to settle for silver.

"Of course, I'm disappointed not to win the gold, but I'm still proud that we Chinese athletes took home two silver medals — and congratulations to the gold medalist," Shao said.

"No matter what kind of venue we compete in, everyone faces the same conditions. As long as you give it your all, there's no reason to regret anything," Hu added.

As the high jump competition was wrapping up, the 4x60-meter relay races had already begun on the adjacent track, with the cheers from the crowd ringing out.

Yet, both jumpers said they didn't notice any of it — they were completely absorbed in their own performances.

That same ability to block out distractions has served them well off the field, too, especially in coping with the surge of public attention that followed the 15th National Games.

People haven't just been talking about their athletic prowess; more visibly, they've also been drawn to their striking good looks and toned, athletic physiques.

Seeing so many spectators come out to cheer for her, Shao said that all this public interest is actually a good thing for athletics.

"If people can focus that attention on the high jump, I'd be very happy," she said.

Now 24, Shao is a postgraduate student at Tsinghua University's School of Social Sciences and is often called a "beauty A-grader" by the public.

She finds it natural to balance her academic studies with her training.

Standing at just 1.75 meters — hardly an advantage for a female high jumper — Shao has strengthened herself by training more than 300 days a year.

She now has her sights set on this year's Asian Games in Nagoya, Japan.

This year is the Year of the Horse, her zodiac year, and she likens herself to a colorful pony.

"Compared to those tall, powerful horses, I might look small, but even the small have their own strength."

BASEBALL

Pioneer Pichardo reluctant to steal team's spotlight

In her ideal world, Olivia Pichardo would just play ball and not take attention away from her teammates.

"Sometimes it feels a little ridiculous," she told reporters. "But, it's something I understand is going to happen. That's not what my primary focus is ever on."

Pichardo grew accustomed to being the only girl on her baseball team during her years in Little League, high school and travel ball. Four years ago, she tried out for the Brown University team, made it and, early in her freshman season, became the first woman to appear in a Division I game when she pinch-hit against Bryant University.

As a senior, last Saturday she became the first woman to pitch in a Division I game when she got the final out in a key win over Cornell.

"I feel like sometimes it might distract a bit too much from the success of our team," Pichardo said.

"We just made the playoffs for the first time since 2007, so that's a huge accomplishment, and I wouldn't want to take away from that."

Pichardo was listed as an outfielder and pitcher in her first three years, and focused only on pitching this season. The fact she stuck it out for four years might seem surprising. Brown has played 151 games since Pichardo arrived, and she has appeared in only six. She pinch-hit once as a freshman, once as a sophomore and three times as a junior, when she also played right field for an inning and caught two fly outs.

> "I've always been able to play at every level that I've progressed to, so there was never any reason for me to stop playing baseball just because I didn't see other women in the same space as me."
>
> **Olivia Pichardo,** the first woman to play Division I college baseball

Until Saturday, she hadn't appeared in a game this season, let alone warmed up in the bullpen. With Brown leading Cornell 16-3 in the ninth inning, coach Frank Holbrook's plan was to have little-used reliever Ty Harris get the first two outs and have Pichardo finish.

The 174-centimeter, 75-kilogram Pichardo has a four-pitch repertoire that includes a low-80s four-seam fastball to go with a sinker, changeup and curve. She entered with the bases loaded and threw two fastballs to Tyler Beaulieu, who grounded out to short to end Brown's 16-4 win.

Pichardo said she has never had any problem melding with her teammates. She prefers just being one of the guys and not taking spotlight away from the team. She does, however, understand the magnitude of what she's accomplished, not just in college, but also in summer ball. In 2023, she became the first woman to hit a home run in a summer league, connecting for Sag Harbor in the Hamptons Collegiate Baseball League.

"It's important for inspiring the younger generation of female baseball players, give them some kind of hope, I guess, that, if they want to play at the collegiate level, no matter what division, that door is open for them and it is possible," she said.

Pichardo, who graduates this spring with a degree in business economics, has been able to capitalize on name, image and likeness opportunities as the most visible woman in college baseball.

She's in her third year as an endorser for the baseball equipment and apparel company Warstic Sports, and she has a deal with Topps Allen & Ginter baseball cards.

Once Brown's season ends, she'll turn her attention to trying out for the United States women's team that will play in the group stage of the 2027 World Cup. She has been a regular on Team USA since 2022 and pitched against Japan in the 2024 World Cup in Thunder Bay, Ontario.

Pichardo said she's been grateful for every baseball opportunity since her father signed her up for a league in her hometown of Queens, New York, when she was six years old.

"He didn't have any sons, so I like to say I was his designated son," she said. "I've always been able to play at every level that I've progressed to, so there was never any reason for me to stop playing baseball just because I didn't see other women in the same space as me. It was my first sport, my first love, and I knew I wanted to try and play at the highest level possible."

Gunners shoot first, but Atletico returns fire

Arsenal and the Rojiblancos exchange penalties in Madrid, as Champions League semifinal first-leg ends in a 1-1 draw

Atletico Madrid and Arsenal exchanged penalties in a 1-1 draw in the first leg of the Champions League semifinals on Wednesday, a gritty encounter with plenty of intensity from start to finish, even if it lacked the fireworks of the nine-goal thriller that saw defending champion Paris Saint-Germain edge Bayern Munich 5-4 in France on Tuesday.

Viktor Gyokeres put Arsenal ahead at the Metropolitano stadium on Wednesday, converting a 44th-minute penalty kick before Julian Alvarez equalized for Atletico — also from the penalty spot — 12 minutes later.

The Gunners were awarded another penalty in the 78th minute after Eberechi Eze was brought down by David Hancko inside the area, but the call was overturned after a video review.

The second leg is in London next Tuesday, when both clubs have a shot at returning to the final after a long absence, giving whichever side makes it a chance to win the European title for the first time.

"Here, you have to suffer. Many teams have suffered here, including some of the best in the world," Arsenal coach Mikel Arteta said.

"We had some good moments in the match, and moments where we had to suffer. The margins are very slim. We are in an incredible position — the semifinal of the Champions League. Now, we have to play in front of our people — it's in our hands."

In the league phase of the competition, Arsenal routed Atletico 4-0 at the Emirates Stadium.

Atletico last made it to the Champions League final in 2016, when it lost to crosstown rival Real Madrid.

"We tried," Atletico midfielder Jorge Resurreccion said. "We went behind to that penalty, which was doubtful, but the team recovered and we were able to equalize with a penalty ourselves. We had the opportunities to win, but it will all be decided in the second leg. I think we played a good match."

Gyokeres broke the deadlock from the penalty spot after he was brought down inside the area by Hancko, who was a bit late to the ball and slightly bumped the Arsenal striker from behind.

The buildup came after Atletico lost possession in attack.

"Overall, I think it was a tough game, we know it's a tough place to come, but it's only halftime," Gyokeres said.

"We know that, when we play at home, with our fans, it's going to be different, for sure, and we just have to do our job, be at our best. It's going to be a good game at home."

Arsenal last appeared in the final in 2006, when it lost to Barcelona.

The Rojiblancos' equalizer came after a handball by Arsenal defender Ben White following a shot by Marcos Llorente.

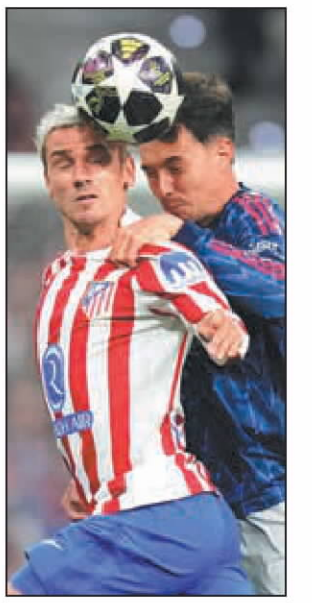
The call came after a video review, and Alvarez converted the penalty with a firm shot for his 10th Champions League goal this season, before being replaced later in the second half with an apparent injury.

Gyokeres' opening penalty was Arsenal's first attempt on target, but both teams had exchanged a few early chances.

Arsenal goalkeeper David Raya had made a nice save on a shot by Alvarez, and Martin Odegaard — who was also substituted later — had his dangerous strike from inside the area blocked by Atletico's defense.

Alvarez led the Atletico attack early on, but the connection with Antoine Griezmann and Ademola Lookman didn't work well until the second half.

Alvarez almost curled in a free-kick after the break, and both Lookman and Griezmann had chances shortly afterward. Griezmann struck the post with a shot in the 63rd minute, and Lookman, who had been doubtful to start because of a muscle injury, missed from close range later in the second half.



"We played a very good second half and had the chances to win the match," Atletico coach Diego Simeone said.

Griezmann, who played his last home Champions League fixture with Atletico, was named the player of the match.

The France star will join MLS club Orlando City this summer.

Arteta infuriated by 'unacceptable' decision to overturn second penalty

Arsenal manager Mikel Arteta called it "unacceptable", and said it was a moment that changed the course of his team's Champions League semifinal against Atletico Madrid.

Meanwhile, Atletico coach Diego Simeone's antics as Dutch referee Danny Makkelie studied the sideline monitor at the Metropolitano stadium came under scrutiny Wednesday.

In a white-hot atmosphere and the score locked at 1-1 in Madrid, Makkelie opted to overturn a second-half penalty awarded to Arsenal when substitute Eberechi Eze went down under a challenge from David Hancko.

"The whole sequence tells the story. I mean it's a clear contact," Arteta told TNT Sports. "At this level it's completely unacceptable."

The game ended 1-1 with the second leg set to take place at Arsenal's Emirates Stadium next week.

Arteta said Makkelie had reviewed the penalty incident 13 times before deciding to overturn his decision. Soccer's rules state decisions should not be changed unless there is a "clear and obvious error".

"You make that decision, you cannot overturn that decision when you have to look at it 13 times," Arteta added.

UEFA said the penalty was ruled out because no foul had been committed, despite replays showing clear contact between Hancko and Eze.

TNT Sports panelists Steven Gerrard, Martin Keown and Steve McManaman also disagreed with the Dutchman's decision to overturn the penalty, but they also pointed to Simeone's reaction on the sideline while the official reviewed the video.

"As the referee is coming over, before he's even looked at the screen, Simeone's in his face, he's waving his arms," said former Liverpool midfielder Gerrard. "Then, he's in his ear when he's at the screen. It's a performance, and he's the best at doing it."

McManaman, who played for Atletico's crosstown rival Real Madrid, said of Simeone: "His performance was terrible, and that's why people don't like the dark arts, or don't like Atletico Madrid."

Earlier in the game, Simeone and Atletico players complained about the penalty call that went against their team late in the first half. Viktor Gyokeres put Arsenal ahead by converting from the spot in the 44th minute. Julian Alvarez equalized for Atletico — also with a spotkick — 12 minutes later.

Antonelli chases hat-trick, as F1 season revs back up

MIAMI — Italian teenager Kimi Antonelli, the youngest championship leader in F1 history, will seek to complete a hat-trick of early season victories at the weekend, as Formula One returns after a month's enforced absence due to the conflicts raging in the Middle East.

The 19-year-old Mercedes driver, triumphant in China and Japan, leads teammate George Russell, who won the season-opening Australian Grand Prix, by nine points ahead of what is, effectively, the start of another season, complete with more revised rules and widespread car upgrades, at the Miami Grand Prix.

"After a month without any racing, we are ready to get back on track," said Mercedes team chief Toto Wolff.

"We've used this break to analyze the opening races, address our weaknesses and raise our level.

"We've started the season well, but that counts for very little if you stand still. We know our competitors will have used this time to improve and build a deeper understanding of their cars, so we expect the field to be closer in Miami.

"That's the reality of F1 — it's a challenge we must rise to."

Antonelli's early triumphs made him the first Italian driver since Alberto Ascari in 1953 to win two consecutive races. Ascari completed his treble that season.

Wolff also addressed the tweaks to the new regulations that will be introduced in Miami, aimed at making the cars, and the spectacle more natural, with reduced battery recharging in qualifying and increased super-clipping to reduce dangerous speed differentials.

He said the revised rules would "respect the DNA of our sport", and deliver an improved spectacle without any significant reduction to Mercedes' early-season performance advantage.

Mercedes driver Kimi Antonelli is looking to snatch a third win on the bounce when the F1 season restarts in Miami on the weekend. AP

For Mercedes, Sunday's race is an opportunity for a first win in Florida since the event was launched five years ago. It has been won twice by four-time champion Max Verstappen for Red Bull, and twice by McLaren with a win apiece for reigning world champion Lando Norris and teammate Oscar Piastri.

'Completely new car'

They will harbor hopes of claiming points, too, with success in Saturday's sprint race, which was won last year by Norris.

Ferrari, however, is widely expected to be a strong contender when it arrives in Miami. Like McLaren, Ferrari is bringing an almost "completely new car", with a heavily revised package.

"It was one of our best tracks for pure pace, compared to others, last year," said Norris. "It's a different track, and it may still suit us a little more than others."

After winning in 2022 and 2023, Verstappen will be aiming to stop Mercedes' winning run and revive Red Bull's challenge this year after a discouraging start. He is ninth, on 12 points, 60 adrift of Antonelli, with teammate Isack Hadjar in 12th place on four points.

Ferrari's duo of Charles Leclerc and seven-time champion Lewis Hamilton is third and fourth, respectively, on 49 and 41 points, with many paddock observers suggesting Ferrari is poised to fight for a first win since Carlos Sainz's success in Mexico in October 2024.

Leclerc's eighth and last win came in Austin, Texas, shortly before Sainz's triumph, while Hamilton is chasing his 106th win and first since the 2024 Belgian Grand Prix — before he joined Ferrari. After a desultory first year, the Briton said he is relishing the challenge of a new formula that has seen him rediscover his racing mojo.

"We're all recharged after the break," said Russell, expressing the feelings of most drivers.

"I'm hoping we can continue where we left off."

It will also mark United States newcomer Cadillac's first racing appearance on home soil when Sergio Perez and Valtteri Bottas venture onto the grid at Hard Rock Stadium in a new American livery.

Xi commends exemplary young people

President's reply extends his festive greetings ahead of national Youth Day

By JI HAISHENG
jihaisheng@chinadaily.com.cn

President Xi Jinping has encouraged Chinese youth to integrate their personal aspirations into the bigger picture of national development, while extending his festive greetings to young people nationwide ahead of China's Youth Day, which falls on Monday.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made the remarks in a reply letter to representatives of recipients of the China Youth May Fourth Medal and the New Era Youth Pioneer award.

In his reply, Xi commended those exemplary young people for their dedication in grassroots and frontline positions, such as sci-tech innovation, rural vitalization, social services and border defense, and highlighted that they have written a meaningful chapter of youth through practical work and responsibility.

This has demonstrated the confident, self-reliant and high-spirited outlook of Chinese youth in the new era, he added.

Citing that this year marks the beginning of the 15th Five-Year Plan (2026-30) period, Xi said it is a prime time for young people to contribute to the country's development. He expressed hope that those representatives will uphold lofty ideals, remain committed to hard work, and inspire more young people to integrate their personal pursuits into the country's overall development.

The president urged young Chinese to strive for new accomplishments in their posts and inject youthful dynamism into advancing the nation's new journey of development.

The China Youth May Fourth Medal and the New Era Youth Pioneer award are designed to honor outstanding young role models who demonstrate political advancement, high moral character, and make significant contributions to society.

Recently, 16 awardees who have won the titles since 2012 wrote to the president to report on their work and insights from serving at the grassroots level, and reaffirmed their resolve to contribute to national development.

This year, 29 individuals and 30 organizations have been awarded the China Youth May Fourth Medal, the country's highest youth honor for Chinese people aged from 14 to 40. Meanwhile, 749 young individuals received the New Era Youth Pioneer award.

Li Yao, a recipient of 2026 China Youth May Fourth Medal and a grassroots official of Kantiangezhuang village in Tangshan, Hebei province, said he felt profoundly inspired by Xi's reply and pledged to translate the encouragement into concrete action in promoting rural vitalization.

He said that he will work with fellow villagers to develop local specialty industries, improve the living environment, and encourage more young people to engage in agriculture and rural development — all with the aim of boosting the village's economy and increasing residents' incomes.

Qiu Kunfeng, also a 2026 China Youth May Fourth Medal recipient and dean of the Beijing-based China University of Geosciences' School of Earth Sciences and Resources, said that Xi's message has offered young people renewed motivation to contribute to the nation's broader development goals.

He said he will remain dedicated to teaching and research, venture into new technological frontiers, and work to address key challenges in strategic mineral exploration.

Zou Shuo contributed to this story.

Beijing bans US sanctions on five Chinese cos, signals legal recourse

By ZHONG NAN
zhongnan@chinadaily.com.cn

The United States' sanctions on Chinese companies contravene international law and the basic norms of global relations, while Beijing's blocking measure aims to safeguard the legitimate rights and interests of domestic firms and individuals, the Ministry of Commerce and analysts said.

The ministry issued a ban on Saturday prohibiting any recognition, enforcement or compliance with US sanctions imposed on five Chinese companies, including Hengli Petrochemical (Dalian) Refining Co and Shandong Shouguang Luqing Petrochemical Co, on the grounds of their alleged involvement in Iranian petroleum transactions.

Since 2025, the US government has imposed sanctions on these Chinese firms under executive orders, placing them on the Specially Designated Nationals List, freezing their assets and prohibiting transactions with them.

In response, a spokesperson for the ministry said that China has consistently opposed unilateral sanctions lacking United Nations authorization and a basis in international law, adding that the prohibition order represents a concrete step under China's Rules on Counteracting Unjustified Extra-territorial Application of Foreign Legislation and Other Measures, which was approved by the State Council in 2021.

The issuance of the ban does not affect China's fulfillment of its international obligations or its protection of the legitimate rights and interests of foreign-invested enterprises under Chinese law, the ministry official stressed.

> "The company has strictly complied with laws and regulations since its inception. We have never engaged in any trade with Iran, and our suppliers guarantee that the origin of our crude oil does not fall under US sanctions."
>
> **Public filing from Hengli Petrochemical (Dalian) Refining Co**

Hengli Petrochemical, the parent company of Hengli Petrochemical (Dalian) Refining Co, condemned the US sanctions last week, dismissing US allegations of ties to Iran as "groundless" and lacking both factual and legal grounds.

"The company has strictly complied with laws and regulations since its inception. We have never engaged in any trade with Iran, and our suppliers guarantee that the origin of our crude oil does not fall under US sanctions," Hengli Petrochemical said in a public filing.

Analysts said that the US has long leveraged the dominance of its currency and financial system to extend the reach of its sanctions. Secondary sanctions — targeting entities dealing with blacklisted parties — have become a key policy tool to reshape global supply chains and influence cross-border commercial activities.

Mei Xinyu, a researcher at the Chinese Academy of International Trade and Economic Cooperation in Beijing, said that China maintains a neutral stance toward external conflicts, but will not tolerate infringements on the legitimate rights of its citizens and businesses.

"Safeguarding those interests is a necessary response to external pressures," said Mei. "At the same time, such measures do not alter China's broader commitment to openness, international cooperation and a stable, predictable environment for foreign investment."

Ding Rijia, a professor of industrial economy at China University of Mining and Technology-Beijing, said China's latest step highlights the country's growing use of legal instruments to counter the extra-territorial application of foreign sanctions.

"It sends a signal to both domestic and multinational companies that China is capable of providing a more predictable legal environment for cross-border trade," said Ding.

Authority of Tokyo Trials 'must not be challenged'

By ZHANG YUNBI
zhangyunbi@chinadaily.com.cn

As neo-militarism is now rising in Japan and "beginning to pose a real threat", the Foreign Ministry said on Sunday that "it is all the more relevant" to revisit the backdrop, conclusion and principles of the historic Tokyo Trials that started 80 years ago.

Sunday marked the 80th anniversary of the opening of the International Military Tribunal for the Far East, also known as the Tokyo Trials, on May 3, 1946.

The trials brought together judicial powers of 11 nations, used abundant solid evidence and a rigorous legal basis, found Japanese militarists guilty of waging the war of aggression and severely violating the international law, and brought to light the innumerable crimes Japanese aggressors committed in various Asian countries.

Through the Tokyo Trials, 25 Class A war criminals including Hideki Tojo were sentenced to death by hanging or imprisonment.

In a written reply published on the Foreign Ministry website, the spokesperson said the Tokyo Trials were held to implement the Cairo Declaration and the Potsdam Proclamation, and embodied the collective will of both the victorious nations and the victimized peoples.

"Through the trials, the purposes and principles of the United Nations Charter were upheld, and the fruits of victory in World War II were honored", the spokesperson said.

Japan's right-wing forces are still trying to whitewash the crimes committed during the war of aggression, including revising history textbooks and indoctrinating the Japanese people with a wrong perception of history, the spokesperson warned.

The right-wing forces currently are gearing up their drive to speed up remilitarization, deploy offensive weapons, rebuild the war machine and push for revision of the pacifist Constitution, the spokesperson said.

All these are diametrically the opposite of what "a country for peace" — as Japan claims itself to be — should do, the spokesperson added.

"The Tokyo Trials, as a litmus test of humanity's conscience, delivered historical justice and, along with the Nuremberg Trials, nailed the fascist war criminals to the eternal pillar of shame," the spokesperson said.

"The historical justice delivered by the two great trials must not be denied. Their legal authority must not be challenged. And the cornerstone of the postwar international order they laid must not be shaken," the spokesperson added.

Liu Jiangyong, a professor of Japan studies at Tsinghua University, said Japan's perspective on history and wars is closely linked to its current political landscape.

"Some in Japan view the convicted war criminals enshrined at Yasukuni Shrine as 'heroes' because they believe Japan's past colonial rule, aggression and expansion constitutes a history of 'victory' and 'pride' — they show not the slightest remorse," he said.

IN CHINA'S HEALTHCARE GAP, AN AI DOCTOR STEPS IN

Guidance, expert connections provided to patients in outlying communities

By WEI WANGYU
weiwangyu@chinadaily.com.cn

Qian Zhifang sat at the kitchen table in her home in rural Hubei province, scrolling through her phone. The 65-year-old factory worker had just checked her blood pressure using a smartwatch her daughter had bought her. Within seconds, a message appeared on the screen, saying that her reading was slightly elevated.

Instead of traveling hours to the nearest city hospital in Wuhan, Zhang opened an app and typed a question, and the response came almost instantly from an artificial intelligence doctor.

"It reminded me to monitor my salt intake and suggested when to see a 'real' doctor," Zhang said. "For someone like me, it feels like having a family doctor at home."

She is part of a growing wave of digital healthcare users. What began as a set of experimental tools is evolving into a system operating at scale, one that simultaneously guides patients in daily health decisions and supports doctors in clinical care.

At the center of this transformation is Ant Health's AQ, launched in mid-2025. The platform has grown rapidly, particularly in smaller cities and rural areas, where access to specialists remains limited. The company reports surging adoption, with combined daily consultations exceeding 10 million and monthly active users tripling that number.

Chinese subs to boost Pakistan's defense

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

The commissioning of the Chinese-built Hangor-class attack submarines will substantially improve the Pakistan Navy's combat and deterrence capabilities, according to military affairs observers.

Wu Peixin, an observer in Beijing, said that the deployment of the Hangor-class submarines marks a strategically significant hardware upgrade in the history of the Pakistan Navy.

"As the first submarines in South Asia fitted with an air-independent propulsion system, they are equipped with China's domestically developed Stirling engine, and this means they can navigate silently at certain speeds for several days. Such capability delivers a generational leap in performance compared with conventional diesel-electric submarines without AIP systems, and to some extent, enables them to engage with nuclear submarines," he said.

On Thursday, the commissioning ceremony for the first Hangor-class submarine, PNS/M *Hangor*, was held in the Chinese coastal city of Sanya in Hainan province.

Pakistani President Asif Ali Zardari, who visited China, and Chief of the Naval Staff Admiral Naveed Ashraf, the top commander of the Pakistan Navy, attended the event and made speeches.

Zardari said that the induction of the advanced submarine was a "historic milestone" in the Pakistan Navy's modernization, affirming his nation's resolve to maintain a robust, balanced and credible defence posture.

Ashraf stated that the new submarines are armed with state-of-the-art weapons, advanced sensors and an AIP system, and they will be key in preserving maritime order and stability in the region.

The new assets will bolster Pakistan's maritime defense and modernize its fleet with cutting-edge technology, the admiral added.

According to the Pakistan Navy, the commissioning of the first Hangor-class submarine "marks another chapter in the time-tested and enriching friendship between Pakistan and China".

In 2015, the Pakistani government announced that Pakistan and China had signed a deal for eight attack submarines, disclosing that the first four vessels would be built in China, and the remaining four in Pakistan.

Wu noted that each Hangor-class submarine is fitted with a cylindrical bow sonar array and multi-line flank sonar arrays on both sides of the hull, granting the boat outstanding capabilities to detect and track hostile submarines.

The observer said that in terms of weapons systems, the Chinese-built submarines can carry torpedoes and missiles made by China as well as weaponry from other countries. These weapons are capable of striking surface warships, submarines and land-based facilities, and laying naval mines.

"With eight Hangor-class submarines set to enter service gradually in the future, Pakistan will build an asymmetric maritime advantage in its region. The new assets will offset its rival's numerical and scale edge in surface vessels, help to secure the country's transportation of fuels and materials, and strengthen its strategic influence across the Indian Ocean region," Wu anticipated.

Another observer, who wished to be identified only as Xiao, said the Hangor-class submarines can operate in coordination with Chinese-built frigates in the Pakistan Navy, and that means the Pakistan Navy can use a small group of advanced assets to pin down and deter hostile naval forces.

"Thanks to the AIP system and other modern silencing technologies, the submarine features outstanding acoustic stealth performance. It can team up with surface warships to strike enemy vessels and land targets at long ranges, wielding powerful strategic deterrence," he said.

Moreover, under the submarine project, China has transferred to Pakistan full sets of submarine design skills, construction techniques, and maintenance capacity, and has helped train a large group of workers, engineers and technicians, allowing Pakistan to break away from absolute reliance on Western suppliers and reduce the full life-cycle cost of the Hangor-class submarines, according to Xiao.

Tokyo Trials-related items donated to memorial hall

NANJING — Eighteen rare archival items related to David Nelson Sutton, a US assistant prosecutor at the Tokyo Trials and one of the earliest international prosecutors to investigate the Nanjing Massacre, were officially donated on Wednesday to the Memorial Hall of the Victims in Nanjing Massacre by Japanese Invaders.

With this year marking the 80th anniversary of the start of the Tokyo Trials, the donation includes six original diaries written by Sutton between 1946 and 1948, when he was conducting investigations for the trial, as well as a series of original reports titled "Reports from China".

From May 3, 1946, to Nov 12, 1948, the International Military Tribunal for the Far East was held in Tokyo by 11 countries, including the United States, China, the United Kingdom and the Soviet Union, to try Japan's Class A war criminals after World War II.

Sutton came to China with the International Prosecution Section in 1946 and was tasked with investigating Japanese war crimes in China, with a particular focus on collecting evidence related to the Nanjing Massacre.

"Sutton was among the earliest members of the International Prosecution Section to conduct investigations in Nanjing and other places, and he played an irreplaceable role in the trial of the Nanjing Massacre case," said Zhou Feng, curator of the memorial hall.

The diaries recorded many details of Sutton's work during the Tokyo Trials. In one entry, dated March 9, he wrote that he had received formal orders to go to Shanghai, Nanking (Nanjing), Peiping (Beijing) and other sites in the China theater to investigate war crimes and gather evidence.

Another entry recorded his arrival in Nanjing at 11:20 am on April 2. On May 3, the day the trial opened, he described the defendants as looking like "insignificant beaten men".

Barak Kushner, a professor at the University of Cambridge, said the Sutton diaries "will be of great interest since there isn't a comparable diary from the time".

The donated materials also include Sutton's "Reports from China", which further exposed Japanese wartime atrocities in China, including mass killings, violence against civilians, germ warfare and the coercion of Chinese people into opium cultivation.

Yang Xiaming, a researcher with the Institute for National Memory and International Peace who began studying Sutton about two decades ago, said the archives donated this time are likely to have originated from a folder lost during the outsourced digitization of the Sutton archives by the law library of the University of Richmond in 2009, before eventually entering the auction market.

Zou Dehuai speaks about archival materials related to David Nelson Sutton that he has donated, during an exchange event marking the 80th anniversary of the opening of the Tokyo Trials in Nanjing, Jiangsu province, on Wednesday. YANG BO / CHINA NEWS SERVICE

"The core value of these archives lies in their status as irrefutable original first-hand historical materials, further strengthening the hard evidence of Japanese war crimes in China," Yang said.

The donor, Zou Dehuai, a collector born in the 1990s who has long searched for wartime historical evidence, first found the Sutton materials in November 2025 on a US-based auction website specializing in military artifacts.

After confirming Sutton's identity and reviewing preview images that indicated the items were original archival materials, Zou placed a bid for the collection and later arranged for its return to China with assistance from others.

At the donation ceremony, Zou received a donation certificate. He said the Sutton archives were the most expensive items he had acquired in a decade of collecting, and also his first donation.

"I hope that after the Sutton diaries settle in the memorial hall, they can better fulfill their value and tell every visitor that justice, though delayed, did arrive," Zou said.

Zhou, the curator of the memorial hall, said the Tokyo Trials had a profound and unshakable impact on safeguarding the victory of World War II and the postwar international order.

The return of these valuable archives to Nanjing, he said, provides new historical materials and perspectives for further research on the Tokyo Trials and helps uphold the legal conclusions of postwar justice and defend peace.

Lai's Eswatini trip dubbed a political farce

Mainland says Taiwan leader ditched people and wasted taxpayers' money

By **MO JINGXI** and **LI SHANGYI**

The Chinese mainland has criticized Taiwan leader Lai Ching-te's visit to Eswatini as a political farce, while urging the African nation and some other individual countries to stop serving as a prop for "Taiwan independence" separatists.

The remarks came after reports said Lai arrived in Eswatini on Saturday aboard a "private jet" of the King of Eswatini. Just a day earlier, a magnitude 6.1 offshore earthquake struck off Yilan county in Taiwan, with strong tremors felt in many areas.

A Foreign Ministry spokesperson said on Saturday that Lai had ditched the people in Taiwan who were still reeling from the disaster and sneaked onto a foreign plane to "smuggle" himself out of the island, squandering taxpayers' money and performing a laughable stunt in front of the world.

"That just added yet another episode to the scandalous 'Taiwan independence' separatism," the spokesperson said.

The spokesperson said the undignified act of Lai and his like once again proves that the one-China principle has long been a basic norm in international relations and a prevailing consensus of the international community.

No matter how the Democratic Progressive Party authorities collude with external forces and keep those people in the DPP's pay, it will always be a losing cause and nothing will ever change the fact that Taiwan is part of China, the spokesperson said.

No matter how "Taiwan independence" forces try to cover up their nature or change their appearance, nothing can save their reputation or help them escape the denunciation of the international community, the spokesperson added.

"We urge Eswatini and some other individual countries to see where the arc of history bends and stop serving as a prop for 'Taiwan independence' separatists," the spokesperson said.

Eswatini is one of the 12 countries — and the only African country — that still maintain so-called "diplomatic relations" with Taiwan.

The Taiwan Affairs Office of the State Council also slammed Lai's trip on Saturday, saying his previous attempt to visit Eswatini by chartered plane had been forced to be canceled after relevant countries upheld the one-China principle.

Chen Binhua, a spokesman for the office, said Lai refused to accept the setback and traveled to Eswatini "in a sneaky manner" while Taiwan was being hit by an earthquake, exposing his indifference to people on the island and his stubborn "Taiwan independence" stance.

Chen said safeguarding peace and stability across the Taiwan Strait and leading secure and prosperous lives are what people on the island truly hope for.

"By disregarding public safety and deceiving the people at will, Lai is bound to be rejected by the vast majority of Taiwan compatriots," he said.

Chen said the one-China principle represents the trend of the times and the shared aspiration of the international community, adding that Lai's so-called "diplomatic achievement" was nothing more than a political trick that would only draw ridicule. "The overarching trend toward national reunification is irreversible," he said.

Crimes: Remembering history, vigilance urged

From page 1

"This year is particularly significant because of the Tokyo Trials anniversary. At such a crucial historical juncture, we must remember history while remaining vigilant against Japan's attempts to whitewash these war criminals," he added.

Recently, commemoration events have been held in China and Japan and by the international community to renew the historic significance of the trials.

On Sunday, the Foreign Ministry spokesperson quoted Mei Ru'ao, the late Chinese judge at the Tokyo Trials, who said, "Amnesia of past sufferings may lead to future disasters."

"Should anyone or any force foolishly attempt to reverse the verdict of aggression, they will be rejected by all peace-loving people in the world and brought once again before the tribunal of history," the spokesperson said.

Mei Xiaokan, daughter of Mei and a veteran researcher on the history of the Tokyo Trials, said, "What concerned my father most at that time was the possible scene in which those people (Japanese war criminals) do not receive the punishment they deserve."

"So he spared no effort in explaining what actually happened (during the war) to his fellow judges, trying to let them better know how atrocious the war crimes committed by the Japanese had been to the Chinese people," she told local media recently in Hangzhou, Zhejiang province.

Tokyo's fallacies such as "a trial exercising so-called victor's justice" and "Japan's war of self-defense" were refuted at the trials, the Foreign Ministry spokesperson noted. "Accepting the judgment of the Tokyo Trials is the prerequisite for Japan's postwar return to the international community."

Trade: Predictable policy environment seen as key

From page 1

He added that the policy measure will help reduce compliance uncertainty for firms operating in multiple jurisdictions, while reinforcing the resilience of global supply chains in the face of rising unilateralism.

Zhang Xin, head of customs affairs at Oriental Energy (Ningbo) New Material Co, a Ningbo, Zhejiang province-based petrochemicals producer, said a predictable policy environment is fundamental to the sound development of China-US economic and trade relations, adding that the company will maintain US imports and optimize supply chains to ensure stable raw material supply.

The company imported 258,000 metric tons of liquefied propane from the US, valued at $150 million, in the first four months of this year, according to data from Ningbo Customs.

Healthcare: AI doctors to bridge divide

From page 1

Its popularity reflects a structural challenge long facing China's medical system. While the country has world-class hospitals in major cities like Beijing and Shanghai, patients from smaller towns and rural areas often travel long distances for specialist care. Many crowd into large urban hospitals for conditions that might be handled elsewhere.

AQ aims to relieve some of that pressure by combining AI-generated health guidance with access to real doctors.

"People often need guidance before they ever see a doctor, and support after they leave the hospital," said Shen Yunfang, head of communications at Ant Health. "Our goal is to help users understand their health situation earlier, while making sure they still seek professional medical care when needed."

Behind the app is a large network of medical data and partnerships. According to Ant Health, the system draws on clinical guidelines, peer-reviewed medical journals, and collaborations with more than 5,000 hospitals and 300,000 physicians. Despite the impressive numbers, the company stresses that the platform is designed to assist doctors, not replace them.

More than 55 percent of AQ users live in third-tier cities or smaller communities, according to the company. "In those regions, people may not have easy access to top hospitals," Shen said.

As these users may depend on the app more than people living in urban areas, Shen assured that they have complete control over the uploading and utilization of their data, including test results, prescriptions, or photos for AI-assisted interpretation through the platform's question-and-answer function. Privacy protections automatically blur sensitive information, and data is encrypted end to end, she said.

"We strictly follow the nation's legal requirements and regulations, and ensure that only the user can access their health data," Shen said. "Trust is critical when dealing with medical information."

One of the app's most unusual features is a library of "AI doctor avatars". These digital assistants are modeled on the knowledge and clinical experience of more than 1,000 physicians.

Patients can ask routine questions to these virtual doctors, while complex cases are redirected to human specialists.

"The avatars allow doctors to focus their time on difficult cases," Shen said. "At the same time, they allow patients in remote areas to interact with medical experts they might otherwise never reach."

Beyond commercial platforms, researchers are pushing the boundaries of what AI in medicine might become.

At Tsinghua University, scientists have developed an experimental system known as "Agent Hospital", where AI doctors are trained to diagnose and treat simulated patients in a fully virtual environment. The system allows multiple AI agents to collaborate, mimicking the workflows of real hospitals.

"The idea is to let AI systems learn medicine the way young doctors do, through repeated exposure to cases, decision-making, and feedback," said Liu Yang, executive dean of the Institute for AI Industry Research at Tsinghua University and the project's lead scientist.

"In a virtual setting, they can accumulate experience at a scale and speed that would be impossible in the real world," Liu said.

The project offers a glimpse of a more automated future, in which elements of medical care could be scaled far beyond the limits of human staffing.

"We are not trying to replace hospitals," Liu added. "But we are exploring how parts of medical reasoning and routine care could be standardized and extended through AI."

Yet as the technology advances, so do the questions surrounding it.

The rapid expansion of AI healthcare tools has sparked debate over accuracy, accountability, and the evolving role of physicians.

While platforms emphasize that AI is designed to assist rather than replace doctors, some experts warn that overreliance on automated systems could introduce new risks, particularly in complex or ambiguous cases.

"Medicine is full of uncertainty," said Mo Kai, a Beijing-based health policy expert. "When cases fall outside standard patterns, human judgment becomes critical, and that's where current AI systems still struggle."

There are also concerns about accessibility. While digital tools can extend care to underserved populations, they may be less effective for elderly users or those unfamiliar with smartphones.

"Technology can expand access," Liu said, "but ensuring that it remains usable and trustworthy for all populations is just as important as improving its intelligence."

Some physicians say such tools are already changing how they work.

Zhang Ling, a cardiologist at China-Japan Friendship Hospital, uses Ant A-Fu's desktop platform to manage online consultations and review patient histories.

"The AI assistant organizes patient information before I even begin the consultation," Zhang said. "It identifies potential warning signs and highlights urgent cases."

That kind of triage can be valuable in China's busiest hospitals, where doctors often see dozens of patients each day.

"It doesn't replace clinical judgment," Zhang added. "But it can make the system much more efficient."

Still, adoption has not been without resistance, particularly from within hospitals. Some administrators and clinicians remain cautious about integrating large AI models into clinical workflows, citing concerns over reliability and professional risk.

"Medicine is not just pattern recognition, but involves judgment, responsibility, and uncertainty," said a hospital administrator who asked not to be named.

"If an AI system produces an incorrect recommendation, even rarely, the consequences in a clinical setting can be serious. That's where many institutions remain hesitant."

Concerns over data governance present an additional barrier. While technology companies stress that patient information is protected, some hospitals are reluctant to share internal data with external platforms, fearing loss of control or unintended exposure.

"From the hospital's perspective, data is one of its most sensitive assets," the administrator said.

"Even if companies claim the data won't be used beyond specific applications, it sometimes sounds not trustworthy enough. Trust takes time to build."

Developers say such concerns are understandable, but, in many cases, misplaced. According to Shen, the Ant Health communication head, most platforms operate under strict data isolation protocols, with patient information encrypted and stored within controlled environments.

Data used for AI-assisted services is typically not fed back into foundational model training, and these safeguards are often written into formal agreements with partner institutions.

"We don't use hospital data to train base models, and that is clearly specified in our contracts," Shen said. "There are also strict rules governing data storage, access permissions, and system architecture."

With AI medicine remaining a developing field, experts have said that algorithms must cope with more diverse medical conditions and the digital barriers faced by users. Ensuring accuracy and maintaining public trust will remain critical challenges.

Ant Health says it is already working on new features, including chronic-disease management tools. A senior-friendly interface with dialect support for elderly users launched in February.

For patients like Qian in Hubei, the technology is already reshaping everyday healthcare. She now checks her blood pressure regularly and consults the app whenever she has questions. If necessary, it can connect her directly to a physician online. "It makes me feel less alone dealing with my health," she said.

Digitized medical services scale up, but real-world performance remains uneven

By **WEI WANGYU**
weiwangyu@chinadaily.com.cn

As artificial intelligence gains traction in China's healthcare system, experts say its expansion is following a clear pattern, shaped as much by clinical realities as by technological capability.

Across academia and industry, there is a growing consensus that AI healthcare holds tangible potential in improving efficiency, extending access, and shifting care toward earlier intervention. Yet where and how these systems are deployed remains highly selective.

"AI tends to be adopted first in areas where data is standardized, workloads are heavy, and risks are relatively controllable," said Wu You, an associate professor at Tsinghua University's medical school.

"These conditions make it easier to integrate AI as a tool for assistance and quality control," Wu said.

That logic has placed imaging-related specialties at the forefront. In radiology, AI systems are increasingly used to assist with CT and MRI interpretation—tasks that are repetitive, high-frequency, and governed by standardized workflows.

Digital pathology is another fast-growing area, supporting the development of regional pathology centers and cloud-based diagnostic networks, although human experts still dominate most clinical decisions.

Beyond diagnostics, AI is also gaining ground in hospital quality management. Tools for prescription review, medical record auditing, and disease-specific quality control are being deployed to improve consistency and reduce error rates.

Meanwhile, patient-facing applications, such as intelligent triage, pre-consultation services, and automated billing, are reshaping hospital workflows, even if many rely more on digital infrastructure than advanced clinical intelligence.

Despite this progress, adoption remains concentrated in top-tier hospitals.

"In most cases, AI systems are first piloted in large tertiary hospitals, which are deeply involved in their development and validation," Wu said. "Only after that do they gradually expand to regional healthcare networks. Direct adoption at the primary-care level is still limited."

One structural reason is that the current medical practice still assumes that physicians must be capable of evaluating and, when necessary, correcting AI-generated outputs. In lower-tier settings, where technical training and resources may be more constrained, that condition is not always met.

Another challenge lies in the gap between controlled testing and real-world performance.

Regulatory approval in China typically confirms that AI systems meet baseline standards for safety and accuracy under controlled conditions. But once deployed in clinical environments, outcomes can vary widely.

"Effectiveness depends on who is using the system, how it is integrated into workflows, and how long it has been in use," Wu said.

In a multiyear study tracking AI-assisted lung CT analysis at two hospitals in Beijing, Wu and her colleagues observed markedly different patterns between junior and senior physicians.

Less experienced doctors were more likely to rely on AI suggestions, sometimes leading to short-term increases in false positives and longer reporting times. Senior doctors, by contrast, showed more stable performance, with gradual improvements emerging over time as workflows adapted.

The findings suggest that early declines in efficiency, particularly among less experienced users, should not necessarily be interpreted as technological failure, but rather as part of the adjustment process in human-machine collaboration.

More broadly, they point to the limits of a regulatory approach focused solely on market entry.

"In high-risk and complex medical scenarios, governance cannot stop at approval," Wu said. "It needs to extend to continuous evaluation and adaptation in real-world use."

As AI becomes more deeply embedded in healthcare systems, experts say the next phase will depend less on technological breakthroughs than on how effectively these systems are integrated, monitored, and governed.

The promise of AI in medicine may be substantial. But its success, they argue, will ultimately be determined outside of controlled trials, in the messy, variable realities of everyday clinical practice.

US prepares to guide ships through strait

Iran warns that "Project Freedom" initiative would be considered a violation of ceasefire

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

US President Donald Trump said on Sunday that the United States will launch a new effort to "guide" hundreds of stranded ships through the Strait of Hormuz as early as Monday, a move that Iran quickly warned would violate a fragile ceasefire.

Trump said in a social media post that "neutral and innocent" countries have been affected by the Iran war, and "we have told these Countries that we will guide their Ships safely out of these restricted Waterways, so that they can freely and ably get on with their business".

The initiative, called Project Freedom, would begin on Monday morning, Trump said, adding that his representatives are having discussions with Iran that could lead to something "very positive for all", The Associated Press reported.

Trump warned that any interference in the program would be dealt with "forcefully," but provided few specifics about how it would work.

In response, Iran's National Security Commission Chairman Ebrahim Azizi said any US interference with the Strait of Hormuz would be considered a violation of the ceasefire.

"The Strait of Hormuz and the Persian Gulf would not be managed by Trump's delusional posts!" Azizi said on X.

He said Trump's announcement is an attempt to shift the blame for the blockade in the Strait of Hormuz to Iran, allowing him to authorize US strikes without Congressional approval.

Iran's tight restrictions on shipping through the strait, combined with a US naval blockade that has curtailed Iranian oil exports and disrupted tanker traffic, have shaken global markets.

Crews stuck on the mainly oil and gas ships have spoken about running low on food, water and other supplies.

Many sailors come from countries in south and southeast Asia.

On Sunday, a cargo ship near the Strait of Hormuz said it was attacked by multiple small craft, marking at least two dozen attacks in and around the strait since the Iran war began, according to an AP report.

There was no immediate claim of responsibility for the attack, the first reported in the area since April 22, the operations center said.

Meanwhile, Tehran said it was reviewing the US response to its latest proposal on ending the war.

Iranian Foreign Ministry spokesman Esmaeil Baghaei said on Sunday the United States has responded to Iran's 14-point proposed plan to end the war.

He made the remarks in an interview with state-run IRIB TV while noting that the US response is being reviewed.

He stressed that Iran's plan is exclusively focused on ending the war, and "nothing pertaining to the nuclear field's details exists in it".

"At present, we are focused on the parameters related to ending the war in the region, including Lebanon," Baghaei added, stressing "we have no nuclear negotiation at this stage".

Trump on Saturday said he was reviewing the proposal but expressed doubt it would lead to a deal, adding on social media that "they have not yet paid a big enough price for what they have done" in the nearly 50 years since the Islamic Revolution there.

Iran's proposal called for the US lifting sanctions on Iran, ending the US naval blockade of Iranian ports, withdrawing forces from the region and ceasing all hostilities, including Israel's operations in Lebanon, according to the semi-official Nour News and Tasnim agencies.

Xinhua and Agencies contributed to this story.

Pentagon to pull more troops from Germany

WASHINGTON — United States President Donald Trump said on Saturday the country plans to withdraw "a lot further" than the 5,000 troops from Germany that the Pentagon had earlier said.

"We're going to cut way down, and we're cutting a lot further than 5,000," Trump told reporters before boarding Air Force One in Florida.

The Pentagon announced on Friday the withdrawal of about 5,000 US troops from Germany, which is expected to be completed over the next six to 12 months.

"This decision follows a thorough review of the (Defense) Department's force posture in Europe and is in recognition of theater requirements and conditions on the ground," Pentagon chief spokesman Sean Parnell said.

NATO said on Saturday that it was working with the United States to understand Washington's decision to withdraw troops from Germany, amid fresh tensions between the US and Germany over the Middle East crisis.

Earlier, Trump hinted at a troop withdrawal after German Chancellor Friedrich Merz said Iran was "humiliating" the US in negotiations to end the conflict between the two sides.

On Thursday, Trump said he may also reduce US military presence in Spain and Italy, while criticizing European allies for not helping in the US-Israeli war against Iran.

Spain's Defense Minister Margarita Robles called Trump's statements "neither appropriate nor, of course, based on any legal grounds".

German Foreign Minister Johann Wadephul said on Thursday that Berlin is prepared, while stating that major US military sites, such as the Ramstein Air Base, still serve an irreplaceable role for both sides.

More than 36,000 US troops were assigned to bases throughout Germany as of December, along with nearly 1,500 reservists and 11,500 civilians.

Yu Xiaohua, a professor at Germany's University of Goettingen, said that Trump might execute a symbolic reduction, maybe a few hundred troops, as a political gesture. Still, some observers see a broader shift underway.

In a commentary published in the French daily Le Monde, former German vice-chancellor Joschka Fischer said, "Whatever the case, the dissolution of the alliance has already begun."

Africa eyes benefits from tariff waiver

By **NDUMISO MLILO** in Johannesburg
For China Daily

With China's zero-tariff offer taking effect on Friday, South African experts and the business community expect it to boost China-Africa trade and bring economic benefits to the continent.

While China previously offered duty-free access to dozens of least developed countries, the current offer has been expanded to include middle-income countries such as South Africa and Nigeria.

Theuns Botha, CEO of Kingday Textiles, which imports textiles from China and exports aluminum and zinc to it, urged South African companies to take advantage of the opportunity.

"This is an incredible opportunity. China is trying its best to increase trade with African countries," he said.

"This offer has been extended to benefit the manufacturing, agricultural and mining sectors and increase employment with high demand from China. We are seeing China opening its markets and making concessions available to the rest of the world," Botha said.

The zero-tariff policy could provide relief to African countries facing uncertain trade relations with the United States, which has unilaterally imposed tariffs, he said.

Dealing with Washington has become "difficult and complicated" under the current US administration, he said, adding that South Africa should expand its production capacity to increase exports to China.

Wolfe Braude, a manager at the Agricultural Business Chamber of South Africa, welcomed China's offer while urging exporters to meet the country's regulatory requirements.

African nations seeking to export agricultural products to China must negotiate and sign sanitary and phytosanitary protocols, he said. South Africa has already signed several such protocols but is planning to add cherries and blueberries to the list this year, he added.

Standards compliance

For nonagricultural products, exporters must comply with the standards set by China's regulatory authorities, Braude said.

Navigating the Chinese market comes with challenges for some companies because of its regulations and procedures, and smaller businesses will require capacity-building support to fully benefit from the opportunity, he said.

Exporters will benefit from understanding the Chinese systems, rules and regulations as a result of the Framework Agreement on Economic Partnership for Shared Prosperity, which South Africa signed with China earlier this year, he said.

Under the agreement, African countries are also expected to benefit from cooperation in areas such as green energy, digitization, technical expertise and financing, he added.

China's development experience offers valuable insights for Africa, Braude said, noting that the country has successfully confronted many of the challenges that African economies continue to face.

Philani Mthembu, executive director at the Institute for Global Dialogue in South Africa, said the zero-tariff policy could further strengthen Africa-China trade ties.

"China is opening its market to South African products, particularly in the agriculture sector, which is very important," Mthembu said.

Looking ahead, he said the next step in the trade relationship should involve greater investment and manufacturing partnerships.

"Even in the automotive space, we encourage China to build factories to manufacture high-tech and other products within the African continent," he said.

The writer is a freelance journalist for China Daily.

China-Australia partnerships offer bright spot amid global disruptions

By **XIN XIN** and **ALEXIS HOOI** in Sydney

China-Australia partnerships offer a bright spot amid major disruptions to global supply chains, business leaders heard at a recent industry event in Sydney, where speakers pointed to expanding collaboration as a way to navigate rising uncertainty.

Australia's designation as the Country of Honor at this year's China International Supply Chain Expo, to be held in Beijing in June, is expected to provide an important platform for deepening industrial and supply chain ties, in line with China's push for high-quality development.

The momentum is particularly visible in renewable energy, with export-ready Australian companies seeking closer engagement with China's rapidly growing energy ecosystem. The Smart Energy Council, in partnership with the Australian Trade and Investment Commission, will lead a delegation of companies to the expo.

David McElrea, the council's chief advocacy officer, told China Daily that the sector illustrates the "enduring partnership" between the two countries. "In Australia, we use a lot of Chinese material and investments; whether it's solar panels, batteries or electric vehicles," he said, highlighting China's central role in driving the global renewable energy transition.

"We're constantly impressed by the innovation in China," he said. "There are so many ways we can work together and the future for cooperation is bright."

The expo promotes collaboration across industry, academia, research and application, encouraging interaction between Chinese and international businesses to strengthen global industrial and supply chain partnerships.

Ma Lei, chief representative of the China Council for the Promotion of International Trade's office in Australia, said Australia's confirmation as the Country of Honor reflects its "strong confidence" in deepening industrial and supply chain cooperation and will inject new momentum into the countries' economic and trade ties.

Ma, whose office organized the Sydney event, said the expo's focus on major industrial chains, including advanced manufacturing, is "perfectly aligned with China-Australia cooperation priorities", creating broad opportunities for businesses in both countries.

Chen Jianyu, general manager of the Sydney branch of the Industrial and Commercial Bank of China, said Australia's designation at the expo reflects the depth of bilateral economic cooperation and underscores the important role of Australian businesses in global supply chains.

The bank, a strategic partner of the expo, supported the Sydney event with the China Chamber of Commerce in Australia.

"Leveraging the ICBC's extensive global network and deep presence in China, we aim to help Australian enterprises connect with the right partners, explore new opportunities and achieve tangible business outcomes," Chen said.

Arnold Jorge, CEO of the Export Council of Australia, told China Daily that heightened uncertainty and ongoing supply chain reconfiguration have made stability a priority.

Against that backdrop, he said Australia's relationship with China — its largest trading partner — offers much-needed complementarities to help overcome current challenges.

PEOPLE

The art of remembering lives

A tombstone designer creates customized memorial spaces, helping families stay connected to loved ones through personal stories, **Zhou Lihua** and **Hu Qing** report.

Xu Hang checks vegetation beside a burial plot at a cemetery in Xianning, Hubei province. The 42-year-old tombstone designer incorporates seasonal planting into his designs to keep spaces alive year-round.
PROVIDED TO CHINA DAILY

During this year's Tomb-Sweeping Day, Xu Hang moved slowly along rows of tombstones at Crane Lake Memorial Park in Xianning city, Hubei province. He brushed dust from the surfaces, and paused beside one he had designed years ago, lost in thought.

No one asked him to do this. It is simply something he has done for nearly 20 years.

The tombstones stand in silence. Each one holds a story that can no longer be spoken aloud.

And Xu's work ensures those stories are not entirely lost.

At 42, Xu is a tombstone designer. Over the past two decades, he has designed nearly 1,000 tombstones.

Having studied environmental art design at Xi'an Polytechnic University, Xu had not planned to enter the funeral industry. After graduation in 2006, he took a job at a cemetery in Zhengzhou, Henan province, and stayed for nearly a decade.

"I wasn't interested in the job at all back then," he recalls.

The setting felt far removed from his ambitions. But over time, something shifted — not through design theory or artistic pursuit, but through an encounter he still remembers clearly.

More than a decade into his career, Xu was organizing a burial ceremony when he presented a tombstone design to a woman in her 50s who had just lost her husband. After the ceremony, she suddenly dropped to her knees.

"Thank you, child," she said.

The moment stayed with him. The woman, whom he later referred to as Aunt Li, told him the tombstone carried the memory of their 30 years together. From then on, she said, this would be the place where she could return and "talk" to her husband.

At that moment, Xu began to understand that what he was shaping was not just stone, but a form of continuity — something that allowed the living to remain connected to those they had lost. A tombstone could hold the presence of a parent for a child, or offer quiet companionship to someone left behind.

"That was when I realized this job could truly matter," he says. "It allows me to help people, and earn their trust."

From then on, he chose to take the work seriously.

He stopped chasing abstract notions of "art" and began by listening. Before starting any design, he sits with families and asks simple questions: What colors did they like? What music or opera did they enjoy? What kind of life did they live?

Clockwise from above: Xu Hang inspects the health of a tree at a cemetery in Xianning, Hubei province. Xu discusses a tombstone design plan with a colleague. A hand-drawn tombstone sketch by the designer. He uses computer software to develop a burial plot master plan. PHOTOS PROVIDED TO CHINA DAILY

A typical design takes around 10 days. Xu begins with hand-drawn sketches, refining them through conversations with the family. Once a direction is agreed upon, he develops digital renderings to finalize materials, colors and layout.

His work often extends beyond the tombstone itself. He treats each site as a small, contained environment — a place designed not only for remembrance, but for return.

Xu says he avoids the traditional use of plain black stone, instead creating what he describes as a "small courtyard". Evergreen plants provide structure, flowers bloom in spring, and even in winter there is some greenery, ensuring the space never feels desolate.

He often leaves intentional blank spaces on the stone, inviting families to return each year and add their own inscriptions or elements. He also visits regularly to check conditions and maintain the sites.

Xu follows a principle passed down from his parents. "If you deceive the living, you may still have a chance to make amends. But if you deceive the dead, you never will," he says.

One project continues to stay with him. A young woman once described her father, a serviceman stationed on a remote island. Her clearest memory was of arriving each year to find him waiting at the dock, the sea stretching behind him under a vast sky.

Xu translated that memory into a horizontal tombstone. Small stones outlined the shape of the island, while the background opened into a wide "sky", decorated with small stones in shades of blue, yellow and white, inspired by *The Starry Night* created by Vincent van Gogh.

When the woman saw the finished design, she said nothing.

"But I knew she understood," Xu says.

His work has drawn attention beyond families. Ding Shan, a teacher at the School of Art and Design at Wuhan University of Technology, became a client two years ago when Xu designed a shared burial site for his grandfather and father.

"Xu Hang is very approachable. We had detailed discussions about materials, design and dimensions to meet my specific requests," Ding says, adding that what impressed him most was Xu's attitude toward his job — treating it as a delicate act of creation rather than just a way to earn a living.

> "The tomb sits by a lakeside cherry blossom tree, with cranes and black swans nearby. It feels more like a park than a cemetery. Knowing our loved ones rest in such a place brings us a sense of peace."
>
> **Ding Shan,**
> a client, teacher at the School of Art and Design at Wuhan University of Technology

"The garden-style layout was truly thoughtful," he says. "The tomb sits by a lakeside cherry blossom tree, with cranes and black swans nearby.

"It feels more like a park than a cemetery. Knowing our loved ones rest in such a place brings us a sense of peace," Ding says.

In recent years, Xu has noticed a shift in how people approach memorials. Families are less concerned with scale or formality, and more focused on emotional expression. They want tombstones to reflect the individuality of the person being remembered — places where they can sit, talk, and spend time.

Younger clients, in particular, often bring clear and personal ideas. Some bring sketches; others gather references and images to explain what they have in mind, he says.

After 20 years in the field, Xu believes not everyone is suited to the work.

"It's not about skill," he said. "It's about what's in your heart."

Awards no longer concern him. What matters is the moment when a family looks at a design and says, "I never imagined it could be like this."

That, he believes, is enough.

He no longer cares about leaving his own name behind. If anything is to endure, he believes, it should be the lives of ordinary people — each one carrying its own quiet significance.

Seeing the wild side of life one frame at a time

Photographer Dong Lei documents the extraordinary diversity of China's environment over the course of 20 years

By CHEN LIANG
chenliang@chinadaily.com.cn

The year began with a quiet milestone for Dong Lei, a photographer from Chengdu in Sichuan province; the publication of his new book, *My Wildlife Circle of Friends*.

He told China Daily that the seed for a photo book had been planted in 2014-15, initially conceived with the title *Mountains of Southwest China Through the Eyes of a Nature Photographer*. In 2017-18, he frequently ventured deep into the Gaoligong Mountains in Yunnan province, documenting the elusive pheasant, Sclater's monal. He spent weeks in isolated wilderness. During downtime, or on rainy days when leaving camp was impossible, he began to create the book and later completed a first draft.

Eventually, a publisher expressed interest. The working title shifted to *China's National Parks (Southwest Chapter) Through the Eyes of a Nature Photographer*, with 10 chapters on key species distributed across 10 national parks of Southwest China.

However, with only five national parks being officially established so far and only two falling within his reach, the publisher had to rethink the marketing strategy. The title was changed to appeal to a younger audience. "The cover design is more cartoonish, but the content inside remains largely the same," Dong said.

The book is a collection of his works from 2006 to the spring of 2025, when he photographed the rare Himalayan red panda in the Xizang autonomous region. "The book contains the highlights of my 20 years of wildlife photography," Dong said.

Li Binbin, an associate professor of environmental sciences at Duke Kunshan University in Suzhou, Jiangsu province, wrote in the book's foreword: "With rapidly evolving imaging technology and readily accessible information, capturing beautiful nature images seems less daunting than before. However, the ability to relentlessly seek out uncharted territories in nature photography, to document and disseminate the biodiversity of China's vast land, and to use imagery to raise awareness of nature conservation — that's where people like Dong Lei are truly rare."

From enthusiast to expert

A nature enthusiast without a formal science background, Dong, 51, started bird-watching in 2003, which gradually transitioned into a career in nature photography.

He studied industrial design at a college in Jiangsu. After graduating, he joined Sichuan University as a teacher of design and photography. Nowadays, he teaches at the School of Design at Southwest Jiaotong University in Chengdu. As an only child, Dong lived according to his parents' expectations: education, marriage and a stable career.

But at the age of 25 lurking beneath the surface of his well-ordered life was "a hint of discontent", he said.

At Sichuan University, Dong found himself with more free time, joining the university's mountaineering association on a trek to Mount Gongga. This became the turning point that led him into the world of nature photography. He enjoyed taking pictures as he walked in the wild.

Around 2004, he immersed himself in wildlife photography. In the early 2000s, it was a new field and relevant visual materials were scarce, mostly found in foreign publications.

"I gradually realized that documenting wildlife through imagery is a crucial way for us to understand nature," Dong said.

From 2006, he began teaching at the China Wildlife Photography Training Camp, organized by the renowned photographer Xi Zhinong. Meanwhile, he embarked on his own project to photograph China's endangered species.

In 2008, he joined Image Biodiversity Expedition, the country's first imaging biodiversity survey institute.

After accumulating substantial first-hand images, Dong and his friends founded swild.cn, a natural image library, hoping to use the power of photography to reveal the vitality of the wilderness in Southwest China.

The Mountains of Southwest China are one of the world's 36 biodiversity hot spots, Dong said. In this region, there are about 12,000 plant species, 29 percent of which are endemic. The abundance of wildlife is equally extraordinary: giant pandas, several species of snub-nosed monkeys and gibbons, snow leopards, takins, white-lipped deer and various pheasants.

"There is a long list of key species that need our documentation," Dong said.

In 2014, he published his first nature photography album, focusing on the biodiversity in the Gaoligong Mountains.

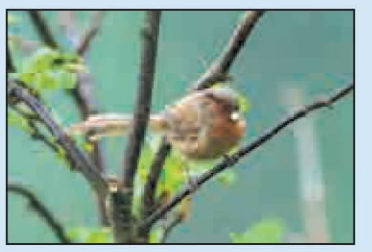
Beyond photography, Dong and his partners gradually evolved toward nature documentaries, beginning around 2015, hoping to showcase the charms of wildlife through more diverse formats.

Over the past decade, he has been involved in the creation of around 10 wildlife documentaries. The mountains of Southwest China remain the central focus of these works.

Of these documentaries, Dong is most fond of *The Glories of the Minya Konka* (Mount Gongga), completed in 2018.

Through precious, on-location footage, the documentary tells the story of Mount Gongga, the highest peak in the Hengduan Mountains of western Sichuan, at 7,556 meters above sea level. It captures the coexistence of snow leopards and leopards, the spectacular giant tree of *Magnolia dawsoniana* and monkey troops seasonally feeding on the flowers, and the courtship of golden pheasants.

In January 2020, the documentary was broadcast on Central China Television and received an award from the National Radio and Television Administration.



Because of these works, Dong is considered one of China's leading nature documentary directors and producers.

Discoveries and memories

Years of fieldwork have led to many unexpected discoveries. In 2007, while visiting the Tangjiahe National Nature Reserve in Sichuan, he rediscovered the rare rusty-throated parrotbill.

In 1886, the Russian explorer Nikolay Przhevalsky toured western China with his expedition team, documenting many species for the first time. The rusty-throated parrotbill, known as Przevalski's parrotbill, was among them.

Ever since the official discovery, enthusiasts from Europe and the United States have been eager to see the bird, but for more than a century no one had seen it.

In the 1990s, there were rumors that some foreign visitors had seen it in Jiuzhaigou in Sichuan, but there was no photo evidence. In 2007, Dong and his mentor, Xi Zhinong, finally photographed it in Tangjiahe.

"I had been bird-watching for three or four years then, and could identify many birds, and I had a field guide with me," he said. "But when I took the photo, I didn't realize it was rusty-throated parrotbill. Who would expect to be able to photograph a bird that hadn't been seen in 120 years?"

In 2018, while taking photos in Gyirong county, Xizang, he documented a new mammal record for China, the Asiatic jackal. "While investigating Gyirong Valley, an animal resembling a fox suddenly appeared in the bushes," he said. "We were able to capture clear photos before it disappeared quickly. The images confirmed the existence of the animal in China."

Both discoveries were significant enough to be published in academic journals, with Dong listed as the first author.

Reflecting on his passion for wildlife photography, Dong explained that it is the vast realm of the unknown that captivates him.

"You might meticulously plan every detail of a trip, only to find yourself unable to capture your intended target, which can be quite disheartening," he said. "Yet, it's often in those moments of unexpected discovery or unforeseen adventure that you find a surprising and profound joy.

"You will definitely not come away empty-handed. You are sure to harvest something. The unpredictability is fascinating."

His encounter with the Nujiang snub-nosed monkeys is a fine example. The monkey was only officially discovered as a species in 2010. It's currently only found in Yunnan and Myanmar, with a population of less than 600.

After learning about the species, Dong and his friends were thinking about photographing the animal. Starting in 2012, they repeatedly visited the animal's natural habitat in the Gaoligong Mountains but without success.

After they heard that the monkeys had been seen near the Pianma Protection Station in the Gaoligong Mountains on Oct 28, 2013, they launched their third attempt.

They started climbing at 3 am, in complete darkness and pouring rain. They had to rely on their hands to climb. "We didn't bring headlamps. When we needed both hands to climb, we had to bite down on the flashlight," Dong said.

They arrived at the destination at 7 or 8 am, when it was bright. However, the forest was quiet. "We were a bit disappointed because the monkeys would be active after daybreak, and it was already quite bright. We worried they had already left," he said.

Undeterred, they split up and searched in different directions. When they returned to camp, it was 9:30 am, and they still hadn't found them. "Our mood was really low, thinking we had wasted our efforts. I even packed my lens into my bag," he said. "It was very cold. The rangers from the patrol station built a fire, and we dried our clothes and warmed ourselves. Just as we were about to give up, the snub-nosed monkeys appeared by the dozen, very noisy!"

Zhang Jinshuo, curator of the National Zoological Museum of China, wrote in his foreword to *My Wildlife Circle of Friends*: "Wherever there is unique biodiversity, no matter how harsh the environment or conditions, he (Dong) can scale its peaks; thus, pursuing the truest side of nature, thereby recording rare endangered species and displaying their elusive natural behaviors."

Due to his increasing commitments in documentary direction and production, Dong finds that his opportunities to photograph wildlife have become limited. However, he said that he remains eager to seize any chance to venture into the wild and capture its beauty whenever possible.

Revitalizing villages by attracting young people

Huzhou, Zhejiang province, is where the idea that lucid waters and lush mountains are invaluable assets first took root.

In March this year, China's first local regulation specifically designed to encourage young people to develop rural areas was enacted in Huzhou.

By integrating youth-driven rural development into local legal and planning frameworks, the regulation aims to address key challenges and inject fresh energy into rural revitalization.

Since the start of 2025, Huzhou has launched over 2,000 youth-led innovation projects across its rural areas.

These initiatives are giving rise to new business models and lifestyles, all driven by the creativity and ambition of young people.

From the digital nomad community — China's first comprehensive hub of its kind — nestled in the tea fields of Xilong township, Anji county of Huzhou, to a wide range of innovative projects that help boost local incomes, more and more young people in Huzhou are turning their dreams into reality among the green hills and clear waters.

Huzhou will continue to empower rural development through young talent, unlocking new growth drivers to help the youth tap their full potential. This influx of talent is reshaping urban-rural integration, offering a dynamic new vision of balanced growth.

TREND

IF IT'S BLOWING IN THE WIND, IT MUST BE SPRING

Floating catkins underpin the need to balance 'more green' with 'less disturbance'

Poplar fluff litters the ground in a residential community in Beijing on April 12. PROVIDED TO CHINA DAILY

By LI WEI in Beijing
liwei@chinadaily.com.cn

During the May Day holidays, Beijing is at its most inviting. Parks fill up, greenways hum with people, and spring seems to hit its stride. Yet for many residents, the season brings something else along with the sun and fresh leaves: fine white fluff drifting through the air.

It spins in loose swirls, slips into collars, sticks to camera lenses, and floats through the half-open window of ride-hailing driver Yang Shuquan's car. "Here we go again," he says, brushing it away with a wave of his hand. "Like snow that just hangs around."

From late April into May, as much of the country settles into spring, cities across northern China enter what locals half-jokingly call a season of "spring snow" — the airborne seeds of poplar and willow trees. The phenomenon can last for more than a month.

Yang has been driving in Beijing for years and knows this stretch well. "It's the toughest time of the year," he says. "You can't really open the windows. Once it gets in, your eyes sting, your throat feels off. After a while, it gets on your nerves."

He's hardly alone in this predicament. As temperatures climb, many northern regions move into peak fluff season. Data from the Beijing Municipal Forestry and Parks Bureau show that in 2026, the first wave began on April 6 and is expected to run through late May, roughly 50 days in total. The May Day holidays fall right in the middle of a second surge.

Nature turns into a hassle

What used to pass as part of the natural rhythm has, over time, turned into a recurring urban irritant.

For Hu Honghai, a resident of Changping district in Beijing, the situation is "messy". "You wash your car, and before long it's covered again," he says. "My eyes feel uncomfortable, my throat too. Sometimes I can't even tell if it's a cold or an allergy." He occasionally wears a mask or uses eye drops, though more often he just puts up with it.

That kind of quiet endurance is common. Wang Cheng, a researcher with the Research Institute of Forestry at the Chinese Academy of Forestry, points out that the fluff is part of a tree's natural reproduction cycle and has existed in northern China for centuries. "When it lingers and builds up, it starts to interfere with daily life and even health," he says.

For people who work outdoors or spend long hours on the road, the impact is more immediate. Yang notes that the fluff can affect not just comfort but safety. "If you're not careful, it can clog the radiator," he says. "In serious cases, that can damage the engine." He has installed a protective mesh to keep it out.

Add the cost of allergy relief, and the nuisance becomes something more tangible.

There's also a fire risk. The fluff contains plant oils and ignites easily. A stray spark is enough. There have been cases of piles of accumulated fluff catching fire due to cigarette butts or children playing with fire, with some escalating into larger incidents. Yang recalls lighting some fluff in a courtyard out of curiosity. "I ended up burning my shoe cabinet," he says. "A brand-new pair of leather shoes went with it."

Why it feels worse now?

The issue isn't only how much fluff there is. It's how close it is to where people live. Wang says that in the past, the catkins would drift into farmland, grasslands, forests, and rivers or wetland areas, where they would get trapped and not float in the air.

But urbanization has changed this. In cities, vast expanses of paved surfaces don't trap the fluff, so it keeps flowing back into the air. Wang explains that several factors come into play — the types of trees planted, how densely they are arranged, and the way urban spaces are built.

The age of the trees also matters, Wang emphasizes, with older trees producing more fluff. In the past, poplar and willow trees were often planted for timber and cut down before they ever reached the stage of heavy production of catkins. But with stronger urban ecological protection, they've been left to grow much longer in cities.

Given the discomfort, the first reaction of many residents is simple enough: why not just cut these trees down or replace them? The reality, however, is far more complicated than it seems.

Poplars and willows — especially populus tomentosa — once played a central role in greening China's northern cities. They grow quickly, tolerate harsh conditions, and provide long stretches of shade. Decades on, many of them now stand as towering trees and have become part of the city's ecological fabric.

Cutting them down is far from a simple fix. It would be expensive, ecologically costly, and at odds with the idea of ecological civilization. For many residents, it would also mean losing a familiar piece of the city's green memory and everyday landscape.

Hu puts it plainly: "Cutting them down doesn't seem realistic. But I've heard the city is replacing some of them." This is a common dilemma: people are bothered by the problem, but also recognize how complicated it is to manage.

A more targeted response

This year, though, things feel a little different. Hu says, "It seems better this year. I can see workers out there every night doing the cleanup. It feels like the issue is being taken more seriously. I've seen it covered quite a bit in the news, and my phone even pushes pollen forecasts."

Behind this perception lies a quieter, more systematic response — one that brings together satellites, big data, environmentally friendly agents, and even robotics. Beijing's catkin-control strategy in 2026 marks a shift from labor-intensive spraying and cleaning to a more precise, technology-driven approach.

Visitors walk through drifting poplar and willow fluff at the Palace Museum in Beijing on April 2.
YAN XIANG / FOR CHINA DAILY

Workers remove accumulated poplar and willow fluff from the ground using a fluff-collection machine and spray treetops with high-pressure water guns in Beijing on April 9, 2025. YUAN YI / FOR CHINA DAILY

At its core are prediction and targeted intervention. Jiang Yingshu, director of the Science and Technology division of the Beijing Municipal Forestry and Parks Bureau, explains that the city has integrated meteorological big data with ground-based monitoring to build a real-time forecasting platform. It provides street-level risk alerts on a five-tier scale, transforming response from reactive cleanup to proactive control.

A key tool developed this year is an improved eco-friendly binding agent. A non-toxic polymer is sprayed onto tree canopies via high-pressure mist cannons or drones to form a thin "ecological film" that binds the fluff before it disperses. "A single application can reduce catkin release from an individual female tree by more than two-thirds, at a cost of roughly 10 yuan ($1.46) per tree," says Jiang.

If there is no heavy rain, one treatment can last the entire season. Large-scale spraying is carried out during calm periods, with fog-cannon ranges adjusted for different tree heights to maximize efficiency and minimize waste. The agent degrades naturally when it rains and in sunlight. Importantly, it does not affect tree growth or pollute the surrounding environment.

On the ground, new portable suction devices — developed by Lvyou Group — are being deployed to remove accumulated fluff. Unlike conventional vacuum cleaners, which blow the fluff around, these devices enable precise collection without disturbing other debris. Lightweight and easy to operate, they are particularly effective in residential areas and hard-to-clean corners, while also reducing fire hazards.

"Looking ahead, we plan to expand research into automated spraying robots and long-term biological suppression methods," says Jiang.

To manage the surge of visitors during the May Day holidays, Beijing's landscaping authorities have rolled out a targeted plan. In parks, scenic spots and transport hubs, crews will step up high-pressure water spraying, ground wetting and routine cleaning, with more frequent patrols on the ground.

Jiang also reminds residents to take basic precautions — wearing masks and protective eyewear, planning outdoor trips for early mornings, evenings or after rainfall when the fluff is lighter, and avoiding any open flames outdoors.

Technological interventions buy time — but do not solve the root problem. Beijing's approach now combines short-term control with longer-term adjustment. On the mitigation side, traditional measures — spraying, flushing, cleaning, and physical barriers — remain in place. Nighttime spraying, often observed by residents, helps both to knock down fluff and increase humidity, reducing the airborne spread of catkins.

On the structural side, the city has stopped planting female poplar and willow trees — the source of the fluff. Meanwhile, a quiet "tree replacement revolution" is underway. Researchers have collected nearly 400 low- or non-fluff germplasm resources and developed 16 improved varieties. Advances in tissue culture propagation now allow for the rapid scaling of new seedlings, with up to one million produced within two to three years.

Even so, change takes time. Wang suggests a gradual, targeted approach: replace problematic trees in residential areas, schools, and hospitals first; manage tree belts in parks to contain the spread; and leave trees in less populated areas as they are. "At its core, it is still an ecological question," he says. "So it calls for ecological solutions."

Although the fluff itself is not always a strong allergen, it can carry dust, pollen and bacteria, triggering respiratory reactions. In March, the National Health Commission and the China Meteorological Administration jointly launched the country's first weekly pollen forecast.

Li Yi, a senior engineer at the Public Meteorological Service Center of China Meteorological Administration, explains that the system combines numerical weather prediction with expert calibration to help allergic people plan their activities.

But challenges remain. Current forecasts focus on total pollen concentration and cannot distinguish specific types, despite significant differences in allergenicity. Moreover, poplar and willow fluff is not yet included, as its dispersion depends not only on weather but also on tree distribution, surface conditions, and human activity — making modeling more complex.

"With denser monitoring networks and better data integration, more refined forecasts may become possible — distinguishing between pollen types. The aim is to move toward more personalized guidance, helping people decide when and where to go outside with fewer risks," says Fan Keqi, an engineer at the CMA Public Meteorological Service Center.

Living with it

For residents, coping with the fluff often means finding a balance between endurance and adaptation. "It's annoying, but you get used to it," Hu says. "Some people even treat it as part of what makes spring distinctive here."

That attitude reflects the complexity of the issue. Cities need greenery and ecological space. Residents, however, also expect comfort and quality of life. When the two collide, simple trade-offs rarely work.

"We shouldn't reject greening because of the fluff," Wang emphasizes. "The key is scientific planning and fine management to strike a better balance between ecological benefits and livability."

This thinking is gradually shaping policy and practice. From pollen forecasts to monitoring platforms, from new tree varieties to advanced control technologies, efforts are underway to shift from reactive responses to proactive management.

For many, the fluff is just a fleeting episode of spring. With the arrival of rain, the air clears and the white fibers disappear. But for the city, the issue does not end with the season. It raises deeper questions about species selection, urban planning, and ecological governance.

As people head outdoors during the May Day holidays to embrace the city's greenery, the drifting fluff serves as a quiet reminder: Every patch of urban green comes with choices — and trade-offs.

Finding a sustainable balance between "more green" and "less disturbance" may be the real challenge behind this annual phenomenon. It is not just about managing trees, but about how a megacity learns to coexist with nature — and to pursue ecological equilibrium alongside development. Beijing is already in the process of writing that answer.

BIZ LIFE

Firms enlist AI for intelligent appliances

Smart tech delivers expanded functions and enhanced user experience

By **ZHENG YIRAN** in Shanghai
zhengyiran@chinadaily.com.cn

Above: A coffee-making robot is displayed at the Appliance & Electronics World Expo 2026 in Shanghai on March 21. PROVIDED TO CHINA DAILY
Left: Bear Electric Appliance showcases over 100 home appliances and its AI smart home gadget series co-developed with Baidu Smart Cloud at AWE 2026. PROVIDED TO CHINA DAILY

Chinese home appliance companies are teaming up with internet giants to rapidly advance the integration of artificial intelligence, benefiting more consumers.

On March 12, which was the first day of the Appliance & Electronics World Expo 2026 in Shanghai. Baidu Smart Cloud inked a deal with Bear Electric Appliance Co Ltd, a maker of small home appliances based in Foshan, Guangdong province.

According to the agreement, the two parties announced that they will launch an AI strategic cooperation with a scale of 100 million yuan ($14.5 million) in the next three years. Relying on Baidu AI Cloud's big model 5.0 and Baidu Smart Cloud's AI technology capabilities, they will carry out in-depth cooperation around the AI big model and smart home appliance scenarios, and jointly promote the innovation and industrial upgrading of the new generation of AI small home appliances.

As per the deal, both parties will establish a long-term strategic partnership around "AI+Home Appliances+Intelligent Life", fully empowering products and enterprise operation systems through AI technology, and accelerating the home appliance industry's move toward the AI native era.

At the product level, both sides will focus on upgrading AI capabilities around the core categories of Bear Electric Appliance, including small household appliances such as air fryers, health pots, and rice cookers. Based on the Wenxin Yiyan big model capability, the new generation of AI home appliances will have natural voice dialogue, intelligent services, and content ecology capabilities. Through end-to-end voice interaction, low-latency voice control, and natural human-machine interaction will be achieved.

Li Yifeng, general manager of Bear Electric Appliance, said: "We attach great importance to cooperation with Baidu in the field of AI. This is not only a technical cooperation, but also an important opportunity to promote the product upgrade of Bear Electric Appliance Co Ltd. We have a rich range of home appliance application scenarios, while Baidu has leading advantages in large models and AI technology. We hope to collaborate with both parties to truly implement AI capabilities in products and user experience, and jointly explore more innovative possibilities for AI home appliances."

Yuan Foyu, vice-president of Baidu, said: "The combination of AI and home appliances has significant value for both industries. AI cannot just stay at the conceptual level, it must enter real life scenarios to make consumers feel the changes brought by technology in their daily use. Bear Electric Appliance Co Ltd has a strong industrial foundation, and Baidu has leading AI technology capabilities in the fields of big models, AI and cloud computing. The cooperation between the two parties will jointly promote the large-scale implementation of AI in small household appliances."

In the future, both parties will use the Wenxin Yiyan big model as the core technology base, continuously promote the large-scale application of AI technology in the field of smart home appliances and create a new generation of AI small home appliances with understanding, decision-making, and service capabilities so that home appliances can evolve from functional devices to home intelligent life partners, and jointly promote the innovative development of the AI home appliance industry, the two parties said.

Baidu's cooperation with Bear Electric Appliance Co Ltd is not the first case of an internet company joining hands with home appliance companies.

On Feb 12, JD.com officially signed a strategic agreement with Midea, Haier, Hisense and TCL, announcing a sales goal of 180 billion yuan.

According to the agreement, all parties will adhere to the principle of putting customers first, and continue to focus on the four core directions of service experience upgrading, product co-construction and innovation, channel deepening and expansion, and marketing operation coordination, jointly promoting the sales growth of many product categories such as televisions, air conditioning, refrigerators, washing machines, range hoods, stoves, water heaters, and small appliances, and achieving mutual benefit and win-win through resource integration.

The cooperation is not simply about supply and marketing collaboration, but based on years of cooperation, further deepening the collaboration of the entire industry chain. Among them, JD relies on nearly 30,000 JD Malls, JD Electric City Flagship Stores, and Home Appliance Specialty Stores nationwide to provide full channel coverage support from first-tier cities to counties, towns, and rural areas for the four major brands, helping them reach a wider range of consumer groups.

Gree also teamed up with JD, signing an agreement in 2015. In 2024, they had a new partnership, launching AI energy-saving products, including air conditioners, refrigerators, washing machines, water purifiers, heaters, and other new home appliances.

Zhang Jing, air conditioner purchaser of JD, said: "The cooperation between Gree and JD this time is not only a simple business alliance, but also a deep integration of innovation and service between the two industry giants. In the future, both parties will further deepen cooperation and provide consumers with more personalized products and services through cutting-edge technologies such as big data analysis and intelligent logistics."

Lu Qun, sales director of Gree, said: "The series of Gree household appliances products are positioned as healthy, intelligent, and personalized, and are important achievements of Gree's core development strategy of 'good appliances made by Gree'. Gree will deeply cooperate with JD and is committed to providing consumers with a more convenient and reassuring consumption experience."

Guo Tao, individual angel investor and an expert in AI, said: "Internet giants choosing to cooperate with home appliance companies is essentially driven by the two-way demand for technology implementation and scenario monetization."

"From the perspective of internet giants, AI technology requires physical scenarios to realize commercial value. Home appliances, as a high-frequency entry point for households, are an ideal scenario for the implementation of AI big models and internet of things technology," he said.

Furthermore, he said: "By equipping small appliances with 'intelligent brains', technologies such as voice interaction and personalized services can be transformed from concepts to daily experiences, which not only verifies the practicality of the technology, but also accumulates massive user behavior data to feed back model iteration."

At the same time, according to Guo, the home appliance market is large and close to the consumer end. Thus, "collaborating with home appliance companies can quickly transform technology into products, and seize the opportunity in the intelligent hardware ecosystem".

He also noted that traditional products are severely homogenized, and AI is the key to breaking through growth bottlenecks. The technological capabilities of large factories, Guo said, can help household appliance enterprises quickly achieve product upgrades, such as optimizing voice control accuracy through large models, automatically adjusting device parameters according to user habits, and enhancing product premiums and user stickiness.

"And the traffic and channel resources of large factories can also help home appliance companies connect production and sales links, reducing innovation costs," he added.

Expo spotlights key advances in consumer tech

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

Becoming an important window into the development of China's consumer electronics industry, this year's Appliance & Electronics World Expo 2026 in March was marked by the deep integration of artificial intelligence across the sector, officials and experts said.

Spanning an exhibition space of 170,000 square meters, the year's AWE displayed tens of thousands of cutting-edge technologies and smart lifestyle solutions to delegates.

"The exhibition offers a panoramic view of achievements made in areas including intelligent terminals, smart mobility, health technology, embodied intelligence, and computing infrastructure, showcasing the latest progress of high-quality development within China's home appliance and consumer electronics industry," said Tao Xiaonian, chairman of the China Household Electrical Appliances Association.

"Just like this year's theme 'Smart AI, Smarter Future' indicated, AI has deeply integrated across the industry. With AI, home appliances are capable of continuous upgrading in functional design, proactive services, multi-device scenario connectivity, and human-computer interaction," Tao said.

According to Tao, breakthroughs in innovative display technologies are blurring the boundaries between the digital world and reality.

For example, smartphones and smart glasses are rapidly emerging as the next generation of personal intelligent devices. Meanwhile, humanoid robots are moving toward commercial applications at an accelerated pace.

As an important part of the light industry, the home appliance sector has achieved impressive results, with retail sales of home appliances exceeding 1.1 trillion yuan ($159.92 billion) in 2025 and hitting a record high, according to Zhang Chonghe, president of the China National Light Industry Council.

"The penetration rate of digital tools in research, development and design has surpassed 85 percent, far above the average level of other industries, making the sector a benchmark for high-end, intelligent and green development in the light industry," Zhang said.

The event also saw the launch of a special committee on household service robots overseen by the China Household Electrical Appliances Association, marking a new phase in ecosystem development for companies across the industry chain.

"The committee addressed common challenges facing the industry, including repetitive data collection, inconsistent technological pathways, and a lack of standards," said Wan Chunhui, deputy secretary-general of the China Household Electrical Appliances Association.

According to Wan, more than 50 companies joined the committee's first batch of members, covering the entire household robotics industry chain, including home appliances, embodied intelligence, companion robots, AI models, AI motion control, chips, new materials, and batteries.

"Leading home appliance companies are taking the lead not only in developing household robot products tailored to specific home needs, but also in providing solutions that upgrade individual smart products into carriers of integrated intelligent services," Zhang said.

According to him, robots for specific scenarios — such as eldercare, cleaning, and companionship — are experiencing rapid growth.

"Producing 55 percent of the world's robots, China is currently the largest robot market globally. Last year, the country produced 18.58 million service robots, a year-on-year increase of 16.1 percent," Zhang said.

Under the central government's guidance of boosting domestic demand, the consumer electronics industry is entering a new phase of growth, as rapid development in the sector continues to blur the boundaries between online and offline consumption, said Yao Yao, head of research for JLL China.

"In Shanghai, the share of newly opened consumer electronics store space among lifestyle stores rose from 21 percent in 2023 to 26 percent in 2025. Leading brands are accelerating their expansion of brick-and-mortar stores, creating technology consumption channels such as immersive experiences and scenario-based marketing, reshaping the connection between consumers and tech products, and effectively boosting in-store consumption," Yao said.

Visitors try out Rokid AI glasses with built-in displays at AWE 2026 in Shanghai on March 13. CHEN LI / FOR CHINA DAILY

For the first time since its inception in 1992, the event set up two venues this year, putting its combined exhibition space at 170,000 square meters.

It consisted of a 140,000 sq m exhibition area at the Shanghai New International Expo Centre, and a newly launched 30,000 sq m space at Shanghai Eastern Hub International Business Cooperation Zone.

TRAVEL

Left: Rich wildlife on broad grasslands is among the highlights of traveling in Ethiopia. **Middle:** A golden sunset over Ethiopia's Omo Valley. **Right:** Dallol in the Danakil Depression is 116 meters below sea level, where the active Erta Ale Volcano creates a spectacular array of color when sulfur and other minerals mix with water.

Coffee culture in the cradle of humanity

From incense-laced ceremonies to ancient heritage, Ethiopia is inviting travelers to experience its traditions first-hand — beginning with a cup of Arabica in Chongqing, **Yang Feiyue** reports.

Ethiopia's coffee ceremonies, art, music, dance and food are available for visitors to immerse themselves in at the recently opened China-Ethiopia Cultural Tourism and Business Center in southwestern China's Chongqing.

Offering a taste of the African country before visitors even board a flight, the center marks a clear sign of Ethiopia's ambition to attract more Chinese travelers.

"When a Chinese individual participates in a genuine Ethiopian coffee ceremony in Chongqing, they don't just taste coffee; they experience a ritual of hospitality, community and tradition," says Tefera Derbew Yimam, ambassador of Ethiopia to China.

"This sparks curiosity, ignites the imagination, and creates a desire to experience the full, authentic version in its original setting."

As 2026 marks the China-Africa Year of People-to-People Exchanges, Ethiopia is positioning tourism as the bridge to turn diplomatic ties into lasting emotional connections with Chinese travelers.

"Tourism is the perfect vehicle because it transcends formal agreements, allowing for direct, immersive and personal engagement," Yimam says, while laying out a vision that goes beyond landmarks and itineraries.

"When Chinese travelers visit, they don't just see landmarks; they experience ancient history, traditional coffee ceremonies, natural wonders, and Ethiopian hospitality firsthand. These tangible experiences forge emotional connections, break down cultural barriers, and create lasting friendships," Yimam adds.

On the ground in Ethiopia, inbound tour operators catering to Chinese visitors have found steadily rebounding interest.

Wen Xin, sales manager of an Ethiopia-based agency serving Chinese travelers, says both the number of visitors and the scale of tour groups are gradually returning to pre-pandemic levels.

However, the shape of travel has shifted.

"Compared with before the COVID-19 pandemic, we are seeing a clear trend toward smaller groups, with the proportion of large tour groups declining," she says.

The primary demographic remains seasoned travelers, who have already visited many countries around the world.

Wen adds that a niche but growing segment consists of photography enthusiasts, particularly those drawn to Ethiopia's rich birdlife.

For Chinese travelers who do make the journey, the experience often leaves a strong impression, one that has less to do with ticking off landmarks and more to do with moments of unexpected stillness.

Sun Yang, a traveler who documented his Ethiopia trip on Weibo, recently spent a few days in Lalibela, home to the famed rock-hewn churches. He found not just ancient architecture, but also a chance to slow down in ways he had not realized he needed.

"It felt like walking from one state into another. The hotel grounds were dotted with cacti, the air carried a hint of vanilla, and stone steps were scattered with rose petals," he writes.

He is impressed by an elderly man playing the *masinko*, a traditional Ethiopian fiddle also known as a *masenqo*, while waitresses sang and laughed as they worked.

"I suddenly felt a little unaccustomed to this warmth. It was too direct, without any sense of distance."

Ethiopia has marketed itself as "The Land of Origins" — the cradle of humankind and the birthplace of coffee, which the ambassador says are not abstract concepts but experiences designed for contemporary Chinese travelers.

Above: Mursi women of Ethiopia's Omo Valley, where the ancient tradition of wearing lip plates continues to be passed down through generations. **Below left:** The celebration of Timkat is one heritage to Ethiopia and the world. PHOTOS PROVIDED TO CHINA DAILY

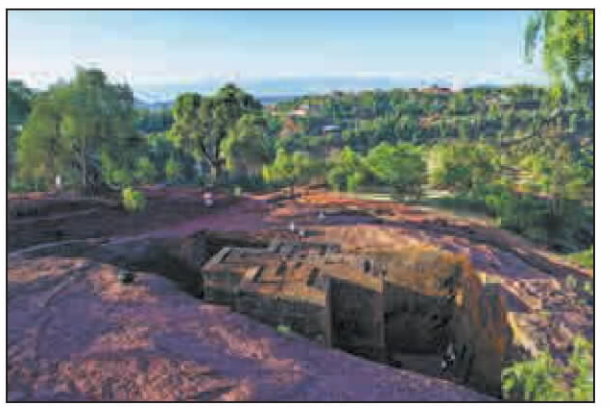
He points to the national museum in Addis Ababa, where visitors can stand before "Lucy", the 3.2-million-year-old hominid fossil. But the journey does not end there.

"We offer excursions to archaeological sites in the Omo Valley, where ancient traditions still thrive among indigenous communities, allowing visitors to glimpse lifestyles that echo our earliest ancestors," he says.

"It's about feeling the dust of time beneath your feet and recognizing our shared human journey."

For coffee lovers, Ethiopia has rolled out an immersive route into its southwestern highlands, the heartland of Arabica coffee. Travelers can walk through coffee forests, meet farmers, witness harvesting and processing, and participate in a traditional Ethiopian coffee ceremony, known locally as, *Buna Tetu* (come drink coffee).

"These experiences transform abstract concepts into delightful, aromatic, and cultural memories," Yimam says.



Sun had the chance to experience this tradition firsthand. One evening, a coffee ceremony was prepared for him. Frankincense was lit, and coffee beans were roasted, ground, and brewed before his eyes.

He was told that in Ethiopia, coffee is enjoyed in three rounds. As he sat watching the smoke rise, he found himself in an unfamiliar space.

"I suddenly realized I hadn't sat this 'slowly' in a very long time. No phone, no next plan, nothing that needed to be documented," he reflects.

Ethiopian Airlines is launching new domestic routes in 2026 to destinations including Negele Borana, Gore Metu, and Debre Markos.

According to the ambassador, this is a strategic move to diversify tourism offerings beyond the popular northern circuit while promoting sustainable travel.

Negele Borana, in Oromia, serves as a gateway to Bale Mountains National Park, where visitors can spot endemic wildlife such as the Ethiopian wolf and mountain nyala. Gore Metu offers immersion in rural Ethiopian life, with opportunities to engage with local farming communities and explore waterfalls and lush highland scenery. Debre Markos, in Amhara, is home to ancient monasteries and offers spectacular views of the Blue Nile Gorge.

Above: Tefera Derbew Yimam, ambassador of Ethiopia to China.

Left: The Church of Saint George in Lalibela, an entire place carved downward from a single block of stone, is a UNESCO World Heritage site that continues to inspire wonder and reflection.

"These new routes are a testament to our commitment to offering a richer, more varied, and truly unforgettable Ethiopian experience," the ambassador says.

To make Chinese tourists feel welcome, Ethiopia has rolled out concrete measures in recent years.

Yimam notes that training and certification programs are underway for local guides to become proficient in Mandarin, ensuring a growing pool of Chinese-speaking guides is available.

Major hotels, reputable tour operators, and larger souvenir shops in Addis Ababa and other key destinations have increasingly integrated WeChat Pay and Alipay, he says.

Workshops are also held for hotel and restaurant staff members to better understand Chinese customs, preferences and dietary requirements.

For Chinese families planning a trip, Yimam recommends applying for an e-visa in advance rather than relying on visa-on-arrival. "While visa-on-arrival is technically available, the e-visa process offers significantly more convenience, peace of mind, and a smoother entry experience, especially for families," he says, adding that visa-on-arrival can involve longer queues during peak travel periods.

On the connectivity front, Ethiopian Airlines already operates flights from Addis Ababa to several Chinese cities, including Beijing, Shanghai, Guangzhou (in Guangdong province), Chengdu (in Sichuan province) and Hong Kong.

The airline has submitted a request to authorities for additional flights on existing popular routes, and is actively exploring new direct routes from secondary and tertiary Chinese cities as part of a long-term growth strategy, Yimam says.

"Our goal is to solidify Addis Ababa's position as the leading aviation hub connecting China and Africa, making Ethiopia the natural first choice for Chinese travelers," he explains.

According to Wen, most Chinese travelers still lean toward more accessible experiences.

"Currently, most people in China have limited knowledge of Ethiopia's history and culture, so they tend to prefer quick, landmark-oriented sightseeing," she says.

"Many visitors take advantage of layovers in Addis Ababa to sample local cuisine and visit museums. The coffee ceremony is also quite popular," she shares.

Wen says her agency is open to exploring new destinations in the future, after conducting thorough research on each route beforehand.

"Much of Ethiopia's tourism resources remain not overly commercialized, and large areas still retain a relatively pristine and natural travel environment, making it an ideal destination to explore," Wen says.

When asked what single experience he hopes every Chinese visitor takes away, the ambassador recalls a memory rooted in everyday life.

"If I had to choose just one personal memory or place that I hope every Chinese visitor gets to experience for themselves, it would be witnessing a traditional Ethiopian coffee ceremony in a local home, particularly in the rural heartlands," he says.

Visitors can sit on low stools, take in the scent of roasting green coffee beans mingling with frankincense, the rhythmic sound of a pestle grinding beans, and anticipate the coffee brewing in the *jebena* — the traditional clay pot.

"More than that, it's the feeling of being welcomed, of sharing stories, of connecting with people across cultures without needing many words. It's a moment of pure, unadulterated Ethiopian hospitality and tradition."

He emphasizes that this experience, in his opinion, encapsulates the soul of Ethiopia.

"I truly hope every Chinese visitor gets to share in this beautiful, authentic tradition."

ICE HOCKEY

Bernie Parent (left) and Bobby Clarke of the Philadelphia Flyers carry the Stanley Cup off the ice in Buffalo in 1975 after defeating the Buffalo Sabres. AP

Dentists prove to be the real MVPs

Every squad has one, and these specialists join team doctors and other medical staff at every single NHL game

Jason Schepis was at home with his kids in New Jersey watching the gold medal men's hockey game at the Olympics when he saw some of his handiwork get scattered all over the ice late in the third period of a thriller.

Jack Hughes, the 24-year-old forward for the United States, had just taken a stick to the mouth from Canada's Sam Bennett and, as he explained later, saw at least one full tooth and shards of others lying on the ice.

Schepis knew those teeth, too. In fact, as the New Jersey Devils team dentist, he had repaired those very same chompers before, after Hughes took a high stick in the NHL playoffs a few years ago.

"We did the root canals, fixed it up," Schepis recalled. "Those were his teeth."

Hughes, like hockey players tend to do, shook off the injury, and he went on to score in overtime for a 2-1 win and America's first gold in men's hockey since 1980. His gap-toothed grin became the picture-perfect encapsulation of a sport where missing teeth is a badge of honor and "spittin' chiclets" is so ingrained in the lexicon that it's the name of a popular hockey podcast, not just the tooth-sized candy-coated chewing gum.

To say that hockey players need dentists is something of an understatement. Every team has one, and these specialists join team doctors and other medical staff at every single NHL game, ready to jump into action when the need arises.

"When there is an injury to the mouth, our physicians are like: 'Oh yeah, we're so happy you're here, because we would not have been able to do that,'" San Jose Sharks dentist Mark Nishimura said.

"Sometimes we're really not busy, and other times, when it's bad, it's bad."

It was bad when Nishimura was handed Joe Pavelski's teeth following a puck to the player's jaw during the 2019 playoffs, though that resulted in a goal. Later that year, Keith Yandle lost nine teeth, returned to the game and played 168 more in a row.

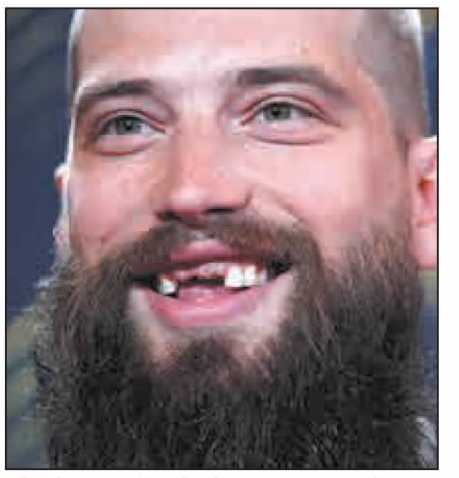
Brent Burns took a wayward stick to the face in 2013 that knocked out three of his pearly whites, and, since returning, he has skated in more than 1,000 games in a row. When a puck ramped off his own stick into his mouth in 2006, Chris Clark needed three hours of surgery involving braces, screws and a cadaver bone.

Rink-side surgery

Clark calls hockey dentists "triage doctors," learning about that from his own tooth-losing, palate-fracturing experience with the Washington Capitals.

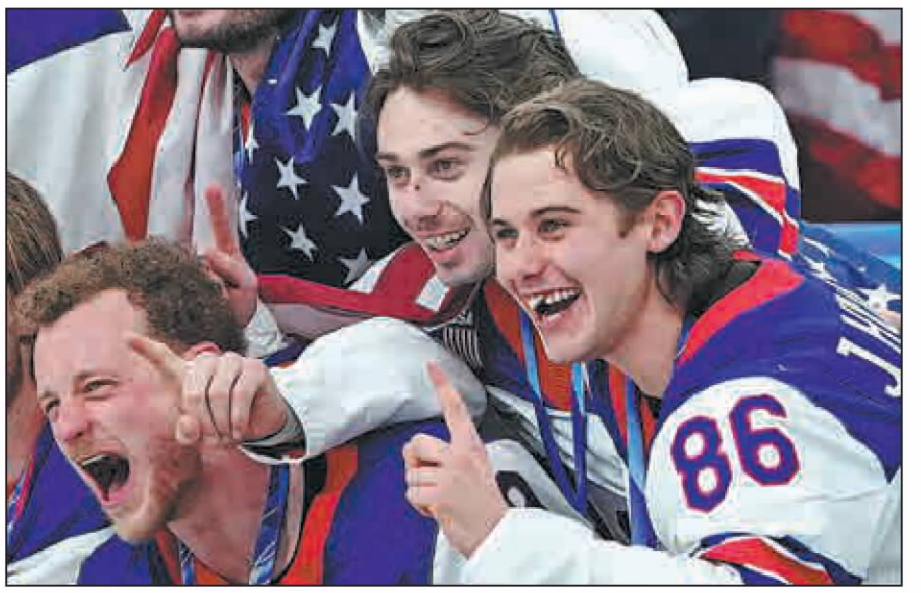
Longtime Capitals dentist Tom Lenz was there that game and has seen it all, including driving players to his office at night when time is of the essence.

Because a puck or a stick to the mouth almost always causes damage different than the general population, he got nervous in his early days more than two decades ago.



"You never know 'til you get back there, so you always have to be ready to just jump in and take care of it," Lenz said. "It can be a simple chipped tooth. It can be teeth knocked out. It can be jaw fractures. We try to get them stable, out of discomfort — whatever that takes."

That includes dealing with lacerations elsewhere on the faces of players, officials and even coaches. The home dentist, at least in the regular season, is responsible for the visiting team, too, and consults with the other doctors in the building, like when Schepis, in early 2024, ruled out Chicago's Connor Bedard because of a broken jaw.



The playoffs are different, so Schepis was there on the road when Hughes took a stick to the mouth from Jordan Staal in the series opener between the Devils and the Carolina Hurricanes in May 2023.

"They're snapped in half, the nerves are hanging out, the ice is cold (and) he can't breathe because the nerves are hanging," Schepis said. "Just numbed him right up, did the root canals right there, pulled the nerves out. The orthopedic surgeons think it's like miracle work."

AP

A different breed

When Alex Ovechkin took a stick to the mouth in October 2007 that knocked out one of his front teeth, Lenz put in an implant that's also known as a "flipper" with the plan to make a permanent fix once his career is over.

Lenz said Ovechkin wanted it immediately, then lost the implant and his smile without the tooth became part of his look, even if his mother did not approve.

Ovechkin is now league's leading career goal scorer and still playing at age 40.

"Had one made within a day or so because he was so adamant, saying 'I can't go around like this'," Lenz said. "It's so him now that it's going to be strange to see him with all his teeth up there."

Not Hughes, who told Jimmy Fallon that missing teeth definitely won't become his look long term. He has already been fixed up.

Now in his 14th full season in the league, Brenden Dillon wore a mouthguard playing as a kid because he needed braces three times from hockey-related incidents. After going without one with the minors, he got popped in the mouth in his first NHL fight and has worn one since.

"Not a fun part of (the game)," Dillon said. "I don't think (it happens as much in) basketball, football — maybe baseball, a ball here and there maybe — but way more in hockey. Sticks, pucks, the glass, ice — the whole nine yards. It feels like once a game, at least somebody's getting dinged up with something."

High pain tolerance

Schepis, Lenz and other NHL team dentists work in other sports. Lenz said many of the NBA players he works with have never had sutures before.

"Hockey players sometimes will even ask: 'How many is it going to be'?" Lenz said.

"If it's like two or three or so, a lot of the guys will just go: 'Then just suture it. No anesthetic, I don't want to take that. Just suture it and I want to get back out there'."

Nishimura remembers being asked: "Do you want to put these back in?" when Pavelski lost those teeth off a shot from Burns, his teammate at the time. The Sharks beat Vegas 5-2, and it became part of his courageous career.

"Pavs went back, we numbed him up, sutured him," Nishimura said. "He went back out and finished the game. It's incredible. Hockey players, they don't quit. They are a special breed of human beings."

Dillon, now with New Jersey, has had a couple of root canals, a couple of chipped teeth and realizes he should wear his mouthguard during practice, too. Lenz has noticed a decline in facial injuries since visors were made mandatory; only four players, grandfathered in, are skating without one.

Clark wore a visor sparingly in his playing days, but is glad to see the current generation widely adopt it, much like helmets becoming required equipment, because sticks and pucks to the mouth are such a regular occurrence.

"It's sort of part of the deal," Clark said.

So is having a hockey dentist on call. Schepis says he once did a root canal on Jaromir Jagr at 1 am and put in 30-plus sutures for another player when the puck caused damage all the way through his mouth.

"There's a lot of little nuances to sports dentistry compared to regular dentistry, because it's just not standard," Schepis said. "You have to move fast and you have to always move with the player's best intention. But we know they want to be out there. We know the team wants them out there. You always have to be available any time of night."

SOCCER

Artist Lili Cantero paints a soccer ball with images commemorating Spain's 2010 World Cup victory at Rodilla cafe in Miami's Wynwood Art District last month as part of the launch of the Wynwood United Soccer Ball Art Trail that will showcase hand-painted soccer balls honoring historic World Cup moments. AP

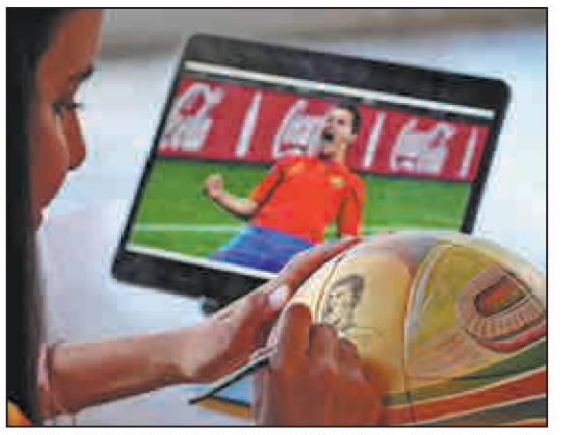
Re-creating the game, beautifully

Artist produces special soccer balls depicting historic World Cup moments to promote tournament

Lili Cantero thinks of soccer as family.

The artist from Paraguay — someone who has built a devoted following in the soccer world, with her work admired by Argentina captain and Inter Miami star Lionel Messi, among others — still has fond childhood memories of gathering with relatives around a radio to listen to matches almost every weekend.

"That's where my love for the game began," Cantero said. "For me, soccer, futbol, is being with family and being with friends. The game is not just a game. It's a culture. It's love. It is family. It is friendship."



And now, it is her work.

Leading up to the start of the FIFA World Cup in June, Cantero will be putting her specialty — painted soccer balls — in 10 different businesses in Miami's Wynwood Art District, a place where warehouses have been converted into galleries and where just about anything can be turned into a mural. It is the heartbeat of the Miami art community, and for Cantero and the marriage of her work and soccer, it seemed a perfect fit.

"I think it's the perfect combination in the perfect moment with the perfect people," said Cantero, who has called Miami home for about two-and-a-half years. "Messi coming to the city was ... an interesting way to grow this sport here, and in the country. Because many kids, they look at him with so many aspirations and dreams and everything, so they think they can play this sport and also to grow in this sport. And I think that's beautiful."

Cantero's approach is simple: she believes soccer, like art, can bring people of different races, different backgrounds, different languages — different everything — together. Her biggest break might have come in 2018, when a pair of soccer boots she designed — adorned by images of Messi and his family — were sent to the soccer legend. Messi posed with them and the image of that moment went viral, suddenly giving Cantero the game's official seal of approval.

Diego Maradona and Pele both knew of her work. Same goes for former Brazil forward Ronaldinho, FIFA president Gianni Infantino and Messi's former Barcelona and Inter Miami teammate Jordi Alba, among many others.

Artist Lili Cantero paints a soccer ball with an image of David Villa to commemorate Spain's 2010 World Cup victory. AP

> "I feel honored to be known for this art and what I do. I think art and soccer have the power to change the world. It changed my life, so I can tell that it's true."
>
> **Lili Cantero,** an artist from Paraguay

The first of the Wynwood series of ball displays was unveiled last month when she revealed one depicting how Spain won the 2010 World Cup.

"I feel honored to be known for this art and what I do," Cantero said.

"I think art and soccer have the power to change the world. It changed my life, so I can tell that it's true. And when you go to the favelas (impoverished Brazilian neighborhoods) and you see, like, the kids playing, thinking the only way that they could do something in life is through soccer, that's art for me."

Wynwood is always bustling; art and fashion dominate the area, and there is no shortage of people working hard to ensure everything stays vibrant.

The World Cup will bring tens of thousands of people to south Florida, and Wynwood wants them to know they're all welcome in the art district.

"We're always promoting the arts, we're always changing the art in the neighborhood, the murals," David Lombardi, the chairman of the Wynwood Business Improvement District, said at the unveiling of Cantero's first ball in the series.

"It's vibrant, it's changing, it's alive, and people want to be a part of it."

Cantero never played the game, but is addicted to it.

She showed up for her first unveiling in a Spain jersey — mindful, yes, of how that nation ousted Paraguay, her homeland, on the way to that title.

Some soccer balls take Cantero days to paint. Others take her just a couple of hours. At the unveiling of the project, she even did some live work — setting up a tablet to her left, looking at an image of Spain star David Villa celebrating a goal during that 2010 World Cup.

With deft flicks of her right hand, she added that image of Villa, bit by bit, to the back of the ball, oblivious to the crowd that had gathered around to watch her.

Every soccer ball she's designing in this series will depict another World Cup moment.

"I grew up in Paraguay, and everyone tells me you cannot make a living with art. And now, I'm doing this, far away from my country, representing who I am and my roots," Cantero said. "It's been an honor."

XI'S VISION | YOUTH DEVELOPMENT

Xi encourages youths to play greater role

He praises role models' dedication to grassroots, calls for new achievements

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

On a summer day back in 1984, Xi Jinping, then Party secretary of Zhengding county in Hebei province, hopped on his bicycle to make a special visit — to greet a group of students visiting from Renmin University of China in Beijing for a field study.

Inside a dormitory room of the county's guesthouse, Xi sat down with the young students shoulder to shoulder on beds, sharing his insights and experiences from working at the grassroots level. The discussion was very engaging and lasted for two hours.

Youths have always been a central concern for Xi. Engaging deeply with young people, he emphasizes the importance of "integrating with the youth" and "becoming one with them".

From his early years at the local level to the present day as China's top leader, Xi has maintained a consistent and close bond with young people through various means, including exchanges of letters and face-to-face interactions.

In particular, he makes it a regular practice to engage with young people around Youth Day, celebrated on May 4. Around this time each year, he visits college campuses, attends youth gatherings or writes back to young students to extend his greetings.

He has consistently highlighted the crucial role of young people, showing unwavering care and support for the younger generation. He continually offers them encouragement and inspiration, while maintaining high expectations for their growth and contributions.

Ahead of this year's Youth Day, which fell on Monday, Xi wrote a reply letter to a group of young role models, commending their dedication in grassroots positions in areas such as sci-tech innovation, rural vitalization, social services and border defense. He also encouraged young Chinese to integrate their personal aspirations into the bigger picture of national development, strive for new achievements in their posts and inject their youthful dynamism into advancing the nation's new journey of development.

This call has been answered by a vast number of young people across the country over the years. Among them is Wang Xuemeng, a young forestry technician at the Saihanba forest farm in Hebei.

After graduating from university in 2018, Wang chose to follow in the footsteps of her grandfather and father to become a forester at Saihanba. Like them, she has woven her youth and ideals into the nation's ecological endeavors.

More than six decades ago, 369 young pioneers, including Wang's grandfather, with an average age below 24, arrived on the barren, windswept plateau with a critical mission: to build an artificial forest farm to halt the southward advance of the Hunshandake sandy land, which posed a persistent threat to Beijing and other northern cities.

Thanks to sustained efforts by generations of foresters, Saihanba has been transformed from a wasteland to a sea of forests — an achievement hailed by Xi as a "miracle". Today, a third generation is carrying this legacy forward.

Wang said that while earlier generations focused on helping the trees survive and thrive, the task of her generation is to protect the forest farm while enhancing its value as an ecological resource.

"Our strength in the three-generation relay stems from the same original aspiration: to safeguard the ecological shield for our nation," Wang said. "For over six decades, generations of foresters have all integrated their personal ideals into the broader mission of China's ecological progress."

President's speech on basic research hailed

President Xi Jinping has delivered an important speech in Shanghai at a symposium on strengthening basic research.

Xi, also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, stressed in the speech on Thursday that greater efforts and more concrete measures should be taken to strengthen basic research, enhance China's capacity for original innovation, and further solidify the foundation for building the country's strength in science and technology.

Some of those who attended shared their views with Xinhua News Agency on the implementation of the guiding principles of the symposium.

They said that Xi's important remarks provided a clear direction for achieving high-level self-reliance in science and technology, and for building China's strength in science and technology. They vowed to take pragmatic steps to strengthen basic research, enhance original innovation and boldly pursue new scientific heights.

Ding Kuiling, president of Shanghai Jiao Tong University and an academician of the Chinese Academy of Sciences, said that Xi's remarks have boosted confidence and motivation for advancing basic research.

"We will focus on the country's major strategic needs, grasp the latest trends in basic research, promote the transformation of research paradigms, implement the plan for breakthroughs in basic and interdisciplinary research, and integrate independent sci-tech innovation and talent training with the strengthening of basic research," Ding said.

Calling Xi's remarks a "mobilization order" for strengthening basic research, Liu Chenli, president of the Shenzhen Institutes of Advanced Technology of the CAS, said that China has entered a stage of development in which it must pursue breakthroughs at the source and explore paths in uncharted territory.

"Only by mastering the capabilities to make breakthroughs in basic research can we truly hold the initiative in competition and development," he said.

The symposium holds great significance, as this year marks the start of the country's 15th Five-Year Plan (2026-30).

Zhang Xi, president of Jilin University and a CAS academician, noted that through successive five-year plans, China has made considerable progress in basic research with remarkable original achievements, and has cultivated a large pool of outstanding young talent dedicated to the field.

"After the symposium, I will lead my colleagues and students to continue strengthening research on new materials to provide sci-tech support for promoting high-quality development," Zhang said.

Huang Sanwen, president of the Chinese Academy of Agricultural Sciences and a CAS academician, said that basic agricultural research serves as the "master switch" that generates source technologies and guides the development of the agricultural industry.

"Only by deeply understanding the life cycles of plants, animals and microorganisms can we efficiently cultivate new varieties, discover new methods for pest and disease control, and expand the applications of agricultural products," Huang said.

Tan Zhemin, president of Nanjing University and a CAS academician, said that once a breakthrough is achieved in basic research, it opens up entirely new frontiers of understanding, drives transformative technological innovation, and profoundly reshapes the way people live and work.

Wang Xiaoyun, chief engineer at China Mobile and an academician of the Chinese Academy of Engineering, said she was deeply impressed by Xi's emphasis on promoting the deep integration of industry, academia, research and application led by enterprises, as well as on smoothing the innovation chain spanning basic research, application development and commercialization of achievements.

She pledged to strengthen market-oriented applied basic research, take application needs as the fundamental starting point, pursue interdisciplinary integration and cross-sector innovation as major breakthrough drivers, and consolidate industry-academia-research collaboration as an essential underpinning.

Privately backed nuclear plant a crucial milestone

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

The operation of Unit 1 at the San'ao Nuclear Power Plant in Zhejiang province represents a watershed moment for China's energy sector, as the unprecedented inclusion of private capital in national nuclear infrastructure is seen as providing a critical clean energy boost for the Yangtze River Delta's accelerating shift toward an AI-driven and digital economy.

Managed by China General Nuclear Power Group, or CGN, the country's first privately backed nuclear power project and the region's first Hualong One unit officially began generating electricity last week.

The milestone unit is expected to generate over 9 billion kilowatt-hours of electricity annually, meeting the daily production and residential power demands of more than 1 million residents, while supplying the zero-carbon baseload power required to sustain energy-intensive data centers, the company said.

The San'ao project marks a historic milestone for China's energy sector, as it breaks the traditional model of exclusive State investment in nuclear power, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Nuclear power requires massive upfront capital and features a long investment cycle. By bringing in private enterprises, the project proves that mixed-ownership models can inject new financial vitality and operational efficiency into national strategic infrastructure, while allowing private capital to share in the long-term dividends of the country's green transition, he said.

GIG ECONOMY, DIGITAL PLATFORMS TEAMING UP TO RESHAPE WORK

Transformation driven not by traditional corporate hiring, but by millions of young users experimenting with flexible, task-based employment models

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

The country's young people are rewriting the rules of work — turning hobbies, side gigs and digital platforms into viable careers, and in the process are reshaping the labor market from the ground up.

A decade ago, a chance encounter quietly set Lane Lu on that path. Newly married and looking for extra income, the resident of Wenzhou, Zhejiang province, stumbled across repair-service listings on Xianyu, the country's leading secondhand marketplace.

Lu posted a listing on an impulse. What followed surprised him.

"I never expected so many people would reach out," he recalled. "Not just from my city, but from all over the country — there was even someone from South Korea."

The barriers were minimal — no deposits, no storefront, just a smartphone and a willingness to try. Lu, who had always enjoyed tinkering with gadgets, took what felt like a small, almost naive step into a niche that would ultimately generate more than 200,000 yuan ($29,280) a year.

Residents of Wang Fuk Court return to their homes to collect their belongings on Monday, the last day of the first round of homecoming, after a deadly fire last year. EDMOND TANG / CHINA DAILY

Citywide efforts ease retrieval of Wang Fuk Court belongings

First round of collections concludes, authorities continue to help residents

By ATLAS SHAO in Hong Kong
atlasshao@chinadailyhk.com

The first round of belongings collection efforts by residents of Wang Fuk Court in Tai Po concluded on Monday, with more than 6,000 people briefly returning to their fire-damaged homes.

The 15-day operation, which began on April 20, granted residents of the seven fire-hit buildings a three-hour window to return to their homes and retrieve their remaining belongings. Residents of the only building spared from the fire, Wang Chi House, were given a 90-minute opportunity in December to go back to their apartments.

The government said on Monday night that a total of 6,265 people from 1,674 households went for the retrieval, and the process was smooth and in order.

Many brought back photo albums, paintings, necklaces and other items with financial and emotional worth.

A cross-sector support campaign has been mobilized by city authorities and community-level workers, offering timely relief to displaced residents, including assistance from police, district care teams, volunteers, on-site social workers and psychologists, as well as volunteer drivers.

> "A household moved over 100 bags of items, and the care teams helped them transport these items till after 8 pm. Many residents have responded that volunteers and the various departments helped them a lot during the process."
>
> **Lo Hiu-fung,** district councilor of Tai Po district

Among the initiatives is a facility named "Wang Fuk living room". Operated by the nonprofit organization AidVengers Federation, it was launched to support displaced residents with services such as traditional Chinese medicine treatment, free Cantonese-style soups and drinks, as well as various recreational activities.

On Monday, a 74-year-old Wang Fuk Court resident surnamed Wong could be seen chatting animatedly with a volunteer at the living room initiative.

Wong, who relocated to the suburb of Kai Tak, told China Daily that the facility has provided helpful services. As he still buys food in Tai Po, he comes to the living room from time to time to chat with neighbors and join activities.

Reflecting on his visit to fire-ravaged homes, Wong said volunteers provided a lot of help in communicating with the government to provide a more suitable time slot for him.

"I'd taken over 10 bags of items downstairs on that day, and the Civil Aid Service and a senior-level police officer had helped me a lot with moving them," he said.

Yip, a 20-year-old volunteer working at the living room initiative, was chatting with Wong. "I started to provide help soon after the outbreak of the fire and have continued till now," he said.

Rody Choi Cheuk-hin, chairman of the AidVengers Federation, said, "All items at the living room initiative are supported by kind people, organizations, volunteers and neighbors."

Lo Hiu-fung, a district councilor of Tai Po district, highlighted the dedicated citywide efforts implemented during the operation's planning phase.

Government departments provided flexible, dedicated arrangements during the process, Lo said.

District Services and Community Care Teams, for example, helped to distribute supplies and transport items, and assisted residents in registering for the collection operation.

"One time, a household moved over 100 bags of items, and the care teams helped them transport these items till after 8 pm. Many residents have responded that volunteers and the various departments helped them a lot during the process," Lo added.

The Hong Kong Special Administrative Region government announced on Monday that the property owners and residents of Wang Fuk Court will be exempted from the final tax payable for the year of assessment 2025-26 in order to ease their financial burden.

Authorities also said they will arrange a second round for the collection of belongings by residents, starting with Wang Chi House in mid-May.

'Star of Pakistan' honoree leverages AI to aid patients

By LI YINGQING and **YAN YUJIE** in Kunming

Chinese surgeon Pan Xiangbin, recently honored with Pakistan's "Star of Pakistan", aims to further leverage advanced technologies such as artificial intelligence to extend life-saving care to more patients worldwide.

Pakistani President Asif Ali Zardari presented Pan with the award in Changsha, Hunan province, on April 26, in recognition of his cross-border work providing heart surgeries for children.

Pan dedicated the honor to his team, describing it as a reflection of the 75th anniversary of diplomatic ties between China and Pakistan.

According to Qassim Naveed Qamar, an official of the Sindh provincial government in Pakistan, Pan has become a well-known figure in Pakistan, given his ability to perform the complex procedures he specializes in.

In January 2025, Pan, a deputy director of China's National Center for Cardiovascular Diseases, led a team to Pakistan to treat children with congenital heart disease. They performed a series of free surgeries, with patients recovering well.

One of the patients, Afrah Amir, described the doctors as "angels from a distant land" who gave her a chance at a better future.

"For my daughter and me, no friend has ever been as supportive in our time of need as the Chinese doctors," the girl's mother said. "They are truly our friends."

The positive outcomes were made possible by a minimally invasive technique developed by Pan's team, known as the percutaneous and non-fluoroscopic procedure. Using ultrasound imaging instead of traditional X-ray guidance, the method allows doctors to treat heart conditions through blood vessels without open-heart surgery, while avoiding radiation exposure for both patients and medical personnel.

First included in a United Nations project in 2023 to improve access to cardiovascular treatment in developing countries, the procedure has since been adopted by more than 1,000 hospitals across over 60 countries, benefiting more than 200,000 patients.

Pan said China's medical assistance goes beyond sending doctors abroad.

"Our surgical vehicles can reach remote villages, bringing cardiac procedures directly to patients' doorsteps," he said. "More importantly, we are willing to share these technologies with local doctors so they can treat even more people."

During their time in Pakistan, his team also trained around 200 local medical workers.

Now, Pan is looking to push those efforts further by integrating AI and robotics.

In April, using a domestically developed surgical robot system, his team in France carried out a fully ultrasound-guided, robot-assisted mitral valve repair on a patient thousands of kilometers away — marking a new step in remote, high-precision cardiac care.

"We will use AI and other advanced technologies to improve efficiency and save more lives," Pan said.

China's medical outreach, he added, is also evolving in another direction — bringing patients to China for treatment.

At Fuwai Yunnan Hospital of the Chinese Academy of Medical Sciences in Kunming, where Pan serves as executive director, children from neighboring countries have received life-saving surgeries as part of international programs such as the China-Cambodia "Love Heart Journey".

According to Chea Munyrith, president of the Cambodian Chinese Evolution Researcher Association, many young patients treated there return home sharing their experiences, helping more families learn about available care — and in some cases even inspiring them to begin learning Chinese.

Pan said the hospital's growing regional role reflects the progress of China's medical system, which now not only serves domestic needs but is increasingly able to compete internationally and support other countries.

Youth: Younger generation a bridge for intl friendship

From page 1

Such commitment is widespread among China's young people today. Beyond the story of Saihanba, it is reflected in various forms — from young scientists at the forefront of national research and athletes competing on the world stage, to volunteers teaching in less-developed western regions and university graduates driving rural vitalization in their hometowns.

Zhang Jun, secretary of the Shanxi Provincial Committee of the Communist Youth League of China, noted that more than 15,000 university graduates from the province have joined the national Go West volunteer service program. Zhang encouraged more young volunteers to step up and play a part in serving the western regions and working at the grassroots level.

Pledging further guidance and support, Zhang said Shanxi will create more opportunities, improve the recruitment and training process, and enhance job matching, so that more aspiring young people can gain experience, realize their potential, and contribute their youthful energy to advancing Chinese modernization.

According to an article in China Population News, people age 14 to 35 accounted for about 26 percent of China's total population in 2025, and their number is projected to remain at approximately 350 million by 2030 and stay above 210 million even by 2050.

The article noted that China is poised to maintain a sizable youth population for the foreseeable future, and this dynamic demographic profile will, in turn, provide favorable conditions for sustained and healthy socioeconomic development.

For President Xi, this dynamic generation is not only a vital force driving national progress, but also a bridge for international friendship and an envoy for people-to-people exchanges.

This vision is being translated into action through a series of concrete initiatives. In 2023, Xi announced a plan to invite 50,000 young people from the United States to China for exchange and study programs over the following five years, and more than 40,000 young people from the US have participated so far, opening a window for them to understand the real China and building a bridge to carry forward the friendship between the two peoples.

In 2025, China and Vietnam co-launched the Red Study Tour program, through which Vietnamese youths will visit China to trace the historical footsteps of the two countries' revolutionary forebears and strengthen the bonds of friendship. Furthermore, China has established Luban Workshops in numerous countries, including many in Africa, providing vocational skills training and creating sustained platforms for practical exchanges and cooperation among young people.

In January 2024, Xi replied to a letter from representatives of Kenyan students and alumni at Beijing Jiaotong University. Jamlick Mwangi Kariuki was one of the writers.

Xi places great importance on Africa's youths, creating many opportunities for them to grow and contribute more to their nation's development and China-Africa friendship, Kariuki told Xinhua News Agency.

After completing his undergraduate studies in China, Kariuki returned to work on the Mombasa-Nairobi Railway, a flagship project under the Belt and Road Initiative in Kenya. He later returned to China for postgraduate studies.

Kariuki also encouraged more Kenyan youths to study in China, emphasizing the critical importance of cultivating professionals with an international perspective for Kenya's development.

Yang Dian, a researcher at the Chinese Academy of Social Sciences' Institute of Sociology, was quoted by China Youth Daily as saying that it is crucial to expand platforms for international youth exchanges and cooperation.

He said that global public goods, such as the Belt and Road Initiative and the Global Development Initiative, have provided young Chinese people with opportunities to engage on the world stage. Through these platforms, he said, young people can enhance mutual understanding, build friendships and grow together via mutual learning.

Yang also called for leveraging such cooperation frameworks to increase exchange programs, which he said will help foster a global perspective and strengthen the younger generation's cross-cultural communication skills.

Zhu Xingxin in Taiyuan contributed to this story.

Nuclear: Project to provide massive green energy support

From page 1

As the region accelerates its shift toward an artificial intelligence-driven and digital economy, intermittent renewables like wind and solar alone cannot sustain the immense, 24/7 power requirements of massive data centers, experts have said.

The San'ao project provides the critical, zero-carbon baseload power required to keep China's premier tech hub running smoothly without compromising the nation's dual-carbon goals, according to Lin.

Xing Yiteng, deputy director-general of the department of development and planning at the National Energy Administration, said that energy investment maintained robust growth in the first quarter of this year.

Furthermore, private enterprises deepened participation in key national energy research initiatives during the first three months of the year, he said.

According to CGN, since the inception of the mega-project, the company has collaborated with approximately 2,000 private enterprises, achieving multiple breakthroughs in independent core technology, intelligent engineering construction and innovative financing models.

Geely Technology Group holds a 2 percent stake in the project, setting a benchmark for the participation of private capital in major national energy infrastructure.

In addition, the project has localized 24 key pieces of core equipment for the first time, including the main steam relief control valves and nuclear-grade pressure and temperature switches, showcasing the robust competitiveness of China's entire nuclear power industry chain.

As global energy landscapes shift and the demand for AI computing power undergoes explosive growth, the Yangtze River Delta requires massive, uninterrupted energy support.

"The region has the nation's most vigorous demand for computing power and the most complete industrial supply chain, creating an urgent, sustained need for stable, clean and efficient baseload electricity," said Lin.

Once all six units in the San'ao project are fully operational, their combined annual power generation capacity is expected to exceed 54 billion kWh. This output is equivalent to reducing standard coal consumption by over 16.35 million metric tons and cutting carbon dioxide emissions by nearly 50 million tons annually, according to CGN.

Gig: Used goods hot on Xianyu portal

From page 1

Today, Lu splits his time between two worlds. By day, he works as a consultant at an elderly health service institution. By night — and often into the wee hours — he repairs home appliances, troubleshoots electronics and installs electric vehicle charging equipment.

The turning point came in 2019. His own Philips electric toothbrush, worth more than 1,000 yuan, broke down. Instead of replacing it, he took it apart — and realized the fix was straightforward. That moment reframed his approach. He formally listed small-appliance repair as a service on Xianyu.

"Everything broken at home comes to me," he said. "During busy days it's normal for me to work until 2 am."

For Lu, the work is about more than income. He sees it as a quiet countercurrent to disposable consumption — extending the life of devices that might otherwise be discarded. A water flosser that costs just a few dozen yuan to repair, he noted, can be made to last for years.

"Every time I repair something, the sense of accomplishment is incredibly real."

The side business has also reshaped how his family views his career. His parents, who once favored the stability of a traditional job, have come around. "My dad thinks it's great. He says I've finally found a way to show my value," Lu said.

Lu's trajectory is increasingly mirroring a broader structural shift, as digital platforms blur the boundaries between hobby, freelance work and entrepreneurship — and redraw the contours of the modern labor market.

A recent report by the China New Employment Research Center examining emerging career trends said the country's youth are moving away from the pursuit of stable, long-term jobs toward a more fluid model of "multiple roles and identities". Instead of a single career trajectory, younger workers are assembling portfolios of income streams — part freelancer, part creator, part entrepreneur.

Shoppers examine items on display at a Xianyu store in Nanjing, Jiangsu province. FANG DONGXU / FOR CHINA DAILY

This shift is occurring against the backdrop of the rapidly expanding platform economy, which has absorbed more than 200 million flexible workers in recent years, according to official data. Platforms such as Xianyu are increasingly functioning as innovation ecosystems. They incubate new forms of employment and serve as a testing ground for emerging technologies and business models, said the report.

As spending patterns move from pure material acquisition toward experiences and personal growth, new categories of digital services have emerged. The report identifies three fast-growing segments on Xianyu — personal development, emotional companionship and skill monetization. Orders across these categories are expanding at annual rates exceeding 100 percent.

The so-called "emotional economy" is among the fastest-growing. Orders for emotional companionship services — including consultation, praise sessions and personality analysis — rose more than 107 percent last year. Sellers are increasingly positioning themselves as therapists, coaches or advisers, monetizing empathy and communication skills in ways that would have been difficult to scale in traditional offline settings.

At the same time, skill-based services are proliferating. In 2025, nearly 19.6 million sellers offered services ranging from photography and design to tutoring and home renovation on Xianyu. Generation Z accounted for about 41 percent of those sellers, while millennials contribute roughly a third — underscoring the platform's central role in youth employment, said the report.

Income levels remain modest on average, with active side-hustle participants earning around 4,317 yuan annually. Yet the aggregate impact is significant, particularly as a supplementary income source. More importantly, the data suggest that these activities are not merely casual experiments. A survey of over 1,200 platform users shows that more than 40 percent derive at least 30 percent of their monthly income from side gigs, while roughly 30 percent spend upward of 30 hours a week on platform-related work — effectively treating it as a second job.

The implications for China's labor market are substantial. Nearly 80 percent of surveyed users say they plan to develop their platform-based activities into long-term ventures, according to the survey.

Platforms such as Xianyu are also emerging as alternative training grounds, where users refine skills, test business ideas and build customer networks before committing to larger-scale ventures. The report recommends that universities and policymakers recognize this shift by incorporating verified side-hustle experience into academic credits or professional evaluations, effectively legitimizing digital labor as a formal component of career development.

The scale of participation is striking. According to platform data, more than 8 million female users on Xianyu now earn over 10,000 yuan per month. On average, female users posted 16 listings each last year, with strong activity in categories such as collectibles, rental services, artificial intelligence tools and home renovation.

Women, in particular, are playing a major role in shaping the platform's evolution. Many are leveraging interest-based communities to identify niche markets and build loyal customer bases. Some focus on reselling collectibles, while others provide specialized services ranging from AI customization to interior design.

The growing services highlight a broader redefinition of value creation in the country's digital economy. Skills that were once considered peripheral — emotional intelligence, community-building and niche expertise — are becoming monetizable assets.

Whether through selling discounted movie tickets, organizing group purchases or launching entirely new service categories, users are steadily pushing the boundaries of what digital marketplaces can offer.

Linda Liu, a frequent user of Xianyu, bought a sought-after concert ticket at a premium on the platform in March. "When the ticket arrived, it turned out to be a great seat, and the seller even packaged it with a thoughtful kit," she said. "It felt like we valued the same thing. It was definitely worth it."

'One-person companies' taking economy by storm

By **WANG ZHUOQIONG**

China's startup landscape is being reshaped by a fast-growing class of businesses powered not by teams, but by individuals armed with artificial intelligence.

Known as "one-person companies", or OPCs, these ventures are emerging as a defining feature of the country's digital economy, prompting local governments to rethink how entrepreneurship is supported and scaled.

The numbers underscore the shift. As of mid-2025, China had more than 16 million one-person limited liability companies, said a report by the Zhongguancun Talent Association.

In the first half alone, 2.86 million new OPCs were registered, up 47 percent year-on-year and accounting for nearly a quarter of all new businesses. The surge reflects how AI tools — from code generators to content engines — are dramatically lowering the cost of starting and running a company.

Hangzhou, Zhejiang province, is positioning itself at the forefront of the trend. The eastern tech hub recently moved to formalize the model, with Shangcheng district unveiling one of the country's first policy frameworks aimed specifically at OPC development.

The district's new measures, released in early March, lay out a blueprint for building AI-focused OPC communities, offering everything from subsidized office space to computing resources and funding support.

Hangzhou's push reflects broader ambitions to cement its status as a national center for AI innovation. As the core district of the provincial capital, Shangcheng has been cultivating what they describe as a "tropical rain forest" innovation ecosystem — a dense network of startups, capital and infrastructure designed to accelerate emerging industries.

"We will allocate no less than 100 million yuan ($14.65 million) annually to support OPCs in growing from creative individuals into 'one-person unicorns'," said Chen Gang, a senior official in the district's technology, economic and information bureau.

> "We will allocate no less than 100 million yuan ($14.65 million) annually to support OPCs in growing from creative individuals into 'one-person unicorns'."
>
> **Chen Gang,** an official from Shangcheng district's technology, economic and information bureau in Hangzhou

The policy framework is structured around the full life cycle of OPC development.

Early-stage founders will gain access to move-in-ready workspaces, streamlined administrative services and living support.

As ventures scale, the focus shifts to mentoring, resource matching and scenario-based testing opportunities. More mature companies will be guided toward financing channels and integration into industrial supply chains.

Infrastructure is a central pillar of the plan. Shangcheng will provide more than 20,000 square meters of low-cost office space near key hubs, with subsidized workstations available for up to three years. The district is also building a unified AI services platform, bundling models, computing power and development tools into a membership system.

Financial backing is being scaled up in parallel. A dedicated OPC fund with a target size of 1 billion yuan will focus on early-stage and hard-tech projects, while urban scenarios — spanning consumption, tourism and public services — will serve as testing grounds for new applications. The district is also introducing a talent evaluation system that will annually identify top OPC founders and award up to 200,000 yuan in incentives.

By 2026, Shangcheng aims to establish 10 OPC communities, incubate 100 AI enterprises and attract 1,000 founders.

The local push mirrors similar efforts elsewhere in China. In Beijing, Zhongguancun-based initiatives are exploring "AI OPC-friendly communities" by integrating resources from universities and alumni networks. Shenzhen, Guangdong province, has set targets to build more than 10 OPC communities by 2027, each designed to create concentrated clusters of AI-driven startups.

Industry participants said the model is already reshaping how companies scale.

At Honghub, a Hangzhou-based OPC community, more than 1,300 projects have applied since its launch in late 2025, with a select group of startups now operating within the network. Some have expanded from single founders to teams of dozens, while others generate tens of millions of yuan in revenue with just a handful of employees.

Even so, structural challenges remain. The country's financial and regulatory systems are still geared toward traditional enterprises, leaving OPCs with limited access to tailored credit evaluation and financing channels.

Asset-light founders often struggle to secure loans without collateral, while the model itself raises questions about how companies sustain growth and retain talent as they expand.

Despite these hurdles, policymakers and investors are betting that OPCs will become a core component of the AI economy.

Standoff deepens in Hormuz

US denies claim Iran struck military vessel after announcing 'guiding' plan

By CUI HAIPEI in Dubai, UAE
cuihaipei@chinadaily.com.cn

A United States Navy vessel reportedly came under Iranian missile fire near the Strait of Hormuz on Monday after it ignored warnings to halt, but the US military denied that any warship had been struck.

Iran's semiofficial Fars News Agency reported that two missiles targeted the US frigate as it sailed near Iran's Jask Port and attempted to navigate the strait. The outlet added the vessel failed to continue its voyage and was forced to withdraw from the waters.

The reported attack came hours after Washington unveiled a new operation to guide stranded commercial ships through the strait, following Tehran's warning against the US military approach or entry into the waterway.

"We have told these countries that we will guide their ships safely out of these restricted waterways, so that they can freely and ably get on with their business," US President Donald Trump said on Sunday.

Operations would begin on Monday, he said, threatening that any Iranian interference would trigger a forceful US response.

Self-service kiosks stand idle at a Spirit Airlines check-in area at Fort Lauderdale-Hollywood International Airport in Florida on Sunday after the US carrier halted operations, citing surging fuel costs. CRISTOBAL HERRERA-ULASHKEVICH / EPA

US media outlets The Wall Street Journal, CNN and Axios highlighted Trump's chosen word of "guide" rather than "escort" to describe how the so-called Project Freedom will work, though Trump gave few details. Axios quoted a US official as saying that US Navy ships will be "in the vicinity" to prevent Iranian attacks on the commercial ships.

In response, Iran said all maritime passage through the strait must be coordinated with its military.

"We warn that any foreign armed force — particularly the aggressive US military — will be targeted and attacked if it attempts to approach or enter the Strait of Hormuz," Ali Abdollahi, chief commander of Iran's Khatam al-Anbiya Central Headquarters, told state broadcaster IRIB.

Iran has enforced tight control over the strait since the war began on Feb 28, disrupting global oil, gas and fertilizer supplies, while the US has maintained a parallel naval blockade on Iranian ports.

Stranded ships

According to maritime intelligence firm AXSMarine, more than 900 commercial vessels were stranded in the Persian Gulf as of April 29, down from over 1,100 recorded when the conflict started.

US Central Command said it would support the effort with 15,000 military personnel, more than 100 land and sea-based aircraft, along with warships and drones.

The vital waterway has remained largely blocked since late February, cutting off the transit of 20 percent of the world's oil and gas and fueling a steep rally in global energy prices. A ceasefire took effect on April 8, and one round of direct US-Iran peace talks has since been held in Islamabad, Pakistan, yet both sides remained deadlocked over core demands.

Global equity markets edged higher on Monday, while crude oil prices were little moved, having surged back above $100 a barrel last week.

Raman Kapoor, an oil tanker captain whose vessel is stranded in the Gulf, told Al Jazeera that no ships were likely to attempt crossing the Strait of Hormuz under current conditions.

"No ships would want to show their courage and pass through the strait unless it is officially declared safe to transit," he said, adding that while his vessel was able to restock in fuel, food and water, other commercial ships were not able to.

Meanwhile, Iranian state media said Washington had delivered its response to Tehran's 14-point proposal via Pakistan, and that Iran was reviewing it. There was no immediate confirmation from Washington or Islamabad of the US response.

"At this stage, we do not have nuclear negotiations," Iranian Foreign Ministry spokesman Esmaeil Baghaei was quoted by state media as saying.

Observers said the proposal to delay nuclear talks until a later phase would appear at odds with Washington's repeated demand that Iran accept stringent restrictions on its nuclear program before the war can end.

Shi Guang in New York and agencies contributed to this story.

Asia-Pacific urged to act together, build deeper ties

By YANG HAN in Hong Kong
kelly@chinadailyapac.com

The Asia-Pacific needs to "act together to develop together" by strengthening cross-border connections to bolster resilience and inclusive growth, says Asian Development Bank President Masato Kanda.

"The decisions we make at this new crossroads will secure the future for the next generation," Kanda told the opening session of the bank's 59th annual meeting on Monday in Samarkand, Uzbekistan.

"In this fragmented world, traditional and isolated development responses will fail. To survive and thrive in this new era, we must build deeply connected and resilient systems," he said, adding that shocks today travel rapidly across borders and hit communities that are least able to absorb them.

To address these challenges, the ADB pledged on Sunday to back $70 billion by 2035 for new energy and digital infrastructure, aiming to build regional systems that will strengthen shared security and resilience in the Asia-Pacific.

"Energy and digital access will define the region's future," Kanda said, announcing the launch of the Pan-Asia Power Grid Initiative and the Asia-Pacific Digital Highway.

"By linking power grids and digital networks across borders, we can lower costs, expand opportunity and bring reliable power and digital access to hundreds of millions of people," he said.

The $50 billion power grid initiative will link national and subregional grids, allowing renewable energy to flow across borders. The $20 billion digital highway program aims to narrow infrastructure gaps and support AI-driven growth.

The power grid plan marks a shift from country-to-country links to a regional power market. By 2035, the ADB aims to integrate about 20 gigawatts of renewable energy across borders, connect 22,000 circuit-kilometers of transmission lines, improve energy access for 200 million people, create 840,000 jobs, and cut regional power-sector emissions by 15 percent.

The digital highway initiative aims to provide first-time broadband access to 200 million people and faster, more reliable digital connectivity for another 450 million by 2035. It is expected to cut connectivity costs in remote and landlocked areas by about 40 percent and help create 4 million jobs.

Economic impact

Also in Samarkand, finance ministers and central bank governors from ASEAN+3 met on Sunday, discussing the economic impact of the Middle East situation and underscoring the need for stronger regional unity.

ASEAN+3 comprises member states of the Association of Southeast Asian Nations and their three East Asian dialogue partners — China, South Korea and Japan.

"ASEAN+3 entered 2026 from a position of relative strength ... however, the escalation of conflict in the Middle East has amplified downside risks to the regional outlook significantly," said a statement released after the meeting.

With growth expected to moderate and inflation to rise, finance leaders underscored the importance of upholding multilateralism and strengthening regional unity and cooperation in addressing shared challenges.

At a sideline event, Yasuto Watanabe, director and CEO of the ASEAN+3 Macroeconomic Research Office, said the region has become more interconnected, with deeper integration and stronger regional demand. It now accounts for 28 percent of global demand, making ASEAN+3 the world's largest market, he said.

"Today, we are navigating what many describe as 'changes unseen in a century,'" he said, noting heightened global uncertainty and growing structural challenges.

Embassy event brings Shaanxi to Washington

By YIFAN XU in Washington
yifanxu@chinadailyusa.com

The aroma of freshly made *biangbiang* noodles mingled with the rhythms of Tang Dynasty music as the Chinese embassy in Washington welcomed more than 7,000 visitors on Saturday.

Part of the annual "Around the World Embassy Tour", the event this year transported attendees to Northwest China's Shaanxi province, offering a vibrant window into the "cradle of Chinese civilization" and the opportunities of an opening China.

In keynote remarks, Chinese Ambassador to the United States Xie Feng highlighted the province's historical weight.

"Shaanxi is like a river, carrying the continuity of Chinese civilization," Xie said. "As a saying goes, 'To understand 5,000 years of Chinese history, visit Shaanxi.'"

He noted that 14 dynasties once established their capitals there, nurturing cultural treasures from the Terracotta Warriors to Xi'an drum music.

Fast-forward to the present, Shaanxi is emerging as a hub of future growth, he said, describing the province as a "frontier of China's opening-up" with a key role in the Belt and Road Initiative and a leading presence in high-tech industries.

"A more prosperous China will surely be an anchor of peace and a harbor of stability in a turbulent world," he said. "A more open China will bring strong momentum and vast opportunities for shared development of all countries."

Shaanxi is helping renew the China-US friendship through local-level exchanges and people-to-people ties, Xie said, adding that the province and its cities have established 13 sister-city partnerships with US counterparts.

He cited the 14th China-US Tourism Leadership Summit in Xi'an in 2024 and a joint performance by Utah's One Voice Children's Choir and Chinese students beneath the city's ancient wall in 2025 as evidence of a sustained public appetite for exchange and cooperation.

After more than 50 years of diplomatic engagement, China-US relations have reached another crossroads, he said, urging both sides to draw lessons from history, focus on steady and sustainable development, and seek "a right way" to coexist in the new era.

Fan Weibin, vice-chairman of the Standing Committee of the Shaanxi Provincial People's Congress, said the province is expanding cooperation with the US in trade, culture, tourism, education and other sectors, and welcomed more US people to experience Shaanxi firsthand.

A highlight of the open house event was a performance of Xi'an drum music, known as a "living fossil" of Chinese music. Musicians in Tang Dynasty (618-907) attire played drums, flutes and chimes, while a vibrant *yangko* dance brought to life the folk traditions of northern Shaanxi.

The audience responded with enthusiastic applause and cheers, enjoying this direct encounter with musical and dance traditions passed down for centuries.

The embassy grounds were transformed into a lively showcase of culture and heritage. Visitors tried their hand at painting *shehuo* masks and explored ancient murals through virtual reality.

Stalls featuring cultural products and other goods from local Shaanxi companies drew large crowds, with long lines forming for regional delicacies.

Flavor of Chang'an

Among the exhibitors, Lu Zhiqi of Shaanxi Ziqi Food Company said he was proud to bring local flavors to Washington. "We hope visitors can taste the flavor of Chang'an (Xi'an's ancient name) — and of China — through our traditional delicacies," he said.

Lu added that the company combines traditional techniques with digital production lines to produce additive-free products tailored to US market trends.

Ralph Winnie Jr, director of the China program at the Eurasia Center, said such events underscore the value of cultural diplomacy.

"People-to-people exchanges and relationship building are very important to break down cultural barriers and promote understanding," he said.

David Harrison, a high school teacher from Virginia, said, "I've seen the Terracotta Warriors in books, but the craftsmanship here makes it all feel so real."

The technology displays highlighted China's rapid change and inspired him to bring his students to visit, he said.

Briefly

ATLANTIC OCEAN

Suspected outbreak of rare hantavirus kills 3

Three people have died and three are ill after a cruise ship was hit by a suspected outbreak of hantavirus, a rodent-borne virus that can cause fatal respiratory illness, authorities and media reports said on Sunday. Netherlands-based Oceanwide Expeditions said in a news release that it was "managing a serious medical situation" on a polar expedition ship, which was off Cape Verde, an island nation in the Atlantic west of Africa. The cruise departed from Argentina about three weeks ago with around 150 passengers and stopped in the Antarctic and other locations on its way to Cape Verde, according to media reports. A Dutch Foreign Ministry spokesperson confirmed that two Dutch passengers had died, but gave no further details.

OIL MARKETS

7 OPEC+ countries to hike production in June

Seven countries in the OPEC+ grouping of oil-producing countries say they have decided on a modest increase in production starting in June as part of a commitment to "market stability". The decision from the seven countries — Saudi Arabia, Russia, Iraq, Kuwait, Kazakhstan, Algeria and Oman — to raise production by 188,000 barrels per day comes after they held a virtual meeting on Sunday. The increase is part of adjustments to the additional voluntary production cuts first announced in April 2023. The voluntary adjustments could be returned gradually, either in part or in full, depending on market developments, the group said.

PEOPLE

From left: A humanoid robot poses for a photo with a trainer at the Gansu Humanoid Robot Innovation Center. Two humanoid robots are displayed at the center. WU YUEXUAN / FOR CHINA DAILY

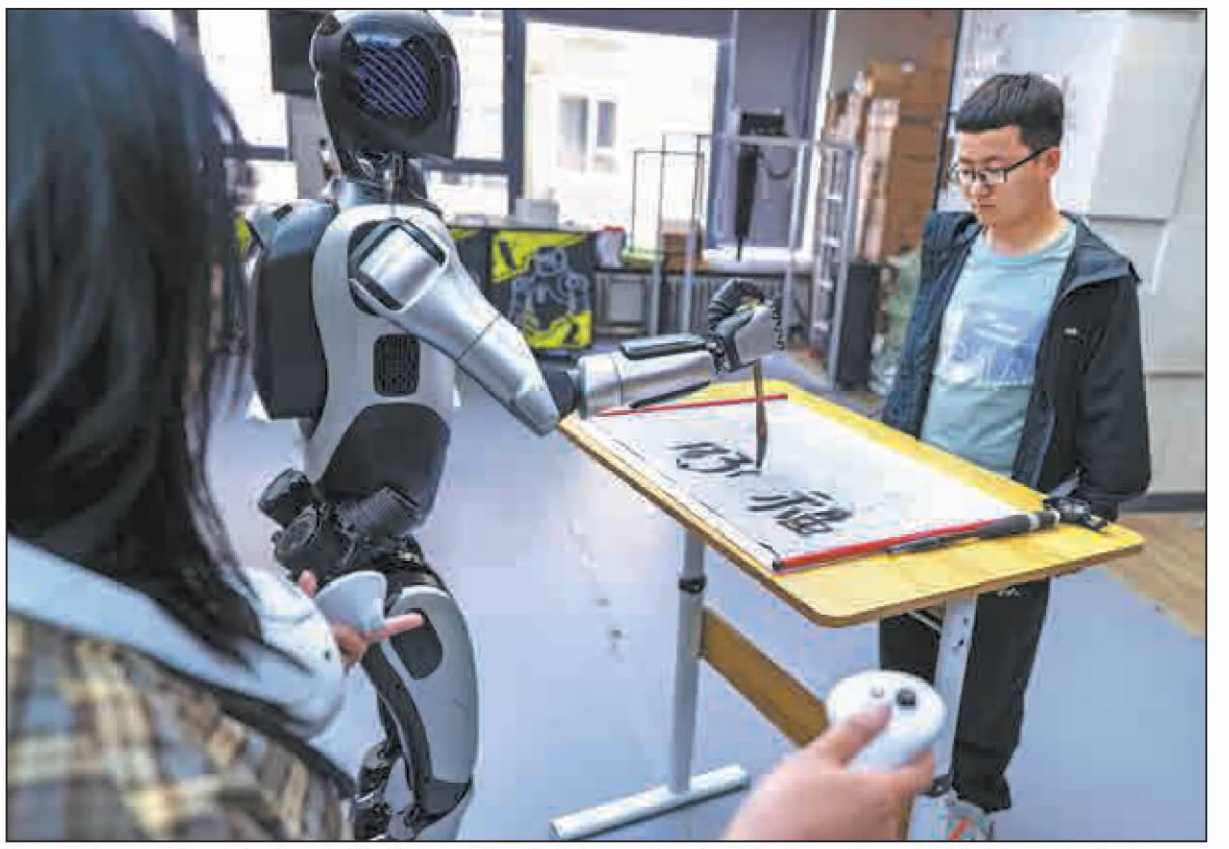
Trainer teaches robots like kids in a kindergarten

Through trial and error, Kang Xiaolong continues to learn alongside his humanoid students. The goal is to make robots interact better with people.

By **MA JINGNA** and **HU YUMENG** in Lanzhou

In a lab in Lanzhou, Gansu province, a humanoid robot sways slightly as engineers gather around One engineer demonstrates a movement, arms stretching out and body leaning in, while another tweaks parameters on a computer. The motion is recorded, translated into code and sent back to the robot, which attempts to follow the command.

This is part of a typical day for Kang Xiaolong, a robot trainer at the Gansu Humanoid Robot Innovation Center, one of the largest robot training hubs in Northwest China.



"It's a bit like teaching kindergarten kids," Kang said. "You guide them step by step, again and again, until they get it."

Kang, 31, graduated from Lanzhou University in 2020 with a degree in electronic information science and technology. He began his career in control software, working across fields such as new energy and industrial sensors, before joining the innovation center in 2025. The work was stable, but something was missing.

"Robotics is something new and exciting," he said. "It brings together mechanical engineering, electronics, software and AI models. You must continue to learn, but that's also what makes it interesting."

Training a robot is far from straightforward. A single movement can take days to refine, he said. The process often begins with a human demonstration, sometimes captured through motion-tracking systems. Engineers then retarget the motion — adapting it to the robot's proportions and mechanical limits — before testing it in a simulation.

Only after that do they try it on a real machine.

Kang Xiaolong (right) watches the robot that he trained to write Chinese calligraphy at the Gansu Humanoid Robot Innovation Center. PROVIDED TO CHINA DAILY

"We always have someone standing behind the robot, ready to support it," Kang explained. "If something goes wrong, we immediately hit an emergency stop. These machines are expensive and fragile."

Even with precautions, unpredictability is part of the job. "If you're not careful, you might get bumped or kicked," he said with a laugh. "So far, I've been lucky."

Kang's team focused on training robots for performances and public events — one of the more mature applications in the industry. But beyond commercial use, he is particularly interested in something more ambitious: blending robotics with local culture.

"In Northwest China, we have rich cultural resources," he said. "We want robots to reflect that — maybe through regional dances or dialects."

The idea of teaching robots to dance is appealing, but also technically demanding. Some styles, such as the iconic "playing the pipa behind the back" pose from Dunhuang murals, require fluidity and subtle expressions that robots still struggle to replicate. Limitations in joint flexibility and hardware design make certain movements difficult, if not impossible.

"Even if a robot can copy the shape of a movement, capturing the 'spirit' is much harder," Kang said.

Despite these challenges, progress is visible. Compared with earlier models, today's humanoid robots are more agile and expressive. In some cases, Kang said, their movements can look almost human. "It's not about replacing humans," he explained. "It's about teaching machines to work with us better."

Beyond the lab, the robots are increasingly meeting the public. Children are often the most enthusiastic, drawn to the machines' interactions.

Some even pose surprisingly profound questions.

"We've had kids ask if robots can solve the Goldbach conjecture," Kang said, "or even how a robot defines the unknown if it knows everything."

For him, the most rewarding moments come when the robots that he has trained step into the real world and are met with genuine delight. "It does feel like watching something you've taught being appreciated," he added. "It's not just about the technology, but how it can bring people happiness."

Railway engineer becomes a model worker through grit and global experience

By **ZHANG XIAOMIN** in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

For Lu Xiaofan, being awarded the title of model worker in 2022 in Liaoning province was not just a badge of honor. It was a reminder to push himself harder, sharpen his skills and rise to greater responsibilities.

Since 2014, when he graduated from college, Lu, 33, has worked in a variety of posts at the Dalian branch of China Railway No 9 Group. Looking ahead, he hopes to take a more active part in the company's overseas projects.

"Our company has accumulated extensive construction experience and completed many projects abroad, offering employees plenty of room to grow," said Lu, who is currently working as a legal affairs officer at a mining construction site in Guizhou province.

His entry into the industry was not driven by a childhood dream but by pragmatism.

Looking back, he said, "It turned out to be a perfect fit. This job has made me a person who can stay focused, endure hardship and communicate well with others."

Lu's journey into overseas projects began in 2018.

After four years in his first frontline position as a bridge test engineer, he rose to become the lead of a quality control circle for a bridge project in Dalian.

He was then assigned to the company's project management department in Belarus, where he took part in six construction projects and, for three of them, served as the on-site Chinese technical lead.

On a road project north of the China-Belarus Industrial Park in Minsk Oblast, he proposed an improvement to the originally planned well-point dewatering method based on studying the terrain and soil conditions, comparing years of weather data and investigating the rainwater treatment station's storage and reuse capacity.

"Such improvements ensured construction quality, saved costs and eased schedule pressure," Lu said.

The overseas stint, he said, deepened his understanding of the world. Beyond technical skills, his business communication abilities improved significantly.

"I knew very little about Belarus before going there, only its name," he said. He also found that local employees had limited knowledge of Chinese people and companies, and sometimes held prejudices.

Lu Xiaofan reviews project blueprints at the construction site of the Minsk Arena on Prospekt Pobediteley in Minsk, Belarus. PROVIDED TO CHINA DAILY

Lu made a point of engaging with his local colleagues, visiting museums and communities in his spare time and by participating in public welfare activities.

"Since the project ended, many of my coworkers and I still keep in touch on WeChat. We send each other blessings on important holidays," he said.

After returning to China in 2021, Lu worked in the engineering management department of the Dalian branch of the railway, focusing on overseas project management and contributing to technological innovation.

He later participated in a project in Tonghua, Jilin province, taking charge of early-stage planning and review.

There, he conducted regular analyses and adjusted operational strategies to ensure strong economic returns.

He also took on the coordination duties for several overseas projects and helped compile a country-specific policy manual for the company's overseas engineering and technical management systems.

With the company pushing for differentiated, high-quality development and a stronger global footprint, Lu has set his next goal — mastering construction and production techniques for overseas mining projects.

"There is no end to learning," he said. "Only by striving can you move forward."

Brewing success across Southeast Asia

Chinese tea-based beverages attract new fans by adding tropical fruit flavors and adapting to local tastes and trends

By **YANG WANLI** in Bangkok
yangwanli@chinadaily.com.cn

As Chinese tea beverages embark on their journey to global prominence, Southeast Asia has emerged as the first destination for many leading Chinese brands.

The combination of Chinese tea with the vibrant flavors of tropical fruits results in an innovative and health-conscious offering that captivates consumers in the region.

"The beverage market in Southeast Asia is characterized by its diversity and openness, coupled with a rich supply of fresh fruits and a rapidly expanding consumer base, presenting Chinese brands with ample opportunities for integrated growth and future prospects," said Chen Zhiyu, Thailand regional director of ChaPanda.

The Chinese tea chain, established in Southwest China's Sichuan province in 2008, has rapidly expanded into overseas markets over the past two years. It now operates in South Korea, Thailand, the United States, France, and Australia. As of March, it had about 70 overseas branches, with 40 percent in Southeast Asia.

In 2024, the brand entered Thailand — the first stop of its overseas expansion. "The tropical country has great consumption power for cold beverages all year round. Although there are a variety of fruit smoothies available (in Thailand), a combination of light Chinese tea and fresh fruit is a new track," Chen said.

Southeast Asia's coffee and tea market reached $9.9 billion last year, marking a 52 percent jump from $6.5 billion in 2021, as rapid outlet expansion, digital ordering, and broader consumer adoption fueled growth, according to the Singapore-based business information company Momentum Works.

The region's market potential is widely recognized by many Chinese brands. Back in 2018, Mixue opened its first overseas store in Hanoi, Vietnam. So far, it operates more than 4,700 stores outside China with Southeast Asia remaining its core overseas market.

The Chagee brand, meanwhile, has followed a more measured approach. After entering Malaysia in 2019, it has expanded to 196 stores in the market. In Singapore, it operates 22 outlets, including at Changi Airport and the National University of Singapore.

In Indonesia, operations have been carried out through a joint venture with a subsidiary of the local retail group Erajaya, with halal certification secured to better align with local consumer expectations.

Several brands have also emerged as key players in this trend. After the COVID-19 pandemic, brands such as Heytea, ChaPanda, and Naisnow expanded their presence across the region.

Fruit teas are among the top sellers for most of the brands. "The popularity of fruit teas, light milk teas, and vegetable teas suggests that consumers are increasingly aware of the health benefits. This mindset is (evident) among young (consumers) and the middle class," said Fei Cheng, general manager of Naisnow International Business Department.

Health consciousness

In Thailand, the tea industry encompasses diverse segments, from traditional Thai iced tea to premium organic varieties, driven by health-conscious consumers and bubble tea adoption (94 percent among people aged 20 to 29), according to a report by a local Thai company, Iconic Research.

It revealed that Thai consumers increasingly view tea as a wellness beverage, substituting it for sugary sodas and energy drinks. This health consciousness directly fuels growth in the Thailand organic tea sector and the green tea market.

The research showed that 62 percent of tea drinkers actively pursue healthy eating, making them receptive to messaging about functional benefits and clean ingredients. Generation Z leads this wellness movement, seeking products aligned with health and sustainability values.

Naisnow entered the Thai market by opening its first overseas branch in Bangkok in December 2023.

The brand highlights a healthy lifestyle by offering a wide range of high-fiber and vitamin-rich options made with a mixture of Chinese teas and fresh fruits.

Moreover, the trend of reducing daily sugar consumption is also supported by local authorities. On Feb 11, Thailand's Department of Health launched a major initiative to cut the default sugar content in "normal sweet" beverages by half of their original recipes.

In line with the preferences of local consumers in Thailand, Chen revealed that ChaPanda had initially increased the sugar content of its drinks by 15 percent from the level in the Chinese market to meet the average sweetness level of Thai beverages.

"But as more consumers nowadays are becoming more aware of health, we have reduced the sugar content ... while trying to explore more recipes with healthy ingredients," Chen said.

From top: Thai customers enjoy beverages at a Naisnow outlet in Bangkok's CentralWorld mall in March. A staff member prepares a fruit tea at a ChaPanda outlet in Bangkok's Siam Square. Exterior of the Naisnow outlet at CentralWorld. A Chinese zodiac-themed Year of the Horse pendant at the outlet. Chinese desserts at the outlet.
PHOTOS BY YANG WANLI / CHINA DAILY

In addition, the brand uses local halal milk to make milk-based beverages to meet the demands of Muslim customers.

"(To appeal) to local consumers, we also make (region-specific) costumes for the brand's mascot panda. For example, the panda will be dressed in a gentleman's style in France. In Singapore, the mascot will cosplay as the Merlion, while in Thailand it will have a beach-style outfit," Chen said.

The proliferation of Chinese tea beverage outlets across Southeast Asia does more than introduce these unique flavors to a new audience. It also provides a glimpse into the depth and diversity of Chinese traditions on the world stage.

"When I traveled to China, I particularly enjoyed drinking Heytea and Chagee. The reason why I like going to China is that the people there are very friendly, the scenery is particularly spectacular, and each place has its own unique charm," said Paullar, a 31-year-old Thai.

"Apart from tea, I also really like Chinese cuisine. Chinese traditional customs and delicious food make me enjoy every trip to China very much," she added.

Beyond drinks

Beyond business expansion, Chinese tea beverage brands are also integrating social responsibility into their global strategies.

In Singapore, Chagee opened a "silent store" employing hearing-impaired staff members, complete with accessible facilities. This initiative demonstrates a commitment to inclusive employment, while offering a practical example of how brand operations can contribute to local communities.

Mixue emphasizes local hiring and talent development. In Malaysia, the brand employs over 2,900 local staff members and has trained more than 4,000 personnel to date.

To that end, the company has experimented with culturally themed product launches, linking drinks to national celebrations or local design elements.

In August 2025, to commemorate Singapore's National Day, Chagee introduced a new orchid-flavored beverage, the "Orchid Biluochun Milk Tea" inspired by Singapore's national flower, the Vanda Miss Joaquim.

Most recently, it partnered with the Asian Civilisations Museum and the Singapore Tourism Board to launch "Garden of Senses: A Tea Reverie", an immersive, multi-sensory tea culture exhibition. This marks a landmark collaboration and is ACM's first in-depth curatorial partnership with an international brand.

By the end of 2025, Chagee's overseas membership in the Asia-Pacific region had grown 177 percent from a year earlier, with 61 percent of members under the age of 30, demonstrating the brand's strong value recognition among local youth.

Fei from Naisnow said Chinese tea-based beverages are a cultural icon for many foreign consumers, and the company seeks to serve as a gateway for the world to explore Chinese culture.

Apart from providing popular Chinese desserts as options beyond drinks, Naisnow has also integrated the brand with Chinese cultural elements and developed many related products.

"For instance, to celebrate the Year of the Horse, we collaborated with designers to make small pendants. The gifts symbolize this year in the Chinese zodiac — a spirit of progress and perseverance. They also provide another look at Chinese culture," Fei said.

Chinese tea, together with other cultural trends such as toys, the creative industry, and costume dramas that go viral among the younger Thai generation, combines commercial objectives with social contributions, said Arphon Thiragun, a lecturer at the School of Sinology at Mae Fah Luang University.

Over the past decades, she said Chinese culture has influenced Thai people through multiple cultural forms. For example, Hong Kong movies and the iconic musical style of Teresa Teng are unforgettable memories for many elderly Thai people. Such cultural exchanges are now evolving into more creative and vivid forms.

She cited examples such as the popularity of the cute fashion accessory Labubu from China and the Thai mascot Butterbear — both are widely loved by consumers from China and Thailand.

"Now, such cultural exchanges create mutually beneficial outcomes for business operators and consumers. In particular, deepened cultural exchanges are shaping the image of the world in the minds of younger generations and have sparked their enthusiasm for exploring different countries and their cultures. This will lay a solid foundation for a deep understanding of the world," she added.

Xinhua contributed to this story.

Models from China and abroad showcase Qiang ethnic clothing at the 2026 New York Fashion Week Asia-Pacific Wuxi Show on March 20.

Eastern beauty meets global fashion

On March 20, dozens of top global brands and international haute couture designers graced the runway at the 2026 New York Fashion Week Asia-Pacific Wuxi Show, held at the Nianhua Bay in Wuxi, Jiangsu province.

Throughout the event, intangible cultural heritage (ICH) elements stood out as a major highlight.

Garments made using ICH techniques such as Su embroidery, Miao embroidery, and Qiang embroidery, appeared one after another on the runway.

The Qiang people, often called "the ethnic group living among the clouds," have a long history in China, well known for distinctive cultural, culinary, and sartorial traditions.

Chen Shijiang, a young Qiang lady from Baixi village, Maoxian county, in Sichuan's Aba Prefecture, amazed the audience with her collection, showcasing the beauty of traditional Qiang attire to the world.

Some reporters visited her studio to hear the story of her deep connection with Qiang clothing.

Chen, now a fourth-generation inheritor of her family's Qiang embroidery legacy, told the reporters that the Qiang people believe that all things have a spirit.

"We use clothing as a medium to pass on the good fortune and symbolism found in rivers, mountains, flowers, birds, and insects," she added.

She said that her collection displayed in this show reinterprets traditional Qiang clothing with a contemporary design language, honoring tradition while embracing modernity.

Her work blends intricate patterns and fluid tailoring with Qiang ICH techniques, bringing traditional wedding attire to life on the fashion stage.

Her pieces have been exhibited in countries such as Italy, the UK, and Switzerland, and have also been featured in international cultural exchange events.

TREND

‘Silent riders’ thrive, show resilience in digital era

Workers with impairments are overcoming barriers, redefining what inclusive employment looks like.

Sun Jingjing (right), a hearing-impaired Meituan delivery rider, communicates with Gu Xinru, a sign language instructor who helps Sun become familiar with the work, at a delivery station in Shanghai.
PROVIDED TO CHINA DAILY

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

Zhao Lei, 38, has a hearing impairment and has worked as a ride-hailing driver for five years. When passengers book a ride, the app notifies them before they call Zhao, encouraging them to switch to text-based communication.

As a driver with a hearing impairment who is registered on DiDi, a major ride-hailing platform in China, Zhao said in sign language that the job provides him with a stable income and allows him to make ends meet.

Beyond ride-hailing services, people with hearing difficulties are also finding new opportunities in China’s on-demand delivery sector. “Without delivery jobs, most people with hearing impairments could only work in factories,” said Sun Jingjing, a 34-year-old delivery worker for Meituan in Shanghai, an on-demand service platform.

Although challenges remain, improvements in speech-to-text functions and AI communication tools are opening new possibilities. For this “silent” group, the app-based service economy is creating new horizons.

New forms of employment

Zhao, from Heilongjiang province, became a ride-hailing driver in 2021 after his startup venture failed. Once he had saved enough money, he bought a car and registered with DiDi.

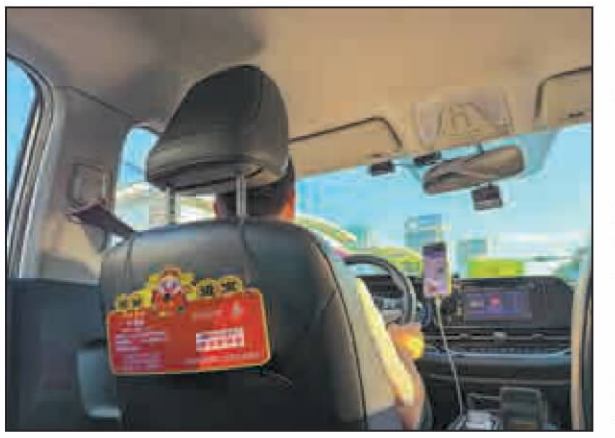
Now an experienced driver covering about 300 kilometers a day, Zhao knows the city’s roads so well that the map is largely in his mind. He often shows his driver’s license to passengers to ease any concerns.

Yet for a driver with hearing impairments, the biggest challenge remains communicating with passengers by phone.

“When there’s a traffic jam, I need to let the passenger know it will take a few more minutes,” he explained. “In other cases, I have to call the passenger if I arrive early.”

Over time, Zhao has developed his own ways to bridge this gap. In such situations, he may ask a passerby to help make the call or use AI-powered text-to-speech tools to generate voice messages.

Since May last year, DiDi has introduced a feature that notifies passengers before the trip if their driver has a hearing impairment, encouraging them to use text-based communication. During the ride, the app also provides guidance to passengers, such as gently tapping the driver on the shoulder in urgent situations.



In recent years, many people with hearing impairments like Zhao have entered the ride-hailing industry. Zhao is part of a group chat with more than 100 drivers with hearing impairments, where they exchange experiences and advice.

Under current regulations in China, people with hearing impairments can apply for a small-car driver’s license if they meet specific hearing requirements, such as being able to hear car horns from different directions, with the help of assistive devices. After passing the necessary tests, they are also eligible to work in the ride-hailing sector.

Clockwise from top left: Two job seekers exchange information using sign language at a special job fair in Taiyuan, Shanxi province, on March 11. The event was dedicated to providing opportunities to people with disabilities. WEI LIANG / CHINA NEWS SERVICE A sign in the back seat of a DiDi ride-hailing car in Shenzhen, Guangdong province, on Nov 24, informs passengers that the driver is hearing-challenged. ZUO DONGCHEN / FOR CHINA DAILY An employment seeker with hearing difficulties communicates via text on a mobile phone while applying for a position at a job fair in Chaozhou, Guangdong province, on Feb 22, 2024. CHEN YIHANG / FOR CHINA DAILY

While a small number of passengers may have doubts, most are understanding. “Some even use sign language to say ‘thank you’ to me,” Zhao said.

Ride-hailing drivers and delivery workers represent new forms of employment that have emerged with the growth of internet technologies and the digital economy. As of March, more than 80 million people were engaged in these flexible jobs, including 12 million delivery workers and nearly 7 million ride-hailing drivers.

Compared with traditional job options for people with disabilities, these roles offer not only more equal access but often higher pay.

Last year, more than 10,000 people with hearing impairments worked as delivery workers for Meituan.

In Shanghai, a Meituan delivery station on North Sichuan Road established a dedicated branch for workers with disabilities in the autumn of 2024. The station also employs a sign language instructor to support daily communication with its 17 employees with hearing impairments.

Before becoming a delivery worker, Sun, who is originally from Henan province, spent four years working at an electronics assembly factory. The job was exhausting, she said, and paid only 2,000 yuan ($292.6) to 4,000 yuan per month.

She described on-demand delivery work as more equitable, noting that people with hearing impairments are not discriminated against and can perform just as well as others.

When Sun began working as a delivery rider in October last year, she was unfamiliar with the delivery system and the electric motorcycle, earning only about 3,000 yuan a month.

With guidance from more experienced colleagues at the station, she gradually improved. She now completes more than 1,200 orders per month, and her income has risen to around 8,000 yuan.

In December 2024, Meituan upgraded its accessibility features for delivery workers with hearing impairments. The updated system includes functions such as speech-to-text conversion and AI-powered voice calling.

While making deliveries, Sun wears a vest labeled “Silent Rider”. When people notice it, they will often step in to help her find her way if she is lost.

Excellence in silence

Yang Haobing, 30, is another “silent rider” at the station. He ranks among the top performers in both order volume and income, completing around 1,300 to 1,500 deliveries each month and earning more than 10,000 yuan.

Since becoming a full-time delivery rider for Meituan in October 2024, Yang has made it clear that he does not want to be treated differently because of his hearing impairment. He holds himself to higher standards than those of other riders, which in turn motivates those around him.

Yang attributes his success to diligently memorizing routes and frequently exchanging tips with fellow riders. “I like this job, not only because of the income, but also because it allows me to get to know the city while riding,” he said.

When he first arrived in Shanghai in 2019, Yang worked as a chef. Compared with kitchen work, he said, delivery work offers more practical, worldly experience. Now, he and his girlfriend are working hard in Shanghai and plan to get married once they have saved enough money.

According to Yang, many people with hearing impairments are doing delivery work through referrals, since on-demand delivery offers higher incomes, and people with hearing impairments can do just as well as others.

Gu Xinru, a sign language instructor at the Meituan delivery station, described these riders as energetic and resilient, noting their strong work ethic and ability to overcome challenges.

Zhao, the ride-hailing driver, has also received many positive reviews from passengers. Some praised his steady driving and efficient, well-chosen routes. Even in heavy traffic, reviewers noted that he adjusted course quickly. Many passengers also offered tips as a gesture of appreciation, according to Zhao.

Now, Zhao’s monthly income can reach over 15,000 yuan.

Still, communication remains Zhao’s biggest concern. Although he uses text-to-speech tools to make phone calls, he noted that “typing simply isn’t as fast as speaking, and when responses are delayed, passengers can become anxious. Some even hang up as soon as they hear the AI-generated voice.” He added that regional dialects can further complicate speech-to-text conversion.

Zhao said he hoped the app would introduce more accessibility features.

While hearing-impaired drivers and delivery riders work hard to overcome communication barriers, companies such as DiDi and Meituan have also introduced accessibility features on their apps, drawing on feedback from users.

According to DiDi, the company has held multiple meetings with these drivers and users to better understand their key challenges and practical needs. In May last year, it launched features such as call notifications and an in-trip communication card, with pilot programs rolled out in six cities. A total of 50 hearing-impaired drivers from Beijing, Shanghai and Guangzhou in Guangdong province volunteered for the trial, including Zhao.

Based on data from 120,000 test orders, the prompt notifications successfully encouraged about half of the passengers who attempted to call hearing-impaired drivers to switch to text-based communication. The in-trip communication card was also viewed 50,000 times.

After noticing the sign indicating a driver with hearing impairments, many passengers were initially surprised and shared their experiences online. Some even searched for basic sign language on the spot and used it to thank the driver at the end of the ride.

“The car is very quiet, without music or conversation,” one social media user wrote. Others described the experience as moving and inspiring, saying they were touched by the drivers’ hard work.

Gu, the sign language instructor, often helps these delivery riders handle communication issues with customers. In one case, a delivery rider received a negative review from a customer who complained about an “impolite response”. Gu later contacted the customer to explain that the rider could not hear and that his text replies might seem abrupt. After learning the situation, the customer sent a long message to apologize.

Gu said many customers shift from being critical to offering tips once they realize the rider has hearing impairments. She added that delivery work provides more opportunities for interaction, helping hearing-impaired individuals better integrate into society.

In June last year, the General Office of the State Council issued a three-year action plan for promoting the employment of people with disabilities (2025-27), which emphasized stronger support for flexible employment among people with disabilities.

The plan also calls for further leveraging the role of the platform-based digital economy. In addition, support for the employment of people with disabilities will be incorporated into the evaluation criteria used to assess internet companies’ fulfillment of their social responsibilities.

“Though those delivery workers cannot hear, they can feel the wind, smell the flowers, and be greeted on the street,” Gu said. “Fairness is not about giving them special treatment, but about allowing them, like anyone else, to support themselves through their own efforts.”

TV makers putting on big show abroad

Domestic brands ramping up for global share, with Mini LED tech narrowing gap with sector leaders

By LI JIAYING
lijiaying@chinadaily.com.cn

Chinese television brands are increasingly taking over the overseas operations of foreign peers, as the industry moves toward deeper integration and higher-end competition.

This trend has been highlighted by a series of recent deals. Shenzhen, Guangdong province-based Skyworth Group recently reached a long-term strategic cooperation agreement with Japanese multinational electronics manufacturer Panasonic.

Under the deal, Panasonic will transfer the operation of its TV business in the United States and Europe to Skyworth. The Chinese company will take full responsibility for joint research and development, manufacturing, sales, marketing and after-sales services for Panasonic-branded TVs in these regions, while the two sides will also collaborate on high-end OLED products.

"In the face of intensifying global competition, Panasonic's competitiveness in Europe and the US has weakened, while Skyworth, with its experience in overseas channel operations, is seeking to rapidly expand into mid-to-high-end markets," said Yang Liu, a senior analyst at research and advisory company Sigmaintell Consulting.

Yang added that as competition in the TV market becomes increasingly saturated and supply chain costs continue to rise, integration models combining "technology, supply chain, channels and scale" are likely to become a key trend.

"By leveraging technology for market access and channels for business expansion, Chinese brands are expected to steadily increase their global influence," Yang said.

Similar moves have been seen across the industry. In January, domestic home appliance heavyweight TCL, which floated in Hong Kong, announced plans to establish a joint venture with Sony, in which TCL will hold a 51 percent stake and Sony 49 percent, to take over the latter's home entertainment business, covering the full chain from R&D to sales and customer service.

Skyworth acquired the operating rights for Philips-branded TVs in North America last year, and earlier acquired German TV brand Metz. In 2017, Hisense acquired a 95 percent stake in Toshiba's TV business, forming TVS Regza.

These developments point to the growing global competitiveness of Chinese TV brands. Data from market research institute AVC Revo show that global TV shipments reached 264 million units in 2025, with Samsung, TCL, Hisense, LG and Xiaomi ranking as the top five vendors.

Notably, TCL's shipments surpassed 30 million units for the first time, narrowing its gap with Samsung to within 5 million units.

"Whether through JVs or brand licensing, competition in the global TV sector has increasingly evolved into a contest between Chinese and South Korean players," Yang said.

At the same time, weakening demand in the domestic market is accelerating Chinese manufacturers' push overseas. AVC Revo's data show that China's TV sales fell to 27.63 million units in 2025, the lowest level on record. Research firm Omdia's analysis also indicates that as government subsidies ended and consumers had already brought forward purchases, shipments in China in the fourth quarter of 2025 dropped 25.3 percent year-on-year.

The slowdown has weighed on domestic revenues. According to TCL's annual financial results filed with the Hong Kong bourse, the company's domestic TV business generated HK$17.2 billion ($2.2 billion) in 2025, down 9.7 percent year-on-year, while Skyworth's domestic revenue in the TV sector fell 7.4 percent to 11.78 billion yuan ($1.73 billion). Hisense's TV unit also recorded a 5.14 percent decline in domestic revenue.

Consumers check out Mini LED televisions at a shopping center in Jiaxing, Zhejiang province, on Feb 21. JIN PENG / FOR CHINA DAILY

> Mini LED TVs have become a major focus of the industry over the past two years. The technology is likely to play a significant role in helping Chinese manufacturers compete in the high-end segment."
>
> **Wang Xianming,** director of TV industry chain research at market intelligence firm Runto

Against this backdrop, overseas markets have become a key growth engine. TCL's overseas TV revenue rose 15.7 percent to HK$47.5 billion in 2025, while Skyworth's overseas revenue increased 21.8 percent to 9.885 billion yuan. Hisense's overseas revenue reached 29.23 billion yuan, accounting for more than half of its total.

Behind the revenue growth is a shift toward higher average selling prices and improved product mix, industry experts said.

"As Chinese players increasingly expand their global footprint, future competition between Chinese and South Korean brands will focus on the mid-to-high-end segment, which South Korean brands have long dominated," said Wang Gang, a home appliances analyst at Sinolink Securities.

A report by Sinolink Securities noted that while Chinese brands' global shipment share rose from 10 percent in 2015 to nearly 30 percent in 2025, their average prices still lag behind South Korean competitors by $200 to $300.

This gap, however, is beginning to narrow. Data from global research firm Counterpoint Research show that the combined share of TCL and Hisense in the global premium TV market rose from 22 percent in the fourth quarter of 2023 to 39 percent in the first quarter of 2025, while South Korean brands have seen a continuous decline since 2024.

"Chinese brands have shown strong agility in their growth strategies over the past year," said Matthew Rubin, principal analyst of TV Set Research at Omdia.

Rubin noted that even though accessing the US market is more challenging now, major Chinese brands have adjusted supply chains to meet new requirements, mainly through positioning profitability as a bigger priority.

As premium models remain the main driver of profitability, Chinese manufacturers are increasingly focusing on high-end display product profiles. TCL said in its annual financial statements that the average selling price in North America rose more than 20 percent in 2025, driven by larger screen sizes and premium products such as Mini LED TVs.

Similarly, Hisense reported that shipments of its Mini LED TVs grew more than 26 percent year-on-year, and it ranked first globally in ultra-large TV segments of 98 inches and above, as well as 100 inches and above, with shares of 30.3 percent and 57.1 percent, respectively.

Skyworth also said its cooperation with Panasonic will focus on high-end technologies such as OLED, Mini LED, smart system integration and image processing algorithms.

According to Omdia, global Mini LED TV penetration rose from 3.1 percent in 2024 to 6.1 percent in 2025, with TCL ranking first globally with a 31.1 percent share after a 118 percent surge in shipments.

"Mini LED TVs have become a major focus of the industry over the past two years," said Wang Xianming, director of TV industry chain research at market intelligence firm Runto.

Wang noted that global Mini LED TV shipments reached 7.85 million units in 2024, surpassing OLED TV shipments of 6.12 million units for the first time. In 2025, that lead widened further and the trend is expected to continue in the coming years.

"The technology is likely to play a significant role in helping Chinese manufacturers compete in the high-end segment," Wang said.

Zhang Hong, deputy general manager of Sigmaintell's large-display division, said competition in the premium Mini LED segment has evolved into differentiated technology paths between Chinese and South Korean brands.

"Chinese manufacturers are pursuing multiple approaches, with Hisense focusing on RGB-Mini LED and TCL positioning its flagship products around SQD-Mini LED, while South Korean players such as Samsung and LG continue to adopt a dual-track strategy centered on both OLED and Mini LED technologies," Zhang said.

China's vacuums sweep into overseas markets with high-tech prowess

By LI JIAYING

As their global market share continues to expand, domestic robot vacuum brands are no longer seen as budget alternatives, but are increasingly setting the pace in performance and user experience in the global market.

From Dreame's X50 Ultra robot vacuum being named in Time Magazine's Best Inventions of 2025 — the only robot vacuum on the list — to Chinese brands dominating Amazon's best-seller rankings, the rise of Chinese robot vacuum players is becoming increasingly visible to global consumers.

According to a report released by market intelligence IDC in March, global shipments of home cleaning robots reached 32.72 million units in 2025, up 20.1 percent year-on-year. Notably, Chinese manufacturers — including Roborock, Ecovacs, Dreame, Xiaomi and Narwal — took all top five spots in terms of global shipments.

"Chinese manufacturers played a central role in driving the steady growth of the global robot vacuum market in 2025, supported by ongoing product innovation, stronger channel execution and the continued release of demand," said Zhao Siquan, a senior analyst at IDC China. "Going forward, competition will increasingly center on AI capabilities and ecosystem integration, with technological innovation becoming the key differentiator."

The shifting market dynamics are also reflected in the fortunes of traditional players. iRobot, a US pioneer in the robot vacuum industry, filed for bankruptcy late last year and agreed to be acquired by one of its Chinese suppliers, Shenzhen, Guangdong province-based Picea Group.

In a post-bankruptcy interview, iRobot CEO Gary Cohen said the company had fallen about four years behind Chinese competitors on product innovation.

"Driven by breakthroughs in laser navigation, AI-based visual recognition, multi-sensor fusion and embodied intelligence algorithms, Chinese robot vacuum brands have moved ahead of traditional incumbents such as iRobot in overall product intelligence," said Jiang Han, senior analyst at market consultancy Pangoal.

Driven by a dual strategy jointly powered by technological innovation and scenario adaptation, Chinese industry players are able to tailor products to different household layouts and flooring conditions across markets, thereby forming differentiated competitiveness, Jiang said.

A visitor tries out Dreame's vacuum during a home appliance expo in Shanghai on Aug 1. SHI JUE / FOR CHINA DAILY

> The ability to respond swiftly to these pain points is key to gaining a competitive advantage."
>
> **Meng Jia,** president of Dreame's robotic vacuum division

"Take the European market as an example, where wall-to-wall carpeting is common in many households. While the 'mop-lifting' function has been introduced as a solution, its limited lifting height means that long-pile carpets can still get wet," said Meng Jia, president of Dreame's robotic vacuum division.

To address the challenge, the manufacturer developed a detachable mop function specifically for carpeted homes. In vacuuming mode, the mop remains at the base station, and is automatically installed only when mopping is required, Meng said.

"The ability to respond swiftly to these pain points is key to gaining a competitive advantage," he added.

Another common frustration in everyday homes targeted by the Chinese brand is the difficulty of cleaning corners, where traditional robot vacuums often leave gaps of around 5 centimeters along edges, Meng explained.

In this regard, the manufacturer developed a bionic robotic arm that extends the mop to reach edges and mimic human cleaning, reducing gaps to less than 0.1 cm. Its robot vacuums equipped with this feature have sold over 7 million units as of late April.

According to Meng, such strong product capabilities have given Chinese brands the confidence to compete in the global high-end segment.

"With globally pioneering technologies such as the bionic robotic arm, embedded base station and binocular 3D vision-based obstacle avoidance, our flagship models are priced close to premium home appliances in markets such as Western Europe and North America, yet have still become a preferred choice among local consumers," he said.

The strategy has also translated into market performance. In 2025, Dreame's robotic vacuum cleaners ranked first in market share across 30 countries and regions, with its share exceeding 40 percent in 18 markets including Germany, Sweden and Poland. The company's revenue from the segment also doubled in 2025, marking its sixth consecutive year of 100 percent growth.

New life beckons for Lake Victoria

As the first light touches the horizon, the area awakens, weaving tales of tradition and transformation on Kisumu's shores

By **VICTOR RABALLA**
in Kisumu, Kenya
victor@chinadailyafrica.com

In Kisumu's Dunga Beach on the shoreline of Lake Victoria in Kenya, the day begins before the sun even rises.

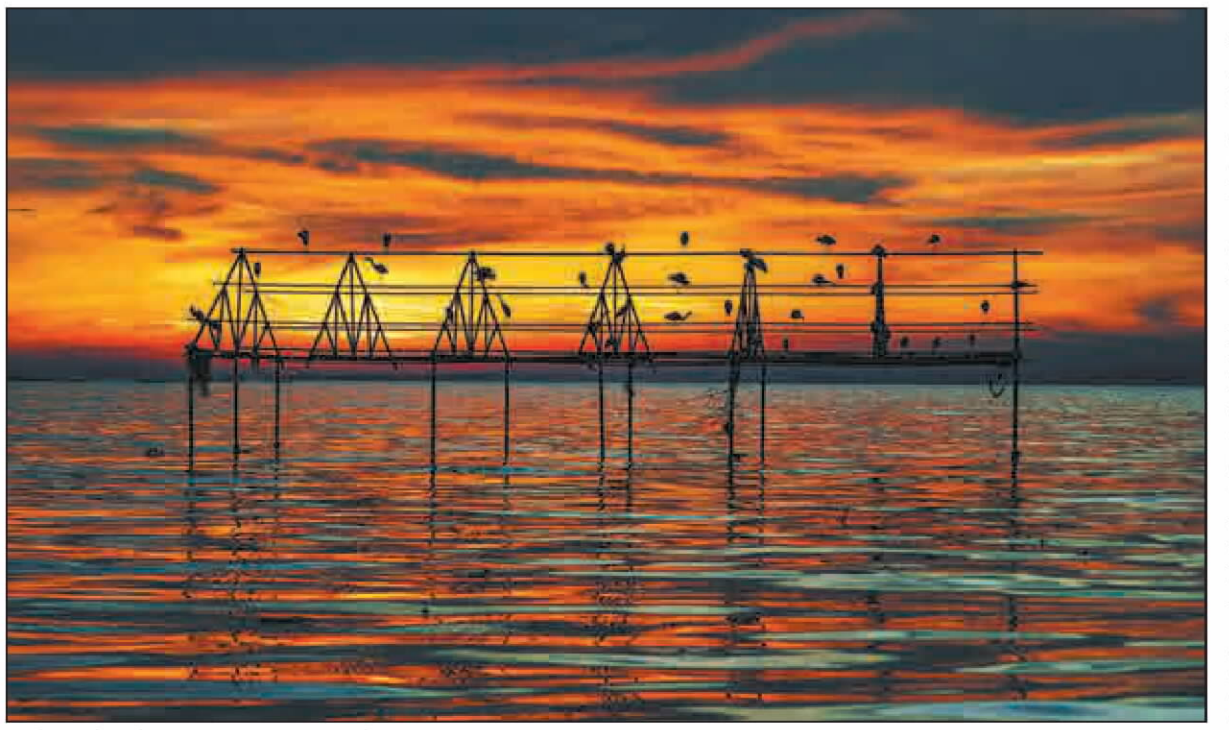
It's a place where morning clouds drift lazily over horizons that seem endless and where human life remains deeply intertwined with the water and sky.

As both tourists and locals gather at daybreak, the first light slowly reveals a searing energy. Wooden boats, anchored shoulder-to-shoulder, rise and fall to the tunes of the tide, almost as if the lake is breathing.

Here, fishing is more than an economic activity; it is a culture, identity and living inheritance passed from one generation to the next.

At this landing site just 5 kilometers from the central business district of Kenya's third-largest city, entire communities revolve around the catching, drying, selling and feasting of fish, mainly Nile perch and tilapia.

"See that dock over there?" gestures Lillian Ochieng', a long-time fish trader from the region. Her gaze sweeps across a cluster of small canoes returning from night expeditions, their silhouettes cutting through the mist like returning ghosts of the water.



She pauses, a faint smile crossing her face, as though balancing years of memory against the weight of the present moment.

"My grandmother stood on this same shore," she said softly. "She learned how to smoke fish here, my mother learned how to sell fish here and it is now my turn. We laugh, we argue, we survive ... and we come back again tomorrow ... this is part of our lives."

The soft creaking of timber, the distant calls of fishers and the gentle slap of water against wooden hulls blend into a rhythm that belongs to the shores of Lake Victoria, second in size only to North America's Lake Superior among freshwater lakes.

Sprawling across roughly 68,800 square kilometers, this shared water resource between Kenya, Uganda and Tanzania delivers breathtakingly consistent sunrises and sunsets, moments so serene and spectacular that they seem to pause the world in quiet admiration.

In that gentle surrender, time itself appears to loosen its grip — until the watch on your wrist feels unnecessary — as if the lake has its own way of reminding you that some moments are not meant to be measured, only lived.

Birds perch and rest on structures over Lake Victoria in Kisumu, Kenya. XIE JIANFEI / XINHUA

Region of possibilities

Beyond Lake Victoria's enduring legacy as a fishing hub, Kisumu is quietly stirring to life as an emerging tourism destination. This is not only propelled by the allure of the lake but as a gateway to some of the region's most iconic safari destinations.

Just beside the lakeshore lies the serene Kisumu Impala Sanctuary, where wildlife roams against a stunning lakeside backdrop. Nearby, Ndere Island offers a tranquil escape, rich in birdlife and framed by sweeping panoramic views of the lake.

Visitors also have the opportunity to enjoy fishing boat excursions and immerse themselves in local homesteads and traditional fishing communities, with a visit to the Kisumu Museum offering insight into the region's cultural heritage and history.

Further afield, the iconic Kit Mikayi rises dramatically from the ground, steeped in Luo folklore and symbolizing a polygamous family structure.

The monument's name means "stone of the first wife". It's not just a natural wonder, but a towering stack of massive rocks, rising around 40 meters high. The rocks are naturally balanced on top of each other, forming an impressive structure.

You can even climb parts of it for views of the surrounding countryside. It's also considered a sacred site for prayers, rituals and spiritual gatherings.

To the south, the bird-rich Dunga wetland and the flamingo-dotted Lake Simbi Nyaima offer rare ecotourism experiences, drawing nature enthusiasts into a quieter, more intimate encounter with the region.

For Vivian Kobe, founder and managing director of Viba Explore Tours, the magic of Lake Victoria lies not just in its beauty, but in its untold stories.

"When visitors come here, they expect to see water," she says. "But what they discover is an entire way of life: fishing communities, birdlife, islands, culture. Lake Victoria is not just a destination, it's an experience layered with history and human connection."

Kobe has spent years curating immersive travel experiences, from sunrise boat rides at Dunga to cultural tours through villages and island excursions across the lake.

She believes the region is only beginning to scratch the surface of its tourism potential. "We're now seeing more travelers looking for authentic, slower experiences," she says. "Lake Victoria offers exactly that, unfiltered, intimate and deeply rooted in community."

Just beyond the bustle of Dunga Beach lies the fragile, thriving ecosystem of the Dunga wetland, a 500-hectare stretch of papyrus plants, water channels and birdlife that has quietly become one of western Kenya's most remarkable ecotourism sites.

Hesborne Okoth Owino, the site and species coordinator at Dunga Wetland Swamp Boardwalk, says the wetland hosts 156 bird species, including endangered and migratory varieties.

The wetland offers a rare glimpse into biodiversity, from the elegant gray crowned crane to the elusive sitatunga antelope, that continues to draw nature lovers from Europe, the United States and, increasingly, China.

Fishermen dock their boats along the shores of Dunga in Kisumu, Kenya. VICTOR RABALLA / CHINA DAILY

> We are witnessing a noticeable rise in Chinese visitors at Sarova Imperial (Hotel), a clear sign of growing international interest in Kisumu and the wider Lake Victoria region, which is prompting us to adjust our offerings to better meet their expectations."
>
> **Duncun Mwangi,** managing director of Sarova Imperial Hotel in Kisumu, Kenya

"Between 6 am and 9 am, you can record up to 60 bird species in a single session at Dunga Boardwalk," Owino says. "It's one of the most rewarding birding experiences in the region."

The boardwalk is a sightseeing spot built over a wetland swamp filled with papyrus reeds. The raised wooden walkway stretches into the lake area, creating the enchanting illusion of walking on water, immersed in the stillness and beauty of nature all around you.

Even more fascinating is how human activity subtly intersects with nature. Fish cages scattered across parts of the lake have begun influencing bird migration patterns, occasionally attracting flamingos. But a quiet transformation is underway. The rows of floating fish cages that dot sections of the lake stand as symbols of a new economic frontier.

In Busia County, entrepreneur Peter Odongo has embraced cage culture fish farming, turning the lake into a controlled yet thriving production system.

"The lake has always fed us," Odongo says.

"But now we are learning how to work with it differently, more sustainably, more predictably."

Fish farming is rapidly gaining ground as pressure mounts on dwindling wild stocks among the more than 40 million people who depend on the Lake Victoria basin, whose expansive shoreline stretches across the three East African countries.

For investors and local communities alike, it represents both opportunity and adaptation: an evolution of tradition in the face of modern challenges.

City in transition

Back on land, Kisumu's skyline tells another story, one of growth and ambition. Hotels, apartments and new infrastructure projects signal rising investor confidence.

Duncun Mwangi, managing director of Sarova Imperial Hotel, says the lakeside city is poised for a tourism breakthrough.

"We're seeing gradual expansion in tourism offerings, from water buses to safari vessels, that allow visitors to experience the lake in new ways," Mwangi says.

Improved infrastructure — including the Standard Gauge Railway extension to Malaba, linking the coastal city of Mombasa to Uganda's border — could boost travel patterns and promote domestic tourism around Lake Victoria, he says.

Air travel to Kisumu remains relatively expensive and limits tourist inflows, he says.

To adjust to the growing number of global visitors, Sarova Group of Hotels has tapped into its experience to develop Asian cuisine, among other major international culinary offerings, to ensure a diverse and globally appealing dining experience.

"We are witnessing a noticeable rise in Chinese visitors at Sarova Imperial, a clear sign of growing international interest in Kisumu and the wider Lake Victoria region, which is prompting us to adjust our offerings to better meet their expectations," Mwangi says.

Abhishek Sharma, general manager of Acacia Hotel in Kisumu, says the ongoing upgrades of the Kisumu International Airport could see growing demand for premium experiences tied to the lake for guests who take direct and chartered flights.

The Kenyan government has initiated works on a runway extension, construction of a modern cargo terminal with cold storage to support fish exports, and improved air traffic and operational systems.

Sharma says Acacia Hotel has established an independent travel desk to assist guests who want more than accommodation, conferencing and dining.

"From lake tours to cultural sites ... and tour drives around the neighboring towns, our facility offers a complete and immersive experience for every traveler," he says.

At a regional level, Charles Kataro, CEO of Lake Victoria Tourism Association, underlines the need to tap into the growing interest from Chinese travelers in the region.

"Chinese travelers are increasingly seeking less crowded, experiential destinations, which plays strongly in Western Kenya's favor," Kataro says.

The association has started to capitalize on the Chinese market by collaborating with tour operators and online travel agents, leveraging digital platforms such as Douyin — China's TikTok, introducing familiarization trips for Chinese influencers, and aligning the destination with Belt and Road-related travel narratives.

Kataro, who envisions a bold future for the lake, is also championing the introduction of cruise tourism that would connect Kenya, Uganda and Tanzania into a seamless regional travel circuit.

"Lake Victoria can become a regional tourism hub," he says, imagining a lake that no longer divides borders but links experiences across them.

That vision is beginning to take shape, with the Kenya Tourism Board working with stakeholders to co-create new strategies of promoting the region, from city hotels in Kisumu to island lodges scattered across the lake's vast waters.

Board member Victor Shitakha says cruise tourism is expected to spark activity across key ports, including Kisumu; Tanzania's Mwanza, Musoma and Bukoba; and in Uganda, Entebbe, Port Bell and Jinja.

For Malcolm Ormiston, founder of WaterBus, which connects more than 10 communities across the lake region through flexible routes, the network is expected to expand as demand grows.

"Offering improved rural transport, ensuring fast, safe and comfortable journeys, the service carries more than 1 million people per year," Ormiston says, adding that the locally built vessels support regional industry.

While the water buses primarily serve as a transport solution, moving passengers and goods between landing sites and islands, the fleet is transforming mobility and tourism across Lake Victoria.

The vessels also offer sunset cruises, island excursions, bird-watching trips and relaxation cruises, opening up new opportunities in the region.

Operators say the water buses are "the cleanest way to travel the lake", generating 95 percent fewer hydrocarbons per passenger per hour compared with small two-stroke outboard engines commonly used on canoes in commercial passenger operations.

To reshape the urban life of the city, which was founded in 1901, Kisumu identified the lakefront area as a key asset and proposed its development as an extension of the central business district.

Under Governor Anyang' Nyong'o, the Kisumu Lakefront Development Corporation was established to drive this transformation, guided by the United Nations Human Settlements Programme.

By turning the waterfront into an accessible and visually striking public space, Lake Victoria is fast becoming Kisumu's defining asset, recasting the city as a modern waterfront hub where nature, tourism and commerce converge.

SPORTS

SOCCER

HEARTBEAT OF A TROUBLED NATION

The 'beautiful game' is the one thing that unites everyone in Haiti

People play soccer in Petion-Ville, Port-au-Prince, Haiti, on April 12. The Haitian national team has qualified for the 2026 FIFA World Cup, reaching the Finals for just the second time in its history. Soccer is the most popular sport in Haiti. ALL PHOTOS BY AFP

On a street in a suburb of Port-au-Prince, a dozen teenagers using stones for goalposts are immersed in a Sunday game of soccer as traffic winds around them.

Haiti has many problems, including political instability, poverty and crime, but through it all, the heart of the nation beats for soccer.

Haiti's qualification for this summer's World Cup has come as a breath of fresh air for the poorest nation in the Americas, the nearly 12 million people of which have long grappled with gang violence that has caused a humanitarian crisis.

"Soccer is hope and love. It inspires pride and passion," said Salome Sandler Tally, founder and coach of the women's section of Aigle Noir AC, a professional club based in the Haitian capital.

"Qualifying for the World Cup is something special for a country that loves soccer so deeply."

The Grenadiers, as Haiti's team is known, made their only previous appearance at the Finals when it was held in West Germany in 1974.

"It is incredible to have achieved this 52 years later," Tally said.

'Pagan ceremonies'

In early April, the cash-strapped government allocated 264 million gourdes ($2 million) for the national soccer team as a qualification bonus and to help pay for World Cup preparations.

Haiti will face Brazil, Morocco, and Scotland in Group C. Its games will be played in the United States, which is co-hosting the tournament with Mexico and Canada from June 11-July 19.

In its World Cup qualifying campaign, Haiti did not play a single match on home soil.

The nation's main venue — the Sylvio Cator Stadium — has been closed since February 2024, as it is located in a Port-au-Prince neighborhood controlled by gangs, as is about 90 percent of the capital.

But the "beautiful game" is played everywhere by people who are barefoot, in flip-flops or in sneakers. They have matches on asphalt, dirt or worn-out artificial turf — in neighborhood leagues, interschool competitions and tournaments involving both professional and amateur clubs.

Patrice Dumont, a former senator and sports columnist, said that in Haiti, a deeply religious nation, summer holiday leagues "are sites of pagan ceremonies that would make even the most devout fanatics blanche" — an apparent reference to the charged atmosphere at the matches.

"You see them in every community — provided there is space — ranging from three-a-side matches to full 11-a-side games, always drawing massive crowds of spectators," he said.

Evens Lezin, a 49-year-old amateur player, said qualification for the World Cup will give "hope" to Haiti's youth.

"We can move forward, but it requires discipline," he said.

"Nowadays, many young people are delinquent. They struggle with alcohol, they smoke and they lack healthy recreational pursuits, but soccer can offer an escape."

In every conversation

The topic of soccer finds its way into every conversation. It bridges generational and social divides, and is talked about in restaurants, supermarkets, in living rooms and over the airwaves.

"Soccer is probably one of the few spaces for socialization still accessible to a large segment of the youth. It is the quintessential conversation starter," said soccer fan Marc Donald Orphee, 35.

Even though the majority of the men's and women's national team players play abroad, that has not diminished the public's devotion to the national side.

Pierreline Nazon, 18, a star of the women's under-20s team, compares herself to Melchie Dumornay, a Haitian midfielder for OL Lyonnes, a top French team.

Nazon spoke to reporters as she took time out from a training session in the hills above Petion-Ville, a suburb of the capital spared from violence.

"My dream has always been to play soccer — to be like Melchie, and even to surpass her," she said.

"I know I will achieve this. That is why I keep training, seizing every opportunity to play, even though the situation in Haiti is difficult."

In Haiti, soccer is played everywhere, by people who are barefoot, in flip-flops or in sneakers; in matches on asphalt, dirt or worn-out artificial turf, for neighborhood leagues, interschool competitions and tournaments involving both professional and amateur clubs. A quintessential conversation starter, it bridges generational and social divides.

SPORTS

BASKETBALL

After suffering two ACL tears in consecutive years, including one in a World Cup final, 31-year-old Wu Tongtong has returned to the court and rebuilt herself into one of the most complete guards of the 2025-26 Women's Chinese Basketball Association (WCBA) season, earning both regular-season MVP and assists leader honors, as well as re-establishing herself in the national team setup. AGENCIES

WALKING TALL ONCE AGAIN

Two career-threatening ACL injuries couldn't keep WCBA MVP Wu Tongtong down

Few setbacks are more cruel for an athlete than reaching the peak of their career only to be forced off the world stage by a torn ACL.

For Wu Tongtong, that ordeal came twice.

For the 1.75-meter guard, defined less by physical stature than by resilience, the challenge was not only to return, but to rebuild.

After suffering two ACL tears in consecutive years, including one in a World Cup final, the 31-year-old returned to the court and rebuilt herself into one of the most complete guards of the 2025-26 Women's Chinese Basketball Association (WCBA) season, earning both regular-season MVP and leading assists honors.

Setbacks

Just a few years ago, though, Wu's career appeared to be unraveling.

In the final of the 2022 FIBA Women's Basketball World Cup in Sydney, Wu, one of China's best-known all-around guards, combining a sturdy frame with reliable shooting range, suffered a devastating ACL tear in her left knee, along with severe meniscus damage.

For many athletes, such an injury can seriously alter — if not permanently end — a career.

After surgery and rehabilitation, she initially responded with optimism. The forced pause, she believed, might offer some balance after years of nonstop competition between national team duty and the WCBA.

"People always have ups and downs," she said. "I could rest, spend time with family, reset and come back."

Her recovery from the first surgery progressed smoothly, reinforcing her belief that a return to form was within reach.

Then came the second blow.

In June 2023, during a training session as she neared a comeback, Wu tore the ACL in her right knee.

"I hadn't even officially returned to the court, and I went down in the same way again," she said. "That made me feel desperate."

Before the injuries, Wu had rarely been sidelined.

Coaches and trainers consistently praised her physical condition. But, after the second tear, uncertainty replaced expectation.

Walking became difficult. Daily life, once effortless, required assistance.

Watching others play from afar, she was forced to confront an unfamiliar identity as an athlete separated from the game.

Struggle

Wu, who grew up in Fuxin in Northeast China's Liaoning province, had shown athletic promise from an early age. She ran fast, skated well and drew attention from multiple sports programs, with coaches from different disciplines trying to recruit her.

But when her father asked what she wanted to pursue, the girl's answer was immediate: basketball.

"At the time, I didn't have big ambitions like making the national team," she said. "I just loved playing."

That love supported her as she left home at a young age to pursue basketball, and it also became her anchor through the darkest period of her career.

To shorten the recovery timeline, Wu made a bold medical decision during her second surgery, opting for an artificial ligament implant.

Doctors warned that it would carry greater risk and long-term uncertainty than traditional reconstruction using the body's own tissue.

"If I didn't do it, I would face another long recovery period," she said. "Basketball has given me so much. I was willing to give something back."

The road back, however, was grueling.

In training, she sometimes struggled with basic movements, even simple jumps onto a 10-centimeter platform that children could complete easily.

Repetition bred doubt, and there were moments when she questioned whether she would ever return to the elite stage.

Driven more by inner resolve than external examples, Wu leaned into solitude during rehabilitation, spending 438 days away from competition while rebuilding herself physically and mentally, step by step.

"I always place responsibility on myself," she said.

"As long as I am still here, and mentally strong, I can face anything."

Rebirth

Her return began quietly, without fanfare.

Last season, she left Shanxi Flame after nine years and joined Xinjiang Magic Deer. The transition coincided with her ongoing physical rebuilding and a team still trying to find its shape.

The turning point came in the offseason, when she trained under former China women's national team head coach Zheng Wei with the Guangdong squad for China's 15th National Games. Immersed in high-intensity competition throughout the summer, she went through a physically demanding, but transformative period that gradually restored both her fitness and confidence, ultimately helping her team win the title.

By the 2025-26 WCBA season, Xinjiang had emerged as one of the league's surprise contenders.

Led by veterans including Wu, Wang Xuemeng and Zhang Qifang, the team steadily advanced through the season and into the semifinals.

Wu played a central role, averaging 17 points and 8.9 assists per game, while serving as both the primary initiator and offensive organizer.

"I thought I would improve, but I didn't expect these awards," she said. "It's an affirmation. I'm grateful to my teammates."

Before each game, her primary wish is simply to come through unscathed, but once the ball is tipped, caution disappears and competitive instinct takes over.

"I've made peace with the injuries," she said.

"If you keep dwelling on the past, you're wasting the present version of yourself."

The injuries have also reshaped how she sees her role. Once focused mainly on her own performance, she now sees herself as a connector and mentor.

On the sidelines, she often breaks down tactical details for younger teammates and emphasizes injury prevention, urging them to value their bodies.

As Chinese women's basketball continues to evolve, and younger players rise through the system, Wu acknowledges that her national team role may be changing. Instead, she is focused on something simpler and harder to lose — her love of the game.

"Anyone who truly loves something should have something to pursue," she said. "If someone has gone through similar difficulties as me, I hope they can stand back up, too."

XI'S VISION | GOVERNANCE PERFORMANCE

Village fostered new philosophy of development

Recasting of relationship between growth and environmental protection resonates still

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

More than two decades ago, Yucun, a village in Anji county of East China's Zhejiang province, was known for what locals called the "stone economy". Quarrying and cement production brought income and made Yucun one of Anji's better-off villages, but the prosperity came at a heavy environmental cost: Hills stripped bare, waterways polluted and the air thick with dust.

Yucun began shutting down its quarries, a decision that sharply reduced village income. The choice that the village faced was stark: Keep quarrying, or seek a different future — one built around ecological restoration.

At that crossroads, Xi Jinping, then Party secretary of Zhejiang province, visited the village in August 2005. After hearing briefings from local officials, he endorsed the shutdown as a wise move and said growth should not come at the expense of the environment, because such growth is not development.

He also put forward a concept that would later become widely cited: "Lucid waters and lush mountains are invaluable assets."

The idea was rooted in a concrete local choice rather than abstract theory, and it soon reached far beyond one village. It resonated not only because it recast the relationship between environmental protection and economic growth, but also because it challenged the GDP-centered view of governance performance that prevailed at the time.

Qian Kunfang, then Party secretary of Anji county, recalled that in an era when "GDP first, even industry first" prevailed, economic indicators were the most direct yardstick for judging local officials. He said that if officials failed to deliver results, they were effectively putting their political future at risk.

In that context, Xi's endorsement of Yucun's shift sent a clear message: Restructuring the economy and protecting the environment were not a retreat from development, but a different understanding of what real development — and real governance performance — should mean.

Two decades later, that shift is being reinforced through a Party-wide education campaign on fostering and practicing a correct view of governance performance.

For Xi, the commitment to high-quality development should become an important part of officials' correct view of governance performance.

Speaking on Jan 20 at a study session for principal officials at the provincial and ministerial levels, Xi said that such a view requires officials to proceed from reality, follow objective laws, and rely on sound decision-making and hard work to deliver results that stand the test of practice and history and are recognized by the public.

In 2023, during the annual two sessions meetings of China's top legislative and political advisory bodies, Xi warned against taking a hasty, resource-depleting or GDP-only path, saying that this was why the new development philosophy must be firmly established.

The environmental field has been one of the most visible areas where that philosophy has taken shape. Xi has repeatedly emphasized that "to protect the environment is to protect productivity, and to improve the environment is to boost productivity".

Yucun offers a concrete example of how that principle works on the ground. Yu Xiaoping, deputy Party chief of Yucun, said the village has stayed true to its ecological foundation while developing agritourism, cultural tourism and educational tourism programs based on local conditions, turning ecological gains into a driver of common prosperity.

According to Yu, in 2025, the village's collective economic income reached 17.22 million yuan ($2.52 million), per capita income among villagers stood at 74,800 yuan, and the village received 1.25 million tourist visits. Yucun distributed 3.17 million yuan in dividends that year.

To some foreign observers, China's green transition has also become a test of how governance performance should be understood — not by short-term output alone, but by long-term public benefit.

David Ferguson, a British translator, said that people-centered development is the overarching theme of the new development philosophy, which advocates innovation, coordination, green development, openness and shared prosperity. "Green development, one of President Xi's priorities, is about giving people a beautiful living environment and handing it down to their children and grandchildren."

All-out rescue urged after fireworks blast

By **CHEN MEILING** in Beijing and **HE CHUN** in Changsha

President Xi Jinping demanded a prompt investigation and proper handling of the aftermath following an explosion at a fireworks plant in Central China's Hunan province on Monday, stressing that those responsible must be held accountable.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made an instruction ordering strengthened risk screening and hazard control in key sectors, enhanced public safety management, and efforts to safeguard people's lives and property.

Authorities across regions and departments must draw profound lessons from the accident and reinforce responsibility for workplace safety, Xi stressed.

Premier Li Qiang, who is also a member of the Standing Committee of the Political Bureau of the CPC Central Committee, urged efforts to strengthen workplace safety in key industries and sectors and resolutely prevent the occurrence of major accidents.

Vice-Premier Zhang Guoqing led senior officials from relevant departments to Liuyang, a county-level city under the provincial capital Changsha, on Tuesday to guide emergency rescue and response efforts following the explosion.

Zhang stressed the need to spare no effort in searching for the missing, treating the injured, and advancing the investigation and rectification of risks and hidden dangers in key industries and sectors.

He also called for intensifying the crackdown on illegal and noncompliant activities in the fireworks and hazardous chemicals industries. Violations — including overstaffing, excessive use of gunpowder, operations beyond the licensed scope, production exceeding designed capacity, and unauthorized alteration of workshop usage and production processes — must be severely penalized.

The State Council, China's Cabinet, will establish an accident investigation team to look into the case.

The explosion occurred at around 4:40 pm on Monday at the plant of Huasheng, a fireworks manufacturing and display company. As of late Tuesday, it had caused 26 deaths and had left 61 people injured.

Officials said at a news conference in Liuyang on Tuesday afternoon that on-site rescue operations had been basically completed, with efforts being made to treat the injured, prevent secondary disasters and inspect fireworks producers in the city, which have all halted operations as of 7 pm on Monday.

Before the conference, all participants observed a moment of silence for the victims.

Chen Bozhang, deputy Party secretary and mayor of Changsha, said that the Changsha Party Committee and the municipal government expressed deep condolences and offered sincere apologies to the victims' families, as well as the injured, other affected people and the whole of society.

Chen said that more than 1,500 personnel from multiple departments have been mobilized to carry out emergency rescue, medical treatment and other related work.

"Personnel verification is underway. The person in charge of the company has been detained by police," he added.

Ding Weiming, Party secretary and political commissar of Changsha's fire and rescue team, said that responders faced major challenges — a high risk of repeated explosions and harsh site conditions.

A large quantity of finished and semifinished products on site reignited sporadically, keeping the blasts going, Ding said, adding that gunpowder stored nearby could not be quickly moved, posing a threat to rescue workers.

Meanwhile, the plant's walls, pillars and roof had largely collapsed, burying victims and blocking access to the scene, he said.

Ding noted that fire trucks and remote-controlled water cannons will be used to protect the two intact but highly hazardous on-site gunpowder depots.

Liu Jiayong, secretary of the Party Leadership Group of the Changsha Health Commission, said that among the 61 injured, 55 have minor injuries and were in stable condition after receiving treatment, while six were in a critical condition and were receiving targeted treatment.

Dai Shuiwen, mayor of Liuyang, said, "We have closed fireworks plants and launched comprehensive safety inspections and rectification campaigns across all sectors simultaneously, in order to close regulatory loopholes, hold companies fully accountable for safety and raise overall safety standards."

Liuyang is a major fireworks manufacturing hub in China, accounting for about 60 percent of the domestic market and roughly 70 percent of the nation's exports.

Zero-tariff policy to advance Africa's renaissance

China has expanded zero-tariff treatment to all 53 African countries that have diplomatic relations with it, a move that will reinvigorate the African renaissance dream and marks a major shift in China-Africa cooperation.

From May 1 this year to April 30, 2028, China will grant zero-tariff treatment — in the form of a preferential tariff rate — to 20 African countries that have established diplomatic ties with China and are not classified as least-developed countries. This builds on China's existing zero-tariff policy for 33 least-developed countries in Africa, which took effect in December 2024. Together, these 53 African countries will enjoy zero-tariff access to a consumer market of over 1.4 billion people — one of the largest in the world.

The zero-tariff policy presents a rare opportunity for China and Africa to upgrade trade, remove barriers and foster more open markets. It will also help Africa revitalize its industrialization and unlock agricultural potential, as well as modernize and standardize agricultural production and agri-processing. With zero tariffs in place, Africa is poised to attract Chinese investment and expand production capacity in mining — a sector that has long been a global supplier of critical minerals such as copper, cobalt and lithium — to drive the growth of local manufacturing industries.

YUM CHA: GREETING THE DAY THE GUANGDONG WAY

Cantonese chefs help ensure traditional morning repast continues into the present

By **LI YINGXUE** and **LI WENFANG** in Guangzhou

At daybreak in Guangzhou, the capital of Guangdong province, the city seems to stir itself awake to a single call — "water's boiling, tea is perfect".

In the teahouses, bamboo steamers rise and cups are rinsed in practiced rhythm. Here, nothing dispels the night's fatigue quite like *yum cha*, or morning tea — "one pot of tea, two dim sum dishes".

China Vibes — FOOD —

For Patrick Parsons, Lord Oxmantown and heir apparent to the Earldom of Rosse in Ireland, this time-honored Lingnan ritual is not only a window to a different culture — one in which he has immersed himself for more than two decades, and shared with his Chinese wife of 22 years — but a deeply felt part of everyday life.

On Parsons' personal *yum cha* menu, *har gow* — delicate shrimp dumplings — takes pride of place.

"The wrapper is translucent, the texture is excellent. I love shrimp, and these are done beautifully," he said, adding that *siu mai*, or pork dumplings, is another favorite.

New generation saddles up for equine success

Equestrian sports sector spurred on by growing professionalism, popularity

Left: A teenager trains at an equestrian training center in Shenyang, Liaoning province, on Feb 10. ZHANG WENKUI / FOR CHINA DAILY **Right:** Children interact with a horse during a New Year's horse racing event in the Sandu Shui autonomous county in Guizhou province on Jan 1. YANG WENBIN / XINHUA

Kong Linghai's workday begins at six in the morning. He feeds and grooms his horses, cleans their stables, and then saddles them.

For the 28-year-old horse riding instructor at Mingyang Equestrian Club on the outskirts of Harbin, Heilongjiang province, these seemingly routine tasks are trust-building rituals with the animals in his care.

"Horses are living creatures and you have to understand their nature before you can communicate with them," he said.

Since Kong graduated from the Inner Mongolia Agricultural University with a degree in sport horse training and management six years ago, he has worked his way up from apprentice to instructor, cutting his teeth at equestrian clubs in Beijing and Harbin and teaching more than 6,000 students.

His trajectory reflects a broader shift, in which professionals with university and college equine training like Kong are becoming increasingly sought after in a country undergoing cultural changes in the relationship between humans and horses.

China is home to 3.6 million horses and more than 2,000 equestrian clubs, according to government data, and the sector's market size reached 21 billion yuan (about $2.9 billion) by the end of 2023. The figure is expected to surpass 60 billion yuan by 2030, according to the market consultancy iiMedia Research.

Lured by the thrill

When Huang Ying first saw a horse in late 2024, he was in his first semester at Hejun College in Huichang county, Jiangxi province. Before that, the 19-year-old's world revolved around basketball.

Then, the horses arrived at the college's newly built equestrian center. "When I saw them for the first time, I was amazed by how gentle and calm those large animals were," he recalled.

The first time he was given an opportunity to try horseback riding, he recorded the moment on his phone. "The horse's back was so high, and I was terrified. I was afraid of falling off. I was telling the people below to hold it steady," he said.

The thrill lured Huang into spending the following weeks mucking out stables, mixing feed, and hauling hay — work the college requires all equestrian students to do before they are allowed to mount a horse. It was during those hours of shoveling and sweeping that he began to consider a new path.

As Huang engaged in the stable chores, he formed a bond with the horses and chose to become an instructor after the faculty pointed him to equine career possibilities that also included training as a professional rider, farrier or stable manager. "I'm patient. I wanted to teach others, the way I was taught," he said.

In addition to his affinity with horses, he saw a career advantage in choosing equestrian sports.

"Basketball, soccer and badminton are too popular. There are too many people competing for those jobs. For someone like me, at a vocational college, going up against graduates from top-tier sports universities, I probably wouldn't stand a chance," he said.

Yu Hui, Huang's instructor at Hejun College, said the teaching objective is to train a new generation of industry professionals equipped with technical and management skills and formal credentials.

"Before, the equestrian coaching industry in China was dominated by people who were rough around the edges," Yu said candidly. "They might have known how to ride, but they lacked education."

A graduate of Wuhan Business University's horse racing and management program, Yu spent a decade working as an instructor in commercial equestrian clubs before joining the college in 2022, when the equestrian program was established.

He rose from apprentice to head instructor, specializing in youth education, show jumping, competition horse training, and instructor development.

The shift from club instructor to university instructor, he said, required a fundamental rethink of his role.

At the clubs, his students were children ages three to 16, brought by parents with specific goals of improving posture, or acquiring a riding credential to boost applications to Western universities, where equestrian skills are sometimes viewed favorably.

His teaching philosophy at the college follows a sequence: from understanding the horse and mastering the technique, before learning to work with people on a professional level. The top priority is treating horses with respect, he added.

"Equestrian sports are about equality between human and horse and any form of abuse is unacceptable," he noted.

This philosophy has already made an impact on students like Huang. "You have to be gentle with a horse. You can't shout at it or lose your temper. Horses can sense your emotions. If you approach them with anger, they'll lose trust in you. They might bite or kick," he said.

Huang learned to read the animal through subtle physical cues, such as the tilt of an ear, a shift in its stance and the rhythm of its breathing.

He recalled one horse in particular that was prone to becoming spooked and bolting. "I was scared. I thought, if I get seriously hurt from this, what happens to my career?"

Instead of backing away, he sought advice from his instructors, and over time, the horse began to trust him. "There's a sense of conquest, a sense of accomplishment, when you earn that trust," he said.

Grabbing the reins

Over the years, Kong Linghai has found increasing security with his equine career, and is a rarity among his peers for holding a formal university degree.

"When a horse is acting up, a trained professional will understand the animal's nature and apply systematic knowledge to address the issue. Someone without that background might resort to harsher, more forceful methods," Kong said.

The details matter when it comes to teaching in a real setting such as parents worrying about their child's safety, he said.

Kong recalled one incident, when a mother thought the horse was too big and "wild" for her son. He didn't change the horse. Instead, he observed the boy's riding skills and concluded that the problem wasn't the horse's temperament, but how the youngster was handling the reins.

He taught the child to adjust his grip and timing. Soon, the boy went from barely controlling the horse to riding it with ease. The parents went from constant complaining to full acceptance. "That's what specialized knowledge can do," Kong said.

Wang Yonghao, who runs Mingyang Equestrian Club in Harbin, said, "Instructors with formal education are far more capable overall than those who learned on the job".

Riders from the Inner Mongolia or the Xinjiang Uygur autonomous regions may have excellent riding skills, but they often lack the theoretical foundation and broader competencies that a formal education provides, he added.

Wang also views his equestrian club as part of a broader shift in how equestrian sports are being marketed in China.

Before opening the club in November 2025, Wang spent years in the field of culture and tourism, running a trail-riding camp in the vast Hulunbuir grassland in the north of the Inner Mongolia autonomous region.

He noticed a recurring pattern where many young people wanted to learn to ride but were put off by the cost of traditional equestrian clubs.

"Under the conventional model, lessons are expensive. Many families and young adults simply can't afford the tuition, even if they're drawn to the lifestyle," Wang said.

He set out to create something between a full-service club and a tourist attraction.

Mingyang sits on a 50,000-square-meter plot about 20 to 30 kilometers from downtown Harbin. It combines riding lessons with trail rides, camping, fishing, a petting zoo, and photo shoots. The aim, Wang said, is to "make equestrian sports more accessible — less remote and exclusive — so ordinary people can enjoy".

A casual ride costs 70 to 80 yuan per hour, while a structured lesson for a child runs from 300 to 400 yuan. A crash course designed for beginners costs around 900 yuan for enough sessions to learn basic control to ride independently.

In Beijing or Shanghai, comparable training would cost two to three times as much.

Four months after opening, the club's popularity exceeded Wang's expectations. "On weekends and holidays, we're fully booked," he said.

With 19 horses and four full-time instructors, the club can handle about 40 to 50 riders a day, plus family members who accompany them. On busy days, around 200 people come through the gates.

"What we're seeing is a shift. Equestrian sports are moving from being an elite pursuit to something more mainstream," he added.

Wang said the way forward involves continuing to bridge the gap between elite equestrian culture and the broader public.

"In a city of about 10 million people, only a few clubs offer serious instructions. That tells you how much room there is to grow," he said.

Rising enrollments

Yu, the instructor in Jiangxi, said the growth in demand is reflected in enrollment numbers.

When Hejun College launched its equestrian program in 2022, it admitted just over 20 students. By 2023, the number had grown to more than 40. By 2025, nearly 200 students were enrolled in equestrian studies.

Yu said the college now boasts one of the largest equestrian facilities in Jiangxi, with a 40-by-50-meter indoor arena and a 30-by-40-meter outdoor training area, a two-story stable with 40 stalls, and a fleet of 19 horses, including one warmblood used for competition. A second, larger venue is under construction nearby, designed to host major competitions.

The curriculum combines practical stable work with theoretical courses on horse nutrition and care, stable management and equine anatomy.

"The most important attraction for students is job placement," Yu said. "Our first-time employment rate is over 95 percent, with more than 90 percent of graduates entering equestrian-related fields," he said.

The college has partnerships with more than 200 equestrian clubs across China, many in first- and second-tier cities where the industry is growing fastest. Some students receive job offers before they graduate. "The market has a huge appetite for skilled talent," Yu said.

The growth of Hejun's program reflects a broader policy push. In 2020, China's Ministry of Agriculture and Rural Affairs and the General Administration of Sport jointly issued the national equestrian industry development plan (2020–25), which explicitly called for integrating the equestrian industry with tourism, culture, and animal husbandry.

The plan envisioned a complete industrial chain, from breeding to sporting events management, and signaled that equestrian sports were no longer niche hobbies but a recognized economic sector.

Zhao Chunjiang, director of the equine research center at China Agricultural University in Beijing, sees the trend as part of a larger pattern.

Equestrian sports and their competitive levels are closely tied to a country's economic development, Zhao said. As incomes rise in China, he expects participation to grow accordingly.

The benefits extend beyond physical fitness, he said. Working with horses builds willpower and resilience, and the sport's inherent emphasis on etiquette can add a refined quality to a person's character that is increasingly valued in contemporary society, Zhao explained.

Yet he acknowledges that barriers remain. Equestrian sports demand high-quality facilities and well-trained horses. They're still a niche activity in China, not yet as widespread as in Western Europe, he added.

Zhao argues for innovation in business models to broaden participation, along with greater domestic breeding of sport horses to reduce costs and improve animal welfare.

A horse-riding performance takes place during the opening ceremony of the 7th Beijing International Garden Festival in the capital on April 28. ZOU HONG / CHINA DAILY

Threats, strikes test fragile Mideast truce

US, Iran trade charges over Hormuz control, UAE reports attacks on its energy facilities

By CUI HAIPEI in Dubai, UAE
cuihaipei@chinadaily.com.cn

Tensions were reignited in the Middle East on Tuesday as the United States and Iran traded charges over the Strait of Hormuz and the United Arab Emirates came under Iranian missile and drone attacks, threatening a fragile ceasefire that has held for more than three weeks.

Mohammad Bagher Ghalibaf, speaker of Iran's parliament, accused the US of undermining regional security and the security of global shipping and energy transit with its moves to end Iran's hold on the strait.

Ghalibaf warned that Tehran will respond to such provocations. "We know full well that the continuation of the status quo is intolerable for America, and we have not even started yet," he said in a social media post.

The latest escalation came after the UAE reported Iranian attacks on Monday for the first time since the truce was declared on April 8. The close US ally confirmed it was targeted by 12 ballistic missiles, three cruise missiles and four drones — all launched by Iran.

"These attacks constitute a dangerous escalation and unacceptable violation, posing direct threats to the UAE's security, territorial stability and civilian safety," the UAE's Foreign Ministry said in a statement.

One Iranian missile hit an energy facility in the constituent emirate of Fujairah, leaving three Indian nationals injured, while a drone attack targeted a tanker operated by the Abu Dhabi National Oil Co, a state-owned oil giant, authorities said.

A senior Iranian military official did not deny the strikes, but emphasized that the Islamic republic had "no preplanned program to attack the oil facilities in question".

"US officials must end their ugly behavior of using force in a diplomatic process and stop military adventurism in this sensitive oil region, which affects economies around the world," the official was quoted as saying by Iranian state television.

Iran's Foreign Ministry spokesman Esmaeil Baghaei accused the UAE of backing and cooperating with the "aggressors" against Iran, saying that all regional countries have hopefully "learned the necessary lessons from the developments that occurred during these 50 days".

US President Donald Trump has repeatedly demanded that Iran fully reopen the Strait of Hormuz, a strategic maritime corridor through which about one-fifth of global crude supplies were transported before US and Israeli forces launched strikes against Iran on Feb 28.

Iran has, however, vowed not to relinquish control of the strait, which is its core geopolitical leverage.

Trump claimed that US forces had "shot down" seven small Iranian military boats. A US admiral earlier said that six such vessels were destroyed, but Iran denied it all. Instead, it said a US naval frigate was hit, a claim that has been denied by the US military.

Authorities in South Korea confirmed on Monday that its cargo vessel HMM *Namu* suffered an engine room explosion and fire while navigating the strait, but said no crew members were injured.

Iran's Foreign Minister Seyed Abbas Araghchi said on Tuesday that the ongoing events in the strait prove "there is no military solution to this political crisis", and he praised Pakistan's sustained mediation efforts.

"The US should be wary of being dragged back into a quagmire by ill-wishers. So should the UAE. Project Freedom is Project Deadlock," he wrote on social media, referring to the plan announced by Trump to "guide" stranded ships from "neutral countries" out of the Persian Gulf.

Saudi Arabia joined calls for de-escalation of the Middle East situation on Tuesday, urging diplomatic means to reach a settlement. German Chancellor Friedrich Merz urged Tehran to return to the negotiating table and stop weaponizing regional energy transit, echoing appeals from French President Emmanuel Macron and British Prime Minister Keir Starmer.

Oil prices retreated slightly on Tuesday after surging on Monday. Brent crude, the international standard, fell $1.14 to $113.30 per barrel. Before the Iran war began in late February, it was trading near $70.

The Strait of Hormuz is a thoroughfare for global supplies of not just oil, but also fertilizers and other commodities. As it has remained virtually closed since the US and Israel launched attacks on Iran, global prices have continued to rally.

Shooting in Washington DC

Law enforcement officers stand guard near the scene of an officer-involved shooting on Monday in Washington, DC. The United States Secret Service said a man spotted carrying a gun in the vicinity of the White House by plainclothes agents was shot by law enforcement after he opened fire on them near the Washington Monument. The incident led to a brief lockdown at the White House. JONATHAN ERNST / REUTERS

Growth: Green efforts benefit world

From page 1

Amery Browne, former foreign minister of Trinidad and Tobago, said China's experience challenged the assumption that material progress must come at the expense of the environment.

What impressed him, he said, was that ecological protection had been given priority, while renewable energy and related advances could also contribute to global efforts to tackle climate change and other shared challenges.

China's green industries are also reshaping global markets. Its renewable energy products are exported to more than 200 countries and regions, meeting over 80 percent of global demand for photovoltaic components and 70 percent for wind power equipment, and helping countries around the world — particularly developing nations — gain access to clean, reliable and affordable energy.

China has also remained the world's largest producer and seller of new energy vehicles for 10 consecutive years.

Beyond the environmental field, the same decision-making logic has shaped other areas of governance.

It can be seen in targeted poverty alleviation, which rejects one-size-fits-all remedies, and in the development of new quality productive forces, which stresses local strengths over blind imitation.

This logic is also reflected in cultural heritage protection, where preservation is treated as an achievement in governance. In regional strategies, it means matching resources, industries and functions across wider areas instead of chasing isolated, short-term gains.

Hong Xianghua, a professor at the Party School of the Communist Party of China Central Committee (National Academy of Governance), said scientific decision-making has become an important pillar of China's efforts to modernize governance and pursue high-quality development.

At its core, the approach reflects a people-centered philosophy that measures governance performance by whether it improves lives and can stand the test of time, he said.

It also requires systematic planning — balancing development with protection, efficiency with fairness, and immediate needs with long-term goals — while grounding policy in China's realities and objective laws of development, he added.

In a more complex domestic and international environment, sound decision-making is essential for identifying development trends, managing risks, building consensus and turning institutional strengths into more effective governance, Hong said.

Teahouses: Commitment to craftsmanship reinforced at legal level

From page 1

His tea habits, too, have undergone a quiet transformation. In Ireland, black tea is typically served with milk and sugar. But in Guangzhou's teahouses, Parsons has come to prefer tea in its pure form.

Whether Pu'er or his favored Jin Jun Mei, he drinks it unadulterated. "Even when I'm abroad now, I never add milk or sugar," he said. "I've learned to appreciate the tea itself — its original flavor is much clearer this way."

This immersion in a culture of food and sociability has led him to draw parallels with home. In his view, the lively atmosphere of Guangzhou's teahouses echoes the social function of Irish pubs.

"It's a bit like being in a pub in Ireland," Parsons observed. "People come together for that warm, convivial atmosphere. It feels similar," he said.

Despite differences in timing — morning tea versus evening drinks — the purpose, he added, is strikingly similar: "to meet friends, to gather with family. It can feel a little chaotic, but that's part of its charm."

He is also intrigued by the finer details of the tradition, such as the custom of tapping fingers on the table to express thanks when tea is poured — often linked to a story about the Emperor Qianlong traveling incognito among commoners.

"That kind of story gives the ritual a deeper meaning," he said.

For those safeguarding this culinary heritage, the teahouses' bustle rests on exacting craftsmanship.

Xu Jinhui, executive chef of the China Hotel, describes Cantonese morning tea as "a cultural ritual" blending dim sum, tea and human connection.

In his view, dim sum is the "face" of Cantonese culture, and *har gow* its ultimate benchmark. "The wrapper must be thin yet resilient, crystal-clear, with the classic 13 pleats," Xu explained. "One bite should be fresh, tender and smooth. That refinement is the essence of Cantonese dim sum."

He emphasized rhythm and balance: tea first to awaken the palate, then steamed items for purity of flavor, fried dishes for texture, and sweets to finish — layering taste while avoiding heaviness.

Yet the passage of time has brought a sense of urgency.

"In more than 30 years in this trade, I've seen too many old techniques and flavors quietly disappear," Xu said.

"If we don't act now, they may be gone for good in a few decades."

That concern has led to projects aimed at reviving "lost dim sum", some requiring painstaking reconstruction. He cited the example of Jinling duck taro dumplings, where the ratio of taro paste, wheat starch and lard — and even the precise oil temperature tested with small fragments — determines the signature honeycomb texture.

Traditional methods, such as hand-pounding fillings, are preserved in defiance of industrial shortcuts, with the aim of "putting museum pieces back onto the plate".

This commitment to craftsmanship is now reinforced at the legal level. Regulations on the protection and inheritance of Guangzhou's morning tea culture, took effect on May 1, marking the country's first legislation dedicated specifically to *yum cha*.

They establish standards for on-site traditional preparation and require clear disclosure of production methods, including a strict 24-hour window for freshly made dim sum. Freshness, once reliant on a chef's discipline, is thus codified as a consumer right.

After navigating the crowds of the Canton Fair, Parsons returned to a teahouse table. Recalling his first visit years ago, he said the snacks and teahouses already left a strong impression — simpler than today, but just as special.

As tradition and regulation evolve together, *yum cha* continues to adapt. Yet each morning, the ritual endures: diners rinse their cups, share a few baskets, and ease into the day — one sip of tea, two bites of dim sum.

AI app by ByteDance explores paid plans for revenue

By CHENG YU
chengyu@chinadaily.com.cn

Doubao, a flagship artificial intelligence app developed by Chinese tech company ByteDance, is testing a tiered subscription model that would charge users up to 500 yuan ($73) per month, a move that industry experts called a clear sign of Chinese AI large model developers pivoting from increasing user volume to generating revenue.

A recent service notice on Doubao's app store page outlined three monthly pricing tiers: a standard plan for 68 yuan, an advanced plan for 200 yuan and a professional plan for 500 yuan. ByteDance said the plans are still being tested and full details will be released through official channels, adding that some free services will also continue.

People familiar with the matter told China Daily that the paid features will target more complex, productivity-driven use cases, including automated PowerPoint generation, deep data analytics and film or video content creation.

Industry experts said the move reflects a broader shift across China's AI sector, where companies are racing to prove commercial viability after years of heavy investment.

According to statistics from global financial data and analytics platform Wind, AI companies performed differently in 2025. While 35 leading AI companies reported net profit growth of more than 50 percent year-on-year, 40 enterprises saw their revenues decline, highlighting the tension between rapid AI adoption and profitability.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said that Doubao's pricing experiment underscores a significant shift occurring in China's AI industry.

"After an initial phase of spending money to increase their size, developers are now under pressure to build sustainable revenue streams, shifting their focus from accumulating traffic to extracting value," he said.

The idea to charge users is driven by a surge in computing costs due to explosive demand. According to ByteDance cloud platform Volcano Engine, as of March, Doubao's underlying large model processed more than 120 trillion tokens per day, doubling in just three months and expanding roughly a thousandfold since its launch in May 2024.

Tokens are the fundamental units of data processed by AI models. The platform said the number of enterprise clients exceeding 1 trillion cumulative token usage is currently 140, compared with 100 at the end of last year.

Tan Dai, head of Volcano Engine, said in a previous news conference that the difference in token pricing essentially reflects a difference in capability.

"More advanced models carry higher costs per token, but they also generate greater economic value," Tan added.

Subscription models for AI services are already well established globally. Leading models such as ChatGPT, Claude and Gemini typically charge between $8 and $20 per month for entry-level plans, with premium tiers priced at $200 to $250.

"The shift to paid models signals a new competitive logic — not who can attract the largest number of users, but who can translate AI capability into measurable economic returns," said Wang, the researcher.

China's demand for AI data is growing rapidly, and it is beginning to reshape the economy. According to the latest figures from the National Data Administration, daily token usage soared from just over 1 trillion at the start of 2025 to 100 trillion by the end of the year.

A worker uses a forklift to carry plastic waste before putting it into a compressor for recycling in Bentong, Malaysia's Pahang state, in 2024. AFP

SUPPLY SQUEEZE

Demand for recycled plastic soars amid conflict in the Middle East

Under a cloudy sky in early April, five workers feed discarded Cookie Monster nappies into a machine to shred and recycle them.

"This is the warm 'popcorn' for low-density polyethylene, or LDPE, as a base material for industrial packaging, tarpaulin and drip tape," said G. Aushal, managing director of Sannanda Rika.

His company sources discarded plastic waste from the European Union and Japan to recycle it into up to 500 metric tons of LDPE materials every month. On the floor of the recycling plant, located 50 kilometers west of Kuala Lumpur, are hundreds of pallets of 25 kg packs of LDPE that are wrapped and stacked.

The Iran war has affected not only the flow of oil but also plastic supply. Aushal's recycled plastic firm, along with others in the industry, has seen increased demand.

He said: "A Singapore-based customer could not secure plastic supply, so he asked me to ship up to three 40-foot containers of recycled plastic resin per week instead of per month previously." One container typically carries 27 to 28 tons.

Will Low, vice-president of the Malaysia Plastic Recyclers Association, said the demand for recycled materials has risen an estimated 20 to 30 percent since the US and Israel launched airstrikes against Iran in end-February. "At the same time, prices of some virgin materials have increased more than 50 to 60 percent. That is why some manufacturers have brought forward plans to increase the percentage of recycled materials in their product," he said.

In a blog post on April 12, Malaysia's Deputy Finance Minister Liew Chin Tong said now is the best time to scale up the plastic recycling industry amid a shortage of imported plastic resin in Malaysia.

Given the shortage, Low said recycled plastic is a strategic alternative.

"Typically, the price of recycled resin final product is 10 to 20 percent lower than virgin resin, which is produced directly from crude oil. We are pushing hard for the government to implement Extended Producer Responsibility (EPR) to drive the demand for recycled resin," he said.

A worker installs low-density polyethylene plastic roll into a machine at a plastic factory in Klang, Malaysia's Selangor state, in 2024. MOHD RASFAN / AFP

EPR makes producers responsible for products across their life cycle to reduce plastic waste. The Malaysia Plastics Sustainability Roadmap aims to increase recycled content in packaging from 10 percent in 2023 to 15 percent in 2030 to stimulate investments in the "collection, sorting and recycling industries".

Malaysia's Housing and Local Government Ministry plans to make some manufacturers — depending on their size — report the recycled content of plastics, paper, metal, used beverage cartons and glass in their products by 2030.

While there is increased demand for recycled resin, it cannot always replace virgin resin. The usage of recycled resin is limited to certain categories of plastic products.

Mike Tan, chairman of the Malaysian Plastics Manufacturers Association's Johor branch, said: "High-precision electronic components and medical devices, including some personal protective equipment, often require virgin resin due to its superior heat resistance and robust insulating properties."

An industry veteran said the toughness of plastic resin is reduced each time it is recycled.

"Household products can use more recycled plastic resin, as at most it affects the color with a lower risk of breaking. But automotive products need higher-quality material, as recycled resin may not provide long-lasting durability," said the 41-year-old, who wanted to be known only as Chia.

Before its recent uplift in prospects, Malaysia's plastic recycling industry had been under scrutiny over contaminated plastic scrap imports.

In 2019, then Environment Minister Yeo Bee Yin vowed that Malaysia would not become a dumping ground for overseas plastic waste and pledged to return illegal shipments to their countries of origin.

According to 2025 data from the United Nations Commodity Trade Statistics Database, Malaysia imported $162 million worth of plastic scrap weighing nearly 460,000 tons, making it the third-largest in the world behind only the Netherlands and the US. This value has tripled from a decade ago.

To clamp down on the smuggling of plastic waste, Malaysian officials in February proposed a three-month moratorium on plastic imports before making a final decision on whether or not to import plastic waste at all.

The United Nations Development Programme estimated Malaysia produces over 1 million tons of plastic waste annually, of which a mere 10 percent is recycled.

"If you ask me, there may be no need to import plastic waste at all," outgoing Malaysian Anti-Corruption Commission Chief Azam Baki, who is leading the clampdown on illegal e-waste and plastic waste, said on April 2. He said that improving domestic waste management systems could eliminate the need for imports altogether.

In July 2025, Malaysia further restricted the import of plastic waste by insisting on pre-shipment inspections in exporting countries to address the health and environmental risks linked to illegal or poorly managed plastic waste practices.

But two researchers at Monash University Malaysia — Associate Professor Saman Ilankoon and his PhD student Shafeeq Ahmed Syed Ali — said if domestic plastic waste is not separated at its source, "it does not produce enough good quality and uncontaminated feedstock for the local industry".

"Meanwhile, imported homogeneous plastic sources offer higher-quality feedstock for producing high-value resin and generating sustainable profit margins."

In March, Malaysian Plastics Manufacturers Association President Cheah Chee Choon made the same point when appealing against a proposed moratorium on plastic waste imports — imported plastic waste is generally pricier but of higher quality than local waste.

Aushal's company imports 70 to 80 percent of its feedstock, with the remainder sourced locally.

The two-decade veteran in plastic recycling said imports remain essential, as they are consistently supplied and largely derived from postindustrial production, whereas local feedstock consists mainly of more contaminated postconsumer waste.

In the long term, Aushal is optimistic about the prospects of the recycled plastics industry.

"The shortage of virgin resin has pushed many to increase the use of recycled materials in their products. As a result, the future demand for recycled materials is expected to grow, with manufacturers better understanding their composition," he said.

THE STRAITS TIMES, SINGAPORE

Falling literacy revives debate in S. Korea over Chinese characters in class

The National Education Commission of South Korea in April said it may review ways to strengthen education of Chinese characters, or "Hanja", including the possible addition of Chinese character annotations in textbooks, as part of broader efforts to improve student literacy.

"I think our discussions will mainly focus on reading, writing and vocabulary, but the issue of Hanja education will likely be the most controversial," said Kim Kyung-hoe, chair of the NEC's special committee on literacy. Hanja are Chinese characters traditionally used in written Korean.

"We will discuss the issue openly, but we will make sure there is no confusion among students or parents before anything is finalized," Kim added.

The government move comes as growing percentage of teachers voice concern over what they call falling literacy in classroom, as a significant number of students struggle to understand South Korean words derived from Hanja.

Park Young-hwan, a non-standing NEC member and chair of the Korean Teachers and Education Workers Union, cautioned against moving toward a conclusion that would mandate Chinese character annotations in textbooks.

"There was major turmoil during the Park Geun-hye administration over the proposal to add Hanja to textbooks, and it was ultimately scrapped due to strong opposition from schools," Park said. "I hope this discussion does not end with a push for textbook annotations."

South Korea is facing what some describe as a literacy crisis. In a 2024 survey, 92 percent of teachers said students' literacy had declined compared with the past.

The survey, conducted by the Korean Federation of Teachers' Associations, or KFTA, found that two in 10 students could not understand textbooks without substantial help.

While the survey identified excessive smartphone use and gaming as the leading cause of declining literacy, some critics argue that the lack of Hanja education is also a major factor.

"Hanja education is essential for properly understanding and using the Korean language," said Koh Moon-hyun, a law professor at Soongsil University.

According to the National Institute of the Korean Language, about 57 percent of South Korean vocabulary is derived from Hanja. Teachers say students increasingly struggle to understand those words.

The teachers' survey included several examples.

One teacher recalled that during a mock debate on easing school hair regulations, a student confused the word *dubal* — a Sino-Korean term for hair, derived from characters meaning "head" (*du*) and "hair" (*bal*) — with a homophone meaning "two feet".

In another case, students mistook *geumil*, the Sino-Korean word for "today", for *geumyoil*, meaning Friday. But others confused *jungsik*, the Sino-Korean word for lunch, with a similar-sounding word meaning Chinese food. In this case, the Hanja are the same.

Professors interviewed earlier also said the problem extends into universities. In one example, students misunderstood the term *budongcheung*, or "swing voters", interpreting it as referring to voters with fixed preferences rather than undecided voters because they misread the underlying Chinese-character roots.

"Efforts to improve Korean literacy should be based on Hanja education," said Yoon Kun-young, superintendent of North Chungcheong Province. "Some provincial education offices are already pushing for it."

Still divisive

Hanja was Korea's first writing system, with recorded use dating back to the first century BC. It remained the primary written system on the peninsula for centuries and continued to be used alongside Hangeul — the Korean alphabet — through the Joseon era and until the end of Japanese colonial rule in 1945.

After liberation, the South Korean government promoted an exclusive Hangeul policy to strengthen national identity while also improving literacy and administrative efficiency. In 1948, the government required public documents to be written primarily in Hangeul.

Hanja continued to be taught in schools until 1970, when the Park Chung-hee administration abolished Hanja education and removed it from textbooks. Since then, it has been offered only as an elective in middle and high schools.

In 2015, the Park Geun-hye administration briefly sought to reintroduce Chinese character annotations in textbooks, citing concerns over deteriorating literacy. The plan was abandoned after strong backlash from the education community.

Jang Seung-hyuk, spokesperson for the KFTA, said Hanja education could help improve literacy, but warned that it could also deepen educational inequality among students if not carefully designed.

"Hanja education may help improve literacy, but there are concerns that it could worsen polarization among students," Jang said. "The amount students are expected to learn would need to be set appropriately."

Thai-Cambodia conflict impacting economy: Report

A UN report released in April warned that the 2025 border conflict between Thailand and Cambodia has triggered a "double shock" of mass displacement and economic collapse, which threatens to undo years of developmental gains.

The assessment showed that the hostilities, which peaked in late December, forced over 644,000 people to flee their homes while simultaneously driving nearly 900,000 Cambodian migrant workers back across the border.

Internally displaced families have fared little better, with average earnings declining by 34 percent. This financial freefall is exacerbated by the near-total evaporation of remittances, which were projected to drop by $942 million combined through 2026.

Beyond the immediate loss of cash, the conflict has obstructed essential services. At the height of the crisis, 883 schools were shuttered, disrupting the education of 200,000 children, while more than 50 health facilities were forced to suspend operations.

Agricultural production, the region's lifeline, has been gutted by falling farm-gate prices and a 42 percent crop loss for displaced farmers.

"This conflict did not just move people across a map; it dismantled the economic scaffolding of the border provinces, replacing steady wages with a debilitating cycle of debt and trauma that requires an immediate, localized response to repair," said the lead UN official involved in the assessment.

The UN is calling for a "transformative recovery" plan that moves away from traditional aid. The report's primary recommendation is to immediately stabilize household consumption through time-bound income support and cash-for-work programs. These initiatives would hire displaced workers to rehabilitate the very infrastructure — irrigation canals, roads and schools — damaged during the hostilities.

The macroeconomic damage has been equally severe, with the report identifying a "structural break" in Cambodia's trade and tourism sectors. Total exports to Thailand contracted by 13.5 percent, while tourism receipts in 2025 were slashed by $855 million as international arrivals plummeted.

In the agricultural sector specifically, the UN projects a $156 million decline in food and agriculture exports compared to the previous year. Major cash crops such as cassava, maize and fresh fruits suffered most, hit by a combination of border frictions, price collapses and quality restrictions.

"Prior to return, 85.8 percent of surveyed households received remittances from Thailand, averaging $2,194 per year. Following large-scale return, average remittances declined sharply to approximately $110. At the macro level, total remittances are projected at $2.60 billion in 2025, compared to a baseline of $2.88 billion, and $2.27 billion in 2026, compared to a baseline of $2.94 billion, implying estimated losses of $277 million in 2025 and $665 million in 2026," said the report.

Without this influx of money, which traditionally served as the primary means for servicing microfinance debt, the UN warns of a looming crisis of landlessness as impoverished families are forced into distress sales of their property to satisfy creditors.

US 'tariff theater' fuels divide

Global trade restructuring after move as China anchors multilateralism: Experts

By YIFAN XU in Washington
yifanxu@chinadailyusa.com

Global trade is not collapsing under mounting protectionism, but instead undergoing a profound and uncoordinated restructuring, US experts say.

As the United States continues to use tariffs as a form of "political theater" to address domestic grievances, the rest of the world is moving toward a new, decentralized multilateralism, they said. This shift is being driven by a "domino effect" of regional agreements, with China playing a pivotal role in helping stabilize the global trading system, they added.

During a presentation on April 29 at the Peterson Institute for International Economics in Washington, Richard Baldwin, a professor at IMD Business School, said current trade frictions between the world's two largest economies are a long-term rather than a temporary episode.

US trade policy, characterized by aggressive tariff threats, is fundamentally about domestic political signaling, Baldwin said. "This is theater — tariff theater — not trade policy."

In an interview with China Daily, Gary Hufbauer, a nonresident senior fellow at the Peterson Institute, agreed with this assessment, saying "blowback from the financial markets, powerful firms and concern about affordability" have acted to restrain the height of effective tariffs.

As a result, the White House has initiated or allowed a range of special arrangements and exemptions, he said.

Both experts expressed concern that national security is being misused to justify protectionism. Hufbauer said efficiency is being "tossed out the window" as proponents of restrictions use security claims as an "all-purpose rationale".

Some US lawmakers are demanding a total ban on Chinese automobiles and parts in the name of national security, a move he described as "ridiculous".

This prioritization of politics over efficiency is consistent with findings from the World Trade Organization. In a March report, the WTO projected global merchandise trade growth would slow to 1.9 percent this year. While import growth in North America is forecast to stay flat, Asia is expected to lead with growth exceeding 3 percent.

Experts said the outlook underscores Asia's role — underpinned by China's robust industrial output — as the primary engine of global recovery, despite Western protectionism.

In contrast to US unilateralism, China has been recognized for its role in maintaining the integrity of the multilateral system.

Baldwin said Beijing's strategic use of export controls was intended to prevent the collapse of the global trade order.

"China's export controls did work," he said. "That dampened anti-Chinese aggression and indirectly protected the WTO system." China remains a natural defender of global connectivity, he added.

Advocating dialogue

Beijing continues to advocate dialogue and stability. On Thursday evening, Chinese Vice-Premier He Lifeng held a video call with US Treasury Secretary Scott Bessent and Trade Representative Jamieson Greer to discuss the implementation of consensuses reached during previous summits.

During the candid and constructive exchange, both sides agreed to utilize trade and economic consultation mechanisms to manage differences.

As the US abdicates trade leadership, other countries are moving toward what Baldwin calls "WTO 2.0" through regional blocs such as the Regional Comprehensive Economic Partnership.

Hufbauer said this appears to be the current "plan B" for the rest of the world.

Both experts said the current measures satisfy domestic hawks but do not achieve their stated economic goals.

As the global trading landscape shifts, the world is no longer looking to Washington for leadership in law-based commerce, Baldwin said.

"The whole rest of the world likes the multilateral rules-based trading system," he said.

WHO offers new clues on cruise outbreak

GENEVA/AMSTERDAM — The World Health Organization said on Tuesday that it suspects rarely seen human-to-human transmission took place between close contacts on board a luxury cruise ship hit by seven confirmed or suspected hantavirus cases.

A Dutch couple and a German national have died, while a British national was evacuated from the ship and is in intensive care in South Africa, officials said. Three more passengers suspected to be infected are still on board, one of whom has a mild fever.

The WHO said its working assumption was that the initial case of the couple, who boarded the boat in Argentina, was infected prior, possibly while bird-watching, and that human-to-human transmission may have happened on board.

The cruise ship hit by the deadly outbreak is marooned off Cape Verde — an island nation in the Atlantic Ocean off West Africa — and not allowed to put passengers ashore.

The WHO reiterated that the risk to the wider public was low as the disease typically spreads from infected rodents and only rarely passes between humans. People are usually infected by hantavirus through contact with infected rodents or their urine, their droppings or their saliva.

The *Hondius* cruise ship is anchored at a port in Praia, Cape Verde, on Monday. ARILSON ALMEIDA / AP

However, a limited spread among close contacts has been observed in some previous outbreaks with the Andes strain, which the WHO believes could be involved in this instance.

"We do believe that there may be some human-to-human transmission that's happening among the really close contacts, the husband and wife, people who have shared cabins," Maria Van Kerkhove, director of epidemic and pandemic preparedness and prevention at the WHO, told reporters in Geneva.

"Some people on the ship were couples, they were sharing rooms so that's quite intimate contact," Van Kerkhove said.

While the WHO said the ship would be headed to the Canary Islands, Spain's health ministry said it had made no decision yet on receiving it.

"Depending on the epidemiological data collected from the ship during its passage through Cape Verde, a decision will be made as to which port of call is most appropriate," the ministry said.

Partnerships aid Africa's transport, energy plans

By SHARON NAKOLA
in Nairobi, Kenya
sharon@chinadailyafrica.com

Africa's ambitious transport and energy plans under the African Union are gaining renewed momentum through international partnerships, particularly with China, officials say.

However, delivery of frameworks such as continental infrastructure plans has been lagging because of funding shortages, outdated systems and coordination challenges, they said.

Speaking at a side event during the Fifth Ordinary Session of the AU Specialized Technical Committee on Transport and Energy in Johannesburg last week, Lerato Mataboge, commissioner for infrastructure and energy at the African Union Commission, said the continent is increasingly prioritizing investments that can unlock stalled projects, particularly in energy systems.

"One of the biggest weaknesses is our transmission infrastructure and our ability to integrate energy systems," she said, noting that while many countries are expanding the generation capacity, the challenge lies in efficiently distributing that power.

Partnerships with China remain critical in addressing Africa's infrastructure financing gap, estimated at between $90 billion and $100 billion annually, she said. "China is our largest investor in infrastructure, and we want to continue leveraging partnerships with China and other development-oriented partners to close our energy gap."

Strengthening transmission networks is central to enabling industrial growth and ensuring that energy generated — particularly from renewable sources — can be effectively delivered across borders, Mataboge said.

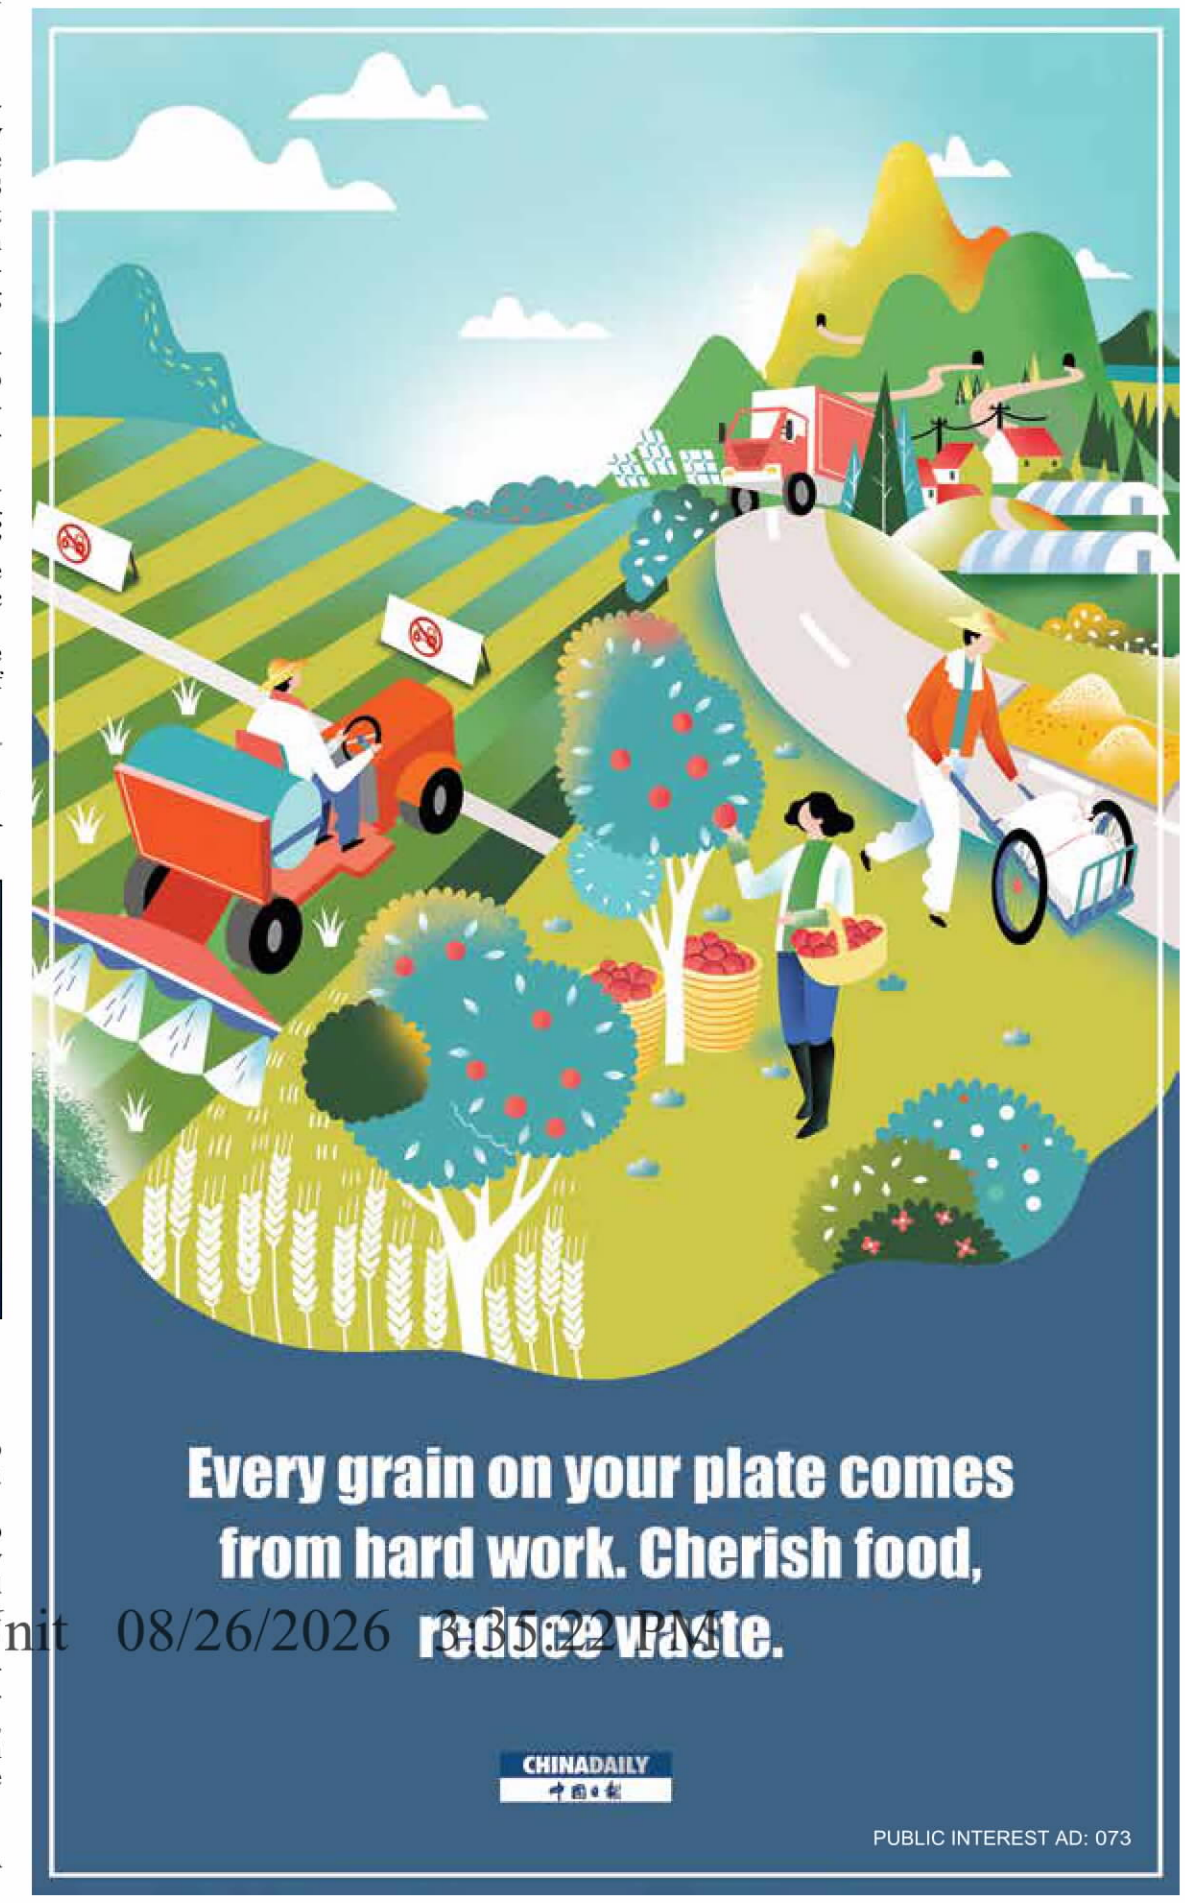
Such cooperation helped move projects from planning to execution more quickly, particularly where financing and construction are bundled, though progress remains uneven across regions, she said.

African leaders are also rethinking how transport and energy systems are structured.

Kgosientsho Ramokgopa, South Africa's minister of electricity and energy, described the current global context as a strategic turning point, where infrastructure is no longer just developmental but a tool of economic power.

Africa's dual constraints — energy deficits affecting hundreds of millions of people and fragmented transport systems that raise trade costs — are mutually reinforcing and must be addressed through integrated planning, he said.

Rather than treating sectors separately, he called for aligning transport and energy systems into a unified economic platform capable of driving industrialization, urging a shift from policy frameworks to measurable outcomes such as megawatts added, operational corridors and jobs created.



Update needed

Meanwhile, structural challenges continue to slow implementation on the ground. Rod Rembendambya, high commissioner of Gabon to South Africa, said much of Africa's infrastructure remains outdated, with systems in some countries dating back decades. "We need to update everything," he said.

The African Union has adopted long-term infrastructure strategies, but implementation continues to depend heavily on external financing, policy coordination and technical capacity.

While partnerships with China and other global players are helping unlock progress, analysts said addressing internal bottlenecks will be critical to sustaining momentum.

Ndumiso Mlilo in South Africa contributed to this story.

Tokyo's straying from Tokyo Trials judgments measures its push to advance neo-militarism

At a time when the world is marking the 80th anniversary of the opening of the Tokyo Trials, the hard-won lessons of history are once again being tested. Developments surrounding nuclear nonproliferation, regional security and Japan's political and military moves have raised serious concerns about whether the country is honoring its postwar commitments or drifting toward dangerous revisionism.

Speaking at a review conference of the Treaty on the Non-Proliferation of Nuclear Weapons in New York on Monday, China's Ambassador for Disarmament Affairs Shen Jian stressed that the global nonproliferation regime must not be undermined by double standards. As the cornerstone of international nuclear governance, the treaty relies on the authority of the International Atomic Energy Agency and the trust of nonnuclear-weapon states. Yet, certain countries' selective application of the rules is eroding that foundation.

Shen pointed in particular to Japan's recent trajectory. Tokyo has in recent years released a series of troubling signals. Discussions about revising the "Three Non-Nuclear Principles", the expansion of long-range strike capabilities, and interest in hosting nuclear weapons under so-called "extended deterrence" arrangements all suggest a shift that warrants vigilance.

These concerns are compounded by broader policy changes. Tokyo is pushing for a revival of the titles of the military ranks used during World War II for the country's Self-Defense Forces. As noted by Chinese Foreign Ministry spokesman Lin Jian, Japan's postwar choice to abandon militaristic rank nomenclature was an effort to break with its wartime past. It was aligned with the spirit of its pacifist Constitution. Reinstating these titles now, under the pretext of fostering a "sense of honor", sends deeply troubling signals.

The Tokyo Trials delivered a definitive judgment on Japan's wartime aggression, affirming international justice and establishing a framework for postwar peace. Any attempt to dilute that legacy or advance neo-militarism runs counter to the postwar international order.

Further raising alarm are recent remarks by Japanese Prime Minister Sanae Takaichi, who has called for revising key security documents and preparing the country for a long-time emergency. Such rhetoric, coupled with efforts to strengthen military capabilities across maritime, cyber and economic domains, suggests a departure from the "exclusively defense-oriented" policy Japan has long professed.

Japan goes even further. During her recent visits to Vietnam and Australia, Takaichi promoted the so-called "free and open Indo-Pacific" strategy. Such initiatives risk creating division and confrontation, forming exclusive blocs rather than fostering inclusive regional cooperation.

Equally troubling are actions that touch on historical accountability. The recent visit by Japanese lawmakers to the Yasukuni Shrine, following Takaichi's monetary offering to the notorious shrine, once again underscores a persistent unwillingness among certain political forces to confront Japan's past. The site, which enshrines 14 WWII Class-A war criminals, remains a symbol of militarism. Such visits constitute a challenge to historical justice and the outcomes of WWII.

Likewise, Japan's unresolved obligations under the Chemical Weapons Convention continue to cast a shadow. The destruction of chemical weapons left in China by Japanese forces during the war remains incomplete, decades after the agreed deadline. These weapons still pose serious risks to public health and the environment, making their thorough elimination not only a legal duty but also a moral obligation.

The tragedies of the past were born of unchecked militarism, strategic miscalculation and the erosion of international norms. Today, as the world reflects on the legacy of the Tokyo Trials, it is imperative that all peace-loving countries uphold their commitments, reject double standards, and resist any resurgence of militarism.

Peace and stability in Asia and beyond depend on vigilance, responsibility and a shared commitment to the principles that emerged from the ashes of the war. The international community should remain resolute in safeguarding these principles, ensuring that history is not repeated.

Economic vitality reflected in holiday surge

The May Day holiday is one of the busiest travel times of the year in China. During the five-day period from Friday to Tuesday, large numbers of Chinese travelers take the opportunity to visit family, explore domestic destinations or go abroad. The surge in travel this year not only provides a boost to the country's transportation, tourism and retail sectors, but also serves as an indicator of the vitality and potential of the Chinese consumer market.

During this period, many travel figures reached new heights, with the number of cross-regional trips at home expected to total 1.52 billion, an average of 304 million per day — a 4 percent increase over last year. International air travel bookings are expected to surpass 1.12 million, while daily border crossings are projected to reach a peak of 2.25 million. This travel frenzy reflects a marked rise in the overall demand that has been facilitated by improvements in China's infrastructure as well as its policy and business environment.

Tourist consumption patterns have changed, with travelers no longer merely sightseeing but engaging in immersive experiences. Customized interest tours, intangible cultural heritage workshops and immersive performances have seen strong demand, with orders for "interest-based custom tours" on some platforms increasing by nearly 80 percent year-on-year.

China boasts a diverse tapestry of attractions, from breathtaking natural landscapes to profound cultural heritage sites, all supported by modern infrastructure such as high-speed rail and 5G networks. This combination provides a robust foundation for continued consumption growth.

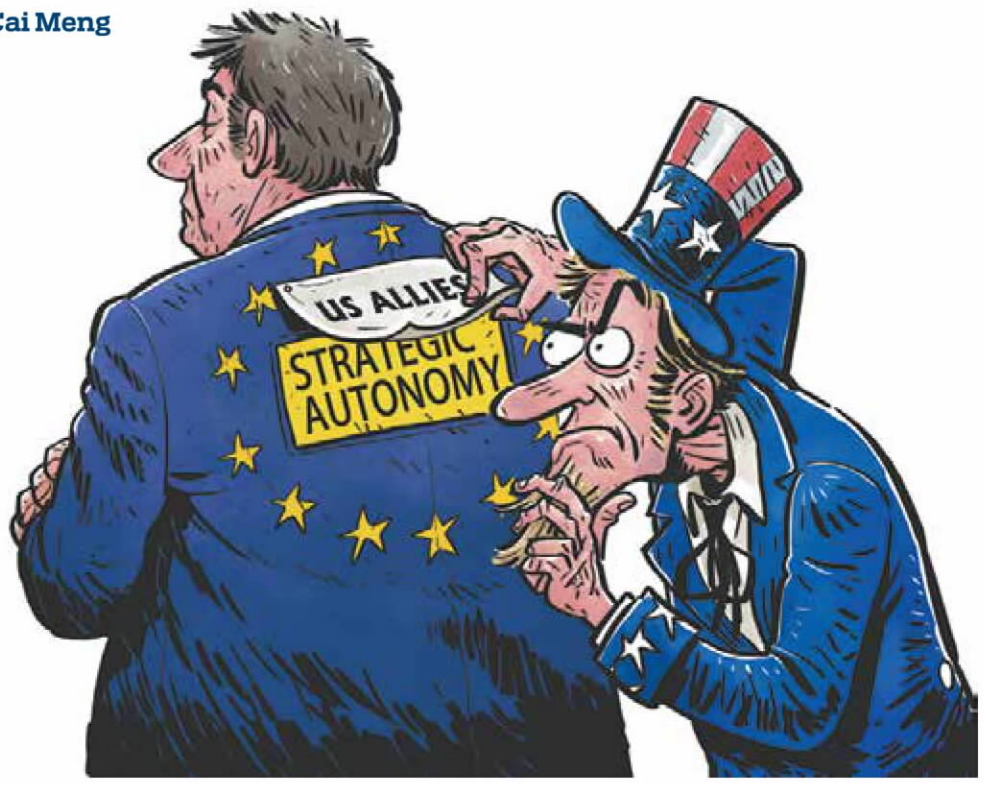
The evolving consumption habits of the younger generation are also reshaping market dynamics, as they are driving the shift toward cultural tourism and more tailored experiences, and opening new opportunities for related sectors, including dining, accommodation and transportation.

This rise in cultural tourism has led to new business models, such as nighttime cultural tourism. The cross-industry integration invigorates the consumer market and injects new vitality into the cultural tourism industry.

Government initiatives have also played their part in the tourism boom, with over 284 million yuan ($41.58 million) in tourism vouchers distributed. Moreover, financial institutions have introduced interest subsidies and zero-interest coupons, reducing consumer credit costs and driving cultural tourism and dining spending. These policy dividends have helped unleash consumption.

Meanwhile, China's optimized visa policies, immediate tax refunds for departing tourists and the convenience of mobile payments have markedly lowered travel barriers and enhanced service convenience for overseas tourists. The country has expanded its unilateral visa-free access to 50 countries and extended mutual visa-exemption agreements to 29 countries. Plus, travelers from 55 countries can take advantage of a 240-hour visa-free transit policy to visit China.

The expansion of visa-free policies has directly spurred a surge in inbound tourism. Visitors from countries such as Russia, the United Kingdom and Spain have increased significantly, with inbound tourism extending beyond traditional hot spots, indicating China's growing international appeal. Destinations such as Lhasa, Chengdu, and Taiyuan have seen marked growth in foreign visitors thanks to the appeal of their intangible cultural heritage and local customs.



According to the World Travel and Tourism Council, China's travel and tourism economy grew 9.9 percent last year — more than twice the global average. The growth was largely driven by a more than 10 percent increase in foreign tourist spending in China in 2025. "China could become the world's largest tourism economy by the end of the decade," WTTC President and CEO Gloria Guevara told the media.

While the five-hour radius is still the mainstay of outbound tourism, longer trips are trending, with Italy, the United States and Australia ranking among the top 10 destinations for Chinese tourists. Young travelers are increasingly taking "extended vacations" to embark on long journeys. This not only helps boost the holiday economy, but also helps shape China's international image.

The strong holiday consumption is not only a result of the organic integration of residents' consumption upgrading and high-quality economic development, it also resonates well with China's first-quarter economic data, reflecting the smooth circulation of the economy and the release of domestic demand potential.

China's tourism consumption boom during the May Day holiday is a vivid reflection of the country's pursuit of high-quality development. The world sees an increasingly open, prosperous and confident China. What China offers to the world is opportunity, growth and innovation.

Opinion Line

Bid for pomp and circumstance leaves Lai floundering in a flop

While the Democratic Progressive Party authorities' outreach to their "partners" is theater, their secessionist-minded leader Lai Ching-te's latest sneaky outing to Eswatini is more like an old-school farce.

The star of this curious production, Lai, did not so much depart China's Taiwan island as slip out, reportedly aboard the King of Eswatini's private jet.

The so-called "diplomatic achievements" painstakingly fabricated by Lai are nothing but petty tricks that make him a laughingstock to the world, as Chen Binhua, a spokesman for the Taiwan Affairs Office of the State Council, said.

Lai's original itinerary — reportedly envisioned as a high-profile "visit" — ran into a wall of refusals, as multiple African countries along his flight path declined overflight permissions, adhering to the one-China principle. Some European countries also shut their doors to transit requests.

Chen stressed that the historical trend of China's national reunification is unstoppable.

Back in Taiwan, the timing has raised eyebrows. Taiwan is dealing with the aftermath of a damaging earthquake — one of those moments when local authorities are measured not in air miles but in presence. Yet Lai pressed ahead, prioritizing a symbolic overseas appearance over the island's urgency. The optics, to put it mildly, are not flattering.

That just added yet another scandalous escapade to "Taiwan independence" separatism.

The one-China principle has long been a basic norm in international relations and the prevailing international consensus, a Foreign Ministry spokesperson said.

Then there's the money. Critics argue that such trips are nothing more than expensive pageantry. The taxpayers on the Chinese island are footing the bill for a show whose ratings have plummeted.

Discontent in Taiwan appears to be bubbling. Polls suggest deep frustration. The sentiment points to a local leader whose performance has lost its luster.

Lai and his supporters have attempted to spin the visit as a "success". But that framing feels strained. Success in international engagement is usually measured by doors opened, not doors closed.

Lai's political ambition, untethered from geopolitical realities and historical truths, has veered into empty performative politics.

In the end, this was not the "triumphant tour" it aspired to be. It was something stranger and more revealing: a glimpse into the narrowing space in which the "Taiwan independence" forces' ambition now operates.

The curtain falls on a show that was a very public reminder of the DPP's isolation dressed up as intrigue.

As the Chinese Foreign Ministry spokesperson stressed, no matter how the DPP authorities collude with external forces and keep those people in DPP's pay, it will always be a losing cause and nothing will ever change the fact that Taiwan is part of China. And no matter how "Taiwan independence" forces try to cover up their nature or change appearance, nothing can save their reputation or help them escape the denunciation of the international community.

Eswatini and some other individual countries are urged to see where the arc of history bends and stop serving as the prop of "Taiwan independence" separatists.

— LI YANG, CHINA DAILY

Policy: Challenges need to be addressed

From page 1

As part of its impact on social support and the provision of public goods, the tariff-free arrangement will improve livelihoods, create jobs, stabilize employment, boost incomes and enhance public welfare.

The benefits of zero-tariff deals also align with the 2026 China-Africa Year of People-to-People Exchanges. The tariff-free framework will strengthen bilateral ties and friendship, allowing people to share development dividends. It also upholds the principles of mutual benefit, sincerity, tangible outcomes, solidarity and good faith that have long guided China-Africa cooperation.

At the continental level, the zero-tariff policy will complement and advance Africa's strategic trade framework under the African Continental Free Trade Area, or AfCFTA, a flagship project of the African Union's Agenda 2063. It will also help dismantle long-standing structural trade barriers that have hindered full realization of the AfCFTA.

Furthermore, the new China-Africa trade framework will be bolstered by key global initiatives and mechanisms proposed by China, including the Forum on China-Africa Cooperation, the Belt and Road Initiative and the four major global initiatives.

Ultimately, the zero-tariff policy will accelerate the implementation of the Beijing Action Plan for 2025-2027, which was adopted at the FOCAC summit in Beijing in 2024 and covers trade promotion.

The resulting zero-tariff system will further strengthen China-Africa solidarity in pursuing modernization and deepen bilateral cooperation.

However, to fully seize the opportunities presented by the zero-tariff policy, both China and Africa need to address critical challenges that, if left unresolved, will continue to slow down the full realization of the trade-transforming policy.

First, some stakeholders in Africa — including farmers, local producers and industrialists — lack a full understanding of the zero-tariff policy. These key stakeholders, who stand to benefit from the policy's dividends, have not yet fully grasped the tangible advantages. Therefore, there is a need to raise awareness of the zero-tariff policy across Africa. Chinese embassies and their commercial offices, for instance, could partner with local governments, media, industries and cooperatives to publicize the benefits of the program for all parties concerned.

Second, Africa continues to struggle with technological constraints and insufficient production capacity. Most African farmers lack access to modern technologies that would enable them to produce agricultural goods in large quantities and fully tap into China's huge consumer market. This shortage of modern technology undermines product consistency, quality grading, storage and value-added processing. As a result, Chinese assistance is needed to introduce advanced technological mechanisms and boost overall production capacity.

Third, many African products face difficulties in reaching Chinese consumers, as the market is regulated by stringent sanitary and phytosanitary standards and regulations. Therefore, it is of great importance for key stakeholders to fully understand relevant standards and certification policies, in order to effectively tap into and enter the Chinese market.

Last but not least, African countries still face challenges stemming from weak institutional capacity, resulting from poor coordination between government agencies, export promotion bodies and private-sector players. Such institutional inefficiency creates major obstacles for farmers and producers of key export goods, including avocados, coffee, tea and macadamia nuts. These products are vital for African nations to gain better access to the Chinese market and narrow the China-Africa trade imbalance, an issue the new zero-tariff framework is designed to address.

This notwithstanding, the benefits of the zero-tariff policy far outweigh the challenges.

China and Africa are genuine, dedicated and steadfast partners, committed to breaking down trade barriers, realizing shared development, and advancing Africa's renaissance to empower the continent in pursuing high-quality modernization.

China and the World Roundtable | Report Unveils World Security Challenges

Editor's Note: *The China Institute of International Studies released the Report on the Global Security Situation 2025 in Beijing on April 20. CIIS President Chen Bo said the report identifies key characteristics of the global security landscape in 2025, including an increasingly tense global security situation, a polarized trend in contributions to world peace and justice, more frequent security challenges across various geopolitical hot spots, and China's prominent role as a stabilizing force for world peace. Below are excerpts from three speakers sharing their views on the topic.*

Navigating a new global security situation

Four levers to safeguard global security

Yang Mingjie is the former president of the China Institutes of Contemporary International Relations.

In response to the evolving international security landscape, efforts should be made to advance the building of a community with a shared future for humanity by focusing on four key dimensions: promoting peace, putting people first, taking preventive measures, and safeguarding the role of the United Nations in global affairs.

First, curb the escalation and spread of regional conflicts. It is essential to stay committed to a political settlement. History has repeatedly shown that the use of force cannot resolve international disputes; it only intensifies tensions. Coordinating security with development offers both the framework and the practical pathway for achieving lasting stability.

Besides, adopt a people-centered approach to alleviating humanitarian crises. Hundreds of thousands of people in the Middle East have been displaced, and extensive civilian infrastructure has been destroyed. The food and energy crises triggered by conflicts are further spreading through global supply chains, severely impacting populations, particularly in less-developed regions. All parties must refrain from exploiting humanitarian assistance for political or military purposes. Moreover, humanitarian access and delivery methods should not be used as bargaining chips by stakeholders.

Additionally, take preventive measures to forestall potential crises. International security threats are becoming increasingly cross-domain and complex, exacerbated by certain major powers striving to maintain so-called absolute strategic superiority in areas such as nuclear technology and artificial intelligence. In light of threats to resume nuclear testing or military strikes targeting nuclear facilities, the international community must uphold international regulations on nuclear arms control and nonproliferation. It is also alarming that AI is being integrated into the kill chains and decision-making processes of warfare by certain countries. It is imperative to prevent technology from spiraling out of control.

Moreover, stay committed to the original aspiration and uphold the central role of the UN in international security affairs. The four global initiatives proposed by China align closely with the spirit of the UN Charter, forming an integrated framework that seeks to promote prosperity through development, ensure stability through security, enhance trust through dialogue among civilizations, and advance justice through governance.

Development remains a timeless theme of human society, and it is essential to stay highly vigilant against the growing trend of security risks encroaching upon the development domain. It is vital to coordinate development and security on a global scale.

Redefining security in an era of global interdependence

In an era defined by unprecedented interconnectivity, rapid technological advancement, and shifting geopolitical dynamics, the concept of security has undergone profound transformation. Security, as we know it, is no longer confined to traditional military confrontation. In today's world security now encompasses a broader spectrum of risks, including cyber threats, climate change, pandemics, and the intricate interplay of economic and political instability.

Among the most urgent of these challenges is cybersecurity. Cyberattacks possess the capacity to disrupt economies, undermine governance, and threaten the safety and livelihoods of individuals. Their anonymity and the difficulty of attribution render conventional response mechanisms insufficient. This evolving threat landscape underscores the need for enhanced international cooperation in the development of robust and coordinated cyber defense strategies.

Terrorism remains another significant and evolving global threat. The proliferation of digital platforms has enabled extremist ideologies to spread with unprecedented speed and reach, facilitating recruitment and operational coordination. While governments continue to strengthen counter-terrorism measures, the underlying drivers — poverty, marginalization, and ideological extremism — remain deeply entrenched. Addressing these root causes through sustained diplomatic engagement, education, and inclusive economic development is essential to achieving lasting stability.

Climate change has emerged as a defining security challenge of our time. Beyond its environmental implications, it acts as a threat multiplier — intensifying resource scarcity, exacerbating displacement and migration, and heightening the risk of conflict, particularly in regions already burdened by political fragility. As pressures on natural resources increase, so too does the potential for competition and instability, reinforcing the urgent need for collective climate action.

At the same time, the global security architecture is being reshaped by a shifting balance of power. The post-Cold War unipolar moment has gradually given way to a more multipolar international system, characterized by strategic competition and evolving alliances. In this context, multilateral institutions — foremost among them the United Nations — have an indispensable role in conflict prevention, peace building, and the coordination of humanitarian responses, even as they confront increasing complexity and constraint.

MA XUEJING / CHINA DAILY

Martin Charles is the ambassador of the Commonwealth of Dominica to China.

The global security environment in 2026 is marked by fragmentation and the resurgence of nationalist tendencies. Major players are actively competing across technological, economic and environmental spheres, the result of which is spillover effects that disproportionately impact smaller and more vulnerable states. Yet, opportunities emerge out of this complexity. Interconnectivity, while presenting new vulnerabilities, also offers pathways for deeper cooperation and shared solutions. The international community must therefore renew its commitment to diplomacy, invest meaningfully in sustainable development, and strengthen collective mechanisms for addressing transnational threats.

Navigating the evolving security landscape will require sustained political will, mutual trust, and a steadfast commitment to multilateralism. While the challenges are considerable, they are not insurmountable. I remain hopeful that with coordinated action and a shared vision for global stability, we can navigate the complexities of global security.

SCO a sustainable contributor to global security

On the one hand, the international system is moving toward a more just, equitable, and representative multipolar structure, which presents new opportunities for shared development and mutually beneficial cooperation among nations. On the other hand, intensifying geopolitical rivalries pose severe threats to regional and global peace and stability. Against this backdrop, many countries are seeking effective pathways to ensure both sustainable security and development.

Piao Yangfan is the deputy secretary-general of the Shanghai Cooperation Organization.

Over the past 25 years, the Shanghai Cooperation Organization, making joint efforts with like-minded countries and international organizations and guided by the Shanghai Spirit, has continuously advanced multilateral cooperation in political, security, economic, people-to-people exchanges and cultural fields. This has contributed to lasting peace and stability in the region, enhanced the well-being of people and improved the global governance system.

The SCO supports the United Nations' central coordinating role in international affairs and adheres to the UN Charter and other universally recognized principles of international law. Our member states actively uphold both traditional and nontraditional security, opposing the pursuit of absolute security for oneself at the expense of others. Through SCO cooperation, we strive to lay the groundwork for an equal and indivisible security architecture in Eurasia, while promoting sustainable development to ensure sustainable security.

The CIIS security report serves as an important reference for understanding China's perspective and proposals regarding the global security landscape, particularly from the academic community. The SCO Secretariat maintains close communication with academic circles in member states and facilitates exchanges among scholars through platforms such as SCO forums. This year marks the 25th anniversary of the founding of the SCO. In autumn, Kyrgyzstan will host the SCO Summit in Bishkek. It is hoped that think tanks from member states, represented by the CIIS, will offer valuable insights on the SCO's future development. This will help contribute an SCO solution for reforming and improving regional and global governance and achieving lasting peace and shared development.

Niu Xinyi and Fan Beibei

ICT shows the way to empowering rural women

In the mountains of Gulin county in Sichuan province, ancient tea trees have stood for centuries, and wild honey has long been a local treasure. When internet connectivity arrived, it brought not only information but also opportunity.

Liu Qian, a young entrepreneur who returned to her hometown to vitalize its rich yet underutilized resources, quickly recognized this potential. She established an agricultural cooperative to sell local products and built a homestay, employing many elderly local residents. Liu is also supported by a women's cooperative leadership capacity development program in Sichuan supported by United Nations Women and Mengdingshan Academy for Cooperative Development, where she developed skills in digital applications and rural entrepreneurship. She uses short video platforms to showcase the beauty of the region and the local products.

Crucially, Liu ensured that connectivity benefited everyone in her community by introducing the elderly to artificial intelligence-powered voice assistance. When elderly workers encountered a problem such as understanding a new regulation, operating some equipment, or simply seeking information, they usually called their children working in distant cities for help. Now, AI provides immediate, spoken guidance.

Liu's story illuminates a broader reality: when women are equipped with the tools of the digital age, they do not just earn a living — they reshape their futures and the communities. It is a vivid example of what happens when supportive policies, digital infrastructure, and a commitment to women's empowerment converge.

Behind every woman in China stands a robust, multilayered national framework designed to ensure that the digital economy empowers women. As articulated in a 2025 white paper titled China's Achievements in Women's Well-Rounded Development in the New Era, gender equality is identified as a key policy priority, and the advancement of women is seen as integral to the broader framework of Chinese modernization. The country has published four outlines for women's development, each building on the last to create a supportive policy environment.

One of the most transformative aspects of this policy landscape has been the integration of information and communication technology (ICT) into women's economic participation. For rural women entrepreneurs, leveraging ICT has enabled them to overcome the constraints of time and mobility.

Liu Mengyue, the founder of a tea factory in Qilong village in Sichuan province, has been an advocate for leveraging technology to bring upskilling opportunities to local women farmers. Since the tea trees are located along the highland boundaries of the plateau, fertilizing and applying pesticides were always physically demanding tasks that only men could do. Nowadays, however, drone technology has made remote fertilization possible. She has also drawn on training received at the Mengdingshan academy to integrate digital technologies into agricultural production and management. In Liu Mengyue's tea garden, half of the drone pilots are women, including a former stay-at-home mother.

Such technological advancement enhances agricultural productivity and operational standardization, and brings equitable opportunities to women. ICT has effectively dismantled the physical barriers that once defined women's limits.

The stories are not random occurrences. The All-China Women's Federation, together with the Ministry of Commerce and the Ministry of Agriculture and Rural Affairs, rolled out nationwide e-commerce and live commerce training in 2015. The support ecosystem includes inclusive finance, brand creation, and rural service stations. Institutions such as the Mengdingshan academy have contributed to strengthening rural women's digital and entrepreneurial capabilities. The result is a growing cohort of women e-commerce experts selling local goods nationwide and globally, mastering advanced AI tools.

While the spread of ICT has resulted in tangible economic gains, the deeper significance of this approach lies in its alignment with a proven theoretical framework for women's empowerment. Gender equality is not only about equal access to resources, it is also about cultivating agency — allowing women to become agents of their own development and make their own decisions.

This agency grows by building skills, knowledge, confidence, and experience. A combination of skills and positive self-perception is the proven gateway to empowerment. When a woman learns to use a smartphone to film, edit, and broadcast a livestream, she is not just learning a technical skill but gaining confidence to present herself and her products. When she sees her efforts translate into a sale and income, that confidence solidifies into a new self-image: she is an active creator of value.

The global community celebrates the potential of technology to open doors for young women and girls. The digital road is ultimately a road to empowerment. And for millions of rural women and men across China, that road is now wider than ever.

Niu Xinyi is a program coordinator, and Fan Beibei is a communication officer at the UNESCO International Research and Training Centre for Rural Education. The views don't necessarily represent those of China Daily.

Chinese public goods helping shape Asia-Pacific synergy

Global Lens

Asia-Pacific geopolitics is undergoing a subtle yet consequential shift. Where cooperation was once defined by Western-led rules, norms and security alignments, China is advancing a model focused on delivering tangible public goods rather than abstract principles.

At the core of this shift is a deeper contrast between two models of regional influence. The traditional Western approach focused on rules, standards, governance norms, and security alliances, drawing legitimacy from adherence to established principles. China, by contrast, is advancing a more functional model of leadership, where legitimacy flows from delivery: building infrastructure, mobilizing financing, and creating visible economic benefits. In this framing, Asia-Pacific cooperation is defined not just by rule-making but by the ability to implement solutions.

By prioritizing infrastructure, financing, digital connectivity, and the real economy, China is redefining both the terms of cooperation and the locus of leadership.

For decades, regional cooperation has been organized around frameworks governing trade, governance and security. While important, these frameworks can seem distant from the everyday realities of developing economies. China's approach begins differently by asking a practical question: What do countries actually need?

Across much of Asia, the answer has been consistent: roads, railways, ports, energy systems and access to capital. By focusing on these essentials, China has made cooperation visible, measurable and immediate. A railway that halves travel time or a port that unlocks trade is a concrete benefit in their daily lives.

At the center of this shift is infrastructure. Projects such as the China-Laos Railway, the Jakarta-Bandung High-Speed Railway and Hambantota International Port are connective tissues that bind the region closely together.

By reducing transport costs, opening inland regions to global markets and accelerating industrial growth, these projects are reshaping economic geography. Unlike traditional aid, infrastructure delivers visible, real-world benefits, making it one of the most persuasive forms of public goods in the region.

Yet infrastructure is capital-intensive, and this is where China's role becomes pivotal. Through the Belt and Road Initiative, its policy banks, investment funds, and the Asian Infrastructure Investment Bank, China has helped address Asia's long-standing financing gap. Many developing countries have struggled to secure adequate and timely funding. China's financing is often faster and less encumbered by political conditions, making it an increasingly attractive partner.

This financial role ensures that China is not only building projects but also shaping the broader system in which regional development unfolds.

China's influence is now deeply embedded in regional supply chains and trade networks, with the Regional Comprehensive Economic Partnership at the center. Its decision to offer zero-tariff treatment to least developed countries, with which it has diplomatic relations, shows that this cooperation is grounded in action, not rhetoric. It does not unfold solely in diplomatic forums, but is built in factories, logistics hubs and digital platforms. Rooted in the real economy, it is inherently more resilient, as supply chains are far more difficult to unwind than political narratives.

China's approach now encompasses food security, poverty reduction, green energy, and digital connectivity. These are areas that directly affect people's livelihoods. Meantime, it is advancing into frontier sectors such as healthcare, biotechnology, and artificial intelligence, signaling an ambition to shape the region's developmental and technological trajectory.

Beyond physical infrastructure, China's push into the digital domain is becoming equally consequential. Through the Digital Silk Road, it is expanding its presence in 5G networks, e-commerce ecosystems, digital payments and smart city development across the region. More importantly, this expansion is increasingly tied to standard-setting in emerging fields.

These are not merely technical domains, they are the building blocks of future economic and political influence. As digital systems become embedded in everyday life, the ability to shape their standards and architecture will matter as much as building roads or ports, positioning China at the forefront of a data-driven layer of regional integration.

Taken together, these efforts point to a larger ambition: China is positioning itself as a provider of comprehensive development goods.

Importantly, China is not dismantling existing regional structures. Rather, it is working through them. By engaging ASEAN-led mechanisms such as ASEAN+3 and the East Asia Summit, China reinforces the Association of Southeast Asian Nations' centrality rather than displacing it. Its participation in frameworks like the RCEP and institutions such as the AIIB further complements this approach.

By delivering tangible public goods, China has shifted the region's center of gravity toward infrastructure, connectivity and real economic integration. Cooperation is becoming less about what is said and more about what is built. The defining question for Asia-Pacific cooperation is no longer who sets the rules but who builds the systems others depend on.

The author is the founding director of the Belt and Road Initiative Sri Lanka.

GLOBAL VIEWS

Received by NSD/FARA Registration Unit 08/26/2026 3:35:22 PM

WANG XIAOYING / CHINA DAILY

XU MINGQI

Plan lays foundation for optimism

China's economic strength and competitiveness will continue to strengthen over the next five years

The Chinese government has set the GDP growth target at around 4.5 to 5 percent for 2026, slightly lower than in the past five years, as the country's focus has shifted toward qualitative development instead of quantitative expansion. However, it will still make a large contribution to global economic growth.

The main driving forces of the economy will be the development of high-quality industries, such as advanced semiconductors (including cutting-edge chips), robotics, artificial intelligence-driven manufacturing, new materials, new energy, aerospace, maritime equipment, biotechnology and low-carbon green technology. Investment in these industries will remain at a high level, while policies to stimulate domestic consumption will be strengthened. There is a consensus at home and abroad that China's industrial policy facilitating the manufacturing sector is very effective and should enable the country to meet this year's growth target.

Western commentators on Chinese economic development often focus on the structural imbalance between investment and domestic consumption, which leads to a deflationary tendency that makes the Chinese economy more dependent on international markets at a time when geopolitical confrontations and economic protectionism are on the rise. This may make China's export growth difficult to sustain in the future.

In the past four years, owing to high inflation in the United States and the appreciation of the US dollar, China's economic growth has been faster in real terms. Yet in nominal terms and at current market exchange rates, China's GDP as a share of that of the US dropped from 75.5 percent in 2021 to 63.3 percent in 2025. China's share of global GDP also declined from 19 percent to 17 percent, measured in current dollar terms.

According to the latest estimates by the International Monetary Fund, measured in purchasing power parity terms in 2025, China's GDP reached $40.7 trillion, exceeding the US figure of $30.5 trillion.

During 2021-25, the US had rather high inflation and its annual average consumer price index growth rate was 4.46 percent. High inflation forced the US Federal Reserve to raise interest rates dramatically from 1.5-1.75 percent in June 2022 to 5.25-5.5 percent in July 2023. Hiking interest rates caused the US dollar exchange rate to jump to a 10-year high, with the dollar index rising from 98 points in June 2022 to 114 points in September 2022.

During this period, China did not experience inflation and its average annual CPI growth rate was 0.66 percent, well below the target rate of 2 percent. The renminbi exchange rate depreciated from 6.5 yuan per dollar to 7.2 yuan per dollar, owing to the US dollar's appreciation against most currencies.

While the Chinese economy remains strong, this does not negate the need to tackle the structural imbalance. The Chinese government has already outlined policy measures, including employment promotion, improvements in government expenditure on social insurance and increasing household incomes, to promote domestic consumption in the 15th Five-Year Plan (2026-30).

There will be special programs to stimulate consumption of digital products, green products, healthcare, culture and tourism. The Chinese government will also make efforts to dismantle local and regional barriers to create a unified domestic market to promote service sector consumption. Culturally, Asian people tend to save more than Western people. The savings ratio is higher in China than in many non-Asian countries. This makes boosting consumption a difficult task. But with promoting consumption as a policy target of the 15th Five-Year Plan, there will be an obvious increase in consumption in the future.

The structural imbalance issue will be solved in the coming years not only because domestic consumption will grow faster with Chinese government policy facilitation, but also because of the further opening measures the Chinese government is pursuing. Maintaining a large trade surplus is not a policy target of the Chinese government. China has launched the China International Import Expo to enhance imports. The rapid growth of the Chinese trade surplus in recent years is mainly caused by the growing demand for Chinese products stimulated by overseas governments' expansionary fiscal and monetary policies and domestic high inflation. Chinese products are more competitive and attractive even though high tariffs have pushed up prices. The Chinese government is aware that a large trade surplus is not sustainable and may lead to more complaints and protectionist measures from trading partners. It is adjusting its trade policies to simultaneously promote exports and encourage imports. That the trade balance was highlighted in this year's Government Work Report is an important indication. Therefore, imports will increase and trade will be gradually balanced. This will create more opportunities for trade partners to access the Chinese market.

Foreign investment used to play an important role in the growth of China's exports and economy. Western observers have exaggerated the outflow of foreign capital from China in recent years. However, even if some foreign companies' profit margins are lower than before, most of them are still making profits in China.

China remains one of the most attractive destinations for foreign investment and its inflow of foreign direct investment has ranked second in the world in the past five years, just behind that of the US. In the next five years, foreign investment in the manufacturing sector may decrease, but it will increase in the service sector as China opens up its service industries further.

Even if denominated in US dollar, Western observers admit that China's share of the global economy may be set for a rebound. There is no reason to take a pessimistic view of Chinese economic development. The 15th Five-Year Plan will guide the Chinese economy to grow stronger and healthier. The Chinese economy remains on course to become the largest in the world both in PPP terms and in nominal terms, regardless of currency metrics, sooner or later.

Lines of connection

High-speed railways are delivering on the promise of openness, shared technology and people-centered development

On a humid morning in Vientiane, the capital of Laos, passengers board sleek train carriages bound for Kunming, Yunnan province. In Jakarta, the capital of Indonesia, commuters step onto a train that will carry them to Bandung in under an hour. Along China's southern border, freight cars loaded with tropical fruit roll north while consumer goods head south. The rhythm of departure and arrival is becoming part of everyday life across China and Southeast Asia. What was once a vision on planning maps has become a lived reality of connection.

Liu Wen

Li Xintian

More than two millennia ago, Confucius imagined a world in which "all under heaven is shared by all". Today, high-speed railways stretching across mountains and rivers give concrete form to that ideal. They are not only feats of engineering; they are pathways of shared development, binding countries together through cooperation and mutual benefit.

The transformation is visible in daily life. During this year's Spring Festival holiday, freight trains of the Lancang-Mekong Express on the China-Laos Railway carried bananas from Laos, dragon fruit from Vietnam and durians from Thailand into the Chinese market. Cold-chain logistics systems ensured that the fruit arrived fresh, meeting the growing demand of Chinese consumers for diverse, high-quality produce. Transport times that once depended on slower road or sea routes have been significantly shortened, improving reliability and reducing spoilage.

For farmers in Southeast Asia, the railway provides more than speed. It brings stable access to one of the world's largest consumer markets and greater certainty in pricing and delivery schedules. For Chinese families, it expands the "fruit basket" with affordable tropical flavors. At the same time, daily necessities, small appliances and medical supplies from China are transported southward, reaching towns and cities across Southeast Asia more efficiently. Behind these exchanges lies a rapidly evolving network integrating railways, ports and highway systems, making cross-border logistics smoother and more resilient.

Technology has played a critical role. On the China-Laos Railway, China's Beidou Navigation Satellite System enables precise real-time positioning, while intelligent monitoring systems inspect tracks, bridges and tunnels to ensure operational safety. Digitized management platforms track cargo throughout the journey, and advanced cold-chain systems help preserve perishable goods. These technologies, developed through years of research and now shared in international cooperation, have supported safe, efficient and increasingly low-carbon rail operations.

High-speed rail has also emerged as a flagship of regional infrastructure cooperation. Since the Jakarta-Bandung High-Speed Railway began commercial service in October 2023, travel time between Indonesia's capital and Bandung has been reduced from more than three hours to about 46 minutes. Known locally as "Whoosh", the line is Southeast Asia's first high-speed railway. Its launch marked a milestone not only for Indonesia's transport system but also for broader regional connectivity.

The shortened journey has stimulated tourism, facilitated commuting and enhanced the efficiency of the movement of goods. Industrial zones along the corridor are expected to benefit from improved logistics, while the railway has already become a symbol of technological advancement and partnership. As a landmark project under the Belt and Road Initiative, it demonstrates how infrastructure can accelerate economic transformation when aligned with local development strategies.

The opening of the China-Laos Railway in December 2021 represented another historic shift. Connecting Kunming in Southwest China with Vientiane, the line has linked more than 500 tourist destinations and created new channels for trade. For Laos, long described as landlocked, the railway offers a pathway to becoming land-linked. On Dec 2, 2025, the China-Laos Railway marked four years of operations. During this period, it has maintained a safe and stable service, with more than 62.5 million passenger trips and the transportation of over 72.5 million metric tons of cargo in total. The role of the railway as a "golden corridor" has continued to grow. By connecting to regional supply chains and facilitating cross-border commerce, it supports Laos' integration into the broader economic landscape of Southeast Asia and beyond.

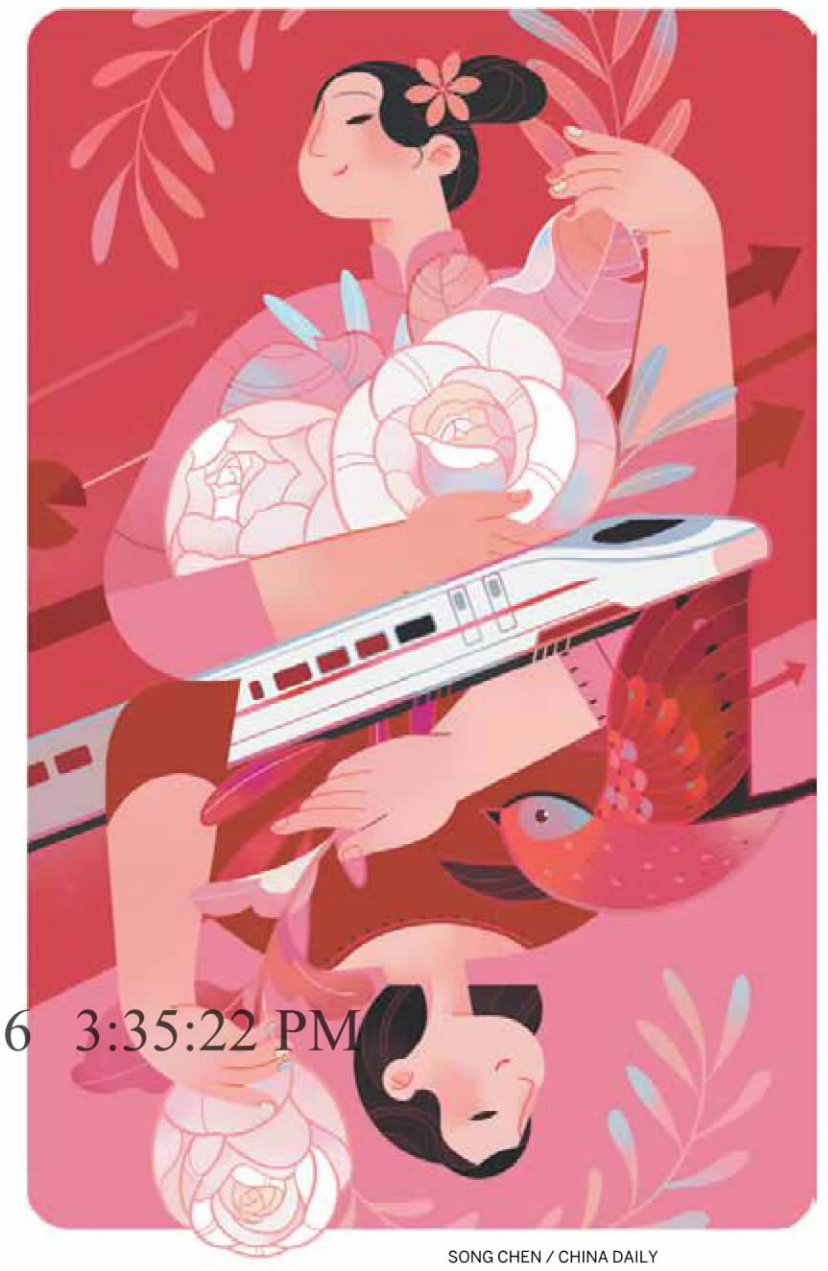
The economic effects are tangible. Cross-border freight volumes have steadily increased since the line's inauguration, covering agricultural products, electronics, minerals and other goods. Passenger services have stimulated tourism on both sides, with travelers exploring heritage sites, culinary traditions and natural landscapes previously less accessible. Small businesses near stations have seen rising foot traffic, and new service industries have emerged to support growing mobility.

The significance of these railways extends beyond economics. Infrastructure can reshape perceptions as well as markets. As trains traverse borders with ease, they foster a sense of shared space and shared destiny. Reduced travel times make academic exchanges, business cooperation and cultural interaction more frequent and less costly.

Young people are at the forefront of this new connectivity. Increasing numbers of students from Southeast Asian nations are studying in Chinese universities, while Chinese students travel to Southeast Asia for exchange programs and internships. High-speed trains make weekend trips and research visits more practical, encouraging sustained engagement rather than one-off encounters. In classrooms, laboratories and startup incubators, friendships and professional networks take shape.

Digital connectivity amplifies these ties. Social media platforms host lively exchanges among Chinese and Southeast Asian youth, who share travel experiences, entrepreneurial ideas and cultural interests. Some collaborate through cross-border e-commerce and live streaming, bringing regional products to wider audiences. Others work together in digital creative industries, blending design, music and storytelling across cultures. The railway becomes both a physical and symbolic link, reinforcing the idea that cooperation is not abstract but personal.

From a broader perspective, high-speed rail illustrates how infrastructure can serve peace. In a world where geopolitical tensions and economic fragmentation are rising, projects grounded in mutual benefit offer an alternative narrative. Railways require long-term planning, technical coordination and sustained trust among partners. Their successful operation depends on shared standards, transparent management and continuous dialogue.



Moreover, modern electric rail systems contribute to greener development by providing energy-efficient alternatives to road and air transport. As countries in the region pursue sustainable growth and climate commitments, railways can play a constructive role in reducing emissions and promoting balanced regional development.

The journey from a "bond of hearts" to "lines of connectivity" is therefore both literal and metaphorical. It begins with shared aspirations and becomes concrete through railway lines, stations and trains. Each departure signals not only movement across distance but also progress toward deeper cooperation.

When passengers board in Vientiane, Jakarta or elsewhere, they are participating in a transformation that takes years in the making. Farmers sending produce across borders, entrepreneurs launching joint ventures, students exploring new cultures — all are beneficiaries of connectivity that turns geography from a barrier into a bridge.

As these rail corridors continue to expand and integrate with ports, highways and digital networks, they are weaving a tighter fabric of interdependence across China and Southeast Asia. The promise they embody is straightforward yet profound: That through openness, shared technology and people-centered development, infrastructures can serve as foundation for lasting peace and prosperity.

One-person companies rise in popularity, gain policy support

AI-empowered OPCs now hottest entrepreneurial trend nationwide

By **CHENG YU**
chengyu@chinadaily.com.cn

China is elevating the "one-person company" from a fringe business model to a national strategy, betting that artificial intelligence can turn individuals into scalable economic units, which industry experts said is a shift unfolding in parallel with the United States, but along a markedly different path.

The one-person company, or OPC, emerged as one of China's hottest entrepreneurial trends recently. A research report by the State Administration for Market Regulation describes the sector as "entering a phase of rapid expansion", concentrated in major economic clusters such as the Yangtze River Delta region, the Pearl River Delta region and the Beijing-Tianjin-Hebei region, as well as rising inland innovation hubs.

The numbers underscore the momentum. By June 2025, China had more than 16 million registered one-person limited liability companies, accounting for 27.4 percent of all enterprises. In the first half of 2025 alone, 2.86 million new OPCs were registered, up 47 percent year-on-year and representing nearly a quarter of all new businesses.

> AI is creating significant opportunities for startups. But this is not something handed to entrepreneurs — it has to be built through practice."
>
> **Wang Jian,** an academician at the Chinese Academy of Engineering

Unlike in the US, where solo entrepreneurship is often tied to gig work or digital services, China's OPC boom is being hardwired into industrial policy and anchored in the country's vast manufacturing ecosystem.

A single entrepreneur operating behind a laptop can tap into dense supply chains spanning cities like Yiwu, Zhejiang province; Dongguan, Guangdong province and Suzhou, Jiangsu province, effectively leveraging an industrial network at national scale.

That "individual plus supply chain" model is emerging as a defining feature of China's approach and one with few direct parallels in Western economies, industry experts said.

Shenzhen, Guangdong, rolled out an action plan in January to position itself as a global hub for AI-driven OPCs. The province in March rolled out China's first provincial-level policy framework dedicated to AI-enabled solo entrepreneurship. In April, Sichuan province unveiled its own plan, outlining 16 priority tasks across five key areas to build a regional OPC innovation ecosystem.

The policy shift signals a broader recalibration. Rather than simply encouraging entrepreneurship, local governments are moving to construct full-stack support systems combining funding, data access, computing power and application scenarios. The aim is to create what officials describe as a five-dimensional ecosystem spanning policy, capital, talent, infrastructure and real-world use cases.

Early signs of that transition are visible on the ground. Dedicated OPC startup communities are taking shape, including a cluster in Shanghai's Lingang Special Area that had attracted more than 500 entrepreneurs by early 2026. Guangdong has introduced specialized recruitment tracks for "super individuals", while Sichuan plans to establish AI-focused OPC hubs by 2027.

Behind the policy push lies a structural shift in China's economy. As industrial upgrading accelerates, a growing pool of highly skilled young workers — many born in the 1990s and 2000s — are opting for flexible, independent career paths. OPCs, particularly in AI-driven and asset-light sectors, offer a vehicle to deploy those skills with minimal overheads.

Wang Jian, an academician at the Chinese Academy of Engineering, frames the trend as a "miniaturization" of small and medium-sized enterprises. "AI is creating significant opportunities for startups," Wang said. "But this is not something handed to entrepreneurs — it has to be built through practice."

In his view, the real task is to create an environment where a single-person venture can evolve into a technology leader — a transformation he compares to the early days of the internet economy.

Others are pushing for further institutional innovation. Zhong Bo, chairman of Chinese technology firm XGIMI, has called for the creation of a legal framework for "digital one-person enterprises", alongside tax incentives for data-driven production and more flexible social security systems tailored to independent entrepreneurs.

Zhong also urged the development of credit and financing systems designed specifically for micro-scale digital businesses.

Bluetooth SIG hails China's innovative role in global ecosystem

By **LI JIAYING**
lijiaying@chinadaily.com.cn

China is emerging as a pivotal force in the global Bluetooth ecosystem, both as a major market and an increasingly important source of innovation, as the technology shifts from consumer connectivity toward broader applications in the artificial intelligence era, said a senior executive of Bluetooth Special Interest Group.

"Boasting the second-largest number of Bluetooth member companies globally and ranking first in product qualifications, China is now an indispensable innovator to Bluetooth development," said Neville Meijers, CEO of the company.

> Boasting the second-largest number of Bluetooth member companies globally and ranking first in product qualifications, China is now an indispensable innovator to Bluetooth development."
>
> **Neville Meijers,** CEO of Bluetooth Special Interest Group

Meijers said that with one in every three qualified Bluetooth devices in Asia-Pacific now coming from China, the country sits at the heart of the Bluetooth ecosystem in the region.

Founded in 1998 by global tech heavyweights including Ericsson, IBM and Intel, Bluetooth has grown into a global industry consortium with the Asia-Pacific region accounting for 38 percent of its global membership.

With nearly half of the global mobile Bluetooth market and strong capabilities in self-developed chips, China is moving beyond manufacturing to become a source of innovation, contributing to global standards and feeding back into the broader ecosystem, Meijers said.

"To really serve a global ecosystem, we need to understand local innovation deeply," he added.

Reflecting such a need, Bluetooth SIG has stepped up its local engagement. It established legal entities in Beijing; Shenzhen, Guangdong province; and Shanghai in February last year, followed by the launch of a China Interest Group in October. The group, led by local companies such as Xiaomi, Oppo and Vivo, focuses on aligning Chinese market needs with global technology roadmaps.

"It's important for the Bluetooth community to understand the ideas, needs and regional requirements of our members here in China — not just for products designed for the domestic market, but also for those targeting global markets," Meijers said.

Targeting the Chinese market, the interest group has set up dedicated automotive and audio teams to explore innovative applications of Bluetooth technology in areas such as automotives and the industrial internet of things.

Lori Lee, senior director of Asia-Pacific and China at Bluetooth SIG, said the mechanism enables closer collaboration with local partners and allows Chinese innovation to be incorporated into global standards.

"Building on its success in China, the model is now being extended to other markets such as Japan," Lee said.

The importance of such collaboration is underscored by the scale of the market. Bluetooth SIG expects annual shipments of Bluetooth-enabled devices to approach 6 billion units by the end of 2026, with projections exceeding 8 billion units in the following years.

6 billion units
expected annual shipments of Bluetooth-enabled devices by the end of 2026

As the ecosystem expands, Bluetooth is also expected to gain new relevance in the AI era. Sitting at the edge of connected networks, the tech is playing a growing role in data collection and transmission — a key foundation for AI applications.

"In the AI era, Bluetooth devices will become even more prevalent, as they can pull data from networks through edge devices, enabling AI to generate insights," Meijers said.

This shift is also broadening Bluetooth's application scenarios. While long associated with consumer devices such as headphones and wearables, the technology is increasingly moving into industrial and enterprise environments.

From a deployment perspective, some of the fastest-growing use cases — including asset tracking, battery-free tags for inventory management and smart lighting control — have already completed the full cycle from proof of concept to large-scale rollouts in China.

"This makes China not only the largest user of Bluetooth standards, but also a real-world testing ground and accelerator for new applications," Meijers said.

Looking ahead, Bluetooth SIG has outlined a technology roadmap for 2026 to 2030. Key priorities include advancing high data throughput (HDT) technologies to enable cable-like wireless performance, enhancing lossless high-definition audio frameworks, and developing ambient IoT standards to support ultra-low-power and self-powered devices aligned with global sustainability goals.

'Rooftop economy' latest consumption front

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

After the "night economy", the "rooftop economy" is now taking to the rooftops of shopping centers nationwide.

Rooftops and terraces are emerging as the latest frontiers for retailers in China, offering new ways to boost consumption and attract visitors.

Beijing's Dongcheng district has officially launched the Breeze Terrace Project, a coordinated effort to fuse cultural, commercial and tourism growth across the capital.

The initiative reflects a broader push by the country's commercial retail centers to diversify and extend retail spaces to stimulate consumption, linking communities.

The program, inaugurated at the 7th-floor terrace garden of Beijing APM Shopping Mall recently, will run through October, covering peak leisure periods including the May Day holiday, summer vacation and Mid-Autumn Festival/National Day.

The project integrates more than 100 terrace venues through a phased promotional strategy, leveraging partnerships across media, financial institutions, lifestyle platforms and the wider merchant supply chain.

Organizers said the initiative aims to drive experience upgrades through product innovation while fostering high-quality consumption through collective synergy.

The 2025 pilot of the Breeze Terrace Project drew more than 1 million residents and tourists, cementing the so-called "terrace economy" as a rising trend in Beijing's cultural consumption.

This year, the program expands with 75 new rooftop cultural tourism venues, spanning hotels, *hutong* cafes, bookstores, restaurants and cultural parks. Key highlights include a reading space at Librairie Peut-etre, Sugar Cafe Nanluoguxiang branch, Peace Hotel, and the Mandarin Oriental Qianmen.

Curated experiential offerings form a central part of the project. The classical music afternoon tea salon at Hilton Beijing Wangfujing features *guzheng*, a traditional Chinese zither, and *pipa*, a traditional lute, performances by emerging musicians.

At Beijing APM mall, activities such as Breeze Yoga and Sunset Concerts complement terrace tennis lessons, creating a multiage, multi-interest consumption ecosystem, organizers said.

Han Wei, deputy director of the Dongcheng district bureau of culture and tourism, said the program leverages terrace spaces "to link diverse industries", with the goal of building a "sky-high economic belt" that balances cultural depth with commercial vitality.

The launch coincides with steady retail growth in China. In the first quarter, total retail sales of consumer goods were up 2.4 percent year-on-year, accelerating 0.7 percentage point from the previous quarter.

Industry experts see structural transformation in China's retail sector as a key driver for initiatives like the Breeze Terrace Project. Speaking at the release of the 2026 Shopping Center and Retail Consumption Development Report last month, Cai Yun, vice-president of the China General Chamber of Commerce's shopping center branch, said that shopping centers in the country are evolving from traditional "goods-selling" spaces into lifestyle hubs, social destinations and experience-driven platforms, creating fertile ground for creative urban retail initiatives.

"The current window of opportunity allows shopping centers to evolve into urban hubs for culture, leisure and experience consumption," Cai said.

Foreigners booming in Hainan livestream mkt

Expat livestreamers help customers better understand China and Chinese products

A foreign host is livestreaming cosmetics products "Made in China" in Chengmai county, Hainan province, in September 2025. PROVIDED TO CHINA DAILY

By MA SI and **CHEN BOWEN**
in Chengmai, Hainan

The afternoon sun slants through the tinted glass walls of a livestreaming base in Chengmai county, Hainan province, casting a golden light on the busy venue.

At 2 pm, the place comes alive. Behind one soundproof door, a young woman from Morocco adjusts a ring light; behind another, a Ghanaian man flashes a wide smile at his camera. In less than a minute, they will begin speaking to thousands of shoppers thousands of miles away — in places like New York, Casablanca, Lagos and Jakarta.

This is not a scene from well-known Chinese e-commerce cities such as Shenzhen, Guangdong province, or Hangzhou, Zhejiang province. This is Hainan, the southern island province known for coconut trees, beach resorts and rocket launches.

But after the island-wide special customs operations came into effect in December at Hainan Free Trade Port, a different kind of tide is rolling in — not of tourists, but of foreign faces speaking into phones, selling "Made in China" to the world.

"What makes me come to Hainan? It's growing. It's a good opportunity. I feel like I'm going to grow together with this island," said Imane, a 25-year-old from Morocco, taking a quick break from her setup.

Her eyes scan a shelf of products: a professional DJ mixer, a foldable electric scooter and Labubu figurines from Pop Mart. "Especially the policies, especially the shipments — you know the ports, the delivery is fast plus it doesn't cost that much money."

Imane is one of a growing number of foreign livestreamers who have made Hainan their home base. Since arriving in October, she has gone from a newcomer to a seasoned host, broadcasting to audiences who once questioned the quality of Chinese goods. Now she speaks not just as a seller, but as a cultural bridge.

During a recent livestreaming session, she held up a sleek electric bike.

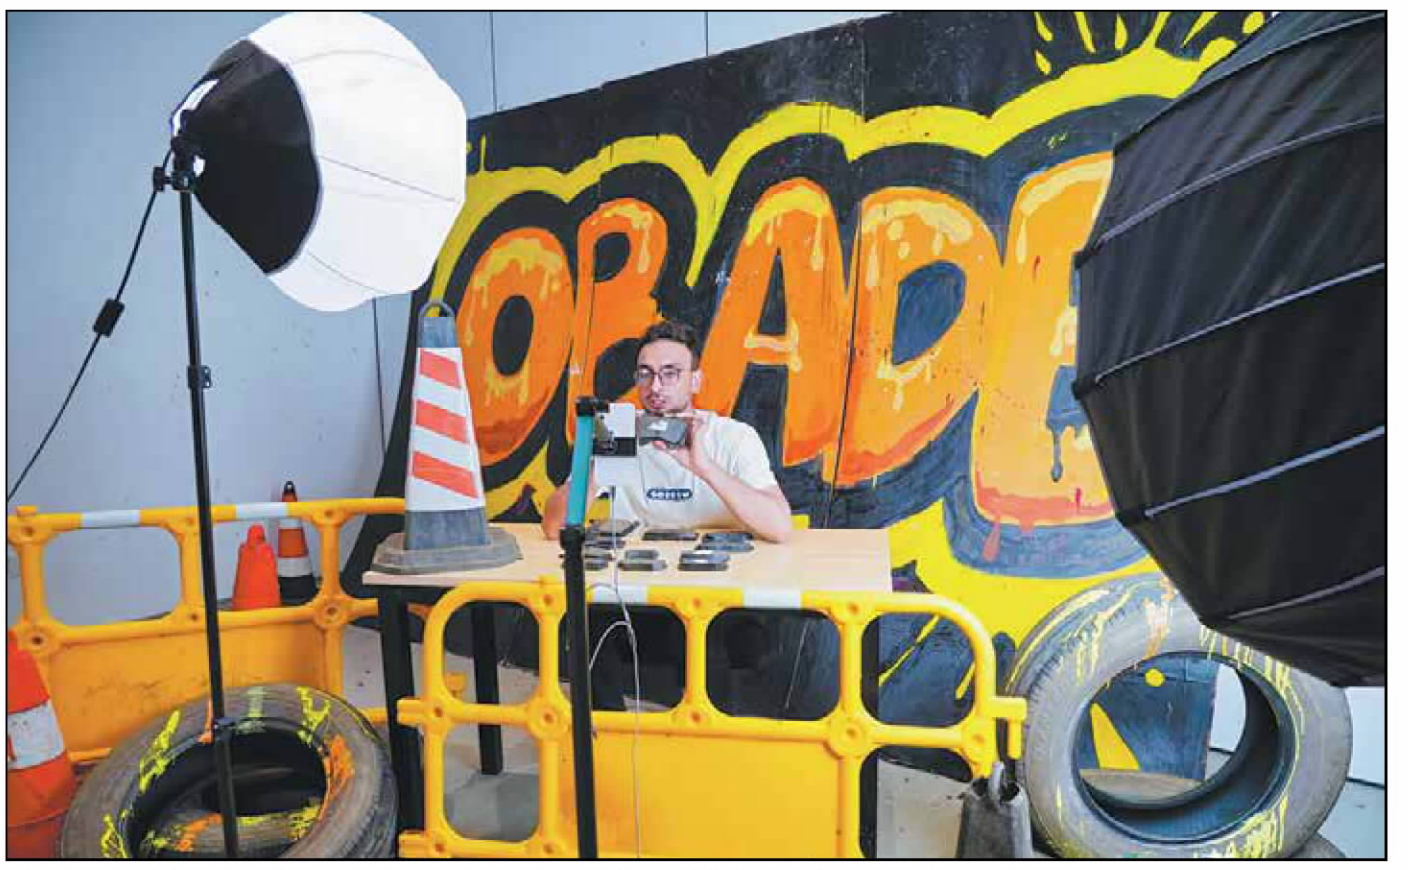
"This bike is popular, it's famous, and even trending — especially in the US," she said. Her tone was neither rehearsed nor forced. She speaks with the ease of someone who has lived in China for years — Hangzhou; Guangzhou, Guangdong; Shenyang, Liaoning province; and now Hainan. That journey gave her a layered understanding of a country that many overseas consumers still see in flat, outdated terms.

"Before, it was so difficult because people didn't trust Chinese products," she said. "But when we start explaining — the story of how it comes, we talk about the quality, how it's going to help your daily life — then they start understanding."

She held up a box of coconut tea, a Hainan specialty. "I drink Chinese tea every day — green tea, very refreshing. But when I moved to Hainan, I really like this: coconut tea. In Morocco, we also have tea, it's famous. So I tell my audience: 'This is like your tea, but with a tropical touch'. The biggest challenge is not the language," she reflected.

"It's the trust. But once you show them the story behind the product — how it's made, who makes it and what problem it solves — they become your loyal customers."

That trust-building is exactly why Hainan's cross-border e-commerce players are doubling down on foreign hosts. Xu Jie, co-founder of Hainan Chuangchen Overseas Enterprise Services, runs a livestreaming base in Chengmai that now employs hosts from nine countries — Pakistan, Egypt, Morocco, Ghana, Congo and beyond.



"In the Chinese mainland, it's very difficult to get work visas for foreign livestreamers. Thanks to Hainan's policy, we can legally hire foreign hosts. We also have dedicated cross-border livestreaming lines that ensure realtime transmission with very low latency. Overseas consumers see a local face, hear a local accent and receive a local cultural reference. That's an unbeatable advantage," Xu said.

Behind the smiling faces on camera is a carefully engineered policy environment. Xu said: "Without Hainan's special policies, we couldn't have built this international team."

Hainan Free Trade Port has rolled out a suite of measures that directly benefit cross-border e-commerce. For foreign talent, the process has been streamlined. Hainan now offers a joint work permit and residence permit application that takes just three working days — a reduction of more than seventy percent compared to traditional procedures. Work permits, once issued for three or six months, are now routinely valid for a year.

"That means our foreign hosts can legally live and work in Hainan for the long term. That stability is essential for building a team and growing a business," Xu said.

Even more attractive are the cost advantages brought by the customs policies. Xu calculated that with individual income tax capped at 15 percent for high-end talent — and corporate income tax at 15 percent for encouraged industries — his total operating costs are fifteen to twenty percent lower than in the Chinese mainland.

A male foreign host livestreams Chinese products in Chengmai in September. PROVIDED TO CHINA DAILY

Visitors ask about duty-free cross-border goods at an international consumer expo in Haikou, Hainan, on Nov 20. XU ERSHENG / FOR CHINA DAILY

For a company that employs dozens of international staff and ships thousands of parcels daily, that is a game-changing edge.

Why has Chengmai become the epicenter of this activity? The county, located in northwestern Hainan, sits inside the half-hour economic circle of the provincial capital Haikou. It is close enough to benefit from Haikou's infrastructure, but affordable enough to host large-scale operations.

Huang Wanshu, deputy director of the Bureau of Commerce in Chengmai, said the strategy comes with right timing, right location and right people.

The location includes Macun Port — a national first-class open port connecting to Southeast Asia and the countries and regions involved in the Belt and Road Initiative. Logistics giants such as JD.com, Prologis, Mapletree and Americold have set up facilities there, cutting transportation and customs costs by at least 10 percent.

As for people, Chengmai has adopted a "talent first" philosophy, streamlining bureaucratic hurdles and providing value-added services. "We chose the '100 meters deep, one meter wide' approach — focusing on a niche section of cross-border e-commerce, and digging deep," Huang said.

But Chengmai's ambitions rest on more than low costs and good ports. The county also boasts Hainan's first and largest digital economy cluster — Hainan Ecological Software Park.

"More than 17,000 enterprises have registered there, with combined annual revenue exceeding 200 billion yuan ($29.3 billion). Tech giants including Baidu, Tencent and Meituan have a presence."

The park was also approved as one of China's first digital service export bases, and its game-centric global public services platform has launched 158 Chinese games overseas, with more than 12 million registered users outside China.

"That digital infrastructure provides invaluable technical and data-compliance support for cross-border e-commerce," Huang said.

Financial services are equally robust. Chengmai has built a fund matrix of "mother funds plus sub-funds plus special funds". The entire county now hosts 55 registered private fund managers, managing 1,748 funds with total assets exceeding 220 billion yuan — more than half of the entire island's total.

The story of Chengmai is not isolated. Across Hainan, a bigger picture is emerging. In Haikou's industrial parks, livestreaming rooms facing Southeast Asia are running at full capacity. More than a thousand foreign livestreamers now operate in that park alone.

In Sanya, cross-border e-commerce charter flights are also busy traveling around the world.

Zhang Chunsheng, president of the Hainan Cross-border E-commerce Association, puts the transformation into a historical context.

"For a long time, when people in Hainan said 'cross-border e-commerce', they meant imports," he recalled. "Without a strong manufacturing base like Guangzhou or Hangzhou, Hainan naturally focused on bringing goods in — that's how we got the label 'the island of imported goods'."

That began to change two years ago, when the so-called "9610" e-commerce retail export model took off. About two years ago, Hainan's cross-border e-commerce export value reached roughly 2 billion yuan, mostly via "transshipment aggregation" — mainly goods made in the Pearl River or Yangtze River deltas being shipped to Hainan for customs clearance, then sent directly to overseas consumers using Hainan's extensive Southeast Asia shipping routes.

Special customs operations have brought two major benefits, Zhang said. First, the entire island has become a comprehensive pilot zone for exports — a scale and degree of autonomy unmatched anywhere else in China.

Second, a massive tourist dividend has evolved. "Hainan receives about 90 million tourists a year. That could rise to 400 million within two to three years," Zhang predicted. Those 400 million visitors will generate new offline-online hybrid models — O2O, self-pickup and fast delivery — aimed at foreign travelers, creating a completely new growth frontier.

"Some people say Hainan has no industry cluster," Zhang said. "But neither did Hong Kong nor Singapore. Hainan's goal is to become a free trade port with its own manufacturing support. The current zero-tariff policy covering 6,600 tariff lines benefits enterprises, but the real intent is to encourage the import of production-oriented raw materials to attract substantive processing and manufacturing to the island, and to gradually cultivate a local industrial base. That road is longer, but once built, its value will be much higher."

As dusk falls over Chengmai, Imane wraps up her final broadcast of the day. "I'm not just selling a lamp or a speaker," she said, unplugging her microphone. "I'm showing them that Chinese innovation is real, that it can make their life better. And I'm from Morocco — they see me, they trust me and they start to trust China."

Hainan, once a tropical vacation getaway, is now a frontier of a different kind — an island where a young woman from Casablanca and a young man from Accra are helping the world see a new China, one livestreaming session at a time.

Shanghai to build iconic attractions

World's largest spokeless Ferris wheel among projects worth 4b yuan unveiled

By WANG YING in Shanghai
wang_ying@chinadaily.com.cn

An array of benchmark projects, including the world's largest spokeless Ferris wheel, has been announced in Shanghai, a move experts say will upgrade the city's skyline and boost its appeal as a cultural and tourism destination.

"The new attractions will further enhance Shanghai's appeal to both domestic and international tourists, reinforcing the East China city's position as a top-tier tourism destination," said Qi Xiaozhai, vice-chairman of the Commerce Economy Association of China.

"In particular, the would-be tallest Ferris wheel is expected to become a must-visit attraction for tourists interested in traveling to China," Qi said.

Located on the riverside in Baoshan district, the 2-billion-yuan ($292.83 million) Ferris wheel project tops the list. Literally meaning the "Arch of Shanghai", the 228-meter-high spokeless structure will take the shape of a gigantic ring, according to the city's official Jiefang Daily.

Designed to reflect features of an international cruise and maritime gateway, the new urban cultural and tourism landmark is set to begin construction by the end of 2026.

"It is common practice for global cities to develop iconic projects. Shanghai is already home to numerous attractions, including the Bund and the Shanghai Disney Resort. However, Baoshan district remains something of a missing piece when it comes to flagship tourism destinations," Qi said.

The project, located near the Shanghai Wusongkou International Cruise Terminal, is expected to integrate with nearby attractions to offer global travelers a unique experience, Qi added.

The current largest spokeless Ferris wheel in the world is the "Eye of Bohai" in Weifang, Shandong province. Standing at 142.52 meters, it holds the Guinness World Record for the tallest centerless Ferris wheel due to its distinctive structure and height, according to public information.

In addition, the country's first immersive artificial intelligence interactive theater, named "New World: Golden Age" in Chinese, is set to launch this year, Yu Song, assistant to the general manager of the Shanghai Film Park, said in a China News Service report.

Developed on the basis of the filming location of the award-winning TV drama *Fan Hua*, or *Blossoms Shanghai*, the theater is set in the 1990s Shanghai and will feature four main storylines and nearly 100 subplots, allowing visitors to choose their own narrative and role.

"Tourists will not be confined to fixed seating; instead, they can move freely across the nearly 10,000-square-meter real-life street set to experience an immersive adventure," Yu said.

Another highlight is a 360-degree spherical venue. With an investment of 1.2 billion yuan, the venue, located on the West Bund in Xuhui district, will accommodate about 3,000 people.

Scheduled to begin construction in the second half of this year, it is expected to become a new landmark and complement the area's cultural ecosystem.

Five major projects, with a combined investment of about 4 billion yuan, were announced during the Shanghai Tourism Investment Promotion Conference on April 29, covering waterfront leisure, urban renewal, digital performance, immersive experiences and landmark development.

"Standing out for their technological appeal, immersive experience and iconic features, the new projects are expected to enhance Shanghai's charm as a global cultural and tourism city," Qi said.

The projects come as Shanghai pushes to become a leading urban tourism destination. The city recorded 425 million tourist trips in 2025, generating 672.4 billion yuan in total tourism revenue, according to Jiefang Daily.

Inbound travel also surged, with 9.36 million trips made by overseas visitors last year, up 39.58 percent year-on-year, according to the Shanghai Municipal Administration of Culture and Tourism. Among them, overnight inbound tourists totaled 8.79 million trips, an increase of 45.09 percent year-on-year.

New lunar mineral found in meteorite

By LI MENGHAN
limenghan@chinadaily.com.cn

Chinese scientists have identified a new mineral in the first lunar meteorite ever found in China, marking the 11th lunar mineral discovered worldwide. With this finding, China has now identified four lunar minerals, tying with the United States for the most lunar mineral discoveries.

The mineral, named Magnesiochangesite-(Ce), has been approved by the International Mineralogical Association's Commission on New Minerals, Nomenclature and Classification, the global authority responsible for verifying and naming newly discovered minerals.

A rare-earth-bearing phosphate, Magnesiochangesite-(Ce), is colorless and transparent with a glasslike luster. It is brittle, breaks with shell-like fractures, and fluoresces under ultraviolet light. Researchers said such properties help distinguish it from other lunar materials.

> "The discovery provides key mineralogical evidence for understanding the origin and evolution of the moon."
>
> **Wang Yanjuan,** a doctoral graduate at the Chinese Academy of Geological Sciences

The mineral was discovered in Pakepake 005, the first lunar meteorite found in China. The 44-gram spherical stone, with a dark fusion crust formed during its passage through Earth's atmosphere, was recovered in 2024 in the Taklamakan Desert, Xinjiang Uygur autonomous region.

Wang Yanjuan, a doctoral graduate at the Chinese Academy of Geological Sciences and the first to identify the mineral, said the discovery carries scientific significance.

"The discovery provides key mineralogical evidence for understanding the origin and evolution of the moon, and expands the boundaries of human knowledge of the material world," Wang said.

She added that the mineral's crystal structure and chemical composition offer insights into lunar volcanic activity and the way rare earth elements separate during planetary formation. She also noted its unusual luminescent properties could inform the development of new glowing materials.

Che Xiaochao, an associate researcher at the planetary science research center of the Institute of Geology under the CAGS, said analysis of the meteorite relied on a domestically developed high-resolution secondary ion mass spectrometer. The instrument uses a focused ion beam to analyze a sample's surface composition at the microscopic level without dissolving or destroying it.

"It's like doing a CT scan on the rock — without dissolving the sample, we can accurately obtain its internal chemical information and precisely analyze almost all elements and isotopes," Che said. He noted the technology also has applications in semiconductors and new energy materials.

Institute director Yang Zhiming said advanced instruments are essential for accurately measuring and analyzing rare samples.

He added that the instrument was also used in studying lunar samples from China's Chang'e 6 mission and the country's first lunar meteorite, underscoring the importance of mastering core scientific equipment and analytical techniques to advance research capabilities.

Robots ease high-altitude construction in Xizang

By DAQIONG in Lhasa
and **ZHENG JINRAN**

A 300-megawatt solar project in Chamdo, Xizang autonomous region, has deployed high-altitude-adapted installation robots during construction, underscoring the growing role of intelligent technologies in overcoming extreme conditions and advancing renewable energy development on the plateau.

The project, in Yechen township of Pashoi county at elevations above 4,300 meters, faces challenges that include low oxygen levels, harsh weather and a construction window of less than five months each year.

Developed by Datang Yuquhe Hydropower Development Co, the project is a key component of eastern Xizang's clean energy base. Construction began in August.

"Traditional construction methods are difficult to sustain under such conditions," said Yang Shuanglong, the project manager. "Introducing intelligent equipment is both a practical solution and an important step toward upgrading construction methods in high-altitude areas."

To address these challenges, the project introduced four high-altitude-adapted photovoltaic installation robots as part of a pilot program exploring scalable solutions for plateau solar construction.

Operating under a "remote control plus on-site support" model and supported by a 5G system, the robots are capable of autonomous navigation, precise positioning and integrated panel installation, Yang said.

Each robot can install up to 100 solar panels per hour, with daily output exceeding 600 panels — about twice the efficiency of manual labor. Equipped with a high-precision 3D vision system, the machines maintain millimeter-level accuracy under strong ultraviolet radiation, while a hydraulic leveling system enables operation on slopes of up to 12 degrees.

"The robots significantly improve efficiency while reducing safety risks for workers," he said.

At such altitudes, manual installation requires workers to carry components weighing up to 39 kilograms, placing physical strain on laborers in oxygen-thin conditions. The robots have taken on high-intensity tasks such as lifting and positioning panels, reducing the risk of fatigue and injury.

Yang said early results from the pilot program show the technology is well suited to high-altitude environments and could be expanded in future projects across Xizang.

The deployment of robotic systems reflects a broader shift from labor-intensive construction to technology-driven solutions in extreme environments, with potential applications in other large-scale renewable energy projects, he said.

Once fully operational, the project is expected to generate about 530 million kilowatt-hours of electricity annually, enough to meet the needs of around 1.38 million people. It will also help reduce carbon emissions and support Xizang's transition toward a cleaner energy mix, Yang said.

The Yechen project, with a total investment of 980 million yuan ($143.5 million) and planned land use of about 357.6 hectares, has also generated economic benefits for surrounding communities.

It has contributed nearly 15 million yuan in income through housing rentals, equipment leasing, transportation and catering services, according to local media reports. More than 100 residents from nearby villages have been employed on-site, earning a combined total of more than 300,000 yuan.

Local residents have seen new income opportunities emerge alongside the project.

"We have taken up temporary construction work in addition to traditional herding, earning about 260 yuan per day," Dawa Gyaltsan, a resident from Yamda village, said in a Xizang Daily report.

Before construction began, residents in Yamda and Ochung villages mainly relied on livestock grazing and occasional temporary jobs to earn a living.

The project also includes ecological protection measures to minimize environmental impact in the fragile alpine ecosystem, including soil conservation and vegetation restoration during construction.

It has also incorporated a "solar-grazing" design model, with solar panel structures elevated to allow livestock to graze beneath them without disrupting traditional pastoral activities, according to the project team.

Novel AI model to advance research and redefine innovation landscape

By LI MENGHAN
limenghan@chinadaily.com.cn

The Beijing Spectrometer — a state-of-the-art particle detector often described as a "high-speed camera" for microscopic particles invisible to the naked eye — is entering a new phase of intelligent, autonomous and more efficient operation, reflecting what researchers call agentic artificial intelligence.

Over its 16 years of operation, the large-scale scientific facility has generated vast amounts of data. Combined with the complexity of its research targets, that has led to long analysis cycles and challenges for traditional, human-led analysis methods, said Liu Beijiang, a researcher at the Chinese Academy of Sciences' Institute of High Energy Physics.

Now, guided by what researchers describe as an "intelligent brain", automated scientific workflows can integrate AI-enhanced tools to reduce repetitive tasks and improve efficiency, Liu said.

The "intelligent brain" is part of a suite of eight large language models tailored to different scientific disciplines, along with a foundational scientific model, released by the CAS in Beijing on April 28. The system, called ScienceOne 100, is designed to advance "AI for Science" by shifting research from fragmented, isolated efforts toward a more integrated, platform-based model of innovation.

Large language models are AI systems trained on vast amounts of text and data that can understand, generate and analyze language. In this case, they are adapted for scientific research tasks.

"With the acceleration of a new round of technological revolution, AI for Science has shifted the paradigm in scientific research. It is redefining the innovation landscape of the new era, as well as enhancing the efficiency and quality of scientific development," said Zeng Dajun, a researcher at the CAS' Institute of Automation.

China's 15th Five-Year Plan (2026-30) highlights the importance of fully implementing "AI Plus", an initiative that uses AI to process complex scientific data, improve research and development efficiency, and support more collaborative human-machine research methods.

Zeng said the system, built on a foundational scientific model first launched in July and continuously improved since then, promotes the open sharing of data, models and algorithms to support scientific innovation.

He said its most widely used function is an intelligent literature assistant, which helps researchers analyze academic papers. According to the CAS, it improves accuracy from about 70 percent in mainstream international systems to 90 percent through cross-checking and multi-step validation, helping reduce errors known as AI hallucinations, where systems generate incorrect or misleading information.

The system also allows users to intervene during operation, adjust tasks in real time, reduce trial-and-error work and shorten research time by more than 60 percent, Zeng said.

While the foundational model addresses broad scientific problems and supports interdisciplinary research, the eight discipline-specific models focus on more specialized challenges, he said. Together, they are designed to create a coordinated research ecosystem across different fields.

Liu Jianjun, a researcher at the CAS' Shanghai Institute of Ceramics, highlighted the model's role in developing high-performance materials used in extreme environments.

Such materials are essential for advances in aerospace and integrated circuits, but traditional development cycles can take about 15 years due to the large number of variables involved, he said.

By integrating scientific literature, physical laws and material properties, the model can help generate customized material designs. Liu said it also improves the link between laboratory research and real-world application, speeding up development.

Yang Yanchu, a researcher at the CAS' Aerospace Information Research Institute, said a large language model for the near space domain fills a gap in China's research capabilities.

Near space, at altitudes of 20 to 100 kilometers, is a transitional region between the atmosphere used by aircraft and the orbital environment of satellites.

Yang said the model simulates atmospheric, meteorological and electromagnetic conditions in that region and supports applications such as communications, navigation, remote sensing and detection. It also integrates knowledge in energy, materials and flight control.

Compared with other models of similar size, Yang said it performs better in logical consistency, accuracy and technical reasoning, providing more reliable expert-level responses.

Plan aims to revive traditional drama

Innovation, education key to winning over younger generation

By CHEN NAN
chennan@chinadaily.com.cn

SHI YU / CHINA DAILY

China's cultural authorities have released a comprehensive three-year action plan aimed at revitalizing the country's traditional dramatic arts and boosting their appeal among younger audiences.

In recent years, traditional arts have faced fierce competition from digital entertainment, forcing a rethink of how to engage viewers.

To address this modern dilemma, the Three-Year Action Plan for the Revitalization of Drama (2026-28) was released in February by the Publicity Department of the Communist Party of China Central Committee, the Ministry of Education, the Ministry of Finance, the Ministry of Culture and Tourism, and the China Federation of Literary and Art Circles.

The plan sets forth 24 measures across seven areas, including improving the development and training of theater troupes and their repertoires, cultivating new artists and better engaging the public.

To ensure these art forms remain relevant, theater professionals have emphasized the need for works that resonate with contemporary audiences and the importance of cultivating new viewers through educational institutions. They've also highlighted embracing technological innovation to expand artistic expression and create a sustainable ecosystem for the dramatic arts.

According to the Ministry of Culture and Tourism, among China's 348 traditional opera types, roughly one-third are considered rare. Some exist in only a single troupe nationwide.

"Theater troupes across all levels are tasked with identifying enduring works, organizing research and promoting performances, with an emphasis on standardizing the transmission of key classics," the plan said.

Authorities are also focusing on rescuing and revitalizing precious historical materials.

"Cultural, tourism and publicity departments are coordinating with theater groups, research institutes, museums and libraries to collect, study, publish and exhibit traditional scripts, scores and archives," the plan said, noting that special attention is being given to preserving the audiovisual recordings of veteran performers, and oral histories of notable artists.

Local governments are encouraged to enact regulations to support the protection and development of regional opera forms. Experts say these measures aim to ensure China's opera heritage is systematically preserved and dynamically transmitted to future generations.

Liu Tong, director of the Chinese opera expert committee of the China Education Federation of the Arts, highlighted the plan's emphasis on "tailoring strategies to local conditions and specific troupes".

"Drama troupes across the country vary greatly — some are well-resourced, others face dual pressures of limited funding and talent shortages. Rare genres are particularly vulnerable; if key performers leave, the art itself may disappear," he said.

Liu said the plan's proposals, including a genre preservation program, a classical repertoire library and targeted support, respond directly to these realities, noting that troupe management requires more than funding.

"Effective governance must balance artistic principles, repertoire planning, market engagement and talent continuity," he said.

Shang Wenbo, director of the Taizhou Luantan opera troupe, has firsthand experience of pulling a dying art form back from the brink.

The group, a representative of national intangible cultural heritage, was dormant for nearly 30 years and faced significant hurdles, including the loss of performers, shrinking audiences and market decline.

Taizhou Luantan is a regional form of Chinese traditional opera originating from Zhejiang province. Featuring a flexible, improvisational style that blends local folk songs, dialect and storytelling, its themes are drawn from everyday life and local history.

"Our survival isn't luck, but is about finding a path that works for us," Shang said.

Under a hybrid public-private model, the troupe modernized its operations and implemented targeted talent development, producing a steady stream of original works. As a result, young actors gained practical experience, and the productions reached national stages and gained commercial success.

"The plan's support for grassroots troupes and reform is both encouragement and guidance," Shang added.

A major priority of the plan is the systematic training of young theater talent. This includes multitiered programs targeting primary schools, secondary schools and higher education institutions, combining academic instruction with hands-on performance experience.

According to Liu, China's traditional opera education system is facing a talent shortage, with only 1,670 students currently enrolled in vocational opera programs nationwide, which is far below industry demand.

He emphasized that the key lies in increasing student participation, calling for optimized enrollment policies. Measures should include tuition reductions, living allowances and other incentives to attract young people, particularly to smaller, less-known opera genres.

Liu said that deepening cooperation between opera schools and primary and secondary schools is of critical importance, as it creates a pipeline from early interest to professional training.

Wang Rongrong, a veteran Peking Opera actress with the Jingju Theatre Company of Beijing, highlighted the plan's emphasis on "master-apprentice" relationships, which allow young actors to inherit both technical skills and interpretative wisdom from veteran performers. She noted that these relationships are particularly critical for rare genres.

Peking Opera, or *jingju* in Chinese, dates back more than 200 years and was recognized as an Intangible Cultural Heritage of Humanity by UNESCO in 2010. It brings together the art forms of singing, dancing, martial arts and acrobatics.

The plan also encourages cross-troupe exchanges, summer academies and intensive workshops, providing young actors with exposure to a variety of genres and performance techniques. Digital platforms are set to complement these efforts, with online master classes, artificial intelligence-assisted rehearsal tools, and virtual performance spaces to allow students to learn even when geographic constraints or limited local resources exist.

Recognizing that private theater troupes face persistent challenges, such as shortages of scripts and limited access to high-quality original works, the China Theatre Association launched the "One-Yuan Seed Plan" on Feb 24.

The initiative, which is also highlighted in the plan, aims to leverage the association's professional and resource advantages by inviting renowned playwrights to submit works suitable for private troupes. In a symbolic gesture, the performance rights are transferred for a nominal 1-yuan (15 cents) copyright fee, helping local and county-level private troupes gain access to tested and acclaimed works.

Chen Yongquan, vice-chairman of the association, said that the plan will authorize and publish 100 works in stages. The first batch includes 20 plays, spanning contemporary, historical and folk themes, all recognized for their quality and audience appeal.

So far, 35 private troupes have expressed interest, showing enthusiasm for performing classic and popular works. Chen noted that thriving private troupes are vital to cultural development and the broader arts ecosystem.

"They strengthen the foundation of Chinese drama, promote public engagement with traditional culture, and expand access to high-quality cultural services," he said.

Drama's long-term revival depends on the quality of productions, according to the plan, and as such it prioritizes improving repertoire quality through script evaluation, guided creative processes and funding incentives.

"A new initiative aims to improve the script review system. Productions must start with strong, well-vetted scripts. Script evaluation will become a prerequisite for staging plays. A national platform will be built to collect and promote outstanding scripts. This platform will connect playwrights with theater troupes," the plan said.

The plan also emphasizes the role of digital innovation and modern media in expanding the reach of dramatic arts. Traditional outlets such as radio, television, and film will be utilized to promote theater, with provincial TV stations encouraged to launch dedicated opera programs. Concurrently, technology is playing a larger role in audience development. Theater troupes are being supported in using the internet and artificial intelligence to reach broader demographics, while online performances and livestreams will be standardized to ensure quality and industry impact.

Feng Yuanzheng, president of the Beijing People's Art Theatre, and also a veteran actor and director, said: "Content is always the top priority. Only compelling works that combine artistic excellence with contemporary relevance can attract and retain audiences.

"I experimented with AI-generated scripts, and while the results were technically excellent, they lacked soul. Original scripts carry the emotions, quirks and personality of the author — something no machine can replicate," he said. "Scripts written by humans breathe life into stories. The precision of AI cannot replace the lived experience and emotional depth that make characters resonate with audiences."

To cultivate future audiences, the plan calls for strengthening general theater education in schools. Programs that bring performing arts to campuses will be expanded to offer students diverse ways to watch, participate, and engage. Additionally, schools with sufficient resources are encouraged to establish drama clubs to nurture young talent and future theatergoers.

Industry professionals emphasize that making productions accessible to younger viewers is critical. Kunqu Opera performer Ke Jun highlighted the success of youth-focused productions — such as a teen version of *The Peony Pavilion* — which attracted hundreds of thousands of young viewers. By utilizing online streaming as a "second stage", troupes can reach distant audiences and foster a new cycle of engagement.

To lower barriers and integrate traditional arts into everyday life, Shanghai Yue Opera House director Xu Biaoxin called for utilizing accessible digital formats. These include short videos, livestreams, behind-the-scenes content and performer personal branding, ensuring that classical performing arts remain relevant to modern, younger audiences.

Theater works to pass torch to new talent

By CHEN NAN

This March, Beijing's audiences flocked to the theater, eager to witness a performance that has enchanted generations.

Since its premiere in 1958, Lao She's *Teahouse*, brought to life by the Beijing People's Art Theatre under the meticulous guidance of directors Jiao Juyin and Xia Chun, has held a mirror to nearly half a century of China's social transformations. Yet, beyond its historical narrative, it is the dedication of the theater's actors — both veteran and young — that keeps this masterpiece alive.

The theater has long upheld a near-sacred tradition: once a production takes root, the core cast, stage design and performance style remain steadfast. This disciplined continuity ensures that each audience experiences the authenticity of old Beijing.

"Our goal is for the audience to feel the original spirit of the teahouse — without distortion, without modern embellishments," said actor Yang Lixin, who is also the restaging director of *Teahouse*.

For decades, actors like Liang Guanhua, Pu Cunxin and He Bing have embodied iconic characters with unwavering commitment. Liang, who has portrayed the second-generation Wang Lifa since 1999, meticulously records every performance in a personal log, reflecting on decades of insight and subtle refinement. Pu, now the chairman of the China Theatre Association, treats each staging as a fresh ascent, approaching every show with the immediacy of a first encounter with the audience.

Yet, the theater's leadership recognized that classical theater could not survive without thoughtful succession. To pass the torch to the younger generation, the Beijing People's Art Theatre revived its actor training programs in 2019 after a 30-year hiatus. The new cohort underwent rigorous instruction, including one-on-one mentorship, master classes, and immersion in real-life experiences.

"The challenge for young actors is not merely to imitate, but to understand and inhabit the essence of these roles," Pu said. "They must bring their own vitality and sensitivity, while honoring the rhythm, nuance and humanity of the characters."

Through this blend of tradition and innovation, the theater's younger performers stepped into secondary roles, learning the discipline, empathy, and interpretive depth that defined the institution. Actor Yang Mingxin described rehearsals as a living classroom where stage veterans, directors, and designers collaborated to create an environment of learning by observation and practice.

Today's theater-goers, especially younger ones, judge performances on merit rather than resemblance to legendary predecessors. This shift gave emerging actors room to explore and contribute their unique voices to the continuum of Chinese theater.

According to Feng Yuanzheng, a veteran actor, director and president of Beijing People's Art Theatre, the most urgent issue facing the theater is how to enable young actors to take the reins as soon as possible. In recent years, the theater has been actively exploring actor training and has boldly involved young actors in the creation of new productions.

In this interplay between old and new, the Beijing People's Art Theatre demonstrates the delicate art of cultural stewardship: honoring the past while empowering the next generation.

Feng said the current challenge is how to encourage today's young playwrights — or young people who enjoy creating — to develop works with contemporary significance.

In 2024, the theater held a director-playwright training program and one of the biggest challenges for young participants was committing themselves fully, Feng said.

"It is very difficult for a young person to spend three years completing a script; even half a year feels long to them," he said. Feng added that, for actors, the most persuasive way to win audience acceptance is through fully realized characters. And for a theater, the most effective way to gain audience recognition is through the quality of its productions.

Policy Digest

Subsidy program to aid phase-out of old commercial trucks

The Ministry of Transport and the National Development and Reform Commission have issued a notice rolling out a 2026 subsidy program to accelerate the replacement of old commercial trucks.

The program, effective throughout the whole year, provides financial incentives for scrapping and replacing heavy- and medium-duty trucks that comply with the older emission standards. A focus is promoting the transition to new energy vehicles, with priority support given to the purchase of electric trucks.

The subsidy amounts vary based on the vehicle type, scrapping time and the type of new vehicle purchased. The maximum combined subsidy for scrapping an old truck and purchasing a new electric truck can reach up to 140,000 yuan ($20,500) per vehicle .

Funding for the subsidies will be allocated to local governments through ultra-long-term special treasury bonds. If the central government allocation is exhausted, any additional funding required must be covered by local finances.

Initiative to boost deep AI integration with industrial growth

China's Ministry of Industry and Information Technology and the National Data Administration have launched an action plan to foster synergistic development between artificial intelligence models and data resources to empower new industrialization.

The initiative targets 20 key manufacturing sectors, including steel, automobiles, medical equipment, aerospace and electronic components. Its core objective is to establish a self-reinforcing loop that connects data, AI models and practical industrial applications by the end of this year.

Key tasks outlined include building high-quality general and specialized industry datasets, and developing industry-specific models and intelligent agents.

According to the established timeline, provincial authorities and relevant State-owned enterprises directly administered by the central government are required to submit detailed implementation plans by May 30, provide a mid-term progress report by Aug 30, and submit a final summary by Nov 30.

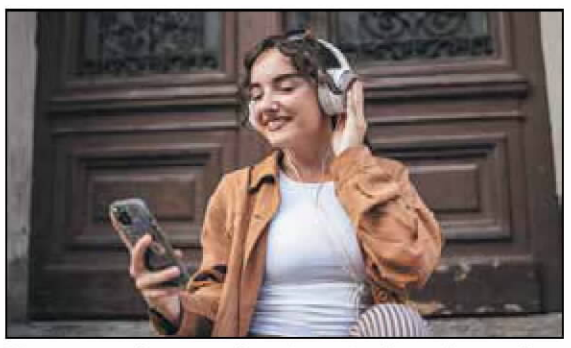
Earphone renaissance

No charging, no device pairing — just plug in your earphones and enjoy the music. After being overshadowed by wireless Bluetooth earbuds for nearly a decade, wired earphones are making a comeback in 2026.



According to the market research firm Circana, sales of wired earphones rose by 20 percent in the first quarter of this year.

On the social media platform Xiaohongshu (RedNote), the hashtag "wired-earphone outfits" has also gained popularity, with young netizens creatively incorporating them into their style — using them as necklaces, belt decorations, and even hair accessories — bringing back the Y2K aesthetic.

So, what's driving this revival? Many people say Bluetooth earbuds are easy to misplace and require constant charging, while wired earphones are simple, reliable, and always ready to use.

In today's fast-paced digital world, the ever-present earphone cable has come to symbolize effortless, dependable freedom — with a touch of nostalgia and retro charm.

As one Xiaohongshu user puts it: "With wired earphones, you can enjoy lossless audio on music apps. And when you're with someone you like, you can share one side of the earphones. You sit close and enjoy the music together — it's really romantic."

Young people are embracing wired earphones for style and simplicity. VCG

Apple wisdom

What's the secret to happiness?

"When you have an apple, just enjoy the apple."

The simple yet thoughtful answer didn't come from a philosopher, but from a primary school student.

In April, during the annual Crabapple Blossom Season Campus Open Day at Tianjin University (TJU), an interactive board was set up at the university library for an activity titled "Quick Answers to Life's Puzzles".

University students wrote down their concerns, while younger children responded with candid and unfiltered honesty.

One university student asked, "What should I do if I can't find inner joy?" A child replied, "Watch *Peppa Pig*."

A high school student asked, "How can I get into TJU?" — referring to admission to the prestigious university. A primary school student responded humorously: "I got in on Open Day."

The cross-generational exchange quickly went viral online, attracting more than 100,000 likes on the Chinese social media platform Xiaohongshu.

Che Yifan, a library staff member at TJU, said the team hadn't expected such widespread attention.

"The original idea was simply to create a relaxed space for people of all ages to communicate," Che explained. "We hoped it would help students see their worries from a different perspective."

In a commentary shared on its official social media account, the university described the library as "the heart of the university".

"When members of the public come here with curiosity and hope, we want this heart to beat for society," the university wrote. "Culture knows no age or boundaries. It nurtures everyone equally, helping people become warmer, stronger, and more confident."

Even the youngest minds can offer insights adults never expect. VCG

Music bridges cultures in Nanning

From Rio to Nanning, young musicians share melodies, dance, and laughter, bringing Brazilian and Chinese cultures together on stage.

Members of Brazil's Forte de Copacabana Orchestra sing the Chinese folk song *Mo Li Hua* (Jasmine Flower) in Nanning, Guangxi Zhuang autonomous region, on April 16. PROVIDED TO CHINA DAILY

By ZHANG LI in Nanning
zhangli@chinadaily.com.cn

Marcia Melchior, artistic director of Brazil's Orquestra Forte de Copacabana, or the Forte de Copacabana Orchestra, watched the young musicians on stage. A clear vocal melody rang out, followed by a graceful tune that filled the air. Brazilian performers danced to the rhythm, and local Chinese youth joined in, forming a circle and moving freely to the beat.

"This is more than just performing," Melchior said. "Music is universal; it connects people. Even without a common language, people can feel it with their hearts."

The scene unfolded at the opening ceremony of the 2026 Guangxi Sanyuesan Festival in Nanning, South China's Guangxi Zhuang autonomous region, on April 18.

Traditionally celebrated on the third day of the third month on the Chinese lunar calendar — which fell on April 19 this year — the festival is a time for the Zhuang ethnic group to honor their ancestors and express love through singing.

From April 15 to 20, the Forte de Copacabana Orchestra was invited to participate in the festival and join cultural exchanges with local youth.

Based in Rio de Janeiro, the orchestra is composed of young musicians aged 13 to 25. Recognized as part of the Cultural and Intangible Heritage of the State of Rio de Janeiro, it serves as an important messenger of friendship between Chinese and Brazilian youth.

During the festival, the orchestra combined classical music with the passionate rhythms of Brazilian samba, performing melodies familiar to both Brazilian and Chinese audiences. Upbeat Brazilian classics brought energy to the stage, while *Flor de Lis* (Lily Flower) echoed the Chinese folk song *Mo Li Hua* (Jasmine Flower), creating a musical dialogue across cultures.

Above: Brazilian performers and Chinese youth take part in embroidered ball throwing. **Below:** Brazilian performers join local children for cultural activities. **Bottom:** Members of the Forte de Copacabana Orchestra perform at the Nanning Youth Activity Center. PROVIDED TO CHINA DAILY

Singer Michelly Gondim admitted that learning to sing in Chinese in a short time was not easy, but the challenge made it even more memorable.

"This is an incredible experience. Being able to share these cultural elements with Chinese artists is truly special," she said.

At the Nanning Youth Activity Center, Brazilian musicians performed Chinese songs alongside children dressed in traditional local ethnic costumes. The musicians played and sang as the children added harmonies, their instruments and voices blending into a warm melody.

Gondim said she was deeply moved by the children's dedication and the audience's enthusiastic response. "It made us feel close right away," she added.

Violinist Bruna Zurmele recalled how quickly the children learned Brazilian rhythms during rehearsals. "One young boy even picked up a hand drum and joined us on stage, keeping perfect time with the samba beats," she said. "That moment really stayed with me."

She added that Guangxi's climate and scenery reminded her of her hometown, Rio de Janeiro, making her feel right at home. She was also touched by the warmth and hospitality she encountered throughout the trip.

"Everywhere we played, people came over to watch and interact with us. Their kindness left a lasting impression," she said.

During the intangible cultural heritage session, Brazilian guests and Chinese youth participated in traditional activities such as three-person board-shoe racing, embroidered ball throwing, and *touhu*, or pitch-pot. They also tried Zhuang brocade weaving, fan painting, tea art, and local delicacies, immersing themselves in the charm of Guangxi's traditional culture.

Cellist Thiellen Sena said the visit gave her a more vivid understanding of China and inspired her to learn more about its culture.

"I started from scratch, learning and experiencing everything along the way," she said. "The whole process was just fascinating."

Xinhua contributed to this story.

Slow living shapes young lifestyles

From crochet to ancient wellness rituals, a new generation discovers old-school lifestyles, weaving heritage and mindfulness into everyday routines.

By **XIONG XINYI** and **CHEN XUE**

Tulip (pseudonym), based in Hangzhou, Zhejiang province, still treasures her first crochet piece: a navy-blue coaster she made in high school, with guidance from an older friend. What started as a simple hobby seven years ago has since grown into a full-time career.

"The internet moves too fast," she said. "People are trapped in constant anxiety. But crochet is inherently slow — it can't be rushed. It's about weaving together fragmented moments, stitch by stitch."

Known by the handle Qingzheng Mozai on social media, Tulip represents a rising wave of young Chinese embracing an "old-school life" as a counterbalance to the relentless pace of modern life. This philosophy encompasses crafts, food, and personal rituals, forming a holistic approach to living.

The scale of this shift is evident in the numbers: a 2025 survey by China Youth Daily found that 89.9 percent of 1,337 young respondents said they liked visiting local food markets while traveling. Similarly, content related to crochet has attracted billions of views across platforms such as Xiaohongshu and Douyin, according to a March report by China News Service.

A former fashion design student, Tulip struggled with crochet during her university years, receiving poor grades in related courses. But she didn't give up. She began posting her work online, looking for a community of like-minded people. The support she found there helped her improve, both in her crochet skills and in her understanding of the deeper value crochet brought to her life — a sense of peace.

"I used to fear heavy workloads," she admitted. "But crochet showed me how to take things step by step. No matter how heavy the load, it eventually gets done."

Her passion for crochet even led her to translate a foreign crochet pattern book into Chinese — a task that required not just language skills but also a deep, practical knowledge of the craft, as many international patterns didn't have Chinese editions.

"It taught me to stay true to my own vision," she said.

> "In an age of constant connectivity, bathing is one of the few things that forces us to strip away everything — clothes, phone, and social roles."

Embracing wholeness

Food has long been a vessel for memory and connection, a sentiment deeply understood by Huang Chengjuan, the creator behind the Yan Jiu Suo account, and Lu Shi Yue (her social media pseudonym). Both of them cherish the slow, mindful preparation of traditional foods.

Huang, based in Guangzhou, Guangdong province, made a dramatic shift from being a vice president at a gaming company to becoming a full-time food creator after the birth of her son. At that moment, she realized she wanted more than just a career — she wanted to build something that could carry stories and memories.

"I could see exactly what my future would look like," she recalled, recognizing that food offers more than just nourishment — it carries the weight of tradition and shared experiences.

Through her social media platform, Huang shares her journey of researching and recreating traditional Chinese delicacies, bringing ancient flavors back to life for a new generation.

"Young people don't just want to learn how traditional dishes are made," she observed. "They want to understand the culture behind these foods, take what resonates with them, and incorporate the essence of traditional living into their daily lives."

Part of Huang's mindful approach to food includes visiting local food markets, where she shops not just for fresh ingredients, but also for a human connection.

"Chatting with vendors about flavors, origins, and seasonal availability offers a quiet wisdom that you can't find in a shopping app," she said.

Lu Shi Yue, based in Dali, Yunnan province, shares a similar ethos but with a unique twist: her culinary creations are deeply influenced by Chinese literature.

For example, she has recreated wisteria cakes, a pastry filled with wisteria petals that was popular during the Republic of China period (1912-1949) but is rarely seen today. This project, like many others, is part of her exploration of how food intersects with stories and culture.

Above left: Tulip (pseudonym) poses with yarn and crochet tools. **Above right:** Lu Shi Yue (pseudonym) makes spring-inspired wisteria cakes. **Below:** Huang Chengjuan enjoys home-cooked traditional Chinese dishes. PROVIDED TO CHINA DAILY

Lu moved from Beijing to Dali in 2023 in search of a slower pace of life. She soon realized, however, that the real challenge wasn't slowing down — it was confronting the fragmentation that comes with modern life.

"People are constantly interrupted by notifications, short videos, and the endless scroll. That's what really exhausts us," she explained. "What we're seeking is wholeness. When we complete something, whether it's a dish or a book, there's a sense of fulfillment in seeing the whole picture come together."

This is why so many of her followers recreate her dishes and engage with her work on a deeper level. They find not only a connection to the past and to literature but also a sense of belonging in the present.

"Wholeness may seem slow, but it's actually the quickest way to recharge," Lu added.

This same philosophy shapes the life of Yang Wenxi, known online as Zhu Le Tang, based in Chengdu, Sichuan province. She has found the power of slowing down through an ancient wellness ritual: bathing.

Yang is passionate about baths to the point that she installed a private one at home. "In an age of constant connectivity, bathing is one of the few things that forces us to strip away everything — clothes, phone, and social roles," she said.

She has since developed a system of slow, body-centered self-care inspired by ancient Chinese wellness traditions. For example, during spring, a season traditionally associated with renewal in traditional Chinese medicine (TCM), she incorporates haircombing into her daily routine to help support *qi*, or vital energy.

She also revives small, personal rituals, like warming clothes over incense, reconnecting with the ancient wisdom that helps her navigate the stresses of modern life.

In addition to bathing, Yang has also taken up calligraphy, which she said helps her "switch my racing mind into energy-saving mode".

"When we write, take baths, burn incense, or simmer soup, we use these 'slow motions' to recalibrate a rhythm that's been disrupted by fast-paced life," Yang explained.

She has also noticed that when young people like her turn to older lifestyles, it's not about trying to relive the past. "We're simply borrowing wisdom and strength from them to make our present lives more comfortable — and more truly our own," she said.

Nanyin finds new voices

A new generation breathes life into centuries-old Nanyin melodies, sharing them with global audiences in a fresh, modern way.

By **GUI QIAN**
guiqian@i21st.cn

When Zheng Mingming was about 5, she loved sitting next to her grandmother, listening to her sing ancient songs in the Minnan dialect. Her grandmother, a "resident musician" at a Nanyin hall in Quanzhou, Fujian province, had hundreds of songs memorized.

Whether at family gatherings, festivals, and quiet afternoons at home, Nanyin music was the soundtrack to Zheng's everyday life.

Little did she know that this family tradition, passed down through five generations, would one day lead her to perform on a world-renowned stage.

On March 28 and 29, at Hong Kong City Hall, Zheng, a member of the modern Nanyin ensemble Tiam Drop, played the Nanyin *pipa*, a crooked-neck lute held horizontally, accompanied by five fellow musicians. More than 400 audience members from around the world listened intently and responded with thunderous applause.

The performance was part of the 54th Hong Kong Arts Festival, which featured about 1,200 outstanding international and local artists.

For the first time ever, Tiam Drop, a youth troupe founded in 2021, brought Nanyin to this prestigious Asian arts event.

Often referred to as a "living fossil" of Chinese music, Nanyin originated in Quanzhou and is one of the oldest known music genres in China, with a history of 800 to 1,000 years. Traditionally performed in the Minnan dialect, it features instruments like the *pipa*, *dongxiao* (a vertical bamboo flute), *erxian* (a two-stringed instrument), and *sanxian* (a three-stringed instrument).

In 2006, Nanyin was included in the first batch of China's national-level intangible cultural heritage list. In 2009, it was inscribed on UNESCO's Representative List of the Intangible Cultural Heritage of Humanity.

Growing up in Quanzhou, Zheng was deeply immersed in Nanyin. Every spring and autumn, local Nanyin musicians would hold ceremonies honoring Meng Chang, the god of music. During celebrations such as the Birthday of the Buddha, families would prepare dishes to share, while the community gathered to sing, play Nanyin, and enjoy a meal together.

"Nanyin is not just music; it's a way of life, filled with human warmth. It encompasses a complete universe — music, rituals, culture, and so much more. There's no end to it," Zheng said.

Members of Tiam Drop, an ensemble that brings a modern touch to Nanyin, a centuries-old music genre from Quanzhou, Fujian province. PROVIDED TO CHINA DAILY

> "Nanyin is not just music; it's a way of life, filled with human warmth. It encompasses a complete universe — music, rituals, culture, and so much more. There's no end to it."
>
> **Zheng Mingming,** a musician and member of the Nanyin ensemble Tiam Drop

Many Nanyin lyrics are drawn from ancient tales, such as the Minnan love story of Chen San and Wu Niang. This story has inspired hundreds of songs passed down through generations, with each performer adding their own layers of emotion and detail.

"It's like reading a book, but even more enjoyable because you can sing and play it," Zheng explained.

"In Nanyin, time seems to fly," she added. "Each time you master a song or an instrument, you uncover new challenges — it's like leveling up in a game."

She noted that there are about 6,000 existing Nanyin songs, with some suites taking more than 40 minutes to perform.

The music 'chef'

Cai Kaidong, the founder and producer of Tiam Drop, was initially baffled by Nanyin's intricate musicality. A seasoned musician with experience performing with bands, arranging music, and producing albums for well-known groups, he realized he couldn't recall a single melody after listening to a Nanyin piece nearly 10 times.

This revelation made him question why so many people, even professionals like himself, found Nanyin so difficult to grasp.

"It's not that Nanyin isn't good," he explained. "It's just that our ears are so accustomed to the 'cooking style' of modern music."

He was referring to Nanyin's melody-centered texture, which differs from the harmonic progressions and strong rhythmic structures familiar to modern pop listeners.

"Nanyin is like raw meat from ancient times — pure and uncooked — while modern listeners are used to processed meat," he explained, using a culinary analogy. "What we need to do is provide 'chopsticks' in the form of arrangements to serve it to the audience."

However, Cai is determined not to turn Nanyin into something it's not. So, he has adopted the principle of "no changes, only arrangements" for Tiam Drop. The lyrics, melody, playing techniques, and tonality remain unchanged, but two subtle elements are introduced. First, bass harmony using the *daruan*, a long-lost Chinese plucked instrument. Second, a rhythmic framework with the cajon, whose neutral tone ensures that no foreign musical style is imposed.

"The *daruan* is a native instrument, yet not a single song featuring it has survived. This works in our favor, as it won't alter the core or style of Nanyin," Cai explained.

"The cajon is like plain boiled water. I don't want it to stand out; it shouldn't have any 'flavor'. I only use it to offer a subtle 'hint' at key moments — such as the start of a new section or a shift in emotion," he added.

These arrangements give Nanyin a clear structure — beginning, development, climax, and ending — making it more accessible to younger audiences.

At the Hong Kong Arts Festival, Tiam Drop even led an interactive session, teaching over 400 people to sing along. The experience was so moving that Cai removed his in-ear monitor and stood on stage, stunned.

On March 30, Tiam Drop hosted "Echoes of a Millennium: Nanyin" sharing session at the Legislative Council of Hong Kong, where Legislative Council member Kenneth Fok Kai-kong tried the instruments and later praised the group on social media: "This unwavering commitment and passion for culture truly deserve our full support."

Cai remains grounded in his mission.

"Every generation has its own role to play, and what it does will be remembered," he said.

"Our generation just needs to approach traditional Chinese music with sincerity, responsibility, and respect."

Shining Wisdom

China's governance model offers lessons for the world

Rafael Henrique Zerbetto

Over my 10 years in China, I paid close attention to the country's poverty alleviation work and had the chance to visit some of the last villages lifted out of poverty, in places such as Guizhou province and the Xinjiang Uygur autonomous region.

Walking through the narrow lanes of these rural communities, I saw local committees coordinating efforts to create jobs, develop tourism, improve education, and protect the environment — all tailored to each village's unique needs.

Wherever I went, even in the most remote areas, I met officials who knew their communities deeply, and I began to understand how China's governance system turned national strategy into local action.

I also kept up with the publication of all the volumes of *Xi Jinping: The Governance of China* and read many of President Xi's other books. I even contributed to editing and proofreading translations of his works into Portuguese.

These experiences helped me grasp the philosophy behind China's whole-process people's democracy, a system that allows citizens, including ethnic groups, to participate at every stage of policy-making — from planning to implementation — unlike Western representative democracy, which relies heavily on elections.

The accessibility of governance theories through President Xi's writings has made this participation more possible and active. Ordinary citizens are not only able to understand the rationale behind policies, but they can also suggest improvements and see their ideas reflected in both local and national initiatives.

Even as a foreigner, I found this system transparent and inclusive: I could attend public briefings, read official reports, and discuss policy limitations with local committees, contributing ideas to make daily life smoother for the international community and the country more attractive to international talent.

I witnessed firsthand how policies moved beyond theory into practice.

In one village, for example, a small cooperative was established to process local agricultural products. I watched as villagers who had spent decades in poverty were now operating machinery, negotiating with buyers, and learning digital marketing strategies. I realized that the state's efforts aimed to empower people with knowledge, skills, and sustainable livelihoods — not just provide financial aid.

By comparison, poverty alleviation in Brazil often comes in the form of conditional cash transfers. While such programs can improve consumption and provide temporary relief, they are not connected to a broader development plan. Seeing China's tailored, multi-sectoral approach made it clear why its overall efficiency and long-term impact far surpassed that of Brazil.

As a Brazilian, I felt especially proud when President Xi chose the 19th G20 Summit in Brazil in 2024 to deliver two important speeches. In one, he spoke on the fight against poverty and hunger, sharing China's successful experiences in supporting the Global South. In the other, he addressed the need to reform global governance, advocating for multilateralism and the strengthening of a rules-based international order.

Through it all, I came to deeply appreciate the holistic nature of China's governance model. Poverty alleviation, economic growth, social participation, international diplomacy, and citizen empowerment were all interconnected.

As an observer, reader, and contributor, I came to see that this system — rooted in China's long history and adapted to modern challenges — offers valuable lessons for the world.

This is why I believe that translations of President Xi's books will help foreigners better understand China's policies and promote international cooperation.

By the end of my 10 years, I realize that governance is more than just laws, policies, or speeches. It is the delicate weaving together of strategy and human experience — a village lifted out of poverty, a citizen's voice heard, a foreigner's suggestion considered — all forming a living, evolving tapestry of collective progress.

Written by Rafael Henrique Zerbetto, a Brazilian foreign languages expert at the Asia-Pacific Center of the China International Communications Group and a board member of the Brazilian Citizens Council of Beijing. He was one of the recipients of the Chinese Government Friendship Award in 2025.

SKATEBOARDING

CONTINENT GETS ON BOARD

Kids grind for glory at inaugural Asian championships in Meishan

By **PENG CHAO**
in Meishan, Sichuan province
pengchao@chinadaily.com.cn

Zheng Haohao stood at the edge of the concrete bowl, took a deep breath, and then dropped in.

What followed was pure flow, capped by a smooth 540-degree spin and a clean landing.

The crowd erupted.

"I'm thrilled, and honestly a little surprised by my own performance," said the 13-year-old after taking third place in the women's park final at the recent 2026 Asian Skateboarding Championships in Meishan, Sichuan province.

"I used to be afraid of the 540, because you have to rotate in the air. I'm glad that I finally found the courage to get past it."

Zheng's passion for skateboarding began six years ago, when she received a board as a birthday gift from her mother at age seven.

At nine, the skater from Huizhou, Guangdong province, competed in the women's park event at the 2021 National Games.

Her career highlight came at age 11, when she represented China at the 2024 Paris Olympics.

Zheng was the youngest athlete across all sports at the Paris Games, and the youngest-ever Chinese Olympian.

Thanks to pioneers like Zheng, since the sport's first inclusion at the Tokyo Olympics, skateboarding has gained increased popularity among a new generation and seen a pool of budding talent emerge.

An example and idol

Despite being labeled a prodigy by many, Zheng said her journey has been anything but easy.

There were tough days, she admitted, when she would cry after practice because she just couldn't land her tricks.

"Talent alone isn't enough," she said. "What really matters is who works harder, plays smarter and loves the sport more."

Zheng said she skates out of love, not obligation.

"As long as you stay passionate, no matter how many times you fail, you'll always believe that, maybe, the next one will land. You just have to keep trying," she said.

For her, the appeal of skateboarding lies in the thrill of pushing her own limits.

"That sense of freedom when you're in the air — you can't get it anywhere else," she said.

Zheng also loves the social aspect of skateboarding. The sport, born on the streets, has helped her build friendships with skaters from around the world.

"We may be rivals on the course," she said, "but off it, skateboarding brings us together as friends."

When she first picked up her board, Zheng was often the only girl at the skatepark. However, the once male-dominated sport, she noticed, is now attracting an ever-increasing number of girls. In fact, many have given the sport a try after seeing Zheng compete in Paris.

"I'm really happy to do my little bit for Chinese skateboarding. It gives me a sense of pride to inspire more kids, especially girls, to pick up the sport," she said.

Zheng's idols are Gu Ailing, China's Winter Olympic freestyle skiing champion, and Zheng Qinwen, the country's first Olympic tennis singles gold medalist.

"Their fighting spirit inspires me," she said. "I want to be like them someday — winning a major title for my country."

Zheng recalled her mother's playful encouragement: "Gu Ailing has a nickname — 'the Frog Princess', so, I guess that makes you the 'Tadpole Princess'."

She said her love for skateboarding won't end. After she retires, she says her dream is to become a female judge at international bowl events after retiring.

"That would be awesome — because, so far, I've never seen (a female judge)," she said.

'Just cool'

Yu Jinmo, also 13, fell in love with the sport for a simpler reason: "It's just so cool."

At age six, she was walking past a square with her parents where an older boy was skateboarding and she was instantly drawn to it. So, her parents took her to a skateboard club, where she started practicing.

In 2022, Yu earned a spot on the Sichuan provincial skateboarding team. That same year, she claimed a gold in skateboarding at the National Roller Skating Championships.

At the 2026 Asian Skateboarding Championships in Meishan, she finished second in the game of skate competition.

Yu enjoys trying new tricks — especially ones that no one else has done — even if it means risking poor results in competitions or a greater chance of injury.

"As long as a move looks cool, I will definitely give it a shot," she said.

Yu has suffered multiple injuries. The worst was when she missed a rail during a competition, fell, and landed on her chin.

She bled heavily and was taken to the hospital by ambulance.

That, however, hasn't kept her off her board.

"If you truly love the sport, those injuries don't really matter," she said.

Yu said her skateboarding experience has taught her a simple lesson: stick to what you love, and don't worry about what others say.

"My grandma used to be a little bit against me learning skateboarding, but, after seeing what I've achieved, she's now come around to support me," she said.

'Keep going'

Wu Bowen, 19, was also into skateboarding because it looked cool. However, he didn't take it up for medals, but to escape weekend homework.

"My parents noticed my athletic talent, so they supported me," said the youngster from Nanping, Fujian province. "I just thought it was fun."

Wu started at around 13, which is pretty late compared to most skaters, but, just 15 months later, he took sixth place at the 2020 National Skateboarding Championships.

In 2025, he won gold in men's park at the national championships.

"Most of my rivals have been skating for nearly ten years, but that doesn't scare me," he said.

"I can land the hardest tricks, the highest jumps, and the biggest moves — and I'm pretty consistent."

Wu said he had never performed so well and so flawlessly as he did at the Meishan event, despite only finishing third in the men's park final.

"I was so nervous in the prelims that I messed up my first run. Then I told myself: don't treat it as a competition, just enjoy it," he said. "Results matter, but what's more important is showing what you've got."

The competition was special for him, as the stands were filled with spectators — no longer just a few familiar faces.

"Every time I landed a trick, cheers erupted. That was a one-of-a-kind experience," he said.

Wu used to be a person with no big dreams. Skateboarding gave him a concrete goal: to perform on an international stage and bring honor to his country.

The teen noted that most Chinese athletes retire by the time they reach their early 20s, but he doesn't plan to follow suit.

"The sport has a high age ceiling. Overseas, some guys are still skating in their 50s," he said.

"I enjoy every bit of progress. As long as I see myself improving, I'll keep going."

Competitive location

While skateboarders compete for their dreams in Meishan, the host city is paving the way for more to follow.

Li Rui, deputy director of Meishan's education and sports bureau, said the city has built the Meishan International Roller Skating and Skateboarding Center — an Olympic-standard venue — to promote the sport's development.

The five-day event last month — Asia's first continental championship just for skateboarding — was the venue's inaugural competition and welcomed 172 athletes from 13 countries and regions.

"Our city may not be strong in traditional sports, but we have an edge in action sports like skateboarding," Li said.

In Meishan, skateboarding is a hit among students and young professionals. The city is home to more than 5,000 regular skaters and over 10 skateboard clubs and grassroots organizations.

The city has been promoting the sport in schools, neighborhoods, and malls, while adding skate spots in sports parks and plazas.

Training programs and youth summer camps are also underway to build a broader base for the sport, Li said.

"The goal of hosting the championships is also about using the event's exposure to boost skateboarding at both the professional and grassroots levels," he added.

The event brought not only sporting excitement, but also economic vitality, Li said. It attracted over 50,000 spectators and sports fans, generating over 80 million yuan ($11.7 million) in direct spending on tourism, dining, accommodation and shopping.

"I took my family out for a meal one night, and the tables around us were packed with Koreans, Filipinos — you name it," Li said. "That's proof of how the event drove up local spending."

Liao Jincheng, deputy general manager of Meishan Sports Industry Development and Investment Co Ltd, who oversees the venue's operations and training programs, said tickets for the semifinals and finals were completely sold out.

He said the venue will host professional teams for training camps and work with schools, youth centers, and skating associations to maximize its usage.

Right next to the skateboarding venue is a world-class rock climbing gym boasting 7,200 square meters of climbable surfaces — one of the largest facilities of its kind in the world, Liao said.

"Under Meishan's development plan, the venue's surrounding area will turn into a hub for action sports," Liao said. "Hopefully, one day, we'll see a national or world champion come from here."

A skate place to visit

What:
Meishan International Roller Skating and Skateboarding Center.

The Olympic-standard venue recently played host to the 2026 Asian Skateboarding Championships, Asia's first continental championship just for skateboarding.

Where:
Meishan city, Sichuan province.

How to get there:
Take a high-speed train to Meishan from Chengdu Shuangliu International Airport, or other train stations in Chengdu, the capital of Sichuan province, with journeys ranging from 20-40 minutes.

Other attractions:
The city is also home to Meishan International Climbing Center, one of the world's largest rock climbing facilities, boasting 7,200 square meters of climbing surfaces and host of the 2026 World Climbing Asia Championship.

Famous scenic spots nearby include the Temple of the Three Sus, Wawu Mountain, Liujiang Ancient Town and Heilongtan Lake.

RCEP seen as key anchor for Asian growth

Agreement set to help global economy cope with geopolitical shifts, growing challenges

By **MA SI, WANG KEJU** and **CHEN BOWEN** in Haikou

As the world's largest free trade agreement, the Regional Comprehensive Economic Partnership is set to play an even more prominent role in anchoring Asian economic integration and helping the global economy navigate geopolitical shifts and mounting challenges, officials and experts said.

Highlighting the RCEP's role as a powerful counterweight to trade unilateralism, they called for it to evolve from one of "scale advantage" to one of "functional and quality enhancement" — while also urging greater efforts to leverage Hainan Free Trade Port as a key gateway connecting China with other RCEP member economies.

The remarks were made at the 2026 RCEP Media and Think Tank Forum, which opened on Saturday in Haikou, Hainan province. With the theme of "Working Together to Address Challenges and Promote Development", the forum was hosted by China Daily and the China Institute for Reform and Development.

Liu Xiaoming, governor of Hainan, said covering 30 percent of the world's population and economic output, the RCEP is the free trade agreement with the greatest potential. It has played an irreplaceable role in maintaining global economic stability and has also become a key driver of Hainan's export-oriented economy.

"Hainan Free Trade Port demonstrates China's resolve to expand opening-up and advance economic globalization. We stand ready to work with all RCEP parties to jointly forge a new pattern of regional development through closer coordination," Liu added.

The governor said that Hainan has seen growing economic vitality since the island-wide special customs operations were launched in December, offering favorable trade policies such as tax reduction and duty-free measures.

Qu Yingpu, publisher and editor-in-chief of China Daily, said that over the past year, Asia has contributed over 60 percent to global economic growth, a result of joint efforts by China and other Asian nations.

"China has always championed open regionalism and true multilateralism, and the construction of the Hainan Free Trade Port stands as a vivid example of this commitment," Qu said.

He said that China Daily has been deeply engaged in the building of the Hainan Free Trade Port International Services portal.

"Confronted with high walls of trade barriers, what we need is not to build walls to protect ourselves, but to pave roads and build bridges," he said, calling on media and think tanks to use professional insights to dispel misinformation and to tell authentic stories of regional economic cooperation.

Qu also highlighted the China-ASEAN Free Trade Area 3.0 Upgrade Protocol, which, for the first time, includes emerging areas such as digital economy, green economy, and industrial and supply chain connectivity. "With everyone's efforts, I believe the fruits of technological innovation will cross borders and benefit all."

The RCEP, which is aimed at gradually eliminating tariffs on over 90 percent of goods traded among its 15 members, has delivered tangible results since coming into effect in 2022. Intra-regional trade surged from $4.9 trillion in 2021 to $6.1 trillion in 2025, a 24 percent increase, while its share of global trade rose from 27.2 percent to 29.1 percent.

Yose Rizal Damuri, executive director of the Centre for Strategic and International Studies in Indonesia, said: "Geopolitical competition is becoming more intense and more varied. Emerging industries are reshaping global landscapes, and contradictions in energy and food markets are worsening.

"This means that regional integration — such as the RCEP — is precisely what the current moment calls for. The institutional framework is providing member economies with a combination of growth opportunities, policy predictability and supply chain resilience."

Chi Fulin, president of the China Institute for Reform and Development, said, "China's vast market has become the largest source of certainty for RCEP's development."

"The next five years are crucial for China to build a strong domestic market. The efforts to accelerate China's tariff reduction commitments under the RCEP framework, especially on intermediate goods, and to further open up services trade will provide enormous new growth engines for RCEP cooperation," Chi added.

Chi also highlighted the strategic role of the Hainan Free Trade Port. "As a major gateway, Hainan is well-positioned to pioneer breakthroughs in finance and data flows, and serve as a vital platform linking the Chinese market with ASEAN, thus better safeguarding regional industrial and supply chain stability."

Lyu Bin, president of the China Oceanic Development Foundation, said, "Most RCEP members are ocean-based economies, and the ocean plays a vital role."

He called for more efforts to expand RCEP cooperation in mariculture, marine ecotourism and disaster prevention, as well as leveraging digital technologies to build smart ports and offshore new energy supplies.

The Chinese scientific research vessel *Tansuo 1* arrived in Guangzhou, Guangdong province, on Sunday after completing the first China-Chile joint manned deep-sea expedition to the Atacama Trench off the coast of Chile, marking a major step forward in international marine scientific cooperation and China's active participation in global ocean governance.

The hadal trench — the ocean's deepest layer below 6,000 meters — is one of the least understood scientific frontiers, but it is key to studying life under extreme conditions, uncovering the mechanisms of earthquakes and tsunamis, and identifying unique genetic resources.

The 156-day expedition, led by the Institute of Deep-Sea Science and Engineering of the Chinese Academy of Sciences, set sail from Sanya, Hainan province, on Dec 6. It covered more than 40,000 kilometers — equivalent to circling the Earth — and involved 83 researchers from China, Chile, Germany, Denmark, Canada and Spain.

The expedition focused on the Atacama Trench — which reaches depths of over 8,000 meters and holds significant scientific value for biodiversity and geology — and the largely unexplored Mussau Trench in the western Pacific, an area key to understanding tectonic plate formation.

During the mission, China's domestically developed manned submersible *Fendouzhe*, carried by *Tansuo 1*, completed 63 dives, 50 of which exceeded 6,000 meters. The team collected a large number of biological and geological samples, as well as high-definition underwater footage, laying a solid foundation for multidisciplinary research in deep-sea geology, biology and environmental science.

In a breakthrough, scientists identified for the first time the deepest chemosynthetic ecosystem in the Southern Hemisphere — a system sustaining life on the seafloor without sunlight or photosynthesis — providing crucial evidence for the hypothesis of a global chemosynthetic corridor on Earth.

Additionally, researchers discovered several species of deep-sea snailfish and captured numerous images of benthic animals, most of which were identified as new species, highlighting the region's rich fish biodiversity. They also identified fault ruptures on the seafloor caused by historical major earthquakes, offering valuable evidence of how seismic activity shapes deep-sea geomorphology and affects biological habitats.

Due to ultrahigh pressure, extremely low visibility and frigid temperatures, deep-sea exploration is considered even more challenging than space exploration. However, China's homegrown submersible *Fendouzhe* has addressed many of these challenges, enabling operations at full ocean depth.

Building on this capability, the Institute of Deep-Sea Science and Engineering launched the Global Hadal Exploration Programme in 2022 to bring together global expertise to explore, understand and protect deep-sea environments.

The program was officially endorsed by the United Nations Decade of Ocean Science for Sustainable Development (2021-2030), marking significant recognition of China's leadership in international deep-sea cooperation.

As a flagship operation of the program, the joint expedition has provided valuable experience in global deep-sea scientific data sharing, talent cultivation and long-term seafloor observation.

The mission aligns with China's emphasis on fundamental research, deep-sea exploration and global scientific cooperation outlined in the 15th Five-Year Plan (2026-30), demonstrating the country's commitment to active participation in global ocean governance and international mega-science cooperation.

HENAN THEATER CLUSTER REVIVES HISTORY

Immersive storytelling transcends language to thrill audiences

By **LI LEI** in Beijing
and **SHI BAOYIN** in Zhengzhou

A general swears an oath to his troops: anyone who tramples the wheat will die. Moments later, his own horse bolts, flattening the precious stalks. The stage — dark, charged — holds its breath. To honor his word without sacrificing his life, the warlord Cao Cao draws his sword, seizes his hair, and slices. In ancient China, cutting one's hair was almost as shameful as losing one's head. With that single gesture, 1,800 years collapse. For a moment, the boundary between stage and history blurs. The field beneath Cao Cao's feet is no longer a set; it feels real.

This is *Echoes of Guandu: Where Wheat Whispers History*, a 35-minute play staged on the very battlefield where history once pivoted. It's one of nearly 800 minutes of back-to-back daily performances at "Unique Henan: Land of Dramas", a dizzying complex of 21 theaters and 56 interlocking spaces in Zhengzhou, the capital of Central China's Henan province. This is the kind of place where stories don't simply unfold — they sit down beside you and stay with you forever.

Outside the entrance, visitors first encounter a seven-hectare field that changes with the seasons — red sorghum one season, golden wheat the next — stretching before a 328-meter-long rammed-earth wall. Walk through the gate, and the theater's grid spaces open up. Inside, history does not sit quietly behind glass. It erupts from the stage, rises from the earth and whispers from the seat beside the viewers.

Performers shout in Chinese, and few foreign visitors follow every word. Yet many walk out with tears in their eyes.

"It's difficult for overseas students to fully understand the performances, but they really put thought into following the stories," said Bian Ting, a Chinese-Spanish educator who runs a Mandarin language school in Spain.

Sustain momentum of triumph over poverty

This year marks the fifth anniversary of the monumental declaration by President Xi Jinping, in February 2021, of China's complete victory in the fight against absolute poverty. The country's alleviation of the poverty problem over its recent history is nothing short of a miracle that holds valuable lessons for all countries.

The victory was the culmination of an eight-year campaign that lifted nearly 100 million rural residents out of absolute poverty across the entire country. It came on the heels of a critical turning point in 2012, when targeted poverty alleviation became a central political priority.

The phenomenal triumph over poverty is a most dramatic transformation of the mass poverty situation since the founding of the People's Republic of China.

Access to Chinese EVs drives debate in US

Unavailability of vehicles stokes frustration as free market tested

By **MAY ZHOU** in Houston, Texas
mayzhou@chinadailyusa.com

Visitors view the models of Chinese EV brand XPeng at the 2026 Brussels Motor Show in Belgium on Jan 10. PENG ZIYANG / XINHUA

Left: Visitors learn about a Geely electric car during an event in Madrid, Spain, on March 25. CHENG MIN / XINHUA **Right:** A woman tries a Xiaomi SU7 in Barcelona, Spain, during Mobile World Congress on March 5, 2025. YONHAP NEWS AGENCY

Jose, a landscape worker in Houston, Texas, recently visited his grandparents and cousins in Mexico.

"I am a little jealous of my cousin's truck," Jose told China Daily. "He's driving a Changan Hunter. It feels so luxurious."

Jose said he's amazed by the standard features packed into the Hunter truck imported from China. They include a tailgate that converts into a step to make it easier to get into the truck bed, a bed cover to secure items, a large touch screen, a 360-degree camera with a backup camera view, and heated seats. The vehicle is also marketed as an extended-range electric vehicle, a groundbreaking achievement in the pickup truck category.

"My cousin paid about $30,000 for that truck. Here, that's barely enough for a base model of a similar truck," Jose said. "I wish we had prices like that here."

Those features that Jose covets can be obtained on a similar United States-made truck through premium packages and aftermarket additions. The caveat lies in the price: similar US trucks with similar features would cost around $45,000 to $50,000, an amount Jose said he can't afford.

Following Mexico, Canada recently opened its market to Chinese EVs and lowered the tariff from 100 percent to 6.1 percent.

Tesla announced it is launching its China-made Model 3 in Canada at a record low price of C$39,490 ($29,040). In the US, the same car is priced at $42,490, according to electrek.com, making it $13,450 cheaper in Canada.

In February, The Wall Street Journal's senior personal technology columnist Joanna Stern wrote a report titled "I test drove a Chinese EV. Now I don't want to buy American cars anymore".

She drove a Xiaomi SU7 Max for two weeks in New Jersey, borrowed from a friend who got a temporary permit to drive it in the US.

The opening of Stern's report sounded like a love letter: "Now, every time I climb back into my Ford Mustang Mach-E, I can't stop thinking about you — your long range, your modular interior, your absurdly large infotainment screen," she wrote. "Please come back to America ... for me."

It's the same car that Ford CEO Jim Farley tried for at least half a year, and loved.

"I don't like talking about the competition so much, but I drive the Xiaomi," he said on "the Fully Charged podcast" over a year ago. "We flew one from Shanghai to Chicago, and I've been driving it for six months now, and I don't want to give it up."

Praising the Xiaomi SU7 as a "high quality, great visual experience", Farley said he drove it "because of the competition". "To beat them, you have to know them," he said.

Strong appeal

Chinese EVs are known for their innovation, competitive pricing, and advanced software integration.

While consumers in many other countries have embraced them, people in the US — consumers, analysts, elected officials, and auto industry figures — are still debating whether or not to let them into the country.

The biggest group wanting Chinese imports are consumers, most of whom, unlike Stern and Farley, haven't had a chance to lay their eyes on a Chinese EV.

But they are aware of them, and many want to buy one, according to a consumer survey released in February by Cox Automotive, a global leader in auto service and technology.

Roughly 47 percent said they'd buy a Geely Xingyuan over Tesla's Model Y, while 38 percent would opt for a BYD Seagull over the same Tesla.

Overall, 38 percent of those surveyed said they are very likely to consider a Chinese brand in the US. Among Gen Z, the percentage was as high as 69 percent — their enthusiasm largely due to their embrace of new technology and green energy, experts said.

The 2025 Dave Cantin Group Market Outlook Report showed that 40 percent of US consumers would consider buying a Chinese-made vehicle.

In April, the WSJ reported about people with dual citizenship driving Chinese EVs bought in Mexico into El Paso, Texas, for their daily cross-border commutes. The article drew almost 2,000 comments from readers.

A sample analysis of the comments using artificial intelligence showed those favoring an open market outweighed those wanting a ban for "national security" reasons.

The "most liked" comment said: "Sure. Let's prohibit imports instead of building better cars. American cars are not only more expensive; they are actually worse quality."

The reason is straightforward: no new car sold in the United States today has a sticker price below $20,000, while Chinese brands sell capable EVs in Mexico and elsewhere starting around the same price.

The average new car in the US had a list price of $51,456 in March, according to the vehicle valuer Kelley Blue Book.

"If US automakers aren't going to make small, affordable cars, why shouldn't we consumers be able to buy imported Chinese cars? I don't want an SUV or truck," said one of the most liked comments.

US automakers have relied heavily on expensive models to make profits in recent years. Yet, "we've reached peak truck, as consumers finally push back and demand more vehicle options, particularly sedans, that are more affordable, leaving some dealers struggling with their product mix," the 2025 Market Outlook Report said.

Affordability a key factor

Auto affordability has become a serious issue in the US. A modeling study by Plante Moran found that a third of the US population can't afford new vehicles, CNBC reported in January.

"Affordability is reshaping purchase decisions, driving interest in cheaper Chinese vehicles," Dave Cantin Group President Brian Gordon said when the 2025 Market Outlook Report was released in August.

However, US automakers are not willing to give US consumers the options to buy Chinese EVs.

"We should not let them into our country because (of) the economic impact," Ford CEO Farley said in a Fox TV interview in mid-April. "Manufacturing is the heart and soul of our country, and for us to lose that to those exports would be devastating for our country."

Many readers of the WSJ article said that banning Chinese EVs undermines the principle of a free market and the competitiveness of the US auto industry.

"Let's see ... should we protect a handful of billion dollar corporations (the US automakers) or should we protect millions of US citizens who want/need an affordable car? I favor the little people but I'm pretty sure Congress does not," wrote Simon Smith in the comments section.

"Let them in! If US automakers can't build a quality, affordable product, they deserve to lose the market. What happened to free markets?" asked Claude Whitworth.

Noah Smith, an economic analyst, former assistant finance professor and Bloomberg economic columnist, argued that the presence of Chinese EVs will benefit the US overall.

"The main reason to let in Chinese EVs is that the United States needs to embrace EVs in general," Smith said in a January blog.

He argued that if the US keeps driving combustion cars while the rest of the world switches to EVs, its automotive technology "will be orphaned from the rest of the world".

"One way Chinese EVs would benefit America is by forcing Detroit to compete," Noah Smith wrote, reasoning that competition would force US automakers to make big investments in EV innovation and technology and "keep doing this until it worked".

> Let them in! If US automakers can't build a quality, affordable product, they deserve to lose the market. What happened to free markets?"
>
> **Claude Whitworth,** a reader of Wall Street Journal

The US is not in a good position when it comes to EV innovation and production. According to analysis from E2's Clean Economy Works tracker, US companies announced just $12.3 billion in new clean-energy and battery investment in 2025 — the lowest annual figure since the project began.

Meanwhile, cancellations and downsizing reached $34.8 billion, with the EV battery sector losing $21 billion in committed capital.

The contraction was, to a great degree, due to domestic policy changes with tax credits for solar, wind and EVs compressed or rolled back.

Meanwhile, China is forging ahead with new EV technologies.

At the 2026 Beijing Auto Show that ended on May 3, CATL unveiled six new battery technologies in a single day, including a third-generation Qilin cell rated for more than 1,000 kilometers of range, a Shenxing fast-charging cell that reaches 98 percent of a full charge in six minutes and 27 seconds, and a 350 watt-hour-per-kilogram condensed-state cell that is good for 1,500 km.

BYD founder Wang Chuanfu, while launching the second-generation Blade Battery, put the design philosophy plainly: "The only way out is to make charging as fast and convenient as refueling a gas car."

Protectionism vs practicality

While the US public is warming toward Chinese EVs, some US politicians want a complete ban on them.

On April 29, Republican Senator Bernie Moreno and Democratic Senator Elissa Slotkin introduced a bipartisan bill — the Connected Vehicle Security Act — that would ban vehicles, connected vehicle technologies such as software and data systems made by China or in partnership with China from the US. They cited national security and job protection as the primary reason for this bill.

The bill has been endorsed by the United Auto Workers union. "Our national and economic security relies on a strong US auto industry," said UAW President Shawn Fain.

"General Motors supports policies that protect and strengthen American manufacturing and the global competitiveness of US automakers," GM said in a statement.

Job security is sometimes at odds with innovation, some investment analysts said. New technology means disruption, and disruption means changes to existing orders.

Many experts agree that China's EV advance has been driven primarily by competition.

However, American consumers may not be able to get what they want, at least in the short term, the 2026 Market Outlook Report from Dave Cantin Group predicted.

"While a highly limited, regulated and negotiated entry remains a small possibility in 2026, we don't see this impacting the retail landscape for another three to five years in the US," the report said.

Iran sends response to US peace proposal

The only path to ending the war is Washington's retreat, expert says

By CUI HAIPEI in Dubai, UAE
cuihaipei@chinadaily.com.cn

Iran has sent its response to a United States proposal aimed at ending the war in the region, the Islamic Republic News Agency said on Sunday. The response, details of which are awaited, was sent to mediator Pakistan, and will focus at this stage on ending the war, IRNA said.

Earlier on Sunday, Iran reiterated that any attack on its oil tankers or commercial vessels would be met with attacks on US bases in the region and enemy ships. The warning came after US forces struck two Iranian oil tankers, claiming the vessels were trying to breach the US blockade of Iran's ports — while insisting a fragile month-old ceasefire remains in effect.

"Any aggression against our vessels will be met with a heavy and decisive Iranian response against American vessels and bases," Ebrahim Rezaei, spokesman for the Iranian Parliament's National Security and Foreign Policy Commission, wrote on social media, saying that as of Sunday, Tehran's "restraint is over".

On Sunday, a bulk carrier reported being struck by a projectile off Qatar's coast, the United Kingdom Maritime Trade Operations said. Also, the United Arab Emirates' air defenses dealt with two drones coming from Iran on Sunday, the latest in renewed attacks on the oil-rich Gulf country.

Since the US and Israel launched military strikes against Iran on Feb 28, Iran has largely blocked the Strait of Hormuz to global energy shipments. Saudi Aramco, a majority state-owned petroleum and natural gas company, said in a statement on Sunday that the world has lost around 1 billion barrels of oil over the past two months. Before the conflict, the narrow waterway carried one-fifth of the world's oil supply.

In another development, Iranian officials signaled an elevated strategic status for the strait, one that could rival the significance of Iran's nuclear program.

"In reality, it is a capability on the level of an atomic bomb, because when you have a capability that can affect the entire global economy with a single decision, that is an enormous capability," Mohammad Mokhber, who served as the acting president of Iran in 2024, told state-linked Mehr News Agency on Friday.

A Qatari liquefied natural gas tanker was sailing toward the strait on Saturday en route to Pakistan, according to LSEG shipping data. Sources said the move was approved by Iran to build confidence with Qatar and Pakistan, both mediators in the ongoing conflict. A Panama-flagged bulk carrier bound for Brazil passed through the Strait of Hormuz using a route designated by Iran's armed forces, Iran's semi-official Tasnim News Agency reported on Sunday.

Meanwhile, a CIA assessment indicated that Iran would not suffer severe economic pressure from the US blockade for about another four months, Reuters reported.

Separately, Russian President Vladimir Putin said on Saturday that Moscow is ready to transport and store Iran's stockpile of enriched uranium, adding that he hopes the conflict will end "as quickly as possible". There was no immediate comment from Iran.

The war will likely end in Washington's retreat, said Jeffrey Sachs, director of the Center for Sustainable Development at Columbia University, as the US cannot continue the conflict without triggering disastrous consequences.

"A renewed escalation would likely lead to the destruction of the region's oil, gas and desalination infrastructure, causing a prolonged global catastrophe. Iran can credibly impose costs that the US cannot bear and that the world should not suffer," he wrote in a commentary, coauthored with analyst Sybil Fares, for Al Jazeera on Saturday.

"The only path, and the one the US seems to be taking, is a retreat, with Iran in charge of the Strait of Hormuz, and with none of the other issues between the US and Iran settled," they added, calling it "neither a war of necessity, nor a war of choice — it was a war of whim. The underlying premise was hegemony".

Vast potential seen in blue economy cooperation

By ZHANG CHENXU in Beijing, **MA SI** and **CHEN BOWEN** in Haikou

There is immense potential for China and the Association of Southeast Asian Nations to deepen cooperation in the blue economy sector and build a more integrated common market, a move that will strengthen regional resilience against external shocks and inject fresh momentum into regional growth, officials and experts said on Sunday.

Speaking at the China-ASEAN Blue Economy Cooperation Dialogue in Haikou, the capital of Hainan province, they said that rising geopolitical uncertainties, growing protectionism, and mounting energy and supply chain risks have underscored the need for both sides to further explore cooperation potential in the areas of marine energy, port logistics, shipping, marine tourism and coastal industries.

Against this backdrop, the Hainan Free Trade Port, with its unique location and policy advantages, is expected to serve as a strategic hub for deeper China-ASEAN blue economy cooperation, they added.

According to the World Bank, the blue economy, also known as the marine economy, refers to the "sustainable use of ocean resources for economic growth, improved livelihoods and jobs, while preserving the health of ocean ecosystems".

Wang Bin, a member of the Standing Committee of the Hainan Provincial Committee of the Communist Party of China and head of the provincial Party committee's Publicity Department, said that Hainan serves as an important gateway for China's opening-up to ASEAN.

"Hainan is making every effort to promote high-quality marine development and play an active role in China-ASEAN cooperation," Wang said.

Sharing a similar view, Lyu Bin, president of the China Oceanic Development Foundation, said the Hainan FTP offers a rare opportunity to address bottlenecks that have constrained China-ASEAN blue economy integration, thanks to its unique opening-up arrangements and policy environment.

Chi Fulin, president of the China Institute for Reform and Development, said that such foundational strengths allow Hainan to function as a strategic hub for the emerging China-ASEAN blue economy common market.

"A common market for China-ASEAN blue economy would put the region in a stronger position to weather external shocks and sustain stable growth," Chi said. "It would also open up new room for cooperation and promote closer integration of industrial and supply chains."

Hainan's burgeoning marine economy is also bolstering confidence in the push for deeper regional cooperation. The province's gross ocean product rose 7.9 percent year-on-year last year, making it one of the mainstays of local growth, official data showed.

Emerging sectors are driving the expansion, with the deep-sea oil and gas industry posting robust gains in reserves and output. The independently developed Deep Sea No 1 gas field, China's first ultra-deepwater project, recently completed its 100th crude oil shipment since its commissioning in 2021.

That optimism over the common market on the blue economy was also shared by officials and experts from ASEAN countries.

Unny Sankar Ravi Sankar, minister of economic affairs at the embassy of Malaysia in China, said the blue economy offers one of the most promising pathways for China and ASEAN to build a more integrated common market.

"The blue economy will transform the development landscape of the entire region," Sankar said.

China and ASEAN together form one of the world's most dynamic maritime regions, creating vast room for deeper blue economy cooperation and regional integration, said Rokhmin Dahuri, former minister of Marine Affairs and Fisheries of Indonesia.

Yet the promising outlook also underscores the need to address the structural challenges facing the blue economy.

Dahuri said the sector is still confronted with pressing challenges, including overfishing, marine pollution, habitat degradation and biodiversity loss.

To deal with these challenges, he said, there is a need to strike a balance between economic growth and environmental protection.

"China can play an important role in cutting-edge technologies, including artificial intelligence, smart digital applications, drones and robotics," Dahuri said, adding that such technologies could help countries tap the potential of the blue economy in a more sustainable way.

Poverty: China achieves UN goal a decade before deadline

From page 1

The hallmarks of the targeted poverty alleviation approach are the precision data-centric emphasis on six areas — accurate identification of poor households, targeted projects, efficient capital use, household-specific measures, appropriate cadre deployment, and goal fulfillment.

In addition, the operational focus is built on a model that covers industry-led poverty alleviation, relocation from uninhabitable or ecologically fragile areas, compensation for ecological protection, education to break intergenerational poverty, and social security for those unable to work.

The success of the national poverty alleviation plan is due to a unique dual-pillar model of growth plus governance.

The critical impetus is built on economic growth in agriculture and industry, as these areas have created jobs that in turn generated income opportunities.

In parallel, a well-coordinated system was fostered to implement the desired agenda under which millions of grassroots cadres were coordinated and mobilized to reach out to the highly localized grassroots levels.

The entire setup has been rooted in a people-first, livelihood-centered governance philosophy.

Even five years down the road since the announcement of victory over absolute poverty, the strong dual-pillar fundamentals have served well to sustain the momentum of income progress for those lifted from poverty. In the 15th Five-Year Plan (2026-30) period, regular mechanisms will be developed to prevent relapses into poverty. The possibility of poverty relapse will also be avoided through increased development-based assistance, rather than one-off subsidies, to assure long-term growth capacity in formerly poor areas. In addition, key rural counties will continue to be revitalized to mitigate any reversion to the former situation.

The five-year plan specifically considers employment as the first line of defense, whereby high-quality, full employment is front and center for improving livelihoods. Furthermore, skills upgrading is a central focal point that will link job quality with job security, as jobs are indeed the best buffer for sustainable poverty alleviation.

Yet another major stipulation of the plan is to refine income distribution, which will shrink the extremes of wealth and poverty alike.

This reframes poverty as an issue of income distribution and not as a separate "silo" policy matter. The integrated thinking has signaled that poverty, as a resolved problem, is being mainstreamed into the broader economic policy framework, thus institutionalizing its place in the overall national strategic blueprint.

The Chinese development story has thus moved from a "war on poverty" to an "enhancing social harmony and sustainable development" narrative, in which the social sustainability aspects of employment and empowerment, as well as prosperity with protection, are the mainstay. The major recognition is that humans will be a core capital that is crucial for national advancement. This recasting consolidates all previous poverty alleviation efforts into forces that will eventually turn China into a great modern socialist country.

Indeed the complete victory in the fight against absolute poverty has enabled China to achieve the no-poverty goal set by the United Nations in its 2030 Agenda for Sustainable Development. And China has done so a full decade before the deadline. The speed and scale of China's poverty reduction are probably unparalleled in world history.

A famous proverb says that a chain is only as strong as its weakest link. The human society of China has resolutely resolved one of its weakest links, poverty, and is on track in its quest for high quality of life for all.

Victory is sweet, and China will probably not rest on its laurels. Achieving a miracle may be easier than sustaining the miracle. But with the current leadership's resolve and the people's determination, poverty may well be relegated to a chapter in the Chinese history book.

The author is director of the Centre for Governance and Sustainability as well as professor in practice of strategy and policy at National University of Singapore's Business School. The views do not necessarily reflect those of China Daily.

Theater: Overseas Chinese reconnect with roots

An aerial drone photo taken on May 1 shows "Unique Henan: Land of Dramas", a large immersive theater complex in Zhengzhou, Henan province. GUAN YANGYANG / FOR CHINA DAILY

From page 1

She visited the Unique Henan theater complex for the second time after having brought her students there last year. "It makes history come alive for them," she said.

Bian was part of a group of 40 overseas Chinese school leaders on a weeklong inspection of international study travel offerings.

The group visited the theater complex and other cultural sites to explore potential study-tour collaborations.

Opened in 2021, the Unique Henan theater complex is unlike most attractions that draw overseas visitors. In the interlocking grid spaces and theaters — one of the largest theater clusters in China — wheat seeds rain down as villagers tell stories of famine and survival, while railway workers sprint across tracks that seem to extend into the audience. In one theater, visitors sit in a classroom where chalk dust hangs in the air, as actors playing teachers turn the story into a lesson in entertainment.

Many described it as a place where they feel history rather than simply learn it.

This captivating world was brought to life by Wang Chaoge, a director known for creating immersive performances across China. By the end of 2025, the complex had logged more than 58 million visits.

Liu Kaipeng, the complex's brand director, said that more than 80 percent of visitors come from outside Henan, and people from over 50 countries and regions have visited the site.

Currently, no simultaneous translation is provided, yet the set design and emotional performances largely transcend language.

"We now offer multilingual directional signage and optimized payment systems. Next, we will work with overseas influencers to help visitors from all cultural backgrounds understand Central China's culture," Liu said.

For now, overseas Chinese visitors are spreading the word themselves.

"This theater truly provides an immersive experience. It has deepened my affection for Henan," said Apple Rouse, vice-president of the US-based Chinese American Youth Association, who returned to Henan after more than two decades. "As an overseas Chinese, I feel deeply proud of how China has developed."

Chen Shuo, who runs several Mandarin language schools in Italy, said during his first trip to Henan: "I didn't think much when I first arrived, but the moment I stepped through the gate and saw that wheat field, something changed. Walking through the field into the city, passing every theater — I wanted to explore each one."

For Hardy Wang Haoyu, vice-president of the Canada-based North American Youth Federation, the experience reshaped his thinking about identity.

"After three decades overseas, I've come to see China not just as our path back, but sometimes as our way forward. Some of the answers we're looking for may actually lie in China," he said. "For those of us living in the West, China can be a solution to the challenges we face."

Qi Xin in Zhengzhou contributed to this story.

RCEP MEDIA & THINK TANK FORUM

Liu Xiaoming, governor of Hainan province, addresses the 2026 RCEP Media & Think Tank Forum in Haikou on Saturday. FENG YONGBIN / CHINA DAILY

RCEP gearing up for bloc's next phase

Forum explores ways to improve world's largest free trade pact amid challenges

By **WANG KEJU** in Haikou
wangkeju@chinadaily.com.cn

The world's largest free trade pact is gearing up for its next phase amid growing protectionism and other challenges, a forum in Hainan heard.

Experts weighed in, calling for the Regional Comprehensive Economic Partnership to expand its membership, focus more on the service industry and keep pace with other trade agreements.

They discussed the present and future of the agreement at the 2026 RCEP Media & Think Tank Forum held in Haikou, Hainan province, over the weekend. The event was hosted by China Daily and the China Institute for Reform and Development.

The sustained efforts of China, as a key player of the bloc, to advance high-standard opening-up, they say, would allow other member economies to share in its massive market for inclusive development.

RCEP economies are projected to grow at a rate of about 4.5 percent this year, with their contribution to global economic growth expected to remain at over 32 percent, according to the RCEP Industry Cooperation Committee.

By contrast, the IMF in April cut its global growth forecast for 2026 to 3.1 percent, citing the severe disruptions caused by conflicts in the Middle East.

RCEP members are looking at how to improve the pact amid a worsening external environment as the trade agreement enters its next phase following a general review in 2027, according to experts.

It will be the first time for such a review since the agreement came into effect in 2022.

Expanding RCEP membership is high on the agenda, as it will not only broaden the pact's footprint, but also strengthen its resilience against rising protectionism, said Wang Yiming, former deputy director of the Development Research Center of the State Council.

The RCEP opened its doors to welcoming new members since July 2023. China's Hong Kong, Sri Lanka, Chile and Bangladesh have expressed their interest in joining the RCEP.

"The RCEP's attractiveness and influence are continuously increasing. More and more economies are submitting applications," Wang said. "We need to actively respond to these applications and push for the expansion of RCEP membership."

But growing membership cannot address the pact's structural weaknesses, said Zhao Jinping, vice-president of the China Association of Trade in Services.

The agreement faces a significant gap in services trade, where RCEP commitments lag behind those of other major trade pacts, he said.

In 2024, services accounted for 26.4 percent of total cross-border trade worldwide, a historic high, according to WTO data. Yet the share of services in RCEP's total trade remains relatively lower.

The scheduled general review could serve as "a critical window" to expand commitments to the service industry, expanding intra-regional trade and investment, Zhao said.

Digital transformation

Lee Hee-sup, secretary-general of the Trilateral Cooperation Secretariat, said that digital commerce, cross-border data flows, green development and innovation-driven industries are emerging as new growth drivers.

The pact should actively promote digital transformation to stay relevant in a fast-changing global landscape, he added.

The China-ASEAN Free Trade Area 3.0 Upgrade Protocol, signed last October, could provide experience that the RCEP can draw from, observers note. The China-ASEAN agreement has incorporated the digital economy, green economy and supply chain connectivity into its framework — areas that are also at the forefront of the RCEP's next phase.

China, with its continuous efforts to advance high-standard opening-up and open its door wider, will enhance market connectivity, factor mobility and regulatory alignment between China and other RCEP economies, said Guo Da, executive president of the Hainan Institute for Free Trade Port Studies.

Data from the RCEP Industry Cooperation Committee showed that in the first quarter, China's trade with other RCEP members surged 20.2 percent year-on-year to 3.73 trillion yuan (about $515 billion), with imports jumping 25 percent.

Hainan seen as gateway to regional markets

By **MA SI** and **CHEN BOWEN** in Haikou

The Hainan Free Trade Port is set to play an increasingly pivotal role in linking China with the vast markets of the Regional Comprehensive Economic Partnership, injecting fresh impetus into global economic growth amid rising trade headwinds, experts said.

Underscoring Hainan FTP's role as a key gateway advancing China's opening-up drive in the new era, they said the island's strategic geographic position at the center of the RCEP region and preferential trade policies will create new opportunities for cooperation in supply chains and services trade.

The remarks were made at a sub-forum of the 2026 RCEP Media & Think Tank Forum in Haikou, Hainan province.

Zhao Jinping, vice-president of the China Association of Trade in Services, said Hainan FTP will serve as a stress test field for China's high-level opening-up, against the backdrop of escalating global geopolitical uncertainties and rising trade protectionism.

"As its institutional and policy frameworks continue to improve, Hainan will evolve into a crucial hub enabling enterprises to tap into new investment and trade opportunities across the bloc of RCEP, the largest free trade agreement in the world," Zhao said.

Tu Xinquan, director of the China Institute for WTO Studies at the University of International Business and Economics, said the RCEP has become a vital force in sustaining global trade. For instance, direct China-US economic ties have weakened due to geopolitical factors, while the indirect trade links, especially through the RCEP, are on the rise, he said.

"As a frontier and test bed for China's reform and opening-up, Hainan can act as a core hub connecting the Chinese mainland with other RCEP members, much like Singapore and the Hong Kong Special Administrative Region have facilitated exchanges between the Chinese mainland and Western countries," Tu said.

Bigger role

Guo Da, executive president of the Hainan Institute for Free Trade Port Studies, said high-level free trade ports such as Hainan can play a bigger role as the RCEP cooperation deepens. Currently, about 40 percent of Hainan's foreign trade flows to RCEP member economies, he noted.

Driven by unified RCEP rules and Hainan's free trade port policies, trade between Hainan and RCEP members has grown at an annual average rate of over 20 percent in recent years, he said.

Nicholas Kwan, deputy head of the chief executive's policy unit of the Hong Kong Special Administrative Region, said: "Hong Kong has long aspired to join the RCEP and looks forward to cooperating with Hainan to achieve a 'one plus one greater than two' effect.

"Hong Kong can be a great partner for Hainan. For instance, in the commercial space sector, Hong Kong's financial and service strengths can be effectively aligned with Hainan's Wenchang commercial space launch site to facilitate cooperation," Kwan said.

Kim Do-hoon, former president of the Korea Institute for Industrial Economics and Trade, said that to give full play to Hainan's potential, more efforts are needed to cultivate local industries such as transport, and attract more big companies to invest in the island.

Zhu Jianmin, chairman of Oxiranchem Group, said: "The Hainan FTP's tax policies, unique geographic location and logistics advantages have enabled us to source raw materials globally and target ASEAN markets effectively."

What they say

Geopolitics is the occasional typhoon outside. RCEP is not the roof — it is the room where neighbors keep talking positively and trading while the storm passes ... That is the accumulated wisdom of Asian diplomacy.
Wilson Lee Flores, *columnist for The Philippine Star*

As a frontier and test bed for China's reform and opening-up, Hainan can act as a core hub connecting the Chinese mainland with other RCEP members, much like Singapore and the Hong Kong Special Administrative Region have facilitated exchanges between the Chinese mainland and Western countries.
Tu Xinquan, *director of the China Institute for WTO Studies at the University of International Business and Economics*

The RCEP upgrade could have big goals, but not too many. It should avoid turning into a wish list. Before piling on new issues, member economies must first resolve existing pain points: improving the utilization of rules of origin, addressing disparities in implementation capacity, and tackling nontariff measures. These may sound technical, but they are extremely practical and fundamental to the agreement's effectiveness.
Yose Rizal Damuri, *executive director of Center for Strategic and International Studies, Indonesia*

Hong Kong has long aspired to join the RCEP and looks forward to cooperating with Hainan to achieve a "one plus one greater than two" effect. Hong Kong can be a great partner for Hainan. For instance, in the commercial space sector, Hong Kong's financial and service strengths can be effectively aligned with Hainan's Wenchang commercial space launch site to facilitate cooperation.
Nicholas Kwan, *deputy head of the chief executive's policy unit of the Hong Kong Special Administrative Region*

In a world where geopolitical events unfold almost every day, the RCEP has emerged as a vital anchor for multilateralism, proving that despite political differences and uneven levels of development, regional economic cooperation and integration remain not only possible but essential.
Yu Hong, *senior research fellow at the East Asian Institute of the National University of Singapore*

From durian to cars: Partnership tells success stories of agreement

By **CHEN BOWEN** and **MA SI** in Haikou

From duty-free durian to new energy vehicles, real-world stories prove the value of the world's largest trade pact, speakers said at an event in Hainan on Saturday.

The panel on the Regional Comprehensive Economic Partnership was part of the 2026 RCEP Media & Think Tank Forum in Haikou, Hainan province.

Supachai Wuthichuwong, a member of the editorial board of Thailand's MGR Online, offered concrete evidence of those benefits.

"Taokaenoi, the largest seaweed manufacturer in Thailand, has been importing seaweed from South Korea and benefited from RCEP rules' zero tariff," he said. "It processes the raw material and makes popular seaweed snacks that are sold globally."

China has imported durian from Thailand duty-free, while Thailand has imported new energy vehicles from China duty-free, which are the kinds of examples the media should use in the RCEP region, he added.

Ko Ko Maung, executive board member of the Myanmar Institute of Strategic and International Studies, called RCEP "a strategic framework for shared prosperity".

Participants challenged the view that the RCEP is a conventional trade deal in the discussion.

"That is technically correct but analytically incomplete," said Wilson Lee Flores, columnist for The Philippine Star. "RCEP is better understood as an institutional stress test — can 15 economies with different political systems, income levels, legal traditions and strategic cultures cooperate without a centralized authority?"

Flores contrasted Europe's model of treaties, courts and bureaucracy with Asia's approach of flexibility, gradualism, consensus and patience.

"When we ask why progress on rule upgrades, a secretariat or membership expansion seems slow, we must first ask: slow by whose clock?" he said.

"In the Philippines, many small farmers still ask, 'Where do I even find the tariff schedule?' That is not ignorance. That is infrastructure — digital, logistical, educational — still being built."

Inclusive growth

He said gradual pace is "the price of inclusive growth" and that the existence of RCEP reveals a "quiet resilience".

Flores said RCEP offers a separate track for cooperation even when political temperatures rise.

"Geopolitics is the occasional typhoon outside. RCEP is not the roof — it is the room where neighbors keep talking positively and trading while the storm passes," he said. "That is the accumulated wisdom of Asian diplomacy."

With RCEP's general review approaching in 2027, Flores called for a regional public education initiative over the next two years: multilingual media campaigns, university partnerships, youth exchanges, journalist fellowships and digital storytelling focused on practical success stories.

"Not theory. Not jargon. But examples," he said. "If the people themselves feel included in the journey of regional development, then the foundations of RCEP will become far stronger, more stable and more enduring for future generations."

Xing Haiming, former Chinese ambassador to South Korea, described RCEP as a flag — "a flag that everyone in our region can see and touch, a flag that brings tangible benefits to ordinary people, enterprises and countries".

The panel agreed that the pact's ultimate measure is not bureaucratic milestones but whether farmers, entrepreneurs and consumers see better lives. RCEP's benefits are already on store shelves and dinner tables — stories, speakers said, that deserve to be told.

ASEAN vows to strengthen energy shield

Leaders seek quicker regional power links, renewable rollout amid oil shocks

By **PRIME SARMIENTO**
in Hong Kong
prime@chinadailyapac.com

Leaders of the Association of Southeast Asian Nations have vowed to strengthen collaboration in energy security and renewable energy development amid the escalating Middle East crisis, with analysts calling for swift actions in that direction.

ASEAN leaders have agreed to expedite the ratification of the ASEAN Framework Agreement on Petroleum Security and promote energy transition and operationalize the ASEAN Power Grid.

The bloc's initiatives on energy security were among the highlights in the statement issued on Friday at the conclusion of the 48th ASEAN Summit in the central Philippine province of Cebu.

The summit was held as rising oil prices weigh on regional economies. The Asian Development Bank forecast inflation in developing Southeast Asia to rise from 2.3 percent in 2025 to 3.2 percent in 2026 on the back of upward pressures from higher energy and food production costs if the Middle East conflict is prolonged.

Analysts said that with most Southeast Asian countries dependent on energy imports, ASEAN must be able to expedite policies on regional energy cooperation as the war with Iran enters its 11th week.

"This turned out to be a very specifically themed summit, reflecting the acuteness of the repercussions of the Middle East crisis on ASEAN countries," said Oh Ei Sun, a senior fellow at the Singapore Institute of International Affairs.

Lavanya Venkateswaran, a senior economist for ASEAN at Overseas-Chinese Banking Corporation in Singapore, said the bloc's commitment on regional energy reflects a collective concern over the current situation in the Middle East.

However, these commitments "must also translate into swift actions considering the foreboding downside risks from geopolitics", she said.

ASEAN leaders committed to strengthening regional energy security and resilience through enhanced regional cooperation and coordination. They are looking to diversify the supply of energy through measures, such as developing renewable energy, strengthening intra-ASEAN energy trade, accelerating biodiesel and bioethanol blending, and promoting the adoption of electric vehicles.

Philippine President Ferdinand Marcos Jr, this year's rotating chair of ASEAN, said on Friday that the bloc's energy initiatives have to be enforced as soon as possible, but that the energy ministers are yet to meet and lay down a timetable.

Yeah Kim Leng, a professor of economics at Sunway University in Malaysia, told China Daily that the ASEAN leaders' responses to energy security and financial resilience are fitting but their effectiveness depends on timely and implementable regional cooperation and coordination frameworks.

The ratification of the petroleum security agreement is crucial but it may not be achieved in time to cope with the current crisis, Yeah said.

"This framework would have enabled member countries to supply 10 percent of their domestic petroleum needs to members facing supply crisis, a stark reality confronting several member countries during the current global energy crisis," he said.

Cooperation urged

Chan Wai-Shin, director of research at the Singapore-based Asia Research and Engagement, said ASEAN economies cannot optimize the energy transition in isolation, especially in light of the Middle East crisis.

Regional cooperation "makes much more sense economically", Chan said, adding that the abundance of solar and wind throughout the region is complementary.

Meanwhile, strengthening power trade, cross-border interconnections and financial investment across the region would reduce overall system costs, enhance regional self-sufficiency and accelerate renewable deployment, he said.

Jayant Menon, a visiting senior fellow at ISEAS-Yusof Ishak Institute in Singapore, said the urgency of moving forward on renewable energy is the "only silver lining to come out of this whole crisis".

"Renewable energy is not shock-proof, but it creates some kind of national independence, because it can be nationally generated. This will be the positive legacy of this crisis," he said.

Russian servicemen march on Red Square during the Victory Day parade in Moscow on Saturday, amid a three-day ceasefire between Russia and Ukraine, which runs through Monday. KREMLIN VIA NEWSCOM

Russia, Ukraine trade accusations of violating US-brokered ceasefire

KYIV — Russia and Ukraine on Saturday traded accusations of violating a three-day US-brokered ceasefire but no major strikes were reported by the warring sides so far.

United States President Donald Trump initially announced on Friday the surprise truce, which runs through Monday and coincides with Russia's World War II victory celebrations, along with an exchange of 1,000 prisoners from each side that is set to take place in the coming days.

"I'd like to see a big extension," Trump told reporters on Friday evening. "It could be."

United Nations Secretary-General Antonio Guterres welcomed the ceasefire and planned exchange of prisoners between Ukraine and Russia, his spokesman said on Saturday.

"The secretary-general reiterates his call for an immediate, full, unconditional and lasting ceasefire, as a first step toward a just, sustainable and comprehensive peace, in line with the UN Charter, international law and relevant UN resolutions," Stephane Dujarric said.

However, the Russian Defense Ministry said on Sunday that Ukraine had violated the ceasefire by launching drones and artillery strikes against Russian troops, Interfax news agency reported.

Over the past 24 hours, Russia has shot down 57 Ukrainian drones, the ministry said, adding that Moscow was observing the ceasefire.

Also on Sunday, Ukrainian officials reported Russian drone strikes and nearly 150 battlefield clashes over the past 24 hours.

In the northeastern Kharkiv region, Governor Oleh Syniehubov said eight people, including two children, were wounded in drone attacks on the regional capital and nearby settlements.

In its morning report, Ukraine's General Staff said 147 clashes had taken place along the front line.

Casualties were still reported on both sides, as Moscow and Kyiv continued to exchange drone strikes.

Russian drones killed two people and wounded three in the Zaporizhzhia and Dnipropetrovsk regions, local authorities said.

In Russia's western Belgorod region, three people were wounded by Ukrainian drone strikes, said Governor Vyacheslav Gladkov.

Meanwhile, Russian President Vladimir Putin said on Saturday that he thought the conflict was coming to an end.

"I think that the matter is coming to an end," Putin told reporters of the four-year conflict.

Putin was speaking in the Kremlin after setting out his view of the causes of the special military operation. He blamed "globalist" Western leaders, saying they promised NATO would not expand eastward after the 1989 fall of the Berlin Wall, but then tried to draw Ukraine into the European Union's orbit.

His statement came just hours after the parade on the May 9 national holiday celebrating the Soviet Union's victory over Nazi Germany in World War II. The annual event pays homage to the 27 million Soviet citizens who perished in that war.

HUNGARY

Magyar sworn in as prime minister

Peter Magyar was sworn in as Hungary's prime minister on Saturday after winning a parliamentary vote at the inaugural session of the new National Assembly, pledging to "change the system". A total of 195 of the 199 members of parliament cast votes, with 140 in favor, 54 against and 1 abstention. Magyar, leader of the Tisza Party, secured the required majority to be elected prime minister, marking the start of his four-year term.

PAKISTAN

First 'Panda bond' to be issued within week

Pakistan is expected to access Chinese capital markets for the first time through a renminbi-backed bond this week, Finance Minister Muhammad Aurangzeb said on Saturday. "God willing, next week you will hear good news that for the first time, we will be accessing Chinese capital markets through Panda bond," he said at a news conference. The $250 million issue, the first of a planned $1 billion program, will be backed by the Asian Development Bank and the Asian Infrastructure Investment Bank.

ISRAEL

Detained aid flotilla activists deported

Israel deported two activists, Saif Abu Keshek, a Spanish national, and Brazilian Thiago Avila, on Sunday after arresting them aboard a Gaza-bound flotilla in international waters, the foreign ministry said. The activists were part of a second Global Sumud Flotilla launched from Spain on April 12 to try to break Israel's blockade of Gaza by delivering aid to the enclave. They were detained by Israeli authorities on April 29 and brought to Israel.

AGENCIES—XINHUA

Evacuation of hantavirus-hit cruise ship begins off Spain's Canary Islands coast

GRANADILLA DE ABONA, Spain — Occupants of a cruise ship struck by a deadly hantavirus outbreak that has sparked international alarm began leaving the vessel for their repatriation in Spain's Canary Islands on Sunday.

Three passengers from the MV *Hondius* — a Dutch husband and wife and a German woman — have died, while others have fallen sick with the rare disease, which usually spreads among rodents.

No vaccines or specific treatments exist for hantavirus, which is endemic in Argentina, where the ship departed in April.

However, health officials have emphasized that the risk for global public health is low and played down comparisons to a repeat of the COVID-19 pandemic.

The final flight to evacuate most of the ship's nearly 150 passengers and crew would leave for Australia on Monday, before the ship continues to the Netherlands, Spain's Health Minister Monica Garcia said.

Passengers wearing blue medical suits began disembarking the Dutch-flagged vessel onto smaller boats to reach the port of Granadilla on Tenerife, Agence France-Presse journalists saw.

The evacuees then boarded a bus for their transfer to Tenerife South Airport, where their repatriation flights were due to take off.

"The disembarkation of the passengers and the Spanish crew member has started," the Health Ministry confirmed on Telegram.

The evacuees changed into new protective equipment before boarding their repatriation flight, the first of which left carrying 14 Spaniards who will observe quarantine at a military hospital in Madrid.

"The operation is going very well," World Health Organization chief Tedros Adhanom Ghebreyesus told reporters at the port.

Separate flights for Canadian, Turkish, French, British, Irish and United States citizens were also planned for Sunday, Garcia said.

Regional authorities have warned that the operation must be completed by Monday, when adverse weather conditions will force the ship to leave.

The Canary Islands' regional authorities have consistently resisted taking in the ship, which was only authorized to anchor offshore instead of docking in the port.

However, all passengers are asymptomatic and underwent a medical assessment before their disembarkation, Garcia told reporters shortly before the operation began.

Spanish authorities have insisted there will be no contact with the local population in Tenerife.

AFP journalists at Granadilla saw white tents erected along the quay and that the police, some in protective medical suits, had sealed off part of the small industrial port.

Spain "is doing what it must do, with technical and scientific rigor and full transparency, with institutional loyalty and with international cooperation", Prime Minister Pedro Sanchez said on Sunday.

The only hantavirus type that can transmit from person to person — the Andes virus — has been confirmed among those who have tested positive, fueling international concern.

The WHO said on Friday that it had confirmed six cases out of eight suspected ones. There are no suspected cases remaining on the ship.

The agency believes the first infection occurred before the start of the expedition, followed by transmission between humans onboard the vessel.

Health authorities in several countries have been tracking passengers who had already disembarked and anyone who may have come into contact with them.

COMMENT

Editorials

Tokyo should heed the call of the times for peace and cooperation

Under the leadership of Prime Minister Sanae Takaichi, Japan is charting a perilous course that threatens to destabilize the Asia-Pacific region. The nation's renewed push for constitutional revision, military expansion and strategic alliances under the guise of safeguarding a "free and open Indo-Pacific" is not only a departure from its post-World War II commitment to peace but also a dangerous revival of the country's militaristic tendencies.

Takaichi's advocacy for amending Japan's Constitution is a concerning development that signals a significant shift in the nation's defense posture. The country's pacifist Constitution stipulates that Japan should commit to peace and nonaggression. Takaichi's push for constitutional change is not merely a legal reform but a strategic maneuver to break free from the restrictions on Japan's military development. This move is deeply disturbing, as it indicates a willingness to abandon the principles of peace that have guided Japan since the end of World War II.

This concern is compounded by her government hyping up a "free and open Indo-Pacific" as a means for bloc confrontation.

During her recent visits to Australia and Vietnam, Takaichi promoted an updated version of the "free and open Indo-Pacific" vision, which serves as a pretext for building "small circles" that undermine the strategic security and interests of other nations. By framing this vision as a response to perceived "threats", Japan is effectively creating an environment of tension and confrontation, rather than fostering cooperation and dialogue.

Tokyo's "free and open Indo-Pacific" narrative is particularly problematic, as it is being used to justify military collusion and the formation of alliances that exclude and target specific nations, as Jiang Bin, a spokesman for the Ministry of National Defense, said at a news briefing on Saturday. He pointed out that Tokyo is undermining the strategic security and interests of other countries, by creating excuses for Japan to break free from the restrictions on its military development.

"The call of our times is for peace and cooperation rather than war and confrontation," he said, urging Japan and the countries it has been stepping up military collusion with "to do more things that are truly conducive to regional peace and stability", which is in line with the common aspiration of their peoples.

The joint statement issued by Japanese and Philippine defense officials, "opposing any unilateral attempts to change the status quo by force or coercion in the East China Sea and the South China Sea", is a baseless accusation that serves to highlight Tokyo's attempts to create camp confrontation. The statement, while claiming to uphold regional security, is little more than a thinly veiled attempt to shift the blame onto China for the region's tensions.

The international community must view these developments with concern, as they signal a dangerous shift in Japan's military posture.

This is reinforced by Takaichi's actions, such as kneeling at the Tomb of the Unknown Australian Soldier during her visit to Australia, which was a calculated bid to curry favor with Western allies. However, Japan's Asian neighbors, which suffered immensely under Japanese imperialism, have yet to receive a formal apology for Japan's historical aggression.

The lack of genuine atonement is a significant barrier to reconciliation and further isolates Japan within the region.

The militaristic resurgence of Japan, coupled with a disregard for historical accountability, is deeply disturbing in a region that suffered immensely from Japan's past aggression.

The consequences of Japan continuing on its militaristic path will be far-reaching. The international community must recognize the dangers of Japan's current trajectory and hold Tokyo accountable for its actions. Only through sincere reflection on its past aggression and a sincere commitment to peace can Japan hope to rebuild trust with its neighbors and contribute positively to regional stability.

Openness a viable path for shared prosperity

The resilience and vitality of the world's second-largest economy are once again drawing wide attention as fresh data show China's foreign trade maintained double-digit growth in the first four months of 2026.

According to data released by the General Administration of Customs, China's total goods trade reached 16.23 trillion yuan ($2.39 trillion) in the first four months of the year, up 14.9 percent year-on-year. Exports climbed 11.3 percent to 9.33 trillion yuan, while imports surged 20 percent to 6.9 trillion yuan year-on-year. In April alone, total trade expanded 14.2 percent year-on-year, underscoring the continued momentum of China's foreign trade.

Behind the impressive figures lies a more diversified and resilient trade structure. Trade with the Association of Southeast Asian Nations and the European Union grew by 15.7 percent and 13.2 percent respectively year-on-year, while trade with Belt and Road partner countries increased 13.5 percent. Trade with the Regional Comprehensive Economic Partnership members rose 20 percent in the first four months year-on-year, showing that the trade agreement continues to inject new impetus into regional integration.

Such trends highlight that China's trade is becoming less dependent on any single market and increasingly embedded in broader regional and global networks. In an era marked by supply chain disruptions and geopolitical uncertainty, diversified partnerships are enhancing China's ability to withstand external risks while contributing stability to global industry and supply chains.

Equally noteworthy is the growing role of the services trade in China's trade structure. Data released by the Ministry of Commerce showed that China's total services trade reached 1.82 trillion yuan in the first quarter, with exports of services rising 11.2 percent year-on-year.

The effectiveness of China's high-level opening-up policies is highlighted by the robust growth of travel-related services. As China continues to expand its visa-free "circle of friends" and optimize departure tax refund policies, more foreign visitors are being drawn to the country for tourism, business and cultural exchanges. Travel service exports surged 32.3 percent in the first quarter year-on-year, the fastest among all service sectors.

What foreign visitors increasingly see is not merely a vast market, but an open, dynamic and confident China. From efficient digital payment systems and convenient transportation to thriving cultural consumption and modern urban landscapes, China's development is becoming ever more defined by innovation, green transformation and inclusiveness.

Meanwhile, the rise of new growth drivers in high-end manufacturing, artificial intelligence and new energy sectors is reshaping the global perception of China's economy. Exports of electric vehicles, lithium batteries and wind turbine units jumped by 68.1 percent, 43.2 percent and 40.7 percent respectively year-on-year in the first four months. China's robot industry also accelerated its overseas expansion, with exports reaching 11.32 billion yuan in the first quarter and products shipped to 148 countries and regions.

Reflecting both the booming global investment in AI and China's increasingly important role in global technology supply chains, exports of integrated circuits surged 78.3 percent year-on-year. As industry experts noted, China has become a key supplier of AI-related infrastructure, mature-process chips and supporting industrial components.

Some in the West have recently hyped up the notion of a so-called "China Shock 2.0", alleging that China's rapid advances in new energy and artificial intelligence rely excessively on overseas markets and create "overcapacity" that threatens developed economies. Yet such narratives ignore the reality of China's innovation-driven development and the benefits it brings to the world economy.

As Foreign Ministry spokesman Lin Jian pointed out, China has genuine innovation capabilities that create tangible opportunities for global cooperation. The country has evolved from being "the world's factory" to being "a global market and innovation hub". China's exports, he stressed, have served to stabilize global supply chains, eased inflationary pressures, lowering living costs for consumers worldwide, and contributed to closing the world's green development supply gaps and accelerating the world's energy transition and low-carbon transformation.

More importantly, China's high-tech products are breaking technological monopolies and barriers, enabling more countries and people to access and afford emerging technologies.

Openness brings progress, and cooperation delivers mutual benefit, as Lin said. China's development is not a threat to any country, but an increment for common global development.

By steadfastly advancing high-level opening-up, promoting balanced trade development and fostering innovation-driven growth, China is providing the world economy with much-needed certainty and new momentum.

Opinion Line

Museums have evolved to be carriers of historical continuity

In contemporary cultural policy, museums are often described as repositories of artifacts, or guardians of the past. Yet this definition increasingly lags behind the times. In China, official discourse has moved toward a more expansive understanding of museums in which they are no longer static containers of history, but dynamic imparters of knowledge.

This shift is clearly articulated in statements by the central authorities that emphasize that every museum is a big school. A university does not merely display knowledge; it interprets, transmits and shapes understanding. To define a museum in these terms is to assign it a civic function: it becomes a place where individuals encounter a shared narrative.

This reconceptualization also explains a second, equally important point. The central authorities have cautioned that museum development should avoid uniformity: museum construction should not be one model for all, nor should it pursue superficial scale; exhibitions must highlight distinctive content. What matters is not how many museums exist, but whether they offer distinctive cultural experiences that invite engagement. Exhibitions that draw on local history, traditions and material culture are more likely to resonate with surrounding communities, while also offering visitors a clearer sense of China's regional diversity and the varied roles different areas played in shaping its development.

For example, by foregrounding classical painting, garden culture, literati traditions and refined crafts such as silk weaving and embroidery, the Suzhou Museum has placed Suzhou within the cultural world of Jiangnan — the prosperous region south of the Yangtze long associated with commerce and artistic life. Suzhou's local heritage thus becomes a lens through which China's long engagement with the wider world can be understood.

In 2023, the Cleveland Museum of Art presented a major exhibition, "China's Southern Paradise: Treasures from the Lower Yangzi Delta", which examined the Lower Yangzi (Yangtze) region as both a cultural center and a conduit of exchange between China and the wider world. Drawing extensively on loans from Chinese museums, the exhibition traced how Jiangnan's economic vitality — rooted in silk production, commerce and urban culture — enabled sustained interaction with global trade networks and artistic currents. In doing so, it echoed the approach seen in Suzhou: local history was not treated as self-contained, but as part of a broader narrative of circulation and encounter. Presented on an international stage, such exhibitions demonstrate how regionally grounded cultural histories can illuminate China's long-standing engagement with the world.

Chinese museums can also draw lessons from international institutions, which often possess a sharper awareness of how to engage their audiences. During the COVID-19 pandemic, the Metropolitan Museum of Art presented "Companions in Solitude: Reclusion and Communion in Chinese Art", an exhibition that explored the long-standing tension in Chinese thought between withdrawal from society and connection with others. Bringing together over a hundred works of painting, calligraphy and decorative arts, the exhibition framed Chinese aesthetics around a universal human dilemma — how to balance solitude and social life — in a moment of global isolation.

This curatorial approach continued in the museum's 2025 exhibition "Recasting the Past: The Art of Chinese Bronzes, 1100–1900", which demonstrated how later Chinese artists reinterpreted antiquity, emphasizing that tradition in China is dynamic rather than fixed. Taken together, these exhibitions suggest a clear trajectory: moving beyond presenting China as an object of external curiosity toward articulating its internal artistic logic and historical continuity.

In describing cultural relics as those that "embody a rich civilizational legacy, transmit history and culture, and sustain the collective spirit", and in calling for them to "come alive", the central authorities capture a fundamental transformation in the role of museums. Objects are no longer treated as static artifacts, but as carriers of continuity — linking past and present, individual and collective identity. This shift is increasingly reflected in more open exhibitions, expanded digital access and interactive formats that extend cultural experience beyond the museum itself.

Emphasizing participation over instruction allows culture to be encountered rather than imposed. Ultimately, it reflects a broader rethinking of culture itself: not merely as heritage to be preserved, but as a shared resource to be experienced. In an age of increasing fragmentation, the capacity to bring people into common cultural spaces may be among the most effective ways to sustain social cohesion.

— ZHAO XU, CHINA DAILY

What They Say

AI in filmmaking cannot replace human emotions

Editor's note: *Artificial intelligence is reshaping a broad range of industries, including the film industry. During the 16th Beijing International Film Festival, various insiders of AI, the film industry and scholars shared their insights on AI's role in filmmaking and how professionals should respond to the trend of AI. Below are excerpts from their comments as reported by Xinhua News Agency. The views don't necessarily represent those of China Daily.*

AI can assist film producers in collecting and summarizing data and information. It can also help film directors visualize, while also assisting them in character design and casting.

Large AI models are able to create B-roll footage and scenes featuring animals. Footage that once took a week and cost hundreds of thousands of yuan to shoot can now be produced efficiently at low cost.

Currently, films that have powerful visual effects, such as *The Wandering Earth 3*, still rely on motion capture and modeling for previsualization of action and performance, as AI is as yet unable to achieve the same results. The smaller the screen, the wider the application of AI. The larger the screen, the more limited its application becomes.

AI technology is applied to only part of the production process of theatrical films, and has not yet been used to generate all the scenes in them. In AI-generated scenes, rendering human skin texture and subtle facial expressions remains a challenge.

The iteration of generative AI has drastically changed the underlying logic of audio-visual content creation. The production pattern of movies and television shows is shifting from one that features a clear division of labor and collaboration of multiple sectors to one that is highly creative, agile and involves human-machine cooperation.

AI technology is able to combine different kinds of media. Its "real-time generation" capability has greatly enhanced the interaction between products and their users, blurring the boundaries between animated films, live-action films and video games, and boosting the integration of films and video games. This will give rise to new patterns of consumption.

Films need a dose of human warmth to strike an emotional chord with the audience. For example, films such as *Dead to Rights* and *Her Story* have won praise mainly because they showcase genuine emotions, making audiences shed tears or smile.

The memorable parts of many classic film scenes are actors' impromptu performances inspired by directors. Algorithms cannot replicate this aspect of movies.

In an era when more and more people have gained access to tools for audio-visual creation, filmmakers need to make greater efforts in polishing their products, including the way a story is told, the aesthetic quality of the film and the audio-visual experience it provides, so as to make watching films in cinemas an irreplaceable choice for the audience.

Nature-based solutions to climate challenges

Climate change is no longer a distant warning. Melting glaciers, dying coral reefs and collapsing ecosystems are racing toward dangerous tipping points, posing significant risks to both people and nature.

Many countries, including China, are responding to the alarming signals. China's 15th Five-Year Plan (2026-30) focuses on developing river-basin economies, highlighting a powerful idea: nature is part of our infrastructure, and investing in it could strengthen resilience.

Global Lens

Nature-based solutions (NbS) could turn this idea into practice.

NbS involves actions that protect, restore and manage ecosystems so that they continue to provide essential services for people and businesses.

Forests regulate water and stabilize slopes, wetlands store floodwater and filter pollution and mangroves shield coasts from storms and erosion. Urban trees and parks cool streets and reduce heat stress.

In these ways, nature delivers essential ecosystem services — flood protection, water security, coastal defense and urban cooling — that make existing "grey" infrastructure more resilient.

By viewing nature as a form of infrastructure, we recognize that, unlike roads, dams or drainage systems, natural systems can renew themselves and deliver multiple benefits simultaneously.

Trees or mangroves, for example, could regulate water, store carbon, support livelihoods and enrich communities with cultural and recreational spaces.

Thus, nature is no longer external to socio-economic development, but a core asset that generates goods and services essential for sustaining other economic activities. Our long-term prosperity depends on protecting nature.

In a warming world with more frequent hazardous weather events, the capacity of ecosystems to absorb climate and disaster shocks is one of the most cost-effective ways to adapt.

Yet, investment in nature still falls short. Global estimates indicate an annual biodiversity finance gap of around $700 billion between now and 2030.

One major barrier is that many of nature's benefits — such as a stable climate, or cleaner air — are not properly valued and priced in project appraisals or national accounts.

Tools and outcome metrics to measure and quantify the socioeconomic gains from NbS are still developing, making these benefits easy to overlook.

Also, data on nature remain fragmented, standards on nature finance are still evolving, and many public NbS projects have to coordinate across multiple agencies and ministries.

MA XUEJING / CHINA DAILY

All this can make nature-positive investments look risky, hard to structure and difficult to implement, even when they make strong economic sense.

As climate impacts intensify, building resilience is no longer a choice but a necessity. Investing in nature can change how we design infrastructure, plan cities and shape our economies for the long term.

A holistic approach is needed to align policy, project preparation and finance, so that NbS are systematically built into decisions rather than added on later.

First, efforts could focus on bringing nature into the mainstream of project finance. This entails developing and using simple methods to identify nature-related risks and opportunities early in project preparation, so that suitable NbS measures can be built into the design from the very start.

This work can build on the environmental and social safeguard reviews that many financial institutions carry out for the projects they finance, making such standards easier to apply and institutionalize.

In parallel, a practical "menu" of NbS options can be compiled for key investment areas, offering project teams a set of tried-and-tested measures for climate-resilient infrastructure that can then be tailored to local conditions.

Second, financial markets need to deepen and continuously innovate to better support investment in nature, including NbS. For NbS that are integral to climate-resilient infrastructure, more adaptation finance could be directed to these activities as part of core project funding.

Some NbS can also generate high quality carbon credits, drawing on existing accounting methodologies used in some global and national voluntary markets.

Moreover, new types of labeled sustainable finance instruments can be piloted to channel capital into nature-positive projects.

Emerging nature-finance taxonomies from international institutions, such as the one recently launched by multilateral development banks, could offer a useful starting point for defining qualifications and guiding the design of such instruments.

Furthermore, a portfolio approach could bundle NbS projects that would otherwise be too small or fragmented, helping to overcome bankability challenges and attract larger-scale investment.

Third, to support the endeavors mentioned above, cross-sector policy making needs to be strengthened so that clear, consistent guidance comes from the top. A country's climate strategies — especially adaptation plans — should be aligned with planning for biodiversity conservation and natural resource management, and coordinated across ministries.

This is crucial when setting strategic targets and designing financial and economic incentives, so that NbS are encouraged and enabled in a coherent way across different sectors and levels of government.

Last but not least, capacity building also needs sustained attention across all key stakeholders, including financial institutions, governments, contractors and regulators, so they know why and how to integrate NbS into major decisions in the first place.

This will be a gradual process, and expand as more data, practical tools and financial instruments become available, tested and ready to scale up.

Across emerging markets and developing countries, strong examples of NbS are already emerging, including in China, where rivers, grasslands and coasts are often being used to support development and resilience.

Picture a solar farm spread across once-degraded land, with panels raised just high enough for sheep or goats to graze in their shade: the panels help slow down wind erosion, the ground cover restores biodiversity and stores carbon, and local herders earn steadier incomes while clean power feeds nearby towns.

Such vivid combinations of clean energy, healthier ecosystems and stronger rural livelihoods show how emerging markets and developing countries can pioneer NbS at scale and play a leading role in advancing climate-resilient, nature-positive growth.

As the world looks toward the 31st United Nations Climate Change Conference, the focus is shifting from high-level commitments to concrete implementation.

Now is the right moment to bring NbS out of the margins into the mainstream of climate and development plans.

Countries and other stakeholders can arrive at the upcoming conference with real projects underway — restoring rivers, forests, coasts and city landscapes that protect people and the planet.

Roman Novozhilov is the chief of the Environment, Social and Governance Department at the New Development Bank; and Yuan Zheng is a climate finance specialist of the Strategy, Policies and Partnerships Department at the New Development Bank.
The views don't necessarily reflect those of the New Development Bank and China Daily.

Qu Yue

Enduring protection for workers in emerging fields

On April 26, the Chinese government issued a document offering guidelines on strengthening services and management for workers in new forms of employment — such as food delivery riders, couriers, ride-hailing drivers, and live-streamers who make a living through digital platforms.

It is China's first national-level policy document of its kind to focus specifically on the needs of this emerging workforce.

As China's social security and public service systems were developed alongside industrialization and are largely based on the work unit model, traditional workers are tied to a fixed employer, sign formal labor contracts, contribute to social insurance and receive corresponding benefits.

But workers engaged in new forms of employment have to face ambiguity.

Their flexible arrangements, often involving platforms, outsourcing firms and franchisees, create complex employment relationships.

As a result, these workers often lack clear legal protection and institutional support in areas such as pay, work injury insurance, rest rights and social security.

China's population service system requires that everyone, regardless of age, occupation, household registration status or employment type, be included.

Workers in new forms of employment, however, represent a large blind spot in this system. They often work away from their place of household registration, don't have stable employment and live in a dispersed manner.

The guidelines are meant to close that institutional gap by formally bringing this group into the national services and governance system, safeguarding their rights and providing tailored support.

The guidelines take into account the realities of the new forms of employment and clarify the responsibilities of all parties involved so that rights protection is based on clear and enforceable standards. This is essential to achieving high-quality and full employment.

Platform companies and courier firms are required to improve their management systems, use labor contracts or written agreements suited to the sector, and define rights and obligations in a lawful and reasonable way based on actual working arrangements.

The guidelines also urge platform companies to set remuneration in line with the workload, pay wages in full and on time and ensure workers' right to rest. They call for enhanced protection in special conditions such as extreme weather.

To ensure that the concerns of workers are heard, mechanisms will be established for consultation and dialogue on matters affecting their rights, with transparent outcomes.

Practices, such as unreasonable fees or commissions, unfair traffic allocation and abuse of market dominance, are expected to be investigated and punished. The protection of workers' rights may also be included in corporate social responsibility assessments.

To address a long-standing concern of workers, the guidelines have also tackled algorithm-related issues.

Platform companies must improve transparency and guarantee workers' rights to be informed about, participate in and make choices regarding algorithmic rules.

When adjusting algorithms, platforms should consult labor unions and worker representatives, and reasonably set rules on task allocation, pricing and time estimation, while strictly complying with filing requirements.

The guidelines call for measures to curb excessive competition, prevent harm to workers' rights, protect personal data and privacy, and crack down on fraud, predatory lending and other crimes targeting this segment of the workforce.

On the public services front, basic services need to be provided based on place of residence rather than household registration, a principle firmly upheld to allow services to follow the flow of workers.

Measures include improving social security systems suited to flexible employment, facilitating the transfer and continuation of social insurance, expanding pilot programs for occupational injury protection, enabling direct settlement of cross-regional medical expenses and exploring the inclusion of flexible workers in the housing provident fund.

The guidelines call for multi-party coordination mechanisms led by townships and communities to address practical issues such as access to residential compounds, parking areas, meals, rest areas and restroom facilities.

Community service centers and union stations are to be used to build service hubs such as "driver homes" and "rider stations", offering basic amenities including drinking water, charging facilities, hot meals and emergency supplies.

Outstanding workers are to be recognized and rewarded while regular skills competitions are to be organized to enhance professional pride.

Targeted support is also emphasized. Workers financially impoverished are to receive social assistance in accordance with regulations, while support is to be provided to the families of workers injured or killed on the job.

The guidelines highlight the importance of psychological services in easing work-related stress, expanded vocational training, improved systems for skill certification and professional evaluation, and clearer pathways for career advancement.

The guidelines come at a time when there are new changes in China's population structure and the platform economy is reshaping employment patterns.

The social security system is shifting from one centered on work units to one centered on society at large, extending protection from "employees of units" to "members of society."

By standardizing employment practices, safeguarding entitlements and opening pathways for career development, the guidelines lay a foundation for the long-term, healthy development of new forms of employment.

With the help of the guidelines, jobs that were once temporary stopgaps can be transformed into viable, stable careers, unlocking the potential of tens of millions of workers as a source of human capital.

Investing in education brings talent dividend

In the 15th Five-Year Plan (2026-30), China has emphasized the importance of investing in both physical assets and human capital, with education playing a vital role in enhancing the well-being of its people.

Education should be seen not just as an expense, but as a long-term investment that transforms human resources into core capital for future growth.

Human capital investment views the population as a dynamic and evolving resource. By improving the allocation of educational resources and strengthening policy design, it enhances people's knowledge, skills, health and innovative capacity.

Through upgrading the labor force's skill structure, strengthening intergenerational development capacity, and promoting population mobility and integration, education investment improves both the quality and structure of the population.

This facilitates a shift from reliance on a traditional demographic dividend toward a more sustainable talent dividend that supports long-term economic transformation.

Such investment should be precise and consider the entire life cycle to address major demographic changes such as declining birth rates, population aging and the demand for quality improvement. To counter falling fertility, it is essential to expand child care services and optimize basic education resources, thereby reducing the cost of raising children.

For an aging population, education for older adults and vocational training can unlock the potential of the elderly workforce and extend productive working lives.

We also need to forecast demographic trends, ensure a balanced regional distribution of educational resources, and coordinate education with fertility, employment and elderly care policies.

We have to shift from expanding scale to improving quality, building a resilient education system that can better deliver a talent dividend.

With increasing population mobility between urban and rural areas and across regions, migrant children often struggle with educational integration.

Technologies such as artificial intelligence can be used to recommend personalized learning pathways and improve accessibility.

Breaking institutional barriers, such as those related to the household registration system, is essential to ensure educational equity based on the principle of equal rights within the same city.

This involves easing or even abolishing school enrollment thresholds linked to social insurance contributions or residence permits, and removing household registration restrictions for senior high school admissions so that migrant children can compete fairly for quality educational opportunities.

On the fiscal side, funding mechanisms should be improved through transfer payments to support destination areas in providing public education.

Educational process equity has to be promoted through teacher rotation, mixed classes and integrated support systems that combine academic assistance, psychological counseling and social integration services.

Building a lifelong education system requires strong institutional safeguards, open resource sharing and technological empowerment.

Developing a national qualifications framework and a credit bank system can enable mutual recognition among academic education, vocational training and lifelong learning outcomes, lowering barriers to participation.

Universities, enterprises and social organizations can work together to build digital learning platforms offering blended online and offline courses for people of all ages, with particular emphasis on skills training for career transitions and community-based education for older adults.

Technologies such as artificial intelligence can be used to recommend personalized learning pathways and improve accessibility.

Closer integration between industry and education is also essential to deliver training aligned with industrial upgrading and ensure a continuous appreciation of human capital.

Nudging families toward a more rational approach to educational investment requires policy guidance and effective public communication. They need to shift from traditional attitudes that overemphasize academic credentials.

The role of skilled professionals in economic and social development needs greater recognition. A diversified talent evaluation system can be established by combining academic diplomas with vocational skill certificates and improving the national qualifications framework.

Also, the remuneration, social status and career prospects of skilled workers should be enhanced, helping families recognize vocational education as a viable pathway for upward mobility. Better alignment between skills training and the demand in the labor market, along with the promotion of successful role models, can help alleviate education-related anxiety.

Governments can strengthen career guidance services to help families make informed choices based on children's interests, abilities and market trends.

It is crucial that governments anchor education policy in the goal of high-quality population development, ensure balanced provision of inclusive educational resources, fulfill fiscal responsibilities and address gaps in underdeveloped regions and among vulnerable groups.

Sound regulatory mechanisms are also needed to standardize the education market and improve coordination among education, population and employment policies.

The market, in turn, is expected to respond to diversified educational demands by providing differentiated services, deepening cooperation between schools and enterprises and leveraging digital technologies to enhance quality and efficiency.

Families too should make rational choices that align with their children's strengths and social needs, prioritize moral education and holistic development and work in coordination with national population and education strategies.

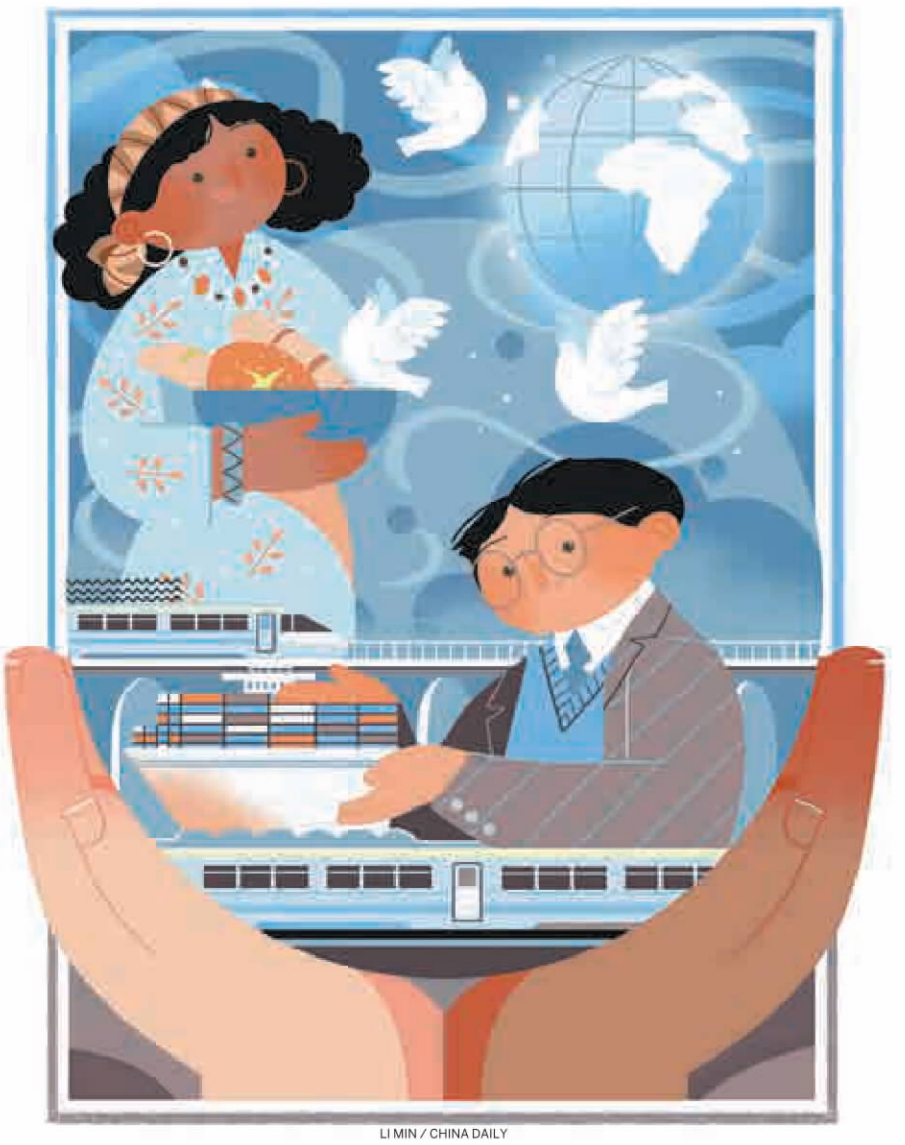
GLOBAL VIEWS

EFEM N. UBI

Free trade milestone

China's zero-tariff treatment for the 53 African countries with which it has diplomatic ties is set to boost Africa's economic growth and modernization



The importance of Africa's trade with China is reflected in numerous bilateral, multilateral and regional agreements. This is also indicative of the new policy of the Chinese government that, starting May 1, China fully implemented zero tariffs on all products from 53 African countries with which it has diplomatic ties.

Historically, Africa has faced significant challenges in its trade relations with Western countries. Stringent duties and high tariffs imposed by Western countries have often hindered the export of African goods. For instance, the United States administration has reignited tensions in international trade. This approach has had a negative impact on many African nations, thus making it difficult for them to compete on the global stage.

In contrast, China has offered a solution by removing trade barriers. By taking these steps, China is offering new opportunities for economic growth and prosperity across the African continent, provided these advantages are effectively leveraged by African governments.

The trade relationship between China and Africa has been highly significant. In light of this situation, implementing a zero-tariff policy can help boost trade with China, reduce trade imbalances, support Africa's manufacturing growth, and encourage trade and development within Africa itself.

Data released by China's General Administration of Customs indicate that China has become Africa's largest trading partner, with trade totaling $348 billion in 2025. However, it is estimated that Africa's trade with China accounts for 4.5 to 5.5 percent of China's global trade. Thus, with a zero-tariff policy now in place, Africa will gain wider access to China's vast and promising market. This initiative also indicates that China is readily attuned to the concerns expressed about trade imbalances with Africa, extending beyond traditional diplomatic and soft-power considerations. This significant policy will gradually enable Africa to increase production and expand trade, thereby increasing revenue and competitiveness while also lowering production costs.

LI MIN / CHINA DAILY

One barrier to the effective participation of some African nations in international trade is the persistent lack of robust industrialization. Across the continent, numerous countries are struggling with insufficient infrastructure, outdated production techniques, and limited manufacturing capacity. According to the African Trade Report 2024 released by the African Export-Import Bank, the African continent accounts for about 2 percent of global trade. And some African nations rely heavily on exporting unprocessed raw materials such as crude oil, copper, cobalt, coffee, cocoa and lithium, while importing finished goods, machinery and technology.

This situation compromises their ability to compete globally, preventing them from fully exploiting the opportunities that international markets offer. The implementation of a zero-tariff policy could catalyze the growth of a more dynamic and resilient industrial sector in Africa. By eliminating tariffs, some African nations can reduce costs for manufacturers, encourage foreign investment and promote local production. This shift could lead to increased manufacturing output and innovation, which are crucial for fostering competitive industries. This comprehensive approach can pave the way for economic development that ultimately benefits not only the individual countries but the entire continent.

Some African countries can fully leverage this opportunity by combining their comparative advantages with efforts to improve logistics and standards systems. This will further boost export growth and diversification, which many African nations have been grappling with over the years.

The policy can also boost agriculture and food security. The zero-tariff policy is expected to enhance the agricultural sector across the African continent. Also, by promoting the processing and packaging of agricultural goods, some African nations can create a spectrum of jobs that range from farming and harvesting to manufacturing and distribution. These African nations can expect an increase in employment opportunities within local communities. This is particularly crucial, as the agricultural sector serves as one of the largest sources of employment in Africa, providing livelihoods for millions of people. In fact, China's zero-tariff policy for Africa has the potential to uplift rural economies and empower communities throughout the continent.

The landmark zero-tariff policy will also have positive effects on boosting intra-African trade and, importantly, the African Continental Free Trade Area. This policy will encourage intra-African trade by enabling some African nations to capitalize on their comparative advantages. As a result, countries will not only trade raw materials and commodities among themselves, but also exchange finished or value-added goods. Furthermore, it can incentivize the development of regional supply chains in Africa to meet China's growing demand.

In conclusion, China's zero-tariff policy for the 53 African nations with which it has diplomatic ties could not have come at a more opportune moment for Africa, as the world grapples with uncertainty, trade wars and conflicts that threaten the stability of developing countries. This effort offers opportunities for Africa's modernization through industrialization and manufacturing, aiming to realize a shared future for both parties.

STEPHEN NDEGWA

Companions in modernization

China's tech push is also helping expand Africa's digital footprint with high-impact projects that are reshaping the continent's technological landscape

MA XUEJING / CHINA DAILY

In global economic debates, innovation is often framed as a competitive race among major powers. Headlines tend to focus on who leads in artificial intelligence, advanced manufacturing or green technology. The narrative is usually about who is ahead, who is falling behind, and who will dominate future industries.

But for much of the developing world, the real question is whether innovation expands opportunity beyond the traditional centers of power. For Africa, China's growing push for technological innovation is increasingly providing that opportunity. And as articulated during this year's two sessions — the annual meetings of the National People's Congress and the National Committee of the Chinese People's Political Consultative Conference — this partnership is entering a more mature, policy-driven phase focused on shared modernization.

For Global South nations, China's modernization drive is not an isolated project, but an open one. The two sessions were charged with a focus on new quality productive forces, driven by digitalization and AI. This is a signal of where China is investing in its immense research and development capacity and, crucially, what it is willing to share with partners such as Africa.

One of the most striking moments came during Chinese Foreign Minister Wang Yi's news conference on the sidelines of the NPC session. When a Nigerian journalist was given the opportunity to ask a question, the gesture stood as a small but powerful symbol of the importance China places on its African partnership. Wang's response was a reaffirmation that China's path to modernization is intrinsically linked to Africa's — a sentiment that resonates deeply from the Great Hall of the People in Beijing to the tech hubs of Nairobi and Lagos.

This commitment was given strategic depth by Wang during his visit to three African countries in January, during which he laid out a comprehensive vision for the future. His message moved beyond simple infrastructure development to a holistic partnership for the 21st century, built on several key pillars that will directly impact Africa's digital future.

The first is the principle of prioritizing development as companions in modernization. This is backed by the implementation of zero-tariff treatment for 100 percent of taxable imports from the 53 African countries that have diplomatic ties with China, starting May 1. This policy is a game-changer. It is designed to boost African exports, and crucially, it fosters the development of local industries and technological capacity, giving African innovators a direct pathway to the huge Chinese market.

Second, Wang emphasized promoting mutual learning in national governance. This means creating platforms such as the China-Africa knowledge network for development to share expertise. For Africa's digital transformation, this is vital. It is not just about receiving technology, but about understanding the policies, regulatory frameworks and innovation ecosystems that allow technology to thrive. It is a direct channel for African engineers, entrepreneurs and policymakers to learn from China's development.

Third, Wang called for upholding openness and inclusiveness as partners with a shared future. This stands in direct contrast to the trend of technological protectionism elsewhere. By strengthening coordination in international forums, China and Africa can jointly advocate a global governance system that gives developing nations a greater voice in making the rules for emerging technologies such as AI, ensuring these technologies serve the shared interests of all humanity.

This policy alignment is already translating into tangible, high-impact projects that are reshaping Africa's technological landscape. The focus is shifting from basic connectivity to intelligent infrastructure. A landmark example is the 2026 strategic memorandum of understanding between MTN Group and Huawei, signed to accelerate Africa's digital and intelligent transformation.

This partnership is a blueprint for the future. It leverages AI as the core driver to build "agentic networks", the next-generation infrastructure that evolves from automation to true autonomy. By targeting Level 4 autonomous networks, where AI handles most network management, this collaboration aims to dramatically improve efficiency and unlock new possibilities for service innovation. In addition to enabling faster internet traffic, it is about creating an AI-ready digital backbone that can support everything from smart agriculture and telemedicine to fintech and logistics, powered by innovation labs based in Africa.

This builds on a long history of cooperation where companies such as Huawei have been instrumental in building the continent's digital skeleton, contributing to constructing a large share of Africa's 4G networks and deploying hundreds of thousands of kilometers of fiber-optic cables. Now, with AI integration, we are moving from building the skeleton to wiring the nervous system of a digital economy.

For Africa, the convergence of its youthful population is obvious, with more than 60 percent of the total population in the sub-Saharan region being under the age of 25, and these technological investments create unprecedented potential. The continent is already the world's fastest-growing mobile internet market, gaining 1.5 new users every second. Young developers in Africa's Silicon Valley are building solutions on this foundation — mobile payments that expand financial inclusion, platforms connecting farmers to markets and digital health services reaching rural patients.

The pieces are coming together. China's renewable energy push, another pillar of its innovation drive, is also making solar power more affordable, helping power this digital ecosystem and address the electricity gap that affects 600 million Africans, according to the International Energy Agency.

As Chinese companies invest in solar farms, hydropower and minigrids across the continent, they are providing the clean and reliable electricity needed to keep data centers running, charge millions of new mobile devices coming online every day and power the small businesses that form the backbone of Africa's digital economy.

Ultimately, the narrative is no longer simply about China's tech push. It is about a strategic partnership that is actively co-creating Africa's digital future. Innovation delivers its greatest value when it spreads, and in this partnership, there is a clear path for the technological breakthroughs of the 21st century to truly transform economies far beyond the traditional centers of power.

Research points to innovation depth

Foreign-funded R&D centers expand quantitatively and qualitatively

By ZHONG NAN
zhongnan@chinadaily.com.cn

Multinational companies once measured their presence in China by the number of factories they operated and the scale of their supply chains. Today, those metrics no longer fully capture their footprint.

The number of research and development centers has emerged as a more telling indicator of how deeply foreign businesses are embedded in the Chinese market and how committed they are to long-term innovation.

As of March this year, Beijing had 332 foreign-funded R&D centers, with 55 newly established this year, while Shanghai had 647 such centers, including 15 new additions this year, data from the Ministry of Commerce showed.

That shift is also becoming more evident in capital flows. The actual use of foreign direct investment in China's high-tech industries rose 30.7 percent year-on-year to 102.73 billion yuan ($15.05 billion) in the first quarter of 2026, accounting for 41.2 percent of the country's total FDI, according to the ministry data.

Of this, the actual use of FDI in R&D and design services rose by 127.8 percent on a yearly basis.

Zhao Yang, an official with the Ministry of Commerce's department of foreign investment administration, said China's industrial and innovation strengths are translating into tangible advantages.

Foreign-funded R&D centers are entering a phase of both quantitative expansion and qualitative upgrading, shifting from local adaptation hubs to integral nodes in multinational companies' global innovation networks, said Zhao.

Yin Zheng, executive vice-president of China and East Asia operations at Schneider Electric, said that running businesses, especially in the manufacturing sector, is no longer about simply taking orders and scaling up production in China.

"For many multinational corporations today, the country has evolved from a cost-efficient production base into a critical hub for innovation, market expansion and long-term strategic positioning," Yin said.

The French industrial group is currently building two new plants in Xiamen, Fujian province, and Wuxi, Jiangsu province, while upgrading its Beijing R&D center, focusing on energy management, optimization, efficiency and digitalization.

Bai Ming, a researcher at the Chinese Academy of International Trade and Economic Cooperation in Beijing, said the trend reflects growing confidence among foreign investors in China's economic resilience and its capacity for sustained innovation.

As a result, investment decisions that were once seen as optional are increasingly being elevated to strategic imperatives, particularly in high-tech and consumer goods sectors, Bai said.

Sean Stein, president of the US-China Business Council, said the shift is evident.

"Twenty-five years ago, no one came to China to do R&D. Now, what I am seeing is that the best companies are doing some of their most important R&D in China," said Stein.

For example, US cosmetics group Estee Lauder is tailoring products for Chinese consumers, not only in packaging, but also in formulations and research and development. Tapestry Inc, the parent company of US fashion brands Coach and Kate Spade, has established an R&D center in Dongguan, Guangdong province, he added.

As part of its expansion in China, Estee Lauder launched two projects in Shanghai in late March — the China Fulfillment Center and the Group Open Innovation Center — to boost its research and development and intelligent supply chain operations.

Visitors experience cosmetics from Estee Lauder during the eighth China International Import Expo in Shanghai on Nov 9. PROVIDED TO CHINA DAILY

A visitor checks out products from Danfoss during a machinery exhibition in Shanghai on Nov 28, 2024. PROVIDED TO CHINA DAILY

Visitors get to know information at Schneider's exhibition stand during the eighth CIIE in Shanghai on Nov 10. PROVIDED TO CHINA DAILY

> "For many multinational corporations today, the country has evolved from a cost-efficient production base into a critical hub for innovation, market expansion and long-term strategic positioning."
>
> **Yin Zheng,** executive vice-president of China and East Asia operations at Schneider Electric

"China is more than one of the world's largest beauty markets. It is a global leader in shaping consumer trends, digital innovation and the future of our industry," said Stephane de La Faverie, the group's president and CEO.

Similar momentum is seen in other sectors. Louis Dreyfus Company, a Rotterdam-headquartered multinational trader and processor of agricultural commodities, has continued to expand its footprint in China, investing in four greenfield projects to strengthen processing capabilities.

James Zhou, LDC's chief commercial officer, said his group has already set up a global R&D center in Shanghai and launched two production lines for specialty feed ingredients in Tianjin, aiming to translate research into commercial applications.

"We are looking to expand our integrated specialty phospholipid production model — pioneered through innovation and advanced oilseed processing capabilities in China — to other LDC plants worldwide," said Zhou. "Meanwhile, we have launched various plant-based food and feed ingredients and solutions, tailored to evolving needs in China."

Pan Yuanyuan, deputy director of the international investment unit at the Chinese Academy of Social Sciences' Institute of World Economics and Politics, said foreign investment is becoming an increasingly important driver of employment and services sector development in China.

"In high-tech areas such as advanced manufacturing, green and low-carbon development, digital infrastructure and scientific research, multinational companies are increasingly leveraging China's industrial and supply chains to scale up innovation and accelerate its commercial application, integrating the country more deeply into their global production and innovation networks," she added.

Seeing great growth potential in the Chinese market, German anchoring system manufacturer Fischer expanded and upgraded its existing production base in Taicang, Jiangsu province in March.

Its new heavy-duty anchoring and structural reinforcement product lines have been put into operation, with products set to be supplied to the Chinese market from this month and expanded to cover the broader Asian market from November.

Alexander Bassler, CEO of Fischer, said that the Chinese market is one of the most dynamic and forward-looking globally for the group, with the speed at which innovations emerge and are implemented at scale standing out in particular. The company also sees new growth opportunities in areas such as digitalization, smart infrastructure, sustainable construction and high-tech industries, Bassler added.

"At the same time, demand is rising for high-quality, durable and technologically sophisticated solutions. This opens up excellent prospects for our company. Our fastening and system solutions are used in many modern-day industrial and construction projects and make a valuable contribution to efficient and sustainable solutions," he said.

Kim Fausing, president and CEO of Danfoss Group, said the Danish industrial conglomerate aims to deploy more resources in China's data center sector, drawing on its global expertise and technologies to support scalable, energy-efficient infrastructure for artificial intelligence-led digital expansion.

"China has become a key player in global digital and energy transitions, as data centers play a growing role in the energy system, driven by rising electricity demand from artificial intelligence and cloud computing," said Fausing.

As its sales in China more than doubled over the past decade to exceed 10 billion yuan, Danfoss, which operates 12 manufacturing bases and four innovation facilities across the country, posted a 13 percent sales growth year-on-year in 2025, driven by strong momentum in sectors such as data centers and marine industries, where demand for energy-efficient solutions is rising.

As China strives to drive high-quality economic development through higher-level opening-up, this year's Government Work Report called for steadily expanding institutional opening-up, promoting the reinvestment of foreign capital and the expansion of localized production, and improving services for foreign-funded enterprises.

More than 6,200 foreign-invested enterprises were registered with customs authorities in the first quarter, while the number of such companies with import and export activity rose by more than 1,000 from a year earlier to reach 69,000, statistics from the General Administration of Customs showed.

These companies recorded 3.47 trillion yuan in trade between January and March, up 16.1 percent year-on-year, marking the eighth consecutive quarter of growth.

"Multinational companies are playing a key role in driving new quality productive forces, and their trade outlook in China remains strong," said Wang Jun, GAC's vice-minister, adding that stable policy expectations and an open business environment are helping them select more trading partners and tap into more markets.

Wang said global businesses' integration with China's manufacturing sector is deepening.

In China, foreign-invested firms accounted for more than 30 percent of each sector's total trade in industries such as automobile manufacturing, instrumentation and pharmaceuticals during the January-March period, according to the GAC.

Meanwhile, these companies accounted for more than 30 percent and 60 percent of China's industrial robot and 3D printer exports, respectively, with growth in both categories outpacing the national average.

Trade ties depend on reliable partners

REPORTER'S LOG
By Zhong Nan

I have been covering the China Import and Export Fair (Canton Fair) for years, and every time I walk into its vast venue in Guangzhou, Guangdong province, my first instinct is to scan the crowd. It is a habit that comes naturally — reading the market through the density of people, especially foreigners, the pace of movement, and the hum of conversations across the halls.

That instinct still worked for me at the fair's 139th edition this year, but only up to a point. The crowds are there, the booths are busy and the noise level remains high. Yet, after a few hours on the floor, the feeling shifts. The signals are familiar, but the story behind them is not.

What has changed most is not the scale, but the substance of interaction. Buyers still stop, take photos and ask questions, but their questions have become more layered and more cautious. Conversations move quickly beyond product specifications and pricing, shifting toward delivery reliability, cost stability and the ability to manage unexpected disruptions.

In other words, customers today are not just buying products, but the ability to deliver with certainty.

Several exhibitors told me that decision-making cycles have lengthened compared with previous years. Buyers are taking more time to evaluate options, often revisiting the same supplier multiple times before moving forward. The process feels less transactional and more like risk assessment.

People can feel the contrast across the venue. The fair appears energetic and crowded, reinforcing the impression of strong demand. Yet the mood is more restrained, as both buyers and sellers deal with a more uncertain external environment shaped by cost pressures, supply chain disruptions and geopolitical considerations.

The mix of buyers is another sign of that shift. Visitors from emerging markets remain highly visible, but participation from Europe, the United States and South Korea has not faded. Instead, demand is spreading across regions rather than relocating, creating a more complex landscape for exporters trying to serve multiple markets at once.

That complexity is also reflected in what is being displayed. In newly expanded sections dedicated to drones, service robots and smart technologies, price is no longer the primary narrative. What stands out instead is application — how products are used, how systems are integrated, and how reliably they can be delivered at scale.

The fair itself is evolving alongside these changes. For many companies, it is no longer just about what happens on the exhibition floor, but part of a longer process. Leads are identified before arrival, conversations are structured during the event, and follow-ups begin almost immediately after. The physical interaction remains important, but it is no longer the starting point.

This shift is quietly redefining what success looks like. Counting visitors or collecting business cards is no longer a big deal. What matters more is how many of those contacts turn into real conversations, and how many of those conversations translate into actual orders over time.

All this points to a broader transformation in China's foreign trade model. Competitive advantage is moving away from simple cost competitiveness toward something more complex — the ability to deliver consistently, respond quickly and remain reliable when conditions become uncertain.

BUSINESSINSIGHT

How trade policy shapes consumer outcomes in US

EAGLE EYE
By John Quelch

CAI MENG / CHINA DAILY

In recent years, the United States has placed increasing emphasis on trade policies that prioritize national security, supply chain resilience and economic growth. In an era of global volatility and technological rivalry, these may be real and relevant policy objectives. However, it is equally, if not more, important to consider how such measures affect markets and, ultimately, the daily lives of US consumers.

Tariffs and import restrictions are two types of trade barriers that directly affect household well-being. First, such policies can reduce diversity in the domestic market by making it more difficult for consumers to access high-quality, lower-cost imports. A second effect concerns competition. When foreign firms face barriers to entry, domestic firms may encounter less competition, resulting in higher prices and reduced incentives to innovate over time. Together, these factors can make it more difficult for families to make ends meet, particularly for lower and middle-income households that are more sensitive to changes in the cost of goods.

The electric vehicle sector provides a useful example of how these dynamics play out. As part of its broader climate and industrial objectives, the US has set ambitious targets for deploying sustainable energy technologies, including EVs. At the same time, levies on imported EVs have increased significantly in recent years, in some cases by more than 100 percent. As a result, vehicles that are competitively priced at the point of production may end up costing significantly more by the time they reach US consumers, once taxes, tariffs and distribution costs are factored in.

In other major markets, including Europe and Canada, similar models — with a range of high-tech features such as advanced driver-assistance systems and integrated digital platforms — are often available at lower prices. Of course, cross-market comparisons are shaped by multiple factors, including government subsidies, regulatory frameworks and shipping costs. Nonetheless, the effect of current US trade policy is to make it more difficult for US consumers to access lower-cost alternatives at a time when affordability remains a pressing concern.

Survey data suggest that many US households are increasingly focused on value for money and would welcome a wider range of EV options. Expanding the variety of available vehicles could accelerate adoption, support environmental goals and ease financial pressures on households. However, current policies limit the availability of such options.

There is substantial empirical research on how tariffs affect consumers. Studies by the Federal Reserve Bank of New York indicate that US consumers and businesses, rather than foreign producers, have borne most of the costs of tariffs imposed since 2018. Similarly, the Kiel Institute for the World Economy found that tariffs function much like a consumption tax, with the burden falling largely on domestic consumers.

Industry projections provide further insight into how trade policies may affect consumers. According to the National Automobile Dealers Association, trade-related costs could raise vehicle prices by several thousand dollars. For many households, a car represents the second-largest expenditure after housing, meaning even modest price increases can significantly affect affordability and access.

As former White House economic adviser Gary Cohn has observed, tariffs can have regressive, tax-like effects, as lower-income households tend to spend a larger share of their income on goods.

At a macroeconomic level, tariffs can also contribute to higher prices. Several analyses suggest that recent trade restrictions have added upward pressure to the cost of various consumer goods, compared with historical trends. Tariffs are only one of several factors influencing inflation, including supply chain disruptions, energy prices and monetary policy, but they remain a policy tool with clear and measurable effects. Goldman Sachs, for example, has estimated that tariffs have had a modest but noticeable impact on inflation, with some effects likely to persist.

At the same time, tariffs have generated substantial government revenue, estimated to have exceeded $200 billion in 2025. This underscores the trade-offs involved in their use.

Trade barriers affect not only prices, but also the way firms compete. In more open markets, companies tend to improve efficiency, invest in innovation and adapt to evolving consumer preferences. When access to international competitors is constrained, these incentives may weaken. Over time, this can lead to higher prices, slower technological progress and fewer choices for consumers.

This raises important questions about how to balance short-term support for the domestic EV industry with long-term competitiveness. Policies that strengthen domestic production capacity can be valuable, particularly in emerging sectors. However, sustained success overseas often depends on the ability to compete on both quality and cost.

Trade policy discussions frequently emphasize the importance of safeguarding national interests, supporting job creation and strengthening industrial capacity. These are important objectives. It is equally important to consider the perspective of consumers, who bear much of the cost of these policies.

A well-designed trade strategy seeks to balance multiple objectives: safeguarding national security, supporting domestic industry and promoting consumer well-being. Achieving this balance is complex and requires ongoing adjustments as economic conditions evolve. Policies that preserve a degree of openness and competition — while advancing strategic priorities — are more likely to support innovation, efficiency and broad-based growth.

In this context, careful consideration of the long-term effects of trade policies can help inform better decisionmaking. By weighing impacts not only on industry, but also on prices, consumer choice and household purchasing power, policymakers can better align trade strategies with the broader goal of sustainable and inclusive economic development.

Ultimately, trade policy should be evaluated not only by how effectively it advances national objectives, but also by how it shapes everyday economic experiences of consumers. Ensuring that markets remain dynamic, competitive and responsive to consumer needs is an essential part of that broader goal.

Demographics, urbanization changing housing market

MAIN STREET
By Sheng Songcheng

China's real estate sector is undergoing a historic transition. During the 14th Five-Year Plan period (2021-25), the industry entered a phase of deep adjustment after more than two decades of rapid expansion. The development model that once powered growth — characterized by high leverage, rapid turnover and heavy borrowing — has over time become difficult to sustain.

The structural conditions underpinning the market have also changed. China's demographic profile is shifting, urbanization is slowing as it approaches maturity and the marginal contribution of property investment to economic growth has diminished.

Recognizing these shifts, policymakers have begun outlining a new direction for the sector. Since mid-2023, policy discussions have repeatedly emphasized a consistent approach: strictly control new supply, optimize the existing housing stock and improve the quality of housing. Most notably, central authorities have explicitly prioritized the goal to halt the decline and move toward stabilization in the property market, elevating its stabilization to a strategic level vital for the broader macroeconomy.

As China enters the 15th Five-Year Plan period (2026-30), the policy framework has become increasingly clear. The half-decade has a distinctly layered objective. First, it seeks to address risks that accumulated during earlier phases of rapid growth, including risks related to real estate, local government debt and smaller financial institutions. At the same time, it aims to establish a new institutional foundation for the housing sector — reforming systems governing property development, financing and sales, while expanding the supply of affordable housing.

Guided by this shift in thinking, China's real estate industry may undergo a fundamental transformation, gradually returning to its core purpose: providing housing rather than serving primarily as a vehicle for financial expansion.

The most urgent task in this transition is risk management and reduction. Since China launched its market-oriented housing reforms in 1998, real estate has played an essential role in improving living conditions and driving economic growth. Yet the current challenges facing the sector are not simply cyclical fluctuations. Rather, they reflect deeper balance-sheet pressures emerging across the economy.

Over the past two decades, China's property sector developed a distinctive high debt-high growth model. Developers expanded aggressively using leverage; households increased borrowing through mortgage lending; and local governments relied heavily on land-transfer revenues to support fiscal spending. Together, these dynamics pushed up property prices while accumulating financial vulnerabilities.

Today, the situation has reversed. As housing and land prices enter a downward cycle, the liabilities associated with those assets — bank loans, bonds issued by developers and other forms of debt — remain rigid. This mismatch between declining asset values and fixed debt obligations has weakened balance sheets across the sector. Faced with such pressure, economic actors tend to shift their priorities from maximizing profits to minimizing risks. Income that might otherwise be used for investment is instead directed toward debt repayment. At the same time, falling property values reduce household wealth, which in turn dampens consumption and weakens domestic demand.

Managing this process requires caution. During periods of market stress, developers may attempt to sell assets quickly or slash prices in order to generate liquidity and repay debts. While such decisions may be rational for individual firms, if many companies simultaneously act in the same way, the collective effect can be destabilizing. Prices may fall sharply, liquidity may dry up and the industry may enter a negative cycle, in which declining asset values intensify debt pressures.

The appropriate strategy is therefore not a sudden correction, but a gradual adjustment — what Chinese policymakers often describe as "exchanging time for space". Real estate's share of China's GDP increased from 4.5 percent in 1998 to about 6.2 percent in 2025. The sector will continue to play an important role in the economy, but its functions can be recalibrated. By guiding key indicators such as the price-to-income ratio, rental yields and vacancy rates back toward sustainable levels, the industry can gradually shed the excessive financial and speculative functions that accumulated during the boom years.

Building a new development model requires strengthening the institutional framework governing property development, financing and sales. One important reform is the strengthening of the project-company system, ensuring that each real estate project operates as an independent legal entity and that funds raised for a project are used exclusively for its construction and delivery. Another reform involves establishing a "lead bank" system for project financing, under which a designated bank — or banking consortium — oversees financing and manages project cash flows. This mechanism builds on China's housing-project "white-list" program introduced in 2024, which has already supported financing for millions of homes.

Another significant change concerns the way homes are sold. For many years, China relied heavily on the presale of unfinished apartments. Increasingly, however, policymakers are encouraging the expansion of completed-home sales so that buyers purchase homes that are ready to occupy. This approach reduces delivery risks and helps restore confidence in the market.

At the same time, many developers are exploring asset-light business models, in which they provide development management services rather than funding projects directly. As the industry undergoes adjustment, this shift toward professionalized services may become an important path for sustainable development.

Another critical task is strengthening the affordable housing system. Housing possesses both a market dimension and a social-welfare function. International experience demonstrates the value of a dual-track system. Singapore's public housing program, administered by the Housing and Development Board, houses more than 80 percent of the city state's residents, while Germany's cooperative housing sector helps stabilize rental markets.

China faces its own structural challenges. The country's urbanization rate has surpassed 66 percent, and housing difficulties for new urban residents and young people coexist with underused housing stock. Expanding the supply of affordable housing and improving related institutional arrangements will therefore be essential to creating a tiered housing system that combines social protection with market efficiency.

Housing remains, above all, a place to live. Ensuring adequate housing for vulnerable urban households through public housing programs is therefore a core social objective. For lower-income families, shared-ownership housing and other mechanisms can help lower the threshold for homeownership. For households seeking improved living conditions, market-based housing can meet demand under appropriate policy guidance.

Better housing quality also contributes to human capital. The concept of building "good homes" — safe, comfortable, green and technologically advanced — reflects a growing recognition that housing quality matters as much as housing quantity. Large-scale urban renewal and the renovation of aging residential communities will not only improve living conditions, but also generate new investment opportunities.

Finally, housing also affects consumption through its influence on household wealth. Because more than 90 percent of Chinese households own homes, declining property prices can reduce perceived wealth and dampen spending. Policymakers are therefore exploring ways to enhance the efficiency of housing-related financial tools such as China's housing provident fund system, whose accumulated balances remain substantial but underutilized.

For all these reasons, stabilizing the housing market remains essential. Sales and investment have continued to decline in recent years, and restoring stability will be crucial for both the sector itself and the broader economy. Major metropolitan areas — where economic activity is concentrated and population inflows remain strong — will play a key role in anchoring the market. At the same time, improving housing quality, expanding affordable housing, and strengthening fiscal and financial support will help rebuild confidence.

China's real estate sector is now standing at a critical juncture between old and new development models. The path forward is increasingly clear: address accumulated risks, stabilize the market, and establish a new framework centered on quality, sustainability and housing as a basic social good. Achieving this transformation will not only determine the future of the industry itself, but also shape the stability and long-term development of China's economy.

BLUEPRINT INTO ACTION

New project aids Xinjiang's energy goals

Region to leverage resources to support transition plans and boost green power

By **FANG AIQING** and **MAO WEIHUA** in Urumqi

The Dashixia Water Control Project in the Xinjiang Uygur autonomous region has recently completed the installation of major components for all three power-generating units and the construction of its power transmission system.

Located on the Kumarak River in Aksu prefecture, the project features the world's tallest concrete-faced sand-gravel dam, rising 247 meters high, equivalent to an 80-story building.

According to the construction team, the 750,000-kilowatt project is scheduled to reach full impoundment by the end of May, with its first unit set to be commissioned in late June. All three units are expected to become operational in August, generating nearly 1.9 billion kilowatt-hours annually — enough to power 650,000 households.

Chen Wendeng, a project leader at China Gezhouba Group No 3 Engineering Co, which is in charge of construction, said that in addition to its water conservancy and ecological benefits, Dashixia's power generation will save about 764,000 metric tons of standard coal and cut carbon dioxide emissions by 2.45 million tons annually. It will also ease demand pressure in southern Xinjiang during summer and autumn and help smooth fluctuations from wind and solar power.

The Dashixia project epitomizes Xinjiang's energy transition and sets a promising tone for the 15th Five-Year Plan period (2026-30).

At a news conference in Urumqi on Saturday, regional leaders outlined Xinjiang's goal of leveraging its rich energy resources to support national energy security while boosting new energy and green power over the next five years.

Erkin Tuniyaz, chairman of the region, said Xinjiang will tap the potential of oil, gas, minerals, coal and new energy resources to foster large-scale industrial clusters, while using green electricity to accelerate industrial upgrading, develop emerging sectors such as computing power, and promote the integration of artificial intelligence with various industries.

Zhang Yingchun, the region's executive vice-chairwoman, said that during the 15th Five-Year Plan period, Xinjiang will accelerate construction of a new energy-based power system, promote local consumption of green electricity and speed up the building of outbound power transmission channels.

Official data shows that Xinjiang's installed new energy capacity surpassed 170 million kW in February, accounting for more than 60 percent of the region's total installed capacity. One-third of Xinjiang's outbound electricity, transmitted to 22 provincial-level regions, is green power.

Zhang said greater emphasis will be placed on advanced equipment manufacturing — including power transmission and transformation equipment and energy storage equipment — as well as green hydrogen.

Regarding green hydrogen, Xinjiang will pursue breakthroughs in production, storage, transportation and application technologies, build a full hydrogen energy industrial ecosystem and promote integrated development of green hydrogen, ammonia and methanol, she said.

A green hydrogen project in Yiwu county, Hami, has recently been added to Xinjiang's approved list of local new energy consumption projects. The project plans to install 690,000 kW of new energy capacity along with supporting energy storage facilities.

Using a wind-solar hybrid off-grid model, the project will rely entirely on self-generated green electricity for hydrogen production without connecting to the public power grid. It marks Xinjiang's first off-grid project directly linking green power generation with end users. Once completed, the project is expected to produce about 30,000 tons of green hydrogen annually while consuming approximately 1.65 billion kWh of green electricity each year.

A Xinjiang Daily report quoted the regional development and reform commission as saying that the project will effectively address difficulties involving grid connection and renewable energy consumption in remote areas.

SPC urges personal data infringement crackdown

By **CAO YIN**
caoyin@chinadaily.com.cn

China's top court has emphasized the need to safeguard data security and protect individual rights in the digital age, releasing a landmark case in which two individuals were sentenced to prison for acquiring and disclosing more than 900 million pieces of personal information online.

As technology rapidly advances, criminal methods have become increasingly sophisticated and concealed. "This has resulted in the theft, leakage and sale of sensitive personal data, often due to inadequate data management by certain governments, enterprises and online platforms," the Supreme People's Court said on Friday.

It noted that some criminals exploit acquired personal data to engage in activities such as fraud, extortion and "box-opening", which severely harm individuals' personal and financial safety and pose substantial threats to public security and social order.

In the highlighted case, two defendants surnamed Lin and Wang illegally obtained personal information through encrypted communication tools and other internet channels between 2023 and 2025. Lin acquired more than 600 million pieces of personal data, while Wang obtained over 300 million pieces.

They subsequently sold the information for profit through methods including virtual currency payments. Lin also collaborated with another individual to set up an online group with more than 2,000 members, using the personal data to insult and abuse others.

After hearing the case, the Beijing Haidian District People's Court ruled that Lin and Wang were guilty of illegally obtaining and selling personal information, classifying their offense as "extremely serious".

Lin was sentenced to seven years in prison and fined 70,000 yuan ($10,287), while Wang received a prison term of five years and six months and was fined 50,000 yuan.

The Beijing court said such malicious acts of publicly disclosing others' personal information, including names, identity card numbers, phone numbers, home addresses, whereabouts and social media accounts, are known as box-opening, or doxing. The acts are often followed by inciting netizens to launch verbal attacks, harassment and cyberbullying.

"Doxing brings great physical and mental harm to victims and their families, as well as severely disrupts public order and social stability," the top court said. It underscored that the security of personal information concerns everyone, adding that cracking down on such acts is necessary to maintain order in cyberspace and foster a healthy online ecosystem.

On Friday, the top court also unveiled details of four other notable cases involving personal information infringement, calling on judges to continue intensifying the crackdown on the crime and related offenses such as extortion and fraud.

In one case, from February to July 2022, two defendants jointly funded the purchase of a Trojan program online and implanted it into an official booking website to illegally obtain more than 290,000 records of HPV vaccine appointment information stored on the site.

The pair then rented a virtual host server, uploaded the illegally obtained website source code to a domain service space and created a counterfeit phishing website. They organized a team with different assigned roles and used a platform to mass-send messages claiming successful vaccine appointments, luring recipients into clicking phishing links.

By impersonating doctors and customer service representatives, they used tactics such as price adjustments, priority appointments and reordering for discounts to defraud 51 victims of more than 580,000 yuan.

The two ultimately received prison terms of 12 years and 11 years and nine months, respectively, for personal information infringement and fraud, along with fines, according to a ruling by a court in Jiangsu province.

The top court said the criminals took advantage of women's health concerns by breaching a legitimate vaccine appointment website to illegally acquire personal information, which they then used for targeted fraud.

"Such actions warrant severe penalties due to their grave violation of personal data security and property rights," it added.

Nation to assess Beautiful China implementation

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

New measures to assess whether provincial-level governments are effectively implementing the Beautiful China initiative were unveiled recently to promote green and low-carbon development.

The Beautiful China initiative is a national development strategy aimed at fundamentally modernizing the country's ecological environment by 2035 through a comprehensive transition to green production, low-carbon lifestyles, and large-scale nature restoration.

Issued by the Communist Party of China Central Committee and the State Council on Thursday, the measures also aim to advance the initiative on all fronts and achieve a comprehensive improvement and fundamental transformation in the country's ecological environment quality.

The assessment will adopt a 100-point scoring system, with results classified into four grades: excellent, good, pass and fail, according to a document released by the central authorities.

The document said the office of the leading group for the Central Ecological and Environmental Protection Inspection and the Organization Department of the CPC Central Committee, together with other relevant departments, will formulate detailed scoring rules for the assessment.

The evaluation will cover the implementation of responsibilities related to the initiative, progress in achieving annual major targets and fulfilling annual priority tasks, as well as fund utilization performance and public satisfaction levels.

The annual major targets include the condition of the atmospheric environment, water and marine ecological environments, soil ecological environment and overall ecological quality, along with the prevention and control of solid waste pollution.

In a media release, the office highlighted a goal-and-problem-oriented approach as one of the key principles guiding the assessment. It said key and directional indicators will be established to address major ecological and environmental concerns strongly voiced by the public and to steadily intensify the campaign against pollution.

The document also noted that provincial-level governments that fail the assessment must take corrective measures promptly and complete rectification within the required time frame.

In addition, principal heads of provincial-level Party committees and governments may be summoned by the Organization Department of the CPC Central Committee and the office of the leading group for the Central Ecological and Environmental Protection Inspection if rectification is not completed within the prescribed period.

According to the statement, China's top anti-corruption authorities, together with the Organization Department of the CPC Central Committee, will pursue accountability in accordance with regulations and laws where necessary.

The measures were made public as teams from the Central Ecological and Environmental Protection Inspection arrived in seven provincial-level regions, including Liaoning, Jilin and Heilongjiang provinces, for monthlong environmental inspections.

A key focus of the inspections will be whether these regions have properly implemented the Xi Jinping Thought on Ecological Civilization, according to a media release from the Ministry of Ecology and Environment, where the office of the leading group for the inspection is based. Inspection teams are typically led by ministerial-level officials.

The team assigned to Liaoning, for example, is headed by Cai Mingzhao, a member of the Standing Committee of the 14th National Committee of the Chinese People's Political Consultative Conference.

Central authorities unveiled guidelines in early 2024 to comprehensively promote the development of a Beautiful China.

By 2027, China is expected to see a continued decline in the total discharge of major pollutants and further improvement in ecological environment quality, according to the guidelines.

And by 2035, green production methods and lifestyles will be widely adopted, carbon emissions will have peaked and entered a steady decline, and the country's ecological environment will have fundamentally improved.

Visitors embrace Wuhan's tech-led factory tourism

By **ZOU SHUO** in Beijing and **LIU KUN** in Wuhan

Jia Meng's twin daughters thought they were visiting another museum during a recent outing. Instead, they walked into a room where a humanoid robot tried again and again to perfectly place a teapot in the center of a mat.

"It wasn't very good at pouring tea," said Jia, a 42-year-old freelancer from Wuhan, Hubei province. "But it's an emotionally stable perfectionist. It never got frustrated. My girls were glued to it for half an hour."

The robot in question, at the Hubei Humanoid Robot Innovation Center in Wuhan's Optics Valley, has hands that cost 50,000 yuan ($7,351) each.

It's still learning — human testers guide it, and the data is carefully selected for training. One day, the robot may teach itself, something Jia is looking forward to witnessing.

But the real jaw-dropper for Jia and her twins came later at the city's twin computing center — one of the few places in China that houses both a supercomputing center and an artificial intelligence computing center.

With 400 petaflops of computing power — one petaflop equals the combined might of 2 million laptops — the "smartest brains" of the digital age can find a specific star among 200,000 celestial bodies in just 100 seconds with 100 petaflops of power. Without that power, the same task would take over 100 days.

Jia's family was among the first wave of visitors to Optics Valley's new industrial tourism routes. Since March 12, the valley — known as one of China's tech heartlands — has launched nine themed tours, including "super factory", "AI" and "low-altitude economy".

The East Lake High-tech Development Zone, also known as the Optics Valley of China, has hosted more than 50 group tours in just a few weeks, according to the Wuhan bureau of culture, sports and tourism. "It's running smoothly, and the heat is only rising," an official with the bureau said.

The most popular stops are fully automated assembly lines, blacklight factories running without a single human worker and laser cutters that engrave metal in a flash, the official said. "Many parents and children told us it's the first time they turned textbook knowledge into real-life scenes," the official said.

Turning live production lines into tourist attractions is not easy. Factories have added glass-separated walkways, interactive screens and emergency exits. Each site pairs an engineer with a professional guide.

"Production first, safety above all," the official said. Visitors never enter the actual workshop, never touch equipment and never disturb a single bolt. "Staggered booking, capped group sizes and unified escorting — that's how we balance industry and tourism."

Asked whether visitors might one day assemble simple products or operate mini machines, the official said, "Definitely."

Plans include DIY laser bookmark-making, smart-device simulators and even a chance to try robot-like assembly tasks. "We want to move from watching to participating, from checking in to truly experiencing," the official said.

Finance professional Xiu Lei, 26, from Wuhan took his young daughter to Optics Valley expecting a quiet weekend. He left feeling like a child in a tech "wonderland". At Wuhan HGLaser Engineering Co, he saw a missile casing with a laser-welded seam — a sharp contrast to manual welding. "The guide pointed to it, and I felt a surge of pride," he said.

Then his daughter scribbled her name on a piece of paper. Seconds later, a laser engraved it onto a bookmark, and a machine automatically packed it into a gift box. "She was over the moon," Xiu said.

Next came Xiaomi's smart factory. Riding a sightseeing cart through spotless workshops, Xiu watched an air conditioner unit roll off the line every 6.5 seconds. The "lights-out factory" ran fully automated — products packed themselves, took an elevator and moved to a warehouse.

Wuhan is not alone. In Liuzhou, Guangxi Zhuang autonomous region, tourists make their own snail-rice noodles. In Jiaozuo, Henan province, visitors make DIY milk tea at the Mixue factory. In Renhuai, Guizhou province, home to Moutai, industrial A-level scenic spots hosted more than 10 million visitors in 2024, generating 12.86 billion yuan in tourism revenue.

Shanghai's raccoon dogs find urban coexistence 'sweet spot'

City's residents learning to live with wild animals previously thought of as pests

By ZHOU WENTING in Shanghai
zhouwenting@chinadaily.com.cn

Wang Fang, director of the Institute of Biodiversity Science at Fudan University, announces the research team's findings in the latest annual census on wild raccoon dogs in Shanghai on Nov 30. PHOTOS PROVIDED TO CHINA DAILY

Human-wildlife conflict in Shanghai has dropped significantly as the city's raccoon dog population stabilizes between 3,000 and 5,000 individuals, according to the most recent survey data.

While the protected species is expanding into new districts, localized densities in residential areas have fallen to record lows, driven by improved waste management and public education, a survey published on Nov 30 by the Shanghai Forestry Station, Fudan University, and the Shan Shui Conservation Center shows.

Despite their "bandit mask" markings, raccoon dogs are not actually raccoons. Instead, they are ancient members of the *Canidae* family, making them cousins to foxes and wolves. Native to East Asia, they are the only members of the dog family that hibernate during the winter.

Though their numbers have declined in Shanghai, they are still spreading and migrating in the coastal metropolis, with the city's Putuo district recording their presence for the first time last summer, and Chongming Island recording them for the first time a year ago.

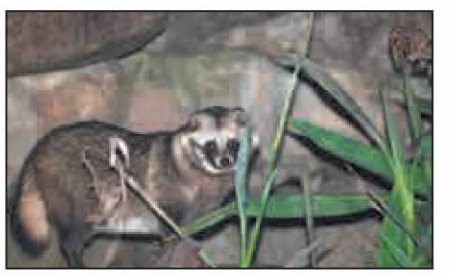
"These changes can mainly be attributed to the improvement in the ecological management, including community waste disposal and stray cat feeding over the past three years, and the deepening of public education and outreach," said Wang Fang, director of the Institute of Biodiversity Science at Fudan University.

"Also, the sense of security provided by real survey data has been key in changing the perceptions and attitudes of many in the public. A rising number of residents are adopting the mindset of coexistence, as the population of the animal is under control and poses no direct threat to humans," he said.

Raccoon dogs are generally not aggressive toward humans and do not view people as prey. In an urban environment, they are shy, nocturnal and highly conflict-averse.

Since 2022, the Shanghai Forestry Station, the Fudan institute, and the Shan Shui Conservation Center, a Beijing-based non-profit environmental organization, have jointly conducted annual surveys on raccoon dogs throughout the city.

The results of the latest survey included public concerns such as whether raccoon dogs getting sick would have an impact on humans living in the same community.



Shanghai's urban environment has abundant habitats and food resources, and with less competitive pressure from other species, this attracts some wild animals into the city.

According to the results of the surveys, Shanghai's thousands of raccoon dogs are distributed in more than 300 areas across the city, primarily in residential compounds and urban green spaces.

Based on results collected from online questionnaires and citizen hotline complaints last summer, 112 residential communities across the city reported raccoon dog activity between January 2024 and April 2025.

Over 500 citizen volunteers and professionals conducted multiple comprehensive surveys in those communities spanning nine districts. They collected transect survey data covering more than 560 kilometers and gathered 440 questionnaires regarding residents' attitudes toward raccoon dogs.

Left: Researchers take blood samples from a raccoon dog on Aug 29, 2024. **Center, Right:** Raccoon dogs are found during the team's field investigations.

Their results showed that raccoon dogs were either sighted during field investigations or reported by residents in 102 of the communities surveyed, with the distribution density at an average of 0.41 raccoon dogs per hectare. This represented the lowest level recorded in the past four years, indicating that the issue of high raccoon dog densities in residential community environments from four to five years ago has improved.

In comparison, the density of wild raccoon dogs in areas like the Qinling Mountains in Shaanxi province, the Taihang Mountains in northern China, and Sichuan province in Southwest China is typically below 0.1 raccoon dogs per hectare. Their density in Shanghai is comparable to that in the wild.

Zhao Xi, a leading member of the research team, said residents are beginning to understand that raccoon dogs are nocturnal and have little overlap with human activity times. "They have very low proactive aggression toward people, therefore many residents have come to accept their presence in the city," Zhao said.

The latest survey indicates a shift toward positive sentiment, with residents' emotional inclination toward raccoon dogs rising to 3.06 on a 5-point scale (where 1 is least favorable and 5 is most favorable). This represents a 25 percent increase since 2022, a trend mirrored by the fact that nearly 80 percent of residents now find the animals tolerable — up from just 50 percent three years ago.

According to Li Zirong, deputy director of the Shanghai Forestry Station, such results reflected the high prevalence of raccoon dogs, involving residents and street managers. As a result, they gradually developed a feasible response plan for communities.

Efforts include distributing brochures in communities, explaining to residents which departments to contact when encountering a large number of wild animals, and what measures to take when encountering wild animals with skin diseases, said Wang.

Experts highlighted that improper kitchen waste management and cat food feeding have been identified as major factors increasing raccoon dog visibility.

The latest survey showed that in residential compounds where cat food is fed to stray cats, the number of raccoon dogs observed was 2.75 times higher than in those where stray cat feeding does not occur. In residential compounds where both issues were poorly managed, the number of raccoon dogs was 3.32 times higher than in those where both issues were well managed.

Data from all four residential compounds continuously surveyed over four years clearly reflected the importance of managing such human behaviors. In an apartment complex in Songjiang district, the raccoon dog density decreased from 5.8 raccoon dogs per hectare in 2022 to 2.22 per hectare last year.

Li Min, a resident at this apartment complex in the district's Sijing town, said she used to complain a lot about raccoon dogs rummaging through the trash around her home, but later she learned that it was because residents were feeding them cat food and were not disposing of garbage properly.

"As long as we don't feed them and keep our distance, they won't cause trouble. We can coexist peacefully," said Li.

This trend is not unique to Shanghai. Wild animals are increasingly moving into cities across China. Species such as wild boars, leopard cats, civets and otters are now frequently found in urban environments. Experts attribute this shift to the completion of major urban construction projects, which have allowed local ecosystems to recover and become more hospitable to wildlife.

As in Shanghai, there are teams in cities such as Beijing and Nanjing in Jiangsu province, among others, conducting research on the urbanization of wildlife.

"This requires both research and management, which is something that must be done for the civilized management of megacities, regardless of people's perceptions of a particular wild animal, its size, or its level of cuteness," Wang said.

Wang's team is leading a multi-year national initiative involving 10 research groups to study how wild animals like raccoon dogs, squirrels and hedgehogs adapt to city life. A critical component of the project is the development of oral vaccines to prevent the spread of animal-borne diseases. The team plans to launch a pilot program in Shanghai's Songjiang district, where they will distribute these vaccines in the environment for animals to find and consume.

"Through community co-management, government involvement and vaccine development, we aim to clarify the relationship between humans and wildlife. Shanghai's approach in this is scientific and civilized, and quite advanced on an international level," he said.

Metropolis aims to double its parks by 2036

By ZHOU WENTING

Following the milestone achievement of being China's first city with 1,000 parks, Shanghai authorities have announced an ambitious expansion plan to construct 100 new parks this year and 1,000 more over the next decade.

The initiative aims to bring the city's total to over 2,000 by 2036, ensuring that residents in this high-density metropolis of 25 million have greenery at their windows and parks at their doors.

Residents have praised this initiative as a reflection of the city's commitment to integrating ecological beauty and community comfort into urban planning.

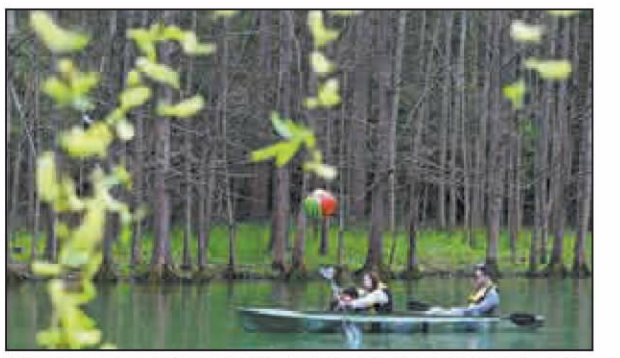
Parks are an essential element in urban ecology, contributing to the city's resilience by cooling and humidifying the air, purifying pollutants, reducing noise and managing stormwater.

During the 2022 renovation of Peace Park in Hongkou district, an additional 8,700 cubic meters of temporary storage space were created to absorb and filter rainwater from the surrounding area of approximately 36 hectares, which exceeds the area's total drainage capacity.

Parks also serve as connectors for fragmented habitats. Chinese water deer have reappeared in parks in Pudong New Area and on Chongming Island in the past few years, demonstrating the ecological benefits of such green spaces.

The Shanghai Landscaping and City Appearance Administrative Bureau said that in Shanghai, where land resources are scarce, expanding urban areas to create more public spaces is not feasible. Under the dual pressures of space and cost, tapping into existing potential has become a core strategy for a new wave of park construction.

Over the past few years, the city has developed replicable strategies for expanding green spaces, with several high-quality parks serving as models for improving public well-being. As of last year, all 36 parks planned along the city's Outer Ring Road had been completed. In addition to another 14 that were previously put into operation, they form a continuous ecological corridor across the city.



A notable example among them is the Xuhui West Bank Nature Art Park, which opened in August as Shanghai's 1,000th park. It used to be a 100-meter-wide greenbelt along the Outer Ring Road, serving as a buffer between urban and suburban areas.

Today, spanning roughly 300,000 square meters, which is equivalent to the size of more than 40 standard soccer fields, the park features sunflower fields, native vegetation, playgrounds, amenities like vending machines and accessible restrooms. It continues to serve its ecological isolation function, but has also become a popular leisure and recreational destination for residents and families.

"It was once a dense forest here that we could only look at from a distance. Now, it's a place where we can stroll and enjoy flowers anytime. I can't help but marvel at the full sense of happiness in our current lives," said 65-year-old Zuo Shuhua, a retired teacher who has lived nearby for over two decades.

To maximize existing resources, Shanghai opened 187 plots of green spaces formerly belonging to government agencies and public service units to the public by last year. The Minhang district government office complex removed its walls and barriers, transforming around 2,900 sq m of auxiliary green space into a garden that is now open to the public around the clock.

In addition to tapping into existing resources, the construction of pocket parks has made green spaces easily accessible right at residents' doorsteps. Shanghai plans to build or renovate 40 pocket parks within this year.

A family paddles at Shanghai Century Park in Shanghai on March 22. CHEN HAOMING / XINHUA

One such pocket park built in recent years is located in Xuhui district near Shanghai Stadium. Transformed from a once-neglected area, it now provides a convenient passage from the residential area to the metro station, reducing a detour of over 10 minutes to just a two-minute walk through the park. It also features flower shops and leisure seating areas, making it a recreational haven for the elderly and children.

Residents have expressed their hopes that parks can have designated areas for pets, allowing pet owners to comfortably and happily visit the parks with their furry friends.

LIFE

Dance brings ancient war alive

Revived production tours China, blending martial arts and opera to explore conflict and power through movement, **Zhang Kun** reports in Shanghai.

Blending modern dance with Peking Opera, martial arts and traditional Chinese music, the dance theater production *Under Siege: The Full Story of Farewell My Concubine* is on a four-month tour in 23 cities around China.

Choreographed and directed by Yang Liping, the production premiered in 2015 and draws on one of the most famous battles in Chinese history.

Designed with international audiences in mind, it has since been performed more than 300 times at home and abroad, earning a reputation as a landmark in China's contemporary dance theater scene.

The show has attracted critical praise overseas, described by The Guardian as rich in "hallucinatory images", while The Times noted its "urgency, vividness and wit".

A newly revived production was launched in April. Starting with three shows in Kunming, Yunnan province, it has traveled through Shanghai, Suzhou in Jiangsu province, and Wenzhou and Hangzhou in Zhejiang province.

Three shows were staged at the Poly Theatre in Beijing on Saturday and Sunday. The production will conclude its tour in August in Guangzhou, Guangdong province.

Yang explains why she chose to revisit the work now. "I feel there is a hunger for artworks of power and strength."

Over the past decade, she says, many dance productions in the country, including her own *Peacock*, have focused on grace and feminine beauty. Audience tastes, however, are changing.

"I think they want to see works that reflect real Chinese power," she says.

The narrative centers on the struggle between Xiang Yu and Liu Bang following the fall of the Qin Dynasty (221–206 BC). Their final confrontation in Gaixia ends in tragedy, as Xiang, defeated after a tactical ambush, chooses suicide over escape.

This historic rivalry between Xiang and Liu has long been retold in Chinese literature and performance, forming the basis of the Peking Opera classic *Farewell My Concubine*. The story reached global audiences through the 1993 film directed by Chen Kaige, which won major international awards.

Yang's version, however, shifts the focus. Rather than retelling the battle alone, she explores the emotional and psychological tensions experienced by individuals caught in cycles of power, desire and fear.

"People of all times and all over the world can relate to such situations," she says.

"Dance tells stories through the body, which is universal. You don't need language to understand it."

Xiang emerges as a tragic hero with serious personality flaws that make him a great theatrical character.

"He is stubborn and indecisive, yet also deeply loyal and righteous, willing to break rather than bend," Yang says. "It is this roughness and authenticity about him that endears the character to audiences."

The production's visual language reinforces that intensity.

Designed by Oscar-winning artist Tim Yip, the stage features installations by Liu Beili, including thousands of suspended pairs of scissors that shift above the performers, creating a constant sense of danger.

On one side of the stage, a paper-cutting artisan remains visible throughout the performance, crafting symbolic shapes tied to the unfolding narrative. The presence of this traditional craft adds a quiet counterpoint to the larger spectacle.

In keeping with Peking Opera conventions, Xiang's concubine is portrayed by a male dancer. As the story reaches its climax, the stage fills with vast cascades of red feathers — a striking visual metaphor for blood, sacrifice and loss.

From the Chinese folk art of paper-cutting to the costume design and choreography that borrow from traditional Peking Opera, Yang "adopted wide-ranging elements of Chinese culture ingeniously, and gave *Under Siege* a strong Eastern essence and contemporary avant-garde temperament", reads a review by Xuan Jing for the Shanghai-based Wenhui Daily.

Yang has explored digital innovation, including dance video projects using artificial intelligence, but she remains firm about the value of live performance.

"Technology can create impressive effects, but real experience cannot be replaced in a live dance show," she says.

For her, the physical immediacy of dance is essential. "People want to see real combat, where each strike of the fist hits hard on human flesh."

Also, the simple and strongly expressive stage design plays an important role during international tours, Yang says.

The production has performed in theaters old and new, on stages of various sizes. The full set of props can conveniently fit into three standard container trucks, which is cost-efficient for international transportation, according to Wang Yanwu, the producer of the show.

Yang, now 67, continues to shape China's dance landscape.

Born in Yunnan province, she rose to prominence with her 1986 work *Spirit of the Peacock*.

She later created *Dynamic Yunnan*, a large-scale production featuring local folk artists such as singers, dancers, and instrumentalists, which has been performed more than 7,000 times since 2003.

Caffeine and creativity meet along the North Bund

By HE QI in Shanghai
heqi@chinadaily.com.cn

During the May Day holiday, the 2.3-kilometer riverfront at Shanghai's North Bund in Hongkou district was filled with the aroma of freshly brewed coffee as crowds flocked to the 2026 Shanghai International Coffee Culture Festival.

Nathan Manfredi, marketing director of Phil & Sebastian, a specialty coffee roaster in Canada, attended the festival for the first time, and was overwhelmed by the enthusiasm.

"We're sharing coffee stories and learning about local coffee culture, and we can see people in China are crazy about coffee," Manfredi says.

Running from April 30 to May 4, the festival's main venue hosted nearly 300 brand booths and over 20 international coffee brands. The event was divided into international, industry chain, cross-border integration, and interactive experience zones.

Standout draws included a slate of Shanghai-style signature coffee creations from Jin Jiang International Holdings' luxury hotel portfolio: the Hudec Orange Sparkling Iced Americano paired with Park Hotel Shanghai's iconic palmier and the nostalgic Lacovo (Le Kou Fu) Mocha from Golden Tulip Shanghai Rainbow, both emerging as the event's most popular photo spots.

A variety of latte art is showcased at the festival.

"Shanghai's coffee festival is more than a local celebration; it serves as a global bridge, connecting the world's top coffee players with China's booming market and reflecting the city's inclusive and open character," says Xu Jian, deputy dean of the China Institute for Urban Governance at Shanghai Jiao Tong University.

Xu unveiled the 2026 China Urban Coffee Development Report at the opening ceremony.

According to the report, China's coffee industry reached 354.9 billion yuan ($52 billion) in 2025, marking a 13.3 percent year-on-year increase. Shanghai alone now has 10,336 coffee outlets, surpassing the 10,000 mark.

"In 2017, Shanghai had 5,500 coffee shops, already the highest number in the world. By 2025, the figure had almost doubled in less than 10 years, and the city has consistently remained at the top globally," Xu says.

"Coffee shops have become part of daily life in Shanghai, as common as convenience stores."

The festival has also become a core gateway for global specialty coffee brands to enter the Chinese market, attracting coffee professionals from around the world.

Oskar Garberg, co-founder and CEO of Standout Coffee and a Swedish barista champion, was among the festival's notable guests.

"I've been to numerous coffee shops, and the standards are extremely high here. People in Shanghai have grown up with a deep knowledge of tea from childhood, and they have embraced coffee remarkably well," Garberg says.

The niche Stockholm-based roaster has built a loyal following in Shanghai. "We are a small Swedish brand from the other side of the world, but people recognize us here, and I even sign autographs," he says, making no secret of his expectations for the Chinese market.

"I would love to open a shop here. We will soon have two locations in Stockholm, and Shanghai could definitely be our third."

Park Hyeri, co-founder of Aery, an 18-month-old specialty coffee brand from Busan, South Korea, made her festival debut.

"Shanghai's coffee culture is unique because every shop has its own signature pairing or combination," Park notes.

"That isn't very common in South Korea, so we introduced combo sets here to show Shanghai customers our personality, even though we don't offer them in our Korean stores."

The 2026 Shanghai International Coffee Culture Festival draws a big crowd during the May Day holiday. PHOTOS PROVIDED TO CHINA DAILY

Beyond industry insiders and hardcore enthusiasts, the festival drew a steady stream of casual visitors and expats.

Edvard Tadevosyan, a Swedish finance major at Shanghai University of Finance and Economics, said he was surprised by the city's vibrant coffee scene. "I never imagined Chinese people would love coffee this much. The coffee shops here are amazing."

The festival's influence continues beyond the main event, with Shanghai rolling out a "one district, one feature" coffee culture map across all 16 districts and the Lin-gang Special Area in Pudong.

Nearly 50 flagship events and over 40 international professional competitions are planned in the coming months, alongside citywide promotions at more than 6,000 merchants.

Bookstores, cinemas, museums and commercial districts are also joining the festivities with themed activities and consumer incentives.

Li Junfeng contributed to this story.

LIFE

Taki Li presents a selection of limited-edition cocktails created for the Symposia cocktail series at Bvlgari Hotel Beijing. PHOTOS PROVIDED TO CHINA DAILY

Mixology at the world's best bar

Taki Li's approach to creating cocktails and customer service has shaped her drinking spot into a top nighttime destination, **Li Yingxue** reports.

On a busy night, Taki Li barely looks up. Her hands move instinctively — measuring, stirring, adjusting — each action precise and economical. There is no excess, no wasted gesture. Even at full capacity, with orders stacking and voices rising, she remains composed. It is this restraint, more than flair, that defines her.

It also explains why, at a moment when Bar Leone HK sits at the top of The World's 50 Best Bars 2025 by the namesake academy since 2009, Li has become one of the most closely watched bartenders in the industry.

Recently, that attention has extended beyond Hong Kong. As part of the Symposia cocktail series at Bvlgari Hotel Beijing, the 35-year-old bar manager brought her approach to a different audience — less as a showcase, more as an exchange. The format was collaborative, built around shared ideas rather than individual signatures.

For Nicola Turturro, director of the bar and restaurant at the hotel, what stood out was not just technical ability, but presence. "Very natural hospitality. She is super engaging and always smiling. Even though the bar was packed with people waiting outside, she was very calm and elegant in her movements."

That balance — between intensity and ease — is central to Li's practice. "It's a huge pleasure and honor to have her with us," Turturro adds. "She brings something, and we bring something. The two menus join together to create the drinks."

A meeting of philosophies

For Li, collaboration begins with alignment rather than contrast. "This time we used Amaro, which has floral notes, as one of the main ingredients. It fits very well with our identity as an Italian bar."

The four drinks she presented follow a clear logic: classical foundations, restrained execution, and subtle contextual references. One, Amber Night, draws directly from its surroundings. As Turturro explains: "It is inspired by the pine trees we have outside. We use a liquor made with pine needles and rum to remind guests of the warmth of our hospitality."

The emphasis is not on novelty, but coherence.

This focus on understanding how elements come together was not something she developed overnight. In fact, Li's path into bartending began with uncertainty rather than intention. "My first shift behind the bar was as a part-time server in a tiny spot," she recalls. "A guest ordered an amaretto and I hadn't expected the almond hit to be so strong and, unsurprisingly, he complained."

The moment could have passed as a routine mistake, but it became a turning point. "The bartender pulled out all the bottles and showed me how it was done," she says. "He explained the flavors, how everything comes together. I was hooked."

At the time, Li was still a student, working without any clear sense that it might become a career. The experience triggered a deeper curiosity — one that stayed. After graduating, she stepped behind the bar full time, beginning what would become a long-term commitment to the craft.

"I hadn't expected it to become something so serious," she reflects. "But once I started learning, I realized how much there is behind every drink."

With a background in design, she brings a strong sense of structure and detail to her work. "My design background taught me creativity and an eye for beauty. The number one rule is to be mindful of details."

Her early career was shaped in leading hotel bars in Hong Kong, but after years within that system, she sought a different environment.

Taki Li, bar manager of Bar Leone in Hong Kong, which is currently ranked No 1 on The World's 50 Best Bars 2025 list.

"I'd only worked in hotels, and I wanted the experience of a stand-alone bar, to work more closely with a team, which felt almost like family."

That transition came in 2023, when she joined Bar Leone's opening team in Hong Kong under Lorenzo Antinori, a signature mixologist from Rome.

Bar Leone's concept is built on cocktail popolari — a return to accessible, classical drinking. The bar avoids complex machinery and modernist techniques, focusing instead on fundamentals.

For Li, this framework sharpens rather than limits creativity.

"I prefer classic styles, focusing on reducing elements to their essence. With limited elements and steps, creation becomes a different kind of challenge."

Her process begins with structure. "I usually start with a classic I want to nod to, then build around it with flavors, ingredients, or a concept I want to explore."

Balance remains central. "The right garnish not only makes the drink look good but also lifts the whole experience," she says.

A place with strict standards

At the bar, volume and precision operate simultaneously. The bar fills quickly — often within the first hour — and maintains a steady flow until closing.

"It's a high-volume state," Li says. "We have strict standards — drinks must be delivered within 8 to 10 minutes."

Maintaining consistency under pressure requires coordination. "Teamwork is very important, guests don't interact with just one person." As bar manager, Li's role is to align the team's rhythm as much as its output.

For Li, technical skill is secondary to interpersonal ability. "Personality is more important than technique," she says. "Technique can be trained. Personality is core."

She distinguishes between competitive bartending and daily service. "Competition is a one-way presentation, daily operation is two-way communication."

There, the experience is structured around this interaction. "Guests step into the bar and the drink is the last thing they experience." What precedes it — conversation, guidance, atmosphere — is equally critical.

"We want guests to feel like they have been invited into our Italian home."

The spot's rapid rise has amplified expectations. Asia's No 1 in 2024, followed by World's No 1 in 2025, has placed the bar and its team under sustained global attention.

"When we got Asia's No 1, I was more nervous. When we got World's No 1, I kept telling my colleagues: 'Hold me, don't let me cry!'"

The recognition carries wider industry weight. As Turturro notes: "It doesn't happen every day that a bartender from the number one bar in Asia creates a cocktail with you."

Yet Li remains focused on the original intent. "We want to be a neighborhood bar, not just a place people wait in line for."

Her priorities are shifting toward leadership and development. "In the past 10 years, I focused on bartending. In recent years, I moved into management. I enjoy it."

Collaborations like the Beijing guest shift suggest a broader trajectory.

As Turturro observes: "Guests now look for the story behind the drink, they want to understand why."

Li's answer remains consistent: strip away the unnecessary, focus on balance, and build connections. "If my bartender is happy, the drinks will be good," she says.

It is a simple principle — one that, in her hands, is executed with exacting precision.

Archives reveal centuries-old ties with Naples

NAPLES — From local college names to street names, archives reveal close links between the southern Italian port of Naples and China over the centuries, serving as witnesses to the development of cultural exchanges between the two nations.

Luigi Carbone, Naples' city councilor and president of the City Council's commission for culture, tourism and productive activities, says that the ties between Naples and China are deeply rooted in history.

It has "become part of our DNA", says Carbone.

With a winding lane named "Salita dei Cinesi" (Chinese Slope), Naples became home to the Collegio dei Cinesi (Chinese College) almost 300 years ago, when it was founded by Italian missionary Matteo Ripa.

Serving as a painter and translator for the Qing Dynasty (1644-1911) royal court, Ripa returned to Italy in 1723 and established the college with a clear mission: to overcome language and cultural barriers by nurturing truly inclusive, cross-cultural talent.

The college later turned into one of the earliest institutions in Europe to systematically teach Chinese language and culture.

After several name changes, the college evolved into the University of Naples L'Orientale, remaining a leading center for Sinology studies in Italy.

According to Antonella Vurchio, a librarian at L'Orientale, the library's earliest core collection came from the Collegio dei Cinesi.

Roberto Tottoli, rector of the university, says the "illuminating legacy" of Collegio dei Cinesi went directly to L'Orientale. In his view, Chinese language and culture studies have been the university's mission from the beginning.

Tottoli says the university's cooperation with Chinese institutions has expanded from language teaching and history to international relations and archaeology. It has signed multiple memorandums of understanding with Chinese partners and entered into cooperation with the Chinese Academy of Social Sciences.

In addition, the Confucius Institute at L'Orientale has promoted cultural exchanges, people-to-people understanding, and friendship between China and Italy.

Valeria Varriano, director of the Confucius Institute at L'Orientale, says many Italians are first drawn to traditional Chinese culture, and are then surprised by China's vitality.

The institute has become a hub in Naples that connects schools with the university and promotes exchanges between Chinese students in Italy and Italian students, adds Varriano.

Wu Junru, the Chinese director of the Confucius Institute of Naples, says the institute serves not only as a language-teaching body but also as a platform for cultural exchanges.

People watch a lion dance during a Chinese New Year celebration in Naples in 2022. XINHUA

Italian student Davide Saracino says figures such as Matteo Ripa and Marco Polo helped build bridges across civilizations in their era, and it is up to younger generations to continue their work.

LIFE

From left: Students at Dahejia Primary School post sticky-note messages to welcome pianist Lang Lang. The school is nestled against the mountains near the Yellow River. Students listen attentively during Lang's music class. Students use drawings to express their understanding of music. PHOTOS BY BAI SHUHAO / CHINA DAILY

Healing in a major key

Pianist Lang Lang brings artistic inspiration and emotional comfort to children recovering from earthquake trauma, **Bai Shuhao** reports in Linxia, Gansu.

In mid-April, pianist Lang Lang sat at an electronic keyboard inside a classroom at Dahejia Primary School, a small rural school tucked beneath the snowcapped ridges of the Qilian Mountains.

Outside, the Yellow River flowed quietly across the Loess Plateau. Harsh sunlight streamed through the classroom windows. Inside, Lang's fingers drifted over the keys, the notes flowing through the room like water finding its course.

The children listening might not fully realize that the man before them was one of China's most internationally celebrated musicians. Many had never attended a live piano performance. They just knew that the music sounded beautiful, and that the keyboard in their classroom could produce sounds they had never imagined.

"When class ended, they didn't want to leave," says Zhang Zhengyun, the school's music teacher, who taught the lesson alongside Lang. He is one of the few full-time music instructors in the entire county.

Dahejia Primary School is located in Jishishan county, Linxia Hui autonomous prefecture in western Gansu province — an autonomous county where ethnic groups account for roughly two-thirds of the population. Long affected by poverty, the county was removed from China's national poverty list in 2020.

But three years later, disaster struck. On a winter night in December 2023, a magnitude-6.2 earthquake shook the region, followed by more than 400 aftershocks. Many homes built of adobe or brick collapsed; in some villages, as much as 70 percent of the residences were damaged. Dahejia Town, where the school stands, was among the hardest-hit areas.

After the earthquake, the school building remained standing but was deemed unsafe. For months, students attended classes in temporary prefabricated shelters. A new campus was later constructed, tripling the school's size and upgrading its facilities. Today, it serves 510 students across 12 classes.

When Lang arrived this spring, children were running on a newly laid rubber track during their physical education class. Word of his visit spread quickly. Within minutes, students gathered around him, curious and excited.

They know his name well and affectionately call him "Uncle Lang". On the third floor is a music classroom he donated.

The Lang Lang Arts Foundation first donated a piano classroom to a school in Jishishan in 2021. In 2025, the initiative expanded through a partnership with the Ant Foundation and One Foundation and educators from Beijing Normal University, introducing music courses designed specifically for rural schools. Altogether, 22 schools and 35 teachers in the county received music training, while the number of equipped music classrooms grew to eight.

Inside Dahejia's music room stand five electronic keyboards, along with tambourines, triangles and hand drums. Before every class, students rush in, tapping the black-and-white keys.

"Most of them can't perform yet," Zhang says. "But the instruments spark their curiosity."

That curiosity is precisely the goal. In Jishishan, where villages are widely scattered across mountainous terrain, some remote teaching sites serve only three to five students. Teachers are often responsible for multiple subjects and music education, when it exists at all, may amount to little more than playing popular songs through classroom speakers.

"The biggest challenge is the shortage of trained music teachers," says Bu Xiaomei, an associate professor at Beijing Normal University who helped design the online curriculum after conducting field research in the region.

Providing a dedicated music teacher for every teaching site, she explains, is unrealistic. Instead, the program trains existing teachers to deliver structured, high-quality lessons supported by prepared materials and recorded instruction.

Above: Lang Lang poses for a group photo with students at Dahejia Primary School. BAI SHUHAO / CHINA DAILY **Below:** At the end of the class, Lang performs Mozart's *Turkish March*. PROVIDED TO CHINA DAILY

The curriculum introduces basic music theory, singing, and simple piano accompaniment, with deliberately modest expectations intended to ensure that every child has access to an instrument.

"The goal is to teach them to use the piano to play simple harmonies and accompany their own singing, so that every child gets a chance," Bu says.

During the class, Zhang divided students into groups and asked them to draw musical notes on paper as a challenge for Lang, who then improvised based on their creations.

Earlier that day, Lang had noticed vendors selling roasted sweet potatoes on the street. He turned the image into a playful improvisation, composing a rustic melody inspired by local life — prompting laughter and instant recognition from the children.

He also invited volunteers to play alongside him. Nearly every hand shot up.

One girl carefully played a melody, note by note, while Lang listened attentively. A boy with no musical training joined next. Starting with the familiar tune *Twinkle, Twinkle, Little Star*, Lang guided him through simple harmonies.

"See?" he told the class. "Playing the piano isn't so hard."

The lesson ended with Lang performing Mozart's *Turkish March*, while students clapped to the rhythm in unison. He left them with a challenge: to learn the piece before his next visit.

"It feels a little like a spring outing," Lang says, looking toward the surrounding mountains.

Music, he says, has shaped his own life. "It made me a better person.

"No matter how well they play, something more important is letting them find the joy of music."

For many children here, music serves another purpose. Most of the current students experienced the earthquake firsthand. Some still jump at sudden noises. Many families relocated after losing their homes, forcing children to adapt to unfamiliar surroundings.

Schools provide psychological counseling, but teachers say music classes also help students process their emotions.

"Music gives children a way to express their feelings," Bu says.

Zhang agrees. After completing the required lessons, he often allows students to choose activities freely. "The most important thing is that they feel happy."

The enthusiasm is unmistakable. Students wait outside the classroom before the teacher arrives, constantly asking when the next music class will begin. Many eagerly volunteer to sing or perform, disappointed when they are not chosen.

Zhang himself pursued music despite family opposition when he was young. He still draws inspiration from the works of Franz Liszt, whose music, he says, gave him strength during difficult times. He hopes to pass that same energy on to his students.

After the lesson, students from eight local schools gathered for a small concert with Lang. Children from Dahejia sang in clear, bright voices. Before performing, they explained the meaning of their county's name: Jishishan — "stones accumulating into a mountain". They said they are just like those small stones.

The impact of such a project is difficult to measure. Few students here are likely to become professional musicians. But Lang says he understands that.

"Of course I would be happy if some became pianists, but what is more important is that music grows with them, helping them become better versions of themselves."

Before his arrival, students had covered a whiteboard with handwritten messages for him:

"Thank you for coming. We are very happy."

"I want to become a musician."

"I want to be successful like you — even though I play basketball better than the piano."

As he said goodbye, Lang left them with a phrase he often shares with students, one that reflects his own journey:

"May your dreams come true."

Heartthrob to hard hat, star becomes a green storyteller

By **XING WEN**
xingwen@chinadaily.com.cn

Seven years ago, Zhang Jiawei was just another electrical engineering student at Nanjing Normal University until a talent scout spotted his towering 6-foot-3 frame and camera-ready face.

Today, that same young man, now known by his stage name Zhang Linghe, commands nearly 19 million followers on the Chinese social media platform Sina Weibo and 5 million on Instagram, where each of his posts easily garners a million likes.

The would-be electrical engineer now lives under spotlights, walks red carpets, and spends his days on drama sets.

Recently, however, he appeared in the documentary *The Answer Is Earth*, produced by Warner Bros. Discovery and the international environmental organization WildAid.

The film explores how China's green shift is quietly reshaping people's daily lives against the backdrop of the country's latest nationally determined contributions, announced on Sept 24, 2025.

The targets to be met by 2035 include reducing economywide net greenhouse gas emissions by 7-10 percent below peak levels, raising the share of nonfossil energy to over 30 percent, and expanding wind and solar power capacity to more than six times that of 2020, aiming for 3,600 gigawatts.

In the documentary, Zhang puts on a helmet and arc-flash protective clothing to work alongside real electrical engineers on an offshore booster station, finally getting the chance to experience the career path he could have taken.

"Today, some of the most important stories in the world are about climate change, energy, sustainability, and our changing relationship with nature," says Vikram Channa, vice-president of Warner Bros. Discovery.

"These are defining issues of our time. And yet, these stories are often told through facts and figures — not always in ways that people can truly connect with. That is where storytelling has the power to make a difference.

"Our goal was to make these stories feel accessible, intimate and real, especially for younger audiences, while staying grounded in scientific truth."

Channa believes Zhang is the right person to guide the journey because of his engineering mindset, which allows him to reconnect with the logic and natural curiosity behind these subjects.

"Through that journey, science becomes personal. Engineering becomes relatable. And the future becomes something audiences can feel part of," Channa says.

The documentary brought Zhang to his home province of Jiangsu, where he visited an offshore wind power cluster, a pumped-storage hydroelectric plant, and an ecological dredging platform on Taihu Lake to get hands-on experience in different jobs, including as a wind farm operation and maintenance engineer, dredging boat captain, fisherman, waste collector, and eco-agricultural technician.

Actor Zhang Linghe experiences jobs including equipment maintenance at an offshore booster station (left) and visits a wind turbine manufacturing plant (right) in a recently released documentary focusing on the country's low-carbon transition. PHOTOS PROVIDED TO CHINA DAILY

He used language familiar to young audiences to explain electricity-related terms.

For instance, he described a pumped-storage hydroelectric plant — which uses surplus electricity to pump water to an upper reservoir and then releases it to generate power during peak demand — as a "giant power bank".

Zhang believes being a "translator" in the documentary can help more people understand what energy transition and low-carbon living really mean.

In the first episode, he lived and ate alongside electrical engineers at the offshore booster station, helping them carry out routine inspections and maintenance work on the station's power equipment.

Zhang observed that when the cameras were rolling, the engineers tended to speak in formal, academic terms. But once the crew paused, they would open up like family. And it was in those off-camera moments that he truly felt their passion for the job.

"I could feel how proud they are of what they do," Zhang says.

"They also want more young people to join them, but too many are chasing trendy majors and jobs instead. This documentary should show that this career has a real future and that it's truly making a difference for the environment."

Already known for a number of highly popular drama series, Zhang has been widely discussed for his good looks as a rising heartthrob in the entertainment industry.

"Because many people got to know me through my characters, and then started following me as a person, I want to make good use of that attention and influence to bring more positive things to everyone," he says.

"I hope that while following me, audiences can also see the country's energy transition, make small changes to their own lifestyles, and contribute to the progress of our energy transformation."

He also hopes more people can see his truest version. He describes this documentary as bringing him back to the world of Zhang Jiawei.

"In the past few years of becoming Zhang Linghe, I gradually drifted away from Zhang Jiawei, the young man surrounded by kind people, who was always willing to express his innermost, truest feelings."

He says that after becoming a star, he insulated himself from his old life, but this documentary journey brought him back to his hometown, doing work he was once familiar with, and most importantly, being surrounded by a group of very real people.

"The journey made me more willing to open up."

He once chose to become an actor partly out of a desire for freshness as he didn't want a conventional nine-to-five job. Acting allows him to live as a new character every few months, collaborating with different actors and directors.

However, by seeing and experiencing the daily lives of people doing different jobs throughout the journey, he has developed a completely different perspective.

"What they're doing is truly changing people's lives, changing the future of our country, and changing their own futures," he says.

"Sometimes, whether something feels fresh or not really depends on whether you can find something challenging in the repetitive work."

BASKETBALL

Los Angeles Lakers' LeBron James takes a pass as Oklahoma City Thunder's Shai Gilgeous-Alexander defends during Game 3 of a second-round NBA playoffs series on Saturday in Los Angeles. With a 131-108 victory, the Thunder's unbeaten playoffs run puts it on the brink of another Western Conference finals. AP

Thunder over LA looks ominous

Lakers on the brink of elimination, as Cavs claw one back against the Pistons

LOS ANGELES — The Oklahoma City Thunder used another explosive second half to beat LeBron James and the Los Angeles Lakers 131-108 on Saturday, pushing the Lakers to the brink of elimination in the NBA playoffs.

Ajay Mitchell scored 24 points and handed out 10 assists without a turnover to help the Thunder take a 3-0 stranglehold on the best-of-seven Western Conference semifinal series.

The Lakers will host Game 4 on Monday, when they'll try to become the first NBA team to rally from 3-0 down to win a playoff series.

"I'm not giving up on this series," defiant Lakers coach JJ Redick said. "We're going to try to win on Monday. We're going to try to extend the series and we're going to try to take this thing back to OKC."

The Cleveland Cavaliers, fueled by 35 points from Donovan Mitchell and clutch shooting from James Harden, avoided falling into a similar hole, grabbing a crucial 116-109 Game 3 victory over the Detroit Pistons to cut their series deficit to 2-1.

The Cavs, who dropped the first two games in Detroit, remained unbeaten at home in these playoffs.

But the Lakers, still without injured scoring champion Luka Doncic, couldn't conjure a crucial win as their series shifted to Los Angeles.

Rui Hachimura led the Lakers with 21 points and James added 19 points, six rebounds and eight assists.

But, the Thunder's depth was just too much for the depleted Lakers.

"That's the strength of their team," Redick said.

With reigning Most Valuable Player Shai Gilgeous-Alexander connecting on just seven of 20 shots from the floor, second-year guard Ajay Mitchell — starting in place of the injured Jalen Williams — stepped up.

"He's a gamer," said Gilgeous-Alexander, who finished with 23 points.

"It might be a shock to the world, but this is no shock to us."

Just like in game two, the Lakers took a two-point lead into halftime, this one largely on the strength of 11 first-half three-pointers.

But, again, the Thunder exploded in the third period, opening the second half on a 21-6 scoring run.

After that, it was all but over. The Lakers connected on just eight of 22 shots from the field in the third period, including just one from three-point range.

The turnovers began to mount for the Lakers, and the Thunder pushed its lead to as many as 27 in the fourth quarter.

Gilgeous-Alexander said the Thunder, which swept the Phoenix Suns in the first round, will "absolutely" be aiming to finish off the Lakers on Monday.

"We would never want to waste an opportunity to win a basketball game," he said. "We've got to do the same thing we did in the first three games — be the aggressor, play the right way together."

Cleveland Cavaliers' James Harden (right) shoots against Detroit Pistons' Tobias Harris in Saturday's game. AP

Harden on target

In Cleveland, Donovan Mitchell added 10 rebounds and four assists. Harden, a three-time NBA scoring champion, scored nine of his 19 points in a tight fourth quarter, drilling a trio of baskets that included a dagger trey that pushed Cleveland's lead to four with 25.9 seconds left.

"I love it," Harden said. "When your number's called, just getting to my spots. And it's something that I work on literally every day.

"Don(ovan) Mitchell had been working so extremely hard throughout the course of the game, (I was) just trying to find opportunities to help him. So that last minute-and-a-half, two minutes, however long it was, it presented itself. And for me, (it's about) just going out there and taking my shots."

Harden, who drew plenty of criticism for turnovers in the clutch in the first two games, kept the Cavaliers in front with big shots. The 17-year veteran hit a 16-foot step-back jumper to extend the lead to 108-104. After a driving dunk by Cade Cunningham, Harden made a floating seven-footer to put the lead back up to four.

"Chatter is going to be chatter, regardless," he said. "Whether you do something good, whether you do something bad, you give me opportunities in this fourth quarter, and I take advantage of them."

"It's the James Harden I've seen for however many years he's been in the NBA. That's the James we needed tonight," Cavaliers coach Kenny Atkinson said. "We were searching, and we got some good screenings into the matchups we wanted and he went to work."

Cunningham responded with a 3-pointer before Harden provided the decisive blow with 25 seconds remaining on a step-back 3-pointer while being guarded by Harris to make it 113-109. Robinson was short on a 3-pointer after a timeout and Mitchell made three free throws down the stretch.

The Cavs withstood a 27-point triple-double from Cunningham, who added 10 rebounds and 10 assists.

Cleveland led 64-48 at halftime and pushed the lead to 17 early in the third, before the Pistons clawed back.

Detroit managed to edge ahead with less than four minutes to play before Cleveland responded again.

The Cavs will try to level the series when they host Game 4 on Monday.

Kerr offered 2-year deal to battle on with the Warriors

Steve Kerr

SAN FRANCISCO — Steve Kerr is giving it another go with Golden State.

Kerr has reached an agreement, in principle, on a two-year contract to continue coaching the Warriors, according to a person with knowledge of the negotiations. Kerr is still yet to sign the new deal, the person told reporters on Saturday night, speaking on condition of anonymity because the contract is yet to be finalized.

The Warriors missed the playoffs for the second time in three years, earning the 10th seed in the Western Conference and eventually losing to Phoenix in the play-in tournament.

Kerr's 12-year coaching run with the franchise has featured four championships and six NBA Finals appearances, including five straight from 2015-19. Kerr shared an embrace with Stephen Curry and Draymond Green near the end of the loss in Phoenix, saying afterward he knew it could be their final time together.

He has a career record of 604-353 and a 104-48 playoffs mark, with Golden State winning its last championship in 2022.

The Warriors were 37-45 this season while dealing with numerous injuries, including losing Jimmy Butler to a season-ending right knee injury in January and Curry's 27-game absence with a right knee injury of his own.

ESPN was first to report Kerr's new contract.

Kerr, 60, got his first coaching job in 2014-15 and immediately guided Golden State to the franchise's first title in 40 years. The Warriors would then begin the next season with a record 24-0 start under the guidance of assistant Luke Walton, as Kerr missed the initial 43 games as his team went on to a record 73 victories. Kerr took a leave of absence to recover from debilitating complications following two back surgeries, then missed time again in 2017, with Mike Brown filling in as Kerr underwent a procedure to deal with a spinal fluid leak.

Green had predicted on his podcast once the season ended that Kerr wouldn't return.

Throughout his coaching career, Kerr has used his platform to speak out against gun violence and social injustice, among other prominent issues. His father, Malcolm, president of the American University of Beirut, was murdered in Lebanon when Kerr, 18 at the time, was a freshman at the University of Arizona.

In March 2018, Kerr took part in the Oakland March for Our Lives. Earlier that same month, he joined Democratic Congressmen Ro Khanna and Mike Thompson — then-chair of the House Gun Violence Prevention Task Force — and students from across the South Bay during a town hall at Newark Memorial High School to discuss gun violence in schools, and cheered the efforts of youth nationwide.

Kerr has said it isn't hard to do double duty as a basketball coach and use his voice as a public figure for those who don't have one.

"I think, in some ways, the balance is presented to us, given what's happening around the country," Kerr said. "I know that when I played, players and coaches were never — maybe not never, but rarely — asked about politics and voting."

AGENCIES VIA XINHUA

ATHLETICS

Nketia races into Australia's sprinting spotlight

MELBOURNE — From dreams of rugby glory for New Zealand to a Hail Mary shot at the NFL, sprinter Eddie Nketia is now on track to win medals for Australia and take a share of the limelight trained on teen talent Gout Gout.

Nketia clocked Australia's fastest 100m in 9.84 seconds at a US college meet last month, albeit with a tailwind that ruled it out of the record books.

Australians latching onto the enormous potential of 18-year-old Gout and 22-year-old Lachlan Kennedy may now have another star in the sprinting firmament.

For 24-year-old Nketia, who runs for University of Southern California (USC), the buzz back in Australia since his 9.84 at the Mt SAC Relays has been almost as overwhelming as the run itself.

"Honestly, it was genuinely a surprise, because I never expected I could run 9.84 in my life," he told reporters in a video interview from his California base.

"And it's like, 'look at where we're at now'. My name is everywhere back in Australia. And it's a lot to take in. It's insane."

Prior to his run, Nketia had been virtually unknown in Australia, despite the nation's rekindled interest in athletics thanks to the performances of Gout.

Auckland-born Nketia only switched allegiance from New Zealand in December after a mandatory stand-down period from major global events.

He spent much of his childhood in Canberra, but returned to New Zealand to finish high school.

His Ghanaian father, Gus Nketia, was also a sprinter and held New Zealand's fastest 100m (10.11) for 28 years until the younger Nketia eclipsed it with a 10.08 at the 2022 world championships — with the help of his father's coaching, of course.

It was a poignant moment hailed by New Zealand media, but Nketia's relationship with the nation's athletics federation was already strained.

New Zealand has strict criteria for Olympic selection, only picking athletes with a demonstrated ability to finish in the top 16 of their events.

Eddie Nketia (right), representing the USC Trojans, races in a 200m prelim during a Division I Track and Field Championship in Eugene, Oregon, last June. NCAA PHOTOS VIA GETTY IMAGES

In the weaker Commonwealth Games field, only potential top-six finishers are considered.

That policy has rankled more than a few Kiwi athletes over the years, and Nketia publicly criticized Olympic selectors after missing out on Tokyo 2020.

After also missing the 2022 Commonwealth Games in Birmingham, Nketia's mind was made up.

"Circumstances just kept ruining my chances of becoming a better athlete," he said.

Turning his back on his birth nation was a tough decision for Nketia, who remains proud of his Kiwi heritage and was a promising junior rugby player with a dream of playing for the All Blacks.

He ditched the track altogether to join the University of Hawaii's American football program, saying he needed a fresh start.

"It wasn't essentially that I was tired of track. I was just tired of missing tournaments," he said.

At 1.90 meters and about 97 kilograms, the powerfully built Nketia played as a wide receiver before returning to the track with USC.

His USC coach Brenton Emanuel calls him "Incredible Hulk" — gentle off the track, but a beast on it. He believes Nketia could ultimately be ranked among the greats of sprinting.

"He puts his superpower on and he just goes," he told reporters, sitting next to Nketia in the video call.

Nketia wants championship medals and has circled this summer's Commonwealth Games in Glasgow, Scotland, which run from July 23 to Aug 2, on his calendar.

First, though, he wants to smash the 100m 10-second barrier legally during the NCAA season.

Only two Australians, Patrick Johnson (9.93) and Kennedy (9.96), have broken it, while Gout's PB is 10 seconds flat.

Gout is skipping Glasgow, but Nketia envisages a showdown in Australia next year against the teenager and Kennedy.

The prospect of the trio combining on relay squads also has Nketia excited, saying they could make Australia a sprinting power to rival the United States and Jamaica.

"When it comes to world championships next year ... and Olympic Games as well, it's like we're going to go all the way, do what we can to get as many podiums as possible," he said.

RMB's role as intl option grows

Recent deals highlight currency's expanding use in commodity trade pricing, settlement

By **ZHOU LANXU** and **JIANG XUEQING**

The renminbi is starting to gain ground in the dollar-dominated global commodity trade, as recent deals highlighted the Chinese currency's expanding role in offering a diversified option for pricing and settlement, economists and executives said.

Breakthroughs in RMB-denominated commodity transactions, regarded as one of the most difficult frontiers for the RMB's global use, may signal a faster phase of the currency's internationalization, as demand rises for alternatives to the US dollar and China's role in global trade grows, they added.

The RMB ranked the fifth in global payments with a share of 3.1 percent in March, up from a sixth ranking in February, as calculated by global financial messaging services provider Swift.

The Cross-Border Interbank Payment System, or CIPS — the primary platform for cross-border yuan clearing and settlement — recently recorded a single-day transaction volume of 1.22 trillion yuan ($179 billion), a record high, according to Shanghai Securities News.

Meanwhile, Reuters reported last month that Indian refiners were settling payments for specific oil cargoes purchased under a US sanctions waiver using the Chinese yuan, while mining giant BHP Group has reportedly adopted a Chinese pricing benchmark in its iron ore trade with China, signaling a broader acceptance of RMB settlement and pricing in commodity markets.

Zhang Bin, a national political adviser and a nonresident senior research fellow at the China Finance 40 Forum, said these developments suggest that the RMB is increasingly providing global trading partners with a more diversified currency option for commodity trade.

"The dollar has long served as a dominant currency for pricing, settlement and investment. However, intensified geopolitical tensions and changes in global economic governance have led some countries to reconsider the assumption that the dollar is reliable," Zhang said. "As countries seek to add an extra layer of safeguard in investment and business operations, the yuan is a particularly promising option, given China's significant and expanding role in global trade and investment."

Huang Yiping, dean of Peking University's National School of Development, highlighted the potential of the RMB in playing a bigger role in commodity pricing, as China is one of the world's largest importers of commodities and a leading exporter of manufactured goods.

"Promoting the use of the RMB to price more of our economic activities is both possible and an indispensable step of RMB internationalization," Huang said.

China launched yuan-denominated crude oil futures trading in Shanghai in 2018, an early step toward expanding the RMB's role in global commodity pricing. In recent years, countries like Russia have increasingly used the Chinese currency in oil trade with China.

"The fundamental conditions for the formation of a 'petroyuan' cycle — in which oil is increasingly priced, settled and reinvested in RMB assets — are gradually taking shape after China has become the world's largest crude oil importer," said Zhang Ming, deputy director of the Institute of World Economics and Politics at the Chinese Academy of Social Sciences.

However, analysts cautioned that how far the Chinese currency's role in commodity trade can evolve may ultimately depend on the depth of China's financial reforms and opening-up, the country's long-term economic strength, and the resilience of the US dollar's dominance.

"Part of the recent increase in RMB usage in commodity trade has been driven by short-term geopolitical factors, and the longer-term trajectory still needs to be observed," said Shao Yu, chief economist at the innovation center of Fudan University's School of Management.

Wu Xiaoqiu, former vice-president of Renmin University of China, said the key still lies in deepening market-oriented reforms to enable freer trade of the currency if a petroyuan system is to be established.

Pan Gongsheng, governor of the People's Bank of China, the country's central bank, said China has worked to enhance institutional arrangements and financial infrastructure to support broader cross-border RMB usage to offer more diversified currency choices for all entities.

The yuan's rising role in commodity trade is part of a broader expansion of the currency's international use, with a Deutsche Bank report saying that the process of RMB internationalization is likely to accelerate.

Renminbi assets are becoming increasingly attractive, underpinned by China's strong growth prospects and the rapid development of future-oriented industries, said Stefan Hoops, CEO of DWS — Deutsche Bank's asset management arm.

Hoops pointed to a structural shift in trade invoicing: Whereas the vast majority of Chinese exporter invoices were denominated in US dollars five years ago, a growing share are now denominated in RMB.

China ready to help restore peace, stability in Mideast

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Foreign Minister Wang Yi said on Wednesday that China is ready to help create the conditions for starting peace talks and play a greater role in restoring peace and stability in the Middle East, as the region stands at a critical juncture between war and peace.

Wang made the remarks in Beijing during talks with Iranian Foreign Minister Seyed Abbas Araghchi, whose visit was his first trip to China since the United States and Israel launched attacks on Iran on Feb 28. Before traveling to China, as part of his intensive shuttle diplomacy, Araghchi had visited Pakistan, Oman and Russia in late April.

Since the start of the conflict, Wang and Araghchi have held three phone conversations, maintaining close communication as the situation evolved.

Wang noted that more than two months of fighting has "dealt a severe blow" to regional and global peace and stability.

"China deeply regrets this. A full end to the fighting cannot wait, any resumption of hostilities would be even more inadvisable, and staying committed to negotiations is particularly important," Wang told his Iranian counterpart.

Araghchi briefed Wang on the latest developments in Iran-US negotiations and Iran's considerations in terms of its next steps. He said that Iran will firmly safeguard its national sovereignty and dignity while continuing to build consensus through peaceful negotiations in pursuit of a comprehensive and permanent solution.

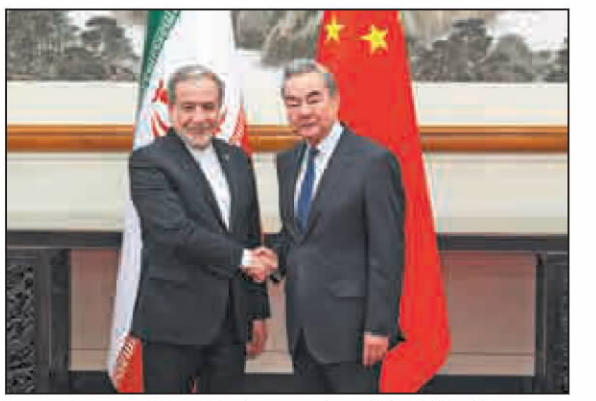
Araghchi added that the issue of keeping the Strait of Hormuz open should be properly resolved at an early date.

Iran appreciates China's tireless efforts, which were made in a constructive spirit, to prevent the situation from deteriorating and spilling over, he said, adding that Tehran trusts Beijing and looks forward to China's continued active role in promoting peace and ending hostilities.

Araghchi also voiced hope that China would support the establishment of a new postwar regional architecture capable of coordinating development and security.

Wang told Araghchi that China supports Iran in safeguarding its national sovereignty and security, and appreciates Iran's willingness to seek a political settlement through diplomatic channels.

On the Strait of Hormuz, Wang said that the international community shares a common concern on restoring normal and safe passage through the strait, and China hopes that the parties concerned will respond to global calls as soon as possible.



On the nuclear issue, Wang said that China appreciates Iran's commitment not to develop nuclear weapons, while maintaining that Iran has the legitimate right to the peaceful use of nuclear energy.

China believes that Gulf and Middle Eastern countries should keep their future in their own hands, Wang said. China encourages Iran and more Gulf countries to engage in dialogue and pursue good-neighborly relations, and supports regional countries in building a peace and security architecture based on common participation, shared interests and common development, he added.

Poverty alleviation requires constant vigilance, support

WORLD WATCH
By Daryl Guppy

On their first visit to China, Western leaders invariably congratulate China on its successful elimination of absolute poverty. But they may not understand well that poverty alleviation is an ongoing process — for China and other countries as well — that requires constant vigilance and assessment.

China's 15th Five-Year Plan (2026-30) builds on the nation's achievements in poverty alleviation, with the strategy's focus shifting from campaigns of poverty reduction to long-term support and monitoring. The challenge is to ensure that low-income households do not relapse into poverty.

Rural development in agriculture remains a top priority, with the aim of improving farmers' incomes. Increased productivity and more efficient logistics mean farmers can access broader and more competitive markets that offer better prices. The progress from poverty to reasonable prosperity rests on enabling infrastructure and research.

Key focus areas include strengthening high-quality development and technological self-reliance. Continued enhancement of healthcare and social services and increased access to senior high school education all align with the 2035 target of achieving "basic socialist modernization" and the prosperity that goes with it.

Although Western leaders admire China's poverty reduction programs, they fail to emulate them. This failure can be traced to differences in the way that China and some in the West think about poverty and its causes.

Modern rich Western nations prefer to describe poverty in terms of homelessness or disadvantage. This language hides and changes the way Western countries approach poverty alleviation.

IN CHONGQING, SPICE BRINGS VARIETY TO LIFE

Visitors keen to know what fuels the mountainous metropolis need look no further than its 40,000 hotpot restaurants

By **TAN YINGZI** and **DENG RUI** in Chongqing

China Vibes — FOOD —

The first bite is a velvet fire: rich beef tallow, dried chili, then the numbing buzz of Sichuan peppercorns dancing across the tongue. On a lantern-lit hillside under loquat trees, a group of Vietnamese hairdressers have just discovered their new obsession.

"This is unbelievable," one whispered, chopsticks already reaching for another mouthful.

In mid-April, more than 20 visitors from Hanoi, Vietnam's capital, made a pilgrimage to Nanshan Mountain's Pipayuan Shiweixian Hotpot Restaurant in Chongqing — a 30,000-square-meter terraced citadel of the hotpot world, which holds a Guinness World Record with more than 800 tables and 5,851 seats.

As dusk fell, golden lights outlined the wooden pavilions, and the scent of the bubbling beef-tallow broth drifted from terraces climbing over 100 meters high.

The Vietnamese visitors gathered around four tables, dipping shrimp paste, beef, tofu skin and mushrooms into dual-flavor pots, with the spicy side delivering the full mala (spicy and numbing) experience.

"It's truly overwhelming," said Do Duc Anh, 39.

"You taste the food and see the whole landscape. It's like eating inside a dream."

But Pipayuan is just one stage in the city's "Hotpot Broadway", which has grown spectacularly against the backdrop of the Yangtze River and soaring green mountains.

Renters dig deep for home renovations

Long-term tenants carry costs of upgrades, focusing on quality, comfort, individual style

By YU RAN
For China Daily

Facing the prospect of long-term renting in a tough property market, a growing number of tenants are laying out money from their own pockets to upgrade apartments to their individual tastes, experts said.

Wu Tong, an associate professor at East China Normal University's School of Social Development, said the trend signals a deep generational shift.

"Compared with their parents' generation, who often spent decades saving to purchase a home as a symbol of stability and achievement, today's young people place greater emphasis on their immediate sense of well-being," said Wu.

"They care about whether they feel comfortable and happy now, rather than postponing satisfaction entirely to the future."

China's rental housing market is underpinned by 260 million renters, according to the 2024–25 Housing Rental Industry Development Report released by the PBC School of Finance at Tsinghua University in August. In 2024, the total number of rental housing units nationwide reached 91 million, with nearly 90 percent of listings coming from individual landlords.

Rising demand for higher-quality rental housing leaves more than 60 million existing units with potential for being upgraded and renovated, according to the 2025 China Urban Long-Term Rental Market Development Blue Book released in April.

Transforming existing stock into "better homes" has become central to optimizing rental supply, it said. Over 40 percent of renters are willing to increase their budget for higher-quality renovations.

New tenant Xiao Cai, 30, decided that renting would not prevent her from improving her space.

After five years of moving between small shared flats in Zhangzhou, Fujian province, Xiao, who works in the education industry, rented a 60-square-meter one-bedroom apartment for 1,000 yuan ($146.30) a month in 2025.

The budget-friendly unit came with plain white walls and shiny floor tiles, but it had good lighting and a functional layout. By signing a three-year lease, she secured a price well below the local market average.

Six months after moving in, water leakage caused sections of the walls to peel, so she decided to undertake a proper renovation. Her initial budget was 3,000 yuan, but the final cost exceeded 9,000 yuan, equivalent to her monthly salary.

Although she had planned to paint the walls and install stone plastic composite flooring herself, a lack of skills and time led her to hire professionals. To control costs, she purchased most large furniture items secondhand, significantly reducing expenses while maintaining quality.

"The most worthwhile investment was upgrading the walls and floors, because they directly determine the overall quality and comfort of the space. The biggest savings came from buying secondhand furniture and making some items myself," said Xiao.

The renovation made the apartment feel like it belonged to her, she said. "Now I genuinely look forward to returning. The house is rented, but the life inside it is mine. Renovating it wasn't about ownership, it was about creating a place where I can feel stable and at ease," said Xiao.

Comfortable spaces

In Beijing, Shanghai, and Guangdong province's Shenzhen and Guangzhou, the rental population is close to 40 million, accounting for nearly 50 percent of total residents, the blue book showed. More than half of renters said they are willing to accept renting for five years or longer, while nearly 20 percent are open to renting for more than 10 years.

For Kai Li, 28, an HR professional in the AI hardware industry, long-term renting is not a reluctant compromise, but a calculated choice in an environment where property ownership feels distant.

She has moved six times in six years from cramped urban village rooms to progressively larger rentals, with each move reshaping her expectations of a rental property.

Kai currently rents an 80-square-meter, three-bedroom apartment for 7,500 yuan per month in Shenzhen, the most spacious place she has lived in since leaving her hometown in Hunan province. "Over time, I realized I needed to look at whether a space had potential — good light and a workable layout, especially a balcony. I rent with the idea that I will shape it," said Kai.

For many young people who move to a new city, stability is less about property ownership and more about having a space that is a place to cook, host friends, play guitar or simply sit alone, she said.

Before renovating, she hesitated. She negotiated a lease of more than two years at a slightly reduced rent, using the money she saved for the upgrades.

Most of the renovation focused on soft furnishings and spatial zoning. She asked the landlord to repaint the walls, then divided the apartment into areas for dining, working and resting. The total cost exceeded 8,000 yuan, and most of the furnishings and decorations can move with her.

"I didn't want to overspend, but I also knew that if I was going to live here for years, the space had to support my daily life. Otherwise, coming home after work would feel like just another obligation," she said.

The balcony has become her anchor. Shelves assembled by hand hold rows of plants and small vegetable pots. One afternoon, sitting there alone, she felt a quiet sense of achievement.

"Everything here was arranged by myself. Even spending a short afternoon at home helps me recover my energy," said Kai.

Homeownership may feel distant, but comfort and self-definition need not be postponed, she said. "If we can't control the housing market, we can still choose how we live inside the space we have," said Kai.

Data from the 2025 Shanghai Youth Rental Housing Trends Report released by the Shanghai Youth Research Centre showed rental rates of 68 percent among those born after 2000, 64 percent among those born after 1995, and 53 percent among those born after 1990.

In Shanghai, the number of renters aged 20 to 30 reached 76,000 in 2024, marking a 68.89 percent increase compared with 2022.

When choosing rental housing, respondents placed greater emphasis on fundamental living conditions and transport accessibility. Survey data showed that indoor comfort (79 percent), convenient transportation (72 percent), and high housing quality (67 percent) rank as the top three considerations. To secure a better living experience, more than 40 percent said they were willing to pay more for better renovations.

Design innovations

The rising emphasis on comfort is influencing not only tenants but also landlords and designers.

After years of designing brand visuals for major corporations, Chen Xiaoli questioned the meaningfulness of her work.

"In large companies, my work often felt like a small interchangeable part in a vast system. It was hard to see its real impact or feel a clear sense of value," said Chen.

Now 35, and based in Hangzhou, Zhejiang province, Chen turned to low-budget soft furnishing renovations in late 2025.

Within three months, she had taken on seven to eight projects, a shift she describes as moving design "from screens into real life".

The transition began unintentionally. After a low-cost renovation of her own rental property to attract more suitable tenants, she shared the results online. The apartment quickly drew attention and inquiries.

"I realized that landlords and tenants choose each other. If a flat looks worn and neglected, tenants won't feel motivated to care for it. But when a space feels thoughtfully arranged, it attracts people who appreciate and protect it. That small investment can completely change the relationship between a person and a home," she said.

Unlike corporate branding work, she said, each renovation directly affects someone's daily routine. Some of her clients are landlords hoping to improve competitiveness in a buyer's market; others are young renters seeking a stronger sense of belonging.

"When a tenant tells me she feels happier opening the door after work, or when a landlord says a property that sat idle for months finally sold after renovation, I can clearly see the impact. My design is not just decoration, but improving someone's everyday life," said Chen.

About 80 to 90 percent of her clients are landlords, while renters — typically aged 25 to 35 — often seek lighter services such as design plans and shopping lists costing around 1,000 yuan. Larger projects range from 20,000 to 40,000 yuan, a scale of work many traditional renovation companies are reluctant to take on.

Her design principles are consistent: prioritize function and movement flow before aesthetics, ensure adequate storage, unify colors and style, and avoid unnecessary waste.

"You don't need expensive items to create beauty. What matters is coherence and practicality. Whenever possible, I encourage clients to reuse what they already have, rather than discard everything," she said.

For Chen, the growing willingness among young people to invest in rental spaces signals a broader shift in mindset.

"Many people used to think renting was temporary and something you just had to endure. But young people today don't see it that way. Regardless of tenure, people still want their living space to reflect dignity and care," said Chen.

Landlords take note

As of March 2026, the hashtag "rental home renovation" had garnered over 2.3 billion views on Douyin, while related posts on Xiaohongshu, or RedNote, exceeded 3.7 billion views.

For savvy landlords, the online enthusiasm is also a barometer of renters' needs.

Zhu Chengjie, 49, moved from Jiangsu province to Shanghai more than two decades ago to start his own business. He gradually settled down in the city and now owns three apartments in Shanghai that he has rented for nearly a decade. Most of his tenants are young office workers fresh out of university, drawn to the city by career opportunities.

Recently, Zhu decided to renovate one of his apartments in Jing'an district.

Instead of simply repainting the walls, he hired a designer to make modest but thoughtful adjustments to the layout and furnishings, partly to justify a slight increase in rent, but also because he had noticed young tenants were placing greater emphasis on the style and quality of their living environment.

"I've noticed that young people today have much higher expectations for their living environment. A clean and functional space is no longer enough. They want warmth, personality and comfort," said Zhu.

His other two tenants have also approached him with requests to make small changes, such as adding houseplants, rearranging furniture or introducing soft decorative elements. Zhu has agreed to most of the requests.

"As long as the structure isn't affected, I'm happy to agree. After all, everyone wants to feel comfortable in the place they live," said Zhu.

When he first arrived in Shanghai, housing conditions were not his priority. Seeing today's young tenants invest time and energy in rented homes, he views it as a sign of changing attitudes. "Many of them are working hard in this city, just like I once did. Wanting to live well while striving for the future is not indulgence, but a reflection of confidence and social progress," said Zhu.

Experts said the change is closely linked to evolving market conditions and generational attitudes toward risk and stability.

Wu, from East China Normal University, noted that this transformation has been shaped by economic changes in recent years. When housing prices were widely expected to rise continuously, homeownership carried strong investment and status implications.

"As the market stabilizes and long-term (property) appreciation becomes less certain, renting is increasingly viewed as a rational and flexible choice. In an environment marked by employment uncertainty and income pressure, maintaining liquidity and reducing long-term financial burdens can provide a stronger sense of security," he said.

Wu added that reducing financial risk does not necessarily mean lowering living standards. Instead of investing heavily in property, many young people choose affordable soft furnishings to improve their living spaces.

"This is a pragmatic way of balancing quality of life with risk management," he said.

Chinese firms in US grow, show resilience

Outlook of companies for countries' economic relations has improved, notes survey report

By **YIFAN XU** in Washington
yifanxu@chinadailyusa.com

Chinese companies operating in the United States remained largely profitable last year despite geopolitical tensions, according to a recently released survey report, which also indicated improved expectations for China-US economic relations this year.

The 2026 Annual Business Survey Report on Chinese Enterprises in the United States was unveiled on Monday in Washington, DC, by the China General Chamber of Commerce-USA and the CGCC Foundation.

The event brought together business leaders, industry experts and others to discuss the survey findings, which revealed remarkable operational resilience among Chinese companies and a pivot toward cautious optimism for the coming year.

According to the report, 81 percent of surveyed Chinese companies in the US remained profitable in 2025, while the share of enterprises with pretax profit margins above 15 percent rose sharply from 7 percent to 21 percent over the past year.

The report noted that the outlook of surveyed companies for China-US relations in 2026 has improved. "In economic and trade relations, expectations of 'moderate deterioration' fell by 24 percentage points from the previous year, while expectations of 'modest improvement' rose sharply to 36 percent," it said.

The CGCC, which was founded in 2005, is the largest independent chamber representing Chinese business interests in the US.

Speaking at the event, Zhang Jianyu, chairwoman of the CGCC, said the chamber's member companies have cumulatively invested more than $140 billion in the US economy, directly creating over 230,000 jobs and contributing to more than 1 million positions nationwide.

Qiu Wenxing, minister and deputy chief of mission at the Chinese embassy in the US, who delivered a keynote address, underscored the need for deeper integration of the world's two largest economies.

Referring to the investment and employment statistics quoted by the CGCC chairwoman, Qiu said: "That is the contribution Chinese companies have already made. We can do more to help America achieve even better lives for its people."

He urged US business leaders to be "quick and agile to seize the opportunity presented by China's development", particularly through the 15th Five-Year Plan (2026-30), which offers expanded market access for international investors.

Qiu called on both Chinese and US business communities to "do the right thing instead of the politically correct thing", advocating for deeper engagement and more objective dialogue.

The relationship between China and the US is inherently mutually beneficial, and that characteristic could form the foundation for shared prosperity, he said, emphasizing that the two countries must find a common path based on "mutual respect, peaceful coexistence and mutually beneficial cooperation".

"The world depends on a stable, sound and sustainable relationship," Qiu said, adding that efforts made by the two governments to stabilize ties are injecting "positive momentum" and certainty into business operations.

Pin Ni, vice-chair of the CGCC and president of Wanxiang America Corporation, said that any "decoupling" between China and the US would be disastrous for the US due to its inflationary impact.

Amid the expectations of improved economic ties, the survey report highlighted some significant hurdles. Tariff policies remain the primary source of pressure, it said, negatively affecting 79 percent of respondents through rising costs and supply chain disruptions. Geopolitical tensions have also become a "structural ceiling" for brand building, it added.

Ni stressed that successful long-term growth in the US requires a deeper commitment to localization and human capital. "Localization is not just about investing in a company; it is about investing in the local people," he said.

The strategic goal of Chinese companies in the US is to become a permanent and contributing part of the local economy, he added.

Monday's event included a panel discussion on the global rise of Chinese brands. The speakers noted that while Chinese companies make high-quality products, they need to improve their "narrative capability" in order to extend their reach.

Crisis management and storytelling should be combined to successfully navigate local challenges, the speakers added.

Talks: Nation steps up effort to promote peace, encourage dialogue

From page 1

Since the fighting started, China has stepped up efforts to promote peace and encourage talks.

In April, President Xi Jinping put forward a four-point proposal on maintaining and promoting peace and stability in the Middle East, calling for peaceful coexistence, respect for national sovereignty, adherence to the international rule of law, and a balanced approach to development and security — a framework that has guided China's diplomatic engagement in the crisis.

Wang has held nearly 30 phone calls with senior officials from relevant parties, including Iran, Israel, Russia and Gulf countries. He spoke last week by phone with US Secretary of State Marco Rubio, and the two sides exchanged views on the Middle East situation.

Niu Xinchun, executive director of the China-Arab Research Institute at Ningxia University, said that the US-Iran ceasefire remains fragile, with the risk of renewed hostilities still present.

He noted that prolonged disruption to the Strait of Hormuz could affect global energy supplies and maritime trade, drive up shipping costs, and increase pressure on the global economy.

Li Zixin, an associate researcher at the China Institute of International Studies, said that Tehran may hope that Beijing can convey necessary messages to Washington through bilateral and multilateral channels and convince Washington to exercise restraint.

China's communication with all key parties gives it a constructive role in preventing the ceasefire from breaking down and steering the crisis back toward dialogue, Li said.

Visitors enjoy hotpot in a pool at a water park in Meixin Wine Town, Chongqing, on Aug 2, 2025.
HE PENGLEI / CHINA NEWS SERVICE

Chongqing: Hotpot served in unlikely places

From page 1

Here, dining is steeped in the vibrant, down-to-earth bustle of everyday life.

Nearby, Xianlongjing Hotpot Park sets 600 tables among lotus ponds, bridges and pavilions. At night, the traditional folk spectacle of datiehua, or molten iron fireworks, showers the lake in dramatic performances. As the sparks fly , diners dip on-site harvested lotus roots into the bubbling broth.

For a cooler dining experience, the Underground City Hotpot Restaurant repurposes a wartime air-raid shelter with 4,500 sq m of tunnels, which can seat 1,300 people at a constant 25 C.

Elsewhere, Chongqing offers more unusual places to enjoy hotpot. Set on a rooftop, the Mujiuge Hotpot Restaurant serves its ninegrid pots near a secondhand bookstore. At the Meixin Wine Town in Fuling district, diners can soak in a swimming pool while dipping into bubbling cauldrons — the ultimate summer flex in a city famously known as one of the country's "four furnaces", where summer temperatures routinely soar above 40 C.

Back on the hillside in Pipayuan, eight tables were filled with a Surabaya-based delegation of more than 40 Indonesian entrepreneurs. After touring factories to explore China's development and latest technology, they had been drawn to the eatery by Douyin videos. "It looked like a fantasy," said Fabiola Yonita Santoso, head of the delegation.

At the foot of the hill, Dave O'Toole from Dublin, Ireland, and Eve Adams from Seattle in the United States — a long-distance couple finally reunited — photographed their hotpot moment.

"My hometown is the birthplace of the Guinness World Records," O'Toole said with a laugh. "This is amazing."

Pipayuan manager Gan Yuanchuang said the restaurant now hosts many foreign diners daily, mostly from Southeast Asia. During the loquat season, which runs from late April to early May, diners pick the cool fruit to soothe palates scorched by spicy broth.

The roots of hotpot stretch back to 19th-century river porters, who simmered offal with chili. By the 1930s, two local entrepreneurs, known as the Ma brothers, had opened Chongqing's first hotpot eatery, bringing hotpot from the dockside into a proper restaurant. Today, Chongqing has nearly 20,000 hotpot enterprises and around 40,000 restaurants, with 160,000 of China's 500,000 hotpot spots tracing their lineage back to the city.

The flavor of hotpot has reached over 50 countries and regions. Locals believe that the fiery nature dispels the damp mountain air, while the unhurried, hours-long meals embody the city's inclusive, communal spirit.

Whether on a lantern-lit hillside, floating among lotuses, deep inside a cave, or bobbing in a swimming pool, a trip to Chongqing without dipping into its bubbling, numbing cauldrons would be unthinkable.

China to attract more global students

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

The 15th Five-Year Plan (2026-30) prioritizes the expansion of high-level opening-up of education and strengthening of the "Study in China" brand, and education officials and university leaders are confident that China is on track to become one of the world's most attractive destinations for international students.

Inside
See more, **page 11**

Wang Daquan, head of the Chinese Service Center for Scholarly Exchange under the Ministry of Education, said, "We have confidence in that goal, and we will continue to make efforts to achieve it."

Citing data collected by the center over the past three years, Wang pointed to the steady rise in the number of applicants, greater diversity in the countries of origin of students, a significant increase in the number of self-funded students, and a marked rise in the number of degree-seeking candidates at the undergraduate, postgraduate and doctoral levels.

He attributed this upward trajectory to several distinct advantages, including the strong cost-effectiveness of China's higher education system, with tuition fees in the country being among the lowest globally.

He also highlighted China's stable policies, safe environment, and rapid development — all of which allow international students to share in the country's growth. The expanding global footprint of Chinese enterprises and the Belt and Road Initiative are creating new career opportunities for graduates in their home countries and elsewhere, he added.

According to the latest data from the Ministry of Education, 380,000 international students from 191 countries and regions were studying in China as of the 2024-25 academic year.

Asian students made up the largest share at 61.1 percent, followed by those from Africa at 16.2 percent and from Europe at 15.6 percent. The number of degree-seeking students stood at 205,000, with postgraduates representing 35 percent of that figure. Engineering ranked first among the chosen fields of study, with 27.8 percent of students opting for it.

International students experience traditional Chinese stone-rubbing art, an intangible cultural heritage, in Lingshui, Hainan province, on April 26. ZHANG WEI / CHINA DAILY

The Beijing International Studies University exemplifies the shift from scale expansion to high-quality development at the institutional level.

Zheng Chengjun, vice-president of the university, said that as of March 2026, the university's international student population stood at 1,024 — a remarkable 70.6 percent increase year-on-year.

There has been notable growth in the number of students coming from Belt and Road partner countries and the Regional Comprehensive Economic Partnership member states. Leading the enrollment figures are students from Saudi Arabia (177), Morocco (100) and Russia (54), followed by South Korea, Kazakhstan and Vietnam.

Zheng said the university aims to attract more postgraduate students during the 15th Five-Year Plan period. "International students act as a crucial link for trade, tourism and diplomatic relations between China and the world," he said.

By organizing international cultural festivals and improving campus facilities, the university ensures that international students find a true sense of belonging, he said.

Zhao Zhongxiu, president of the University of International Business and Economics, said the university has 70 years of experience in international education and has trained tens of thousands of students from over 170 countries and regions.

He said that deepening educational cooperation is a vital response to global uncertainties. Education cooperation can build cultural identity and people-to-people bonds, helping to forge a community with a shared future for humanity, he said.

In the economic sphere, international students boost two-way trade promotion, play a role in China's outward direct investment and contribute to building home-country human capital. In the field of science and technology, international cooperation in education serves as a major vehicle for talent flow and innovation, enabling global knowledge sharing and collaborative research, he said.

Zhang Hao, a professor at the Beijing Language and Culture University, emphasized that international students are the most powerful medium for telling the story of the real China when they return home.

To attract more students, Zhang urged Chinese universities to strive to reach high global rankings and work for the development of benchmark programs such as high-speed rail, electric vehicles and new energy.

Angelina Sanzharovskaya from Kazakhstan, a master's student majoring in Russian Interpretation at BISU, who has been in China for over three years, said: "The best thing about being a student here is the opportunities the university provides. Through various events, I've visited different cities and learned about the immense diversity of Chinese culture."

El Batoul Nejjaoui from Morocco, a postgraduate student at the same university with nearly 10 years of experience in living and working in China, said that as China plays an increasingly important role globally, she wants an on-the-ground understanding of its economy and urban development.

Disparity: Lack of opportunity leads to poverty

From page 1

If you pretend not to see poverty because it is classed as something different, then you do not need to act with urgency. But the reality is undeniable.

Walk the streets of the central business districts of Sydney or Melbourne, Australia, and you have to step around homeless beggars sleeping on the streets. In the countryside, they huddle in rough camps on the edge of towns. There are around 3.7 million people, or 15 percent of Australia's population, counted as living in poverty, according to a report co-authored by the Australian Council of Social Service and the University of New South Wales Sydney.

In the advanced economy of the United States, the figure is around 37 million, or 11 percent of the population, who live in poverty, according to the US Census Bureau. The percentage is much larger in the UK, where 13.4 million, or 20 percent of the population, are counted as living in poverty, according to UK government figures.

Western countries believe that poverty is the result of personal deficiencies and is not caused by structural economic problems. These unspoken beliefs are often reflected in the abusive language used to describe the poor as lazy, unintelligent or useless deadbeats.

In England, the Victorian era promoted the idea that idleness was a sin and that the workhouse or poorhouse — a place maintained at public expense to house needy people — was the solution for the lazy poor. These are ideas common to Western thinking about the foundation and causes of poverty.

Disgusted by the forced labor of industrializing Britain, German economist and philosopher Karl Marx took a different approach with his insightful analysis of social conditions: The workhouse was not a triumph of morality. It was a feature of an exploitative economic system that required a reserve of poverty-stricken workers to ensure that wages were kept low.

China treats poverty as a function of the economic system, so it has structured the system toward common prosperity and social good.

These are not abstract philosophical differences for academic debate. They are today's drivers of Chinese policy as shown in the details of the 15th Five-Year Plan.

China attacks the structural economic issues that create poverty. Western countries seem comfortable in accepting the assertion that the poor will always be with us, and so they see this as a moral problem and not an economic one.

When poverty is the result of a lack of economic opportunity, then the solution to poverty alleviation is to create the conditions necessary for economic opportunity.

Solutions require equal access to physical infrastructure and to modern digital infrastructure. Digital banking services in China like WeChat Pay and Alipay help expand inclusive financial access, as they generate financial records that can be used for loan assessments. Access rests on the rollout of reliable digital infrastructure.

China's focus is on using new quality productive forces to enable people to stay out of poverty by enabling and supporting economic opportunities.

Past success in tackling poverty means there is a genuine belief that life will improve, and that poverty will become just a memory on the path to a moderately prosperous society. Continued success is an ongoing process.

US jet fires on Iranian tanker headed to port

Reports suggest Washington, Tehran moving toward a temporary framework agreement

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

The US military fired on an Iranian oil tanker in the Gulf of Oman on Wednesday as US President Donald Trump intensified pressure on Tehran to reach a deal ending the war.

An American fighter jet fired several rounds at an unladen Iranian-flagged tanker attempting to sail toward an Iranian port, US Central Command said in a post on X.

> "The Americans will not gain anything in a war they are losing that they have not gained in face-to-face negotiations."
>
> **Ebrahim Rezaei,** Iranian lawmaker

Since the two sides agreed to a ceasefire on April 8, their negotiations have yielded no concrete results, and tensions have recently risen again.

Speaking to reporters in the Oval Office on Wednesday, Trump said the US has had "very good talks" with Iran over the past 24 hours. He added there is "never a deadline" for when he expects Tehran to respond to a US proposal for ending the war.

Trump claimed Iran had accepted his demand that it not obtain a nuclear weapon, but there was no official confirmation from Tehran and Reuters reported that no agreement had been reached.

Iran said on Wednesday it was reviewing the new US proposal. Multiple media reports indicated Washington and Tehran were moving toward a one-page memorandum to end the war while deferring complex issues, such as Iran's nuclear program, to later negotiations.

US media outlet Axios first reported a proposed 14-point, one-page memorandum to end the war. CNN, citing an unnamed source familiar with the negotiations, confirmed the information.

The memorandum would declare an end to the war and trigger a 30-day negotiation period on resolving critical issues including nuclear matters, unfreezing Iranian assets and future security arrangements in the Strait of Hormuz.

Iran is still reviewing a US proposal and will convey its response to Pakistan — which has served as the main intermediary between the two sides — after completing its assessment, Iranian Foreign Ministry spokesperson Esmaeil Baghaei said on Wednesday, according to Iran's ISNA news agency.

Iranian lawmaker Ebrahim Rezaei, spokesman for Parliament's National Security and Foreign Policy Committee, expressed skepticism. He described the text reported by Axios as "more of an American wish list than a reality".

"The Americans will not gain anything in a war they are losing that they have not gained in face-to-face negotiations," Rezaei wrote in a social media post on Wednesday.

The firing occurred after the US launched "Project Freedom", a military operation to guide commercial vessels through the Strait of Hormuz, a vital waterway for oil, gas, fertilizer and other petroleum products.

The US started the mission on Monday but halted it on Tuesday, citing progress in peace talks. Trump called the operation a "humanitarian gesture", saying other countries had asked the US to "help free up their ships, which are locked up in the Strait of Hormuz".

Iran and some analysts have disputed the US claims. Baghaei, the Iranian Foreign Ministry spokesperson, said the waterway had been safe for international shipping before US-Israeli attacks began.

Following the halt of Project Freedom, Iran's Islamic Revolutionary Guard Corps Navy said in a post on X on Wednesday that safe passage through the Strait of Hormuz is possible under "new procedures", though it did not specify what these procedures entail.

Protesters light flares in the colors of the Palestinian flag during a rally in Athens, Greece, on Tuesday, demanding the release of two activists detained by Israel. LOUISA GOULIAMAKI / REUTERS

UN demands Israel 'immediately' release activists

GENEVA — The United Nations on Wednesday urged Israel to immediately release two activists taken from a Gaza-bound flotilla, and demanded an investigation into "disturbing accounts" that they had been severely mistreated.

Spanish national Saif Abu Keshek and Brazilian Thiago Avila, who are held in a prison in Ashkelon, were among dozens of activists on a Gaza-bound flotilla intercepted by Israeli forces in international waters off the coast of Greece a week ago.

Israel must "immediately and unconditionally" release Keshek and Avila, "who were detained in international waters and brought to Israel, where they continue to be held without charge", UN Human Rights Office spokesman Thameen Al-Kheetan said.

"It is not a crime to show solidarity and attempt to bring humanitarian aid to the Palestinian population in Gaza, who are in dire need of it," he added.

The flotilla's vessels set sail from France, Spain and Italy with the aim of breaking Israel's blockade of Gaza and delivering humanitarian aid to the war-ravaged Palestinian territory.

Keshek and Avila's detention had initially been extended until Tuesday, but the Ashkelon Magistrate's Court extended it further until May 10.

Representatives for Avila and Keshek have accused Israeli authorities of abusing the two men, who have been on hunger strike for the past week.

Spokesman Kheetan decried the "disturbing accounts of severe mistreatment", calling for an investigation and insisting "those responsible must be brought to justice".

"We call for an end to Israel's use of arbitrary detention and of broadly and vaguely defined terrorism legislation, inconsistent with international human rights law," he said.

"Israel must also end its blockade on Gaza, and allow and facilitate the entry of humanitarian assistance to the besieged Palestinian strip, in sufficient amounts," he added.

'No evidence'

On Tuesday, Spanish Foreign Minister Jose Manuel Albares said there was "no evidence" to justify the "illegal" arrest of Keshek and Avila.

"This is a completely illegal detention; no Israeli agent has jurisdiction in international waters," he told public broadcaster RTVE.

Brazil's President Luiz Inacio Lula da Silva demanded on Tuesday that Israel release the two activists.

"Our government, together with that of Spain ... demands that they be fully guaranteed their safety and immediately released," he said in a post on X.

Meanwhile, the Palestinian government on Tuesday condemned Israel's approval of about $300 million for settlement roads in the occupied West Bank, calling it a "flagrant violation" of international law.

It said more than 1,600 settler and Israeli force attacks were recorded last month, including assaults, crop damage and home demolitions.

Small ball, wide door: Ping-Pong Diplomacy lives on

By **YANG HAN** in Hong Kong
kelly@chinadailyapac.com

Fifty-five years after United States table tennis players made a historic visit to China, the spirit of Ping-Pong Diplomacy continues to live on as people-to-people exchanges remain a cornerstone in bilateral relations.

That is the view of Bill Einreinhofer, a three-time Emmy Award-winning US film producer and director of the public television documentary *Your Serve or Mine*.

An Asian premiere of the documentary was held at the Asia Society Hong Kong Center on Tuesday to coincide with the 55th anniversary of Ping-Pong Diplomacy this year.

"Contemporary observers typically refer to the 'bad' relationship between the United States and the People's Republic of China. But in the early 1970s, there was no relationship," Einreinhofer told China Daily.

Yet, the leaders of both countries wanted to find a way to talk and they discovered it through a "remarkable accident" — when somebody got on the wrong bus and opened the door that most people did not even know existed, he said.

At the 1971 World Table Tennis Championships in Nagoya, Japan, US player Glenn Cowan accidentally boarded the Chinese team's bus. He was warmly greeted by China's Zhuang Zedong, who gave Cowan a Huangshan Mountain silk tapestry as a gift.

On April 10 that year, at China's invitation, nine players from the US table tennis team made their historic trip to China, becoming the first US nationals to visit the country in more than 20 years.

The trip was the beginning of "Ping-Pong Diplomacy", paving the way for high-level China-US diplomatic talks, with then-US president Richard Nixon visiting China in 1972 and the formal establishment of diplomatic ties in 1979.

Einreinhofer's documentary, shot on locations in China and the US, not only interviews athletes who took part in the 1971 exchange, but also explores people-to-people exchanges between China and the US in recent times, and how the spirit of Ping-Pong Diplomacy continues to live on.

"The visit of American table tennis players to China made communication possible. The same holds true today," Einreinhofer said. People-to-people exchange plays an important role away from the glare of the media spotlight as it gives both countries an opportunity to communicate candidly, he said.

As he talked to people of different generations for the documentary, Einreinhofer said he found that young people remained eager to explore their counterparts' culture and "daily routines", which could give them deep insights into similarities and differences.

Bridging cultures

"Years ago, I was a young scholar studying in the US ... that is why I feel so compelled to bring this film to Hong Kong and to audiences across the Chinese mainland," said Ziheng Wang, who coproduced the documentary.

The film was first shown on US public broadcaster PBS in April last year and has been broadcast on more than 250 local stations, Wang said. The team hopes to bring the documentary to other cities where it was filmed at, including Beijing and Shanghai, she said.

The team also developed free learning resources and lesson plans for US public high school students to learn about Ping-Pong Diplomacy, saying exchanges of ideas among the next generation are becoming an important link in people-to-people diplomacy in this era.

Chan Tin-yan, 20, an undergraduate student in Hong Kong who plans to study in the US in two years' time, said he was amazed to learn the history of Ping-Pong Diplomacy and how the city served as a bridge for US players to enter the Chinese mainland.

"My biggest takeaway is this kind of cultural connection between two different countries is really good," Chan said.

"It is so vital to see all the communications and exchange what we have in different cultures."

Reflecting on growing up in an era when China was often referred to as "Red China" and diplomatically unrecognized in the US, Einreinhofer said the conditions for bilateral exchanges at that time were far worse than the tensions today.

That is why he remains deeply optimistic, he added.

"It is because of the nature of the American people, the nature of the Chinese people. We are two very welcoming cultures," he said.

Spain to allow virus-hit ship to dock in Canary Islands

By **JONATHAN POWELL** in London
jonathan@mail.chinadailyuk.com

Authorities in Spain have granted permission for a Netherlands-flagged luxury cruise ship hit by a deadly hantavirus outbreak and anchored off Cape Verde to sail to the Canary Islands.

In a statement late on Tuesday, Spain's Health Ministry said the World Health Organization had explained that Cape Verde, in West Africa, could not receive the 147 passengers and crew of the MV *Hondius*.

"The Canary Islands are the closest location with the necessary capabilities," the ministry said. "Spain has a moral and legal obligation to assist these people, among whom are also several Spanish citizens."

Arrival in the Canary Islands was expected in "three to four days", it said, without specifying the port.

"Once there, the crew and passengers will be duly examined, cared for, and transferred to their respective countries," it said.

Since departing Argentina about a month ago for an Atlantic Ocean crossing, three passengers have died.

The WHO is investigating how hantavirus appeared on the ship, noting that the first victim developed symptoms on April 6 and possibly contracted the virus before boarding.

The rare disease, typically transmitted from infected rodents via urine, droppings or saliva, was suspected in the deaths of the three passengers. The WHO has said it had been told that "there are no rats on board" the ship.

As additional cases emerged, passengers and crew were placed in isolation after Cape Verde authorities barred the ship from docking. The vessel is anchored just off Praia, the island nation's capital.

WHO Director-General Tedros Adhanom Ghebreyesus said three patients with suspected hantavirus infections have been evacuated from the ship and are on their way to the Netherlands.

After the evacuations, the ship would "continue its route", said Ann Lindstrand, the WHO representative in Cape Verde.

Oceanwide Expeditions, the operator, confirmed it plans to send the ship north to the Canary Islands, either Gran Canaria or Tenerife.

Passengers told The Associated Press that they were coping well with the isolation.

"Our days have been close to normal, just waiting for authorities to find a solution," said Qasem Elhato, 31. "But morale on the ship is high and we're keeping ourselves busy with reading, watching movies, having hot drinks and that kind of things."

Chinese display firms showcase innovation, resilience at exhibition

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Major Chinese display technology companies showcased a broad range of new products and next-generation applications at the 2026 Display Week hosted by the Society for Information Display in Los Angeles, highlighting continued investment in innovation, research and development, and global industrial cooperation amid evolving global trade conditions.

The event, taking place Sunday to Friday at the Los Angeles Convention Center, featured more than 200 exhibitors and a record-setting 675 technical papers and sessions, providing attendees with a chance to see the latest displays and measurement tools.

Chinese display manufacturer BOE made its 12th consecutive appearance at the event, presenting more than 30 new technologies and products, including several global and industry-first launches. According to the company, many of the exhibits were developed under its three core technology brands.

In an interview with China Daily, BOE's Chief Brand Officer Si Da said that research and development remains central to the company's long-term strategy and competitiveness.

"Geopolitical factors are something we must consider, but before considering geopolitics, we must first focus on our own technological capabilities and innovation capacity, because that is the core competitiveness behind BOE's success," Si said.

BOE invests approximately 7 percent of its annual revenue into research and development, with expected R&D spending reaching nearly 14 billion yuan ($2.06 billion) in 2025.

The company also emphasized an open innovation strategy involving collaboration with universities, research institutions, developers and industrial partners globally.

"We believe technological development requires coordinated collaboration across industry, academia, research institutions and application partners," Si said, adding that it also demonstrates the openness of Chinese technology companies.

Global partners also highlighted cooperation with the Chinese display maker. Yulia Kern of Dawar Technologies said the company values rapid communication and collaboration on customized applications.

"We like that if there's a unique application with some custom features that BOE always responds and says, here's what we could do," Kern said.

At the same exhibition, TCL CSOT, a subsidiary of TCL Technology, introduced its APEX Pixel framework, which the company said is designed to unify pixel-level innovation across LCD, OLED and other display technologies.

Industry representatives attending the exhibition pointed to growing applications for advanced display technologies across entertainment, transportation and agriculture.

Bram Desmet, chief executive officer of Flanders Scientific, which supplies professional displays for filmmaking and broadcasting applications, said customers in the industry require high-performance monitors with strong color accuracy.

"It's a very niche market, very small but very demanding customers. Customers expect almost perfect performance," Desmet said.

He said he was particularly interested in tandem OLED-related technologies presented at the exhibition.

"It's very promising," he said. "I'm particularly excited about the tandem of lead products displayed here. I think that that's a very interesting future technology."

Advanced display technologies are also expanding into agricultural equipment and industrial vehicles.

Fred Haddad, technical product manager at CNH Industrial, said the company is exploring the use of OLED heads-up displays in vehicle windshields for agricultural machinery.

"We are looking at applications for displaying vehicle information, oil pressure, speed, RPM, on the windshield of our vehicles," Haddad said.

According to him, technologies such as high-brightness displays and windshield-integrated systems could help improve efficiency in farming operations by assisting with seeding, watering, spraying and crop monitoring.

The exhibition also reflected ongoing concerns surrounding tariffs and supply chain adjustments.

Tianma, another Chinese display manufacturer, presented ruggedized displays designed for aviation and marine environments, including products capable of operating under direct sunlight and extreme temperatures.

Dale Maunu, director of marketing at Tianma, said tariffs continue to affect customers and supply chain decisions.

"The tariffs definitely affect customers," Maunu said. "For customers that we ship to directly from our warehouse in Southern California, every invoice just has one more line for tariffs. Customers always pay the tariffs. It dramatically affects the supply chain."

According to Maunu, some assembly operations have gradually shifted to countries such as Vietnam and Thailand as companies seek to manage tariff-related costs and maintain competitiveness in international markets.

Maunu also reflected on broader structural changes in global manufacturing over the past two decades. He said the movement of production capacity overseas was accompanied by a decline in specialized industrial skills within the United States.

Japan's moves imperil peace

PM's visits may encourage groupings in region, undermine stability: Experts

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

CROSS CURRENTS

Japanese Prime Minister Sanae Takaichi's recent visit to Australia, which has hyped up so-called supply chain resilience and critical minerals security, may encourage the formation of exclusive groupings in the Asia-Pacific and undermine regional peace and stability, experts said.

During her visit to Canberra, the two countries signed four separate agreements, including statements on defense, energy and critical minerals cooperation, as well as a joint declaration on "economic security cooperation".

The two sides have also signed a new agreement on critical minerals, saying they would elevate it to a "core pillar" of the economic relationship and identifying six rare earths "strategic projects" that they can support to diversify supply chains.

Last month, Japan and Australia signed contracts to deliver the first three of a $6.5 billion fleet of Japanese-designed Mogami-class frigates.

In her talks with Prime Minister Anthony Albanese, Takaichi expressed hope that Japan and Australia will take on a leading role in promoting regional stability under the updated "Free and Open Indo-Pacific" vision, noting that their growing cooperation is effectively evolving into what could be seen as a "quasi-alliance".

She said she discussed issues, including China, with Albanese. However, according to an official statement released on his official website, the Australian prime minister made no mention of the topic.

The Japanese prime minister arrived in Australia on Sunday following a three-day visit to Vietnam, where she held talks on energy and critical minerals.

Japan's efforts to deepen institutionalized energy security cooperation with Australia, effectively forming a "small-circle" framework, can be seen as a geopolitical maneuver under the banner of "economic security", said Liu Shuliang, an associate researcher at the Tianjin Academy of Social Sciences.

"Japan's push to deepen cooperation with Australia appears focused on economic security, but also carries a clear geopolitical dimension aimed at China," he said.

Multiple elements of Japan-Australia collaboration suggest a clear alignment with the United States' "Indo-Pacific Strategy", particularly in the efforts to restructure critical mineral supply chains, consistent with the objectives of the US-led "Indo-Pacific Economic Framework for Prosperity", he added.

In their joint declaration on economic security cooperation, Japan and Australia emphasized concerns about "economic coercion" and committed to "building resilient supply chains".

"This reflects a broader push to align with US-led efforts to diversify and rebalance control over strategic resources," Liu said.

Framed as "economic security", the mechanism risks becoming an exclusive regional bloc that politicizes economic issues, potentially disrupting global supply chains and deepening regional divisions, he added.

Broader objective

Chen Hong, director of the Australian Studies Centre at East China Normal University in Shanghai, said Japan is using supply chain diversification as a rationale, but its broader objective appears to be to deepen ties with Australia and align more closely with US strategic efforts in the region.

He said Japan is seeking to leverage Australia's natural resources to address its own strategic constraints, while simultaneously advancing security and defense cooperation with Canberra.

"This approach risks blurring the line between economic and security domains, potentially fostering bloc dynamics that could undermine the foundations of long-term open and cooperative development in the Asia-Pacific," he said.

Chen said that from earlier warship contracts to deepening defense and security cooperation, these developments underscore Japan's ongoing push to stretch the constraints of its post-World War II pacifist constitution, expand arms exports, and redefine its role in overseas security, with a view to strengthening its military footprint.

"Under this backdrop, Takaichi's call for strengthening the quasi-alliance between Japan and Australia would send a dangerous signal and risk heightening security concerns across the Asia-Pacific region," he said.

Japan's move is likely to accelerate regional bloc formation, fuel an arms race, undermine peace and stability, and heighten the risk of division and confrontation in the region, Liu from Tianjin added.

Experts said that given the evolving international landscape, Australia must maintain strategic autonomy.

Australia-China relations are in a relatively positive phase, and Australia should take an objective view of China's growing role in promoting peace and development, while avoiding being drawn into geopolitical rivalry and ideological narratives, Liu said.

Australia should place greater emphasis on sustaining pragmatic economic and trade cooperation with China, rather than align with the decoupling attempts in supply chains that risk undermining its own interests, Chen said.

It should support multilateral cooperation and avoid alignment with confrontational frameworks, he added.

Agencies contributed to this story.

Briefly

SOUTH KOREA

Judge in ex-first lady's case found dead

A South Korean judge who presided over the appeal trial of former first lady Kim Keon-hee's Deutsch Motors stock manipulation and other charges was found dead early on Wednesday, Yonhap News Agency reported. Shin Jong-oh, a judge at the Seoul High Court, was found in a flower bed near the court building in Seoul. A suicide note was found at the scene, and police are investigating the exact cause of death. A special counsel team on Monday appealed to South Korea's Supreme Court against an appellate court ruling that sentenced Kim, the wife of South Korea's former president Yoon Suk-yeol, to four years in prison over charges including stock manipulation and graft.

AFRICA

Ethiopia, Sudan accuse each other of attacks

Ethiopia and Sudan traded accusations on Tuesday, each claiming the other had violated its territory. The Ethiopian government on Tuesday rejected Sudan's recent accusation of drone strikes as "baseless". Sudan recalled its ambassador to Ethiopia after accusing Addis Ababa of a series of drone attacks that hit its international airport on Monday. Sudan's Foreign Minister Mohi El-Din Salem said in a statement on Tuesday that his country is "ready to enter into an open confrontation with Ethiopia". In a statement issued on Tuesday, the Ethiopian Ministry of Foreign Affairs rejected Sudan's "baseless accusations".

UNITED STATES

2 killed and 3 injured in back-to-back shootings

A man shot five people, killing two, in back-to-back shootings on Tuesday at a shopping center and then an apartment building because he was angry over business dealings, police said. The first shooting happened just before 10 am at a shopping center in a neighborhood in a suburb north of Dallas, the police department said. When police arrived, they found four adults who had been shot. While they were investigating, another shooting was reported at an apartment complex roughly 6 kilometers away, and responding officers found a dead man inside one of the apartments.

XINHUA—AGENCIES

President flexes control in primary state elections

COLUMBUS, Indiana — Elections in the US states of Indiana, Michigan and Ohio on Tuesday made a picture increasingly clear — that President Donald Trump still dominates the Republican Party, and Democrats seem to have the momentum ahead of November's midterm elections.

The biggest test of the president's power came in Indiana, where he backed primary challenges against seven Republican state senators who rejected his redistricting plan in December. Five of the president's candidates won.

"Big night for MAGA in Indiana," US Senator Jim Banks wrote on social media, adding that he was "proud to have helped elect more conservative Republicans to the Indiana State Senate".

It's been a costly and unprecedented intraparty battle that has exacerbated tensions among Republicans ahead of the November midterm elections that will determine control of Congress.

State Senator Travis Holdman, one of the incumbents to lose his primary, said he was at peace with his defeat. He voted against redistricting and faced more than $1.3 million in attack advertising funded by organizations tied to Banks and Governor Mike Braun.

Donna Wooten (right) votes across from her husband, Jerry Wooten, at a vote center during a primary election on Tuesday, in West Lafayette, Indiana. CARA PENQUITE / AP

"I did what my constituents asked me to do and it cost me my job," he says. "But that's OK."

Holdman warned that a more aggressive style of campaigning was arriving in his state.

"Welcome to DC politics in Indiana because this means that's what's coming," he said.

The race that was too close to call was the most expensive of the seven primaries.

The fundraising groups led by Banks and Braun combined to spend more than $2.2 million on advertising attacking Senator Spencer Deery, according to the ad-tracking firm AdImpact.

Trump began leaning on Republican-led states last year to redraw their congressional maps to make it easier for his party to hold its thin majority in the US House. Although redistricting is normally done once a decade, after a new census, the president wanted to abandon tradition to gain a political edge.

Texas was the first to follow through, and the White House pressured Indiana to go along, too. Vice-President JD Vance met with state politicians in Washington and Indianapolis, and Trump weighed in by conference call.

Meanwhile, in Michigan, Democrat Chedrick Greene won a special election on Tuesday, securing the party's control of the state Senate through the remainder of Governor Gretchen Whitmer's term.

Over in Ohio, primaries locked in candidates for two major races with national implications.

Cessation of hostilities a prerequisite to address Strait of Hormuz deadlock

While Washington insists it is working to "secure" passage through the Strait of Hormuz for the world, recent reports describe mounting tensions. The framing is as revealing as the facts: the United States attempts to portray its actions as "a public good", even as the origins of the crisis lie on its doorstep.

Prior to the escalation started by the US-Israeli strikes on Iran the strait was not at the center of a crisis. This causal sequence should not be obscured by Washington's altruistic claim. If someone sets alight a house and then seeks credit for trying to extinguish the blaze, the applause is likely to be muted.

Washington argues that the US itself does not depend on the Strait of Hormuz. Yet inflation in the US remains stubborn, with energy costs a persistent driver. Declining approval ratings for the US administration and the looming pressure of midterm elections underscore the domestic stakes.

In this light, when Washington alleges that Iran is on the verge of collapse, Iran desperately wants a deal, or that Tehran has more to lose from a closure of the strait, it is not unreasonable to infer the opposite.

The diplomatic theater of Washington, which tries to exert pressure on China over the Middle East crisis, adds another layer of obfuscation to the proceedings. Some US officials, including the treasury secretary, have publicly urged China to "step up" its role in persuading Iran to keep the strait open. The treasury secretary told the media, "if they want to be good global citizens", Beijing could join hands with other countries at the United Nations, in reference to an April UN Security Council draft resolution allegedly aimed at "protecting" commercial shipping in the Strait of Hormuz that China and Russia vetoed for its lack of fairness and justice.

Yet this request distorts China's role. Beijing has, in fact, been engaged in responsible diplomatic efforts aimed at de-escalation. Chinese Foreign Minister Wang Yi's meeting with his Iranian counterpart in Beijing on Wednesday was the latest move in a broader push to encourage dialogue and restraint.

As Wang stressed in the meeting, China believes that a comprehensive cessation of hostilities is urgently needed, that a relapse into conflict is even more inadvisable, and that continued adherence to negotiation is of paramount importance.

On the issue of the Strait of Hormuz, the world shares a common concern over the restoration of safe and normal passage. As Wang said, Beijing hopes the parties involved will respond as promptly as possible to the strong calls of the international community.

China encourages Iran and other Gulf states to engage in dialogue aimed at fostering neighborly relations, and supports the establishment, by regional countries themselves, of a regional peace and security architecture based on shared participation, the safeguarding of regional interests, and the realization of common development.

The pro-peace endeavors of China are grounded in a framework articulated in a four-point proposal it put forward last month on peace and stability in the Middle East, which emphasizes peaceful coexistence, respect for sovereignty, adherence to international law and the coordination of development with security.

It is unrealistic for Washington to press Beijing to endorse the premise that military action lacking UN authorization and legitimacy can be retrospectively legitimized as a contribution to global common interests. Nor should Washington expect the world to accept the reopening of the Strait of Hormuz — under the US' military pressure — as an altruistic act by those who precipitated the crisis in the first place.

The US may declare to its domestic audience that its Epic Fury operation has concluded with desired effects. But the costs of disruption in the Strait of Hormuz are borne not just by the protagonists, but by the world as a whole.

If Washington genuinely seeks to uphold the world's common interests as it professes, it should begin by recognizing its role in shaping the current predicament. It should also accept that diplomatic efforts by others will not serve as a post hoc endorsement of the US-Israeli attacks on Iran. What the US administration seeks to do now is to pressure others to clear up a mess of its own making while taking the credit if any breakthrough is made.

Stability in critical global arteries cannot be secured through unilateral forces. It requires consistency, restraint and a willingness to place shared interests above immediate political gain. Until that lesson is absorbed, the Strait of Hormuz will remain not just a strategic choke point, but a mirror reflecting the misjudgment of some.

Service sector driving high-quality growth

The 2026 Beijing International Automotive Exhibition, the world's largest auto show, was a testament to the rapid internationalization and quality upgrade of China's service sector, and compelling evidence of how China pursues high-quality development through innovation and openness.

With automakers from 21 countries and regions displaying more than 1,400 vehicles, the industry showcase, held from April 24 to May 3, highlighted China's role as a competitive player in electric vehicles and the transition of some global brands from "in China, for China" to "in China, for the world" as they deepen cooperation with local partners and leverage China's supply chain to optimize global production and sales. The mutual learning and co-evolution of Chinese and foreign companies in the Chinese market demonstrate that openness is two-way empowerment.

The event also offered the world a window through which to observe the development of China's convention and exhibition economy, a vital and integral part of the broader service trade industry.

Take the capital city as an example. With the construction of high-capacity, smart and green venues, Beijing's exhibition industry has become a key driver of the local economy. From automotive shows to energy storage expos and medical health fairs, the theme of the city's exhibition calendar is becoming increasingly innovative, intelligent and sustainable, reflecting its efforts to build itself into a globally influential convention and exhibition hub.

Shortly after the annual gatherings of China's top legislature and political advisory body in March, the State Council, the country's Cabinet, has twice specifically emphasized the development of the service industry in its meetings, sending a clear signal that the service industry is an important part of the modern industrial system, relating to the overall high-quality development and modernization.

The policymakers have unambiguously stated the need to actively plan and promote the expansion and improvement of the service industry.

In April, China held its first national conference on the service sector, which called for fostering new growth points, enhancing the digital and intelligent transformation of the sector, strengthening producer and consumer services, and cultivating more "China Services" brands, while also promoting broader opening-up of the service industry.

These pragmatic policy signals underscore a recognition that as China's economy transitions from a phase of rapid growth to one of high-quality development, modern services should play a major role in driving innovation, employment and consumption.

The numbers speak for themselves. In 2025, the added value of China's service sector exceeded 80 trillion yuan ($11.65 trillion), accounting for 57.7 percent of GDP and contributing 61.4 percent to economic growth. The industry also provided around half of the country's jobs and accounted for 46.1 percent of per capita spending by urban and rural residents, making it a key engine for expanding domestic demand.

China's expansion of its service sector also provides numerous shared opportunities and benefits for the world at large. The country's industry, economy and market will continue to contribute to global growth and certainty in the process. Instead of clinging to the zero-sum game mentality peddled by some naysayers of the Chinese economy, a pragmatic choice for multinational corporations is to embrace the opportunities presented by the superlarge Chinese market and foster win-win cooperation.

The service industry is the cornerstone of a thriving economy, serving as a barometer of a nation's development stage and a driver of global competitiveness. And China's thriving exhibition industry is a prime example of how the service sector is driving the country's high-quality economic growth.

Opinion Line

Politicized fragmentation is the wrong prescription

According to Reuters, G7 countries, led in part by France, have convened discussions aimed at curbing what they describe as China's "grip" on critical mineral supply chains, even considering the creation of a permanent coordinating mechanism. Parallel reports by Euronews highlight cooperation among the European Union, the United States and Japan to restructure supply chains for the crucial raw materials.

Yet this is putting prescription before diagnosis.

The modern global supply system is facing obstacles at a time when the world's largest economy has increasingly embraced tariffs, export controls and financial sanctions as instruments of statecraft. Trade has been weaponized; interdependence, once celebrated as a stabilizing force, is now treated as a vulnerability. Inevitably, such actions reverberate across supply chains that were built on assumptions of relative openness and predictability.

However, rather than acknowledging this underlying disease and strengthening their immunity, some developed economies are spreading the contagion. The implicit belief seems to be that disengaging from China will naturally deliver "security".

This belief is, at best, incomplete. Within the EU itself, there is growing recognition that excessive reliance on the US — be it in energy, defense, finance and now industrial policy — poses its own strategic vulnerabilities.

Moreover, the premise that interdependence is inherently dangerous misreads how global markets function. Within a rules-based system, mutual dependence is precisely what disciplines behavior. It creates incentives for stability, predictability and cooperation. The risks arise not from interdependence itself, but from its politicization.

Unlike many economies, China is simultaneously a major importer of raw materials, a processor and exporter of refined inputs and a crucial market for high-end manufacturing equipment and semiconductors. Being so deeply embedded across multiple nodes of global supply chains, it has no appetite for causing systemic disruption.

To suggest, therefore, that China is the principal source of "instability" in global supply chains is to overlook both data and logic. The fragmentation now underway risks harming all participants. Resource-exporting countries would face collapsing demand if markets were artificially segmented and manufacturing hubs would struggle to sustain output without access to large, integrated markets.

The more uncomfortable question for some policymakers in the G7 and beyond is whether the "partners" they are now prioritizing truly represent more reliable, rule-abiding alternatives. Trust in international economic relations cannot be declared; it should be demonstrated through consistent adherence to agreed norms, which, in recent years, have been eroded not by emerging economies, but by the very actor that once championed them.

Within Europe, a cohort of policymakers has adopted a de facto adversarial stance toward China. Yet this stance often coexists with a willingness to acquiesce to pressure from Europe's transatlantic ally. The result is a policy posture that is neither strategically autonomous nor analytically coherent.

A rational approach tells one that supply chain resilience cannot be achieved through bloc formation or ideological alignment. It requires restoring confidence in the openness and predictability of the global trading system. That, in turn, demands a recommitment to multilateralism.

This doesn't imply passivity. Economies are entitled to safeguard legitimate security interests. But the indiscriminate expansion of "security" to encompass broad swaths of economic activity risks becoming self-defeating. China, for its part, has signaled that it will continue to pursue mutually beneficial economic relations with partners that engage on the basis of equality and respect. At the same time, it has made clear that discriminatory measures will invite proportionate responses. Such reciprocity is not evidence of risk; it is a predictable feature of sovereign interaction and rules defense.

The choice facing some developed economies is therefore not between dependence and independence, but between managed interdependence and unmanaged fragmentation. The former requires discipline, humility and analytical clarity. The latter offers only the illusion of control, at the cost of stability.

— LI YANG, CHINA DAILY

What They Say

Industry still the foundation for development

Editor's note: *China's economy is witnessing the emergence of new drivers. Zheng Yongnian, dean of the School of Public Policy at The Chinese University of Hong Kong, Shenzhen, spoke to Economic Daily about why it shouldn't abandon low-end industries. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Currently, a new wave of technological revolution and industrial transformation is making breakthroughs at a greater speed. New growth drivers are emerging for the Chinese economy, which shows no sign of peaking.

China strives to harmonize economic and social progress and balance the roles of the government and the market. This approach highlights both efficiency and equity, and integrates vitality with order. The country continues to deepen reforms in key fields to improve the socialist market economy system, and adheres to the approach of combining an efficient market with a capable government.

On the one hand, China recognizes that the government cannot manage everything on its own, and acknowledges that further efforts are required to unleash economic vitality. On the other hand, it has drawn lessons from other economies to avoid disorderly capital expansion and the structural imbalances that may follow. These institutional arrangements are conducive to sustaining long-term growth.

A robust manufacturing industry is an important advantage for China's economic development. The country is not only upgrading its traditional industries, but also fostering emerging industries and industries of the future. It is accelerating efforts to build a modern, comprehensive, advanced and secure industrial system.

China enjoys a complete industry chain and a huge market thanks to its all-encompassing manufacturing industry. The country needs to continue developing the real economy and the manufacturing industry, and advancing the integration of scientific and technological innovation with industrial innovation.

Some traditional businesses, such as rebar and cement, remain vital for the manufacturing industry, and should not be abandoned simply because they are not "high-end".

High-value-added and high-technology sectors have only a limited share in the overall economy. Also, many high-technology sectors require collaboration and support from other industries. In some fields, the capacity of different sectors to coordinate with each other matters more than individual technological breakthroughs.

A modern industrial system includes traditional, emerging and future industries. The three do not replace one another, but support and reinforce each other. A truly strong economy needs not only high-end manufacturing, but also some low-end and mid-level sectors. Only in this way can the economy achieve greater resilience and competitiveness.

Under the new circumstances, China needs to boost not only its GDP but also the "Chinese people's economy", or gross national income. GNI, which includes the country's overseas earnings, embodies the open way in which China pursues development. For instance, as Chinese enterprises make investments abroad under the Belt and Road Initiative, China's production capacity, technologies and development experience are "going global".

The country doesn't seek a monopoly or intend to stop other countries from developing as some Western countries have done. Nor will it impose its own development pattern on other countries.

VIEWS

Erik Solheim

Ecology and economics are allies, not rivals

For most of modern history, the world operated on the conviction that if you want to develop your economy, you will damage the environment. The two move in opposite directions, so you can choose one.

This was not the view of ignorant or careless people. It was the lived experience of industrialization.

Global Lens

The British knew that sending children into coal mines during the Industrial Revolution was harmful. But they did it anyway, because they saw no other path to prosperity.

That model spread from Britain to Germany, to the United States, to Japan, to the Republic of Korea, to China, and eventually to every corner of the world that wanted to grow. For nearly two centuries, the trade-off between development and nature was not a debate. It was a fact of life.

That fact has changed only in the past few years, and the agent of change was not idealism. It was price. Twenty years ago, the world took an entire year to add one gigawatt of solar capacity.

Today the same gigawatt is added in half a day. Solar energy costs have fallen by around 90 percent in a decade. Wind costs have followed a similar trajectory. Batteries are now doing the same. When clean energy becomes the cheapest option in most of the world, the old trade-off dissolves.

You no longer have to choose between growing your economy and protecting your environment, because the tools that grow your economy are increasingly the same tools that protect it. The debate that defined two centuries of development has not been won by one side or the other. It has simply been overtaken by technology and economics.

Any nation replacing a drop of oil from the Strait of Hormuz with solar energy saves money, and becomes more energy independent.

This shift changes everything about how we should read what is happening in China.

What looks from the outside like a collection of separate environmental policies is actually something more coherent: a systematic attempt to prove, at scale and over time, that the old trade-off was a historical condition rather than a permanent truth.

I have been watching this unfold for two decades. Earlier this year, I took a boat along the Lijiang River in Guilin, Guangxi Zhuang autonomous region.

That river was once heavily polluted, widely reported as one of China's most polluted rivers. But what I saw from the water settled something for me.

The water is so clean you can go for a swim, maybe even drink it. It shows that protection and prosperity can advance together, and that the decision to treat nature as an asset rather than a sacrifice is one that pays back. Beautiful nature invites tourists and brings prosperity.

The Yellow River, the Yangtze and the Lancang-Mekong rivers sustain hundreds of millions of people across Asia. China is now building a national park at their origin in the Qinghai plateau to protect these watersheds for the long term. On the Talatan grassland nearby, vast solar installations cover what was once barren desert. The panels generate electricity for the national grid while their shade slows the wind, reduces evaporation, and allows grass to grow beneath them.

SONG CHEN / CHINA DAILY

Herders now graze their sheep underneath what has become the largest solar installation on earth.

Energy production and ecological restoration are not competing here. They are the same project.

This is what makes the concept of ecological civilization genuinely significant. As articulated by Chinese President Xi Jinping, "Lucid waters and lush mountains are invaluable assets." The argument is not that China will sacrifice economic growth to protect nature, but that protecting nature is itself a sound economic strategy. The Yangtze River basin is the proof. A decade ago, a landmark commitment was made in Chongqing to prioritize ecological protection along the river over large-scale development. In 10 years, around 96.5 percent of the river's water meets the high-quality standards.

Over the same period, the region's GDP has more than doubled.

The tiger population in the Northeast China Tiger and Leopard National Park has grown from 27 to around 70.

Nearly 50,000 people have got jobs connected to China's first five national parks.

Managed well, nature generates wealth rather than competes with it.

This March, China adopted the Ecological and Environmental Code, consolidating 30 separate environmental laws into a single statutory framework. It is the second formal code in Chinese law after the Civil Code. It shows that while some other countries are retreating from environmental commitments, China is embedding those commitments in legal foundations.

The message is that this direction will hold, regardless of short-term economic pressures. That kind of institutional continuity is precisely what makes ecological recovery possible. You cannot restore a river or a tiger population in one political cycle. You can only do it by committing over decades and meaning it.

This matters beyond China because the old trade-off weighed most heavily on the countries that could least afford it. The logic of pollute first and clean up later was, in practice, a sentence passed on poor nations, not a strategy chosen by them. Clean up later turned out to mean never, or not until enormous damage had already been done.

But developing countries no longer face that sentence. Clean energy is not a luxury technology available only to wealthy nations.

It is, increasingly, the cheapest technology available to anyone. In Rwanda, protecting mountain gorillas generates around $1,500 per hour-long visitor experience, making conservation one of the country's most important economic assets. The gorillas are worth more alive in their habitat than they could be in any other form.

India, the home of around 75 percent of the world's tigers, has doubled its tiger population, not only for animal welfare but as an economic strategy. That is the logic that China is applying to its rivers, its forests, and its wildlife at a scale the world has not seen before.

The debate whether a country must choose between development and nature shaped two centuries of industrial history. Many still have that old mindset. But the economics of clean energy and the practical experience of ecological restoration have now answered that debate. The choice was never as fixed as it seemed.

And for the nations still at the beginning of their development paths, it is no longer a choice at all.

China and the World Roundtable | Global Collaboration on Maritime Governance

Editor's note: *The Shared Oceans Shanghai Forum 2026 was held at Shanghai Maritime University in April. Launched in 2025, the forum promotes joint efforts to build a maritime community with a shared future. Experts from various countries and international organizations discussed maritime security, connectivity and other issues at the forum. Below are excerpts from the comments of some of the participants.*

Building a maritime community with a shared future

Improved global maritime governance needed

Mao Ruipeng is the director of the Institute for Global Governance at the Shanghai Institutes for International Studies.

The United Nations has a leading position in global maritime security governance, serving as the overarching framework for shaping and safeguarding the modern international maritime order.

Oceans play a fundamental role in global trade transport, data transmission, energy supply and food security.

In recent years, the strategic significance of oceans has heightened, causing maritime security to gradually shift from a marginal issue to a core topic of discussion within the UN.

Yet maritime security is confronted with increasingly diverse threats and challenges, ranging from traditional risks, such as piracy and illegal fishing, to emerging hazards, including plastic pollution, climate change, ecological crises and threats to submarine cables. These challenges require comprehensive solutions.

Although maritime security has become a key topic of discussion within the UN, the organization is facing several challenges in handling the various threats.

The first hurdle is the stance taken by major countries. The United States' maritime policies, which emphasize key waterways and seek to control them, are steering UN discussions on maritime security away from international cooperation.

The second issue is the deep-seated differences between countries regarding the scope of maritime security.

There are vastly different views on which specific maritime security issues should be deliberated at the UN Security Council. Indeed, maritime security has become a battleground for rivalry and contention among various parties.

The third challenge comes from the UN itself. While many international organizations are involved in maritime security affairs within the UN system, they should have had an effective leading and coordinating mechanism.

As a result, some countries and think tanks have called for the UN to set up a dedicated institution to address maritime issues in a coordinated manner. Despite these challenges, the UN is expected to make slow but steady progress in placing greater emphasis on maritime security.

Inclusivity critical for maritime public goods

Wang Bocheng is an associate professor at the School of Marxism in Shanghai Maritime University.

The world has a wide variety of maritime public goods, but there is a structural imbalance in the provision of these goods.

There is considerable international cooperation and public goods in fishery resources.

But in other fields, such as maritime security and polar governance, the interests of different countries collide, leading to a shortage of relevant public goods.

Another problem lies in the imbalance of participants. There is a divide between the Global North and the Global South. Developed countries tend to follow the approach of "small yards, high fences", which effectively denies most developing countries access to the maritime public goods they provide.

A public good is defined by non-excludability and non-rivalry in nature. But many maritime public goods around the world fall in the category of quasi-public goods or club goods — goods that only a limited number of countries can use.

A typical example is the provision of public goods by some Western countries. These goods are highly exclusive, and often marked by attempts to impose stringent standards and high thresholds to keep China out.

China launched the Belt and Road Initiative and proposed the building of a maritime community with a shared future. It has provided maritime public goods — such as institutional frameworks, technological support and deep-sea data — which are available to all countries.

Guided by the vision of a maritime community with a shared future, China contributes to ocean conservation, maritime resource utilization and maritime security by offering its own solutions.

But China is facing unprecedented challenges, especially the intensifying geopolitical competition. It is therefore essential for the country to strengthen cooperation with other BRICS countries and other countries of the Global South.

Through this cooperation, it can demonstrate the openness, stability and inclusiveness of its supply of global maritime public goods.

Global collaboration will ensure stability at sea

Thong Viro is the deputy director-general of administration management at Sihanoukville Autonomous Port in Cambodia.

More than 80 percent of global trade is carried by sea. A stable maritime order is, therefore, the cornerstone of the global economy. However, today's international landscape has become increasingly complex due to geopolitical shifts, regional conflicts and non-traditional security threats.

When the maritime order is disrupted, the impact on maritime transportation is immediate. Shipping costs rise, supply chains fracture, and ultimately the pace of global economic recovery slows.

As a port administrator in Sihanoukville, I witnessed how sensitive international trade is to the global security environment. Without security, there is no efficiency, and without stability, there is no prosperity.

In an era of economic globalization, a country's interests are no longer confined to its own borders, especially when it comes to maritime and shipping. No single country can protect these growing overseas interests alone. The following steps can help in this direction.

First, we must uphold international laws and respect the established maritime order. A fair and rules-based international framework provides fundamental legal protection for our overseas assets and personnel.

Second, we must strengthen collaborative security mechanisms. Protecting overseas interests means sharing information, conducting joint patrols along critical waterways, and providing mutual assistance in times of crisis. Through international cooperation, we can build a robust safety net for global shipping lanes.

Third, we must embrace the vision of a maritime community with a shared future, a vision that captures the reality of modern trade with great clarity. All stakeholders and partners in the maritime industry should collaborate closely and continue harnessing advanced technologies, intelligent port systems and green initiatives to make international shipping safer and more resilient.

Also, when we help secure a shipping lane, we are not merely protecting one country's overseas investments. We are protecting the entire global supply chain for the world economy.

Aligning growth with green responsibilities

Two years ago, the Red Sea was closed to commercial shipping. Major carriers rerouted around the Cape of Good Hope. Freight costs surged. Supply chains that had linked Asia, Africa and Europe through the Suez Canal for over a century were severed almost overnight.

For Egypt, the impact was immediate. The Suez Canal, a lifeline through which roughly 12 percent of global trade passed, saw its revenues drop by nearly half.

This episode revealed a critical truth. While more than 80 percent of global trade moves by sea, the governance structures that underpin maritime security remain fragmented. Shipping lanes are global, but the mechanisms to protect them are not. This gap poses a key challenge, and the stakes go far beyond shipping alone.

Kazem Agamy is the dean of the Arab Research Institute for Sustainable Blue Economy at the Arab Academy for Science, Technology and Maritime Transport.

The ocean economy, spanning fisheries, coastal tourism, offshore energy and marine biotechnology, is valued at roughly $2.5 trillion annually. Egypt, with coastlines on both the Mediterranean and the Red Sea and more than 50 working ports, is deeply embedded in that economy. For its people, the sea means jobs, food, and opportunity. But they cannot capture those benefits if the ocean itself is degraded.

Illegal fishing depletes stocks. Plastic and industrial pollution erode coastal habitats. Submarine cables, which carry over 95 percent of the world's intercontinental data, remain inadequately protected. The United Nations Convention on the Law of the Sea provides the legal framework, but governance is only as strong as its implementation.

In this context, three priorities require urgent and sustained attention. First, there should be better maritime awareness. We need shared surveillance, stronger regional coordination and joint operations that are equal to the threats we face.

Second, blue economy strategies must align with environmental responsibilities. Economic growth that undermines the ecosystems upon which it depends is inherently unsustainable. Lasting development requires balance, responsible stewardship, and a long-term vision.

Third, we must invest in knowledge and human capital.

The path forward lies in partnership, grounded in international law, guided by science and measured by concrete results.

Greater connectivity crucial for regional growth

Azhar Jaimurzina Ducrest is the chief of the Transport Connectivity and Logistics Section of the Transport Division of the Economic and Social Commission for Asia and the Pacific.

This year, ESCAP member states are preparing their new regional action program for sustainable transport development which will cover the period from 2027 to 2031.

Similar to the previous regional action program, this will be a unique strategic framework designed to address the evolving challenges of our times in the field of transport.

In 2021, member countries recognized maritime connectivity as one of the seven thematic areas of utmost priority for the region. They also established a key mechanism for regular regional dialogue on sustainable maritime connectivity for Asia and the Pacific.

The new regional action program is expected to build on these achievements to set a clear road map for collective action. In this context, the pivotal role of the Asia-Pacific region as the engine of global trade and the efforts of ESCAP countries in advancing maritime connectivity must be recognized.

Numerous national and regional initiatives, of which China's Maritime Silk Road is a flagship example, helped us achieve significant progress in more efficient and resilient transport operations.

These efforts have done more than just build infrastructure; they have created vital arteries for economic flow and people-to-people exchanges. By enhancing port efficiency and fostering intermodal connectivity, these initiatives have significantly contributed to the development of maritime transport across Asia and the Pacific, leading to tangible results in shortened lead times, more integrated supply chains, and a stronger, more unified regional market.

The views don't necessarily represent those of China Daily.

GLOBAL VIEWS

ZHOU WEISHENG

Dynamic medium of interaction

The Chinese language is evolving from a communication tool into a key carrier of global public value

Promoting mutual understanding and people-to-people ties through language has become a pressing priority for the international community. China's Global Civilization Initiative aligns closely with the United Nations Educational, Scientific and Cultural Organization's Universal Declaration on Cultural Diversity, offering new theoretical and practical pathways for the international dissemination of the Chinese language.

Conceptually, the Global Civilization Initiative, first proposed in March 2023, advocates respect for the diversity of civilizations, emphasizes the importance of the inheritance and innovation of civilizations, upholds the common values of humanity, and promotes international people-to-people exchanges and cooperation.

It echoes the Universal Declaration on Cultural Diversity, which states that cultural diversity is the common heritage of humanity. Within this framework, language is not merely a tool for transmitting information but a core mechanism for generating cultural meaning and enabling civilizational interaction. As one of the world's most spoken languages, Chinese has become a vital medium for diverse civilizations to coexist and interact.

Traditionally, however, Western views on language dissemination have been confined to cultural export or even cultural competition. Such perspectives often emphasize one-way communication and the expansion of influence, which can easily lead to the polarization and the instrumentalization of cultural relations. In today's complex, volatile world, this paradigm no longer meets practical needs. It is therefore necessary to steer the international dissemination of Chinese culture toward "cultural symbiosis" and realize a more effective provision of public value. Cultural symbiosis means the interaction, integration and coevolution of different civilizations; while public value supply refers to providing the global community with institutional resources for understanding, trust and cooperation through language and cultural exchanges.

On the practical front, the global reach of the Chinese language has expanded dramatically in recent years. Statistics show that over 180 countries and regions offer Chinese language education. More than 80 countries have integrated Chinese language teaching into their basic national education systems. Digital platforms have also lowered barriers to language learning, driving sustained growth in the number of online Chinese language learners. These figures show that Chinese has evolved from a regional language into a globally influential one — what might be called international Chinese language.

In terms of cultural influence, the international dissemination of the Chinese language features a distinctive "embedded" trait. Unlike mere cultural product exports, language learning itself fosters cultural understanding. For example, when learners study Chinese concepts such as *he er bu tong* (harmony in diversity) and *tianxia datong* (universal harmony), they gain not just vocabulary but also the relational thinking and holistic perspectives rooted in traditional Chinese philosophy. This kind of culturally embedded learning through language helps reduce cognitive biases and deepens cross-cultural understanding.

Language plays a fundamental and structural role in promoting people-to-people bonds. International relations depend not only on institutional arrangements but also on societal cognitive and emotional foundations. As more people learn Chinese, non-Chinese speakers can access first-hand linguistic resources to better understand Chinese society. This "disintermediated" access to information helps reduce misunderstandings and biases.

As a key vehicle for the international dissemination of Chinese culture, the Confucius Institute offers a representative case. Since its founding in 2004, it has been going beyond language teaching to include cultural activities, teacher training and academic exchanges. Despite differing institutional environments and public opinions in various countries, it remains vital for promoting Chinese language education and cultural exchange. More importantly, these institutes have developed a practical collaborative dissemination model — partnering with local educational institutions to share resources and facilitate cultural interaction, which fully embodies the vision of cultural symbiosis.

Meanwhile, technological progress is reshaping the ways in which the Chinese language is disseminated globally. Artificial intelligence translation, online education platforms and social media are shifting language dissemination from institution-led to multi-actor participation. For example, Chinese-language content creators on short-video platforms are presenting culture in more everyday and diverse ways. This decentralized model of dissemination enhances the diversity and authenticity of cultural expression, increasing international audiences' acceptance.

Admittedly, the global dissemination of the Chinese language still faces challenges such as cultural context differences, discourse system transformation and the international public opinion environment. Thus, future efforts should focus on three key dimensions: first, strengthening localized expression by integrating Chinese language teaching with local cultures; second, promoting two-way exchanges to avoid cognitive biases that can arise from one-way communication; third, reinforcing language's role as a public good to deliver more shared value to the world.

Guided by the Global Civilization Initiative and the principle of cultural diversity, the global dissemination of the Chinese language is moving toward cultural symbiosis. By fostering civilizational mutual learning and people-to-people ties with language as a bridge, Chinese is evolving from a communication tool into a key carrier of global public value. Driven by continued institutional innovation and technological progress, the Chinese language is poised to play a more active and profound role in building an inclusive, diverse and sustainable global civilizational system.

SHI YU / CHINA DAILY

YANG MEINI / FOR CHINA DAILY

ZHAI KUN AND LIN HANDONG

Certainty amid volatility

China and ASEAN should strengthen the resilience of their comprehensive strategic partnership to maintain regional stability

The year 2026 marks the fifth anniversary of the establishment of the comprehensive strategic partnership between China and the Association of Southeast Asian Nations, at a time when the global order is undergoing the most intense fragmentation since the end of the Cold War. Amid this new period of turbulence and transformation, China-ASEAN relations have not only withstood the test but also demonstrated robust resilience, showing clearer planning, more pragmatic cooperation and enhanced mutual trust. The continued deepening of this partnership reflects both an outcome of upgraded bilateral cooperation and a shared regional choice favoring stability, development and strategic autonomy.

Zhai Kun

Lin Handong

Through institutional alignment and planning coordination, ASEAN and China have crafted a highly predictable blueprint for regional development. The Plan of Action to Implement the ASEAN-China Comprehensive Strategic Partnership (2026-30) explicitly supports ASEAN community building and integration, including efforts toward the ASEAN Community Vision 2045 and its strategic goals, and reaffirms China's support for ASEAN centrality in the regional architecture and ASEAN-led mechanisms. This demonstrates that advancing relations is not about creating parallel structures but about upgrading cooperation within ASEAN's established institutional context.

Furthermore, China has aligned its own development planning with regional cooperation. China's 15th Five-Year Plan (2026-30) clearly calls for expanding high-standard opening-up and promoting the implementation of the China-ASEAN Free Trade Area 3.0. By institutionalizing and itemizing their cooperation agenda, both sides have preserved a rare and valuable mid-to-long-term certainty during an otherwise volatile period.

Practical cooperation is increasingly showcasing the deepening of China-ASEAN relations. Politically, China and ASEAN maintain high-level strategic communication through annual leaders' meetings, while foreign ministers' meetings, senior officials' consultations and the ASEAN Defence Ministers' Meeting Plus form a multi-tiered cooperation mechanism. Economically, ASEAN has been China's largest export market for three consecutive years and its largest source of imports for seven consecutive years. The upgrading of the ASEAN-China Free Trade Area to version 3.0 means bilateral cooperation is moving toward higher-level rules connectivity, and it now incorporates emerging fields such as the digital economy, the green economy and supply chain interconnectivity.

On the security front, as of April 18, China and ASEAN had held 54 meetings of the joint working group on the implementation of the Declaration on the Conduct of Parties in the South China Sea, advancing consultations on a Code of Conduct for the waters. In 2025, China mediated the Cambodia-Thailand border conflict, playing a key role through shuttle diplomacy that culminated in the Fuxian consensus. The China-Cambodia-Thailand Track II dialogue has also preserved vital communication channels for the rebuilding of mutual trust. Meanwhile, China and ASEAN countries have carried out efficient joint law enforcement in non-traditional security areas, jointly combating cross-border online gambling, telecom fraud and other crimes, effectively responding to the demand of people in the region for security.

Greater regional trust has become a force behind stronger China-ASEAN relations. According to the State of Southeast Asia: 2026 Survey Report released by Singapore's ISEAS-Yusof Ishak Institute, trust in China among ASEAN respondents in this survey had reached a historic inflection point since the annual report's release in 2019, with trust levels (39.8 percent) exceeding distrust for the first time. In hypothetical "taking sides" scenarios, those choosing China (52 percent) surpassed those choosing the United States (48 percent). Among ASEAN's dialogue partners, China, with an average score of 9.1, remains the most strategically important partner.

The results reflect ASEAN's recognition of China's economic performance and policy continuity. It is noteworthy that a clear majority, over half at 55.2 percent, identified "strengthening ASEAN's resilience and unity" as the primary approach to navigating the competition between the US and China, underscoring that strategic autonomy remains ASEAN's core principle. In this sense, the key to the continuous deepening of China-ASEAN relations lies in China's consistent respect for the autonomous demands of ASEAN and joint efforts to expand the region's stability, development space and institutional resilience.

Both sides face fresh historical opportunities and notable challenges. Over the next five years, China and ASEAN need to seek common ground while shelving and narrowing differences, and find targeted, practical solutions to the difficulties hindering deeper relations.

On the one hand, the State of Southeast Asia: 2026 Survey Report shows that ASEAN's political concern over the South China Sea situation, at 48.2 percent, has declined, but it remains the top geopolitical issue involving China. In 2026, as conditions for concluding the Code of Conduct become increasingly favorable, all parties must guard against disruptive external interference.

China can also address the South China Sea issue within the broader framework of strategic bilateral cooperation to prevent it from overshadowing overall relations. Functional security projects, such as joint search and rescue exercises and maritime law enforcement capacity building, could help stabilize expectations. In addition, by strengthening China-ASEAN cooperation in the blue economy, including marine fisheries, marine biological resource development and marine renewable energy, the two sides can provide support for the handling of sensitive issues.

On the other hand, the survey shows that 41.9 percent of respondents are confident or very confident in China as a Global South leader. As a natural member of the Global South, China's positioning consistently aligns with that of other developing countries. In practice, China should focus more on poverty alleviation, climate change and digital transformation through localized and perceptible grassroots actions. For instance, most ASEAN respondents (60 percent) view climate change and intensifying extreme weather events as the most pressing challenge, but their underlying logic differs fundamentally from that of the European Union. Climate change directly affects agricultural output, freshwater security, coastal livelihoods and vulnerable rural groups in ASEAN. Therefore, China should not stop at general discussions of climate issues, but respond to the survival pressures behind them. Only by doing so can China better support the collective empowerment and self-strengthening of the Global South.

Debut of full-spectrum hyperspectral satellite to empower commercial aerospace innovation

By **REN QI**
renqi@chinadaily.com.cn

Kuaizhou-11 Y7 rocket launches at 12:12 pm on March 16 from Jiuquan Satellite Launch Center in Gansu province, deploying eight domestic satellites into scheduled orbits in a flawless mission. CCTV+

A significant milestone in China's commercial aerospace sector, the recent successful launch and precise orbital insertion of the Xiguang-1 06 satellite reflect the development of China's industry, underscoring the robust support provided by the local government, experts said.

Developed by Xi'an Zhongke Xiguang Aerospace Technology Group Co Ltd, based in Xixian New Area of Shaanxi province, the satellite was launched aboard the Kuaizhou-11 Y7 carrier rocket from Jiuquan Satellite Launch Center in Gansu province.

As China's first and currently the only in-orbit commercial hyperspectral remote sensing satellite with full-spectrum coverage of the 400–2500 nanometers band, the satellite ushers in a new industry era of "full-spectrum precise perception".

Covering the visible to shortwave infrared bands with 26 independent spectral bands, the satellite managed to transmit clear images within 24 hours of entering orbit.

"The satellite functions as if it is performing CT scans on the planet. It doesn't just look at surface morphology, but can analyze material composition, monitor crop health and predict ecological hidden dangers," said Kou Yimin, chief engineer at Zhongke Xiguang Aerospace.

Supported by the Xi'an Institute of Optics and Precision Mechanics of the Chinese Academy of Sciences, the development team achieved independent control over core technologies, adopting an integrated design to significantly reduce weight, lower costs and shorten the development cycle.

The satellite's applications have already been implemented broadly. In Sichuan and Yunnan provinces, it monitors the growth of characteristic cash crops like tea and traditional Chinese medicinal herbs. In northwestern China's mining areas, it provides early warnings for geological disasters such as landslides, ensuring safe production.

Behind this single satellite's success is the collaborative support of an entire industrial chain. With Zhongke Xiguang Aerospace as the leading enterprise, Xixian New Area has built a complete commercial aerospace ecosystem encompassing upstream new materials, midstream core component manufacturing and downstream data application services.

In the upstream, Shaanxi Pulimei Material Technology Co Ltd focuses on aerospace composite materials.

"We specialize in aerospace-grade heat-resistant and structural materials, with multiple product performances reaching leading domestic levels," said Zhang Xinhang, chairman of the company.

For midstream manufacturing, Shaanxi Weixing Zhihang Technology Co Ltd possesses the capacity to produce 50,000 aerospace boards annually in its 100,000-class clean room. General Manager Zeng Xuan noted their products meet stringent aerospace standards and have supported multiple satellite models with a 100 percent qualification rate.

Downstream, Shaanxi Baota Xingkong Aerospace Technology Co Ltd operates the "Yan'an Constellation" and a big data center, providing standardized products for over 30 industries nationwide and boosting data interpretation efficiency by over 60 percent.

Such an achievement is inseparable from strong policy guarantees. Xixian New Area has rolled out measures to strengthen policy supply and financial empowerment to back up such projects. Currently, the area hosts 34 enterprises in the aerospace industry chain, achieving an output value of 5.69 billion yuan ($835.29 million) in 2025.

"The success of this satellite sets another benchmark for the new area to cultivate a more modernized industrial system with new quality productive forces," a spokesperson for Xixian New Area told China Daily.

"We will use this to accelerate the linkage of commercial aerospace, high-end equipment and new materials, contributing the 'Xixian experience' to China's high-quality manufacturing development."

High-income status seen around corner

Official data put China's '25 per capita GNI above World Bank's '24 benchmark

By **ZHOU LANXU** and **OUYANG SHIJIA**

China is on track to reach high-income status within one to two years, as steady growth and structural upgrading place the country on the cusp of a key developmental milestone, even as external uncertainties add complexity to the outlook, economists said.

"Taking a relatively conservative view, China is likely to reach the threshold of a high-income economy within the next one to two years," said Sun Xuegong, director-general of the department of policy study and consultation at the Chinese Academy of Macroeconomic Research. The academy is affiliated with the National Development and Reform Commission.

Sun said that crossing the threshold would mark "an important milestone" and signal a new phase of development characterized by upgrades to industrial structures and shifts in household consumption patterns, in line with the country's broader push for high-quality growth.

The outlook comes as China is now very close to this key milestone. In the World Bank's classification in July last year, China was ranked as an upper-middle income economy with 2024 per capita gross national income (GNI) at $13,660, versus the 2024 high-income benchmark of $13,935.

In 2025, the country's GNI reached 139.4 trillion yuan ($19.2 trillion), the National Bureau of Statistics said. Using NBS figures, China Daily estimates per capita GNI at 99,109 yuan for 2025, or about $14,503 at current exchange rates — exceeding the 2024 threshold of $13,935.

The final classification depends on the updated benchmarks for 2025 and exchange rate adjustments based on the World Bank's calculation method, allowing the next round of income group updates to be released in July to provide a key observation window for assessing whether China formally enters the high-income category.

International institutions share a cautiously optimistic view. Marshall Mills, senior resident representative of the International Monetary Fund in China, said he saw significant potential for further expansion of China's economy as reforms to improve resource allocation and boost consumption could lift annual GDP growth by nearly 0.5 percentage point.

This will help address the challenges of a shrinking labor force and slowing productivity growth and support the country's prospects of reaching high-income status within the next five years, he said.

Beyond headline income levels, economists and policy advisers stressed that sustaining growth after reaching high-income status will be critical. Some economies have struggled with slowing momentum after crossing the threshold.

Sun, from the Chinese Academy of Macroeconomic Research, said the key lies in strengthening innovation capacity, which China has prioritized as a strategic priority. The country's steady rise in the Global Innovation Index rankings — where it ranked 10th in 2025 — reflects significant progress that could help it avoid the so-called middle-income trap.

> "Taking a relatively conservative view, China is likely to reach the threshold of a high-income economy within the next one to two years."
>
> **Sun Xuegong,** director-general of the department of policy study and consultation at the Chinese Academy of Macroeconomic Research

$19.2 trillion
gross national income of China in 2025, according to the National Bureau of Statistics

Equally important is maintaining social stability and improving income distribution, Sun said, adding that advancing common prosperity will be crucial to ensuring long-term, sustainable development after achieving higher income levels.

The outline of the 15th Five-Year Plan (2026-30) has demonstrated China's determination of achieving steady mid-to-long-term growth, reiterating China's goal of achieving "mid-level developed country" status by 2035.

With first-quarter GDP growth resilient at 5 percent despite rising external headwinds, Mao Shengyong, deputy head of the NBS, said that growth driven by technological progress and industrial upgrading will be sustainable going forward.

Zhang Bin, deputy director at the Institute of World Economics and Politics under the Chinese Academy of Social Sciences, said that given China's current level of industrialization and production capacity, reaching the World Bank's high-income threshold would be a natural outcome.

Crossing the line does not mark the end of development, Zhang said, adding that China's per capita GNI remains far behind the more than $80,000 in leading advanced economies such as the United States.

"China still faces gaps in frontier technologies and advanced capabilities, requiring continued efforts to catch up with leading economies," he said.

Tech firms spending big on strategic land buys

By **CHENG YU**
chengyu@chinadaily.com.cn

China's internet giants are ramping up land purchases in major cities, committing more than 15 billion yuan ($2.2 billion) since late last year in a strategic shift from asset-light leasing to owning property tied to core operations.

Companies including ByteDance and JD have led a fresh wave of land purchases in hubs such as Beijing and Hangzhou, Zhejiang province, signaling a deeper transformation in how China's tech sector manages capital and growth.

The new buying spree is not a traditional real estate play but reflects a broader move toward heavy-asset ownership. Firms are increasingly seeking to anchor research, data and headquarters functions in self-owned facilities, aligning with long-term industrial strategies rather than short-term property gains, industry experts said.

JD has been among the most active. Last month, a unit of JD spent 1.76 billion yuan to acquire two parcels of land in Beijing E-Town, adjacent to its existing headquarters. The purchase came just one day after its other subsidiary paid 663 million yuan for a commercial site in Hangzhou.

In late 2025, JD secured land in Nanjing and acquired office space in Hong Kong's Central District for HK$3.47 billion ($442.9 million), underscoring a multi-city footprint built in rapid succession.

Other tech majors are following suit. Alibaba Group acquired office space in Hong Kong's Causeway Bay in October 2025 for HK$7.2 billion, while ByteDance has spent roughly 6.1 billion yuan this year alone on two prime sites in Beijing's Haidian district, a core technology hub.

The pace of investment has accelerated markedly since 2025, with purchases becoming more concentrated and strategic. Unlike earlier, scattered acquisitions of office buildings, the latest deals feature high self-use ratios, strong links to industrial activity and long-term operational horizons.

Yan Yuejin, deputy head of the E-House China R&D Institute in Shanghai, said: "This is about optimizing balance sheets and hedging against uncertainty. Holding high-quality real estate in core locations can provide stable asset appreciation, especially as property prices have adjusted."

The shift also reflects a redefinition of land use by tech firms. Rather than speculative holdings, companies are developing integrated campuses for research and development, digital industry parks and artificial intelligence computing centers — infrastructure viewed as critical to future growth, Yan said.

A file photo shows a horse-themed setup by ByteDance's Douyin in Shanghai on Jan 27. CHEN YUYU / FOR CHINA DAILY

"Demand from internet companies — often linked to what policymakers called new quality productive forces — is emerging as a rare source of certainty, particularly in the commercial and R&D segments of major cities still grappling with a property slowdown," he added.

Restaurant chains eye rapid growth

Country's catering industry experiencing acceleration in franchised development

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

The country's catering sector is experiencing sustained acceleration in chain store development, driven by market consolidation and operational quality upgrades, according to the 2026 White Paper on the Development of Restaurant Chains in China released by the China Chain Store & Franchise Association and Meituan.

The report shows that the percentage of restaurants in the country that are part of a chain rose from 21 percent in 2023 to 25 percent in 2025, an average annual increase of 2 percent. This growth highlights the sector's resilience in adapting to evolving consumer preferences and operational challenges. Across segments — including beverages, fast foods, snacks and marinated flavors — leading chain enterprises with national influence have emerged in every category.

"This is exactly why we upgraded the 'Top 100 Catering Franchises' to the 'Top 300 Chain Restaurants' this year," said Peng Jianzhen, CCFA director. "With the chain rate rising, more brands are emerging, and as niche categories diversify, benchmark chains are appearing across every sector — Chinese, Western, casual dining, fast food, beverages and baking."

The white paper identified a clear divergence among brands of different sizes, according to the Meituan Research Institute. Top-tier brands with over 10,000 outlets continue to consolidate leadership through standardized operations and strong brand influence.

Chains with between 101 and 500 stores increased store count in 2025 by 28.3 percent year-on-year, while chains boasting between 501 and 1,000 outlets also expanded rapidly, increasing store numbers by 32.6 percent year-on-year. The smallest chains, typically with three to 10 outlets, shrank sharply, with an 18.5 percent year-on-year reduction, largely due to limited risk resilience and underdeveloped supply chains.

Xiaocaiyuan, a "Top 300" Chinese chain restaurant brand, stands as a prime example of high-quality growth. Founded in 2013, Xiaocaiyuan has expanded to over 800 directly operated stores. According to its first interim report following its public listing in August 2025, the company achieved revenue of 2.71 billion yuan ($397.5 million) during the reporting period, a year-on-year increase of 6.5 percent, with the growth driven by the steady expansion of its store network. Net profit reached 382 million yuan, representing a surge of 35.7 percent compared to the same period in 2024.

Overall, the total number of catering outlets in the country remained largely stable, with 7.47 million stores nationwide by the end of 2025 — a 0.1 percent decline from the previous year.

Category differentiation is a defining feature of the market.

Beverage chains, in particular, have become the primary growth engine, with a chain rate of 54 percent, far above the industry average. These brands benefited from high platform subsidies and booming takeaway demand, allowing rapid replication of standardized operations.

Top-tier brands, leveraging mature operating systems and strong management, are the backbone of China's chain development.

Luckin Coffee is an example of this trend. Its 2025 financial report shows a net addition of 8,708 stores, bringing the total to 31,048 — a 39 percent year-on-year increase. Self-operated stores alone exceeded 20,000. Luckin also prioritized product innovation, launching over 140 new items in 2025, driving a 39 percent increase in freshly prepared beverage sales to 4.1 billion cups.

Other segments, including Chinese and Western cuisine, face more complex operational challenges, said the report. High unit costs, intricate supply chains, and difficulties in standardization have prompted operators to focus on service quality and menu innovation rather than rapid expansion. Consumer demand for value and quality favors standardized, cost-effective categories.

The consumer market remains robust. Total retail sales of consumer goods reached 50.12 trillion yuan in 2025, up 3.7 percent year-on-year, while catering revenue totaled 5.79 trillion yuan, up 3.2 percent. Although slightly below overall retail growth, this demonstrates the sector's resilience amid intensified competition and evolving consumer expectations.

Macroeconomic indicators provide additional context: GDP growth reached 5 percent in 2025, disposable income rose by 5 percent, and the service industry producer index increased by 5.5 percent. Catering revenue could have grown around 5 percent without subsidy-driven "takeaway battles", indicating that competitive pricing pressures slightly suppressed revenue, though market fundamentals remain strong, said the report.

While competition has intensified, operational quality is improving. Meituan and Dianping data show a decline in low-rated outlets in 2025, while mid-tier scores rose, reflecting enhanced service stability and operational excellence. Market shakeouts have accelerated improvements in management standards, menu consistency and customer experience, laying the foundation for sustainable medium-term growth.

Technology adoption is also increasing. The 2026 white paper on the Development of China's Catering Ingredients, released by catering research unit NCBD and Expo Fine-food Shanghai, reported that the cooking robot market exceeded 3.5 billion yuan in 2025 and is projected to surpass 12 billion yuan by 2030. These robots are being deployed in group meals, fast food and regional cuisines, helping restaurants standardize operations and improve efficiency.

Chain penetration is higher in major cities. First-tier cities such as Beijing; Shanghai; Guangzhou and Shenzhen of Guangdong province, have a chain rate of 33.2 percent. Lower-tier cities are catching up, with fifth-tier cities reaching 21 percent, reflecting accelerated chain expansion into less developed markets, said the report. But a rising number of catering brands is shifting to lower-tier markets with localized strategies.

Taking Miss Xiaogu, a brand which focuses on three core categories — spicy hotpot, *malatang* (numbing, spicy and hot) and *malaxiangguo* (numbing, spicy and fragrant pot) — as a prime example, the brand has now surpassed 1,200 stores globally.

Targeting the lower-tier market, Miss Xiaogu has specifically engineered a profitable single-store model characterized by low costs and high repurchase rates, deeply aligning with community consumption needs. By leveraging the core advantage of low rental costs in these markets, the brand practices deep community-based operations. It has precisely anchored two core positioning strategies: as the "family backup kitchen" and as a "convenient canteen for young people". This approach has allowed it to rapidly gain a foothold in smaller cities, establishing itself as a benchmark case for the downward expansion of restaurant chains.

Peng of CCFA suggested key priorities for the industry should include trade-in subsidies for catering equipment. He said catering equipment should be included after automobiles and home appliances in trade-in policies.

Expanding subsidies would facilitate digital and intelligent transformation, improving equipment standards and productivity, he added.

Peng also suggested in the report ideas for opening domestic listing channels, allowing catering companies to access domestic capital markets. Additionally, he called for specific policies to support the international expansion of Chinese cuisine in order to enhance global influence and market share.

Walmart's Chengdu store turns prototype for nationwide upgrades

By **WANG ZHUOQIONG**

Walmart China's recently revamped Chengdu, Sichuan province, store marks the launch of its next-generation store model in the country, signaling a rising trend of proximity-focused formats in retail.

The 20-year-old location has been overhauled with a new merchandise layout, spatial design and enhanced omni-channel experience, reflecting the company's strategy to deliver fresh, high-value and convenient shopping for urban consumers.

The Chengdu store will serve as a prototype for a nationwide upgrade. Walmart plans to renovate more than 100 existing stores and open five to 10 new locations this year, signaling a renewed push for high-quality growth in the retail market in the country.

The new store format targets urban middle-income families and single shoppers. Walmart has optimized a compact footprint of roughly 3,000 square meters with around 10,000 stock keeping units, emphasizing fresh food and groceries.

Zhu Jun, senior vice-president of Walmart China, said: "The Chengdu reopening represents the company's response to changing consumer habits and will serve as a blueprint for similar renovations in other cities this year."

Fresh food is central to the new model. Walmart has intensified sourcing from local suppliers and enhanced production, display and shelf-life management standards. Short-shelf-life items, including fresh-cut beef, sashimi, chilled fish and fruit platters, have been expanded, while Chengdu-specific offerings such as a "Sichuan Hot Pot Fresh Ingredients Zone" cater to local tastes.

The stores also feature digital shelf-life monitoring systems, seasonal product corners, and flower and fruit zones, designed to maximize freshness and provide a dynamic shopping experience.

Walmart's refreshed "Marketside" private label has expanded its portfolio of bakery, beverages, snacks and fresh food. The label underscores Walmart's strategy to differentiate through simplicity, freshness and local sourcing.

The Chengdu reopening comes as the retailer continues to rebalance its portfolio. While Walmart China is consolidating to about 300 stores nationwide, its membership format Sam's Club has become the primary growth engine.

Customers shop on April 24 at Walmart's newly opened Chengdu store in Sichuan province, marking the launch of its next-generation store model in China. PROVIDED TO CHINA DAILY

Sam's Club has opened 10 new locations over the past year and plans at least 14 more in 2026. The recent opening of the Wuxi, Jiangsu province, store marked its 64th location in China, highlighting the company's focus on its membership warehouse format while quietly refining neighborhood Walmart stores.

This expansion mirrors a broader reshaping of the country's offline retail market, according to Worldpanel by Numerator's first quarter 2026 analysis. The data underscore a widening gap between traditional modern trade channels and community-focused, high-value formats.

Hypermarkets, supermarkets and convenience stores faced headwinds in the first quarter, according to Worldpanel. Factors include the post-holiday "reverse migration", stronger foodservice recovery, a rebound in travel spending and continued online penetration.

Modern trade sales fell 3.2 percent year-on-year, highlighting the challenges of large-format retail in an increasingly fragmented market, Worldpanel's analysis shows.

Smaller, proximity-focused formats bucked the trend, posting a 2.7 percent year-on-year increase, driven by higher purchase frequency and everyday convenience. These results underscore the resilience of urban and community-oriented retail, a space where Walmart's compact "new generation" store model seeks to gain traction.

Among China's top 10 retailers, Walmart China and Hema Fresh stood out for growth and market adaptation. Walmart China pursued a dual-line strategy, focusing on neighborhood markets and Sam's Club membership stores. Strengthened product capabilities and localized supply chains helped both Walmart and Sam's Club private labels achieve rapid growth, reflecting a strategy consistent with the Chengdu store prototype, Worldpanel stated.

Hema Fresh increased its market share by 1.2 percentage points, overtaking CR Vanguard Group. Its dual-format expansion strategy improved both efficiency and scale, with penetration rates approaching 8 percent in the first quarter. Hema's value-for-money private label leveraged supply chain advantages to increase penetration by 4.6 points in the eastern region and achieve breakthroughs in the southern region.

Yonghui Superstores saw a 1 percentage point decline in market share, but reported strong rebounds in sales and private label performance, aided by initiatives in product quality and scene-driven sales.

JD Seven Fresh expanded offline, leveraging logistics and supply chain advantages to attract in-store traffic. Its northern region penetration rate rose 1.2 points year-on-year in the first quarter.

Worldpanel highlighted an emerging trend of ecosystem integration between online and offline retail. High-efficiency formats, including small supermarkets and discount stores, continue to perform, while online channels grow through content commerce and instant retail.

Prosecutors pledge to tighten marine protection oversight

Advanced tech, better governance to be used to safeguard ocean ecosystems

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China's top procuratorate has pledged to strengthen legal oversight in marine environmental protection by leveraging advanced technologies and enhancing coordinated governance, as the country steps up efforts to safeguard ocean ecosystems and support sustainable development.

The Supreme People's Procuratorate said it will intensify case handling in key areas such as marine water quality, coastline changes and control of invasive species.

The move aligns with the country's 15th Five-Year Plan (2026-30), which advocates for stronger prevention of marine environmental risks at the source and greater efforts in pollution control and ecological restoration in key coastal regions.

Xu Xiangchun, director of the SPP's public interest litigation department, said procuratorial organs in coastal regions have made notable progress in recent years by leveraging geographic advantages and actively performing their public interest litigation functions.

"Protecting marine ecological resources is also closely linked to safeguarding people's livelihoods," Xu said, noting that improving marine environmental quality directly supports coastal communities and industries.

> "Protecting marine ecological resources is also closely linked to safeguarding people's livelihoods."
>
> **Xu Xiangchun,** director of the SPP's public interest litigation department

Xu acknowledged that balancing ecological protection with economic development remains a challenge, particularly in cases involving historical issues and complex local conditions. "It is important to properly handle this relationship to address problems at their root," he said.

He added that many long-standing and complex issues in marine protection require coordinated efforts across different levels of procuratorial organs and government departments, rather than relying on a single authority.

One case released by the SPP illustrates this approach. In Xiangshui county, Jiangsu province, an agricultural company converted 300 hectares of saline land along the Yellow Sea into aquaculture ponds and leased them to 106 shrimp farmers. Untreated wastewater was discharged into the sea, affecting coastal water quality and harming public interests.

The local procuratorate identified the case during a campaign to protect the Yellow Sea and launched a public interest litigation investigation in April 2023. It then convened authorities overseeing water resources, agriculture and rural affairs, and the environment.

Although all parties agreed the discharge was illegal, enforcement proved difficult. Farmers had already invested heavily, an immediate shutdown risked social tensions, departmental responsibilities overlapped, and the large aquaculture area posed technical challenges.

The procuratorate issued recommendations urging coordinated enforcement, better management of discharge outlets and standardized wastewater treatment. Following joint enforcement efforts, more than 60 drainage outlets were removed and dynamic monitoring was introduced.

To balance environmental protection with economic stability, local authorities invested more than 10.7 million yuan ($1.5 million) in wastewater treatment facilities, ensuring compliant discharge while maintaining production. An ecological education base was also built.

The case later revealed broader problems. In 2024, prosecutors found similar issues across more than 9,300 hectares of coastal aquaculture areas and issued recommendations to promote unified treatment. A centralized tailwater treatment area covering more than 833 hectares was established, 40 monitoring points were added, and an ecological aquaculture community of more than 8,000 hectares was developed.

By April last year, more than 24,600 hectares of aquaculture areas in Yancheng, Jiangsu, had completed rectification and achieved compliant discharge. The Xiangshui experience has since been promoted across the province.

Xu said prosecutors will focus next on key areas of marine ecological protection and intensify case handling. Led by an ongoing public interest litigation campaign around the Bohai Sea, prosecutors will guide local authorities to strengthen oversight in major marine environmental and resource protection cases and develop region-specific models.

Technology will play a larger role, Xu said. Given the fluid and complex nature of marine ecosystems, traditional methods of identifying clues and collecting evidence are no longer sufficient. Prosecutors will make greater use of satellite remote sensing and big data models.

He added that prosecutors will deepen cooperation with departments overseeing ecology and environment, natural resources and maritime affairs, improve information-sharing and joint case-handling mechanisms, and issue guidance to address practical issues such as damage assessment and compensation management.

Supercomputer reconstructs evolution of the universe

By LI MENGHAN
limenghan@chinadaily.com.cn

Chinese scientists and international collaborators have used one of the largest cosmological simulations ever created to "fast-forward" the universe from the "Big Bang" all the way to the present day inside a supercomputer.

The project, called HyperMillennium and led by the National Astronomical Observatories of the Chinese Academy of Sciences, simulates a cubic volume of space with a side size of 12 billion light years. That is roughly equivalent to lining up about 120,000 Milky Way galaxies end to end.

Inside this digital universe, 4.2 trillion virtual dark matter particles evolve under gravity, reproducing 13.8 billion years of cosmic history. Dark matter refers to an invisible form of matter that does not emit or absorb light but is believed to make up about 85 percent of all matter in the universe and to provide the gravitational "framework" on which galaxies form.

"Due to the vast scale of the universe and the long course of its evolution, the distant galaxies observed through telescopes are actually static snapshots dating billions or even tens of billions of years ago, making it impossible to track their evolution in real time," said Gao Liang, a professor at the CAS' National Astronomical Observatories who leads the project.

Gao said ordinary matter that emits light represents only the "visible surface" of the cosmos, while dark matter forms its "invisible skeleton". Because dark matter does not interact with electromagnetic radiation, it cannot be directly observed with telescopes.

"Cosmological simulations are the key to solving this puzzle. By calculating the gravitational interactions among vast numbers of virtual dark matter particles, they can reconstruct — with high precision — the evolution of the universe from its early days to the present, allowing us to directly 'see' how dark matter particles cluster, distribute, and form structures over time," he said. "By comparing simulated virtual universes with real telescope observations, scientists can test and refine theoretical models of dark matter and dark energy."

Wang Qiao, a researcher at the observatory, said next-generation sky surveys are increasing demand for such simulations. These include the European Space Agency's Euclid mission and the China Space Station Telescope.

He said simulations must balance two competing requirements: a large enough volume to match the scope of sky surveys and extremely fine resolution to capture the formation of small galaxies.

"The emergence of ultra-large-scale cosmological simulations like the HyperMillennium aims to bridge the gap driven by observational progress, providing a crucial link in humanity's quest to understand the universe's ultimate mysteries," Wang said.

Globally, he noted, there are now three major simulations tracking trillions of dark matter particles: Japan's Uchuu simulation, Europe's Flagship 2, and China's HyperMillennium. The Flagship 2 emphasizes large cosmic volume, while the Uchuu focuses on high resolution. According to Wang, the HyperMillennium combines both strengths.

Wang added that the HyperMillennium runs on China's ORISE supercomputer, using software optimized for that system.

The simulation of 4.2 trillion particles produced about 13 petabytes of data — roughly equivalent to 13 million high-definition movies. A petabyte is 1,000 trillion bytes of data. Processing this dataset required 16,000 accelerator computing cards working for 18 days, underscoring advances in high-performance computing.

The first academic paper from the project was recently published in the Monthly Notices of the Royal Astronomical Society. It focused on Abell 2744, a giant galaxy cluster known for its complex structure and extreme gravitational interactions. The study found that the simulation closely matches real observations, supporting its accuracy in simulating rare and complex cosmic systems. The first batch of data will be made available worldwide later.

Mike Boylan-Kolchin, a professor at the University of Texas in the United States, described the simulation as "a computational marvel that will help unlock fundamental physics from observations of the cosmos".

"It has an unprecedented range of volume and mass resolution, enabling detailed predictions about how huge numbers of relatively common galaxies are distributed across the cosmic web and the properties of inherently rare and interesting objects that are inaccessible with smaller volumes. The HyperMillennium simulation will be a touchstone for the galaxy formation and cosmology communities for years to come," he said.

Volker Springel, director of the Max Planck Institute for Astrophysics in Germany, said he was struck by the simulation's scale and precision, adding that it "redefines what is nowadays possible in numerical cosmology".

BLCU aims for 16,000 intl students by 2030

By ZOU SHUO
zoushuo@chinadaily.com.cn

Beijing Language and Culture University plans to expand its international student population to 16,000 by the end of the 15th Five-Year Plan period (2026-30), with degree-seeking students expected to reach 8,000, according to university president Duan Peng.

In an exclusive interview with China Daily, Duan said BLCU currently hosts 12,000 international students for the 2025 academic year — a 3.5-fold increase from 2023. Among them, 4,300 are undergraduate, master's or doctoral candidates, marking a fivefold rise in degree-seeking students over the same period. The university now ranks first in China for both total international enrollments and degree-pursuing international students.

"Our historical peak was in 2009, with about 8,000 to 9,000 international students. Today we have surpassed that," Duan said. "Back then, degree students numbered around 1,500; now we have over 4,300 — more than double."

Since its founding in 1962, BLCU has cultivated 300,000 international alumni, including 300 ambassadors. Among them are 11 current foreign ambassadors to China who are BLCU graduates.

"These alumni serve as enduring bridges of friendship and understanding," Duan said.

To achieve its 2030 target, BLCU is leveraging its global network of 29 Confucius Institutes and classrooms, four China institutes, Tokyo College of BLCU, Beijing Language and Culture University Bangkok College, BLCU Kazakhstan and the BLCU Saudi Arabia program.

The university has diversified its academic offerings beyond language education to include business, artificial intelligence, computer science and joint engineering programs.

Looking ahead, Duan said the university will broaden its outreach to attract outstanding students worldwide.

"The goal of making China a top study destination is one that all of us in higher education should strive for," he said.

Andriantina Princie Fandresena, a 21-year-old doctoral student from Madagascar, said she has been in China for nearly three years and considers BLCU her second home.

Duan Peng

"I share my daily life on social media — the campus, the scenery, even Chinese songs I've translated into Malagasy — to help more people understand China. I am also researching how to introduce Malagasy culture to Chinese friends," she said.

She added that she often posts practical tips for prospective students from Madagascar, helping them navigate the application process.

"I want more people from my country to experience studying in China," she said.

Another student, Zechariah Werner Levi from the United States, gave up a career in commercial real estate to study at BLCU.

"I wanted to improve my Chinese and understand the Chinese market," he said. "China is hyperfocused on the future — AI, electric cars, consumer services. I hope to work between the US and China someday."

He has since invited his father, mother, brother, sister and best friends to visit China.

"Showing the real China is the best way," he said.

He also posts on social media to give US citizens a more authentic picture of daily life in China.

"I haven't felt any discrimination — people are super nice and welcoming. And the digital ecosystem here — WeChat, delivery, even calling taxis — makes the US feel so slow when I go back," he added.

2 Guangdong museums win global design prize

By QIU QUANLIN in Guangzhou
qiuquanlin@chinadaily.com.cn

Top: Xuelei Fragrance Museum. PROVIDED TO CHINA DAILY
Above: Shenzhen Science and Technology Museum.
REN XIAOXIAO / FOR CHINA DAILY

Two museums in southern China's Guangdong province have been recognized in the Prix Versailles, a global architecture award established by UNESCO and the International Union of Architects, highlighting the country's advances in contemporary design.

The two are the Shenzhen Science and Technology Museum in Shenzhen, a hub of China's reform and opening-up, and the Xuelei Fragrance Museum in Guangzhou, the provincial capital.

"The award showcases the systematic construction, contemporary expression and cultural confidence of China's fragrance culture to the world," said Weng Haocong, director of the Xuelei Fragrance Museum.

Widely regarded as a major prize in architecture and design, the 2026 list of the world's most beautiful museums — commonly known as the Prix Versailles — was announced in France on Monday.

The award recognizes outstanding contemporary architecture and spatial design projects worldwide, emphasizing how architecture responds to urban, cultural, ecological and public life challenges.

According to the organizers, the award values innovation, local cultural expression, ecological efficiency, social interaction and public engagement.

The Shenzhen museum, with a building area of about 128,300 square meters, features a 38-meter-high atrium and permanent exhibition halls covering 35,000 sq m.

Its exterior incorporates cutting-edge technology that creates visual illusions, changing appearance with different weather conditions and times of day. Because of its futuristic design, it has been dubbed "the big spaceship" by locals and visitors, and has become a new landmark for science and culture in the Guangdong-Hong Kong-Macao Greater Bay Area.

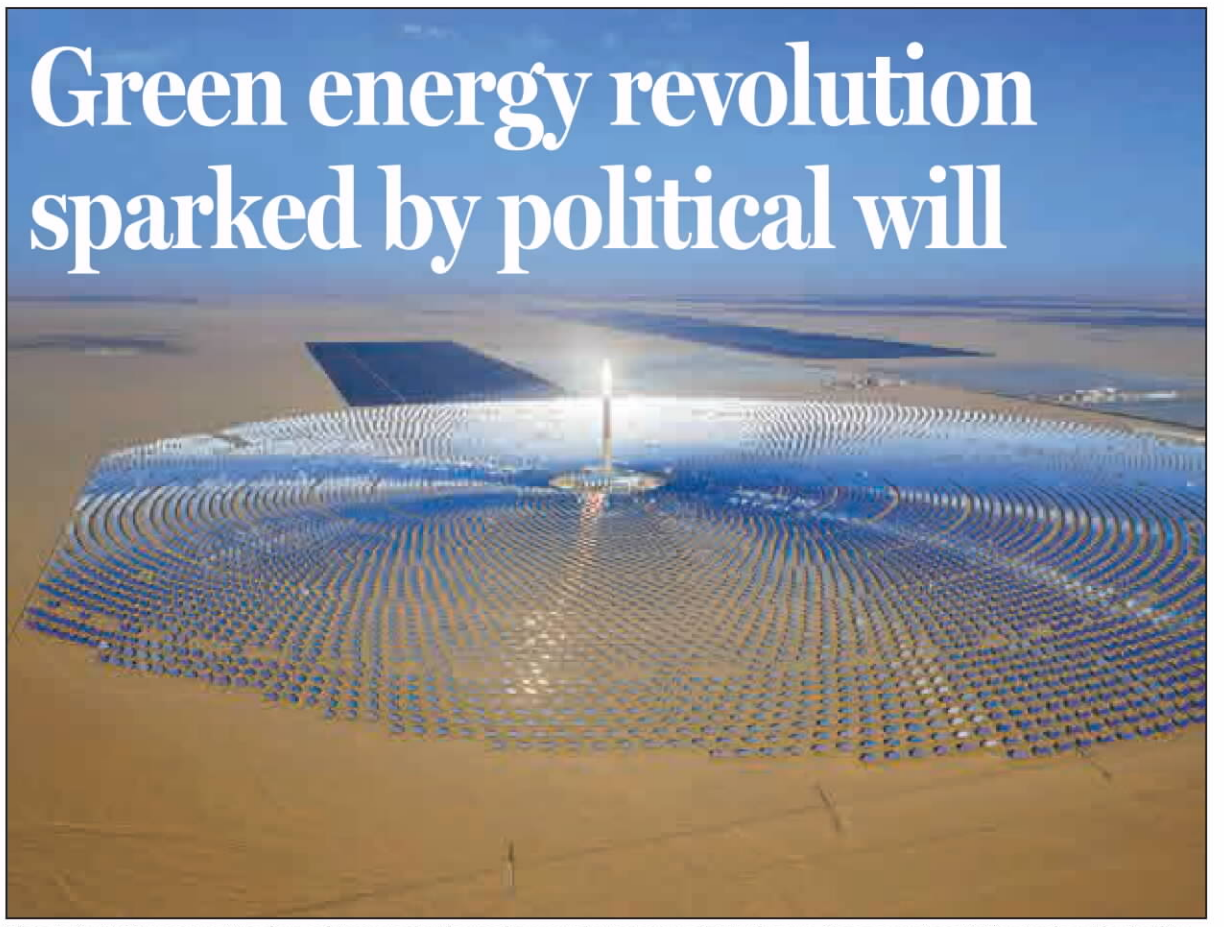
The Guangzhou-based fragrance museum received the honor after being certified by the Guinness World Records in November as the largest fragrance museum.

Located in Baiyun district, it has an immersive space of over 9,500 sq m, with 18 themed exhibition areas, more than 50 interactive installations and over 300 scent points.

The structure is composed of clusters of red-brick cylinders inspired by the distillers used in modern perfume-making, resembling a "fragrance castle" that appears to breathe.

Unlike traditional museums that focus primarily on visual experiences, it offers a sensory journey centered on smell, providing visitors with a distinctive immersive experience.

For Guangzhou, the recognition signals an expansion of the city's cultural and tourism offerings beyond sightseeing and cuisine to more nuanced sensory experiences, Weng said.



Chen Shaofeng, chairman of the Guangdong Provincial Museums Association and deputy director of the Guangdong Museum, said the fragrance museum, as a specialized institution, plays an important role in promoting fragrance culture.

Editor's note: *As protection of the planet's flora, fauna and resources becomes increasingly important, China Daily is publishing a series of stories to illustrate the country's commitment to safeguarding the natural world.*

Green energy revolution sparked by political will

China's first 100-megawatt molten salt tower solar thermal power plant operates in Dunhuang, Gansu province, in September. The facility, completed in late 2018, is able to generate some 390 million kilowatt-hours of green electricity every year. PROVIDED TO CHINA DAILY

Adaptive legal framework supercharged nation's renewable network rollout

By HOU LIQIANG
houliqiang@chinadaily.com.cn

When the Renewable Energy Law took effect in 2006, China's clean tech sector was a fraction of its current size, struggling to compete as the country wrestled with severe, localized power shortages.

Two decades later, the transformation is staggering. By 2025, renewable electricity generation in China reached approximately 4 trillion kilowatt-hours, exceeding the total consumption of the European Union's 27 member states. More than 60 percent of China's installed power generation capacity comes from renewable sources.

This meteoric rise from a marginal player to the global leader in renewables was not an accident of the market; it was engineered by forward-thinking legislation. According to energy experts, the 2006 law provided the vital regulatory foundation required to transform an energy crisis into an economic opportunity.

Zhou Dadi, executive vice-chairman of the China Energy Research Society, explained that the law was enacted against the backdrop of severe domestic electricity shortages and intensifying international climate negotiations.

Accelerated economic development following the country's reform and opening-up in 1978 further worsened the electricity supply, making rolling blackouts a frequent occurrence, he told China Energy News. On the international front, the United Nations Framework Convention on Climate Change, signed in 1992, established the principle of "common but differentiated responsibilities".

Although developed countries accounted for 60 percent of global greenhouse gas emissions at that time, and China's emissions remained far lower than those of developed economies, the country's total energy consumption — given its vast population — could no longer be overlooked, Zhou said.

The enactment of the Renewable Energy Law proved to be the decisive answer. It established renewable energy as a priority category, granted it policy preferences, and provided the legal guarantees required to launch the industry.

In 2003, the National People's Congress, China's top legislature, listed renewable energy legislation on its priority agenda.

Wang Zhongying, a key participant in drafting the law, recalled 2004 as a critical turning point that sped up its passage. That year, China announced to the world that it would enact the law at the International Conference for Renewable Energies in Bonn, Germany.

Wang highlighted the important role of international cooperation in shaping the law.

"Through renewable energy research projects with the World Bank and the United Nations Development Programme, as well as group study tours organized by different departments to Germany and Denmark, we deepened our understanding of renewable energy and accelerated the law's drafting," he said.

The efforts of Wang and his team saw the law, featuring classified pricing, guaranteed purchase and special funds, adopted in February 2005.

Qiao Liming, former head of Asia at the Global Wind Energy Council, said that while the law initially provided the framework and policy direction, it was the subsequent series of implementation rules that truly drove the market.

A spiral case stay ring is fixed at a pumped storage hydropower station in Hami, Xinjiang Uygur autonomous region, last month. CAI ZENGLE / FOR CHINA DAILY

A worker installs photovoltaic panels on a hillside in Anqing, Anhui province, last month. WU JUNQI / FOR CHINA DAILY

She pointed to the fixed feed-in tariff policy — borrowed from the German model — as the most critical element. "It allowed renewable power to be stably connected to the grid and sold, thus opening the door to the market," she said.

China's feed-in tariff mechanism — with classified price levels for different technologies and resource regions — requires grid operators to purchase renewable electricity at government-set prices, a guaranteed above-market rate funded through a small surcharge on electricity bills.

After six adjustments to subsidies for wind power and eight for solar, newly approved onshore wind and solar projects in China have achieved grid parity, with their on-grid tariffs set at the same level as local coal-fired power since 2021.

For the first decade after the law's enactment, China's wind power capacity grew 120-fold, from 1.26 million kilowatts to 150 million kW, while solar module prices fell to just one-tenth of their original cost.

However, as the industry expanded, challenges emerged. By the first half of 2016, the volume of curtailed wind and solar power had already surpassed the total for all of 2015. To address this, authorities replaced the full-guaranteed purchase mechanism with renewable portfolio standards in 2019, setting out binding targets for renewable consumption in each province.

In 2017, the Green Electricity Certificate was launched to provide a standardized way for businesses to track and verify that the power they consume comes from clean energy.

Dimitri de Boer, director for China at ClientEarth, an environmental law organization, noted that legislation must not remain static in order to be effective.

"Over time, the law, together with supporting policies, has gradually optimized the framework from administratively set prices, to competitive allocation, to full market integration and grid parity," he said.

De Boer said the second and current revision of the law provides an opportunity to further enhance its effectiveness in light of new and emerging trends.

He said further incentives for energy storage, demand-side response and flexible electricity pricing, for example, can help the energy system to adapt to the next stage of the energy transition, especially as China moves toward very high renewable penetration scenarios.

Equally, it's important to clarify the role of coal in the new system, repurposing it from base-load power to peaking power provision, he added.

De Boer suggested the circular economy and recycling in renewable energy industry chains, especially as the early installations begin to retire, become key focuses of the revision.

"At the same time, we need to ensure that renewable energy doesn't have an excessive impact on biodiversity," he said.

Beyond its domestic impact, China's rapid expansion of clean energy spurred by this legislation has had global significance. By driving down component costs and turning climate action into an economic opportunity, China has made the global energy transition faster, more efficient and far more accessible to developing nations.

De Boer said the share of oil and gas in China's primary energy needs is now only half that of the United States or the EU, meaning China is better insulated from global energy price shocks than many other major economies.

Reducing exposure to volatile fossil fuel markets, he suggested, offers a practical lesson for other nations.

The incredible progress in renewable energy sectors in China is one of the greatest contributions to climate action globally, as it provides the solutions needed by the entire world, De Boer said.

"China has helped to turn climate action from a burden into an economic opportunity," he said.

"Without China's clean energy achievements, the global energy transition would be more expensive, less efficient and take much longer."

Law just one part of key drivers of power transition

Hou Liqiang
Reporter's log

This year marks the 20th anniversary of China's Renewable Energy Law coming into force — a milestone many developing nations now turn to for reference as they scramble to accelerate their own energy transitions.

And rightly so. The law signaled strong political will and kicked off one of the fastest energy transitions in history — one that started almost from scratch. Today, renewable energy accounts for over 60 percent of China's total installed power generation capacity, with total installed renewable capacity surpassing 1,800 gigawatts in 2025.

China's experience in promoting energy transition holds significant potential for many developing nations, as it is not far from other developing states in terms of development stages. As Nigeria's Minister of Environment, Balarabe Abbas Lawal, once stressed in an interview with China Daily, China "understands what we are going through because they have just gone through it".

Yet, we must be careful not to over-romanticize China's experience in renewable energy development — particularly the law's role. Doing so risks missing some key drivers of China's success: its vast domestic market and complete industrial chain. These are precisely what many developing countries lack.

Consider China's geography — from 1.3 million square kilometers of desert in the northwest to 4.73 million square kilometers of maritime territory, spanning multiple climate zones from tropical to cold temperate. This diversity allowed China to test and scale a wide range of renewable technologies under different conditions. Its massive population and industrial base created unparalleled economies of scale, driving down the cost of solar panels and wind turbines to record lows.

But for many much smaller nations with limited land, fragmented infrastructure, or a small electricity market, copying the law without these structural advantages may lead to disappointment.

The hard truth? No amount of legislation can substitute for market scale or an integrated industrial ecosystem. Even China succeeded not by law alone — but through intense bilateral and multilateral cooperation.

The country learned from Germany and Denmark through demonstration projects, welcomed international investment, and trained a generation of policymakers, entrepreneurs and skilled workers. That cooperation — not the law in isolation — built today's giants, such as wind turbine giant Goldwind and BYD, the latter selling 4.6 million new energy vehicles in 2025.

Therefore, developing countries cannot go it alone. They must deepen South-South cooperation — sharing regional markets, jointly building supply chains, and co-investing in manufacturing. Some capacity may be outdated for China but remains highly useful elsewhere, as it can help developing nations start to build their own industrial chains — the key to future takeoff.

Thus, developing nations should set ambitious goals, but begin with humility. The law offers a compass, but only cooperation can pave the road.

Report: China, Philippines cooperation on electricity a 'win-win'

By HOU LIQIANG

The Philippines and China could benefit from a wealth of untapped potential in renewable energy cooperation, capitalizing on the Philippines' natural resources and Chinese know-how, according to a recently released report.

By partnering with China on renewables, the Philippines could fast-track its shift to clean energy and unlock a strategic market for Chinese companies, creating a "win-win" scenario, the report said.

The Bridging Opportunities: A Roadmap for China–Philippines Renewable Energy Cooperation report was compiled and released in April by People of Asia for Climate Solutions, a Manila-based NGO, and global nonprofit New Energy Nexus.

The report comes as the Philippines strives to raise the share of renewables in its energy mix to 35 percent by 2030 and 50 percent by 2040, while fossil fuels continue to dominate at roughly 78 percent.

The country's energy transition has become more urgent amid the ongoing fossil fuel crisis, as it remains heavily reliant on crude oil imports, the study said.

The Philippines imports 98 percent of its crude oil from the Middle East, according to the country's Department of Energy.

Today's oil crisis is a reminder that the Philippines remains highly exposed to global fuel shocks. What this report shows is that the solution is already within reach, said Brenda Valerio, country director for the Philippines at New Energy Nexus.

"With the right partnerships, we can accelerate deployment while building domestic capability, jobs, and more affordable energy for households and businesses," she said.

While diplomatic ties between the Philippines and China span five decades, collaboration in renewable energy remains limited. The study found that the opportunity is not simply in increasing capital flows, but in structuring partnerships that drive shared growth, including joint ventures, local manufacturing partnerships, knowledge transfer and technical capacity development that anchor value within the Philippines.

Valerio said the Philippines has abundant renewable resources from solar and wind to geothermal. With clear policy direction for energy transition, the country's electricity demand continues to grow, creating a strong market for new capacity.

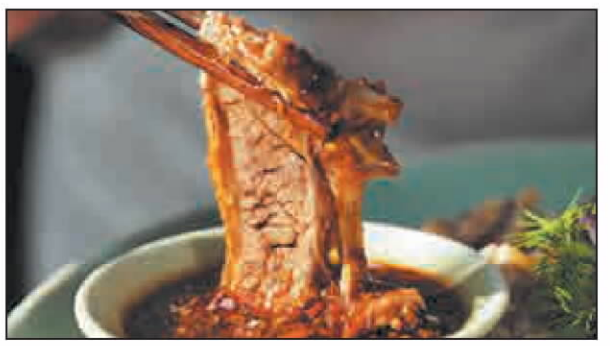
Despite this, however, she pointed out several important concerns that make international companies, especially those from China, hesitate to engage in the country's renewable energy development.

She noted policy inconsistency as the most frequently cited challenge. "Not necessarily the absence of policies, but gaps in implementation. So processes can be slow or unclear, which creates uncertainty for investors," she said.

She added that the complexity of permitting and regulatory requirements — which can lengthen project timelines and increase costs — along with infrastructure constraints, are also factors to blame.

Chinese renewable energy companies bring extensive experience in technology, manufacturing, and large-scale deployment. The study found that collaboration should expand to distributed and community-based solutions such as rooftop solar and microgrids, which can be deployed faster and help address grid constraints.

"This can be a perfect match. The Philippines has rich renewable resources and urgent needs, while China has strong capacity and readiness. Together, we can deliver clean, safe and affordable electricity for Filipino communities," said Wang Xiaojun, executive director at People of Asia for Climate Solutions.



"The longer we hesitate, the more we lose," he said.

LIFE

From top: Dishes Sun Lixin has taught the public via video, including Huaishan Four Treasures Soup (made with Chinese yam, cauliflower mushroom, cordyceps flower and chicken), beef ribs with dipping sauce, and braised pork knuckle.

Sun Lixin, former executive chef of a century-old restaurant and a veteran of state banquets.

Banquet halls to home stoves

Once a master of state dinners, Sun Lixin now teaches cooking to millions online, proving that even the most refined dishes can live on in everyday, family kitchens, **Li Yingxue** reports.

From top: More of Sun's creations include blueberry Chinese yam, a chicken dish, and a fish dish. PHOTOS BY ZHANG WEI AND PROVIDED TO CHINA DAILY

Deep in the maze of Beijing's *hutong* (alleyways), inside a lived-in *siheyuan* (enclosed courtyard), the air is thick with steam and the steady crackle of fire. A wok flashes over an open flame. Oil shimmers, spits, and releases a familiar, irresistible aroma.

Leaning toward a slightly trembling phone camera, a nearly 70-year-old chef speaks in a warm Beijing drawl: "Watch this step carefully — this is called coating. Don't lose focus."

To millions online, he is simply "Second Uncle". In real life, he is Sun Lixin — once the executive chef of the century-old restaurant Bianyifang, best known for its Peking duck, and a veteran of countless state banquets.

In 2019, alongside Zheng Xiusheng, the former executive chef of the Beijing Hotel, he co-founded "Lao Fan Gu", a moniker meaning veteran master chefs. The duo's account has since amassed a Douyin (a social media platform) following of more than 16 million.

But Sun's journey to internet fame was anything but overnight.

Born in 1956, Sun stepped into the kitchen straight out of middle school. His formative years were shaped by Tuo Dailiang, a revered Sichuan cuisine master who once oversaw a massive national banquet marking the 10th anniversary of the People's Republic of China (in 1959).

At 16, Sun learned his first dish, Kung Pao Chicken, and never strayed far from its disciplined principles: a balance of numbing spice, heat, savoriness, freshness, and a subtle sweet-sour finish; precision in knife work; and harmony in texture.

"My master cooked for top leaders, but he was always extremely low-key," Sun recalls. "He told me not to chase fame, just focus on making every meal well."

That philosophy would later define Sun's own career. By his 20s, he had already risen to head chef at one of China's earliest foreign-affairs hotels. Over decades, he became known not only for preserving tradition but also for quietly pushing its boundaries.

One of his most unlikely legacies is a dish now found on menus across China: blueberry yam.

The idea emerged from thrift. While preparing a traditional dish of osmanthus yam strips, Sun found that scraps were inevitably discarded. Unwilling to waste them, Sun steamed and mashed the leftovers.

The result was bland — until he borrowed from Western pastry techniques, adding whipped cream and condensed milk, piping the mixture into delicate mounds, and finishing it with blueberry sauce. What began as an anti-waste experiment became a nationwide staple.

If blueberry yam was an inspired improvisation, Sun's reinvention of roast duck was a deliberate, years-long pursuit.

After taking on a leadership role at Bianyifang, he noticed a shift in diners' expectations toward healthier eating. Roast duck, an iconic dish of Chinese cuisine, was synonymous with richness. Sun wanted to change that without losing its soul.

Starting in 2003, he worked with nutrition experts to overhaul the process. Vegetable juices replaced traditional marinades. Even the liquid poured into the duck cavity — once spiced water — was reimagined. The result was a technique he describes as "roasting outside, simmering inside", producing a duck that was lower in fat and oil while retaining its signature depth of flavor.

The innovation earned a national patent and industry acclaim. But for Sun, the goal was never recognition. It was continuity.

"Preserving tradition doesn't mean refusing changes," he says. "You keep the roots, but give them new life for today."

Having already modernized state banquet dishes for changing tastes, Sun soon realized the medium for sharing them also needed to evolve. In 2019, he turned to a different audience: home cooks.

"Lao Fan Gu" began modestly on Douyin. Early videos were sprawling, sometimes stretching a single dish across dozens of episodes. Viewers quickly lost patience. The team adapted, condensing lessons into concise, digestible segments. Then came a breakthrough: a meticulous re-creation of a historic state banquet menu sparked a surge in followers.

What sets "Lao Fan Gu" apart is not production polish, as there are no studio lights or staged backdrops, but authenticity. Filmed in a real, working home kitchen, the videos capture Sun and Zheng in constant motion, joking like crosstalk performers as they cook. Fans have dubbed it "the crosstalk kitchen".

Yet beneath the humor lies rigor. When demonstrating a smooth walnut dessert once served at state banquets, Sun pauses to emphasize a point: even a stray piece of jujube skin, he notes, would count as a serious mistake in a professional kitchen.

As their audience grew, so did its diversity. Some viewers were complete beginners; others were seasoned chefs. Striking a balance became a challenge.

"If it's too technical, beginners can't follow it," Sun says. "If it's too simple, professionals don't learn anything."

The solution was a dual-layered approach: precise breakdowns of advanced techniques alongside plainspoken explanations in everyday language. Complex methods like stock-making or battering are dissected step by step, while timing and heat are explained in a way that anyone with a home stove can grasp.

The impact is tangible. Viewers often return with updates — moving from tentative first attempts to proud successes — as the once-intimidating kitchen becomes a space of growing confidence.

One user, "yuanfangchuanlaifengdi", commented under a braised pork ribs video: "So detailed! I followed your recipe today — my ribs are stewing now, can't wait." Hours later, he returned with an update: "It's delicious. I used to add so many seasonings, but this simple version tastes even better."

Sun recalls a letter from a woman whose marriage had been on the verge of collapse. Her husband, once disengaged from household life, began cooking after watching "Lao Fan Gu". Gradually, he became more involved at home. "You saved my family," she wrote.

For Sun, the message was clear. "Cooking is a kind of glue for family harmony," Sun reflects. "That's the real meaning behind our motto: we cook well, and you eat well."

Today, "Lao Fan Gu" extends beyond short videos. The team develops ready-to-eat products, visits university campuses, and hosts livestreams demonstrating intricate regional dishes. Their audience's questions — about nutrition, relationships, daily life — have broadened the scope of what began as a cooking channel.

In 2022, Zheng passed away, marking a profound loss. However, the project continues, joined by other veteran chefs, including 75-year-old master chef Hou Yurui, a national judge and expert in Hunan cuisine. Known for his gentle demeanor and focus on health, Hou excels at explaining the underlying logic behind cooking techniques.

Alongside these seasoned masters, younger apprentices increasingly appear on camera, continuing the intergenerational relay of culinary knowledge. Sun remains at the center, steady as ever.

From a teenage apprentice to a master of state banquets, and now a mentor to millions of home cooks, his journey reflects a quiet arc of return. The techniques may be refined, the platforms modern, but the purpose is unchanged.

"In fact, banquet menus are quite simple, with many dishes using everyday ingredients," Zheng once said. "We hope people can learn them and re-create them at family gatherings, passing them down through generations."

That vision endures. In kitchens far from Beijing's *hutong*, in the glow of phone screens and the rhythm of home stoves, Sun and the "Lao Fan Gu" team continue to translate the grandeur of the banquet table into something intimate, repeatable and alive — one dish, one family, one generation at a time.

From indigo dye to dough art, Xinzhou turns tradition into experiences

TAIYUAN — In an ancient courtyard in Xinzhou city, in North China's relic-rich Shanxi province, Cui Yafei saw a plain white silk scarf turn lush green after it was soaked in dye for 10 minutes, and watched as it then turned indigo within minutes of being exposed to the air.

"Everyone is a designer here. Every piece is a unique memory shared between us and the traditional natural dyeing technique," says Cui.

For her, the hands-on process is far more rewarding than simply taking "check-in" photos at famous landmarks.

The "magic" is part of a traditional natural dyeing technique, a municipal-level intangible cultural heritage project in Xinzhou. The indigo dye is extracted from the leaves of isatis root, a herb that Zhao Hui, the local inheritor, treats with profound respect.

"If maintained well, the dye could outlive me," Zhao says, noting that her workshop in Xinzhou ancient city now offers over 100 different color variations, which are attracting a growing number of young visitors.

Steps of Dong ethnic embroidery (left) and indigo dyeing (middle and right) captured on April 21 in Liping county, Guizhou province. PHOTOS BY XINHUA

The rise of the "handmade economy" marks a shift in Chinese consumption trends, where travelers increasingly seek cultural experiences and emotional value over material purchases.

Xinzhou, known in ancient times as Xiurong, with a history dating back to the late Eastern Han Dynasty (25-220), has transformed into a living folklore museum, integrating cultural heritage protection with high-quality tourism development.

Just steps away from the dyeing workshop, another group of tourists was busy kneading dough at a traditional *huamo* (steamed buns with elaborate decorations) shop. Under the guidance of Gao Juan, a district-level inheritor of the local *huamo*-making techniques, a lively fish-shaped *huamo* took form in seconds.

"Beyond traditional shapes, we now offer tourists an experience of making cartoon-style buns," Gao says, adding that her business has significantly benefited from the "heritage plus experience" travel model.

Local government support has played a crucial role in the revival. To date, 30 creative cultural shops have opened on a dedicated street in Xinzhou ancient city, including 12 intangible cultural heritage projects.

The trend is resonating across China. In Jingdezhen, Jiangxi province, young people are lining up to try their hands at the pottery wheel; in Jiangsu province's Suzhou, crowds gather to craft unique lacquer fans using mineral pigments; and in the tea workshops of Fujian province, visitors learn the 1,000-year-old art of tea making from master craftsmen.

Experts believe the shift reflects a profound change in consumer demand. "Consumers are no longer satisfied with passive reception; they are more willing to pay for unique emotional value, social experiences, and memories of the process," says Yan Chun, a folklore scholar and associate professor at Shanxi Normal University.

The rise of the "handmade economy" has taken ancient traditions out of deep alleys and brought them to the public, activating new consumption momentum, Yan adds.

CULTURE

Sketching from memories

Picture book artist taps her inner child and grandmother's stories to create award-winning works, report **Li Muyun** and **He Chun** in Changsha.

"Everyone has a child inside," says Cai Gao, the 79-year-old renowned picture book artist who has spent decades nurturing her inner child and her work. "Anything that stops me from being a child, I cut it loose. No mercy," she asserts.

This unwavering inner child has propelled her to the pinnacle of her career. On April 13, Cai became the first Chinese illustrator to receive the Hans Christian Andersen Award, the highest international accolade given every other year to writers and illustrators of children's books. The announcement was made at the annual news conference of the International Board on Books for Young People (IBBY) during the Bologna Children's Book Fair in Italy.

The night she received the news, Cai's thoughts were not on the prize or herself, but on the people and the land that shaped her.

Born in 1946 in Changsha, the capital city of Central China's Hunan province, Cai grew up during the last days of an era when stories were passed down orally from generation to generation. Her worldview was profoundly influenced by the tales her grandmother shared with her while sitting in the courtyard, sewing by hand.

She fondly recalls her grandmother in an immaculate plain blue cotton gown with a fresh flower — either a jasmine or gardenia — pinned to her collar.

"She loved life, and made our daily existence feel like a celebration," Cai reminisces, adding that her grandmother often took her to see both local and visiting opera troupes. This exposure allowed Cai to sketch the characters and preserve the performances in her memory.

Despite never having the opportunity to attend art school, Cai considers her childhood experiences — playing in the courtyard of pomegranate trees, listening to her grandmother's nursery rhymes, and watching theater plays — as the "best education".

"My childhood cannot be replicated," she says. "I'm lucky to have had all of that."

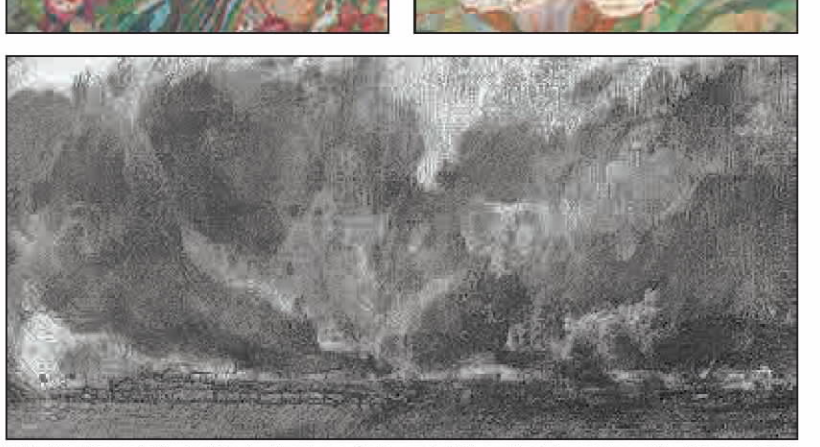
Many of her books echo her childhood memories, including *Where the Moon Goes, I Go*.

"The girl picking the pomegranate in that book is me," she says with a broad smile. "It's easy to illustrate your own childhood. Art is not such a big deal for me because it is never far from life."

Graduating from Hunan First Normal School (now Hunan First Normal University), Cai began her career as a rural teacher. Despite the challenges of rural life, she found beauty in her surroundings and never abandoned her passion for art. Reflecting on her six years working and living in the countryside, she describes herself as a "Sunday artist", seizing any spare moment outside of her teaching duties to pick up her brush.

In 1982, at 36, Cai started working as an editor for children's books at Hunan Juvenile and Children's Publishing House in Changsha. This position allowed her to delve deeply into the world of picture books, both editing and illustrating. Her talent was internationally recognized in 1993 when her book, *Bao'er*, won the Golden Apple Award at the 14th Biennial of Illustration Bratislava, making her the first Chinese artist to receive this prestigious accolade.

Cai Gao (right) interacts with readers at a book sharing and signing session in Changsha, Hunan province, on April 18.
PHOTOS PROVIDED TO CHINA DAILY



> "The girl picking the pomegranate in that book is me ... Art is not such a big deal for me because it is never far from life."
>
> **Cai Gao,** the first Chinese illustrator to receive the Hans Christian Andersen Award

Top: Illustrations from Cai's work *How I Came to Be Me*. **Above left:** An illustration from Cai's work *Where the Moon Goes, I Go*. **Above right:** Another illustration from Cai's *Blazing City 1938*.

The story of *Bao'er* is adapted from a tale by Qing Dynasty (1644-1911) novelist Pu Songling's masterpiece *Liaozhai Zhiyi* (Strange Tales from a Chinese Studio). Cai selected the only story featuring a child as the protagonist and reimagined it, focusing on a boy's love for his mother and his courage in confronting evil and darkness.

In Cai's book, when the boy focuses intensely, his eyes turn a clear blue, symbolizing his determination and insight. "Blue is the color of enchanting, clear water, with sunlight lingering deep inside," Cai explains. "Children's eyes are clear and innocent, allowing them to see through to the essence of things."

Like *Bao'er*, many of Cai's works are deeply rooted in Chinese folk traditions and classical literature.

The picture book *The Land of the Peach Blossom* is inspired by the classic essay and poem *The Peach Blossom Spring* by Tao Yuanming from the Eastern Jin Dynasty (317-420), reflecting the Taoist vision of life. Published in 2001 by Fukuinkan Shoten Publishers in Japan, the book's first edition of 5,000 copies sold out within a month. In 2003, two illustrations from the book were selected for inclusion in Japanese sixth-graders' Chinese textbooks.

Tan Fengxia, a professor at Nanjing Normal University and a member of the 2026 Hans Christian Andersen Award jury, praised Cai's work as a powerful model for how Chinese stories can transcend borders.

"She has embraced Western artistic influences with an open mind, blending them into a visual language that is distinctly rooted in Chinese tradition, yet speaks across cultures," Tan says. "She crosses cultural barriers by touching on universal themes: the love for our children and the desire to offer them something bright."

"I love Chinese culture. I love every written character of the Chinese language," Cai says. "I hope the world can see more of the finest Chinese works and, through them, gain a better understanding of China."

Among the works that most impressed the HCA jury was the 2023 edition of *Blazing City 1938*, a wordless, black-and-white picture book created by Cai and her daughter Xiao Aozi, who is also a painter. Through the eyes of a little girl, the book revisits the Wenxi Fire, a devastating catastrophe in Changsha during the Chinese People's War of Resistance Against Japanese Aggression (1931-45). The fire destroyed over 90 percent of the houses in Changsha, leaving the city in ruins.

Shereen Kreidieh, president of the HCA Jury, describes Cai's work as "amazing".

"With just two colors and no words, it tells a complete story of war, allowing any child anywhere in the world to have a feeling of what's happening," Kreidieh says.

With her books, Cai hopes to convey the Chinese people's love for peace, a message she believes is increasingly important in today's global context.

"Our picture books should serve as bridges of understanding, bringing more harmony to the world," she says.

Chinese animation selected for prestigious film festival

By ZHANG KUN in Shanghai
zhangkun@chinadaily.com.cn

The Chinese animated feature *Nobody* has been selected for the Annecy International Animation Film Festival's official feature film competition, one of the festival's most prestigious sections, organizers announced in late April.

The festival, which was established in 1960, is held annually in France and is globally recognized as the premier animation film festival.

The 2026 edition is scheduled to take place from June 21 to June 27.

Produced by Shanghai Animation Film Studio and Shanghai Film Infinity, *Nobody*, or *Langlang Shan Xiao Yaoguai* in Chinese (The Little Monsters of Langlang Mountain) is a feature-length spin-off of the acclaimed animated short film anthology *Yao-Chinese Folktales*. It was released domestically on Aug 2 and achieved phenomenal success with a cumulative box office of 1.72 billion yuan ($252 million), setting a new all-time record for Chinese 2D animated films.

Written and directed by Yu Shui, the film follows a little pig monster, an outcast neglected by his boss, who inadvertently forms a grassroots counterfeit-pilgrimage team.

The group embarks on an absurd, self-styled journey to the West, hoping to receive immortality from Buddha. The film explores universal themes of family, friendship, growth, and dreams.

The competition section of the Annecy Festival is renowned for its stringent artistic standards and forward-looking industry vision, representing one of the highest benchmarks in global animation.

According to Shanghai Film Infinity, a subsidiary of Shanghai Film Group, the selection of the film is a significant milestone that not only marks another prominent showcase for Chinese animation artistry on the world stage but also opens a core channel to the global market, promising broader international attention and potential cooperation opportunities.

Following its domestic triumph, *Nobody* has begun its international release, opening in markets including Australia, Malaysia, New Zealand and the North American countries.

Its overseas performance has been notably strong in Vietnam, where it has already entered the top five highest-grossing Chinese-language films of all time.

Nobody continues a historic connection between Chinese animation and the Annecy Festival that dates back to 1962, when *Tadpoles Looking for Mother*, one of the world's first ink-wash animated short films, produced by Shanghai Animation Film Studio, amazed audiences with its unique techniques and won the Children's Film Award at Annecy.

Mozart takes center stage at NCPA May Festival

Beijing's flagship chamber music event returns with a star-studded lineup, marking the composer's 270th anniversary with global collaborations, **Chen Nan** reports.

Every spring, the National Centre for the Performing Arts in Beijing presents a grand celebration of chamber music — its annual NCPA May Festival.

Running until May 24, the festival is showcasing a diverse array of performances including new works, international ensembles, and the multifaceted forms of chamber music.

This year's festival is especially significant as it marks the 270th anniversary of the birth of Mozart. His works are being featured throughout the event, including at the opening concert last Friday.

Titled *Bows and Strings VI*, the concert saw an impressive ensemble of 10 distinguished artists, including renowned violinist Lyu Siqing, cellist Li-Wei Qin and clarinetist Wang Tao, joining forces with the China NCPA Orchestra under the baton of resident conductor Lai Jiajing.

Together, they performed several of Mozart's iconic masterpieces, including a groundbreaking version of his *Serenade in C Major, K 648*, newly adapted to include brass instruments and piano, which is a departure from traditional string arrangements. Referred to as "A Very Little Night Music", the serenade for two violins and bass is a previously unknown piece. Composed by Mozart when he was in his early teens, the piece dates back to the mid-to-late 1760s and consists of seven miniature movements for a string trio.

"This sense of collaboration and artistic exploration is at the heart of the NCPA May Festival, making it one of the most anticipated musical events of the year in China and beyond," said Lyu, the NCPA May Festival's artistic director, at the NCPA in Beijing on April 15. "With a diverse and star-studded lineup, the 2026 festival promises to be an unforgettable celebration of music, talent, and cultural exchange."

Beyond the opening concert, Lyu, who is also a leading performer at the festival, is presenting several more performances. On Monday, he collaborated with cellist Qin and pianist Chen Sa as a trio in a chamber music concert titled *Dawn and Echo in Vienna*, with music pieces such as Mozart's *Piano Trio in B-flat Major, K 502* and Franz Schubert's *Piano Trio No 2 in E-flat Major, Op 100 (D 929)*.

Then, on May 21, he will take the stage again with the Royal Scottish National Orchestra in a symphonic performance, paying tribute to the grandeur of classical music with pieces including Tchaikovsky's *Polonaise*, an excerpt from *Eugene Onegin*, Act 3, Scene 1, Op 24, and Jean Sibelius' *Violin Concerto in D Minor, Op 47*.

The festival will also feature an outstanding lineup of international and Chinese soloists, including violinist Ning Feng, pianist Zhang Haochen, and renowned ensembles such as the Berlin Philharmonic Piano Quartet, Cappella Andrea Barca, the Concertgebouw Chamber Orchestra, and the Hong Kong String Orchestra.

A highlight of the festival will be the performance by violinist Ning and his mentor, the esteemed German musician Antje Weithaas, who will perform alongside I Musici, which was founded in 1951 in Rome, Italy, and is one of the oldest active chamber music groups in the world. The duo will also join forces with the China NCPA Orchestra and conductor Lyu Jia for a performance of Mozart's *Symphony No 36 in C Major, K 425 (Linz)* on May 15, where Ning will take on the viola part, bridging the gap between violin and viola in a fascinating crossover.

Top: Violinist Lyu Siqing (third from right), the artistic director of the NCPA May Festival, announces this year's edition in Beijing on April 15. **Above:** The Berlin Philharmonic Piano Quartet will perform in Beijing on May 16.

For those who appreciate the richness of European chamber music, the festival offers an exciting opportunity to experience the Kodaly Quartet's 60th anniversary celebration, showcasing the unique flavors of Hungarian chamber music.

The Concertgebouw Chamber Orchestra will bring a poetic touch to the festival with its program, embodying the exquisite aesthetics of European chamber music. Additionally, the China NCPA Orchestra will collaborate with pianist Zhang Haochen in a unique fusion of works by composer Chen Qigang and Mozart.

The festival will close with a touch of jazz featuring the legendary Grammy winner Kurt Elling, one of the world's foremost jazz vocalists.

Cellist Qin, who has participated in previous editions of the NCPA May Festival, underscored the significance of chamber music in a recent interview. He highlighted how chamber music offers a unique opportunity for musicians to express their artistry beyond solo performances.

"In chamber music, the cello often plays the 'heartbeat' role, providing rhythmic support," he said at the NCPA in Beijing on April 15. "At first, this may seem monotonous or even boring, but as I gained more experience, I came to appreciate the flexibility of chamber music, the way it allows multiple musicians to combine their voices into a rich, multilayered performance. It's like being both a lead character and a supporting role in a film, and that complexity brings something special to the audience."

In keeping with its community engagement, the festival will once again feature its public performances, bringing music into the heart of the city. These concerts will reach audiences in urban spaces, such as factories, campuses and public areas, providing an opportunity for frontline workers and local residents to experience the joy and warmth of music.

Literature and learning bridge China and Greece

By **TAN YINGZI** and **DENG RUI** in Chongqing

Left: The 3rd Global Forum on Mutual Learning Among Civilizations began on April 16 at Southwest University in Chongqing. **Right:** A Greek guest tries traditional Chinese painting under the guidance of a teacher at the event. PHOTOS PROVIDED TO CHINA DAILY

The cultural ties between Greece and China are growing ever stronger, highlighted by a series of collaborative events and initiatives held in Southwest China's Chongqing recently to commemorate the 20th anniversary of the two countries' comprehensive strategic partnership.

Amid the buzz of these celebrations, Greek author and Chinese literature translator Dimitris Sotakis shared his excitement at the 3rd Global Forum on Mutual Learning Among Civilizations, held in mid-April. "We now have many possibilities for collaboration in China in the field of literature that I represent," Sotakis told China Daily.

He added that over the past year, his literary works have found a receptive audience in China, with his second book translated and published on the Chinese mainland. His invitations to major book fairs and events in China further underscore the growing interest in Greek literature.

"Contact with the Chinese language and its way of thinking also acts as a mirror for Greek. It forces us to reevaluate concepts we take for granted, to see our language not as something static, but as a dynamic system that evolves through encounters with differences. This interaction is not one-way, but a continuous dialogue that enriches both sides," he said, adding that there are still many significant contemporary Chinese writers whose works remain unknown in Greece, emphasizing the need for translation programs to bridge this gap.

Held from April 14 to 16 at the Center for Chinese and Greek Civilizations, also known as the Chinese KELKIP, at Southwest University in Chongqing, the forum brought together experts in the Greek language and culture from Greek universities and Chinese institutions with Greek studies departments across China, serving as a crucible of ideas and cultural exchange.

A highlight of the event was the launch of the Sino-Hellenic University Alliance for Mutual Learning Among Civilizations, which unites universities from both nations to foster educational exchange. This initiative promises to be a cornerstone for future scholarly collaboration.

The forum also saw the release of two book series aimed at enhancing mutual learning. One is the Contemporary Greek Legal Classics Translation Series — the first collection in China focused on Greek law. The other, the Documentary Series on Sino-Foreign Medical Exchanges Along the Silk Road, features Sino-Arab and Sino-Persian volumes.

Cui Yanqiang, director of the Chinese KELKIP, noted that the Greek law series was a collaborative effort between legal scholars and university professors from both countries.

In a video speech, Shahbaz Khan, director and representative of the UNESCO Regional Office for East Asia, commended the center for its efforts to promote dialogue, educational exchange, and deeper understanding between cultures. "By bringing together two rich intellectual traditions, the center has created a meaningful platform for reflection and cooperation," he said.

The celebrations continued on April 18 with a salon in honor of World Greek Language Day. The Ambassador of Greece to China, Evgenios Kalpyris, awarded representatives of nine centers of Greek studies at Chinese universities for their outstanding contributions to promoting Greek studies in China. He highlighted the Greek language's 4,000-year history and its "undeniable global dynamism".

Greece established the Greek KELKIP in Athens in 2021, while Southwest University, with its strong background in humanities and philosophy, especially in Chinese and Greek civilizations, collaborated with other Chinese universities to set up the Chinese KELKIP two years later to engage in comprehensive cooperation with Greece.

CHINA CLAIMS HISTORIC SILVER

Young, all-Chinese roster reaches heights not seen in three decades

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

From having to rely on naturalized troops at its home Olympics to securing a silver medal at the worlds with an all-Chinese roster, China's men's ice hockey has come a long way over the past four years.

With gloves tossed in the air and the crowd on its feet roaring, pucksters in red and white collided in bear hugs, as the wild celebration at the Universiade Center Arena in Shenzhen, Guangdong province, on Tuesday sent a strong message to ice hockey's elite — the long-overdue rise of China's men's program is happening for real and, remarkably, on its own.

The elation was triggered by the host squad's 3-2 penalty shootout win (4-3 overall) over Estonia in its fifth and final round-robin game at the International Ice Hockey Federation Men's World Championships Division I Group B tournament to clinch a silver medal at the third-tier event in the IIHF Worlds system. It marked the Chinese men's best result since the current multi-division worlds format was adopted in 2001.

The awe-inspiring podium finish, witnessed by a rapturous home crowd, is expected to place Team China at 24th overall in IIHF's 2026 standings, after the completion of the top- and second-tier championships at the end of May, giving the country its highest-ever ranking in the traditionally Western-dominated sport since it claimed 20th place way back in 1994.

Team China's strong campaign at the six-nation Shenzhen tourney — eventually won by Estonia with four straight regulation wins, two more than the host — has produced a more profound boost, beyond just statistical feats, for the game domestically, given its dramatic shift of strategy over the past four years.

Rather than recruiting North American-born players with Chinese heritage, like the country did around the Beijing 2022 Winter Olympics, this current national program has put together a new breed of young talent all born and raised in China, yet nurturing their hockey prowess in overseas minor leagues, and mixed them up with the best of the domestic league to represent their nation on the international stage.

Ten of Team China's 23 players in Shenzhen are currently honing their game in overseas programs, such as the US college league, the Japan-based Asian league and Canada's Ontario Hockey League.

The untapped potential of this young cohort, and the camaraderie among them, have created a more united squad with greater pride in representing their home country than the naturalized Olympic squads of four years ago, where over half of China's men's and women's lineups were born either in the United States or Canada.

And, arguably, nobody has embodied the program's new approach more than China's teen prospect Wang Haoxi.

The 18-year-old, 1.96-meter Beijing native, who became the highest-selected Chinese player in NHL history after being picked by the San Jose Sharks at 33rd overall in the 2025 draft, lived up to his billing as the new face of Team China by winning the tournament's Best Defenseman award.

Wang, who goes by the name Simon in Canada where he plays in the OHL, made no secret of Team China's ambition, throwing down the gauntlet to the world's elite.

"No, it did not exceed our own expectations, because we know how good a team we are," Wang said after the penalty shootout victory over Estonia.

"Our team is very strong, and we fought our hardest in every game. If we hadn't needed overtime to beat Romania (in the second game), we could've secured the gold and the promotion," said Wang, who appeared in 57 games in the 2025-26 OHL season, recording 26 points between the Oshawa Generals and Niagara IceDogs.

Tying with Estonia on the total number of wins, Team China had to settle with a runner-up finish, three points shy of the European side, due to, as Wang pointed out, its two overtime wins.

With an upbringing and development path similar to Wang's, 17-year-old goalie Tu Yueran couldn't hold back his pride after making his senior international debut for Team China in Shenzhen, having stood out in Canada's minor program.

Tu's composure beyond his years and solid skills took over in the critical shootout as he denied three of Estonia's five attempts to help secure the win together with teammate Zheng Mingju, who sent the crowd into frenzy by scoring China's final and fifth penalty to close out the match.

"Being able to represent China is the best feeling in the world (for us). I am glad we got the job done," said Tu, who goes by the name Eric in Canada and, somewhat appropriately, has an image of the impenetrable Great Wall on the back of his helmet.

"To play for your country with so many people rallying behind you feels so different from playing for a club overseas," said Tu, who made 1035 saves representing the Calgary Hitmen in 45 games in the 2025-26 Western Hockey League season.

"Winning the game gave us a lot of confidence. We had that belief in the room already, and winning has just added to that."

China's head coach Perry Pearn, a Canadian former assistant coach with the NHL's Vancouver Canucks, said the trajectory of China's young core is fascinating.

"It's exciting, because we let some young players go (without being called up) that are pretty close to being here, who are playing pretty good junior hockey in North America," said the 74-year-old, who coached Canada's women's national team and Japan's men's squad before taking the China's men's team job in 2025.

"I don't think it will be long before they are ready to come here. Of course, Eric (Tu) and Simon Wang are pretty good kids from the standpoint of hockey in general. I think that really bodes well for the Chinese game."

BASKETBALL

Thunder strikes first against Lakers as Pistons down Cavs

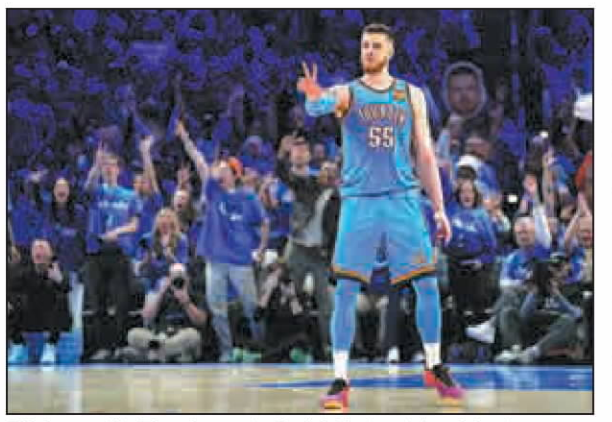
The Oklahoma City Thunder overpowered LeBron James and the Los Angeles Lakers 108-90 on Tuesday to grab a 1-0 lead in their NBA Western Conference semifinal series.

A balanced offensive performance and steely defensive display from the reigning NBA champion were enough to seal victory over the depleted Lakers, which started brightly, but trailed for the final three quarters.

Chet Holmgren led the Thunder with 24 points and 12 rebounds, while reigning NBA Most Valuable Player Shai Gilgeous-Alexander and Ajay Mitchell added 18 points apiece.

"We were a little choppy, a little rusty, but offensively we just stuck with it," Gilgeous-Alexander said, saluting a Thunder defense that restricted the Lakers to their lowest score in a playoff game since 2021.

"We just try to make people play outside their comfort zone, as simple as that," Gilgeous-Alexander said of the Thunder defense. "Whatever guys like to do, we like to take that away from them."



The commanding Thunder victory underscored the size of the task facing the fourth-seeded Lakers if they are to defy the odds and upset the champion in the best-of-seven series.

Oklahoma City completed a 4-0 regular-season sweep over the Lakers, winning each game by an average margin of 29.3 points.

Tuesday's series-opener at Oklahoma City's Paycom Center echoed the Thunder's regular-season dominance, with the champion pulling away down the stretch to score an emphatic win.

James, who had defied his 41 years to lead the Lakers to a surprise 4-2 upset of the Houston Rockets in the first round, led Los Angeles with 27 points in a losing effort.

Rui Hachimura added 18 points with Marcus Smart bagging 12 and Deandre Ayton 10.

Oklahoma City Thunder center Isaiah Hartenstein celebrates as fans react to his basket during a second-round NBA playoffs series game against the Los Angeles Lakers in Oklahoma on Tuesday. AP

Detroit quells late rally

In Tuesday's other playoff game, Cade Cunningham scored 23 points as the Detroit Pistons held off a second-half rally to beat the Cleveland Cavaliers 111-101 in their NBA Eastern Conference semifinal series opener.

The top-seeded Pistons looked to be cruising to a comfortable win after dominating in the first half and taking a 17-point lead in the third period.

But, a spirited Cleveland rally saw the Cavaliers close to within four points before Detroit finally pulled clear again in the fourth quarter.

Jalen Duren had three dunks, two rebounds and a block in a 67-second stretch to break open a tied game.

Cunningham was one of six Detroit players to finish in double figures, with Tobias Harris adding 20 points while Duncan Robinson bagged five three-pointers on his way to a 19-point haul at the Pistons' Little Caesars Arena.

Daniss Jenkins added 12 points from the bench with Ausar Thompson and Duren scoring 11 points apiece.

Donovan Mitchell led Cleveland with 23 points, including four three-pointers, while James Harden scored 22 points with eight rebounds and seven assists.

"It was a great team win — defending the ball, rebounding the ball," Cunningham told broadcaster NBC.

"We've got a great system in place. You've got somebody that will come in behind you whenever you get tired.

"But it's one win, we've got to come back and do it again."

Detroit had battled into the conference semifinals after coming back from 3-1 down to defeat Orlando 4-3 in the first round.

Cunningham said the Pistons are anxious to avoid a repeat.

"You've got to protect home court. We didn't do that in the last series, so we want to do that this series," Cunningham said.

"They want to come in and steal one, so we've got to do this again the day after tomorrow."

Stable Sino-US ties linked to global growth

Sound relations protect supply chains and support trade flows, say observers

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Expanded cooperation between China and the United States will help reinforce the stability of global industrial and supply chains, while generating fresh momentum in advanced manufacturing, premium consumption and innovation-driven industries, said analysts and business executives of both sides.

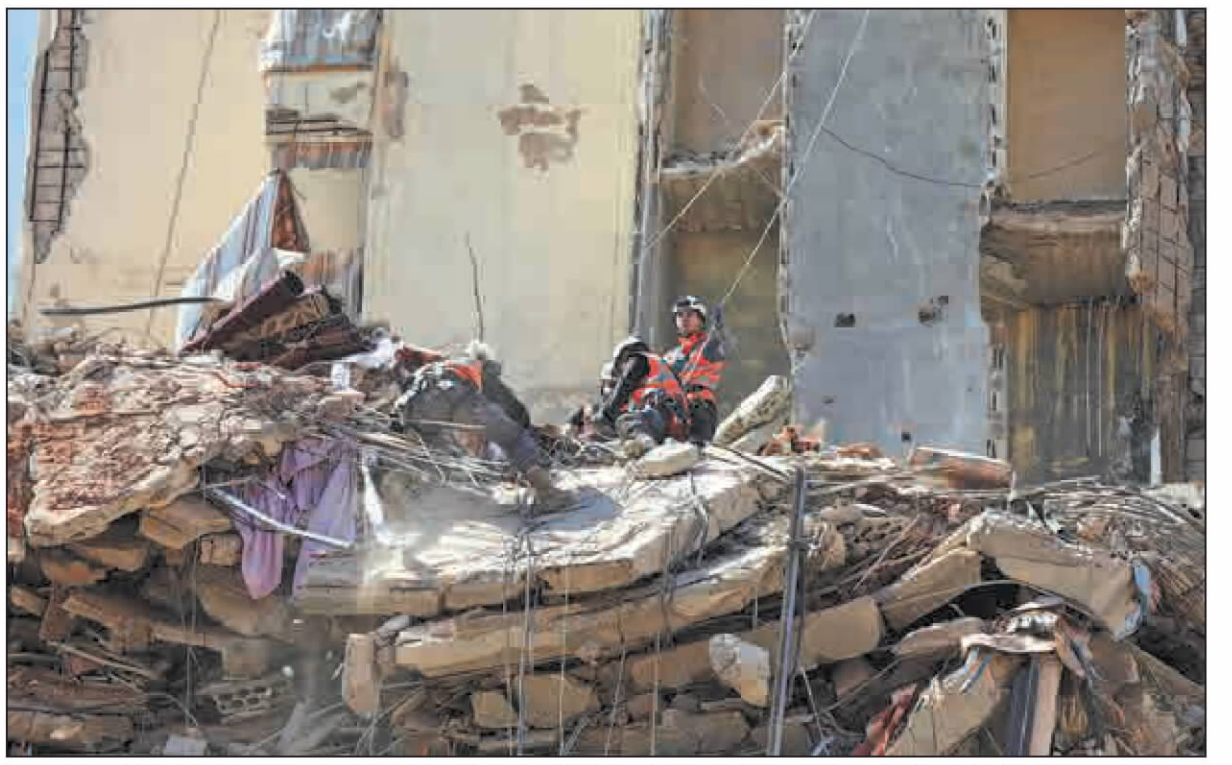
They also said that stable China-US economic ties are vital to safeguarding global supply chains, and the two countries have shared interests in sectors including frontier technologies that far outweigh any tariff game.

Companies are also eyeing emerging business opportunities, as the two economies remain highly complementary. China maintains strengths in manufacturing capacity, supply chain integration and industrial efficiency, while the US continues to lead in high-end consumption, technological innovation and service-related demand.

Da Wei, a professor of international relations at Tsinghua University, said that amid rising geopolitical and economic uncertainties, stable China-US economic ties are crucial to safeguarding global supply chains, supporting trade flows and strengthening industrial ties.

He Weiwen, a senior fellow at the Beijing-based think tank Center for China and Globalization, said the two countries should place greater emphasis on cooperation in artificial intelligence and other frontier technologies, as China and the US have enormous shared interests and opportunities in trade and investment related to open-source AI, big data, quantum computing, 6G, robotics, green transformation and biotechnology.

Speaking at a sub-forum of the Boao Forum for Asia Annual Conference 2026 in Boao, Hainan province, in late March, Carlos Gutierrez, former US secretary of commerce, said the world would benefit from a more stable and constructive economic relationship between China and the US, with both sides ensuring that opportunities remain open and mutually accessible. If the two sides can find ways to manage differences and establish a framework for coexistence, it could provide a model for the global system, he said.



China's strategic role in the global supply chain and its vast market are becoming increasingly prominent for US companies. Nathaniel Madarang, president for Asia-Pacific region at Goodyear Tire & Rubber, said China is not just a market or a production base, but a vibrant market, a competitive manufacturing base and an innovation hub.

Noting recent visits to China by several US business leaders — including Ray Dalio, founder of asset management firm Bridgewater Associates, and Stephen Schwarzman, chairman of investment firm Blackstone Inc — Wang Guannan, spokeswoman for the China Council for the Promotion of International Trade, said that despite mounting external uncertainties, business communities in both China and the US continue to favor cooperation over confrontation, underscoring strong demand for deeper economic ties.

Tehran, Washington inch toward limited agreement

By **CUI HAIPEI** in Dubai, UAE
and **JAN YUMUL** in Hong Kong

The United States and Iran are edging toward a limited, temporary agreement to halt their war, Reuters reported on Thursday, quoting sources and officials, with a draft framework that would stop the fighting but leave the most contentious issues unresolved, even as US President Donald Trump said a deal to end the war was "very possible".

The Saudi Arabia-based news outlet Al Arabiya cited sources as saying that discussions surrounding the Strait of Hormuz are on, though there was no immediate confirmation from Iran or the US.

In another development on Thursday, Tehran denied attacking a South Korean cargo ship in the Strait of Hormuz earlier this week. The Iranian embassy in Seoul said Iran "firmly rejects and categorically denies" allegations that its armed forces were behind a blast on Monday aboard the Panama-flagged HMM *Namu*, with 24 crew members on board. Trump later claimed that Iran had "taken some shots" at the vessel and urged South Korea to join the so-called Project Freedom initiative to reopen the vital waterway.

Despite that incident, hopes of progress have emerged after weeks of stalemate.

"We've had very good talks over the last 24 hours, and it's very possible that we'll make a deal," Trump told reporters on Wednesday. But he warned earlier that if Iran fails to honor any agreement, bombing would resume "at a much higher level and intensity".

Launched by the US and Israel in late February, the conflict has seen Iran launch retaliatory strikes across the Gulf and impose effective control over the strait, roiling global energy markets.

Meanwhile, Iran is yet to formally respond to Washington's new proposal. Parliament Speaker Mohammad Bagher Ghalibaf said the US aims to force Tehran to surrender through "a naval blockade, economic pressure and media manipulation designed to destroy the country's cohesion".

Iranian Foreign Ministry spokesman Esmaeil Baghaei confirmed that the US proposal remains under review, adding that Tehran will relay its official stance to mediator Pakistan once internal deliberations are finalized, Iran's ISNA news agency reported.

Iran's President Masoud Pezeshkian said on Wednesday his country is ready to pursue diplomatic paths to end the war, while insisting on safeguarding the nation's rights.

In a phone call with French President Emmanuel Macron, Pezeshkian voiced deep distrust of the US over recent provocative acts, including wartime strikes on Iran amid indirect negotiations.

US media outlet Axios, citing unnamed officials, reported on Wednesday that both sides were close to reaching a one-page memorandum of understanding to end hostilities and set a framework for future nuclear negotiations.

Meanwhile, Israel pummeled southern parts of Lebanon on Thursday, Lebanese state media and AFP correspondents said, a day after it targeted a Hezbollah commander in its first strike on Beirut's southern suburbs since a truce sought to end weeks of fighting.

The Israeli army said on Thursday that the strike on the southern suburbs killed "the Commander of Hezbollah's elite 'Radwan Force' Unit".

According to Mohamad Elmasry, a professor at the Doha Institute for Graduate Studies in Qatar, Washington appears more serious about striking a peace deal with Iran, yet major questions remain over the concessions it is prepared to make.

The draft memorandum omits several longstanding US demands that Iran has repeatedly rejected, including curbs on Tehran's missile and nuclear programs. "That may be seen as a negative sign — the proposal fails to address some of Iran's core concerns in an acceptable way," Elmasry told Al Jazeera.

Prospects of a potential detente buoyed global markets. Tokyo's Nikkei index surged more than 4 percent on Thursday, leading broad gains across Asian equities. China's benchmark Shanghai Composite Index rose 0.48 percent on Thursday after gaining 1.17 percent the previous day.

Meanwhile, global oil prices slid to a two-week low on Wednesday, with benchmark Brent crude falling around 11 percent to near $98 a barrel at one stage.

Human connections nurture long-term links with Africa

WORLD WATCH
By Balew Demissie

Over the past seven decades, China-Africa relations have expanded significantly, driven by growing trade, major infrastructure investments and closer diplomatic engagement. Platforms such as the Forum on China-Africa Cooperation have played a key role in formalizing and guiding this partnership, creating mechanisms for sustained economic and political collaboration. Building on this foundation, it is now time to further strengthen China-Africa people-to-people exchanges.

Such exchanges represent a strategic shift toward a more people-centered relationship, recognizing that sustainable China-Africa relations require more than infrastructure, trade and investment; they also need strong social and cultural connections. This is closely aligned with the African Union's Agenda 2063, which emphasizes cultural renaissance, youth empowerment and knowledge exchange as drivers of long-term development.

Direct interactions between African and Chinese people build mutual trust, deepen understanding of each other's cultures, values and perspectives, and challenge stereotypes. These exchanges enhance academic and scientific collaboration, as universities and research institutions work together through joint studies, knowledge sharing and capacity-building initiatives.

These interactions also promote entrepreneurship, tourism and creative industries, generating new economic opportunities. Ultimately, they foster human connections that support long-term partnerships. From advancing the China-Africa Vocational Education Cooperation Plan to establishing 17 Luban Workshops in 15 African countries, China has helped train tens of thousands of skilled professionals, providing solid intellectual support for Africa's development.

GUANGXI HAS BECOME A GREAT PLACE TO HANG OUT

Region's karst landscapes now a magnet for the world's climbing community

By **XING WEN** in Beijing,
and **SHI RUIPENG** and **ZHANG LI** in Guilin, Guangxi

The arch of Shegeng Cave rose before He Chuan, a 47-year-old climber from Beijing, like a stone cathedral dropped into the karst peaks of the Guangxi Zhuang autonomous region. A winding path snaked through its vast opening and, 70 meters above, the limestone ceiling hung — raw, ridged, pockmarked with cavities and streaked with subtle mineral lines. For a moment, he simply stood still.

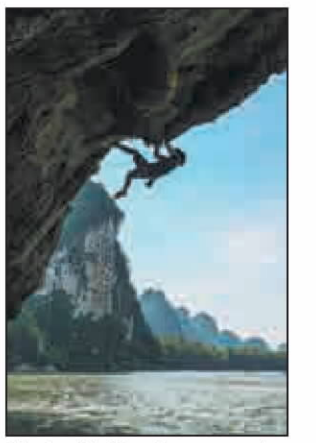
Then he saw natural handholds scattered across the wall, like a challenge laid down by Mother Nature. His pulse quickened. "I have found a place that could rewrite Chinese climbing history," he later recalled. He was right.

From May 2024, Chinese and international route setters began descending on the cave in the Leye-Fengshan UNESCO Global Geopark, working in three rounds to carve 110 routes into the living rock. Based on the Yosemite Decimal System, a grading system for rating the difficulty of the climb, the routes range in difficulty from a welcoming 5.8 to a savage 5.15b.

The hardest line is named She Diao (The Eagle Shooters), a 30-meter route up the inner left wall of the north entrance. It follows a steep, overhanging parabola that demands elite-level fingertip strength.

After completing the route, French climber Seb Bouin noted that the crux moves demand extremely difficult fingertip-pulling power. Yet when he paused and looked up through the cave's opening, he could see green mountains and drifting clouds. He said the climbing process is complex, but "enjoying the scenery while climbing" makes it utterly exhilarating.

Graded as China's hardest route to date, She Diao has vaulted Shegeng Cave in this remote corner of Guangxi into the world's top climbing destinations.



On May 15 last year, the cave officially opened as a pilgrimage site for enthusiasts chasing the planet's most extreme vertical challenges.

But Guangxi's rocks don't belong only to the elite. Further south, a different rhythm hums in the fabled karst landscape of Yangshuo county. Here, the stone is for everyone.

For generations, Yangshuo has been where the Lijiang River winds through arched peaks. Now, a growing community is swapping river cruises for chalk bags.

"For most Chinese and international tourists, Yangshuo is the true international climbing destination," said Liu Yongbang, vice-president of the Yangshuo Climbing Association. "It boasts routes for beginners, and intermediate and advanced climbers, along with a unique climbing lifestyle."

That lifestyle is a world away from the urban grind. Climbers from across the globe rent modest guesthouses or quiet rural rooms, hop on scooters each morning, and spend hours on the natural limestone faces. Once there, they practice moves, control the tightness of rope for partners, and swap route beta.

Climber Liu Yongbang ascends a steep rock wall in the mountains of Guilin, Guangxi Zhuang autonomous region, in 2024. PROVIDED TO CHINA DAILY

Face-off over AI dramas' illegal use of personality rights

Ethical issues in short videos and infringement complaints under scrutiny by courts, experts

ART BY LU PING / CHINA DAILY

By **CAO YIN**
caoyin@chinadaily.com.cn

Artificial intelligence is rapidly transforming China's short-drama industry, significantly boosting production efficiency and output. However, this surge is also causing concern among actors, voice artists, and even ordinary viewers, as the ethical and legal implications of AI's capabilities come under scrutiny.

In late March, several bloggers, including models and devotees of traditional Chinese attire, accused a popular AI-generated series, *Peach Blossom Hairpin*, of using technology to replicate facial features, outfits, and makeup without permission. These characters were widely distributed on short-video platforms, sparking a debate about the ethical use of AI in media production.

As a result of these complaints, the micro-drama platform Hongguo removed the show and banned its producer from uploading new content for 15 days due to insufficient proof of compliance with regulations on facial imagery. The decision underscored the growing tension between technological innovation and personal rights, highlighting the need for clearer guidelines and regulations, experts said.

This incident is not isolated. A number of celebrities, including actors Yi Yangqianxi and Yang Zi, have recently expressed their concerns, stating that they had never authorized the use of their images or voices in any AI-related dramas. They said AI-generated characters closely mimicking their appearance or voice constitute infringement.

Some cases have already reached the courts, with producers facing legal consequences for infringing upon personal rights.

Short dramas, or micro-dramas, typically shot in a vertical format with episodes lasting just a few minutes, have become immensely popular across China in recent years. By February, the short drama industry had 718 million monthly active users, with over 3,200 new short dramas released nationwide during the Spring Festival holiday alone, according to internet analytics firm QuestMobile. The explosive growth has been partly fueled by the convenience and accessibility of short-form content, which caters to the fast-paced lifestyles of modern audiences.

Generative AI is altering the production of these dramas. Industry analytics company DataEye reported that AI-powered animated shorts accounted for 38 percent of the top 100 comic-style dramas in January, up from 7 percent a year earlier.

The cost of producing a short drama has dropped from 50,000 yuan ($7,320) to 5,000 yuan per episode, and production time has been cut from two to four weeks to three to seven days. This dramatic reduction in cost and time has allowed more content creators to enter the industry.

However, the push for speed and cost reductions has led to mounting controversies. In the first quarter of this year, Hongguo removed 1,718 policy-violating animated short dramas, with 670 suspected of using people's facial information without consent.

These incidents highlight the challenges of balancing innovation with ethical considerations, as the technology outpaces the legal frameworks designed to regulate it. Legal experts said technological advancement should not come at the expense of personal rights.

More frequent

Zhao Qi, a judge at the Beijing Internet Court, said disputes over AI-related infringements of portrait and voice rights are becoming more frequent as the technology evolves.

Some defendants claimed they had used AI face-swapping technology just for fun, not profit.

But Zhao said that publicly broadcasting someone else's facial features without permission is prohibited under the Civil Code. "The distinction between personal use and public distribution is crucial, as the latter can have significant implications for the individuals involved," she said.

On March 23, the court disclosed details of a notable case in which Zhao ruled in favor of an actress whose images were violated by two companies that used AI face-swapping tech in a short drama. The court ordered the defendants to apologize on their video platforms and pay compensation to the actress.

The dispute began when the actress found her likeness mapped onto a character in a 90-minute drama, misleading audiences into thinking she had performed in it, and sparking online discussion. The series also appeared on another company's platform, leading her to sue both platforms for unauthorized, profit-driven use of her image.

Zhao said the production company argued the AI-generated character coincidentally resembled her. It claimed it only used prompts like "pretty journalist" without directly referring to her, and that the resemblance was "statistically probable". The production company said it quickly removed the segment after her complaint, causing no harm.

The streaming company argued that it legally obtained distribution rights and was not responsible for content creation.

However, when asked to demonstrate their AI production processes during the trial, the companies failed to do so due to technical and account issues, Zhao said.

"Even if an AI-generated face differs slightly from the original, it's still infringement if the public can recognize the person and no permission was given," the judge said.

"The streaming platform, despite having distribution rights, was also held accountable for failing to review content and prevent infringement."

Similar disputes have been ended through negotiation.

In March, for instance, an AI-generated fantasy short drama with over 23 million views sparked controversy for allegedly misappropriating a model's likeness and makeup style designed by a photographer. After the model, surnamed Ma, and the photographer filed complaints with the streaming platform, the series was taken down. Following negotiations, the two sides reached a settlement regarding compensation for the infringement of portrait rights and copyright.

Growing concerns

Only a year ago, AI-generated videos were rough, choppy, and visibly artificial, said Chen Peng, a short-video industry professional. They mainly consisted of single images or clips lasting just a few seconds, according to reports.

"But today, the technology has been completely transformed. It has leapfrogged in both the efficiency and quality of image and video generation," Chen said.

"Powered by next-generation large generative models, it can now produce complete short dramas with visuals, scenes, background music, and voice overs," he said.

"Thanks to breakthroughs in character consistency, long-text understanding, and fine-tuning by creators, the image quality, motion, and details are now virtually indistinguishable from real footage," he added.

The rapid development of technology has also lowered the barriers to becoming a creator and reduced production costs.

Zheng Ning, head of the law department at the Communication University of China's Cultural Industries Management School, said AI-generated short dramas can now achieve full-process generative AI coverage — from scriptwriting and character generation to scene rendering, voice overs and music production, editing and promotional distribution.

"This comprehensive integration of AI into the creative process is reshaping the industry making it more accessible, but also more complex," she said.

According to her, this compresses traditional film and television production timelines from months or even years to days or hours. With the barriers to entry removed, amateurs and tool providers — non-professionals — can also get involved in creation.

Zheng also pointed out that traditional film and television strictly follow a "review before release" principle, requiring creators and producers to go through a full process of content filing, review, and access approval, keeping the distribution scope and release cadence under control.

"But with AI-generated short dramas, the cumbersome review process has been simplified, enabling dozens of episodes to be updated in a single day, and hundreds of pieces of content to be generated in bulk, spreading extremely fast in cyberspace," she said.

The weak legal awareness of AI users has led to infringements of portrait and voice rights, Zheng said. Internet platforms, faced with the overwhelming output of AI-generated short dramas, have also failed to fulfill their responsibility to review content, while their review technologies still have significant shortcomings.

"Many platforms often rely on a reactive approach — removing content only after receiving complaints — rather than proactively identifying infringements. As a result, by the time an infringement is addressed, the short drama has already gained massive viewership and generated substantial revenue," she added.

Way forward

Zheng and Zhao both believe comprehensive governance of the short drama industry is needed, as frequent infringement issues not only violate creators' rights but also hinder the sector's long-term development.

"AI users should strengthen their legal awareness," Zheng said, advising them to conduct self-reviews to ensure their content does not infringe others' rights, and to obtain authorization before use.

"Platforms also need to prioritize preventive measures and provide easier reporting channels for users to protect their rights," she said. This could be achieved, she suggested, by enhancing the review process and applying cutting-edge technology to block infringing content more accurately and efficiently.

> "AI makes it easy to produce a short drama that 'looks good', but harder to create work that 'truly moves people'. This urges all creators to resist the inertia of algorithms and remain committed to observing humanity. The focus on the way of promoting the industrial development should shift from 'using AI to replace creation' to 'using AI to empower creation'."
>
> **Zheng Ning,** head of the law department at the Communication University of China's Cultural Industries Management School

Judge Zhao said platforms cannot shirk their responsibilities by using the high volume of uploads as an excuse. "Technological advancements have raised the legal duty of care expected of platforms as content distribution hubs," she said, noting that the increased responsibility requires platforms to adopt more sophisticated tools and strategies to manage content effectively.

Both Zheng and Zhao support platforms establishing more convenient complaint reporting systems, and taking stronger actions against users who repeatedly post infringing content.

Zheng proposed a blacklist for infringing parties and an industry ban on repeat violators.

She also emphasized stronger enforcement of regulations that require AI-generated content to be labeled and filed on record before release. Industry associations should also strengthen self-regulation, while technologies to detect voice imitation and face-swapping should be continuously upgraded, she added.

"AI makes it easy to produce a short drama that 'looks good', but harder to create work that 'truly moves people'. This urges all creators to resist the inertia of algorithms and remain committed to observing humanity," Zheng said.

"The focus on the way of promoting the industrial development should shift from 'using AI to replace creation' to 'using AI to empower creation'," she said.

By prioritizing human-centric storytelling, creators can harness AI's potential while preserving the artistic integrity of their work, she added.

Zhao said the courts will continue to balance technological innovation with the protection of personality rights, ensuring neither is compromised. This delicate balance will be crucial in navigating the future of AI in the creative industries, as both innovation and ethical considerations continue to evolve.

TOP NEWS

Trade: Business with EU, ASEAN up

From page 1

With global trade flows changing and regional demand increasing, China's trade with the US dropped 16.6 percent year-on-year to $128.68 billion in the first quarter of 2026. At the same time, trade with the Association of Southeast Asian Nations rose 18.4 percent in US dollar terms, and trade with the European Union increased 17.6 percent, data from the General Administration of Customs showed.

Huang Kai, vice-president of Fujian Zhongjing Petrochemical Co, the largest private petrochemical company in Fujian province in terms of production capacity, said that stable China-US trade ties are important for the company to ensure operational stability and support steady business growth.

The company imported 308,000 metric tons of propane from the US in the first four months of this year, accounting for 34.8 percent of its total propane imports, according to Fuzhou Customs.

JAC Auto Parts (Ningbo) Co, an automotive parts manufacturer based in Ningbo, Zhejiang province, counts the US among the company's core export markets. Its exports to the US rose 30 percent year-on-year to 40 million yuan ($5.88 million) in 2025, said Ningbo Customs.

Yang Weiguo, the head of the company's foreign trade unit, said, "The US is not only a major automotive market, but also one of our most important export destinations, and a key import source of core auto components such as rollers and anti-collision beams."

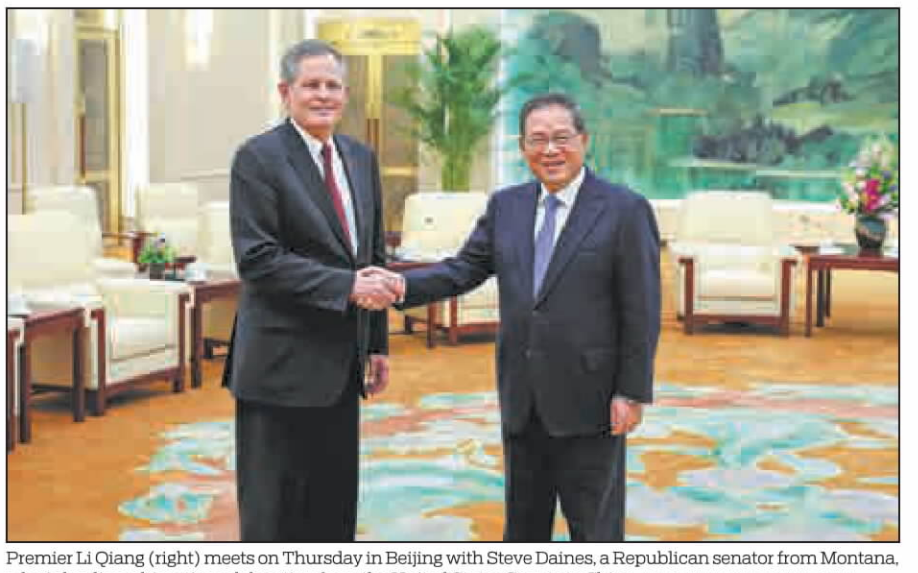
Guangxi: All levels of climbers welcomed

From page 1

In climbing, "beta" means a specific sequence of moves, holds and techniques used to complete a particular route. During evenings, climbers share meals and swap stories, living a slow, simple and voluntary life that binds a global community.

Liu is one of them. Born in Hengyang, Hunan province, he chose to settle in Yangshuo for its endless natural rocks and the promise of its climbing future.

"Yangshuo has gathered climbers from all over the world," he said. "Every Chinese climber who wants to learn outdoor climbing comes here. We have over 600 practitioners, 2,000 routes and 74 crags, and new routes are still being developed. Many experience their first ascent as visitors, then become climbers, and some eventually settle down as residents."



Foreigners can access most crags after registering with the local association. For beginners, Yangshuo's 37 certified clubs, all with high-risk operation permits, offer safe, reliable gateways into the vertical world.

Then there is 12-year-old Zhou Zhou, who arrived in 2024 from Changsha, Hunan, afraid of bugs, the sun and the dark.

Under Liu's instruction, she began to climb. A year later, her mother saw the change. "She has become brave and independent," her mother said. "It seems that the rock remakes her."

From the soaring arch of Shegeng Cave to the crags of Yangshuo, Guangxi's limestone is no longer just scenery. It is a canvas for human daring, a global crossroads, and for those who linger, a way of life.

China, US urged to work for more practical results

Premier, officials meet bipartisan delegation from Senate, call for strengthening dialogue

By **MO JINGXI**
mojingxi@chinadaily.com.cn

China called on the United States to work with it in the same direction, engage in more dialogue rather than confrontation, and pursue more mutually beneficial cooperation rather than zero-sum competition, as it hosted on Thursday the first bipartisan delegation from the US Senate since US President Donald Trump took office in 2025.

The delegation, led by Steve Daines, a Republican senator from Montana, is visiting Beijing and Shanghai this week to meet with Chinese officials and tour technology companies, according to a statement released by his office.

Premier Li Qiang and Zhao Leji, chairman of the Standing Committee of the National People's Congress, China's top legislature, met separately with the delegation on Thursday.

Li said that China is willing to work with the US to implement the important consensus reached by the two heads of state, strengthen dialogue and communication, foster a favorable atmosphere for exchanges at all levels and cooperation in various fields, and strive for more practical results.

Experience has repeatedly shown that adhering to mutual respect, peaceful coexistence and win-win cooperation is the right way for the two major countries to get along with each other, Li added.

Zhao called on the US side to look at China and its development rationally and objectively, welcoming more US lawmakers to visit China.

Foreign Minister Wang Yi, who also met with the delegation on the same day, called on the two countries to stabilize and improve bilateral relations for the benefit of both countries and the world. "Face-to-face communication is the prerequisite for enhancing mutual understanding and the starting point for building trust," he said.

Noting that the visit carries symbolic significance, Wang said he hopes the delegation will experience the new dynamism of China's development, build new bridges of communication, explore new areas of cooperation, and inject fresh momentum into the stable, healthy and sustainable development of China-US relations.

"China's policy toward the US remains consistent," he said, emphasizing that the two countries should take mutual respect as the foundation, peaceful coexistence as the guiding principle and win-win cooperation as the goal.

Over the past year and more, China-US relations have experienced "twists and turns", but overall stability has been maintained under the strategic guidance of head-of-state diplomacy, Wang said.

"Since President Trump assumed office, President Xi Jinping has held multiple phone calls and meetings with him, helping to calibrate the direction of bilateral relations at critical moments," he said.

Wang noted that the key to finding the right way for China and the US to get along lies in continuously addressing misunderstandings in each other's perceptions, just like the first button of a shirt that must be placed right.

China and the US have different social systems and development paths, but both are rooted in their respective historical and cultural traditions and chosen by their own peoples, he said.

Quoting an ancient Chinese saying that "all living things grow together without harming one another", Wang said the two sides should seek "harmony without uniformity" and be partners rather than rivals.

China will not follow the obsolete model of a country seeking hegemony when growing stronger, he said, emphasizing that the country will remain committed to peaceful development and to the path of socialism with Chinese characteristics.

Members of the US delegation shared their impressions of the China visit and exchanged views on the development of US-China relations, according to the Foreign Ministry. The two sides also exchanged views on international and regional issues of common concern.

This trip marks Daines' seventh visit to China since he was elected to the US Congress. The senator last visited China in March 2025, becoming the first senior Republican to visit the country after Trump began his second term in office.

Diao Daming, a professor at Renmin University of China's School of International Studies, said, "If Trump comes to China as planned, Daines' trip takes place at an important preparatory stage and could be seen as a preliminary communication to convey positions for subsequent high-level interactions."

Diao added that the inclusion of Democratic senators in the delegation sends a positive signal that both US political parties still see value in strengthening communication with China.

Two former defense ministers given suspended death sentences for graft

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

The Chinese military court separately handed down on Thursday death sentences with two-year reprieves to two former defense ministers of China over graft charges.

Wei Fenghe and Li Shangfu are both former members of the Central Military Commission and former state councilors. They were stripped of their political rights for life and all their personal assets were seized as Wei was convicted of accepting bribes and Li of both accepting and offering bribes.

The court rulings said that no further commutation or parole will be allowed after their penalties are commuted to life imprisonment in accordance with the law upon the expiration of the two-year reprieve period.

Wei, 72, a native of Shandong province, enrolled in the military in 1970 and joined the Communist Party of China two years later. He became a member of the CMC in 2012 and was appointed as a state councilor and minister of national defense in 2018.

In September 2023, disciplinary and supervisory authorities of the CMC launched an investigation into Wei for serious violations of Party discipline and national laws. It was found that he failed to fulfill his political responsibilities, resisted investigation, sought personnel benefits for others, and accepted large sums of money as bribes. Other serious violations were also identified.

The investigation statement said that Wei experienced a collapse of faith and a loss of loyalty. His actions betrayed the trust placed in him, severely damaged the political environment of the military, and caused significant harm to the Party's cause, national defense, military development and the image of senior leadership, it added.

Li, 68, a native of Jiangxi province, joined the CPC in 1980 and enrolled in the military two years later. He became a member of the CMC in 2022, and was appointed as a state councilor and minister of national defense in March 2023.

Li was placed under probe in August 2023. Authorities found that he failed to fulfill his political responsibilities, resisted investigation, violated organizational discipline by seeking personnel benefits for himself and others, and accepted and offered large sums of money as bribes. Other serious violations were also identified.

The investigation statement said that Li abandoned his original aspiration and ignored Party principles. His actions severely damaged the political environment within the military's equipment sector and the industry's ethos, causing significant harm to the Party's cause, national defense, military development and the image of senior leadership, it said, describing the nature of Li's misconduct as extremely serious.

The cases against Wei and Li were transferred to military procuratorial authorities for review and prosecution after they were expelled from the CPC in June 2024. Before that, the CMC had decided to expel Wei from the military and revoke his rank of general in the Rocket Force, and to expel Li from the military and revoke his rank of general in the Army.

A commentary published by PLA Daily in February said the military will continue to deepen political rectification and advance efforts to improve conduct and fight corruption. It said the task of removing the breeding grounds and conditions for corruption remains difficult and demanding.

The article added that the concentrated investigations into corruption do not indicate that corruption is worsening, but rather that anti-graft efforts are becoming more thorough.

Relations: Reinforcing societal connections critical

From page 1

In addition, China has signed bilateral tourism cooperation agreements with over 30 African countries, increasing the number of African destinations for Chinese tourist groups to 34.

At the 2024 FOCAC summit in Beijing, it was announced that China and Africa had agreed to designate 2026 as the China-Africa Year of People-to-People Exchanges. Following this commitment, the Chinese government released the "Concept Paper of the 2026 China-Africa Year of People-to-People Exchanges" in June 2025, highlighting the central role of the amicable ties between the people of both sides in strengthening bilateral relations. Throughout the year, China and Africa will organize nearly 600 activities across both sides, focusing on areas including education, technology transfer, youth exchanges, tourism and trade, and aligning people-to-people engagement with broader long-term development priorities.

As part of these efforts, Ethiopia and China are actively strengthening people-to-people exchanges, recognizing that education, cultural engagement, media collaboration and youth programs are essential to building a resilient China-Africa community.

Ethiopian viewers now have access to a variety of Chinese television content — including dramas, documentaries and animation. In addition, the China Film Festival, held at Addis Ababa University from March 6 to 28, provided a platform to deepen Ethiopian understanding and appreciation of Chinese culture.

Ultimately, resilient China-Africa people-to-people exchanges will be built not only by governments but also by students, artists, scholars, entrepreneurs and travelers whose cross-cultural connections create enduring bridges for sustainable, inclusive and mutually beneficial relations. Long-term alumni networks further strengthen diplomatic, business and policy collaboration. It is expected that both sides will assess the initiative's impact using quantitative indicators such as exchange programs, scholarships, cultural events, joint research projects, student mobility and academic partnerships, along with qualitative measures such as surveys on public perception.

Despite significant progress in China-Africa people-to-people exchanges over the past decades, practical barriers continue to limit these interactions.

First, language remains a challenge. Strengthening Mandarin proficiency in Africa and establishing African studies institutes in China are essential to bridging this gap.

Second, visa and mobility challenges — such as complex application processes, high fees, lengthy processing times and limited categories for researchers and cultural practitioners — further restrict travel.

Third, problems with travel and accommodation logistics, including online booking difficulties and the lack of integrated digital platforms, impede exchanges. Gaps in digital infrastructure — such as limited internet access and SIM card availability, and incompatible banking systems — further affect communication and the overall travel experience.

To address these challenges, both sides can expand language education by strengthening Mandarin programs in Africa, promoting African studies in China and supporting language exchange initiatives. Visa procedures should be simplified through digital applications, reduced fees for selected applicants and multi-entry visas for students, researchers, academics and entrepreneurs. Travel and digital infrastructure should be improved with integrated online booking platforms, reliable internet access, easy SIM card acquisition and accessible digital payment systems.

Deepening China-Africa connections requires a strategic, multidimensional approach that integrates education, culture, digital innovation and community engagement. Institutionalized scholarships, joint degree programs, visiting scholar exchanges, collaborative research and long-term academic, artistic and professional exchanges provide a strong foundation, while digital platforms enable virtual conferences, online cultural events and digital storytelling. Media cooperation through journalism partnerships, documentaries and forums fosters balanced narratives and cross-cultural understanding.

At the grassroots level, cultural festivals, artistic collaborations, sports exchanges and youth programs strengthen interpersonal ties. Key sectors for engagement include education, which drives knowledge production and professional development; culture and the arts, which deepen mutual understanding through film, literature and residencies; tourism, which encourages direct interaction and heritage preservation; youth engagement through leadership programs and innovation competitions; and community groups, which advance grassroots collaboration in public health, environmental protection and social development. Together, these strategies provide a comprehensive framework for sustained, people-centered China-Africa cooperation.

Now is a strategic time to deepen China-Africa people-to-people exchanges. Africa's growing youth population and largely agrarian society are eager for skills development, education and international exposure. Strengthening technology transfer and vocational training creates opportunities for mutual learning, while Africa's cultural industries and tourism sector offer significant potential for economic growth and cross-cultural exchange. At this stage, reinforcing societal and cultural connections is critical, as the future of China-Africa cooperation will increasingly depend on strong people-to-people exchanges, youth engagement and mutual understanding.

China-Africa people-to-people exchanges represent a forward-looking initiative that places human connections at the center of international cooperation. By promoting educational collaboration, cultural dialogue, think tank forums, youth engagement and media partnerships, Africa and China can foster relationships based on mutual respect, understanding and trust. As global challenges become more complex, partnerships must move beyond transactional interactions toward deeper societal engagement, emphasizing mobility, language learning and cultural exchanges.

C-drama craze sweeps across Southeast Asia

Polished plots, fine costumes, cultural familiarity win over young viewers

By **YANG WANLI** in Bangkok
yangwanli@chinadaily.com.cn

Chinese costume dramas are gaining immense popularity on Southeast Asia's streaming platforms, driven by polished production values and cultural familiarity.

In Thailand, conscription posters featuring characters from a historical romance series have gone viral on social media, highlighting the genre's growing cultural reach.

Recruitment posters, released by the Royal Thai Army on its official Facebook account a few weeks ago, highlighted characters from *Pursuit of Jade* — a recently released Chinese costume drama that boasts beautiful visuals and dramatic plot twists.

"Do you want a boyfriend full of heroic spirit like the Marquis of Wu'an in *Pursuit of Jade*? Ask your mate to join the cavalry!" read one of the posters referring to the male lead, Xie Zheng, in the Chinese drama. It earned about 100,000 likes online, with many praising the creativity involved.

Since its premiere in March, Google Trends showed that *Pursuit of Jade* ranked first in search volume for Chinese dramas across 15 markets, such as Thailand, the United States, Canada, Malaysia, South Korea and Singapore. The drama gained record-breaking popularity on iQIYI International, became the first mainland Chinese costume drama on Netflix's global non-English TV charts, and trended in multiple Asian regions, driven by strong viewer engagement and high MyDramaList ratings.

"I have followed Chinese dramas for years, and *Pursuit of Jade* is my latest favorite," said Amy Chen, 34, a Malaysian Chinese who works in Kuala Lumpur.

Apart from cultural proximity, Chen attributed her enthusiasm for Chinese TV series and short films to "opulent production design, actors' exquisite makeup and costumes, well-designed storylines, and high-quality streaming platforms".

Weaving traditional cultural elements such as Qin Opera and shadow puppetry, *Pursuit of Jade* showcases the unique charm of Chinese culture while its success serves as a microcosm of the growing popularity of Chinese dramas overseas.

China's export revenues from television series increased from $24 million in 2012 to $70 million in 2023 — an approximate threefold growth, according to a report by the Chinese National Radio and Television Administration.

Among the various offerings, costume dramas, one of the earliest genres to attract overseas audiences, continue to be the most popular type of Chinese television drama in the international market, according to the NRTA.

As a core market for Chinese TV series, Southeast Asia's growing market potential has attracted leading Chinese online video platforms such as WeTV, iQIYI, Youku and Mango TV to launch overseas services.

Following the craze for Korean dramas, their Chinese counterparts have won over a large number of Thai viewers in recent years, said Sirisak Koshpasharin, vice-chairman of Thailand's National Federation of Motion Pictures and Contents Associations.

In the past, he said, the older generations in Thailand loved classic dramas such as *Justice Pao* because many Thais were Chinese immigrants. "But what is more surprising is that a growing number of young people now also like Chinese series too," he said, attributing the new trend to cultural and lifestyle similarities between the two countries.

"Now many Chinese dramas have good stories, production value and hooks that make Thai people like them," Sirisak added.

Fertile ground

Apart from TV series, Southeast Asia's growing number of internet users also offers a fertile ground for the overseas expansion of Chinese micro-dramas, which commonly run one to 10 minutes per episode and series can run into hundreds of episodes.

According to data analytics firm DataEye, paying micro-drama users in the region last year increased by 28 percent year-on-year, solidifying the region as a core market with both commercial viability and a solid audience foundation.

Beyond entertainment, watching Chinese dramas or short films has also sparked interest among younger generations overseas in exploring China further, both online and in person.

"Chinese dramas as well as video products had a strong impact on me during my childhood," said a 21-year-old Thai college student, who wanted to be known only as Chompoo. A fan of the Chinese costume drama *My Fair Princess*, she now also follows *Pursuit of Jade*.

"I have never been to China before and really want to (visit) in the future. Its scenery, new trends and food are all attractive to me. China's technologies and innovations are also awesome," Chompoo added.

Kampol Piyasirikul, head of the Chinese Studies Program at Thammasat University, said: "Beyond TV series, boy bands, pop singers and fashion toys from China are also popular among young Thais. Such cultural exchanges will play an increasingly important role in enhancing mutual understanding and trust between the people of China and the rest of the world," he said.

Jan Yumul in Hong Kong and Jantarawan Thrakulphiw in Bangkok contributed to this story.

AI risks loom over Musk-OpenAI trial

OAKLAND — Concerns over the risks posed by artificial intelligence have loomed large over a US trial pitting Elon Musk against OpenAI chief executive Sam Altman, even as the court focuses on a business dispute rather than the technology itself.

At the center of the case is the breakdown of a partnership once built on a shared goal: ensuring that increasingly powerful AI benefits humanity rather than any single company or individual.

Musk, a cofounder of OpenAI, filed the case accusing his fellow cofounder of breaking promises to keep the company a nonprofit. Altman, in turn, accuses Musk of trying to hobble the ChatGPT maker for the benefit of his own AI company, xAI.

The trial is being held in federal court in Oakland, California, and centers on the 2015 birth of OpenAI as a nonprofit startup primarily funded by Musk.

Both Musk and Altman have said they wanted OpenAI to safely develop artificial general intelligence for the benefit of humanity and not under any one person's control. Both camps allege that it's the other side that was trying to control it.

A jury of nine people selected from the San Francisco Bay Area will decide which side holds merit.

Early on, Judge Yvonne Gonzalez Rogers warned lawyers, particularly Musk's team, not to turn the case into a broader debate on AI safety.

"This is not a trial on whether or not AI has damaged humanity," Gonzalez Rogers told lawyers before jurors arrived at the federal courthouse.

Still, Musk managed to skirt the judge's guidance in his testimony. Musk said he has "extreme concerns" about AI and has had them for a long time. "I was concerned AI would be a double-edged sword," he said.

Witness testimony has touched on concerns over AI risks, including workforce disruption, racial and gender discrimination, job displacement, misinformation and emotional attachments that take some AI chatbot users down a spiral of psychosis.

Musk also told the court he could have founded OpenAI as a for-profit company like his other ventures, but "deliberately chose this", saying, "for the public good".

The judge expressed skepticism, noting that Musk is now building in the same field through his AI company xAI, launched in 2023.

OpenAI's side also defended its position. Cofounder and president Greg Brockman, a defendant in the lawsuit along with Altman, said the technology under development at OpenAI was "transformative" and "about humanity as a whole".

Brockman testified that his No. 1 goal was always the OpenAI "mission", and that Musk sought unilateral control over the company. He recalled a meeting where at first Musk seemed open to Altman being CEO, but later, "he said people needed to know he was in charge".

Musk is seeking damages and Altman's removal from OpenAI's board. If he wins, it could derail OpenAI's plans for a potential initial public offering.

Guzheng combine tradition, innovation

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

As the hall fell quiet, the last few notes from testing strings slowly faded. Forty *guzheng* stood in staggered rows across the stage, forming a gentle arc under the lights. The polished wooden instruments caught the glow. The performers settled into position, some glancing toward the conductor, others keeping their eyes on the strings, waiting for the cue to begin.

The 40 *guzheng* players then performed in unison, their sound flowing as one and filling the hall with a powerful, continuous wave of music.

The special concert by the Gu Zheng Tianxia Ensemble, held at Olin Hall at the Bard College Conservatory of Music on Saturday night, at the end of the US-China Music Institute's eighth annual conference on Chinese music in the West.

This is one of the largest *guzheng* conferences in the United States, hosted by the US-China Music Institute at Bard College Conservatory of Music. The three-day program, which also kicked off celebrations for Asian Heritage Month, featured the sound of Chinese traditional music. The conference brought together renowned *guzheng* masters from China, musicians from across North America and young student performers for artistic exchange, collaboration and performance.

The name "Tianxia", meaning "under heaven" in Chinese, reflects the idea of connection across regions and generations, as well as the growing global presence of the *guzheng*, according to Cai Jindong, director of the US-China Music Institute and a professor of music and arts at Bard College.

The *guzheng*, one of China's most recognizable traditional instruments, typically built with 21 nylon-wrapped steel strings and movable bridges, has gradually expanded far beyond its origins, appearing increasingly on international stages.

The growing presence of the *guzheng* reflects both cultural continuity and contemporary relevance. With a long history in China, the instrument has become increasingly popular in China and the West, as musicians explore new techniques and forms of innovation while maintaining its traditional character, Cai said.

"The beauty of the traditional *guzheng* does not lie in the fixed notes themselves, but in the space between them like water flowing around stones, with its own curves, pace and movement," said Han Mei, a professor of music and director of the Center for Chinese Music Culture at Middle Tennessee State University.

"This reveals the essence of the instrument: the traditional left-hand techniques of the *guzheng* transform sound from a series of separate points into a continuous process. That is what fundamentally defines the *guzheng*," she said.

Influenced by traditional Chinese music, she added, Western contemporary composers have also incorporated this fluid approach to sound into new music, electronic music and electroacoustic works.

"I've always been drawn to the sound of the resonating strings," said musician and guitarist Kevin Barker, who is learning the *guzheng*. "It's very different from the guitar, where you fret the strings, so the notes don't overlap in the same way as they do with the *guzheng*. It's always been an interesting sound to me."

His daughter is learning the *erhu*, a traditional Chinese bowed instrument.

"So seeing the instrument presented in this kind of academic setting is really interesting. It is also interesting to see the rigor with which people are thinking about it," he said.

Wang Yixin, the first graduate of the *guzheng* major in Bard College's undergraduate dual-degree program, said that traditional Chinese music needs innovation and younger generations to help carry it forward.

"Many music groups in New York place a strong emphasis on traditional training, including classical repertoire. We need to innovate while staying rooted in tradition," she said.

Wang added that in the process of sharing the music more broadly, it is important to give audiences access to authentic traditions and help them develop a deeper understanding of the culture.

"The *guzheng* carries Chinese culture within it," said Yuan Sha, a *guzheng* professor at China Central Conservatory of Music.

"Seeing the instrument performed in so many different styles in the US, Western audiences are also able to feel the emotions and love conveyed through *guzheng* music. The emotion behind the *guzheng* is universal, and sincere emotion matters far more than technical skill," she said.

She added that Chinese *guzheng* performers and educators have conducted in-depth studies of the instrument, but these explorations should not be limited to China.

"We should have greater exchange and engagement with international musicians," she said.

Brussels talks on EU-US deal make no progress

By **JONATHAN POWELL**
in London
jonathan@mail.chinadailyuk.com

Facing US pressure, including tariff hikes on European cars, negotiators from the European Parliament and EU Council, who were trying to conclude the EU-US trade deal, made no breakthrough after six hours of talks in the Belgian capital on Wednesday night.

The European Parliament and the Cypriot presidency of the EU Council failed to finalize a deal to scrap EU tariffs on US industrial goods, as agreed by the European Union and the United States in the framework of current negotiations in Scotland last summer.

The setback comes days after Washington threatened 25 percent tariffs on EU cars, which are above the 15 percent cap on US tariffs for EU goods set by US President Donald Trump and European Commission President Ursula von der Leyen in the deal made in Turnberry, Scotland in July.

The Cypriot presidency said while exchanges produced "positive momentum" between the two sides, negotiators had made "progress".

With the US turning up the pressure, negotiators agreed to meet again in 10 days, reported Euronews.

EU Trade Commissioner Maros Sefcovic met US Trade Representative Jamieson Greer on the sidelines of a G7 trade ministers' meeting in Paris on Tuesday and Wednesday, briefing him on progress toward scrapping EU duties on US industrial goods, which is now unlikely before June.

In March, the European Parliament approved the Turnberry accord with conditions, pending sign off by EU governments. On Friday, Trump accused the EU of breaching the accord and vowed to raise tariffs on cars, while also pressing the bloc to drop tariffs on US goods.

The EU said it was "fully committed to delivering on our shared commitments" and has kept Washington "fully informed throughout the process".

EU member states remain divided over the next steps, raising tensions within the bloc. As a condition for approval, European Parliament members are seeking safeguards, tying any EU tariff cuts to US compliance, plus a sunset clause that would end the deal in March 2028 unless renewed.

France backs adding safeguards, but a German-led bloc, including the Baltic states, Greece, Ireland, and Sweden, prefers last year's deal as agreed.

EU member states broadly agree on shielding the accord from future Trump threats, including those over EU cars or Greenland earlier this year.

The European Commission is pushing for a swift implementation of the EU-US deal, and there is added pressure from leaders of the conservative European People's Party, Parliament's largest group, who say businesses need certainty.

Cypriot Trade Minister Michael Damianos sought to reassure them, saying "the Council is committed to moving swiftly with the implementation" of the deal, adding, "We are fully committed to continuing our constructive engagement with the European Parliament."

An EU diplomat told Euronews the aim of Wednesday's meeting was largely to set out political positions, with technical talks to follow.

German socialist Member of the European Parliament Bernd Lange said, "We made good progress on the issue of the safeguard mechanism and the review and evaluation of the main regulation, but there is still some way to go."

Negotiators are now aiming for a new round of talks on May 19.

BRAZIL

Chinese citizens to gain visa-free entry

The Brazilian government announced on Thursday that it will grant visa-free entry to Chinese citizens holding ordinary passports starting on Monday, Xinhua News Agency reported. According to a statement published by Brazil's Foreign Ministry, eligible travelers can stay in Brazil for up to 30 days per visit. The move follows an announcement in late January by Brazilian President Luiz Inacio Lula da Silva to grant visa-free entry for certain short-term visits by Chinese citizens, in what analysts viewed as a reciprocal gesture to China's own visa-free policy for Brazilian nationals. China's policy, effective from June 1, 2025, to May 31, 2026, allows Brazilian passport holders to enter China visa-free for up to 30 days for business, tourism, family visits and transit.

UNITED KINGDOM

Voters cast ballots in local elections

British voters cast ballots on Thursday in local and regional elections that could shake up the country's politics and heap more pressure on embattled Prime Minister Keir Starmer. Starmer's center-left Labour Party is bracing for big losses in polls that would choose about 5,000 local councilors and a handful of mayors across England, as well as semiautonomous parliaments in Scotland and Wales. They are the biggest set of elections since Labour swept to power in a landslide in July 2024. Polls would close at 10 pm (Friday morning, Beijing time). Some results were expected overnight, but most would not come until Friday.

FRANCE

Bill gets nod to return ill-gotten artifacts

The French National Assembly on Wednesday approved, following a new round of debate, a draft law on the restitution of cultural property acquired through illicit appropriation. The lower house of parliament passed the bill with 141 votes in favor and none against, though turnout was relatively low compared with the total 577 seats. The bill seeks to establish a clearer and simpler legal framework for returning cultural assets acquired by France through illicit means, including looting, theft and sales conducted under coercion. It applies to cultural property acquired between 1815 and 1972, excluding military items and certain archaeological objects.

CHINA DAILY—XINHUA—AGENCIES

Japan's missile launch shatters pacifist stance

Move raises remilitarization fears and heightens regional tensions: Analysts

CROSS CURRENTS

By YANG RAN
yangran1@chinadaily.com.cn

Japan has, for the first time since World War II, fired offensive missiles on foreign soil, a move that experts say has effectively gutted the country's pacifist constitution and marks a critical escalation in its accelerating remilitarization, posing threats to regional stability.

During the "Balikatan" joint military drills with the United States and the Philippines on Wednesday, Japan launched Type 88 missiles overseas for the first time since the end of World War II. The exercise also marked Tokyo's first participation as a full member rather than an observer, with hundreds of Japanese troops deployed.

Lian Degui, director of the Center for Japanese Studies at Shanghai International Studies University, said the overseas deployment of Japan's Self-Defense Forces, alongside the use of offensive weapons, constitutes a major breakaway from the country's exclusively defense-oriented policy.

"This completely shatters the military red lines framed by Japan's postwar pacifist constitution and poses a major shock to regional peace," Lian said.

Da Zhigang, a research fellow at the Heilongjiang Provincial Academy of Social Sciences' Institute of Northeast Asian Studies, said Japan's live-fire use of offensive missile systems in a combat-simulated environment signals a fundamental shift in its military posture.

"This signifies that Japan no longer intends to remain merely a logistical or supporting role militarily, but hopes to possess active offensive strike capabilities," Da said. "This could disrupt the security balance in the Asia-Pacific and fuel a regional arms race."

Analysts noted that beyond military implications, Japan's use of domestically produced missiles also serves as a showcase for its military industry, aimed at attracting export orders and accelerating its military buildup.

Arms exports

Lian said arms exports are a key pillar of Japan's remilitarization strategy. "Increasing weapons sales can bring economic benefits while promoting the growth of the military-industrial complex, thus strengthening the country's overall military capabilities," he said.

Zhang Yulai, a professor at the Japan Institute of Nankai University in Tianjin, echoed the view, saying Japan has long sought to revitalize its military-industrial complex through expanded arms exports.

"Since former prime minister Shinzo Abe's second term, Japan has steadily chipped away at restrictions on weapons exports, trying to revive its military-industrial complex and profit from the business of war," he said.

The drill is the latest in a series of moves that reflect Japan's accelerating remilitarization. Last month, Tokyo revised the Three Principles on Transfer of Defense Equipment and Technology, along with related implementation guidelines, to allow overseas sales of weapons, including those with lethal capabilities.

Prime Minister Sanae Takaichi has also reaffirmed her intention to revise the constitution, particularly Article 9, the clause widely regarded as the cornerstone of Japan's postwar pacifist stance.

"Japan is systematically hollowing out its pacifist constitution through a series of legal revisions, breaking through the military constraints established under the postwar international order," Da said. "This expansionist military tendency raises the risk of regional disputes and undermines peace and development in the Asia-Pacific."

The pattern of exchange and cooperation built in Northeast Asia over recent decades may be replaced by challenges and friction, he said. "Many actions by the Japanese government have effectively opened Pandora's box for the revival of militarism, which has aroused high vigilance from the international community."

Commenting on Japan's overseas missile launch, Chinese Foreign Ministry spokesman Lin Jian warned on Wednesday that right-wing forces in Japan are pushing for accelerated remilitarization.

"The serious lack of education on true history, the fundamentally wrong historical views, compounded by strategies for military rearmament and preparation for war, have led to the malevolent emergence of neomilitarism in Japan and put regional peace and stability under threat," Lin said.

Da said Japan's historical revisionism, coupled with its arms modernization efforts and overseas troop deployments, is eroding trust among people in the region and the world.

Xinhua contributed to this story.

Beating the heat

Canadian firms eye new opportunities under 15th Five-Year Plan

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

China's 15th Five-Year Plan (2026-2030) is prompting renewed interest among Canadian businesses as companies reassess opportunities in sectors including energy, agriculture and advanced technology, speakers at a Toronto business forum said.

The event, hosted by the Canada China Business Council on Wednesday, brought together business leaders and officials to discuss how China's development blueprint could transform commercial engagement between the two countries.

"We are entering a new phase after several years of uncertainty," said Bijan Ahmadi, executive director and chief operating officer of CCBC.

"Companies are once again exploring opportunities and looking more seriously at where engagement, market demand and policy priorities are beginning to align," he said.

Ahmadi said the relationship between Ottawa and Beijing has "shifted" since Canadian Prime Minister Mark Carney formed government last year.

"Canada has re-engaged with China and started the process of recalibrating bilateral ties toward a more pragmatic and constructive relationship.

"This engagement has already contributed to stronger trade performance and renewed business confidence," he said.

Luo Weidong, Chinese consul general in Toronto, described the new five-year plan as "a treasure trove of development opportunities in China".

"The plan is not only a growing blueprint for China's economic and social development over the next five years, but also a guiding document that clarifies national strategy, identifies government priority, and guides and regulates the behavior of market entities," Luo said.

Both Luo and Ahmadi said China and Canada remain economically complementary, with businesses in both countries continuing to seek new areas of cooperation.

"Complexity is not a reason to disengage. It is a reason to be more precise," Ahmadi said.

He said Canadian companies need to understand "where opportunities are real, where constraints remain, and where commercial strategies can align with policy priorities and market demand".

According to Ahmadi, three themes in the 15th Five-Year Plan are especially relevant for Canadian businesses: high-quality growth, food and energy security, and stronger domestic consumption.

"These priorities translate into real opportunities," he said. "They reinforce the value of quality, reliability, safety and technical expertise, and the trustworthiness associated with Brand Canada in the Chinese market."

Luo also highlighted energy cooperation as a major area for future growth.

"Against the backdrop of the Iran crisis, there is both necessity and urgency to deepen cooperation in this field," Luo said.

He said China's next development phase would prioritize "the clean and efficient utilization of fossil fuels" while accelerating development of solar, wind, hydrogen and nuclear power.

Ahmadi noted that Canada's expanding export infrastructure could support deeper engagement with Asian markets, including China.

"Developments such as the Trans Mountain pipeline expansion, LNG Canada and several ongoing and upcoming energy projects are enabling increased flows of crude oil, LNG and LPG to Asia, with China among the leading Asian destinations for Canadian energy products," he said.

He added that China's decarbonization goals are also creating opportunities for Canadian companies specializing in carbon capture, methane reduction and environmental services.

Agriculture and food security emerged as another major focus.

"Canada's high-quality agricultural products, meats and seafood will enjoy expanded market opportunities," Luo said.

Ahmadi said Chinese demand is increasingly shifting toward "premium, safe, traceable and reliable food products".

"For Canadian producers, this means opportunities to re-establish and expand market access in areas such as canola, seafood, beef, pork, pulses, grains and other high-quality food products," he said.

Beyond commodities, he said Canadian firms could also compete through "traceability systems, product customization, nutrition and wellness food products".

The speakers also pointed to growing opportunities tied to changes in China's demographic structure and the expansion of its middle class.

Luo said sectors including eldercare, childcare, tourism and cultural consumption could become "new blue oceans" for Canadian investment.

Ahmadi similarly said demand in China is increasingly shifting toward "trusted and premium products and services".

"China's aging population is also creating new needs in healthcare services, rehabilitation, elder care, insurance, wealth management and pension-related services," he said.

On advanced manufacturing and emerging industries, Luo said sectors such as quantum technology, aerospace, hydrogen energy and sixth-generation mobile communications could become major new growth drivers.

29 passengers got off ship after 1st hantavirus fatality

THE HAGUE — More than two dozen passengers left a cruise ship hit by a deadly hantavirus outbreak on April 24 without contact tracing, nearly two weeks after the first passenger died on board, the ship operator and Dutch officials said on Thursday.

The news raised concerns that the virus could spread as travelers returned home, though experts say the risk to the wider public is considered low.

The Netherlands-based operator, Oceanwide Expeditions, had previously said the body of the Dutch man who died on April 11 was taken off the ship on the South Atlantic island of St. Helena on April 24, when his wife also disembarked. She then flew to South Africa a day later and died there.

The company said on Thursday that 29 passengers left the vessel at St. Helena, while the Dutch Foreign Ministry put the number at about 40. The company had not previously acknowledged that dozens more left the ship at that time.

The World Health Organization said on Thursday it had informed 12 countries that its nationals had disembarked the ship on St. Helena.

The first confirmed case on the ship was only on May 2, the WHO had previously said. That was in a British man evacuated from the ship to South Africa from Ascension Island three days after the St. Helena stop.

WHO Director-General Tedros Adhanom Ghebreyesus said on Thursday that there were now five confirmed hantavirus cases from the outbreak, with three more suspected, and warned more cases were possible.

The vessel is now sailing to Spain's Canary Islands, a voyage that is expected to take three or four days, with more than 140 passengers and crew members still on board.

Authorities in South Africa and Europe are trying to trace contacts of any passengers who previously got off the ship.

It emerged on Wednesday that a man tested positive for hantavirus in Switzerland after he also disembarked at St. Helena and flew home, though his precise movements are not clear.

Dutch authorities did not confirm where other passengers who disembarked are now.

The WHO said on Thursday it expected the hantavirus outbreak on the ship to be "limited", as long as public health measures and "solidarity" are implemented.

COMMENT

Editorials

US should reciprocate China's readiness to work to stabilize and improve relations

Chinese Premier Li Qiang, top lawmaker Zhao Leji and Foreign Minister Wang Yi held separate meetings with a bipartisan delegation of US senators led by Republican Senator for Montana Steve Daines in Beijing on Thursday.

The three meetings conveyed a consistent message from the Chinese side: China and the United States should strengthen communication, properly manage differences and work toward a stable and healthy bilateral relationship.

At a time when uncertainty continues to cast long shadows over the world economy, stable China-US relations bear directly on the well-being of the peoples of both countries and on world peace and prosperity.

It was emphasized in the meetings that the key to stable relations is to keep working on bridging the perception gaps between the two sides. The two countries should endeavor to seek "harmony without uniformity" and choose to be partners instead of rivals.

Since Daines' previous visit to China in March 2025, considerable changes have taken place in not only China-US relations but also the broader international situation.

Through their direct interactions with the Chinese side and firsthand observations in China, the members of the delegation have had an opportunity to better appreciate the importance of China-US ties and the vital role both countries can play in promoting global stability and development.

In his meeting with the US delegation, Li expressed China's readiness to enhance dialogue and communication, and create a favorable atmosphere for exchanges at all levels and cooperation in various fields, so as to strive for more practical achievements between the two countries.

It was stressed in the meetings that the Taiwan question is the first and inviolable red line in China-US relations.

Both the US legislature and government should realize that the Taiwan question concerns the very core of China's core interests and constitutes the bedrock of the political foundation of China-US relations. China's resolve to safeguard its territorial integrity is unwavering and must not be underestimated. If the US side really cares about peace across the Taiwan Strait, it should stop sending wrong signals to the "Taiwan independence" forces on the Chinese island.

Adhering to the one-China principle and the three Sino-US joint communiques, as well as honoring the commitments made by successive US administrations regarding the Taiwan question, are prerequisites for the stable development of Sino-US relations. These are international obligations that the US side must fulfill.

Li urged the US lawmakers to bear in mind the broader interests of China-US friendship and cooperation, and view and handle China-related issues with prudence, thereby playing a constructive role in the sustainable development of bilateral relations.

Zhao signaled the willingness of China's top legislature to strengthen engagement with the US Congress, facilitate increased exchanges and mutual visits, extending a welcome to more US lawmakers to visit China.

It is hoped that the US senators, who play a key role in influencing US lawmaking and policymaking, will view China objectively, understand China rationally, respect China's core interests earnestly, manage differences properly and join hands to do more major, practical and good things that are beneficial to both countries and the world, as Wang stressed.

The visiting US senators should comprehend Beijing's stance that mutual respect is the foundation for bilateral ties, peaceful coexistence the guiding principle and win-win cooperation the objective. The hard-won stability in bilateral relations should be cherished, so that the two sides can work together to explore a proper way for major countries to get along with one another.

Regulatory overreach masks EU's malaise

The European Union's instinctive response to technological anxiety is paperwork, suspicion and the politicizing of economic relationships.

The latest manifestation of this tendency is a revised EU Cybersecurity Act proposed by the European Commission, which would allow Brussels to classify certain countries as states of "cybersecurity concern" and designate companies as "high-risk suppliers" based on vaguely defined "non-technical risks". Suppliers from targeted countries could effectively be excluded from entire supply chains across 18 critical sectors.

This is nothing more than pride and prejudice.

According to a report released by the China Chamber of Commerce to the EU and KPMG on Wednesday, replacing Chinese equipment under the proposed framework could cost the EU as much as €367.8 billion ($432.6 billion) over the next five years. That is equivalent to the GDP of a mid-sized EU economy. Yet Brussels appears willing to absorb the economic pain in pursuit of a strategic doctrine that remains deeply subjective.

The problem lies in how the EU is defining risk. Technical vulnerabilities can be tested, audited and corrected. "Non-technical risks", by contrast, are inherently ambiguous and elastic. Once security becomes detached from verifiable engineering standards, regulation risks becoming an ideological instrument.

As a spokesperson for China's Ministry of Commerce said, the draft law introduces arbitrary standards that weaponize supply chains under the banner of "security", while undermining the principles of market competition and nondiscrimination that the EU itself once championed.

If "high-risk supplier" becomes a geopolitical label, rather than a technical assessment, then any foreign company can theoretically be excluded at any moment in accordance with which way Brussels decides the political wind is blowing.

Former European Central Bank president Mario Draghi's warnings about the EU's competitiveness crisis — a widening productivity gap, slow growth and weakening industrial power that risk a "slow and agonizing death" of the EU's economic model — have not been subtle. Yet they have not been heeded.

Instead, Brussels increasingly behaves like "a regulatory overlord" presiding over a shrinking estate that is being sold off to pay for the upkeep of the manor. The EU is already struggling with sluggish growth, industrial erosion, energy insecurity and declining global competitiveness. It should pause before traveling too far down this road.

As the EU is debating sweeping supplier exclusions, German Foreign Minister Johann Wadephul has reportedly advanced proposals for broad institutional reform within the EU itself, arguing that Europe must adapt more effectively to geopolitical and economic realities. It can't keep centralizing more regulatory authority while becoming further detached from industrial realities.

Some of the EU's lawmakers appear astonishingly distant from the sectors they regulate. Technology legislation is frequently written through the narrow lens of political symbolism rather than operational practicality. Industrial policy becomes performance geopolitics. Business considerations become moral theater.

The consequences are visible. The EU wants green transition leadership while burdening manufacturers with costs competitors do not face. It wants digital sovereignty while depending heavily on imported technologies. It wants strategic autonomy while reducing supplier diversity. The contradictions grow sharper with each new regulatory package it unveils.

The revised EU Cybersecurity Act risks becoming another example of the EU confusing strategic caution with economic self-harm. The irony would be particularly acute in telecommunications and digital infrastructure. Chinese suppliers became deeply embedded in the EU's markets thanks to their high cost-performance and proven reliability. Retrofitting or dismantling large portions of these systems will not magically create stronger European alternatives overnight. It will simply increase the costs for consumers, delay infrastructure upgrades and deepen Europe's investment burden during a period of already weak economic momentum.

The EU speaks the language of openness while practicing selective exclusion. That inconsistency damages its credibility in the world market, where many emerging economies see growing European enthusiasm for "de-risking" as little more than a softer euphemism for economic protectionism.

There is a distinction between rigorous standards and politically expandable categories that can be stretched to fit shifting strategic anxieties. Brussels should reconsider the most problematic aspects of the draft law: the designation of countries of "cybersecurity concern", the ambiguous "non-technical risk" criteria and the sweeping restrictions attached to "high-risk suppliers".

If the EU truly wishes to adapt to a harsher global era, it must reconnect its policymaking and lawmaking with economic realities rather than ideological abstraction. Otherwise, the EU may discover too late that its greatest vulnerability was not foreign technology but its regulatory addiction.

FIFA pricing risks alienating premium product-making fans

The 2026 FIFA World Cup has already been sold as the biggest ever: 48 teams, three host nations, a projected $13 billion in revenue and a corporate footprint sprawling across North America like a traveling trade expo. Somewhere in between lies the faint outline of an actual soccer tournament, watched by actual people, many of whom are increasingly being priced out of it.

It is as if FIFA were standing in the middle of the world's most popular sport like a luxury landlord rattling a velvet donation bucket insisting that the rent must go up again because demand is "historic".

Negotiations over China's broadcasting rights for the 2026 World Cup remain stalled, with FIFA demanding $300 million, 17 times what it is charging India, a country with a comparable population. This despite the fact that China's men's national team did not qualify. That absence alone dramatically alters the economics of the tournament in China. Without the Chinese team, domestic enthusiasm has inevitably softened. Advertisers know this. Sponsorship appetite has cooled. The longer FIFA clings to fantasy valuations, the more sponsors will simply turn their attention elsewhere.

Besides, this is not 2002, when families gathered around television sets at dawn, or even 2010, when live broadcasting still held sway. The death of CNN founder Ted Turner on Wednesday is itself an elegy for the decline of the television network. Chinese viewers now consume soccer through fragmented streams, mobile highlights, social clips and flexible digital platforms. Younger audiences are perfectly comfortable catching goals after they have been scored rather than sacrificing sleep for group-stage kickoffs. In that environment, FIFA's pricing model looks more like figures plucked out of the ether.

There is another layer of absurdity here. Chinese journalists have reportedly faced prolonged visa delays that have prevented many outlets from securing on-site studios, commentary positions and working facilities in time for the tournament, which kicks off in the United States on June 11. Reduced access inevitably means reduced broadcast quality. Yet FIFA still appears determined to charge champagne prices for watered-down beer.

And then there are the tickets.

This week the FIFA chairman defended soaring World Cup ticket prices by arguing they reflect the US market. It's difficult to track exact 1994 US World Cup ticket prices, but according to ESPN, prices ranged from $25 to $475 per match. For the final between Brazil and Italy, some tickets exceeded $1,500. Adjusted for 2026 inflation, that means tickets roughly ranged from $55 to $1,050, with the final costing the equivalent of about $3,300 today. In sharp contrast, attending eight matches at the 2026 World Cup (one per round) costs roughly $6,900 for the cheapest category tickets — and up to $16,400 for the most expensive, as per BBC Sport.

Soccer has always sold dreams. FIFA has decided to sell exclusivity instead. This is the danger of overcommercializing a sports spectacle. The World Cup is not the Super Bowl. It is not Coachella with shin pads. It belongs, at least morally, to billions of people who invest themselves emotionally in the game every four years.

FIFA should understand the risks of overestimating its hand. This is, after all, the same organization whose recent history includes the 2015 FIFAgate, a scandal that revealed systemic bribery, opaque governance and industrial-scale self-interest inside soccer's ruling structures. Yet the institution survived, repainted itself in the language of reform, then resumed accumulating money with renewed enthusiasm.

Which raises the obvious question. Who watches over FIFA now?

Because soccer governance increasingly resembles a closed financial ecosystem answerable mainly to itself. Even former insiders have openly criticized FIFA's lack of accountability.

The World Cup should be the great festival of sport for the world. Instead, FIFA risks transforming it into a gated premium product wrapped in the rhetoric of global unity.

China's broadcasters are right to resist unrealistic pricing. Fans everywhere are right to complain about ticket costs. And FIFA would do well to remember a simple truth: soccer made FIFA rich. FIFA did not make soccer beloved.

What They Say

APEC crucial cohesion platform in Asia-Pacific

Editor's note: *The second Asia-Pacific Economic Cooperation Senior Officials' Meeting and related events will be held in Shanghai from Monday to May 19. People's Daily Overseas Edition spoke to Tu Xinquan, dean of the China Institute for World Trade Organization Studies at the University of International Business and Economics, and Zhang Jingjia, an associate researcher at the APEC Study Center of Nankai University, on China's role in the forum. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

At a time when geopolitical conflicts are disrupting global value chains and multilateral mechanisms are under strain, APEC is one of the few frameworks where economies can still sit down together to discuss trade and economic cooperation pragmatically. This gives the mechanism practical significance.

By promoting upgraded connectivity initiatives and striving for tangible results in physical, institutional and people-to-people connectivity, APEC economies can better withstand external shocks and enhance regional economic resilience.

At the same time, APEC can accelerate the green and innovation-driven transformation across the region. Greater cooperation in clean energy, green minerals and environmental protection will help member economies move toward smarter, greener and more digital growth while reducing dependence on traditional fossil fuels. Innovation-led transformation is essential for the long-term sustainable development of the Asia-Pacific. It can also create new engines of growth in times of uncertainty.

The Asia-Pacific region still holds enormous potential for economic growth and trade cooperation. China is the largest trading partner for nearly all the APEC members, giving it an important role in regional cooperation. Despite frictions between China and the United States and Japan, economic and trade ties remain a vital bridge. They continue to play an irreplaceable role in maintaining relations and supporting regional stability.

In this context, APEC serves as both a stabilizer and a source of cohesion for the Asia-Pacific region. More importantly, it provides a valuable platform for leaders and officials at different levels to engage in practical discussions and sustained communication. Even when differences and disputes persist, dialogue remains essential to regional stability and economic certainty. This is precisely why APEC's role cannot easily be replaced.

China's three priorities for APEC 2026 — openness, innovation and cooperation — can help reinforce the focus on regional shared development. They also reflect both China's strengths and its vision for the future of APEC and the wider world.

The country has demonstrated a firm commitment to expanding opening-up through a series of concrete measures this year. It is also a strong supporter of the multilateral trading system and the World Trade Organization. Regarding innovation, China has become one of the world's major innovation hubs, particularly in manufacturing, and is well-positioned to contribute more to APEC's innovation-driven development. When it comes to cooperation, China has consistently advocated partnership rather than confrontation, a position that aligns closely with APEC's core principles.

Although China remains a developing country, it is making tangible contributions to global development and regional prosperity by expanding market access, increasing outward investment, deepening supply chain cooperation and strengthening technological collaboration. It also advocates stronger connectivity and more resilient supply chains.

VIEWS

Jiang Jianguo

China's right path to human development

China is promoting the well-rounded personal development of its people and the all-around advancement of human rights. These goals were part of the Communist Party of China Central Committee's recommendations for formulating the 15th Five-Year Plan (2026-30), as well as the plan's outline approved by national lawmakers.

Together, the two documents provide guidance for the country to put into practice the idea that "living a happy life is the primary human right".

"Putting the people first" is the fundamental principle guiding China's pursuit of well-rounded personal development of the people and advancement of human rights in all fields in the new era.

Chinese modernization is ultimately measured by the growth and development of the people. Its purpose is to stimulate the people's initiative and creativity by enhancing their capabilities and competence.

Promoting well-rounded personal development essentially means following a people-centered approach and upholding the commitment to respect, empower and support the people and facilitate their progress while advancing human rights.

Human rights are interdependent and must be advanced comprehensively through a systematic approach.

China's pursuit of all-around advancement of human rights is reflected in its efforts to build a human rights protection system covering all fields, improve the protection of all rights, and channel more public resources into core areas of personal development.

Both the recommendations for the 15th Five-Year Plan and the plan's outline place emphasis on investment in human capital that is key to promoting both well-rounded personal development and all-around advancement of human rights, as people themselves are the fundamental goal of modernization.

On the one hand, more public resources are being directed to sectors related to livelihoods, such as education, employment, healthcare and social security.

On the other hand, the country is aligning investment priorities to ensure that resources are allocated to safeguard and promote people's rights.

The focus is on meeting people's basic subsistence needs, boosting the quality of life, and ensuring people live a life of security, stability and dignity.

By improving the basic public service system and the social security system, the aim is to establish a network to protect subsistence rights that covers all people and ensures their well-being throughout their lives.

MA XUEJING / CHINA DAILY

Unlocking people's potential is another major goal. Investment in human capital will help enhance people's ability to grow, participate and create. The documents emphasize removing barriers to personal development and call for improving the lifelong learning system, optimizing human resource development, and refining the country's employment support mechanisms so that different groups of people enjoy greater parity of opportunities.

The recommendations and the outline lay a solid institutional foundation for the advancement of human rights. They call for continued improvement in the institutions, standards and procedures for whole-process people's democracy as well as coordinated efforts to promote sound legislation, strict law enforcement, impartial administration of justice and observance of the law by all.

The documents also aim to facilitate upward mobility of people. They attach importance to creating an environment of fair competition, making rules and policies more fair to ensure equal opportunities, and improving the institutions for coordinated development among different regions and between urban and rural areas.

As China's human rights cause starts a new chapter, the country needs to develop human rights theories based on its own practice and accelerate the building of its own human rights knowledge system.

China's human rights cause has given rise to new concepts such as "living a happy life is the primary human right" and "the rights to subsistence and development are the primary and basic human rights".

There is an imbalance between human rights knowledge provided by the Global North and that provided by the Global South.

Continued efforts are therefore needed to draw inspiration from Chinese modernization, build China's human rights theoretical framework and help address that imbalance.

China also has to build a more vivid narrative, allowing the world to know better about its human rights achievements.

Chinese modernization provides both the material and a solid foundation for the country to tell its human rights story. Since it entered the new era, China has made remarkable achievements in human rights.

Human rights have been promoted through development, protected through reform and improved through governance. These macro-level achievements should be translated into multi-dimensional and relatable stories.

By sharing with the world its human rights stories and insights, China can help make global human rights governance more just, equitable and inclusive.

At present, global human rights development still faces many challenges, including hegemonism, regional conflicts and extreme poverty. China has adhered to inclusive development, pursued the common human aspiration of "human rights for all" and created favorable conditions for developing countries to share in development gains.

Going forward, the country needs to continue strengthening international human rights and building a community with a shared future for humanity.

Flood of opportunities in ecological preservation

The idea of ecological civilization was first introduced during the 17th National Congress of the Communist Party of China in 2007, marking a new direction in the country's social and economic development. In 2012, it became even more central when it was included in the "five-in-one" framework, placing environmental protection alongside economic, political, cultural, and social development.

Global Lens

The importance of the concept has continued to grow. In 2017, ecological civilization was described as a long-term goal for China's future, and, in 2018, it was written into its Constitution.

Today, it is a key concept shaping how the country approaches development.

In recent years, China has made remarkable progress in embedding ecological civilization effectively into its development planning.

A major challenge to the country's continuous socioeconomic development during the post-2020 era has been that the climate, as in the rest of the world, has been changing much faster than scientists had expected. Fortunately, the concept of ecological civilization has provided an important framework within which the issues associated with climate change can be properly addressed.

One of the clearest signs of climate change is the shifting patterns of rainfall.

Since the early 2000s, northern China, traditionally a water-scarce area, has been receiving more rainfall than before, while some areas along the Yangtze River have been recording less rain.

This climate shift is gradually changing China's ecological landscape.

These changes are closely linked to the increase in global warming. Rising temperatures are making extreme weather conditions more frequent and intense, and sometimes for longer durations.

For example, more typhoons are moving faster northward in the country, increasing the risk of heavy rainfall, and thus increasing economic losses in inland regions.

As a result, areas that once faced regular droughts now have to face new challenges such as severe storms and floods.

Against this backdrop, ecological civilization is helping China respond to both new opportunities and unfamiliar challenges. Increased rainfall is easing water shortages in northern and northwestern regions.

Across the Mongolian Plateau, for example, surface water bodies and wetlands have shown clear signs of recovery since 2010. These changes are opening up new environmental and economic possibilities.

In Inner Mongolia autonomous region, this trend can already be observed. East Juyan Lake, which disappeared in the late 20th century, has reappeared in recent years. Wuliangsuhai Lake has begun to stabilize after years of steady decline. Hongjiannao Lake, the largest desert freshwater lake in China, is also gradually recovering, helped not only by increased rainfall but also by the implementation of stronger environmental policies and better water and land management practices.

These environmental improvements are also improving agriculture and local economies. In northeastern provinces like Heilongjiang and Jilin, warmer temperatures and more rainfall are extending growing seasons and supporting the expansion of maize and rice production.

In the North China Plain, more rainfall and effective groundwater management have significantly reduced pressure on aquifer depletion. This process is helping farmers maintain stable production of wheat and maize, which ensures food security and increases rural household incomes.

At the same time, recovering ecosystems are creating new economic opportunities for people. Proper management of wetlands and lakes is supporting fisheries, eco-tourism and several green industries. In this way, ecological improvements are being increasingly linked with socioeconomic development.

In cities, ecological civilization is also changing how climate risks are managed.

Places such as Wuhan, Hubei province and Shenzhen, Guangdong province, among others, have developed "sponge city" programs, which allow rainwater to contribute to groundwater recharge.

This means water can be used instead of causing floods and economic damage.

Major infrastructure projects, including the South-North Water Transfer, are also helping to balance water resources across regions, and contributing to the country's economic development.

Recent extreme weather events have further pushed these efforts forward. Cities have further improved monitoring systems and inter-institutional coordination, making adaptation to climate change more effective, proactive and less damaging.

However, challenges remain. More intense rainfall is putting added pressure on flood control systems and urban drainage networks that were designed for the more stable climate conditions in the past.

Adaptation is an ongoing process that requires continuous improvements.

Ecological civilization offers a clear direction for this effort. It connects environmental protection with economic and social planning, helping China adapt to changing climate conditions while continuing its steady social and economic development.

By improving water and land management practices, supporting agriculture, and strengthening resilience in cities and regions, China is turning climate challenges into opportunities for more sustainable growth.

In other words, ecological civilization is not just an ideological concept but also a practical way forward in a changing climate.

Li Juncheng

Young urban ears increasingly tuning into podcasts

A subway ride, a treadmill, a late-night walk home: all these are places where podcasts have quietly taken root. For many young urban people, listening has become part of the daily rhythm.

An episode on the morning commute, another at the gym, one more before bed — this is not a niche habit, but simply how people live now.

The rise of podcasts can be traced back to around 2020. The pandemic changed how people moved through daily life. Commutes shrank, travel stopped, and working from home became routine for many.

Time once used for socializing, commuting, or light entertainment needed a new home. Podcasts stepped into that space with unusual ease. They were easy to access, easy to fit into daily routines, and rich enough to offer both information and company.

The growth has been fast. China is now one of the world's fastest-growing podcast markets. By 2025, the number of Chinese-language podcast listeners was expected to cross 150 million, while the total market revenue may have exceeded 5 billion yuan ($733.5 million). In the competition for attention, podcasts have claimed something rare: uninterrupted time.

That is one reason podcasts feel different from so much of today's content. Short-form video is built for speed and surprise. Podcasts ask for something else. A conversation can stretch across 40 minutes, an hour, or sometimes even longer. There is no rush to the punchline, no need for visual fireworks. The human voice carries the experience. It can sound casual, intimate, thoughtful, even reassuring. That is a big part of the medium's power.

In a world crowded with noise, they offer a different kind of attention. In a world driven by speed, they make room for thought.

Podcasts also fit naturally into moments when the eyes are busy but the mind is free. Walking, running, cooking, driving, folding laundry — these are all times when audio makes sense. A podcast can turn spare minutes into something fuller and make a daily routine feel less empty.

Still, the appeal of podcasts goes beyond convenience. They also answer a quieter emotional need.

A listener who cannot sleep at night may listen to a familiar host talking about a book, a film or simply the events of the day. The effect can be surprisingly comforting. Research suggests that listening to the human voice can prompt the release of oxytocin, often called the "trust hormone", which is linked to reduced stress and a greater sense of closeness. Podcasts make use of that effect in an understated way. Over time, the relationship between host and listener can become almost personal.

The boom has been helped by the range of people making podcasts. In August 2025, public figures such as Luo Yonghao and Chen Luyu entered the field with video podcasts. At the same time, independent creators have continued to bring their own voices, expertise and obsessions into the mix.

The result is a broad soundscape that now includes culture, science, dialects, folklore, philosophy, and new occupations. On Xiaoyuzhou, a major platform, 2025 saw more than 64,000 new podcast shows and nearly 700,000 new episodes.

That is where podcasts start functioning as an alternative publishing world. In the traditional book market, many subjects never find a strong commercial home. They may matter deeply to a small audience, but they are too specialized to justify a print run. Podcasts remove that barrier. With a smartphone, a microphone, and a quiet room, a creator can speak to thousands of people who care about the same narrow subject.

That helps explain why podcasts are becoming culturally important in ways that are easy to overlook. In Lyuliang, Shanxi province, a group of Jin dialect enthusiasts launched a podcast to explore and preserve their local dialect. In Hangzhou, Zhejiang province, several podcasts have moved offline, turning digital conversations into live cultural gatherings.

These examples are small, but they point to something larger. Podcasts can strengthen connections between people and places and turn shared interests into real communities.

Of course, the industry still has real problems. Content quality varies widely, business models are uneven and regulation is still catching up. But new cultural forms often look less important than they later prove to be.

Online literature once seemed like a side current; it later fed a much larger IP economy. Podcasts may follow a similar path. As more high-quality original content moves toward sustainable paid models, the medium could become a stable part of the digital cultural landscape.

The appeal of podcasts lies in depth, sincerity, and voice. They are rooted in ordinary life, shaped by ordinary people, and carried by ordinary moments. That is precisely why they matter.

In a world crowded with noise, they offer a different kind of attention. In a world driven by speed, they make room for thought. And in the space between one voice and another, they are helping shape a new kind of mass culture.

GLOBAL VIEWS

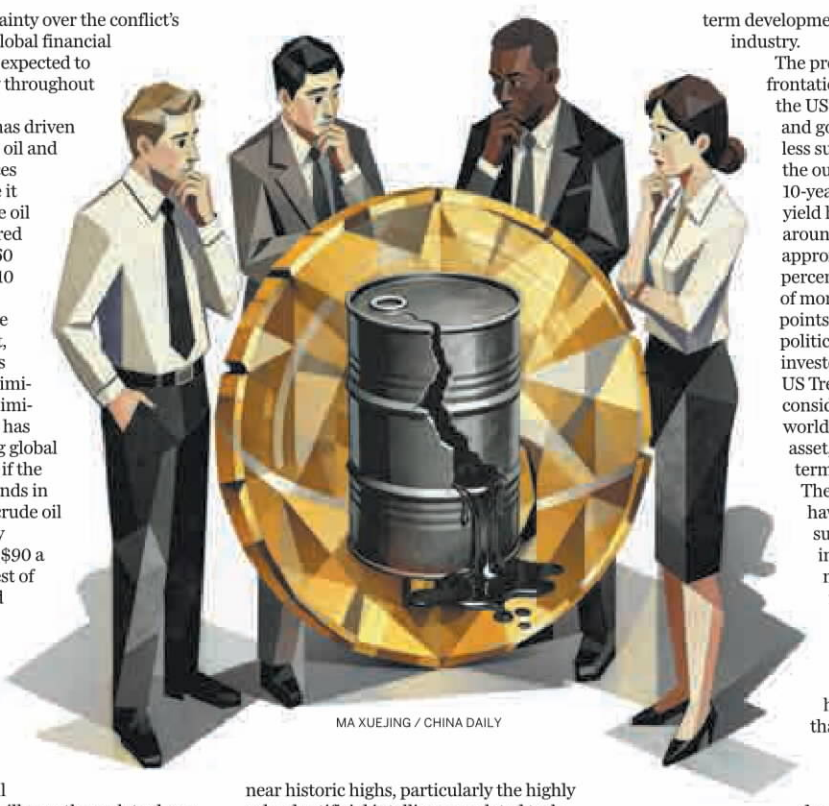
Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

ZHANG MING

Pressure point

Volatility in global financial asset prices is expected to remain persistently elevated throughout the year

More than two months have elapsed since the outbreak of the Iran crisis. The trajectory of the situation remains highly uncertain. This prolonged standoff is likely to reinforce global stagflation and exert significant influence on the pricing dynamics of various financial assets.



Since 2022, the global growth landscape has shifted from prolonged stagnation to stagflation. The former features "three lows and one high" (low growth, low inflation, low interest rates and high government debt), while the latter features "one low and three highs" (low growth, moderately high inflation, relatively high interest rates and high government debt). The key difference between the two lies in inflation, which in turn determines the divergence in interest rate trends.

The marked rise in global inflation since 2022 stems, on the supply side, from disruptions to global industry and supply chains caused by the COVID-19 pandemic and the Ukraine crisis; on the demand side, it reflects the unprecedented macroeconomic policy easing adopted by various countries after the pandemic, which boosted household consumption.

Over the past two to three years, global inflation has moderated to some extent. However, the ongoing Iran crisis and the resultant surge in global commodity prices represent yet another major supply-side shock to the world economy — following the pandemic and the Ukraine crisis. With aggregate demand unchanged, this results in lower economic growth and higher inflation, thereby further entrenching global stagflation. For instance, in its latest World Economic Outlook released in April, the International Monetary Fund revised down its global growth forecast for the year from 3.3 percent to 3.1 percent.

The Iran crisis has already roiled global financial markets since its eruption. Given the high uncertainty over the conflict's future course, global financial asset prices are expected to fluctuate wildly throughout 2026.

The conflict has driven up global crude oil and natural gas prices markedly. Since it broke out, crude oil prices have soared from around $60 to as high as $110 a barrel — an increase of more than 80 percent, with natural gas prices posting similar gains. A preliminary consensus has emerged among global investors: Even if the confrontation ends in the near term, crude oil prices will likely remain around $90 a barrel for the rest of the year. Should the confrontation persist, prices may break through the $110 to $120 range. More importantly, higher oil and gas prices will pass through to downstream goods, including electricity, chemicals, fertilizers and food. Rising pesticide and food prices would place noticeable pressure on emerging markets and developing economies, potentially triggering humanitarian crises.

MA XUEJING / CHINA DAILY

The confrontation has sharply increased volatility in global equity markets, and the overvalued US stock market could tip into a bear market. Since the outbreak, major global equity indices have all corrected to varying degrees. The US market remains near historic highs, particularly the highly valued artificial intelligence-related tech stocks. Even before the confrontation, some analysts had argued that US stocks faced considerable downward pressure this year. The outbreak has amplified the likelihood of a sharp correction for three reasons. First, the conflict will push up US inflation, interrupting the Federal Reserve's rate-cut cycle and possibly even forcing a return to rate hikes; second, it has dampened risk appetite and heightened risk aversion among global investors; third, it could drive up electricity prices, constraining the near-term development of the AI industry.

The prolonged confrontation could make the US' fiscal deficits and government debt less sustainable. Since the outbreak, the 10-year US Treasury yield has risen from around 4 percent to approximately 4.3 percent — an increase of more than 30 basis points. Normally, geopolitical conflicts lead investors to buy more US Treasuries, widely considered the world's premier safe asset, pushing long-term yields down. The fact that yields have risen instead suggests that investors are now questioning the safe-haven status of these instruments and are less motivated to hold them. If that safe-haven status continues to erode, and if domestic US inflation rises significantly, the possibility that 10-year yields will remain persistently high cannot be ruled out. Given that US federal debt has already exceeded 120 percent of nominal GDP, persistently high long-term yields imply a sharp increase in future debt service burdens. Moreover, the confrontation itself will substantially widen the current US fiscal deficit. Taken together, the US-Israel-Iran conflict is likely to aggravate the unsustainability of the US' fiscal deficits and government debt.

As the confrontation grinds on, gold prices are likely to reverse their recent decline and move higher. Gold had fallen from around $5,400 to $4,400 per ounce, before recovering to roughly $4,700. The initial price drop — despite heightened geopolitical tensions — mainly reflects the enormous run-up in gold prices over 2024 and 2025, which had already priced in much of the future uncertainty. In addition, gold exchange-traded funds, which are increasingly behaving like speculative investments rather than long-term investments, have grown in scale and influence. Nevertheless, if the confrontation drags on longer than markets expect, and if US Treasuries are no longer seen as a trustworthy safe asset, gold's unique status as a store of value could drive its price back up — although even in an upward trend, volatility will remain high.

For major economies of the Global South — particularly energy importers — the Iran crisis could lead to higher import costs, slower growth, rising inflation and greater asset price volatility. These countries should consider the following countermeasures: First, if domestic energy prices rise too rapidly, authorities could release strategic petroleum reserves or impose temporary price controls to cushion the impact; second, strengthen monitoring of short-term cross-border capital flows and take steps to prevent excessive outflows; third, prepare policy contingency plans to boost domestic growth based on national circumstances and comparative advantages, so as to cope with the uncertainty stemming from the evolving confrontation.

CHEN WENXIN

New discourse to uphold multilateralism

While the US' withdrawals from multilateral organizations upset world cooperation, China will continue to contribute to global governance through initiatives

The United States announced on Jan 7 its withdrawals from 66 international organizations that "no longer serve American interests", 31 of them being the United Nations bodies. Although the US' withdrawals from multilateral institutions are nothing new, the scale of this move is unprecedented and carries far-reaching implications for global governance and the international order.

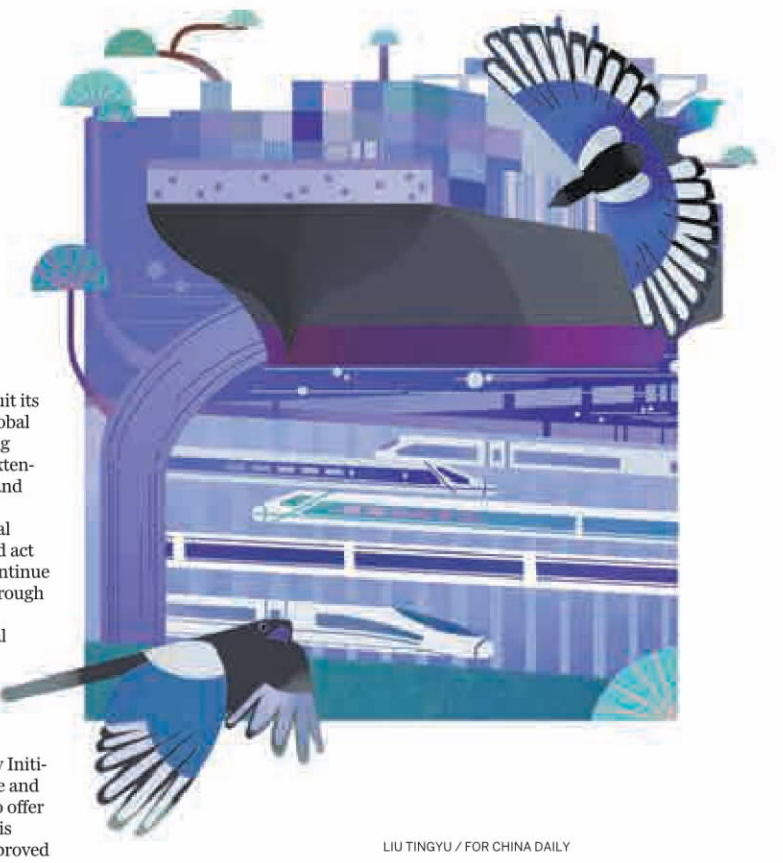
The withdrawals reflect deliberate strategic planning. The 66 organizations were identified through a comprehensive review mandated by President Donald Trump's Executive Order 14199. Each decision was shaped by a mix of strategic calculation and political considerations to serve the "America First" agenda.

Moreover, unlike earlier withdrawals that were confined to a single domain, the organizations that have been hit this time cut across a wide range of core areas of global governance, such as climate change, human rights and cultural cooperation. Therefore, the withdrawals this time will have far-reaching and complex implications for the multilateral system.

By withdrawing from international organizations, the US is not abandoning global governance, but seeking to redefine its role within it.

One objective is to concentrate power in a handful of priority domains. Consistent with its national security strategy, the Trump administration seeks selective engagement in global governance to sharply reduce investment in non-strategic areas while preserving dominance in the global economy, advanced technology and military security.

Another aim is to minimize constraints and advance unilateral hegemony. By systematically dismantling the existing global system and exerting pressure in international interactions, Washington seeks fewer institutional checks and greater freedom of action to force through its agenda unilaterally.



A third goal is to scale back investment in global governance. The US increasingly evaluates global engagement through a cost-benefit lens and reshapes its global role accordingly. Continued cuts to funding for international organizations are intended to reduce external burdens, reflecting a utilitarian approach.

Following the sweeping US withdrawals, the global governance system and the international order will face more challenges.

The foundations of the global governance structure have been eroded. The US' exit from UN-related bodies and mechanisms such as the UN Framework Convention on Climate Change has disrupted the existing global system and weakened the authority and effectiveness of multilateral mechanisms, pushing the UN-centered governance structure into a crisis of trust.

The withdrawals have also weakened global coordination and deepened fragmentation in global governance. Cooperation in climate action, public health and security has been disrupted, leading to the under-provision of global public goods, stalled regional collaboration and rising difficulties in policy alignment. As a result, global governance will become ever more divided.

The US' withdrawals from multilateral organizations as a tool for power politics and selective application of rules to suit its interests have deepened divisions. Global cooperation also faces the risk of being steered away from the principles of extensive consultation, joint contribution and shared benefits.

LIU TINGYU / FOR CHINA DAILY

In response to this, the international community must build consensus and act collectively. China, for its part, will continue to contribute to global governance through global initiatives.

First, the central role of multilateral institutions can be strengthened. By upholding the UN as the core platform of global governance, China has put forward four global initiatives — the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative — to offer Chinese solutions to the world. On this basis, China can further advocate improved decision-making and financial mechanisms to ensure continuity on critical agendas. Reforming these institutions will allow China to deepen cooperation with other Global South countries, amplify the voice of developing nations and help address long-standing imbalances in Western-dominated governance. China can also use multilateral platforms to promote the enforcement of international law, establish multilateral mechanisms to ensure compliance and bolster resilience against unilateralism.

Second, more diversified and coordinated cooperation networks can be built. Linkages can be deepened among regional mechanisms such as BRICS, the Shanghai Cooperation Organization and the Association of Southeast Asian Nations, creating synergies through policy coordination, resource sharing and mutual recognition of outcomes. Furthermore, China will continue to leverage the Belt and Road Initiative to align national development strategies with regional cooperation plans. At the same time, emerging economies and developing states can be encouraged to develop new forms of multilateral cooperation to strengthen cross-regional resilience.

Third, a global consensus for collective action should be reached. Global issues can be prioritized to foster broad-based cooperation. In climate governance, China will continue to uphold the principle of common but differentiated responsibilities to advance more inclusive implementation pathways. In public healthcare and food security, it is essential to build global platforms to facilitate technology exchanges, joint responses to emergencies and coordination on raw resources. Moreover, China can also work to promote a new discourse on global governance, to ensure equity, justice and shared responsibility are embedded in rule-making. This is key to upholding multilateralism, building consensus to address global challenges and injecting certainty into global governance.

BUSINESS

Rules eased to boost cross-border financing

PBOC, SAFE hike lending leverage ratios to support corporate overseas expansion

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

China has stepped up policy support for cross-border financing by raising leverage ratios for overseas lending by foreign banks in the country and the Export-Import Bank of China, in a move aimed at boosting the real economy, facilitating trade and investment, and accelerating the global use of the renminbi.

The adjustment comes as banks' overseas lending has expanded steadily in recent years, with the share of renminbi-denominated loans continuing to rise, even as some banks have seen their outstanding overseas loans approach existing regulatory caps.

Under the new regulations, the overseas lending leverage ratio for wholly foreign-owned banks, Sino-foreign joint venture banks and branches of foreign banks in China has been raised from 0.5 to 1.5, while that of the Export-Import Bank of China, also known as China Eximbank, has increased from 3 to 3.5.

In a recently issued joint notice, the People's Bank of China, the central bank, and the State Administration of Foreign Exchange also said that domestic banks extending loans with maturity exceeding one year in renminbi and foreign currencies to overseas enterprises indirectly — such as through overseas banks — can now have those loans processed in accordance with regulations of their respective jurisdictions, simplifying procedures and improving cross-border financing efficiency.

Western Securities estimated that the adjustment will increase the aggregate overseas lending ceiling of 41 locally incorporated foreign banks in China, including wholly foreign-owned and JV banks, by 497.5 billion yuan ($73.13 billion), and raise China Eximbank's overseas lending ceiling by 194.8 billion yuan. Together with expanded quotas for domestic branches of foreign banks, the total increase in overseas lending capacity is expected to reach between 700 billion and 800 billion yuan.

Zhou Antong, an analyst at Western Securities, said in a research report that China Eximbank will benefit the most from the policy change, with its share of overseas lending assets expected to rise further. The second tier of beneficiaries include large foreign banks operating in China. In addition to higher overseas lending quotas, the simplified procedures for indirect lending will also benefit their global networks by strengthening cross-border coordination and boosting income from international business.

The report said that the policy adjustment aligns with the goals of the 15th Five-Year Plan (2026-30). It will provide financial support for the global expansion of China's "new three" industries, namely electric vehicles, solar panels and lithium-ion batteries, and other competitive sectors, while meeting the capital-intensive needs of high-end manufacturing going abroad.

Moreover, companies engaging in on-lending through overseas banks or participating in international syndicated loans can now proceed directly in accordance with local regulations, significantly reducing cross-border compliance costs.

Analysts said Chinese banks still have considerable room to expand their global footprint, making the role of China Eximbank especially important in areas such as overseas trade financing and cross-border guarantees. At the same time, as the internationalization of the renminbi accelerates and China's exports have grown rapidly in recent years, foreign banks are playing an increasingly vital role in cross-border payment services. Against this backdrop, expanding the business scale of foreign banks and strengthening their role as key partners in foreign trade has become an urgent priority.

Wesley Yang, deputy CEO of Standard Chartered China, said: "Raising the overseas lending leverage ratio for foreign-funded banks in China to 1.5 provides concrete and effective policy support for their further development."

Yang said that as Chinese companies expand overseas at a faster pace, demand for cross-border financial services, particularly cross-border loans, has risen significantly.

"The new policy will not only allow foreign banks to further leverage their strengths and deepen involvement in cross-border lending, but also effectively expand key channels for renminbi funds to go global, supporting the currency's broader use in international credit and investment," Yang said.

Standard Chartered will seize the opportunity presented by this new policy to continue leveraging its global network and extensive experience in cross-border financial services. The bank is dedicated to providing efficient financial support to both Chinese and foreign enterprises — particularly Chinese companies expanding overseas — including comprehensive cross-border RMB solutions, to help them navigate their global expansion with confidence and achieve long-term success, he added.

Dong Ximiao, chief economist at Merchants Union Consumer Finance, said the policy adjustment will further ease overseas financing difficulties for companies "going global", while encouraging greater use of the renminbi by overseas entities and advancing the currency's internationalization.

Zeng Gang, chief expert and director of the Shanghai Institution for Finance and Development, said the move will significantly enhance financial institutions' ability to serve the real economy.

On the one hand, raising the leverage ratios will substantially expand banks' lending capacity, addressing constraints such as limited overseas financing quotas and high funding costs. This will enable greater support for cross-border industrial chains, overseas infrastructure and livelihood-related projects, helping overseas entities maintain stable operations. On the other hand, simplifying indirect lending procedures encourages banks to conduct business in a compliant and more autonomous manner, improving the convenience of cross-border investment and financing, Zeng said.

The measures will also help balance cross-border capital flows and promote deeper integration of Chinese financial institutions into the global financial system, he added.

Rail drill

Staff members monitor real-time data during an emergency drill for nonstandard train receptions and departures at Taiyuan North Station in Shanxi province, under China Railway Taiyuan Group, on Wednesday. As a core node on China's major coal transportation corridor, the station handles the marshalling of freight trains on multiple trunk lines, including Shijiazhuang-Taiyuan Railway and Datong-Taiyuan Railway, with a total coal transport volume of 9.75 million metric tons in 2025.

Immersive, emotion-driven experiences redefine May Day holiday tourism mkt

By **LI JING**
lijing2009@chinadaily.com.cn

When visitors arrived at the ancient city wall of Nanjing in Jiangsu province during the May Day holiday, many expected a typical historical tour. Instead, they were greeted by actors portraying Ming Dynasty (1368-1644) figures strolling along the ramparts, inviting tourists into improvised scenes, posing for photos and weaving vivid stories about the site's centuries-old past.

"I originally came just to see the city wall relics," said Wu Jiaying, a tourist from Zhejiang province. "But the interactive performance made history come alive."

Across China during the just-concluded five-day holiday, such immersive encounters became increasingly common, reflecting a broader shift in the country's tourism market. Travelers — particularly younger ones — are moving away from traditional "checklist" sightseeing toward experiences that offer atmosphere, storytelling and emotional engagement.

"Tourism today is less about visiting the most famous sites and more about whether the experience creates emotional resonance," said Wu Liyun, a professor at the China Academy of Culture and Tourism at Beijing International Studies University.

"What travelers seek is emotional value — the feeling of being relaxed, understood and connected with a place."

Cities across China experimented with new tourism formats during the holiday, combining cultural heritage with interactive storytelling.

In Chengdu, Sichuan province, themed "city walk" routes linked more than 500 cultural and lifestyle venues, from historic streets and parks to music venues and food markets. Historical characters appeared along popular walking routes, interacting with visitors through improvised performances and poetry recitals.

Meanwhile, in Anshun, Guizhou province, the 600-year-old Yunfeng Tunpu — often described as a "living relic" of Ming Dynasty military settlements — reimagined traditional sightseeing by turning the entire village into a live-action role-playing game. Rather than passively listening to tour guides, visitors adopted character identities to solve a historical mystery, hunting for clues and interacting with NPCs inside ancient military tents and batik workshops.

> "Tourism today is less about visiting the most famous sites and more about whether the experience creates emotional resonance."
>
> **Wu Liyun,** a professor at the China Academy of Culture and Tourism at Beijing International Studies University

For local businesses, such interactive formats help extend visitor stays and encourage spending on accommodation, dining and entertainment rather than relying solely on ticket revenue.

Travel platform data suggest that younger travelers are driving the shift, prioritizing personal interests over generic itineraries.

According to a report jointly released by online travel platform Fliggy and lifestyle app Xiaohongshu, also known as RedNote, around 69 percent of surveyed users chose their holiday destinations primarily based on personal interests rather than traditional sightseeing priorities.

Concerts, sporting events and festivals have also become major tourism drivers. Online platform Tongcheng Travel said city soccer tournaments boosted visitor flows to destinations including Nanjing and Suzhou in Jiangsu province, Shenzhen in Guangdong province and Hangzhou in Zhejiang province.

Also an online travel services provider, Qunar said hotel bookings near Zhengzhou Olympic Sports Center in Henan province rose 214 percent year-on-year during the May Day holiday as concerts attracted visitors from across the country.

Analysts say these diverse interests are reshaping travel flows, drawing visitors well beyond traditional tourism hot spots.

Reflecting this structural change in tourism consumption, Wu said: "In the past, tourism relied largely on natural or historical resources and ticket sales. Today, destinations must combine those resources with creative products and local lifestyles to build deeper, more memorable experiences."

Local neighborhood culture, markets and interactive performances are increasingly becoming tourism attractions themselves, she added.

Economists say the phenomenon highlights the rise of the "emotion economy".

"The object of consumption is shifting from the utility of goods to the symbolic and experiential value they carry," said Tian Lihui, a professor of finance at Nankai University.

According to consultancy iiMedia Research, China's emotion-driven consumption market reached 2.72 trillion yuan ($377 billion) in 2025 and is projected to exceed 4.5 trillion yuan by 2029.

The trend is also providing fresh momentum for domestic consumption and economic growth.

In January, the State Council, China's Cabinet, issued a work plan to guide efforts in optimizing and expanding the supply of services, including experience-based and emotion-driven services.

This model allows businesses to move beyond price competition toward higher-value offerings, Tian said.

"Businesses are no longer just selling products — they are curating experiences," he said. "A cafe sells a moment of quiet, a hotel sells rest and a tourism destination becomes the stage for emotional storytelling."

The Ministry of Culture and Tourism said local governments organized around 13,700 cultural and tourism events nationwide during the holiday while issuing more than 280 million yuan in consumer subsidies and vouchers.

As competition between destinations intensifies, the shift toward immersive and lifestyle-oriented tourism is likely to accelerate.

"What attracts visitors now is not only landmarks," Wu said. "It is the opportunity to experience a city's culture, lifestyle and emotional atmosphere."

Coca-Cola posts robust Q1 results driven by biz in China

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

The Coca-Cola Company reported first-quarter results that exceeded market expectations, with revenue and profit rising on steady global demand and stronger momentum in emerging markets, including China.

Net revenue climbed 12 percent to $12.47 billion, beating analysts' estimates of $12.23 billion. Organic revenue grew 10 percent, while net income increased 19 percent to $3.97 billion.

Global unit case volume expanded 3 percent in the quarter, driven by growth in China, the United States and India. The Asia-Pacific region posted a 5 percent increase in volume, underscoring its role as a key growth engine for the beverage giant.

By category, sparkling soft drinks grew 2 percent globally. Coca-Cola grew 2 percent, driven by growth in the Asia-Pacific and North America. Coca-Cola Zero Sugar grew 13 percent. Sparkling flavors grew 3 percent, while water, sports drinks, coffee and tea grew 5 percent.

CEO Henrique Braun said during the results announcement that the Asia-Pacific is one region that the company is definitely developing for the future.

Braun said volume growth was recorded across all operating units in the region, alongside gains in market share. In China, he said the company's focus on categories with a competitive advantage is beginning to deliver results.

"We're not going to play in every category," Braun said. "We are focusing on quality, scale and segments where we believe we have the right to win — and that is now starting to pay back."

Coca-Cola China continues to lead on sparkling in the domestic market, said the company.

The company has expanded its product portfolio to capture evolving consumer preferences. New offerings in the quarter included Coca-Cola's new prebiotic soda, Sprite + Tea, and functional beverages such as Minute Maid Vitamin C Citrus, targeting consumption scenarios ranging from meals to sports.

The company has stepped up efforts to connect with consumers through culturally tailored marketing and product innovation. During the Chinese New Year holiday, the beverage giant launched an AI-enabled campaign inspired by traditional Chinese art, allowing consumers to create personalized digital portraits via connected packaging.

The company also introduced a limited-edition "Year of the Horse" fireworks can packaging, incorporating zodiac imagery and embroidery-inspired design elements.

To better serve the local market, Coca-Cola China continues to collaborate with its bottling partners and accelerate supply chain expansion. Over the past three years, the Coca-Cola China system has invested in upgrading five production facilities, encompassing facility construction, capacity expansion and smart upgrades, supporting sustainable business growth.

A visitor takes a bottle of Coca-Cola from a robotic arm during a high-tech expo in Shanghai on March 28. PROVIDED TO CHINA DAILY

In April, Coca-Cola's Jinwan New Plant in Zhuhai, Guangdong province, was officially inaugurated. As a key production and sales base in southern China, the facility represents a total investment of about 835 million yuan ($122.75 million), with 15 planned production lines.

Durian boom ripening into supply chain story

Cold chain, efficient cross-border e-commerce make China global trade hub for tropical fruit

> "The industry is still expanding rapidly, but already entering a period of structural differentiation."
>
> **Liu Junhong,**
> a businessman from Guangxi Zhuang autonomous region

BEIJING — When durian season arrives, it makes a grand entrance to China via railway wagon, cold-chain container and express vessel, bringing with it a fruit whose distinctive aroma may divide opinion, but whose commercial appeal is unmistakable.

In the space of about 24 hours from the morning of April 25, three "durian express" vessels carrying 356 containers and more than 6,300 metric tons of fresh Thai durians arrived at Nansha Port in Guangzhou, South China's Guangdong province. The fruit was to be distributed across China in time to add to supplies for the May Day holiday. Since April 15, Nansha Customs has supervised the import of more than 9,500 tons of fresh durians.

The railway picture is just as telling. From Jan 1 to April 26, the China-Laos Railway transported 50,300 tons of imported durians, up 94.2 percent year-on-year, according to China Railway Kunming Group. The figures show not only that Chinese consumers are buying more durians, but also that the supply routes serving this growing demand are becoming faster and more efficient.

Durians have long occupied an unusual place in China's fruit market. For devoted buyers, it is the "king of fruits", rich, creamy and worth paying for. For others, its unique smell remains a barrier.

Yet that traditional divide is narrowing as durians move beyond boutique supermarkets and first-tier urban consumers. Better cold-chain logistics, more efficient cross-border supply chains and the spread of e-commerce have brought durians into community group-buying channels, lower-tier cities and county-level markets.

That expansion has made China the center of gravity for the global durian trade. Customs data show that China imported about 1.87 million tons of fresh durians in 2025, making it the world's most important consumer market for the fruit. Industry participants say the consumer base has grown rapidly. Rising incomes, larger supply and improved cold-chain infrastructure have all helped enlarge the market.

For ports and railways, the challenge is speed, as fresh fruit is an unforgiving cargo. At Mohan railway port, the core hub for China-Laos Railway international freight, the authorities have deepened coordination with Laos' Boten port, streamlined customs procedures and worked to keep cross-border logistics flowing.

Railway departments, customs and companies have formed special teams for the transport of fresh fruit. Green channels for inspection give priority to entry, inspection and testing, linking arrival, clearance and transfer more smoothly and sharply reducing the time fruit spends at the port.

Nansha, China's largest seaborne port for durian imports, is making a similar effort. As Southeast Asia's main producing areas enter peak season, its durian imports are expected to keep rising between April and June.

Yet scale has not reduced scrutiny. For the concentrated arrivals in late April, customs officers carried out targeted inspection and quarantine, checking for harmful organisms and taking samples for pesticide residues, heavy metals and other safety indicators.

"Visible pest risks can be checked by the eye, but invisible microbes and contaminants must also be strictly guarded against," said Lin Xiaojing, an official with Nansha Customs.

As a result, the market is expanding not only in size, but also in standards. Niti Pratoomvongsa, commercial counselor at the Royal Thai Consulate-General in Nanning, capital of South China's Guangxi Zhuang autonomous region, said Chinese consumers are shifting from a focus on price toward a stronger concern for quality, food safety, production standards and traceability. This change is raising the bar for competition.

Southeast Asian suppliers are responding. As planting areas expand in Thailand, Vietnam, Malaysia and Cambodia, industry participants say the competition among Southeast Asian suppliers in China is still being reshaped.

Chinese capital and business operators are also moving further upstream. Liu Junhong, a Guangxi businessman who shifted from engineering and agricultural irrigation into durians five years ago, has inspected markets in Malaysia, Thailand and Vietnam and invested in a planting project in Cambodia's Kampot province.

"The industry is still expanding rapidly, but already entering a period of structural differentiation," Liu said. His answer is to focus on higher-end varieties such as "Black Thorn" to avoid future homogenized competition.

Growth, however, does not guarantee easy profits for everyone. Wang Zhengbo, chairman of Guangxi TWT Supply Chain Management, a trading company specializing in Thai durians, noted that the durian chain is long and layered, from planting to retail, with costs accumulating at each stage. Large traders and those controlling upstream resources are relatively stable, while some smaller players are more exposed to price volatility.

At the production end, Nicholas Lui, a durian grower from Malaysia's Pahang state, said rising fertilizer, fuel and labor costs — together with stricter procurement standards, are narrowing margins.

Even so, the direction of travel remains clear. China's market is widely seen by industry participants as far from saturated, but it is becoming more selective. Poor quality fruit, uneven standards and inefficient supply chains will find it harder to survive.

The boom is also creating new forms of consumption. In Nansha, a port-side fresh market model allows fruit to be unloaded, containers opened and products sold directly. A durian carnival on April 30 offered Thai Monthong, Malaysian Musang King and other varieties to consumers. In producing countries, some businesses are exploring durian tourism, combining picking experiences with agricultural travel. Processed products, from frozen pulp to cakes and snacks, are also extending the value chain.

The fruit's flavor may not have changed. But from orchard to port, railway and dinner table, the business around it is becoming faster, stricter and more regional. For China and Southeast Asia, the durian season is no longer just a seasonal rush. It is a vivid example of how consumer demand can reshape the routes, standards and economics of a whole supply chain.

Nation's innovative bamboo goods going global

A view of furniture and office supplies made from bamboo at a homestay in Anji county of Huzhou, East China's Zhejiang province, on Aug 16, 2023. ZHU HAN / XINHUA

KUNMING — Under the spring sunshine, vast stems of bamboo are shooting up in the mountains of Southwest China's Yunnan province. Hundreds of kilometers away, a batch of exquisitely packaged bamboo chairs passed customs inspection at the China-Vietnam border, bound for customers in Hanoi, Vietnam.

Since the first order in February this year, bamboo products from Yunnan's Daguan county, including chairs and canes, have been in high demand in Vietnam, with orders continuing to grow.

"We believe high-quality bamboo products can cross borders and let overseas friends feel the charm of Chinese bamboo culture," said Ou Xianqin, chairperson of a local bamboo culture technology company, adding that their bamboo products are exported to Australia, Japan, the United States, Singapore and other countries, with export value reaching about 2 million yuan ($294,000) over the past three years.

Daguan county, with its favorable climate and geography, is a core bamboo production area. By 2025, the county's bamboo planting area had reached 68,000 hectares, with total bamboo industry output exceeding 3.1 billion yuan.

China has the world's richest bamboo resources and is the most developed in its utilization, earning it the title "Kingdom of Bamboo". Figures from the National Forestry and Grassland Administration show the country has nearly 8 million hectares of bamboo forests, producing 150 million metric tons of bamboo each year. The bamboo industry generates over 520 billion yuan annually, with more than 15,000 types of bamboo products available.

As China seeks to replace wood and plastic products with bamboo alternatives to reduce pollution and carbon emissions, Chinese bamboo enterprises are accelerating their global expansion, tapping overseas markets and contributing to sustainable development worldwide.

Known as the "hometown of bamboo", Anji county in East China's Zhejiang province has about 66,700 hectares of bamboo forests and nearly 1,000 bamboo enterprises. In 2025, the county's bamboo industry output exceeded 20 billion yuan.

At Zhejiang Fenghui Bamboo and Wood Co Ltd in the county, a dazzling variety of bamboo tableware, packaging and lighting fixtures are displayed.

General Manager Liang Fenghui, who took over the business from his father, said the company turns bamboo trunks, branches and even scraps into daily necessities that replace plastic, offering more than 3,000 kinds of related products.

Several years ago, Liang's company developed a series of tableware from discarded bamboo shoot shells. The products later became a hit online, with the bamboo shoot shell lunchboxes alone generating over $500,000 in overseas sales last year.

The company exports 70 percent of its products to markets such as the US, Japan and European countries, achieving 185 million yuan in sales in 2025.

"Don't underestimate these daily necessities that replace plastic — they represent a huge market," said Liang.

According to China Green Times, a forestry industry newspaper, bamboo straws alone have an annual production capacity exceeding 1.2 billion units in the country. Bamboo tableware and lunchboxes are exported to nearly 110 countries and regions, including Japan, South Korea and the US.

"When I took over from my father, we mostly waited for orders, satisfied with 10 percent annual growth," Liang said. "But now, it's time to expand outward."

BLUEPRINT INTO ACTION

Jilin's hubs to modernize production

Industries centered on advanced manufacturing seen as growth drivers

By **LIU MINGTAI** in Changchun and **ZHOU HUIYING**

Northeast China's Jilin province will accelerate the development of a modern industrial system centered on advanced manufacturing, highlighting the province's distinctive advantages, Governor Hu Yuting said on Thursday.

"Jilin is a major agricultural and industrial province, as well as a hub for science, education and culture," Hu said at a news conference on Jilin's 15th Five-Year Plan (2026-30). "Moreover, Jilin has significant comparative advantages in fields such as optoelectronic information, satellite manufacturing, new materials and healthcare."

The province is home to national-level research institutions and teams such as Jilin University and the Changchun Institute of Optics, Fine Mechanics and Physics.

"These institutions have advantages in fields like intelligent cerebellum, dexterous hands and polyetheretherketone, or PEEK, materials, with outstanding capabilities in high-end precision manufacturing," Hu said.

In the aerospace information sector, the Changguang Satellite Technology, based in Changchun, has led the industry in satellite manufacturing technology, offering low-cost, mass-production capabilities.

"The company has launched 152 Jilin-1 family satellites, making it the world's largest sub-meter-level commercial remote-sensing satellite constellation," Hu said.

"We will focus on promoting the integration of communication, navigation and remote sensing, harnessing vast amounts of data to drive the development of the digital economy and satellite internet," he added.

In 2025, Changguang developed and launched 24 satellites and sold 18, generating more than 1 billion yuan ($147 million) in revenue.

Its rapid development of aerospace data services has spurred the coordinated development of more than 1,000 upstream and downstream enterprises.

"After more than 20 years of dedicated effort, Changguang has achieved a qualitative leap," said Jia Hongguang, the company's deputy general manager. "As China's first full-industry-chain commercial remote-sensing satellite enterprise, we have established a complete commercial aerospace industry layout."

In the high-end optoelectronic chip sector, Gpixel Changchun Microelectronics Inc, a global leader in high-performance complementary metal-oxide semiconductor, or CMOS, image sensors, was officially listed on the main board of the Hong Kong Stock Exchange on April 17, marking a critical milestone in the high-quality development of Changchun's optoelectronic industry.

Since its establishment in 2012, the company has launched more than 40 high-performance CMOS image sensor models across nine series, with chip production exceeding 600,000 units and sales surpassing 800 million yuan.

During the 15th Five-Year Plan period, the province will promote the transformation of the automotive industry toward intelligent connected new energy vehicles, with a strong emphasis on hydrogen fuel cell vehicles.

Efforts will also be made to accelerate the transition to all-solid-state battery vehicles.

"FAW Group's all-solid-state battery vehicles have already been launched, effectively addressing the issue of reduced battery discharge efficiency in low-temperature conditions," Hu said.

Jilin will also promote the petrochemical industry's transition toward fine chemical new materials. "Ethylene, a key raw material for fine chemicals, for instance, is produced at a newly built 1.9 million-metric-ton ethylene project, with more than 40 supporting projects under construction," Hu said. "The next step is to extend the industrial chain, increase added value and create new advantages."

"The key to building a modern industrial system lies in developing new quality productive forces tailored to local conditions," he said. "We will focus on promoting the deep integration of technological innovation and industrial innovation, streamlining the path from technology to sample to commodity to industry, and reinforcing the role of enterprises as the mainstay of technological innovation."

Located at the world's golden latitude for ice and snow, Jilin boasts rare resources such as powder snow, calm winds, warm sunshine and hot springs.

During the past snow season, Jilin saw strong momentum in its ice and snow economy, with the number of detachable ropeways and ski visitors ranking first in the country.

Jin Yuhui, a member of the Jilin Provincial Government Party Leadership Group, said: "Next, we will continue to amplify the effects of the ice and snow economy and use the hosting of the 33rd Winter Universiade, which will be held in January 2027, as an opportunity to comprehensively shape and enhance new advantages in the ice and snow industry."

Guangzhou targets medical tourism

By **ZHENG CAIXIONG** in Guangzhou
zhengcaixiong@chinadaily.com.cn

Guangzhou, the capital of Guangdong province, is sparing no effort to build a globally competitive destination for international medical tourism, with the launch of the Guangzhou International Medical Tourism Service Center recently.

The center will collaborate with the city's 17 pilot hospitals to offer international medical services for foreign patients, including authoritative diagnosis and treatment.

Leveraging the cultural, commercial and tourism resources of the Guangdong-Hong Kong-Macao Greater Bay Area, it will also engage in international brand marketing, medical agency services, travel arrangements, as well as wellness and healthcare, promoting the synergy and integration of medical, tourism and urban service resources.

Lai Zhihong, vice-mayor of Guangzhou, said international medical tourism has recently become an important growth driver in the global health industry.

Relying on its high-quality medical resources, unique Lingnan culture, open environment and advantages as a transportation hub, demand for medical treatment and healthcare in Guangzhou has continued to grow in recent years, Lai said at the launch ceremony of the center.

He urged medical personnel across the city to treat foreign patients with excellent medical services, exquisite expertise and noble medical ethics to help build the city into an international consumption hub with high-quality and distinctive medical services.

Official data shows that inbound passenger visits by foreigners to Guangzhou in 2025 exceeded 3.2 million, with foreign residents' demand for medical services growing rapidly.

Chen Bin, director of the Guangzhou Municipal Health Commission, said Guangzhou has introduced 12 innovative measures to support the development of international medical services. "The new innovative measures will focus on key areas such as building an international medical service brand, optimizing industrial spatial layout, constructing an international medical center, and fostering strengths in specialized medical disciplines and technologies," Chen said.

The innovative measures facilitate multisite practice in Guangzhou for foreign doctors and nurses as well as those from Hong Kong, Macao and Taiwan, while supporting pilot medical institutions in setting up specially appointed positions to recruit high-end international medical talent and attract high-level professionals through multiple channels.

Chen said medical institutions and hospitals are urged to further promote traditional Chinese medicine and build high-level acupuncture diagnosis and treatment centers to strengthen international services, offering foreign patients featured TCM medical services.

According to Wang Zilian, vice-president of the First Affiliated Hospital of Sun Yat-sen University, the measures provide a strong guarantee for the delivery of efficient and high-quality international medical services.

"Based on their existing international medical centers, hospitals will continue to improve their independent diagnosis and treatment environments and multilingual service systems, enhance multidisciplinary diagnosis and treatment capabilities, and further provide high-quality medical services to patients from Hong Kong, Macao, Southeast Asia, and countries involved in the Belt and Road Initiative," Wang said.

Wu Chen, general manager of the Guangzhou International Medical Tourism Service Center, said the center not only serves medical tourism functions but also focuses on integrating Guangzhou's high-quality medical resources, distinctive cultural tourism assets and cross-border commercial insurance to support the city's development into an international consumption hub and cultivate new drivers of health consumption.

"The center will focus on strengthening comprehensive service capabilities, promoting integrated industrial development, and expanding global cooperation networks to create a product system that deeply integrates medical care, wellness and tourism in the following months," she said.

Meanwhile, the center will also collaborate with major local hospitals to provide overseas patients with one-stop international medical services covering visa assistance, remote pre-consultation, multilingual translation, travel and accommodation arrangements, as well as postoperative follow-up, Wu added.

Dance across cultures

Performers of a song and dance ensemble from Kazakhstan entertain spectators during a flash mob event for the 36th Macao Arts Festival in the Three Lamps district of the Macao Special Administrative Region on Thursday. The festival is organized by the Cultural Affairs Bureau of Macao.

Briefly

Central environmental inspections launched

Teams involved in China's high-profile central environmental inspection campaign will conduct monthlong inspections in seven provincial-level regions, the Ministry of Ecology and Environment said in a news release on Thursday. Liaoning, Jilin, Heilongjiang and Guangdong provinces, the Guangxi Zhuang, Xizang and Xinjiang Uygur autonomous regions, as well as the Xinjiang Production and Construction Corps, will be covered in the sixth batch of the third round of inspections, it said. The inspections were launched following approval by the Communist Party of China Central Committee and the State Council, in accordance with regulations on central ecological and environmental protection inspections. Inspection teams are typically led by ministerial-level officials and report to a central leading group headed by a vice-premier of the State Council, the country's Cabinet.

Ex-senior adviser sentenced for bribery

Zhou Xi'an, a former senior political adviser in Anhui province, was sentenced to death with a two-year reprieve for taking bribes worth about 134 million yuan ($19.6 million), a court in Fujian province said on Thursday. The Zhangzhou Intermediate People's Court also imposed a lifelong deprivation of political rights and confiscation of all personal assets against Zhou, who previously served as vice-chairman of the Anhui Provincial Committee of the Chinese People's Political Consultative Conference. The court ordered that Zhou's illegal gains and related proceeds already seized be turned over to the State treasury, while the remainder will continue to be recovered. According to the ruling, between 2012 and 2025, Zhou used his previous positions, including mayor of Bazhong in Sichuan province, Party chief of Ziyang in Sichuan, and vice-governor of Anhui, as well as the influence derived from his authority and status, to help certain organizations and individuals in matters such as project contracting, fund allocation and land-use approvals. In return, he illegally accepted money and valuables totaling more than 134 million yuan.

CHINA DAILY

Ocean warming threatens penguins in Antarctica

By **ZHENG CAIXIONG** in Guangzhou
zhengcaixiong@chinadaily.com.cn

Climate change and shifts in the food web are continuing to threaten the survival and reproduction of penguins in Antarctica, a Chinese expert has warned.

"The loss of sea ice has imposed breeding pressure on emperor penguins, which rely on stable sea ice for chick rearing," said Liang Qi, an associate professor at the School of Geospatial Engineering and Science at Sun Yat-sen University.

"Meanwhile, as ocean temperatures rise, Antarctic krill — their key prey — have shifted their distribution toward higher latitudes. This has lengthened the foraging distance of penguins to some extent, increasing their energy expenditure during the breeding season," Liang said.

Liang recently carried out research and multiple unmanned aerial vehicle, or UAV, survey flights in the penguin breeding area on Adelie Island in Antarctica as part of a Chinese Antarctic expedition.

The expedition team returned to Shanghai aboard the polar icebreaker *Xuelong*, or Snow Dragon, in April following a 160-day voyage to Antarctica. It was part of the country's 42nd Antarctic expedition to the world's southernmost region and achieved fruitful scientific research outcomes.

"Previously, we mainly monitored penguin populations using remote-sensing satellite data. Now remote sensing methods face several limitations in penguin identification, fine characterization of habitats and population inversion due to poor algorithm generalization and a lack of ground observation validation samples," Liang said.

In addition to measuring individual penguins' body size, Liang also accurately identified and mapped penguin nests. "In the past, we mainly relied on satellite monitoring, but satellites operate at a long distance and are easily affected by weather conditions. The application of drones has provided solutions to these problems," he said.

The number of penguin nests, or breeding pairs, is a key indicator for assessing the current population size in penguin habitats and predicting future population dynamics. It is also one of the core parameters recorded in on-site Antarctic penguin surveys.

Under normal circumstances, expedition team members must endure harsh Antarctic conditions and make repeated trips to penguin breeding colonies to obtain data through manual counting.

By using drone photography, however, Liang achieved accurate identification and counting of penguin nests in the colonies.

During the expedition, Liang completed more than 60 drone flights and obtained various observational data on penguin habitats, including visible light, multispectral, thermal infrared and Light Detection and Ranging, or LiDAR, data.

In addition, he conducted ground-based Simultaneous Localization and Mapping, or SLAM, scanning to measure penguin morphology. Penguins are widely distributed across the Fildes Peninsula, Liang said.

To implement the integrated space-air-ground observation system, Liang sometimes had to hike 10 kilometers through the field to reach penguin habitats for spectral measurements and manual population counts, with a total round trip spanning 20 km.

"The survey conducts penguin habitat observations simultaneously on satellite, unmanned aerial vehicle and ground-based platforms, enabling more refined satellite remote-sensing observations of Antarctic penguin populations," he said.

"This survey will provide important support for the subsequent establishment of a large-scale spatial and long-term time-series monitoring network for Antarctic penguin population dynamics," he added.

Liang said he can currently only reveal some preliminary data because final data analysis is still underway and requires more time.

According to Liang, Antarctica has four of the most common penguin species — emperor penguins, Adelie penguins, chinstrap penguins and gentoo penguins — with a total population of roughly tens of millions.

Liang said protecting penguins requires an urgent, two-pronged approach of monitoring and emission reduction.

A large-scale, high-frequency monitoring network should be established using multisource satellites and unmanned aerial vehicles to gain a deeper understanding of changes in penguin population distribution and habitat conditions, he said.

Meanwhile, slowing the rate of ocean warming and maintaining the physical stability of the Antarctic sea ice and fast-ice system would buy valuable time for the restoration of penguin breeding habitats, he added.

Hu Xiaotong contributed to this story.

Novel mass printing material developed

By LI MENGHAN
limenghan@chinadaily.com.cn

Have you ever wondered how a peacock's tail shimmers with brilliant blues and greens, or why a butterfly's wings flash colors that never fade? These are not paints or dyes, but "structural colors" — hues created entirely by microscopic structures that trap, bend and scatter light.

For years, scientists have tried to copy nature's approach to create vivid, long-lasting colors for uses that range from anti-counterfeiting labels to flexible displays. Now, researchers have taken a major step forward by developing a new type of optical metamaterial that gives them more precise control over microscopic structures, along with a production method that is as fast and inexpensive as printing a newspaper. Their findings were published in the journal Nature on April 22.

An optical metamaterial is a man-made material engineered to control light in unusual ways. Instead of relying on the natural properties of ordinary materials, scientists build tiny patterns smaller than a human hair that can bend, reflect and guide light with extreme precision.

One important use is structural coloration, whereby microscopic patterns create colors without pigments or dyes. The technology could lead to fade-resistant paints, secure holograms and energy-efficient displays. Scientists also see optical metamaterials as an important technology for future advances in optics, communications, high-end manufacturing and defense.

However, most earlier studies focused on structures built at only one scale, limiting scientists' ability to control light. Manufacturing also depended on highly specialized, but slow and expensive equipment. As a result, producing a sample as small as a fingernail could take days, keeping the technology largely confined to laboratories.

Now, a research team from the Chinese Academy of Sciences and the National University of Singapore says it has overcome the long-standing challenge of balancing quality, customization and low cost.

The team designed a new multi-scale structure made of tiny dome-shaped surfaces combined with nanoscale crystal-like patterns. The researchers likened the design to a symphony orchestra, where different parts work together to control different properties of light. This gives scientists a multitude of ways to fine-tune how light behaves.

The researchers also developed a roll-to-roll nanoprinting system. It works much like newspaper printing: a flexible plastic sheet moves continuously through a high-precision printer that stamps nanoscale patterns onto the surface before rolling up as a finished product.

Using the method, the team expanded production from millimeter-sized test samples to sheets measuring meters wide — a thousandfold increase — without sacrificing quality.

Reviewers at Nature praised the breakthrough, saying the printing strategy is both novel and attractive.

Song Yanlin, the study's corresponding author and researcher at the Chinese Academy of Sciences' Institute of Chemistry, said the work combines materials science, optics and advanced manufacturing.

"Our roll-to-roll nanoprinting technology makes producing optical metamaterials as simple and efficient as printing a newspaper or a book," Song said. "It not only lowers costs and improves production efficiency, but also allows us to customize the optical properties of each metamaterial pixel on demand, opening new possibilities for micro-nano optics research."

Li Kaixuan, the study's first author and a doctoral graduate of the Institute of Chemistry, said a metamaterial film measuring 1 meter long and 30 centimeters wide can be printed in just 10 minutes. The process requires only 1 milliliter of a special nanoparticle ink, costing no more than 10 yuan ($1.5) per ml.

Li also highlighted the technology's broad potential applications. These include highly sensitive biosensors that can strengthen optical signals from viruses, helping detect infections that are otherwise difficult to identify, as well as photonic chips for VR and AR devices that could improve data transmission efficiency.

Rice-fish co-culture system hikes yields, study finds

By ZHOU WENTING in Shanghai
zhouwenting@chinadaily.com.cn

In collaboration with scientists from 18 countries, a research team from Shanghai-based East China University of Science and Technology has confirmed the benefits of the ancient rice-fish co-culture farming method, offering a scientific pathway for ecological agriculture and food security.

Their study validated that the traditional practice not only boosts rice yields, but also controls pests and diseases through ecological regulation. Rice yields in rice-fish co-culture systems increased by an average of 12.5 percent compared with traditional rice monoculture, according to their global data analysis.

Notably, the presence of fish nearly doubled the number of invertebrate predators and parasitoids in the fields, while pests decreased by 24.1 percent, diseases by 38.8 percent and weeds by 45.7 percent.

"Such research results provide a scalable solution with high ecological and production benefits to address global challenges such as food security, pesticide reduction, agricultural non-point source pollution and biodiversity loss," said Wan Nianfeng, a lead scientist on the research team and a professor at the university's School of Pharmacy.

A paper on the research, conducted by Chinese researchers in collaboration with peers from countries including the United Kingdom, France, the United States, Switzerland and Spain, was published as a cover article in Current Biology, a Cell Press journal, on Monday.

The practice of integrating rice cultivation with fish farming dates back 2,000 years to the Han Dynasty (206 BC-AD 220), with archaeological evidence supporting its historical use.

The rice-fish co-culture system in Qingtian county of Lishui city, Zhejiang province, was the first in China to be designated as a Globally Important Agricultural Heritage System by the Food and Agriculture Organization of the United Nations in 2005.

The research team said it discovered how the rice-fish co-culture mechanism enhances production through pathway analysis. In the two-trophic-level relationship between rice and pests, the method directly suppresses harmful organisms to boost yields. In the three-trophic-level relationship among rice, pests and natural enemies, it increases the number of natural enemies to suppress pests, achieving indirect yield enhancement.

"Remarkably, this top-down control effect persists across organic and nonorganic systems and in both temperate and tropical regions, forming a clear ecological chain in which rice-fish co-culture promotes natural enemy populations, which suppress pests and ultimately enhance rice productivity," Wan said.

To further verify the global effect, the team conducted a four-year field experiment. The results showed that compared with rice monoculture areas, rice-fish co-culture areas had significantly fewer pests, while the number of predatory spiders increased.

The researchers also found that both the thousand-grain weight and overall yield of rice improved. Pathway analysis reconfirmed that rice-fish co-culture enhances natural enemy populations to suppress pests, achieving indirect yield enhancement.

Pot behavior experiments further clarified the mechanism. The research team observed that fish species such as crucian carp and red carp prefer feeding on pests like brown planthoppers, but do not prey on predatory spiders.

"It suggested that fish play the role of 'precision regulators' in rice fields, directly reducing pests while protecting and reinforcing the natural 'pest control army', thereby establishing an efficient cooperative network for pest control," Wan said.

New action plan bolsters family farms

Growers will be encouraged to develop modern, green agricultural businesses

By ZHAO YIMENG
zhaoyimeng@chinadaily.com.cn

China has unveiled a new action plan aimed at improving the quality and efficiency of modern agricultural business entities, encouraging smallholder farmers to develop green and efficient family farms while boosting rural incomes.

The plan, released this week by the Ministry of Agriculture and Rural Affairs, calls for stronger support for family farms and closer integration between smallholder farmers and modern agriculture.

Local authorities are encouraged to guide willing farmers toward developing moderately scaled, intensive, green and efficient family farms, the plan said.

China has been promoting new agricultural operators such as family farms, cooperatives and agricultural service providers to improve productivity and advance modern agriculture, according to central documents related to agriculture and rural affairs.

Local governments will adopt differentiated support measures for family farms at different stages of development, while encouraging farms to determine appropriate operating scales based on land conditions, industrial characteristics and local agricultural services, the plan said.

The ministry also pledged to improve management of a national registry for family farms and encourage qualified operators to formally register as business entities.

A digital service system will be promoted to allow farms to display information about their operations and products to consumers while connecting them with supply-chain companies and financial institutions.

Authorities also plan to broaden the platform's functions by integrating logistics, weather alerts and product traceability services, according to the plan.

To improve agricultural productivity, the ministry said it would expand socialized agricultural services, particularly in grain and major agricultural product production, with a focus on supporting smallholder farmers and addressing weak links in agricultural production.

China also plans to strengthen digital management systems for agricultural operators and improve monitoring of grain- and oil-producing family farms and cooperatives that receive government financial support.

The plan highlighted the importance of technology and innovation, encouraging agricultural operators to work with universities, research institutes and enterprises to promote new crop varieties, technologies, equipment and production models.

It also supports the development of leisure agriculture, rural tourism and e-commerce. Agricultural operators are expected to establish regional and independent brands and improve cold-chain logistics, storage and processing capacity.

The ministry said it would support broader financing channels for agricultural operators, including the use of agricultural facilities and livestock as collateral for loans and leveraging the national agricultural credit guarantee system.

To strengthen income growth among small-scale farmers, authorities will encourage family farms and cooperatives to establish closer benefit-sharing mechanisms with rural households through land-use rights, employment opportunities and dividend distribution.

Local governments are expected to link policy support with the effectiveness of agricultural operators in increasing farmers' incomes, including the number of households assisted and the income growth achieved, according to the plan.

Gene therapy can address congenital deafness

By ZHOU WENTING in Shanghai
zhouwenting@chinadaily.com.cn

All congenital deafness patients who completed the effective 2.5-year follow-up in a nationwide multicenter clinical study experienced hearing restoration to the level of understanding everyday conversations after receiving a gene therapy.

Among them, 57 percent were able to recognize the sound of pages turning in a quiet library, and 43 percent could hear whispers.

Led by the Shanghai-based Eye and ENT Hospital of Fudan University, the clinical study involved 42 patients in the 9 months to 32 years age range. The gene therapy requires just a single injection.

Globally, it is the earliest, largest and longest-followed clinical study in the field of gene therapy for deafness, encompassing both the youngest and oldest patients reported worldwide.

A paper on the study, conducted jointly by eight hospitals across the country, was published on the website of the journal Nature on April 22.

Experts said that among the 26 million congenital deafness sufferers worldwide, the DFNB9 type caused by the OTOF gene mutation is particularly severe, often resulting in profound bilateral hearing loss from birth. The condition significantly affects language and cognitive development.

The team, led by Shu Yilai at the Shanghai hospital, has long focused on gene therapy for deafness and developed a safe and effective OTOF gene therapy system, pioneering the first clinical trial in 2022.

Published in journals including The Lancet in 2024, their work has been praised by international peers, who say it could open a new era for treating hearing impairment and other diseases through gene therapy.

The multicenter clinical research published this time aimed to reveal long-term patterns of improvement in patients' hearing and speech and identify key factors influencing treatment efficacy.

The research found that younger patients, particularly those aged 5 months to 3 years, showed more significant improvements than adults. Additionally, patients who exhibited responses in Distortion Product Otoacoustic Emissions, or DPOAE, before treatment tended to have better hearing recovery.

The therapy also proved effective for adult patients, researchers said. Among the three trial participants over 20 years old, two showed marked hearing improvement.

Zhang Wenxi was 32 when she underwent the treatment in 2024. She had congenital profound deafness and received a cochlear implant at age 6.

"On the second morning after receiving the gene therapy, it was the first time in my life that I heard the sound of running water from a faucet," she said, adding that her hearing improved from being able to detect sounds at 100 decibels before treatment to about 55 decibels now.

"The sounds I had never heard before opened the door to a new world for me. It is truly an incredible journey of rebirth," said Zhang, a mother of a 4-year-old child.

She added that the natural sounds she now hears are very different from those perceived through the cochlear implant, particularly in distinguishing sounds in noisy environments and locating their source.

Shu, the lead scientist of the research and a co-corresponding author of the paper, said that as patients' hearing improves, their speech abilities also improve.

"In particular, their enhanced ability to recognize speech in noisy and complex auditory environments will allow them to better integrate into everyday social, educational and life scenarios, and truly enjoy natural hearing," he said.

The study also included three international patients from the United States, South Korea and India, Shu said, adding that the work has attracted global attention, with patients across the world contacting the team via email.

Zhou Xingtao, president of the hospital, said the institution will continue to support efforts to develop and optimize the treatment and expand it to more types of deafness, as well as to fields such as vision and olfaction — the sense of smell.

CULTURE

The artist behind the author

Prominent writer returns to painting and presents new exhibition depicting scenes from youth and memory across many years of work, **Lin Qi** reports.

When Yung Liu, widely known as Liu Yong, talks about observing begonias, he doesn't just describe them. He performs them. He extends his forearms, bends his wrists, and lets his body sway, tracing the arc of branches and the quiet tension of leaves unfurling. The gesture is instinctive, almost childlike. His eyes light up as he drifts into memory — Taipei night markets alive with open-air opera, food stalls steaming under dim bulbs, and the hum of a city that shaped him. Then, unexpectedly, his voice falters. He recalls fishing trips with his father, and emotion breaks through.

At 77, Liu is not discussing his literary career — the one that made him a household name across Chinese-speaking communities.

Instead, he is revealing a parallel life that has long run beneath the surface: painting. Now, that side of him has taken center stage. At the National Museum of China in Beijing, Liu presents *Poetic Years: Dreams Flow into Paintings*, an exhibition of 89 works in traditional Chinese ink styles, on display through June 8. The show charts decades of exploration — from flower-and-bird compositions and tranquil moonlit scenes to lively reinterpretations of urban life reminiscent of the 12th-century classic *Qingming Shanghe Tu* (Along the River During the Qingming Festival), but filtered through a modern sensibility.

The exhibition also marks a personal return. More than 30 years ago, Liu frequented the same institution — then known as the National Museum of Chinese History — gathering material as a television scriptwriter exploring Chinese civilization.

"I visited many times, for there were so many artifacts of great importance here," he says, adding that the "serendipity" and "decades of hard work" have brought him back, so that he can rekindle his link with the national museum and, this time, with his own art.

Liu's reputation as a writer is formidable. Since the 1970s, he has produced best-selling essays, fables and art theories, often drawing on everyday life to distill reflections on human nature, resilience, and time.

"His prose is known for its philosophical clarity, wit and understated humor, qualities that also permeate his paintings," says Huang Xiaojiao, the exhibition's curator at the National Museum of China.

For Liu, the connection is inseparable. "These paintings are my heart and soul," he says. "When I look at them, I feel renewed."

He is keen, however, to correct a common assumption: writing may be what most people know him for, but painting came first.

"I want people to see the whole of my world," he explains. "Writing is familiar to readers. But painting — that's my true profession."

That claim is not rhetorical. Liu showed early promise as a painter in his teens. He studied under Hu Nianzu (1927-2019), a respected figure in the mountain-and-water style of classical Chinese painting who hailed from Hunan province. And he won prizes in school art competitions.

His technical foundation was solid from the start. One of the earliest works in the exhibition — a 3.5-meter handscroll of historical figures completed in 1964 when he was just 15 — demonstrates both discipline and ambition.

Another early piece, created in 1966, captures cascading mountain springs shrouded in mist. It was inspired by a grueling winter hike. "It rained heavily. The paths were muddy and dangerous," Liu recalls. "I came home soaked. But instead of resting, I painted it and finished in about an hour.

"When I see it now, I remember that feeling — the energy and enthusiasm of a 17-year-old."

Liu went on to study fine arts at Taiwan Normal University, graduating in 1972 before taking a position as a high school art teacher.

Throughout the 1970s, he exhibited and wrote about Chinese painting in Taiwan, as well as cities in Europe and the United States.

Even as his literary career gained prominence, he never abandoned painting. Instead, the two practices evolved in parallel — each informing the other.

While his artistic influences are rooted in the Song Dynasty (960-1279), widely considered the pinnacle of Chinese art, Liu has never been content with imitation. Living and working in the West exposed him to new ideas, prompting him to experiment with unconventional techniques.

Top: Veteran artist Yung Liu (center) at the exhibition opening, noting that nature has long nourished his landscape paintings. **Above:** Liu being interviewed in front of his work *Night Hunt*. PHOTOS BY JIANG DONG / CHINA DAILY

Clockwise from above left: *Shujuan* (Volumes of Books), one of four paintings Liu has donated to the National Museum. *Celebrating the Lantern Festival at Longshan Temple.* A painting by Liu depicting night-blooming cactus. PHOTOS PROVIDED TO CHINA DAILY

One such method involves spraying ink through a tube — a practice inspired by a childhood chore. As a boy, he helped his mother smooth wrinkled bedsheets by blowing water across the fabric. He also manipulates paper, repeatedly wrinkling and ironing it to create textured surfaces that interact unpredictably with ink.

These experimental approaches are evident in a series of large-scale works, including four paintings donated to the National Museum of China in 2025 that are now on show: *Chenxi* (Morning Glow), *Shuiyue* (Moon on Water), *Shujuan* (Volumes of Books), and *Jiangshan* (The Land).

Each vertical scroll rises more than 3.6 meters, echoing classical landscape traditions while subtly dismantling them. Details are pared down. Colors recede. What remains are distilled forms — mountain silhouettes, luminous moons, flowing lines — rendered through delicate contrasts of light and shadow. The effect is meditative, almost austere, inviting viewers into a space of stillness and introspection.

Liu says painting "not only captures a view, or shows a space, but also carries the weight of time in passing". That idea finds poignant expression in a pair of works displayed side by side. Both depict a porcelain vessel of flowers under moonlight, yet each tells a slightly different story.

Come Back in the Morning with a Harp if You'd Like shows a lotus pot in an empty classical Chinese garden, with a hollowed rock mountain on one side and a stone table and stools on the other side. *Beautiful Moon, Light Breeze, Night-Blooming Cactus* shows a vigorous cactus in an empty room, with curtains on both sides.

Liu says neither painting includes human figures. Yet traces of human activity are everywhere — an open book, a partially unrolled scroll, a toppled wine bottle, and curtains swaying.

Liu often works in pairs like this, exploring variations on a theme. The approach reflects his broader philosophy: that art should create a space where viewers feel compelled to linger, a long-held core value of Chinese painting.

"I want to paint scenes that people can enter," he says, "places where they can rest — not just physically, but emotionally."

In recent years, Liu has turned increasingly toward studying classical masterpieces. After turning 70, he began copying iconic works such as *Zaochun Tu* (Early Spring) by Guo Xi and *Xishan Xinglyu Tu* (Travelers among Mountains and Streams) by Fan Kuan, both living in the Northern Song Dynasty (960-1127). The process is rigorous and physical.

"I kneel on the floor and re-create each stroke," he says.

"One has to move forward boldly," Liu reflects, "but also look back and examine oneself."

What's on

Poetry of textiles

The Tsinghua University Art Museum is home to a rich collection of vintage textiles. Its ongoing exhibition, *Creating a Poetic Realm with Silk*, features a curated selection of embroidered and woven pieces from ancient times. Running through April 2027, the show celebrates the varied history of textiles from a fresh perspective, highlighting the craftsmanship behind intricate designs where colorful threads and fine fabrics form calligraphic characters and painterly compositions in classical styles.

The themes range from popular motifs of flowers, fruits and birds to moral teachings and social etiquette, as well as symbolic objects reflecting the spiritual pursuits of ancient scholars and wishes for longevity and prosperity. Together, these works reveal the cultural depth, vigorous vitality and timeless charm of traditional handicrafts.

9 am-5 pm, closed on Mondays. Tsinghua University, Haidian district, Beijing. 010-6278-1012.

Modern landscapes

The 20th century saw growing exchanges between Eastern and Western artistic traditions in China. Artists experimented with blending classical mountain-and-water (*shanshui*) aesthetics with oil painting techniques. *Beyond the Mundane*, now on view at the He Xiangning Art Museum in Shenzhen, Guangdong province, reflects the institution's long-standing focus on modern Chinese art. The exhibition traces how artists over the past century reimagined landscape painting, pushing stylistic boundaries while engaging with tradition.

On view through May 31, it brings together works by 20 artists, including

Xu Beihong (1895-1953) and Dai Ze (1922-2023). Despite the challenges they faced, these artists turned to China's mountains and rivers as sources of national spirit and identity, capturing them with expressive, dynamic brushwork.

9 am-5 pm, closed on Mondays. 9013 Shennan Dadao, Nanshan district, Shenzhen, Guangdong province. 0755-2660-4540.

Graduation show

Awakening in Colors, now open at the Art Museum of the Central Academy of Fine Arts, marks the launch of the academy's annual "graduation season". The program, featuring exhibitions and campus bazaars, has become a major event for both professionals and the public. The current exhibition showcases works by master's and doctoral students graduating next month, on view through May 14, followed by an undergraduate presentation.

Once limited to the art community, CAFA's graduation shows have in recent years drawn large public crowds, with visitors often waiting in line outside the museum, many traveling from other cities. Guided tours for companies and cultural institutions are also organized, helping graduates connect with potential employers.

9:30 am-5:30 pm, closed on Mondays. 8 Huajiadi Nan Jie, Chaoyang district, Beijing. 010-6477-1575.

Brewing ideas into fashion

A new generation of designers blends heritage with fresh perspectives to reach wider audiences, **He Qi** reports.

The final stage of the New Wave Fashion Awards, launched by the Shanghai Fashion Designers Association, was held during Shanghai Fashion Week Autumn/Winter 2026. PHOTOS PROVIDED TO CHINA DAILY

Beneath the century-old red-brick arched windows of the former Gibb, Livingston & Co building at 100 Dianchi Road, the warm, mellow aroma of Fujian tea lingers in the air.

A century ago, this building was a key departure point for Chinese tea exports to the United Kingdom.

This March, designer Wang Fengchen transformed the building into Fengji Old Teahouse, a limited-time installation that bridges past and present. Inside, curated Fujian tea leaves from 2015 — the founding year of her eponymous label Feng Chen Wang — are displayed alongside the brand's landmark designs from the past decade.

For Wang, 2026 marks a pivotal moment. Ten years after establishing her brand in London, she returns with a clearer sense of direction and identity. As the first Chinese graduate to earn a master's degree in menswear from the Royal College of Art, she built her reputation through a distinctive deconstructed aesthetic that draws on Eastern cultural references while engaging global audiences. Her collections have appeared on the runways of Paris and New York, and her brand became the first Chinese designer label to enter the core retail zone of Galeries Lafayette in Paris.

For her brand's 10th anniversary, she chose to stage this landmark showcase in Shanghai with its first independent runway show in China.

"In the past, tea served as a cultural language connecting the world. Today, our design speaks as a language from the East to the world," Wang explains. "I set out from here a decade ago, and now I'm back. Shanghai is the root of my brand."

Her installation, which draws on the building's history of Sino-Western trade, is one of six curated creative spaces presented in the final stage of the inaugural New Wave Fashion Awards. Organized by the Shanghai Fashion Designers Association, the competition seeks to "identify creative directors for a new era".

Breaking from the traditional ready-to-wear-only judging model, it challenges six finalists to build full brand narrative spaces in Shanghai's key landmarks, testing their ability to turn design concepts into tangible experiences. Designers are required to coordinate resources, manage budgets and oversee every stage of execution, simulating the real-world responsibilities of a creative director.

As juror Cui Dan explains, the role today extends beyond design itself. "A creative director of the new era must not only convey a brand's worldview but also evoke public empathy through meticulous details."

If Wang's space is a narrative of heritage, brand motoguo's *We Eat Fear for Breakfast!* display at the Somekh Building is an emotional adventure — and among Angelo Flaccavento's top picks. Flaccavento, a renowned international fashion critic, traveled especially from Milan to serve as a core juror for the competition.

Centered on the metaphor of "devouring fear", the space by designers Keek Wen Han and Eng Khai Wai mixes surreal, playful installations to build a bold brand universe. It transforms anxiety into courage and delivers emotional healing, while showcasing the brand's iconic, unisex designs and 10-year creative ethos.

Founded in 2015, motoguo has gained international recognition as the first Southeast Asian brand shortlisted for the LVMH Prize. Known for its whimsical, gender-neutral designs, the brand has appeared on international runways and chosen Shanghai as its core development base. Over the past decade, the duo has navigated industry challenges and downturns, ultimately cultivating a loyal community in Shanghai.

"Shanghai is a place where people can pursue their dreams, and it has given us so much support," Keek says.

"A creative director must have a comprehensive brand worldview, and we hope to deliver emotional value and healing to people," Eng says. The duo received the Future Force Award, recognizing both their creative direction and sustained development.

Other finalists present equally distinct narratives through their installations. Gong Li's project for 8ON8 continues his long-standing exploration of "comfortable avant-garde", balancing experimentation with wearability. Angus Chiang marks the 10th anniversary of his brand with *PARC*, a playful, park-like environment featuring interactive elements and signature works.

Li Wen, who transitioned from architecture to fashion, brings a spatial perspective to her installation *Where Shadows Rest* for MAYALI. Her work treats clothing as "architecture for the human body".

Among the finalists, Chen Sifan stands out as the youngest participant. His *Keting-LivingRoom* space at Film Park on Jiashan Road brings design into a familiar, domestic setting, making it more accessible to a broader audience. His project earned the Public Impact Award. "Thank you to the competition for giving creators like us, without funding or a platform, a chance to speak out," he says.

"It's a very interesting competition," says Flaccavento. Over five days, he visited all six installations, experiencing the works within their intended contexts rather than through the conventional runway format.

"What I liked about this award is that we were not shown just clothes, but clothes in an environment that was built to express the vision of the designers." In his view, the competition's greatest vision is its accurate understanding of the core role of a modern creative director. "They're acknowledging the role of the creative director in contemporary fashion, and sourcing from local designers. It's a visionary idea."

Flaccavento also highlights the strength of Chinese designers in building communities: "The clientele is someone who shares your values and vision, and then buys your clothes — it's more organic." He adds that this value-driven, organic bond is the enduring lifeblood of the fashion industry.

"Fashion is a global language. Chinese fashion is part of a broader movement, reflecting local culture while contributing to global dialogue," Flaccavento points out. "While not all Chinese designers achieve international competitiveness, those who do are sophisticated, refined, and their way of working with local crafts and culture can be showcased in Paris."

The broader industry context reinforces this momentum. Since its establishment in 2003, Shanghai Fashion Week has supported nearly 1,000 independent Chinese designers. In the 2026 autumn/winter season, it showcased around 1,000 brands and hosted 92 debut shows, achieving an 18.7 percent increase in business transactions and record-high orders for designer labels. These figures point to both growth and increasing influence.

This competition is just the beginning, says Lyu Xiaolei, secretary-general of Shanghai Fashion Week Organizing Committee. She adds that the SFDA will keep launching systematic talent support, including a new designer competition with the social media platform Douyin, to offer full-chain help for Chinese creative talents.

"The new wave of Chinese design is just setting sail," Lyu says.

International opera collaborations strike power chord

By **ZHANG KUN**
zhangkun@chinadaily.com.cn

Left: Katharina Wagner, Richard Wagner's great-granddaughter and artistic director of the Bayreuth Festival, speaks about the new opera production of *Die Walkure* in Shanghai. **Right:** Scenes from the Shanghai Opera House production of *Turandot*, which was performed at Shangyin Opera House from April 24 to 26. PHOTOS PROVIDED TO CHINA DAILY

The recent premieres of two major opera productions in Shanghai have underscored audiences' growing enthusiasm for classic opera while highlighting the city's emergence as an international hub for opera creation and production.

From April 24 to 26, a new production of Richard Wagner's *Die Walkure* premiered at Shanghai Grand Theatre under the direction of Katharina Wagner, great-granddaughter of the composer and artistic director of the Bayreuth Festival, one of the world's most prestigious Wagner festivals.

The opera is the second installment of the Bayreuth in Shanghai Three-Year Opera Project, which will stage three major Wagner works — *Tristan and Isolde*, *Die Walkure* and *Tannhauser* — between 2025 and 2027.

Featuring a stage design inspired by video-game aesthetics, the production seeks to attract younger audiences by presenting the characters as players in *The Ring Game*. The physically demanding staging requires performers to climb structures as high as nine meters while maintaining vocal control throughout the five-hour opera.

Die Walkure, the second part of Wagner's monumental *Der Ring des Nibelungen* cycle, is conductor Xu Zhong's favorite Wagner opera.

"From the theatrical, musical and character perspectives, *Die Walkure* is my favorite as a conductor," says Xu, who also serves as artistic director of Shanghai Opera House. "The complex emotional dynamics among the characters provide immense space for collaboration between singers and orchestra."

According to Zhang Xiaoding, general manager of Shanghai Grand Theatre, the production signals a broader shift from being primarily a performance venue to becoming a center for opera creation and production.

The Bayreuth in Shanghai project was realized because the German festival is "optimistic about Shanghai", she says, "from the city's cultural temperament to the audience's familiarity with classical music, they believe the future opera market lies in China, in Shanghai".

At the same time, Shanghai Opera House staged three sold-out performances of Giacomo Puccini's *Turandot* at Shangyin Opera House to commemorate the centenary of the opera's premiere in Italy.

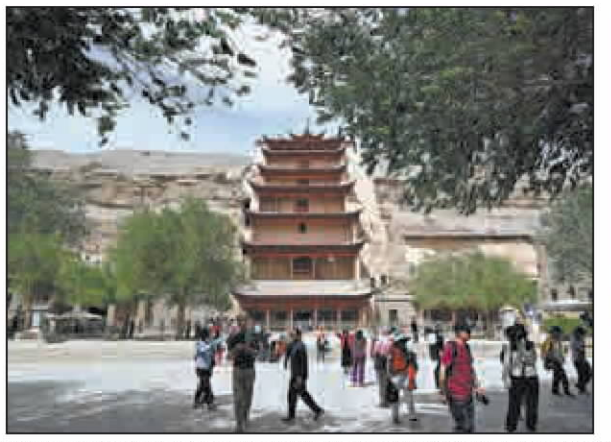
According to Zhang Qingxin, vice-president of Shanghai Opera House, even additional temporary seats sold out a week before opening night.

"I never expected this could happen with opera performances here," says Shi Yijie, president of Shanghai Opera House.

"It's just a coincidence that two big opera productions are staged in the city at the same time," he tells the media before the premiere. "I was told that both operas are sold out already. This is absolutely beyond expectations."

Such strong box-office performance not only confirms Shanghai audiences' passion for classic opera, but also reflects that high-quality coproductions between China and foreign countries are becoming an important driving force for the city's cultural vitality, he says.

The new *Turandot* retained the stage design created by Roberto Ando for the 2018 production and featured tenors and sopranos from China, Italy and Norway.



Director Marco Gandini describes the production as especially meaningful because the opera's story is set in China.

This is the fifth time Gandini has created a production of *Turandot*. "I brought together all the experience and knowledge I've gained over 40 years of opera production around the world," he says, praising the dynamic stage performance, passionate acting and depth of the interpretation.

LIFE

From left: Tourists enjoy spring blossoms near the Big Air ski slope in Shougang Park in Beijing. LI WENMING / FOR CHINA DAILY Visitors explore the Mogao Caves in Dunhuang, Gansu province, a classic example of "living heritage". ZHANG XIAOLIANG / XINHUA Exterior view of Shougang Park's No 3 Blast Furnace, which has been converted into a digital museum. CHEN ZHONGHAO / XINHUA

Keeping the fires burning

More than a decade after its furnaces fell silent, Beijing's Shougang Park is reigniting its industrial past through digital technology and exploring what it truly means for heritage to stay alive, **Yang Feiyue** reports.

Inside Shougang Park's No 3 Blast Furnace, a digital film named *Salute to Steel* is playing, projecting bright and roaring flames onto the furnace core, which has not burned for more than a decade.

In 2010, after more than 90 years of continuous operation, Shougang's steelmaking came to a halt. The sprawling industrial complex on the western edge of Beijing was relocated to neighboring Hebei province.

But people today are not leaving it idle. They are using artificial intelligence to reconstruct historical footage, projection mapping to turn the furnace walls into screens, and immersive surround sound to transform visitors from spectators into witnesses of a lost industrial age.

On April 15, three days before the International Day for Monuments and Sites, a group of heritage experts, retired steelworkers, and academics gathered at the RE Blast Furnace No 3 Digital Museum. The event, organized by the digital heritage committee of the International Council on Monuments and Sites China, was timed to this year's global theme "Living Heritage".

Its purpose was to examine how digital technologies might support the active preservation and intergenerational transmission of industrial heritage — and to ask what it truly means for a heritage site to be "alive".

"Living heritage is not about the physical objects you can touch and measure. It is about the ongoing relationship between people and those objects," says Song Xinchao, chairman of ICOMOS China.

"Break that relationship, and the heritage dies, even if the building still stands, even if the furnace has not been torn down."

Over the course of its long history, China has witnessed many classic cases of living heritage — sites that never died because they were never abandoned by the people who used them.

Song urges relevant parties to draw inspiration from Dujiangyan in Southwest China's Sichuan province, an irrigation system built during the Warring States Period (475-221 BC) that tamed the Minjiang River without a dam. Its designer, Li Bing, used the natural landscape to divert water, remove sediment, and control flooding. More than 2,000 years later, Dujiangyan still waters the fields of the provincial capital Chengdu.

"It has never been a ruin or a museum piece," Song notes. "It has simply worked, continuously, for over two millennia. That is living heritage."

He also considers the Mogao Caves in Dunhuang, in Northwest China's Gansu province, a classic model. They are best known as a treasure house of Buddhist art — thousands of murals and sculptures carved into a cliff face along the ancient Silk Road.

But the grottoes are not only to be viewed from behind a rope, he elaborates.

Every year on the eighth day of the fourth month in the Chinese lunisolar calendar, local residents enter the caves to pray, a tradition dating back more than 1,000 years.

"The Dunhuang Academy, which manages the site, charges only a symbolic five-yuan (74 cents) admission on that day — not because it cannot charge more, but because the relationship between the caves and the surrounding community is itself a piece of heritage worth protecting," Song says.

The ritual keeps the caves alive in a way that climate control and security cameras never could, he adds.

In addition to war and the natural decay that threaten these heritages, Song warns that overcommercialization risks turning culture into a disposable product, and sealing heritage behind glass turns it into a museum specimen. Both approaches, he believes, can break the chain between people and place.

At Shougang Park, efforts have been underway to keep those heritage bonds alive. At the mid-April event, three retired employees donated personal items to root the place more deeply in its own history.

Retired Shougang employees donate personal memorabilia to the RE Blast Furnace No 3 Digital Museum in Beijing during a mid-April gathering. PHOTOS PROVIDED TO CHINA DAILY

Zhang Shijun, a retired Shougang worker, presents French newspapers from 1988 reporting on a 45-member Shougang delegation to France.

Zhang Shijun, in his 70s, walked up to the front and center of the themed day event, holding a few old French newspapers that he had kept for 38 years. He entered Shougang in 1980 after finishing metallurgical machinery and electrical engineering studies in college. In his younger days at work, he won just about every award a young employee could win.

"I can't document the past 100 years — I wasn't born yet," Zhang says with a smile. "But I can document 50 years."

The newspapers reported on a Shougang team that was sent to the northern French city of Calais in 1988 on a mission to dismantle an entire steel plant and ship the equipment back to China for reassembly. The timeline was pressing, and the 45 men of the team worked around the clock.

The coverage emphasized their exceptional efficiency, technical expertise, and strong work ethic, noting that they dismantled thousands of tons of equipment in months for immediate reassembly in China. The French report also framed Shougang's actions as evidence of China's impending economic rise.

By then, they could not have known that by 1994, Shougang would produce 8.24 million tons of steel annually, ranking it first in China, Zhang says with pride. Although the French newspapers are no longer in his hands, he says it gives him great comfort to see them enter the museum's collection.

Zhang's bond with Shougang is personal, forged over decades inside the plant. But today, Shougang's bond with its former employees has expanded to the public.

Shougang Park received over 13 million visitors in 2024, an 8 percent increase from the previous year.

But average spending per visitor was below the citywide average, and the park's service area is limited, considering daily visitors reached 150,000 during the 2022 Winter Olympics, according to Fu Fan, a professor at Beijing University of Civil Engineering and Architecture. Fu has conducted extensive research in the park area.

He notes that the official strategy blends culture, commerce, sports, tourism, technology, and science education, but says there are always ways to improve the visitor experience.

Fu suggests further tapping into the site's history, architecture, and nostalgia to develop a vessel — something that can be consumed, experienced, and shared — so the public and the industrial site can build a closer relationship.

Bu Xiting, a professor at the Communication University of China, offers a way forward, which he calls "cultural reproduction".

He points to the Tate Modern in London, a power plant built in the mid-20th century and now a world-famous museum that deliberately preserved its industrial space.

The lesson for Shougang, he says, is clear: "Instead of waiting 20 years for it to become waste, why not treat it today as an industrial design and an artistic statement?"

He emphasizes immersive experiences that invite visitors to step inside and take it all in.

"The space must wrap around them. The narrative must invite participation. The experience must engage all the senses: hearing, smell, touch, temperature," he says.

Besides envisioning Shougang as a new stage for cultural consumption, an incubator for technological innovation, and a laboratory for the digital economy, Bu says the key is to turn distant collective memory into personal experience — something that can be touched and felt.

At Shougang Park, the furnace no longer burns, but the event's participants concur that something else is burning now.

"The difficulty of preserving living heritage is that it depends on people — on oral transmission, on hand-me-down stories," Song says.

"But that is also its value. It is not a museum specimen. It is life still unfolding."

Charting the world: China renews a tradition of global study

By **WANG RU**
wangru1@chinadaily.com.cn

Left: The first eight books of the new edition of *Guide to the World Nations and International Organizations Surveys*, a major academic program studying countries and key global organizations. **Right:** A seminar organized by the Chinese Academy of Social Sciences to promote the first set of books. PHOTOS PROVIDED TO CHINA DAILY

More than a century ago, in 1843, *Haiguo Tuzhi*, or the *Illustrated Treatise on the Maritime Kingdoms*, a Chinese gazetteer mainly compiled by scholar-official Wei Yuan (1794-1857), was printed and published in present-day Yangzhou, Jiangsu province. The publication was one of the earliest works compiled by modern Chinese people that introduced foreign countries, covering topics related to their politics, economics, military affairs, history, geography and culture.

The collection was so important because it broke the ideological shackles of the isolationism of the Qing Dynasty (1644-1911), allowing the Chinese of that era to open their eyes to the world through this book.

Wei's work laid the foundation for China's understanding of the world. Building on that spirit of openness, later scholars have continued to expand and deepen such research, culminating in the new edition of the *Guide to the World Nations and International Organizations Surveys*.

This is an academic program that aims to conduct systematic studies of the humanities and history, political economy, social governance, security and diplomacy of sovereign states around the world, as well as the historical evolution, institutional development and international influence of major organizations.

The first batch of eight books, as the first phase of the program, has now been published, said the organizers of a seminar in Beijing on April 20. The new edition is based on an earlier version launched by the Chinese Academy of Social Sciences in the 1990s, covering 174 countries and 42 international organizations. The new edition expands this to 196 sovereign states and 60 major international organizations.

"The program is a large-scale, multivolume academic book series with a long history, grand scope, and distinctive representativeness in the fields of area and regional studies, both within the CASS and across China as a whole," says Yao Zhizhong, head of the bureau of international cooperation at the academy.

Zhao Rui, deputy director of the academy, says the new edition was written to meet the needs of the new era. "As we enter this new age, the world is undergoing unprecedented and accelerating transformations, the likes of which have not been seen in a century. Therefore, we must seek a more comprehensive, multidimensional, and in-depth understanding of the world to better serve the cause of building a community with a shared future for humanity."

Currently, 66 projects under the framework have been launched, involving invited experts from across China. The first batch of eight books includes volumes introducing the United States, Japan, Indonesia, Nigeria, the Czech Republic, Fiji, the United Nations and the North Atlantic Treaty Organization.

Zhao Chuandong, deputy director of the National Office for Philosophy and Social Sciences, says the new edition, while being informative and readable, aims to place greater emphasis on the academic nature and research value of the collection.

"Efforts should be made to achieve a balance between academic rigor and general readability," he says.

Liu Chenyang, head of the project to study the Asia-Pacific Economic Cooperation, says that on the basis of a true, systematic and comprehensive introduction of APEC's progress and influence, their project will conduct an in-depth analysis of the role the organization can play in promoting cooperation in the Asia-Pacific region and global governance in the new era.

"APEC brings together major political and economic powers from around the world. Its 21 member economies together account for half of global economic and trade volume. Not only does APEC play a primary role in regional cooperation in the Asia-Pacific, but its influence in the global governance system is also steadily increasing," he says.

Auto giants plug into China's battery power

Carmakers tap nation's cell chemistry, manufacturing scale and engineering talent

By MAY ZHOU in Houston, Texas
mayzhou@chinadailyusa.com

Tesla has recently added Sunwoda Electronic as its fifth global power battery supplier, according to a report by 36kr, a Chinese technology and new economy platform.

Sunwoda manufactures third-generation lithium iron phosphate (LFP) cells known for fast charging speed, and has begun shipping them to Tesla's Shanghai Gigafactory, according to the report. Those cells are going into Tesla cars built in Shanghai for export.

Tesla has a long-running relationship with China's CATL (Contemporary Amperex Technology Company), a global leader in renewable energy technology and the world's largest manufacturer of LFP and energy storage. It also sources LFP cells from BYD —including roughly 20 percent of the cells for its Shanghai Megafactory.

In September, Tesla signed a deal with China's EVE Energy to supply energy-storage cells for its European subsidiary from 2026 to 2030.

Industrial analyst Fred Lambert from Electrek said that by adding Sunwoda, "Tesla is prioritizing cost leverage over vertical integration" — the opposite of what CEO Elon Musk envisioned in 2020.

But Lambert considered Tesla's move "the right call" because Chinese LFP suppliers have been so efficient that it makes it "unnecessary" for Telsa to engineer its own.

Tesla is widely recognized as the largest single non-Chinese customer of the Chinese battery industry.

From multibillion-dollar joint ventures in Spain, Germany and Hungary to technology-licensing deals reshaping production in Michigan, the world's largest legacy automakers are increasingly dependent on Chinese cell chemistry, manufacturing scale and engineering talent.

They are racing to license, co-develop and source from Chinese battery champions — a realignment of the EV supply chain that puts Chinese chemistry, manufacturing know-how and capital at the center of the global EV transition.

European automakers have enjoyed the densest concentration of Chinese battery partnership outside Asia.

Global automotive group Stellantis formed a 50-50 joint venture with CATL to build a 4.1 billion euro ($4.8 billion) LFP gigafactory in Zaragoza, Spain. It is set to come online in late 2026 with capacity scaling toward 50 gigawatt-hours.

Stellantis makes American brands including Jeep, Ram, Dodge and Chrysler; European brands including Peugeot, Fiat, Citroën, Opel and Vauxhall; and luxury brands such as Maserati, Alfa Romeo, DS Automobiles, Lancia and Abarth.

Volkswagen has gone further by becoming the largest shareholder of Gotion High-Tech, a major Chinese battery manufacturer. It recently expanded its holding to more than 26 percent with a roughly $1 billion investment to fund a 2 GWh solid-state battery line targeted at next-generation VW and Audi vehicles.

In November, Gotion began mass production of the "unified cell" that VW selected as the standard format across most of its EV lineup. It is the cornerstone of Volkswagen's strategy to reduce battery costs by up to 50 percent across its entire vehicle lineup.

Thomas Schmall, chief technology officer of Volkswagen, speaking at Gotion's Unified Cell delivery ceremony in China last November, said that with the LFP unified cells now being produced in China and Germany, Volkswagen is "prepared to supply next-generation, highly competitive battery technologies across all Volkswagen brands".

"This makes Gotion a cornerstone of our global 'make-and-buy' battery strategy," he said.

A separate joint venture with Slovakia-based InoBat, in which Gotion owns 25 percent, is building a 20 GWh European plant scheduled to open in 2026.

BMW's largest cell partner since 2018 has been CATL. It has pivoted to all-electric models with its launch of Neue Klasse from 2025, and relies heavily on three Chinese manufacturers — SVOLT, CATL and EVE Energy — for battery supply.

According to industrial reports, the three Chinese battery companies have been building plants in Germany and Hungary to exclusively supply its next-generation cells in cylindrical 46 millimeter format that was designed by BMW.

It's estimated that BMW's Chinese cell content will exceed 60 percent of its global battery volume by 2027 when SVOLT, CATL and EVE are all fully ramped.

> "Combining our strengths allows us to develop products that set new standards globally."
>
> **Oliver Zipse,** chairman of the board of management of BMW AG

Oliver Zipse, chairman of the board of management of BMW AG, told Xinhua News Agency in September at the International Motor Show Germany in Munich that China's innovation is crucial for BMW's global strategy.

"Currently, the biggest innovations we see come out of China. Combining our strengths allows us to develop products that set new standards globally," Zipse said. "We have companies like CATL or EVE where we develop, blend and manufacture cells for our vehicles in China, but also outside of China."

In February, BMW and CATL signed an agreement to jointly develop and pilot the EU's Battery Passport — a digital traceability framework that will be required for European battery sales under the EU Battery Regulation from 2027 onward.

This is significant because it's an infrastructure-grade collaboration that goes beyond cell supply into shared compliance and sustainability tooling, industrial experts pointed out.

Another German automaker, Mercedes, formed a relationship with China's EV battery industry by acquiring an equity stake in China's Farasis Energy, which supplies batteries for Mercedes' flagship electric models. It also gets battery supplies from CATL's factory in Hungary.

In the US, Mercedes builds its EVs using cells from Envision AESC, a Chinese-owned battery maker.

In Asia, major automaker Toyota has a standing agreement with BYD to jointly develop battery-electric vehicles leveraging BYD's Blade Battery technology. Their partnership has produced China-market BEVs and is informing Toyota's broader LFP and solid-state roadmap.

It's another story in the US, where automakers are facing political pressure when it comes to using China's battery technology. That has led to far fewer US battery projects involving Chinese technology, compared to Europe.

In early 2023, Ford announced plans to build a $3.5 billion EV battery factory in Marshall, Michigan by licensing CATL's battery technology.

The deal immediately met challenges from US politicians who said that the deal could make an American company reliant on a Chinese company with links to the Chinese military. In 2025, CATL was listed as a Chinese military company by the US Department of Defense.

The battery factory, known as BlueOval Battery Park Michigan, also faced legal challenges from a group of local residents who argued against the project over issues of environment, rural identity, public participation in decision-making and national security.

Ford later scaled back the project and reduced its production capacity from 35 GWh to 20 GWh. Consequently, jobs were reduced to 1,700 from the planned 2,500.

Ford executives have repeatedly defended the project as the only viable path to building affordable LFP cells in the US at scale.

Lisa Drake, former VP at Ford and now president of Ford Energy, defended Ford's BlueOval Battery Park Michigan on various occasions.

She told Axios last June that "it probably would have taken us a decade to catch up and have LFP technology on our own with our own R&D."

"It's hard to innovate something when you've never seen it with your own eyes. That's why we need to bring it here," she said. "I'm convinced this is the right thing to do for the United States."

In December, Drake confirmed that Ford is widening the CATL relationship beyond automotive cells — Ford will use CATL-licensed LFP technology to manufacture stationary energy storage batteries at its Kentucky BlueOval SK facility.

"We have a licensing agreement, but we feel it's better to build these batteries in the United States with American workers, with our own Ford workers, and understand the IP, than import them like they're being done today," Ford CEO Jim Farley recently told Bloomberg. "The best way to compete with China is to get close to the IP and then run the plants at Ford."

In August, General Motors confirmed it will import CATL LFP cells to power the second-generation Chevrolet Bolt, which begins production at GM's Fairfax, Kansas plant in late 2025 and arrives in dealerships in 2026 at roughly $30,000.

GM said this deal was a stopgap before American production of LFP batteries can pick up the pace and replace the Chinese imports.

Representative John Moolenaar from Michigan publicly attacked the deal, calling GM's decision "disappointing to not only its customers and employees, but also to the American people."

In January, GM said its Fairfax plant will be transitioned to make other vehicles in mid to late 2027. The Bolt will be a limited-run model, and its production will end once the Fairfax facility transition is complete.

The US lost more than $34 billion in clean energy investment in 2025, of which $21 billion came from the EV battery sector, according to an analysis by E2, a US policy advocacy group of business leaders, investors and professionals.

While US politicians are finding ways to restrict China's battery technology to be employed by US automakers, the recent 2026 Beijing Auto Show revealed that China's EV battery technology has taken another big step forward.

Industrial experts attending the show said that a dozen battery manufacturers participated the event with massive booths — some larger than automakers — indicating the importance and central role of batteries in EV production.

CATL revealed six new battery technologies, and BYD unveiled Blade Battery 2.0 with a 625-mile (1,000 kilometer) range. They, along with EVE Energy, revealed new EV batteries that can be fully charged in five to 10 minutes.

BMW chair Zipse was at the Beijing Auto Show. He said in an TV interview that the auto show was "innovative" and "future oriented".

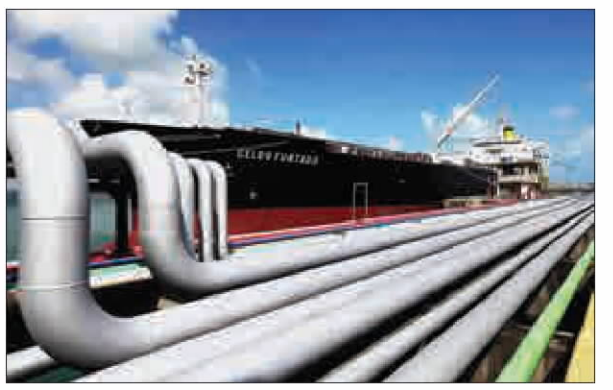
Zipse told Reuters in February that ignoring China, the world's top auto market, would put at risk future economic success, and cooperation with Beijing was fundamental.

"Those who close their minds to China's enormous market and innovation potential are missing out on great opportunities for global growth and economic success," he was quoted as saying.

The Iran war boosts Brazil's oil exports to China

By HÉLIO ROCHA
in Juiz de Fora, Brazil

Brazil's oil exports to China doubled in the first quarter as a result of the Iran war, according to federal government data compiled by the Brazil-China Business Council.



Oil export volume in the first three months totaled $7.2 billion, compared with $3.7 billion in the same period of 2025, an increase of 94.6 percent. In all, 16 million metric tons were shipped, a growth of 122 percent from the previous year.

The main reason, cited by producers and geopolitical experts, is the ease of shipping Brazilian oil compared with oil leaving the Persian Gulf. The war in the Middle East led Iran to close the Strait of Hormuz, through which most oil from Arab countries passes. Iran's war strategy appears to have offset the distance Brazilian oil must travel to reach China.

Marcio Felix, president of the Brazilian Association of Independent Oil Producers, told China Daily the sector was caught off guard.

"It's important to note that recent geopolitical events have indeed generated volatility and demand spikes in the international oil market," Felix said. "For independent producers in Brazil, the ability to respond to these moves is limited in the short term, since oil production is not easily adjustable on short notice, especially in mature assets."

Felix said, however, that "companies have sought to maximize operational efficiency, reduce unscheduled downtime and optimize their assets to capture market opportunities whenever possible" to cope with the unexpected increase in demand.

Oil tanker *Celso Furtado* destined for China is being loaded with oil off the Brazilian coast. TRANSPETRO / FOR CHINA DAILY

"The sector has acted with caution and planning. Facing a more uncertain international scenario, independent producers stress the importance of regulatory predictability and institutional stability, essential factors to enable medium and long-term investments."

Other sectors also grew in the wake of the Iran war, which indirectly affects the United States and the European Union. Beef sales totaled $1.3 billion, up 33.8 percent, while in the mining sector, iron alloys more than doubled in value to $478 billion, with niobium up 63 percent and nickel up 29 percent.

Felix explained that Brazil is reliable suppliers of raw materials and industrial goods to the world.

Brazil's Ministry of Development, Industry and Foreign Trade said in a statement: "China is Brazil's top trading partner. In 2025, exports reached $100 billion, and total trade flow reached $171 billion. Seasonality is a common factor in foreign trade for various products and destinations, but the trade level with China, especially exports, has remained high over the last 20 years, at a steady growth rate. Moreover, since 2013, China has been the top buyer of Brazilian oil."

Geopolitical analyst Marco Fernandes, a member of the BRICS Civil Council — the economic group bringing together the five emerging economies of Brazil, Russia, India, China and South Africa — argued that Brazil's oil exports also exposed some weaknesses in Brazil's oil industry.

"Brazil benefits from higher oil export values," Fernandes said. "Given that the price per barrel has doubled from December 2025 levels, Brazil could set an export record this year, especially if the war drags on. However, this situation also exposes a Brazilian weakness: the country's insufficient oil refining capacity."

Trade dialogue key to global stability and growth

By ZHONG NAN
zhongnan@chinadaily.com.cn

A new round of China-US economic and trade talks is vital to reducing business uncertainties and improving global economic confidence amid persistent geopolitical and trade challenges, experts and business executives said on Monday.

According to information released by the Ministry of Commerce, Vice-Premier He Lifeng, who is also a member of the Political Bureau of the Communist Party of China Central Committee, will lead a delegation to hold economic and trade consultations with the United States in the Republic of Korea on Tuesday and Wednesday.

As the Ministry of Foreign Affairs announced on Monday that US President Donald Trump will pay a state visit to China from Wednesday to Friday, market watchers said the high-level interactions in the ROK are expected to further stabilize bilateral economic ties and keep the channels of effective communication open.

According to the Ministry of Commerce, the two sides will be guided by the important consensus reached between the two heads of state at their meeting in Busan and during previous calls, and will hold consultations on economic and trade issues of mutual concern.

Experts said the consultations between the world's largest and second-largest economies are likely to focus on trade, technology and supply chain concerns amid heightened global tensions.

Zhang Yilun, a research associate at the Washington-based Institute for China-America Studies, said the talks might help to create a smoother atmosphere ahead of the leaders' meeting in Beijing.

Raj Subramaniam, chairman of the US-China Business Council, said that direct and sustained dialogue between the US and China is critical for addressing complex economic challenges and advancing long-term stability and growth.

Zhao Minghao, a professor and deputy director of Fudan University's Center for American Studies, said the US leader's visit to China will provide an important opportunity for both sides to explore channels of engagement.

Zhao said that these interactions not only contribute to greater stability in the China-US relationship, but also improve expectations for restoring efficiency and predictability across global industrial and supply chains, underscoring that dialogue remains essential for managing differences and supporting practical cooperation.

Edgard Kagan, senior adviser at the Center for Strategic and International Studies in Washington and former US ambassador to Malaysia, said that Washington's priorities include securing expanded Chinese rare earth supplies and establishing a framework for future bilateral discussions on artificial intelligence risks and safety, while Beijing seeks more stable ties and predictable US tariff policies.

Wu Xinbo, dean of Fudan University's Institute of International Studies, said the Middle East conflict has heightened concerns over global energy security, shipping routes and regional stability, and both China and the US have strong incentives to prevent further escalation.

"Any consensus reached by the two sides on maintaining regional stability could carry broader global implications," Wu said.

Against this backdrop, Mei Xinyu, a researcher at the Chinese Academy of International Trade and Economic Cooperation in Beijing, said that stable China-US business ties would support international trade flows, ease supply chain disruptions and improve investor confidence amid intensifying strategic competition.

Echoing the sentiment, Ian Shih, president for China at US industrial automation company Rockwell Automation, said that China's vast market, complete industrial ecosystem and continued high-level opening-up provide strong support for companies seeking long-term growth and diversified application opportunities.

Lin Chunmei, president and general manager of Corning China, said the US industrial materials manufacturer will deepen localized manufacturing and innovation in sectors including display, optical communications and automobiles in China.

Head-of-state diplomacy to guide relations

Xi to hold in-depth exchanges with Trump during US president's state visit to China

By ZHAO JIA in Beijing
and **YIFAN XU** in Washington

Beijing said on Monday that it was ready to work with the United States to expand cooperation, manage differences and inject more stability and certainty into a turbulent and changing world as it confirmed that US President Donald Trump will pay a three-day state visit to China starting from Wednesday.

According to Foreign Ministry spokesman Guo Jiakun, President Xi Jinping will hold in-depth exchanges with Trump on issues concerning China-US relations as well as major issues related to world peace and development.

The visit will mark Trump's first trip to China during his second term in office and the first visit to China by a US president in nine years.

Noting that head-of-state diplomacy has played an irreplaceable strategic guiding role in China-US relations, Guo told a regular press briefing that China is willing to work with the US in the spirit of equality, respect and mutual benefit to expand cooperation, manage differences and provide more stability and certainty for a transforming and volatile world.

Since Trump was reelected in November 2024, the two heads of state have spoken five times over the phone and held one face-to-face meeting, maintaining regular communication as Beijing and Washington seek to keep bilateral relations on a stable track.

Speaking on a television program on Sunday, Trump said that he was looking forward to visiting China again and believed the upcoming trip would be "amazing", adding that his relationship with President Xi was "very good".

Su Xiaohui, deputy director of the Department for American Studies at the China Institute of International Studies, said head-of-state diplomacy has consistently served as the "anchor" of China-US relations.

Direct communication between the two leaders, she said, can help both sides better understand each other's intentions, avoid miscalculation, grasp the overall direction of bilateral ties and explore ways to build a stable relationship.

Diao Daming, a professor at Renmin University of China, said that given the complexity of China-US relations, the significance of Trump's visit lies not in resolving all issues at once, but in whether the two sides can use top-level communication to address each other's concerns and send more positive signals to the world.

Washington should view China objectively, develop a rational perception of China and work with Beijing in the same direction, rather than approach bilateral ties from a position of strength, he added.

He said that both sides should expand areas of cooperation, reduce the list of problems, and ensure that economic and trade ties continue to serve as a ballast and driver of bilateral relations rather than a source of friction and conflict.

Regarding the technological landscape, experts have pointed out a current "truce" that offers a window for structured dialogue.

Martin Chorzempa, a senior fellow at the Peterson Institute for International Economics, said during an event last week that "the technology front looks relatively calm compared to past administrations".

Chorzempa suggested that high-level engagement could help cement this atmosphere, noting that many restrictive measures have been "walked back or paused" over the last year.

Sourabh Gupta, a senior fellow at the Institute for China-America Studies, told China Daily that extending the trade and technology truces established at earlier high-level meetings remains a top priority.

STRAWBERRY ADDS FLAVOR TO SUMMER MUSIC SCENE

As festival season arrives, events across the country tap into the beat of China's creative pulse

By CHEN NAN
chennan@chinadaily.com.cn

On a bright morning on the outskirts of Beijing's Yanqing district, a dusty field was already stirring. Tents were being pitched, food stalls rolled into place, and festivalgoers arrived in small clusters, backpacks slung over their shoulders and sneakers dusted with dirt.

The Strawberry Music Festival, which has grown into a staple of China's summer music scene, was about to begin its three-day run on May 2.

Attendees, who had traveled from across the country, carried homemade banners, while others shared snacks on picnic blankets.

Among the visitors was Stephanie Daniels, a British musician who performs under the name SCAPA. It was her first visit to China. After a week of exploring Beijing's studios and collaborating with local artists, she found that the festival offered a more visceral indicator of the country's creative pulse.

"It felt very genuine," she said. "People were there for the music, for the vibe."

Audiences watch a performance at the Strawberry Music Festival in Dongguan, Guangdong province, on May 4. PROVIDED TO CHINA DAILY

The festival featured bands fusing local traditions with global influences. Daniels was particularly impressed by Sound Fragment, a six-member ensemble blending brass with traditional Chinese instruments.

Fans, many in their 20s, absorbed the performances with rapt attention.

"Even if I don't know the lyrics, I feel it in the beat," Daniels said.

By the late afternoon, the festival ground was abuzz with creative activity. Attendees tried out instruments at workshops, contributed to art installations and joined impromptu games of cards and badminton.

As the music shifted toward the evening sets, the air grew thick with energy, laughter and the smell of street food. Daniels moved through the crowd, observing, sampling snacks and soaking in the communal atmosphere.

"To my surprise, there was even a health pop-up at the festival," wrote Jiu Yue, who attended the festival on May 2, on her social media. "As people who love having fun, but also don't want to get exhausted, we discovered a completely different kind of music festival experience here. At the pop-up, we could get a health checkup and even try out a massage."

For many, the Strawberry Music Festival and events of its kind are living laboratories of youth culture — where global sounds meet local traditions, and temporary communities form out of shared curiosity and joy. By sunset, the field was a sea of blankets, instruments and smiling faces — messy, loud and imperfect, yet buzzing with a sense of life and artistry.

Inclusive tech a must for common progress

WORLD WATCH
By Moiz Farooq

China has entered a new chapter in which innovation stands at the center of national progress. Once known mainly for its manufacturing strength, China has emerged as one of the world's key players in technology.

From artificial intelligence to next-generation communication networks, and from advanced industrial systems to green technology, China is making great contributions to global progress.

These achievements are not accidental. They are the result of long-term planning, stable governance and a national vision that prioritizes science, technology and innovation as a core driver of economic and social advancement.

In an increasingly competitive world, China's growing technological strength is creating new opportunities both at home and across the international community.

China's approach to innovation is guided by a clear vision for long-term development.

The country understands that high-quality growth requires strong scientific foundations and advanced technological capacity.

Taxi drivers' dog rescue triggers tourism boom

Story of kindhearted efforts to save injured stray touches netizens nationwide

By **ZHU LIXIN** in Hefei
zhulixin@chinadaily.com.cn

Xuancheng — a city in Anhui province best known for producing quality paper — is experiencing a mini tourism boom thanks to a stray dog and a group of kindhearted taxi drivers who came to its rescue.

The story of "Chief Huang" a gentle rural mutt that had made Xuancheng Railway Station its home, has captured the country's imagination with tens of millions of online views.

On one platform, Douyin, a local animal rescue blogger Wang Mingxuan posted a video he filmed about the rescue, which received 368,000 likes and 100,000 shares and comments.

The dog was nearly killed after being hit by a car in mid-April, but was eventually saved by a group of local taxi drivers who banded together to pay the medical bill.

In what they have dubbed "boomerang love" tourists traveled to Xuancheng, a city of some 2.7 million people, during the May Day holiday, to return the act of kindness.

"It brought tears to my eyes," wrote one netizen. "In this fast-paced society, it's already a touching story that there's a group of people willing to stop and help a little dog. Moreover, these are people who rely on every minute to earn a living for their families. I'm grateful that there is such goodness in this world."

Little yellow dog

Taxi driver He Wei said he first noticed the little yellow dog hanging around the railway station in August or September of last year.

"At that time, it was very small and skinny, sometimes staying in the taxi waiting area, sometimes wandering around the square, quiet and gentle, never barking or running around," He said. "Over time, this little dog became fixed in many people's hearts."

Taxi drivers coming and going often played with it and brought it eggs and sausages to eat.

"As soon as one of the drivers called it, it would happily run over, wagging its tail," said He.

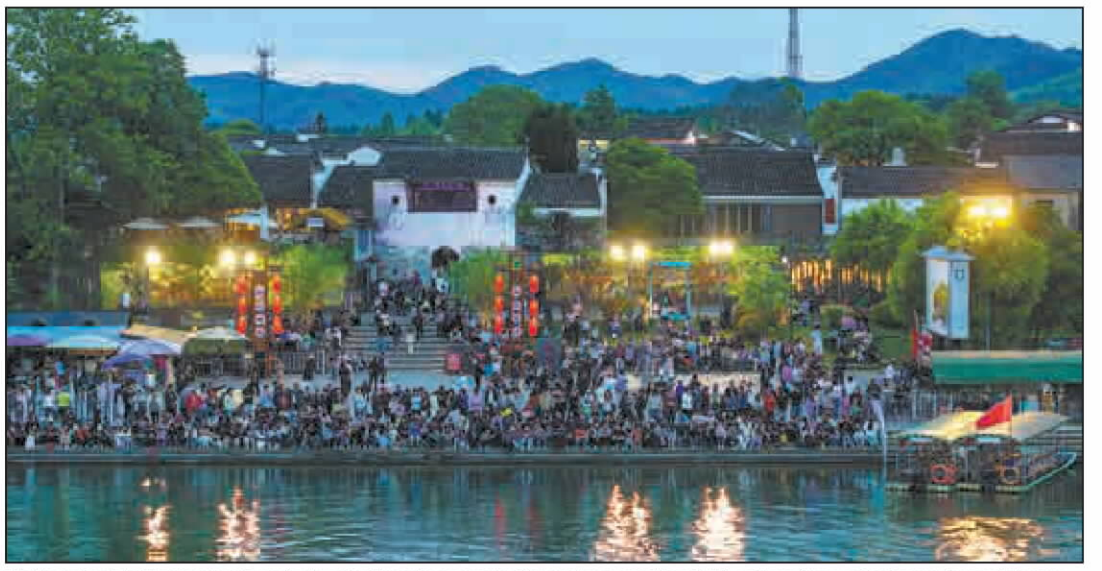
At first, the drivers called the puppy Xiaohuang, literally "little yellow". But as it grew, they gave it a more majestic name — Chief Huang.

By January, some of the local taxi drivers had pooled enough money to have the female dog spayed in a pet hospital. If the stray dog got pregnant, her life would become harder, the drivers reasoned.

"Chief Huang was a ray of light in my gloomy days," said He, who runs a poster design business online during the day, and drives for a ride-hailing service at night.

"One night, I parked my car near the square, lit a cigarette in frustration, and Chief Huang came to sit beside me. We sat quietly together for a long time," He said.

Every time he drove a taxi, He would go to the square to find the dog. Only after seeing it and playing with the dog, "just like an old friend," would he feel at ease.



On the evening of April 15, He went to look for the dog but couldn't find it. He went back the next day but couldn't see Chief Huang.

"We wait for passengers at the station every day. Chief Huang quietly keeps us company. Over time, it has become like family to us," said Fan Bin, a taxi driver.

"Seeing it there each day gives us peace of mind; if we don't see it for one day, everyone starts asking each other about it," said Fan.

The accident

On April 17, Wang received a message online asking for help: a yellow dog near the Xuancheng Railway Station had been hit by a car and was unable to move, eat or drink.

Visitors flock to Taohuatan Scenic Area in Jingxian county, Xuancheng, on May 3. The city witnessed a boom in tourist numbers during the May Day holiday this year. ZHAO MING / FOR CHINA DAILY

"On April 18, I arrived at the station and was surprised by the scene," said Wang.

On the station square, a row of taxis was parked beside a traffic island covered in green shrubs. Dozens of drivers had gathered, not waiting for passengers, but anxiously discussing the little yellow dog curled up in front of them.

At one point, Fan took out a stack of cash and a handwritten donation list. The list had no names, only a series of license plate numbers and donation amounts varying from 20 yuan ($2.94) to 1,000 yuan ($147.10).

Several days earlier, the dog had been hit by a passing vehicle. After the taxi drivers found it, they took it to a pet hospital and were told it needed immediate surgery, costing more than 10,000 yuan.

"(It had) three fractures in the front and hind limbs. The right hind leg was the most severely injured, with bone dislocation requiring immediate surgery, or it would face amputation or even death," said taxi driver Zhang Xinming.

One of the initiators of the donations, Zhang personally gave 1,000 yuan. His monthly income from operating a taxi is about 3,000 yuan.

In the taxi waiting area at the west square of the railway station, two pieces of paper were eventually posted on the bulletin board, recording total donations of more than 4,000 yuan by 48 taxi drivers and eight generous individuals.

"Despite these donations, it was still not enough for the treatment, so after a simple anti-inflammatory treatment, we took the yellow dog back to the train station and continued to find ways to help," Zhang said.

The dog was in so much pain that it wouldn't eat or drink. The drivers were afraid it would be hit by another car, so they moved it into the shrubbery.

Taxi driver He Wei displays his handmade keychain and fridge magnet souvenirs dedicated to Chief Huang. WEN QIN / FOR CHINA DAILY

Deeply moved

Wang had contracted pneumonia and was worried that sudden coughing might stress the yellow dog, so he asked a friend to remove the dog from the shrubs. He recorded the entire rescue with his phone camera and posted it online.

Wang and his friend took the dog to another animal hospital — Xuancheng Chongfuxin Pet Hospital — with a group of taxi drivers following closely behind.

Because there were too many people on-site, they finally selected four driver representatives to enter the hospital.

Upon learning about the donations raised by the taxi drivers, hospital director Zhu Jun was deeply moved and decided to do everything possible to treat the dog.

"We have been in pet medical care for many years, and this is the first time we have seen so many taxi drivers spontaneously raise money and wait outside the hospital for a stray dog," Zhu said.

The hospital decided not to charge more than 4,000 yuan for the operation. The subsequent treatment and recovery costs were all covered by the hospital.

On April 20, after two days of being treated with anti-inflammatories, Zhu and his colleague performed orthopedic surgery on Chief Huang. They successfully repaired three fractures and implanted an artificial ligament in the severely injured right hind leg.

After the surgery, the drivers left the hospital.

"In the following days, we drivers took turns visiting the hospital, bringing Chief Huang's favorite food, and quietly staying by her side, afraid she would feel lonely," Zhang said.

Spreading kindness

Chief Huang is still recuperating in the hospital, but her popularity has rocketed. Many people have not seen her online again.

He Wei has used his design expertise to make refrigerator magnets, key chains, and ornaments with images of the dog at his own expense. Initially, he gave them away for free to local taxi drivers and tourists who showed concern for the dog. But as more people asked for the merchandise, he started selling them at cost.

During the May Day holiday, many people came to Xuancheng and chose taxis as their preferred mode of transportation.

"A young passenger said he was touched by the story of this city. When he reached his destination, he was supposed to pay 13 yuan, but he quietly paid 20 yuan when getting out. When I reminded him, he ran off with his suitcase," said Fan.

The drivers said business during this year's May Day holiday was much busier than last year. It is roughly a three-hour drive from Shanghai, Hangzhou, and Nanjing, and its proximity makes it ideal for micro vacations.

To show their appreciation to local taxi drivers, some scenic spots offered them and their families free admission during the holidays.

Tourists who took taxis to scenic spots like Jingting Mountain and Shibawan Scenic Area were allowed to enter for free with a taxi receipt from the same day.

A number of restaurants and hotels offered discounts or reimbursed tourists' taxi fares. At the local Longquan Cave Scenic Area, taxi passengers had their taxi fare deducted from the ticket price.

From April 30 to May 5, Xuancheng Railway Station averaged 21,000 passengers per day, an increase of nearly 5 percent year-on-year.

The Xuancheng City Planning Museum received a total of 19,701 visitors from May 1 to May 5, with a single-day peak of 4,946, setting a new holiday record.

Serious considerations

Wang continues to rescue stray dogs almost every day. He said he did not intend to produce videos updating Chief Huang's condition, but is responding to enthusiastic requests from his followers about the dog's well-being.

"My original intention was to rescue stray animals, not to chase fame. The fame from Chief Huang's story belongs to our city," said Wang.

The dog's celebrity status has also posed some tough questions for the taxi drivers who love her so much — the chief one being someone's proposal to adopt her and their reluctance to part with the animal.

"She has been with us for so long, like family," Zhang said.

His life story is one of struggle and change. He was once a teacher, later worked for a State-owned enterprise, and after the enterprise went bankrupt, became a taxi driver.

"Adoption is possible, but the adopter must guarantee to treat Chief Huang well for her whole life," Zhang said.

Wang believes that if people want Chief Huang to return to the railway station, they should complete the adoption procedures, obtain a dog license, and comply with regulations.

Meanwhile, some government insiders revealed that after the May Day holiday, cultural and tourism proposals related to Chief Huang's fame had been stopped due to concerns about her welfare and overall stray dog management.

Some netizens have suggested the city should capitalize on Chief Huang's fame. "This is more effective than however many advertisements Xuancheng's cultural and tourism department could run. Who could resist such a warm city?" wrote one.

Another said: "Put Chief Huang's logo on the cars of these kindhearted drivers. From now on, choose them when you need a ride!"

Wang said there is a deeper issue to be addressed in the management of the city's stray animals. According to the Xuancheng government's dog management regulations, urban management departments are responsible for supervising and managing dog shelters and capturing stray dogs.

Stray cats and dogs caught by city officers should be neutered and then placed in appropriate institutions, such as stray animal placement centers cooperating with the government, to reduce the explosive growth of stray cats and dogs caused by uncontrolled breeding, Wang said, adding the government should establish public pet hospitals.

"In fact, the proliferation of stray cats and dogs largely stems from abandonment," Wang said, adding that the government should impose a stricter ban on abandoning domestic cats and dogs and raise the threshold for pet ownership as fundamental solutions to the problem.

Wen Qin of Anhui Daily contributed to this story.

Cargo vessel to help advance space research

Tianzhou 10 delivers experimental supplies, equipment to country's Tiangong orbital post

By ZHAO LEI
zhaolei@chinadaily.com.cn

China launched on Monday the Tianzhou 10 cargo spacecraft to deliver scientific equipment and experimental supplies, including artificial human embryos, ultra-thin solar cells and a greenhouse gas monitor, to its orbiting Tiangong space station.

A Long March 7 rocket, carrying the cargo vessel, blasted off at 8:14 am from the Wenchang Spacecraft Launch Site in Hainan province, according to the China Manned Space Agency.

After a short flight, the Tianzhou 10 spacecraft separated from the carrier rocket and entered its designated orbit. At 1:11 pm, the cargo vessel docked with the Tianhe core module of the Tiangong space station, paving the way for Shenzhou XXI astronauts to enter the vessel and transfer payloads as scheduled.

Later in the day, Shenzhou XXI mission commander Senior Colonel Zhang Lu, spaceflight engineer Major Wu Fei and payload specialist Zhang Hongzhang entered the cargo vessel and began arranging the transfer of the payloads.

Tianzhou 10, which is the 20th spaceship and the ninth cargo vessel to dock at the space station, has delivered nearly 6.2 metric tons of daily necessities, scientific equipment and experimental supplies, as well as about 700 kilograms of fuel. The cargo includes a spacewalk suit, a treadmill and many instruments for scientific experiments and technological tests.

Mission planners at the China Academy of Space Technology said the Tianzhou 10 is designed to dock with the Tiangong space station for a whole year, making it the longest cargo mission in the history of China's space industry.

According to the Chinese Academy of Sciences' Technology and Engineering Center for Space Utilization, which is responsible for scientific missions on board China's space station, the Tianzhou 10 has delivered 67 sets of devices, experimental expendables, samples and spare materials, which have a combined weight of 768.2 kg and will be used to conduct 41 experiments.

The experimental cargo includes zebrafish embryos, mouse embryos and stem cell-derived artificial human embryos. The human embryos, although not true life forms, will help simulate the earliest stages of human development, according to reports from China Central Television.

The experiments in orbit will help establish a space-based embryo research system spanning lower vertebrates to higher mammals. The biological research will provide insights into how the space environment, specifically microgravity and radiation, affects reproduction and development, laying the foundation for long-term human habitation in space.

Among the payloads are flexible solar cells. With a thickness of just 80 micrometers — roughly the same as a human hair — these cells can be folded and rolled, allowing a greater number of solar panels to be packed into a given amount of space. Subjecting this new technology to the extreme space environment will help verify and improve its long-term power-generation stability, paving the way for supplying energy to China's large-scale satellite internet constellations.

The greenhouse gas monitor, developed under the leadership of the Hong Kong University of Science and Technology, is designed to track concentrations of carbon dioxide and methane across global middle and low latitudes.

Xinhua contributed to this story.

Activist returns

Visit: Risk management in AI could figure in talks

From page 1

Gupta said that artificial intelligence has emerged as a significant area where both nations recognize a mutual interest in risk management.

Scott Kennedy, senior advisor and trustee chair in Chinese business and economics at the Center for Strategic and International Studies in the US, said during a news briefing earlier that the current trajectory reflects a period of relative confidence. He said that as the two sides prepare for senior-level dialogues, "China has the right to be confident that they are doing very well bilaterally".

While both sides are seeking to expand cooperation, managing differences and sensitive issues — particularly the Taiwan question — is also expected to be high on the agenda.

During a phone conversation with US Secretary of State Marco Rubio in late April, Foreign Minister Wang Yi said the Taiwan question concerns China's core interests and remains the biggest risk in China-US relations.

Bonny Lin, director of the China Power Project at the Center for Strategic and International Studies, said that stability in the overall relationship is predicated on mutual understanding. Referring to official positions, Lin pointed out that fulfilling international obligations on this question is viewed as "a necessary prerequisite for the stable, sound and sustainable development of China-US relations".

Innovation: Nation plays essential role in sharing technological achievements

From page 1

This is why China has invested heavily in research institutions, national laboratories, high-tech zones and innovation clusters that bring together industry, academia and government. These systems support a continuous cycle of research, invention, industrialization and global expansion.

This shift indicates a deeper transformation in which innovation is not merely a sector, but the main engine of national power.

One of the most striking examples of China's technological progress is its rapid advancement in artificial intelligence and intelligent computing. China is developing cutting-edge platforms in machine learning, deep neural networks, autonomous systems and supercomputing. Its research institutes and companies are building intelligent algorithms that can manage transportation systems, financial operations, healthcare diagnostics, smart cities and governance services. This progress demonstrates China's ability to integrate science with practical solutions for society, while AI is becoming a strategic resource for China's overall development and is also transforming global industry and digital ecosystems.

Furthermore, China is among the world's leaders in new-generation communication technologies.

After setting global standards in the expansion of fifth-generation networks, China is now moving forward with research and trials for sixth-generation systems. These technologies promise extremely fast communication speeds, stronger internet connectivity, and new possibilities in virtual reality, smart manufacturing and remote sensing. China continues to invest in satellite-based internet services, optical fiber networks and advanced communication equipment. These achievements enable the country to play an important role in building future global information infrastructure, and nations around the world are deepening cooperation with China to build reliable and affordable digital networks.

High-tech manufacturing is another area in which China is achieving robust growth. The country has become an important global hub for robotics, drones, electric vehicles, battery production, new materials, biotechnology and precision engineering. China's industrial transformation is supported by advanced equipment, skilled human capital and efficient supply chains. This new industrial system strengthens national competitiveness and enhances the country's ability to contribute to global markets. In addition, the progress in electric vehicles and battery technology is helping reshape the global transportation landscape, as Chinese innovation has made clean and smart vehicles more accessible to consumers across the developing world.

China's focus on green technology further strengthens its technological edge and global cooperative influence. The country is the world's largest producer of solar energy equipment, wind turbines and battery storage systems. It has built massive renewable energy bases, modern power grids and eco-friendly industries that reduce carbon emissions, and the country's approach demonstrates that technological advancement and environmental responsibility can progress together.

Through green innovation, China is offering solutions to global climate challenges and supporting the transition toward cleaner and more sustainable economies. This progress is of great significance for developing nations that need affordable and reliable green technology for long-term growth.

What's more, China also plays an essential role in sharing technological achievements and innovative experience with developing countries. Through cooperation projects in Asia, Africa and Latin America, Chinese companies provide modern technology, training and digital tools for nations' development. The affordable cost of Chinese equipment makes advanced technology accessible to countries that would otherwise struggle to adopt modern systems.

China's approach is based on partnership, respect and shared benefits. It helps build digital infrastructure, renewable energy capacity, industrial systems and modern knowledge-based economies. These contributions demonstrate the country's belief in global common progress and its willingness to support an inclusive technological ecosystem.

For Pakistan, China's growing strength in technology presents major opportunities.

The China-Pakistan Economic Corridor is not only about roads and energy projects. It is evolving into a powerful platform for digital transformation, AI cooperation, smart agriculture, advanced manufacturing and innovation-based industries. Pakistan can benefit from China's experience in financial technology, e-commerce, telecommunications, climate-smart agriculture, digital governance and high-tech manufacturing.

The next phase of the China-Pakistan Economic Corridor will provide opportunities for technology transfer, research partnerships, joint innovation centers and capacity building programs. With China's support, Pakistan can build a modern economy that is competitive, sustainable and deeply connected to global technological trends.

China's advancements in AI can be particularly valuable for Pakistan. Intelligent systems can support urban planning, financial regulation, healthcare delivery and agricultural management. Cooperation in robotics, digital education and high-tech manufacturing can generate employment and modernize industrial capacity. Furthermore, China's experience in digital governance and smart cities can help Pakistan improve public services and strengthen transparency. These areas of partnership show that China's technological rise is not only beneficial for its own future, but also contributes to the progress of friendly countries that share a vision for common development.

China's global technological impact extends beyond products and industries. It represents a broader philosophy of cooperation, peaceful development and shared prosperity. The country encourages other nations to work together in scientific research, environmental protection, digital trade and modern industrial systems. The idea of a community with a shared future for humanity guides China's approach to technology and development. It promotes unity, fairness and mutual respect in international relations, and this is a refreshing alternative to competition-based narratives that create divisions and hinder global progress.

The author is executive editor of Pakistan Economic Net and Daily Ittehad media group. The views do not necessarily reflect those of China Daily.

Festival: People don't come just for music

From page 1

Over the course of the summer, the Strawberry Music Festival will make stops in a number of Chinese cities, including Taiyuan in Shanxi province on May 23 and 24, Changsha in Hunan province on May 30 and 31, and Harbin in Heilongjiang province on June 13 and 14.

The Strawberry Music Festival is just one of several music events that define China's summer landscape. Across the country, festivals have developed distinct identities. The Youth Music Festival, held in Dezhou and Weifang, both in Shandong province, focuses on rock bands, attracting fans who mosh and trade stickers. The Northward Music Festival in Changchun, Jilin province, highlights hip-hop and rap, providing a platform for underground artists to reach new audiences.

For attendees, these festivals are about more than music. Market stalls sell band merchandise, pop-up art projects invite participation, and picnic blankets and sofas create informal social spaces.

Shen Yue, vice-president of Modern Sky, the company behind the Strawberry Music Festival, described the event as a cultural space for a new generation.

"People come not just for music, but to meet friends, experiment with fashion and express themselves," he said. "For many young people, festivals are a temporary escape — a place to feel free, to belong and to create."

China, US jointly cut off drug trafficking corridor

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Narcotics control authorities from China and the United States recently cracked a cross-border drug smuggling and trafficking case, arresting five suspects and cutting off a transnational drug route, China's Ministry of Public Security said on Monday.

Inside
Views, **page 7**

In early April, the ministry's Narcotics Control Bureau and the US Drug Enforcement Administration jointly handled the case, according to a statement issued by the ministry. Coordinated operations were carried out in Liaoning and Guangdong provinces in China, as well as the states of Florida and Nevada in the US. Five suspects — two Chinese nationals and three US nationals — were arrested.

The ministry said the operations successfully dismantled a drug smuggling and trafficking route covering China and the US. It added that the case marked another major result of practical cooperation between Chinese and US antidrug agencies, demonstrating the two countries' shared determination to control drug-related crimes.

The China-US antidrug cooperation has continued to advance in recent years through intelligence sharing, joint case handling, technical exchanges and tighter control of narcotics-related substances and chemicals.

On Jan 30, 2024, the two nations launched the China-US Counternarcotics Working Group in Beijing, identifying priority areas for cooperation. On July 31 the same year, a Chinese interdepartmental delegation visited the US for the first senior officials' meeting of the working group, helping to build mutual trust and advance practical cooperation. Since 2024, China's Narcotics Control Bureau has maintained routine hotline contact and regular exchanges with US antidrug agencies. The two sides have exchanged more than 100 intelligence leads.

Technical cooperation has also deepened. Since 2024, China and the US have held several meetings of antidrug technical experts and established a scientist exchange mechanism. Experts from Chinese and US agencies have shared drug-testing experience and discussed ways to strengthen technical support for addressing the fentanyl issue.

In February, cross-departmental antidrug delegations from the two countries held the 11th China-US antidrug intelligence exchange meeting in the US. They discussed issues including the global and regional drug situation, removal of online illicit information, joint case handling, chemical control, and anti-money laundering efforts related to drug crimes.

Joint case handling has produced concrete results. In February 2025, Chinese antidrug authorities and the China Coast Guard, acting on tips from the DEA, seized more than 4,900 kilograms of methamphetamine and arrested seven suspects in waters near Huangyan Island in the South China Sea.

China has also strengthened control of narcotics-related substances and precursor chemicals. In July 2024, the nation placed 46 new psychoactive substances under control, while in September that year, it added seven chemicals, including three fentanyl precursors, to its controlled precursor chemicals list.

In November 2025, China adjusted its export management catalog for precursor chemicals to specific countries and regions, adding the US, Mexico and Canada to the list and placing 13 additional precursor chemicals under export controls for those destinations.

SCARRED FOR LIFE

40 years on, Chernobyl still questions humanity on how to safely harness nuclear energy

Radioactive Contamination! No Entry!

The warning sign at the entrance to the Polesie State Radiation-Ecological Reserve in Belarus' southern Gomel Region, near the Ukrainian border, is impossible to miss.

Its bold lettering and stark trefoil radiation symbol seem to fix their gaze on every visitor, discouraging any attempt to proceed.

On April 26, 1986, Reactor No. 4 at the Chernobyl Nuclear Power Plant in the former Soviet republic of Ukraine exploded, releasing more than 8 metric tons of highly radioactive material. Over 60,000 square kilometers of land were contaminated, and more than 3.2 million people were affected to varying degrees. It remains the most severe nuclear disaster in the history of civilian nuclear energy.

Belarus, itself a former Soviet republic at the time, suffered the brunt of the nuclear fallout.

As the iron gates of the exclusion zone at the Polesie State Radiation-Ecological Reserve in Belarus creaked open, the vehicle moved slowly along a narrow village road, as if crossing a boundary between present and past.

The road was scarred by years of neglect. Fallen trees lay scattered through the forest, while nameless wildflowers bloomed quietly in the marshes. The hum of the tires felt intrusive, breaking the heavy, almost unnatural silence.

"This was a school — a place where visitors now come to take photos," said Alexey Kazakov, head of the reserve's information department. After the disaster, then-Soviet authorities evacuated all settlements within a 30-kilometer radius of the plant, including the village of Dronki, where the school once stood.

Inside the abandoned classrooms, shattered glass and crumbling plaster covered the floor. Yellowed textbooks lay open to lessons frozen in time, and dusty backpacks still waited for children who never returned. A faded slogan — "Long Live May Day!" — hung on the wall, a haunting reminder that the joy of the 1986 holiday was abruptly stolen by radiation. For residents in the contaminated zone, life was permanently divided into "before" and "after".

An abandoned classroom in the village of Dronki in the Polesie State Radiation-Ecological Reserve in Gomel Region, Belarus, on April 22. HENADZ ZHINKOV / XINHUA

As the vehicle moved deeper into the exclusion zone, the radiation monitor's reading climbed, and its beeping warning grew increasingly urgent.

"There is no completely safe place here; we are always exposed to some radiation," explained Maxim Kudin, deputy director of the reserve. However, because tourist areas are grass-covered and relatively dust-free, short visits carry limited risk.

Revisiting history

To this day, what lingers most deeply from this disaster are the people who came to help back then. Four years after the disaster, 600,000 people joined the dangerous cleanup.

Helicopters hovered above the exposed radioactive core, dropping sand and other materials to smother the fire. Workers washed radioactive dust from buildings and roads, buried poisoned machinery, cleared forests and hunted animals to slow the spread of radiation.

A group of the workers who live in Ukraine's Poltava region returned ahead of the 40th anniversary of the accident for a one-day trip to Chernobyl.

Volodymyr Vechirko, 62, was sent to Chernobyl in summer 1986 to clear away topsoil, clean buildings and make the other still-functioning reactors on the site safe. He has been ill for much of his life, which he attributes to working at the disaster site, including chronic dizziness, weakness and frequent pain.

Because of his poor health, he said, he lost touch with colleagues. "Being back here now, the emotions are overwhelming," he said. "It's incredibly sad to compare what this place was to what it is now."

Oleksii Harbuz, 72, a medical officer during that time, was close to the human costs of the disaster. Returning for the first time in decades, he recalled colleagues who have since died and the bonds formed among survivors.

"This 40th anniversary represents both a deep tragedy and a vital chance to reunite with my brothers-in-arms," he said. "So many of our colleagues have passed away over the years, but those of us remaining hold on."

Scientific research

Since 2018, about 5,000 people have visited the reserve. Scientists accompany visitors, helping them understand the radiation levels, risks, and the gradual recovery of the ecosystem.

Over four decades, Belarus has worked to mitigate the disaster's impact. By 2025, it had implemented multiple national programs, significantly reducing contamination; about half of the affected agricultural land had been restored.

Advances in research have also improved detection and monitoring of radioactive elements, with the reserve's laboratories ranked among the world's best in this regard.

Experimental economic activities — including horse breeding, forestry, and beekeeping — have been introduced into less-contaminated areas. Researchers study how radioactive elements transfer through ecosystems while ensuring strict safety controls. According to Kudin, it is possible to produce goods that meet national safety standards under controlled conditions. The goal is to develop models for safe economic use of affected land.

In the reserve, horses graze calmly, and apiaries produce several tons of honey each year, "just as sweet as anywhere else", a beekeeper noted.

From a fire watchtower, the distant outline of the Chernobyl plant is visible, its reactor encased beneath a gleaming arch. Around it, forests have returned to life.

Yet the scars of the disaster remain. Environmental healing could take centuries, and the question of how to harness nuclear energy safely continues to challenge humanity.

US dismisses 'unacceptable' Iran demands

Uncertainty persists, tensions deepen as Washington rejects Tehran's terms

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Washington has dismissed Tehran's response to its peace proposal as "totally unacceptable", likely complicating talks to end a war that has significantly ruptured the global economy and prompting a rethink on regional security.

"I don't like it — totally unacceptable," United States President Donald Trump said in a social media post on Sunday, without giving further details.

Iran's state broadcaster IRIB reported that the response included the necessity for the US to pay war damages to Iran, the recognition of Iran's sovereignty over the Strait of Hormuz, the lifting of US sanctions, and the release of Iran's blocked assets by the US.

While more details have yet to emerge from the US side, Iranian President Masoud Pezeshkian has outlined three of Iran's postwar strategic options, according to the Mehr News Agency.

Pezeshkian said Iran faces three distinct paths — entering negotiations with dignity and strength to claim Iranian rights; remaining in a state of neither war nor peace; or continuing on a path of conflict and confrontation.

He framed Iran's openness to diplomacy not as a concession but as a calculated posture, citing the words of Imam Ali in *Nahj al-Balaghah* — if an enemy calls for peace, one should not reject it, but equally should never become complacent, optimistic or trusting of that enemy after peace is established.

Nahj al-Balaghah is a collection of sermons, letters and sayings attributed to Ali ibn Abi Talib, the fourth Rashidun caliph and the first Shia imam.

"The rational and logical preference, grounded in national interest, is for the victory secured by the Armed Forces on the battlefield to be completed in the diplomatic arena, with the rights of the Iranian people established from a position of dignity and authority," Pezeshkian said.

On Monday, Iranian Foreign Ministry spokesman Esmaeil Baghaei defended Tehran's proposals as "reasonable and generous" and blamed the US for insisting on "unreasonable demands", Iran's Tasnim News Agency reported.

Baghaei told reporters that Iran uses both military and diplomatic tools as needed to secure its national interests, without seeking others' approval, adding that the country has participated in the diplomatic processes "with good faith and reason".

The US must prove its seriousness, he said, highlighting its record of breaking commitments. He cited the 2018 withdrawal from the nuclear deal and the US attacks over the past year, while negotiations were underway, Mehr reported.

"We fight whenever necessary and we use the weapon of diplomacy whenever we deem it right," Baghaei said.

War 'not over'

While the US and Iran iron out their differences in reaching a deal, Israeli Prime Minister Benjamin Netanyahu said the Iran war "is not over" in an interview with US media CBS aired on Sunday.

"It's not over, because there's still nuclear material — enriched uranium — that has to be taken out of Iran. There are still enrichment sites that have to be dismantled," he said.

When asked how the uranium could be removed, Netanyahu suggested, "You go in, and you take it out."

Meanwhile, Seoul condemned an attack on a South Korean cargo ship in the Strait of Hormuz, saying it plans to respond once the source of the attack is identified, Reuters reported.

Namu, the vessel operated by the shipper HMM, was not in violation of any rules in effect at the time in the waters off the United Arab Emirates, according to the report.

Beijing leads way in improving entry policies as visa-free travel burgeons

By **LIU JIANQIAO** and **GUO JIATONG**

China continues to expand its visa-free travel options, resulting in a growing number of foreign arrivals.

Immigration authorities across the country are rolling out ways to streamline the customs process and accommodate the increase in travelers, aiming to make a more convenient experience.

During the May Day holiday, border inspection authorities nationwide processed more than 11 million cross-border trips by Chinese and foreign nationals, averaging 2.26 million trips a day, up 3.5 percent year-on-year, according to the National Immigration Administration.

China currently grants unilateral visa-free entry to citizens of 50 countries, has mutual visa-free arrangements with 29 countries, and has expanded its 240-hour visa-free transit policy to travelers from 55 countries.

From May 1 to 5, Beijing's ports of entry recorded 111,000 inbound and outbound trips by foreign nationals, up 20.5 percent year-on-year, according to official data.

Among them, more than 37,000 people entered China under visa-free policies or the 240-hour temporary entry permit arrangement, accounting for 74.7 percent of all foreign arrivals during the period, a year-on-year increase of 50.2 percent.

In response, the Beijing General Station of Immigration Inspection has introduced a series of measures to ensure efficient and orderly entry.

"To actively cope with the surge in inbound and outbound passenger flows during the May Day holiday, we've continued to optimize our service measures to ensure smooth and efficient clearance for all travelers," said Zhao Kun, captain of a patrol unit at the station.

"By monitoring passenger flows at ports of entry in real time and dynamically adjusting inspection channels in response to traffic volumes, we ensure staff resources are allocated in line with passenger demand," she said.

"During peak hours, inspection channels are opened in advance and operated at full capacity to reduce passenger wait times."

Fast-track inspection channels operate around the clock and provide on-site registration services, enabling eligible travelers to complete clearance more efficiently, she said.

"We are also fully implementing facilitation measures, such as the 24-hour visa-free transit policy and online entry card processing for foreign nationals, while optimizing the one-stop processing system for temporary entry permits and immigration clearance procedures to further improve efficiency for travelers," she added.

Providing help

The station has also strengthened passenger guidance and traffic management outside inspection counters, while promptly assisting elderly passengers, children and other travelers in need.

"Multilingual service teams have been fully mobilized to provide on-site policy consultation services for international travelers, further enhancing the overall clearance experience," Zhao said.

Phuc Huynh Thien, a visitor from Vietnam, said the convenient policies provided "a perfect start to my trip to Beijing".

"The airport's multilingual services also offered clear policy guidance, making the customs clearance process even smoother," he said.

Popova, a Russian tourist who only provided her surname, was visiting China for the first time with her child. She said police officers helped them throughout the process, from arrival to customs clearance.

"I didn't expect everything to go so smoothly, and my child is very happy," she said. "This experience of clearance has made me even more excited about the rest of our trip in China."

International flights to Beijing's airports continue to grow since the start of the summer-autumn schedule.

Beijing Capital International Airport has gradually increased flight frequencies on more than a dozen European routes, including Brussels, Istanbul and Dublin, while further enhancing connectivity across Asia.

Meanwhile, Beijing Daxing International Airport plans to operate routes to 44 international and regional destinations, aiming to better meet the diverse demands of travelers.

An Australian athlete said he was in the country to compete in a diving event.

"I've been to China before under the visa-free policy, and the entry process was very smooth," he said. "Policies like this can attract more international visitors to China."

He added that he was particularly interested in experiencing Chinese culture. "The culture here is quite different from Australia's, and that's something I really enjoy because I like experiencing new things," he said.

PM Starmer vows to stay on after loss in local polls

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

United Kingdom Prime Minister Keir Starmer has vowed to stay in office and take action on "the big challenges facing the country" after his Labour Party suffered huge losses in last week's local elections, with voter unhappiness at his leadership being identified as a vital factor.

Local elections have no effect on the makeup of the national parliament, but the results, coming after nearly two years of Labour rule, are a clear expression of nationwide sentiment toward the central government.

Across England, hundreds of Labour councilors lost their seats. In elections for the Welsh Parliament, known as the Senedd, the party suffered its worst-ever results. In Scotland too, it performed poorly, prompting Scottish Labour leader Anas Sarwar to repeat his call, first made in February, for Starmer to step down.

In a speech to Labour members of parliament on Monday, Starmer acknowledged that he had "doubters" and "some people are frustrated with me ... I know I need to prove them wrong and I will".

The government would "face up to the big challenges" and "make the big arguments" to try and persuade voters that theirs was the best way forward, he said.

He also picked out the populist policies of the left-wing Green Party and right-wing Reform UK, which enjoyed significant success in the local elections, saying: "We're battling the despair on which they (play), despair that they exploit and amplify. And so analysis matters, argument matters, but so too does emotion ... people need hope."

One Labour member, Paula Barker, has said she will challenge Starmer unless he steps aside. She told *BBC Breakfast* that the UK "had stopped listening" to him and that he was "a very nice man but he's an awful politician".

"It's becoming increasingly clear that our Labour government can no longer succeed if we have Keir at the helm," she said.

Barker has never held a senior position, so her challenge would be symbolic rather than meaningful, but if she goes through with her threat, it will give Starmer's opponents an opportunity to make their position clear.

The person regarded as his most serious rival, Andy Burnham, who stood as a candidate to be Labour leader in 2015, is currently not a member of parliament, having quit Westminster in 2017 to seek election as mayor of Greater Manchester, a post in which he is serving his third term.

Pavilion bridges past, future at Venice event

VENICE, Italy — The China pavilion at the 61st International Art Exhibition of La Biennale di Venezia in Venice, Italy, is drawing crowds with a presentation that bridges the past and the future.

Since joining the Venice Biennale in 2003, the China pavilion has become an important platform for Chinese contemporary art to meet an international audience.

Themed "Dream Stream", the pavilion this year tries to deliver a sense of crossing time and space. The theme was named after *Dream Stream Essays*, an encyclopedia written by Shen Kuo in the Song Dynasty (960-1279).

The exhibition combines calligraphy, video, digital art, multimedia installations and a robot display to present Chinese tradition in new forms.

Artist Xu Jiang said Dream Stream includes elements from the treasure house of Chinese culture, which are presented through imagination.

One of the highlights was a robot that writes the Chinese characters of Dream Stream with a writing brush. Its mechanical arm guides the brush with rhythm across the paper, showing the force and beauty of Chinese calligraphy, with visitors gathering around to take pictures.

Italian visitor Vanna Rossetti said Chinese calligraphy moved her deeply, calling it "a beautiful form of communication".

Matteo Salvini, Italian deputy prime minister and minister of infrastructure and transport, said he admires Chinese culture and praised the exhibition as "wonderful", noting that it showed both China's historical culture and its vision for the future.

After receiving the robot-written calligraphy, he said he liked the fragrance of Chinese ink and would place it in his office.

Laura Fincato, former Italian deputy foreign minister, said the China pavilion reflects openness, dialogue and connection, as well as the creativity of the artists.

Art and culture remain important forces in building bridges when the world needs more communication and mutual understanding, she said.

Li Xiaoyong, charge d'affaires of the Chinese embassy in Italy, said China and Italy, both ancient civilizations, will continue to deepen exchanges in art, cultural heritage protection and other fields, strengthening people-to-people exchanges to develop bilateral ties.

A robot writes a character at the Chinese pavilion during the pre-opening of the 61st International Art Exhibition of La Biennale di Venezia in Venice, Italy, on Wednesday. MARCO BERTORELLO / AFP

The China pavilion's exhibition will run through November.

Head-of-state diplomacy can continue to chart stabilizing course for Sino-US ties

The upcoming visit by US President Donald Trump, scheduled from Wednesday to Friday, will be the first to China by a US president in nine years. Such top-level face-to-face exchanges are essential for the stable development of bilateral ties.

Over recent years, head-of-state diplomacy has played an irreplaceable role in guiding the development of China-US relations. The multiple telephone conversations between Chinese President Xi Jinping and Trump, and their meeting in Busan, the Republic of Korea, in October last year provided strategic direction for the management of differences and the expansion of cooperation.

Under the guidance of head-of-state diplomacy, the two sides have carried out six rounds of economic and trade consultations since May 2025 — in Geneva, London, Stockholm, Madrid, Kuala Lumpur and Paris — and are holding the seventh round in Seoul from Tuesday to Wednesday immediately ahead of the summit meeting.

The frequency of the trade discussions reflects both sides' recognition that coordination on economic and trade issues between the world's two largest economies remains among the most important stabilizing factors in bilateral relations. Since economic and trade frictions escalated last year, maintaining close communication has become essential to prevent the broader relationship from being damaged by negative spillover effects.

It is noteworthy that the United States imposed sanctions on three Chinese companies on Friday, accusing them of "assisting Iran". China firmly opposes such illegal unilateral sanctions that lack a basis in international law and it will protect the companies' legitimate rights, as Chinese Foreign Ministry spokesman Guo Jiakun said on Monday.

The top priority should be to make every effort to prevent the resumption of hostilities in the Middle East, rather than exploiting the conflict to smear or entangle other nations, Guo added.

China and the US have common interests in promoting early and proper resolutions of hotspot issues, which is in line with the world's expectations.

They also have common interests in making joint efforts to reduce trade and investment barriers to each other in some sectors, and exploring more stable and institutionalized frameworks for long-term cooperation.

Such endeavors could potentially pave the way for broader tariff suspensions, more confidence-building measures in some key fields and reciprocal reductions of restrictive policies, so as to help stabilize supply chains.

It should be borne in mind that pragmatic cooperation between China and the US has continued in other areas despite the existing differences between them. A joint counternarcotics operation carried out by related departments of the two sides in early April underscored the shared determination of both countries to combat drug-related crimes and safeguard public security through practical cooperation.

What matters is not that the two major countries have differences and their respective core concerns — that is only natural — but rather how they perceive and approach those differences, and how they show due concern to each other's core concerns. Among them, the Taiwan question is the most important and sensitive issue in China-US relations. The US should handle it with utmost prudence.

Stable China-US relations are not only in the interests of the two countries, but also vital to global peace, stability and development. The momentum with which the two sides maintain their exchanges and sustain their coordination on issues of common concern has sent a positive signal: dialogue and cooperation remain the mainstream aspiration on both sides of the Pacific.

As Guo said on Monday in reply to questions on Beijing's expectations for the upcoming visit by Trump, China stands ready to work with the US to expand cooperation and properly manage differences, based on the principles of equality, mutual respect and reciprocity.

Confrontation does not serve the interests of either side. Guided by a commitment to mutual respect, peaceful coexistence and win-win cooperation, China and the US can sustain their communication, expand the space for collaboration, and increase the areas where their interests converge.

Lai taking dead-end path at cost of Taiwan

The Democratic Progressive Party authorities of China's Taiwan region have been at the center of a heated debate over their proposed arms procurement bill. Initially seeking to allocate a staggering NT$1.25 trillion ($40 billion) for military spending, the DPP authorities' ambitions met with strong resistance from opposition parties and the public alike.

The passage on Friday of a revised bill, with the budget reduced to NT$780 billion, once again demonstrated that the "Taiwan independence" forces cannot ignore mainstream public opinion on the island.

Taiwan's taxpayers are still footing the bill for the gamble of the DPP's push for "Taiwan independence". There is growing anxiety within Taiwan society over the dire consequences of the DPP authorities' secessionist policies.

Lai Ching-te, the secessionist-minded head of the DPP authorities, has pledged to raise the island's security budget to 5 percent of GDP by 2030, describing the initiative as a "necessary investment" aimed at addressing "regional security challenges" and strengthening so-called "asymmetric warfare" capabilities.

Critics within Taiwan have rightly argued that Lai is attempting to justify his secessionist policies with lies falsely framing Taiwan as a "vulnerable" entity.

During a hearing of the Senate Committee on Armed Services last month, Admiral Samuel Paparo, head of the US "Indo-Pacific" Command, bluntly stated, "It's not a chicken and the egg, because you're not going to get chicken or eggs if you starve the chicken." He urged Taiwan to pass its stalled defense budget as soon as possible to avoid starving the US military-industrial complex.

The DPP's planned military spending is akin to paying "protection fees" to the US at the cost of the island's education, healthcare and social welfare.

The DPP authorities are also actively aligning with Japan, aiming to leverage its support for their secessionist cause. Lai has frequently made shameless shows of reverence for symbols of the Japanese colonial era, even going so far as to kneel in gratitude before a statue of a de facto Japanese occupier during a public ceremony over the weekend.

The Lai authorities intentionally downplay the impact of Japanese colonial rule — it is estimated over 600,000 people in Taiwan lost their lives in the struggle against Japan's colonial rule and in the broader effort to restore the Taiwan region to China from 1895 to 1945 — to sever the island from its cultural and historical roots.

Lai portrayed Japanese invaders and colonizers as "saviors", when in fact they were killers and robbers. He also characterized US arms dealers as "protectors", though they are nothing more than exploiters.

Such words and deeds are evidence of the deceptive nature of the DPP authorities, whose diehard secessionist stance means the political foundation for Taiwan to participate in the World Health Assembly does not exist, as the spokesman for the Foreign Ministry said on Monday.

To uphold the one-China principle and defend the seriousness and authority of the relevant United Nations General Assembly and World Health Assembly resolutions, the Chinese mainland has decided not to agree to Taiwan's participation in this year's WHA as an observer.

Notably, to advance the peaceful development of cross-Strait relations and enhance the kinship and well-being of compatriots across the Strait, the mainland has recently rolled out a package of 10 policies and measures — spanning infrastructure, travel, trade and culture.

The DPP authorities have been going to great lengths to smear the aforementioned policies and measures that serve the common interests of both sides of the Taiwan Strait. Their actions are a blatant attempt to call black white.

Taiwan's future lies not in relying on external forces, but in advancing peaceful development and deepening dialogue and cooperation across the Taiwan Strait. That represents the rational path forward and the shared aspiration of compatriots on both sides of the Strait.

Any attempt by "Taiwan independence" forces to seek separatist agendas through foreign support is doomed to failure.

Restitution law recognition that respect begins at home

France's decision last week to simplify the restitution of cultural artifacts acquired through illicit appropriation is an admission that history leaves debts that must be honored.

The French Parliament's overwhelming approval of the legislation — 343 votes in favor and none against in the Sénat, following unanimous passage in the Assemblée Nationale — shows the country's willingness to reconcile itself with its past.

The importance of this law lies not only in what it permits, but in what it dismantles. For generations, France's doctrine of the "inalienability" of public collections functioned almost as a secular catechism of the republic. Once an object entered the national collection, it became virtually untouchable, requiring painstaking parliamentary intervention for every single restitution. The Louvre, Quai Branly and countless provincial museums became guardians not merely of art, but of imperial memory itself.

Now, for the first time, France has established a legal framework enabling the return of cultural objects acquired through looting, coercion or colonial expropriation between 1815 and 1972.

Across the West, debates over colonial history have grown increasingly polarized. The United Kingdom continues its endless evasions over the Parthenon Marbles and the Benin Bronzes. It is not surprising that Chinese Foreign Ministry spokesman Lin Jian expressed China's appreciation that France has stepped up to its responsibility in returning lost artifacts to their countries of origin, regarding the issue as an opportunity for dialogue and "mutual learning between civilizations".

These remarks point toward something deeper. Cultural restitution is not merely about objects. It is about the right of nations to tell their own stories through the artifacts that embody their memory.

Few episodes symbolize this more vividly than the destruction of the Old Summer Palace in Beijing in 1860 by Anglo-French Alliance Forces during the Second Opium War (1856-60). The looting of that palace, which is called Yuanmingyuan Park today, remains one of the traumas in modern Chinese historical consciousness.

In 1861, French writer Victor Hugo wrote a letter to his friend Captain Butler, one of the leaders of the Anglo-French forces, describing the looting of the Old Summer Palace as a crime against civilization, damning it as the act of "two bandits" — "One plundered, the other burned".

"The day will come," he wrote, "when France, once freed and cleansed, will return this plunder to China."

Although the sentence now reads like prophecy, the step toward its realization took more than one and a half centuries. And France is not now emptying its museums. The law excludes military objects and certain archaeological materials, and restitution cases will still require extensive review. Nor does this legislation erase the asymmetry of centuries of colonial extraction.

But symbols matter in diplomacy. What France has recognized is that cultural diplomacy cannot survive on nostalgia alone. A museum is not morally neutral simply because it is beautiful.

This is why French Senator Catherine Morin-Desailly captured the significance of the legislation when she said the law "opens a path where memory is no longer confiscated but shared, where the wounds of history become the foundations of a renewed dialogue between nations".

France at least understands something that many of the Western colonial powers still struggle to accept: that status comes not from the trappings of display but from respect.

And respect cannot be earned by displaying heirlooms stolen from others.

— LI YANG, CHINA DAILY

What They Say

Social assistance upgraded to help more in need

Editor's note: *The country's new law on social assistance will come into effect on July 1. China.org.cn spoke to Yang Lixiong, a professor in the School of Labor and Human Resources at Renmin University of China, to gain insights into the new legislation. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Until now, social assistance in China was limited to those facing extreme hardship or qualifying for minimum living allowances. The new law expands coverage to include special hardship support for families close to qualifying for minimum living allowances and those facing difficulties in paying rigid expenditures, as well as other groups identified by local governments as needing assistance.

A significant change in the new law is the recognition of diverse assistance needs and the introduction of new forms of support. One notable development is the inclusion of service-based assistance, which will now include basic living necessities, essential nursing services, medical care and burial services.

In the past, social assistance mainly relied on the distribution of goods or cash payments. The new law recognizes service-based assistance as a legal right, significantly broadening the scope of social assistance. The challenge now lies in effectively providing such services, which will be a key issue in the development of the social assistance system.

The property ownership criteria have also been revised. In the past, many people with incomes at or below the minimum living standard were unable to qualify due to strict property rules. Some local governments have now lowered the asset threshold, allowing more people to receive assistance.

The methods for verifying income and assets have also become more diversified. Previously, social assistance staff members mainly relied on home visits and neighborhood inquiries, but such methods often proved inaccurate. In today's society, it is much harder to obtain reliable information through such traditional approaches. Therefore, verification methods have become more varied. Digital verification platforms not only reduce the workload for staff members but also improve the accuracy of the process.

At present, different forms of social assistance overlap, particularly because minimum living allowance status is tied to many other welfare benefits. The new legislation therefore stresses the importance of self-reliance among beneficiaries. However, without concrete supporting measures, which include broader welfare reform, achieving this goal will be difficult.

For now, the law mainly sets out broad principles and clarifies government responsibilities. The staff members can be held accountable if they fail to provide assistance to those who qualify or ensure basic support where needed. At the same time, they will also bear responsibility for incorrectly approving assistance.

However, the law remains relatively vague when it comes to the rights and obligations of aid recipients themselves, making implementation more challenging in practice. Defining a clear balance of rights, responsibilities and obligations for recipients will likely require further detailed rules.

The next step involves drafting implementation regulations, since the law itself sets out broad principles. Many provisions need clearer definitions. The immediate priority, therefore, is for the relevant departments to formulate detailed implementation rules for the law on social assistance.

Another priority is strengthening training at the grassroots level. The quality of frontline personnel determines the quality of social assistance work. Conditions and challenges vary widely across regions, and the capabilities of local staff members also differ considerably.

Partners needed in war against drugs

More than a century ago, China and the United States learned a critical lesson: drug trafficking is a global problem and no country, however powerful, could fight it on its own.

One of the earliest steps toward international cooperation came in 1909, when representatives from 13 countries gathered in Shanghai for the International Opium Commission.

It was the first time the international community collectively addressed the opium issue. The meeting adopted a set of resolutions aimed at restricting opium cultivation, limiting production and controlling distribution. In that effort, US advocacy and China's active participation became key drivers of the emerging international drug-control framework.

This momentum continued with the signing of the International Opium Convention in The Hague in 1912, which established international rules governing opium production and trade and called on countries to limit opium use strictly to medical and scientific purposes.

Both China and the US remained important contributors to subsequent international conventions aimed at regulating the manufacture and trade of narcotics.

After the founding of the People's Republic of China in 1949, the Chinese government launched a nationwide campaign against drug abuse and trafficking.

Within a few years, the widespread narcotics problem that had plagued the country was effectively eliminated. China has maintained a zero-tolerance policy toward drugs.

Modern China-US counternarcotics cooperation began following the normalization of bilateral relations in the 1970s. During the then US president Richard Nixon's visit to China in 1972, the two sides held their first discussions on drug control cooperation.

After diplomatic relations were established in 1979, practical collaboration soon followed, including exchanges on customs interdiction techniques and law-enforcement training.

In the following decades, bilateral cooperation deepened and counternarcotics efforts became one of the most constructive and stable pillars of China-US relations.

Yet the drug landscape has evolved. Between 2012 and 2024, new synthetic drugs and psychoactive substances spread rapidly and potent synthetic opioids, particularly fentanyl, moved to the center of global counternarcotics discussions.

In the US, opioid abuse escalated into a major public health crisis, placing immense pressure on medical systems and social governance. China and the US maintained close technical communication on drug trends, with regular exchanges on investigative leads, counternarcotics policies and emerging challenges.

In October 2017, the eighth China-US counternarcotics intelligence meeting discussed issues of mutual concern, including fentanyl and new psychoactive substances.

MA XUEJING / CHINA DAILY

At the G20 summit in Buenos Aires in 2018, Chinese President Xi Jinping and US President Donald Trump reached important consensus on strengthening law enforcement cooperation in drug control.

China then took a significant step. On May 1, 2019, it became the first country in the world to impose full control over fentanyl-related substances. According to the US International Narcotics Control Strategy Report of 2025, there have been no seizures of fentanyl-related substances directly entering the US from China since then.

The two countries also advanced collaboration in law enforcement. In 2017 alone, China's National Narcotics Control Commission shared more than 400 investigative leads related to fentanyl procurement and over 500 concerning US customers purchasing new psychoactive substances. Joint investigations helped crack several transnational drug cases.

Information exchange and case coordination became central to bilateral cooperation, making fentanyl governance a model of international counternarcotics cooperation.

However, cooperation was disrupted when the US imposed sanctions on China's National Narcotics Laboratory over what it described as "human rights issues" in the Xinjiang Uygur autonomous region.

In August 2022, after then US House Speaker Nancy Pelosi visited Taiwan, China-US counternarcotics cooperation was suspended.

As China-US ties stabilized in 2023, drug control was one of the first areas where dialogue resumed. Both sides agreed to establish a China-US counternarcotics working group, bringing cooperation back on track.

At its first meeting in Beijing in January 2024, the working group identified priority areas for cooperation. China subsequently placed 46 new psychoactive substances under control and strengthened oversight over seven chemicals used in fentanyl production.

However, new challenges emerged when the US imposed an additional 20 percent tariff on imports from China in early 2025, citing concerns over fentanyl precursor chemicals. The unilateral move disrupted not only global trade but also the fragile framework of anti-drug cooperation.

China responded with restraint while continuing to strengthen regulatory controls. In March 2025, it released a white paper outlining its policies and achievements in regulating fentanyl-related compounds. Gradually, cooperation regained momentum.

During the China-US economic and trade consultations held in Malaysia in October 2025, the two sides reached an important consensus on fentanyl governance.

High-level engagement soon followed. After the two presidents met in the Republic of Korea, the US lifted the additional "fentanyl tariffs", while China tightened controls over exports of specific precursor chemicals to the US, Mexico and Canada.

In November 2025, FBI Director Kash Patel visited China to discuss drug control cooperation.

It was the first time in over a decade that an FBI director had visited the country, marking the restoration of key communication channels. Shortly afterward, cross-agency teams from both countries held online consultations to coordinate future efforts to address the fentanyl challenge.

The resumption of cooperation demonstrates the resilience of China-US counternarcotics collaboration.

Looking back over more than a century of interaction — from the Shanghai International Opium Commission to today's fentanyl challenge — China-US counternarcotics cooperation has evolved from early diplomatic dialogue into a practical law enforcement partnership.

The lesson is clear: Unilateral pressure cannot stop the flow of drugs or dismantle transnational production and distribution networks.

The China-US experience demonstrates that cooperation, rather than confrontation, is the most effective way forward.

Going ahead, China-US counternarcotics cooperation will continue to face complex conditions. But as long as both sides remain committed to mutual respect, equality and the shared goal of protecting human well-being, cooperation can withstand uncertainties and sustain positive momentum in global governance.

Working together toward a drug-free, healthier and more peaceful world, the two countries can open a new chapter in international counternarcotics cooperation.

China-US engagement conducive to global stability

Global Lens

At a time of mounting geopolitical uncertainty and economic fragmentation, renewed high-level engagement between China and the United States remains essential for global stability. As the world's two largest economies and most consequential technological giants, their relationship continues to shape the trajectory of the international system.

Even amid strategic competition, pragmatic cooperation between Beijing and Washington is not only possible but necessary.

A comparison between US President Donald Trump's visit to China in 2017 and the upcoming visit in 2026 illustrates how profoundly the structural foundations of the bilateral relationship have changed — and why engagement today carries different but significant possibilities.

First, renewed China—US engagement can contribute to global stability by reestablishing channels of high-level dialogue and reducing the risks associated with unmanaged strategic competition.

In a world marked by regional conflicts, supply-chain disruptions, and energy volatility, ongoing communication between major countries is a critical stabilizing mechanism.

Recent diplomatic contacts between US and Chinese officials ahead of Trump's visit have focused on trade disputes, agricultural exports and strategic materials such as rare earths, signaling that both sides recognize the value of dialogue in preventing further escalation.

Such engagement has implications beyond the bilateral relationship.

When China and the US communicate effectively, they help anchor the global economy and mitigate the risk of geopolitical shocks cascading into systemic crises.

Cooperation on issues such as energy security, climate governance, and financial stability is essential because the two nations have considerable influence over international institutions. Even limited progress in bilateral relations can generate positive spillover effects for the global system.

Second, despite persistent tensions, there are opportunities for cooperation in trade, science and technology and education.

Trade and investment ties between the two countries remain deep and resilient, reflecting decades of integration.

Even during periods of heightened friction — including the tariff escalation of recent years — both governments have continued negotiating arrangements designed to stabilize economic relations.

In 2025, for example, the two sides agreed to a temporary trade truce that reduced tariffs and export restrictions while encouraging increased Chinese purchases of agricultural products from the US.

This shows that both countries have an incentive to pursue cooperation in areas where interests converge. There are three main benefits of this approach.

The first is trade stabilization. Businesses on both sides want predictability rather than further tensions.

Maintaining tariff ceilings, reducing non-tariff barriers, and reopening suspended economic dialogue mechanisms could gradually rebuild confidence.

The second is supply-chain resilience. The pandemic and geopolitical tensions have exposed vulnerabilities in global production networks.

Rather than pursuing complete decoupling that is costly and disruptive, Washington and Beijing could work toward "smart openness" by continuing cooperation in key sectors while diversifying risk.

The third is cooperation in global economic governance. From energy markets to financial stability, the world economy requires coordination among major powers.

The current volatility in oil supply and shipping routes underscores how disruptions in one region quickly affect the entire global system.

In this context, even limited coordination between China and the US can stabilize markets and reassure investors.

Yet the nature of engagement today differs fundamentally from that of a decade ago. Trump visited China in 2017 when economic interdependence defined the core of China-US relations.

Although concerns about trade imbalances and technology competition were emerging, the relationship remained largely cooperative.

The visit in 2017 featured extensive ceremonial diplomacy, including meetings in Beijing and cultural events at the Forbidden City, reflecting an atmosphere that emphasized partnership and economic opportunity.

The context of the upcoming 2026 visit is far more complex. The bilateral relationship has seen a shift toward more pronounced strategic competition, set against a backdrop that has always included both integration and tensions.

At the same time, the continuing dialogue shows that competition has not eliminated the need for cooperation.

Unlike the Cold War rivalry between the US and the former Soviet Union, the China-US relationship is deeply embedded in the global economy.

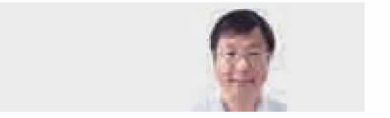
Trade flows, financial interdependence, and scientific collaboration continue to link the two countries in ways that make complete disengagement impractical.

The difference between Trump's first visit and his upcoming second visit is expected to reflect a broader transformation: from engagement driven primarily by economic globalization to engagement aimed at managing strategic competition.

In 2017, the goal was to expand economic ties and resolve trade disputes within a framework of partnership.

Now, the objective is more modest but also more urgent — preventing rivalry from spiraling into confrontation while preserving areas of mutually beneficial cooperation.

This evolution does not imply that the bilateral relationship is declining. Rather, it suggests that China and the US must adapt their diplomatic approach to a new reality.



Engagement today not only involves building trust through direct negotiation and consultation, but also includes establishing guardrails that prevent competition from destabilizing the international system.

In this sense, a renewed China-US engagement is indispensable. The world's two largest economies may compete in technology, security and influence, but they also share the responsibility to ensure global stability.

By sustaining dialogue, pursuing pragmatic economic cooperation, and acknowledging the structural changes that have reshaped their relationship, Beijing and Washington can keep competition within bounds and ensure that the international system continues to function in ways conducive to enhanced global peace and prosperity.

The lesson from the past decade is clear: even in an era of sustained competition, engagement is not a concession but a strategic necessity.

No-waste cities will turn trash into treasure

The city of Shenzhen has reportedly started mining a landfill long believed to be the largest in China. Since 1983, the landfill served as Shenzhen's primary dumping place.

By the time it stopped operations in 2005, it had accumulated some 2.55 million cubic meters of trash that rose to a 110-meter-high hill. That towering pile of rubbish is located barely a kilometer away from a high-speed train station now under construction.

According to the new plan, about 6,000 cubic meters of trash will be excavated from the landfill daily. The reusable stuff will be recycled while the remainder will be sent to a power plant as fuel.

In a few years, the trash hill will get removed, and the venue will be turned into a science and technology zone focused on artificial intelligence and the digital economy. I look forward to witnessing how Cinderella turns into Snow White.

The Shenzhen project is part of China's efforts to develop no-waste cities, a program that aims to significantly decrease solid waste in urban centers. When the program kicked off in 2019, 16 cities and regions, including Shenzhen, were chosen as pilot zones.

Public awareness campaigns were rolled out, urging people to prioritize environmental protection. Waste classification drives were conducted, free plastic bags were restricted and excessive packaging was curbed. At the same time, a central government-owned company was established to strengthen the recycling sector.

The efforts proved fruitful, and within three years, the pilot program was expanded to 121 cities and regions. Today, nearly 200 urban centers are part of the program and plans are to cover the entire country by the end of 2035.

The Shenzhen project is part of China's efforts to develop no-waste cities, a program that aims to significantly decrease solid waste in urban centers.

Since China embarked on its reform and opening-up nearly 50 years ago, the authorities have followed a trial-first approach to solving major issues in the country. With a population of over 1.4 billion and great disparity in development levels and cultural backgrounds, sweeping programs cannot be rolled out at one go.

The same is true for the manner in which the no-waste city program is being implemented.

Turning waste into a national resource is not an easy task, especially because the project requires full cooperation from the public.

It needs people to change their waste disposal habits, which may affect the interests of different social and economic groups.

When waste classification was introduced about 10 years ago, we were told to classify household waste into four categories — recyclable, hazardous, kitchen waste and others — and throw them into four different bins. Initially, compliance was high.

But after some time, when we realized that nobody was supervising our garbage disposal and when we saw neighbors breaking the rules without getting punished, we lazybones followed suit. There are four trash bins at the exit of our apartment building though we have long given up the classification at home.

That, however, does not mean the waste goes without being classified.

The garbage collector in our compound meticulously searches all the bins to ensure that plastic bottles, packaging boxes, clothes and metallic items are set aside for sale before he takes the remaining waste to the community collection station on his electric tricycle.

With recyclable materials collected from a dozen or so trash bins in our complex for over a decade, the garbage collector has not only raised his family in Beijing but also supported his son's higher education.

To the middle-aged collector, the trash bins are a small but steady source of income. And he allows no interference from outsiders in his livelihood. I once saw him confront an outsider who attempted to "mine" the bins without his permission.

Most of the waste coming out of China's households is now classified not by families but by the waste collectors.

This is very different from the original design of the classification campaign, though the end result is acceptable if all reusable items are sent for recycling and lead to a decrease in solid waste.

We still have a long way to go to realize the dream of no-waste cities. On the way, we may even go astray sometimes. But now that we are aiming in the right direction, I firmly believe we will eventually get there. Trust me.

GLOBAL VIEWS

EHIZUELEN MICHAEL MITCHELL OMORUYI

Practical enabler

In a world where trade is increasingly politicized, China's zero-tariff approach offers an alternative vision — one based on openness, partnership and shared development

WANG XIAOYING / CHINA DAILY

At a time when protectionism, geopolitical fragmentation and industrial rivalries are impacting the global economy, China's decision to grant zero-tariff treatment to the 53 African countries with which it maintains diplomatic relations stands out as both strategic and consequential. It is more than a trade adjustment — it is a clear signal about the future direction of South-South economic cooperation. China's approach signals a move away from traditional North-South hierarchies toward more horizontal, partnership-based models of cooperation that emphasize mutual benefit, market access and shared growth.

Global trade is under growing strain. The World Trade Organization reports continued uncertainty in trade policies into 2026, alongside uneven and fragile growth. Against this backdrop, China's move to eliminate tariffs on exports from the 53 African countries it has diplomatic ties with offers a clear alternative: It reaffirms that openness — rather than fragmentation — remains significant to sustainable growth.

Recent WTO monitoring trends indicate new tariffs and other import measures increased more than fourfold from mid-October 2024 to mid-October 2025 compared to the prior 12-month period, marking the highest coverage in over 15 years of WTO trade monitoring. China's zero-tariff policy therefore can function as a stabilizing countermeasure, preserving export opportunities for African economies in an increasingly restrictive global trade environment.

This policy reinforces China's role as a leading practitioner of South-South cooperation, shifting the emphasis from assistance to market-driven opportunity. It aligns with broader development goals while giving African economies direct access to one of the world's largest consumer markets.

The scale of China-Africa engagement underscores the importance of this initiative. According to China's General Administration of Customs, bilateral trade between Africa and China exceeded $348 billion in 2025, with continued expansion into 2026 driven by commodity exports and manufacturing linkages. Africa is deepening its integration into global value chains, with China acting as a central partner. Removing tariffs strengthens this trajectory by lowering costs, improving competitiveness and encouraging export growth. Moreover, China's increasing share of African exports in some key sectors means that the tariff removal not only boosts trade volumes but also reduces price volatility risks for exporters, enabling more predictable planning and investment decisions.

For African economies, the implications are immediate. In agriculture, duty-free access enhances the competitiveness of products such as cocoa, coffee, sesame, tea and fresh produce. China's middle-income group — now numbering more than 400 million — continues to drive demand for high-quality imports, creating opportunities for African exporters. The expansion of agricultural exports, including products such as Kenyan avocados, shows how improved market access can generate tangible gains.

At the same time, a core challenge persists across the "farm to market" system: Many African farmers produce more than ever but capture limited value because they remain confined to fragmented local markets, dependent on intermediaries and disconnected from global pricing and demand. By eliminating tariffs, China's policy can help transform this dynamic into a "farm to global market" system, creating stronger demand signals, improving price competitiveness and encouraging investment in logistics, processing and digital trade platforms that connect producers directly to international buyers. This shift is particularly significant for smallholder farmers, who constitute the majority of Africa's agricultural workforce.

In the minerals sector, the impact is even more strategic. Africa holds significant reserves of lithium, copper and rare earth elements — resources essential for the green transition and advanced manufacturing sectors. Zero tariffs improve price competitiveness and can attract further investment in extraction and processing in Africa. However, long-term benefits will depend on whether some African countries can move beyond raw material exports to value-added production, which underscores the importance of industrial policy coordination.

Manufacturing also stands to gain. Light industries such as textiles, garments and leather goods can leverage tariff-free access to enter the Chinese market, supporting job creation. Those African countries investing in industrial parks and export-oriented production are particularly well positioned to benefit. Emerging sectors, including processed foods, pharmaceuticals and consumer goods, offer additional opportunities for diversification. Historical experience from export-led economies suggests that preferential market access can serve as a catalyst for industrial take-off when combined with supportive policies such as skills development, infrastructure investment and access to finance.

Beyond sectoral gains, the policy has broader developmental implications. By facilitating trade, it supports industrialization, employment and income growth. It also complements existing cooperation frameworks, including infrastructure investment and industrial partnerships, creating a more integrated model linking trade, investment and capacity-building. This reflects a broader shift toward development ecosystems, where trade policy, infrastructure, finance and technology interact to produce cumulative economic effects rather than isolated gains.

Yet a deeper challenge remains: coordination across fragmented markets. In some African economies, increased production and trade integration have not translated into proportional gains in income or value capture. This is because producers, exporters, logistics providers, financiers and regulators operate in poorly aligned systems marked by information gaps and weak linkages. As a result, companies struggle to scale production, meet standards and move up value chains.

In this context, China's zero-tariff policy goes beyond conventional trade liberalization. By guaranteeing large-scale market access, it reduces uncertainty, anchors demand and creates stronger incentives for coordination. Lower tariffs make it possible for companies to invest more in logistics, quality upgrading and market integration, aligning incentives across supply chains. When combined with digital tools — such as e-commerce platforms, digital payments and logistics tracking systems — this can help overcome coordination failures and connect fragmented markets. Digital coordination infrastructure further enhances this process by enabling real-time communication, improving transaction efficiency and increasing transparency across supply chains.

To fully benefit, however, African countries must address structural constraints. Logistics inefficiencies, high transport costs and non-tariff barriers — including certification requirements and customs procedures — continue to restrict trade potential.

Maximizing the benefits of zero tariffs will therefore require complementary policies. African countries must invest in productive capacity, strengthen their regulatory systems and deepen regional integration through initiatives such as the African Continental Free Trade Area. Upgrading value chains and improving export quality will also be essential to translate market access into sustained growth.

Therefore, China's zero-tariff policy should be seen not as an endpoint, but as an enabling framework. It opens the door to deeper economic engagement and practical regional cooperation.

MA HANZHI

African quick step

China's zero-tariff initiative exemplifies its sustained support for developing countries both in multilateral trading system and industrial development

WU PING / FOR CHINA DAILY

Starting May 1, China extended zero-tariff treatment to the 53 African countries that have diplomatic relations with China. Concurrently, it will advance the negotiation and signing of China-Africa Economic Partnership for Shared Development and upgrade green lanes to further expand the access of African agricultural exports to the Chinese market.

According to an announcement by the Customs Tariff Commission of the State Council, from May 1, 2026 to April 30, 2028, China will apply zero-tariff treatment to in-quota goods imported from 20 African countries that have established diplomatic ties with China and are not classified as the least developed countries, provided they comply with the rules of origin and hold the required certificate of origin.

For the 33 least developed African countries that have diplomatic ties with China, the Chinese government has extended zero-tariff treatment to 100 percent of their tariff lines, effective Dec 1, 2024. This makes China the first major economy in the world to grant unilateral, full-coverage zero-tariff treatment to all African countries that have diplomatic relations with it, and to all least developed countries that have diplomatic ties with it. This initiative is key to upgrading China-Africa trade and economic cooperation.

First, the zero-tariff treatment meets Africa's strong desire to expand exports to China. For too long, some African goods have faced unstable export channels and relatively high market access barriers, making it difficult to reach markets consistently. China's zero-tariff policy can help smooth these channels and share the opportunities of the Chinese market with the continent. This move can also help enhance the competitiveness of local African products and create profits for businesses on both sides.

In the short term, zero-tariff treatment will notably help African agricultural, mining and light industrial products enter the market more easily. Countries with production advantages in agriculture, such as Kenya, South Africa and Cote d'Ivoire, are particularly well-positioned to benefit directly.

For example, China and Kenya have signed the Early Harvest Arrangement of the Agreement on Economic Partnership for Shared Development. Under this arrangement, Kenyan tea, coffee and avocados entered the Chinese market duty-free and quota-free starting May 1. Similarly, under the early harvest arrangement between China and the Republic of the Congo, 100 percent of tariff lines were zero-rated for Congolese goods, allowing agricultural specialties such as tuckahoe, peanuts and cocoa beans to enter the market more quickly, while the Republic of the Congo will also further open its market to Chinese goods.

As the largest developing member of the World Trade Organization, China has long actively supported the integration of developing countries into the multilateral trading system. The zero-tariff initiative is undoubtedly the latest example of this effort.

Second, the zero-tariff initiative opens new doors for Africa to better harness its critical mineral wealth. Against the backdrop of the global green energy transition, Africa's rich deposits of cobalt, platinum group metals, and other key minerals have made it a vital hub for resource supply. Yet, due to limited processing capacity, fragmented industrial chains and poor infrastructure, some African nations remain trapped in the "resource curse" — exporting raw materials with low value addition while struggling to achieve economic transformation.

The zero-tariff policy can inject new dynamic into the upgrading of African mineral resources. Previously, Chinese companies preferred to import raw ores from Africa, as processed mineral products faced high tariff barriers, making local processing economically unappealing. Now, under the zero-tariff framework, processed African minerals — such as refined metals and precursors — can enter China duty-free, provided they meet the rules of origin. The requirement of "regional value content of not less than 40 percent" is achievable, since local ores, African-origin materials, and even Chinese-origin inputs exported to Africa all count toward the threshold.

This differential cost makes deep processing in Africa more profitable than simply exporting raw ores, thereby incentivizing Chinese companies to shift from "buying ores" to "investing in processing chains" — building complete mineral supply chains in Africa, from exploration and extraction to processing, along with integrated upstream and downstream industrial parks. This transformation not only enhances Africa's local processing capacity but also helps turn its resource advantages into genuine development strengths.

Third, this preferential access paves the way for a closer shared China-Africa market. Zero tariffs mark only the beginning of deeper pragmatic cooperation. The ultimate goal is to move both sides toward a free trade-oriented partnership. So far, China has signed new framework agreements on economic partnership for shared development with 34 African countries, creating long-term, stable and predictable institutional safeguards for deepening China-Africa trade and investment.

As the benefits of zero tariffs fully materialize, each side will come to better recognize the value of the other's market. That growing recognition will, in turn, accelerate the implementation of existing framework agreements, pave the way toward bilateral free trade agreements and eventually lead to a free trade area between China and African countries.

Against the backdrop of building a China-Africa shared market, cooperation on production capacity between the two sides is poised for unprecedented major opportunities. China has the world's most complete industry chains, while Africa is home to the largest number of developing countries. They are highly complementary in their industry and supply chains.

Zero-tariff policies and institutional arrangements will work in tandem, helping Chinese enterprises go deeper into the African market.

From a market access perspective, zero tariffs will lower the export costs of products made by Chinese-invested factories in Africa. Locally processed goods that meet rules of origin can enter the Chinese market duty-free, improving the expected profitability and economic viability of value-added processing investments in Africa.

From an investment security standpoint, signing agreements on economic partnership for shared development gives Chinese companies stronger legal protections when investing in or building factories across Africa. This reduces risk and creates a stable, predictable environment for long-term operations. Together, these two forces will help the continent build its own manufacturing base. The result is a collaborative model — Chinese technology plus African resources, localized production — that raises Africa's position in the global industry chains.

The deep integration of Chinese capital and technology with African resources will give rise to more "Made in Africa" goods. This will not only meet Africa's own development needs, but also keep such goods flowing into the Chinese market, helping the continent attract investments from China and other countries, move toward a new height in global manufacturing and establish itself as the next world production hub. In this sense, one important role of zero tariffs is to build confidence in the deep integration of the two large markets of China and Africa for a shared future in multilateral trade.

BUSINESS

Qwen-Taobao integration to boost 618 shopping

By **CHENG YU**
chengyu@chinadaily.com.cn

Chinese tech company Alibaba Group said on Monday it has fully integrated its artificial intelligence chatbot Qwen with its super e-commerce platform Taobao, allowing users to search for products, compare items and complete purchases through natural language conversations.

The move marks a major step from Chinese tech firms toward turning AI chatbots into full-scale shopping gateways and intensifying the global race in AI commercialization, especially when there are only a few days ahead of China's annual 618 shopping festival.

Under the new move, users can open the Qwen app and ask the AI assistant to recommend products, compare prices and place orders directly on Taobao. Within the Taobao app itself, users can also access Qwen, offering functions such as AI-powered virtual try-ons, discount calculations and automatic low-price deal hunting.

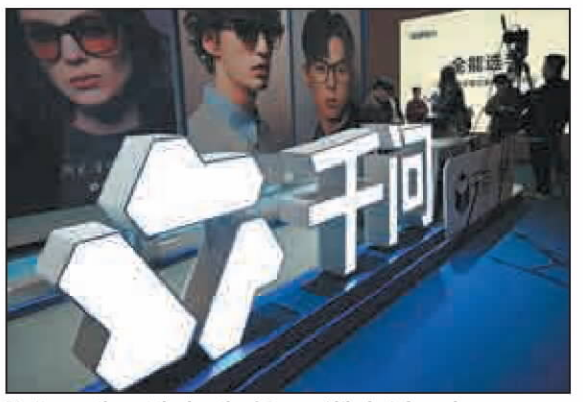
In a trial, China Daily found that the Qwen app was able to handle multi-turn conversations and refine recommendations based on evolving user preferences, signaling how AI systems are moving beyond chat interfaces into tools capable of executing real commercial transactions and services.

In March, ByteDance began testing the integration of its Doubao AI chatbot with Douyin e-commerce, enabling users to complete purchases and payments directly inside the Doubao app without jumping to the short-video platform.

The timing is significant. China's annual 618 shopping festival, one of the country's largest online retail events, is about to begin, with both Alibaba and ByteDance positioning AI as the front door to online shopping.

According to QuestMobile data for the first quarter, ByteDance's Doubao had 345 million monthly active users, compared with 166 million for Qwen. The gap has increased pressure on Alibaba to secure a foothold in AI-driven shopping by tightly integrating Qwen with Taobao's vast product ecosystem, helping prevent users from drifting toward rival AI platforms.

The integration also marks a broader restructuring inside Alibaba aimed at accelerating AI commercialization. In March, the company established the Alibaba token hub business group to unify AI model development, platform services and consumer applications under a more coordinated strategy.



Alibaba has been laying the groundwork for AI commerce for months. During this year's Spring Festival holiday, it launched a heavily promoted campaign offering billions of yuan in subsidies, allowing users to order items such as milk tea through AI voice commands for as little as 1 fen (0.15 cent).

According to the 2026 Government Work Report delivered at this year's two sessions, China will "advance and expand the AI Plus Initiative", and for the first time, the country will "create new forms of smart economy".

The country will also promote faster application of new-generation intelligent terminals and AI agents and encourage large-scale commercial application of AI in key sectors and fields, so as to foster new forms and models of AI-native business, the report said.

Lu Ming, an economist and a member of the 14th National Committee of the Chinese People's Political Consultative Conference, said AI-powered products and services are lowering the cost of making purchasing decisions by simplifying interactions between users and digital platforms in China.

"AI is breaking the traditional boundaries of consumer groups and geographic regions. It is evolving from a chat tool into an assistant that can actually complete tasks," Lu said. "To some extent, AI is also driving consumption by expanding user groups."

Visitors gather at the booth of Qwen, Alibaba's large language model, during a high-tech expo in Shanghai on March 12.

An aerial image shows Piraeus Port in Greece. The port's annual throughput has exceeded 5.6 million TEUs so far, ranking 25th globally. XINHUA

Piraeus Port rises on back of stronger ties

Efforts from major SOE bear fruit as Greek trade terminal reverses losses

By **REN QI**
renqi@chinadaily.com.cn

> "These 10 years mark the decade in which the port of Piraeus moved from a corner of the Mediterranean to a global hub."
>
> **Han Chao,** chairman of Piraeus Port Authority

Since China COSCO Shipping Corp officially took over its operations a decade ago, Piraeus Port in Greece has transformed from an aging facility into a highly coordinated global hub, achieving remarkable growth in capacity, revenue and technological advancement.

In 2016, the annual container throughput of the port was approximately 680,000 TEUs (twenty-foot equivalent units), ranking 93rd globally with outdated facilities and limited capacity. Today, it has become one of the busiest ports in the Mediterranean, with annual throughput exceeding 5.6 million TEUs, ranking as high as 25th globally.

Over the past decade, the transformation of the port's "hard power" has been the most intuitive. Terminals have been continuously extended, deep-water channels dredged, automated equipment gradually put into use, and bridge cranes and yard systems constantly upgraded. The once scattered and inefficient operational scenes have gradually transformed into a highly coordinated modern operating system.

Piraeus Port has now become the fourth-largest container port, the second-largest cruise homeport, and the largest ferry port in Europe, as well as an important roll-on/roll-off automobile hub and ship repair center in the Eastern Mediterranean.

"These 10 years mark the decade in which the port of Piraeus moved from a corner of the Mediterranean to a global hub," said Han Chao, chairman of the port operator Piraeus Port Authority SA.

In recent years, the port's revenue and profit have continued to grow, reversing a long-term trend of losses. COSCO Shipping has invested over 10 billion yuan ($1.47 billion) locally, creating thousands of direct jobs and generating tens of thousands of indirect employment opportunities.

"It has changed not only the port itself, but also the relationship between the city and its people," said Yannis Moralis, mayor of Piraeus.

According to the recently released financial report of Piraeus Port Authority, the company's total revenue in 2025 reached approximately 251 million euros ($295.5 million), a year-on-year increase of 8.6 percent; operating profit stood at 132 million euros, up 2.2 percent year-on-year.

Savvas Sanozidis, secretary of the board of directors of Piraeus Port Authority, said the transmission and integration of COSCO Shipping's corporate values have effectively strengthened supervision over management, promoting transparency, prudence and a high sense of responsibility in all aspects of work, providing a strong guarantee for the company's long-term sustainable development.

Stefanos Gkikas, deputy minister of maritime affairs and insular policy of Greece, stated that the fruitful cooperation between COSCO Shipping and Piraeus Port Authority over the past decade has significantly enhanced the port's competitiveness and further consolidated Greece's position in the international shipping sector.

The development path of the port is also quietly transforming. Stepping into the office building of the container terminal, one can see large screens displaying vessel dynamics, operational progress, and equipment status in real time.

According to Han, the port has built a digital monitoring platform covering the entire port area and introduced 5G and artificial intelligence technologies, driving the production organization method to evolve from "manual planning" to "intelligent coordination".

Looking ahead to the next decade, the development blueprint for Piraeus Port is clearly defined.

"The future port will be smarter and greener," Han added.

According to Han, the construction of the COSCO Shipping Piraeus Port park project was officially launched in April. Once completed, it will become a modern center integrating sports, leisure, and social activities.

Saint Laurent restarts sales in Hangzhou

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Luxury fashion brand Saint Laurent has resumed normal sales to an area in Hangzhou, Zhejiang province, previously reported as "blacklisted" amid concerns over high return rates and livestreaming-driven consumption patterns.

Tests conducted by The Paper on the brand's official Tmall flagship store on Monday showed that addresses in the Yingfeng Street area of Xiaoshan district, which had previously been denied service, could once again place orders.

A report on Sunday by The Paper found that 20 addresses in Yingfeng were rejected for sale by Saint Laurent, while changing the shipping address to other Hangzhou districts allowed orders to go through.

Yingfeng subdistrict, dubbed the "Manhattan of Hangzhou", was established in mid-2020 and spans 23.1 square kilometers. It hosts a dense cluster of cultural media companies and livestreaming e-commerce agencies. The area has become a focal point of the fast-growing livestreaming economy in the e-commerce capital.

Earlier reports highlighted that some merchants, facing behaviors such as "wear and return" by livestreaming consumers, had implemented self-protective measures including regional blacklisting.

The story quickly attracted widespread attention. The controversy over Saint Laurent has now drawn attention to other luxury brands. The Paper also found that Miu Miu, the Italian label under the Prada Group, also limits sales of some items on its Tmall flagship store to at least three Hangzhou subdistricts.

Some merchants defend such measures as risk management, citing high return rates and disputes. Yingfeng's permanent population exceeds 220,000, with roughly 15,000 registered enterprises and a youth demographic of around 70 percent, far above local averages — factors that may contribute to elevated return activity. Courier staff told The Paper that the concentration of livestreaming businesses in Yingfeng may explain the region's high return incidence.

Industry experts stress the fine line between business autonomy and consumer rights.

Cheng Weixiong, a fashion analyst and founder of Shanghai Liangqi Brand Management Co Ltd, said from the merchant's perspective, facing repeated instances of malicious and abnormal returns from the region, blacklisting is indeed a last resort.

However, Cheng noted that from the consumer's standpoint, implementing a blanket ban that punishes everyone for the actions of a few is fundamentally unfair.

Cheng said: "Of course, platforms cannot simply wash their hands of the matter.

"They must promptly halt such regional blacklisting while implementing precise risk controls. The goal should be to prevent a minority from acting badly, ensuring that everyone else does not have to foot the bill."

A clothing goods seller, Cathy Huang said that blacklisting entire subdistricts was often their self-protective measure after individuals kept breaking restrictions via alternative accounts. "As a seller, I can only avoid risks this way," she said.

Some e-commerce operators described frequent returns of worn items, sometimes bearing perfume or makeup. "Some consumers treat returns as a free way to showcase clothes in livestreams, leaving merchants to clean items for resale," Huang said.

Brazil's visa waiver to enhance bilateral partnership

By **LI JING**
lijing2009@chinadaily.com.cn

> Brazil is the most distinctive destination in South America for Chinese tourists, and its cultural attractions such as football and Carnival have long appealed to Chinese visitors."
>
> **Xu Ning,** general manager of the Australia, Americas and Africa division at Beijing-based travel agency UTour

Brazil's decision to grant short-term visa-free entry to Chinese citizens is expected to do more than stimulate tourism demand. Analysts say the move lowers barriers for business travel and will help deepen trade and investment ties between the two major developing economies.

The Brazilian government announced on Thursday that holders of ordinary Chinese passports would be allowed to enter the country visa-free for stays of up to 30 days starting Monday. The policy will remain in effect through Dec 31.

Following the announcement, Chinese online travel platforms reported an immediate rise in interest in Brazil. Data show searches for Brazil-related destinations climbing sharply within hours, with cities such as Sao Paulo, Rio de Janeiro and Salvador among the most searched by Chinese travelers.

"Brazil has become one of the fastest-growing long-haul destinations for Chinese travelers in recent years," said Yang Han, a researcher at Chinese travel platform Qunar's big data research institute.

During the just-concluded May Day holiday, Brazil ranked among the top 10 outbound destinations for Chinese tourists, with flight bookings from China to Brazil rising 95 percent year-on-year, Yang said.

Travel agencies expect the visa waiver to further boost demand, particularly during the upcoming summer travel season and the Mid-Autumn Festival and National Day holiday period later this year.

"Brazil is the most distinctive destination in South America for Chinese tourists, and its cultural attractions such as football and Carnival have long appealed to Chinese visitors," said Xu Ning, general manager of the Australia, Americas and Africa division at Beijing-based travel agency UTour.

Because Brazil often serves as a gateway to the region, Xu added that easier entry could also encourage multi-country trips across South America, including itineraries covering countries such as Argentina, Chile and Peru.

Beyond tourism, analysts say the visa waiver could reduce frictions in commercial exchanges between China and Brazil, where face-to-face visits remain important for negotiations, site inspections and investment discussions.

"Visa-free travel will facilitate the entire commercial process — from market research and negotiations to factory inspections and post-investment personnel mobility," said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, during an earlier interview with China Daily.

The policy comes as economic ties between the two countries continue to deepen. Data from the Brazilian Ministry of Development, Industry, Trade and Services show bilateral trade volume reached $171 billion in 2025, an increase of 8.2 percent year-on-year. The figures cement China's status as Brazil's largest trading partner for 17 consecutive years.

Brazilian businesses are also viewing the policy as a practical step toward smoother commercial engagement.

"Local companies, especially in tourism, trade, services and real estate, see the policy change as positive, as it reduces administrative barriers and facilitates short-term travel from China," said Gabriela Lima, a labor partner at Brazilian law firm TozziniFreire.

Businesses that rely on international mobility see the measure as enabling exploratory visits, negotiations and client engagement, she said.

Lima added that easier travel could increase the frequency of site visits and early-stage investment discussions, helping companies move projects forward more quickly.

Analysts say sectors where China and Brazil have strong economic complementarities may benefit most from easier travel.

China has advantages in manufacturing, equipment supply and infrastructure construction, while Brazil is a global powerhouse in agricultural exports such as soybeans, beef and iron ore.

As companies seek new partnerships, sectors including infrastructure, energy, agribusiness and technology may see more dynamic engagement, Lima said.

Beyond goods trade, analysts say easier mobility may also support growth in service-sector cooperation, such as finance and education, areas where bilateral exchanges remain relatively limited.

Despite the expected boost to exchanges, analysts caution that visa facilitation alone will not remove deeper structural barriers affecting bilateral commerce.

Under the policy, visa-free entry is limited to stays of up to 30 days and does not permit work activities.

"In practice, more regulated sectors are likely to remain attentive to the limits of the measure, particularly the restriction on work activities under visitor status," Lima said.

The temporary nature of the policy could also limit long-term planning for some firms, requiring companies to monitor whether the arrangement will be extended beyond the end of 2026.

"Visa facilitation is not a cure-all," Zhou said. "But it is a clear signal — and an important step toward stronger bilateral cooperation."

Real estate shows signs of rebound

Sector's strengthening being driven by second-hand home sales in key cities

By JIANG XUEQING
jiangxueqing@chinadaily.com.cn

China's real estate market is navigating a pivotal transition toward more sustainable growth, with early signs of stabilization emerging as policy support gains traction and market confidence gradually strengthens.

While the sector's adjustment has weighed on home sales and mortgage demand, the moderation in lending reflects a broader shift toward improved asset quality and more prudent risk management.

Against this backdrop, annual reports from listed banks show that by the end of 2025, the combined outstanding balance of residential mortgages at China's six largest State-owned commercial lenders stood at about 24.48 trillion yuan ($3.6 trillion), down 711.52 billion yuan from the end of 2024, a year-on-year decline of 2.82 percent.

Among them, the outstanding balance of residential mortgages at Industrial and Commercial Bank of China fell by 207.31 billion yuan to 5.88 trillion yuan; China Construction Bank declined by 196.53 billion yuan to 5.99 trillion yuan; Agricultural Bank of China dropped by 168.24 billion yuan to 4.82 trillion yuan; Bank of China declined by 106.48 billion yuan to 3.98 trillion yuan; Bank of Communications fell by 24.15 billion yuan to 1.44 trillion yuan; and Postal Savings Bank of China decreased by 8.81 billion yuan to 2.37 trillion yuan.

These six major banks are the backbone of China's mortgage lending market. According to the People's Bank of China, the country's central bank, the outstanding balance of residential mortgages across financial institutions stood at 37.01 trillion yuan at the end of the fourth quarter of 2025, down 1.8 percent year-on-year, with a full-year decrease of 676.8 billion yuan.

All six banks reported negative growth in mortgage balances last year, though to varying degrees. The smallest decline was at PSBC (0.37 percent), followed by BOCOM (1.65 percent) and BOC (2.6 percent), while larger declines were seen at ICBC (3.41 percent), ABC (3.38 percent) and CCB (3.18 percent).

Xue Hongyan, a special researcher at Jiangsu Su Merchants Bank, said the decline in mortgage balances is a natural result of the real estate cycle adjustment, reflecting both weak demand for new mortgages and the runoff of existing loans.

Wang Pengbo, chief analyst at market consultancy Botong Analysys, echoed this view, noting that the decline was driven by a combination of early mortgage repayments by households and subdued homebuying demand last year.

Affected by macroeconomic conditions and the downturn in the property sector, nonperforming mortgage loan ratios have generally risen across the banking industry. By the end of 2025, among the six largest State-owned commercial lenders, only BOC saw its nonperforming mortgage loan ratio edge down by 0.01 percentage point to 0.6 percent, while the other five recorded increases. ICBC's ratio rose by 0.33 percentage point to 1.06 percent, and BOCOM's ratio increased by 0.43 percentage point to 1.01 percent.

Wang Jingwu, senior executive vice-president of ICBC, said that amid economic restructuring, property market adjustment and temporary imbalances between supply and demand, the bank's nonperforming residential mortgage loan ratio has entered a short-term upward trend, which is broadly in line with the banking industrywide trend.

However, he emphasized that China's economic fundamentals remain solid, with strong resilience and significant potential, and that the long-term positive outlook remains unchanged. Risks in personal lending are therefore manageable. He added that ICBC is closely monitoring real estate market trends and implementing national policies aimed at establishing a new development model for the property sector, promoting better housing and stabilizing the market.

Wu Jian, executive vice-president of BOC, said that despite increasing external uncertainties, the underlying conditions supporting China's long-term growth remain intact. BOC will strengthen forward-looking risk assessment, firmly guard against systemic risks, further optimize its credit structure, and enhance risk management in areas such as real estate, local government debt and structural imbalances in key industries.

Zhang Hui, president of BOC, said the bank supported efforts to stabilize the property market last year by issuing more than 500 billion yuan in residential mortgages. This year, it is steadily expanding both mortgage lending and non-housing consumer loans, promoting coordinated development across products, customer segments and consumption scenarios to build a comprehensive consumer ecosystem.

From late 2025 to early 2026, the real estate market exhibited new characteristics: on the one hand, the reduction in interest rates for existing mortgages and housing provident fund loans has pushed the cost of home purchases to a new low; on the other hand, further targeted, effective and sustainable policy support is still needed to bolster market confidence, said Li Yong, an analyst at Soochow Securities.

Zhou Wanfu, executive vice-president of BOCOM, noted that while the real estate market experienced a brief upswing in the first quarter of last year, with mortgage loans growing year-on-year, it remained in a period of deep adjustment in the first quarter of this year, and BOCOM saw mortgage repayments exceed new disbursements, resulting in negative growth. However, he also pointed out that the volume of mortgage applications at the bank has risen significantly since March, up around 15 percent compared with both the first two quarters and the latter half of last year.

Zhou believes this signals a stabilization in the property market. If the trend continues, mortgage lending could gradually return to positive growth this year, helping drive retail loan growth toward target levels.

Supported by a series of ongoing policy measures, China's real estate market showed a trend of steady improvement in the first quarter. Transaction volumes for existing homes in some major cities have rebounded significantly since March.

On March 22, the number of contracts signed at second-hand home agencies in Shenzhen, Guangdong province, hit a five-year high for a single day. On April 11, Shanghai's daily online transaction volume for second-hand homes also reached a five-year high. Some institutions view this as a positive signal that the real estate market is likely to bottom out by the end of 2026.

Data from real estate information provider CRIC show that the transaction area for second-hand homes in 20 major cities nationwide reached about 17.97 million square meters in March, up 117 percent month-on-month and 6 percent year-on-year. In April, the transaction area for second-hand homes in the 20 key cities was approximately 17.93 million sq m, up 17 percent year-on-year. The cumulative transaction area for the first four months in these cities was approximately 59.18 million sq m, an increase of 8 percent year-on-year.

Analysts said this is not merely a short-term rebound from an oversold market, but rather a sign that market confidence is steadily strengthening as mortgage rates are gradually lowered and home purchase policies are gradually relaxed. Furthermore, this trend is likely to continue into the second quarter.

Nation's 'Big Six' banks upgrading consumer credit business

By JIANG XUEQING

Guided by policies aimed at expanding domestic demand and stimulating consumption, the personal credit business of China's six largest State-owned commercial banks has undergone notable structural changes.

Personal consumer loans and personal business loans at several banks have achieved double-digit growth, becoming key drivers of overall personal lending expansion, while personal mortgage loans and credit card businesses have contracted to varying degrees.

By the end of 2025, the outstanding balance of personal consumer loans at China's "Big Six" lenders totaled approximately 3.34 trillion yuan ($491.3 billion), an increase of 569.71 billion yuan from the previous year-end, up 20.56 percent year-on-year. Outstanding personal business loans reached 9.36 trillion yuan, increasing by 1.26 trillion yuan from the previous year-end, up 15.63 percent year-on-year.

This trend broadly aligns with the People's Bank of China's statistical report on the credit structure of financial institutions. By the end of the fourth quarter of 2025, outstanding household loans in renminbi and foreign currencies totaled 83.28 trillion yuan. Specifically, outstanding operating loans grew by 4 percent year-on-year to 25.11 trillion yuan, recording an increase of 937.8 billion yuan. Outstanding consumer loans excluding personal housing loans totaled 21.16 trillion yuan, up 0.7 percent year-on-year, marking an increase of 180.2 billion yuan.

In contrast, outstanding RMB property loans fell to 51.95 trillion yuan by the end of the fourth quarter, down 1.6 percent year-on-year. Among them, outstanding personal housing loans totaled 37.01 trillion yuan, down 1.8 percent year-on-year, with a full-year decline of 676.8 billion yuan.

Yang Haiping, a nonresident research fellow with the Beijing Wealth Management Industry Association, said that despite continued policy support for the property market and signs of recovery in housing sales, the share of residential mortgages in banks' asset allocation is still likely to trend downward.

By the end of 2025, the outstanding balances of personal consumer loans and personal business loans at the "Big Six" banks had both recorded strong year-on-year growth. In personal consumer lending, with the exception of Postal Savings Bank of China, the other five largest banks all achieved double-digit growth. China Construction Bank posted the fastest growth rate at 29.41 percent, followed by Bank of China and Agricultural Bank of China at 28.35 percent and 26.95 percent, respectively.

In personal business lending, four of the "Big Six" banks achieved double-digit growth. CCB again recorded the fastest growth rate at 28.77 percent, followed by ABC and Industrial and Commercial Bank of China at 19.92 percent and 15.03 percent, respectively.

Notably, the growth rates of personal consumer loans and personal business loans at the six largest State-owned commercial lenders were significantly higher than the average growth rate for financial institutions disclosed by PBOC, China's central bank.

Dong Ximiao, chief economist at Merchants Union Consumer Finance, said that large banks, backed by extensive branch networks and strong brand recognition, are able to attract deposits at relatively low costs. This gives them a competitive advantage in offering consumer and business loans at interest rates that small and medium-sized banks struggle to match.

A staff member at the personal loan center of a China Construction Bank branch in Hai'an, Jiangsu province, processes a personal mortgage loan for clients on May 17, 2024. XU JINGBAI / FOR CHINA DAILY

Since 2024, large banks have seen a marked acceleration in personal consumer lending growth, while some small and medium-sized banks have experienced sharp declines in consumer and business lending due to factors such as new regulations on loan facilitation. This reflects the growing divergence in the retail credit structure across China's banking sector, Dong said.

In terms of asset quality, the nonperforming loan ratios for personal consumer loans among the "Big Six" banks showed mixed trends last year. By the end of 2025, CCB's nonperforming personal consumer loan ratio had fallen from 1.09 percent at the end of 2024 to 1.07 percent, while ABC's ratio had declined from 1.55 percent to 1.46 percent, indicating improved asset quality. Meanwhile, the nonperforming personal consumer loan ratios at Bank of Communications, ICBC, BOC and PSBC all increased. BOCOM recorded the largest increase, rising 0.65 percentage point to 1.77 percent.

During the same period, except for CCB, whose nonperforming personal business loan ratio edged down from 1.59 percent to 1.58 percent, the other five large State-owned commercial lenders all reported increases in their nonperforming personal business loan ratios. BOCOM saw the sharpest rise, climbing 0.73 percentage point to 1.94 percent.

Li Jianjiang, executive vice-president and chief risk officer of CCB, said that in response to rising risks in the retail banking sector in recent years, CCB has significantly optimized its retail credit risk management mechanisms, strengthened risk controls at key stages of the lending process and advanced centralized retail risk management practices. These measures began to show results in 2025, with the pace of increase in nonperforming personal loans narrowing year-on-year.

Li added that risk prevention and control in the retail segment will remain one of the bank's key priorities going forward. As various control measures are further implemented and refined, the bank's asset quality is expected to remain generally stable.

Wang Jingwu, senior executive vice-president and chief risk officer of ICBC, said that with the implementation of policies such as trade-in programs for consumer goods and interest subsidies for personal consumer loans — along with the accelerated rollout of broader policy support measures — the market foundation for personal lending is expected to gradually improve, and the asset quality of personal loans should return to more reasonable levels.

Wang said ICBC has adjusted its internal organizational structure and functions by establishing a dedicated personal credit business department, promoting greater centralization and specialization in personal lending operations. The bank has also strengthened digital and intelligent risk management tools, expanded product innovation and supply in consumer and business lending, actively resolved hidden risks and intensified efforts in the disposal of nonperforming assets.

Through coordinated efforts, the deterioration trend in the bank's personal loans has already begun to slow, he said.

Leading national joint-stock commercial lenders are also stepping up risk management for consumer loans. China Merchants Bank, known for its strong retail banking business, reported a nonperforming loan ratio of 1.22 percent for its small and micro business loans as of the end of 2025, up 0.43 percentage point from the previous year-end. In its 2025 annual report, the bank stated that it will closely monitor market developments, improve its ability to assess risk trends, continuously enrich risk monitoring data dimensions, and iteratively upgrade quantitative risk control models to enable early identification, early warning and early resolution of risks in high-risk businesses.

At the same time, CMB has actively responded to consumption-boosting policies and adopted multiple measures to support consumer spending, resulting in steady growth in its consumer lending business with risks remaining generally manageable.

By the end of last year, the bank's consumer credit business, including credit card loans and consumer loans, had outstanding nonperforming loans totaling 20.72 billion yuan, an increase of 46 million yuan from the previous year-end. However, the NPL ratio declined by 0.02 percentage point to 1.52 percent.

Xu Mingjie, executive vice-president of CMB, said risks in retail lending are still on the rise in 2026, and the asset quality of credit card loans continues to face certain pressures.

CMB emphasized in the report that it will continue to improve its refined risk management strategy for the consumer credit business. The bank will maintain differentiated customer selection standards before loan issuance, focusing on quality customers with stable long-term incomes while continuously expanding data sources and rapidly upgrading risk assessment strategies. It will also strengthen post-loan monitoring, enrich monitoring dimensions, upgrade its models to improve the accuracy of risk identification and closely track changes in customer risk profiles through big data-driven quantitative risk control technologies.

Military official emphasizes innovation, self-reliance

By **JIANG CHENGLONG**
jiangchenglong@chinadaily.com.cn

A senior official at one of China's top military universities has called for stronger efforts in emerging and frontier technologies to secure breakthroughs in core technologies and "fundamentally reverse dependence on others".

Zhang Zhan, political commissar of the National University of Defense Technology, made the remarks in an article published on Wednesday in Study Times, a newspaper administered by the Party School of the Central Committee of the Communist Party of China.

He said China should integrate high-quality innovation resources and strengths to achieve that goal, noting that the country is facing a severe and complex innovation environment and security situation in high-tech fields.

Zhang said China's 15th Five-Year Plan (2026-30) outlines the need to accelerate the building of strategic capabilities in emerging fields and promote the efficient integration and mutual reinforcement of new quality productive forces and new quality combat capabilities.

He said this is a major step to "address complex security threats and secure national strategic advantages", and an important guarantee for achieving the centenary goal of the People's Liberation Army on schedule.

A new round of technological and military revolutions is accelerating worldwide, Zhang said, noting that emerging technologies such as quantum information and bio-interdisciplinary technologies are making breakthroughs in multiple areas, driving the reorganization of global resources, the reshaping of economic structures and changes in the military landscape.

"We must firmly seize the opportunity, build on the momentum, coordinate and allocate resources from all sides, and advance deployment and development in emerging fields," he said.

The senior official called for the vigorous development of new industries, forms of business, models and capabilities in frontier and emerging fields such as artificial intelligence, quantum information, aerospace science and technology, and deep-earth and deep-sea exploration, in order to continuously strengthen the country's economic and defense capabilities.

Zhang also highlighted the importance of supplying high-end talent, calling for integrated development of education, science and technology, and talent cultivation in emerging fields.

He suggested optimizing disciplines and talent training models in line with scientific and technological innovation, industrial development and national strategic needs in emerging fields.

China should accelerate the development of basic, emerging and interdisciplinary disciplines in key areas such as integrated circuits, AI, new energy and new materials, he said.

He also encouraged enterprises to increase investment in basic research in emerging fields and improve their participation and influence in major scientific and technological innovation decision-making for the country and the military.

Separately, the Chinese navy has recently commissioned several types of new warplanes that can be integrated into the combat system of aircraft carrier groups, drawing widespread attention on Chinese social media.

The aircraft include stealth carrier-based fighter jets, multipurpose catapult-launched carrier-based fighter jets, fixed-wing carrier-based early warning aircraft, fixed-wing electronic warfare aircraft and anti-submarine helicopters.

Defense Ministry spokesman Jiang Bin said at an online news briefing on Saturday that the new aircraft are an important part of building systematic combat capabilities for aircraft carrier groups and a major achievement in the Chinese navy's accelerated transformation.

Since entering the new era, the modernization of the Chinese navy has advanced steadily and rapidly, he said.

From the air to underwater, and from near seas to far seas, various weapons platforms have continued to improve in type and function, providing stronger support for safeguarding national sovereignty, security and development interests, Jiang said.

"Whether in escort missions in the Gulf of Aden, international humanitarian rescue, or the hospital ships' Mission Harmony operations, practice has proved that a strong Chinese navy is always an anchor of peace and a bridge of cooperation for the world," he said.

China is ready to work with the navies of other countries to make new and greater contributions to maritime security and world peace, Jiang added.

Taiji gravitational wave program makes breakthrough

A Chinese research team has announced a key breakthrough in the space-based gravitational wave detection program named Taiji, according to the Chinese Academy of Sciences' Institute of Mechanics.

The team designed a full-function interferometer optical bench for the Taiji program, constructed a first-generation Taiji interferometer OB and ground test system, and conducted preliminary testing and calibration.

The research program Taiji aims to study gravitational waves from the merging of binary black holes and other celestial bodies, according to the institute.

The full-function interferometer OB can effectively mitigate interference from temperature fluctuations in the measurement. Boasting picometer-level measurement accuracy, it can detect tiny variations equivalent to one ten-thousandth of the diameter of a human hair, the research team said.

Also, tests show that the equipment's noise level has been greatly reduced and its measurement stability has been enhanced tenfold, with key indicators fully meeting the requirements for the Taiji-2 mission, according to the research.

The relevant findings were recently published in the international academic journal Research, providing technical support for China's future space-based gravitational-wave detection.

CAS set out a three-step strategy to implement the Taiji program. Taiji-1, China's first satellite in the program, was launched in August 2019 and has been performing well in orbit, according to the institute.

Experts mull over AI role in education

Digital conference participants agree tech cannot replace human qualities

By **ZOU SHUO** in Hangzhou
zoushuo@chinadaily.com.cn

Leading officials and experts gathered in Hangzhou on Monday for the 2026 World Digital Education Conference to discuss how artificial intelligence is reshaping learning, while emphasizing that it cannot replace human qualities such as moral judgment, creativity and social interaction.

Themed "AI+ Education: Transformation, Development and Governance", the two-day event aims to build an open and inclusive global dialogue platform and promote consensus on AI governance in education.

In his opening address, Vice-President Han Zheng said China has implemented a national strategy on digital education, accelerating the transformation of education through digital technologies and sharing high-quality digital education resources with learners around the world. China is also working with all parties to build a fairer, more inclusive and more sustainable global digital education ecosystem, he said.

Han noted that the integration of digital technologies such as AI with education represents both a major opportunity for global education development and a common challenge for all countries.

China stands ready to work with all sides to explore the vision and governance approaches for digital education, improve rules and standards and jointly promote the transformation and innovation of digital education, he said.

Han made four suggestions: first, a people-centered approach that stays true to the essence of education; second, inclusive and equitable access that ensures education is accessible to all; third, AI for good with safe and orderly development, ensuring AI truly serves learners' holistic growth; and fourth, open collaboration to promote mutual learning among civilizations.

The United Kingdom's Parliamentary Under-Secretary of State Olivia Bailey said the UK government is determined to ensure AI safety supports teachers. "AI and tech must also earn the trust of parents," she said.

Minister of Education Huai Jinpeng said AI can help students acquire knowledge, master skills and broaden thinking, but it cannot replace the ability to tell right from wrong, address conflicts or shoulder responsibilities. Nor can it replace physical exercise, labor practice or social interaction, he added. "The more AI evolves, the more precious human-specific qualities become," he said.

Huai also posed a fundamental question: when machines may surpass humans in learning and memory, and knowledge shifts from scarcity to abundance, where does human wisdom originate? "Knowledge matters, but cultivating wisdom and innovation matters more. Knowledge can be copied, but thinking cannot; answers can be generated, but creativity cannot," he said.

John Michael Kosterlitz, a Nobel laureate in physics and professor at Brown University and Soochow University, gave an example of his granddaughter using ChatGPT to solve geometry problems. "AI can present several ways of thinking about the same problem — it's very powerful," he said. However, he expressed concerns about plagiarism and assessment, noting that with AI, a student's homework may be partly or entirely written by a machine, making detection difficult. "If AI changes learning, we must also reconsider assessment," he added.

Kosterlitz noted that AI is becoming part of the discovery process itself, as seen in recent Nobel prizes in physics and chemistry. This prompts a larger question: "If machines become better at calculation, explanation and discovery, what should we learn to do best? My answer is this — we must become more responsible in judgment, ethics, imagination and purpose."

Meteorologists warn of hotter, wetter summer ahead

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China is expected to experience higher-than-average temperatures during the upcoming flood season, with a precipitation pattern characterized by flooding in the north and drought in the south — trends that warrant attention but not excessive concern against the backdrop of global warming, meteorologists said.

According to the National Climate Center, temperatures across large parts of the country will be higher than normal from June to August, with highs exceeding 35 C, especially in southern China and the Xinjiang Uygur autonomous region.

Floods and droughts are expected across different regions during this period. Areas such as Hebei, Liaoning, Jilin, Heilongjiang, Zhejiang, Fujian, Guangdong and Hainan provinces, as well as Beijing and Tianjin, are predicted to receive 20 to 50 percent more precipitation than usual, with the potential for extreme heavy rainfall and flood disasters. Meanwhile, periodic drought conditions may affect Hubei and Hunan provinces, as well as Chongqing and Xinjiang.

Responding to recent online assertions that 2026 will see "the hottest summer with persistent extreme heat across large areas", Chen Lijuan, a senior forecaster at the National Climate Center, said such claims are exaggerated and that subjective expressions like "collapsing heat" have unnecessarily fueled public anxiety.

Chen said above-average temperatures do not indicate an uncontrollable situation, as heat waves are limited in both space and time. Some areas in northern China, for instance, are expected to experience high-temperature days in early summer, while southern China will see notable heat and drought in midsummer. During those periods, there may still be occasional cooling spells or rainfall events.

This aligns with recent weather forecasts, which suggest a periodic heat wave.

Cities in the provinces of Shandong, Henan, Shanxi, Shaanxi and Hebei are expected to experience maximum temperatures above 35 C between May 9 and 13. If the forecast proves accurate, the high temperatures will arrive more than 10 days earlier than average. However, a cold spell is expected to interrupt the heat later this week.

El Nino factor

Zheng Fei, a researcher at the Institute of Atmospheric Physics of the Chinese Academy of Sciences, said high temperatures and precipitation patterns expected over the next three months are part of the broader trend of global warming.

"While this is expected, it still requires attention, as the global average surface temperature increased around 0.6 C over the past century, with a 0.24 C rise in 2023 alone," he said.

Zheng said the potential development of El Nino conditions could be a major factor influencing climate patterns from June to August.

El Nino — a climate phenomenon marked by unusually warm sea surface temperatures in the central and eastern tropical Pacific — is highly likely to emerge this month, contributing to rising global average temperatures. It is expected to bring a slightly stronger-than-normal East Asian summer monsoon and a more intense western Pacific subtropical high extending farther west and north, resulting in increased moisture transport from the ocean and pushing the rain belt farther north.

"The El Nino event is expected to intensify during summer and autumn, reach moderate-to-strong intensity, peak this winter and then weaken the following spring. However, the probability of it developing into a super El Nino — comparable to the extreme events of 1997 or 2015 — is only about 10 percent," Zheng said.

"It is currently predicted that the global mean surface temperature in 2026 will be between 1.43 C and 1.52 C above preindustrial levels, and it is highly likely to exceed 2025 levels, ranking among the top three warmest years since 1850," he said.

Notably, El Nino typically affects regions around the tropical Pacific first, with its thermal effects taking several months to reach Asia. Therefore, "the global mean surface temperature is predicted to reach a record high in 2027, making it the warmest year on record," Zheng said.

Cheng Lijing, a researcher at the Institute of Atmospheric Physics, also warned of more frequent and extreme weather disasters associated with El Nino, as substantial heat accumulated in the eastern tropical Pacific is released through evaporation and atmospheric circulation during such events.

"Weather disasters in recent years have been characterized by high intensity and short duration, so the possibility of destructive severe convective weather, like the heavy rainstorm in Beijing in 2025, cannot be ruled out," Cheng said.

Although such weather events remain extremely difficult to predict, the monitoring network is being continuously improved with artificial intelligence-driven technology, enabling more accurate forecasts, earlier warnings and better preparedness, he said.

"Therefore, the public need not be overly concerned," he added.

Shennongjia's monkeys make golden return

Caretakers help in bringing secretive subspecies back from the brink

By LI MENGHAN
in Shennongjia, Hubei
limenghan@chinadaily.com.cn

Clockwise from top: A child interacts with a golden snub-nosed monkey at Dalongtan Golden Snub-nosed Monkey Research Base in Shennongjia, Hubei province, in September 2024. WANG CHUNYANG / FOR CHINA DAILY Researchers record monkeys' behavior at Shennongjia National Nature Reserve. LI SHUHANG / FOR CHINA DAILY A researcher observes monkeys at the Dalongtan base in May 2024. LIU KANG / FOR CHINA DAILY

Attracted by the caretaker's closed fist, a 65-centimeter-tall golden snub-nosed monkey swings gracefully through the branches of Shennongjia in Central China's Hubei province.

When the fist reveals nothing, the monkey — a 25-kilogram male named Beike (meaning "conch") — taps the caretaker and tugs at his sleeve. He eventually finds two peanuts in the other hand, swiftly seizing and cracking the rare treat.

"This monkey recently won a battle to become the new head of his family," said Yang Jingyuan, director of the scientific research institute at the Shennongjia National Nature Reserve. He looks on as dozens of monkeys dart through the canopy, grooming one another and occasionally tussling in the dappled sunlight.

After four decades of conservation, the Shennongjia golden snub-nosed monkey, the rarest subspecies of the golden snub-nosed monkey, has bounced back from near invisibility.

Its population has tripled to 1,618 individuals across 11 groups, roaming a habitat of 401 square kilometers — a resurgence made possible by policy support, scientific management and technological empowerment.

The comeback

With a life span of around 20 to 25 years, the golden snub-nosed monkey is classified as a first-class State-protected wildlife species.

In 1978, the belief that golden snub-nosed monkeys did not inhabit Hubei due to the region's climate and geographical conditions was challenged when a group of Chinese scientists unexpectedly collected two specimens in Shennongjia.

In 1980, Professor Liu Minzhuang from East China Normal University in Shanghai confirmed the presence of golden snub-nosed monkeys in Shennongjia, extending the species' distribution eastward by around 500 km from Sichuan province into Hubei.

However, the discovery coincided with a period of severe deforestation and hunting. By the 1980s, the population of this subspecies had plummeted to just 501 individuals clinging to a mere 85 sq km of habitat. To stem the tide, Shennongjia was designated a provincial reserve in 1982 and upgraded to national status in 1986. In 2024, the subspecies was officially designated as an independent conservation management target, reflecting its unique genetic diversity and morphology, including its iconic upturned nose and a tail that often exceeds its body length.

"The 2024 designation recognized both the culmination of decades-long field research and the species' protection value," caretaker Yang said. As early as 2005, scientists had selected one of the 11 groups — the very group that includes the family Beike now leads — as their focal study group for long-term behavioral and ecological monitoring.

At that time, the group had 105 individuals and inhabited a natural valley in Dalongtan, northeast Shennongjia. The group had a well-organized social structure of eight family units and one all-male unit.

Golden snub-nosed monkeys typically have a hierarchical social structure. Each group consists of dozens to hundreds of monkeys, organized into several family units and one or more all-male units. Each family unit is led by an adult male, who lives with its wives and kids. The all-male unit, made up of adult males who have lost their position as family head and those who have left their families after the age of four, is responsible for the security of the whole group and for training the younger males.

For close observation, researchers built simple living quarters, set up monitoring plank walks and established the Dalongtan Golden Snub-nosed Monkey Research Base in 2005. Through continuous tracking and observation, they identified winter food shortages as one of the key factors driving the population toward endangerment.

To address the problem, the research team conducted a diet supplement experiment, where apples, oranges and pine nuts were stuck onto branches and coated with moss to mimic wild fruits. But no monkey dared to approach — a stalemate that was finally broken when a male, later named Dadan (meaning "bold"), became the first to take the food.

A few months later, the monkey group began to regularly accept the supplemental food, which opened the door for researchers to systematically observe their feeding, reproduction, social behavior and even individual personalities.

Yao Hui, deputy director of the scientific research institute, said that the Shennongjia golden snub-nosed monkey typically lives at altitudes above 1,600 meters, where vegetation is limited — about 60 percent of their diet is tree bark and lichen, supplemented by bird eggs, insects and soil for protein and trace elements.

"As a result, during winter when food intake is severely insufficient and nutrition is lacking, their fur turns grayish; around July and August, however, it becomes a beautiful golden color," Yao said.

Yao underscored that human intervention remains minimal — researchers only provide a small amount of supplemental food during extreme winter shortages. The overall approach is to let the monkeys live as naturally as possible while working to restore their natural habitat.

Measures included the construction of 25 ecological corridors, which facilitate the reconnection of fragmented habitat patches and promote gene exchange among different monkey populations. Additionally, more than 20 sq km of degraded habitat has been restored to expand their living area.

For residents living in areas where the monkeys are distributed, the reserve has relocated them and organized skills training to help them transition to new livelihoods. Training programs focus on ecotourism, herbal medicine cultivation and green agriculture, empowering former forest dwellers to step out of the deep mountains and embrace sustainable lives.

For those living in peripheral regions, they receive alternative energy subsidies to replace coal and firewood with electricity, reducing the human impact on the monkeys' habitat. Additionally, a comprehensive electrification transformation project at the Dalongtan base was completed in 2024, with a large number of photovoltaic panels installed to power most daily needs such as cooking and heating. This initiative not only reduced fire risks but also further minimized human disturbance to the monkeys' habitat.

"Most rescue cases at the local rescue station are reported by villagers — a vivid microcosm of the shift from loggers to guardians," Yao said.

Tech empowerment

Peng Linpeng, director of the information management center at the Shennongjia reserve, highlighted the importance of a rounded, three-dimensional monitoring network for the recovery of the Shennongjia golden snub-nosed monkey population.

Established in 2025, the network goes beyond regular patrols, integrating satellite remote sensing to monitor broad habitat changes like forest pests and diseases. Drones, being more precise and cost-effective, support routine comparative monitoring, deter illegal activities, and collect high-definition three-dimensional geographic data for emergency command and dispatch.

"Considering the species' lofty living requirements, we have set up water quality monitoring stations at the sources and outlets of rivers flowing into the Yangtze and Hanjiang rivers, as well as air quality monitoring stations at elevations ranging from 600 to 3,000 meters," Peng said, adding that highly sensitive smoke detectors have been installed to warn of fire risks.

For real-time wildlife tracking, high-altitude cameras equipped with artificial intelligence have been deployed, offering a detection range of up to 1,000 meters to automatically track, identify and record animals upon their appearance. Over 700 infrared cameras have been installed, with 50 of them capable of real-time transmission. Supplemented by acoustic detectors, monitoring has turned from manual tracking in the past to a highly efficient, precise and automated approach.

"All technological means are designed and deployed for the sole purpose of wildlife protection, rather than for purely academic research," Peng said.

As a flagship species, the recovery of the Shennongjia golden snub-nosed monkey from the brink reflects the ecological prosperity of the reserve — which, with just 0.03 percent of the national land area, is home to more than one-tenth of China's vascular plant and vertebrate species — a thriving reality under the watchful eyes of caretakers, local villagers and cameras.

Yunnan model creates biological sanctuary for province's wildlife

By YAN YUJIE and **LI YINGQING**
in Kunming

White-browed gibbon Dingding sits on the head of Fu Ziqian, a worker at the Taiyanghe National Forest Park in Pu'er, Yunnan province. WANG YUEDING / FOR CHINA DAILY

A 21-year-old white-browed gibbon named Dingding has become the latest international face of China's conservation achievements. A video of the primate "chatting" with staff at the Taiyanghe National Forest Park recently garnered over 44 million views on global social media platforms, highlighting a burgeoning era of harmonious coexistence between humans and endangered species in Southwest China.

While the video touched netizens with its heartwarming interaction, experts say the scene is a microcosm of a much larger ecological shift in Yunnan province.

The tranquil life enjoyed by Dingding and his peers is underpinned by rigorous policy. During the 14th Five-Year Plan (2021-25), Yunnan adopted the "forest chief" system, a centralized strategy that has established one of the country's most extensive wildlife protection networks.

According to the Yunnan Forestry and Grassland Administration, the province serves as a sanctuary for 928 key wild animal and plant species under State protection. At Taiyanghe, this protection translates into a sprawling 216.23-square-kilometer habitat with a forest coverage rate of 97.45 percent.

Taiyanghe has evolved into more than just a forest; it is a center for rescue and mutual healing. Among its residents is Yuanyuan, a white-cheeked gibbon whose presence is a testament to the vigilance of local forest police. After being rescued from life-threatening conditions in its early years, Yuanyuan now thrives alongside other rare species, such as Zhaocai and Jingbao — a pair of binturongs classified as national first-class protected wildlife.

"The animals here enjoy being close to people because they feel secure," said Xu Yanfang, a staff member who works closely with "Princess" Nana, one of the park's rhinoceroses. "Working with them is a healing experience. It's a fascinating dynamic where the caretakers and the animals support each other's well-being."

The park's success is also visible in the longevity of its inhabitants. At 21, Dingding is considered an elderly gibbon, equivalent to over 90 human years. His playful interactions — insisting on being carried or demanding peeled grapes — reflect a level of care usually reserved for domestic seniors.

Fu Ziqian, a veteran staff member, noted that the dietary preferences of the animals often mirror the region's rich natural offerings. "Dingding enjoys local specialties like fish mint and gotu kola," Fu said. "It shows how well-integrated these animals are into the local Yunnan ecosystem."

The conservation effort has moved beyond government agencies and into the hearts of the public. Supporters like 42-year-old Wang Xueyun travel hundreds of kilometers from Xishuangbanna every month to bring fresh fruit to the gibbons.

"I wish for Dingding, Shanshan and Yuanyuan to remain healthy," Wang said. "I hope the other animals can live freely and happily on this land."

As Yunnan prepares to transition into future conservation frameworks, the high-definition cameras and livestreamed sessions led by young operators like 23-year-old Lou Zihan ensure that the message of protection reaches a global audience. For Lou, the mischievous antics of the binturongs she monitors are not just content for social media, but proof that China's "green revolution" is working — one nuzzle at a time.

CULTURAL HERITAGE

Above: Pottery items demonstrating the westward spread of prehistoric craftsmanship from the Yellow River Basin to today's Xinjiang Uygur autonomous region are on show. **Below:** A pottery jar (left) from the Siba culture, in Gansu province, and a Bronze Age pottery jar unearthed in Xinjiang are among the objects on display. PHOTOS BY FANG AIQING / CHINA DAILY

The journey of painted clay

Exhibition reveals how prehistoric ceramic traditions traveled to shape early civilization, report **Fang Aiqing** and **Mao Weihua** in Urumqi.

Thousands of years ago, Neolithic painted pottery culture from the middle and upper reaches of the Yellow River traveled westward along the Hexi Corridor — in today's Gansu province — before spreading across the northern and southern foothills of the Tianshan Mountains in what is now the Xinjiang Uygur autonomous region. Here, it blended with local traditions and continued radiating further west.

Artifacts demonstrating this remarkable journey are on display in an exhibition that opened on April 10 at the Xinjiang Museum.

The exhibition, *From the Yellow River Basin to Tianshan Mountains: Tracing the Westward Journey of Prehistoric Painted Pottery*, features 175 sets of pottery from the collections of the Gansu Provincial Museum, Xinjiang Museum, and 13 other cultural heritage institutions across the two provincial-level regions. The exhibition, running through July 10, was previously displayed at the Gansu museum.

Against ocher and reddish-brown surfaces, ancient craftspeople expressed extraordinary creativity.

Delicate geometric grids, flowing spirals, fish motifs, petals and abstract deity patterns reveal a striking command of line and form. Elegantly curved vessels and animal-shaped decorations, including eagle and goat heads, further testify to the imagination and skill of prehistoric artisans.

Based on years of archaeological findings, the exhibition traces the spread of painted pottery craftsmanship across thousands of kilometers from east to west over more than 3,000 years.

Wang Nannan, director of the exhibition department at the Gansu Provincial Museum and one of the exhibition's curators, says Gansu and Xinjiang are geographically linked and share deep cultural roots, exemplified by the westward expansion of painted pottery culture, which carried early people's aesthetic ideals and passion for life.

Both Xinjiang and Gansu have a significant east-west expanse: Xinjiang stretches nearly 2,000 kilometers and Gansu about 1,500 km.

The upper reaches of the Yellow River flow some 900 km in eastern Gansu. To the west, the long and narrow Hexi Corridor — "Hexi" means "west of the Yellow River" in Chinese — has served, since ancient times, as a key route linking the Central Plains with the country's western regions and beyond.

Wang notes that the prehistoric routes of painted pottery transmission through the Hexi Corridor largely overlapped with the ancient Silk Road, as both relied on the same geographical artery.

Building on this geographical and archaeological reality, scholars have named the east-to-west expansion of early Chinese culture — represented by painted pottery — the "Painted Pottery Road".

Han Jianye, professor at the School of History, Renmin University of China, has studied this topic for years and published a collection of essays on it.

According to Han, painted pottery from present-day Shaanxi and Gansu provinces spread westward from the 4th to the 1st millennium BC. Divided by the Qinghai-Tibet Plateau, the routes branched into a northern path — spreading to Central Asia and beyond via Xinjiang — and a southern path toward the Kashmir region.

"The Painted Pottery Road was the primary channel for early cultural exchanges between China and the West and can be regarded as a precursor to the Silk Road," he writes.

The ongoing pottery exhibition highlights the evolution of painted patterns and vessel shapes, offering a visual thread for understanding this westward transmission.

The middle and upper reaches of the Yellow River were among the birthplaces of prehistoric painted pottery. At the Dadiwan archaeological site in Qin'an county, eastern Gansu, archaeologists have unearthed pottery dating back around 8,000 years. These vessels are typically round-bottomed, or tripod bowls decorated with red bands around the rim, with pigments usually applied before firing. They are among the earliest decorated pottery discovered in China.

Between 7,000 and 5,000 years ago, the Yangshao culture flourished in the Central Plains. Its pottery featured black-painted patterns of straight lines, geometric shapes, fish, petals, and leaves. Around 5,500 years ago, its iconic petal patterns — seen on Miaodigou-type pottery of the mid-Yangshao period — had already spread across much of present-day Gansu and eastern Qinghai provinces.

In eastern Gansu, Yangshao traditions evolved into the Majiayao culture, which thrived some 5,300 to 4,000 years ago. During this period, painted pottery reached an artistic peak.

On display at the exhibition are pieces featuring exquisitely intricate patterns such as lozenges, spirals, gourd-shaped grids, birds and deities, which cover the entire vessels.

During the late Majiayao period, painted pottery — along with the agricultural culture that produced and used it — kept advancing into multiple regions.

The branch that extended toward the Hexi Corridor developed into the Siba culture. Dating back around 3,900 to 3,400 years, it marked the transition from the Neolithic period to the Bronze Age. Its western reach stretched to the Hami Basin in eastern Xinjiang, where it interacted with the local Tianshanbeilu culture.

Double-handled jars unearthed from the Tianshanbeilu cemetery site feature hanging straps and large grid patterns similar to those found in Siba culture pottery. Square spirals and fret motifs seen on late Majiayao and Siba wares also appear in Iron Age relics discovered in Hami.

Around 3,000 years ago, painted pottery flourished in central Xinjiang cultures, including Subeixi in the Turpan Basin and Chawuhu, mainly distributed in the Bayingolin Mongolian autonomous prefecture. Artifacts from these areas provide evidence of eastern influences and local adaptation.

The small-mouthed, bulging-bellied design of Subeixi single-handled jars retained the influence of the Yellow River Basin. At the Chawuhu ancient tomb complex, pottery with red paint on a light background featured a bottom design better suited for hanging and carrying, reflecting the needs of nomadic life.

In Xinjiang, many vessels were found with a *liu* (spout) for easy and smooth pouring.

Wang notes that compared with Yangshao and Majiayao pottery, Xinjiang's prehistoric ceramics featured simpler decorative patterns but more practical functions.

"As painted pottery spread westward, the vessels became smaller but more practical," he says, adding that this change reflected adaptation and integration — evidence of the strong inclusiveness of Chinese civilization.

He explains that the exhibition is organized around geographical nodes, allowing visitors to easily trace the deep connections between ancient communities in Xinjiang and the Central Plains. For example, visitors can observe striking similarities between two single-handled vessels — one from a late Majiayao site in Gansu and another from Bronze Age remains in Xinjiang.

The late Majiayao piece is barrel-shaped, with the handle attached near the top. Its upper part outlines triangular layouts with bold lines, set apart by three horizontal lines, while the lower part features vertical zigzag patterns.

The Xinjiang artifact, on the other hand, has triangular patterns above horizontal dividing lines and circular spirals below; its body is rounder, and the handle is positioned at the center of one side.

"Sometimes it's hard to describe the similarities in words, but when placed side by side, one can naturally feel the resemblance," Wang says.

He adds that the exhibition presents a complete and tangible chain of cultural transmission that requires little specialist knowledge to appreciate.

It is believed that painted pottery began to decline in Xinjiang around the Warring States Period (475-221 BC), with patterns becoming increasingly cursory. This art form survived in the region for nearly 2,000 years before almost disappearing after the Western Han Dynasty (206 BC-AD 24).

Li Zheng, director of the Xinjiang Museum's exhibition department and another curator of the exhibition, says the emergence, spread, and development of painted pottery fully demonstrate Xinjiang's important role in the cultural development of Chinese civilization.

"Although these artifacts were scattered across a vast expanse along the Painted Pottery Road, they shared similar aesthetics and craftsmanship," Li says.

"The routes connected the Yellow River Basin and the Tianshan Mountains in a millennia-long dialogue, vividly illustrating how Chinese civilization is diverse yet unified, continuous, and enduring," he adds.

The exhibition will travel to Bayingolin and later to Hami.

Marbuya Abdureyim contributed to this story.

Yangshao discovery fills gap in Shanxi history

By **DENG ZHANGYU**
dengzhangyu@chinadaily.com.cn

From left: Wang Shuang, an archaeologist, identifies an ash pit belonging to the Neolithic Yangshao culture in Yirang village, Yangquan, Shanxi province; an uncovered pottery shard preserves distinctive red grid patterns. PHOTOS BY LIU SHENG / FOR CHINA DAILY

Archaeologists working in the dusty fields of Yirang village, Yangquan, in North China's Shanxi province, have uncovered a major discovery that offers fresh insight into the region's Neolithic past.

In March, a small team of researchers used traditional Luoyang spades — long-handled tools designed to extract soil samples — to probe the earth. Among the soil layers, they recovered fragments of painted pottery, weathered but clearly marked with distinctive red grid patterns.

According to Han Lizhong, director of the Yangquan Archaeological Research Center, these fragments date to the late Yangshao culture, a Neolithic civilization that flourished along the middle reaches of the Yellow River roughly 7,000 to 5,000 years ago. The culture is famous for its painted pottery, often decorated with geometric motifs and occasional human or animal figures.

This marks the first confirmed discovery of a Yangshao culture site in Yangquan.

"It fills a gap in the region's Middle Neolithic cultural record, expands the known distribution of the Yangshao culture, and demonstrates close cultural exchanges between Yangquan and areas that are now Jinzhong in Shanxi as well as parts of Henan," says Han.

The site lies on the northern bank of the Taohe River, where local farmers had previously uncovered ancient stone axes. "Our ancestors would have found this spot ideal for settlement," Han adds.

Han recalls that archaeologists had surveyed the area several times since the 1990s without success. That changed in March when researchers stumbled upon painted pottery fragments near a newly dug grave. As they expanded their search, they found layers containing pottery from different periods, including pits dating to the Yangshao era.

The site now covers an area of approximately 129,000 square meters — roughly the size of 20 football fields.

"When the first painted shard was found, everyone almost jumped for joy," says Wang Shuang, one of the six field team members. Over the past months, the team repeatedly trekked across hills and valleys, studying the terrain and interviewing villagers for clues about possible artifacts.

The archaeological survey began in November 2024 as part of a special initiative to explore Yangquan's early cultures.

So far, the team has identified three ash pits and one kiln, along with a remarkably continuous cultural sequence spanning the Yangshao culture, Longshan culture, Xia Dynasty (c. 21st century-16th century BC), Shang Dynasty (c. 16th century-11th century BC), and Eastern Zhou Dynasty (770-256 BC).

In Yirang village, time appears layered in the earth: painted pottery from 5,000 years ago, black Longshan pottery from 4,000 years ago, and Shang and Zhou pottery from 3,000 years ago. Together, they reveal a settlement that appears to have remained inhabited for thousands of years without interruption.

Han says Yirang village has a long history, with multiple cultural relic sites still visible. In October 2024, the team had already excavated two Jin Dynasty (1115-1234) tombs there, and recovered 34 artifacts. The current survey, launched the following month, aims to systematically investigate the region's early cultural layers.

The recovered artifacts include pottery, stone tools and bone-and-shell objects. Painted pottery makes up a high proportion, with fine red grid-and-band patterns. Researchers have also identified vessel forms, such as bowls, jars and basins, alongside smaller objects including pottery rings and perforated shell knives.

By comparing these artifacts with discoveries from similar sites, archaeologists have preliminarily dated the settlement to the late Yangshao period.

"The discovery of remains here from the Yangshao culture, Longshan culture, Xia and Shang dynasties, and Eastern Zhou periods establishes a continuous cultural sequence from the Neolithic era onward," Han says.

"It provides valuable clues for understanding the evolution and development of prehistoric societies in the Taihang Mountains."

Zhu Xingxin in Shanxi province contributed to this story.

LIFE

Tang canal rises as a glowing destination

Once the cradle of China's industrial revolution, site gets a makeover, turning it into a hub of tourism and tradition, **Yang Feiyue** reports in Tangshan.

The boat glides slowly along the Tangjin Canal, a waterway that once connected the industrial cities of Tangshan in Hebei province and Tianjin. On either side, hundreds of Tang Dynasty-styled lanterns rise in formation, their crimson glow chasing away the last chill of an April evening as it illuminates the countless bricks and latticed windows lining the streets.

A massive Ferris wheel with playful expressions flashing across its digital screen looms ahead. The air is filled with the distant melody of Pingju Opera, a centuries-old folk tradition born in this very region.

For a moment, it is easy to believe you have traveled back in time to the Tang Dynasty (618-907), an era celebrated as the golden age of Chinese art, culture and cosmopolitan ambition.

But this is not Xi'an in Shaanxi province, the ancient capital most associated with the Tang. It is Hetou Laojie (Hetou Old Street), a water town in the city, better known as a cradle of China's modern industrial revolution.

And, just a few years ago, this waterway was silent.

"Please lower your head," boat guide Shi Jia gently cautions her guests as the vessel approaches a low bridge adorned with a glowing light belt.

It is a practical safety reminder. But for the creative team behind the old street, it has become something of a metaphor.

After more than a decade of lying "low" as a lackluster commercial project, this place has raised its head, blossoming into one of the most dazzling nighttime tourism destinations in the province.

In 2025, the street welcomed 8 million visitors, with a single day reaching 166,000. On a typical Monday night in April, the street is crowded with travelers as if it were a holiday.

Since opening in 2023, it has been recognized as a national tourist and leisure street and received the 2025 China Cultural Tourism Pioneer Award from the China Association of Amusement Parks and Attractions.

The 2,000-*mu* (133-hectare) site is the result of a partnership between the Fengnan district government and Kaige'er Group, a local cultural tourism enterprise. It now offers a fully immersive Tang experience, where visitors can eat, stroll, shop, and watch performances in a meticulously re-created historical atmosphere.

As the boat continues its journey, passengers pass multiple performance installations along the banks, where singers, dancers, acrobats, and actors in Tang-era costumes create vivid scenes that unfold as a scroll painting brought to life.

"The performers are inheritors of intangible cultural heritage, and they perform to audiences' reactions," Shi emphasizes.

She often recommends her guests stay for a short Pingju Opera performance, which originated from Tangshan.

In addition to the dynamic performance, the giant lanterns are eye-catching, each standing about 7 meters tall and featuring patterns from *The Court Ladies Adorning Their Hair with Flowers*, a Tang Dynasty painting now housed in the Liaoning Provincial Museum.

About half an hour's drive from Hetou Old Street, Tangshan Feast, also known as the Tangshan Food Culture Museum, pleases the palate of even the most discerning gourmand.

The 40,000-square-meter indoor complex features 150 varieties of Tangshan snacks and more than 20 types of foods crafted with intangible cultural heritage skills, all spread across "five streets, two alleys, and one river" on its ground floor.

"Tangshan Feast is what we call 'an edible museum'," says Wang Caitong, a guide at the complex.

"It was originally a disused shopping mall. The creative team reshaped the space and built a 'super scene' with cultural tourism appeal — small bridges, flowing water, pavilions, towers, and the hustle and bustle of traffic," she adds.

In 2025, it attracted 5.5 million visitors, 70 percent of whom came from outside Tangshan. On its busiest day, it welcomed 50,000 people.

Old wooden houses, some more than a century old, have been dismantled and reassembled here. In re-creations of some "grandpa" or "grandma" shops, elderly artisans demonstrate traditional crafts.

"We collected six century-old houses from the countryside," Wang says. "Every brick and tile carries the trace of time. These scenes are designed to evoke childhood memories and to make people feel something."

On the second floor, a replica of Xiaoshan'er, a commercial district that once rivaled Beijing's Dashilar and Tianjin's Quanyechang in the 1930s, has been rebuilt.

From top: One of the highlights of a night show at Hetou Old Street in Tangshan, Hebei province, features performers suspended from cables, gliding across the sky on mechanical phoenixes while molten iron showers down around them. Acrobatic performances have helped transform Hetou Old Street into a bustling tourist destination. A giant Ferris wheel draws visitors taking in the view during a nighttime boat ride along the canal in Tangshan. PHOTOS PROVIDED TO CHINA DAILY

Literally meaning "Little Hill", Xiaoshan'er rose to prominence in the late 19th century as the northern terminus of the Tangxu (Tangshan-Xugezhuang) Railway, China's first standard-gauge railway. A commercial explosion then ensued, with department stores, bathhouses, theaters, teahouses, and restaurants packed into just a 500-meter-long stretch.

"In those days, if you came to Tangshan and didn't visit Xiaoshan'er, you hadn't really been to Tangshan," she says.

Every snack at Tangshan Feast has a story. For instance, *gezha*, a mung-bean pancake, is said to have been named by the Empress Dowager Cixi.

"The Empress had a habit of taking at most two bites of any dish. When she tried *gezha*, she liked it so much that she took a second bite and said '*ge zhe*' — meaning 'set it aside'. The eunuch thought she was naming the dish — and the name stuck," Wang recounts.

The "Fourteenth Prince" dry-braised chicken derives its name from Emperor Kangxi's 14th son, who was sent to guard the Qing tombs in Tangshan.

"He didn't have much appetite until the palace chef took a local dry-braised chicken recipe and combined it with imperial roast chicken techniques. The prince ate with great pleasure, and the dish has been passed down for 300 years," Wang says.

The success of Hetou Old Street and Tangshan Feast did not happen in a vacuum. They are the products of a deliberate, province-wide strategy to turn Hebei into a weekend destination for the 110 million people living in the Beijing-Tianjin-Hebei region.

For years, Hebei was overlooked by tourists despite being home to several UNESCO World Heritage sites and containing all seven major landform types, notes Wang Rongli, deputy director of the Hebei provincial department of culture and tourism.

That began to change in 2022, when Hebei launched a strategic push to become the "weekend leisure destination of choice" for residents of Beijing and Tianjin. The slogan, "So close, so beautiful — spend your weekend in Hebei", was elevated to a provincial development strategy.

But traffic comes and goes quickly. "For a brand to last, it must rely on products and services," Wang emphasizes.

Since 2023, Hebei has become one of the first provinces to offer free expressway for tour buses traveling on weekends and public holidays. By 2025, the policy had saved tour operators more than 510 million yuan ($75 million) and covered more than 3.4 million buses, local authorities report.

"The fee reduction isn't large for any single tourist, but it sends a signal that Hebei genuinely welcomes you, and we're even willing to save you the tolls," she explains.

The province has also launched a luggage delivery service called "Easy Hebei Tour", allowing visitors to check in their bags at Beijing West Railway Station and find them already waiting at their Hebei hotel.

"The most durable, most powerful, and most cost-effective marketing is always word-of-mouth," Wang says.

Midway through Hetou Old Street, the night erupts. Along a stretch of the canal transformed into a battlefield, six former fishing boats have been refashioned into Tang Dynasty warships. On and around them, more than 500 performers charge on horseback, spin towering flags, and hurl themselves into staged combat.

From both ends of the canal, actors suspended from cables glide across the night on mechanical phoenixes, their robes streaming behind them as they pass through cascades of molten iron. The iron, heated to 1,600 C, is flung by hand against a brick wall, a thousand-year-old folk tradition called *da tie hua*. It explodes into a blizzard of white-orange sparks that rain down over the water, the boats and the upturned faces of the crowd.

For Shi Jia, the boat guide, the performance captures something essential about Hetou Old Street.

"For 12 years, this place was nothing. Now people come from Shanghai and Guangzhou, Guangdong province, just to see this," she says.

The low bridges are still there. So is her warning: "Please lower your head." But when the phoenixes fly, no one is looking down.

Female storyteller carries forward invaluable cultural legacy

By **PALDEN NYIMA** and **DAQIONG** in Lhasa

Nestled in the high-altitude pastures of Tsonyi county in Nagchu, Xizang autonomous region, Sinchung's life has been one of courage, resilience, and an unyielding commitment to preserving an ancient cultural legacy.

A female storyteller of King Gesar — a rarity in itself — Sinchung has overcome social challenges and geographical relocations to bridge the mythical Tibetan hero king, Gesar, with modern-day audiences.

Born to a nomadic family reliant on herding yaks and sheep, storytelling formed an integral part of Sinchung's childhood. Though King Gesar storytellers were virtually absent in her community, inspiration came closer to home through her father, himself a King Gesar storyteller.

King Gesar is a legendary figure in Tibetan culture, immortalized in the *Epic of King Gesar*.

"When herding together, my father would narrate the fascinating tales of King Gesar," recalled Sinchung. "The stories captivated me so much, I memorized them after hearing them just once."

It was from these herding expeditions that her love for the epic began to take root. By the age of 12, she would hum verses to herself, unaware of their meaning at times, yet deeply influenced by the themes of heroism and spirituality.

A turning point came when Sinchung's mother took in a blind, childless elderly woman.

"This grandmother would often share proverbs and folktales with me, leaving a lasting impression that prepared me for storytelling later in life," she says.

Curiosity about the epic grew further during her teenage years as her family owned a cherished copy of *Horse Race Norbu Chadun*, a King Gesar book.

Unable to read the Tibetan language at the time, Sinchung would pore over the book's illustrations, feeling a personal connection to the legendary characters. "Although I couldn't read, the images felt alive — like family members I had yet to meet," she says.

Determined to learn, Sinchung taught herself the Tibetan alphabet at 14. Scribbling letters into the sand while tending to livestock, she grew proficient over the years.

Reading books about King Gesar became a natural progression, even as she faced skepticism from her community.

"At first, elders appreciated my storytelling, but others mocked me or insisted that such tales were not meant to be sung by a woman," says Sinchung, describing challenges that ranged from societal taboos to outright hostility.

"Some even cursed my family, warning of disastrous consequences," she says.

For a time, the criticism silenced her. Public storytelling stopped, but in solitude, she carried on, practicing Gesar's tales while herding. The process, she says, brought her solace and happiness during those trying years.

Left: Sinchung (third from right) was invited to present her storytelling of King Gesar at an art performance show in Sinpori, Gongkar county, Xizang autonomous region in 2025. **Right:** Sinchung gets ready for her performance. PHOTOS PROVIDED TO CHINA DAILY

Between the ages of 17 and 25, Sinchung dove deeper into the epic. Borrowing books from other storytellers, she expanded her knowledge of the king's journey from his celestial birth and struggles on Earth to his victorious battles against enemies.

During this time, she endured mysterious illnesses that seemed to ebb only when she immersed herself in the poetic verses of King Gesar.

Her marriage at 26, followed by the responsibilities of family life, led to another hiatus. Storytelling took a backseat, especially under her husband's disapproval.

However, WeChat rekindled her passion, providing a new platform to share her art. Singing and rapping Gesar's tales in group chats garnered widespread recognition and won over audiences.

In 2020, Sinchung's family relocated to Sinpori, an ecological resettlement community in Xizang's Gongkar county, as part of a government program to improve the living conditions of high-altitude nomads.

The move to a more community-oriented environment gave her a new platform.

"With my neighbors living close by, it was easy to gather people for storytelling," says Sinchung. The teahouses of Sinpori welcomed her performances, and she eventually established a dedicated King Gesar Storytelling House.

Visitors from near and far listened to her accounts of the heroic king's exploits, bridging ancient glory and contemporary life.

However, Sinchung believes her storytelling alone is not enough to protect this intangible cultural treasure. Embarking on a new mission, she is documenting her knowledge in writing to ensure its preservation for future generations.

With government policies emphasizing the protection and promotion of cultural heritage, she found the encouragement she needed.

"By publishing books, I am ensuring that this invaluable cultural legacy doesn't perish with me," she says. "These stories will serve as an inheritance for future generations, enabling them to connect with and celebrate their identity."

Plans for additional publications are already in motion, ranging from collections of proverbs to compilations of Tibetan riddles.

For Sinchung, storytelling transcends entertainment; it is a living, breathing link to a storied past, and an enduring gift to posterity.

"If I live longer, I hope to contribute more. These stories are not just history, they're a part of us."

The curiosity and passion of actress Juliette Binoche

French star discusses her love of movies and China, **Xu Fan** and **Shi Futian** report.

Online
Scan the code to watch the video.

Juliette Binoche, the French actress who served as jury president of the 16th Beijing International Film Festival's Tiantan Awards, shares her thoughts on cinema and her impressions of the country with China Daily. PHOTOS PROVIDED TO CHINA DAILY

Relaxed, easygoing, and always passionate about cinema — that sums up the first impressions of Juliette Binoche, the French screen legend who recently seized the spotlight in China as jury president of the 16th Beijing International Film Festival's Tiantan Awards.

At the climax of the festival's closing ceremony, Binoche walked onstage alongside iconic Chinese director Zhang Yimou to present the Best Feature Film award — one of the biggest Tiantan Awards — to the British film *Dragonfly*. In a sudden burst of energy, the 62-year-old actress slapped her trouser legs and exclaimed, "Let's find out who the winner is!" — a spontaneous gesture that drew applause from the audience.

After eight days of intense viewing and discussions, she and her six fellow jurors, including French-Vietnamese director Tran Anh Hung and British composer Simon Franglen, voted on 10 awards in total from 16 shortlisted films, selected from a record 1,826 submissions spanning 139 countries and regions.

"I felt great. We watched all the films. I almost forgot I was the jury president, because I was so in touch with the films. I forgot myself," Binoche said, describing her experience.

The festival also reflected the industry's growing preoccupation with artificial intelligence, establishing an AIGC Unit — the first of its kind in the world to focus on AI-generated films. This year, the section received nearly 2,840 submissions from 14 countries and regions — an 89 percent increase from the previous year.

Binoche is unworried about the emergence of AI in filmmaking, believing that it is simply a new tool and that plot and characterization are still the most important aspects.

"At the end of the day, AI is a way of telling a story. When you watch a film, it stays in your mind, heart and body somehow. Technique is just there to help the story. You have to go back to the core of making a film."

For Binoche — the first figure in cinema history to have won Best Actress honors at all three major European festivals: Venice, Berlin and Cannes — enthusiasm remains central to her approach to cinema. Fame and success, it seems, have never dulled her curiosity.

In an interview a few days before the closing ceremony, she discussed the jury's task with China Daily. "What we're trying to do in the festival is to find a diamond of a film — something that people have never seen before. It can be the story, the way it's done, or the acting — but it's something that is going to enrich the viewers and take them somewhere they've never been before."

That search for the unfamiliar has guided her through a remarkable range of collaborations over an acting career spanning more than 40 years: Polish director Krzysztof Kieslowski's *Three Colors: Blue* (1993), in which she played a woman undone by grief; British filmmaker Anthony Minghella's *The English Patient* (1996), where she portrayed a dynamic army nurse; and Swedish director Lasse Hallstrom's *Chocolat* (2000), starring her as a single mother skilled at making chocolate.

Binoche also worked with the late director Hou Hsiao-hsien on *Flight of the Red Balloon*, a 2007 film recounting the story of a French family through the eyes of a Chinese student.

Above: Binoche and director Zhang Yimou present the Best Feature Film award to the British movie *Dragonfly* during the festival's closing ceremony. **Below:** Several of Binoche's films have been aired on China Movie Channel, captivating local fans.

In an attempt to accurately portray the role — a harried single mother who runs a small avant-garde puppet theater and performs all the voices — Binoche devoted a full month to preparation. She took classes at a puppet theater, underwent voice training, and even suggested dyeing her hair blonde.

She recalled that Hou once asked her to bring personal objects from her own home to the set, so that the space would feel lived-in — as if she were staying in her own quarters.

"You just have to dare to open the door to find the magic inside of you," she said, describing her philosophy of performance. "The actor has to believe deeply in their own being and in their heart, gut, cells and mind. There has to be a layer of spirituality."

Binoche has visited China many times since 2009 — attending the Festival Croisements that year, making a guest appearance on Hunan Television's popular variety show *Happy Camp* in 2018, and sharing insights about her directorial debut, *In-I In Motion*, during the 2025 Beijing Culture Forum.

Asked what has impressed her most, she replied without hesitation: "Just meeting people. What are their lives and everyday experiences? Basically, there's a story in each of us. I've traveled to different places, and I'm always moved because some places are still unchanged.

"I love seeing villages where there is this sense of kindness and simplicity, and there are also some traditions that I really love in China."

Binoche also talked about the countryside, the mountains and Taoist legends. "For me, it brings so much awareness of why we are here on Earth. It's a way to prolong your thoughts and to connect with nature and the beauty of nature."

She even confessed an unexpected fondness for the Chinese *kang* — the traditional heated brick platform that serves as a bed, table and social anchor of the northern Chinese home. "I slept in it. I loved it. It was so peculiar and special," she said, recalling her visit to a house that had one.

As an actress with more than 60 films to her name, Binoche has worked with a stellar lineup of international stars, including Ralph Fiennes in *The English Patient*, Johnny Depp in *Chocolat*, and Ethan Hawke in *The Truth*. She has also stepped behind the camera, making her directorial debut with *In-I In Motion*, distilled from 170 hours of raw and archival footage documenting her dance-theater collaboration with British choreographer Akram Khan.

So what kind of role still draws her — actress or director?

"I have experienced so many. I have been very lucky. I have worked with wonderful directors and actors. As an actor, you have to give a lot of yourself, otherwise nothing will come out," she said.

For all her accolades, Binoche admitted to moments of doubt. Sometimes, she wakes at 6 am and asks herself the same question: "Why did I choose this work?"

The answer, even after all these years, returns with quiet clarity. "At the end of the day, it's worth it because it gives a sense of purpose. It makes you happy and lighter in a way. The lightness comes from being really on your own path and choosing a path that is meaningful to you and to others as well," she says.

Spy thriller *Black Silk* deepens cross-border film ties with Russia

MOSCOW — On the outskirts of Moscow, the set of the spy thriller *Black Silk* is more than a filming location — it offers a glimpse into a growing cinematic partnership between China and Russia.

During a recent visit to the set, Russian Minister of Culture Olga Lyubimova described such large-scale international cooperation as "unimaginable" a decade ago. She noted that the task now is to employ modern cinematic language to create emotional resonance for audiences in both countries.

The collaboration is underpinned by a strategic action plan signed in May 2025, in which film authorities from China and Russia committed to a long-term road map for cooperation through 2030. The plan prioritizes joint productions and cross-border film exchanges to deepen cultural ties through cinema.

At the production site, actors from China, Russia, Serbia, Japan and Germany are preparing for their roles. Costumes from different eras and regions coexist, while scripts annotated in multiple languages reflect the multilingual nature of the set.

Black Silk follows the success of its predecessor, *Red Silk*, a flagship project under the China-Russia Years of Culture framework. With earnings of $1.8 million, *Red Silk* topped the rankings of the highest-grossing Russian films of 2025 at the foreign box office.

The new production aims to build on that momentum with enhanced scale and quality.

Set in 1930s Shanghai, *Black Silk* unfolds against a backdrop of international intrigue, centering on a high-stakes search for a mysterious cargo.

While rich in action, the film also draws on historical narratives. Screenwriter Maria Nefedova said the creative team seeks to present history in a way that resonates with contemporary audiences. "Russia and China share a long history of good-neighborly relations. We have faced challenges together, and I hope the film reflects the mutual support between our peoples," she said.

Left: A moment from the opening ceremony of the 16th Beijing International Film Festival in Beijing on April 16. XIE HAN / XINHUA **Right:** A still from the film *Red Silk*. PROVIDED TO CHINA DAILY

To re-create scenes at sea, the production team constructed a large vessel mounted on a hydraulic platform, equipped with a water discharge system to simulate waves and storms. The set allows for dynamic, immersive filming conditions.

Chinese actress Zheng Hanyi, who also appeared in *Red Silk*, said the experience goes beyond filmmaking. "It is also a process of cultural exchange. You can feel the two cultures learning from each other," she said, expressing hope for more joint projects in the future.

Lyubimova said films play an important role in cultural exchange. She expressed confidence that *Black Silk* will further advance cooperation between filmmakers of the two countries.

Production is currently ongoing, with the film slated for release in 2027.

According to Svetlana Balanova, CEO of National Media Group in Russia, film projects jointly produced by Russia and China are strengthening bilateral ties and promoting cultural dialogue.

Balanova highlighted *Red Silk* as a milestone in advancing a systematic approach to jointly promoting national cinema and producing works that reflect shared values.

Last year marked the 80th anniversary of the victory in the Chinese People's War of Resistance Against Japanese Aggression and the Soviet Union's Great Patriotic War. According to Balanova, Russian audiences were drawn to the film's dynamic storyline and performances, while Chinese viewers were attracted by its portrayal of resilience in harsh Siberian conditions.

She added that the sequel will retain key elements that appealed to audiences in the original while expanding its narrative scope, visual style and production capabilities. "*Black Silk* is an independent story with new mysteries and characters, accessible to fans of the first film and those just getting to know the story, both in Russia and abroad," she said.

Following the success of the first installment, Balanova expressed optimism that the sequel would achieve a strong box-office performance and attract a wider global audience.

TABLE TENNIS

CHINA RALLIES FOR GLORY

Despite tough early going, resilience and squad depth see teams through to victory in London

Wang Chuqing (left) and Sun Yingsha proved instrumental as the Chinese men's and women's teams defended their titles at the World Team Table Tennis Championships in London on Sunday. XINHUA

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

Despite a double delight at the world team championships, China's mighty table tennis squad has refused to revel in complacency, as it braces for a challenging lead-up to LA28 with sobering takeaways from London.

With a convincing defeat of archrival Japan in both finals, China's formidable national program has left the sport in awe of its resilience and depth, both of which proved vital and are still unrivaled, for securing its seventh women's and 12th men's team titles in a row at London's OVO Arena Wembley on Sunday.

As Chinese fans celebrate widely for both squads having lifted their respective trophies — the Corbillon Cup for women and Swaythling Cup for men — for a record-extending 24th time, China's top paddlers know it was anything but a smooth sail, hailing the test along the way as being equally valuable to the silverware lifted in the end.

"The result eventually went our way today, but the process was far more challenging than the outcome," world No 1 women's star Sun Yingsha said after helping China outlast Japan 3-2 in a close final.

"We'd prepared the hardest as we could to face such a competitive opponent, and we really had to stay extremely focused (to clinch the victory)," said the 25-year-old who won both her rubbers in the final.

Having racked up 20 world titles at the World Cup, world championships and Olympics, Sun's composure, experience and seamless game proved critical, as she twice leveled the battle for Team China by beating Hina Hayata and Miwa Harimoto in the second and fourth matches, following teammates Wang Manyu's opening loss to Harimoto and Kuai Man's defeat by Honoka Hashimoto in the third rubber.

With the title on the line, Wang delivered under pressure by routing Hayata in straight sets to complete China's comeback win, while clinching its sixth straight final win over Japan at the team worlds since 2014.

The victory was built as much on resilience as on quality, as Sun reckoned, with Team China pushed harder by its East Asian neighbor than in any previous encounter between the two nations.

"There were a lot of ups and downs in today's final. The Japanese team has developed comprehensive strength and is really performing better and better. The battle between us could really have gone either way," said Sun.

"Our strength lies in our depth, and we proved that, collectively, Team China is always the best."

The progress of the ambitious Japanese women, though, shouldn't be overlooked, underlined by teen sensation Harimoto's fearless style that stunned the experienced Wang in the opener, and the unique game of chopper Hashimoto that disrupted Kuai's pace in the third matchup.

"Credit to Sha Sha who steadied the ship," Wang said of Sun's pivotal role. "She gave me a chance of redemption ... Overall, we had a tough final that we should learn from to help us get better."

On the men's side, Team China also got the job done, but not before a bumpy ride that tested its grit and rebuilt its confidence en route to meeting Japan, which was contesting its first team worlds final in 10 years.

With reigning singles Olympic champion Fan Zhendong opting to skip the London showdown, the young Chinese men's squad, led by current world No 1 Wang Chuqin, suffered rare group-stage defeats to South Korea and Sweden, raising concerns over its gold-defending mettle, even before the knockout round kicked off in London.

Thanks to Wang's consistency, and the maturing game of teammates such as Liang Jingkun, Team China regrouped and responded like a champion during the high-stakes knockout stage, saving its best for last to demolish the Japanese side 3-0 in the final, after successfully avenging its earlier group loss to Korea in the quarterfinals and ousting European power France in the semis.

Citing the team's strong mental edge under pressure, Wang said he takes extra pride from being able to hit back at the doubters on the table.

"A lot of people said they didn't know that would happen with Team China before the championships, and I said: 'Bring it on and we will show you what we've got!' This is how we responded," Wang said after the final.

"Of course, the international competition we are facing is getting stronger. We have to prepare for each and every international event with utmost caution, like treading on thin ice," said Wang, who celebrated his 26th birthday on Monday, a day after the final.

Still, the absence of Fan's finesse was felt, with both Liang and another teammate, Lin Shidong, proving not yet as dominant as Wang on the biggest international stage.

Making his team worlds debut, the 21-year-old Lin, despite his potential, had his lack of consistency fully exposed with four losses in London, while Liang's slow start, which saw him have to battle back the hard way from 2-0 down against Japan's Tomokazu Harimoto to deliver Team China's opening win in the final, has emerged as a concern for future major events.

Their respective old injuries, on Lin's shoulder and Liang's waist and knee, should be taken into perspective, yet Team China refuses to make any excuses.

"Our young athletes have gained major experience and have learned lessons about their weakness," Wang Liqin, president of the Chinese Table Tennis Association, said in his review of the championships.

"Looking ahead, we should carry forward the fighting spirit of the Chinese table tennis program, identify our weakness in training and improve them for future competitions in order to strive for more honors in the buildup to the 2028 Los Angeles Olympics," said Wang.

SPORT CLIMBING

Zhao continues his meteoric rise, smashes another record

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

In barely the blink of an eye, 16-year-old Chinese climber Zhao Yicheng had already slammed the buzzer — and rewritten the world record yet again.

At the World Climbing Series Wujiang 2026 on Sunday night, Zhao stormed to victory in the men's speed event with a time of 4.54 seconds, breaking his own world record for the second time in a month and defeating former record holder Samuel Watson of the United States in a much-anticipated semifinal showdown.

For the climbing world, it was more than a race. It was a direct duel between two of the sport's brightest young stars.

Watson, born in 2006, emerged during the Paris Olympic cycle as one of speed climbing's defining talents, becoming the first athlete to push the discipline into the "4.70-second era".

Yet since the Paris Games, global attention has increasingly shifted toward Zhao, his younger Chinese counterpart, who has already claimed three world youth titles and repeatedly produced times faster than previous world records.

Just weeks before arriving in Wujiang, Jiangsu province, Zhao had lowered Watson's mark to 4.58 seconds at the Asian Beach Games. In Wujiang, he went even faster.

Once the starting signal sounded, both climbers exploded up the wall almost simultaneously. Zhao produced the fastest reaction time of the day and maintained his advantage throughout the climb, stopping the clock at 4.54 seconds.

Yet Zhao insisted afterward that the climb was far from perfect.

"I think everyone performed at a high level in this competition, but my performance was definitely not perfect," he said. "I still saw a lot of details I can improve upon, and I feel I can climb even faster in the future."

Despite being labeled a "genius" by many observers, Zhao credited both talent and hard work for his rise.

"I have to admit that I do have talent, because talent makes my hard work more effective," he said. "But I also don't think I work any less hard than others. Talent gives me a higher starting point, while hard work allows me to go further."

The teenager said elite competition motivates rather than intimidates him.

"Honestly, without him, I probably wouldn't have climbed such a fast time today," Zhao said of Watson. "I didn't feel pressure facing him — more motivation than anything."

That motivation was evident in his explosive semifinal start, where Zhao recorded the quickest reaction time of the day.

Zhao Yicheng of China and Samuel Watson of the United States in action during the semifinal of the World Climbing Series Wujiang 2026 on Sunday night. PROVIDED TO CHINA DAILY

"My opponents don't actually affect me that much personally. I focus more on myself," he said. "Before competitions, I usually listen to music to help myself relax and get into the rhythm of the event."

Adding another layer of significance, Zhao's breakthrough performance came in his hometown of Suzhou, Jiangsu province.

For years, he had attended the Wujiang event as a spectator. On Sunday night, he stood center stage as champion.

"From being a spectator to becoming an athlete, I've been watching the Wujiang competition for three or four straight years," Zhao said. "Last year, I was already looking forward to doing something on this stage.

"But, today, I actually felt more relaxed. Maybe people outside have certain expectations of me, but I think the enthusiasm of the crowd allowed me to completely be myself."

Watson, who eventually took bronze, also offered glowing praise for the Chinese teenager.

"He is undoubtedly the most talented speed climber I've ever seen," the 20-year-old American said. "I knew I had to give 100 percent against him."

Watson revealed that the two climbers had already become familiar with each other and even chatted about basketball beside the podium before the medal ceremony.

Chinese climber Long Jianguo claimed silver in the men's speed competition.

Wujiang in limelight

Beyond the headline duel, the Wujiang leg highlighted broader changes reshaping competitive climbing ahead of the 2028 Los Angeles Olympics, where speed, lead and boulder will each become standalone medal events.

Specialization is accelerating across the sport, with athletes pushing single-discipline performances to new extremes. In Wujiang, the overall standard in speed climbing rose dramatically. The men's cutoff time to reach the finals improved from 5.07 seconds at last year's world championships to 4.94 seconds, while the women's mark improved from 7.18 to 6.67 seconds.

The sport is also becoming an increasingly youthful pursuit.

China's entire lead climbing squad at the event consisted of athletes born after 2000, with the oldest only 25 years old.

Eighteen-year-old Chinese climber Hu Junzhe advanced to the semifinals in the lead discipline after an impressive qualification performance.

Meanwhile, Wujiang continues to strengthen its status as one of China's climbing strongholds.

Since first hosting the event in 2013, the city has staged the international competition 11 times. This year's event again embraced the "Climbing+" model, combining competition with tourism, cultural activities, local markets and outdoor experiences as part of a broader push to integrate sports, culture and regional development.

From a once niche pursuit to an Olympic discipline constantly redefining human limits, climbing's rapid rise in China has unfolded alongside Wujiang's transformation into one of the sport's key hubs.

Sino-Tajik bilateral ties enter new phase

Xi and Rahmon sign treaty on permanent good-neighborliness

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

China and Tajikistan signed a treaty of permanent good-neighborliness, friendship and cooperation on Tuesday, ushering in a new phase in bilateral ties.

President Xi Jinping and visiting Tajik President Emomali Rahmon signed the treaty at the Great Hall of the People in Beijing. Rahmon is in China on a four-day state visit, which started on Monday.

During their talks, Xi said that firmly supporting each other is the core essence of China-Tajikistan relations.

He said that regardless of changes in the external environment, China and Tajikistan will always remain good neighbors who help each other, good friends who trust each other with sincerity, and good partners who join hands for development.

The signing of the China-Tajikistan Treaty on Permanent Good-Neighborliness, Friendship and Cooperation will fully demonstrate the high level of political mutual trust between the two countries, providing a solid guarantee for everlasting friendship from one generation to another, Xi said, adding that China is willing to work with Tajikistan to promote the building of a closer community with a shared future to better benefit the people of both nations.

Rahmon hailed the signing of the treaty, saying that it marks the start of a new historical stage in the countries' relations, and will open up new prospects for their long-term cooperation.

The treaty came amid the steady growth of bilateral ties guided by the two heads of state in recent years. In 2023, the two countries announced the building of a China-Tajikistan community with a shared future featuring everlasting friendship, solidarity and mutual benefit. In 2024, the two countries elevated their ties to a comprehensive strategic cooperative partnership in the new era.

Xi paid three state visits to Tajikistan — in 2014, 2019 and 2024. Rahmon visited China 22 times, and his last trip to China was to attend the 25th Shanghai Cooperation Organization Summit in Tianjin and the grand gathering to commemorate the 80th anniversary of the victory in the Chinese People's War of Resistance against Japanese Aggression and the World Anti-Fascist War in Beijing last September.

President Xi Jinping holds a welcoming ceremony for President of Tajikistan Emomali Rahmon in Beijing on Tuesday. Rahmon is in China on a four-day state visit, which started on Monday. FENG YONGBIN / CHINA DAILY

Inside
See more, **page 11**

During the talks on Tuesday, Xi called on the two countries to deeply align their development strategies under the framework of the Belt and Road Initiative to assist each other in achieving their development goals.

He underlined the need to consolidate the positive momentum of economic and trade cooperation between the two countries to explore cooperation potential, and simultaneously enhance the scale and quality of trade and investment.

It is essential to ensure the implementation of key projects, expand cooperation in areas such as green energy, the digital economy, smart cities and artificial intelligence, and boost technological innovation, Xi said.

Xi highlighted the need to strengthen law enforcement and security cooperation in order to resolutely combat the "three evil forces" of terrorism, separatism and extremism, and jointly maintain regional stability.

Rahmon hailed the development of bilateral ties and fruitful cooperation in such fields as trade, investment, transportation and agriculture. He reiterated Tajikistan's commitment to the one-China principle, saying that Taiwan is an inseparable part of China.

Tajikistan looks forward to strengthening practical cooperation with China in key areas such as critical minerals, AI and technological innovation, facilitating mutual visits and enhancing educational exchanges to further advance the relationship between the two countries, he said.

Rahmon said the Global Governance Initiative, proposed by President Xi, holds significant importance for the world. Tajikistan highly appreciates China's relentless efforts to promote the political settlement of international hotspot issues and its important role in easing tensions in the Middle East, he said.

After the talks, the two heads of state signed a joint statement of the two countries on deepening the comprehensive strategic cooperative partnership in the new era. They also witnessed the signing of multiple cooperation documents in areas such as political party exchanges, trade and investment, AI, green minerals and media.

Economic and trade cooperation has been a steady driver of China-Tajikistan ties. China has become Tajikistan's largest trading partner and remains its top source of investment. Bilateral trade reached $790 million in the first quarter of this year, a year-on-year increase of over 50 percent, according to China's Foreign Ministry.

Liu Yitong, an assistant research fellow at the Department for World Economy and Development of the China Institute of International Studies, said that amid growing uncertainties and instability in the international situation, strengthening high-level exchanges and deepening strategic mutual trust between China and Tajikistan are of great practical and exemplary significance.

Rahmon's China visit is expected to solidify political mutual trust, deepen practical cooperation, enhance cultural exchanges and strengthen security collaboration between the two countries, Liu said.

Xi navigates China-US relations amid global uncertainty

By **XINHUA**

The Chinese capital will soon become the setting for one of the most closely watched, high-stakes diplomatic encounters of the year, as the leaders of the world's two largest economies prepare to meet face-to-face.

This will be US President Donald Trump's first state visit to China since his reelection, and the second time President Xi Jinping has hosted him in the country — their last such meeting in the country took place nearly a decade ago.

Against the backdrop of a complex international landscape and shared global challenges, expectations are high: How can President Xi and Trump manage differences between the two sides? How can they navigate the most consequential bilateral relationship?

"You and I are at the helm of China-US relations," Xi told Trump during their talks in Busan, South Korea, in October 2025. Lasting more than 100 minutes, the meeting was another moment of direct engagement between the two leaders as they sought to steer China-US ties through uncertainty.

Using a maritime metaphor that is a recurring theme in his remarks, Xi asked Trump to help keep the "giant ship" of bilateral ties sailing steadily forward.

Over the years, head-of-state diplomacy has anchored China-US relations, serving as a stabilizing force amid shifting global currents. Since Trump's reelection, Xi has spoken with him by phone five times, maintaining close communication on ties and global hotspot issues.

Stable Sino-US ties linked to global outlook

By **PRIME SARMIENTO**
in Hong Kong
prime@chinadailyapac.com

US President Donald Trump's upcoming state visit to Beijing and his meeting with Chinese President Xi Jinping are fueling a high sense of anticipation across the Asia-Pacific and beyond, with analysts noting that stable China-US ties will benefit the regional and global outlook.

Trump is scheduled to visit China from Wednesday to Friday. Analysts expect that discussions on the US tariffs — which have been weighing on Asian economic growth — will be part of the closely-watched dialogue between the presidents.

"International eyes will be on this summit between Xi and Trump, what they will be discussing, whether any new deals will be made and (whether they will cover) certain deals that have been discussed previously and whether that would continue," said Mustafa Izzuddin, an international analyst at Solaris Strategies Singapore.

He said that what is important is that there is a channel of communication between the two major powers.

"I think we have to be realistic about what can be achieved," Mustafa said. "But I think at the same time, there is hope and some degree of optimism that because the two leaders have agreed to meet, that in itself is a positive step".

Mustafa said that Asian countries would like to see trade tensions between the world's top two economies "kept as minimal as possible".

"What happens between the US and China will have huge ramifications for the rest of Asia," he said.

Amitendu Palit, a senior research fellow at the Institute of South Asian Studies at the National University of Singapore, said that most Asian economies are hoping that US-China tensions "are not going to flare up in a way that becomes damaging to the prospects of the Asian economy which leads to disruptions in Asian supply chains".

"So I think this is where the Asian economies really have a very high stake," Palit said.

Chinese Foreign Ministry spokesman Guo Jiakun said on Monday that Xi will have an in-depth exchange of views with Trump on major issues concerning China-US relations and world peace and development.

Irreplaceable role

In a news briefing, Guo pointed out that head-of-state diplomacy plays an irreplaceable role in providing strategic guidance for China-US relations.

Trump's visit this week will mark his first trip to China during his second term in office, and the first visit to China by a US president in nine years.

Xi and Trump last met in October 2025 in Busan, South Korea, on the sidelines of the APEC summit.

Lu Ting, chief China economist at Nomura Securities, said the meeting this week between the leaders "represents a critical moment in US-China relations".

"The meeting offers both sides an opportunity to stabilize relations and secure short-term wins," Lu said in his latest research note.

He expected trade issues to dominate the discussions, with negotiations on tariffs to be heavily influenced by the US Supreme Court ruling in February that invalidated several of the tariffs imposed under the International Emergency Economic Powers Act.

Palit said the US tariff issue is a key concern in Asia owing to its huge impact on international trade and supply chains.

"This is again an area of deep uncertainty," he said. Unresolved conflict between the US and China over tariffs would create "a lot of uncertainty" over the management of supply chains, Palit added.

Beijing, Washington should lead way to peace, development

WORLD WATCH
By Alessandro Golombiewski Teixeira

At a time of intensifying geopolitical tensions, economic fragmentation, climate vulnerability and rapid technological change, the roles of China and the United States are globally significant. As the world's largest economies and most influential actors, their relationship is a core pillar of global stability.

US President Donald Trump's three-day state visit to China from Wednesday to Friday provides a timely opportunity to recalibrate this relationship through renewed dialogue and strategic restraint. The trajectory of China-US relations will shape both bilateral outcomes and global development, particularly across the Global South.

Today's interconnected risks exceed any single state's capacity. Armed conflicts destabilize regions, while supply chain vulnerabilities and financial volatility expose structural weaknesses in the global economy.

Concurrently, rising inflation and unsustainable debt burdens constrain policy space in developing countries.

Climate change compounds these pressures, disproportionately affecting low-income regions.

Across Africa, Latin America, Asia and the Pacific, policy priorities remain centered on economic recovery, poverty alleviation, food security, infrastructure and technological access.

These concerns contrast sharply with the growing strategic competition between major powers.

Against this backdrop, China and the US bear a heightened responsibility to manage their differences within a framework of strategic stability.

Diplomacy: Seeking the right path for relations

From page 1

The two presidents first met in 2017, a year marked by an exchange of state visits that set the tone for their interactions. In April that year, Xi and his wife, Peng Liyuan, visited Trump's Mar-a-Lago estate in the US state of Florida, where the two presidents dined together and Xi met Trump's family, including his grandchildren.

It was during that visit that Xi delivered a line often recalled in discussions of bilateral ties: "There are a thousand reasons to make the China-US relationship a success, but not a single reason to break it."

Several months later, in November, Trump traveled to Beijing, where Xi hosted him during a series of special events. The two leaders and their spouses toured the Forbidden City along its central axis, visiting the Hall of Supreme Harmony, the Hall of Central Harmony and the Hall of Preserving Harmony — an experience imbued with the Chinese cultural ideal of "harmony" reflected in the names of the three grand halls.

Walking inside the ancient royal palace, Xi told Trump that China's history can be traced back more than 5,000 years, or even earlier, and its culture has been passed down in an unbroken continuum.

During a chat over tea on that trip, Trump showed Xi a video of his granddaughter, Arabella Kushner, singing and reciting classical poems in Mandarin. Xi said her performance deserved an A-plus. The clip quickly resonated with Chinese netizens and went viral online.

Those early exchanges were widely seen as helping to build a personal rapport between the two leaders, offering a channel to understand each other, manage differences and prevent the relationship from sliding into outright confrontation. "I have a lot of respect for President Xi," Trump has often said.

The past years have seen Xi's meetings with US leaders using this approach — from the Mar-a-Lago summit and the Yingtai evening talks in the Zhongnanhai compound to the long conversation by China's West Lake — often remembered as defining moments in bilateral ties.

The upcoming meeting is expected to continue the tradition of high-level engagement. "The real significance of this meeting may not lie in any grand deal," said Denis Simon, a senior fellow at the Quincy Institute. "Instead, it will test whether the United States and China can establish an equilibrium."

Earlier this year, on Feb 4 — "*lichun*", the traditional Chinese marker for the beginning of spring — Xi spoke with Trump by phone for the first time in 2026, returning to the metaphor that has come to define his messages on bilateral ties.

"In the year ahead," Xi said, "I look forward to working with you to steer the giant ship of China-US relations through winds and waves, keep it on a steady course, and achieve more major and positive outcomes."

Avoiding miscalculations

In recent years, China-US relations have experienced twists and turns. Some observers fear that China and the United States may repeat the historical pattern of major-power rivalry known as the "Thucydides Trap." Yet, Xi has rejected this notion: "There is no such thing as a 'Thucydides Trap' in the world. But repeated strategic miscalculations between major countries could create one for themselves."

Avoiding such miscalculations, therefore, has become a critical task for China and the United States, which requires both sides to engage in candid dialogue on several key issues.

Foremost is the Taiwan question. President Xi has repeatedly and unequivocally conveyed China's fundamental stance to the US side. In the Feb 4 phone conversation with Trump, Xi once again stressed that the Taiwan question is the most important and sensitive issue in China-US relations, urging the US side to handle arms sales to Taiwan with utmost prudence.

Trade is another critical issue. In the face of unilateral US tariff offensives, China, under Xi's leadership, has taken resolute countermeasures.

At the same time, Beijing has kept channels of engagement open. Xi has dispatched economic and trade teams that have held six rounds of talks with the US side, seeking to narrow differences step by step while expanding common ground. Currently, trade ties between the two countries remain roughly steady. The two sides are holding a new round of trade talks in South Korea from May 12 to 13.

During their Busan meeting, Xi underscored the broader perspective needed to manage such frictions.

"Both sides should take a broader and longer-term view," Xi told Trump, "focusing on the lasting benefits of cooperation instead of falling into a vicious cycle of retaliation." Trump described Xi as a great leader and a firm negotiator.

How, then, does Xi envision the direction of bilateral ties leading into the future? In a speech delivered in San Francisco in 2023, he posed what he described as the number-one question: "Are we adversaries, or partners?"

"If one sees the other side as a primary competitor, the most consequential geopolitical challenge and a pacing threat," he warned, "it will only lead to misinformed policy making, misguided actions, and unwanted results."

Xi also stressed that China has no intention of challenging or unseating the United States. "China never bets against the United States," he said. "Likewise, the United States should not bet against China."

Drawing on the experience of China-US relations, Xi has outlined three principles — mutual respect, peaceful coexistence and win-win cooperation — as the right path forward for the two countries.

'Small ball moves big globe'

This April, Xi sent a congratulatory letter to an event commemorating the 55th anniversary of China-US Ping-Pong Diplomacy, recalling the historic 1971 episode often described as "a small ball moving the big globe."

In 1971, a US table tennis team visited Beijing, a breakthrough that thawed more than two decades of estrangement, and helped pave the way for then US President Richard Nixon's landmark visit to China in 1972, and later the establishment of diplomatic ties between the two countries in 1979. Its impact extended far beyond the bilateral sphere, profoundly reshaping the global landscape.

More than half a century on, Xi referred to the story not merely as a historical memory, but as a reminder of the profound influence stable China-US relations can have on the wider world.

In a 2024 meeting with Antony Blinken, former US Secretary of State, Xi invoked a concept inspired by traditional Chinese culture — "*tong qiu gong ji*" ("working together for the common good on the same planet").

"Planet Earth is only this big, and humanity is faced with so many common challenges," Xi said. "As an old Chinese saying goes, 'Passengers in the same boat should help each other.' Today, as I see it, 'dwellers of the same planet should help each other'."

During their meeting in Busan, Trump also acknowledged the importance of cooperation between the two countries, saying that China and the United States can get many great things done for the world and have many years of success.

"There is no geopolitical relationship more important than the China-US bilateral relationship ... with by far the largest impact on global affairs," said Robert Lawrence Kuhn, chairman of the Kuhn Foundation.

For both countries, a stable China-US relationship helps remove obstacles to domestic development. More broadly, it carries profound significance for global stability and prosperity, according to Kuhn.

The timing adds further weight to the relationship. In 2026, China is embarking on its 15th Five-Year Plan (2026-30), while the United States marks the 250th anniversary of its founding. The two countries will respectively host major global gatherings, the APEC Economic Leaders' Meeting in Shenzhen and the G20 Leaders' Summit in Miami, which will place them at the center of the international agenda.

Beyond red-line and trade issues, observers also point to several areas where cooperation remains vital for both sides, including climate change, counternarcotics and artificial intelligence.

For Xi, it is precisely these countless small acts of cooperation that carry lasting significance.

He once reminded Trump that for China and the United States, "it is always right to do a good thing, however small, and always wrong to do a bad thing, however small."

Just as the Chinese leader has noted on many occasions, China and the United States, as two major countries, can shoulder their responsibilities and work together to accomplish more great and concrete things for the good of both countries and the whole world.

Exchanges among young people exceed expectations

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

More than 48,500 young people from the United States have visited China for exchange and study programs since the launch of the "50,000 in Five Years" initiative more than two years ago, according to the latest data released by the Ministry of Education.

The initiative, which was announced by President Xi Jinping in San Francisco in November 2023, aims to encourage more exchanges among young people of the two countries.

Yang Dan, head of the Department of International Cooperation and Exchanges of the Ministry of Education, said the initiative has been widely applauded by Chinese and US communities as a means to boost people-to-people ties and inject youthful vitality into bilateral relations.

"The initiative's implementation has seen progress, exceeding expectations in terms of speed, outcomes and global impact," Yang said.

As of early March, the number of young people from the US visiting China had surpassed 48,500, he said, adding that they traveled from all 50 states of the US and visited 31 provincial-level regions on the Chinese mainland, as well as the Hong Kong and Macao special administrative regions.

> "The initiative's implementation has seen progress, exceeding expectations in terms of speed, outcomes and global impact."
>
> **Yang Dan,** head of the Ministry of Education's Department of International Cooperation and Exchanges

The groups comprised students from institutions ranging from primary schools to universities in the US, and many of them set foot in China for the first time, gaining a vivid and multidimensional understanding of the country, Yang said.

The projects and activities they participated in ranged from cultural experiences and language learning to summer and winter camps, science and technology exchanges, sports competitions, academic credit programs and degree courses.

"Seeing is believing," Yang said, noting that by touring China, these young people from the US have been able to closely engage with their Chinese peers on topics such as global governance, environmental protection, cultural heritage preservation and innovative development.

He said that young people from the US returned home with lively stories about China, becoming rational and objective voices with regard to China-US ties.

Fifty thousand young people means 50,000 friendships and 50,000 channels of communication, Yang said, emphasizing that they could turn the inclusive, open, trusting and win-win spirit cultivated through peer activities into a solid foundation for the positive growth of bilateral relations.

They can become a lasting source of strength for the stable, healthy and sustainable development of China-US relations, he added.

Moving forward, Yang said, China will explore more diverse forms of exchange, build more platforms and introduce stronger social support to encourage sustained and institutionalized mutual visits.

When more and more young people from China and the US become envoys of friendship and when heart-to-heart communication forms a mighty force, the China-US relationship will be built on a stronger foundation and have a brighter future, Yang said.

One notable example of such an exchange took place at Jiaxing University in Zhejiang province in May last year, when 11 students and faculty members from Missouri State University attended a business administration exchange program.

During the weeklong event, the US delegation visited Alibaba and Hormel Foods to learn about cross-border e-commerce and localized product innovation.

As part of an in-depth exploration of Jiaxing's specialty industries, the participants studied how local woolen sweater enterprises have adopted cross-border e-commerce and artificial intelligence-driven solutions to upgrade their operations and boost exports.

Cultural activities included making traditional pastries, dumplings and *zongzi*, or sticky rice wrapped in leaves with various fillings, as well as visits to Nanhu Lake in Jiaxing and West Lake in Hangzhou, the capital of Zhejiang.

"This trip to China, to Jiaxing, will be an unforgettable memory for the rest of my life. I will tell my classmates back in the US about the different China I have experienced," said Michael James Guilfoy, a student from Missouri State University.

Anthony Lakin, another student from the university, who documented his journey on camera, called it "the best experience" of his life, adding that he would definitely ask his family members and friends to visit China.

Daezia Cymone Smith, a Missouri State University faculty member, said that she will tell her family about "the real China", which is "a very cool experience".

China, US can inject impetus into recovery

Structural complementarity of nations helps benefit businesses on both sides, say experts

By **WANG KEJU** and **MA SI**

As the world's two largest economies, China and the United States can benefit businesses on both sides and inject fresh momentum into global economic recovery by finding more common ground and working together to manage differences, said economists and business executives.

The structural complementarity between the two nations, which spans manufacturing, technology and services, is too significant to be disrupted by trade frictions, they added.

"American companies are continuing to invest. American companies aren't going anywhere," said Sean Stein, president of the US-China Business Council, countering the narrative that US businesses are leaving China.

"It's not just the China market anymore; it's the China platform," he said, noting that the platform encompasses everything — from consumer access and partnerships with local enterprises to research and development and supply chain resilience — which is "only becoming more important".

Stein emphasized that coming to China will help US business leaders develop a clearer view and a more realistic understanding of where China stands. Until that happens, it is easy to imagine dangers and concerns that may not be as serious as they seem, he said. "Twenty-five years ago, no one came to China to do R&D. Now what I'm seeing is that the best companies are coming and doing some of their most important R&D," he added.

According to data from the Ministry of Commerce, foreign direct investment in China's high-tech industries surged 30.7 percent year-on-year to 102.73 billion yuan ($15.12 billion) in the first quarter of 2026, pushing the sector's share in total FDI to 41.2 percent.

Eric Zheng, president of the American Chamber of Commerce in Shanghai, said that if US companies want to remain globally competitive, they should invest in China. "A US company that can thrive in China can succeed in many other markets around the world. The experience and capabilities built here can be directly applied elsewhere," he said.

Zheng added that the complementarity of the US-China economic relationship means that stable and predictable bilateral trade ties serve the fundamental interests of both nations and greatly benefit businesses on both sides.

Geoff Martha, chairman and CEO of the US-based medical technology company Medtronic, said that China is not only a market with the potential to become the world's largest market for medical technology, but also a valuable partner.

"That commitment is reflected in our long-term investments," he said. "We see strong alignment between China's focus on new quality productive forces and Medtronic's work to develop next-generation technologies that can improve care and expand access for patients."

Surveys indicate that US businesses prefer stability over confrontation. In late April, a white paper released by the American Chamber of Commerce in China noted that more than half of US companies in China still rank the country among their top three global investment destinations.

Liao Fan, director of the Chinese Academy of Social Sciences' Institute of World Economics and Politics, said that despite years of trade tensions and escalating rhetoric, the underlying economic logic of China-US cooperation remains intact.

"You cannot decouple two economies that have been interwoven together over decades through investment, supply chain integration and market interdependence. The cost of separation would be measured in trillions of dollars and millions of jobs," Liao said.

Zhang Yansheng, a researcher at the Chinese Academy of Macroeconomic Research, noted that China and the US are not only very important for each other, but their relationship is of utmost importance for the world.

According to the International Monetary Fund, the combined nominal GDP of China and the US accounted for nearly 45 percent of the global economy in 2025. A report released in March by the US-based McKinsey Global Institute also showed that the decline in US-China trade reduced global trade growth by around 10 percent last year.

He Weiwen, a senior fellow at the Beijing-based think tank Center for China and Globalization, said that for the relationship to be truly fair and mutually beneficial, the US must remove the unreasonable restrictions it has imposed on China.

Duo builds bridge of friendship across time, weaving new threads of Kuliang stories

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

Nestled in the green hills near the coastal city of Fuzhou, the capital of Fujian province, is a village called Kuliang, which was once home to a vibrant international community. After the foreign residents left in the mid-20th century, people largely forgot about the thriving community that once called Kuliang home.

Decades later, the stories are being revived thanks to a trans-Pacific partnership. Using old photos, personal networks and new technology, a Chinese professor and a cultural researcher from the United States are rebuilding human connections lost to time.

The collaboration began in 2015, when Elyn MacInnis, a US citizen with strong family ties to China, traveled to Fuzhou with her husband to fulfill two wishes. The first was to scatter her father-in-law's ashes in the Minjiang River, which flows through Fuzhou, thereby honoring his wish to return to the city where he once lived and taught. The second, and more challenging task, was to find the family's old home in Kuliang.

To help with the search, they brought with them a collection of faded color photos taken in the 1940s. Among those who tried to help was Lin Yinan, a Fuzhou native and an associate professor at the Shanghai-based East China University of Science and Technology. "We got the photos and tried to identify the house, but we couldn't pinpoint its location," Lin recalled. "That's where the story began."

Sense of connection

That visit instilled a renewed sense of connection in MacInnis. Upon returning to the US, she delved deeper into the archives to uncover Kuliang's stories and began reaching out to other US families with connections to the mountain village, leading to the establishment of the Kuliang Friends group. The breakthrough came in 2016, when MacInnis found a map of Kuliang and a name list. But it was written in an incomprehensible script: English phonetic approximations of the Fuzhou dialect.

Lin stepped in to bridge the gap. "I'm a local," Lin explained. "I can understand the dialect, and I speak both English and Chinese, so I could help decode it."

Lin's and MacInnis' skills proved complementary. In the US, MacInnis took on the role of archival detective, scouring libraries, family collections and online databases for photographs, letters and diaries. Lin in China became the decoder and field researcher, using his knowledge to translate names and verify locations on the ground.

"We instantly became the team — the Kuliang research team — the two of us," said MacInnis. The duo leveraged the time difference to work around the clock, joking that they simply took turns to sleep while the other worked, since they were on opposite sides of the world. "We worked basically 24 hours a day, seven days a week," MacInnis said, "as hard as we could — in archives, on the internet, with other people."

As the flow of information grew, a new challenge emerged: how could the unnamed faces in the old photographs be identified? Lin and his team of students engineered an innovative solution. They developed the Kuliang Genealogy system, which is China's first digital archive for an overseas community. Using facial recognition technology, the system scans old photos, identifies individuals and reconstructs family trees and social networks.

One of the human connections restored by the system led to an unusual reunion. It gave 85-year-old Gail Harris, whose family once spent their summers in Kuliang, the first-ever glimpse of her mother as a 21-year-old, as captured in a Fuzhou college faculty photo. For Lin, such moments strengthened his sense of mission: to rebuild a severed social fabric. "When I see old photos of Chinese and Americans staying together, I just want to tell their descendants, 'Look, your ancestors were good friends'," he said.

With their joint efforts, Lin and MacInnis have traced at least 80 families and 120 houses with links to Kuliang, and the Kuliang Friends network has expanded to comprise more than 50 members. Notable discoveries include the families of Ruth Hemenway, a US physician who served mothers and children in Minqing, Fujian, for 12 years, and Bruce Hayes, a Fuzhou-born hero who served in a coast-watching unit in support of the Flying Tigers during World War II.

"We keep coming across new stories," said MacInnis. "It will never be rote or boring because we find new people and new stories all the time."

Tangible reality

For her, the power of Kuliang lies in its tangible reality. "Kuliang is not abstract or idealized. It's real," she said, citing the true stories and returning descendants as living proof. The community, she noted, was made up of real people — teachers, doctors, scientists and farmers — who had lived, worked and built trust alongside their Chinese neighbors over generations.

Lin Yinan (right), an associate professor at Shanghai-based East China University of Science and Technology, introduces to Elyn MacInnis the genealogical system to search for foreigners who lived in Kuliang, Fujian province, and their descendants during a meeting in the village on June 21, 2024. LIN SHANCHUAN / XINHUA

This is not something automatic, MacInnis reflected. "The story really is seeing what happens when you take the time to be friends and to work together."

She added that the whole Kuliang bond program has been a joy. For her, it is not only about the historical discovery, but also the chance to share it with a new generation, so they could inherit that spirit.

"It is that friendship that is one of the anchors of peace," she said. "We're all looking for that."

Envoys call for deeper China-California ties

Trade, innovation and green development emphasized at Los Angeles business forum

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Chinese envoys to the United States on Monday highlighted the importance of deepening China-California cooperation in trade, innovation and green development, while calling for mutual respect, openness and practical cooperation to help stabilize China-US relations amid global uncertainties.

The 2026 China-California Business Forum, themed "Better Understanding Better Business," brought together local US business leaders and a Chinese delegation consisting of more than 150 business leaders and trade officials from dozens of Chinese provinces. Hainan participated as the forum's guest province of honor.

In a video address to the forum, Chinese Ambassador to the United States Xie Feng said California's trade with China approached $90 billion last year, leading all US states, and noted that "two out of every five containers moving between China and the United States passed through California ports".

Xie said China's economy had maintained strong momentum despite a "fluid external environment", adding that China's recently adopted 15th Five-Year Plan (2026-30) outlined a strategic blueprint for Chinese modernization and higher-quality growth.

Xie said more people had come to recognize that China, with stable policies, dynamic growth and greater openness, is "an anchor of stability for the global economy" and "a window of opportunity for all parties to share in China's development dividends".

Calling California "a natural partner for China", Xie proposed four suggestions for advancing bilateral cooperation, including focusing on people's well-being, embracing green growth, upholding openness and unleashing innovation.

In particular, Xie said China and California could deepen cooperation in clean energy, green materials, carbon capture, utilization and storage, as well as green finance including green bonds, climate funds and carbon markets, helping build "a cleaner, more beautiful and more sustainable world".

Xie also stressed the importance of stable China-US relations, saying that "the more turbulent the world becomes, the more important China-US relations are". He reiterated that "mutual respect, peaceful coexistence and win-win cooperation should be the direction of our joint efforts".

Echoing Xie's remarks, Chinese Consul General in Los Angeles Guo Shaochun said the forum's development over the past decade demonstrated the significance of sub-national cooperation between China and California.

Guo said China and California maintained highly complementary economies and close cooperation in trade, ports, shipping, education, film and television, among other sectors.

He also highlighted the growing role of Chinese companies in California's economy. Guo said China ranked as the ninth-largest source of foreign investment in California in 2025, supporting more than 25,000 jobs.

At the same time, California-based companies including Apple, Qualcomm and Skechers continue to deepen cooperation with Chinese supply chain partners, he said.

Guo also pointed to cooperation between the ports of Los Angeles, Long Beach and Shanghai on green shipping corridors and low-carbon development in the global shipping industry.

On educational exchanges, Guo said Southern California hosts more than 50,000 Chinese students annually, contributing over $4 billion to the local economy each year.

He also noted the success of Hollywood films in the Chinese market, citing *Zootopia 2* as an example. According to Guo, the film generated nearly 4.6 billion yuan ($637 million) at the Chinese box office, accounting for about half of its global revenue.

Guo said the business community remained "the most dynamic, pragmatic and resilient force in China-US relations" and called for expanded cooperation in modern agriculture, green transition, artificial intelligence, biomedicine and energy storage.

Local business leaders at the forum emphasized the significance of maintaining California-China cooperation.

Bay Area Council President and CEO Libby Schaaf expressed her appreciation for learning about China's trade policies and climate leadership.

"May our example of collaboration and cooperation for our shared benefits be an example and inspiration for all," she said.

France seeks to strengthen relations with Africa

By **EDITH MUTETHYA**
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

France is seeking to rebuild and strengthen its partnerships with African nations as it reassesses its strategy on the continent following strained relations with several West African countries, analysts said.

For the first time, France hosted the Africa Forward Summit in an English-speaking country, a move experts described as a strategic attempt to regain influence in Africa.

The two-day summit in Kenya's capital Nairobi from Monday to Tuesday drew participation from business leaders and some 30 heads of state from Africa, with France stressing "equal partnerships" with Africa, and announcing investments worth $27 billion for the continent.

The shift comes amid France's deteriorating ties with parts of West Africa, driven by rising anti-French sentiments, military coups, and growing calls to end colonial-era security arrangements in recent years.

Aly-Khan Satchu, a Kenyan investment banker, said the traditional "Francafrique" model has reached its end.

Satchu said that global trends point toward greater local ownership in partnerships, and urged African governments to negotiate stronger deals.

"It remains the responsibility of African governments to negotiate in the best interests of their citizens if we are to see the birth of genuinely equal partnerships," he said.

However, Gordon K'achola, founder of the Africa Center for Diplomatic Affairs, said France is trying to rebuild trust without directly apologizing.

"This strategy may not work for them but with woke African young leaders, they are getting into partnerships knowing what they actually want," he said, adding that France's historical legacy remains a major obstacle, particularly in Anglophone Africa, which refers to English-speaking regions in the continent.

He noted a deep trust deficit: "They shall cooperate with African countries with almost zero trust. It will be based on regaining the lost opportunity Africa has had to experience for all these years under the French manipulation."

Speaking at the summit opening, Kenya's President William Ruto said shifting global trade is reshaping the world economy.

"Fragmentation cannot be the answer, nor isolation the strategy," he said, calling for cooperation based on sovereign equality, mutual respect, and shared responsibility.

Ruto said Africa must move beyond aid and dependency toward investment, innovation, and value creation.

"Africa is not part of the global problem but part of the solution," he said, highlighting the continent's natural resources, young population, and renewable energy potential.

Antonio Guterres, secretary-general of the United Nations, said Africa is now leading key global debates on reforming a financial system designed in 1945.

He said African leadership is building new tools such as the borrower's platform so that countries can speak with one voice and negotiate from a position of strength. "It is challenging credit rating systems that prevent many countries from accessing the borrowing tools they need," Guterres said.

He noted African-led efforts to strengthen collective bargaining, reform credit rating systems, and expand the lending capacity of development banks, while easing debt pressures.

Mahmoud Ali Youssouf, the chairman of the African Union Commission, said Africa must take a leading role in global affairs.

Emmanuel Macron, the president of France, said Africa is now viewed as a full partner rather than just a source of raw materials.

"We are working toward a transformation of investment relations, focusing on value chains, energy, and sustainable development," he said, adding that future cooperation will emphasize financial reform, taxation, and debt restructuring.

Starmer vows to stay amid growing calls to resign

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

British Prime Minister Keir Starmer has told his Cabinet he has no intention of stepping down despite coming under increasing internal pressure following last week's hugely disappointing local election results for the ruling Labour Party.

Three junior ministers have resigned from the government as of press time and they called for a change in leadership, but no candidate has yet come forward to challenge Starmer directly.

Earlier on Tuesday, the BBC reported that 78 of Labour's 403 members of parliament had called on him to go, with some senior ministers reported to be among them, but his message to the Cabinet was defiant.

"As I said yesterday, I take responsibility for these election results and I take responsibility for delivering the change we promised," he reportedly told them.

He went on to call the previous 48 hours "destabilizing for government", having an economic impact on the lives of voters, and added, "The Labour Party has a process for challenging a leader and that has not been triggered.

"The country expects us to get on with governing. That is what I am doing and what we must do as a Cabinet." Writing on X, Housing Secretary Steve Reed gave Starmer his backing, repeating the point about voters paying the price for party infighting.

"This instability has consequences for people's lives," he said.

"The people who will be hurt most will be those that elected us less than two years ago. We must unite behind the prime minister."

Starmer gave a speech to Labour MPs on Monday where he hoped to regain control of the situation, but a statement from one of the new 2024 election intakes, Paul Foster, said this had not succeeded.

Rebuilding confidence

"Unfortunately, after much reflection, the prime minister's speech yesterday did little to reassure me that he has the vision needed to reconnect with the country and rebuild public confidence under his leadership," he said.

"It pains me to say this because I am a loyal person by nature, and I do not come to this conclusion lightly. But it is with great regret that I believe the party now needs a change of direction and, ultimately, a new leader."

If Starmer were to leave his post, it would not automatically trigger a general election as the Labour Party has a large majority in parliament, but it would continue a decade-long pattern of leadership change at the top of British government, with previous Conservative Party prime ministers David Cameron, Theresa May, Boris Johnson and Liz Truss all having been replaced midterm, for differing reasons, and only Rishi Sunak leaving office after a general election defeat.

Agencies contributed to this story.

Visit: An open, rules-based and inclusive order essential

From page 1

History demonstrates that major power confrontation generates negative externalities falling disproportionately on developing economies. Trade disruptions, capital market instability and geopolitical risks erode investor confidence and constrain long-term growth. A predictable China-US relationship is, therefore, a global public good.

High-level political engagement is indispensable. Trump's visit underscores the continuing relevance of top-level diplomacy in stabilizing expectations and reducing misperceptions. Institutionalized dialogue serves as a mechanism for crisis management, trust building and policy coordination.

While structural differences will persist, they can be managed through communication and bounded competition rather than escalating confrontation. Moving beyond zero-sum frameworks toward pragmatic cooperation is essential in addressing transnational challenges.

Three principles should underpin this relationship: peace, mutual respect and development.

First, peace is the precondition for systemic stability and long-term economic growth. Disruptions in China-US relations have immediate spillover effects on global trade, investment and technological collaboration. In a fragile global economy, such disruptions impose severe costs on developing countries with limited resilience.

Second, mutual respect is necessary for sustainable engagement. This entails recognizing differences in political systems, development models and strategic interests, while avoiding policies that escalate tensions. A stable relationship requires both sides to exercise strategic restraint and prioritize long-term systemic stability over short-term tactical gains.

Third, development must remain central to global governance. China has advanced this priority through the Global Development Initiative, which refocuses international cooperation on poverty reduction, food security, climate action and innovation-driven growth. Increased China-US coordination in development financing and resource alignment would strengthen implementation, particularly in under-resourced regions.

This approach is consistent with the broader concept of a community with a shared future for humanity, which emphasizes interdependence, shared prosperity and cooperative security. It rejects zero-sum competition in favor of collective responses to transnational challenges, placing coordination and mutual benefit at the center of international engagement.

The implications of China-US relations extend deeply into the international system. For developing countries, preserving an open, rules-based and inclusive order is essential. Multilateral institutions remain critical platforms for coordination. As leading stakeholders, China and the US share a responsibility to strengthen these institutions rather than fragment them.

Climate change illustrates the strategic necessity of such cooperation. As the world's two major carbon emitters with different historical responsibilities and development stages, China and the US are indispensable to any credible global climate strategy. Coordinated action in clean energy deployment, climate finance and technological innovation can generate substantial positive spillovers. Conversely, policy divergence can significantly undermine global mitigation efforts.

Equally critical is the stability of the international financial and trading system. Fragmentation into competing blocs reduces efficiency and heightens systemic risk. Constructive engagement between China and the US can help sustain international order principles while mitigating the risks of strategic decoupling.

While strategic differences remain a structural feature, substantial scope exists for functional cooperation in areas such as public health, scientific research, poverty reduction and sustainable development. Expanding such cooperation generates tangible benefits while serving as a stabilizing force.

For developing countries, the stakes are immediate. Their core priorities are directly shaped by the external environment created by major powers. Stability in China-US relations is a practical determinant of development outcomes.

Trump's visit to China represents a timely opportunity to reaffirm shared responsibilities and advance a constructive relationship. By institutionalizing dialogue, exercising strategic restraint and prioritizing development-oriented cooperation, China and the US can move beyond destabilizing frictions. By doing so, they will contribute to a more stable, inclusive and development-focused international order.

Peace deal hopes dim as deadlock continues

Nuclear tensions deepen amid stalled US-Iran negotiations, surging oil prices

By **CUI HAIPEI** in Dubai, UAE, and **JAN YUMUL** in Hong Kong

Hopes for a peace deal with Iran faded on Tuesday after the United States said a truce was "on life support", as Tehran rejected a US proposal and hinted that a possible retaliation over further US-Israeli strikes could be uranium enrichment to 90 percent purity.

US President Donald Trump said on Monday Iran's counteroffer has put the April 8 ceasefire at severe risk.

"I would call it the weakest right now, after reading that piece of garbage they sent us. I didn't even finish reading it," he told reporters.

"The ceasefire is on massive life support," he said.

In response, Iran's Parliament Speaker Mohammad Bagher Ghalibaf said his country's armed forces stand ready to deliver a lesson-teaching response to any act of aggression.

"There is no alternative but to accept the rights of the Iranian people as laid out in the 14-point proposal," he said in a post on X on Tuesday.

Also on Tuesday, Ebrahim Rezaei, spokesman for the Iranian Parliament's National Security and Foreign Policy Commission, said Iran could enrich uranium up to 90 percent purity — a level considered weapons-grade — if its territory faces fresh military attacks. "We will review it in Parliament," he said.

The latest twists further roiled global energy markets, already disrupted by the Middle East crisis and the overlapping blockades around the Strait of Hormuz — a critical oil and gas transit route that carries about 20 percent of the world's oil shipments.

The benchmark Brent crude oil futures extended gains on Tuesday, climbing to almost $108 a barrel.

"The energy supply shock that began in the first quarter is the largest the world has ever experienced," Amin Nasser, CEO and president of Saudi Arabia's oil giant Aramco, told investors, warning it would take months for markets to rebalance even if the strait opens immediately.

"If its opening is delayed by a few more weeks, then normalization will last into 2027," he said.

The US Department of Energy said on Monday it is releasing 53.3 million barrels of crude from the Strategic Petroleum Reserve to energy firms under a global arrangement aimed at easing supply tightness, Reuters reported.

Respective demands

Washington had proposed an immediate halt to fighting before negotiating more divisive issues, including Iran's nuclear program. Tehran, however, demanded a full end to hostilities across all fronts — including in Lebanon, where Israel was continuing military strikes.

Iran also insisted on its sovereignty over the Strait of Hormuz, compensation for war damages and an end to the US naval blockade, among other preconditions.

Negotiations between Iran and the US are stuck in a deadlock amid an extremely dangerous situation, Giorgio Cafiero, a Washington-based political analyst, told Al Jazeera.

"The understatement of the century is that the ceasefire is very fragile," he said, adding any "slight miscalculation" could trigger a protracted conflict that could eventually spiral into a messy quagmire.

Iran, the US and Israel reached a ceasefire last month following 40 days of hostilities sparked by joint US-Israeli strikes on Feb 28.

Following the truce, Iranian and US delegations held one round of peace talks in Pakistan on April 11 and 12, which yielded no breakthrough. In recent weeks, the two sides have exchanged multiple proposals aimed at ending the conflict, mediated by Pakistan.

In Lebanon, local leaders have urged the US ambassador in Beirut to press Israel to halt its aerial bombardment. Israeli strikes on a town in southern Lebanon killed six people and wounded seven others, the National News Agency reported on Tuesday, as fighting continued despite a ceasefire agreement.

Lebanon's Health Ministry told Agence France-Presse on Tuesday Israeli strikes have killed 380 people since the ceasefire began on April 17.

A ministry official said that "380 people, including 22 children and 39 women, have been killed in strikes on Lebanon since the ceasefire came into effect", out of a total of around 2,900 people killed since the war erupted on March 2.

Meanwhile, US Ambassador to Israel Mike Huckabee said on Tuesday that Israel sent its homegrown Iron Dome anti-missile batteries, along with personnel to operate them, to the United Arab Emirates. The UAE did not immediately comment on his remarks.

Moscow welcomes EU discussions on dialogue

Kremlin spokesman Dmitry Peskov said on Monday that discussions in Europe on the need for dialogue with Russia were a positive development, though the situation is still in initial stages. Russian President Vladimir Putin, while responding to questions on Saturday over a potential negotiation mediator between Russia and Europe, said he would prefer former German chancellor Gerhard Schroeder for the role. Putin said Europeans should choose their own leader, one they trust and who has not made hostile remarks against Russia. "It is noteworthy that there is growing talk in Europe about the need for dialogue with Russia," Peskov told state media RIA Novosti. "We welcome this; it is a positive development, but we are still only at the beginning. We will see how things develop from here."

SPAIN

'Work not over' after hantavirus evacuation

World Health Organization chief Tedros Adhanom Ghebreyesus said on Tuesday that "our work is not over" to contain the hantavirus after evacuations from a cruise ship hit by a deadly outbreak of the illness. The fate of the MV *Hondius* has sparked international alarm after three passengers died in an outbreak of the rare virus, for which no vaccines or specific treatments exist. Yet, health officials have stressed that the global public health risk is low and rejected comparisons to the start of the COVID-19 pandemic. "There is no sign that we are seeing the start of a larger outbreak," Tedros told a joint news conference in Madrid with Spanish Prime Minister Pedro Sanchez. "But of course the situation could change, and given the long incubation period of the virus, it's possible we might see more cases in the coming weeks," Tedros said of the Andes variant, which is transmissible between humans.

Chengdu Hi-Tech Industrial Development Zone forging global ties

By **YUAN SHENGGAO**

Located beneath snow-capped mountains in Sichuan province, Chengdu is evolving into an international gateway for modern China. At the forefront of this transformation is the Chengdu Hi-Tech Industrial Development Zone, or the CDHT, a pivotal force driving the park city's emergence as a major hub for international exchanges.

The 2026 World Mayors Dialogue is being held in Chengdu until Friday, gathering representatives from 32 cities across 26 countries and five international organizations. Some participants will visit iconic sites such as Tianfu Long Island and Tiexiangsi Water Street in the CDHT to experience the progress of Chinese modernization.

On Thursday, the 2026 Chengdu International Friendship Cities Cooperation and Development Conference will kick off in the zone. Under the theme of "Openness for Win-Win Cooperation, Partnership for Shared Progress", the delegates will conduct in-depth discussions on the future development of cities.

These two high-profile international events further highlight the CDHT's growing significance as a hub for global engagement.

The Business and Innovation Centre for China-Europe Cooperation, or the CCEC, in the Chengdu Hi-Tech Industrial Development Zone in Chengdu, capital city of Sichuan province. PROVIDED TO CHINA DAILY

Founded in 1988, the CDHT spans an area of 237.2 square kilometers and was the first national innovation demonstration zone in western China. The zone's integrated circuit industry boasts the largest scale in central and western China. It produces over 60 percent of the world's iPads and 50 percent of MacBooks.

In 2025, the zone achieved a regional GDP of 366.15 billion yuan ($53.87 billion), marking a 6.1 percent year-on-year growth. Its foreign trade reached 550.8 billion yuan, accounting for 53.4 percent of Sichuan's total. It is home to a quarter of Sichuan's listed companies.

International cooperation

In 2025, the CDHT actively engaged with the international community to attract investment and talent. The zone organized or participated in 28 international delegations involving 164 representatives. These focused on key sectors such as electronic information, biomedicine, high-end equipment manufacturing and the digital economy, engaging with regions including Europe and the Association of Southeast Asian Nations.

The CDHT prioritized upgrading its international cooperative parks in 2025. The zone sent six specialized delegations abroad, including three visits to Singapore to facilitate agreements between its Singapore-Sichuan Hi-Tech Innovation Park, or the SSCIP, and five Singaporean organizations, such as Singapore Polytechnic.

A milestone was reached in October with the inauguration of the SSCIP Singapore Innovation Cooperation Center in Singapore, establishing a dual-center cooperation model between the city-state and Sichuan. The center signed cooperation agreements with more than 30 Singaporean organizations, including DBS Bank and InnoForge Ventures, to foster closer bilateral ties.

Collaboration with South Korea also deepened last year. The CDHT hosted the Golden Panda Innovation and Entrepreneurship Global Competition in the country and established an offshore incubator system by signing agreements with 19 South Korean innovation centers. This year will see the launch of a Seoul product pavilion in the CDHT and the establishment of an innovation exchange center in Seoul, fostering two-way industrial and market collaborations.

The zone has also ramped up activities in Japan, organizing more than 30 China-Japan trade and culture events in 2025. These efforts led to partnerships including one between China's National Innovation Center for UHD Video Technology and Japan's Canon.

The Business and Innovation Centre for China-Europe Cooperation in the CDHT introduced more than 10 new initiatives in 2025, including partnerships with organizations such as the Sichuan Philharmonic Orchestra and Complutense University of Madrid.

Supporting enterprises

In 2025, the CDHT addressed businesses' needs to "go global" and attract international resources through its innovative Foreign Affairs Supporting Enterprises Program. The program provided comprehensive policy outreach, delivering 11 workshops on APEC Business Travel Cards, consular protection, invitations for foreign nationals and more.

Business travel services were streamlined through a "green channel" with dedicated personnel and full-process tracking. This facilitated the issuance of more than 60 APEC Business Travel Cards and 290 foreign expert invitations, ensuring smooth talent mobility.

In addition, enterprise support was extended directly to companies. The CDHT has established a robust response mechanism by collaborating with the local foreign affairs office, immigration and police. In 2025, it provided tailored solutions for over 300 export-oriented businesses through on-site visits.

The Singapore-Sichuan Hi-Tech Innovation Park hosts more than 16,000 high-tech enterprises. These include 100 foreign-invested companies such as NCS and Medtronic.

A representative from the CDHT's international cooperation and investment promotion bureau said: "In the process of supporting enterprise development, we have identified several common challenges, such as low efficiency in connecting local resources and the lack of an internationalized community atmosphere." To address these issues, the CDHT launched an international service center in January to enhance services.

The center integrates government, industry and lifestyle functions into a 3,500-square-meter space. It enables more accessible administrative services by consolidating municipal, district and neighborhood-level service items, covering immigration, tax registration and property documentation. Nearly 350 processes can be completed through one service window, which provides bilingual services.

A key feature of the center is its cross-border industrial service corridor, which houses six platforms for trade services, cross-border finance, international talent and intellectual property. It offers life-cycle support for local companies expanding abroad and foreign enterprises entering Chengdu.

The center also prioritizes cultural exchanges and lifestyle services by establishing spaces for exhibition and communication. Southeast Asian-style markets, cafes and a dedicated section featuring Southeast Asian books have been set up to foster a sense of belonging. A Singapore-Sichuan academy, an innovative art space and a singles club will also be launched.

For expatriates, the CDHT is continuously improving their quality of life through its international service center. Integration programs, such as the Home in CDHT series, hosted over 20 events such as Dragon Boat Festival celebrations and fashion salons in 2025. Hundreds of foreigners participated.

Gateway to China

The CDHT has developed dedicated programs to elevate its role in international exchanges. These include the industry-focused CDHT Dialogue, the culture-oriented CDHT Salon and the CDHT Tour for foreign delegations. By hosting over 170 high-profile events in 2025, including investment promotions in Singapore, London and Frankfurt, the CDHT's international influence and appeal as a hub for business and culture have grown further.

In 2025, the zone played host to important dignitaries, including heads of state, and delegations of government officials and business executives from Central and Eastern Europe. This year, the zone organized industrial exchange activities, such as the China (Chengdu)-Switzerland biomedical industry exchange in January. Cultural events included a theater performance of Shakespeare and a Joan Miro art exhibition in April, celebrating the diverse collaborations between China and Europe.

In a historic first, the CDHT established a sister-city relationship with Municipio I of Rome, Italy, marking its initial step into formalized international city partnerships. This development further solidifies the zone's position in global cooperation networks.

As the CDHT continues to push the boundaries of international communication, it stands as a shining example of China's progress on the world stage. The zone's focus on cross-border partnerships, enterprise empowerment and cultural exchange ensures it will remain a key player in fostering international cooperation and driving global engagement.

COMMENT

Editorials

'Gray rhino' of Japan's remilitarization is wildly charging over regional order

There is something revealing about the debate now convulsing Japan's ruling establishment over whether China should formally be called a "threat" in the drafting of the country's new security documents that are scheduled to be deliberated next month.

Tokyo's political class already behaves as though China is a "threat". The unresolved question is whether Japan is ready to say aloud what its policies already presume.

Officially, the Sanae Takaichi government still speaks the language of a "strategic relationship of mutual benefit" with Beijing. Japanese diplomats continue to invoke the old formula of pursuing a "constructive and stable relationship" with China. Takaichi herself insists she is trying to keep the channels of dialogue "open".

Yet governments are judged by budgets, deployments, doctrines and alliances. And on that score, Japan's trajectory does not accord with its words.

Worse, Tokyo even attempts to hold Beijing accountable for tensions in bilateral relations that are, in fact, of its own making.

Against that backdrop, the current dispute inside the Liberal Democratic Party over whether China should be labeled a "threat" resembles less a substantive policy disagreement than an exercise in political cosmetics. In 2022, Japan's National Security Strategy already described China as "the greatest strategic challenge" Japan has ever faced. In its Diplomatic Bluebook released in April, the Japanese government effectively downgraded China-Japan relations.

But the more important reality is that Tokyo's conduct has long since outrun its rhetoric.

That is why the supposedly "moderate" voices inside the Japanese establishment deserve closer scrutiny. Those warning against provocative wording targeting China might not be voicing rationality. Their concern may be with avoiding a backlash that could complicate Japan's advancing of its neo-militarism.

In other words, they object not to the destination, but to the visibility of the journey. This matters because Japan has traveled this road before.

The parallels with the ideological evolution of Japanese militarism in history are difficult to ignore. Japan's descent into catastrophe did not begin with Pearl Harbor. It started much earlier — with the gradual fusion of nationalism, historical mythmaking, elite insecurity and militarized politics.

Today's rhetoric is simply old wine in a new bottle. After all, the Takaichi government has already expanded offensive military capabilities, promoted missile cooperation abroad, relaxed arms-export rules and openly discussed preparedness for a prolonged "emergency", including setting up a centralized, prime-minister-led command hub for intelligence gathering and analysis. Japanese officials are now pushing for restoring wartime-style military ranks inside the Self-Defense Forces.

Viewed collectively, these moves reveal something larger: the erosion of Japan's postwar system that emerged from the ashes of Japanese imperialism. That is precisely why the 80th anniversary of the opening of the Tokyo Trials — which fell on May 3 this year — matters.

The tribunal's significance was never confined to punishing individual war criminals such as Hideki Tojo. Its deeper purpose was to delegitimize the ideological machinery that had enabled militarism itself: emperor absolutism, historical revisionism, expansionist nationalism and the mythology of victimhood.

The pattern of the Takaichi government's fomenting of neo-militarism is historically familiar: cultivate fear, centralize authority, glorify sacrifice, exaggerate external threats and redefine expansion as self-defense.

In history, Japan's invasion of its neighbors obstructed the region's development; today the right-wing forces in Japan again threaten the very order on which the Asia-Pacific has prospered after the war. As Chinese Foreign Ministry spokesman Guo Jiakun warned on Tuesday, the "gray rhino" of Japan's remilitarization is charging straight toward the region.

The right-wing forces in Japan shamelessly portray the nation not as a historical aggressor requiring vigilance, but as a perpetually endangered "democracy" forced into reluctant militarization by "hostile neighbors". That narrative inversion — aggressor recast as victim — is central to their obfuscation of intent. The danger for Japan is therefore not primarily external but from within: the erosion of historical memory, the normalization of ideological nationalism and the steady abandonment of postwar restraint in favor of the romanticism of assertive "self-defense".

History rarely repeats itself precisely. But nations that convince themselves they have transcended history and therefore no longer need to reflect on it are often the ones most vulnerable to reenacting it.

Code of conduct requires sincerity to finalize

The 48th Summit of the Association of Southeast Asian Nations concluded in Cebu, the Philippines, last week with the release of a statement underscoring the need for a Code of Conduct in the South China Sea grounded in international law.

Philippine President Ferdinand Marcos Jr, at a subsequent news conference, expressed optimism that this long-sought agreement could be finalized within the year.

While the COC is welcome, achieving it requires unwavering focus and, crucially, an end to actions that undermine the very trust the document seeks to build.

Over the past year, cooperation in the South China Sea has maintained stable momentum with peace, cooperation and friendship being the general consensus of regional countries. Provocations and attempts to undermine that consensus go against the regional will.

China insists that peace, cooperation and friendship constitute the new narrative for the South China Sea. It has engaged in in-depth discussions with Indonesia regarding joint maritime development, held bilateral dialogues on maritime issues with Malaysia, and carried out cooperation on the sustainable development of fisheries with Vietnam.

Apart from such concrete actions, robust institutional safeguards are still needed. Building upon the continued and effective implementation of the Declaration on the Conduct of Parties in the South China Sea, consultations on the COC have now entered a critical stage, with all parties looking forward to concluding the negotiations.

As Chinese Foreign Ministry spokesman Guo Jiakun said on Monday, formulating the COC is an important measure for implementing the DOC, and also an important agreement between China and ASEAN countries. It will help the parties better manage differences, advance cooperation and keep the South China Sea peaceful and stable.

China is engaging in close consultations with ASEAN countries on the text of the COC and is determined to work alongside all parties — by overcoming external interference and bridging differences while seeking common ground — to reach a consensus as soon as possible, thereby establishing a practical and effective framework for all parties to manage differences, enhance mutual trust and promote cooperation.

To reach an agreement on the COC at an early date, the parties concerned need to stick to the shared goals of peace and development, focus on common ground and resist disruptions from parties outside the region.

China also hopes that the Philippines — during its tenure as this year's rotating chair of ASEAN — will recognize the responsibilities it bears, resist the temptation of pursuing narrow self-interests, demonstrate the sense of responsibility expected of it, and play a positive and constructive role in promoting regional peace and stability.

As China's Permanent Representative to the United Nations Fu Cong has stated on several occasions at the UN Security Council, the UN Convention on the Law of the Sea, together with relevant international treaties and customary international law, form the basis of the modern international maritime order. States should interpret and apply the convention in complete good faith and refrain from selectivity and double standards.

China has always been a defender and builder of the rule of law in the international maritime sphere, defending the integrity and authority of the convention with concrete moves.

A code of conduct that truly serves the region cannot be built on consensus when the Philippines persists with its provocative territorial incursions. The upcoming months offer a narrow window of opportunity. Manila should make the correct choice between walking down a path of escalating tension with the collusion of outside forces or translating its optimism into real actions aimed at completing the COC this year.

The COC will be a common roof that can shelter all only if it is built by everyone. The region has waited too long. The time for sincere cooperation is now.

Peace, development, win-win cooperation trends of the times

At a moment when much of the international system appears trapped between geopolitical fragmentation and economic uncertainty, US President Donald Trump's three-day state visit to China starting on Wednesday offers something fundamental: a chance for the world to consider what kind of diplomacy effectively answers the call of the times.

China's answer is diplomacy that upholds the principles of peace, development and win-win cooperation.

Beijing's foreign-policy vocabulary, such as mutual respect, equity, shared benefits, common development and peaceful coexistence, reflects its perspective that peace, development and win-win cooperation are the unstoppable trends of the times.

The world is suffering from multiple deficits simultaneously: a deficit of development, as inequality widens between and within nations; a deficit of peace, as wars and proxy conflicts proliferate; a deficit of governance, as international institutions struggle to keep pace with technological and geopolitical change; and perhaps most dangerously, a deficit of trust.

Looking back at history, each era has produced its own dominant diplomatic philosophy.

The Westphalian system established sovereign equality as the organizing principle of international relations. The multilateralism and economic interdependence of the post-1945 order arose from the ashes of World War II.

The Cold War era, by contrast, was largely governed by ideological rivalry and bloc confrontation.

Today's world faces a complex set of challenges: climate change, technological disruption, uneven development and distrust between major powers.

That reality helps explain why China's emphasis on communication and the managing of differences resonates with so many countries. Peace, development and win-win cooperation benefit all countries. These principles answer the genuine need for an international framework that privileges coexistence over confrontation and shared growth over zero-sum rivalry.

Modern international relations were not built on the fantasy of absolute victory. The Westphalian system rested on a simpler insight: sovereign states must coexist despite profound differences. Stability depended not on uniformity, but on mutual recognition.

The post-1945 international order deepened that logic. The United Nations system, imperfect though it remains, was founded on the principles of sovereign equality, territorial integrity, multilateral cooperation and peaceful dispute resolution. Its central lesson was painfully earned: attempts to secure absolute security for some produce insecurity for others.

That is why China's principled emphasis on mutual understanding, fair global governance, shared security and inclusive development as set out in the global initiatives it has put forward have been welcomed by so many countries across the world.

The diplomatic framework of Beijing aligns with a broad international desire for stability over confrontation and development over ideological crusades.

Meanwhile, the development of China provides other economies, including the United States, with opportunities. The commitment to innovation and opening-up enshrined in the 15th Five-Year Plan (2026-30) indicates that China will continue to share its development dividends with the world.

Despite the divisive attempts of some forces, the world's two largest economies remain deeply intertwined and the two countries are still interconnected and globally consequential in science and technology. The global challenges of climate change, artificial intelligence governance, financial stability, supply chain stability and the energy transition cannot be meaningfully addressed without cooperation and coordination between China and the US.

Both countries understand this, as does the rest of the world. In these turbulent times, the world is looking for reassurance that cooperation remains not only possible but more importantly necessary between the two countries, as the stable and healthy development of Sino-US relations serves the common interests and expectations of the international community.

The choice facing Washington is cooperation grounded in communication or competition driven by miscalculation. The world looks to it to answer the call of the times with a reciprocal commitment to peace, development and win-win cooperation.

— LI YANG, CHINA DAILY

What They Say

Potential of sports events industry to be fully tapped

Editor's note: *The sports events industry is booming in China. Li Hai, dean of the School of Economics and Management at Shanghai University of Sport, spoke to Economic Daily about the growth of the industry, and what needs to be done to address the challenges it faces. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Data from the Chinese Professional Football League show that its three-tiered leagues attracted a total attendance of 8.96 million in 2025, a year-on-year increase of 18 percent. Attendance at the Chinese Super League matches was more than 6 million, a 32.54 percent year-on-year increase.

The Formula 1 Chinese Grand Prix 2026, which was held in Shanghai, attracted more than 230,000 spectators, with ticket revenue increasing by over 30 percent year-on-year. Grassroots sports events, such as the Jiangsu Football City League, or "Suchao", have also gained widespread popularity, driving marked growth in consumption in local tourism, catering and accommodation sectors.

The booming consumption of sports events in China is a result of the synergy of multiple factors. The government is striving to build the sports industry into a pillar of the economy. According to a 2025 guideline on unleashing the potential of sports consumption and further promoting high-quality development of the sports industry, China aims to nurture a number of globally influential sports companies and events and increase the value of the industry to over 7 trillion yuan ($1.03 trillion) by 2030.

The attitude of people toward sports events has also changed. Watching and participating in sports have become popular leisure activities. The number of international and domestic sports events hosted by China has also increased. In 2025, Shanghai hosted 182 sports events, 69 of which were international games. The use of digital technology has made these events more accessible to the public.

Unleashing the potential of the development of sports events in China still faces challenges. There is a need for better integration of sports with culture, tourism and commerce. Event approval procedures are complicated, and not many domestic sports events are truly influential and sustainable.

To achieve the 2030 goals, strengthen the sports industry and advance the high-quality development of sports events industry, several measures are needed. A multi-department collaborative mechanism led by the sports authorities should be set up to offer better services, strengthen the supervision of sports events and promote the upgrade of relevant consumption. The government needs to continue supporting the sustained growth of top-tier international events, fostering domestic events and building a system that covers multiple types and levels of sports.

Greater efforts are also needed to cultivate event management talent, improve the standards and rules for event operation, and enhance the ability of referees. Also, sports events should be combined with other sectors to boost their business. Local authorities should be encouraged to leverage their cultural resources and create special sports events, operate the events in a "whole-process" manner, and make them cultural symbols that drive the local economy.

VIEWS

Marcus Vinicius De Freitas

Sino-US meeting with global implications

United States President Donald Trump's visit to China and his expected meeting with Chinese President Xi Jinping will inevitably generate headlines centered on tariffs, trade balances, semiconductors, technological contention, and the question of strategic competition between Washington and Beijing.

Yet interpreting this encounter solely through the prism of bilateral tensions would be to misunderstand its deeper historical significance.

What is truly at stake is not merely the future of Sino-US relations, but the gradual emergence of a different understanding of the international order itself.

This is not a meeting between two big countries situated in the Northern Hemisphere, but in many respects a North-South encounter.

Although geographically located in the north, China is widely seen as a leading voice of what might be called the "New South."

Its historical trajectory, developmental experience, and civilizational memory place it closer to many of the aspirations, anxieties, and ambitions of developing nations than to the traditional Western powers that shaped the post-World War II order.

LI MIN / CHINA DAILY

China remembers poverty, fragmentation, foreign occupation and underdevelopment not as distant historical abstractions but as important components of its modern national identity. That memory continues to influence how Beijing approaches the world today.

For many nations across Africa, Latin America, Southeast Asia, and parts of the Middle East, China's rise demonstrates that economic modernization outside the traditional Western political model is possible.

The expansion of BRICS, the growing attraction of alternative financial institutions such as the New Development Bank, and the demand for Chinese infrastructure investment across the developing world all reflect a broader search for greater strategic autonomy in international affairs.

Beijing's international discourse resonates across much of the developing world because it is anchored primarily in the language of development, connectivity, sovereignty, and long-term economic transformation rather than ideological conversion.

In many capitals of the Global South, the central geopolitical question is no longer which power offers the most attractive political doctrine, but which partnerships are best positioned to deliver infrastructure, industrial growth, technology transfer, educational opportunities, and economic stability.

Development itself has increasingly become the new language of sovereignty.

That is why the significance of the Trump-Xi meeting extends far beyond bilateral negotiations.

The world today confronts enormous collective challenges: the future of free trade, the preservation of global peace, the governance of artificial intelligence, climate adaptation, energy security, supply-chain resilience, and the ethical dilemmas generated by the rapid expansion of scientific and technological frontiers.

None of these questions can be resolved through unilateralism or through geopolitical domination that characterized international politics earlier.

The great strategic question of the 21st century is no longer who possesses the strongest army, but whose vision of the future is more attractive, more inclusive, and more capable of producing prosperity. China understands this transformation very well.

Beijing has consistently promoted concepts such as the "community with a shared future for humanity", an idea frequently dismissed in parts of the West as rhetorical abstraction.

Yet behind the slogan lies an attempt to articulate an alternative philosophical foundation for global governance — one less centered on ideological universalism and more focused on coexistence, economic integration, connectivity, and civilizational pluralism.

Naturally, critics question whether Chinese practice always aligns with Chinese discourse. Across large parts of the developing world, there is growing fatigue with an international order that is excessively concentrated in a limited number of Western capitals.

Many emerging nations increasingly seek participation rather than subordination; partnership rather than tutelage.

The appeal of multipolarity stems not necessarily from anti-Western sentiment, but from the perception that the existing system has failed to adequately accommodate the aspirations of the broader developing world.

This does not signal the decline or irrelevance of the US. American innovation, financial influence, military reach, scientific leadership, and cultural power remain extraordinary assets.

Nor should the Trump-Xi encounter be romanticized as a coherent ideological dialogue between North and South.

The US president hardly represents the traditional liberal internationalist establishment that dominated Western diplomacy after the Cold War.

Political rise of the US president, in many respects, reflects growing dissatisfaction within the West itself regarding the costs and contradictions of globalization.

The growing inequality within Western societies is driven more by the societies' uneven wealth distribution than by the effects of globalization.

That is precisely what makes this meeting historically revealing. Both countries, in different ways, embody competing responses to a world in transition.

For the Global South, the symbolism of the meeting matters as much as any agreement eventually signed behind closed doors.

It reflects the growing recognition that emerging nations can no longer be treated as peripheral actors in the global conversation.

The world is entering a new phase in which legitimacy will depend less on the capacity to instill fear and more on the ability to inspire confidence, deliver development, and accommodate others' aspirations.

That may ultimately prove to be the deeper significance of the encounter between presidents Trump and Xi — and perhaps one of the defining lessons of the emerging international order of the 21st century.

The author is a visiting professor at the China Foreign Affairs University, and a senior fellow at the Policy Center for the New South.
The views don't necessarily represent those of China Daily.

Ker Gibbs

What Xi-Trump meeting could achieve

When United States President Donald Trump arrives in Beijing on May 13 for the summit with Chinese President Xi Jinping, it will mark his second visit to China as president, following his first trip in 2017. The symbolism is significant.

I have spent most of my adult life in China, and served as president of the American Chamber of Commerce in Shanghai during the Barack Obama, Trump, and Joe Biden administrations.

I have watched the US-China relationship from close range — through periods of genuine cooperation and periods of serious strain.

I have seen what works and what doesn't. And I have tried to capture those lessons in my recent book about China.

The most important lesson is also the simplest: when the US and China cooperate, both countries benefit, and the global economy prospers. When they don't, everyone loses.

The summit comes at a difficult moment that is becoming even more complicated. A trade war that began years ago has damaged both sides more than either is ready to admit.

Tariffs have disrupted supply chains, raised costs for consumers and businesses, and generated uncertainty that keeps investors on the sidelines. China has adapted — its exports have diversified, its domestic market has absorbed some of the pressure — but the costs are real. US farmers, retailers, and technology companies have felt them too.

The conflict in Iran has added a new layer of complexity. The war has reshaped the diplomatic landscape in ways that cannot be ignored.

The Strait of Hormuz, through which around 20 percent of the world's oil and gas supplies passed, has been effectively closed.

China and the US have different approaches to the crisis. That is an uncomfortable position for a relationship that needs stability.

Beijing has made its intentions clear: Foreign Minister Wang Yi met with Iranian counterpart Abbas Araghchi in Beijing last week and called for a comprehensive ceasefire.

Beijing does not want chaos in the Middle East. It does not want a closed Strait of Hormuz. It does not want the disruption to global trade that this conflict produces. On these points, Chinese and US interests are more aligned than the headlines suggest.

This is important, because the two countries have worked constructively together in the past, including on Iran.

In 2015, the US, China, Russia and European partners negotiated an Iran nuclear agreement known as the Joint Comprehensive Plan of Action. After the deal was signed, the then US president Barack Obama's Energy Secretary Ernest Moniz made a stop in Shanghai, where he met with a group from the American Chamber of Commerce.

Moniz was one of the key negotiators, along with the then US Deputy Secretary of State Wendy Sherman and then-Secretary of State John Kerry, and told us that China had played an important and constructive role throughout more than two years of difficult negotiations.

This example demonstrates that the US and China can work together to resolve difficult problems of mutual concern even in an environment defined by competition and mistrust.

On the conflict in the Middle East, as Iran's largest trading partner, Beijing's voice carries weight in Tehran.

When China's foreign minister makes it clear that a resumption of hostilities is unacceptable, it conveys a distinct and constructive perspective.

Beijing has demonstrated a willingness to use this influence positively. The summit represents an opportunity to build on this role.

What are the realistic expectations from the talks?

A tactical trade agreement is the most likely outcome: agricultural purchases, energy commitments, adjustments to tariffs in specific categories, perhaps progress on rare earth supply chains. These are useful and genuinely important.

Businesses on both sides need predictability. Markets need stability. The Busan agreement of October 2025 provided a framework; the Beijing summit can build on it.

Progress on structural questions is important. Neither side has yet articulated a plan for how the two economies are supposed to coexist over the long term — the role of US companies in the Chinese market, the governance of technology competition, the rules by which two very different economic systems can coexist without constant friction.

We need a mutual understanding of what the relationship is for, and where it is supposed to go.

During the earlier days of reform and opening up, the path forward seemed clear: integration, mutual prosperity, and growing interdependence. The context of the relationship has evolved fundamentally.

The absence of a shared map is, in my view, the biggest obstacle to a stable relationship — more than any specific trade dispute or technology restriction.

The vacuum is filled with suspicion, and suspicion produces exactly the kind of zero-sum thinking that makes every problem harder to solve.

I have spent four decades watching this relationship evolve — from the optimism in the past to the competition of today.

The relationship is more resilient than its worst moments suggest, and more fragile than its best moments imply.

The two countries are bound together by trade, by history, and by the shared reality that neither can afford the consequences of genuine rupture.

The summit can help do something valuable: demonstrate that both sides prefer management to confrontation, stability to chaos, and dialogue over angry isolation.

In a relationship so consequential, that is not a small achievement. It is the foundation on which everything else must be built.

Yu Minming and Yan Xuedong

Chinese expertise supports high-quality BRI cooperation

By bringing world-class experts to Southwest Jiaotong University, Danish scholar Frede Blaabjerg, a 2025 recipient of the China Friendship Award and chief expert of the university's "111" innovation base for railway electrification and automation, has helped build a premier international academic team.

For an institution with a 130-year legacy in rail transportation, internationalization has become a two-way track: it involves welcoming global talent while projecting its own expertise onto the global stage.

In advancing the Belt and Road Initiative, universities need to transcend their roles as mere classrooms or technical exporters. They have to become dynamic nexuses that weave together education, innovation, talent and global standards.

To this end, Southwest Jiaotong University has engineered a multi-dimensional global strategy, a five-fold framework that integrates education, science, talent, standards and services into a singular engine for international development.

The success of high-quality BRI cooperation rests upon coordinated development, and at the heart of that coordination are people.

As the primary engines of talent cultivation, universities must respond to the needs of partner countries by establishing prestigious educational brands and cross-border training platforms.

In doing so, they enable the fluid flow of resources, fostering the high-level, interdisciplinary talent essential for today's mega-projects.

For universities specialized in rail, this necessitates capitalizing on their unique heritage and technical prowess. Such institutions should center their efforts on consolidating premier educational resources to pilot an open, "one-to-many" model of international cooperation.

In tandem, they need to address the demand for railway professionals in BRI partner countries by developing joint training systems anchored in dual institutions, dual supervisors and dual certification. This framework ought to span the entire academic spectrum, from undergraduate to doctoral studies, while also encompassing non-degree training and professional development.

Education is at its core a commitment to people-to-people connectivity, which serves as the social foundation of high-quality BRI cooperation. In this mission, universities provide far more than professional expertise. They align perspectives and bridge cultural divides, building the human trust that ensures lasting international cooperation.

For these reasons, international talent cultivation belongs within the wider landscape of China's diplomacy and national talent strategy.

This calls for offering rigorous international degree programs. As a vanguard of this mission, Southwest Jiaotong University has spearheaded national initiatives to train elite transportation engineering talent for BRI partner countries.

As the sole institution in Sichuan province authorized by the Ministry of Commerce to nurture BRI talent, the university has trained over 7,000 international students from 58 countries and regions through its English-medium programs. Many graduates have since emerged as leaders in their home countries' transportation sectors, serving as vital links of friendship with China.

Beyond the cultivation of talent, high-quality BRI cooperation requires more than capital and infrastructure. It demands the harmonization of rules and standards. Just as the university prepares the professionals to lead these projects, it also provides the technical frameworks that make cross-border partnership possible.

Through their technical depth and research capacity, universities are uniquely positioned to support the entire value chain from standard-setting to validation, certification, and technical services.

In this capacity, universities can actively support China's pursuit for standards connectivity under the BRI and help establish regional platforms for railway standards coordination. Such efforts allow standards to move past mere regulation, acting instead to facilitate technological compatibility and industrial integration.

The viability of BRI cooperation hinges not only on infrastructure but also on the development of local skills to sustain it. Universities excel at translating China's modernization experience and technical expertise into local capacity. This shift represents the essential transition from providing short-term assistance to driving long-term, self-sustaining growth.

Rail-focused universities need to support capacity building in developing countries by instituting multi-level training systems for government officials, technical specialists and frontline workers.

Such programs reinforce the international railway training network while diversifying cooperation across emerging sectors and collaborative models, ensuring that the BRI partnerships deliver tangible and lasting benefits to local communities.

Scientific and technological innovation is a primary driver of high-quality BRI cooperation. As hubs of research and innovation, universities should utilize their specialized infrastructure and expertise to provide technical advisory services and practical solutions for major projects. In doing so, they transform Chinese scientific achievements into shared progress for the global railway sector.

Achieving this requires deeper integration into global innovation networks. Rail-focused universities are expected to play a more active part in international bodies such as the International Union of Railways (UIC) and the Organization for Co-operation between Railways (OSJD), contributing to the formulation of international railway training standards and building joint laboratories with leading overseas institutions. Through sustained cooperation and technical support, they can resolve complex engineering challenges in BRI projects, positioning Chinese railway technology to further advance global development.

High-quality BRI cooperation is a systemic undertaking. The value of universities surpasses the delivery of resources and technology, as it stems from their capacity to build platforms, bring together partners, and maintain the long-term sustainability of collaborative efforts.

Far from being peripheral actors, these institutions stand as architects in building a global community with a shared future.

Moving forward, universities, especially those with distinctive rail expertise, should remain dedicated to national strategic goals while expanding the scope of their international reach.

By doing so, they can bolster high-quality BRI cooperation and help build a more interconnected and prosperous world.

GLOBAL VIEWS

LIU WEN AND GUAN ZHONGQI

Real-world solutions

China's cooperation with Belt and Road partners in affordable and adaptable AI paves way for more inclusive and integrated digital governance

As the global artificial intelligence landscape evolves at breakneck speed amid intense races, China is emerging as a key driver of inclusive, affordable digital cooperation. Under the Belt and Road Initiative, it is forging a new model of complementary and mutually beneficial collaboration that links technological strengths with real-world development needs.

Liu Wen

Guan Zhongqi

China's AI industry has expanded rapidly over the past two years, building two core advantages that underpin its growing role in global digital cooperation.

The first is its complete industry chain, supported by massive computing power and vibrant AI application activities that can effectively meet surging global demand.

Data from OpenRouter — a platform widely used by developers to access AI models — for the week from April 6 to 12 show that the weekly token consumption of China's large-scale AI models reached 10.3 trillion, compared with 2.95 trillion of the United States and ranking first worldwide. Notably, Chinese models — Qwen 3.6 Plus, DeepSeek V3.2 and Step 3.5 Flash — are among the world's top AI models. Token consumption serves as a key measure of real-world model deployment, user adoption and industrialization scale.

The second, and more critical, advantage is the unmatched cost efficiency in computing power. Leading Chinese large models deliver performance on a par with top global peers at a fraction of the cost. For example, the inference cost — the core expense of running generative models — of Chinese models such as MiniMax M2.5 and DeepSeek can be less than 20 percent of that of leading international counterparts.

This superior cost-performance ratio forms the cornerstone of China's global AI competitiveness, drastically lowering the threshold for developing countries to access cutting-edge AI technologies. Backed by integrated computing and power supply systems, this breakthrough eases the financial and technical burden of digital transformation, allowing developing economies to embrace digital progress at sustainable and affordable costs.

These advantages align well with a growing global need for AI technologies. On the demand side, the global appetite for AI applications is rising rapidly. Gartner projects that global AI spending could surge to $2.52 trillion in 2026, creating enormous market opportunities for China's growing and scalable AI industry.

China's AI industry has been going global in recent years, with a clear shift in its international focus. Its early global presence focused on infrastructure and hardware, including power facility construction and exports of intelligent robotic products. According to Chinese customs data, in 2025, the country's exports of industrial robots surged 48.7 percent year-on-year, making China a net exporter of industrial robots for the first time.

A defining structural shift took place in 2025, as China moved from hardware exports to delivering full-stack AI-powered services and solutions worldwide. Chinese cloud and AI enterprises have accelerated their global presence, with expanding overseas computing infrastructure and surging international business.

Major Chinese cloud providers have achieved high triple-digit growth in overseas AI-related revenue for consecutive quarters, with rapid expansion in international markets including Southeast Asia, the Middle East and Latin America. By the first quarter of 2026, numerous Chinese AI enterprises had established a commercial presence in more than 170 countries and regions, providing affordable computing services, intelligent applications and industry solutions for global users.

LI MIN / CHINA DAILY

This trend confirms that China is exporting not just physical equipment, but AI solutions that embody large models, intelligent hardware and industry-specific applications, thereby laying a solid foundation for deeper, more integrated global AI cooperation.

For China's AI globalization, economies involved in the BRI represent the most dynamic and promising frontier, especially in Southeast Asia, the Middle East and Latin America. AI spending in these markets, including local investment in hardware, industry-specific smart solutions and cloud services, is projected to grow at an annual rate above 25 percent in the coming years. This robust demand aligns with China's technological strengths, industrial maturity and practical experience in large-scale AI applications, creating ideal conditions for deepened cooperation.

Unlike traditional one-way technology transfer, China's AI cooperation with partners engaged in the BRI is problem-oriented and tailored to local needs.

To help partners avoid the heavy cost of building independent data centers, China provides flexible token-based computing services customized to national conditions. It deploys targeted AI solutions for key industries and livelihood sectors, and coordinates the planning of computing, network and power infrastructure to support sustainable digital development.

In practice, China's cost-efficient AI has delivered tangible economic benefits and markedly improved operational efficiency across BRI markets. At key China-Europe freight train hubs such as Xi'an International Port Station and Manzhouli Port, AI-powered intelligent scheduling, automated container handling and cross-border digital clearance systems have cut transit times by more than 30 percent, according to China State Railway Group. On Silk Road e-commerce platforms, the use of AI tools has helped small and medium-sized enterprises in the Association of Southeast Asian Nations, Central Asia and the Middle East increase sales by 30 to 80 percent and significantly improve their profitability, according to the Ministry of Commerce.

Beyond short-term economic gains, China's AI partnerships are helping BRI countries build long-term technological capacity and independent digital industries.

Chinese AI solutions can sharply reduce large model training costs for developing countries, enabling them to skip massive upfront infrastructure investment and catch up rapidly in the digital era, according to industry white papers and public data from leading Chinese AI enterprises.

China's AI cooperation also advances inclusive development and public welfare, helping narrow the global digital divide. China has carried out extensive digital technology training and capacity-building programs for partner countries. These programs cover AI agriculture, smart healthcare and cross-border e-commerce, supporting the growth of local digital industries.

Looking ahead, AI cooperation among the BRI partners will advance toward higher quality, sustainability and scalability. Token-based computing services are set to become a core growth engine. JP Morgan predicts in a report published in February that China's AI token consumption will increase by a staggering 369 times by 2030, unlocking huge long-term cooperative potential.

China's AI cooperation with its BRI partners has pioneered a win-win model for global digital governance that is affordable, adaptable and inclusive. By enabling developing nations to fully share in the dividends of AI progress, China also gains vital overseas market feedback that drives continuous technological iteration and industrial innovation.

Together, China and its BRI partners can build an open, inclusive and equitable global digital ecosystem, advance the integrated development of the global digital economy and promote shared prosperity for all countries in the digital age.

Liu Wen is an associate professor at Nanning Normal University and a PhD researcher at Beijing Foreign Studies University. MAO KEJI

Punching above its weight

India's AI Impact Summit demonstrates its knack for turning weakness into diplomatic edge

WANG XIAOYING / CHINA DAILY

When Prime Minister Narendra Modi's government hosted the India Artificial Intelligence Impact Summit in New Delhi in February, the event was billed as a global gathering for the greater good. Under the theme "Prosperity and happiness for all", it drew world leaders and tech tycoons alike. By the end, 91 countries and international organizations had signed the New Delhi Declaration on AI Impact. For a country whose AI industry remains heavily dependent on imported GPUs, whose foundational models lag behind those of the United States and China, and which suffers acutely from a brain drain and automation's disruptions, the feat was impressive. India had somehow seized the agenda on one of the defining technologies of the age.

The same pattern is visible elsewhere. In 2015, India, together with France, launched the International Solar Alliance. Today the organization, headquartered in India, counts more than 100 states as members and is the first intergovernmental body with its secretariat on Indian soil. Yet India's own solar industry, though growing fast in installed capacity, remains technologically dependent — above all on Chinese components and supply chains. Once again, limited hard power has not stopped New Delhi from claiming a prominent seat at the table.

The contrast is striking. In both artificial intelligence and solar energy, India's material capabilities fall well short of its diplomatic reach. What explains this ability to set the global agenda despite modest underlying strength? The answer lies in a deliberate strategy of narrative-shaping, geopolitical positioning and skillful packaging — what might be called India's "diplomatic wrapping" technique.

India's shortcomings in AI are no secret. The country imports virtually all its high-end computing power, its home-grown large language models trail international pioneers, and many of its best engineers work abroad. Yet during the New Delhi summit, the government turned these vulnerabilities into assets through a carefully orchestrated campaign.

First, it leaned heavily on its credentials as a heavyweight of the "Global South". By emphasizing AI applications tailored to developing countries and promoting the idea of "AI dividends for all", India positioned itself as a counterweight to Western-dominated rule-making. The widespread endorsement of the final declaration was partly the result of this framing: many poorer nations saw New Delhi as a more sympathetic interlocutor than Washington or Brussels.

Second, Indian officials shrewdly addressed the "technological anxiety" felt across much of the developing world. Talk of "sovereign AI" — national models attuned to local languages and data-privacy concerns — resonated strongly with countries wary of over-reliance on a handful of dominant platforms. Where Western discourse often dwells on existential risks or cutting-edge competition, India offered a friendlier, more inclusive vision.

Third, the summit served as an investment prospectus. By repeatedly touting India's vast market, youthful population and long-term potential, the government lured commitments from Google, OpenAI, Microsoft and others, as well as domestic conglomerates such as Adani, Reliance and Tata. Plans for massive data-center investments and the allocation of thousands of GPUs to local researchers were presented as proof of seriousness. In effect, India was trading political convening power and future market access for the capital and technology it currently lacks.

Finally, the event was wrapped in symbolism. India cast itself as a trailblazer for the Global South: the first developing country to host a major AI summit on this scale. The message was clear — technological leapfrogging is possible even from a position of relative weakness.

The playbook was tested earlier with the International Solar Alliance. Although India's solar capacity has surged past 100 GW, the industry still relies heavily on imported panels and equipment, much of it from China. The alliance, launched on the sidelines of the 2015 Paris climate conference, aims to mobilize $1 trillion in investment for solar deployment across the "sunshine belt" of developing nations. India provides the headquarters and political leadership, but the financial burden is shared through voluntary contributions and private-sector involvement — a "light-asset" model that minimizes New Delhi's own exposure.

Here too, India skillfully deployed the Global South narrative. It framed solar power as a tool for energy security, poverty reduction and climate resilience, while highlighting the financing and technology barriers faced by poorer countries. Initiatives such as "One Sun, One World, One Grid" helped extend India's reach. Even though China leads the manufacturing of solar hardware, India succeeded in positioning the International Solar Alliance as a Southern-led platform for cooperation rather than a mere technical contest.

India's approach is neither accidental nor confined to these two domains. Four elements stand out. The first is the identity leverage. With its huge population, political credentials and developing-country status, India is unusually well placed to speak for the Global South at a time when trust in Western-led institutions has frayed. By championing "inclusion", "sovereignty" and "equitable access", New Delhi converts numerical weight and moral framing into bargaining power.

The second is narrative dexterity. India has a talent for reframing weakness as virtue. In AI, it presents "sovereign" models as a democratic alternative to great-power dominance. In solar energy, it portrays itself as a fellow traveler rather than a technological laggard. At the same time, it sells a compelling vision of future returns to attract today's investment.

The third is geopolitical opportunism. India exploits the strategic movements of major powers and Western unease, to widen its room for maneuver. It courts Western capital and technology while burnishing its non-aligned credentials.

The fourth is timing. Both AI governance and the global energy transition are still in flux. New Delhi has moved quickly to occupy the institutional vacuum, building low-cost platforms that deliver high symbolic returns.

India's "packaging strategy" demonstrates that in an era of fluid global governance, soft power, narrative control and convening ability can amplify limited material resources. By creating forums, shaping the conversation and mobilizing coalitions, a country can achieve influence disproportionate to its technological or industrial heft.

Yet there are clear limits. Packaging cannot indefinitely substitute for genuine capability. India's brain drain continues, its technological dependence remains, and the gap with the US and China in frontier AI is wide. The real test for India will be whether it can convert the diplomatic spotlight into durable domestic progress — whether the data centers and laboratories materialize, whether talent begins to flow home, and whether "sovereign AI" becomes more than a slogan.

For other emerging powers, particularly China, the Indian example offers both inspiration and caution. Hard strengths in manufacturing, supply chains and cost control remain formidable assets. But they must be married to persuasive storytelling and institutional entrepreneurship if they are to be fully translated into agenda-setting power. In the contest for global influence, presentation matters — but so does the product inside the wrapping.

Vehicles await export from a port in Yantai, Shandong province, on Monday. TANG KE / FOR CHINA DAILY

Car exports maintain strong momentum in April

By LI JIAYING
lijiaying@chinadaily.com.cn

As the country's auto industry further deepens its global footprint, China's automobile exports maintained strong momentum in April, driven by steady shipments of new energy vehicles and accelerated overseas expansion by major domestic carmakers.

China exported around 901,000 vehicles in April, up 74.4 percent year-on-year, including 430,000 NEVs, whose exports more than doubled from a year earlier, according to data released by the China Association of Automobile Manufacturers on Monday.

Chen Shihua, deputy secretary-general of the association, said vehicle exports have continued to grow rapidly this year, providing stable support for the broader auto industry. Chen added that the NEV market has maintained steady momentum, with NEVs accounting for 53.2 percent of total new vehicle sales in April.

The export growth comes as Chinese NEV makers continue to play a contributing role in the global market. Data from the China Passenger Car Association show that Chinese brands accounted for 61 percent of the global new energy passenger vehicle market in the first quarter.

"Although lower than the 68 percent peak recorded in 2025, the figure still reflects the country's leading position worldwide," said Cui Dongshu, secretary-general of the CPCA.

The association said the top 10 overseas markets for Chinese NEV exports in the first quarter were Brazil, Belgium, the United Kingdom, the United Arab Emirates, Italy, Australia, Germany, Thailand, Spain and South Korea. South America, Europe, the Middle East and Southeast Asia emerged as the main sources of incremental growth.

The rapid rise of Chinese NEVs, combined with elevated global fuel prices, is accelerating the global shift toward greener consumption solutions. According to CPCA data, the global penetration rate of NEVs continued to rise, reaching 20.2 percent in the first quarter.

The growing demand is also reflected in overseas consumer markets. According to a report by The Straits Times, inquiries for electric vehicles priced below 30,000 euros ($35,241) on Germany's major automotive marketplace Mobile.de jumped 87 percent since early March.

Meanwhile, in the UK, demand for used electric vehicles also surged. Data from Autotrader, the country's largest automotive marketplace, show that inquiries for EVs aged between five and seven years tripled in April compared with a year earlier, significantly outpacing interest in newer and more expensive models.

Against this backdrop, leading Chinese automakers are accelerating their overseas expansion, with the focus transferring from simply exporting products to building localized industrial ecosystems.

BYD is advancing production projects in Hungary and Malaysia, while Chery Automobile recently launched its first overseas regional operation center in Barcelona, Spain. XPeng also said it plans to expand overseas manufacturing capacity this year, targeting markets including Europe, Southeast Asia and Latin America.

At the same time, carmakers are stepping up overseas research and development plans. Xiaomi Auto has identified Europe as its first major overseas market, while Leapmotor and Geely have recently expanded engineering and innovation operations in Germany and other parts of Europe to support long-term global growth.

Firms fire up production for FIFA World Cup

By ZHONG NAN
zhongnan@chinadaily.com.cn

With less than a month remaining before the FIFA World Cup 2026 kicks off in Mexico City, a wave of Chinese-made products, from footballs and flags to fan jerseys and drinkware, is already flowing into the tournament's host countries and beyond.

The tournament between June 11 and July 19 will be the first World Cup to feature 48 teams, with matches across 16 cities in the United States, Canada and Mexico.

In April, workers at the production workshop of Qingdao Wonderful Flag Industry Co, a Qingdao, Shandong province-based flag maker, were busy sewing and assembling national flags of countries participating in the World Cup.

"On April 1, right after the final World Cup qualifying match concluded and the list of the 48 teams was confirmed, orders flooded in almost immediately," said Xiao Chang'ai, chairman of the company.

According to Xiao, the company is now running at full capacity to fulfill orders for national flags, covering both traditional soccer powerhouses such as Brazil, Argentina and Germany, as well as newly qualified teams making their World Cup debut.

"By the end of March, most flags for traditional powerhouse teams had already been produced and shipped," she said. "But the real challenge for us will begin once the tournament starts in June."

As the competition unfolds, overseas buyers closely track match results and place orders almost in real time, often demanding delivery within just one or two days, Xiao added.

To keep pace with the surge in last-minute demand, the company has all production lines running round the clock, with daily output now exceeding 100,000 flags of various sizes, according to Qingdao Customs.

Ningbo Eco-will Technology Co, a manufacturer of luggage tags, ceramic cups and insulated tumblers in Ningbo, Zhejiang province, saw its exports to the US, Canada and Mexico jump 47 percent year-on-year to 40 million yuan ($5.89 million) in the first four months of 2026, as local sellers actively stocked up on merchandise ahead of the World Cup sales season.

Qiu Chunmiao, the company's foreign trade manager, said the World Cup has significantly boosted the firm's exports of sports-themed products this year, especially insulated tumblers carrying officially licensed soccer team logos.

Ningbo Customs said exports of sporting goods and equipment through Ningbo's ports reached 5.74 billion yuan between January and April, up 11.34 percent on a yearly basis.

Wang Xiaohong, a researcher at the China Center for International Economic Exchanges in Beijing, said China's flexible manufacturing ecosystem offers exporters a clear advantage in responding to short-cycle demand generated by major sporting events.

Wen Congjian, chairman of Yiwu Danna Silk Import and Export Co, a Yiwu, Zhejiang-based apparel maker that designs patented soccer fan jerseys, said Chinese companies are no longer competing solely on volume, but are placing greater emphasis on value-added products.

"With patent protection, we can better protect our designs and lift product prices by around 20 percent," Wen said, adding that the company has secured overseas patents for more than 40 fan jersey designs related to the World Cup.

Yiwu's exports of sporting goods and equipment reached 2.83 billion yuan in the first quarter, up 12 percent year-on-year, data from Yiwu Customs showed.

Recovery of consumer mkt seen accelerating

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

Indicators that the country's consumer market is beginning to recover are emerging, and one unlikely measure is the price of fried chicken. At a financial seminar on May 8, Wu Mianqing, CEO of BigOne Lab, said the so-called "KFC Index", which tracks average transaction prices at the fast-food chain across China, is showing signs of recovery nationwide.

Over the past two years, KFC's per-transaction spending has steadily declined, reflecting broader consumer caution: shoppers were purchasing more but paying less. That trend began to stabilize in the fourth quarter of 2025, and Wu sees potential for positive growth in 2026.

"If pricing trends at a foundational food and beverage leader shift, it is often an early signal of consumption recovery," he told the Shanghai Observer.

Macroeconomic data provide further support. Total retail sales of consumer goods in China rose in the first quarter by 2.4 percent year-on-year, accelerating by 0.7 percentage point when compared with that of the fourth quarter of 2025. Economists have debated a "downgrading" of Chinese consumption in recent years, yet the rebound in retail data has prompted a reassessment of that narrative.

Qin Shuo, a financial commentator, told the Shanghai Observer that the apparent softness is more structural than cyclical. While headline CPI growth has remained subdued, he said that consumption is not shrinking — its volume, diversity and complexity continue to expand. Shoppers are spending across a broad range of goods, from high-end imported items to local lifestyle brands.

"Looking at the market in terms of physical goods, there is no downgrade," Qin said. Micro-level indicators also point to recovery in high-end consumption. Wu said that international luxury brands have experienced strong growth in China since the second half of 2025. Warming capital markets and diversified sources of consumer confidence are fueling renewed spending.

Luxury brands are increasingly treating China as a global testing ground. In the third quarter of its fiscal year 2026, ending March 28, Tapestry Group, the parent of Coach, reported 30 percent growth across the Asia-Pacific, with China surging 55 percent year-on-year. The company's net sales rose to $1.92 billion, up 21 percent, while net income jumped 69 percent to $344 million.

China is now Tapestry's largest market outside the United States.

Last quarter, Coach added 2.4 million new customers worldwide, with over 35 percent in the Generation Z segment. The brand has opened more than 350 stores across 90 Chinese cities, spanning tier-1 to tier-4 markets, with plans to expand into another 200 cities.

In addition, Liu Gongrun, deputy director at the CEIBS Lujiazui International Institute of Finance, told the Shanghai Observer that traditional metrics overlook the rapid growth of service consumption. In cities like Shanghai, where services make up roughly 80 percent of GDP, residents are spending on immersive experiences, cross-border livestreaming and other high-engagement offerings. Younger consumers, Liu added, are increasingly driven by cultural resonance and experience rather than by purely purchasing products.

Qin said that the combination of local innovation and demographic shifts has created a new rhythm for Chinese consumption: diversified, rational and innovative.

Nation vows to further trim local govt debt

10 trln yuan bond swap program helps cut hidden arrears to 7.4 trln yuan by '25

By WANG KEJU
wangkeju@chinadaily.com.cn

China has pledged to accelerate local government debt resolution, declaring that the current five-year 10 trillion yuan ($1.38 trillion) bond swap program is on track and will be completed on schedule.

The latest announcement follows an executive meeting of the State Council, the country's Cabinet, on Saturday, which reviewed progress on the sweeping debt-relief package launched in 2024.

The program, designed to run through 2028, allows local governments to issue bonds to replace outstanding hidden debt — a legacy of off-balance-sheet borrowing that had ballooned to 14.3 trillion yuan by end-2023.

By end-2024, data from the Ministry of Finance showed that hidden debt had fallen to about 10.5 trillion yuan, and according to estimates by Luo Zhiheng, chief economist at Yuekai Securities, it further dropped to roughly 7.4 trillion yuan by late 2025.

As of early May this year, more than 1.3 trillion yuan of local government refinancing bonds had been issued to swap for remaining hidden debt, said local financial authorities.

"The debt-reduction effort has moved to routine supervision. Hidden debt has been sharply reduced, with several provinces completing their annual targets ahead of schedule and some achieving a 'zero hidden debt' goal," Luo said.

The average interest cost on swapped debt has fallen by more than 2.5 percentage points, and the share of high-interest and non-standard debt has declined, freeing up fiscal space for local governments, said the ministry.

The State Council meeting acknowledged that while initial results are encouraging, challenges remain.

Two priority areas for the next phase were identified: clearing overdue payments to enterprises — a persistent drag on business confidence — and managing the operating debt of local government financing vehicles (LGFVs).

"Local governments are still under financial strain, and some are unable to fully resolve arrears owed to businesses," said Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International.

Wang called for continued use of special bonds and other fiscal tools to settle these obligations,

> "Hidden debt has been sharply reduced, with several provinces completing their annual targets ahead of schedule and some achieving a 'zero hidden debt' goal."
>
> **Luo Zhiheng,** chief economist at Yuekai Securities

which he said are essential to "smooth the economic circulation and thus help stabilize the macroeconomy".

Policymakers are also turning greater attention to the operating debt of local government financing vehicles — a new front in the country's campaign to defuse financial risks.

Unlike hidden debt incurred implicitly by local governments, the operating debt of LGFVs arises from market-oriented investment and project activities, and is classified as standard corporate debt. The primary tool for resolving such debt is financial restructuring through banking and capital market institutions, not direct fiscal swaps, Luo said.

"Financing platforms have relatively weak cash flow and profitability. Under certain conditions, their operating debt could require implicit government guarantees. It is necessary to proactively resolve this through financial tools that lengthen maturities and optimize structures."

China, in this year's Government Work Report, has called for greater financial and fiscal support for debt restructuring, along with measures to facilitate the reform and transformation of LGFVs. Under the current resolution plan, many localities are pushing to complete the exit of all financing platforms by June 2027 — a key step to curb new hidden liabilities.

But Luo cautioned that the task is far from finished.

"Exiting the platform in name is not enough. The real challenge is the transition from financing platforms to industrial investment firms. That requires injecting quality assets, integrating local resources and building market-oriented incentives so that these entities can stand on their own."

Road to success

An aerial view shows the newly opened eight-lane elevated section of the G3 Beijing-Taipei Expressway crossing over railway lines in Anhui province, on Monday. The 107-kilometer Hefei-Xuzhou South Section expansion project, partially built by China Railway 24th Bureau Group Corp, officially opened to traffic on Saturday, upgrading the once-congested four-lane highway. As a key national transportation corridor connecting North China and the Yangtze River Delta, the project doubles the expressway's traffic capacity to over 80,000 vehicles per day, easing long-standing congestion and providing critical infrastructure support for the revitalization of northern Anhui and the integrated development of the Yangtze River Delta region. Embodied intelligence enters real-world tests

Rapid advances in humanoid robotics moving sector away from technical showcases to commercialization

By LI JIAYING
lijiaying@chinadaily.com.cn

China's embodied intelligence sector is moving from technical showcases toward tougher tests of real-world commercialization, as rapid advances in humanoid robotics performance fuel both investor enthusiasm and rising expectations for practical industrial applications.

The trend was on full display at a humanoid robot half marathon in the tech hub Beijing E-Town, where autonomous robot "Lightning" completed the race in April in a net time of 50 minutes and 26 seconds.

The time was faster than the human men's half-marathon world record and cut nearly two-thirds off the 2:40:42 result posted by Tiangong Ultra, last year's robot champion.

The 21.0975-kilometer course featured flat roads, steep slopes, consecutive bends, speed bumps and other complex urban road conditions, including 22 regular curves and several near-90-degree turns, placing high demands on the robots' balance, path planning and joint response speed.

"A marathon on an urban course is an extreme stress test for core robot capabilities including motion control, autonomous navigation, endurance, heat dissipation, environmental adaptability and system reliability," said Liang Hongjun, an official of the intelligent manufacturing and equipment industry division at the Beijing Municipal Bureau of Economy and Information Technology.

Liang said the marathon provides a standardized task that allows teams to improve technologies around a common goal, complete a full technical route through competition and accelerate the application of results.

At the inaugural event a year ago, 20 teams took part and only six finished, with a completion rate of less than 30 percent. This year, the number of teams surged to more than 100, nearly five times the previous level, while the completion rate exceeded 45 percent.

"The leap in performance is essentially a comprehensive validation of hardware reliability, algorithmic stability and systems engineering capability," said Yan Weixin, chief scientist at Shanghai Artificial Intelligence Research Institute, adding that this is not a single-point breakthrough of any one technology, but rather the co-evolution of all relevant technical dimensions.

A clear trend seen at this year's half-marathon was the shift from remote-controlled running to autonomous navigation, with robots increasingly able to read the road, avoid obstacles and plan routes without human control.

Among more than 300 participating robots this year, autonomous-navigation entries accounted for nearly 40 percent. By contrast, last year, apart from the champion Tiangong Ultra, which used follow-based semi-autonomous navigation, all other teams relied on remote control.

To encourage more autonomous teams to finish, the race recorded real-time results for autonomous entries, while remote-controlled teams had their times multiplied by a factor of 1.2.

Zhao Mingguo, a researcher at the Department of Automation of Tsinghua University, said this year many teams had successfully transferred autonomous driving technologies from vehicles to robots, using lidar, pure-vision navigation and antennas to improve environmental perception.

"Which technological route will ultimately adapt best to different demands still requires further testing through more real-world tasks," Zhao said. "Over the next one to two years, indoor and outdoor robot navigation technologies are likely to advance even faster."

Behind the robots' improved performance lies rapid progress in core technologies. The winning Lightning robot developed by Chinese smartphone brand Honor delivered a maximum motor torque of 600 newton-meters, compared with about 420 newton-meters for last year's competitors.

In addition, its battery system supported more than 10 kilometers of running on a single charge, requiring only one battery replacement during the entire race.

Thermal management technologies have also advanced significantly. While many robots in last year's half marathon relied on simple air-cooling systems, Lightning adopted a liquid-cooling system capable of sustaining motor speeds above 20,000 revolutions per minute while circulating more than four liters of coolant per minute, similar to how blood circulation regulates human body temperature.

"Judging from the race performance, China's humanoid robots have moved beyond the entry-level stage of 'being able to run' and entered a more practical stage of 'running steadily and farther'," said Hao Lulu, a senior analyst at CCID Consulting.

Hao said some humanoid robots can now handle slopes and sharp turns independently, while leading autonomous-navigation models have real-time obstacle avoidance capabilities and dynamic balance algorithms that support stable posture adjustment at high speed.

Beyond the racetrack, momentum is also building in capital markets. According to the Embodied Intelligence Development Report 2025 released by the China Academy of Information and Communications Technology, China's embodied intelligence and robotics sector recorded 744 investment deals in 2025, with total financing reaching 73.54 billion yuan ($10.82 billion).

Since the start of 2026, total financing in embodied intelligence has climbed to more than 34.5 billion yuan, according to financial information platform Sina Finance, with as many as 23 companies entering the "10-billion-yuan club".

Notably, the national AI industry investment fund made its first move in the embodied intelligence track by participating in a 2.5 billion yuan financing round for major humanoid manufacturer Galbot — a move widely viewed by the industry as a sign that embodied intelligence is increasingly a key component of the country's national AI strategy.

"The robust growth of China's robotics industry is the result of multiple factors working together, including top-level national strategic planning, industrial policy support, and capital market responsiveness," said Yu Huan, a fund manager at Great Wall Fund.

Meanwhile, a growing number of robotics companies are preparing for capital market listings. Unitree Robotics had its STAR Market IPO application accepted by the Shanghai Stock Exchange in March, while companies including Leju Robotics, Deep Robotics and Galaxea are also accelerating restructuring plans ahead of potential listings.

However, even as investment enthusiasm rises, commercialization remains a major challenge for the industry.

According to consultancy firm IDC, global humanoid robot shipments exceeded 18,000 units in 2025, led largely by Chinese manufacturers. Yet more than 85 percent of shipments were concentrated in entertainment performances, education, scientific research and exhibition-oriented applications focused mainly on technology demonstrations and interaction.

Jiang Han, a senior analyst at market consultancy Pangoal, echoed that the current challenge remains that although leading companies have announced large-scale deliveries, many shipments still go to universities and research institutions for algorithm research, rather than entering industrial or commercial settings as production tools.

"The industry has yet to form scaled purchasing based on productivity demand," Jiang said.

"In 2025, many so-called commercial orders in the industry were essentially display purchases for public relations and data-collection partnerships, rather than true productivity replacement," said Liu Yang, co-founder of humanoid robot manufacturer Infiforce, in an earlier interview.

"The harsh reality of 2026 is that industrial clients are no longer satisfied with watching your robot do a somersault," Liu said. "They want to know whether a humanoid robot can operate continuously in their factory for three months or six months, whether it can cut costs and improve efficiency, and whether it can generate repeat purchases ... Frankly speaking, no company in the industry has fully passed this proof-of-concept stage. This is a matter of survival."

Liu Dong, founder of XYZ Embodied AI Co, predicted that the industry will see growing divergence in application scenarios this year.

"Applications in industrial and specialized settings are poised for a small-scale boom. In these scenarios, customers are highly willing to pay, and the solutions offer high reusability and fault tolerance," Liu Dong said.

"We may see the emergence of 'hidden champions' in some vertical sectors in this field," he added. "However, for commercial and household scenarios, there is still a final stretch to complete before large-scale adoption truly arrives."

Robot rentals set path for mass-market adoption

By LI JIAYING

As humanoid robots increasingly move into real-world settings such as tourism, transportation, retail and security, robot rental services are emerging as a fast-growing business model that many in the industry see as one of the earliest scalable paths toward commercialization.

"Rental services are currently the most suitable entry point," said Li Yiyan, CEO of Botshare, a domestic robot rental platform backed by robotics manufacturer AgiBot. Li said that while humanoid robots still face limitations in generalized capabilities and large-scale commercial adoption remains in its early stages, the long-term opportunities could extend far beyond the hardware itself.

"In the future, when robots enter homes, factories and security services on a larger scale, an enormous aftermarket ecosystem will emerge," Li said. "Secondhand robot trading, maintenance, repair and door-to-door services could all eventually be completed through robot rental platforms."

The rapid rise of the sector is already reflected in business registration data. According to Chinese corporate database platform Qichacha, China registered 38,200 robot rental-related enterprises in 2025 alone, up 55.7 percent year-on-year and marking the highest annual total in the past 10 years. As of April 2, another 9,114 related companies had already been registered nationwide this year.

Pan Helin, a member of the Ministry of Industry and Information Technology's Expert Committee for Information and Communication Economy, said humanoid robot leasing has only emerged as a new business model over the past year, but is already creating a new form of the sharing economy.

"Although the user market remains relatively small for now, robot leasing helps expand application scenarios while also generating valuable operational data," Pan said. "That data can in turn help optimize humanoid robot algorithms and product design."

As the market heats up, more platform companies are entering the race.

Late last year, Botshare surpassed 200,000 registered users within three weeks of launch and recorded more than 200 orders per day on average. Chinese e-commerce giant JD has also expanded into self-operated robot leasing services, covering embodied robots, robot dogs and exoskeleton robots.

Yet despite growing attention surrounding the sector, profitability pressures are also becoming increasingly evident.

Daily rental prices for humanoid robots have fallen sharply from around 30,000 yuan ($4,415) in the early stages of the market in early 2025 to roughly 3,000 yuan today, with some entry-level models renting for less than 1,000 yuan per day.

For example, Unitree's G1 humanoid robot is typically rented out at a daily rate ranging from 2,500 yuan to 3,500 yuan, while its dancing-capable U2 model costs around 4,000 yuan per day. The company's robotic dogs are generally priced at 400 to 500 yuan per day for rental services.

At the same time, many companies still rely on an operational model that pairs each robot with a dedicated technician, pushing up labor, logistics and maintenance costs.

"Competition in the industry is no longer simply about who can secure more short-term orders," Li of Botshare said. "The real challenge is who can first establish nationwide service coverage, delivery standards and risk-control systems, becoming the preferred gateway for both clients and manufacturers entering real-world scenarios."

Against this backdrop, the company is already accelerating overseas expansion in search of higher-margin markets.

In April, Botshare initiated its global network covering key regions including Europe, North America, Asia-Pacific and the Middle East. The first phase of the expansion spans 13 countries, including Germany, France, the United States, Malaysia, Thailand and the United Arab Emirates.

Li said the average daily rental price for a humanoid robot in European countries ranges from 2,000 to 3,000 euros ($2,350-3,525), while prices in North America can reach as high as $6,000 per day.

"Regions with higher labor costs naturally have stronger demand for robots to replace human labor," Li said. "Labor costs in Europe and North America are far higher than in China, which means demand for robotics applications could also be greater there."

According to industry analysts, the rise of robot leasing platforms signals accelerating commercialization across the sector.

Li Junlan, senior analyst for robotics and the internet of things at global market consultancy IDC, said the rental model can significantly lower trial and procurement barriers for customers.

"It allows small and medium-sized industry players, as well as companies still in the observation stage, to access and test robotic products more easily, which helps the market expand more quickly," Li said.

Looking ahead, she expects China's robot leasing market to continue expanding in 2026, supported by favorable policy conditions and growing enterprise demand for cost reduction and labor substitution.

"Companies facing pressure to improve efficiency and cope with labor shortages are expected to be most willing to explore human-machine collaboration," she said.

Still, hurdles remain before the sector can achieve sustainable large-scale growth.

Pan said that the industry continues to face challenges such as insufficient standardization in delivery and maintenance services, limited adaptation to specific use scenarios, exaggerated marketing claims and lengthy repair cycles.

"The key to scaling up the industry lies in whether it can build a stable and trustworthy service system," he said.

More educators embrace AI as a teaching aid

Report shows digital divide between rural and urban teachers is narrowing

By **ZOU SHUO** in Hangzhou
zoushuo@chinadaily.com.cn

A report on primary and secondary school teachers' digital literacy shows that artificial intelligence is rapidly becoming a routine teaching aid in China, while the urban-rural gap in digital skills continues to narrow.

The report, released on Tuesday at the 2026 World Digital Education Conference in Zhejiang province's Hangzhou, is based on a large-sample assessment of 530,000 teachers across 19 provincial-level regions. It found that 14.77 percent of teachers use AI tools every day, while only 3.41 percent have never used them.

According to the report, 85.17 percent of teachers believe AI helps expand teaching resources, and 81 percent say it saves lesson preparation time. AI tools embedded in smart teaching platforms are the most popular, used by 82.68 percent of teachers, followed by general-purpose large language models, used by 76.2 percent.

Most teachers, however, are still in the early stages of exploration. About one-third use AI only for simple assistance, while another third use AI in targeted ways during specific teaching segments. Fewer than 20 percent integrate AI throughout the entire teaching process, and only about 10 percent use AI to innovate teaching models.

The report also highlights a narrowing digital divide between urban and rural educators. On 13 indicators, the gap between the two groups is less than 5 percentage points. In eastern regions, more than 90 percent of teachers hold a positive attitude toward AI, while in central and western regions, the figure exceeds 70 percent.

With regard to training needs, most teachers want practical guidance on resource development, basic operations and application scenarios. Nearly half have called for regulations and ethical guidelines for AI in education.

"When AI handles routine tasks, teachers can focus on nurturing people," said Wang Wei, head of the education bureau of Futian district in Shenzhen, Guangdong province.

The district has created hands-on AI toolkits for all 19 subjects and uploaded them to the national smart education platform for teachers in other regions to share. More than 80 workshops have generated over 1,170 AI application cases covering 20 provincial regions, he said.

Futian is also developing a teacher AI literacy framework with 43 observation points and has issued guidelines outlining encouraged, restricted and prohibited AI uses.

"Preparing future teachers for future schools is not simply teaching them how to use tools," Wang said. "It is helping them complete a profound role transformation — from transmitters of knowledge to designers of learning, from followers of technology to trendsetters in human-machine collaboration, and from single-subject teachers to cross-disciplinary innovators."

"What truly determines a nation's competitiveness in the next two decades?" asked Zhao Yixin, a senior executive at Chinese tech giant Huawei.

His answer: the "AI talent dividend", whose foundation lies in classrooms and on teachers' podiums.

Zhao warned of a growing "AI generation gap" — students are using AI while many teachers still explain AI concepts with slides. Huawei has proposed a "teachers first" strategy and built an AI teaching practice platform to help teachers become AI designers, collaboration nodes and decision-makers.

The company has also partnered with Zhejiang Normal University to embed AI literacy into preservice teacher training, compressing days of lesson preparation into hours.

"Teachers will not be replaced," Zhao said. "But teachers who do not use AI may be replaced. The responsibility to educate will always remain in teachers' hands."

Selfless service

The nursing school of Shandong Medical and Pharmaceutical University in Yantai, Shandong province, holds a capping ceremony on Monday to promote the noble spirit of saving lives and selfless devotion. This event preceded the 115th International Nurses Day on Tuesday.

Portraits preserve memories of Long March martyrs

NANCHANG — For more than nine decades, Zhong Xindi knew her father mostly through fading memory. He left home when she was 3 to join the Red Army, and later died during the Long March, the historic military maneuver in modern Chinese history. There were no photographs to remember him by, no familiar face for the family to hold onto, only a name, and the knowledge that he never returned.

Then, a little more than a month ago, students from Anhui Normal University brought the 94-year-old a portrait of her father, Zhong Yanzhu, when he was young.

"Dad, I finally saw your face again," Zhong said, stroking the painted cheek with a trembling hand as tears ran down her face.

In Ruijin, East China's Jiangxi province, absences like Zhong's are woven into the memory of the Long March. Over 90 years ago, the county had a population of about 240,000. Some 113,000 people joined the Red Army, and more than 30,000 local soldiers set out on the Long March. More than 10,800 of them died along the way. Many left no photograph behind for loved ones.

Now, a project to paint portraits of Red Army martyrs is giving some families a face to attach to stories passed down for generations. The first batch included 151 portraits, created by college students, not from imagination, but from careful reconstruction.

Qiu Tian, one of the Anhui Normal University students involved in the project, said the team first contacted the relatives of martyrs and studied photographs of their children to determine basic facial contours. They then revised the portraits repeatedly, drawing on family descriptions of the martyrs' eyes, expressions and habitual looks, until relatives felt the likeness was right.

"I thought he would surely smile when he 'met' his family again, so I gave him a slight grin," Qiu said.

Each portrait, he said, was a dialogue across generations, and a form of human care that technology alone could not provide.

The portrait project is part of a broader effort in Jiangxi to bring names, faces and family ties back to Red Army martyrs whose traces were long obscured by war. For decades, finding a martyr's relatives often meant searching genealogies, combing through archives, and interviewing elderly villagers — work that could take years and still yield no results.

That, however, is beginning to change. Big data comparison, DNA identification, cross-provincial archive sharing, and social media have created new paths for verifying long-fragmented records.

Located less than 80 kilometers from Ruijin, in Yudu county, best known as the starting point of the Long March, over 80,000 Red Army soldiers crossed the Yudu River and embarked on a roughly 12,500-km trek later described by American journalist Harrison Salisbury as "a great human epic".

The martyrs' memorial hall in Yudu has registered more than 16,000 identified martyrs. Hundreds of other names, scattered along the Long March route, are still being checked.

In the past, information on a single Jiangxi martyr might have been dispersed across archives in several provinces, making verification slow and uncertain. With a shared database along the Long March route, the process can now be shortened. In 2024, Yudu verified the identities of 47 martyrs who died in the Battle of Xiangjiang River through the mechanism.

Social media has also helped turn once-improbable searches into possible reunions.

After seeing a short video of volunteers searching for the relatives of martyr Yang Yanting, Zhong Baoqing, curator of the Ruijin revolutionary martyrs memorial hall, began reviewing historical documents. He eventually confirmed Yang's hometown and relatives. In September 2025, Yang's nephew came to Ruijin and touched his uncle's name on the martyrs' wall.

"My father had always hoped his elder brother would come home," he said.

According to incomplete statistics, among the over 100,000 martyrs in the province's Ganzhou city, more than 40,000 have been marked as whereabouts unknown. In March, the city launched a campaign to verify more martyrs' information by establishing a unified database after integrating resources from multiple departments.

As this year marks the 90th anniversary of the Long March victory, Jiangxi has pledged to step up efforts to verify martyrs' information and help more of them regain their names, family ties and portraits, according to the provincial veterans affairs department.

At the end of the martyrs' wall in Yudu's memorial hall, a large blank space remains. An inscription explains that tens of thousands of martyrs are still without verified names, and that the emptiness stands for their sacred memory.

Each new nameplate added to the wall and each portrait delivered to a family fills a small part of that blank.

Tajik president honored by Peking University

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

> "We hope more Tajik students will be encouraged by the president's visit to study in China."
>
> **Rustamov Badriddin,** sophomore majoring in sociology at Peking University

Tajikistan's President Emomali Rahmon was awarded an honorary professorship by Peking University on Tuesday in a ceremony highlighting growing academic and people-to-people exchanges between China and Tajikistan.

During the ceremony, He Guangcai, chair of the Peking University Council, conferred a commemorative plaque, while Gong Qihuang, the university's president, presented Rahmon with the honorary certificate.

The honor recognizes Rahmon's role as a national leader and seasoned statesman in advancing bilateral friendship, promoting regional peace and development, and supporting reforms in global and regional governance, according to the university.

Since 2005, Peking University has admitted a total of 47 students from Tajikistan, with six currently studying under Chinese government scholarships, Rahmon said in his speech.

During his visit to China, scheduled to conclude on Thursday, the two sides are expected to sign an agreement to establish a new Confucius Institute at Dangara State University, adding to existing platforms for cooperation, Rahmon said.

Rustamov Badriddin, a sophomore majoring in sociology at Peking University who studied Chinese at the Confucius Institute at Tajik National University, said the number of Tajik students at top Chinese universities remains limited.

"We hope more Tajik students will be encouraged by the president's visit to study in China and enroll in more universities in the future," he said, adding that universities in his home country have been promoting Chinese-language learning and motivating students to pursue further studies in China.

According to Rahmon, 13 universities now offer Chinese-language majors, while a Luban Workshop — a hands-on training center for technical education — has been established at Tajik Technical University.

Liu Qi, a doctoral candidate at the university whose research focuses on Central Asia, said the expansion of student exchange programs and the planned Confucius Institute would provide substantial momentum for youth exchanges.

"President Rahmon's visit sends a strong signal of friendship and helps Chinese students better understand neighboring countries' history, culture and development," she said.

In his speech, Rahmon also expressed hope that more Chinese universities would establish campuses in Tajikistan and deepen cooperation in fields such as engineering, natural sciences and agriculture.

"Agriculture is a highly promising area for collaboration," Liu said, adding that her dissertation will feature agricultural development in Central Asia.

For instance, China has introduced advanced agricultural technologies, including drip irrigation systems and newly developed cotton seeds, at a cotton plantation established in Tajikistan by a company based in the Xinjiang Uygur autonomous region.

China's achievements in agricultural development are increasingly being shared with Central Asian countries, helping boost local agriculture and strengthen regional cooperation, she added.

Paraguay urged to recognize one-China principle

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Beijing has blasted Paraguayan President Santiago Pena's recently concluded visit to China's Taiwan region, warning that "rejecting the one-China principle will only isolate oneself from the international community".

Pena visited the island from Thursday to Sunday, met with Taiwan leader Lai Ching-te on Friday in Taipei, and signed several so-called cooperation documents.

The Paraguayan leader claimed that the South American country supported Taiwan's "participation in international multilateral systems", that "the international community should recognize Taiwan", and that Taiwan does not need to worry about changes in bilateral ties.

In response, Foreign Ministry spokesman Guo Jiakun said on Tuesday that "China firmly opposes and condemns such moves made by the Paraguayan side" and that "the wheels of history wait for no one".

"There is but one China in the world. Taiwan is an inalienable part of China's territory, and the one-China principle is a basic norm governing international relations and a prevailing consensus in the international community," Guo said.

"Over the years, we have heard time and again the strong call of people from various sectors in Paraguay to develop relations with China," he added.

Guo cited a poll in Paraguay showing that nearly 90 percent of respondents supported establishing diplomatic ties with China.

"This fully demonstrates that establishing diplomatic relations with China serves the fundamental and long-term interests of the Paraguayan people, and that colluding with the Taiwan authorities wins no support," he said.

The spokesman said relevant Paraguayan political figures had not only turned a blind eye to this, but had also blatantly visited Taiwan to endorse Lai Ching-te and his followers in defiance of global criticism, willingly serving as chess pieces for "Taiwan independence" separatist forces.

"It is apparent to all whether this is truly for the benefit of the Paraguayan people or driven by ulterior motives," Guo said.

At a daily briefing last week in Beijing, Foreign Ministry spokesman Lin Jian urged Paraguay's authorities to stand on the right side of history at an early date and sever the so-called "diplomatic ties" with the Taiwan authorities.

On Tuesday, Guo said, "We urge the Paraguayan government to change course at an early date, see where the arc of history bends, follow the will of its people, and make the right political decision to recognize the one-China principle."

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

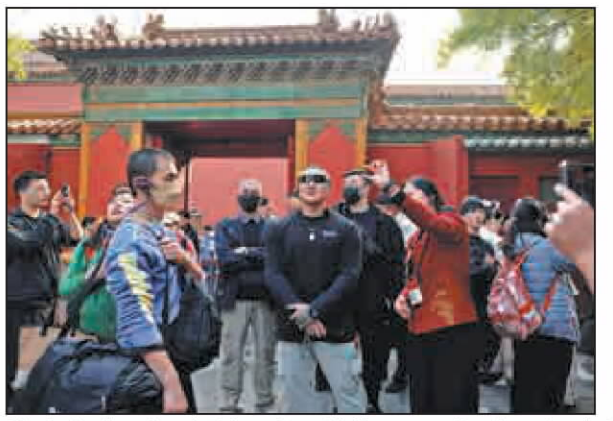
Influencers dispel DPP disinformation

Taiwan netizens shown actual conditions on Chinese mainland

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

A growing number of Taiwan social media influencers are crossing the Strait to document the Chinese mainland's rapid development, sparking a "reality-check" trend that has caught the Democratic Progressive Party off guard despite its tightened restrictions on exchanges.

In February, Fan Chi-fei, a former correspondent for several Taiwan media outlets, shared her experience of traveling to Chengdu, Sichuan province, on her YouTube channel, describing the trip as "very interesting" and praising the local cuisine and giant pandas.



Speaking about the motivation behind the trip, Fan said in the video that "after reporting on the mainland for so long, it would make little sense not to visit and see it for myself".

Her trip has caught attention on both sides of the Taiwan Strait, as she was previously labeled as a "pro-green" figure who supported the DPP's political stance and made negative reports about the mainland.

Fan joins a number of Taiwan social media influencers who have visited the mainland for the first time in recent years. Other prominent online influencers, including Chen Chih-han, known as "Guan Zhang", and Chung Ming-hsuan, both of whom have more than 1.3 million YouTube followers, and have also made their first trips to the mainland over the past two years.

Through livestreams and vlogs, these content creators have presented the mainland's actual conditions, leading some viewers to reassess narratives on the island and realize that the reality differs from the image portrayed by the DPP authorities.

KAN LI / CHINA NEWS SERVICE Chen Chih-han (center), a Taiwan-based influencer known as "Guan Zhang", visits the Palace Museum in Beijing in October. PROVIDED TO CHINA DAILY

Out of the 'cocoon'

Chen, born in 1979 and formerly a supporter of the DPP, first visited the mainland in June last year to see it for himself. He livestreamed his six-day trip to Shanghai and Hangzhou in Zhejiang province.

Before departure on the first day, he admitted that he had felt uneasy, saying that many people on the island had tried to discourage and intimidate him.

Upon arrival, Chen said: "I had been influenced by the narratives on the island my whole life, believing whatever others told me. It wasn't until I came here in person today that I realized I had been completely misled."

Some narratives promoted on the island by certain media outlets have attempted to portray the mainland as "backward", including claims such as the "high-speed rail seats have no backrests" and the "toilets have no doors".

Chen challenged these claims through firsthand experiences shared during his livestreams, describing them as "lies spread by the DPP". During his trip, he used high-speed rail and mobile payment services in multiple cities while showcasing authentic street scenes and the daily lives of ordinary people.

To his surprise, he was warmly welcomed by people on the mainland, with some even politely asking to take photos with him.

"The trip completely overturned my negative impression of the mainland," Chen said, adding that he was astonished by the mainland's rapid development. Online, some who watched the livestream commented that they had misunderstood the mainland as well, and Chen's trip gave them a chance to know the realities.

Four months later, Chen made his second visit to the mainland, covering stops including Beijing, Shenyang in Liaoning province and Xiamen in Fujian province. This time, he offered a more direct acknowledgment of the mainland's progress, along with outspoken criticism of disinformation spread by the DPP.

"I originally thought I would never come to the mainland in my lifetime," the 47-year-old said, while encouraging young people in Taiwan to come and see the mainland for themselves.

Since taking office in 2016, the DPP authorities have steadily tightened restrictions on cross-Strait people-to-people exchanges. In 2024, the Lai Ching-te authorities raised the travel alert for the mainland to an "orange" level, advising people to avoid nonessential travel while highlighting what they described as the risks of visiting the mainland.

Fan, who visited the mainland for the first time in December last year, said many people tried to discourage her from making the trip. "They were worried that I might be detained and unable to return," she said.

The stark contrast between the DPP's portrayal of the mainland and what these influencers experienced firsthand led to a noticeable shift in their attitudes toward the mainland.

The DPP authorities have scaremongered and intimidated influencers who have visited the mainland, saying such trips are part of a "united front trap" or "cognitive warfare", while intensifying scrutiny of the funding sources and backgrounds of related groups.

Those who shared positive impressions after traveling to the mainland have faced personal attacks from DPP supporters and have been accused of engaging in "cognitive warfare".

Public reactions to these trips have therefore been polarized, with some expressing support while others criticizing them as being "brainwashed" by the mainland.

"I will continue to visit the mainland and bring the actual conditions back to Taiwan in an effort to help more people gain a more direct understanding," Chen said after his second visit.

Affinity and curiosity

"If you haven't visited a place, then you have no right to criticize it," said Chung, the 26-year-old travel YouTuber. Since first visiting the mainland in 2024, he has traveled to destinations including Beijing, Shanghai, Chongqing, and the Xinjiang Uygur autonomous region.

During his latest trip to Xinjiang in February, Chung drove alone for more than 1,600 kilometers across the region, visiting Sayram Lake and sharing a meal with a local family. In the video, he described Xinjiang's scenery as very beautiful and said the people there were "warm and kind". The video has attracted more than 1.4 million views on YouTube.

Chung also praised the mainland's convenience and well-developed infrastructure in his travel videos, a contrast that drew attention given his previously perceived pro-DPP stance. A video interview he conducted with Tsai Ing-wen, the former Taiwan leader from the DPP, remains featured on the front page of his channel.

Another Taiwan YouTuber, known online as "Boboyu", used his trip to Hangzhou to explain why more people in Taiwan are becoming interested in traveling to the mainland, citing affordable taxis and accommodation, as well as the convenience of a shared language across the two sides.

He said that while the shared language makes the trip much easier, the use of simplified characters, different payment methods and distinct accents still provide the sense of novelty that Taiwan travelers look for.

Notably, compared with travel videos filmed in other destinations, content about the mainland tends to attract far greater attention. Chen's livestreams during his mainland tour set multiple YouTube records in the Taiwan region, including the platform's highest livestream viewership, with total views reaching as high as 20 million.

Cai Zhuofeng, general manager of the Haixi multichannel network base in Xiamen and a veteran livestreaming industry practitioner, said people in Taiwan are eager to learn what the mainland is really like, while audiences on the mainland are interested in seeing how Taiwan visitors experience life there. "This has made content created by Taiwan visitors receive significantly more attention," Cai said.

More mainland-related content has been emerging across Taiwan's social media landscape, following a growing trend of influencers such as Chung and Chen visiting the mainland. Fan has expressed the hope of traveling to Yunnan province in the future.

As accessible online content has offered a more direct view of life on the mainland, the DPP authorities have not only tightened restrictions on cross-Strait personnel exchanges, but also moved to curb the social media app RedNote, or Xiaohongshu, which features genuine content related to the mainland.

In December last year, Taiwan's "interior affairs department" announced a one-year ban on the app. The mainland-based lifestyle-sharing platform has more than 3 million users in Taiwan, around 70 percent of whom were born after 1990.

Jhuang Yi-chang, founder of an online gaming startup in Taiwan, who took part in a digital media training camp held in Wuhan, Hubei province, in March, said: "Because so many positive stories and experiences continue to circulate on Xiaohongshu, people in Taiwan who come across them begin to realize that the mainland may not be as it is portrayed by the DPP authorities. As a result, more of them become interested in visiting the mainland to see it for themselves."

Gradually, Jhuang said, people in Taiwan, regardless of their political stance, are becoming more inclined to see the mainland's realities for themselves.

Despite restrictions and warnings issued by the DPP authorities, 306,900 Taiwan residents made their first trips to the mainland last year, up 34.6 percent year-on-year.

According to the National Immigration Administration, in the first quarter, applications for mainland travel permits by Taiwan residents increased 11.8 percent year-on-year, while the number of Taiwan residents entering the mainland rose 27.6 percent.

The mainland has introduced measures aimed at facilitating cross-Strait exchanges. From July 1, 2025, to Dec 31, 2027, Taiwan residents applying for mainland travel permits for the first time will be exempt from application fees. Since 2024, first-time permit holders from Taiwan have also been eligible for free or discounted admission to scenic areas and tourist attractions on the mainland within one year of entry.

Among the 10 policy measures introduced by the mainland in April are steps to promote the full resumption of cross-Strait passenger flights to further facilitate personnel exchanges. The mainland has also called on Taiwan to restore direct cross-Strait passenger flights.

At a news conference in March, Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, welcomed Taiwan compatriots, including influencers and media practitioners, to come to the mainland, saying that the mainland will continue to create favorable conditions for their travel and exchanges.

Shi Xuefan contributed to this story.

Wenzhou welcomes island's aspiring entrepreneurs

By **LI SHANGYI**

The entrepreneurial spirit found in the city of Wenzhou in Zhejiang province has left a profound impression on Pan Po-chuan, a 35-year-old from Taiwan who has dedicated his career to helping Taiwan startups scale and thrive within the Chinese mainland ecosystem.

Born in Taipei, Pan has served as director of the Wenzhou-Taiwan Integrated Development Youth Entrepreneurship Base in Wenzhou since 2021. While studying on the mainland in 2015, he was struck by the city's rapid development and its strong support for young entrepreneurs from Taiwan.

"Entrepreneurs from Wenzhou and Taiwan are both highly driven and entrepreneurial," Pan said. "Why not join forces to become even stronger together?"

Covering more than 1,000 square meters, the entrepreneurship base is home to around 50 companies founded by young Taiwan entrepreneurs. It is equipped with startup workstations, livestreaming studios and e-commerce training facilities.

As part of Wenzhou's support policies for Taiwan entrepreneurs, the base provides two months of free hotel-style accommodation, helps newcomers secure affordable long-term housing in youth apartments, and offers free business registration and office space without utility or property management fees.

To help young entrepreneurs from Taiwan launch their businesses smoothly, the base also assists them in finding free or low-cost retail spaces to connect directly with consumers, Pan said.

"You have to take the first step to understand the mainland market, which has introduced many preferential policies for Taiwan compatriots," Pan said, encouraging more young people from Taiwan to pursue opportunities on the mainland.

Beyond entrepreneurship services, Pan has also established an influencer incubation center focused on livestreaming and digital content creation. The center has signed 40 influencers, including nine young people from Taiwan.

According to 10 policy measures introduced by the mainland in April to promote cross-Strait exchanges, Taiwan industry professionals can participate in the production of mainland micro-dramas and web dramas through various channels.

In recent months, Pan has invited directors and actors from Taiwan to Wenzhou to build a cross-Strait performing arts talent platform. He said the initiative aims to combine the resources of Zhejiang's web series industry and artificial intelligence technologies with creative talent from both sides of the Strait.

Speaking about his broader mission, Pan said many aspects of life on the mainland are not fully understood in Taiwan because of restrictions on information flows and media communication. As a result, Taiwan youth who have established themselves on the mainland play an important role in fostering mutual understanding across the Strait, he added.

"We need to translate our message into expressions that people in Taiwan can understand and relate to," he said. "That way, they can experience the mainland's friendliness firsthand and develop a genuine understanding through personal experience."

Pan Po-chuan participates in a seminar on information technology in Beijing via video feed in June 2022. YI HAIFEI / CHINA NEWS SERVICE

Looking ahead, Pan expressed one particular hope: "I hope direct flights between Wenzhou and Taiwan can resume as soon as possible. Wenzhou was once the mainland city with the shortest flight distance to Taiwan, and restoring direct flights would greatly facilitate cross-Strait exchanges."

Viral vendetta

During this year's Labor Day holiday, while crowds flocked to major tourist attractions, a very different kind of sensation was taking shape online. The micro-short drama series *Enemy* went viral on May 4, garnering over 760 million views on Douyin.

At first glance, *Enemy* seems like a survival-game thriller, with two protagonists cast as fated enemies. Yet beneath that surface lies a tragic love story from another lifetime.

In their past lives, the two characters were childhood companions and lovers. Set against the backdrop of the Nanjing Massacre, the historical storyline follows these two traditional Chinese opera performers as they are forced by Japanese invaders to perform in a propaganda play. Feigning obedience, they secretly resist, ultimately choosing to poison themselves and their captors, dying together onstage.

Remarkably, the viral hit was created by just two young content creators, Zhang Wenchu and Yang Xiyun. With a limited budget, they handled nearly every aspect of production themselves — even handmaking costumes to recreate Republican-era China.

The popularity of *Enemy* reflects young audiences' growing appetite for sincere storytelling. In an era increasingly saturated with AI-generated content, viewers are still drawn to stories shaped by emotional depth and genuine creative devotion.

Chinese cultural elements, like traditional opera, continue to captivate young audiences. VCG

Weirdly useful

When travelers visit China, the list of must-buy souvenirs is no longer limited to museum collectibles, silk scarves, or embroidered fans. In recent years, a wave of quirky, humorous everyday Chinese products has found unexpected popularity overseas, turning ordinary household items into practical yet playful lifestyle goods.

Lotus-shaped birthday candles, once a familiar sight at children's birthday parties in China in the 2000s, are now appearing at parties abroad. Glow-in-the-dark toilet mats and colorful showerheads have also gone viral online, praised for transforming ordinary bathrooms into cozy and whimsical spaces.

Another unlikely hit is the "dried-rat doll", a deliberately rough-looking plush toy with a skinny, scrappy shape. Often customized to resemble celebrities, these quirky dolls have become a form of social currency for young overseas fans, who bring them to concerts and even Formula One events.

Beyond novelty and humor, more practical Chinese-made products are also gaining ground. According to FastMoss data, a mini clip-on fan sold more than 11,600 units on TikTok Shop US in the past month, generating over $182,000 in sales.

Behind this steady stream of viral products is the speed, flexibility, and responsiveness of China's manufacturing ecosystem. Yiwu International Trade Market, home to tens of thousands of booths, offers a vivid example of how quickly Chinese suppliers can capture niche consumer demand and turn it into mass-market goods.

As Huang Liuying, an associate professor at the School of Management, Zhejiang University, wrote in Zhejiang Daily, "Behind these seemingly small trinkets is Yiwu's supply chain, which precisely captures emotional demand and demonstrates a deep integration of emotional value with the real economy."

Young builders deepen Belt and Road ties

Through daily interactions and shared experiences, Chinese youth overseas are turning development projects into bridges of friendship and trust.

Yang Meihang visits the Edge of the World near Riyadh, Saudi Arabia, on June 7, 2025. PROVIDED TO CHINA DAILY

By GUI QIAN
guiqian@i21st.cn

At a humble street food stall in Luanda, Angola, Yang Xin sat sipping local drinks with her driver, an Angolan colleague. Despite his modest income, he treated her to a meal and asked sincerely about her well-being.

This simple gesture of kindness became a quiet testament to friendship during Yang's time as an expatriate. It also reflects the broader spirit of many young Chinese working abroad under the Belt and Road Initiative (BRI), building bridges of connection overseas.

Yang, a young woman from Guangzhou, Guangdong province, is a veteran contributor to the initiative. Since arriving in Angola in 2014, she has been involved in clean energy planning, water resources management, infrastructure development, and housing construction. Although her main role is as a translator, her responsibilities extend far beyond language interpretation.

"I handle almost all cross-cultural communication and inter-agency coordination. I've traveled to nearly every province in Angola," she said, highlighting the wide range of skills required for work overseas.

Over the years, Yang has witnessed the evolution of Chinese enterprises in the country. After Angola's infrastructure was devastated by civil war, Chinese firms were among the first to step in to help rebuild. Private companies specialized in civil engineering and housing, while larger, state-owned enterprises handled major projects in water, power, and renewable energy.

More recently, the presence of Chinese businesses in Angola has diversified. Beyond large corporations, individual Chinese-run retail stores have spread across Luanda, and new ventures like milk tea shops and food delivery services have emerged. The local Chinese culinary scene, once dominated by Sichuan restaurants, now features a variety of regional cuisines, including Cantonese dim sum, Fujian snacks, southern-style rice noodles, and northern dumplings.

"As a native of Guangzhou, enjoying authentic home cooking abroad gives me a deep sense of belonging," Yang said.

Unlike Yang Xin, who chose to settle in one place, Yang Meihang, a young man from Shangrao, Jiangxi province, moves across different countries and cultures, gaining a rich understanding of global diversity and thriving in a rapidly changing world.

Yang Meihang has a background in electronic information engineering and translation. In 2024, he was stationed in the Philippines working in energy business development. He later traveled to Oman, Kuwait, and Saudi Arabia, leading market expansion efforts across the Middle East.

People watching a televised soccer match at a restaurant in Angola.
YANG XIN / FOR CHINA DAILY

"The BRI is more than construction projects and contracts — the genuine connections between people we build along the way are just as important."

Yang Xin, a former translator and expatriate in Angola

"In their eyes, Chinese people 'only do business and do not fight'. There are no ideological conflicts. Our interactions are always peaceful and sincere."

Yang Meihang, a market expansion specialist in the Middle East

He observes that market conditions differ widely by region. "The Philippine market is relatively mature while the Middle East offers tremendous potential for infrastructure investment and attracts significant foreign capital, which brings both opportunities and challenges," he said.

Amid the grand narrative of the BRI, Yang Meihang finds that the warmth of everyday interactions leaves the deepest impression. He experiences this warmth not only in personal encounters but also through the local people's appreciation of Chinese culture and products.

"Local shops in Middle Eastern countries are full of products made in China, and many people are eager to learn Chinese. In Saudi Arabia, parents often encourage their children to greet Chinese visitors in Chinese — I've experienced this several times," he recalled.

"In their eyes, Chinese people 'only do business and do not fight'. There are no ideological conflicts. Our interactions are always peaceful and sincere," he added.

The same goes for Yang Xin. "The BRI is more than construction projects and contracts — the genuine connections between people we build along the way are just as important," she said.

She remembers a school principal in Angola, passionate about Chinese history, who once gifted her a book he had written on Chinese cultural studies. On another occasion, when no company drivers were available for an urgent trip, a local client offered her a ride on his motorcycle.

"Being stationed abroad isn't a one-way export; it's about mutual understanding. We brought steel and concrete, and in return, we gained friendship," she said.

Growing abroad

Overseas experiences have not only made these two young people active participants in the BRI but have also led to significant personal growth.

For Yang Meihang, the five-hour time difference between Saudi Arabia and China amplified his sense of isolation each evening. Spending long hours alone, he taught himself Arabic and established a running routine.

Living in a completely different environment also strengthened his sense of responsibility and helped him better understand himself. At first, the differences in appearance, culture, and cuisine made him feel like a stranger. Over time, as he connected with locals and fellow Chinese expatriates, he gradually found his footing and embraced his new life.

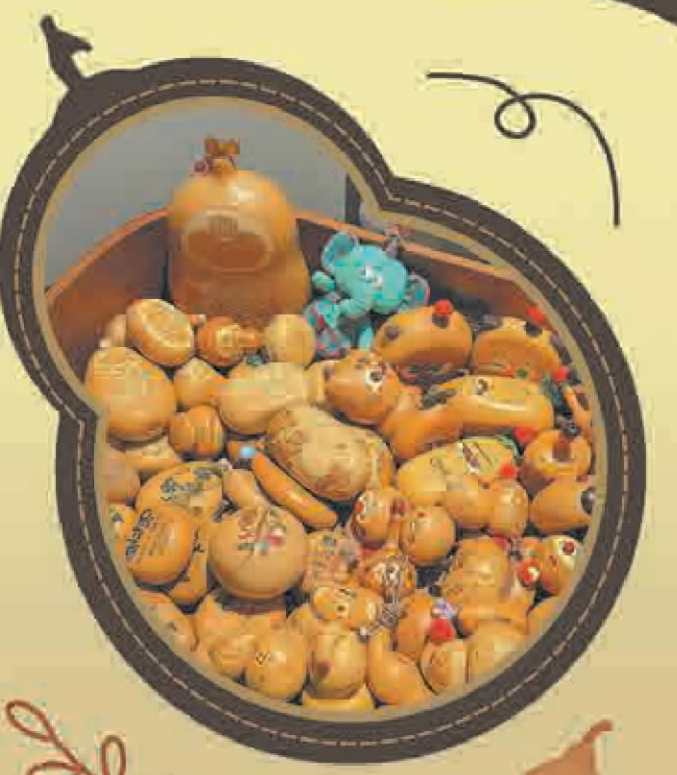
"As a member of the new generation of overseas builders, you must have the determination to navigate unfamiliar environments," he reflected. "An open mind and curiosity are essential for understanding local customs — only then can you truly thrive abroad."

Yang Xin brings a female perspective to her overseas experiences. She acknowledges that women often face additional societal pressures around marriage, childbirth, and personal safety, but she believes that working abroad can empower women, giving them courage and broadening their horizons.

"Overseas salaries are competitive, and many of my female colleagues have even bought their own apartments, achieving financial independence for the first time," she said. "This freedom allows us to make choices confidently and live life on our own terms."

Now back in China, Yang Xin has transitioned from full-time employment to freelancing. She occasionally takes on overseas translation projects, manages a social media account where she shares reflections on her time in Angola, and offers consulting to young people interested in overseas postings.

Through these efforts, she continues to apply the lessons and confidence she gained while working abroad.



On her social media account, she wrote: "Experiences like these show young people that the world is vast, challenges can become opportunities, and life offers far more possibilities than we often imagine."

Hands-on hobbies calm young minds

How fidget toys, traditional gourds, and diorama stickers are reshaping stress relief among China's youth.

By **XIONG XINYI** and **GUI QIAN**

While reviewing documents with her right hand, 26-year-old Zhouzhou (pseudonym) from Hangzhou, Zhejiang province, absently twists a small, colorful toy in her left hand.

"It's like spinning a pen in class when we were kids," she said. "The movement doesn't require much attention, but it helps you relax."

The object is a Tangle fidget toy, made of connected curved pieces that can be twisted into different shapes.

Zhouzhou discovered the toy in late summer 2025, before it became popular online. She bought several items to film an ASMR video and posted it on her social media account, Meishi Zhouzhou. The video quickly gained traction, with more than half of the viewers asking what the toy was.

As Zhouzhou observed, the Tangle appeals to people visually and through its sound. "Most versions make a crisp sound, like ice cubes dropping into an Americano," she said.

Touch adds another layer to the experience, with materials ranging from firm to soft. Some users rely on the toy to replace habits such as picking at their skin or nails. Others simply enjoy the ritual of it.

Zhouzhou enjoys collecting and neatly arranging the colorful pieces. "I find that neatness really satisfying," she said.

What began as a personal interest gradually became something she wanted to share with others. She now sells the toy through livestreams, too.

One student customer bought 22 pieces — not all at once, but one by one after each livestream demonstration.

"For many students, comfort doesn't come from expensive bags or gadgets," Zhouzhou said. "Unlike adults who save up for a big purchase, students see these stress-relief toys as little indulgences."

According to China Youth Daily, more than 1 million units had been sold in China by the 2026 Spring Festival after the toy was launched in March 2025.

Tradition brings comfort

While trendy stress-relief toys dominate e-commerce today, the desire for comfort through touch is far from new. Throughout many generations, people have turned to small objects to create moments of quiet reflection.

The history of Chinese bottle gourds can be traced back to ancient times, when they were cherished for their symbolic meanings of harmony and prosperity. Over the centuries, gourds evolved from ritual vessels to handheld companions.

Now, these old objects have sparked a new fervor among young people. Li Yajuan is one of them.

After work, Li picks several gourds from her collection, places them on a tray, and rubs them while watching TV. She carries one during her commute and takes one to doctor's appointments. She also kept one close during a recent hospital stay when she felt frightened and alone.

Working in e-commerce and design, she first bought gourds for a design project. The hobby soon replaced drawing and tearing paper as her preferred stress relief. Since autumn 2024, she has spent more than 100,000 yuan ($14,703) building her collection.

> "Compared with the fast pace and intensity of mobile games, we enjoy the slower process of building our own ideal little worlds."
>
> **Liang Jie,** a diorama sticker lover

> "Playing with gourds is about calming your mind and accepting the process, along with whatever changes happen naturally, whether they occur in a day or over the course of a year."
>
> **Li Yajuan,** a gourd collector

"Playing with gourds is about calming your mind and accepting the process, along with whatever changes happen naturally, whether they occur in a day or over the course of a year," she said. Some gourds can be polished quickly, while others require weeks of sun exposure.

When she feels angry, she rubs harder, and the gourds become shinier. To Li, those changes are positive feedback — turning something negative into something better.

But for collectors, the real excitement comes from the chase, with 500 people sometimes competing for just 10 items.

Once, Li lost her internet signal in an elevator while trying to buy a rare gourd and assumed she had missed out. Moments later, right after stepping out of the elevator, she found she'd successfully secured the limited piece.

"I just crouched in the hallway in disbelief," she recalled. Over time, the hobby taught her to accept that some things are out of one's own control. "If something is meant to be yours, it will come," she said.

Her hobby has since grown into a small business selling polishing cloths and pouches. In fact, the gourd industry has already become a sizable market. In Dongchangfu district of Liaocheng, Shandong province, gourd cultivation generates annual gross revenues of 2.6 billion yuan, accounting for 75 percent of the national market, according to Liaocheng city authorities.

Tiny worlds heal

Not all stress-relief hobbies rely on touch alone. For some young people, comfort comes from carefully constructing miniature worlds that offer a temporary escape from daily pressures.

Without needing scissors or glue, users can place diorama stickers of characters, buildings, furniture, flowers, and other motifs onto a pre-designed background board to create tiny bedrooms, grand castles, and city streets.

Liang Jie, from Zhejiang province, shares videos of herself putting together miniature scenes on her social media account, Lucia Sticker Channel.

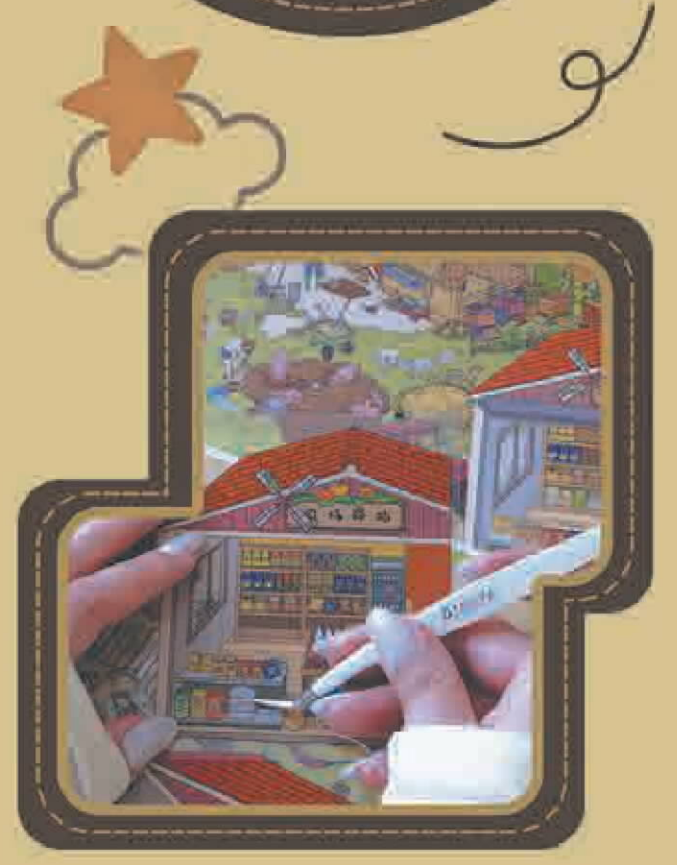
Liang turned to diorama stickers during a transitional period after leaving her job at a large corporation. Before bed, she works on stickers while listening to podcasts, treating the process as a form of meditation — a way to reflect on the day and stop thinking about the future.

The crisp peeling sound and the gradual layering of scenes make each diorama immersive. "It's like a flat version of Lego — more affordable — and also like a puzzle, but more structured and three-dimensional," she said. "Diorama stickers are a way to erase bad moods."

Liang and many of her followers have basically stopped playing online games since discovering diorama stickers. "Compared with the fast pace and intensity of mobile games, we enjoy the slower process of building our own ideal little worlds," she explained.

By early May, the hashtag "diorama stickers" had attracted 730 million views on Xiaohongshu, also known as RedNote, and nearly 1.43 billion plays on Douyin, the Chinese version of TikTok.

As the hobby grows in popularity, Liang has noticed sticker brands exploring a wide range of new styles and concepts.



Some brands are focusing on Chinese aesthetics, drawing inspiration from intangible cultural heritage and traditional opera. Others are creating soothing, story-driven scenes that capture the warmth of everyday life — such as a spring courtyard or a winter island — the kinds of spaces many young enthusiasts long for. Some are also experimenting with gaming-style experiences, allowing users to step into pixel-art worlds.

"Unlike the happiness that comes from simply buying something, diorama stickers offer the satisfaction of creating joy with your own hands," Liang said.

Whether twisting a plastic loop, polishing a gourd, or layering stickers onto miniature scenes, these activities share a common feature: repetitive hand movements that participants say help them find a controllable, calming rhythm amid uncertainty.

Cosplay unites generations

Amid wigs, costumes and fantasy characters, a mother's support for her daughter becomes a bridge between parents and children.

Jiang Fuchun, owner of a cosplay photo studio in Shanghai, brings anime and video game characters to life with her intricate creations. PROVIDED TO CHINA DAILY

By MENG WENJIE
mengwenjie@i21st.cn

Four years ago, Jiang Fuchun rarely wore makeup. Today, in her Shanghai photo studio, she stands beside a vintage piano in a pink wig and Rococo-style dress, her eyes framed by glittering makeup and layers of lace cascading from her skirt.

The look is inspired by *Identity V*, a popular game by China's NetEase Games — one of many anime and video game characters Jiang has learned to recreate since stepping into the world of cosplay.

Jiang, 49, is the owner of Mofa Riji, or Magical Diary, a cosplay-themed photo studio. Over the past four years, the studio has attracted an online following of nearly 1.1 million.

Her transformation began with a simple request from her daughter.

"At the end of 2021, my daughter had just started middle school and was going through some emotional struggles," Jiang recalled.

The teenager showed little interest in many things but was drawn to fashion inspired by ACG (anime, comics, and games) culture. Then, one day, her daughter brought up an idea that would change the family's course: opening a photo studio devoted to cosplay.

"I just wanted to support her," Jiang said. "At that time, her happiness was the most important thing for our family."

After discussing it with her husband, Jiang decided to give it a try. With a background in IT and later experience in insurance sales, she admitted she knew little about cosplay at the time. But her daughter, then 14, helped choose locations, design interiors, source props, and plan nearly every photo shoot.

"She understood this world much better than I did," Jiang said. "I was just trying to keep up with her ideas."

What began as a family project gradually opened a new stage for Jiang herself. Mofa Riji has since expanded from a single space in Shanghai to a second location in Chengdu, Sichuan province. It has welcomed nearly 30,000 visitors, about 80 percent of them under 30, with middle school students forming the largest group.

Where generations meet

Over time, Jiang began to see the studio as more than a place for costumes and photographs. It had become a space where parents and children found new ways to connect.

One encounter stayed with her. A mother brought her 10-year-old daughter to the studio for a birthday photo shoot. The girl wanted to dress as a cute zombie character, but her mother strongly objected, saying it was unlucky to dress like a zombie on her birthday. Instead, she insisted on a bright red outfit, which she felt was more festive. The disagreement lasted throughout the session, and the shoot did not go smoothly.

"Seeing that change — from rejection to active support — moved me deeply. It showed me that parents can learn to understand, too."

Jiang Fuchun, owner of Mofa Riji, a cosplay-themed photo studio

To Jiang's surprise, the girl returned a year later. This time, her mother had already prepared her favorite outfits and wigs and accompanied her to another session.

"Seeing that change — from rejection to active support — moved me deeply. It showed me that parents can learn to understand, too," Jiang said.

Stories like this unfold frequently at Jiang's studio. She has come to see her role as more than running a business. She often takes time to speak with parents, helping them see cosplay from their children's point of view.

Some parents, for example, are initially unsettled by the pale makeup. Jiang explains that once the makeup, wig, and costume come together, the overall look becomes much more beautiful and natural.

"Cosplay allows young people to fully inhabit a character and gain joy and confidence through that process," she often tells parents.

But Jiang also draws on her own perspective as a mother. On one occasion, when a mother objected to her 11-year-old daughter wearing colored contact lenses, Jiang supported the decision, knowing that the girl was still too young to wear them safely.

"At the same time, I made sure the mother understood that the hobby itself wasn't wrong," Jiang said. "Even if families only spend a few hours here, I hope parents leave feeling a little closer to their children."

What has surprised Jiang most is how many parents are now willing to step into their children's world.

Some mothers even join cosplay sessions with their daughters, letting the children choose their characters for them.

"They may not know much about the culture, but they are willing to try," Jiang said.

Today, Jiang's daughter is an adult with other interests and only occasionally helps out at the studio. Jiang, however, continues to run the business — no longer as a mother nervously entering an unfamiliar world for her child, but as someone who has found her own sense of purpose and fulfillment in that creative space.

Online, fans affectionately call her "Auntie Jiang". Many young followers share similar stories with her: "My parents didn't understand my cosplay hobby at first, but after watching your videos, they finally got it."

"When I read comments like that, I feel the studio carries something many young people are looking for — the chance to be understood by their parents," Jiang said.

From Venezuela to China: *wushu* dreams realized

By YAN DONGJIE in Tianjin
yandongjie@chinadaily.com.cn

At the athletes' entrance area of the 10th World Junior Wushu Championships in Tianjin, Hernando Dudamel, coach of the Venezuelan *wushu* team, gave last-minute instructions to his 14-year-old daughter, Valeria Dudamel, before she entered the competition area.

His eyes showed both the focus of a coach and the quiet pride of a father.

It was the second time Hernando had accompanied Valeria to the World Junior Wushu Championships as her coach, but the first time the father and daughter had visited China. For Valeria, competing in the birthplace of *wushu* was not only an important step in her athletic career, but also a chance to feel closer to the culture behind the sport she loves.

Held in Tianjin from March 25 to 30, the championships were a key qualification event for the 2026 Youth Olympic Games in Dakar, where *wushu* will make its debut as an official sport.

At the event, Valeria competed in *changquan*, *qiangshu*, and *daoshu* — *wushu* events featuring bare-hand routines, spear techniques, and broadsword routines — and secured her place at the Games, becoming one of only two *wushu* athletes from South America to qualify, according to the Venezuelan team.

"*Wushu* is an elegant sport full of culture and tradition," Hernando said. "It is deeply rooted in Chinese heritage and brings together people from around the world who share the same passion."

Hernando's own connection with Chinese martial arts began in the 1990s, when kung fu films became popular across Latin America. As a young man, he was drawn to the movements, spirit, and culture behind the films. He began practicing at a friend's gym and never stopped.

At that time, training conditions in Venezuela were limited.

"We lacked proper training equipment and had to use simple gear like fitness mats," he recalled.

Still, he kept going. Over the past 25 years, *wushu* has grown from a personal passion into a way of life.

Valeria Dudamel (left) practices with a US athlete at the 10th World Junior Wushu Championships in Tianjin, held from March 25 to 30, 2026. PROVIDED TO CHINA DAILY

Valeria grew up in this environment. Influenced by her father, she started practicing *wushu* at the age of 8 and later joined Venezuela's national youth *wushu* team.

During training, Hernando treats her like every other athlete. He sets strict standards, corrects her movements carefully, and expects the same discipline from her as he would from the rest of the team.

"He is my coach during training and my father at home," Valeria said. "*Wushu* has given us a very special family bond."

In Hernando's view, *wushu* is not just about movements or medals. It is also about personal growth.

"Discipline and respect are the qualities I hope she can develop most," he said. "*Wushu* helps shape character, which is far more important than competition itself."

From mastering her first routine at 8 to winning three gold medals at the South American Wushu Championships and now qualifying for the Dakar Youth Olympic Games, Valeria has grown through years of training and competition.

"Watching her become independent, responsible, and determined is my most precious reward," Hernando said.

Their journey is also part of a wider story of inheritance in Latin America's *wushu* community. Many athletes who once competed alongside Hernando have now become coaches, referees, and mentors.

"Decades ago, we competed side by side. Now our athletes compete and learn from one another," Hernando said. "We bonded over Chinese *wushu*, and this connection is truly special."

Despite the language barrier after arriving in Tianjin, Hernando and Valeria said they quickly felt welcomed by the people around them.

"Although we don't speak Chinese, the warmth and kindness of the people we met — from volunteers at the venue to local residents — made us feel at home," Hernando said.

Their tight schedule did not allow them to visit more Chinese cities, but both father and daughter said they hoped to return and learn more about China's culture, history, and food.

"I have practiced *wushu* for 25 years, but this was my first visit to its birthplace," Hernando said. "More than the competition itself, what I will remember most is watching Valeria grow through this journey."

Zhong Aiyamei contributed to this story.

BASKETBALL

Detroit Pistons' Cade Cunningham (left) attempts to stop Cleveland Cavaliers' Donovan Mitchell during Game 4 of a second-round NBA playoffs series on Monday in Cleveland. The game saw Mitchell tie the NBA playoff mark of 39 points in the second half. AP

Mitchell ties playoff mark, as Cavs rally to level it up

Standout second half sees Cleveland star post 39 in Game 4 win over Pistons

CLEVELAND — The Cleveland Cavaliers are back on an even footing in their second-round series after a huge second half from Donovan Mitchell in Game 4.

Mitchell tied an NBA playoff mark with 39 points in the final two quarters, as he rallied the Cavaliers to a 112-103 victory over the Detroit Pistons on Monday night.

"What a shift, right? Really struggled in the first half, and then a big-time second-half performance by Don," Cavaliers coach Kenny Atkinson said.

"It's pretty impressive. I'm not sure I've seen in the playoffs a turnaround like that, where a guy is struggling and just absolutely turns the switch and is the complete opposite of the first half."

The home team has won all four games in the series, which shifts to Detroit for Game 5 on Wednesday night.

Mitchell matched the mark of Eric "Sleepy" Floyd on a free throw with 27.6 seconds remaining. He had a chance to break the record, set in 1987 when the Golden State Warriors faced the Los Angeles Lakers, but missed his second foul shot.

"Everybody let me know that I missed a free throw to break the record, though," said Mitchell, who finished with 43 points. "I will say that, but we're two and two headed to Detroit.

"That was what we came home to do, and that is all that matters."

James Harden had his 40th playoff double-double with 24 points and 11 assists. Evan Mobley had 17 points as Cleveland remained unbeaten at home in six playoff games.

"I airballed the first layup and was missing shots short," Mitchell said. "Sometimes it's natural, right? I wasn't really trying to get in there and force it, and, then, just doubling down on the defensive end, trying to take whoever I'm guarding, take them out of the equation. I'm not tripping, we were down four at the half.

"I always tell y'all it's not just about the scoring, it's about your overall impact on the game. And for me, it was just like, 'OK, now I have an opportunity to try to get downhill' and then started going in."

Caris LeVert had a season-high 24 points for Detroit. Cade Cunningham scored 19, the first time he has been held under 20 in 11 playoff games this season, and Tobias Harris added 16.

Pistons coach JB Bickerstaff, who takes pride in the physical style his team plays, was not pleased with the free throw disparity. Mitchell had more trips to the foul line (15) than the whole Detroit roster (12).

"There is no way one guy on their team should have more free throws than our team. We're not a settling for jump shots team," he said. "We didn't do enough to help ourselves, but ever since we came to Cleveland, the whistle has changed."

Even though Mitchell struggled in the first half and the Cavaliers shot 15 of 38, with most of their shots being 3-pointers, the Cavaliers felt pretty fortunate to only be down by four at halftime.

Atkinson's message at halftime was to play with more pace and attack downhill, which opened things up.

Mitchell scored 15 during Cleveland's 24-0 run that went from the last 12 seconds of the first half to the first six minutes of the third quarter. Cleveland trailed 56-52 at halftime before taking control.

The Cavs were 10 of 12 from the field and made three 3-pointers. They also converted five turnovers by the Pistons into nine points.

"When (Mitchell) sees a gap, he's going to go. We've got to eliminate his touches and catches on the run," Cunningham said.

"That run, we just never caught our footing again. That was the first time they really got loose in the series."

The 24-0 run was the longest in an NBA playoff game since Minnesota also scored 24 straight in Game 6 of its Western Conference semifinal series against Denver in 2024. It was also the longest spurt by Cleveland in a postseason game since play-by-play stats started being kept in 1997-98. The previous high was 19 in an Eastern semifinal series game against Boston.

"We understood that if we could just get some stops, get out in transition and get some easier looks, we'll be in good shape. We were doing a solid job, we just weren't scoring," Mitchell said.

"I think understanding that we were in a good spot, we did a good job of weathering a storm."

Mitchell and Harden accounted for 49 points apiece with their points scored and points off assists. Mobley was a force on both ends of the court, with eight rebounds, five assists, three steals and five blocked shots.

"Don's going to get all the flowers, but we should give a lot of flowers to Mobley for tonight's performance," Atkinson said.

"Donovan Mitchell was killing us, and that's pretty much it," Pistons center Paul Reed said.

It was Mitchell's eighth playoff game with at least 40 points, his fourth with the Cavaliers. He has at least 30 points in three straight games.

Cleveland is still looking for its first road playoff win this season, and will need at least one if it hopes to make the Eastern Conference finals for the first time since 2018.

Thunder holds off tenacious Lakers for another series sweep

LOS ANGELES — Shai Gilgeous-Alexander scored 35 points, Chet Holmgren made a tiebreaking dunk with 32.8 seconds to play, and the Oklahoma City Thunder swept the Los Angeles Lakers out of the second round of the NBA playoffs with a 115-110 victory in Game 4 on Monday night.

Ajay Mitchell scored 10 of his 28 points in the frantic final period, as the Thunder, in its toughest victory of the season, overcame the Lakers' tenacious effort and improved to 8-0 in the playoffs.

"We've done our job so far, that's all it really means," Gilgeous-Alexander said. "We've gone out there, we've executed, we've played at a high level and we've been able to win eight tough games against really good opponents. That's all it means. Nothing is guaranteed."

LeBron James, the top scorer in NBA history, had 24 points and 14 rebounds in the final game of his unprecedented 23rd season, but he missed a driving bank shot with 20 seconds left that would have put the Lakers ahead.

The 41-year-old James has repeatedly said he hasn't decided whether to play next season, so there was no ceremony or momentousness around this game. Instead, the Lakers desperately tried to extend their year, only to lose to Oklahoma City for the eighth time this season.

"I don't know what the future holds for me, obviously, as it stands right now, tonight," James said. "I've got a lot of time. I'll go back and recalibrate with my family and talk with them, and when the time comes, obviously you guys will know what I decide to do."

Austin Reaves scored 27 points before missing a tying 3-point attempt with eight seconds left for the Lakers, who advanced one round farther than almost anybody expected after losing NBA scoring champion Luka Doncic and Reaves to significant injuries a month ago.

Los Angeles still lost six of its final seven playoff games and fell well short of the conference finals for the third straight season.

"I didn't want our season to end," Lakers coach JJ Redick said. "I wanted to keep this thing going. I enjoyed every bit of this year."

Oklahoma City faced its first fourth-quarter deficits of the entire playoffs in Game 4, as the Lakers repeatedly refused to fold. The Thunder still got it done, and has earned at least the rest of the week off before it opens the conference finals against the winner of San Antonio's second-round series with Minnesota. The Spurs and the Timberwolves were all tied up heading into Game 5 on Tuesday.

"They won more of the minutes tonight than we did, and that hadn't been the case (earlier in the series)," Oklahoma City coach Mark Daigneault said. "They outplayed us for stretches. They're a really good team with prideful players. We did not expect them to give us an unearned win, and we went out and earned it."

Oklahoma City went 8-0 against the Lakers this season, winning all four regular-season matchups as well — but this one was the toughest. The Lakers took the lead and kept it close down the stretch with big buckets from Reaves and Rui Hachimura, who scored nine of his 25 points in the fourth quarter.

Holmgren's dunk with 2:03 left put the Thunder up 109-103, but Hachimura coolly converted a four-point play. Marcus Smart then drove the lane and hit a layup while being fouled in the final minute, converting a three-point play for a 110-109 Lakers lead.

But Holmgren got the ball inside and triple-pumped for a dunk with 32.8 seconds left, and James missed on his drive. After Gilgeous-Alexander hit two free throws, Reaves missed again, and the Thunder hung on to secure its sixth berth in the Western Conference finals in the last 16 seasons.

The Thunder won the first two games of the series at home by 18 points apiece, and they routed the Lakers 131-108 in Game 3.

Doncic missed the final 15 games of the Lakers' season after incurring a grade-two hamstring strain on April 2 in Oklahoma City, and he watched the season finale on the bench in a black sweatsuit. The Slovenian superstar apparently didn't get close to returning from the injury, which often requires two months of recovery.

Leeds draw keeps Spurs mired in relegation fight

LONDON — Mathys Tel went from hero to villain as Tottenham drew 1-1 at home to Leeds on Monday — a result that leaves the north London club's Premier League future hanging in the balance.

The Frenchman broke the deadlock early in the second half to ease the tension at Tottenham Hotspur Stadium, but then gave away a penalty with a reckless clearance attempt.

In the dying minutes, Spurs were grateful to Antonin Kinsky, who produced an astonishing save to deny the visitor a win.

Tottenham is now two points clear of 18th-placed West Ham with just two games left this season.

The Hammers lost 1-0 to Arsenal on Sunday — a result that guaranteed the safety of Leeds and Nottingham Forest, but left Spurs and West Ham scrapping it out for the final relegation spot.

Wolves and Burnley are already down.

Spurs boss Roberto De Zerbi, who only arrived in late March, pledged his players would "fight until the end".

"(When) we lost to Sunderland, it was impossible to see ourselves two points above the relegation zone with two games to go," he said.

"Now, we have to be positive and work. We have the quality to win other points and stay up. I think we deserve to stay up. We will fight until the end.

"When you are fighting relegation, you have to fight harder with the legs than with the head. We have to push until the end. Even if we had won today, it wouldn't have been finished yet."

Dominic Calvert-Lewin celebrates scoring Leeds United's equalizer in a 1-1 Premier League draw against Tottenham Hotspur in London on Monday. REUTERS

Dire home record

Tottenham came into Monday's match with just two home wins in the league under its belt all season.

Kinsky got down smartly to his right to keep out Joe Rodon's header in the 21st minute, and, at the other end, Joao Palhinha fired over from close range.

Tottenham broke the deadlock five minutes into the second half when Tel controlled the ball beautifully after it fell to him following a Pedro Porro corner.

The Frenchman picked his spot, curling the ball past a diving Karl Darlow.

But, with about 20 minutes of normal time to go, Tel attempted an overhead kick to clear the ball from his own penalty area, making contact with the head of the onrushing Leeds captain Ethan Ampadu.

Referee Jarred Gillett ruled that it was a penalty after a VAR check and Dominic Calvert-Lewin smashed the ball home.

Midfielder James Maddison was given a rousing welcome by the home crowd when he was introduced as a late substitute — his first match of the season after recovering from an anterior cruciate ligament injury.

Then, the referee signaled 13 minutes of added time — a decision that lifted the home crowd further.

But Leeds came agonizingly close to a winner, with Kinsky producing a remarkable save onto the crossbar in the 98th minute from a point-blank range strike to deny Sean Longstaff.

In a frantic finale, Spurs had a last-gasp penalty claim turned down after Lukas Nmecha got the faintest of touches to the ball before Maddison went to ground.

The point lifts Spurs to 38 — two clear of West Ham, which has an inferior goal difference.

De Zerbi — the third manager of an injury-blighted and shambolic season for Spurs — was appointed with a brief to save the club from a first relegation since 1977.

His team is now unbeaten in four games, but the specter of the drop still hangs over the club, which won the Europa League just 12 months ago.

Spurs still have two potentially tough games to come against Chelsea and Everton, while West Ham faces Newcastle and Leeds.

CHINA DAILY

GLOBAL EDITION 中国日报 THURSDAY, MAY 14, 2026

WORLD WATCH
By Tom Watkins

Visit comes at pivotal juncture

United States President Donald Trump started his three-day state visit to China on Wednesday.

Here we are again, yet another pivotal moment as the world revolves around US-China relations.

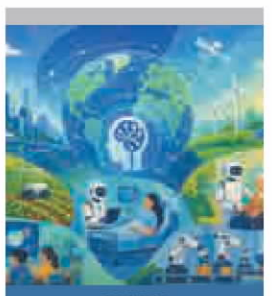
Once again, we have arrived at a point where action or inaction will shape the direction of trade, technology, global security, the economy and geopolitical stability of the US, China and the rest of the world.

Peace and prosperity should be our goal.

The last thing either side and the world need now is greater instability. The world cannot afford a new Cold War, or worse, and wise choices must be made to ensure a peaceful and prosperous future for all of humanity.

We collectively need to seek "win-win" solutions rather than treat this vital relationship as a zero-sum game where one party's success requires the other's failure.

Perhaps at no other time in the modern US-China engagement has it been as imperative that we avoid unnecessary confrontation and conflict by keeping dialogue open and engaging in constructive, government and nongovernmental exchanges at the highest levels, as well as rebuilding and strengthening people-to-people, educational and cultural exchanges that have waned in recent years, particularly student exchanges, which are a foundation for long-term understanding between our two peoples.



Dialogue between US and Chinese leaders must have a "trickle-down" effect that improves the overall relationship, reduces distrust and produces positive, tangible results for average citizens on both sides of the Pacific.

Change is inevitable. Progress should not be optional when it comes to US-China geopolitical relations.

Going forward, all major world issues will intersect at the corner of Beijing and Washington, DC. Are we going to swing for the win or strike out?

Both nations have work to do at home to better serve our respective peoples.

Xi: China, US should be partners

Success in one is opportunity for the other, stable bilateral relationship good for world

By CAO DESHENG
caodesheng@chinadaily.com.cn

China and the United States should find the right way for major countries to get along well with each other in the new era, President Xi Jinping said on Thursday.

Xi made the remarks during his talks with visiting US President Donald Trump at the Great Hall of the People in Beijing.

Xi stressed that the two countries have more common interests than differences, success in one is an opportunity for the other, and a stable bilateral relationship is good for the world.

He expressed the hope that 2026 will be a "historic, landmark year" that opens up a new chapter in China-US relations.

"China and the United States both stand to gain from cooperation and lose from confrontation. We should be partners, not rivals. We should help each other succeed and prosper together," he said.

Noting that transformation not seen in a century is accelerating across the globe and the international situation is fluid and turbulent, Xi said that the world has come to another crossroad.

"Can China and the United States overcome the Thucydides Trap and create a new paradigm of major-country relations? Can we meet global challenges together and provide greater stability for the world? Can we build a bright future together for our bilateral relations in the interests of the well-being of the two peoples and the future of humanity? These are the questions vital to history, to the world, and to the people. They are the questions of our times that the leaders of major countries need to answer together," Xi said.

Xi stressed that the Taiwan question is the most important issue in China-US relations. If it is handled properly, the bilateral relationship will enjoy overall stability. Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy, he said.

"Taiwan independence" and cross-Strait peace are as irreconcilable as fire and water, he said, adding that safeguarding peace and stability across the Taiwan Strait is the biggest common denominator between China and the US.

On China-US economic and trade relations, Xi said that they are mutually beneficial and win-win in nature, and trade wars have no winner.

He said that where disagreements and frictions exist, consultation conducted on an equal footing is the only right choice.

Xi noted that the talks between economic and trade teams of the two countries, held in the Republic of Korea on Wednesday, produced generally balanced and positive outcomes, adding this is good news for the people of the two countries and the world. The two sides should jointly sustain the good momentum that they have worked hard to create, he said.

In his speech, Trump hailed his "fantastic" relationship with Xi, saying Xi is "a great leader".

He said that the relationship between the US and China is going to be better than ever before.

Before the talks, Xi held a welcoming ceremony for Trump outside the Great Hall of the People.

Beijing rolls out red carpet for Trump

By MO JINGXI
mojingxi@chinadaily.com.cn

Beijing rolled out the red carpet to welcome US President Donald Trump for a much-anticipated summit with President Xi Jinping, as the world looks to the two largest economies for greater stability.

Inside

• Editorial, **page 7**
• See more, **pages 2-5**

Xi held a welcoming ceremony for Trump on Thursday morning outside the Great Hall of the People in Beijing, before they held talks.

Trump arrived in the Chinese capital on Wednesday evening, beginning his three-day state visit to China. Vice-President Han Zheng greeted him at the airport.

The trip marks the first state visit to China by a sitting president of the United States in nearly nine years and follows Xi and Trump's meeting in Busan, Republic of Korea, last October, which helped to set the tone for efforts to stabilize and improve China-US relations.

The Xi-Trump summit is seen as another important moment in head-of-state diplomacy, which has played a strategic guiding role in China-US relations.

Over the years, Xi has repeatedly stressed that the China-US relationship is among the most important bilateral relationships in the world, and that the two countries must find the right way to get along.

His message has been consistent: While China-US cooperation can enable the two countries to achieve major undertakings serving their own interests and those of the world, confrontation would spell disaster for both countries and the wider world.

Analysts said the high-level engagement between Xi and Trump will be closely watched as to whether the two sides can keep the "giant ship" of China-US relations on a steady course, manage differences through dialogue, and expand practical cooperation, thereby injecting greater certainty into a turbulent world.

For a relationship as significant and complex as that between China and the US, direction matters as much as momentum.

During the meeting with Trump in Busan, Xi said, "You and I are at the helm of China-US relations. In the face of winds, waves and challenges, we should stay the right course, navigate through the complex landscape, and ensure the steady sailing forward of the giant ship of China-US relations."

In their phone conversation last year, Xi said that recalibrating the direction of the giant ship of China-US relations requires the two sides to take the helm and set the right course, adding that it is particularly important to steer clear of various disturbances and disruptions.

Zhiqun Zhu, a professor of political science and international relations and director of the China Institute at US-based Bucknell University, said the "giant ship" metaphor highlights both the complexity of the relationship and the importance of guiding it in the right direction.

"It's a top-down approach, with leaders on both sides playing a pivotal role," Zhu said. "Only when the general direction is set can the relationship move forward."

Zhu said that maintaining the momentum of high-level engagement is crucial for the stability and predictability of China-US relations. Leaders on both sides, he said, should be commended for overcoming difficulties, lowering tensions and moving the relationship forward.

But setting the course also requires a clear understanding of the nature of the relationship.

At a welcome dinner in San Francisco in November 2023, Xi said that he had long been thinking about "how to steer the giant ship of China-US relations clear of hidden rocks and shoals, navigate it through storms and waves without getting disoriented, losing speed or even having a collision".

"In this respect, the number one question for us is: Are we adversaries, or partners? This is the fundamental and overarching issue. The logic is quite simple. If one sees the other side as a primary competitor, the most consequential geopolitical challenge and a pacing threat, it will only lead to misinformed policymaking, misguided actions and unwanted results," Xi told participants from across American society.

People wave Chinese and United States flags to welcome US President Donald Trump, as he arrives in Beijing on Wednesday. Trump is on a three-day state visit to China. WANG JING / CHINA DAILY

Sun Chenghao, a fellow at Tsinghua University's Center for International Security and Strategy, said the "giant ship" metaphor speaks to the extraordinary weight of the relationship.

"China-US relations are too large and too consequential to be allowed to drift off course, or even capsize due to temporary storms," Sun said.

China and the US are the world's two largest economies and permanent members of the United Nations Security Council, and both play major roles in regional and global affairs.

Despite the twists and turns in bilateral ties, China-US economic relations remain deeply intertwined. Chinese customs data showed that bilateral trade in goods reached 4.01 trillion yuan ($590 billion) in 2025, accounting for 8.8 percent of China's total foreign trade.

"China's view that the relationship concerns not only the well-being of the two peoples but also the future of humanity is not merely diplomatic rhetoric," Sun said. "Rather, it is a judgment based on real interests and the stability of the international system."

That judgment has run through Xi's remarks on China-US relations over the years.

When meeting with Trump during his first term as US president in 2017 at the latter's Florida resort, Xi said there are a thousand reasons to make China-US relations a success, and not a single reason to break them.

Nations' friendship still bouncing along

From Ping-Pong Diplomacy to sports and youth exchanges, China and US continue building bridges

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Deliah Autry, 30, is a member of the United States Women's National Flag Football Team, a three-time world champion, and a doctor of physical therapy specializing in pediatrics.

Last August, she made her first trip to China, attending the 12th World Games hosted by Chengdu in Sichuan province. The souvenirs that impressed her most included a Labubu doll and the games' medals, she said.

"The medal itself is so intricate and detailed, and has a little necklace. It is something that I would love to show my kids one day," she said.

The cultural events also impressed her. At the athletes' village, Chinese college students helped them try immersive cultural activities.

"We got to do arts and crafts, learn how to write our names in Mandarin. We got to try on traditional Chinese clothing, so it was just an awesome way for us to learn from them ... a great experience and a way for us all to connect," Autry said.

She made her second trip to China last month. In Beijing, she took part in the commemoration to mark the 55th anniversary of China-US Ping-Pong Diplomacy and the launch ceremony of the China-US Youth Sports Exchange Events, which received a congratulatory message from President Xi Jinping.

Autry said she now has a better and deeper connection to and understanding of Chinese culture.

"I am impressed by the people, how genuine and kind-hearted everybody is, and I think it is something that I have personally attached to you (China) because you see the true humanity and love, especially for sports," she said.

In Beijing, she watched a high school flag football team from Tacoma, Washington state, playing against a Chinese student team.

Autry said flag football is a great avenue to continue making connections between the cultures, despite language barriers and differences in cultures and politics.

"There were a lot of handshakes, high-fives, and smiles, and I think that just brings the positivity forward ... It was just an awesome display of how sports bring everybody together," she added.

"There is a mutual understanding and respect for these athletes, and we all know that we are playing with the same passion and love for the game," she said.

Autry said sporting events and exchanges are a great way to show young people how cultural differences and language barriers are just small things and "what the true purpose is in life, which is to find a deeper connection with other humans across the world".

Last year, Autry met a lot of the players from the Chinese women's national team at flag football tournaments.

"I follow a lot of them on social media, and we are able to connect. And there have been times throughout the year where we have seen each other outside in other tournaments and it is just really awesome to build that connection," she said.

Reaching out

Justin O'Jack, chief representative of the University of Virginia's Pacific Asia Office, encourages young Americans to engage in more trips outside the US.

"These kinds of trips, where students can travel abroad and spend time in a country like China, really have a transformative impact on a young person's life," he said in an interview with China Daily, "... if their only impression of China is through the media that they consume, of course it's going to be different than experiencing it as a person here in China," he added.

O'Jack studied abroad when he was a college student, first in India and then in China.

"That experience as a student studying abroad in China definitely has influenced me in many ways, one of which is in the career that I chose — first running study abroad programs in Shanghai for American students and now representing an American university."

He said Chinese students represent the majority of international students applying to his university's undergraduate program for the current class graduating in 2030.

"Chinese students by far make up the majority of applications we received — I would say, (there are) over 10,000 applications from around the world. Over 40 percent of those were from students here in China," he said.

"The interest in studying abroad in the US continues to be very strong, especially among the undergraduate student population," he added.

During the COVID-19 pandemic, there was a hiatus in the number of American students from his university studying in China, and now "we are seeing that start to grow and rebound", O'Jack said.

"We are not at the pre-pandemic levels yet, but we are still working and heading in the right direction," he said.

Sharing ideas

In 2023, President Xi proposed an initiative to invite 50,000 young Americans to China for exchange and study programs over a five-year span.

O'Jack noted that the program has largely focused on high school and younger groups of students, and "that is important because the youth are our future".

Anders Ibsen, 40, who was sworn in as mayor of Tacoma in January, hosted a Chinese ping-pong delegation at Lincoln High School in the city, a school that Xi visited in 2015.

Ibsen said it is very important to "give young people an understanding about what it means to have greater partnerships, especially with our growing global economy".

"That's the basis of shared prosperity as well as peace ... in someone's life. If they can understand that it's a big world and that there are a lot of other different ideas out there, then we're all better off," he added.

Last month, Ibsen traveled to China with Tacoma high school students, his second visit to the country. "I first visited here in 2018. I visited Fuzhou (in Fujian province), which is one of Tacoma's four sister cities."

"To give you some reference, the city of Tacoma is a major port city on the west coast ... About half of our total trade comes from China. As a result, we very strongly value the partnership," he said.

Chinese trade will continue to be very important to the port of Tacoma, as well as the investments it has seen in the local economy, Ibsen said.

During the trip, Ibsen said the group was also able to learn more about innovative programs the government is working on. "There's always something to learn. We should always continue being students," he said.

When asked about what impressed him most in China, he said it was "the people".

"In the case of the city of Tacoma, my primary concern is keeping my residents safe and prosperous ... and by having these cultural exchanges, we can focus on the results, we can dispense with noise, we can dispense with politics," he said.

"We can just focus on what makes things better for people, what makes for a happier, more peaceful world. And that is the strength of cooperation. That's why we're here," he added.

Lasting impact

The first US table tennis delegation arrived in China in April 1971, for the icebreaking visit that helped boost the launch of bilateral diplomatic ties.

At that moment, Jan Berris had been in her position at the US consulate in Hong Kong for just two years "as a very junior consular official working on cultural affairs". However, she said she knew that "the event would have repercussions on the US and China as well as the rest of the world".

"But I had no idea that it would have such a huge impact on my own life," said Berris, who is now vice-president of the National Committee on US-China Relations, a nonprofit organization and advisory body founded in 1966 to encourage understanding and cooperation between the two nations.

When she returned to the US the month after the historic visit, two of her former professors at the University of Michigan asked if she would consider working at the committee based in New York.

The committee was then preparing to co-host with the US Table Tennis Association the visit of the Chinese ping-pong team to the US.

"My professors were on the board of the national committee and they felt that my diplomatic experience, brief as it was, would be helpful," Berris said.

She said she was not quite sure that she really wanted to live in a big city as "it was formidable".

"Actually, my undecided state was resolved by another major announcement that was made just a few months later, when President Richard Nixon went on national television and announced that Dr Henry Kissinger had made a secret visit to China," she explained.

One of the results of that visit was the Chinese ping-pong team's visit to the US in April of 1972.

"That helped me make my decision," Berris said. The next day, she asked the US State Department if she could work on the planning for the Chinese team's visit.

What began with a small ping-pong ball — slowly at first, and then in leaps and bounds — grew into a "broad and eventually very deep" network of relations between the two countries in every profession, and every field imaginable that brought all levels in the two societies together, she said.

"Now, a lot of people ask me how I can work in the same job for 55 years. But for me it has been easy, because I love my job," she said.

The first exchanges and the visits of the two ping-pong teams, with the hundreds and thousands of exchanges that followed, "serve to help people from both countries humanize the other" side, she said.

CEOs upbeat on China market

Presence of business leaders shows nation remains highly important for US companies

By **WANG KEJU, JIANG XUEQING, MA SI** and **ZHONG NAN**

Business leaders from the United States have voiced their confidence in the Chinese market and pledged to expand investments in what they consider as one of the world's most significant engines of future growth, given the market's vast scale, ability to innovate rapidly and resilient supply chains.

A high-profile business delegation comprising top US executives from sectors including technology, finance, aviation and agriculture arrived in Beijing on Wednesday as part of US President Donald Trump's entourage. The delegation's presence signals that commercial ties binding the two economies remain too deep to sever, economists and business executives said.

Among the top business leaders and CEOs visiting with Trump are Jensen Huang of Nvidia, Tim Cook of Apple, Elon Musk of Tesla and SpaceX, Cristiano Amon of Qualcomm, Larry Fink of BlackRock and Kelly Ortberg of Boeing, according to a Truth Social post by Trump. Also on the list are executives from GE Aerospace, Goldman Sachs, Citi, Mastercard, Visa, Blackstone, Cargill and more.

Speaking to China Daily, Mastercard CEO Michael Miebach said: "China is one of the world's most dynamic economies, and Mastercard is committed to the market for the long term.

"Since we began processing domestic transactions in May 2024, we've made strong progress — expanding acceptance, deepening local partnerships and bringing simple, secure 'tap and go' experiences to everyday life."

Looking ahead, he added, "We will continue to invest in China and bring more products and services that support both businesses and consumers."

According to experts, the lineup of CEOs from some of the US' most influential companies sends a clear signal that despite years of tariff impositions, export controls and heated talks of decoupling, China remains a highly significant market for US businesses.

"The economic gravity between the two countries remains immense," said Chen Wenling, a senior researcher at the Academy of Contemporary China and World Studies. "Even as trade tensions and geopolitical risks cast a shadow, the fundamental forces of China-US complementarity have not disappeared."

Chen noted that the US leads in financial markets and retains significant high-tech advantages, while China's edge in market scale, supply chain depth and rapid innovation is equally real.

Sean Stein, president of the US-China Business Council, said: "If you just say they're the two largest economies, you're missing the most important part. They're also the two most dynamic and most innovative economies."

"It is when you add the innovation and dynamism pieces that you truly recognize the need for the two countries to find ways to work together more effectively," Stein said.

Data released in November by the Chinese embassy in the US showed that more than 80,000 US companies have invested in China, while 7,000 Chinese firms operate in the US.

On Wednesday, a spokesperson for the China Council for the Promotion of International Trade said that the council welcomes representatives from the US business community to visit China, adding that there is plenty of scope for, and tremendous potential in, practical cooperation between Beijing and Washington.

"We look forward to the business communities of both countries further deepening exchanges and cooperation, and making new contributions to the stable, healthy and sustainable development of China-US relations," said the spokesperson.

In addition to the companies in the delegation, US businesses across industries continue to demonstrate their confidence in the Chinese market through tangible action.

Henry Ding, president of 3M China, said: "In recent years, 3M has continued to expand its domestic manufacturing footprint, strengthen local R&D innovation capabilities, and accelerate the localization of its full value chain in China, spanning R&D, testing and manufacturing."

He added that today, more than 50 percent of the products 3M sells in China are manufactured locally.

Ding said that 3M China will continue to increase its local R&D investment this year and plans to achieve more than 30 percent growth in new product launches compared with 2025, significantly outpacing other global markets.

Ian Shih, president of Rockwell Automation China, said that China's vast market, complete industrial ecosystem and continued high-level opening-up provide strong support for companies seeking long-term growth and diversified application opportunities.

At the 8th China International Import Expo held in Shanghai last November, US companies claimed the largest exhibition area, with their pavilions collectively covering more than 50,000 square meters, marking the seventh consecutive year that US companies have led all foreign participants.

Collaboration in energy sector expected to expand

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Expanding energy ties between China and the United States will contribute to broader bilateral economic cooperation amid shifting global market dynamics, industry experts said.

Liu Jia, chief expert at the Economics & Technology Research Institute, a think tank of China National Petroleum Corp, or CNPC, said that the world's two largest economies share a complementary dynamic, with the US' energy export growth aligning with China's substantial market demand.

The push for closer cooperation comes as the US rapidly expands its liquefied natural gas infrastructure, with export capacity projected to reach 150 million metric tons per year by 2028, according to the research institute.

Liu said that this expansion creates a structural necessity for partnerships, as new US liquefaction projects require the security of long-term buyers to obtain necessary financing and make final investment decisions. "China offers the world's most predictable demand growth, providing the scale needed to anchor these US infrastructure investments," he said.

According to figures released by the institute, China imported 68.43 million tons of LNG in 2025 and is expected to maintain its position as the world's top LNG importer this year.

This synergy has already been evident in the market for years, with major Chinese State-owned enterprises such as China Petroleum and Chemical Corp, or Sinopec, and CNPC signing long-term purchase agreements with leading US exporters, including Cheniere Energy and Venture Global LNG.

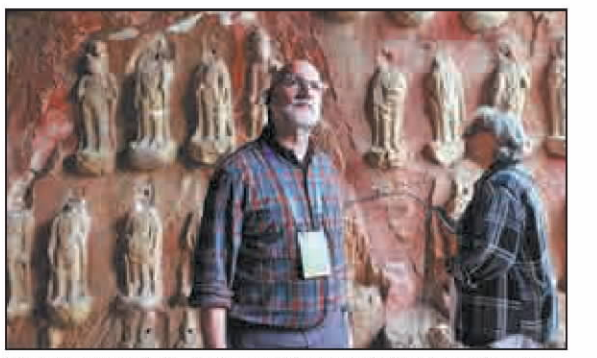
According to the institute, energy has always been an important component of the broader trade balance between the two nations, highlighting the sector's role in addressing trade disparities.

In addition to direct trade, the two countries have also established investment links.

US oil major ExxonMobil began operating its mega ethylene project in Huizhou, Guangdong province, last year. It is one of the largest foreign investment projects in China, and the first major petrochemical project constructed in China solely by a US company.

According to Liu, US and Chinese companies have jointly invested nearly $200 billion in third-party oil and gas projects across the Middle East, Central Asia and Africa.

To maintain this momentum, Liu suggested that both sides should expand cooperation into emerging fields such as energy storage and power grid technology.



Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University, said that stable and predictable energy trade has provided an important area of mutual benefit.

As China's demand is predictable and the US supply is expanding, energy can serve as a bridge through which both sides can achieve tactical gains, Lin said.

Experts also recommended strengthening ties in traditional industrial sectors, including the supply of chemical feedstocks such as ethane and propane, as well as uranium mining.

"Establishing regular dialogue mechanisms between think tanks and industry bodies in both countries will be essential for stabilizing market expectations and deepening mutual consensus," said Liu from the Economics & Technology Research Institute. "This framework is necessary to ensure that energy cooperation remains a robust cornerstone of the bilateral relationship, even amid broader geopolitical shifts and profound changes in the global landscape," he added.

Heritage tour

Visit: Both sides should be beacons for building bridges

From page 1

I have advocated, over decades, that the best way for the US to compete with China is to invest in our own people, infrastructure, technology and education, rather than trying to "knock China down". Pushing a strategy to hold China back will be as effective as starting to build a chain-link fence as a tsunami is coming ashore.

Worldwide, people are closely watching the development of the US-China interaction, hoping that agreements would be reached to promote a more stable world order.

China-US economic and trade cooperation has brought benefits and challenges to both countries for over half a century.

We are at an inflection point. A miscalculation or mistake will have a devastating global impact.

While we need to continue to work toward building sensible economic, cultural and military ties, it is vital that China and the US continue to follow a seven Cs framework to help manage this delicate bilateral relationship, which is critical to the world:

- Communication (Open, high-level and subnational channels)
- Collaboration (On global issues like health and climate)
- Cooperation (To seek win-win solutions)
- Coordination (On regional and global issues)
- Competition (Managed and constructive)
- Contextual Understanding (Grasping the history and perspectives of both nations)
- Avoiding confrontation, conflict and casualties

Worldwide, people are closely watching the development of the US-China interaction, hoping that agreements would be reached to promote a more stable world order.

As the 21st century unfolds, both the US and China should be the beacons for building bridges.

It is imperative that we find ways to develop a shared vision and common agenda in areas that are in our collective national interests while we have open dialogue on topics where we disagree.

Chinese and US activists, not just governments, should work to create and endow a robust international exchange, a people-to-people organization that connects students, artists, writers, athletes, tourists, educators, health and behavioral healthcare professionals, poets, sub-national government officials and NGOs between our two countries to listen, to understand and build bridges that will help sustain peace and prosperity for all.

These kinds of global connections lay the groundwork for meaningful dialogues, thoughtful synergy, mutual respect, joint prosperity and peaceful collaboration.

We need to get along and jointly prosper peacefully.

The author was deputy chief of staff to former Michigan governor James Blanchard, president and CEO of the economic council of Palm Beach County, Florida. The views do not necessarily reflect those of China Daily.

Summit: Cooperation is a realistic choice

From page 1

In March 2024, when meeting in Beijing with representatives from the US business, strategic and academic communities, Xi said that whether the two countries can find the right way to get along bears on the well-being of the two peoples and the future of humanity.

Sun said the most immediate benefit of a stable and predictable China-US relationship is that it reduces uncertainty for both sides.

"If tensions continue to rise, those affected first are often not abstract strategic interests, but ordinary businesses, farmers, consumers, international students and researchers," Sun said.

He added that trade barriers would push up costs, technology restrictions would narrow the space for innovation cooperation, and fewer people-to-people exchanges would weaken mutual understanding between the two societies.

Beyond the bilateral level, China-US cooperation is also closely watched in terms of its implications for global governance at a time when the world faces sluggish growth, geopolitical tensions and mounting challenges requiring international coordination.

In Busan last year, Xi told Trump: "The world today is confronted with many tough problems. China and the US can jointly shoulder our responsibility as major countries, and work together to accomplish more great and concrete things for the good of our two countries and the whole world."

According to Sun, many global challenges — from climate change and artificial intelligence to public health, financial stability and regional security — cannot be effectively addressed without sustained communication between the two countries.

Zhu, of Bucknell University, echoed that view, saying that if the two most powerful nations cannot get along well, the global economy will suffer and international cooperation on critical issues such as climate change and AI governance will become difficult.

The resilience of the relationship also depends on whether the two societies can maintain direct contact and mutual understanding.

David Chong, founder and president of the US-China Youth and Student Exchange Association, said that he has become increasingly aware that keeping the giant ship of China-US relations moving steadily requires joint efforts from both countries at all levels.

Since 2015, Chong's association has helped bring more than 2,000 young Americans to China for exchange programs. Through activities ranging from cultural and sports exchanges to experiencing cutting-edge technologies such as artificial intelligence, young Americans have been able to see, hear and experience China firsthand in concrete and everyday settings.

"People-to-people organizations may not be in the 'cockpit' of the giant ship," Chong said, "but they can serve as 'connectors' and 'road builders' by strengthening the cultural and social foundation for the steady development of China-US relations".

Sun, the researcher, said that cooperation remains the most realistic and responsible choice.

"The reason is simple: Competition cannot erase interdependence, and differences cannot eliminate shared risks," Sun said. "China and the US cannot expect a voyage without winds and waves, but they must not allow the storms to decide the course."

SINO-US SUMMIT

Summit to chart path for Sino-US ties

Head-of-state diplomacy essential for restoring trade stability: Experts

By **BELINDA ROBINSON** in New York and **RENA LI** in Los Angeles

As the heads of state of the world's two largest economies start their meetings in Beijing this week, trade experts and economists said they expected the summit to chart the course for the future of bilateral ties and help restore stability to global trade.

Chinese President Xi Jinping and US President Donald Trump will meet in Beijing, as Trump arrived on Wednesday for a three-day state visit to China.

China said on Monday that it was ready to work with the United States to expand cooperation, manage differences and inject more stability and certainty into a turbulent and changing world.

During a Port of Los Angeles media briefing on Monday, former US trade representative Katherine Tai described the meeting as "a really important moment for the US-China trade relationship".

Responding to a China Daily question on what is most needed to help reduce global uncertainty surrounding tariffs, supply chains and broader trade relations — including lower tariffs, clearer rules, or greater predictability — Tai, who served as the principal trade adviser and negotiator on US trade policy during the administration of former president Joe Biden, emphasized the importance of policy clarity and long-term planning.

"I think that what we need most — and I say 'we' in the real collective sense, because this relationship impacts everybody around the world — is some clarity around the principles that the United States wants to put out there and to enforce in the relationship with China," Tai said.

She said uncertainty in recent trade policies and market expectations has affected governments, businesses and global supply chains, adding that clearer communication and more consistent policy direction would help support long-term economic planning and cooperation.

Tai further noted that strategic pressure alone cannot sustain a functional trade relationship despite the fact that both nations have the capability to "choke" each other in strategic sectors.

"Once you have each other's attention, then you actually need to have an agenda and a plan in place for the short term, the medium term and the long term, for making this very important, complicated and challenged trade relationship work," Tai said.

Jerry Nickelsburg, director & senior economist at the UCLA Anderson Forecast, said the meeting between Chinese and US leaders could help provide a more stable environment even as longer-term shifts continue.

Despite recent adjustments in global trade flows, the interdependence of the two markets remains significant. China continues to serve as the third-largest export market for the United States, following Canada and Mexico, according to US trade figures.

"There seems to be an interest in preserving the stability of the current situation in US-China economic relations on both sides," Nickelsburg said.

Gene Seroka, executive director of the Port of Los Angeles, said that Chinese factories and exporters continue to operate steadily despite ongoing trade tensions.

Mitigating uncertainty

During recent visits to Hong Kong, Shanghai, and Guangzhou, Seroka noted that order volumes remained stable, even as China expanded its exports to other global trading partners to mitigate uncertainty.

Jim Sutter, CEO of the US Soybean Export Council, expressed hope that the meeting would reaffirm China's purchase of US agricultural goods, including soybeans, calling soybeans an "important indicator" of the strengthening ties between the two nations.

US industry leaders and local officials have echoed the call for cooperation.

Jeffery Jones, chairman of the Council for Trade and Investment Promotion in New Jersey, said that trade and business development should remain a priority.

"I'm a former mayor. On the political side of things, I don't have to go to the presidential level to say that from one town to another, municipal level, if we don't work together, nothing good happens," he added.

Daniel Mabey, Asia Region President for the United Natural Products Alliance, noted that because China is a major supply chain partner for numerous industries, it is essential that "dialogue continues and continues to move forward" to get the relationship back on a productive track.

"Most of the US-China relationship is based on trade and China is a big supply chain partner for a lot of industries, not just our industry," Mabey said.

"I used to live in Beijing for a long time ... I have had lots of industry dialogue. We need to get the tracks straightened again and work together."

Leaders' interactions offer 'irreplaceable strategic guidance' for US-China ties

By **ZHAO HUANXIN** in New York
huanxinzhao@chinadailyusa.com

Beijing's top envoy in Washington has said that interactions between the heads of state provide "irreplaceable strategic guidance" for China-US ties, expressing hope that this week's summit will be a "successful one" that will chart the "right course" for future relations.

At the invitation of Chinese President Xi Jinping, US President Donald Trump is visiting China from Wednesday to Friday.

In an interview with Newsweek published on Tuesday, Ambassador Xie Feng said that with the joint efforts of both sides, the summit will hopefully see the two countries expand cooperation and properly manage differences, while exploring ways to get along in the "new era" based on mutual respect and peaceful coexistence.

"In an increasingly turbulent world, the strategic value of China-US relations becomes more prominent," Xie said. "A stable and constructive China-US relationship not only serves the fundamental interests of both our peoples, but also meets the shared expectation of the international community."

On the Taiwan question, Xie said that he believed the American people, who faced the danger of division and had a civil war in the past, can understand China's will and determination to safeguard national unity.

The Chinese side urges the US side to commit to the one-China principle, the three China-US joint communiques with concrete actions, make the right choice as early as possible, fundamentally remove the biggest obstacle to China-US relations, which is the Taiwan question — a burden that risks dragging the two countries into confrontation and conflict — and open up broader room for developing bilateral ties, Xie said.

Xie also said that history has proven once and again that a tariff war or trade war produces no winner, damages the interests of both sides, and hurts the whole world.

He noted that under the guidance of the two leaders, China and the United States have reached a series of common understandings through economic and trade consultations, and have stabilized bilateral economic and trade relations.

"This has not come easily and should be cherished. But it is still far from enough. We hope the US side will move further ahead and completely remove the unilateral tariffs and other restrictive measures," he said.

Xie said competition between the United States and China should be viewed as a "track-and-field race toward mutual excellence" rather than a "zero-sum boxing match".

"Let our two countries compete to offer more public goods to the world, to better help developing nations reduce and eliminate poverty, and to contribute more to the sustained and inclusive development of the global economy," the envoy said.

Turning to the fentanyl issue, Xie noted that the fentanyl crisis in the US was not created by China, but "out of the humanitarian spirit and for the sake of China-US friendship", China is providing assistance to combat the "common enemy of humanity".

He noted the current US administration has strengthened legislation, law enforcement and regulatory control to combat fentanyl, and the number of fentanyl-related deaths in the US has dropped by 37.5 percent, to which China also made important and positive contributions.

He urged Washington to appreciate and cherish China's goodwill, view bilateral cooperation outcomes in a just manner, stop shifting the blame for the fentanyl issue, avoid imposing alternative tariffs as substitutes for fentanyl-related tariffs, and remove China from the list of so-called "major drug source countries" as soon as possible.

On artificial intelligence, Xie said that the world does not want to see an "Iron Curtain" in AI, nor attempts at technological enclosure, let alone a Star Wars-style rivalry.

"China-US coordination on AI bears on the future of both our countries and the entire humanity. We hope the US side will work with us in the same direction, to enhance dialogue, manage competition and conduct cooperation, so that AI will become a new frontier for China-US cooperation and a new ladder for human progress," Xie said.

Chinese Americans welcome leaders' meeting

By **LIA ZHU** and **CHELSEA GE** in San Francisco

US President Donald Trump's state visit to Beijing from Wednesday to Friday, the first visit to China by a US president in nine years, has sparked enthusiasm among Chinese Americans, who view the meeting between the two heads of state as an important moment for dialogue, cooperation, and understanding between the two countries.

During the visit, Chinese President Xi Jinping and Trump are expected to have in-depth discussions on major issues, including China-US relations, world peace and international development.

"I'm excited at this opportunity for President Trump to go to China and visit President Xi," Phillip Chen, a California Assembly member, told China Daily. "I believe that this world right now is a very large village, and that the relationship between China and the United States will continue to blossom."

"I personally think that as it stands right now, we've been cooperating for many, many years. We have to make sure that we work closely together to make sure that our mutual interests are served sufficiently," he said, adding that he hoped the meeting would help open up opportunities for more exchanges and cooperation.

William Zhang, a San Francisco-based community leader and an ardent advocate for peaceful cross-Strait relations, called the meeting "a long-awaited conversation between the two heads of state".

"President Trump will hopefully learn firsthand how much importance the Chinese government places on the peaceful reunification of the nation," he said, adding that Washington should uphold the one-China principle. "It is a prerequisite for the stable and healthy development of China-US relations," Zhang said.

Lei Wang, a Chinese culture advocate in Southern California, sees the leaders' meeting as an opportunity to promote and expand understanding of Chinese culture at the federal level.

"This is a good thing. There's a popular song in China right now called *Better to Meet in Person* and I believe that a meeting between the two countries' leaders will help deepen mutual understanding," he told China Daily.

Wang, also a small-business owner, said he hoped the meeting would help promote business interaction, trade activities and business investment between the two countries.

California, located on the Pacific coast, is an important gateway for Chinese goods entering the US, said Wang. "If China-US relations aren't good and trade relations don't flow smoothly, it will seriously affect California's foreign trade, imports and exports, which in turn affects many people's employment and how businesses operate."

"We need the trade to continue to support the employment and the society here in the US," Wang said. "Therefore, I really hope that both sides can deepen understanding in trade and economic relations, reach consensus, and push the relationship toward a more positive and stable direction."

Despite differences and frictions that have marked bilateral relations, Hu Lirong, CEO of CW Bearing USA, expressed confidence in dialogue between the presidents.

"These are challenges that can ultimately be worked through under the leadership of the two countries' leaders," he told China Daily.

Hu said the company has focused on localized operations, creating jobs for the community, with young employees accounting for about 30 percent of its workforce. He added that the company places strong emphasis on technical expertise and cross-cultural communication.

Chang Jun in San Francisco and Li Mingmei in New York contributed to this story.

Observers in Europe pin hopes on dialogue

By **ZHANG ZHOUXIANG** in Brussels
zhangzhouxiang@chinadaily.com.cn

As US President Donald Trump began his visit to China on Wednesday — his second state visit to China following his previous trip in November 2017 and his first during his second presidential term — European political and business figures are closely watching the bilateral relationship.

The meeting between Chinese President Xi Jinping and Trump comes at a time of heightened global uncertainty, marked by geopolitical tensions, economic fragmentation, supply chain disruptions and slowing growth across major economies. Some observers in Europe believe that stable China-US relations are increasingly seen not only as a bilateral necessity, but also as a prerequisite for global economic predictability and international stability.

Ondrej Dostal, a Czech member of the European Parliament, described Trump's visit as a recognition of China's global importance and of the limits of confrontation-based policies.

Dostal argued that unilateral pressure and economic coercion have undermined international trust and damaged global trade. The world needs stable trade, mutual respect, diplomacy, infrastructure, development, and coexistence between civilizations.

According to Dostal, the leaders' meeting may also encourage European governments to reassess their own approach toward China. "If even Washington now recognizes that it must negotiate with Beijing, then European governments should finally stop pretending that confrontation with China serves European interests," he said.

Former director-general for international affairs in the German state of Hessen Michael Borchmann said the meeting carries significance far beyond bilateral ties.

Quoting a US research institute's description of the meeting as "Managing the World's Most Important Relationship", Borchmann said the phrase "absolutely fits" the current geopolitical environment.

Enhancing communication

"At a time when the world is facing growing uncertainty and fragmentation, enhancing communication, managing differences and maintaining stable China-US relations also benefits the world," he said.

Borchmann said the meeting follows last year's temporary trade truce reached in Busan, South Korea, where both sides attempted to halt escalating tariff retaliation. He expressed hope that the meeting would deepen consensus on trade and issues including the Middle East and global development.

He also referenced Xi's long-standing emphasis on stable bilateral ties. "There are a thousand reasons to make the China-US relationship a success, but not a single reason to break it," Borchmann quoted Xi as saying.

From the European business community, Bernard Dewit, chairman of the Belgian-Chinese Chamber of Commerce, stressed the importance of constructive engagement between the world's two largest economies.

Speaking from a European perspective, Dewit described stable China-US relations as "very important" for global economic and geopolitical certainty.

He noted that many European countries are facing economic recovery challenges, inflationary pressures and security concerns, and said improved China-US ties could help reduce tensions, restore investor confidence and strengthen international cooperation.

Dewit also emphasized Europe's preference for dialogue over bloc confrontation. Europe, he said, does not want to see the world divided into opposing camps and instead supports multilateralism, predictability and strategic autonomy.

As the leaders' meeting unfolds in Beijing, many in Europe will be watching closely for signs that the two major powers can stabilize relations and provide a measure of certainty to an increasingly fragmented world.

SINO-US SUMMIT

Harley Seyedin

Strengthening bilateral ties for global stability

The relationship between the United States and China remains one of the most important bilateral relationships in the world. As US President Donald Trump is visiting Beijing, both countries have an opportunity to strengthen cooperation, stabilize economic ties and promote prosperity for their peoples and the global economy.

Despite years of trade tensions and tariffs, the two economies are deeply interconnected. Research by the Stanford Center on China's Economy and Institutions emphasizes that the two nations benefit enormously from trade, investment, innovation, and educational exchange.

US consumers and businesses benefit from affordable goods and integrated supply chains, while Chinese consumers and businesses benefit from access to US technology, agricultural products, financial services, and higher education.

Millions of jobs in both countries are linked directly or indirectly to this economic relationship.

One major development in recent years has been the significant reduction in the US-China trade deficit.

According to data from the Office of the US Trade Representative and the US Bureau of Economic Analysis, the US goods trade deficit with China fell to approximately $202.1 billion in 2025, down from $295.5 billion in 2024. This represents a 31.6 percent reduction in just one year.

The decline was due to changes in supply chains, increased domestic manufacturing in some sectors, diversification of trade partners, and evolving tariff policies. Yet even with these adjustments, bilateral trade remained enormous. Total China-US goods trade still exceeded $414 billion in 2025, demonstrating that the two economies continue to rely on each other in many areas.

Global Lens

By focusing on practical cooperation and long-term mutual benefit, the two countries can build a more positive and productive relationship that benefits not only themselves, but the entire world.

Trump's visit provides an opportunity to move beyond confrontation and toward practical cooperation.

Both nations share common interests in global economic stability, energy security, climate resilience, public health, artificial intelligence governance and financial market stability.

Cooperation between Washington and Beijing is not simply beneficial for US and Chinese citizens; it is essential for global growth and international confidence.

There are many areas where positive collaboration can expand. In agriculture, China remains an important market for US farmers exporting soybeans, corn, beef and other products. Increased agricultural purchases can help support rural communities across the US while ensuring food security and stable supplies for Chinese consumers.

In technology, both countries can cooperate on standards for AI safety, cybersecurity and advanced manufacturing. Joint research partnerships between universities and companies have historically produced breakthroughs in medicine, engineering and clean energy.

Climate and energy cooperation also present major opportunities. The US and China are the world's two largest economies and energy consumers.

By working together on renewable energy, battery storage, carbon reduction technologies, and electric vehicles, both countries can accelerate innovation while creating jobs and investment opportunities. Cooperation in these sectors could help reduce global emissions while improving energy affordability and reliability.

Educational and cultural exchanges are equally important. Hundreds of thousands of Chinese students have studied in US universities over the past two decades, contributing billions of dollars to local economies while building people-to-people ties.

Academic collaboration and tourism help reduce misunderstandings and strengthen mutual respect. Business leaders, students, scientists, and cultural organizations all benefit when relations are stable and constructive.

The global economy also benefits from open communication between the US and China. Financial markets react positively to signs of dialogue and predictability between the two powers.

Businesses on both sides want stable policies, clear regulations, and reduced uncertainty. A cooperative atmosphere encourages investment, strengthens supply chains, and supports economic growth worldwide.

While differences will remain on trade, security, and geopolitical issues, history shows that engagement produces better outcomes than isolation. Strong diplomacy and mutual respect can help manage disagreements while preserving areas of common interest. The US and China are competitors in some areas, but they are also partners in maintaining global prosperity and stability.

Trump's visit could become an important moment to reset the tone of the relationship.

Constructive discussions on trade, investment, market access and economic cooperation could create new momentum for both nations.

The US and Chinese peoples both seek economic opportunity, stable growth, innovation, and peace.

By focusing on practical cooperation and long-term mutual benefit, the two countries can build a more positive and productive relationship that benefits not only themselves, but the entire world.

The author is the president of the American Chamber of Commerce in South China, and the winner of the 2017 Oslo Business for Peace Award, which is awarded by a committee consisting of Nobel laureates in peace and economics. The views don't necessarily reflect those of China Daily.

Jack Midgley

When friends far away can share daily life in real time

Young Chinese creators on Xiaohongshu post a smart study nook or a city workout routine, and peers from the United States quickly take notice.

They borrow the idea, tweak it for their own lives, and share it right back.

This digital back-and-forth links millions of young people, quietly building the trust and practical know-how that enables real innovation.

Global Lens

MA XUEJING / CHINA DAILY

These are the new "people-to-people" exchanges. They happen daily without long flights or months of planning.

Free, effortless and constant, these digital connections are shaping an inclusive future of innovation among people in China and the United States.

Presidents Xi Jinping and Donald Trump have an important opportunity to amplify these connections when they meet in Beijing.

Together, they can help transform the grassroots energy into productive China-US ties that are already growing at the speed of digital connections.

Xiaohongshu's explosive growth brings this to life. The platform's lifestyle content routinely generates massive engagement domestically, while its cross-border search functionality has captured a multi-million-strong audience in the US.

US students respond to Chinese posts with duets and adaptations, often tagging back with comments like "Xiaohongshu changed my set-up!" as tips on lighting, storage, and focus zones flow freely.

President Xi captured the heart of this dynamic when he said that the hope of China-US relations lies in the people.

The numbers reinforce this statement. Xiaohongshu racked up around 3.7 million US downloads in early 2025 and is projected to hit double digit millions this year, while already serving over 300 million monthly users worldwide.

A vast majority of these users are young people.

TikTok connects with 170 million US users, many of them young people sharing news and ideas, while in 2026 duets between Chinese and US creators have attracted hundreds of millions of views.

These platforms keep the innovative exchanges flowing constantly and cheaply, shrugging off diplomatic ups and downs in the relationship.

Miranda Qu, Xiaohongshu's co-founder, laid the groundwork for this trend by turning community input into viral lifestyle solutions that now draw global audiences.

The platform stands out because young Chinese creators blend personal stories with actionable advice on focus-boosting study setups, apartment-friendly fitness routines, and smart daily hacks.

US youth have joined in, blending Chinese precision with their own creative twists to build sharper, more intentional habits on both sides of the Pacific.

These real people-to-people exchanges build habits of cross-cultural innovation.

TikTok's Khaby Lame adds speed to the mix with his silent takedowns of overcomplicated life hacks that resonate universally, while Xiaohongshu provides the depth that makes these exchanges truly transformative.

What makes these digital exchanges so potent is their role in providing the secret sauce of innovation: an intuitive feel for what clicks with users.

When a Chinese creator's dorm organization trick reshapes a US student's space, or Khaby's simplicity sharpens a video edit, they are co-creating that shared sense in real time.

A joint summit statement pledging support for digital youth exchanges would encourage young people both from China and the US to build on today's rapidly-growing interactions.

The benefits can go far beyond feel-good moments.

These connections humanize people on both sides of the Pacific and equip the next generation with important skills to tackle global opportunities such as climate tech, supply chains, artificial intelligence and even the exploration of space.

Above all, they demonstrate that real cooperation can hum along even when global politics does not.

Curiosity has a way of outpacing the need for total agreement every time.

The real story of China and US relations is playing out on screens everywhere.

Young creators are already linking people and cultures across the Pacific.

The summit of the two leaders is helping to endorse those bridges and ensure they grow into the enduring ties that define a bright future for the countries that young people will lead one day.

Zhu Feng

Only cooperation with China serves US interests

US President Donald Trump's visit to China, and expected head-of-state meetings, are drawing a lot of attention at a time when the world is seeing conflicts in Ukraine and the Strait of Hormuz. A key task for both Beijing and Washington is to sustain a stable, manageable and enduring bilateral relationship.

Although geopolitical experts often refer to the "Thucydides Trap" theory — a phenomenon whereby a rising power can cause fear in an established power, escalating to war — to interpret Sino-US relations, China has taken a different approach.

This is evident in the strategies it employed to counter the tariff war initiated by Washington last year, and its vision of building a community with a shared future for humanity, which is supported by four global initiatives and guided by principles of mutual respect and win-win cooperation.

This approach has worked, producing steady, positive outcomes in bilateral interactions, while acting as a stabilizing force in a turbulent, ever-changing world.

In this context, Washington should take advantage of the opportunity for dialogue presented by the US leader's visit, to seek closer cooperation with China.

While some in the US who view China as their greatest "strategic competitor" and seek to contain it have done little to conceal their intentions, the broader trend of China-US exchanges and collaboration remains unstoppable.

This disconnect on the US side needs to be addressed with an objective understanding of Beijing.

After the US Supreme Court ruled in February that the US administration's imposition of reciprocal tariffs on trading partners under the International Emergency Economic Powers Act was illegal, the US side levied an additional 10 percent import surcharge on all trading partners under Section 122 of the Trade Act of 1974.

As the Chinese side has repeatedly emphasized, China and the US need to enable each other's success as interests converge and pursue mutually beneficial cooperation.

The US also introduced a series of negative measures concerning China, including the Section 301 investigations, aimed at undermining China's production capacity advantages and reducing dependence on Chinese industry and supply chains.

However, Washington should have been aware that, given China's 35 percent share of global industrial output, a rapid and complete decoupling is unattainable.

Although the US administration is trying to keep a relatively low profile on the Taiwan question and disputes in the South China Sea, its arms sales to the Chinese island in late 2025 were the largest since 1979.

Additionally, joint military exercises with the Philippines and other external forces in the South China Sea have significantly increased in frequency.

The US should not treat softened rhetoric as a short-term, tactical measure to stabilize bilateral relations.

A US-led rare earths supply alliance designed to reduce dependence on China's rare earths is closely tied to technological innovation and access to critical resources. The same is true of Washington's ambition to revitalize and expand its manufacturing sector.

However, the path to "make America great again" is not necessarily contradictory to China's great rejuvenation. China's significant growth potential, as revealed in its 15th Five-Year Plan (2026-30), can offer US enterprises many opportunities to cooperate with their Chinese counterparts.

For China-US relations to continue providing mutual economic benefits, fostering exchanges across various social sectors, and enhancing complementary security through normal engagement and cooperation, the US side needs to foster a correct perception of China within its broader strategic framework.

Despite some challenges, Sino-US relations have remained generally stable, thanks to head-of-state diplomacy, with the two leaders maintaining frequent communication and dialogue, and recalibrating the direction of ties at critical junctures.

As the Chinese side has repeatedly emphasized, China and the US need to enable each other's success as interests converge, and to pursue mutually beneficial cooperation.

Both China and the US should make mutual respect the cornerstone, peaceful coexistence the principle and win-win cooperation the goal.

This approach will help the two countries explore the appropriate way to interact, jointly contributing to global peace and stability.

China will never follow the obsolete model of a country seeking hegemony when growing stronger. It will instead remain committed to peaceful development.

Beijing hopes that Washington can respect China's core interests and work together to properly manage differences.

In a world facing increasing turmoil, a stable China-US relationship not only serves the fundamental interests of both nations but also aligns with the widespread expectations of the international community.

Iran hardens stance on strait

Tehran moves to draft new regulations for key waterway as oil flows dwindle

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Iran's Foreign Minister Abbas Araghchi said on Tuesday that Tehran is currently in consultations to develop regulations governing arrangements for the Strait of Hormuz based on international law.

Araghchi made the remark during a meeting in Tehran with Norway's Deputy Foreign Minister Andreas Motzfeldt Kravik, formalizing what senior officials have been signaling in recent weeks — that Iran intends to establish a new legal order for the waterway.

Last month, International Maritime Organization Secretary-General Arsenio Dominguez said that countries have no right to blockade international straits or impede the freedom of navigation through straits used for international transit.

Iran's arrangements for the Strait of Hormuz could face setbacks as a United Nations Security Council draft resolution calling for freedom of navigation in the strait is gaining traction with 112 cosponsors, Al Jazeera reported on Wednesday.

Qatar, Saudi Arabia and Kuwait have joined Bahrain and the United States as principal sponsors, according to the report. India, Japan, South Korea, Kenya, Argentina and most European Union member states have also signed on, it added.

More than one month after a tenuous ceasefire took effect, US and Iranian demands to end the war remain far apart.

Washington has called for Tehran to scrap its nuclear program and lift its chokehold on the strait, while Iran has demanded compensation for war damage, an end to the US blockade and a halt to fighting on all fronts, including in Lebanon.

The Lebanese Health Ministry said Israeli drones struck three vehicles on the main highway south of Beirut on Wednesday, killing eight people, including a woman and her two children.

Iran has urged the United States and Israel to accept its rights and demands, warning that any new aggression would be met with a swift and regretful response.

Iranian Brigadier General Reza Talaei-Nik told reporters that the US and Israel would have to submit to Iran's legitimate and definitive rights, either on the battlefield or at the diplomatic table.

"If the enemy does not yield to Iran's rightful demands in diplomacy, it should expect a repeat of its past defeats on the military field," Talaei-Nik said, the Mehr News Agency reported.

The conflict is weighing heavily on global energy markets. Global oil supply will fall by around 3.9 million barrels per day across 2026 and undershoot demand because of disruptions caused by the crisis, the International Energy Agency said on Wednesday, with more than 1 billion barrels of Middle East supply already lost.

Brent crude futures edged down slightly to around $107 per barrel, after a three-day rally driven by the Hormuz deadlock.

Energy deals

Meanwhile, Iraq and Pakistan have cut deals with Iran to ship oil and liquefied natural gas from the Gulf, according to five sources with knowledge of the matter, Reuters reported.

In a deal between Baghdad and Tehran that has not been previously reported, Iraq secured safe passage for two very large crude carriers, each carrying about 2 million barrels of crude, that passed through the strait on Sunday.

Iraq is working to secure Iran's approval for more transits, an Iraqi oil ministry official familiar with the initial deal and current talks told Reuters, as the government seeks to safeguard the oil revenues that make up 95 percent of its budget.

A second ministry official and a shipping industry source also confirmed the talks with Tehran. All of the sources requested anonymity as they were not authorized to speak on the matter.

Similarly, two tankers loaded with Qatari liquefied natural gas are headed to Pakistan following a separate bilateral agreement between Islamabad and Tehran, two industry sources with knowledge of the matter told Reuters, also asking not to be named as they were not permitted to speak with media.

In another development, the Arab League urged Iran on Tuesday to cease all hostile acts against Arab states and condemned the alleged infiltration of the Islamic Revolutionary Guard Corps into Kuwait's Bubiyan Island, which resulted in the injury of one of the Kuwait Armed Forces' personnel.

Arab League Secretary-General Ahmed Aboul Gheit said the armed infiltration of Kuwaiti territory "constitutes a dangerous precedent that cannot be tolerated and represents a serious escalation".

Iran's Foreign Ministry rejected the claims as "baseless", saying four Iranian officers had entered Kuwait's territorial waters because of a navigation system disruption during a routine maritime patrol mission and called on Kuwaiti authorities to resolve the issue through official channels.

Agencies and Xinhua contributed to this story.

US Senate approves Warsh to Federal Reserve board

NEW YORK — The United States Senate on Tuesday confirmed Kevin Warsh to a 14-year term as a Federal Reserve governor, marking a pivotal step toward his expected ascension as the next leader of the central bank.

The confirmation passed with a 51-45 vote. In a notable break from party lines, Senator John Fetterman of Pennsylvania was the sole Democrat to join the Republican majority in supporting the appointment. Warsh will succeed Stephen Miran on the board, with his term retroactively beginning on Feb 1.

Following the vote, the Senate immediately initiated the confirmation process for Warsh's concurrent four-year term as Fed chair. The transition comes as the term of incumbent Jerome Powell is set to expire on Friday.

Warsh, 56, is a lawyer and financier who previously served as a Federal Reserve governor from 2006 to 2011, playing a key role in navigating the global financial crisis during that time. His return to the board comes amid heightened scrutiny of the central bank's political independence.

Powell has announced he intends to remain on the board as a governor after his chairmanship ends, saying he plans to keep a low profile.

Kevin Warsh testifies on Capitol Hill in Washington on April 21 during his nomination hearing to be a member and chairman of the Federal Reserve Board of Governors. JOSE LUIS MAGANA / AP

For his part, Warsh signaled a shift in direction for the Fed, calling for "regime change". His proposed strategy includes tighter coordination with the Treasury Department and the administration on nonmonetary policies.

However, the economic landscape remains challenging. A surge in global oil prices since the outbreak of the US-Israeli war against Iran has fueled domestic inflation, significantly dampening investor expectations for rate cuts this year.

Financial markets are currently pricing in a one-in-three chance of a rate hike by December. The Fed's current target range for short-term borrowing costs stands at 3.5 percent to 3.75 percent.

The Federal Open Market Committee is scheduled to hold its next policy-setting meeting on June 16-17.

Data released on Tuesday by the Bureau of Labor Statistics showed US prices for most goods and services surged in April.

The Consumer Price Index increased at a seasonally adjusted 0.6 percent month-on-month and 3.8 percent year-on-year. Stripping out food and energy, the core CPI ticked up 0.4 percent and 2.8 percent, respectively.

The year-on-year headline rate of inflation hit the highest level since May 2023.

Analysts said the war in Iran is to blame, as prices have increased because of higher oil prices stemming from the situation in the Strait of Hormuz, through which some 20 percent of the world's oil flows.

Dean Baker, cofounder of the Center for Economic and Policy Research, said the war has sent oil prices higher and "we are beginning to see ripple effects in other areas".

"Prices are now outpacing wages, meaning that workers are on average worse off than they were a year ago," he said.

Australia extends EV tax breaks as fuel fears grow

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Australia has extended an electric vehicle purchase incentive program as it aims to cut dependence on fossil fuels amid the Middle East crisis, a move expected to benefit Chinese automakers that have been gaining ground in the country in recent years.

The federal budget, unveiled by Treasurer Jim Chalmers on Tuesday, keeps in place current tax exemptions for EVs under the Electric Car Discount policy until March next year, before the discounts — which go back to July 2022 — are wound down starting April 2027.

The ongoing support for EVs is part of measures to strengthen "fuel resilience", as the conflict in the Middle East has been "pushing up prices, pushing down growth, and punishing Australians", Chalmers said in his budget speech.

Hussein Dia, a professor of transport technology and sustainability at the Swinburne University of Technology in Melbourne, told China Daily that "one of the clearest signals" of the budget announcement is that "Australia is moving from early EV adoption toward a broader transport system transition".

"The focus is gradually expanding beyond short-term incentives toward longer-term resilience, infrastructure, productivity and energy security," Dia said.

"The continuation, but gradual recalibration, of the Electric Car Discount suggests the government believes the EV market is now maturing. The policy has played an important role in normalizing EVs in Australia and accelerating early uptake," he said.

Recent fuel disruptions and geopolitical uncertainty in global oil markets have also reinforced the importance of reducing dependence on imported liquid fuels, he added.

"In that sense, transport policy is increasingly becoming energy policy. Electrification is now being viewed not only through an environmental lens, but also through economic resilience and national security lenses," he said.

The continuation of the EV discount comes amid record sales, with EVs accounting for 16.4 percent of all new vehicle sales in Australia in April, according to the Federal Chamber of Automotive Industries.

"The Electric Car Discount has provided important stimulus to the market, and its continuation will support the growth of EVs," the chamber's chief executive, Tony Weber, said.

Chinese players' role

The purchase incentive is expected to benefit Chinese automakers, which made up four of the top 10 selling brands in April, with one of BYD's best-selling EV models alone recording 1,780 units, or an increase of 139.6 percent year-on-year, according to the chamber.

Dia said Chinese EV makers are playing an increasingly important role in the Australian market.

"Brands such as BYD have helped expand the range of more affordable EV models available to Australian consumers, particularly during a cost-of-living period where price remains one of the biggest barriers to adoption," he said.

"Increased competition is helping make EVs more mainstream and accelerating the transition away from imported fossil fuels."

Aman Gaur, head of legal, policy and advocacy at the Electric Vehicle Council, likewise referred to the growing role of Chinese carmakers in Australia, which has a "competitive automotive market with over 60 brands providing a variety of cars for all lifestyles".

"Chinese manufacturers have added more options for Australians with a great range of electric cars on offer," he said.

Labour divisions in UK overshadow King's Speech

By JULIAN SHEA in London
julian@mail.chinadailyuk.com

United Kingdom Prime Minister Keir Starmer sought to shift the focus from personalities to policy on Wednesday as the King's Speech to Parliament set out his government's legislative agenda for the coming year.

The speech, written by the government but delivered with royal pageantry by King Charles III, outlined new initiatives on energy security, defense, immigration and education reform, but it was the internal wranglings of the governing Labour Party that continued to dominate the headlines across the UK.

Starmer, who has been in office for less than two years, has faced mounting pressure following Labour's dismal performance in last week's local elections, with his leadership being picked out as one of the main causes of voter rejection.

On Tuesday, four ministers resigned in protest against Starmer's continued leadership. The most high-profile departure was Health Secretary Wes Streeting, widely regarded as a serious contender to replace him.

Another possible candidate would be Andy Burnham, though the Greater Manchester mayor would first need to return to Parliament before mounting a leadership bid, likely requiring a sitting Labour lawmaker to vacate a seat and trigger a by-election.

On Wednesday morning, Streeting was called in to Starmer's Downing Street office for a face-to-face meeting, leaving less than 20 minutes later.

Around lunchtime, The Daily Telegraph reported that Streeting was set to quit his post, with an ally saying he was "going to go for it" after the meeting, and that a leadership contest could be triggered as soon as Thursday.

Starmer's spokesperson, meanwhile, told reporters on Wednesday that "the prime minister has full confidence in the health secretary".

The BBC's political editor, Chris Mason, quoted a Starmer loyalist as saying that Streeting lacked sufficient backing to trigger a formal leadership challenge, while Burnham "doesn't have a seat, for all this noise". "Wes has bottled it and caused massive damage and instability in the process," the ally added.

Sky News reported that more than 100 Labour lawmakers have added their names to a letter saying the party needs to focus on "working together to deliver the change the country needs ... this is no time for a leadership contest", but it is believed that around 90 others have come out and called on Starmer to go.

In a further blow to his authority, 11 major trade unions affiliated with the Labour Party have issued a joint statement calling the local election results "devastating", and saying they have no confidence in Starmer's continued leadership.

Editorials

China ready to work with US in spirit of equality, respect and mutual benefit

While global turbulence does not always stem from shifts in major-country relations, stable and healthy ties between the world's two largest economies can help facilitate the easing of international turmoil as their intertwined economic relationship is a stabilizer for the world economy.

Under such circumstances, US President Donald Trump's state visit to China from Wednesday to Friday has naturally attracted wide attention as head-of-state diplomacy plays an irreplaceable and strategically vital role in guiding China-US ties.

As Chinese Foreign Ministry spokesman Guo Jiakun said on Wednesday, China welcomes Trump's visit, during which the two leaders will have in-depth exchanges of views on key issues concerning bilateral ties and global peace and development.

The Sino-US economic and trade consultations held in the Republic of Korea on Wednesday also serve to highlight the two sides' commitment to managing their differences through dialogue and negotiation. The candid, in-depth and constructive exchanges on economic and trade issues of mutual concern, as well as on further expanding practical cooperation, carry on the momentum of the previous six rounds of talks and show the complementarity of Sino-US economic ties.

It is precisely this pragmatism that — despite their differences — has enabled practical cooperation between China and the United States to continue demonstrating vitality and potential under the guidance of head-of-state diplomacy over the past years — even in the face of attempts by some to derail it.

The business delegation led by Trump on his visit to China, which consists of business leaders of some big-name companies in a wide range of strategic sectors, including semiconductors, finance and artificial intelligence, further illustrates the willingness of the US business community to expand mutually beneficial cooperation with China.

The two countries possess broad space for cooperation in fields such as AI, health, green development, advanced manufacturing and supply-chain stability during China's 15th Five-Year Plan (2026-30) period and beyond.

Experience has proved that China and the US stand to gain from cooperation and lose from confrontation. It is imperative that they strengthen their dialogue and cooperation in strategic sectors, particularly AI governance. The initiative on AI governance Beijing has put forward reflects China's commitment to promoting international cooperation on AI governance and ensuring that the era-defining technology benefits all humanity.

China's cooperative spirit is embodied in its four global initiatives — the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative.

These initiatives underpin the country's international engagement across key areas, including its major-country diplomacy with the US. The four global initiatives respond to the common aspirations of the international community for peace, development, fairness, justice and mutual respect. And they are public goods China has contributed to advance world peace and development.

China does not seek spheres of influence, ideological confrontation or cliques. It should be clear that no country can address the grave global challenges the world faces today on its own, no matter how strong it is. Still less can any country achieve security through confrontation or "decoupling", not to mention at the cost of others' security or crossing others' red lines.

China supports multilateralism and an open world economy. Such concepts are rooted not only in China's diplomatic practices, but also in the principles of the modern international order established after World War II, including sovereign equality, peaceful coexistence and multilateral cooperation.

The world does not need a new Cold War — it needs peace and development achieved through dialogue and cooperation, grounded in responsible major-country diplomacy. When China and the US work together to promote peace, development and win-win cooperation, they serve not only their shared interests but also those of the entire world. Against this backdrop, Trump's visit to China has raised expectations that, even with their differences, China and the US can still engage in candid communication, expand practical cooperation and jointly shoulder responsibilities for global peace and development.

As Guo said in reply to questions about the first visit by a US president in nine years, China stands ready to work with the US in the spirit of equality, respect and mutual benefit — expanding cooperation and managing differences — so as to bring greater stability and certainty to the world.

The more volatile the world situation becomes, the more major countries should work together to function as stabilizers. China is willing to work with all countries, including the US, to strengthen communication, properly manage differences and deepen win-win cooperation.

Country's innovation boon to the world

China's continuous efforts in scientific and technological innovation and its high-standard opening-up are having marked effects on both its economy and international cooperation.

Recent data indicate a shift in China's manufacturing industry toward high-end production. This reflects the country's transition to innovation-driven growth.

The country has made rapid progress in the development of emerging industries, with some strategic sectors, including artificial intelligence, intelligent robots, integrated circuits, advanced materials, new energy and biomedicine, growing rapidly. Future industries, including quantum technology, biomanufacturing, hydrogen and nuclear fusion energy, brain-computer interfaces, embodied intelligence and 6G, are also gaining momentum.

The technological innovation in the field of AI is transforming the Chinese economy while having a profound effect globally. China is rapidly emerging as a major force in global AI advancement. As of early this year, the country's core AI industry was projected to be worth more than 1.2 trillion yuan ($176.71 billion), with an annual growth rate nearing 30 percent. China now holds 60 percent of the world's AI patents.

Chinese scientists unveiled six major achievements at the 2026 World Digital Education Conference that concluded on Wednesday in Hangzhou, Zhejiang province. Among them was a generative genomic large model named Carbon, which is being hailed as the "DeepSeek" for the life sciences field due to its nearly hundredfold improvement in computational efficiency.

The rapid development of China's AI sector is bolstered by both policies and strategic planning. In the outline of the 15th Five-Year Plan (2026-30), AI is identified as a key driver of new quality productive forces. The government has launched a comprehensive "AI Plus" initiative. This policy framework supports AI research and accelerates its application across sectors.

Thanks to the progress made, AI and other technologies are empowering industries across the board. China has established tens of thousands of "smart factories" nationwide and accounts for more than half of the global increase in industrial robot installations. According to the World Economic Forum, China now boasts the world's highest number of "lighthouse factories", accounting for 40 percent of the world's total. These factories employ cutting-edge technologies to achieve more efficient and sustainable production processes.

China's experience in applied AI, particularly in sectors such as manufacturing and healthcare, offers a reference for global industry transformation. The improvement in China's technological innovation capabilities has led to a substantial increase in its industrial competitiveness, enabling the country to transition from "running after" to "running together" and even "leading the way" in some fields. China's intelligent computing power was second only to the United States last year.

China's competitiveness in the open-source path for algorithmic models and its position in computing hardware capabilities further solidify its status as a major force in the AI industry.

The scale and network advantages of China's digital infrastructure are equally impressive. By 2025, the country had 4.84 million 5G base stations, accounting for about 60 percent of the world's total, and a staggering 74.99 million kilometers of optical fiber cables.

Additionally, as the world's largest producer of solar and wind power, China has a reliable and low-cost supply of green energy for power-intensive computing centers, further enhancing its role in the global AI ecosystem.

By sharing its innovation and experiences with the world, China is offering a new development path that emphasizes collaboration and openness, encouraging other countries to engage with AI in a way that promotes shared growth and mutual benefit. This is a vision of a connected world, where technology serves as a bridge rather than a barrier.

Collaboration, science effective defenses against hantavirus

The recent outbreak of the Andes hantavirus aboard the cruise ship MV *Hondius* is a reminder to the international community that humanity's battle against infectious diseases is far from over.

While the World Health Organization has assessed that the overall global public health risk is low, the incident has nevertheless triggered concern because the Andes virus is currently the only known hantavirus strain capable of limited human-to-human transmission.

As of early this week, multiple confirmed and suspected cases linked to the cruise ship have been reported across several countries, and multiple deaths were recorded. Coordinated by WHO and relevant national authorities, international medical evacuations, quarantine arrangements and contact-tracing efforts are underway.

China's disease-control authorities have responded promptly. According to the Chinese Center for Disease Control and Prevention, no cases of human infection with the Andes virus have been reported in China as of early this week, nor has any natural host capable of carrying the virus been identified within the country. Wang Shiwen, deputy director of the National Institute for Viral Disease Control and Prevention under China CDC, told the media that the risk of imported transmission and large-scale outbreaks in China remains extremely low.

Experts further clarified an important scientific fact often overlooked amid sensational headlines: human-to-human transmission is not a common characteristic of hantaviruses in general. Under normal circumstances, hantavirus infection mainly occurs through contact with infected rodents or exposure to contaminated urine, feces and saliva. While the Andes virus represents a rare exception, transmission generally requires close and prolonged contact in enclosed environments. Existing evidence indicates that such transmission remains limited and controllable with proper public health measures.

Since the COVID-19 outbreak, the international community has learned that panic, politicization and disinformation can spread faster than the virus itself, thus undermining global prevention and control efforts.

The current hantavirus incident once again demonstrates the importance of adhering to science in the face of disease outbreaks. Yet climate factors have made it harder to respond by expanding rodent habitats and extending transmission seasons. Countries must strengthen their early warning systems, improve cross-border information sharing and enhance emergency coordination mechanisms. Infectious diseases do not respect national boundaries. The multinational response surrounding the outbreak aboard MV *Hondius* illustrates the importance of timely information sharing among governments, public health agencies and international organizations.

Equally important is the need to uphold the coordinating role of the WHO. Throughout the current outbreak, WHO has worked within the framework of the International Health Regulations to facilitate information exchange, coordinate contact tracing and provide scientific risk assessments. WHO has consistently stressed that the overall public risk remains low while urging continued vigilance and monitoring.

Professionalism and multilateral coordination are precisely what the world needs to confront future health threats. Attempts to stigmatize countries, float conspiracy theories or undermine international cooperation would only weaken the collective capacity to respond effectively.

At the same time, the outbreak underscores the importance of strengthening public health literacy. Public health experts note that ordinary preventive measures — such as avoiding contact with rodents and contaminated environments, maintaining hygiene standards and seeking timely medical treatment if symptoms arise — remain effective. WHO's hantavirus guidance also highlights the importance of rodent control, sanitation and rapid clinical management. Severely unwell patients can significantly improve their prognosis through early intensive medical care.

Humanity has paid a heavy price during past pandemics. Only through scientific response, openness, solidarity and strengthened global governance can the world better safeguard public health security. The hantavirus outbreak should serve as another reminder that international cooperation and respect for science remain humanity's strongest defenses against infectious diseases.

— LI YANG, CHINA DAILY

What They Say

Experience economy will help upgrade businesses

Editor's note: *China's experience market reached 18.4 trillion yuan ($2.7 trillion) in 2025, a 22.6 percent year-on-year increase. China.org.cn spoke to Wei Xiang, a researcher in the National Academy of Economic Strategy at the Chinese Academy of Social Sciences, about the development of the experience economy. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The shift from buying goods to buying experiences marks a structural evolution driven by a growing demand for personalized and emotionally resonant consumption. The experience economy thrives on anticipation and the lasting memories created afterward.

Two major forces are fueling the rise of the experience economy. The first is the transformation of the broader economic structure. Demand for purely functional consumption has largely matured. What is growing now is demand for higher-level services and emotionally engaging experiences. People increasingly seek meaning, individuality and emotional resonance through consumption.

The second force is demographic change. Aging societies are reshaping consumption patterns. Older consumers tend to favor slower, more immersive forms of spending that emphasize enjoyment, health, culture and emotional fulfillment. This demographic shift also aligns with the development of experience-based industries.

The rise of the experience economy offers a broader lesson for both governments and businesses. The boundaries between production, consumption, services and experiences will increasingly blur. Future industries should create participatory experiences in which consumers themselves become part of the value-creation process.

The experience economy also generates new forms of personal value. One is cognitive value. Experiences expand people's horizons and reshape their understanding of the world. Personal growth does not result solely from meeting influential people or receiving external opportunities. Often, it is the direct experience itself that encourages individuals to improve their own perspectives and capacities.

Another is social value. Social interaction increasingly includes teamwork, openness, organizational abilities and other forms of noncognitive skills developed through shared experiences. In the future, social interaction may extend beyond human relationships to include interaction with intelligent machines and digital environments, creating entirely new forms of connection.

For the experience economy to remain sustainable, two capabilities are especially important. First, businesses must understand the relationship between functionality and emotion. Future competition will not depend solely on marketing, but also on the ability to measure, detect and respond to emotional change during production and service delivery.

Second, companies must develop stronger flexible customization capabilities. Businesses must have the ability to transform diverse emotional and experiential needs into scalable production systems.

Ultimately, the development of the experience economy will accelerate the transition toward higher-value service sectors and help drive the broader upgrading of economic structures. On the social side, it will enhance public well-being. Through thoughtfully designed experiences, individuals can enjoy a stronger sense of fulfillment, identity and emotional satisfaction. Such experiences do not necessarily need to be expensive.

GLOBAL VIEWS

TARIQ H. MALIK

From AI visibility to developmental leadership

Turning technological strength into governance credibility and cross-border cooperation

Artificial intelligence is often framed as a race for models, chips and market share. However, discussions at the Forum on the Development of International Science and Technology Organizations and Global Science and Technology Governance, held on March 28 during the Zhongguancun Forum in Beijing, emphasized that the more important question goes beyond technological competition. For China, the central challenge is not simply whether the country is visible in AI, but whether that visibility can be converted into stronger governance, more credible international leadership and deeper cross-border cooperation. That is where the next phase of China's AI story will be decided.

China's strength in AI should be understood through its broader development path. Its developmental narrative could be described through four qualities: an equalizer, a bricoleur, a systemizer and a socioeconomic weaver. These are more than rhetorical labels. Together, they capture a development logic that widens access, combines tools pragmatically, organizes complexity at scale and links technology to broader social and economic transformation. This helps explain how a technological field becomes embedded in the wider fabric of production, administration and modernization.

This also helps clarify what is distinctive about China's position today. Many countries can develop advanced technologies, but few can connect them to long-term developmental coordination. China's historical policy trajectory, including the cumulative discipline of the five-year plans, has given it an unusual capacity to link technological ambition with industrial scaling and organizational follow-through. Over successive five-year plans, priorities have evolved in a structured manner — from early emphasis on informatization and industrial digitization, to the integration of digital technologies with the real economy, and more recently to the elevation of AI as a strategic driver of modernization.

In that sense, China's rise in AI reflects a deeper developmental logic: the ability to move from experimentation to infrastructure, from innovation to production and from technical potential to system-wide application. The more pressing question now is what comes next. If earlier stages of development focused on catching up, scaling up and building industrial capacity, the next stage requires China to play a stronger role in shaping the governance language around AI itself.

Governance should therefore move to the center of the discussion. AI is a matter of legitimacy, rules, institutions and cooperation. The narrative alignment theory helps explain this shift. Narratives are not decorative additions to technology; they shape the categories through which technology is understood, justified and accepted. They influence whether AI is seen as a source of fear or trust, fragmentation or cooperation, exclusion or development. They also affect whose rules, organizations and standards gain authority internationally. At this stage, leadership can no longer be measured only by who builds the most advanced technology. It should also be measured by who can connect technology to legitimate and credible governance frameworks.

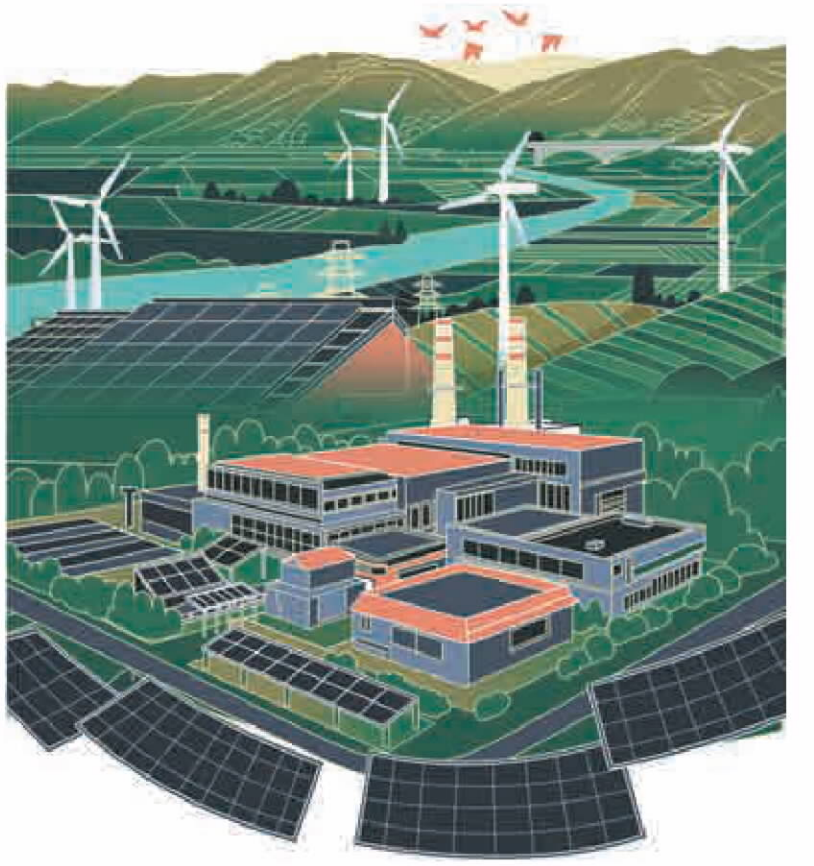
This has direct implications for China. The country already has substantial material strengths: scale, industrial capacity, digital ecosystems and a strong policy commitment to scientific and technological advancement. But technological strength alone does not automatically generate narrative authority. A country may be highly capable in production and application, yet still remain less influential in defining the interpretive framework through which that capability is understood globally. China now faces a strategic transition. To move from AI visibility to developmental leadership, it should present AI not only as a field of innovation, but as part of a broader story of public value.

China's next task is to institutionalize AI through clearer governance pathways. One is rule-making: contributing more actively to technical standards, ethical protocols, data governance principles and cross-border interoperability. Another is organizational leadership: embedding AI in durable, credible and cooperative institutions, including international science and technology organizations, university networks, professional associations and public-private platforms linking research, industry and policy. A third is narrative clarity: communicating AI not only as a driver of growth, but also as a contributor to order, inclusion and long-term development. This requires a language that is internationally intelligible as well as institutionally persuasive.

Global science and technology governance is increasingly shaped by legitimacy and coordination, not by technology alone. If China wants to play a more prominent role in this environment, it should build frameworks in which innovation and governance develop together. That means showing how AI can support public administration, industrial resilience, the green transition, healthcare, education and cross-regional learning. It also means engaging more deeply in international cooperation, so that China is seen not merely as a powerful producer of technology, but as a constructive participant in shaping the rules and organizational architectures through which technology serves development. The future of leadership in AI will depend not only on invention but on the ability to align innovation with legitimate governance.

There is also a deeper historical lesson here. Successful economies often decline when they become imbalanced. Why did technological spirit and innovative capacity shift from one country to another, leaving once-successful economies behind? The answer points to an imbalance. Development weakens when institutions and structures no longer align with new realities. This lesson matters for AI as well. The danger is not only technological lag; it is also the failure to balance invention with meaning, production with legitimacy and capability with trust. China's opportunity is that it can still build this balance. It can connect technological advances with governance design before deeper misalignment takes hold.

China's position between the Global North and the Global South further strengthens this possibility. It is unusually placed to act as a bridge: learning from industrialized economies while also speaking to the developmental aspirations of emerging ones. This gives China a distinctive opportunity in AI governance. It can help formulate AI not simply as a luxury of the richest economies, but as a developmental instrument that can be adapted across different institutional contexts. In that sense, China's contribution could be larger than national advancement alone. It could help widen the global conversation from technological competition to developmental inclusion.



For this reason, the most important transition is conceptual as much as technical. China does not need only more AI. It needs stronger alignment between AI, governance and development, building on the basis of Beijing's series of provisional regulations over the past years and its five-year industrial projections. It must translate technological capability into governance credibility, industrial strength into institutional trust and national achievement into cross-border collaborative leadership. This is not a soft addition to hard technology. It is the condition under which technological strength gains lasting authority.

In the end, the countries that matter most in AI will not be those that simply build powerful systems. They will be the ones that embed those systems in legitimate institutions, credible rules and cooperative international relationships. China has already demonstrated considerable capacity in development and innovation of smart technologies. Its next challenge is to show that this capacity can also help shape a stable, trusted and development-oriented governance future for AI.

ZHANG FANG

Integrating smart tech and green innovation

Digital technology and systematic governance pave the way for high-quality green development

The green transition is no longer a matter of choice but a defining imperative for high-quality development in China. The outline of the 15th Five-Year Plan (2026-30) for national economic and social development, approved during the 2026 National People's Congress, sets a binding target of reducing carbon dioxide emissions per unit of GDP by 17 percent, while raising the share of the core digital economy industries in GDP to 12.5 percent.

In terms of industrial development, the outline introduces a new strategic direction centered on "intelligent and green development, and integrated innovation of industries and technologies". Compared with the earlier five-year plan, which emphasized "upgrading of industry and value chains, in addition to intelligent and green development", the shift toward integrated approaches signals the entry into a new stage of development that has systemic integration as its core feature, as China accelerates its green and low-carbon transition to form a new low-carbon innovation paradigm driven by artificial intelligence technologies.

The integrated innovation of industries and technologies in the 15th Five-Year Plan period can be found in the deep coupling of electricity and computing power. With the rapid advancement of AI technologies, demand for clean computing power is surging.

According to the China Academy of Information and Communications Technology, electricity consumption by computing centers in China reached 150 billion kilowatt-hours in 2023, a year-on-year increase of 15.4 percent, with a projection to reach above 400 billion kWh by 2030 in the medium to high growth scenario. Against this backdrop, the 15th Five-Year Plan explicitly calls for the coordinated deployment of green electricity and computing power, while the 2026 Government Work Report has, for the first time, included "computing-power and electricity synergy" as part of the new infrastructure initiative.

Computing power and electricity synergy refers to the systemic integration of computing infrastructure with the electricity power system through digital technologies, intelligent algorithms, and information networks. On the one hand, models such as direct green power supply and integrated source-grid-load-storage systems help tap into the abundant clean energy in the western part of China, effectively reducing energy costs. On the other hand, some computing tasks are flexible, and can be interrupted and migrated by intelligent scheduling. This approach shifts the increased consumption of electricity to phases with lower electricity costs or lower network utilization through peak load shifting. It substantially transforms data centers from passive electricity consumers into active regulation units, thereby improving the utilization of renewable energy. This model addresses the curtailment of renewable energy and meets the growing green energy demand of computing power, achieving a mutually reinforcing balance between the environmental value of green electricity and the economic value of computing power.

Accurate carbon emissions accounting driven by precise data is the foundational pillar of carbon governance. The effectiveness of carbon reduction efforts depends critically on the transparency and verifiability of carbon accounting systems. China is accelerating the development of a unified national factor database of greenhouse gas emissions, while building an integrated "space-air-ground" monitoring network using satellite remote sensing, drones and ground sensors to ensure that carbon emissions and carbon sinks can be accurately measured and effectively managed.

Progress is also being made in tracing carbon emissions from electricity consumption. By establishing a provincial-level, time-of-use and location-specific factor database of electricity carbon emissions, companies can trace the sources and destinations of their carbon emissions. This technical pathway is expected to upgrade green development evaluation from traditional annual average indicators to higher-frequency, more granular metrics, providing scientific support for precise carbon reduction.

This data-driven foundation enables a broader transformation: moving beyond isolated improvements to achieve intelligent, systemic integration. The most compelling manifestation of this shift is occurring within the industrial sector, particularly in the realm of energy-saving equipment.

In March 2026, four central government departments, including the Ministry of Industry and Information Technology, rolled out a three-year action plan to accelerate the high-quality development of energy-saving equipment. The core thrust of the plan is to shift from optimizing equipment-level energy efficiency to achieving energy conservation. This policy orientation reflects three significant shifts: Technological innovation extends from equipment efficiency to the full chain, and from materials to processes; operating system coordination upgrades from stand-alone operation to wide-range high efficiency and precise matching; and digital empowerment advances from passive response to active optimization, using AI to enable cluster-level intelligent scheduling of energy-consuming units.

This direction is propelling China's energy-saving equipment industry from a single focus on individual equipment efficiency to a new stage characterized by system integration, intelligent drive and cross-sectoral convergence. It signifies a transformation in value creation from equipment sales to system services and a shift in technical pathways from local optimization to global optimization.

The new paradigm for China's green and low-carbon development, with computing-power-electricity synergy as a key pathway, data-driven carbon governance as a foundational pillar, and system-level intelligent integration as its technological signature, is accelerating a profound shift from granular, isolated optimization to system-wide integration innovation. This paradigm represents not only a strategic response to intensifying global green competition, but also a distinctive contribution of Chinese wisdom to global decarbonization efforts.

Metis TechBio records HK's largest healthcare IPO in '26

Company's float signals maturing AI pharma with diversified biz models

By **LI JING**
lijing2009@chinadaily.com.cn

Chinese mainland's artificial intelligence drug-delivery developer Metis TechBio Co Ltd raised more than HK$2.1 billion ($270 million) in its Hong Kong initial public offering on Wednesday, marking the largest healthcare listing in Hong Kong so far this year and underscoring strong investor interest in how AI could reshape pharmaceutical development.

Founded six years ago, the Beijing-based biotech firm issued about 201.2 million H shares in its global offering. Chris Lai, the company's co-founder and CEO, said the listing would help accelerate the company's goal of applying AI-driven nanotechnology to enable targeted drug delivery and new therapeutic approaches.

The listing places Metis alongside two earlier Hong Kong-listed peers — XtalPi Holdings Ltd and Insilico Medicine Cayman TopCo — referred to as Hong Kong's "AI drug discovery trio", though the companies pursue different commercial strategies in the rapidly evolving sector. XtalPi is a Shenzhen, Guangdong province-based AI drug discovery company, while Insilico Medicine is a global AI-driven biotech firm with strong research roots in China.

AI has attracted billions of dollars globally as pharmaceutical companies seek to shorten drug development timelines, but the industry is still testing whether these technologies can generate sustainable revenues.

China's AI drug discovery sector is moving from laboratory experimentation toward early commercial validation, said Tian Lihui, a finance professor at Nankai University.

According to consultancy iiMedia Research, the sector's revenue expanded from about 70 million yuan ($9.7 million) in 2019 to more than 600 million yuan by 2025, reflecting rapid growth in AI-driven drug development in China.

Early financial milestones among industry peers reflect that shift. XtalPi reported its first annual profit in 2025, while Insilico — though still loss-making — has begun generating tens of millions of dollars in revenue from licensing deals and research collaborations.

"The key question for the industry is no longer whether the technology works," Tian said. "It is how to turn it into scalable profit."

Metis has taken a different route from its peers by focusing on nanotechnology-based drug delivery, a technically complex step in turning promising molecules into effective medicines.

Efficient delivery systems determine whether drugs can reach targeted tissues while minimizing side effects — a challenge highlighted during the development of mRNA vaccines and other next-generation therapies.

"Large-molecule drugs are becoming increasingly important, and effective delivery is a core bottleneck," said Liu Jing, professor of accounting and finance at Cheung Kong Graduate School of Business.

"AI gives companies like Metis an opportunity to narrow the technological gap with established Western leaders."

Metis' core platform, NanoForge, combines AI models, molecular simulation and high-throughput screening to design lipid nanoparticles and other nanomaterial drug carriers.

According to its prospectus, the platform has generated more than 10 pipeline programs, including several clinical-stage candidates. Its most advanced candidate, MTS-004, has completed Phase III clinical trials in China for pseudobulbar affect, a neurological disorder for which there are currently limited treatment options domestically, said the company.

Like many biotech startups, Metis is still in a heavy investment phase.

Revenue rose to 105 million yuan in 2025 from 1.5 million yuan a year earlier, largely due to an upfront payment tied to licensing rights for MTS-004.

The company reported a net loss of 392 million yuan in 2025, narrowing from 499 million yuan the previous year.

The company said about half of the IPO proceeds will fund expansion of its AI infrastructure and nanomaterial platform, while roughly 20 percent will fund ongoing and planned clinical trials.

Metis' listing also highlights how the AI pharma sector is diverging into several business models.

One approach, represented by XtalPi, treats AI primarily as a tech platform, providing computational research services and automated laboratory capabilities to pharmaceutical clients.

Insilico has adopted an AI-biotech strategy, using algorithms to design new drug candidates and advancing them into clinical trials before licensing them to pharmaceutical partners — a strategy with higher potential rewards but also higher financial risks.

Metis represents a more specialized strategy, applying AI specifically to the drug-delivery layer rather than the entire discovery pipeline.

"These paths reflect a broader debate between platform strategies and vertical specialization," Tian said, adding that companies capable of integrating both approaches may ultimately build stronger competitive advantages.

Despite renewed enthusiasm for AI drug development, analysts say capital markets are becoming more selective.

"Valuations are no longer driven purely by technological narratives," Tian said. "Investors are increasingly looking at clinical pipelines, partnerships with major pharmaceutical companies and tangible commercial contracts."

Metis' IPO attracted heavy demand, with the Hong Kong public tranche more than 6,900 times oversubscribed and the international placement 82 times oversubscribed, the company said.

The offering drew several cornerstone investors, including BlackRock, which subscribed about $50 million, as well as a State-backed investment fund under China Reform Holdings, which made its first investment in an AI pharma company.

Zero-tariff policy boosts Hunan-Africa biz ties

CHANGSHA — When more than 6,000 bottles of South African wine cleared customs at Changsha Huanghua International Airport in Central China's Hunan province on May 1, the importer received an immediate benefit from China's expanded tariff-free treatment for African goods, which amounted to 21,000 yuan ($3,093) in duty savings.

According to Zhang Xin, chairman of Hunan Express Wisdom Information Technology Co Ltd, South African wine was previously subject to a 14 percent tariff in China. Now that the tariff has been slashed to zero, the company anticipates an annual cost reduction of about 5 million yuan.

This shipment was among the first in Hunan to benefit after China expanded zero-tariff treatment to goods from all 53 African countries with which it has diplomatic relations, broadening an earlier policy that covered the least-developed countries among them.

Under the upgraded policy, China has become the first major economy to offer unilateral, across-the-board zero-tariff treatment to all its African diplomatic partners and to all least-developed countries with which it has diplomatic relations.

For this inland Chinese province, one of the country's busiest regional players in terms of trade with Africa, the tariff cut is more than just a customs adjustment. Local officials and companies see it as a way to lower import costs and draw more African raw materials and consumer goods through Hunan, including some products bound for re-export.

Hunan has spent years trying to position itself as an inland gateway for China-Africa commerce, using the China-Africa Economic and Trade Expo and pilot zone for in-depth China-Africa economic and trade cooperation as its main platforms. The province's trade with Africa has grown by an average of 15 percent a year to 58 billion yuan, ranking first among provinces in central and western China.

The latest move follows an earlier policy that took effect on Dec 1, 2024, when China granted zero-tariff treatment on all tariff lines to the least-developed countries with which it has diplomatic ties, including 33 African countries.

From that day to March 31, Changsha Customs processed around 26.98 million yuan in tariff reductions for Hunan imports from those least-developed African countries.

The policy has, notably, coincided with stronger import growth. Hunan's imports from Africa rose 27.2 percent year-on-year to 30.92 billion yuan in 2025. In the first four months of 2026, its total trade with Africa reached 18.16 billion yuan, up 8.8 percent from a year earlier, with imports increasing 29.4 percent to 10.41 billion yuan.

The new broader coverage could have a bigger effect because it involves several of Hunan's main African suppliers, including Kenya, South Africa, Nigeria, Morocco and Tunisia. Between January 2025 and March 2026, imports from these five countries accounted for 98.1 percent of the total tariffs collected from Hunan's imports from Africa.

Lan Shengbin, deputy head of Changsha Customs, said some Hunan manufacturers had previously paid tariffs of 7 to 10 percent on components from countries such as Tunisia, Morocco and Egypt. Removing such duties will lower production costs and help companies diversify their supply chains, he said.

Hunan is trying to turn its tariff savings into a broader trade model, using the province as a point for importing, processing and redistributing African goods, including some products re-exported overseas.

One example came in July 2024, when 400 fresh roses from Kenya were imported into Changsha and then re-exported through the Changsha Huanghua Comprehensive Bonded Zone to Uzbekistan. It was China's first re-export transaction involving African fresh flowers, according to Changsha Customs.

Hunan Xiyue Culture Media Co Ltd, the importer, now brings in flowers, fruit and ornamental fish from Africa, some of which are shipped on to overseas markets.

Huang Zinan, a company executive, said the tariff cuts would reduce import costs, improve cash flow and allow African products to be sold at more competitive prices.

Consumer goods are another target. During the May Day holiday, an African goods market in Changsha drew approximately 89,000 visitors over six days. Organizers said lower import costs for raw materials had allowed prices to be reduced on some products, including chocolate made with Ghanaian cocoa, shea-butter products from Mali and coffee from Zambia.

Hunan Yufei Industry Investment Co Ltd, which helped organize the market, said its Quality African Products brand now covers more than 400 products from 13 African countries, ranging from coffee and avocados to spices.

Hunan authorities are seeking to turn the tariff change into a wider trade push. In late April, the provincial commerce department announced seven measures covering expanded imports from Africa, overseas warehouse services, industrial capacity cooperation and more China-Africa Economic and Trade Expo activities in African countries.

Major PV project launched to directly power computing facilities

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China has officially launched its first large-scale computing-electricity synergy project with direct green power supply, marking a milestone in the nation's massive commitment to building a unified, nationwide computing network by physically linking desert renewable energy directly to digital infrastructure.

The 500,000-kilowatt photovoltaic power station located in the Ningxia Hui autonomous region began operations recently. It signifies the first time that wind and solar resources from China's vast deserts are being funneled directly into data center loads through dedicated transmission lines, bypassing the traditional detours of the national power grid.

The facility is part of a larger 2-million-kW first-phase development involving a total investment of 8.7 billion yuan ($1.28 billion), which includes 1.5 million kW of wind power scheduled for full integration by September.

China established the "East Data, West Computing" initiative in 2022, a mega data project aimed at accelerating the development of an integrated national computing network.

Once the first phase is fully operational, it will provide 2.29 billion kilowatt-hours of green electricity annually to the large computing base in Zhongwei, Ningxia.

At the heart of this project is the concept of "direct green power supply". Traditionally, renewable energy is fed into the public grid, where it mixes with coal-fired power before reaching consumers. Direct supply, however, utilizes dedicated "point-to-point" transmission lines and "dual-track" supply systems.

In the Zhongwei project, new data center loads are served via physical direct lines, while existing loads utilize bilateral market trading. This setup allows data centers to achieve a high "green power ratio" while significantly reducing transmission costs and carbon footprints.

To ensure stability, the project employs a wind-solar complementary model that sees PV power dominate during the day, while wind power takes over at night. It is supported by on-site energy storage to smooth out fluctuations.

The launch coincides with the nation's efforts to synchronize energy and digital strategies. The National Energy Administration recently said it would permit renewable energy projects to supply green electricity directly to multiple users via dedicated lines.

According to the NEA, new policies will be released in the near future to perfect these synergy frameworks, guiding the relocation of energy-intensive computing facilities to regions rich in renewable resources, such as Ningxia Hui and Inner Mongolia autonomous regions.

Experts believe the Zhongwei project provides a blueprint for the rest of the country.

"By establishing a direct physical link between the energy source and digital load, we are solving the geographical mismatch between where energy is produced and where data is processed," said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University. "This not only lowers the power usage effectiveness of data centers, but also insulates the digital economy from electricity price fluctuations."

Looking ahead, the Zhongwei project plans a second phase that will bring total capacity to 4.6 million kW with a total investment of nearly 20 billion yuan.

As China continues to expand its digital infrastructure, the synergy between "bits" and "watts" is set to become the primary engine driving the nation's high-quality, low-carbon development, Lin said.

BUSINESS

New mall aims to meet evolving needs

Site's owner takes different approach, mixing commerce, culture and community together

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Visitors entering Westlake 66, the newly opened mixed-use complex in the bustling Wulin central business area of Hangzhou, Zhejiang province, might be surprised to find that luxury brands are not front and center.

Instead, the first floor is mainly dominated by lifestyle and experiential retailers, including collective toy companies Pop Mart and Jellycat, as well as the folding bicycle brand Brompton. The second floor features sports and outdoor labels alongside e-commerce brands founded by online influencers, reflecting a shift in consumer preferences toward experiences rather than prestige alone.

The 390,200-square-meter project, developed by Hang Lung Properties Ltd, is the company's 11th venture in the Chinese mainland. Known for managing luxury shopping malls in cities such as Shanghai and Wuxi, Jiangsu province, Hang Lung is taking a different approach in Hangzhou — integrating commerce, culture and community to establish Westlake 66 as both a commercial hub and a social destination.

"Modern consumers don't just want to shop — they seek diverse scenarios, from coffee breaks and dining experiences to social interaction," said Derek Pang, Hang Lung's senior director of Chinese mainland business operation, during an interview. "We are building a platform where locals, tourists and different community groups can interact — whether cycling from West Lake or exploring the city's newly renovated shops."

Hangzhou has long attracted young professionals and technology-driven industries. Its economic mix of finance, professional services and tech, combined with steady population growth, makes it a compelling retail and office market. "The city's consumption power is immense," Pang said.

According to Cushman & Wakefield's Hangzhou 2025 Commercial Real Estate Annual Report, three malls — Hangzhou MixC, Hangzhou Tower and Yintai in77 — each generated over 10 billion yuan ($1.47 billion) in sales in 2025. This underscores Hangzhou's position as one of China's few cities with multiple high-performing shopping centers.

Westlake 66 occupies the Wulin business area, the city's most prosperous commercial hub, which welcomed 189 million visitors last year. While Hangzhou Tower and the other two department store operators have dominated the high-end luxury segment, Westlake 66 is expected to complement existing projects, offering a fresh, lifestyle-driven alternative.

Hang Lung sees Westlake 66 as a long-term investment. Despite a development cost of 16 billion yuan, the company has focused on operational efficiency from day one. "Opening well is crucial. Only then can long-term development and subsequent expansion be realized," Pang said.

The mall does maintain a luxury presence, though it is secondary to experiential offerings. Several high-end brands have opened on the first floor, with additional openings planned for the latter half of 2026. By 2028, Hang Lung aims to expand the retail footprint, reflecting confidence in the city's consumption potential and Westlake 66's appeal as a lifestyle destination.

At its soft opening in April, Westlake 66 was home to around 250 stores, over a third of which are first-to-market in Hangzhou. Janice Cheung, director of mainland business operation at Hang Lung, said the project targets a new generation of consumers, for whom shopping and dining are experiences defined as much by social interaction as by product consumption.

"The project aims to connect people across different circles, creating more social interaction," Cheung said. The office lobby, located on the fourth floor with direct access to the mall, hotel and park, exemplifies this philosophy. "We are rethinking traditional layouts to foster engagement and a richer experience for office tenants and visitors alike," she added.

To stand out in a crowded market where tenant mixes often overlap, Westlake 66 emphasizes operational capability and innovative concepts.

Lifestyle-oriented retailers such as Ole supermarket debuted its "Ole Lifestyle" concept, while Chinese brands like Truuzen, a leather bag brand from Foshan, Guangdong province, are provided a platform to grow alongside global names.

Above: A staff member cuts fresh fish for customers in the Ole Lifestyle supermarket at Westlake 66, the newly opened mixed-use complex in the bustling Wulin central business area in Hangzhou, Zhejiang province, during the mall's soft opening on April 28.
Left: People shop at Westlake 66 in Hangzhou on April 28.
PHOTOS BY LIN YUNLONG / FOR CHINA DAILY

390,200
square meters
floor space of Westlake 66 shopping mall in Hangzhou

"We are pleased that many domestic brands are making an impact nowadays. We'd love to offer platforms for them to develop sustainably," said Cheung.

Cheung also highlighted the importance of bridging online discovery with offline engagement. Pop-up stores featuring debut or exclusive products offer a rotating experience for repeat visitors. "Consumers may discover a brand online, but physical stores allow them to fully experience it and build long-term loyalty," she said, citing AmandaX, an apparel brand for women aged 30-50, as an example. AmandaX started on Taobao in 2019 and opened its first offline store in Shanghai last year.

Hang Lung executives expressed optimism about Hangzhou's consumption climate. After a slow start in early 2025, retail sales rebounded sharply in the fourth quarter, returning to double-digit growth. The company forecast that the momentum will continue in 2026, partly supported by Westlake 66's dynamic retail mix and immersive experiences.

"Westlake 66 is designed to be the new pulse of the city," said Weber Lo, CEO of Hang Lung. "By creating a community-centric hub with first-to-market brands and memorable experiences, we are confident to set a new regional benchmark while contributing to the city's broader economic ecosystem."

Looking forward, Hang Lung plans to expand the retail area by 40 percent and triple prime street frontage to over 200 meters through its partnership with Baida Group. The next phase is scheduled for 2028, reinforcing the company's commitment to long-term urban development in Hangzhou.

Leading commercial operators have reported positive signals that the country's consumption market is on an upward trend. According to Swire Properties' first quarter report, retail sales at HKRI Taikoo Hui Shanghai rose 81.5 percent, while Taikoo Li Sanlitun in Beijing grew 56.2 percent. Its commercial estates in Guangzhou, Guangdong province, and Chengdu, Sichuan province, expanded by 17.6 percent and 18.4 percent, respectively.

Cushman & Wakefield said that Shanghai's retail leasing market remained active in early 2026, with foot traffic and sales surging during the Spring Festival holiday. Lifestyle, food and beverage, and entertainment sectors performed particularly well, signaling a broad-based recovery.

Luxury outlets drive niche consumption experiences

By **WANG ZHUOQIONG**

Luxury outlet retail in China is demonstrating vitality and resilience as the sector capitalizes on the growing demand for cultural, lifestyle and vacation experience-centered shopping.

Among luxury outlet retail operators, Florentia Village Beijing-Tianjin Luxury Design Outlet leads the way.

The flagship project of Italy's RDM Group reported a 6 percent year-on-year increase in sales and a 7 percent rise in visitor traffic in 2025, signaling sustained consumer demand despite broader market headwinds.

On May 10, Florentia Village Beijing-Tianjin celebrated its 15th anniversary. The shopping complex has contributed to the diversification of the country's outlet market, integrating culture, commerce, tourism, sports, and exhibitions into a unified "micro-vacation" retail experience, said the company.

The shopping complex has established a 180,000-square-meter commercial footprint, hosting more than 200 internationally renowned brands. This includes national outlet exclusive brands such as Roger Vivier, Abercrombie & Fitch, and Peak Performance, as well as North China exclusives like Acne Studios, Mulberry, Mackage and Stone Island.

Jacopo De Vena, managing director of Florentia Village & RDM Asia, said the company has pioneered a "micro-vacation" model, combining authentic Italian architecture, a holiday-style setting, and immersive experiences.

Over the years, FV has adapted to shifting consumer preferences from transactional shopping toward lifestyle-oriented and experiential shopping, said the director. Notably, the sports and outdoor category has emerged as a critical revenue pillar, increasing nearly 20 percent in contribution to the revenue from 2024 to 2025.

Recent upgrades, including expanded VIP lounges, Italian espresso bars and new landscaped pathways, reinforce the shopping complex's signature "La Dolce Vita" atmosphere.

"Consumers today increasingly prefer relaxed, lifestyle-oriented scenarios. We've adapted to the trend and have seen these categories becoming a vital pillar of our revenue structure," De Vena said.

According to Bain & Company's 2025 China Personal Luxury Goods Report, 65 percent of Chinese luxury consumption occurred in the Chinese mainland market in 2025. The report anticipates moderate growth for the Chinese personal luxury market in 2026, with the region poised to remain the cornerstone of global luxury market growth.

A gondolier glides along the canal at Florentia Village Beijing-Tianjin Luxury Design Outlet in Wuqing, Tianjin, as people stroll across the Venetian-style bridge on May 10. PROVIDED TO CHINA DAILY

Driven by the continued expansion of the middle-income group, a rebound in consumer confidence, and supportive policy measures, further repatriation of luxury spending to the Chinese mainland is expected. However, the degree of growth will remain highly dependent on specific product categories and individual brand performance.

The China Commerce Association for General Merchandise's 2024-2025 China Outlet Industry White Paper estimates that in 2025 there were about 251 outlet projects in operation nationwide, with a total sales scale of about 239 billion yuan ($35.2 billion).

The development of China's outlet industry is undergoing a strategic shift — moving away from sheer scale expansion toward a focus on achieving extreme operational efficiency, said the report.

Against this backdrop, Florentia Village Beijing-Tianjin, which is located within the Beijing-Tianjin-Hebei one-hour economic circle, leverages high-speed railway and expressway access to capture intercity passenger flows.

This has allowed the outlet to convert transient visitors into a loyal customer base with high repurchase rates, said the director. Seasonal cultural and experiential programming has further boosted Florentia Village Beijing-Tianjin as a dual-city micro-vacation destination, with nearly 80 million visitors to date.

"We broke free from the traditional outlet logic of over-reliance on discounts. By connecting deeply with consumer groups from both Beijing and Tianjin, we converted regional transit passenger flow into a stable consumer group with high stickiness and high repurchase rates," he said.

De Vena added that RDM Group continues to consolidate its market leadership by focusing on six strategic dimensions: scenario creation, high-end merchandising, stock iteration, digital operations, membership deepening, and regional integration.

Through immersive holiday environments, exclusive brand collaborations, and a mature digital ecosystem — encompassing 7.8 million registered members nationwide — the group has built a standardized model capable of replication across all Florentia Village's projects.

Looking ahead, RDM Group is expanding its national footprint with Shanghai third phase and Chongqing second phase, aiming to transform Florentia Village into localized micro-vacation cultural landmarks.

The group emphasizes high brand completeness, cross-border consumption facilitation, and multi-dimensional upgrades to brand matrices, experiential offerings, and commercial value.

Despite increasing competition, national projects achieved an 8 percent year-on-year increase in visitor traffic and 6 percent sales growth in 2025, demonstrating strong resilience and market recognition, said the company.

"Today's outlet is not just a shopping destination; it is a lifestyle and leisure experience," said De Vena. With strategic location, differentiated offerings, and refined operations, Florentia Village continues to be optimistic about the luxury retail and experiential consumption across the country.

Global South teachers to get digital skills training

By **ZOU SHUO** in Hangzhou
zoushuo@chinadaily.com.cn

The world's first international action plan specifically designed to improve the digital skills of teachers in developing countries has been unveiled, aiming to systematically assist Global South nations tackle common challenges in the digital transformation of education.

The action plan for enhancing digital literacy of teachers in the Global South was released during a parallel session of the 2026 World Digital Education Conference in Hangzhou, Zhejiang province, on Tuesday.

The plan, initiated by the Africa division of the Institute of Global Teacher Development, reflects China's practical efforts to deepen South-South cooperation and participate in global education governance.

The plan identifies four interlinked structural challenges: insufficient network and device access, a shortage of high-quality and locally adapted multilingual resources, weak foundational teacher skills coupled with a lack of systematic professional development, and fragmented coordination mechanisms. It argues that piecemeal interventions are no longer sufficient.

Key measures include establishing a collaborative mechanism for digital literacy among teachers in the Global South by engaging international organizations, education authorities, universities and enterprises.

The initiative will align with authoritative platforms such as UNESCO's Global Teacher Campus to provide tiered training programs.

The plan also leverages existing overseas platforms such as Confucius Institutes and Luban Workshops to deliver localized support for teachers.

According to the plan, Zhejiang Normal University will lead implementation efforts. Over the next three years, priority flagship projects will be launched, including the establishment of collaboration mechanisms, the joint development of advanced courses and the piloting of lighthouse schools, or model schools.

The lighthouse schools will be established in two or three host Global South countries, with initial design work and resource allocation set to begin in an effort to achieve early tangible outcomes.

Liu Hongwu, director of the College of African Area and Country Studies at Zhejiang Normal University, said the action plan directly addresses key challenges in improving digital literacy among teachers in the Global South during a critical period for the global digital transformation of education.

"The plan addresses four structural challenges widely faced by Global South countries: weak infrastructure, scarce localized resources, lack of training systems and fragmented cooperation mechanisms," Liu said.

He said the plan adopts a systematic four-dimensional framework that creates a closed loop spanning coordination mechanisms, training, demonstration schools and on-the-ground support networks.

"By focusing on teachers' digital literacy, the initiative represents a strategic shift from hardware construction to human capacity building in developing countries," Liu said.

He also acknowledged implementation challenges, including complex coordination among multiple stakeholders and insufficient adaptation of resources for low-bandwidth environments in many Global South countries.

Nevertheless, Liu described the action plan as a pragmatic step that contributes Chinese wisdom and feasible solutions in bridging the global digital divide and promoting equitable education.

Meanwhile, the Hangzhou Initiative on AI and Education, which was also released on Tuesday at the conference, stresses equitable access to the benefits of artificial intelligence and calls for greater use of smart education platforms to share quality resources and intelligent tools to help bridge the global digital divide.

The initiative proposes establishing a global network for teacher training and capacity building, with special attention given to children with special needs.

It also supports UNESCO's leadership role in using digital technologies for post-crisis remedial education, especially for girls and women.

Hidden city reopens

BLUEPRINT INTO ACTION

Yunnan to promote lifestyle businesses

Better living conditions, policy support reshape province's tourism economy

By **YAN YUJIE** and **LI YINGQING** in Kunming

Yunnan is positioning itself as a destination not only for tourism, but also for long-term living and entrepreneurship, as the southwestern Chinese province recorded sharp growth in overnight international visitors and long-stay residents in 2025, Governor Wang Yubo said on Wednesday.

Speaking at a briefing on Yunnan's 15th Five-Year Plan (2026-30), Wang said the province is looking to attract more people to "travel, settle and start businesses" in Yunnan, as improving living environments and lifestyle appeal reshape the province's tourism economy.

Yunnan received 8.64 million inbound tourist visits in 2025, up 30 percent year-on-year, according to official data.

Among them, overnight inbound visitors rose 51.8 percent to 4.95 million, outpacing overall growth and signaling rising demand for deeper travel experiences.

The province also saw a surge in long-stay visitors, locally referred to as "sojourners".

More than 5.5 million people chose to live temporarily in Yunnan last year, up 41.4 percent year-on-year, with an average stay of 83 days.

"Many visitors came as tourists but stayed on because they fell in love with the place, becoming new residents of Yunnan," Wang said.

He attributed the trend partly to sweeping improvements in urban and rural living conditions in recent years. According to Wang, all counties, cities and districts in Yunnan now meet national sanitary standards, while all natural villages have reached the top-tier standard for rural living environments.

"With better environments and more beautiful cities and villages, tourists from across China and around the world are flocking to Yunnan," he said.

Earlier this year, Alexandra Solovey, a 46-year-old tourist from the United States, visited Kunming with her husband and daughter. She said the pleasant weather, local cuisine, friendly residents and sense of safety made Yunnan "a fantastic destination".

Among those choosing to stay longer is Zhang Boai, a 35-year-old former flight attendant from Beijing. After traveling across Lijiang, Dali, Kunming, Pu'er and Xishuangbanna in mid-2025, Zhang and her husband relocated to a village in Pu'er with their 3-year-old son later that year.

"I want my son to have a happy childhood close to nature, where he can play freely," Zhang said.

The long-stay trend is also giving rise to new business models.

In Laozhuaqing village in Pu'er, 32-year-old Ying Xixi from Wenzhou, Zhejiang province, has launched a digital nomad community, offering shared workspaces for remote workers.

Since opening in late February, the site has already hosted dozens of digital nomads.

"Yunnan has rich resources, diverse ethnic cultures and a great climate, which are all attractive to entrepreneurs like us," Ying said, adding that she hopes for more supportive policies for startup communities and lifestyle-based businesses.

Wang said the province plans to expand policy support, diversify business scenarios and cultivate more sectors suited to lifestyle entrepreneurship. Yunnan also aims to build a number of "cities of entrepreneurship" and "cities of thriving industries" to attract more innovators and business founders.

The growing sojourn economy is already bringing tangible benefits to rural communities.

Yan Di, Party branch secretary of Manhena village in Xishuangbanna, said long-stay tourism has increased significantly since 2024. Last year, the village received more than 10,000 sojourn visitors, many staying for more than 10 days at a time.

The village, home to 109 households and 486 residents, reported an average household income of 80,000 yuan ($11,780) last year, with tourism contributing more than 60 percent.

"Life is steadily getting better," Yan said.

In Lijiang's Yulong county, 57-year-old Fan Hongyan, originally from Xiangxi in Hunan province, opened a guesthouse in September after traveling to more than 50 countries.

"The first time I came here, I was deeply captivated by the scenery and environment," she said. "I knew this was where I wanted to live."

HK's emissions detector to aid climate research from Tiangong

By **WU KUNLING** in Hong Kong
amberwu@chinadailyhk.com

The world's first lightweight, high-resolution, high-precision carbon dioxide and methane point-source detector, developed by Hong Kong scientists, has arrived at the Tiangong, making it the city's first scientific payload aboard the orbiting national space station.

The project, hailed as proof of Hong Kong's ability to support the nation's space development and carbon neutrality drive, is able to detect over 99 percent of CO2 emissions from the nation's coal-burning power plants and CH4 emissions from its coal mines, providing precise and reliable data for policymakers in China and around the world, said Su Hui, co-leader of the project and chair professor of the Department of Civil and Environmental Engineering at Hong Kong University of Science and Technology, on Wednesday.

The Hong Kong-made payload, the Multi-Spectral Imaging Carbon Observatory, nicknamed "eye for space", arrived at Tiangong at 1:11 pm on Monday aboard the Tianzhou-10 cargo craft. It was part of a consignment of essential deliveries such as artificial human embryos and ultra-thin solar cells, and supplies including an extravehicular spacesuit.

The MUSICO will participate in China's first Earth observation project under its human spaceflight program.

Weighing less than 80 kilograms and smaller than a domestic washing machine, the payload is capable of accurately measuring CO2 and CH4 — two major greenhouse gases — from space, with extra-high spectral resolution and 100-meter spatial resolution, said the research team.

By analyzing intensity changes in sunlight over specific spectral bands as it passes through the atmosphere and reflects off the Earth's surface, the payload identifies gas-specific absorption features to determine gas concentrations and pinpoint individual emission sources, enabling effective monitoring of key facilities such as power plants and landfills.

Su said the detector's observation range covers latitudes from 42 degrees south to 42 degrees north — encompassing most of the world's densely populated and industrially active regions. The data it collects will be shared with government departments and research institutions in China and abroad under the nation's data management policies.

She added that recipients include the nation's Ministry of Ecology and Environment, and the United Nations Environment Programme which will add it to an open global dataset for researchers and authorities worldwide.

Zhang Limin, another co-lead of the project and head of HKUST's Department of Civil and Environmental Engineering, said that while the Hong Kong Special Administrative Region has participated in many of the nation's space projects in the past, this payload is the first mission led by the SAR — a milestone.

He highlighted that the project's results will also provide a scientific basis for cross-regional climate research and emissions reduction efforts in economies involved in the Belt and Road Initiative, contributing to the global response to climate change.

HKUST President Nancy Ip Yuk-yu said the project proves that Hong Kong's research capabilities can make substantial contributions to the nation's highest-level aerospace platforms.

It also supports the nation's dual-carbon goals and provides scientific backing for the Beautiful China Initiative and global climate governance, Ip said.

Soundbites

Editor's note: *The State Council Information Office held a group interview on Wednesday featuring outstanding teachers to discuss advancing the spirit of educators and accelerating the building of China into a leading country in education.*

On Cuiying Mountain in Lanzhou, we established China's first semi-arid climate change observation station of international standards. I often take my students into the field, trekking across deserts, traversing glaciers and climbing plateaus. They are trained and tested in harsh natural environments, strengthening both their character and resilience. I like the saying along the Taklimakan Desert highway: "There is only a desolate desert, not a desolate life." I often tell my students the same: how could our research be anything but world-class, when we write our papers on the vast land of our motherland and pursue knowledge in the great deserts of the northwest?
Huang Jianping, *an academician of the Chinese Academy of Sciences and a professor at Lanzhou University in Gansu province*

Labor education is not a decorative add-on, but a source of nourishment and energy for children's all-round development. To help children develop a love for work from an early age, we have designed a curriculum based on the 24 solar terms, encouraging them to engage in hands-on activities in tune with the seasons. Only when teachers remain curious about the world will children long to explore it. I hope our children will feel a spark of excitement at the sight of wild chrysanthemums, and pause to listen when they hear birds singing. Education, at its heart, is about nurturing the ability to perceive happiness and to create it.
Zhang Zhenle, *principal of Fuchun No 7 Primary School Education Group in Hangzhou, Zhejiang province*

I have always worked on the front line of teaching. Together with my institution, I have helped deepen the integration of industry and education, as well as school-enterprise cooperation. I hope to support companies in solving technical challenges while personally guiding students in developing practical skills. Watching them grow from novices to skilled professionals, then step out of campus and into major aviation enterprises, contributing to China's domestically developed aircraft and other critical national projects, gives me a deep sense of fulfillment.
Zhou Shuqiang, *professor at Chengdu Aeronautic Polytechnic University*

The essence of nurturing both intellect and character lies in "seeing every individual". At our school, each class is assigned a psychological counselor, and we have launched a smart mental health platform to support the well-being of both students and teachers. We focus not only on students' academic progress, but also on their emotional needs and individual differences. At the same time, we recognize the dedication of every teacher, providing practical support to help address real challenges, so that everyone on campus is seen and respected.
Xie Wei, *principal of Yinchuan No 15 Middle School, Ningxia Hui autonomous region*

We support teachers in defining clear development goals based on their individual circumstances, whether they are newly recruited or experienced backbone teachers. Taking into account teachers' years of experience and professional strengths, we design stage-specific learning content and practical opportunities, enabling them to grow steadily and continuously. We aim to ignite teachers' inner drive, helping them feel the nobility of the profession and sustain their intrinsic passion, while also strengthening their professional competence. There is only one character's difference between a "profession" and a "vocation", but it transforms teachers' mindset, energizes the entire team, and eventually benefits tens of thousands of children.
An Huixia, *principal of Xinghua Preschool Education Group in Taiyuan, Shanxi province*

POLICY REVIEW

Guideline boosts gig worker protections

Government policy provides growing oversight over new employment types

By JI HAISHENG
jihaisheng@chinadaily.com.cn

SHI YU / CHINA DAILY

During campus breaks, Xiao Tang, a university student from Hebei province, takes to Beijing's streets as a ride-hailing driver. A driving enthusiast, he has turned his time off campus into a source of income and a tangible sense of autonomy. "I enjoy it. It gives me control over my time," he said.

His experience is a snapshot of a much larger trend. "Young people across China are increasingly turning to digital platforms for work, forming the backbone of the country's expanding 'new forms of employment,'" said Zeng Yanbo, a researcher at the Shanghai Academy of Social Sciences' Institute of Sociology.

"New forms of employment" are distinct from traditional full-time work, referring to jobs where tasks are matched, assigned, managed and compensated via internet platforms, such as online service provider Meituan, ride-hailing platform Didi and short-video app Douyin.

More than 70 percent of such workers are aged between 18 and 35, according to Zeng. "Young people are drawn to these jobs mainly for the low entry barriers, the quick settlement of income, and the freedom to set their own schedules," she said.

As this workforce continues to grow, the country has introduced a series of policy measures designed to safeguard these workers' rights, improve services and steer the high-quality development of the sector.

In April, the general offices of the Communist Party of China Central Committee and the State Council, China's Cabinet, issued a set of policy measures on strengthening service and management for new employment groups. Experts said that this marks the first central-level policy framework dedicated exclusively to platform-based workers.

They added that it signals a decisive shift for China's digital economy — from a phase of rapid expansion to a new stage of standardized development that balances innovation with labor dignity and security.

According to a survey on China's workforce in 2023, the country has approximately 84 million workers engaged in new forms of employment, accounting for 21 percent of its total workforce. Projections indicate the figure may surpass 100 million this year.

"The new employment group is an important component of China's workforce and an indispensable force for socioeconomic development. It has now become a crucial pillar of the job market," said Zhang Dandan, a professor of economics and vice-dean at Peking University's National School of Development.

Li Yan, 37, from Yuncheng in Shanxi province, has spent a decade delivering food in Beijing. For most of those years, he worked as a freelance courier on major platforms, appreciating the flexible hours but lacking any form of employment security.

A pivotal shift came in March of last year, when he joined e-commerce company JD as a full-time delivery rider.

Despite it currently being a low season for orders, Li said he still earns around 8,000 yuan ($1,180) per month. Beyond the pay, a transformative benefit has been his enrollment in a social security program, with JD covering the employer's mandatory contribution and subsidizing employees' personal contributions. For Li, this security has become a tangible foundation for his future. He said he is committed to building a long-term career with the company, with plans to stay until retirement.

While individual stories highlight the search for security, the sector's overall vitality remains robust. A recent report by Jinan University's Institute for Economic and Social Research in Guangdong province and recruitment portal Zhaopin showed job postings in new forms of employment rose 15.1 percent year-on-year in 2025, while job seekers rose 11 percent year-on-year, with over 80 percent of positions offering monthly salaries between 8,001 yuan and 15,000 yuan.

For years, the explosive growth of platform jobs, hailed for creating employment, outpaced the development of corresponding safeguards. "The core challenge lies in the mismatch between a new, flexible employment model and a social protection system designed for traditional, stable jobs," Zhang said.

The newly issued policy document provides a comprehensive, two-phase blueprint to bridge this gap. The primary goal is to standardize labor practices and ensure robust rights protection by 2027, followed by the establishment of a sound service and management system within the next three to five years.

It has urged internet platforms and express delivery companies to set reasonable wages for workers based on work tasks and labor intensity, and to ensure full and timely payment. Another pillar of the reform is bringing transparency and accountability to the algorithms that govern such work. Platforms are now required to disclose rules for order assignment, pricing, assessment and penalties, according to the document.

While the policy direction is clear, experts caution that its implementation faces deep-seated economic challenges. Zhang identified income as the primary, underlying concern. "For riders, the core issue is earnings from each delivery," she said.

Citing a widespread belief that any new cost levied on platforms — for social insurance subsidies or safety incentives — will be passed down to workers, Zhang said, "Real, sustainable security for workers must be built on a foundation of adequate earnings in the first place."

Alongside safeguards, she stressed that it is essential to introduce measures that curb cutthroat competition and strictly prevent the infringement of workers' rights and interests.

Yin Yu, a senior partner at Guangdong-based Guanghe Law Firm, urged lawmakers to expedite dedicated legislation to protect the rights of workers in new employment forms.

She told Legal Daily that the next critical step is to translate the proven measures outlined in the policy document to binding legal statutes. This legislation, she said, should systematically define the nature of employment relationships, the rights and obligations of all parties, liability divisions, and regulatory oversight responsibilities, thereby solidifying the institutional safeguards for this workforce.

Zeng emphasized the urgency of establishing comprehensive skill standards and structured promotion pathways for delivery riders and similar professions. She advocated benchmarking against the technical worker grading system, a strategic move aimed at elevating these roles from temporary positions to viable lifelong careers.

This transformation, she noted, is essential for providing workers with long-term growth opportunities and fundamentally reshaping the perception and stability of platform-based employment.

Delivery platform reforms prioritize riders' safety over speed

By JI HAISHENG

The removal of late-delivery penalties in early 2026 has marked a turning point for China's gig economy, signaling a shift from speed-first algorithms to worker safety.

For veteran riders like Li Xincang, 39, who has navigated Beijing's streets for over a decade, the shift represents the professionalization of a sector once defined by high-risk labor and social insecurity.

When Li, a native of Puyang in Central China's Henan province, arrived in the capital over two decades ago, he started working on construction sites like many other rural migrants.

"The wages were often delayed, and there were no social security benefits at all," he said.

Seeking a more predictable income, he switched to food delivery in 2014 and has worked for consumer services platform Meituan for almost nine years.

Today, the veteran leads a team of over 110 riders and earns more than 10,000 yuan ($1,470) a month. Earnings are deposited quickly, he said, explaining that part-time riders get paid the next day, while full-time team members receive weekly wages.

"Delivery work won't make you rich, but it can support a family steadily," Li said. The reliable and timely income allowed him to pay off debts of over 100,000 yuan and build a decent house back in his hometown.

Beyond the paycheck, Li cherishes the flexibility. "I can choose to work mornings, evenings, or nights, and manage my own schedule. I can even take a moment to relax if I need, or scroll through my phone during a break," he said. "This is something you hardly get on a factory floor or a construction site."

Li said that the most crucial improvement he has witnessed is the reform of the delivery algorithm, the system that organizes his daily work.

"In the past, we could get up to 12 orders at a time, with very tight deadlines. We had to rush and sometimes even risk traffic violations," he said. Now, influenced by the government and stakeholders, the system limits trips to six or seven orders with more reasonable time windows. "The algorithm now puts safety before speed," he added.

The platform reinforces this by issuing warnings or short-term account restrictions for repeated traffic violations. A pivotal relief came in early 2026 when penalties for late deliveries were removed.

"Riders no longer feel forced to risk their lives on the road," Li said. "This shift has significantly reduced the danger of accidents caused by overwork or rushed deliveries."

This growing sense of security extends from the daily grind to long-term planning. A key milestone was the introduction of a pension subsidy program late last year. Li and his teammates are now covered by the program that subsidizes their participation in basic pension insurance for gig workers.

"Compared with construction work that offers no proper social security, this job gives us a greater sense of security," Li said. "This pension scheme will protect us after we retire. Having it makes my family feel truly at ease."

Support on the ground has also been upgraded. Li praised the launch of hubs dedicated to delivery riders, which offer 24/7 shelter, charging ports and seasonal supplies. However, he is critical of commercial outlets that hang similar signs for show without providing real service and suggests resources should be directed toward stations that genuinely help workers.

For Li, the past decade traces a clear path — from chasing immediate wages to building a stable, secure life with a future to look forward to. He acknowledged his own story as part of a broader shift where the nation's policy direction and corporate initiatives are converging to provide millions with not just an income, but a growing sense of dignity.

Li said he may continue riding for a few more years, or he might return to his hometown to promote local farm produce online, leveraging a following he has built on social media.

He added that his plans remain flexible, while his next steps will ultimately depend on his family's needs.

Policy Digest

Roadmap to cultivate global textile leaders

China will cultivate no fewer than 25 leading textile and apparel brands by 2028 as part of efforts to significantly enhance the competitiveness and market influence of the sector, according to an action plan issued by the Ministry of Industry and Information Technology and four other departments that was recently publicized.

The action plan for the cultivation of excellence in textile and apparel brands (2026-28) sets out six key tasks, including the categorized cultivation of leading brands across supply chains, industrial ecosystems and consumer markets. Enterprises will be guided to focus on specialized market segments and consumer scenarios to create a group of supply-chain brands and consumer-facing brands.

The plan calls for stronger development of smart textiles, including smart wearables, intelligent home textiles, and products related to healthcare and medical applications.

To promote digital and intelligent upgrading, the plan encourages the release of innovative application scenarios for "AI plus textiles" across the entire industrial chain. It also supports the use of human-computer interaction and virtual interaction to better understand personalized consumer demand, while improving the technological level and wider application of virtual fitting, intelligent outfit recommendations and virtual anchors.

Campaign to uplift rural culture, health services

The Publicity Department of the Communist Party of China Central Committee and 12 other departments recently issued a notice launching the 2026 campaign to bring culture, science and health services to the countryside, aiming to deliver more high-quality resources directly to rural communities.

Under the campaign, cultural and artistic services will be brought to rural areas by mobilizing literary and artistic teams to provide cultural services. Support will also be given to mass cultural and sports activities.

Legal services will be strengthened through regular rural-themed public legal education activities, while agricultural technology services will focus on the needs of rural industrial development.

The campaign will expand science outreach in rural communities through innovative science popularization demonstration activities and high-quality public science content.

Medical resources will be sent to rural communities via free clinic weeks, visits by renowned doctors to grassroots areas, and stationed or mobile medical services at township and village levels, and public welfare services will also be expanded.

Tap water coverage in countryside hits 96%

China's rural tap water coverage reached 96 percent by the end of 2025, the Ministry of Water Resources said on Tuesday.

By the end of last year, large-scale water supply projects covered 71 percent of the rural population, while 72 percent of counties had adopted unified county-level management for rural water supply, the ministry told a press conference.

China had nearly 3.82 million rural water supply projects by the end of 2025, forming a supply network covering 850 million rural residents. The number of people relying mainly on water cellars and water storage tanks for water supply had dropped by 79 percent by the end of last year from the level at the end of the 13th Five-Year Plan (2016-20) period.

During the 14th Five-Year Plan period (2021-25), areas lifted out of poverty completed 914.9 billion yuan ($133.71 billion) in water conservancy investment, including 145.5 billion yuan in key counties.

China aims to raise rural tap water coverage to 97 percent by the end of 2026, with large-scale water supply projects covering 73 percent of the rural population, according to the ministry. By 2030, the country aims to lift rural tap water coverage to 98 percent.

CULTURE

Pearls of perspective

Growing up in China, award-winning novelist worked throughout her life to strengthen cross-cultural understanding, **Yang Yang** reports.

In the history of Sino-US exchanges, Nobel Prize-winner Pearl S Buck, a writer from the United States also known as Sai Zhenzhu, stands prominently as "the most influential Westerner to write about China since the 13th century's Marco Polo", as described by late US historian James C Thomson Jr.

Buck's true significance lies in her approach to cross-cultural understanding, says Guo Yingjian, a specially appointed professor at Renmin University of China, one of the earliest Chinese scholars to research Buck.

"She shows us that effective cultural exchange doesn't start with labels, ideological judgments, or demonization. Instead, it begins with understanding people's lives: their suffering, dignity, and shared emotions," he says.

Through reading her popular and sympathetic novels, particularly *The Good Earth*, Americans' perceptions of China changed significantly in the 1930s and 40s.

"The majority of Chinese were seen for the first time in literature as honest, kindhearted, frugal-living, hard-working, deity-fearing farmers who are much the same as American farmers," wrote Chinese scholar Liao Kang in 1997.

Buck's empathy went beyond pity, reflecting an understanding of others' circumstances, says Guo.

She captured both the hardships and resilience of Chinese farmers, writing about not only poverty but also dignity, not only backwardness but also human complexity, he says. Consequently, the China she depicted, though not a full picture, was warm, textured, and humane, he adds.

One important reason Buck was able to represent Chinese characters with empathy and compassion lies in the fact that "she did not view China as a foreign tourist on a brief visit; rather, she lived and grew up in China, and spent a long time sharing the same world with ordinary Chinese people," says Guo.

Her writing about China did not stem from an abstract "Oriental imagination", but from everyday life, land ethics, family relationships, and basic human emotions, he notes.

A daughter of Southern Presbyterian missionaries, Buck left her hometown of Hillsboro, West Virginia, for China in 1892, when she was about four months old. In 1896, her family moved from Huai'an to Zhenjiang, Jiangsu province, where they lived for the next 18 years.

Unlike other missionaries, Buck's parents, Absalom and Caroline Sydenstricker, chose to live among Chinese people to fully immerse themselves in local culture rather than in isolated Westernized compounds.

Life in Zhenjiang greatly influenced Buck and her writing, especially the daily interactions with her nanny and tutor, says Lu Zhangping, director of the Zhenjiang Pearl S Buck Research Association.

In Zhenjiang, a local Chinese woman surnamed Wang cared for Buck for 18 years. Wang, kind and diligent, often cooked her delicious meals and snacks. Their relationship went far beyond that of servant and master. Wang treated her like her own child. Whenever Buck was punished by her mother for disobedience, Wang would quietly help her with the chores and offer guidance. From a young age, Buck had developed a deep respect and admiration for Chinese women.

Wang often told Buck tales about the famine during her own childhood, her family, and bandits; martial arts stories about standing up to the powerful; fighting injustice; and Chinese classics set in Zhenjiang, including *Romance of the Three Kingdoms*, *The Legend of the White Snake* and *The Water Margin* (or Outlaws of the Marsh).

Her parents hired a traditional scholar, 50-year-old Mr Kung, to teach Buck classical Chinese literature and thought. Mr Kung, originally from Beijing, moved to Zhenjiang after his house was burned down by German soldiers.

Every afternoon at 2 pm, Mr Kung arrived at Buck's home for two-hour lessons. He taught her about Confucius, Bodhisattva, Chinese history, classical literature, life maxims, and local customs and traditions. When answering her questions, he went beyond mere book knowledge, emphasizing the connection between the "source" and the "flow" that links the past, present and future. He also encouraged young Buck to study Chinese classical novels and taught her about the "Complete Library of the Four Treasuries" that was stored in Zhenjiang's Wenzong Ge, an ancient library.

For 10 years, through reading classical texts and practicing calligraphy, She not only became well-versed in traditional Chinese classics and familiar with Chinese history, culture and geography, but also developed a beautiful regular-script style of writing, spoke fluent Mandarin, and even learned to carve seals. In Zhenjiang, she also witnessed the miserable lives of victims of the 1905 Yangtze River flood, which provided first-hand material for *The Good Earth*.

In 1910, Pearl Buck returned to the United States to attend Randolph-Macon Woman's College and, shortly after graduating in 1914, returned to China. She taught English in middle schools in Zhenjiang for two years and, after marrying John Lossing Buck in 1917, the couple went north to live in the countryside of Suzhou, Anhui province, to research life and agriculture in rural areas.

She played an active role in encouraging and organizing fundraising efforts in the US. **Middle left:** Buck speaking at the National Press Club in Washington. **Middle right:** A photo taken on August 17, 2025, in Nanjing, Jiangsu province, shows a Western-style building, which is now home to the Pearl S Buck Memorial House. **Above:** *The Patriot*, released in New York in 1939, was the first novel Pearl S Buck published after receiving the Nobel Prize in literature in 1938. PHOTOS PROVIDED TO CHINA DAILY

"During her four to five years in Suzhou, Pearl Buck learned about the rural areas and farmers in China more profoundly," Lu says.

From 1919 to 1934, the Bucks both taught at the University of Nanking. In the house located at No 3 Pingcang Alley, now in the Gulou Campus of Nanjing University, she completed her first novels, including *East Wind, West Wind* (1930), *The Good Earth* (1931), *Sons* (1933), and *The Mother* (1933), as well as a translation.

In 1933, Buck published the first English translation of *The Water Margin*, one of Chinese literature's Four Great Classic Novels of the Ming Dynasty (1368-1644), giving it the title *All Men Are Brothers*, a line she learned from the Confucian classic *The Analects*.

In 1938, when Buck received the Nobel Prize in literature, she gave a lecture, *The Chinese Novel*, in which she said, "My earliest knowledge of story, of how to tell and write stories, came to me in China". She also mentioned the "Complete Library of the Four Treasuries" she learned from Mr Kung.

The Good Earth, featuring a poor Chinese farmer's family caught in the tides of history, became an instant best-seller in the US and was translated into more than 30 languages. It won the Pulitzer Prize in 1932. In 1937, a film adaptation was produced and won an Oscar for Best Actress the following year.

In 1934, with much reluctance, Pearl Buck left China, but her connection with the Chinese people was never severed.

Since the 1920s, she had been writing articles for US magazines, including The Atlantic, Asia, The Chinese Recorder, and The Nation, on Chinese farmer's life, culture, the shifting roles of women, and China's social dynamics.

In the United States, Buck fully committed herself to humanitarian and cultural endeavors related to China.

In 1941, she became president of Asia magazine to promote modern Chinese literature, aiming to create vibrant, multidimensional Chinese characters that challenged Western stereotypes.

The same year, the East and West Association was established, and as the president, Buck utilized lectures, publications, broadcasts, and translations to spread Chinese culture and provide crucial international support for wartime China.

In 1943, Buck joined the Citizens Committee to Repeal Chinese Exclusion as a key spokesperson, publicly criticizing the exclusion laws. Her efforts contributed to the repeal of the Chinese Exclusion Act later that year.

During the Chinese People's War of Resistance against Japanese Aggression (1931-45), Buck steadfastly supported China's mission. Since the September 18th Incident in 1931, she had openly condemned Japanese militarism and consistently informed the American public about the realities of the war in China.

To aid China, she initiated the Book of Hope fundraising campaign in 1940 and subsequently led the China Emergency Relief Committee and the United China Relief agency, organizing large-scale fundraising efforts to provide medical supplies, build hospitals, and aid civilians and war orphans.

Throughout the war, she frequently used media platforms to voice her support. In 1938, she reviewed the book *Red Star Over China*, predicting China's revolutionary victory and in another article published later that year she praised Chinese guerrilla tactics. In 1942, she published the novel *Dragon Seed*, set against the backdrop of the Nanjing Massacre in 1937, during which 300,000 Chinese soldiers and civilians were killed, making it one of the most horrific atrocities of World War II.

In 1938, in the Banquet Speech of the Nobel Prize, Buck said: "I have never admired China more than I do now, when I see her uniting as she has never before, against the enemy who threatens her freedom. With this determination for freedom, which is in so profound a sense the essential quality in her nature, I know that she is unconquerable."

In 1945, she witnessed Japan's surrender to the Allies, marking the end of the war. In 1973, Buck died in Danby, Vermont, at 80. According to her will, her tombstone at Green Hills Farm in Pennsylvania bears no English name, no birth or death dates, and no epitaph — only three Chinese characters in seal script, handwritten by Buck herself: *Sai Zhen Zhu*, her Chinese name.

In the Statement on the Death of Pearl S Buck in 1973, former US president Richard Nixon said: "In life, Pearl Buck was a human bridge between the civilization of the East and West."

Today, China is quite different from the one depicted in Buck's works. Characterized with modernity, urbanization, globalization, and digitalization, modern China is a far cry from the one focused on land, villages, and family ethics in *The Good Earth*, Guo, the professor, says.

"If we still read Buck solely as a way to understand China's reality, we're missing the point," Guo says.

"In today's context of challenging Sino-US relations, her significance is in her reminder that even if relations between countries are tense, the possibility for understanding between individuals should remain," Guo says, adding, "It is an agreement we reached after discussing the significance of Pearl Buck with the Ministry of Education's China Center for International People-to-People Exchange in current cultural exchanges.

"No matter how dominant political narratives become, they cannot completely obscure the reality of ordinary people's lives. While the China she wrote about is in the past, the method she represents — understanding people through their humanity — is still relevant today," he stresses.

A well-versed exchange between Chinese and Arab writers

GUANGZHOU — Young poets, writers and scholars from China and Arab countries have gathered in South China's Guangzhou, Guangdong province, for a poetry festival aimed at deepening literary dialogue and people-to-people exchanges.

A China-Arab States special session of the 2026 International Youth Poetry Festival began over the weekend in the southern metropolis, drawing more than 40 young poets, Sinologists and writers from 13 Arab countries, including Morocco, Syria and Egypt, alongside more than 40 young Chinese poets.

The event will run through Sunday. In the coming days, Chinese and Arab poets will take part in a series of cultural exchange activities in Guangzhou, Shenzhen, both in Guangdong province, and Beijing, including poetry readings, academic dialogues, poetry seminars, and field visits.

The opening ceremony of China-Arab States special session of the 2026 International Youth Poetry Festival in Guangzhou, Guangdong province, on May 9. PHOTOS BY LU HANXIN / XINHUA

"Though separated by thousands of miles and different languages, the two great poetic traditions of China and the Arab world have become both the root and soul of their civilizations, with condensed language, profound wisdom, and sincere emotion," says Zhang Hongsen, chairman of the China Writers Association.

Zhang says he hopes young poets from both sides will draw inspiration from one another while staying rooted in their own cultures, allowing poetry to flourish through exchanges between tradition and modernity, and the local and the global.

For Egyptian poet Yahia Mohamed Wagdy Lotfy Omar, poetry can travel across languages and borders.

"When I write a line of poetry, a friend on the other side of the world who speaks a different language can still be moved by it and understand it. That is poetry," he says, adding that translation serves as an important bridge, and such gatherings can help poets break through their own limitations.

Launched by the China Writers Association in 2024, the International Youth Poetry Festival has previously held special sessions for BRICS countries and China-Latin America exchanges.

Organizers say the platform is growing into an international venue for young writers to promote literary dialogue and mutual learning among civilizations.

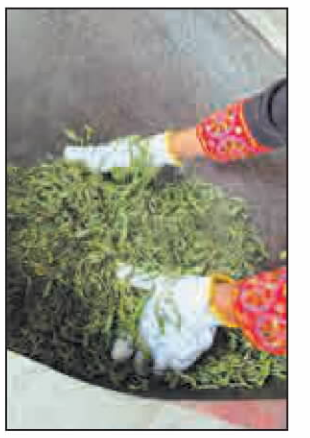
LIFE

Blending tea culture with travel



Enthusiast-turned-entrepreneur shares his appreciation for the drink along with his sourcing adventures, report **Zheng Zheng** and **Wu Wanzhen** in Shanghai.

When Derek Poskin first arrived in the historic canal city of Yangzhou, Jiangsu province, in 2016, he was tracing a poem by Tang Dynasty (618-907) poet Li Bai and developing a growing appreciation for Chinese tea culture. Nearly a decade later, the American, born in 1988, has become a tea entrepreneur, sourcing premium leaves across China and selling them to customers worldwide.

"Coffee is for work. Tea, though, is for life. I've always been passionate about Chinese tea," Poskin says from Empty Cup, his renovated tea house nestled in Yangzhou's old quarter, where he introduces visitors from around the world to China's tea traditions.

"I started drinking and buying more, and eventually turned my house into a warehouse. I had to share it somehow, and that's how the business began."

From passion to business

Poskin launched his tea venture in 2018 as a side project, aiming to connect Western tea enthusiasts with the traditions behind it. However, the early years were challenging.

"The first three or four years were really slow," he admits, recalling how only family members purchased his products initially. "I still remember the first time I got an order from somebody I didn't know. I was like, 'Oh my gosh'. That was the moment I knew I was making it. It's been a long, long process."

Navigating China's tea landscape is no simple feat. The country produces thousands of varieties across six main categories — green, white, yellow, oolong, black, and dark teas like Pu'er.

Rather than working through middlemen, Poskin travels directly to tea-growing regions across China, from the ancient forests of Yunnan province in the southwest to the oolong gardens of Fujian province along the eastern coast.

"One of the reasons I came to China was to live the tea culture. The best way to do that is to go where the tea is made," he explains. "Before coming to China, I had been drinking tea for a long time but had never actually seen a tea plant. Now I've hiked through some of the country's most remote tea mountains."

Connective expeditions

One of Poskin's most memorable expeditions took him to Guafengzhai, a remote village of the Yao ethnic group in Yunnan's Yiwu town, about two kilometers from the border with Laos. Renowned for its high-quality Pu'er tea, the village had long been a bucket list destination for the entrepreneur.

The journey began with a leap of faith — connecting through social media with a young, local farmer named Zhao Xiaoyun. "I had this prearranged date with a person I'd never met, in a town I'd never been to, to venture to the borders of China," Poskin recalls. "But as soon as I met her, I knew we were on the same page. We both spoke the language of tea."

The four-day expedition immersed him in every aspect of tea production. Joining Zhao, her mother, sister, and friends deep in the tea forests, he picked leaves, laid them out to sun-dry, and helped with the roasting.

"We've hosted foreign tea merchants who have visited our plantation for business before, but Derek stands out for his exceptional knowledge of tea," says Zhao. "When we taught him the leaf fixation process, a critical step that halts oxidation and preserves flavor, he learned it immediately."

The primeval forests, with tea trees hundreds of years old growing wild among other vegetation, left an enduring impression. "Walking through those ancient groves felt like stepping into another world," Poskin describes. "The farmers would point out edible herbs along the way, letting me taste spicy leaves that would numb my mouth like Sichuan peppercorns.

"That's one of the most magical aspects — experiencing the land with the people who live on it," he adds.

Pieces of a puzzle

Poskin's dedication to understanding tea goes beyond sourcing trips. He spent a year in Chaozhou, Guangdong province, studying the art of making clay teapots used for *gongfu cha* (tea with skill). This method uses small pots and cups to bring out complex flavors through multiple short infusions.

He has participated in some local customs and festivals during his trips, often as the only foreigner. "One time, around Qingming Festival, I was invited to join a family's tomb-sweeping ritual," he recounts. "We killed chickens, burned incense and paper money, and set out meals for the ancestors. It was incredible to be part of that living tea culture."

The tea is just the surface, he emphasizes. "When I experience the world through the eyes of the people in the mountains, I realize how deep tea culture really is. The leaves themselves are just a piece of the puzzle."

Through his travels across different provinces, Poskin's understanding of the drink itself has shifted from a search for correctness to an appreciation for diversity.

"I came thinking there was one correct way to drink tea," he explains. "But I've learned that Chinese tea culture is incredibly fluid and varies by region." For example, people might drink green tea straight from a glass jar in Yangzhou, while in Chaozhou, elaborate *gongfu cha* sets are the norm.

"Chinese tea culture is fluid, more Taoist," he says. "Every place has its own style, and any way you drink tea is the right way. I find that very welcoming and liberating."

Bridging East and West

These experiences have become central to his business model. Poskin documents his sourcing journeys through videos and photographs, sharing them with customers to create transparency and a connection between consumers and producers.

His content creation extends to a podcast called Tea Soup, a YouTube channel, and an active social media presence through which he has built a following of enthusiasts eager to learn about authentic Chinese tea culture.

Most of his customers are based in the United States, with significant sales to Germany and other EU countries. To introduce premium flavors to a wider audience, he utilizes blending techniques that maintain high quality while remaining affordable.

"I buy some really good tea and blend it with a less expensive tea that complements it, so people can try something high-quality at an affordable price," he explains. For each product, he creates detailed tasting notes, origin information, and brewing instructions.

Unlike many e-commerce businesses, Poskin operates exclusively through his own website, maintaining full control over the customer experience — from freshly coined tea names to packaging designs. "It's something I have complete control of. For me, this is a creative expression," he says.

Looking ahead, Poskin envisions his business evolving into a social enterprise that gives back to farming communities. His new teahouse project in Yangzhou aims to create a physical space where people can experience Chinese tea culture firsthand.

"The business is doing well. My partner and I are interested in making it a social enterprise — giving back to the farmers and doing something positive," he reflects. "I don't need to make endless money. I'd rather cap it and use the excess for good.

"From the start, this has been a passion project," he emphasizes. "I want a deeper understanding of Chinese tea, to source better tea, and to awaken more people to Chinese tea culture."

Reflecting on a decade in China, Poskin offers fellow entrepreneurs a perspective of patience. "China is a world of opportunities. There are so many people who can help you. But don't rush it," he notes. "Great things take years, and then they happen all at once."

Salon and music strengthen Sino-New Zealand friendship

WELLINGTON — Featuring a concert by the Amber Quartet, the "Tea for Harmony: Yaji Cultural Salon" in late April integrated Chinese tea culture with classical Western music in Auckland, New Zealand's largest city.

Organized by the China Cultural Center in Auckland, the event opened with tea tasting, traditional tea preparation, tea appreciation, and storytelling about tea culture, creating an elegant, harmonious atmosphere. Participants were invited to make a personalized cup of tea using an ancient Chinese style in which tea powder is applied to "draw" pictures on the tea's foam.

The Amber Quartet was founded in 2005 and has become an internationally influential string quartet in China. During the event, Debussy's *String Quartet* and works featuring the ethnic cultures of both countries were performed. "They were truly amazing," Sharon Ann from the audience says, speaking of the performers' superb skills.

PHOTOS BY WU JIAXIANG / XINHUA

Chen Shijie, Chinese consul general in Auckland, says that the event uses music as a bridge and tea as a bond to convey the friendship of the Chinese people, helping deepen mutual understanding and relations between the people of China and New Zealand, and strengthening the public foundation of bilateral relations.

Bob Harvey, former mayor of Waitakere, says he values the historical ties and current cooperation with China. "This night is cemented with tea for harmony and peace. It is such a special moment."

LIFE

An island's women on wheels

On remote Qushan in Zhejiang province, a team of female delivery drivers is reshaping traditional roles, balancing motherhood and work while forging independence and solidarity, **Chen Nan** reports.

Part of the Zhoushan Islands in China's Zhejiang province, hundreds of kilometers from the mainland, lies Qushan Island, home to fewer than 100,000 residents.

Life here revolves around a main road, which is a narrow stretch lined with schools, a clinic, a handful of shops, four bubble-tea cafes, and a lone coffeehouse. This modest cluster forms the island's "central business district". Yet, in the past year, it has become the stage for an extraordinary cast of women.

They are mothers averaging 40 years of age who have traded the predictable rhythms of domestic life for the hum of electric scooters and the uniform of the island's delivery service. Day after day, clad in orange and black, they navigate winding lanes and stair-stepped alleyways, threading the island together one takeout order at a time.

Once tied to roles defined by family and circumstance, such as wives awaiting fishermen at sea, and mothers trapped in part-time work, they now claim a new agency in these small, daily movements, quietly "rebuilding themselves" with every delivery.

From February to March this year, renowned Chinese photographer Xie Hailong, whose work has chronicled ordinary lives for 35 years, visited Qushan, drawn by curiosity.

"On an island surrounded by wind and sea, I wanted to see how these women could seize their own lives," he says. More than 10 of his photographs are being displayed in an exhibition titled *Seeing: Cities and Riders*, running from April 17 to the coming Sunday at public locations across 12 cities nationwide, capturing these women, who root themselves in a life defined not by circumstance, but by choice, against the rhythm of waves and wind.

Xie, 75, is known for a photo that he took in 1991, telling the story of Su Mingjuan, then 8 years old, with great sparkling eyes and a pencil in hand, in rural Jinzhai county, Anhui province. The photo became a household image after it was used as a poster for Project Hope, which was launched by the China Youth Development Foundation in 1989 and is dedicated to helping underprivileged children get an education.

Xie was inspired by a video online that he watched in 2025, featuring this group of women whose optimism, smiles and authenticity shone through every frame.

"I was captivated by their energy and found myself curious about this unique team — how, in such an isolated place, surrounded only by wind and sea, could they courageously choose their path, work tirelessly, and hold tightly to the life they wanted to live," the photographer says.

The first time he saw them in person, their vibe instantly drew him in. They were a diverse group of women, aged between 30 and 50, all dressed in bright orange uniforms. They gathered at the "CBD" of the island and chatted and laughed together.

"Their electric bikes were parked nearby, and they were like a burst of color against the backdrop of the island. When an order came in, one of them would zip off to deliver it, only to return afterward and join the group once again," says Xie.

During the days when their husbands were out at sea, these women became each other's family, supporting one another through thick and thin. When one of them had fewer orders, the others would step in and share theirs. If a newcomer was unfamiliar with the island's streets, the experienced riders would patiently guide her. Between orders, they would pull out little mirrors and lipsticks to touch up their makeup, reminding each other that, even in their uniforms, they never forgot the importance of feeling beautiful.

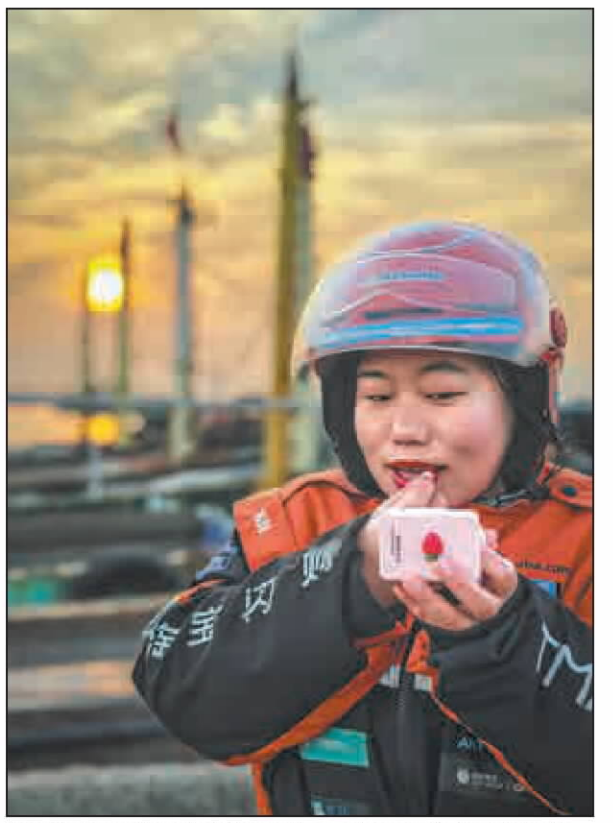
"It is a life that is both modest and deeply connected, where community comes first, and every little act of kindness carries weight. These women aren't just making deliveries; they are building lives for themselves and each other, grounded in determination, sisterhood and joy," the photographer says.

Among these women is Chen Lirong, born in 1997 and the youngest and fastest of Qushan's female riders. She is also the navigator, the one steering the small team through the chaos of rising orders. Each day begins at 7 am with the routine of family: delivering her two daughters to school. By 8:30 am, her delivery box is already brimming with orders. She rides until mid-afternoon, pauses to pick up her children, and then continues the cycle — juggling work and motherhood with the precision of someone who has spent years learning to adapt.

For Chen, deliveries are more than a job; it is the first work she has ever held that allows her to earn a living while tending to her children. Even at the busiest moments, she can glance at her phone, or quickly dash out an order and return home to care for her daughters.

In April 2025, when Taobao Shangou, or Taobao Instant Commerce, an online daily life services platform, officially launched operations on Qushan Island, Chen's reliability earned her the trust of Hu Gaoyang, the logistics manager. She became the leader of the all-female riders, guiding new mothers into the unfamiliar, physically demanding world of delivery work.

Initially, both Chen and Hu worried that the women, many long accustomed to full-time childcare or household work, might not adapt to the harsh rhythms of outdoor delivery. But as the first surge of orders hit, those doubts quickly vanished.



During the summer of 2025, order volumes skyrocketed by more than 1,000 percent. Some riders, brand-new to the job, handled 189 deliveries in a single day, and over the course of a month, completed more than 2,000.

> These women aren't just making deliveries; they are building lives for themselves and each other, grounded in determination, sisterhood and joy."
>

PHOTOS BY XIE HAILONG / FOR CHINA DAILY

Chen herself was no stranger to struggle. Born in Anhui, she had drifted from factory work in Guangdong province to follow her husband to Jiangsu province. By 2016, marriage and childbirth brought her to Qushan, where her husband became a fisherman and she a homemaker, bound to domestic responsibilities while he went out to sea. Early one March morning, photographer Xie captured a photograph of her sending her husband off at 4 am, the harbor dark and silent.

"There was no dramatic embrace," Xie recalls. "Just a quiet farewell. The silent care between them hit me harder than any posed shot. I found myself tearing up behind the camera."

Raising two daughters while managing household repairs, medical trips and family errands, Chen's desire to work and earn never waned. A previous job in a local factory ended when it shut down, leaving her life once again in a transitional state. But as a delivery rider, she found not only an income, but also her calling. She schedules her team around childcare needs: mothers with younger children ride the mid-shift, those with older children the early shift, while those without children cover the late hours. In high season, she stays late to help manage orders herself, ensuring no one is overburdened.

At 46, Hu Yingrong became the first female delivery rider to join Chen's team. Having lived on the island for nearly 20 years, she's seen her life unfold in ways she never expected. Her eldest daughter is now in college, while her youngest son is still in middle school.

For nearly a decade, Hu Yingrong searched for work on the island that would allow her to balance earning an income with taking care of her children. Before she became a delivery rider, she tried various jobs but found herself doing the laborious task of mending fishing nets.

For a decade, she was bound to those nets. While the men of the island used fishing nets to bring in the harvest, Hu believed that women on the island had their own "mission" — the work of repairing and maintaining them. When the boats returned from fishing, they were filled with nets that needed mending: some torn and some covered in small fish and shrimp that had to be removed.

When her children were on vacation or at school, she would work in a fishnet factory surrounded by piles of discarded nets alongside other women just like her. They worked from sunrise to sunset, often losing track of time.

Then, in 2025, a new opportunity appeared. She became the second female delivery rider on the island, marking the beginning of a new chapter in her life. Finally, she had a job with a base salary, and the harder she worked, the more she earned.

However, the transition wasn't easy. Unlike younger riders like Chen, Hu Yingrong struggled at first. When she joined the team, she was faced with the busy periods of July and August — times when the number of orders was overwhelming. She couldn't even read the delivery routes on her phone's navigation system because they looked like a tangle of branches and twigs, constantly splitting and extending. But with persistence and a willingness to learn, she quickly adapted.

The island is full of buildings without elevators, and she often found herself climbing staircases, sometimes multiple flights in a row.

"My legs would hurt so much," she says, recalling the physical toll. Yet, she pushed through and excelled during the peak seasons, earning over 10,000 yuan ($1,472) a month — figures she had never dreamed of while working in the factory. During the off-season, she could still make 7,000 to 8,000 yuan — an amount that once seemed impossible.

Now, she has carved out some time for herself. After sending her son to school in the morning, and finishing her deliveries, she returns home to do housework or tend to her small vegetable garden.

The exhibition also features photos of other delivery riders taken by other photographers. According to the photo exhibition's curator Yang Han, more than 2,000 works were submitted for the event, with nearly 100,000 riders participating in the voting to select 200 images to be exhibited. The total number of votes surpassed 1 million.

Alongside Xie, more than 50 other photographers are featured, including Zhang Boyuan who has taken pictures of Tang Qi, a rider in Chengdu, Sichuan province, who twice jumped into an icy river to save people.

"Many photographers and ordinary people pick up their cameras and phones to document the riders around them," Yang notes.

"If your pictures aren't good enough, you aren't close enough," Xie says, quoting famous war photographer Robert Capa. "The same applies to portrait photography — this 'closeness' refers to how close you are to the life and heart of the person you're photographing.

"During this shoot, I was moved to tears several times by the passion and optimism of these mothers. Each of them faces various difficulties at home, yet they still wear a smile on their faces. In the past, I've often revisited the children I photographed for Project Hope, checking in on them every few years to see if they're still in school. I hope that in the future, I'll have the chance to return to this small island, to the 'CBD' they've been waiting for, to that little milk tea shop, and see them still wearing smiles on their faces, with their lives getting better and better," Xie says.

Ancelotti: Neymar call to be made on form, not sentiment

As Brazil's coach gets set to announce his World Cup squad, questions remain over inclusion of 34-year-old Santos star

Neymar (center) of Brazilian side Santos fights for the ball with Matias Reali (left) and Manuel Insaurralde of Argentine club San Lorenzo during a Copa Sudamericana group-stage match at the Pedro Bidegain stadium in Buenos Aires in April. AFP

Carlo Ancelotti will walk into Monday's Brazil squad announcement with a nation peering over his shoulder and one burning question hanging in the Rio de Janeiro air: Neymar, or no Neymar?

The 34-year-old forward is Brazil's all-time leading scorer, but his place at the 2026 World Cup, which kicks off next month, hangs in the balance after years of injury troubles and an underwhelming return to Santos.

That leaves Ancelotti weighing romance against the cold, practical demands of fitness, as he lays out his high-intensity blueprint for the record five-time champion.

"When you have to choose, you have to consider many things," Ancelotti told reporters on Tuesday.

"Neymar is an important player for this country because of the talent he has always shown, but he has had problems and is working hard to recover. He has improved a lot recently, and is playing regularly. It is, obviously, not such an easy decision for me. We have to weigh up the pros and cons carefully."

Ancelotti hosted reporters at the Brazilian Football Confederation's headquarters in Rio, overlooking Barra da Tijuca, and spoke about the delicate selection call with the calm that has defined one of soccer's most decorated managerial careers.

The Italian is the only coach to have won league titles in all of Europe's big five leagues and has lifted a record five Champions League trophies as a manager, in addition to two as a player.

'Much loved'

Yet, few selection decisions will be picked apart quite like this one. Teammates have publicly lobbied for Neymar's inclusion, while supporters remain split between affection and anxiety over whether his body can still keep pace with his imagination.

"I know full well that Neymar is much loved, not only by the public, but also by the players," Ancelotti said.

"This is also a factor, because we have to consider the atmosphere that will surround Neymar's call-up. It's not as if I'm going to drop a bombshell in the dressing room. He's very well-liked, he's very much loved.

"I think it's normal for the players to express their opinion. I'm grateful to everyone who has given me advice; I thank you all.

"But, ultimately, the right person to make this decision, the one best placed to do so, is me."

Asked whether the players' appeals had influenced him, Ancelotti said they mattered only in one respect: they underlined that Neymar would not disrupt the group.

For Ancelotti, the dressing room is not the concern. The circus outside it may be.

"The internal atmosphere, I don't think it will affect the team at all. The atmosphere is a very positive, very clean one, and no matter which player is in the squad, it will remain positive and clean right to the end," Ancelotti said.

"But I can't control the external atmosphere and what the media says."

'Improved'

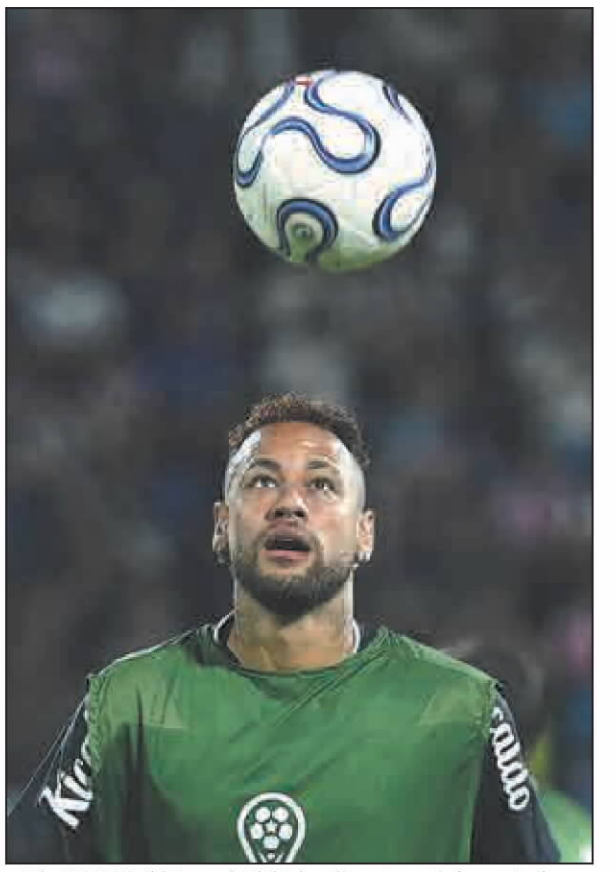
The bigger question may be whether or not Neymar still fits the soccer Ancelotti wants: four forwards who can run, press and track back, a demanding template for a player who has struggled to string together a sustained run of matches.

Carlo Ancelotti

The Italian, however, said Neymar had shown signs of progress.

"He has improved his fitness a lot in recent matches," Ancelotti said.

"He has played some very good matches lately and he can maintain a high intensity in a match, but there are matches and matches..."



Ancelotti said the decision whether or not to select Neymar would be his alone.

"I haven't been pressured by anyone to call up Neymar. I have complete autonomy," he said. "The decision will be 100 percent professional. I will only take into account how he is performing as a footballer. Nothing else.

"Can I draw up a perfect squad? Impossible! But I can draw up a squad with fewer mistakes than others who might do so. Of that I am certain."

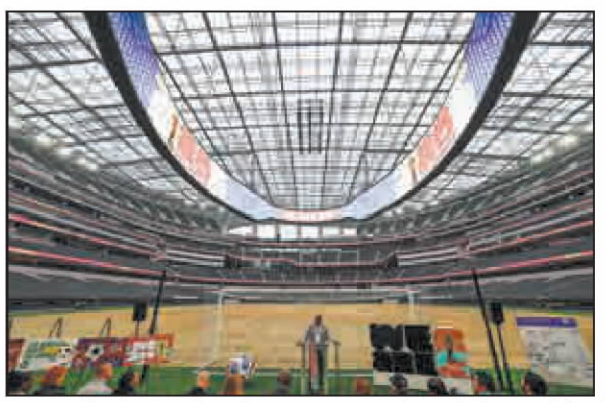
With 30 days to go, LA has everything in place for the World Cup — except the pitch

INGLEWOOD, California — With 30 days to go until its first World Cup match, Los Angeles has the transportation and food nailed down. The playing surface, though? Not just yet.

The United States opens its campaign at SoFi Stadium (to be known as Los Angeles Stadium) against Paraguay on June 12, the first of eight matches to be played at the NFL stadium in Inglewood.



On Tuesday, though, the field was still dirt.

That was set to change on Wednesday, when, after a 1,600-mile trip in refrigerated trucks from Washington state, sod was due to arrive, ready to be laid over the next two days.

"This surface is the players' stage," said Otto Benedict, senior vice-president of facilities and campus operation for SoFi Stadium.

Construction on the field began April 13 after the stadium hosted a Monster truck event.

The stadium modified the field shared by the NFL's Los Angeles Rams and Los Angeles Chargers in two phases. Auxiliary space and wider dimensions were created by removing corner seats to meet FIFA specifications, and a sophisticated irrigation system was installed to maintain the grass.

Los Angeles' SoFi Stadium hosts an event marking 30 days until the World Cup on Tuesday, featuring themed desserts of a World Cup trophy made of chocolate mousse and a soccer ball filled with vanilla mousse, that will be available to fans during the tournament. AFP / AP

"To be the place where the energy first ignites, where the home crowd gets to set the tone for the rest of the tournament is a responsibility we don't take lightly," Benedict said.

Construction, landscape, grass and engineering crews were applauded by local World Cup organizers and community ambassador Magic Johnson, who pointed out his suite where he'll be watching.

"When you think about the financial impact it's going to have on Los Angeles, it's going to be amazing," said Johnson, who is a co-owner of LAFC in Major League Soccer and the Washington Spirit of the National Women's Soccer League.

Tours of the stadium during the tournament are being sold for $86.50 and premium seats, suites and hospitality packages are still available.

Fans availing themselves of those tickets will have access to a variety of food and drink options, from lime marinated shrimp and spiced lamb rack, to aged ribeye cap with bordelaise and mashed potatoes.

There is also a range of themed desserts, including a World Cup trophy made of chocolate mousse, raspberry, chocolate crunch and chocolate sponge.

Metro debuted special edition TAP cards featuring three FIFA-themed designs, 17 country-specific designs, four FIFA collector cards, including a light-up card, and a collector's box.

"We want to provide a system that is safe, fast and fun," LA Metro CEO Stephanie Wiggins said.

Metro is working with 11 other transit lines in the region to offer direct-to-stadium bus services for $3.75 from 15 park-and-ride lots in the LA and Orange counties. Reserved parking lots range in price from $55 to more than $100. Fans can access 300 dedicated buses to every match in an effort to avoid disrupting regular services.

The official FIFA Fan Festival will be held from June 11-14 at Los Angeles Memorial Coliseum with big screens showing games. Ten fan zones around LA county will host activities and watch parties.

President Xi Jinping hosts a banquet at the Great Hall of the People in Beijing on Thursday to welcome US President Donald Trump, who is on a state visit to China. YAN YAN / XINHUA

China, US set out new vision for ties

Building constructive bilateral relations of strategic stability agreed to at Beijing summit

By **CAO DESHENG** and **ZHANG YUNBI**

China and the United States will work toward building a constructive bilateral relationship of strategic stability, a new vision that President Xi Jinping and visiting US President Donald Trump agreed was how the world's two largest economies should handle their relations.

The two leaders on Friday met for tea at the Zhongnanhai compound, which Xi said is the place where the Chinese leaders work and live, "including myself".

The compound used to be part of the imperial garden, and there is a lot of history here, Xi said, adding that one of the trees he and Trump admired during their walk is 490 years old.

Xi said he would send the seeds of the Chinese roses they saw in the garden to Trump as a gift.

During their summit on Thursday at the Great Hall of the People in the Chinese capital, Xi said that China is committed to the steady, sound and sustainable development of China-US relations.

The new vision will provide strategic guidance for China-US relations over the next three years and beyond, and should be welcomed by the people of both countries and the international community, he said.

Xi said that "constructive strategic stability" means positive stability with cooperation as the mainstay, sound stability with moderate competition, constant stability with manageable differences, and enduring stability with promises of peace.

Building a constructive China-US relationship of strategic stability should not be a mere slogan, but concrete action taken by both sides toward the same goal, he added.

Xi expressed his readiness to work with Trump to set the course and steer the giant ship of China-US relations, in order to make 2026 a historic and landmark year that opens a new chapter in bilateral ties.

He also urged the US to handle the Taiwan question with extra caution, saying that it is the most important issue in China-US relations.

He emphasized that if it is handled properly, the bilateral relationship will enjoy overall stability. Otherwise, the two countries will have clashes and even conflicts, putting the entire relationship in great jeopardy, he said.

Xi also called on both countries to make better use of communication channels in the political, diplomatic and military-to-military fields, and expand exchanges and cooperation in areas such as the economy and trade, health, agriculture, tourism, people-to-people ties and law enforcement.

Trump called Xi "a great leader" and China "a great country", saying that he has tremendous respect for the Chinese president and the Chinese people.

Noting that the meeting between Xi and himself was the biggest summit the world was watching, Trump said he will work together with Xi to strengthen communication and cooperation, properly handle differences, make bilateral relations better than ever and embrace a "fantastic" future.

He said that the US and China are the most important and most powerful countries in the world. Together they can do a lot of big and good things for the two countries and the world, Trump said.

Su Xiaohui, an associate research fellow at the China Institute of International Studies, said that the Sino-US summit once again served as a testament to the pivotal role of head-of-state diplomacy, and showed the remarkable importance both countries attach to bilateral relations.

The new vision of building a constructive relationship of strategic stability is the latest reminder of China's proactive approach in shaping its ties with the US, she said.

Diao Daming, professor with Renmin University of China, said the new vision could usher in a new phase in China-US relations and help the two nations explore the right way to get along with each other in the new era.

Diao pointed out that bilateral ties are expected to remain generally stable for a period of time if the US manages to carry forward and keep endorsing this new vision as a bilateral consensus.

Su said that both countries shared a need for strategic stability.

"Constructive strategic stability does not mean that China and the US have no differences. Given the different national conditions of the two countries, differences are inevitable," Su said.

"However, when it comes to managing these differences and maintaining strategic stability, both sides need to work together toward the same goal. This is a test of wisdom for both nations."

Diao said that taking cooperation as the mainstay of the relationship means that although both sides have their own economic and trade interests, the relationship is generally mutually beneficial.

"We believe that competition in these areas should remain within reasonable bounds. The competition should be healthy, allowing both sides to achieve development while supporting each other, instead of a life-and-death struggle or a battle for victory," he said.

Seeking "sound stability with moderate competition" means the entire landscape of China-US relations should not be defined by "strategic competition", Diao said.

"In recent years, bilateral relations have remained generally stable and avoided a free fall. The next step should be to build on this progress," he added.

Meanwhile, the Chinese Foreign Ministry reiterated its position on the Iran situation in a press release on Friday. The statement was released after the two heads of state exchanged their views on major international and regional issues, including the situation in the Middle East, during the summit.

The ministry's spokesperson said that finding an early way out of the conflict serves the interests of both the US and Iran, as well as countries in the region and the rest of the world.

China always believes that dialogue and negotiation are the right way forward, and the use of force is a dead end, the spokesperson said.

It is important to reach a comprehensive and lasting ceasefire as soon as possible, enable peace and stability to return to the Middle East and Gulf region at an early date, and lay the foundation for building a sustainable security architecture for the region, the spokesperson added.

Heritage site visit adds another dimension to dialogue

By **MO JINGXI**
mojingxi@chinadaily.com.cn

The more than 600-year-old Temple of Heaven in Beijing provided a symbolic setting on Thursday for President Xi Jinping and US President Donald Trump as they posed for photos at the site after their closely watched talks earlier in the day.

The visit to the UNESCO World Heritage site added a cultural dimension to the summit between the leaders of the world's two largest economies.

Built in 1420 during the Ming Dynasty (1368-1644), the architectural marvel welcomed the two leaders on an early summer afternoon, as ancient cypresses stood in quiet grace and a gentle breeze refreshed the air.

Xi greeted Trump outside the Hall of Prayer for Good Harvests, the Temple of Heaven's iconic, triple-eaved, blue-tiled landmark.

The two presidents walked up the steps and entered the hall, where they viewed its architectural features, from the precise fittings of its mortise-and-tenon joints and interlocking wooden brackets to the seamless integration of astronomical calendar concepts with its structure.

In the hall, they appreciated the concept of harmony among all things and respect for the law of nature.

Xi noted that in 2017, he and Trump toured the Palace Museum along Beijing's Central Axis.

The Temple of Heaven dates from the same period as the Palace Museum and embodies the idea that Heaven is round and Earth is square, reflecting the view of the universe and guiding philosophy of the Chinese people, he said.

Xi told Trump that ancient Chinese rulers would hold prayer ceremonies at the site for prosperity of the nation, happiness of the people and favorable weather for good harvests. It embodies the traditional Chinese ethos that people are the foundation of a country and only when the people lead a good life can the country thrive, he said.

SINO-US SUMMIT

Xi: As partners, China and US can help each other succeed

Nations 'must make it work' to advance global well-being, he says

By ZHAO JIA
zhaojia@chinadaily.com.cn

Left: President Xi Jinping addresses a banquet held on Thursday to welcome US President Donald Trump at the Great Hall of the People in Beijing. LI XIANG / XINHUA **Right:** US President Donald Trump makes a speech at the welcoming banquet on Thursday in Beijing. BRENDAN SMIALOWSKI / AFP

Achieving the great rejuvenation of the Chinese nation and making America great again can go hand in hand, President Xi Jinping said on Thursday, adding that China and the United States can help each other succeed and advance the well-being of the whole world.

Xi made the remarks when delivering a toast at a welcoming banquet hosted at the Great Hall of the People in Beijing in honor of visiting US President Donald Trump.

As this year marks the start of China's 15th Five-Year Plan (2026-30) for economic and social development, Xi said that over 1.4 billion Chinese people, drawing on the rich heritage of the nation's more than 5,000-year-old civilization, are advancing Chinese modernization on all fronts through high-quality development.

He noted that this year marks the 250th anniversary of US independence, and over 300 million people in the US are reinvigorating the spirit of patriotism, innovation and enterprise, embarking on a new journey for the development of their country.

"The peoples of China and the US are both great peoples," Xi said.

Looking back on the history of China-US relations, Xi emphasized that 55 years ago, the two countries engaged in Ping-Pong Diplomacy. "The door that had remained frozen for over 20 years was opened," he said, describing that diplomatic endeavor as a milestone in contemporary international relations.

Since then, through numerous examples of mutual openness and cooperation, China and the US have continuously written tales of friendship, he added.

Under the new circumstances, Xi said that he and Trump have held multiple meetings and phone calls, working to maintain the overall stability of China-US relations.

He said they both believe that the China-US relationship is "the most important bilateral relationship in the world", and that the two countries "must make it work and never mess it up".

"Both China and the US stand to gain from cooperation and lose from confrontation," Xi said, emphasizing that the two countries should be partners, not rivals.

Xi added that he and Trump have agreed to promote steady, sound and sustainable development of bilateral ties and bring more peace, prosperity and progress to the world.

Reviewing the history of China-US relations, Xi said that the key to the steady development of bilateral relations lies in whether the two sides can uphold mutual respect, peaceful coexistence and win-win cooperation.

The China-US relationship concerns the well-being of more than 1.7 billion people in both countries and affects the interests of over 8 billion people across the world, Xi noted. "Both sides should rise up to this historic responsibility and steer the giant ship of China-US relations forward steadily and in the right direction," he said.

Trump, in his toast, thanked Xi for the gracious reception accorded to him. He described the day as "fantastic" and the visit as important, adding that both sides engaged in positive and constructive conversations.

The people of the US and China share mutual appreciation and respect, and their friendship goes back a long way, Trump said.

He said the relationship between the US and China is the most consequential bilateral relationship in the world and that, together, the two countries have the opportunity to create a better future for the world.

Business leaders from the United States, including Tim Cook (left) of Apple and Jensen Huang (second from left) of Nvidia, arrive on Thursday at the Great Hall of the People in Beijing to attend a group meeting with Premier Li Qiang. WANG ZHUANGFEI / CHINA DAILY

Country to open door wider to foreign businesses

By CAO DESHENG
caodesheng@chinadaily.com.cn

President Xi Jinping said on Thursday that China will open its door wider to the world, and it welcomes more mutually beneficial cooperation with the United States.

Xi made the remarks when meeting with US entrepreneurs accompanying US President Donald Trump on his state visit to China. The meeting took place during talks between Xi and Trump at the Great Hall of the People in Beijing.

Trump asked each of the leaders to present themselves to Xi, saying that he encourages them to expand their cooperation with China.

Xi noted that US enterprises are deeply involved in China's reform and opening-up, and both sides benefit from this engagement.

He said that US companies will have even broader prospects in China going forward.

The business leaders accompanying Trump include Chief Executive Officer of Tesla and SpaceX Elon Musk, Apple CEO Tim Cook, Nvidia CEO Jensen Huang, BlackRock CEO Larry Fink, Boeing CEO Kelly Ortberg and Goldman Sachs CEO David Solomon, among others.

On Thursday afternoon, Premier Li Qiang also met with the US entrepreneurs. He emphasized that a stable and predictable economic and trade relationship between China and the US serves the interests of both countries and the world.

Li said that amid growing instability and uncertainty in the current international situation, it is of great significance for both countries to maintain open and unimpeded dialogue and communication to sustain a stable and healthy bilateral relationship, as this injects certainty and positive energy into global peace and development.

Noting that the economic and trade cooperation between China and the US is large scale, Li said that strengthening cooperation can promote mutual benefit and win-win outcomes and contribute to global economic growth.

As the world's two largest economies, he said, China and the US should work together to lead in promoting open cooperation, manage their differences properly and maintain their economic and trade relationship, serving as a stabilizing and constructive force in the world.

A Chinese economy with steady growth will provide more opportunities for enterprises from all countries, the premier said.

Li highlighted the prominent feature of the Chinese market in terms of scale, growth and stability, saying that new demands are being rapidly unleashed and the new drivers of growth are being strengthened, leading to sustained and positive momentum for economic growth.

The nation welcomes more foreign enterprises to explore the Chinese market and share in the development opportunities, he said.

The premier expressed the Chinese government's unwavering commitment to upholding a stable and open policy environment, and said that China will continue to expand high-standard opening-up, provide high-quality services to foreign enterprises and improve policies.

He expressed the hope that more US enterprises will continue to expand their presence in the Chinese market, strengthen the bond of mutually beneficial China-US cooperation and serve as a bridge to promote communication and dialogue between the two countries, and help US people from all walks of life view China's development more objectively and rationally.

The US business executives emphasized the critical importance of US-China relations, saying that the successful meeting between the leaders of the two countries has injected new momentum into US-China economic and trade cooperation.

The US business community is optimistic about China's development prospects and positively views China's ongoing efforts to advance high-standard opening-up and create a world-class business environment, they said, adding that they are willing to expand cooperation with China and make greater efforts to enhance mutual understanding and cooperation between the two countries.

New vision of stability guiding relationship

WORLD WATCH
By Anthony Moretti

What people all over the globe want to see during this state visit is the identification of areas of cooperation that will advance bilateral stability between the two nations and boost global peace prospects.

The smiles that could be seen when United States President Donald Trump arrived in Beijing on Wednesday for a state visit were again on display hours later when he met with President Xi Jinping.

The world wants China and the US to be partners. Therefore, what people all over the globe want to see during this state visit is the identification of areas of cooperation that will advance bilateral stability between the two nations and boost global peace prospects. After the meeting, there is every reason to believe that such a framework is being created.

At one point, the Chinese president said that the two countries should work together to make 2026 "a historic and landmark year" for China-US relations.

Chinese officials have consistently noted that ideas such as mutual respect and win-win cooperation are essential ingredients of diplomacy in the modern world. The global community will respond positively knowing that respect was regularly on display during the state visit.

China has shown time and time again in recent years that it is committed to stable, healthy and sustainable China-US relations. Due to the "strategic guidance" that President Xi said both presidents could offer their governments and other officials, there is more reassurance.

This is exactly what the global community wanted to see: China and the US creating the necessary structure as they have agreed to work toward building a bilateral relationship of "constructive strategic stability" to make the world a better place.

As Xi said, the "constructive strategic stability" should be positive stability with cooperation as the mainstay, sound stability with moderate competition, constant stability with manageable differences, and enduring stability with promises of peace.

Such a structure is crucial at a time when the world is facing fragmentation, unilateralism, tensions and even wars.

The foundation for that structure? Willingness for cooperation; competition that is managed creatively and not destructively; an understanding that differences must be discussed openly; and a firm commitment to peace.

Similarities, not differences, should define the bilateral relationship and allow for a brighter future. Moving forward, it is incumbent on both governments to consistently deliver a message that as major powers, they are determined to be positive stewards for the world for this generation and future generations.

President Trump said that he expects a positive future for China-US relations as well. The global community will breathe easier if it is convinced that the two countries can work toward closer cooperation and more commitments in resolving differences, which will benefit bilateral relations and contribute to the stability of the world at large.

This state visit, if it remains on its trajectory, could very well be remembered for giving people the hope that new vision of constructive strategic stability will provide well-needed guidance for bilateral relations and the well-being of the international community.

While the atmosphere in Beijing was positive on Thursday, concrete results were expected to follow as the state visit continues.

It is important that the two sides first work through equal-footed consultations to bridge their differences and find more fields of common interest. As the Chinese president said in a meeting with US business leaders accompanying Trump, US businesses have been deeply involved in China's reform and opening-up, which benefits both sides. He promised that China's opening-up will be deepened, and China welcomes business cooperation from the US side on the basis of mutual benefit.

Moreover, what might a "historic and landmark year" look like? Imagine China and the US creating an environment in which they unceasingly work together to tackle the world's most challenging problems: global unrest, climate change, food insecurity, the potential for improper use of artificial intelligence, income inequality, the next world health crisis, barriers to free trade and more. Granted the two presidents will not find solutions to all of those issues in just two days, but they can — and so far have — set the right tone. Sustaining the positive momentum displayed at Thursday's meeting in Beijing will be critical. The world is eager to see that it does.

As always, the open hand of friendship prevails over confrontation and estrangement.

Summit: Temple of Heaven visit continues a tradition in diplomacy

From page 1

Xi said the Communist Party of China has inherited and carried forward the people-centered philosophy rooted in Chinese civilization, and has always adhered to its fundamental commitment of serving the people wholeheartedly, thereby gaining the firm support and heartfelt endorsement of the people.

Trump said he still has vivid memories of his 2017 visit to the Palace Museum.

The Temple of Heaven, which has stood magnificently for more than six centuries, showcases the fine art of classical Chinese architecture as well as the splendid and profound traditional culture, he said.

"It's great. Great place. Incredible. China is beautiful," Trump said.
