At Jin's restaurants, each fish, weighing about 1 kilogram, receives exactly 108 cuts.

Only a highly skilled chef can handle such precision.

Because the dish demands such advanced knife skills, it is rarely made at home and when it is, it is typically reserved for family banquets.

Nowadays, it is a common sight on New Year's Eve dinner tables in hotels and restaurants, said Jin.

In Suzhou, Songhelou remains the top destination for authentic squirrel fish — after all, it was there that the Emperor Qianlong first tasted it.

Last year, the brand opened a branch in London, swapping the traditional mandarin fish for local sea bass — yet the dish still received an overwhelmingly warm reception from the city's cosmopolitan diners.

As the years go by, Chinese chefs continue to adapt the dish, using different fish, tweaking the sauce and adding unique twists.

Today, squirrel fish has earned international fame. It appears on menus in Chinese restaurants globally, celebrated for its stunning presentation and unforgettable flavor.

COMMENT

Editorials

Real issue is some developed economies' ostrich approach to self-made vulnerabilities

France is reportedly considering proposing a video dialogue between the G7 members and China with the aim of addressing "global trade imbalances".

During a G7 finance ministers' meeting last month, French Finance Minister Roland Lescure said France wants to move away from "finger-pointing" and engage constructively with all partners, including China, to resolve trade-related issues.

Although framed as a "global" concern, the "finger-pointing" that accompanies the complaints of a "trade imbalance" voiced by some developed economies is directed primarily at China. Ironically, while such a mindset has become increasingly apparent among some European Union politicians, they strongly oppose Washington's tendency to blame the EU for "exploiting" the United States through its trade surplus. The EU has dismissed the US' justification and threats as absurd. Yet it is the same group of EU politicians who are now trying to copy the US playbook and apply it to the EU's own dealings with China.

Against this backdrop, the proposed dialogue to be held before the G7 summit scheduled for June 15-17 in Evian-les-Bains, France, may provide an opportunity to engage in discussions to avoid harmful tit-for-tat "punishment" practices, demonstrating that trade disputes are best managed through constructive dialogue.

Yet if the purpose of such a dialogue is to address a so-called "trade imbalance" with China, it is starting from a false premise.

China itself records deficits with many other economies such as the Republic of Korea and Australia. The notion that all economies can simultaneously enjoy trade surpluses is mathematically impossible. China's trade surplus with some G7 economies and the EU is not the outcome of its policy. It is largely the result of industrial specialization and the structure of global supply chains.

For years, multinational corporations designed products in the EU and the US, financed them in London, marketed them in Paris and assembled them in China. When those products were shipped abroad from Chinese ports, they appeared in customs statistics as Chinese exports. Yet a substantial portion of the profits goes elsewhere.

Also, many developed economies have spent years restricting exports of advanced technologies to China while simultaneously complaining about bilateral deficits. One cannot block sales in sectors where one enjoys a competitive advantage and then lament insufficient exports. If some G7 members and the EU genuinely seek to reduce their trade deficit with China, relaxing certain export controls would likely achieve more than employing protectionist measures.

China-EU trade remains among the world's largest commercial partnerships, exceeding $820 billion in goods trade last year. Meanwhile, foreign investment in China has shown resilience, with thousands of European companies continuing to expand operations in the Chinese market. Their behavior suggests a more nuanced reality than the political rhetoric often implies. Strong European companies actively seek cooperation with China; it is only some weaker ones that attribute their loss of market share to politicized reasons.

Germany, France, the United Kingdom, Italy and Canada maintain extensive and generally stable commercial relationships with China. Yet when the same issues are elevated to the level of the G7 or the EU, they are frequently recast as "existential threats". That says less about economics than politics. The more immediate issue that advanced economies need to address is inflation driven by energy-market disruptions caused by the Middle East conflict. Higher energy prices are squeezing consumers and undermining growth. If the G7 members and the EU want to address their problems, they should spend less time scrutinizing China's trade statistics and more time examining the sources of their vulnerabilities.

This highlights the larger problem: the G7 increasingly appears less interested in discussing economics than in framing economics through the lens of geopolitics. The world's major challenges today include anemic economic growth, debt distress, climate financing, technological disruption and supply-chain resilience. These are global concerns requiring global solutions. The greatest threat to the international trading system stems from the resurgence of unilateralism and protectionism in some major developed economies.

If the G7 wants a productive conversation with China, it should focus on the real questions, including whether the world's advanced economies are prepared to defend the principles of openness and globalization that helped create their own prosperity in the first place.

US trying to rope allies into suppression

In yet another move to crack down on China's high-tech industries, the United States on Monday groundlessly added Chinese e-commerce giant Alibaba, along with Baidu, BYD, and some other Chinese tech companies, to a list of companies it alleges are aiding China's military.

Meanwhile, to draw its allies deeper into a "de-risking" strategy against China, the US administration has also urged NATO members to allocate defense spending toward efforts to replace components from Chinese high-tech companies in their networks and critical infrastructure.

Joshua Young, the US State Department's China coordinator, reportedly asked officials in Brussels in May to use their defense-related funding to remove Chinese-made equipment and replace it with products from other vendors.

Under pressure from the US, nearly all NATO allies agreed last year to increase overall security spending from 2 percent to 5 percent of GDP by 2035. Within this target, 3.5 percent would be directed toward core defense needs, while the remaining 1.5 percent would be allocated specifically to meet Washington's demand for a larger share of transatlantic alliance expenditures. According to a NATO official, this 1.5 percent can be used for defending networks, including replacing vendors.

By urging NATO countries to do that, Washington aims to push its transatlantic allies to reduce reliance on China in key sectors.

The US' bossy attitude toward its allies in the critical field of defense not only makes a mockery of the notion of Brussels having strategic autonomy, it also appears to serve the selfish aims of laying the groundwork for US companies to fill the equipment gap.

Under pressure from the US, some politicians of the European Union are already mulling plans to revise the bloc's Cybersecurity Act to restrict the use of Chinese equipment across various sectors.

Excluding Chinese high-tech enterprises will not help the concerned economies achieve the so-called "security" they seek. Instead, it will severely damage their image as an open market and markedly undermine the confidence of businesses from various countries to invest in the economies.

China will also be left with no choice but to take necessary measures to resolutely safeguard the legitimate rights and interests of Chinese businesses.

Moreover, forcibly removing high-quality and secure Chinese telecommunications equipment will inevitably result in massive economic losses and severely hinder the economies' digital competitiveness.

A joint study by the China Chamber of Commerce to the EU and KPMG in May predicts that the forced replacement of Chinese suppliers across 18 critical sectors would cost the EU 367.8 billion euros ($432.83 billion) between 2026 and 2030. The EU would have to replace hardware and write down assets, besides contending with lower efficiency and delayed development of digital networks in Europe.

Thus, some EU members, such as Germany and Spain, have stood up to oppose the EU plan to ban Chinese suppliers from telecommunications networks, with both governments warning that a bloc-wide ban would invite retaliation from China and hugely inflate the cost of Europe's AI infrastructure drive. The dissenting voices highlight the erroneous and unsustainable nature of the EU's proposed China-targeted policy and the US' demands.

In fact, Chinese high-tech companies have always demonstrated openness, transparency and efficiency in the global market. High-tech enterprises, such as Huawei, have earned the trust of customers worldwide through technological innovation and high-quality services. The so-called "national security risks" alleged by the US and some of its allies stem entirely from their own Cold War zero-sum mentality and fear of the rise of Chinese high-tech prowess. The US attempt to pressure NATO allies into using defense funds to replace Chinese equipment will not only waste resources but also severely harm the national interests of its allies.

The US allies should uphold rationality by resisting all baseless discrimination and exclusion, as the prosperity and development of the global economy require cooperation and mutual benefit, not the obstruction of suppression and unilateralism.

Dialogue on classics offers timeless wisdom for today

The ongoing second World Conference of Classics in Athens, Greece, serves as a reminder that comparisons between civilizations are meaningful. Confucianism and ancient Greek philosophy developed separately, but during a period — from about 800 BC to 200 BC — that was marked by major intellectual transformations across the world. Confucius, Socrates, Plato and Aristotle sought to answer the same questions: how to live, how to know, how to organize and govern societies, and how to cultivate virtue.

The comparison is best explained through one striking image. Thales of Miletus, often regarded as the first philosopher in the Greek tradition, saw water as the first principle of all things. Confucian thought also turned repeatedly to water, though not as an object of cosmological explanation, but as a moral image of goodness, nourishment and non-contention. The contrast is revealing. Greek philosophy often began in wonder; Confucian thought tended to turn nature into an ethical teacher. Together, they show two ways in which people have learned from the world.

There is also a difference in the ancient Greek and Chinese approaches to knowledge. Ancient Greek philosophy gave enduring importance to debate, logical argument and dialectical inquiry. The Socratic method helped form a tradition in which truth is pursued through argument. Confucianism, by contrast, often teaches through metaphor, analogy and moral evocation. In Mencius' parable of the *Ox Mountain Trees*, the once-lush terrain becoming barren due to the rampant cutting of trees is a reflection of human nature: goodness may be damaged by circumstances while still retaining the capacity for renewal.

In China, during the Shang (c. 16th century-11th century BC) and Zhou (c. 11th century-256 BC) dynasties, ritual, kinship and political hierarchy were closely bound together. Morality was understood in relation to family and society, and the state could be imagined as an extension of familial order. In ancient Greece, by contrast, the polis, or city-states, became the space in which human excellence could be realized through civic participation. Aristotle's famous statement that man is by nature a political animal rests upon this worldview.

For Socrates, virtue was closely tied to knowledge; for Aristotle, it meant excellence of character and intellect, cultivated through the disciplined exercise of body and mind. Confucian virtue, meanwhile, was inseparable from one's roles within the family and society. Aristotle's "golden mean" is embedded in a theory of excellence, while Confucian balance is deeply rooted in harmony among people, roles and ritual order.

In both ancient Greece and early China, poetry stood at the beginning of reflection on the world, carrying within it questions of cosmology, ethics, political order and human destiny. Epic and poetic traditions served not merely aesthetic purposes, but acted as one of the earliest vessels of thought. The Greek world preserved such questions through Homer and Hesiod, while Confucius is associated with the compilation of the *Book of Songs*, a collection of 305 poems dating from the 11th to 6th centuries BC. In both civilizations, philosophy did not emerge in opposition to poetry, but gradually unfolded from within it.

This is why the dialogue between Confucianism and ancient Greek philosophy should not be treated as a narrow academic exercise. Both traditions remind modern societies that human life cannot be reduced to material production, technology or present utility. Ancient Greek and Chinese thinkers, in different ways, understood human beings as part of a larger order — cosmic, natural, social or political. Their wisdom lies not in offering ready-made solutions, but in widening the horizon within which modern questions can be asked.

— ZHAO XU, CHINA DAILY

What They Say

Efforts needed to boost basic research capabilities

Editor's note: *As a new phase of scientific and technological revolution unfolds, global competition in basic research has intensified. Justin Yifu Lin, dean of the Institute of New Structural Economics at Peking University, spoke to ThePaper.cn about China's strengths and weaknesses in basic research, strategies to address the challenges, and the roles of the government and businesses in advancing this critical area. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China has made significant strides in many industries, and is even leading in sectors such as home appliances, shipbuilding and new energy vehicles. When a country reaches the technological frontier in any area, it should make breakthroughs on its own instead of relying on other countries for new technologies.

China has notable strengths in basic research, including a vast talent pool from its 1.4 billion population. The country produces the largest number of science, technology, engineering and mathematics graduates globally, offering immense potential for an engineering workforce. The country's system for mobilizing nationwide resources is another advantage.

However, significant challenges persist in basic research. While developed countries have built systems for nurturing a steady stream of top-tier original research talent, China hasn't established such a system, focusing instead on importing foreign technologies to catch up with other nations.

A critical challenge is the research evaluation system, which overemphasizes quantitative metrics such as paper counts and impact factors, discouraging researchers from undertaking long-term, high-risk and original research that may not yield immediate results. Reforming this assessment framework is essential as China transitions from a "follower" to a "pace-setter" in science and technology.

Assessment cycles for certain disciplines should be extended to five, 10 years or longer, with greater emphasis on peer review rather than quantitative metrics. Efforts are needed to cultivate homegrown academic leaders and involve international scholars in the review process, gradually building an international review platform.

A clear division of labor is necessary in basic research. The outputs of fundamental research, mainly academic papers, are publicly accessible. Enterprises often lack a strong incentive to invest here since they cannot exclusively benefit from their investment. Government leadership and funding are essential in this area.

Conversely, enterprises drive development work by building on basic research breakthroughs to create new products and technologies that deliver exclusive returns. Companies are strongly encouraged to invest in this area, with market forces and competition providing the required vitality.

This division of labor is not absolute. Companies, being directly in touch with market and industrial demands, can sometimes better identify areas needing basic research breakthroughs. Therefore, an in-depth collaboration between the government and companies is needed.

Currently, investment in basic research accounts for roughly 7 percent of China's total R&D spending, compared to 15 to 20 percent in most developed nations. China should gradually raise the share of its R&D expenditure on basic research to 15 to 25 percent.

With limited fiscal resources, the government needs to identify sectors that are vital to the country's economic growth and national security, including semiconductors, key materials, biomedicine, energy security and agricultural breeding, and invest in R&D in these sectors.

Stronger intellectual property protection is essential to ensure profitable returns on new product development and encourage companies to make long-term investments. Meanwhile, the government should share the risks that companies face in basic research by issuing subsidies and offering tax incentives.

Youth as torchbearers of China-DPRK relations

SHI YU / CHINA DAILY

In his signed article published in Rodong Sinmun, the official newspaper of the Democratic People's Republic of Korea (DPRK), on Monday, President Xi Jinping, who was on a state visit to the country, emphasized that the two countries should continuously enhance the well-being and friendship of the two peoples.

China and the DPRK not only enjoy geographical proximity but also share a close deep-rooted friendship, cultivated by generations of leaders from both countries. The enduring relationship between the two countries has deep roots in their socialist development and is a cherished asset for both peoples.

Exchanges between the two populations reflect this goodwill, providing public support for neighborly relations and cooperation in the new era.

The youth play a crucial role in carrying forward this legacy of friendship. Both countries have consistently prioritized youth and cultural exchanges as a cornerstone of their people-to-people cooperation.

Through youth visits, study programs and inter-school activities, a stable and enduring framework of cooperation has developed. In May, 70 Chinese students from 16 universities across China, supported by the China Scholarship Council, arrived at the Pyongyang Sunan International Airport, where they were warmly welcomed by representatives from the DPRK Ministry of Education, Kim Il Sung University, and Kim Hyong Jik University of Education.

By immersing themselves in the Korean language and culture at universities in Pyongyang, Chinese students build lasting friendships with their DPRK peers.

At the same time, DPRK students at institutions such as Jilin University and Yanbian University gain insights from China's reform and opening-up, and advancements in science and technology, which they bring back to their country.

Such exchanges foster mutual understanding and strengthen emotional affinity between the two peoples, inspiring the youth to continue the traditional China-DPRK friendship and contribute to cultural exchanges.

Eager to acquire knowledge, young people lay a solid foundation for cultural exchanges between the two countries, while the vibrant folk cultures of both nations serve as a warm and enduring bond. In October 2025, to commemorate the 80th anniversary of the founding of the Workers' Party of Korea, the Shanghai Dance Theatre presented the classic dance drama *The Eternal Wave* at the East Pyongyang Grand Theatre.

The performance, staged twice, received enthusiastic acclaim and prolonged applause from the DPRK audience. This artistic tribute not only showcased the allure of Chinese culture but also created a platform for spiritual exchange among the youth, allowing them to share sentiments and revisit shared historical memories.

China and the DPRK share cultural roots and have similar folk traditions. Festivals such as Spring Festival and Lantern Festival are celebrated with kindred customs. Song and dance, cuisine, and handicrafts also reflect shared origins. Both countries have now prioritized folk activities as a means of engagement, launching interactive events such as "Happy Chinese New Year" temple fairs, intangible cultural heritage exhibitions, and folk culture experience programs.

These initiatives revive their shared cultural heritage and strengthen emotional bonds between people.

The integration of everyday folk practices is a testament to the bond between China and the DPRK. Both cultures cherish glutinous rice delicacies and spicy flavors, with *kimchi* and *tteok* paralleling pickled cabbage and niangao in Northeast China.

These dishes have similar ingredients and cooking techniques, which evoke shared memories and a sense of festive ritual.

Dandong in Liaoning province is the largest border city between China and the DPRK, offering a vivid snapshot of their blended food cultures. The streets are lined with delicacies such as cold noodles, barbecued meat, and *tteok*. On their part, DPRK residents enjoy Chinese snacks such as *jiaozi*, *tangyuan*, and fried dough twists, making food a delicious channel for emotional exchange.

At the Shencai Gallery in Shenyang, Liaoning province, DPRK oil paintings depict the white mountains, black rivers and railways along the Yalu River, alongside scenes of hardworking people tilling the yellow earth.

Through art and aesthetics, these paintings bridge the distance between the two peoples.

There's an ancient Chinese saying that benevolence and kindness to neighbors are a nation's treasures. The emotional bond between nations is nurtured by countless warm interactions, especially among the younger generation.

Today, the friendship between youths transcends political rhetoric and grand narratives. It is reflected in the pride and connection seen in the eyes of young scholars from Yanbian University and Kim Il Sung University as they exchange thoughts on each other's papers.

It's also found in a WeChat chat window of a trading partner in Dandong, in a simple, heartfelt message: "Thanks, and long live China-DPRK friendship".

These everyday moments vividly reflect the deep emotional bond between the peoples of China and the DPRK, forged through wartime sacrifice and continuously reaffirmed through sincere, respectful interactions today.

This bond also points to a friendship meant to be passed down to future generations, which forms the foundation on which China-DPRK ties have steadily advanced, growing stronger and more resilient over time.

The cross-border visits and interactions among the younger generation are creating a deep reservoir of friendship for the future. With the youth supporting each other in friendship, the future of China-DPRK relations looks vibrant and promising.

Lu Donghong

Forget chips, real bottleneck in AI is power

As artificial intelligence continues to expand, the real contest may no longer be about who builds the smartest models, but who can power them sustainably.

For years, the global conversation around artificial intelligence has centered on chips, algorithms and computing power. But the AI boom is exposing a more fundamental reality: AI ultimately runs on electricity, not just on code.

Without abundant, reliable and affordable power, computing capacity is merely a technical promise.

The explosive growth of AI and data centers is revealing the first hard physical constraint of the digital age — not capital, not software, but the capacity of energy systems.

This shift is quietly redefining national competitiveness. The International Energy Agency has warned that global electricity demand is entering a new phase of rapid expansion, increasingly driven by AI, cloud computing and data centers rather than traditional industrial growth.

Similarly, the World Economic Forum notes that access to power is becoming a decisive factor in the location of digital infrastructure.

In other words, the AI race is turning from a competition over algorithms and semiconductors into a contest over electricity systems.

This transition is producing sharply different outcomes across governance models. In parts of the United States, Big Tech's AI expansion is colliding with local power systems.

Massive data centers are coming up near communities that were never designed to absorb such concentrated electricity demand, leading to increased costs of upgrading grids and supporting infrastructure.

These costs often spill over to households and small businesses through electricity pricing mechanisms, resulting in higher energy bills and local resistance in several regions.

The problem extends beyond isolated disputes, reflecting a structural tension within market-led energy systems when faced with dense digital loads.

The gains from computing expansion are often concentrated within technology firms, while the infrastructure burden is distributed across society.

What begins as an AI story can quickly become a question of affordability, equity and public legitimacy.

China is attempting a different response. The 2026 Government Work Report emphasizes improving national coordination of computing power, and building hyper-scale intelligent computing clusters.

Computing infrastructure is no longer treated as a stand-alone technology sector, but is planned alongside power generation, grid capacity, transmission networks and long-term energy security.

This is important because electricity is increasingly becoming a strategic productive force rather than just an industrial input. In 2025, China's total electricity consumption surpassed 10 trillion kilowatt-hours, making it the first major economy to cross that threshold.

Meanwhile, power demand from internet data services is expanding dramatically, while electricity consumption in high-tech manufacturing continues to outpace traditional industries. These trends reflect a broader transformation.

Electricity is no longer only powering factories and households, but is also becoming the hidden foundation beneath digital expansion, industrial upgrading and AI deployment.

Seen through this lens, China's 5 trillion yuan ($739 billion) investment in grid infrastructure during the 15th Five-Year Plan (2026-30) is more than conventional stimulus spending. It amounts to a systemic redesign for the computing age.

Ultra-high-voltage transmission projects are increasing the ability to move electricity across regions, allowing energy resources to be allocated on a much larger scale.

That, in turn, is gradually reshaping the geography of computing itself.

As transmission improves, data infrastructure can migrate toward energy-rich regions rather than remaining confined to traditional urban technology hubs.

At the same time, the expansion of local distribution grids, microgrids and energy storage systems aims to absorb growing digital demand without ignoring residential consumption or smaller businesses.

China's broader ambition — to meet most new electricity demand with renewable energy before 2030 — reflects its efforts to expand computing power while keeping carbon and system risks under control.

The underlying challenge is not unique to China. It is global. Electricity is rapidly emerging as a new frontier of geopolitical competition. Energy infrastructure is increasingly vulnerable amid geopolitical tensions and regional conflicts, and energy pricing is frequently distorted by political shocks.

The line separating energy security from digital security is becoming harder to define.

In such an environment, power systems are no longer simply development tools. They have become components of national strategic capacity.

That reality has important implications for the future of AI competition. The decisive question may no longer be who possesses the most advanced chips or the largest models.

It may be who can build an electricity system capable of supporting digital growth without triggering social backlash, grid instability or unsustainable carbon costs.

The AI age is revealing a deeper truth often overlooked in technology discourse: technological breakthroughs require a physical foundation that is not only powerful, but also resilient, equitable and sustainable.

China's emphasis on integrating computing and electricity is ultimately an attempt to answer a larger governance question: how to pursue technological transformation without deepening social strains, and how to sustain rapid innovation without sacrificing systemic stability. It is a test of state capacity in the age of artificial intelligence.

Shen Zhixiong and Shao Jingjing

Asia wants peace and prosperity, not confrontation

At the recent 23rd Shangri-La Dialogue, a Chinese People's Liberation Army expert delegation shared China's perspectives on global dynamics and regional security. Their insights resonated with defense officials and academics alike. Most Asian countries desire for regional peace through dialogue and consultation, and expect China to be an anchor of stability in a turbulent world.

During their meeting last month, the heads of state of China and the United States agreed to build a constructive bilateral relationship of strategic stability, providing strategic guidance for China-US relations over the next three years and beyond. This agreement has been welcomed by people of both countries and the global community. Its positive impact was evident at this year's Shangri-La Dialogue.

US Defense Secretary Pete Hegseth's speech at the dialogue marked a shift from last year. While he continued to urge regional allies and partners to increase defense spending, Hegseth adopted a cautious tone on China-US ties and made no mention of the Taiwan region whatsoever in the speech.

In response, the head of the Chinese delegation emphasized that strategic stability underpins global security, and the Asia-Pacific should not become an arena for geopolitical rivalry. No country should pursue absolute security at the expense of others because this approach ultimately leaves everyone vulnerable. China and the US, in particular, must meet halfway, demonstrate strategic resolve through concrete actions, and foster healthy, stable and sustainable relations between the two countries and between the Chinese and the US military.

Conversations with defense officials from various countries revealed a widespread expectation for China and the US to uphold strategic stability and transform their leaders' consensus into tangible results.

Amid challenges from hegemonism and the threat of militarism, it is essential to recognize that Asia's security should be safeguarded by Asian countries, not by others.

Singaporean Defense Minister Chan Chun Sing expressed satisfaction with the positive outcome of the China-US summit. In fact, the ripple effects generated by the sound China-US engagement helped foster a less confrontational atmosphere at the dialogue, where most speakers voiced concerns over global and regional security risks, and called for proactive cooperation among major countries to ensure regional security, stability and prosperity.

However, there were a few discordant notes as well. Japanese Defense Minister Shinjiro Koizumi defended Japan's military buildup and Philippine Defense Secretary Gilberto Teodoro Jr stirred tensions over the South China Sea.

At a time when the "new militarism" poses mounting threats to regional security, Japanese delegates seized on Washington's call for allies to shoulder greater defense burdens, and depicted Japan as an active contributor to defense cooperation.

Koizumi attempted to put a spin on Japan's militaristic expansion by saying it should not be "labeled 'new militarism'". But he evaded questions about Japan's historical accountability and whether the country would apologize for its aggression during World War II.

Teodoro, meanwhile, portrayed the Philippines as a "victim", but dodged questions about Manila saying one thing and doing another over the South China Sea issue, even hinting at pulling out of negotiations on the Code of Conduct in the South China Sea.

Japan and the Philippines have ramped up coordination over the South China Sea and East China Sea issues. They recently issued a joint statement announcing their decision to launch "formal negotiations to delimit the maritime boundary of the exclusive economic zone and the continental shelf between the two countries". Such moves create confrontations and stoke tensions. They risk destabilizing the region and eroding the regional cooperation mechanism with the Association of Southeast Asian Nations at the center.

Any attempt to transplant extra-regional bloc confrontation into the Asia-Pacific runs counter to the shared aspiration of regional countries for peace, development and cooperation. Eng Kok Thay, a secretary of state of Cambodia's Council of Ministers, said Japan's accelerating military buildup deserves scrutiny, while a Malaysian think tank expert cautioned that ganging up under the pretext of "strengthening security" will heighten security anxieties in the region.

Amid challenges from hegemonism and the threat of militarism, it is essential to recognize that Asia's security should be safeguarded by Asian countries, not by others. The Asian security model, which emphasizes sharing weal and woe, seeking common ground while shelving differences, and prioritizing dialogue and consultation, was put forward at the Central Conference on Work Related to Neighboring Countries in April 2025.

The model is a distillation of Asia's decades-long experience in peaceful development. It rejects power politics and unilateralism, opposes the approach of enhancing one nation's security at the expense of others, and advocates common security through equal consultations and sustainable security via win-win cooperation. The logic gained broad resonance at this year's Shangri-La Dialogue.

As an ancient Chinese adage goes, "A single person struggles to rise alone, yet a crowd marches forward with ease". From the Treaty of Amity and Cooperation in Southeast Asia to negotiations on the South China Sea Code of Conduct, Asian countries have demonstrated that regional security can be effectively achieved through equal consultations and mutually beneficial cooperation without the need for military alliances.

Against the backdrop of global governance challenges, Asian countries should stand united, uphold the Asian security model, and embrace the trend of peace, development and win-win cooperation to jointly build a brighter future for the region.

GLOBAL VIEWS

LI MIN / CHINA DAILY

HE FANGYING

For the public good

The virtuous friendship of the classical era offers an ethical foundation for cooperation among nations, peoples and civilizations

The Second World Conference of Classics was held on Tuesday and Wednesday. More than 200 classical scholars from over 18 countries gathered in Athens, the cradle of Western civilization. With one of the sub-forums focusing on "Friendship and Community: The Ethical Community in the Transition from Ancient to Modern Times", the conference reflected on why we should return to the ancient ideals of friendship and community in an age of atomization, fragmentation and loneliness.

Looking back to the classical traditions of both East and West, we can clearly trace the intellectual trajectory by which personal affection gradually became the foundation of the civic order. The ancient Greek word *philia* had an exceptionally broad range of meanings: individual friendship, kinship ties, guest-host relations, military alliances and even erotic love. Its semantic reach far exceeds what we mean by "friendship" today. Not only is it difficult to find an exact equivalent in Chinese, but even in modern Western languages — friendship in English or *amitié* in French — the full resonance of *philia* is lost. In Modern Greek, the word *philia* has seen its meaning drastically narrowed due to profound grammatical and historical changes: from "civic friendship" as the bedrock of polis order, through the medieval period, when *agapi* (selfless love) gradually displaced *philia* as the core of religious ethics. Subsequently, *philia* was secularized into mere personal sentiment between friends, until in modern society it shrank into a private emotional bond between individuals.

Tracing this evolution of friendship in Western intellectual history reveals why revisiting classical friendship today is, first and foremost, a direct response to the modern "crisis of connection". Modernity's triumph is the liberation of the individual. It shattered the shackles of traditional families, villages and guilds, granting each soul unprecedented freedom and independence. Yet the price of this liberation has been a rupture of the primordial ethical bonds between people. The logic of the market economy has turned all relationships into transactions; human interactions are increasingly governed by utility and efficiency rather than by affection and care. Digital technology has further allowed virtual socializing to replace face-to-face, heart-to-heart conversation; the click of a "like" has supplanted deep resonance between souls. The more we "connect" online, the more alone we feel in reality — and the more we long for the ancient art of companionship.

We revisit classical friendship above all because it embodies ethical wisdom that modernity cannot provide. This conference invites scholars to explore in depth the essential differences between classical friendship and what modern people understand as "friendship". In other words, modern people regard friendship as a private sentiment — a relationship based on shared tastes or mutual exchange of interests, while from the perspective of classical thought, both Eastern and Western, friendship is first and foremost a means by which a person comes to know how to live.

As Socrates said in Plato's *Lysis*: Whom you choose to befriend means what way of life you choose. Plato's student Aristotle, in turn, distinguishes three kinds of friendship: friendship based on utility, pleasure and virtue. He makes it clear that the first two kinds are accidental and perishable; only virtue friendship — in which one wishes the good of the other for the other's own sake — is founded on mutual appreciation and respect for each other's character and does not depend on any external utilitarian end. A true friend is "another self", and the process of friendship is one in which two souls sharpen each other and together pursue a life of goodness.

Almost in the same period, Confucius in the East also proposed that true friends are those who can help one cultivate virtue and expand knowledge — companions who share the same path. Friends should admonish and encourage each other, for "the superior man seeks to perfect the admirable qualities of men, and does not seek to perfect their bad qualities".

What is especially important is that friendship in classical times, in both the East and the West, possessed a distinct public character. Aristotle wrote in his *Nicomachean Ethics:* "Friendship seems too to hold states together, and lawgivers to care more for it than for justice." It was a statement that remains thought-provoking to this day. Justice can only demarcate the boundaries of rights between people and resolve conflicts that have already arisen; friendship, however, can enable people to voluntarily consider others and actively care for the common good, preventing conflicts at their source. A society without friendship, even if it possesses the most perfect legal system, is nothing more than a cold alliance of interests, liable to disintegrate at any moment.

To revisit classical friendship is ultimately to seek an ethical foundation for building a community with a shared future for humanity. The world today is facing grave challenges including climate change, public health crises, wealth disparity and civilizational clashes. No single country can meet these challenges alone; they require the cooperation of all humanity. Yet the basis of modern international relations is too often interest and power, and alliances built on such interests are fragile and unstable. When interests collide, cooperation turns into confrontation.

Classical friendship, however, champions mutual respect, mutual flourishing and the pursuit of the common good — thus offering a deeper ethical foundation for cooperation among nations, peoples and civilizations. It reminds us that human beings are not rivals locked in endless competition, but rather a community with a shared future, bound together in weal and woe, for friendship is humanity's oldest common language, and its strongest force for unity.

The stone columns of the Athenian Acropolis have stood for more than 2,000 years, witnessing the rise and fall of countless civilizations. Today, as scholars from around the world gather once more upon this sacred ground to revisit the ancient question of friendship, they come not to retreat into the past, but to reach toward the future. In an age of deepening uncertainty, classical friendship shines as a beacon — lighting the way out of our atomized solitude and toward the rebuilding of human solidarity. The Second World Conference of Classics has convened precisely to let this ancient light burn anew in the 21st century, casting its glow upon the path of humanity yet to come.

Let us conclude by recalling the words of the Roman philosopher Cicero from 2,000 years ago: "But I hold this first: that friendship cannot exist except among the virtuous."

Moving tradition

Reinterpreting the visual code of Chinese opera through design can reconnect it with contemporary society

Traditional Chinese opera is one of the most sophisticated art forms in Chinese culture. Its value lies not only in the preservation of scripts, repertoires and stage traditions, but also in the rich visual language it has accumulated over centuries — costumes, colors, facial patterns, headpieces, gestures, rhythm and spatial order.

In today's cultural context, the challenge is no longer simply how to protect traditional opera as an inherited art form, but how to allow it to enter contemporary life, urban space and international communication. Cultural heritage can retain vitality only when it continues to generate new meanings in the present. Design offers one possible path. Through design, the visual codes of traditional opera can be translated into forms that are accessible to younger generations, urban audiences and global viewers.

For a long time, traditional Chinese opera has been understood mainly within the framework of intangible cultural heritage. This framework has played an important role in documentation, preservation, transmission and professional training. Yet if heritage is seen mainly as something to be protected, it may gradually become distant from contemporary lifestyles. It may be respected, but not necessarily embraced; admired, but not necessarily understood by new audiences.

The creative transformation and innovative development of traditional Chinese culture require a broader view. Tradition should not only be preserved in its original form, but also activated as a cultural resource. This does not mean simplifying tradition into decorative symbols. Rather, it means understanding the internal logic of traditional culture and translating it into contemporary visual systems, design practices and public experiences.

Traditional Chinese opera provides a particularly rich case for such transformation. It is not merely a performing art based on singing, recitation, acting and martial movement. It is also a complete visual culture. The colors of costumes, the symbolic meanings of facial makeup, the structure of headwear, the rhythm of movement and the arrangement of stage space together form a highly coded aesthetic system. These codes carry cultural memory, social values, character types and emotional expression.

When these visual codes are reinterpreted through contemporary design, opera can move beyond the theater stage and enter a wider cultural field. It can appear in fashion, product design, digital media, spatial installation, urban events, public education and international cultural exchange. In this process, opera is not weakened or diluted. Instead, its cultural energy is released in new forms.

A recent design-led cultural project developed at the Beijing Institute of Fashion Technology offers one example of this approach. Rather than reproducing a traditional opera performance, the project explored how the visual and aesthetic codes of opera could be transformed into contemporary design, spatial presentation and public cultural experience. It began within an academic context, but soon attracted wider public attention and entered broader cultural exchange settings.

The significance of such a project does not lie only in one runway presentation or one exhibition. More importantly, it reveals how traditional culture can be reconnected with contemporary society through design. The body, costumes, sound, image and space become new media for cultural translation. Opera's visual language is no longer confined to the stage; it becomes part of a contemporary cultural vocabulary.

This process reflects a shift in space. Traditional opera has historically been associated with theaters, professional troupes and specific performance venues. Today, through design and public cultural projects, it can enter universities, museums, commercial spaces, urban cultural landmarks and international platforms. This spatial shift changes the way audiences encounter opera. They may not first approach it through a complete performance, but through visual experience, atmosphere, movement, color or design.

It also reflects a shift in function. Traditional opera is no longer limited to aesthetic appreciation, education or heritage display. It can participate in the shaping of urban identity, cultural branding and cross-cultural communication. For a city seeking to present both historical depth and contemporary openness, traditional culture can become an important cultural resource. It helps create a recognizable image, build emotional connection and communicate values beyond language.

At the same time, the subject of cultural transmission is also changing. In the past, the transmission of opera was mainly understood as the responsibility of performers, masters, institutions and professional inheritors. Today, designers, educators, students, media practitioners, cultural organizations, cities and international partners can all become participants in the reactivation of traditional culture. This does not replace professional inheritance. Rather, it expands the ecology of cultural transmission.

Design plays a crucial role in this expanded ecology. Good design does not simply extract motifs from tradition and place them onto contemporary products. It studies the structure, meaning and aesthetic logic of tradition, and then reorganizes them for new contexts. In the case of opera, this means moving from the surface of costumes or patterns to a deeper understanding of character, rhythm, symbolism and spatial expression.

This is why the contemporary translation of opera's visual culture must be systematic. If traditional elements are used only as fashionable symbols, they may quickly become superficial. But when design engages with the inner logic of opera, it can create new cultural forms that are both contemporary and rooted. Such work allows tradition to be seen not as a fixed archive, but as a living system capable of renewal.

The international dimension of this transformation is equally important. In cross-cultural communication, traditional culture often faces a dilemma: It is rich in meaning, but not always easy for global audiences to understand. Visual language can help bridge this gap. Costumes, colors, gestures, digital imagery and spatial design can communicate cultural atmosphere and emotional resonance before words are fully understood.

In this sense, design becomes a form of cultural translation. It does not simply explain Chinese opera to the world; it creates new conditions for the world to experience it. Through contemporary visual language, opera can become more approachable to international audiences while retaining its cultural depth. It can participate in dialogue rather than remain an object of distant appreciation.

This also gives traditional culture a new role in urban development. Cities today are not defined only by infrastructure, commerce or technology. They are also shaped by cultural experience. Public cultural projects that draw from traditional heritage can enrich urban space, strengthen cultural identity and create opportunities for international exchange. They allow heritage to become visible in everyday urban life rather than remaining confined to specialized institutions.

The future of traditional Chinese opera therefore does not lie only in keeping it on the traditional stage, although the stage remains essential. Its future also lies in enabling its visual language to travel across design, cities, media and global cultural dialogue. When opera enters new cultural spaces, it does not leave tradition behind. It carries tradition into new relationships.

Cultural confidence is not about clinging to the past. It is about allowing tradition to continue evolving in the present. A living tradition must be able to speak to contemporary society, engage younger generations and participate in global conversations. Through design, traditional Chinese opera can become not only a heritage to be protected, but also a cultural language that continues to grow.

CHINA MARVELS

KEY MILESTONES OF THE THREE GORGES PROJECT

1994 — **December** Construction of the Three Gorges Project (TGP) begins

1997 — **November** The project achieves river closure

2003 — **June, July** Impoundment begins; the two-way five-tier ship locks start trial operation; the first unit is connected to the grid

2004 — **July** The two-way five-tier ship locks open to navigation

2010 — **October** Experimental water level of the project reaches 175 m for the first time

2012 — **July** The hydropower station achieves full-load operation for the first time, with a total installed capacity of 22.5 million kW

2016 — **September** The ship lift begins trial operation

2020 — **November** TGP receives overall completion acceptance

06 THE THREE GORGES NEW WATERWAY PROJECT

The project started on June 8, 2026.

5-tier

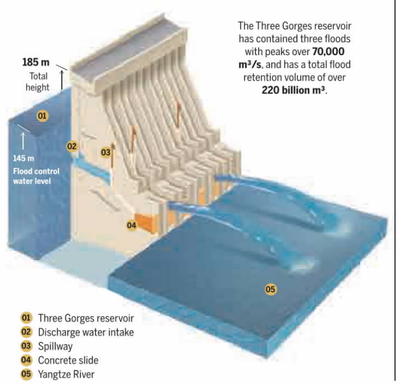
Located to the north of the existing ship locks, a new two-way five-tier ship locks will be constructed.

336 million tons

Upon completion, the annual total navigation capacity at the Three Gorges will reach 336 million tons.

(This drawing is schematic only)

The Three Gorges Project, born from China's early 20th-century dream of national strength and rejuvenation, has become the world's largest water management and hydropower project after decades of deliberation and construction. Delivering integrated benefits in flood control, power generation, navigation and water resource management, it has profoundly reshaped the economic landscape of the Yangtze River — the world's third longest river — while providing robust support for the sustained advancement of Chinese modernization.



THREE GORGES PROJECT

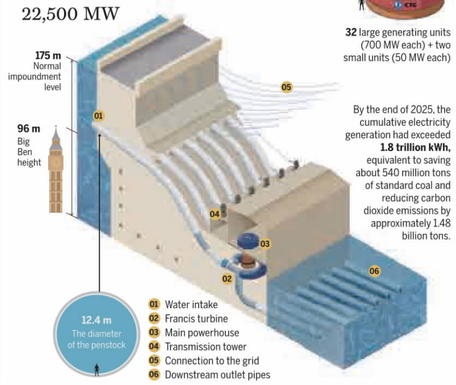
POWERING THE YANGTZE'S GOLDEN WATERWAY

01 WATER RETAINING AND SPILLWAY STRUCTURES

The primary function of the Three Gorges Project (TGP) is flood control. Since the project's reservoir started impoundment, it has performed flood retention for more than 70 times.

The Three Gorges reservoir has contained three floods with peaks over **70,000 m³/s**, and has a total flood retention volume of over **220 billion m³**.

01 Three Gorges reservoir
02 Discharge water intake
03 Spillway
04 Concrete slide
05 Yangtze River

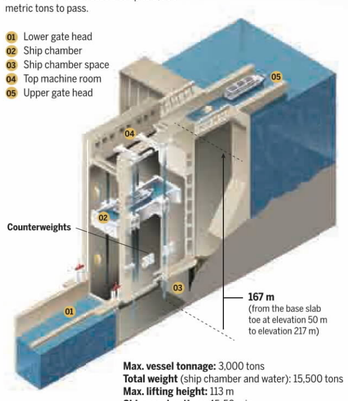


02 HYDROPOWER STRUCTURES

TGP is the world's largest water management and hydropower complex.

TOTAL INSTALLED CAPACITY:
22,500 MW

32 large generating units (700 MW each) + two small units (50 MW each)

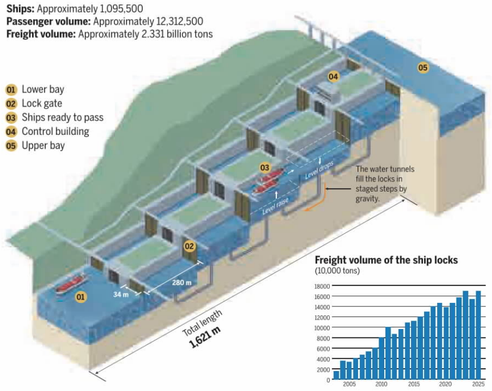


By the end of 2025, the cumulative electricity generation had exceeded **1.8 trillion kWh**, equivalent to saving about 540 million tons of standard coal and reducing carbon dioxide emissions by approximately 1.48 billion tons.

01 Water intake
02 Francis turbine
03 Main powerhouse
04 Transmission tower
05 Connection to the grid
06 Downstream outlet pipes

03 SHIP LIFT

TGP's ship lift is the largest of its kind in the world. It allows vessels of up to 3,000 metric tons to pass.



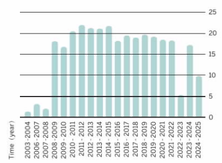
01 Lower gate head
02 Ship chamber
03 Ship chamber space
04 Top machine room
05 Upper gate head

Max. vessel tonnage: 3,000 tons
Total weight (ship chamber and water): 15,500 tons
Max. lifting height: 113 m
Ship passing time: 45-50 min

04 SHIP LOCKS

Since the ship locks began operation in 2003, the annual cargo throughput at the Three Gorges has increased nearly tenfold, from 18 million tons to 173 million tons. The cumulative cargo volume passing through the locks has exceeded 2.33 billion tons.

Ships: Approximately 1,095,500
Passenger volume: Approximately 12,312,500
Freight volume: Approximately 2.331 billion tons



01 Lower bay
02 Lock gate
03 Ships ready to pass
04 Control building
05 Upper bay

Freight volume of the ship locks
(10,000 tons)

05 THREE GORGES RESERVOIR

The reservoir is an essential freshwater regulation and storage hub of the Yangtze River Basin. From 2003 to 2025, the reservoir has supplied more than 370 billion cubic meters of supplementary water to the downstream area, effectively safeguarding water supply for industrial production, residential life and ecological conservation along the river.

REPLENISHMENT OF WATER
(Billion cubic meters)

BIODIVERSITY PROTECTION

While the Three Gorges Project (TGP) operates safely and delivers full benefits, biodiversity in TGP's reservoir area has been preserved. More than 2,160 rare plant species including Davidia involucrata are under conservation, over 120 rare Yangtze fish species, such as the Acipenser sinensis, have been protected and bred.

Acipenser sinensis

It has existed for about 140 million years. It is a large anadromous fish.

Davidia involucrata

Mainly distributed in Sichuan and Hubei provinces. It is hailed as a "living fossil" among plants.

All figures quoted are up to the end of 2025. Sources: China Three Gorges Corp, Chinese Academy of Sciences

BUSINESS

Zero tariffs to boost biz ties with Morocco

Enhanced cooperation creating new opportunities for trade, investment

CHANGSHA/RABAT — The Morocco session of the China-Africa Economic and Trade Expo (CAETE) is expected to bolster Sino-Moroccan economic ties, as China's zero-tariff policy for African countries and deepening industrial cooperation create new opportunities for trade, investment and supply-chain integration.

Jointly organized by the Secretariat of CAETE and Morocco's Ministry of Industry and Trade, the event in Casablanca runs from Wednesday through Friday, marking the first major overseas economic and trade activity organized by Central China's Hunan province in Africa since China fully implemented zero tariffs for the 53 African countries with which it has diplomatic relations.

Policy boost

Analysts and business leaders said the zero-tariff policy is expected to enhance bilateral trade and expand market access for African products in China.

Nasser Bouchiba, president of the Morocco-based Africa China Cooperation Association for Development, said the event comes at an opportune time and will enable premium Moroccan products to gain easier access to China's vast consumer market while enabling Chinese enterprises to expand their presence in North Africa and strengthen the integration of industrial and supply chains.

Bilateral trade between China and Morocco reached $10.96 billion in 2025, up from $9.04 billion in 2024. China has remained Morocco's third-largest trading partner globally and its largest trading partner in Asia for many consecutive years.

In 2025, China's exports to Morocco reached $9.88 billion, while imports from Morocco stood at $1.08 billion.

Industry observers said the zero-tariff policy will reduce export costs for Moroccan goods and enhance their competitiveness in the Chinese market.

Jawad Kerdoudi, president of the Moroccan Institute of International Relations, called the policy a mutually beneficial strategic move, saying it will help reduce Africa's trade deficit with China, attract more Chinese investment and bring capital, technology and jobs to the continent.

Driving cooperation

Hunan stands out as one of China's most proactive provinces in developing economic and trade relationships with Africa. Yang Yi, general manager of Hunan Yufei Industry Investment Co Ltd, said preparations for the Morocco session have been underway for months, with coordinated engagement between Chinese and Moroccan enterprises.

The company is promoting Moroccan specialty products, including argan oil and essential oils, through its "African Products" brand system.

During this year's May Day holiday, an African specialty products fair held in the provincial capital, Changsha, attracted nearly 100,000 visitors over six days.

"We hope to expand sourcing channels and strengthen supply chains so more high-quality Moroccan products can enter the Chinese market under African brands," Yang said.

Leveraging resources

Beyond trade, Sino-Moroccan ties are increasingly shifting toward industrial integration and supply-chain collaboration.

Mohammed VI Tangier Tech City is one example. As of March, it had signed agreements with 42 enterprises, including 34 Chinese companies, with planned investment totaling about $3.5 billion.

Chinese lithium battery materials producer BTR New Material Group is building cathode and anode material projects at the site and is expected to create more than 1,100 skilled jobs.

Morocco, the world's largest exporter of phosphate and rich in cobalt and lithium, is leveraging its resources base to develop a new energy industrial chain linking Moroccan resources, Chinese processing capacity and European markets.

Equipment from Zoomlion Heavy Industry Science and Technology Co Ltd has also been widely used in major infrastructure projects in Morocco, including venues for the 2030 FIFA World Cup.

Financial institutions such as Agricultural Bank of China's Hunan branch are also strengthening cross-border financial support for Chinese enterprises operating in Morocco.

Green growth

Green development has become another key pillar of China-Morocco cooperation. Moroccan business leader Imad Toumi, CEO of Managem group, cited several joint projects, including a battery-grade cobalt sulfate project in Marrakech and a seawater desalination project in Nador.

"These projects reflect a model that combines economic development with environmental protection," Toumi said.

The year 2026 marks the 10th anniversary of the establishment of the China-Morocco strategic partnership.

"China-Morocco cooperation is steadily advancing toward higher-quality and more sustainable development," said Xiao Hao, executive dean of the Institute of African Studies at Hunan University. "With the CAETE's Africa tour kicking off in Morocco, economic, cultural and academic exchanges between the two countries are poised to reach a new level."

XINHUA — CHINA DAILY

On-site lesson

Railway workers take part in a maintenance training program at Jiexiu Station, operated by China Railway Taiyuan Group, in Jiexiu, Shanxi province. Such on-site training is aimed at enhancing staff operational proficiency and reinforcing rigorous safety protocols for daily railway operations. As a first-class station and critical coal transport hub on the South Datong-Fenglingdu Railway, Jiexiu handles massive volumes of energy cargo, playing a vital role in safeguarding the nation's energy supply chain. Midea helps ramp up go-global push

By **YANG WANLI**
in Chonburi, Thailand
yangwanli@chinadaily.com.cn

Midea Group, a Chinese home appliance giant, launched an initiative on Tuesday to help domestic manufacturers build and operate factories overseas through a comprehensive package of digital, artificial intelligence-powered and operational solutions.

The Go-Global Partner Program has been introduced at a time when a growing number of Chinese companies are accelerating overseas expansion amid shifting global supply chains and rising investment in overseas production, said Zhang Xiaoyi, vice-president and chief data officer of Midea Group.

The initiative seeks to address some of the most persistent challenges facing manufacturers venturing abroad, including fragmented cross-border supply chains, inconsistent quality standards, complex regulatory requirements and cross-cultural workforce management, Zhang said.

The program is built on lessons learned from Midea's operations in Thailand, where the company has transformed its air conditioner factory into an overseas Lighthouse Factory — a first for China's AC industry — in which multiple AI agents collaborate across production, logistics, quality control and management functions.

The factory, covering 208,000 square meters, produced more than 5 million AC units last year. Its AI platform integrates 13 specialized AI agents across 25 core business scenarios, enabling managers to monitor operations and access key performance indicators through simple voice or text commands, said Zhou Xiaoling, information technology director of Midea Group.

"Unlike conventional smart factories that primarily automate production processes, AI agents can understand information, learn from experience and provide analytical support. They can work independently, collaborate with people and generate operational insights based on real-time data, enabling intelligent decisionmaking throughout the entire production cycle," Zhou said.

The company's Kuka intelligent manufacturing solution, for example, integrates autonomous mobile robots, automated warehouses and production lines into a unified operational platform. A single production line can save approximately $30,000 annually in overseas labor costs.

To address such issues, Midea also developed an AI- and virtual reality-enabled global workforce training platform. "The results have been substantial. Employee training cycles have been shortened from eight days to three days while training efficiency has increased by 62.5 percent," said Li Peng, manager of Midea Air Conditioning Thailand factory.

Over the past two years, Midea Thailand has worked with more than 70 Chinese companies expanding overseas. Li said the factory's experience demonstrates the value of collaborative overseas expansion.

He revealed that Chinese enterprises have accelerated expansion into Southeast Asia via building entire ecosystems from the ground up in recent years. Thailand has been a priority destination due to its geographical advantage, preferential policies and cultural similarity.

According to the Thai Foreign Business Commission, 113 foreign investors were permitted to operate businesses in Thailand in the first month of this year, representing a 10 percent increase. China stood at the top with an investment of 5.39 billion baht ($164 million).

Chinese investment is driving a wave of high-value projects in Thailand's Eastern Economic Corridor, focusing on advanced technology sectors and fueling Thailand's ambition to become a crucial global export hub, marking a significant strategic shift away from traditional manufacturing, according to Preesan Rakwatin, executive vice-president of the Digital Economy Promotion Agency of Thailand.

Rakwatin said China is now a leading country in cutting-edge technologies, including AI, which has empowered the manufacturing sector in Thailand and will serve as an important driver for a tech evolution in the region.

"Many countries are entering an aging society and we need the help of technology. Thailand welcomes more investment from China and those enterprises with high-tech support. This will not only solve labor shortages in the future, but will also help strengthen our regional competitiveness," he added.

Zhang, Midea's vice-president, said Chinese companies should move beyond traditional capacity relocation toward a more integrated model of global industrial development.

"The future of globalization requires a systematic approach," he said. "Technology, operational experience and industrial ecosystems must work together. The next phase of globalization is defined not merely by where factories are built, but by how knowledge, technology and industrial expertise are shared across borders."

WeChat opens AI ecosystem to developers

By **CHENG YU**
chengyu@chinadaily.com.cn

Tencent has started opening WeChat's artificial intelligence ecosystem to mini program developers, allowing companies to integrate AI agents into one of China's most widely used apps.

The move is one of Tencent's most ambitious attempts yet to embed AI across WeChat's vast ecosystem of messaging, payments, content and mini programs, which together serve more than 1 billion users.

The company published guidelines on Monday for developers seeking access to the WeChat AI ecosystem, introducing both automatic and developer modes for integration. The program remains in internal testing and requires authorization from participating developers.

Among the first batch of trial partners are some of China's largest internet companies.

E-commerce giant JD plans to deploy AI agents across shopping, food delivery and logistics services. Meituan is integrating AI into food delivery and local services, while KFC China will allow users to place orders using natural language, with the system automatically identifying nearby restaurants.

Travel platform Trip.com has completed integration for services such as flight bookings, hotel reservations and itinerary planning. Fashion marketplace Poizon will offer AI-powered product recommendations.

Hardware manufacturers are also joining the initiative. Chinese smartphone maker Honor has completed integration through an agent-to-agent protocol, while Huawei, Xiaomi, Oppo and Vivo are expected to follow, sources confirmed to China Daily.

Tencent views WeChat AI as a differentiated product designed to connect five of its core ecosystems: communications, social networking, content, mini programs and payments.

The initiative reflects a broader shift underway across China's AI industry as companies seek to move beyond standalone chatbots and turn AI into a practical service layer embedded within existing consumer platforms.

Rather than competing directly on model performance, Chinese internet companies are increasingly focused on integrating AI into everyday tasks such as ordering food, booking travel, shopping and making payments.

Yet questions remain about whether AI agents can generate sustainable revenue.

Fu Weigang, head of the SIFL Institute, said that China's AI industry is seeing rapid investment growth, but viable business models remain uncertain.

"Many companies have launched AI agent services, but users still have reservations about allowing AI to make decisions on their behalf," he said. "Outside of the initial attention generated by low prices, many automated functions have yet to prove their value in real-world use."

Cost is another challenge. Every AI interaction generates token costs, raising questions about who ultimately pays: WeChat, mini program operators or merchants.

"WeChat has roughly 1.4 billion users," Fu said. "If these capabilities are rolled out at scale, the overall cost burden could become significant."

United States-based AI companies have made progress in monetization. AI startup Anthropic said in April its annualized revenue run rate had exceeded $30 billion, while OpenAI has reported annualized revenue exceeding $10 billion, driven largely by subscriptions and enterprise services.

China's paid AI market remains at a much earlier stage of development, with only a handful of companies experimenting with tiered subscription models.

"Traditional internet platforms primarily generate revenue through advertising, but AI services function more like utilities, where consumers have historically shown less willingness to pay," Fu added.

SpaceX IPO curbs seen as baseless

By **SHI JING** in Shanghai and **ZHOU LANXU** in Beijing

SpaceX's decision to bar Chinese mainland and Hong Kong investors from its $75 billion IPO underscores a growing global trend of technology decoupling, which Chinese companies must heed without altering their global outreach, said experts on Tuesday.

Underwriters for SpaceX, the space exploration company founded by Elon Musk, said on Friday that they are instructed to reject any orders originating from the Chinese mainland and Hong Kong, according to people familiar with the matter.

It means that mutual funds, private equities, sovereign funds, family offices and high-net-worth individuals from the two jurisdictions will all be blocked from this highly anticipated IPO, which would rank among the world's largest technology listings in history.

Online access to the official website of SpaceX and its roadshow materials were inaccessible in the jurisdictions on Tuesday.

SpaceX has cited the US International Traffic in Arms Regulations for making the decision, indicating national security concerns.

But Dai Guanchun, a senior capital markets lawyer based in Beijing, said that there is no explicit restriction under US law. The subscription of shares does not pose any serious national security or technology leakage risks, he stressed.

"This reflects an excessive politicization of technological exchanges by the United States, disrupting the normal flow of international capital," he said.

"Chinese companies possess world-class innovation capabilities, and Chinese scientists play critical roles in nearly all areas of technological innovation. Excluding Chinese companies and Chinese capital is unjust, undermining long-standing international trust and collaboration," he added.

But Dai stressed that this could be an unavoidable trend. Not just the US but probably Europe as well may impose excessive politicization on technology and capital exchanges.

Against that backdrop, Chinese companies should not be conservative, but rather seek more cooperation in other markets, he added.

Excluding investors from the Chinese mainland and Hong Kong from this IPO is using military export controls as a pretext. It is a selective capital isolation driven by geopolitical competition, as explained by Liu Chunsheng, an associate professor of international economics at the Central University of Finance and Economics.

"It is a typical case of capital decoupling in cutting-edge technology sectors. The military export control regulations used to restrict only the flow of technical hardware, but now companies are using it to block all related capital. The US side is expanding national security concerns to the capital market in strategic sectors such as aerospace and semiconductors. Investment rights are being divided by nationality, creating a so-called 'layered' and partial decoupling," said Liu.

In the short run, this could lead to higher fundraising costs and fewer opportunities regarding commercial operations for US companies like SpaceX, as they will receive less Asian capital. If sustained for a longer term, it could impair the global capital supply, constraining the R&D expansion of capital-heavy aerospace projects, he said.

Tianjin develops sensors for embodied AI

Robots featuring multidimensional tactile devices can now perform tasks once only possible for human beings

By **YAN DONGJIE** in Tianjin
yandongjie@chinadaily.com.cn

A worker collects data simulating household scenarios at a super computing and AI facility in Tianjin on May 20. SUN FANYUE / XINHUA

A humanoid robot developed by PaXini Technology (Tianjin) Co is showcased for household application scenarios. PROVIDED TO CHINA DAILY

On sorting lines in smart factories, at precision workstations in automobile manufacturing plants and even at home tending to household chores, a batch of robots equipped with multidimensional tactile sensors can dexterously grasp, operate and adaptively perform tasks, accomplishing movements that were once only possible for humans.

These robots, capable of sensing pressure, texture and posture, possess "tactile fingertips", enabling artificial intelligence to transition from virtual algorithms to the real world. This is the industrial transformation brought about by embodied intelligence, and the core "sensory organs" enabling it all originate from Tianjin.

"Robots are important carriers of AI, facilitating its transition from the virtual world to reality," said Yin Jihui, secretary of the Hexi district Party committee. As a national advanced manufacturing research and development base, Tianjin is focusing on core technology research and industrial implementation of embodied intelligence robots, cultivating a group of globally competitive industry leaders. PaXini Technology (Tianjin) Co is one such representative example.

"The key to these logistics robots lies in our independently developed multidimensional tactile sensors," Lin Tong, director of PaXini' s data collection center, said. Currently, 80 percent of humanoid robots worldwide utilize PaXini's sensors. Tactile sensors, known as the cornerstone of the intelligent cognition and information interaction industry, have also been listed by China as one of the key critical chokepoint technologies alongside lithography machines and chips.

"Five or six years ago, similar tactile sensor products cost as much as 100,000 yuan ($14,770) each, severely restricting the development of the entire robot industry," Nie Xiangru, co-founder of PaXini, recalled. The high import costs made tactile perception a luxury in the robotics field, making it difficult to be commercialized on a large scale.

To break the monopoly, the PaXini team spent four to five years in R&D, successfully creating the world's first 6D hall array multidimensional tactile sensor, transforming core technology from a heavy reliance on imports to 100 percent domestic self-sufficiency.

Today, PaXini's basic tactile sensor models are priced at only 199 yuan, just 0.2 percent of the price of equivalent products in overseas market. This has made tactile perception accessible from laboratories to various industries, turning a luxury into a basic hardware accessible to everyone.

The key to reducing costs lies in significant optimizations in chips, structure and algorithms with each product generation, Nie said. "The advancement of software algorithms enables us to reduce our reliance on hardware. Coupled with the growth of the industry, when prices become cheaper, the order volume increases, and with more orders, the costs can be further reduced. Naturally, the prices spiral downward."

PaXini's competitiveness lies not only in the independent R&D of core components, but also in its underlying data.

Last year, PaXini's Super EID Factory, officially commenced operations in the Kongtian digital industrial park in Hexi district. It is currently the world's largest embodied intelligence data collection and model training base.

"For robots to be deployed effectively, they require sufficient scenario-based data support," Nie said. The factory utilizes critical data from various vertical work scenarios to enable robots to learn how to work, thus enabling them to adapt to practical applications more quickly.

As the world's largest EID collection and model training base, this factory's daily collection capacity is equivalent to 1.02 to 1.52 times that of an entire worker's career. The factory encompasses thousands of tasks across full-chain embodied intelligence application environments, including automotive manufacturing, households, offices, catering, supermarkets, healthcare and medical services, aiming to simulate the complex scenarios robots may encounter in the real world.

The Super EID Factory will produce nearly 200 million pieces of high-quality and high-dimensional embodied intelligence training data annually. "This provides a revolutionary solution to the core problems faced by the current physical intelligence industry, such as the scarcity of data sets and the lack of tactile modal data," Lin said.

Tianjin, as a policy and industrial hub, offers a favorable environment for cross-border data transactions. This is why PaXini chose to establish its factory in Tianjin. "Choosing Hexi district was not only for its central urban location, but also for its market-oriented business environment and full-chain industrial services," Lin added.

The company was granted 12,000 square meters of usage area in Hexi district to create a "data intelligent manufacturing" scenario without noise or pollution.

> "Five or six years ago, similar tactile sensor products cost as much as 100,000 yuan ($14,770) each, severely restricting the development of the entire robot industry."
>
> **Nie Xiangru,** co-founder of PaXini Technology (Tianjin) Co

He added that as a free trade zone, Tianjin was the first to release enterprise data classification standards and data cleaning operation lists, forming a complete data policy system. Leveraging its diverse application scenarios and geographical advantages, Tianjin has become a core node for data collection and cross-border circulation.

Starting from Tianjin, PaXini plans to further expand its data collection bases and factory scale, ensuring data is not only produced locally, but also fully utilized, aiming to promote the internationalization of China's data standards and serve the global intelligent industry development.

In recent years, Tianjin has formed a complete robot industry chain from core components and complete machine manufacturing to system integration and application services. "In recent years, we have formed a relatively complete industrial ecosystem in the fields of industrial robots, specialized robots and service robots," said Zhai Lixin, vice-mayor of Tianjin.

In 2025, there were 104 robot industry chain enterprises in Tianjin and the industrial output value was 13.5 billion yuan, an increase of 18.9 percent year-on-year, while operating income was 27.8 billion yuan, an increase of 16.3 percent year-on-year.

This year, the Government Work Report proposed "creating a new form of intelligent economy", a novel economic form driven by AI while deeply empowering various industries through "AI+".

"Tianjin has a solid industrial foundation in areas such as automobiles, electronic information and aerospace. This determines that the development of local robots must first focus on serving production and meeting the actual process requirements," Zhao Fengjiao, secretary-general of the Tianjin Robot Industry Association, said.

Shiyun Technology (Tianjin) Co, a high-tech robot company specializing in special industries and high-risk operation scenarios, has achieved mass production and commercial deployment in various fields, including cultural and entertainment performances and industrial intelligent manufacturing.

In medical scenarios, Shiyun's intelligent hospital robot guides can provide guidance with consultations, full-process accompaniment and emergency assistance for patients, making healthcare safer and more efficient, an employee at Shiyun said.

This company has constructed a "body-cerebellum-brain" software and hardware full-stack technology layout, centered around a "one-body, three-intelligences" full-stack platform — using the embodied body as the hardware base and integrating interaction intelligence, motion intelligence and operational intelligence to achieve a complete closed loop from perception to action.

"Shiyun's greatest breakthrough is its focus on embodied intelligence solutions," he said. The company is accumulating high-quality data assets in the industry and has begun constructing and deploying data collection factories nationwide, enabling continuous iteration of "operating while labeling and training", making robots become smarter with each task.

"We will comprehensively establish R&D centers, production workshops and testing centers in Tianjin, building a full industry chain system integrating R&D, manufacturing, sales and services. This year, we will implement 10 standardized scenarios and expect to achieve mass product delivery by 2027," said Cao Keqian, chairman of Shiyun.

According to the "Tianjin Action Plan for Promoting Innovation and Development in Artificial Intelligence (2025-27)", Tianjin will focus on the field of embodied intelligence in the future, promoting the research and application of underwater robots, industrial robots and special-purpose robots.

"For each enterprise, we will adopt a customized approach for assistance, aiming to create a more competitive industrial ecosystem," Zhai said.

AI's immersive experiences up close and personal

By **YAN DONGJIE** in Tianjin

A humanoid robot band plays music at the opening of the 2026 World Intelligence Expo in Tianjin on May 28. ZOU HONG / CHINA DAILY

The rapid advancement of large artificial intelligence models and embodied intelligence is fueling upgrades in hardware and scenario integration, injecting fresh vitality into the cultural and tourism sector, experts said.

At the recent Intelligent Robot Carnival, operators used virtual reality to remotely control humanoid robots from Shiyun Technology (Tianjin) Co for live boxing matches, winning warm applause from on-site spectators. The event took place in Hexi district from May 28 through May 31 in Tianjin, alongside the 2026 World Intelligence Expo.

"The entire experience was incredibly fulfilling and eye-opening. Having never joined tech or cultural tourism events before, I was fascinated by the mix of cutting-edge tech, robot shows and fun interactions," said Muhammed Radhiat Ibrahim, a Nigerian art student at Tiangong University, adding advanced technologies have become easy and fun for ordinary visitors.

A major highlight of the expo is its close-contact experience featuring indoor immersive displays plus outdoor live performances, enabling visitors to interact closely with robots, said Cui Wei, deputy secretary-general of the Tianjin Municipal Government.

"I'm most impressed by the robot welcoming squad. They wave and turn in precise unison and shift formations following music beats," said Anamaria Faasoesa Ranadi Visinia Tuala, a Samoan art student at Tiangong University.

Shiyun has rolled out a full lineup of humanoid robots capable of group choreography, delivering all-round robot performance solutions for scenic spots, museums and galas.

At the exhibition booth of the Unmanned Systems Interdisciplinary Center, Tianjin University, children got up close to cutting-edge AI technologies under staff guidance. On display were a six-rotor aircraft, self-balancing motorcycle, fire-fighting robotic dog and inspection robot, bringing the youngsters a fascinating experience.

"We host popular science activities at the cultural center to spark kids' interest in science and technology, and help the public understand our research goes beyond academics to tackle core industrial challenges," said Xie Hui, head of the center.

"Marking China's first large-scale all-outdoor comprehensive robot gala, the carnival abandons conventional indoor exhibition modes. Spanning 17,000 square meters at Tianjin Cultural Center, it forms an open, boundless tech venue," said Gong Kejia, director of the Hexi district bureau of science and technology.

"The outdoor format completely transformed how I interacted with technology," Ibrahim said. "Unlike indoor exhibitions, where visitors mostly watch from a distance, here I could stand right next to the robot calligraphy demonstration and observe every brushstroke up close."

"AI boasts great adaptability for large-scale conservation, inheritance, revitalization and utilization of cultural relics as well as natural and cultural resources," said Yu Haibo, an associate professor with the College of Tourism and Service Management at Nankai University.

"Every year we introduce cutting-edge robotic products, upgrade displays, competitions and performances, improve popular science programs and polish the city's IP with distinctive sci-tech tourism offerings to brand Tianjin as a renowned smart city," Gong added.

Hexi plans to institutionalize the carnival as Tianjin's landmark brand linking sci-tech, cultural tourism and industrial exchanges.

Prudence urged on Iran nuclear issue

Ambassador Sun Lei calls for maintaining ceasefire and refraining from use of force

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China's envoy to the United Nations on Tuesday called on the UN Security Council to exercise prudence and play a constructive role in addressing the Iranian nuclear issue, amid growing disagreement among Security Council members over the status of UN sanctions on Iran.

> Iran's legitimate right to the peaceful use of nuclear energy should be addressed alongside non-proliferation concerns."
>
> **Sun Lei,**
> China's deputy permanent representative to the United Nations

"I want to reiterate that the Security Council has ceased its consideration of the Iranian nuclear issue," Sun Lei, China's deputy permanent representative to the United Nations, told the council.

He said the proper resolution of the issue bears on the authority and effectiveness of the international nuclear non-proliferation regime, long-term peace and stability in the Middle East, and global peace and security.

Ahead of the meeting, eight countries — France, Bahrain, Denmark, Greece, Latvia, the United Arab Emirates, the United Kingdom and the US — issued a joint statement urging all UN member states to fully implement the recently reimposed Security Council sanctions against Iran.

Speaking on behalf of the group, Jerome Bonnafont, French permanent representative to the UN, said Iran possesses more than 10 International Atomic Energy Agency significant quantities of highly enriched uranium, a level at which "the possibility of manufacturing a nuclear device cannot be excluded".

Sun stressed that "Iran's legitimate right to the peaceful use of nuclear energy should be addressed alongside non-proliferation concerns".

He noted "Iran's repeated commitment not to develop nuclear weapons", and said that, as a state party to the Treaty on the Non-Proliferation of Nuclear Weapons, "Iran enjoys the legitimate right to the peaceful use of nuclear energy."

The remarks were made during an open briefing of the Security Council on the work of the 1737 Committee, which was established to oversee sanctions on Iran prior to the 2015 Joint Comprehensive Plan of Action (JCPOA).

The committee had reported to the Security Council every three months before the adoption of the JCPOA in 2015, which suspended both the committee and its reporting requirements.

In August 2025, France, Germany and the United Kingdom, known as the E3 parties to the JCPOA, triggered the agreement's "snapback" mechanism to reimpose UN sanctions on Iran. In March this year, the United States, serving as Security Council president, sought to resume the committee's reporting by including its 90-day briefing in the council's program of work.

China and Russia challenged the legal and procedural basis for the move, saying that Security Council sanctions on Iran had been permanently lifted following the adoption of Resolution 2231 in 2015.

China and Russia had opposed the US proposal to include the committee briefing in the council's March agenda, as well as a draft report on the committee's activities proposed by the United States.

Sun said that the United States and Iran have reached a ceasefire and are exploring solutions through negotiations, and "the situation remains sensitive, complex and fragile".

"Under the current circumstances, the Security Council must stand on the side of peace and on the right side of history, and act with utmost caution when handling relevant issues," he said.

"China supports the US and Iran in resolving their differences through rational and pragmatic negotiations," Sun said, adding that such efforts could ensure Iran's orderly development of peaceful nuclear activities under the strict safeguards and monitoring of the IAEA while effectively reducing proliferation risks.

"Threats of force or the imposition of war will only push the Iranian nuclear issue and the situation in the Middle East into a dangerous abyss," he said.

Sun said the US withdrawal from the JCPOA and its two separate uses of force against Iran during the negotiation process "had severely undermined diplomatic efforts and contributed to the current difficulties".

He urged relevant parties to "abandon power politics, engage in sincere dialogue on an equal footing, commit to refraining from the use of force, and ensure the effective implementation of any future agreement".

"Maintaining the ceasefire is the overriding priority," Sun said, calling on all parties to work toward ending hostilities and reaching an agreement that serves the interests of those concerned.

"The world is an indivisible security community. One country's security should not come at the expense of another country's security," Sun said.

Heytea opens first tea bar outside China

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

Heytea's new tea bar on New York's Upper East Side, the first location of its kind outside of China, attracted hundreds of people who patiently lined up on opening day just to get a taste of its tantalizing teas .

The store, located at 126 East 86th street in Manhattan, officially opened on June 5. Four days later, in the middle of a humid afternoon, the excitement over the tea bar had not died down, as a line of at least 100 people formed down the block.

Alexander Sherman, 19, traveled for nearly an hour from Brooklyn to the newly opened Upper East Side location just to try a cup of tea. He is enjoying the emergence of Chinese tea and coffee brands in the US.

"I feel like Heytea ... can be likened to Starbucks at this point," Sherman told China Daily. "I know there is Luckin coffee too, but I haven't tried that yet. That's more of a newer establishment here in America. I put Heytea in the same bracket as drinks from Starbucks as it's like a high, upper drink, where you're paying a little bit more of a premium."

"I've been to another Heytea but this Heytea tea bar concept is so cool," he added. "Heytea is pretty big, as bubble teas have been popular in the US for a while. I want to order a Deep Matcha and Chocolate tea or a King Jasmine Guava tea —both look good."

People wait to get a taste of tantalizing products at Heytea's new tea bar on New York's Upper East Side on Monday. BELINDA ROBINSON / CHINA DAILY

The tea bar is designed to have a slower pace, allowing customers to savor the flavor of the tea — setting it apart from its other locations.

Inside, the decor includes wooden seating allowing people to sit and ponder. Tote bags and tea were also available for sale.

The menu boasts over 30 beverages, with a special emphasis on premium tea. Some of the new products include Mountain Oolong Yuzu Apple, Deep Matcha, and Chocolate.

There are also ice creams such as Pistachio Gardenia and Salted Cheese Chocolate.

"I love Heytea, and this is the first time that I'm seeing something this beautiful that they made on the inside. So, I can't wait to get inside," Brianna, 26, from Queens New York, said while in the line. She described Heytea as tasting different to similar US offerings.

"It has a different taste to me than Starbucks or other American places. It has a more natural sweet taste; however, it does not taste too artificial, even the teas, they're just brewed straight. And I like that part about it."

A doorman, who wanted to remain anonymous due to his job, stood outside of the building next door to the tea bar to observe the long line of people.

He revealed that on opening day, the line went back two blocks to East 84th street. He said that it had remained long over the weekend and into the start of the new week.

Founded in 2012, Heytea (originally called Royal Tea) started in a small alley in Jiangmen, Guangdong province, in a shop of less than 30 square meters. It later rebranded to its current name.

Just three years later, its founder, 21-year-old entrepreneur Nie Yunchen, expanded to Guangzhou and Shenzhen. By 2017, it opened in Shanghai. A year later, it branched out to Hong Kong.

In 2023, it opened its first US store in New York. By January 2025, Heytea had 15 locations in the city. The US now has at least 40 stores.

From those humble beginnings in China, Heytea has grown into a worldwide brand with more than 3,500 locations across 330 cities worldwide in the US, UK, Australia, Canada, Singapore, Malaysia, South Korea and more.

Abigail, 20, works on the Upper East Side just a few minutes away from the tea bar. She left work excited to try it.

"I'm not really a coffee person, and I think that's probably like a broad thing you can find among Gen Z," she said. "Like Gen Z's, in terms of where they're getting their caffeine from, it's not as much coffee as it is, like, energy drinks or like matcha and tea and stuff.

"I like the flavors of the drinks, that's probably one factor. And these are supposed to be drinks that you can't get in a regular Heytea. So, I think that's part of the appeal."

She liked the 'buy one get one free' promotion on offer. She said that the long line would not deter her, even though the wait was at least 45 minutes to an hour.

"I guess it shows that people are excited and willing to wait," she said.

US slammed for putting Chinese firms on blacklist

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Beijing has criticized Washington for adding several Chinese companies to a list of entities allegedly supporting China's military, urging the United States to "correct its erroneous practices".

On Monday, the US Defense Department added several major Chinese companies, including Alibaba, Baidu and BYD, to the list, according to US media.

Responding at a daily news briefing in Beijing on Tuesday, Foreign Ministry spokesman Lin Jian said," China has consistently and firmly opposed the US overstretching the concept of national security and formulating various types of discriminatory lists to go after Chinese businesses.

"We urge the US to correct its erroneous practices and stop its unwarranted suppression of Chinese enterprises," Lin said.

China will take necessary measures to firmly safeguard the legitimate rights and interests of Chinese enterprises, he added.

According to leading IT news portal TechCrunch, the list — known as the 1260H list, after the specific section of the 2021 National Defense Authorization Act that created it — "is just one tool that the US has used to place restrictions on Chinese tech".

The updated list, which supersedes an earlier 2025 version, now includes a broad swathe of China's top technology companies, according to Reuters.

It also reported that other companies added include biotech enterprise WuXi AppTec, artificial intelligence-driven robotics company RoboSense Technology Co and Unitree, a leading Chinese maker of humanoid and quadruped robots.

Baidu said in a statement to TechCrunch that "the suggestion that Baidu is a military company is entirely baseless. We will not hesitate to use all options available to us to have the company removed from the list".

Alibaba told TechCrunch that it "is not a Chinese military company nor part of any military-civil fusion strategy", adding that it will take all available legal action against attempts to misrepresent the company.

Hubei opens doors for Taiwan youths

Face-to-face exchanges allow young people from both sides of the Taiwan Strait to see shared culture and daily life up close.

Taiwan participants wearing *hanfu* pose for a group photo with student volunteers from South-Central Minzu University during a cross-Strait youth exchange event in Wuhan, Hubei province, on May 18. PROVIDED TO CHINA DAILY

By **MENG WENJIE** and **LIU KUN** in Wuhan

On the evening of May 18, a dazzling light show lit up both banks of the Yangtze River in Wuhan, Hubei province. In a gentle drizzle, a sightseeing boat slowly departed the dock. Chen Yuting stood on the open-air deck, letting the river breeze brush across her face as she took in the night scenery.

"The view reminds me of the Love River in my hometown of Kaohsiung, Taiwan," she said. "But the Love River feels more delicate, while the Yangtze River has a far grander presence."

The cruise was one of a series of youth exchange activities held in Hubei to promote communication and mutual understanding among young people from both sides of the Taiwan Strait.

More than 400 young participants and guests joined the cruise. On board, student volunteers from South-Central Minzu University in Wuhan had set up booths featuring handmade bookmarks, traditional Chinese knots, round fans and paper-cutting art.

"The essence of youth exchanges across the Strait lies in face-to-face interaction," said Wu Ying-chieh, an associate professor at the university. "It's not about reading news reports or scrolling through online comment sections, but about seeing each other's lives up close."

Originally from Yilan in Taiwan, Wu has spent two decades promoting cross-Strait youth engagement. He often brings visitors from Taiwan to the university's Ethnology Museum, where they explore ethnic cultures through exhibits of traditional garments, handicrafts and everyday artifacts.

"For many, it is the first time they realize how diverse the ethnic cultures are on the Chinese mainland," Wu said. "They are often surprised to find similarities with Taiwan's indigenous traditions."

That sense of cultural connection was echoed by Chen Xin, a 22-year-old journalism student at the university and a member of the Xibe ethnic group from Northeast China's Heilongjiang province. At a campus gathering later during the exchange activities, she wore the traditional attire of the Amis people — an indigenous group in Taiwan — and introduced the university's cross-Strait cultural studies program.

After the gathering, an Amis woman approached her and offered to gift her a traditional set of Amis clothing.

"There was a real sense of warmth," Chen Xin said. "It felt less like a formal exchange and more like a natural connection."

> "It's not about reading news reports or scrolling through online comment sections, but about seeing each other's lives up close."
>
> **Wu Ying-chieh,** an associate professor at South-Central Minzu University

> "As long as we work hard and develop professional skills, we can find opportunities to build our future here."
>
> **Kan Chia-hua,** a doctor at the Central Hospital of Wuhan

From visitors to residents

For some participants, Hubei is no longer simply a stop on an exchange itinerary. It has become a place to study, work and build a life.

Lee Yi-hsuan, a 20-year-old from Taoyuan, Taiwan, shared at the gathering how she came to study at Central China Normal University in Wuhan. With her mother originally from Hunan province, Lee decided after high school to pursue higher education on the Chinese mainland.

She had previously visited Wuhan as a tourist and was impressed by its large student population and the number of universities in the city. "It felt inclusive and full of vitality," she recalled.

After enrolling at the university in 2024, Lee gradually grew from a hesitant freshman into a confident student who now helps other young people from Taiwan adjust to campus life.

She also shares her study and daily-life experiences on Xiaohongshu, offering practical advice to those considering studying on the mainland.

Kan Chia-hua, 35, a urologist at the Central Hospital of Wuhan, has followed a longer path.

Originally from Hsinchu, Taiwan, he came to Wuhan in 2011 to study at Huazhong University of Science and Technology and stayed after completing his doctoral studies.

"When I first arrived, I could not understand the Wuhan dialect at all," he said.

More than a decade later, Kan can not only understand the dialect but also speak some of it himself. Even the way he addresses patients has changed. Instead of using the more formal terms common in Taiwan, such as "sir" or "miss", he has gradually adopted warmer local expressions.

Kan said policies supporting Taiwan residents on the mainland have opened broader professional opportunities. In Hubei, he was able to take medical licensing exams and complete standardized residency training under the same requirements as mainland doctors.

"I've grown together with Wuhan," he said. "Over the years, I've witnessed the city's rapid development while also improving myself."

Beyond his clinical work, Kan regularly joins volunteer medical outreach programs in rural Hubei, where he helps promote disease prevention and health awareness. This year, he received the Hubei Youth May Fourth Medal.

"The award is not only a personal honor, but also a form of encouragement for young people from Taiwan living on the mainland," he said. "As long as we work hard and develop professional skills, we can find opportunities to build our future here."

Chen Yuting has also established her life in Hubei — in a different city and through a very different passion.

A cycling enthusiast, she opened Let's Go Coffee in Xiangyang in May 2025, creating a space where local riders could rest, gather and connect. The cafe has since expanded to a second location in the city.

Chen Yuting had long been fascinated by Xiangyang as depicted in the martial arts novels of Hong Kong writer Jin Yong, also known as Louis Cha Leung-yung (1924-2018). When she first arrived in 2024, she found a city that combined a rich historical legacy with the energy of modern life.

Supportive policies for Taiwan entrepreneurs helped, she said. But what ultimately convinced her to settle in a new place in her 40s was the warmth of the residents.

"People here treat others with sincerity," she said. "I feel like a seed that has taken root and is growing here."

When she first opened the cafe, the owner of a local bicycle shop helped her find renovation workers and communicate with craftsmen who spoke only the Xiangyang dialect.

The owner of a nearby beef noodle shop would also add extra noodles to her order and offer her a complimentary bowl of *huangjiu*, a traditional rice wine.

At her cafe, flavors from both sides of the Strait have gradually come together. This year, she introduced "huangjiu coffee", a drink that combines the local rice wine with preserved plums from Taiwan.

"People in Xiangyang like to pair beef noodles with *huangjiu*," Chen Yuting said. "So I thought, why not bring that local flavor into coffee, along with a taste of Taiwan? For me, this drink is another way of becoming part of the city."

Social Media Digest

Countryside wanderlust

Scroll through TikTok or YouTube, and "China Travel" posts are no longer all neon-lit skylines and crowded landmarks. Instead, rice fields, local food markets and mountain homestays are drawing growing attention on Western social media.

The phenomenon, often described as "country walk", marks the latest shift in the "China Travel" trend: after exploring the country's megacities, more foreign travelers are venturing off the beaten path in search of slower, more authentic experiences.

Many are not just sightseeing. They are learning to make tofu, joining traditional festivals and spending time with residents, turning rural travel into a more personal encounter with Chinese culture.

Several factors have fueled the trend. In recent years, China's countryside has undergone a remarkable transformation, with improved infrastructure, better connectivity and upgraded public services making rural areas more accessible and attractive to visitors. Expanded visa-free entry policies and streamlined transit procedures have also made it easier for foreign travelers to explore destinations beyond the country's major cities.

"When overseas content creators cycle along clean village roads, stay in courtyard-style boutique homestays, and interact with farmers livestreaming on smartphones, the impact of what they see and experience firsthand cannot be offset by any biased written reporting," commented Global Times.

Traveling in China's countryside has become a growing trend among foreign visitors. VCG

Digital nostalgia

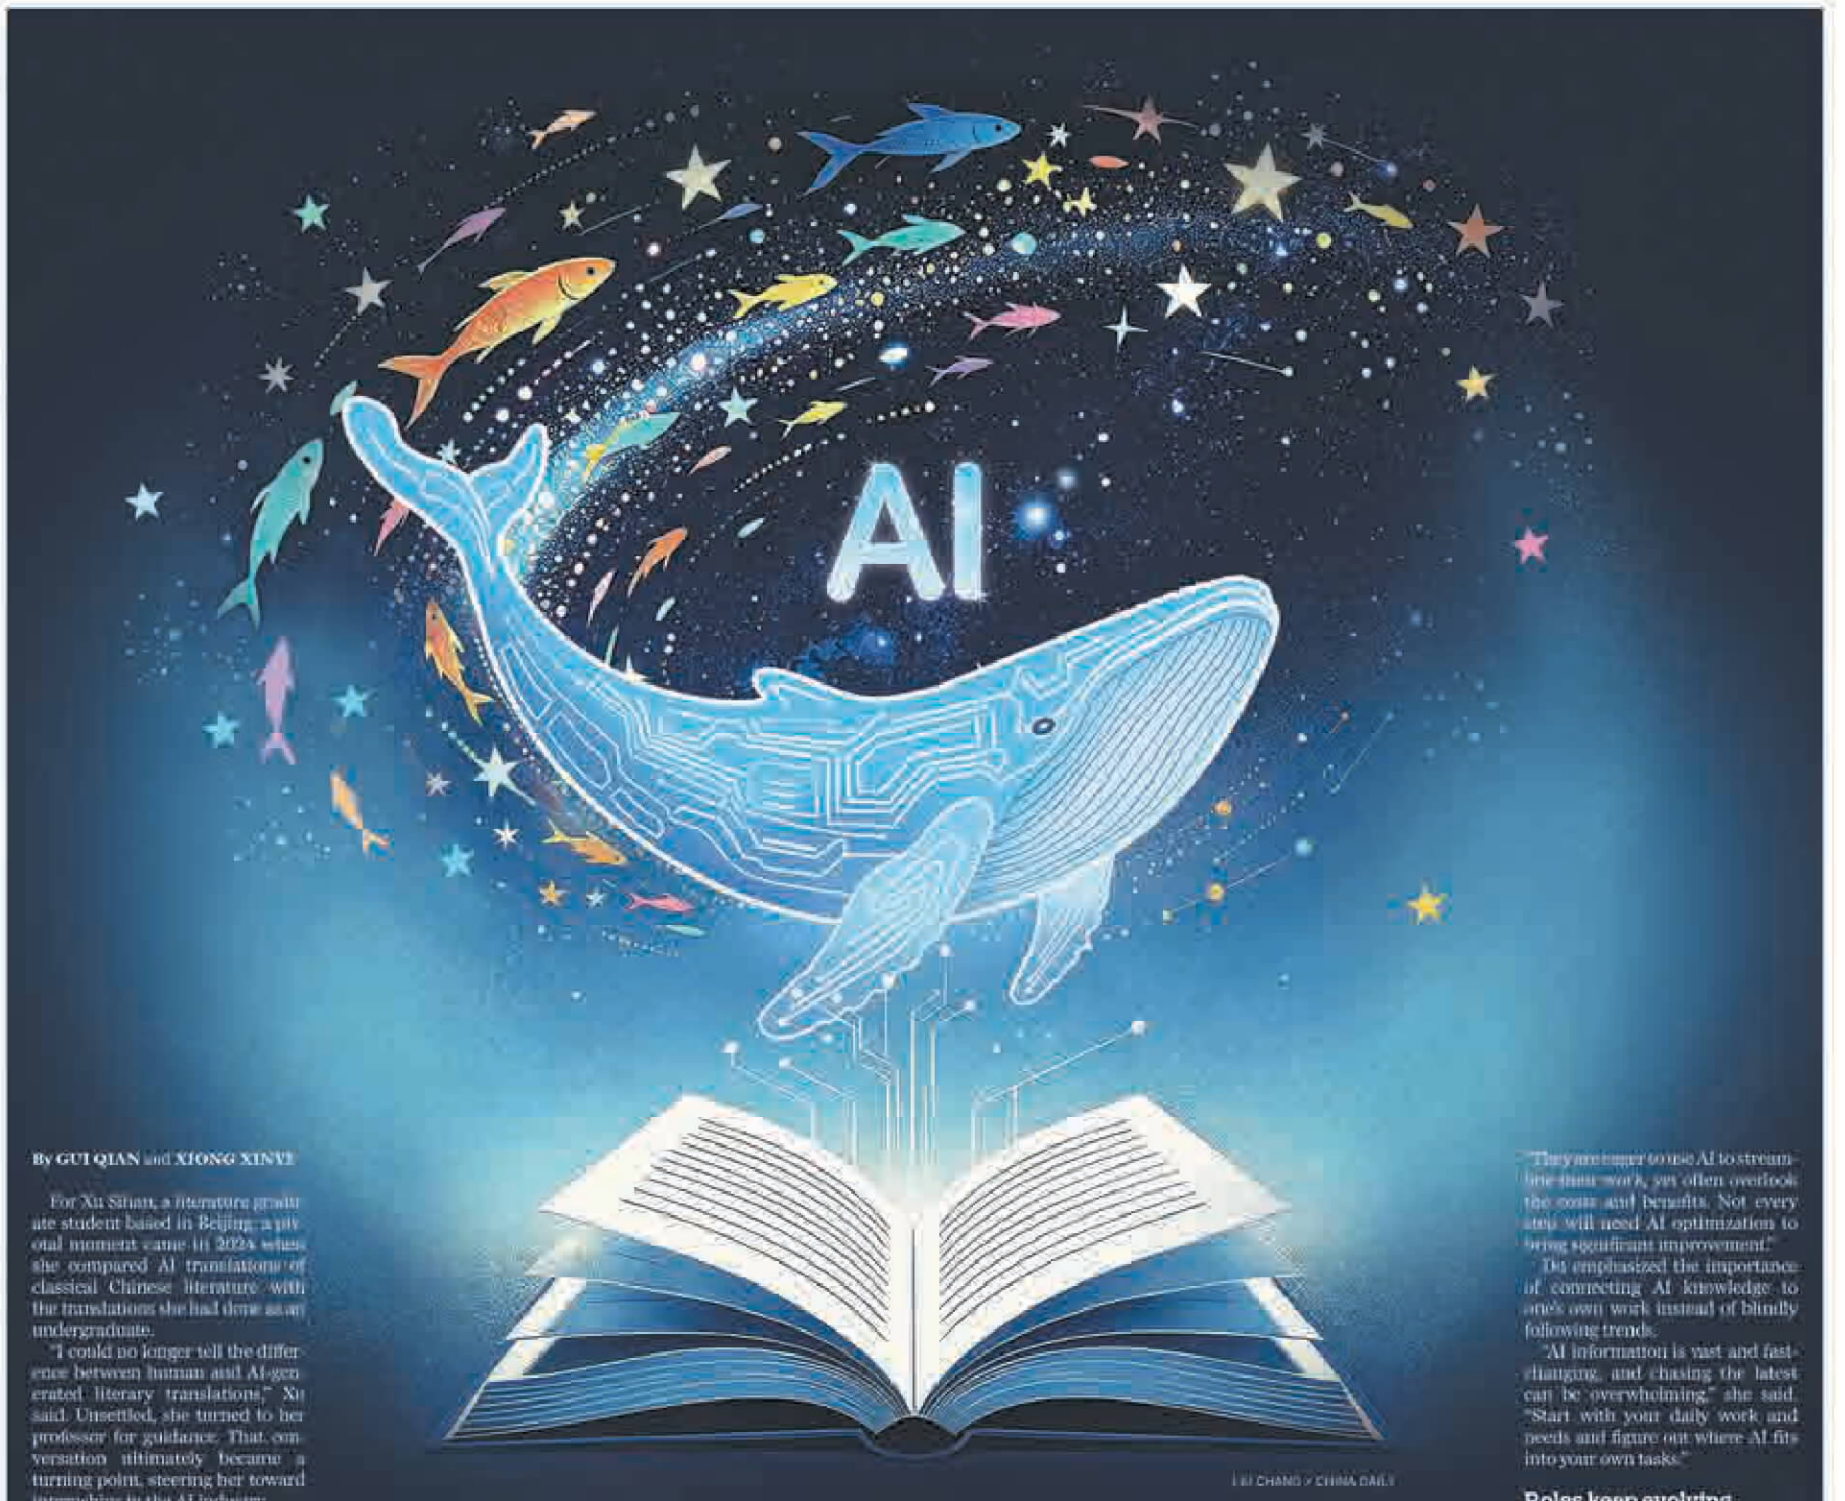
In a world dominated by AI playlists and algorithmic song recommendations, one relic refuses to be replaced: the iPod.

Though Apple discontinued the iPod line in 2022, the iconic music player has resurfaced online, sparking a wave of nostalgia on TikTok, Reddit and resale platforms. Young fans proudly showcase second-hand iPod Classic devices, organize massive downloaded libraries and don classic 2000s wired earbuds.

Its enduring appeal comes from a blend of sleek design, portability and premium sound quality. As one Xiaohongshu (RedNote) user noted, the iPod Shuffle provides a unique listening experience: a simple slide of the power switch starts instant playback, and its shuffle mode turns every song into a delightful surprise.

Beyond hardware, the iPod's minimalist nature is at the heart of its revival. Unlike smartphones brimming with notifications, autoplay videos, and algorithmic feeds, the iPod exists solely for music — an oasis of focus in a distracted digital age.

For Gen Z, it's also a time machine. The device evokes memories of school commutes, carefully curated playlists, and the satisfaction of choosing songs without an algorithm deciding for you. In a fast-moving world, the iPod offers a rare chance to slow down, enjoy music intentionally, and reconnect with a simpler era.



GUO JIATONG

A classic iPod holds timeless appeal amid today's algorithm-driven music world. VCG

LI CHANG / CHINA DAILY

Humanities students embrace AI

As artificial intelligence expands across industries, liberal arts graduates are discovering fresh opportunities in product, content and ethical design.

By **GUI QIAN** and **XIONG XINYI**

For Xu Sihan, a literature graduate student based in Beijing, a pivotal moment came in 2024 when she compared AI translations of classical Chinese literature with the translations she had done as an undergraduate.

"I could no longer tell the difference between human and AI-generated literary translations," Xu said. Unsettled, she turned to her professor for guidance. That conversation ultimately became a turning point, steering her toward internships in the AI industry.

When Xu asked how the humanities could remain relevant in the age of AI, her professor told her that human writing is rooted in unspoken emotions and personal stories — things that resonate with others even when the writer cannot fully explain them. What makes human expression unique is the writer's lived experience.

That insight strengthened Xu's belief that the humanities and AI need not be at odds. When applying for internships, she began prioritizing AI-related roles. In 2025, after sending out numerous applications and receiving only one offer, she became a public relations intern working on AI-related projects at a major tech company. She has since moved into an AI product role at another tech firm.

Looking back on her first internship, Xu said the greatest benefit, as someone from a liberal arts background, was gaining a deeper understanding of the AI ecosystem.

"Before I entered the industry, I followed AI news casually, but once I was in it, I was exposed to at least five times as much information," she recalled. Being surrounded by people who constantly discussed AI made it impossible to remain a casual observer.

"You can no longer tell yourself it is enough to be interested from afar. You must get in the game," she said. The most valuable part, she added, was seeing firsthand how the industry evolved and how professionals responded to each technological shift.

As Xu shared her journey online, she began receiving messages from other liberal arts students asking how they could move into AI-related work. Many worried about missing out, being replaced, or not knowing which roles to pursue.

Those questions pushed Xu to think more concretely about where liberal arts students can fit into the AI industry. She pointed to two possible directions.

The first is to identify real-world needs and focus on practical applications. Xu gave an example of a conversation with a friend working in human resources.

Through that discussion, she realized that job seekers needed an AI agent, or automated assistant, capable of matching job seekers with suitable openings.

For Xu, that unmet need became a product opportunity — one where liberal arts students can contribute by understanding people's needs and translating them into useful applications.

The second direction is to focus on the human and ethical sides of AI. Tasks such as shaping AI personas or helping AI communicate more warmly and empathetically, she said, draw directly on the strengths of liberal arts students.

Xu also noted that the job market in 2026 has become even more competitive. Liberal arts students seeking AI-related positions, she said, may need to demonstrate their abilities through tangible work, such as creating a demo with AI coding tools.

Fortunately, as more people enter the AI field, learning resources have become increasingly abundant. Even students without a computer science background can now begin to understand the basic logic of how AI systems work through online courses.

Above all, Xu stressed the importance of not setting limits on oneself.

"I never set limits on myself because of my identity as a liberal arts student," she said. "That's why I ended up doing work that doesn't look like a typical liberal arts job."

"You can no longer tell yourself it is enough to be interested from afar. You must get in the game."

Xu Sihan, a literature graduate student based in Beijing

"For non-tech people, including liberal arts students, the opportunities far outweigh the challenges."

Liu Dingding, a Beijing-based internet analyst

Finding new paths

If Xu's story shows how students are beginning to find their place in AI, Du Xinqian's path reveals how that shift can unfold after several years in the tech industry.

Du, who studied media in graduate school, moved into tech in 2020, drawn by the rapid growth of the internet industry. She began pursuing internships and roles in the field, eventually landing her first job as a data product manager at Chinese services platform Meituan. She has since pivoted again and is now building her own AI startup.

Before ChatGPT-style generative AI models took off, Du said, the tech industry was largely dominated by major companies, leaving limited room for individuals and small teams. AI, she believes, has created more opportunities for smaller organizations and solo entrepreneurs.

Today, Du shares practical, hands-on experience with AI on social media under the handle "Haihadu". She describes her approach as "pragmatic AI": using AI to solve real workplace problems, rather than chasing flashy effects or treating the technology as a status symbol.

For instance, she uses AI to create content for e-commerce operations, repurpose livestreams into short clips and analyze product performance data.

Du recalled a designer friend who had spent tens of thousands of yuan learning AI but still struggled to use the tools in his own work.

"I walked him through his workflow and pointed out that only the design stage was worth improving with AI," she said. "If he could master that step and scale it up, he would actually make a profit."

"People love learning new AI knowledge but struggle to connect it to their own work," she said. "They are eager to use AI to streamline their work, yet often overlook the costs and benefits. Not every step will need AI optimization to bring significant improvement."

Du emphasized the importance of connecting AI knowledge to one's own work instead of blindly following trends.

"AI information is vast and fast-changing, and chasing the latest can be overwhelming," she said. "Start with your daily work and needs and figure out where AI fits into your own tasks."

Roles keep evolving

Taken together, Xu and Du's experiences suggest that AI is not only creating technical jobs but also redefining what non-technical workers can contribute. Analysts say this reflects a broader shift in the industry.

Wang Peng, an associate research fellow at the Beijing Academy of Social Sciences (BASS), has observed a fundamental change in AI hiring.

"The industry is moving from being purely technology-driven to being application-driven," he said. Non-technical roles, he noted, have evolved from basic data labeling to positions such as AI product managers, prompt engineers, and domain specialists.

The barrier to entry has also changed. It is no longer only about coding ability, but also about business knowledge and proficiency with AI tools.

"It is not an easy fallback option, but a field that emphasizes real cross-disciplinary competence," Wang said.

Liu Dingding, a Beijing-based internet analyst, placed the shift in a broader context.

"In the past, programming was only for tech people who understood code," he said. "Now liberal arts students with ideas can use AI to generate code, articles, images, and short videos."

AI, he believes, is less about replacing people than amplifying their creativity. "For non-tech people, including liberal arts students, the opportunities far outweigh the challenges," Liu said.

As Xu and Du's stories show, AI presents real opportunities for liberal arts students. But those opportunities are not automatic. They require a proactive mindset, practical learning, and the willingness to apply new tools to one's own field.

For Xu, the uncertainty that once made AI feel threatening is now part of what makes the field exciting.

As she put it, "This field is so new that everyone starts from zero."

Z WEEKLY

Finding beauty in darkness

Award-winning photographer Cai Jialing dives into darkness to reveal the tiny, luminous lives most people will never see.

Cai Jialing prepares to descend for a blackwater dive in Anilao, the Philippines, in June 2025. PROVIDED TO CHINA DAILY

Blackwater creatures photographed by Cai Jialing. The image at the top right, *Snowy Night*, earned her the title of Ocean Photographer of the Year 2023. PROVIDED TO CHINA DAILY

By **GUI QIAN** and **WANG JINGYAO**

As night fell, the sea looked like a vast sheet of black silk.

With a backward roll from the edge of the boat, Cai Jialing slipped into the water and began her descent. Around her was endless darkness: no seabed in sight, no shoreline — only a surface buoy above, with a faintly glowing line dropping into the black below.

The creatures she had come to find were gathering around that thin column of light: sea butterflies, salps, transparent octopus larvae — some no bigger than a fingernail, yet so delicate and strange they seemed almost extraterrestrial.

Suspended almost weightlessly in the dark, Cai raised her camera and followed these tiny lives as they rose from the deep — hundreds of meters below.

This is blackwater photography: the art of capturing drifting marine life at night in the open ocean. Only a handful of people in the world do it well. Cai, 28, is one of the youngest.

Before finding her way into blackwater photography, Cai knew almost nothing about diving. She grew up in Chongqing, an inland city in Southwest China, and had no formal training in photography. Yet she had always had "a restless, adventurous spirit" — an instinct that eventually led her to the sea.

In 2016, while studying biology and environmental science at the University of Virginia, she took a highly specialized course in marine biology. Her professor introduced the class to diel vertical migration — the nightly ascent of zooplankton from the deep ocean toward the surface. By day, these animals stay hundreds of meters below to hide from predators; at night, they rise to feed.

This daily movement, often described as the greatest migration on Earth, left Cai in awe. "It felt like a summons from the sea," she recalled.

After the course, she began learning to dive, starting with recreational scuba before gradually moving into the far more demanding world of blackwater diving.

"Blackwater diving is completely different from diving at a typical resort site," Cai explained. "There's no visible seafloor. If you lose control of your buoyancy, you can rise too fast or sink rapidly — either can be life-threatening."

In 2018, Cai tried blackwater photography for the first time in the Philippines, home to one of the world's most experienced blackwater diving communities. Whenever she encountered something she did not understand, there was always someone she could turn to for advice. She would take those ideas underwater, test them on a dive, and come back with new questions.

"Through trial and error, and a lot of practice, I slowly figured it out," she said, and her work began reaching wider audiences.

Rethinking the frame

In 2023, one photograph changed Cai's career. The image, *Snowy Night*, earned her the title of Ocean Photographer of the Year 2023, awarded by Oceanographic Magazine, an international competition recognizing the world's best ocean imagery. It captures a female paper nautilus, or argonaut, riding a drifting wooden stick through dark water, surrounded by countless fine particles that scatter like snow.

The photograph was taken in the Philippines after a nearby volcano erupted, stirring sediment into the water.

While many photographers might have seen the poor visibility as reason enough to abandon the dive, Cai saw something different. For years, she had focused on perfecting her lighting to keep her backgrounds clean. This time, however, she embraced the tiny organisms and particles suspended in the water. The "snow" in *Snowy Night* — volcanic ash, plankton, and the ocean's own dust — became part of the image.

The award brought new opportunities. In January, Cai boarded an expedition vessel bound for Antarctica as a special correspondent for a citizen science project. Over the next two weeks, she completed seven dives in Antarctic waters, encountering penguins, leopard seals, and the plankton she loves most.

Few people knew, however, how anxious she had been before the trip. She had never used a dry suit — the insulated suit divers wear in freezing water — could barely lift the heavy scuba tanks and didn't even know how to assemble her own gear, because in Southeast Asia, there had always been someone to do it for her.

"I was spoiled by those days in 27 C Southeast Asian waters," she admitted.

She managed to fast-track her polar diving training and returned from the expedition with the photographs she had hoped to capture. Later, on her own website, she posted a detailed Antarctic diving guide titled "From 27 C to -1 C", documenting every step of her preparation.

Cai rarely uses lofty terms like "environmental protection" or "conservation" to describe her relationship with the sea. She acknowledges the damage humans have done to the ocean, but she hopes her photographs evoke not guilt, but love, curiosity and awe.

Through her lens, the ocean is alive with tiny, fragile, transparent beings — many of them unnamed, and almost never seen by the public. She wants to make these overlooked creatures visible. For her, the vertical migration of plankton is "one of nature's gifts to explorers", allowing divers to glimpse worlds the human body could never otherwise reach.

Today, Cai continues to dive at blackwater sites around the globe. She has "graduated" from tropical waters, as she puts it, and now seeks out deeper, colder realms.

Eight years after her first blackwater dive, her ocean adventure may still be just beginning.

Deep Dive

The second World Conference of Classics is being held from June 9 to 10 in Athens, Greece, bringing together scholars from around the world to discuss the preservation of classical civilizations, explore their contemporary relevance and foster cross-cultural dialogue at a time of growing global exchange and renewed interest in humanity's shared cultural roots.

Ahead of the event, China Daily surveyed 352 young people across six continents, more than 96 percent of whom belong to Generation Z. The findings offer a snapshot of how young people today encounter, interpret and connect with classical traditions from both the East and the West.

World classics gain new life in digital age

By **MENG WENJIE**
mengwenjie@i21st.cn

In the digital age, technology has changed how people experience classical culture. Films, video games and short videos have made ancient civilizations more familiar and accessible than ever before. But this wider reach also raises a question: how can classical culture be popularized without losing its depth?

According to China Daily's findings, 54.5 percent of respondents engage with classical culture primarily through popular media, while only 13.9 percent pursue systematic academic study. This gap may seem striking, but Huang Weiwei, a professor at the Center for Greek Studies of Beijing International Studies University (BISU), sees the figure in a more positive light.

"In fact, 13.9 percent is a high proportion for rigorous classical study," Huang explained. She noted that classical studies often require years of training in ancient languages — such as Greek, Latin, Sanskrit, or classical Chinese — as well as training in textual criticism and interpretation.

For most young people, digital media are often their first gateway to classical culture.

Huang described this trend as "an inevitable product of today's media environment" and emphasized that creative, audience-friendly formats can help make classical culture more approachable for younger generations. But she also cautioned that accessibility should not come at the cost of depth.

"Entertainment satisfies instant gratification, whereas classical studies pursue truth — these aims are fundamentally different," she said.

The survey also showed which parts of classical culture resonate most with young people. Among Chinese cultural elements, "martial arts, myths and Eastern fantasy stories" ranked first, attracting 31.3 percent of respondents. By contrast, only 10.8 percent chose "the wisdom of ancient thinkers such as Confucius".

Huang Weiwei

Huang said the results reflect a long-standing discussion in classical studies: narrative versus abstract thought.

"Stories engage the emotions, while philosophy appeals to the rational mind," she explained. "It's natural that most people are drawn to narrative rather than abstract reasoning."

Yet Huang stressed that the two should not be treated as opposites. Literary works can also convey profound ideas, and philosophy can be brought to life through imagination and storytelling. For her, keeping classical culture alive means combining intellectual depth with a compelling narrative.

"Many great thinkers communicated complex ideas through allegory," she said. "Zhuangzi in China and Plato in the West both used stories to express sophisticated concepts."

The survey also pointed to another encouraging trend: young people's openness to comparing civilizations. About 38 percent of respondents said they were most intrigued by "discovering that two distant civilizations can share similar philosophical views" while 32.4 percent were impressed by "completely different solutions to the same problem".

Huang describes this mindset as "mature pluralism".

"Today's youth can appreciate shared human concerns while respecting cultural differences," she said. "It's not about ranking civilizations or assuming everyone is the same. It's about finding common ground without erasing diversity."

Meanwhile, young people are increasingly aware that classical heritage is more than physical relics. While 21 percent of respondents expressed concern about damage to artifacts and historic sites, 30.7 percent worried about the loss of language and philosophical understanding.

This awareness raises a deeper question: what relevance does classical study hold for young people today?

Huang said many students at BISU struggle with Greek or Latin and sometimes wonder whether such difficult study is worth it. Her answer is that classical education provides a long-term perspective, offering a form of "immunity" against the fragmentation and distractions of modern life.

"When we read the classics, we see that challenges faced thousands of years ago are not so different from our own," she said. "This perspective strengthens us, helping us face today's problems without feeling isolated or powerless. We study the classics to live more consciously in the present — and to meet the future with hope."

WORLD CUP 2026

Small country has big soccer dreams

Players hope to put Cape Verde on the map

Clockwise from above: Cape Verde players pose for a team photo before an Africa Cup of Nations qualifier against Egypt on Sept 6, 2024; Cape Verde fans offer enthusiastic support to their team during World Cup qualification; Cape Verde shirts hang alongside souvenirs featuring Cesaria Evora, the late folk-singing superstar, at the airport on the island of Sao Vicente, Cape Verde. REUTERS

Cape Verde sways to the sound of morna, a homegrown folk music laced with melancholy, longing and soul. Morna's most famous song, *Sodade*, remembers the tens of thousands of emigres who have left these 10 islands sprinkled off the coast of West Africa for work and opportunities abroad.

"If you write me, I'll write you," the song's lyrics go. "If you forget me, I'll forget you."

In the next few weeks, Cape Verdeans hope their sense of nostalgia will turn to celebration. Their eyes are on the national soccer team, which is packed full of stars whose parents, or even grandparents, left Cape Verde years ago, but who still consider the islands home.

The team, known as the Blue Sharks, is one of the surprise qualifiers for the 2026 World Cup. With fewer than 600,000 inhabitants, Cape Verde is the third smallest country by population to ever reach the world's biggest sporting event (after Iceland in 2018 and Curacao, also in 2026).

Cape Verde's national team combines local talent with a raft of foreign-born players, including centerback Roberto Lopes, who was born in Ireland to an Irish mother and Cape Verdean father, and Logan Costa, who was born in France to Cape Verdean parents and plays for Villarreal in Spain.

The combination of local and international talent has proven magically effective. Cape Verde won seven of its 10 World Cup qualifiers, losing just once and claiming a huge upset victory at home over African heavyweight Cameroon.

The World Cup will be another level. Ranked 69th in the world, the Blue Sharks will face tournament favorite Spain, two-time World Cup winner Uruguay and Saudi Arabia (a relative minnow, but still ranked higher at 61st) in the group stage.

But locals have faith.

"I'm very proud," said Anton Delgado, 25, after spending a recent Sunday afternoon with friends in a bar in Mindelo, a city on the island of Sao Vicente.

"It's a marvel. I've been waiting years for this. We have real hope that we can win a game or even two."

Rhode Island links

That sense of hope is widely shared across Cape Verde. The tiny nation's restaurants, bars and cafes are normally packed with singers and bands playing morna for tourists and locals alike. Now they are gearing up for the World Cup.

At the Cafe Royal, a hotel and restaurant in Mindelo, staff are planning for big crowds. The Royal features a large mural of morna superstar Cesaria Evora, who, even 15 years after her death, remains the most famous Cape Verdean in the world. But it is the country's soccer stars that everyone wants to talk about now.

Noaela Delgardo, 22, who works behind the bar at the Royal, said the World Cup is a rare opportunity for other Cape Verdeans to shine and for the country to gain "more visibility in the world".

Despite the growth of tourism, it is hard not to feel the archipelago's isolation and distance from bigger centers. There are flights from Europe, but the only direct flight to the United States lands in Providence, Rhode Island — a legacy of 19th-century whaling ties between the two places and the large Cape Verdean community that lives in Providence today.

The World Cup is a chance to close that distance, said pensioner Jorge Goncales, 69, while sitting with friends in a tree-filled Mindelo square.

"The whole world comes to us. Now we go out to the world."

Head coach Pedro Leitao Brito — who was named Africa's Coach of the Year last year and is better known by his nickname, Bubista — also sees a chance to put Cape Verde on the map.

"We want to make an impact on the tournament for our people," he told CNN a few weeks ago. "We want to show everyone watching that, yes, we're a small country, but we can play against the big teams. We know it's hard but we want to show that nothing is impossible."

REUTERS

Saudi has spent billions to build a sporting pedigree with World Cup at its heart

Saudi Arabia pulled off one of the biggest upsets in World Cup history by beating mighty Argentina in Qatar four years ago.

That stunning victory against Lionel Messi and the eventual champion turned out to be just the start of its campaign to disrupt soccer. Perhaps no nation has done more to shake up the world's most popular sport.

Within weeks, Cristiano Ronaldo became the first of a slew of superstars to swap Europe for the Saudi league, with the five-time Ballon d'Or winner declaring: "In Europe my work is done. This is a new challenge."

Karim Benzema was lured away from Real Madrid. Brazilian icon Neymar also made the move to the oil-rich kingdom. While attempts to land Messi and Kylian Mbappe were unsuccessful, Saudi Arabia did secure its biggest win of all: The right to host the 2034 World Cup.

It was all part of the country's attempt to pivot away from its heavy reliance on oil and explore other revenue-generating sectors.

Billions of dollars have been spent to secure world championship boxing, Formula One racing and tennis. The Saudi-backed, big-money LIV Golf enticed major winners to defect from the PGA.

Left: Saudi Arabia head coach Georgios Donis gestures during an international friendly against Ecuador on May 30. **Above:** Salem Al-Dawsari of Saudi Arabia reacts after scoring a goal during a friendly match against Puerto Rico on June 5. REUTERS / AFP

It recently announced it would be pulling funding from that venture, but its commitment to soccer remains strong. A number of its top teams are owned by the country's sovereign wealth fund.

2026 expectations

This year's tournament will be a test of how far the Saudi national team has come against the backdrop of such spectacular spending.

"We cannot promise miracles, but we promise you that we will give our all to achieve our goals," newly appointed coach Georgios Donis said.

An influx of top overseas talent does not necessarily translate to improved performance of homegrown players on the international stage.

There was the disappointingly early elimination from the Asian Cup in 2024 in the round of 16. Saudi Arabia's most memorable contribution to that tournament — a little over 12 months after the landmark win against Argentina — was Italian coach Roberto Mancini walking off during his team's losing penalty shootout against South Korea. Months later, Mancini was out of a job.

Frenchman Herve Renard, who had led the team in Qatar in 2022, returned to the helm, and the team promptly secured qualification for this year's tournament. But in April, less than two months before Saudi Arabia kicks off its World Cup campaign, Renard was replaced by Greek coach Donis.

Late arrival

Donis has coached several teams in the Saudi league and has also worked with a number of the players who will be going to the World Cup. Among them is striker Firas Al-Buraikan, a back-to-back Asian Champions League winner with Al-Ahli.

His appointment at such short notice appears to have been based on his specific knowledge and experience of Saudi soccer, with the Saudi Football Federation saying he was "expected to support a seamless transition".

"The advantage for us is that I have spent many years in Saudi Arabia and I know the culture of the country and the players. Therefore, we want to be very competitive and fight hard," Donis said when announcing his squad last month.

Homegrown players

While star signings from overseas have slowed, with big names also departing — including Neymar — the governing body of Saudi soccer has made moves to develop its own players.

In May, Matt Crocker was lured away from his role as US Soccer's sporting director to head up talent development in Saudi Arabia.

Youth investment has doubled over the past three years to $26.7 million, with an expansion of regional training centers, all with a view to successfully contesting the 2034 World Cup on home soil.

Before all that is this year's tournament and the chance to shock the world again.

"I believe all the players have the ability and passion required to commit to our plan, which will enable us, step-by-step, to build a strong and united team," Donis said. "I believe in their abilities, so my priority now is for them to believe in their abilities, to be convinced of the plan, and to know what is required of them."

China-DPRK ties gain impetus

Significance of Xi's visit goes beyond bilateral scope with regional, global view, observers say

By **MO JINGXI**
mojingxi@chinadaily.com.cn

President Xi Jinping's visit to the Democratic People's Republic of Korea has opened new prospects for China-DPRK relations and added positive energy to regional and global peace and development, a senior official and analysts said.

Coming at a critical moment, the visit was rooted in the development of bilateral ties, yet its significance extended far beyond the bilateral scope, demonstrating China's sense of responsibility as a major country and its growing international influence, they said.

Xi, also general secretary of the Communist Party of China Central Committee, concluded a successful two-day state visit to the neighboring country on Tuesday, his first visit to the DPRK in seven years and his first overseas trip this year.

Inside
Views, **page 7**

Briefing reporters at the end of the visit, Liu Haixing, head of the International Department of the CPC Central Committee, said that as this year marks the 65th anniversary of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, and amid accelerating changes unseen in a century in a turbulent world, the top leaders of the two sides took a broad and long-term view, built on past achievements and opened up a new future. They also jointly charted the course for development and worked together to promote peace, Liu added.

He said the visit injected new contemporary connotations and strong impetus into the traditional friendship between China and the DPRK, marking an important milestone in the history of bilateral relations.

During Xi's stay in Pyongyang, the DPRK capital, Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the DPRK, greeted Xi at the airport in person, held a grand welcoming ceremony at Kim Il-sung Square, and accompanied Xi throughout the two-day visit. The DPRK also arranged a carefully prepared artistic performance.

Wherever Xi went, crowds of local people applauded and cheered, while people along the streets stopped and waved at the passing motorcade. Liu said those scenes and the smiling faces fully showed the great importance that the DPRK attached to Xi's visit and the thoughtful arrangements it had made for the visit.

They also reflected the sincere friendship of the DPRK's people toward the Chinese people, as well as the deep foundation and solid roots of the traditional friendship between China and the DPRK, he said.

According to Liu, Xi and Kim had long and in-depth communication during the visit. Their exchanges included formal talks, relaxed walks and warm interactions in a family-like atmosphere.

Stressing that China and the DPRK are both socialist countries led by communist parties, Xi said during talks with Kim that the traditional friendship between the two countries is rooted in their shared ideals and beliefs as well as their common goals, and is backed by a profound historical foundation, a solid political basis and strong emotional bonds.

Xi noted that friendship passed down from generation to generation, a shared future and mutual support have always been defining features of China-DPRK relations.

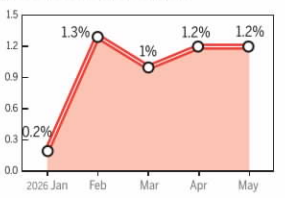
Ebola response

Workers transport Ebola prevention supplies in Mongbwalu, Ituri Province, Democratic Republic of Congo, on Tuesday. The country's public health authorities said that as of Monday, the number of confirmed Ebola cases in the current outbreak in the DRC had risen to 598, including 115 deaths. XINHUA

Producer prices point to better supply-demand dynamics

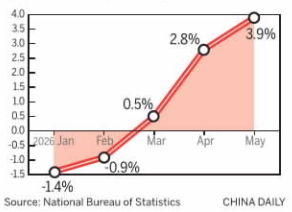
By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China's factory-gate inflation grew in May at the fastest year-on-year rate since July 2022, even as consumer inflation remained moderate, adding to signs of strengthening reflation momentum and improving supply-demand dynamics across the industrial sector, experts said on Wednesday.



The latest readings came as fluctuations in global energy prices and a surge of investment in artificial intelligence continued to feed through to the world's second-largest economy, they added.

Looking ahead, experts said that such momentum could underpin a more positive price outlook in the coming months.



Their comments came after data from the National Bureau of Statistics showed that China's producer price index, which measures factory-gate prices, rose 3.9 percent year-on-year in May, accelerating from a 2.8 percent increase in April and marking the third straight month of recovery.

Dong Lijuan, a statistician at the bureau, said the increase in factory-gate inflation in May reflected stronger demand in certain domestic industries and the pass-through effect of fluctuations in international commodity prices.

Consumer price index (CPI) growth rate year-on-year

Producer price index (PPI) growth rate year-on-year

Source: National Bureau of Statistics CHINA DAILY

"The deeper integration of AI with various industries and growing demand for computing power helped push up prices in sectors such as computer-related manufacturing, electrical machinery and nonferrous metals," Dong said.

Echoing that view, Lu Ting, chief China economist at Nomura Securities, said that AI-related fixed-asset investment is expected to contribute 0.3 percentage points to China's GDP growth in 2026.

However, on a month-on-month basis, the PPI edged up 0.5 percent in May, slowing from a 1.7 percent increase in April.

"The slowdown was mainly due to moderating oil price gains," said Feng Lin, executive director of research at Orient Golden Credit Rating International.

At the same time, consumer inflation remained moderate. China's consumer price index, the main gauge of inflation, rose 1.2 percent from a year earlier in May, matching the increase in April, the NBS said.

Lynn Song, chief economist for China at Dutch bank ING, said that China's inflation has stayed at or above 1 percent for four consecutive months and remained in positive territory for eight straight months, suggesting that the trend of reflation, the restoration of deflated prices to a desirable level, is solidifying.

NBS data showed that the core CPI, which excludes food and energy prices and is considered a more accurate indicator of supply and demand conditions, increased by 1.1 percent year-on-year in May.

Despite the improving trend in prices, analysts said that the widening gap between factory-gate and consumer inflation could put pressure on the margins of downstream firms, underscoring the need for more targeted policy support.

"A sustained recovery in prices still hinges on stronger domestic demand," said Mao Zhenhua, chief economist at China Chengxin International Credit Rating Co.

He added that stronger efforts are needed to boost household purchasing power, especially for lower-income groups, and to further tap into services consumption.

Looking ahead, Wen Bin, chief economist at China Minsheng Bank, said that China's price trend is expected to improve further as domestic demand potential continues to be released and a lower comparison base comes into play.

The improving price outlook has further bolstered confidence among global executives.

Pascal Daloz, chairman and CEO of French industrial software company Dassault Systemes, said that the company is seeking to strengthen its industrial AI ecosystem in China.

"China has become one of the places where innovation is moving fastest," he said.

Ancient thought can help avoid Thucydides Trap

WORLD WATCH
By Tom Watkins

In rereading the book *Lure the Tiger Out of the Mountains: The 36 Stratagems of Ancient China,* by Gao Yuan, I pondered how thinking like an ancient Chinese might help the world avoid the Thucydides Trap.

The Thucydides Trap, a term coined by Harvard academic Graham Allison, is a hypothesis in international relations that is summarized from historical experience. It holds that when a rising power challenges the dominance of an established power, structural fear — rather than malicious intent — greatly raises the risk of confrontation and full-scale war.

The Thucydides Trap entered global discourse again recently when President Xi Jinping asked US President Donald Trump, during their recent summit in Beijing, "Can China and the United States transcend the Thucydides Trap and forge a new paradigm for major-country relations?"

Although some in the West hold a narrow view that Western thought is the sole source of wisdom, how ancient Chinese pursued challenges has an impact on current Chinese thinking and should not be overlooked by the US administration.

While thought and theory in Western international relations often focus on zero-sum power struggles, ancient Chinese philosophy prioritizes patience, indirect action and the preservation of relationships.

Here is how concepts from *Lure the Tiger Out of the Mountains* and classical Chinese philosophy can help the two nations avoid the Thucydides Trap, which, if fallen into, would have deadly consequences for both countries as well as for all of humanity.

The stratagem "lure the tiger out of the mountains" advises against attacking an enemy where they are strongest. Instead, it suggests changing the environment or context to make them vulnerable.

Avoiding the Thucydides Trap in modern diplomacy means shifting competition away from military flashpoints. Instead, nations can channel their rivalry into constructive arenas like green energy, space exploration, fixing trade barriers, or global health. By changing the "mountain" — the context of the competition — the risk of direct and accidental military conflict can drop significantly.

In Sun Tzu's *The Art of War*, the ultimate achievement is "to win without fighting".

Western deterrence theory often relies on visible, overwhelming military buildup, which can trigger a "security dilemma" in which both sides keep arming out of fear. The Cold War between the US and the Soviet Union makes this point clearly. The Chinese strategic tradition views open warfare as a failure of strategy.

SICHUAN RAILWAY MAKES SONG AND DANCE OF SILK ROAD EXPERIENCE

Panda train embarks on maiden voyage across Northwest China to Xinjiang

By **PENG CHAO** in Chengdu
pengchao@chinadaily.com.cn

At Anjing Station in Chengdu, the capital of Sichuan province, the departure gate opened onto a scene reminiscent of a festival. Women in flowing *hanfu* glided forward, palace lanterns in hand. Lion dancers threaded their way through the crowd, panda mascots wobbled with open arms, and the air hummed with the sound of traditional instruments.

China Vibes

Tan Kar Meng, a 60-year-old from Malaysia, couldn't resist stepping up to a lion. "This experience is amazing," he said, laughing. "I never expected anything like this."

He was one of the 92 passengers on the debut journey of the Jinxiu Tianfu, the latest in the Panda Train portfolio — a boutique rail tourism brand launched in 2021.

Its destination was the Xinjiang Uygur autonomous region. The train promised to take passengers across the vast expanse of northwestern China in the style of the Song Dynasty (960-1279).

Xinjiang has always been a land of long journeys and logistical challenges. At more than 1.66 million square kilometers, covering both its northern grasslands and southern Silk Road cities usually means days of bone-wearying bus rides. The Jinxiu Tianfu changes that: Travel by night and wake up to a new horizon.

The 18 train cars contain 46 private rooms, each equipped with a bathroom, smart controls and a minibar. The observation car provides the vantage point to enjoy the natural beauty of lakes, snow-capped peaks and desert canyons.

RURAL VITALIZATION: LIVE AND EMPOWERING

Grassroots Party workers go the extra mile online to turn around fortunes of villages across nation

By **ZHOU HUIYING** in Harbin and **WU YONG** in Shenyang

From the ancient Liaohe River in Tieling, Liaoning province, to the beautiful villages in Jiangxi province, from the harmonious countryside by the Yangtze and Huaihe rivers to the snowy forests beneath the Greater Xing'an Mountains, grassroots Party workers are using mobile phones as new tools, the internet as a new platform and livestreaming as a new means of communication.

They are bringing agricultural fields into livestreaming rooms, sending local cultures onto cloud platforms and connecting policies that benefit the people to thousands of households.

Every afternoon, Hu Yuming, 44, appears on time for his livestream, interacting with netizens from across the country to promote the unique charm of Hejiaxin village in Tieling. He highlights the village's lush grasslands, vibrant wetlands, rich ecological foundation, profound revolutionary heritage and distinctive folk culture.

Hu, the first Party secretary stationed in Hejiaxin, has broken new ground with an integrated model of new media, cultural tourism and public welfare. In collaboration with the countywide first secretary alliance in Tieling, he uses dedication and innovation to paint a real, new-era picture of prosperous industries, beautiful countryside and wealthy villagers.

In September 2021, Hu, who was selected by the Liaoning Police and Judicial Management Cadre College, came to Hejiaxin to serve as its first Party secretary. When his two-year term ended in 2023, he resolutely applied for continuing work in the countryside.

"At that time, the village was seeing some progress in terms of rural development, such as the emerging revolutionary tourism. I hoped to help make it better, so I decided to stay," he said.

In March 2024, authorities in Tieling organized a series of training sessions for over 100 village-level first secretaries on topics such as new media technology and livestreaming, aiming to encourage them to promote local economic development through online platforms.

"The training helped me a lot. While I picked up technical skills, I also realized that the internet can drive economic growth and benefit the local people," Hu said.

In May last year, Hu did his first livestream on Hejiaxin's vast grasslands. "The two-hour session attracted some viewers," he said. "I kept talking as I wanted, introducing the beautiful scenery and local specialties of the village."

There has been no turning back. Hu continues to livestream from the grasslands, and has added memorial halls and farms to his location list. To date, he has helped villagers sell agricultural produce, such as sweet potatoes, corn and garlic sprouts, worth over 50,000 yuan ($7,375).

Hu often has his livestream audiences riveted to the screen with stories about the ancient river, the revolutionary history of Hejiaxin and the village's grassland customs, striving to create a characteristic cultural tourism IP.

In June last year, he planned and organized a grassland kite festival, featuring big displays, parent-child DIY sessions, folk experiences and internet celebrity check-ins.

Through livestreaming, short-videos and a comprehensive network matrix, Hejiaxin attracted over 30,000 tourists during the three-day festival, transforming the once sleepy village into a popular rural tourism spot in northern Liaoning.

Tieling has many first secretaries like Hu, who have dedicated themselves to front-line work and are empowering the countryside with the help of the internet.

The Tieling Municipal Party Committee's Organization Department has led the establishment of platforms and resource integration, forming 42 first secretary professional alliances, strengthening bonds among villages and achieving resource-sharing. Such collaboration has formed a comprehensive service system that uses livestreaming to promote agricultural produce and improve villagers' lives.

"As a member of the first secretary e-commerce alliance, I have participated in numerous cooperation and communication activities," said Hu. "We have supported each other, exchanged information and provided assistance for livestreams, achieving very good results."

Chen Jianguo, 46, Party secretary of Beishan village in Shangrao, Jiangxi, has revitalized the village using just a mobile phone and a livestreaming room.

A typical livestream starts with Chen adjusting his collar, placing a product — such as a jar of homemade preserved vegetables — on the table in front of the camera, and greeting viewers in his signature style: "Good evening, dear friends, and welcome to Beishan Secretary Chen's livestream".

With his professional demeanor, he has already become a local internet celebrity, driving annual agricultural sales worth more than 25 million yuan.

The economic transformation of Beishan is striking, given that the village was struggling to keep its head above water a few years ago.

Chen, who had left Beishan as a young man in 2004 to seek better opportunities in Zhejiang province, returned to his village after the Hefei-Fuzhou high-speed railway opened in June 2015.

"The convenience of high-speed transportation helped take Beishan's agricultural products outside, and brought Beishan's youth back home," said Chen, who closed his digital products store in Wenzhou, Zhejiang, and became a Party cadre in his village.

At a rural e-commerce training session organized by the government of Guangxin district, where Beishan is located, Chen chanced upon a whole new world. "The teacher talked about online programs that are helping drive rural vitalization, and I thought we could integrate resources to promote our agricultural products outside," he said.

In 2018, Chen was elected Beishan village secretary, and a year later, he opened an account on short video platform Douyin.

The start of his online journey wasn't smooth. "Villagers said that all I did was make videos with my phone. Some even went to higher authorities to complain that I was neglecting my duties," Chen said.

Instead of being demotivated by such skepticism, Chen engaged other villagers in making short videos and organized fun sports for farmers, giving everyone the opportunity to share the joy and experience the novelty of video-making through participation.

On May 26, 2023, Chen started his first livestream channel to help villagers sell their agricultural produce and other products. "I received 130 orders, although more than half were from my acquaintances," he said.

With policy support for agricultural e-commerce, Beishan started making big strides through livestreaming. Last year, the village's collective economy reached 500,000 yuan.

Today, Chen has more than 20,300 followers on Douyin, and the village has developed an effective sales and production cycle. It has also built a livestreaming base where villagers get 15 yuan per hour from packing and shipping work.

Over 330 livestreams throughout the year have linked the small village with outside markets and have reconnected villagers who had left home. Primary agricultural products have been developed into branded goods and cultural tourism items with increased value.

"When I returned to Beishan years ago, what I wanted to see most was young people serving their parents tea and tutoring their children at home," Chen said. "That dream is slowly becoming a reality."

Ding Jun, 42, deputy village Party secretary of Hehua in Mingguang, Anhui province, has transformed a small livestreaming room from an initial sales platform into a policy briefing platform to serve the community.

"I started livestreaming in October 2024, when my intention was to help villagers sell local agricultural produce such as gorgon fruit and water chestnuts," he said. "However, as my program began, the most frequently asked questions were about healthcare, pensions, social assistance and homestead issues."

Ding immediately readjusted his focus, interpreting official documents for villagers and breaking down complex procedures into simple steps.

"It is not an easy task, as I first need to thoroughly understand the relevant information," he said. "The most challenging part is when many followers from other places ask me about their local livelihood policies."

To help these people, Ding jots down their questions, seeks details from relevant local departments and then shares the information during his next livestreaming session.

He has held over 300 livestreaming sessions to date, attracting 34,000 followers, with the total number of views exceeding 1.6 million. He has also mediated disputes and gathered public opinion on various local issues.

Hehua village is a microcosm of Mingguang. Since 2024, the city has organized village cadres and Party members to enter livestreaming rooms and bring their lectures to the fields. Using local dialects, they explain in a familiar way policies that benefit farmers.

Agricultural experts and sci-tech assistants have also joined some livestreaming sessions, teaching techniques step by step and solving farmers' problems.

This year, Mingguang launched 121 short videos on theoretical lectures, garnering 620,000 views. The city also livestreamed over 180 theoretical lectures, each of which attracted more than 1,000 views.

In early 2020, Du Bo crafted a vibrant story of cultural tourism revitalization in Northeast China, as she created a short video on epidemic prevention in the local dialect.

As the video garnered 750,000 views, Du, who was then director of the Culture and Tourism Bureau in Tahe county, Heilongjiang province, encountered the powerful reach of new media for the first time.

"The success inspired me to form my own new media team," she said. "In my spare time, we filmed short videos or livestreamed to promote the icy landscapes, forest ecology and ethnic culture of Tahe."

In early 2023, when temperatures in the county hit a harsh -20 C, Du donned traditional Oroqen attire to film a short video in a birch forest, titled *White Deer Fairy*. It went viral overnight.

"Our endeavor coincided with the 70th anniversary of the Oroqen people settling down since they moved out of the mountains," she said. "We went to see their ethnic costumes and cultural products, and those were exquisite. After getting the owner's consent, I borrowed the costumes for filming."

As the director of the tourism bureau, Du's job was to promote local tourism resources. "I not only promoted tourism, but also planned and built a large number of scenic routes and cultural projects each year," she said.

In 2024, Du became deputy director of the Enterprise Investment and Service Bureau of Hulan district in Harbin, the capital of Heilongjiang. However, her efforts to promote local tourism and economic development continued.

Du and her team have released more than 1,000 videos to date, with total views exceeding 4 billion and the number of followers across all platforms reaching over 2 million.

Harnessing of classical wisdom highlighted

Initiative issued at Athens conference calls for 'promoting friendship and coexistence'

By **WANG HUAZHONG** and **ZHENG WANYIN** in Athens

Classical wisdom should illuminate humanity's path forward and address key questions of our time, including how to keep our world in peace and order, according to an initiative announced at the closing ceremony of the Second World Conference of Classics in Athens, Greece, on Wednesday.

Surrounded by stunning frescoes depicting Prometheus stealing the fire to enlighten the human world at the Academy of Athens, over 200 scholars from Asia, Europe, America and Africa engaged in in-depth discussions to reach the consensus regarding the role of classical studies in safeguarding the future of humanity.

"Only by knowing where we come from can we understand where we stand today and where we are heading," said the initiative.

It urged "harnessing the power of virtues in classical wisdom" to remain steadfast on the right course of civilization, "promoting friendship and coexistence" to build a home for our shared future of humanity, "safeguarding peace and order" to strengthen the foundations of future security, and "cultivating humanistic values in the digital age" to guide technological progress.

"We are confident that classical studies will provide an inexhaustible source of wisdom and strength for humanity's peace, development and shared future," it said.

Scholars told China Daily that it was the right time for Chinese and Greek academies to co-host the conference in Athens, which is also a symbolic city of dialogue in ancient history, as the world experiences fundamental changes and rising conflicts of interests and ideologies.

Roger Ames, humanities chair professor at Peking University and vice-president of the International Confucian Association, said the world should congratulate China for helping to shift the world's conversation from geopolitics to civilization.

Inside

Views, **page 7**

"What China has been doing for the last 20 years is promoting a civilizational dialogue where we talk not about money and military power, but about family, values, shared histories, and what we want for our grandchildren."

Amphilochios Papathomas, a professor of ancient Greek literature and papyrology at the National and Kapodistrian University of Athens, said the escalation of conflicts can be avoided through dialogue.

"What we have learned from classical authors, like Thucydides, is that we have to be very cautious to avoid a military and political escalation," he said. He added that the peaceful shift in the balance of power between the United Kingdom and the United States in the early 20th century showed it was possible to avoid the "Thucydides Trap" of military conflict because the two countries had mutual respect.

Hu Yujuan, a senior researcher from the Institute of World History at the Chinese Academy of Social Sciences, added that war cannot be ended by war but by love and benevolence.

She said that the ancient Roman Empire once revered Mars, the god of war, and achieved only a temporary form of "peace through war". However, after turning to worship Venus, the goddess of love, it entered a period of lasting stability known as the "Pax Romana". "Classical wisdom tells us violence cannot resolve all conflicts. Only the power of love can eliminate conflict," she added.

Displaced by disaster

Residents carry their belongings as they evacuate on Wednesday following a landslide triggered by a magnitude 7.8 earthquake in Barangay Kapatan on the southern coast of Mindanao, the Philippines. Authorities said Monday's earthquake affected more than 33,000 households, leaving at least 45 people dead, 17 missing and 487 injured. NOEL CELIS / REUTERS

Train: A moving tribute to Sichuan's textile history

From page 1

The dining car serves Sichuan flavors alongside Silk Road specialties. Bilingual guides, butlers, round-the-clock luggage service and an onboard medical team ensure the journey is seamless.

Panda motifs adorn the walls, while plush toys and even desserts provide a tender nod to Sichuan, the homeland of these beloved creatures. However, the deeper design language belongs to the Song Dynasty, the aesthetic of which is widely considered the pinnacle of ancient Chinese refinement: simplicity, restraint and a profound reverence for nature.

Passengers are invited into the four refined arts of the Song: whisking tea, appreciating incense, arranging flowers and hanging painted scrolls.

Shu brocade and Shu embroidery, each an intangible cultural heritage item, grace seats, fans and ornaments. It's a moving tribute to Sichuan's 2,000-year history of producing the textile that gave the Silk Road its name.

The 16-day debut journey departed on May 19, visiting Urumqi, Tianshan Tianchi, Kanas, Sayram Lake, Kashgar and Turpan. The days were filled with workshops on cultural heritage, visits to Tajik households and Silk Road-themed concerts. Nights belonged to the train.

Lian Hua, vice-chairman and general manager of Sichuan Tourism Investment Group, noted that over 80 percent of tour packages had already been booked — 90 percent by inbound tourists. It seems that the hunger for such experiences stretches far beyond China's borders.

Tensions rise after US helicopter downed

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Tensions between Iran and the United States reignited after Washington blamed Tehran for the downing of a US military helicopter, prompting retaliation from Iran and likely adding obstacles to ending the war amid weeks of deadlock.

US President Donald Trump in a social media post said the Iranians shot down a highly sophisticated Apache helicopter while it was patrolling the Strait of Hormuz.

"There were two pilots involved, both are safe and uninjured. Nevertheless, the United States must, of necessity, respond to this attack," said Trump.

The US Central Command, or CENTCOM, said in a post on social media platform X that forces began launching "self-defense strikes" against Iran at 5 pm on Tuesday at the commander-in-chief's direction.

"CENTCOM forces struck Iranian air defense, ground control stations, and surveillance radar sites near the Strait of Hormuz with precision munitions from US Air Force and Navy fighter jets. The operation was a proportional response to recent attacks on US forces and international commercial ships transiting regional waters," it said.

It added that the US forces remain vigilant and postured to defend against "unjustified Iranian aggression".

Iranian Foreign Minister Abbas Araghchi said in a post on X that despite its "defeats on the battlefield", the "US opted to test our determination" as he warned that Iran's armed forces "will leave no attack or threat unanswered".

"Leave our region if you want to be safe. History of the Persian Gulf has many chapters on dire fates of intruding outsiders," said Araghchi.

Araghchi also held separate phone calls with his Turkish and Saudi counterparts, reviewing the latest regional developments in the wake of US military strikes against areas in southern Iran.

The calls, in the early hours of Wednesday, covered the rapidly evolving security situation following US aggression against Iranian territory, Iranian media reported.

Araghchi condemned the US military strikes as a violation of Iranian sovereignty and territorial integrity. He underscored Iran's right to self-defense and affirmed the legitimacy of the retaliatory response carried out by Iran's armed forces.

Iran's Foreign Ministry condemned US strikes on southern Iran as a violation of the United Nations Charter.

The Iranian Foreign Ministry also reminded regional countries, particularly those on the southern shores, of the Gulf of their legal and moral responsibility to prevent the US military and Israel from using their territory, facilities or infrastructure to plan, organize, execute or support aggressive operations against Iran.

The Islamic Revolutionary Guard Corps said it struck a US air base in Jordan on Wednesday, hitting four key targets, including F-35 fighter shelters. It also said that it attacked the US Fifth Fleet in Bahrain.

China, EU discuss consultation mechanism

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China and the European Union have held "in-depth and comprehensive" discussions on the establishment of a trade and investment consultation mechanism, signaling a willingness from both Beijing and Brussels to manage differences through equal-footed dialogue, experts said.

A structured consultation framework, they added, will help to prevent spiraling frictions and provide the certainty that businesses on both sides need.

The discussions took place during a Tuesday meeting in Brussels, Belgium, between Chinese Vice-Minister of Commerce Ling Ji and Ditte Juul Jorgensen, director-general of the European Commission's Directorate-General for Trade and Economic Security, the ministry said in a statement on Wednesday.

The two sides agreed to work toward pragmatic outcomes from the first meeting of the China-EU trade and investment consultation mechanism, with the aim of stabilizing bilateral economic and trade relations and promoting their sustainable development, according to the statement.

"China and the EU are far more complementary than competitive," said Cui Fan, a professor of international trade at the University of International Business and Economics.

Cui noted that every minute, trade between China and the EU exceeds 10 million yuan ($1.47 million), citing last year's trade data. "The consultation mechanism is an essential step toward properly handling frictions and finding the right way to resolve problems, which serves the interests of business communities on both sides," he added.

Since the beginning of this year, Brussels has broadened its trade defense tool kit, rolling out a series of restrictive measures aimed at Chinese companies and products.

Most recently, its efforts to compel European businesses to diversify their suppliers, under the proposed revision of the EU's Cybersecurity Act, have added yet another layer of investment barriers and institutional discrimination, with China bearing the brunt.

"The EU's increasingly closed internal market is hindering its ability to learn from and absorb cutting-edge technologies, thereby constraining potential pathways for industrial catch-up," said Sun Yawen, an assistant research fellow at the Chinese Academy of Social Sciences' Institute of European Studies.

The continuous escalation of protectionist measures is unlikely to stimulate innovation among EU companies, trapping the EU in a vicious cycle, Sun added.

Despite the EU's "de-risking" agenda, European companies are doubling down on manufacturing in China, according to a survey by the EU Chamber of Commerce in China last month.

"We are seeing EU companies actively adapting to China's dynamic business environment, as China is not only a market full of opportunities but has also become an indispensable source of innovation for their global operations," said Denis Depoux, global managing director of consultancy company Roland Berger.

Thought: Collective intellect called for

From page 1

If both ruling and rising powers adopt the mindset that actual warfare represents a mutual strategic defeat, they are more likely to seek diplomatic solutions.

While both approaches are examples of deterrence, the US-China economic reliance makes their relationship one of deep mutual dependency rather than strict ideological confrontation. This unique interconnectedness creates another layer of complexity.

Western political systems operate on short election cycles (two to four years), which often forces leaders to take aggressive, short-term stances to appease domestic voters. Ancient Chinese thought emphasizes generational timelines.

The Thucydides Trap is fueled by the fear of imminent displacement. If a rising power utilizes profound strategic patience — growing its influence incrementally without forcing a sudden, dramatic pivot in the global order — the ruling power has time to adapt. This slow, structural accommodation lowers the friction that typically sparks rapid, panicky escalations.

Traditional Western geopolitics often seeks a "balance of power" through opposing alliances (like NATO versus the Warsaw Pact), which draws hard lines in the sand. Chinese philosophy relies on the concept of yin and yang — the idea that opposing forces are interconnected, interdependent and necessary for harmony.

Instead of viewing a rival as an existential enemy that must be defeated, this mindset views the rival as a permanent, necessary counterweight. It shifts the goal from complete dominance to coexistence. Nations can fiercely compete in economics while simultaneously acknowledging that they need each other to maintain global financial stability.

The world is hoping that the inevitability of the Thucydides Trap can be avoided.

There are positive ways the US and China can shape the world. Let's spend our collective intellect working toward that end.

The author was former deputy chief of staff to former Michigan governor James Blanchard and was president and CEO of the Economic Council of Palm Beach County, Florida. The views do not necessarily reflect those of China Daily.

Visit: Talks deepened practical cooperation

From page 1

Zheng Jiyong, dean of the Institute of Regional Studies at Tianjin Foreign Studies University, said the development of China-DPRK ties is not merely a continuation of long-standing friendship, but an effort to give traditional friendship new relevance under changing circumstances.

"Under the new circumstances, it requires the integration of political mutual trust, pragmatic cooperation, people-to-people bonds and strategic coordination into a comprehensive framework of relationship that serves both the development interests of the two countries and regional stability," Zheng said in an opinion piece published on the website of the China Global Television Network.

Liu said the strategic guidance of the top leaders is the greatest strength and fundamental guarantee of China-DPRK relations.

Xi's visit came less than a year after Kim visited China, marking another round of close interaction between the top leaders of the two parties and the two countries. Last year, Kim attended commemorative activities in China marking the 80th anniversary of the victory in the Chinese People's War of Resistance Against Japanese Aggression (1931-45) and the World Anti-Fascist War.

According to Liu, the visit deepened practical cooperation and friendly exchanges in various fields to inject new impetus into the socialist cause of China and the DPRK. During the visit, the two leaders made concrete plans for the next stage of practical cooperation and friendly exchanges between the two countries.

On the second day of his visit, Xi paid homage to the China-DPRK Friendship Tower. Xi, accompanied by Kim, also visited the Central Cadres Training School of the WPK in Pyongyang.

Liu, the senior official, said that Xi congratulated the DPRK on the successful convening of the Ninth Congress of the WPK and the 15th Supreme People's Assembly, and spoke highly of the progress that the WPK and the DPRK people, led by Kim, have made in strengthening party building, developing the economy and improving people's well-being.

Liu said that Xi called for the two parties to actively carry out more friendly exchanges at all levels, deepen exchanges of experience in party and state governance, and continuously consolidate the political and public support foundation for bilateral relations and the development of the socialist causes of the two countries.

According to Liu, during the visit, Xi and Kim had an in-depth exchange of views on the current international and regional situation. Xi emphasized that China and the DPRK should strengthen strategic communication and coordination, firmly safeguard their respective sovereignty, security and development interests, jointly uphold regional peace and development, and create a better external environment for the two countries' socialist cause.

In response, Kim said that the vision of building a community with a shared future for humanity and the four China-proposed major global initiatives carry profound significance for promoting world peace and development, and have won the support and appreciation of people around the world.

Wang Junsheng, director of the Department of China's Regional Strategy at the National Institute of International Strategy of the Chinese Academy of Social Sciences, said the world is undergoing profound transformations, bringing significant changes to the geopolitical landscape of Northeast Asia.

"China and the DPRK play important roles in shaping the region's future. Strengthening bilateral cooperation not only helps maintain the sound development of their relations, but also contributes to peace and security across Northeast Asia," Wang said.

Respect for diversity of civilizations emphasized

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

All parties should "uphold respect for the diversity of civilizations as the foundation to consolidate global consensus on mutual learning among civilizations", said a Chinese think tank report released on Wednesday in Beijing.

On the occasion of the second International Day for Dialogue among Civilizations, the China Institute of International Studies, or CIIS, released the report titled "China's Actions for Advancing Global Dialogue Among Civilizations".

"More than ever, the power of civilization must be harnessed to address the challenges of the times and promote world peace and development," the report said.

It urged various parties to "break down cultural barriers by seeking harmony without uniformity, connect hearts and minds through openness and inclusiveness, and eliminate misunderstandings through dialogue and exchanges".

China first proposed the Global Civilization Initiative, or GCI, in 2023. The report said the country "stands ready to join hands with the international community to fully implement the Global Civilization Initiative and pool civilizational strength for building a community with a shared future for humanity".

In 2024, the 78th session of the United Nations General Assembly adopted by consensus a resolution proposed by China and 82 other countries, designating June 10 every year as the International Day for Dialogue among Civilizations.

The CIIS report aims to further review and summarize China's experience, practices and major achievements in promoting the implementation of the GCI and facilitating global dialogue among civilizations.

The report introduces the historical background and profound implications of the GCI, and it systematically reviews China's concepts, policies and practical achievements in promoting dialogue among civilizations from five aspects.

China has been pooling broad international consensus on exchanges and mutual learning among civilizations, supporting the UN in playing its role as the primary platform for dialogue among civilizations, and deepening bilateral and regional dialogue among civilizations, the report said.

Also, the country has been advancing multilateral cooperation on dialogue among civilizations, and integrating dialogue among civilizations into exchanges and cooperation across various fields. It also looks ahead to China's next steps in promoting dialogue among civilizations, according to the report.

Seeking safety

Displaced foreign nationals stand in a line to give their information to volunteers at a park in Durban, South Africa, on Wednesday, after fleeing their homes amid fears of xenophobic attacks. Ghana, Mozambique and Malawi are among the countries to which South Africa has repatriated their nationals this month, most of whom South Africa says do not have the correct documentation. The family history that lies beneath

By **MAY ZHOU** in Houston, Texas
mayzhou@chinadailyusa.com

In a talk following the screening of her first feature documentary film, *May the Soil Be Everywhere*, at the recent Houston Asian American Pacific Islander Film Festival, director Zhao Yehui discussed how she discovered a family history, and how that shaped the film's development.

Zhao's grandmother migrated from a village to a small town, her mother moved to a big city, and she moved to the US — so she had in mind to explore the story of migration across the generations of women.

The journey took her to an abandoned village tucked deep in the mountainous Loess Plateau in Central China. There, she discovered their ancestral home carved out of a hillside built by her great-grandfather.

The film ended up being about tracing family roots, the change of time and landscape, and along the way, a journey to renew herself.

Zhao, an artist, filmmaker and adjunct professor who teaches film, media and performance arts at New York's Hunter College, came to the US to study in 2015.

In her initial years in the US, Zhao put in a lot of effort to assimilate and acculturate herself.

"Part of that process also involves othering myself. So there is a certain sense of self that I give up," she said. By making this film, she intended to find strength by being back with her family and the land.

During initial interviews with her grandma by phone from New York during the COVID-19 pandemic, Zhao first heard of her great-grandfather, who didn't even leave behind a photo of himself.

"I became very interested in this idea of searching for somebody who doesn't exist in the visual imagery," Zhao said. "I'm thinking about what other elements I can bring to illustrate a person who doesn't exist in imagery. That's how the story started."

A significant portion of the film concerns the search for and return to the ancestral cave dwelling that Zhao's great-grandfather had built in a rural mountain valley.

Zhao Yehui

The dwelling had been abandoned for over five decades.

With help from local residents, traversing hills, and bashing through bushes to make a path along the way, Zhao finally found the site.

The roof had collapsed the previous summer from rainstorms, and although the inside was inaccessible, the dwelling's facade remained largely intact. The scene moved her.

"It's just built so beautifully," Zhao said. "I drew this arc tracing the cave and did a very improvised performance of deep listening. That was not planned at all. That happened spontaneously at the moment."

Beautiful memory

Her grandma has beautiful memories of the cave dwelling where she lived until the age of 15. She spoke fondly of fruit trees in the yard — the scent of the flowers, the sweet taste of the fruit.

The cave sparked a family discussion. "How come nobody ever shared about this story that we have this cave my great-grandfather built in the wilderness?"

Her mother replied: "Our family story is not interesting."

But Zhao said her family story was interesting that everyone's family story was interesting. Despite the lack of drama — nobody got killed, nobody's life got turned upside down — Zhao said the filming process led her to feel regenerated.

"I felt this deeper connection with them. I felt like I would get to know more and now have a different perspective."

Near the end, Zhao's family was paying tribute to her great-grandfather by his tomb. Nearby, a high-speed railway loomed overhead.

This reflected Zhao's critical thinking on urban development all over the world, another theme her film explored.

"We're experiencing lots of urban supremacy. We see ourselves being further and further from the earth because of the apartment buildings," she said.

"I wanted to talk about this relationship between people and land and how we can still find strength in our intimate connection with earth."

She later brought her family back to the cave, including her then 88-year-old grandmother, reuniting with family roots deeply connected to the land.

Zhao's film, made with a grant from the International Documentary Association, debuted last year at True/False film festival. It was featured at various events and received a special mention jury award at DokuFest in Kosovo.

Zhao found the practice of oral history that's part of her film very beautiful.

"People have experienced so many changes throughout their lives. They might not remember the years and dates correctly, their personal stories might not directly fit into the grand history narratives, their memories might deviate a little from truth, but their stories represented their true experiences."

Fiji sees Chinese market as key source of travelers

By **ALEXIS HOOI** in Sydney
alexishooi@chinadaily.com.cn

Fiji's pillar tourism sector is riding high amid record visitor numbers, with the Chinese market growing in importance as a key source of travelers for the island destination that promises high-quality experiences.

Fiji's annual visitor arrival numbers recorded a new peak of 986,367 last year, up from 982,938 in 2024, figures from the country's bureau of statistics showed.

The bulk of visitors last year were from Australia, New Zealand, North America, Europe and China, according to Tourism Fiji, with travelers from China to the archipelagic country numbering 28,602.

Paresh Pant, CEO of Tourism Fiji, which is the Fijian government's tourism marketing arm, told China Daily that the country's "unique combination of natural beauty, genuine hospitality and strong cultural identity continues to resonate with Chinese travelers who are increasingly seeking quality travel experiences rather than traditional sightseeing holidays".

Tourism Fiji has significantly strengthened its engagement with the Chinese market through measures such as enhanced partnerships with leading travel platforms, cooperation with key trade partners, and social media links, he said.

"These efforts are translating into tangible results," Pant said, adding that from January to April 2026, visitor arrivals from China grew by nearly 9 percent year-on-year.

"China is one of Fiji's most important strategic growth markets ... it remains one of the markets with the strongest long-term growth potential for Fiji," Pant said.

The value of the Chinese market extends beyond visitor numbers alone, he said, as Spring Festival and other major Chinese travel periods "help complement Fiji's traditional demand cycles and support more balanced year-round visitation".

"This provides important benefits across the tourism sector, including airlines, hotels, resorts, tour operators, and local communities," he said.

Fantasha Lockington, chief executive of the Fiji Hotel and Tourism Association, or FHTA, the industry body representing hotels, resorts and other tourism stakeholders in Fiji, told China Daily that the strong visitor numbers "reflect a few things coming together at the right time".

Chinese travelers are part of that growth, Lockington said, with a visa-free policy, improved connectivity through Hong Kong, and renewed interest in long-haul travel all helping.

"China is important because it helps Fiji diversify its visitor markets. Australia and New Zealand remain our largest and closest markets, but China gives us room to grow in areas such as weddings, honeymoons, diving, wellness, family holidays and incentive travel," she said.

Tourism businesses are also working through Tourism Fiji's China-focused programs, including support in Mandarin-language information, familiar guest amenities and tailored services, she said.

Challenges remain

Lockington said considerable challenges to the industry, such as disruptions to global travel and resources due to tensions in the Middle East, remain.

"Tourism is doing well, but operators are still working in a very unpredictable global environment. For a destination like Fiji, anything that affects fuel prices, aviation, freight, insurance, supply chains or traveler confidence can quickly affect the cost of doing business," she said.

The Fiji government, in response to the global uncertainty, has reactivated a tourism action group to safeguard the pillar sector that accounts for more than 40 percent of the nation's GDP, according to local media.

"The Middle East conflict has disrupted aviation routes. Fuel costs are rising," broadcaster FBC cited Tourism Minister Viliame Gavoka as saying.

The tourism action group's priority is to sustain confidence in current bookings for the peak travel period and to prepare for the 2026-27 season, he said.

Lockington from FHTA said the focus is on helping create the right environment for tourism businesses to keep growing sustainably, as well as supporting industry readiness for the Chinese market.

Pant from Tourism Fiji said the country "continues to operate within a complex global environment shaped by economic uncertainty, aviation pressures and geopolitical developments".

The strategy "remains focused on sustainable, high-value tourism growth rather than purely volume-driven expansion".

"China will continue to play a central role in this strategy," he said, as it "aligns strongly with several key travel trends that are shaping the future of tourism, including premium experiences, family travel, wellness tourism and digitally influenced travel planning".

Tariff threats spark global resistance

New US trade proposal faces firm pushback around the world: Experts

By **YANG RAN**
yangran1@chinadaily.com.cn

The US government's latest tariff threats have met with strong global opposition. Experts said that Washington's protectionist policies will only hasten the decline of its global influence.

This latest tariff offensive, announced by the Office of the US Trade Representative last week, targets imports from 60 economies, including allies such as the European Union and Australia, as well as major trading partners such as China and India.

The US proposed tariffs of up to 12.5 percent, citing investigations that showed these nations failed to curb trade in goods made with "forced labor".

Experts said this proposal represents the US government's latest attempt to rebuild its tariff system, following a significant legal setback in February when the US Supreme Court invalidated broad tariffs imposed by the federal government under the International Emergency Economic Powers Act.

However, unlike the more compromising or wait-and-see stance adopted by countries previously regarding unilateral US tariffs, the international community's pushback this time is firmer.

Bernd Lange, who chairs the European Parliament's Committee on International Trade, rejected US claims that the EU was not curbing trade in forced labor goods as "utterly absurd".

"It appears that every conceivable pretext is now being used to justify existing tariffs or prepare new ones," Lange stated.

Similar sentiments were echoed across the globe. Australian Prime Minister Anthony Albanese called the newly proposed rates "unjustified", adding that "there is an ideological disagreement where the United States administration has broken with what was a decades-long understanding that tariffs are not positive for the country that is imposing them".

Brazilian President Luiz Inacio Lula da Silva also declared that Brazil would "stand and not bow to the pressure of the latest US trade offensive".

According to Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, the shift in global posture is largely driven by a changing rationale for the tariffs and a clearer understanding of the legal vulnerabilities in the US tariff policy.

The US justification for the tariffs, in particular, has changed and weakened, said Tu. "Previously, the US used 'national security' as its rationale, which is hard to refute. But now it's citing 'forced labor'," he explained.

"Once a country accepts that framing, it effectively admits to having forced labor problems domestically. That is absolutely unacceptable for economies worldwide. That's why this round has met with such strong resistance."

Complementing this, the Supreme Court ruling has exposed the legal fragility of US tariff policy. "Countries now realize that the legal basis for US tariffs is shaky," Tu said.

> "Because Washington has weaponized interdependence among nations, a globalization without the US may well be taking shape."
>
> **Wang Yiwei,** director of the Institute of International Affairs at Renmin University of China

"And China's firm countermeasures — which have proven effective — have shown the world that capitulation does not pay. These two developments have prompted many nations to recalibrate their strategies."

'Paper tiger'

Wang Yiwei, director of the Institute of International Affairs at Renmin University of China, argued that the deterrent value of US tariffs is rapidly diminishing and that strong responses from other nations will become the new norm.

"The Supreme Court's ruling, the midterm election dynamics and the lessons from US-China tariff standoffs have all exposed the 'paper tiger' nature of US tariff policy."

Beyond the immediate diplomatic pushback, experts warn that Washington's relentless use of tariff threats is accelerating a long-term trend: global trade is moving on with less US involvement.

This year alone, the EU has signed separate free trade agreements with Mercosur, a South American trade bloc, and India, collectively covering almost 2 billion people. Meanwhile, the Regional Comprehensive Economic Partnership, the world's largest free trade bloc, continues to deepen integration. Reports show that intra-RCEP trade volume rose steadily from $5.67 trillion in 2023 to $6.09 trillion in 2025.

Wang Yong, a professor at Peking University's School of International Studies, said that the frequent use of tariff threats is not only destabilizing the rules-based international trade system but also isolating the US economically. "Tariff policies can be a high-risk strategy that proves to be self-defeating in the end," he said.

According to an analysis by the Cato Institute, the US share of global merchandise trade (imports plus exports) in the third quarter of 2025 was the lowest for that period of the year since 2014, and the drop from 2024 was larger than the cumulative loss between 2015 and 2024.

"Because Washington has weaponized interdependence among nations, a globalization without the US may well be taking shape," Wang Yiwei said.

Ghana on track for a 24-hour economy

By **EDITH MUTETHYA**
in Nairobi, Kenya
edithmutethya@chinadaily.com.cn

Factories running through the night, markets operating around the clock and expanded logistics networks are at the heart of Ghana's drive to build a 24-hour export-driven economy, a flagship government initiative aimed at boosting production, increasing exports and creating millions of jobs across the country.

Launched in July, the 24-Hour Economy and Accelerated Export Development Programme, or 24H+, seeks to promote round-the-clock economic activity by encouraging businesses, industries and public services to operate beyond traditional daytime hours.

Under the initiative, the government plans to build modern markets across all 261 districts. The rollout is underway, with the facilities expected to include storage centers, banking services, clinics, childcare centers, police posts and fire stations to support continuous trading activities.

Speaking at the 2026 Ghana-UK Investment Summit held last week, Augustus Goosie Tanoh, presidential adviser on the 24H+, said the program is on track to create 1.7 million productive jobs by 2028.

He said four agreements signed in the past 90 days are expected to generate more than 160,000 jobs, putting the program firmly on course to meet its employment target. The projects include a solar farm and a bioenergy project.

Chinese companies are also major participants in the initiative. In April, the Hunan Architectural Design Institute Group signed an agreement with the 24-Hour Economy Secretariat to support technical and industrial planning for the Volta Economic Corridor and related infrastructure projects.

The corridor is a spatial-industrial development plan aimed at transforming the Volta River Basin into a logistics and production backbone. It is expected to anchor agroecological parks, industrial hubs and inland water transport systems to facilitate low-cost north-south economic integration.

Tanoh said the initiative currently has a pipeline of 18 bankable projects open for private sector participation and leadership.

"24H+ will be implemented by the private sector through private financing, not by central government agencies drawing down on the consolidated fund or deploying sovereign debt," he said.

"Government will make policy, facilitate, coordinate, incentivize, strictly regulate, backstop (where necessary) and tax appropriately but not deliver."

Policy analysts say the concept holds promise but will require careful implementation to achieve its intended outcomes.

According to Paul Frimpong, the executive director and senior research fellow at the Africa-China Centre for Policy and Advisory in Ghana, the policy is directionally strong, but its impact is likely to vary depending on location.

Despite the potential benefits, Frimpong warned that significant logistical and infrastructure challenges must be addressed to sustain a 24-hour market system.

Security remains a major concern, particularly for traders operating at night. Adequate lighting, enhanced policing and organized market-level security systems will be necessary to ensure safety, especially for women traders.

Emmanuel Amoah-Darkwah, an economist and partner at C-KADD Global, a Ghana-based consultancy firm, said the initiative is feasible but substantial work remains to ensure its successful implementation.

Protests break out after Belfast street stabbing

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Politicians and law enforcement officials in Northern Ireland appealed for calm on Wednesday after a night of anti-immigrant rioting forced people from their homes.

The unrest, which mainly affected the city of Belfast, followed a knife attack on Monday evening in which a 30-year-old Sudanese man who had entered the country illegally and claimed asylum appeared to have tried to cut someone's head off. The suspect has since been charged with attempted murder and other offenses, and police have said they do not think the incident was terror-related.

On Tuesday, peaceful protests against knife crime were hijacked by people carrying clubs and blazing torches who entered streets where immigrants were known to live, apparently intent on revenge.

Deputy First Minister of Northern Ireland Emma Little-Pengelly told *Good Morning Ulster* she condemned "any and all violence or thuggery that we witnessed on the streets in places across Northern Ireland last night".

She said Northern Ireland, which is part of the United Kingdom, had been appalled by the stabbing incident and that "this violence, this thuggery, this intimidation, it is absolutely unacceptable".

The BBC reported mobs had set fire to houses, cars, and a bus during Tuesday night's unrest and quoted a pastor from North Belfast as saying the property of black people had been targeted. Unrest also broke out in other communities, with a police car torched in Portadown and a Turkish barbershop damaged in Ballyclare.

Claire Hanna, leader of the opposition Social Democratic and Labour Party, told Reuters the violence looked to have been a "race-based pogrom", with hundreds of masked men carrying bottles and bricks starting fires and chanting "foreigners out".

Northern Ireland's fire service said it responded to 62 incidents on Tuesday night in the Belfast area, prompting Michelle O'Neill, Northern Ireland's first minister, to say mobs had been "burning families out of their homes".

Jon Boutcher, chief constable of the Police Service of Northern Ireland, said the violence was a "huge act of self-harm by mindless idiots who are actually only damaging their own futures".

"Last night's policing operation was about protecting life and trying to protect properties," he added, saying officers will locate and charge those responsible.

Naomi Long, Northern Ireland's minister of justice and leader of the Alliance Party, told Radio 4's *Today* program that "bad faith actors" had incited the riots through online posts.

"What distresses and disturbs me is there are those that prior to yesterday would have struggled to find Belfast on a map who are online, who are sharing incitement and encouragement for people and weaponizing the fear that people genuinely have about what happened to try to turn this into some kind of anti-immigration issue or a racist protest," she said.

Security concerns shadow World Cup preparations

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

A member of Mexico's National Guard remains outside the hotel where Iran's national football team is staying in Tijuana, Mexico, on Monday, ahead of the FIFA 2026 World Cup football tournament. GUILLERMO ARIAS / AFP

As millions of fans prepare for the 2026 FIFA World Cup that begins on Thursday, security officials across North America are confronting a complex mix of challenges ranging from organized crime and civil unrest to emerging drone threats, underscoring the unprecedented scale of the tournament.

The expanded World Cup, jointly hosted by the United States, Canada and Mexico, is expected to be the largest in the tournament's history. While organizers have emphasized readiness and coordination among host cities, recent developments in Mexico and the United States have highlighted the increasingly complicated security environment surrounding major international sporting events.

In Mexico, authorities have significantly increased security deployments ahead of matches in Mexico City, Guadalajara and Monterrey. More than 100,000 soldiers, marines, National Guard members and police officers are expected to participate in security operations across host cities and major tourist destinations during the tournament. Anti-drone units, surveillance systems and crowd-management teams have also been deployed in coordination with FIFA.

Particular attention has focused on Guadalajara, capital of Jalisco state, which was shaken earlier this year by a surge in cartel-related violence following a military operation targeting organized crime leaders. According to local authorities, nearly 15,000 security personnel have been assigned to the region as the city prepares to host four World Cup matches.

"It's important to remember that normalcy returned to the state in less than 48 hours after what happened in February," Alfonso Briseno, Jalisco's security coordinator, told The Associated Press. "The Mexican government and the state of Jalisco guarantee their safety."

At the same time, Mexico City has experienced large-scale demonstrations ahead of the tournament's opening match. Teachers' groups, families of missing persons and other civil-society organizations have staged protests in the capital, drawing attention to social and economic issues while taking advantage of the global spotlight surrounding the World Cup.

In the United States, officials and industry experts have identified drones as one of the most significant emerging risks facing tournament organizers.

Speaking to Reuters, Melissa Swisher, chief revenue officer of drone-detection company SkySafe, said low-cost drones have fundamentally changed security planning for major sporting events because they can enter restricted areas in a matter of minutes.

"A thousand-dollar drone that's going 40 to 45 miles per hour could cross two miles in under three minutes," Swisher said. "By the time somebody sees it, that's already over."

Experts say drones could potentially be used for unauthorized surveillance, monitoring team movements or gathering footage inside restricted areas.

Tom Adams, director of public safety at DroneShield and a retired FBI agent, warned that drones can bypass many traditional security measures.

"You have something that can overcome all those traditional security measures and get right over everything," Adams said.

To address the threat, law-enforcement agencies and technology companies are deploying detection networks around tournament venues. The Federal Emergency Management Agency has provided approximately $250 million to support drone-threat mitigation efforts in World Cup host jurisdictions, while the Federal Aviation Administration plans to impose temporary flight restrictions around stadiums during matches.

The preparations also offer an indication of the security planning required for the 2028 Los Angeles Olympics, another major international sporting event expected to rely on advanced surveillance, cybersecurity and counter-drone technologies.

Despite the challenges, officials in the host countries have expressed confidence in their preparations. Security measures have been strengthened at stadiums, airports, fan zones, team facilities and transportation hubs, with authorities deploying additional personnel and technology to address potential risks ranging from public demonstrations and organized crime activity to unauthorized drone operations and other disruptions.

Renewables to safeguard Asia from oil shocks

Region urged to reduce dependence on imported energy amid Mideast tensions

By **PRIME SARMIENTO**
in Hong Kong
prime@chinadailyapac.com

The development of renewable energy sources will help shield Asian economies from the harsh impact of soaring oil prices, a regional forum heard on Tuesday.

As the conflict in the Middle East entered its 100th day, record-high prices of oil and gas continued to drive up inflation across the Asia-Pacific and exposed the region's dependence on imported fossil fuels.

However, energy industry experts said the Middle East crisis also offers an opportunity for Asian countries to transform their energy systems, harnessing indigenous sources like solar and wind to reduce their dependence on imported oil.

The disruption in the Strait of Hormuz has confirmed what Asian economies long feared — that their energy security hangs on a waterway that they do not control, said Sara Jane Ahmed, finance adviser to The Vulnerable Twenty Group of Finance Ministers, or V20.

In a webinar organized by the United States-based think tank Global Energy Monitor, Ahmed said that even before the Middle East war started, Asia was already developing clean technology.

As an "electrotech superpower", Asia makes over 95 percent of the world's solar panels, 85 percent of its batteries, and 75 percent of its turbines, she said.

Ahmed said the region has yet to fully tap its abundant resources, noting that solar and wind power have the potential to supply about 14 times Asia's total energy demand.

"Asia needs a new energy playbook, and we can already see what it looks like. Leaning into electrotech and winning back our energy sovereignty is critical," Ahmed said. This, she said, is "shared prosperity and multilateralism in its truest sense".

Brenda Valerio, the Philippines country director at the global network New Energy Nexus, said the high oil prices that drove up local fuel and transport costs have also pushed Filipino consumers to shift to solar energy.

"People are no longer viewing rooftop solar panels as an environmental choice but as protection — protection against volatile electricity prices," she added.

Valerio said New Energy Nexus has a network of about 300 micro and small solar installers all over the Philippines. Its recent survey showed that customer inquiries for solar panels had jumped following the rise in fuel prices.

"They're no longer waiting for perfect conditions. They are responding directly to high electricity prices and fuel insecurity," she said.

Customer interest

However, Valerio noted that actual installations lagged behind the surge in customer interest. This is because installers are facing shortages of solar components, rising logistics costs, workforce shortages, financing bottlenecks, and a slow permitting process.

"The Philippines is not failing to generate demand for renewable energy; we are failing to convert that demand into deployment," Valerio said.

She said that for archipelagos like Indonesia and the Philippines, it is important to establish distributed solar storage, microgrids, and localized energy systems. This would entail diversifying beyond centralized energy systems. Valerio noted that for decades, most energy systems had been designed around large power plants and long transmission networks.

For Muhammad Mustafa Amjad, cofounder of the Pakistan-based energy think tank Renewables First, batteries and a more robust grid system are important for energy transition.

Japan's ex-LDP leader Yohei Kono dies at 89

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Yohei Kono, former speaker of Japan's House of Representatives and former president of the Liberal Democratic Party, died on Monday at the age of 89, Japanese media reported on Wednesday.

Kono, born in 1937, was first elected to the House of Representatives in 1967 and served in such posts as chief cabinet secretary, foreign minister and deputy prime minister. In 1993, while serving as chief cabinet secretary, he issued the Kono Statement.

The statement acknowledged the Japanese military's direct involvement in setting up "comfort stations" and forcibly recruiting women on the Korean Peninsula, in China and elsewhere, offering an apology and reflecting on these actions.

Kono was known in China for his long-standing support for China-Japan friendship. He visited China many times, with his most recent trip taking place in June 2025, according to official Chinese releases. Leading a delegation of the Japanese Association for the Promotion of International Trade, Kono met with senior Chinese officials, including the country's top diplomat Wang Yi, in Beijing during the visit.

Wang said Kono had long been committed to the cause of China-Japan friendship and had remained steadfast in promoting friendly exchanges between the two countries even in the face of difficulties and challenges, which China highly appreciated.

Kono told Wang that history should not be forgotten, nor should it be denied, adding that the past cannot be changed, but the future can be shaped through effort.

Platform of meaningful exchanges to help enhance global human rights governance

Bringing together more than 400 Chinese and foreign guests from nearly 100 countries and international and regional organizations, the 2026 Forum on Global Human Rights Governance is being held in Beijing from Thursday to Friday. The event aims to help build a fairer, more equitable and inclusive global human rights governance system.

Under the theme "Joint Development, Shared Human Rights: The 40th Anniversary of the Adoption of the Declaration on the Right to Development and a New Vision for Global Human Rights Governance", the forum underscores China's commitment to development as the fundamental guarantee for human rights.

This perspective is deeply rooted in China's own achievements. A report evaluating the National Human Rights Action Plan of China (2021-25), which defined the objectives and tasks for promoting human rights in China during the 14th Five-Year Plan (2021-25) period, has concluded that all 181 tasks have been completed and 20 of the 44 binding targets were fulfilled ahead of schedule or exceeded the specified requirements.

China looks forward to sharing its insights on promoting human rights through better development at the forum "to turn the vision of the Declaration on the Right to Development into reality", as Chinese Foreign Ministry spokesman Lin Jian said on Monday.

China has built the world's largest education, social security and healthcare systems. Solid progress toward common prosperity for all has strengthened the foundation for advancing human rights, while the development of whole-process people's democracy has enhanced the protection of the rights and interests of all groups.

The forum's five sub-forums cover topics that are highly relevant to both China's practice and global needs. They address, respectively: the human rights implications of the Global Governance Initiative; the role and significance of the right to development; safeguarding the right to development in the age of AI; green development and the protection of human rights; and the relationship between modernization and the free, comprehensive development of individuals.

International human rights governance is indeed confronting multifaceted challenges. Polarization is eroding the foundation of multilateral cooperation across many regions, as geopolitical competition increasingly politicizes and weaponizes human rights issues. Meanwhile, some countries apply double standards and withdraw from international agreements, further undermining collective efforts. All this has shaken the global human rights governance system centered on the United Nations.

Not to mention that armed conflicts and humanitarian crises are worsening in some regions. A large number of civilians are direct victims of violent conflicts, and the red lines of international humanitarian law are frequently crossed.

Development imbalances and inequality are growing, marginalizing the right to development and hindering progress on the Sustainable Development Goals — a call to action adopted by all UN member states in 2015 to end poverty, protect the planet, and ensure that by 2030 all people enjoy peace and prosperity.

Meanwhile, climate change threatens the survival of vulnerable groups, and rapid technological advances, such as AI, are creating tensions between innovation and human rights protection, posing new governance challenges.

China is no exception to many of these challenges. The evaluation report notes that China still faces imbalanced and insufficient development, while scientific and technological development and industrial transformation give rise to new demands for rights. Notwithstanding these challenges, the country has effectively integrated human rights development with its national conditions providing a practical reference for other nations.

Unlike the Western-centric human rights narrative, China adopts a people-centered approach, fostering dialogue and promoting an inclusive, cooperative human rights paradigm through initiatives aimed at shared development. As the world confronts persistent inequality, poverty and underdevelopment, China's approach provides valuable insights for nations seeking to safeguard basic human rights and improve global human rights governance while pursuing their own paths to prosperity and progress.

China's trade data provide food for thought

China's exports rose by 19.4 percent in May from a year earlier, accelerating from April's already impressive 14.1 percent growth. Imports grew even faster, jumping 27.4 percent after April's 25.3 percent increase. Total trade expanded by 16.9 percent in yuan terms, pushing monthly trade above 4 trillion yuan ($587 billion) for the third consecutive month and bringing the cumulative trade growth for the first five months of the year to 15.3 percent.

Some Western critics have portrayed China as an economy dependent on "dumping overcapacity" with low value added. The data point to a different reality. The composition of the growth is even more notable than the quantity.

The strongest momentum is increasingly concentrated in technology-intensive sectors, including integrated circuits, advanced manufacturing equipment, electric vehicles and artificial intelligence-related products. Semiconductor exports reportedly surged by more than 100 percent year-on-year, while high-tech exports continued to outperform overall trade growth.

This is not merely a story about China exporting more goods. It is a story about China moving higher up the value chain at a time when much of the developed world is struggling to do the same.

Over the past several years, a conventional narrative has prevailed in some Western countries — that tariffs, export controls and "de-risking" would gradually diminish China's position in global supply chains while strengthening their own. However, reality has not borne this out.

Instead of being contained, China's manufacturers have adapted. Faced with external pressure, they have accelerated technological upgrading. Export growth is increasingly being driven by sectors linked to digitalization, electrification and AI.

The strong trade performance was registered amid global turbulence. The conflict in the Middle East has disrupted energy markets, raised transportation costs, and increased uncertainty across the global economy. Yet, thanks to its increasingly diversified trade portfolios, China's trade has not only remained resilient but also accelerated.

Part of the explanation lies in a phenomenon visible far beyond China. Around the world, demand for AI infrastructure, semiconductors, data centers, power equipment and green technologies is surging. Exports of economies, such as the Republic of Korea, driven by AI-related demand, soared in May. China is not operating outside this trend; rather, it is both a major contributor and a principal beneficiary, owing to its key position in global supply chains, particularly in high-tech sectors.

The "China Shock 2.0" peddled by some China-bashers in the West simply does not hold water. What truly drives global trade is the robust demand for China's performance-cost advantaged exports — not the exports of "overcapacity" as they claim.

The increase in both China's exports and imports with developed and developing economies in recent months demonstrates the win-win nature of China's trade with its trading partners, belying "decoupling" or "trade imbalance" claims.

Compared with other major economies, what makes China distinctive is its efficiency, innovation and scale. Few economies possess the combination of manufacturing depth, engineering talent, logistics capacity and industrial ecosystems needed to meet rapidly growing global demand in advanced sectors. Whether one is discussing batteries, electric vehicles, solar technologies, industrial machinery or increasingly sophisticated semiconductors, China has built production networks that are difficult to replicate quickly elsewhere.

It is an exercise in absurdity for certain Western armchair strategists to assume that political coercion will enable some developed countries to restructure global supply chains in accordance with the personal preferences of select politicians.

Notably, China's imports growing faster than exports challenges the caricature of China as simply "an export machine". Strong import growth suggests robust demand for components, raw materials, machinery and intermediate goods needed to support the country's industrial upgrading. It also reflects the deepening integration of China within global manufacturing networks.

None of this means China is immune to challenges. The huge potential of domestic consumption remains untapped. Geopolitical risks are unlikely to disappear. Trade frictions with major economies are likely to continue. But the long-term trade data of China have a habit of revealing how the world's second-largest economy has made the most of what it has to keep its economy and trade developing on the right track. By doing its own things well, China is contributing to the common good of the world.

Transforming 'golden waterway' into powerful growth engine

The beginning of construction this week on the Three Gorges new waterway project — which includes what is expected to become the world's largest inland ship lock, a system that uses watertight chambers and gravity to raise and lower vessels, allowing them to bypass sharp changes in elevation along the waterway — marks another step toward advancing the high-quality development of the Yangtze River Economic Belt.

As the world's third-longest river and China's most important inland waterway, the more than 6,300-kilometer Yangtze River has long served as a vital artery linking the country's vast western hinterland with its dynamic eastern coast. The Yangtze River Economic Belt spans 11 provincial-level regions, is home to roughly 40 percent of the country's population, and consistently generates around 47.3 percent of the country's economic output. It is also one of the country's major hubs for foreign trade.

The waterway project comes in response to a practical need. The existing Three Gorges ship lock, designed for an annual cargo throughput of 100 million metric tons, surpassed that capacity as early as 2011. By 2025, cargo throughput had exceeded 170 million tons. The bottleneck has increased waiting times and logistics costs.

Once completed, the new waterway will raise the annual cargo-handling capacity of the Three Gorges hub to 336 million tons, nearly double its current level. It will help facilitate the smoother flow of goods, strengthen industry and supply chains, and inject new momentum into the development of the economic belt.

Beyond its economic significance, the project once again highlights China's world-class capabilities in infrastructure construction and engineering innovation. With a total investment of 77.2 billion yuan ($11.39 billion), the project is expected to set multiple world records in inland ship lock construction, including vessel dimensions, lock chamber size and excavation scale. Building such a massive hydraulic structure under complex geological and hydrological conditions represents a formidable engineering challenge.

As the first major project to break ground during China's 15th Five-Year Plan (2026-30) period, it demonstrates the country's strong capacity to plan, design and execute mega infrastructure projects that serve long-term national development goals. From the Three Gorges Dam to the Hong Kong-Zhuhai-Macao Bridge and now the Three Gorges new waterway, China continues to transform ambitious visions into reality through technological innovation, scientific planning and efficient implementation.

Equally noteworthy is the project's commitment to ecological protection. The Yangtze River is one of China's most important ecological treasures. The project reflects the principle that development and environmental protection can advance hand in hand.

Ecological considerations have been incorporated from the earliest stages of the project's planning and design. Dedicated fish passages will help maintain aquatic biodiversity, while construction methods have been carefully selected to minimize disturbances to river ecosystems. Particularly striking is the decision to modify the original design to avoid disturbing the spawning grounds of the Chinese sturgeon, a national first-class protected aquatic wild animal and a flagship species of the Yangtze River. Although this increased project costs by approximately 2 billion yuan, it underscores China's determination to prioritize ecological conservation alongside development.

The Three Gorges new waterway project is therefore an epitome of China's pursuit of innovation-driven, green and high-quality development. By easing a critical transportation bottleneck while safeguarding the ecological health of the Yangtze River, the project will help transform the nation's "golden waterway" into an even more powerful engine of sustainable growth.

What They Say

'Made in Yiwu' upgrading reflects move up value chain

Editor's note: *As the 2026 FIFA World Cup prepares to kick off, Yiwu, the global hub for commodities in East China's Zhejiang province, has been in World Cup mode for months. China News Service spoke to Wu Xiaoming, head of the Yiwu sporting goods association, about the transformation of "Made in Yiwu" products. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

In preparation for the World Cup, businesses in Yiwu have meticulously adjusted their product lines and production schedules to meet market demand. This year, in response to specific requests from overseas buyers, many suppliers are offering personalized products featuring specific colors, patterns and jersey numbers.

Many merchants have noted that this time the order cycle for World Cup-related products began much earlier than in previous tournaments. Some companies started building inventory as early as last summer, with most shipments completed before this year's Spring Festival in February.

As one of China's important gateways for the international commodity trade, Yiwu has gained extensive experience in foreign commerce and earned the reputation of being the "world's supermarket". Its competitiveness in global markets has been strengthened by a continuously improving multimodal logistics network that integrates postal services with sea, road, air and rail transport. Efficient trade routes have helped reduce both delivery times and logistics costs, a major advantage in global market competitiveness.

At the same time, "Made in Yiwu" benefits from a well-developed local supply chain. Raw materials, components and packaging materials are sourced locally, reducing both production time and costs.

Unlike traditional large-scale standardized manufacturing, Yiwu's economy is increasingly built around small and medium-sized enterprises with highly specialized divisions of labor and a vast range of product categories. Buyers can source footballs, jerseys, horns, flags, decorative items and many other products in a single market and consolidate shipments, further lowering procurement costs.

By participating in major international sporting events, Yiwu merchants have developed a mature business model around the sports event economy. They have built a loyal customer base and continue to gain recognition and visibility in international markets.

In recent years, Yiwu's sports goods industry has gradually shifted from competing primarily on price to competing on creativity and intellectual property — a challenging but necessary transition.

In the past, the Yiwu commodities market relied heavily on high-volume, low-margin sales, with low entry barriers leading to excessive competition. This model is not sustainable in the long term. Instead of focusing on short-term profits from individual transactions, businesses are increasingly aiming for enduring customer relationships and sustainable growth.

Today, "Made in Yiwu" is undergoing a transformation from labor-intensive manufacturing to technology-driven production. Businesses are embracing intelligent manufacturing, digitalization and greener development practices.

After years of growth and development, the "Made in Yiwu" label is increasingly combining "bringing in" and "going global" to fill market gaps and seize new opportunities. Its development path has evolved from contract manufacturing and low-cost production toward original design, licensed products and standards-setting. This transformation mirrors the broader upgrading of Chinese manufacturing as it moves from the lower end of global value chains toward higher-value segments.

With the advantages of a vast domestic market, a complete industrial ecosystem and strong policy support, China is gradually evolving from a passive participant in global value chains into a more active contributor to international standards. Over time, "Made in China" will become synonymous with high quality, high-tech and high value.

VIEWS

Theodoros Papanghelis

A path forward for the Classics

The idea that classical wisdom nourishes the life of the spirit took shape during the Renaissance period — the transitional movement in Europe between medieval and modern times, beginning in the 14th century in Italy and lasting into the 17th century, when Greek and Latin authors were restored to prominence by leading humanists.

As they conceived it, the *studia humanitatis* — which originated in the 15th century and refers to a course of classical studies including grammar, poetry, rhetoric, history, and moral philosophy — required sustained engagement with the ideas and values enshrined in the great works of antiquity, which were seen as the best guides to two related aims: stylistic excellence and moral improvement.

This humanistic project showed little interest in vocational concerns and tended to sideline the natural sciences, treating them as largely irrelevant to the formation of character.

Its educational program — elitist insofar as it hailed from the notion that the *studia humanitatis* were intended for the freeborn — placed overwhelming emphasis on the study of the past as the primary means of intellectual, moral, and aesthetic self-cultivation.

The humanistic model of education long held a dominant position, with the sciences initially slow to challenge its authority.

From the 17th century onward, however, this began to change.

The natural sciences not only questioned the epistemological foundations of a traditional, historically oriented educational philosophy — while also claiming equal, if not superior, curricular status — but also exerted a more "insidious" influence in that a positivistic tendency rubbed off onto the humanities themselves, shifting attention away from broad pedagogical and ethical concerns toward a more neutral preoccupation with particular philological questions posed by the texts.

This development was further boosted by the professionalization of the humanities in the 18th-century German university.

Although the emergence of *Altertumswissenschaft*, a German concept emphasizing the unity of the various disciplines the study of the ancient world comprises, did not entirely displace earlier humanist ideals, it significantly diluted them by replacing their integrative, value-oriented approach with more technical and specialized forms of inquiry while scientific utilitarians became more vocal.

So, as one of that ilk put it, knowing the position of the liver became more useful than knowing the Greek and Latin words for it.

It was now hard for the humanities to claim the high moral ground they had once possessed and the "particularists" who, as Irving Babbitt once quipped, devoted study to ancient horse bridles and Roman doorknobs, were not much help.

Global Lens

At the same time, however, it was also refreshing, insofar as it seemed, to revive something of the optimistic spirit of Renaissance humanism, albeit reframed through a distinctly cross-civilizational perspective.

Another challenge to the ideals of early humanism came with structuralism and its subsequent developments, which shifted attention from textual content to the deep structural patterns that generate it.

Later intellectual trends associated with postmodernism, along with debates surrounding political correctness and so-called "woke" culture — defined as awareness of important facts and issues, especially issues of racial and social justice — contributed further to the gradual repositioning of the study of classical texts.

More recently, in the prevailing intellectual climate in the West, traditional claims about the enduring authority and relevance of the "classics" have also been increasingly questioned.

Antiquity is nowadays approached less as a repository of intrinsic value and more as a historically situated system of meanings and values — inviting the question "value for whom?" — with which modern readers are expected to engage critically rather than reverently.

Meanwhile, as institutional classics go down their various paths, debates about their place in contemporary curricula flare up from time to time.

Notably, an international conference on this quandary, entitled "The 'Future of the Past': Why Classical Studies Still Matter", was held at the Academy of Athens in November 2022, reflecting the continuing urgency of this question.

Two years later, the inaugural World Conference on Classics, themed "Classical Civilizations and the Modern World", was co-organized in Beijing by, among others, the Chinese Academy of Social Sciences and the Academy of Athens.

When I participated in this event, together with other Greek academics and scholars, I had in mind an article published in 2021 in Asia Times by David Goldman, in which he contrasted the relative decline of classical studies in the United States with their growing prominence in China.

The conference "concept note", as circulated by the Chinese organizers, adopted an optimistic tone.

It suggested that scholarly exchanges among participants would help highlight "the modern value of classical civilizations" and contribute "wisdom and strength to tackle problems facing the development of human society," while also fostering mutual learning and international understanding.

For a Western scholar accustomed, as I am, to conferences, colloquia, and workshops focused on the finer points of narratology, gender, sexuality, meta-scholarship, deixis, and a wide range of other specialized concerns, this framing initially appeared rather broad and somewhat imprecise.

At the same time, however, it was also refreshing, insofar as it seemed, to revive something of the optimistic spirit of Renaissance humanism, albeit reframed through a distinctly cross-civilizational perspective.

Indeed, a number of the papers presented were informed by such an orientation.

The second World Conference of Classics, held in Athens from June 9 to 10, appears to confirm the organizers' intention to develop an ongoing dialogue between Beijing and Athens in pursuit of these aims.

This initiative will be welcomed by those who remain convinced that the comparative study of the core values of classical civilizations continues to offer one of the more promising paths for reflection on our shared humanity.

MA XUEJING / CHINA DAILY

Stefan Szymanski

Networks are the secret sauce for footballing nations

The joy of sport is its unpredictability. As the FIFA World Cup approaches, everyone wants to know who is going to win it.

Statisticians, economists, sociologists and various other experts are attempting to uncover the hidden patterns that might reveal the outcome.

While no one can predict what exactly will happen, social science offers valuable insights into the dynamics at play.

In international sports, the factors determining success are not different from those for economic development.

Success depends on the resources that each side brings to a match. Those resources correspond to the inputs in what economists call a production function.

We can think of sporting competition in the same way as we think about national output, or GDP. In both cases the key inputs are labor, capital and "total factor productivity". The first two are easy to understand. The bigger your national population, the greater the chance that there are superstars to be uncovered. Finding and developing those superstars requires capital for establishing talent scouting networks and training facilities.

Total factor productivity, a concept that explains variations in economic output across countries, often hinges on a nation's innovative capacity.

This in turn is closely tied to human capital — the knowledge and experience accumulated by individuals and shared across society, what one might call the wisdom of the crowd.

This framework works pretty well for football too. More than 200 nations participated in the qualifying rounds of the World Cup, a number that has been pretty stable over the past eight editions of the competition. But only eight countries have ever won the World Cup. Six of those eight have won it more than once, and in the 14 World Cups since 1966, only three countries have entered the elite group — Argentina in 1978, France in 1998 and Spain in 2010.

Global Lens

We can think of sporting competition in the same way as we think about national output, or GDP. In both cases the key inputs are labor, capital and "total factor productivity". The first two are easy to understand.

The pattern is not going to be any different this year. Spain and France are the favorites with outside chances for Argentina, England and Brazil. The most highly favored "outsider" is Portugal, a country with an impressive football pedigree.

All of these countries were at the forefront of football's development more than 100 years ago. This also means football is not like manufacturing.

Many onetime "developing" nations have caught up with countries that were once at the forefront of manufacturing and even outstripped them.

Manufacturing is relatively easy to copy, and therefore does not remain a consistent advantage over the very long term.

A more likely comparator might be universities. The US, Britain and Germany housed the most prestigious universities in the world 100 years ago, and this is still largely true. New universities have come up in other parts of the world and become leaders in some fields, but for consistent excellence, the older universities usually have an edge.

This suggests that there is something in the transition of know-how from one generation to another that gives an advantage — a consensus about best practices and their preservation, even if those best practices evolve over time.

This might well be the process that enabled the same countries to dominate the World Cup for so long.

The dominant soccer nations are tied together in a shared network. In Europe, these countries all border each other, and ideas move freely across national boundaries.

Innovations that emerge in one part of Europe quickly spread to the rest of it. Brazil and Argentina have a similar networked relationship, as well as being plugged into Europe through historical connections with Portugal, Spain and Italy.

Not that these networks imply a friendly sharing of ideas — the relationships are driven by intense rivalries and the desire to win. But it is very hard to keep any secrets in football — your ideas are visible on the pitch.

This network effect, then, may be the "secret sauce" — the source of total factor productivity that explains the dominance of the same national teams.

It is striking that both the US and China, which now vie to be the world's important players in almost everything else, have not dented the pre-eminence of the old nations in football. The US has devoted far greater resources to the effort, but even as hosts, they have a very slim chance of winning this year's World Cup.

When it comes to football, the difference between US men's and women's teams is very striking. The US women's team has been the best in the world since the women's game started to spread. For European and South American women, there were no historical networks to fall back on, and in fact the US created the dominant network. Chinese women too have fared much better than the men.

For countries like China and the US, there are two pathways for competing at the highest level in men's football. One is to join the existing network — which is a strain in terms of geography. The other is to create their own networks. While this is the most likely path, so far it has proved to be a mountain too high to climb.

Chen Xiangyang

China-DPRK friendship steadfast in a turbulent world

In international politics, some relationships are fleeting because they are driven by temporary interests. Others endure because they are rooted in shared history, strategic necessity and long-term national interests. The relationship between China and the Democratic People's Republic of Korea belongs to the second category.

In today's rapidly shifting global landscape, the traditional friendship and cooperation between the two countries is a vital anchor of regional stability. Formally established on Oct 6, 1949, this enduring bond was founded on shared revolutionary ideals. Over the decades, successive generations of leaders have nurtured this relationship, ensuring that it continually adapts to serve the fundamental interests of both nations.

In recent years, exchanges between President Xi Jinping and DPRK top leader Kim Jong-un have provided renewed strategic guidance for bilateral relations. Both sides have consistently stressed that regardless of changes in the international landscape, maintaining, consolidating and developing China-DPRK relations remains a firm commitment.

At the core of this revitalized relationship is a deep reservoir of strategic mutual trust, which has become particularly vital as both nations navigate critical phases in their respective domestic development.

China has embarked on a decisive phase of its modernization journey, guided by the 15th Five-Year Plan (2026-30), which aims to drive its transition toward high-quality development. Simultaneously, the 9th Congress of the Workers' Party of Korea (WPK) rolled out its own Five-Year Plan (2026-30) in February to steer the country into a phase of comprehensive socialist construction through a dual strategic focus on defense building and economic development.

Against this backdrop, safeguarding sovereignty, security and development interests has become a more pressing task for many countries.

This high-level engagement serves two crucial functions. First, it ensures that communication channels remain uninterrupted. When volatility ripples through the Korean Peninsula, direct and reliable baseline channels lower the risk of strategic miscalculation. Second, it facilitates deep institutional learning.

As socialist states led by Communist parties, exchanging practical insights on grassroots governance, livelihood security and risk mitigation transforms a historical friendship into tangible, domestic governance assets.

This dimension is particularly significant at a time when the international environment is becoming more volatile.

The world is witnessing rising geopolitical conflicts, growing protectionism, intensified major-power competition and mounting pressure on the global order.

Against this backdrop, safeguarding sovereignty, security and development interests has become a more pressing task for many countries. For China and the DPRK, closer coordination in regional and international affairs can contribute to a more stable strategic environment.

Moreover, the DPRK's recent initiatives, such as inviting Chinese diplomats to visit the Wonsan-Kalma Coastal Tourist Area in February, underscore a mutual desire to deepen tourism and personnel exchanges, directly elevating the living standards of both populations.

Ultimately, the relationship rests on a bedrock of profound public goodwill and cultural proximity. Rooted in the ethos that "good neighbors wish each other well", the bond between the two societies remains uniquely resilient. This emotional connection has been continually nurtured by the highest echelons of leadership.

President Xi's paying homage to the China-DPRK Friendship Tower in Pyongyang during the visit that just concluded, alongside DPRK leader Kim's frequent visits to the cemetery of martyrs of the Chinese People's Volunteers in Hoechang County, symbolizes a shared history written in solidarity.

By continually expanding exchanges across education, sports, healthcare, media, and youth cohorts, both countries are ensuring that this historical legacy is passed down to future generations.

As a classic Chinese poem aptly observes, "Tide at full, two shores stretch vast and wide; Wind in fair, one sail hangs full with pride." China and the DPRK are bound as good comrades and steadfast neighbors.

No matter how the winds of international politics shift, the resolve to protect, consolidate, and advance this relationship will remain unshakable.

Buttressed by the strategic vision of their top leadership, the towering tree of China-DPRK friendship will continue to flourish, remaining evergreen for generations to come.

GLOBAL VIEWS

HUSSEIN ASKARY

More than goods

The Belt and Road Initiative is not just a vehicle for trade but a promoter of development and civilizational dialogue

WANG XIAOYING / CHINA DAILY

It is a common mistake to view the Belt and Road Initiative simply as a vehicle for trade promotion on a global scale. While trade is important, there is a deeper and more important concept — the "economic belt" or the "development corridor". Economic belts or development corridors feature basic infrastructure — railways, roads, riparian navigation, power lines, oil and gas pipelines, telecommunication cables and water management systems — that produces new agricultural, industrial and urban clusters, as they bring technology and resources to areas that were previously isolated. China's Yangtze River Belt is the best example of this concept, stretching for thousands of kilometers with new industrial, agricultural, science and technology centers popping up all around it in the past three decades or so. Cities such as Chengdu, Chongqing, Changsha and Wuhan have become world-renowned thanks to this corridor. Therefore, all the BRI corridors stretching from Asia to Europe and from Central Asia to West Asia and Africa should be seen in this light. This is the scientific implementation of the Chinese traditional saying "if you want to get rich, first build a road".

Africa is a continent with enormous potential, and this is something the Chinese understand very well. Africa had a population of some 1.4 billion by the end of 2024, with a median age ranging from 20 to 30. According to the United Nations projections, the population will increase to almost 3 billion by 2050 and will still be the youngest group in the world. Europe will decline dramatically in demographic terms while the Americas and Asia will stagnate, then decline after 2050. The European way of looking at this is with alarm that projects Africa to be forever poor and that a great number of youth will try to immigrate to Europe.

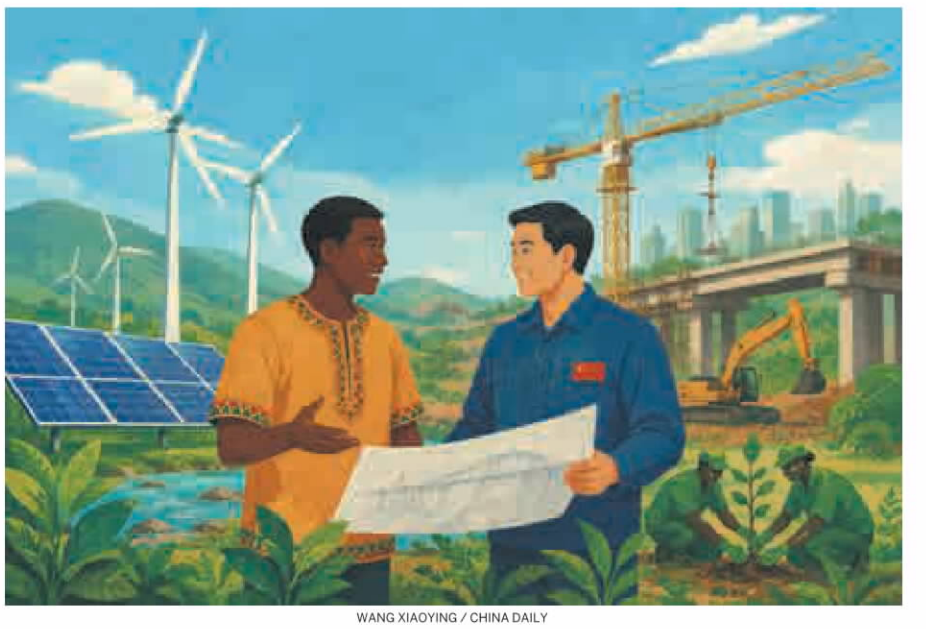
But these young people will be a great source of wealth if Africa overcomes the "three bottlenecks of development" — the lack of credit, infrastructure and skilled labor. China has embarked on filling the gaps in these three areas in its cooperation with African nations. In this sense, China believes that by making its partners prosperous, China itself will benefit in the long term. This is the essence of the win-win philosophy embedded in China's Global Development Initiative, as expressed in the saying "China will only do well when the world is doing well. And when China is doing well, the world will do even better." This is the lesson Europe and the United States need to learn to peacefully co-exist with Africa, Latin America, and Asia and prosper together.

The sheer scale of Africa's foundational needs — in transport, energy, water security and technological capacity — demands a development strategy of vision and precision. Therefore, a sustainable and transformative partnership under the BRI must consciously pursue a dual-track approach.

The first track is the large-scale infrastructure dimension: the financing and construction of strategic infrastructure that redefines the continent's economic geography. These are the flagship projects — the grand hydroelectric dams that power national grids, the transcontinental railways that link landlocked nations to ports, the massive water management systems that safeguard regions against drought, and the industrial parks that serve as hubs for technology transfer. These projects build the backbone for pan-African integration and African countries' long-term industrial take-off.

However, to be truly durable and legitimate, this large-scale infrastructure track must be deliberately coupled with a second, connective track: a focus on targeted, smaller-scale projects that directly oxygenate the local economy and improve daily life. This includes rural feeder roads connecting farmers to markets, village-level solar micro-grids, community irrigation schemes, and vocational training centers. These projects ensure that the macro-framework does not operate in isolation but is rooted in and responsive to on-the-ground needs.

The essential insight is that neither track can succeed in isolation. Megaprojects without grassroots connectivity risk becoming "cathedrals in the desert" — impressive but isolated assets with limited diffuse economic benefit. Conversely, small-scale projects alone, without the enabling national infrastructure, cannot catalyze the structural transformation Africa seeks. The genius of a mature BRI partnership lies in consciously braiding these two strands together, ensuring that the continental arteries feed the local capillaries, and that local vitality, in turn, gives purpose and sustainability to the grand vision. This synergy is the true hallmark of a community with a shared future.



Ultimately, the BRI, like the ancient Silk Road, is a vehicle for the dialogue of civilizations — the exchange of cultural, scientific and philosophical ideas. People-to-people communication through tourism, business and educational exchanges will bring great benefit to the nations of the world as infrastructure and technology do. Through civilizational dialogue we better appreciate how diverse we are as nation-states and cultures, and how similar we are in the aspirations and dreams of a better future. This will be the most important instrument for generating common understanding and avoiding conflicts. Harmonious co-existence does not mean uniform and one-dimensional cultures, political and social systems across all nations. As the saying goes, one flower does not make a garden. The notion of a community with a shared future, advocated by the Chinese leadership, will become a reality when we embrace both diversity and common goals, and this will be the greatest gift we leave to future generations.

EHIZUELEN MICHAEL MITCHELL OMORUYI

Sustainable partnership

Africa-China green cooperation is demonstrating that the gap between development imperatives and environmental sustainability can be bridged

WANG XIAOYING / CHINA DAILY

The defining development challenge of the 21st century is no longer whether countries can grow, but whether they can grow sustainably in an era of accelerating climate change and ecological uncertainty. Climate change, biodiversity loss, land degradation, pollution and growing energy demands are no longer future concerns; they are present realities shaping development trajectories across the world. For developing countries, particularly those in the Global South, the challenge is not whether development should be green, but how economic transformation can be achieved while protecting the environment, creating jobs and improving livelihoods. In this regard, Africa-China green cooperation offers an increasingly important example of how international partnerships can help bridge the gap between development imperatives and environmental sustainability.

The stakes are particularly high for Africa. Despite contributing less than 4 percent of global carbon emissions, the continent remains among the most vulnerable regions to climate change. According to the African Development Bank, climate-related shocks cost African economies between 5 and 15 percent of GDP growth annually, while droughts, floods and extreme weather events continue to threaten food security, infrastructure and livelihoods. Yet Africa holds plentiful solar resources, vast hydropower potential, substantial wind corridors and abundant geothermal energy reserves. These assets position Africa not merely as a victim of climate change but as a potential leader in the global green transition.

Unlocking this potential, however, requires investment, technology, infrastructure and institutional capacity. The United Nations Conference on Trade and Development estimates that developing countries face a substantial financing gap in achieving climate and sustainable development objectives. For many African countries, the challenge is compounded by limited fiscal space, high borrowing costs and inadequate access to green finance. This is where international cooperation becomes indispensable.

China's own development experience demonstrates that economic growth and environmental protection can reinforce rather than undermine one another. Over the past decade, China has emerged as a global leader in renewable energy deployment, accounting for a significant share of global investments in solar power, wind energy, battery technologies, electric vehicles and green infrastructure. According to the International Energy Agency, China has become the world's largest investor in clean energy technologies and now plays a pivotal role in reducing the costs of renewable energy globally. This transformation has not only supported China's domestic green transition but also created opportunities for international cooperation in sustainable development.

As part of its commitment to building an ecological civilization and promoting a community with a shared future for humanity, China has increasingly integrated green development into its international cooperation agenda. This policy orientation has helped position sustainability as a central pillar of China's engagement with developing countries and has created new opportunities for partnerships that support both economic growth and environmental protection.

Increasingly, green development has become an important pillar of China's engagement with Africa. Across the continent, Chinese-supported renewable energy projects are helping expand electricity access, strengthen energy security and support low-carbon development pathways. Solar power plants in countries such as Kenya, South Africa and Egypt, hydropower projects in Ethiopia and elsewhere, and investments in clean transportation and green industrial infrastructure demonstrate a growing emphasis on sustainability within Africa-China cooperation.

Beyond physical infrastructure, Africa-China green cooperation is evolving into a broader partnership focused on technology transfer, skills development, agricultural modernization, environmental governance and industrial upgrading. Such cooperation recognizes that green development is not solely about generating clean energy. It is equally about creating productive capacity, enhancing resilience, fostering innovation and supporting long-term economic transformation.

This is particularly important because the green transition is increasingly becoming an economic opportunity. For Africa, the transition to clean energy offers opportunities to develop new industries, expand manufacturing capabilities, create employment for its rapidly growing youth population, and strengthen regional value chains. Green industrialization, sustainable agriculture, climate-smart infrastructure and circular economy initiatives can all contribute to a more diversified and resilient economic future.

Africa-China cooperation also highlights the growing importance of South-South cooperation in addressing global challenges. Traditional development models often present environmental protection and economic growth as competing objectives. However, emerging partnerships across the Global South increasingly demonstrate that sustainability can serve as a driver of development rather than a constraint upon it. By combining investment, technology, policy learning and local adaptation, countries can pursue pathways that simultaneously advance economic growth and environmental stewardship.

This approach is particularly relevant at a time when developing countries are seeking greater representation in global climate governance. While industrialized countries remain responsible for the majority of historical greenhouse gas emissions, many developing countries are being asked to pursue ambitious climate objectives despite facing pressing development challenges. A just and effective global green transition therefore requires industrialized countries to provide stronger support for technology sharing, concessional finance, capacity building and infrastructure investment. Partnerships such as those between Africa and China can help demonstrate practical mechanisms for translating these principles into tangible outcomes.

At the same time, the future of Africa-China green cooperation should move beyond infrastructure alone. Greater emphasis should be placed on supporting local innovation ecosystems, green entrepreneurship, research collaboration, vocational training, sustainable urban development, and climate-resilient agricultural systems. Expanding cooperation in emerging sectors such as green hydrogen, battery manufacturing, electric mobility, digital technologies and sustainable supply chains could further strengthen Africa's role within the global green economy.

The future will not be shaped by isolated national efforts but by partnerships capable of mobilizing resources, sharing knowledge and fostering collective action. Africa-China green cooperation illustrates how countries can work together to pursue modernization that is environmentally sustainable, economically inclusive and socially beneficial.

For the Global South, the lesson is clear. Green development is not a luxury to be pursued after growth has been achieved; it is increasingly becoming the foundation of future prosperity. By deepening cooperation in renewable energy, sustainable infrastructure, green finance, technology transfer and capacity building, Africa and China are helping to demonstrate that a greener future is not only possible but essential. In an era defined by shared environmental challenges, global partnerships will determine whether sustainable development remains an aspiration or becomes a reality. Africa-China cooperation offers one of the most promising examples of how that reality can be built.

Opening-up seen injecting impetus to Sino-Thai trade

Thai businesses optimistic as Chinese market 'vibrant, brimming with potential'

By **ZHENG YIRAN** in Shanghai
zhengyiran@chinadaily.com.cn

China's opening-up efforts are injecting momentum into bilateral trade with Thailand, especially for premium Thai exports such as durian and cosmetics, a leading Thai business representative has said.

Confident that China will emerge as "the world's largest retail market" within four to five years, Phaichit Viboontanasarn, vice-chairman and secretary-general of the Thai Chamber of Commerce in China, said: "The Chinese market is vibrant and brimming with potential. With only a four-to-five-hour flight separating Thailand and China, Thai enterprises are well-positioned to seize these opportunities by understanding Chinese consumer preferences and delivering more high-quality Thai products and services. I am optimistic that meaningful progress will unfold in the near term."

Phaichit Viboontanasarn

China's Ministry of Commerce said that in 2025, bilateral trade between Thailand and China surpassed 1 trillion yuan ($147.8 billion), up 15.1 percent year-on-year.

Thailand's Ministry of Commerce said that in April, the country's exports to the rest of the world climbed 23.1 percent year-on-year to $31.5 billion, reflecting the growing competitiveness of the Southeast Asian nation's products.

Citing the "Big Market for All: Export to China" initiative — a move by China's commerce ministry to expand the nation's opening-up — Phaichit said: "I wish to express my sincere appreciation to the Chinese government for its steadfast efforts to further open its market in recent years. This campaign is a clear demonstration of China's genuine commitment to welcoming foreign products and enabling Chinese consumers to enjoy a wider range of high-quality goods.

"The approval of China's 15th Five-Year Plan (2026-30), which places strong emphasis on further market liberalization, is equally encouraging. And we continue to see landmark events such as the China International Import Expo in Shanghai grow in scale and influence year after year."

Suphajee Suthumpun, Thai deputy prime minister and minister of commerce, said China remains Thailand's most important trading partner, and a wider range of Thai products are gaining popularity among Chinese consumers.

Phaichit said: "China's market is growing tremendously — not only in scale, but in sophistication. Against the backdrop of China's high-quality development, I firmly believe this is a moment the world cannot afford to overlook, and Thailand is no exception.

"We warmly welcome Chinese consumers to discover Thailand's exceptional products and services, and to explore everything our country can offer. The opportunities are boundless. More broadly, I envision the two countries enjoying a flourishing and enduring diplomatic relationship for the next 50 years and beyond."

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said: "China boasts vast consumers from abundant levels. Meanwhile, the Chinese government always prioritizes trade and investment facilitation. By lowering taxes, expanding market access and increasing the import of agricultural products, foreign countries with lower costs are exporting to China with stronger trade stability.

"The Chinese market is key to import and export enterprises from all over the world. Some of their products, with value-added through Chinese industrial chains, can be better exported to other parts of the world. In addition, expos such as the CIIE and the Canton Fair also promote exports from other countries to China."

Carrier mulls larger investment in nation on AI data center, green push

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's push to expand computing infrastructure and advance green urban development will create fresh growth opportunities for Carrier Global Corp to deepen investment in manufacturing, innovation and digital technologies in the country during the 15th Five-Year Plan (2026-30) period, said a senior executive.

As China accelerates the development of data centers, green urban infrastructure and artificial intelligence applications, Carrier — a United States-based intelligent climate and energy solutions provider and parent company of Toshiba HVAC and Viessmann Climate Solutions — will align its business priorities with these emerging opportunities while exporting products made at its China plants to markets worldwide.

Michael Gierges, president of climate solutions for Asia-Pacific, Middle East and Africa at Carrier, said China is no longer viewed simply as a regional market, but as a key driver of the group's global growth strategy.

"Cooling systems account for a significant share of data center energy consumption, making efficiency improvements increasingly important," said Gierges. "Through our QuantumLeap solution, we integrate intelligent cooling, digital controls and predictive monitoring technologies to optimize thermal management and improve energy performance across data center operations."

Beyond cooling technologies, Carrier is also expanding AI applications across its building solutions business.

"We have developed AI-enabled building control solutions for the Chinese market that help optimize building performance, improve energy efficiency and enable smarter, more adaptive building operations," he added.

With China entering a new era of green and innovation-led growth, the Florida-headquartered company has continued to expand its manufacturing footprint. It launched a new air-cooled chiller production line at its facility in Shanghai's Baoshan district, with investment exceeding 100 million yuan ($14.8 million) in January.

Equipped with digital, automated and intelligent technologies, the facility delivers a capacity increase of more than 30 percent compared with pre-upgrade levels.

Michael Gierges

Together with additional production lines yet to be commissioned and supporting facilities, the project's total investment is expected to reach approximately 400 million yuan.

Building on this, Carrier inaugurated an integrated commercial HVAC testing center in May in Shanghai to strengthen its capabilities in energy-efficiency validation and performance optimization, particularly for data centers.

Gierges said Carrier also sees China as an increasingly important hub for innovation and exports, with centrifugal and screw chiller technologies developed by its local engineering teams now being deployed in markets around the world.

"Collaboration with local partners will remain central to our China strategy," Gierges said, adding that the company's partnerships with Alibaba Cloud, the cloud computing arm of Alibaba Group, will help advance digital transformation and AI infrastructure development.

He also highlighted the company's long-standing partnership with State-owned Shanghai Electric Group Co, which is expected to support sustainable urban renewal, reinforcing its long-term confidence in the Chinese market.

Supported by more than 5,000 employees in China, Carrier currently operates seven manufacturing bases, three research and development centers, and over 70 branch offices across the country. One of its companies in Shanghai received a National May 1st Labor Award, one of China's highest honors for organizations, earlier this year.

Wang Xiaohong, a researcher at the China Center for International Economic Exchanges in Beijing, said China's strengths in industrial supply chains and innovation ecosystems continue to attract long-term investment from multinationals.

China saw the actual use of foreign direct investment in high-tech industries surge 20.3 percent year-on-year to 116.33 billion yuan in the first four months, accounting for 40.4 percent of the country's total FDI, data from the Ministry of Commerce showed.

NeuroXess eyes mass BCI production with new unit coming online in H2

By **CHENG YU**
chengyu@chinadaily.com.cn

Chinese brain-computer interface company NeuroXess is gearing up for what it sees as the next phase of the industry: mass production.

The startup plans to begin operating a 14,300-square-meter manufacturing facility in Jiangxi province in the second half, a move NeuroXess founder and chief scientist Tiger Tao Hu said will help transform BCIs from experimental technologies tested on dozens of patients into products that can be delivered at an industrial scale.

This also reflects the company's dual-core strategy of "research and development in Shanghai, production in Jiangxi", Tao said in an exclusive interview with China Daily.

Such efforts come as BCIs, which create direct communication pathways between the human brain and technology such as a computer or artificial limb, attract growing global attention from investors, governments and technology companies.

While the industry remains dominated by clinical trials and research milestones, companies are increasingly racing to answer a more practical question: Who can manufacture these devices reliably, safely and at scale?

For NeuroXess, the answer lies not only in neuroscience, but also in factories.

The company has completed more than 50 clinical trials and is developing what it calls a fully implanted, fully wireless and fully functional BCI system. The Jiangxi facility is designed to eventually support annual production at the scale of tens of thousands of units.

The company's first patient implanted with the system in late 2025 achieved a brain control speed of 5.2 bits per second after 17 days of training, according to the company, enabling web browsing, gaming and control of external devices.

By early 2026, the participant was independently shopping, writing Spring Festival calligraphy and using digital payment tools through brain control systems.

According to Tao, 2026 has become a pivotal year because three critical pieces are finally coming together.

"The technology, the clinical validation and the manufacturing capabilities have matured at the same time," he said.

As competition intensifies between China and the United States, Tao argues that the discussion often focuses too heavily on individual technologies rather than the broader ecosystem needed to commercialize them.

He rejects the idea that China lags significantly behind the US in BCIs. "The core scientific principles are not fundamentally different," he said.

Tao acknowledged that the US still holds advantages in specialized chips, but argued that China has significant strengths in clinical resources, manufacturing and industrial integration.

BCIs, he said, are not simply chips implanted into the brain, "they are system engineering projects".

The challenge is integrating electrodes, chips, packaging, software, operating systems, wireless communication systems, manufacturing and clinical workflows into a single functioning product.

"A patient doesn't need a world champion in one component," Tao said. "A patient needs a complete system that works."

China's manufacturing ecosystem, he argues, offers a unique advantage. "Technology only matters if patients can actually use it," he said. Tao pointed to China's precision manufacturing supply chains, hospital networks and engineering talent as factors that could help accelerate commercialization.

The Jiangxi factory reflects that strategy. Beyond manufacturing, it will also serve as a rehabilitation and training center. The facility will include simulated streets, subway stations, cafes and convenience stores where patients can practice using BCI systems in realistic environments.

The goal, Tao said, is not simply restoring movement. "The ultimate goal of rehabilitation isn't that a patient can move again," he said. "It's that they have the confidence to go outside again."

Tao Hu (left), founder and chief scientist of NeuroXess, shakes hands with a patient using a thought-controlled exoskeleton at a clinical rehabilitation center in Shanghai. PROVIDED TO CHINA DAILY

In addition, the recent boom in artificial intelligence may prove as important to BCIs as advances in hardware.

Tao describes large AI models not as an add-on to BCIs, but as an "operating system upgrade".

Previously, decoding neural signals often required weeks of calibration for each individual patient. AI models are increasingly making brain signal decoding faster, more accurate and more transferable between patients.

"AI is turning brain computer interfaces from something that must be calibrated for every individual into a technology that can generalize across patients," Tao said.

NeuroXess has already used AI to achieve several notable milestones.

In late 2024, the company conducted what it said was the world's first real-time Chinese language decoding trial. After nine days of training, a participant achieved 71.5 percent accuracy in full-spectrum Chinese syllable decoding without assistance from a language model.

The patient was able to generate spoken Chinese through thought, control a digital avatar and interact directly with AI systems.

In another clinical trial conducted with Shanghai's Huashan Hospital Affiliated to Fudan University in 2025, patients in Shanghai and Fuzhou completed what NeuroXess described as the first long-distance "thought conversation" between two human subjects.

The system translated neural signals into text at speeds exceeding 300 Chinese characters per minute, roughly twice the pace of ordinary speech.

Tao believes such breakthroughs could eventually allow direct interaction between the human brain and AI systems.

"We don't see brain computer interfaces as just medical devices," he said. "We see them as the bridge connecting human intelligence and AI."

BUSINESS

Finance sector keen to boost robotics industry

State lenders' capital support for technology firms continues to strengthen and broaden

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

As humanoid robots move rapidly from research labs into real-world applications, China's banking and insurance sectors are racing to provide the financial fuel behind the industry's growth, rolling out innovative products, tailored financing solutions and ecosystem support to help robotics companies scale up and accelerate technological breakthroughs.

Statistics released by the People's Bank of China — the country's central bank — show that financial support for technology enterprises continues to strengthen and broaden. As of the end of the first quarter, 294,600 high-tech enterprises had obtained loan support, with a loan approval rate of 58.6 percent, up 1.3 percentage points from the end of the previous year. Outstanding loans to high-tech enterprises in Chinese yuan and foreign currencies reached 20.96 trillion yuan ($3.09 trillion), up 13.6 percent year-on-year and 6.1 percentage points higher than the end of last year.

The nation's six largest State-owned commercial banks remain the backbone of technology finance. Annual reports show that by the end of 2025, their combined outstanding technology loans exceeded 23 trillion yuan. Providing targeted support for innovation in the robotics industry has become a key focus for these banks as they work to foster new quality productive forces and upgrade strategic emerging industries.

Humanoid robotics companies are characterized by high research and development spending, significant technological barriers, strong growth potential and light-asset business models. Most startups rely heavily on intangible assets such as intellectual property and patents, while lacking the collateral typically favored by lenders. As a result, they face challenges including insufficient collateral, difficulties in asset valuation and high barriers to financing.

To address these pain points, major banks have continued to innovate their financial service models, tailoring support to the needs of leading enterprises. Through integrated services encompassing equity investment, lending, bond financing and insurance, they are providing support throughout the entire lifecycle of technology companies and helping them achieve rapid growth.

At the 2026 Beijing E-Town Half Marathon and Humanoid Robot Half Marathon on April 19, humanoid robots appeared alongside human runners. During the event, the Industrial and Commercial Bank of China set up a financial service station to provide services for participants and spectators, supporting the successful staging of the technology-focused competition.

In recent years, ICBC Beijing Municipal Branch has provided comprehensive financial support to Beijing Galbot Co, a market-leading company specializing in embodied multimodal large-model general-purpose robotics, helping its technologies move from the laboratory to large-scale production.

ICBC Financial Asset Investment Co, a whollyowned subsidiary of the bank, also participated in an equity investment in Galbot in December, injecting long-term capital into the company while leveraging industrial and financial resources to strengthen corporate governance and industrial collaboration.

Zhejiang Hechuan Technology Co, also known as HCFA, is specialized in industrial automation and has steadily advanced its humanoid robotics R&D efforts in recent years. However, intensive technological breakthroughs and product iterations have led to mounting financial pressure for the company.

After learning of HCFA's financing needs, the Longyou subbranch of China Construction Bank in Quzhou, Zhejiang province, designed a customized financial service package based on the company's operational characteristics, cash flow patterns and development plans. The subbranch extended nearly 200 million yuan in credit to HCFA, ensuring the company could smoothly advance its technological R&D and commercialization efforts.

Qinglong Lite, a humanoid robot co-developed by HCFA, made its debut at the 2025 World Artificial Intelligence Conference in Shanghai, and participated in a fun run event in Longyou county in Quzhou in March.

On April 17, Manycore Tech, a Hangzhou-based provider of spatial intelligence services, was listed on the Hong Kong stock exchange. The company's spatial intelligence technology supports embodied AI and robot training. Several commercial banks and their subsidiaries provided financial support for the company's listing in Hong Kong.

Bank of China, together with Bank of China (Hong Kong) Ltd and its overseas investment banking platform BOC International Holdings Ltd, provided a range of services for Manycore Tech and its subsidiaries, including credit facilities, cross-border cash management, IPO fundraising account services and underwriting support.

Above: People get to know intelligent services at the exhibition area of ICBC during the 15th China (Guangzhou) International Finance Expo in Guangdong province on June 3. PROVIDED TO CHINA DAILY **Left:** Qinglong Lite, a humanoid robot co-developed by HCFA, participates in a fun run event in Longyou county in Quzhou, Zhejiang province, in March. China Construction Bank has extended nearly 200 million yuan in credit to HCFA. LIU SHUTING / FOR CHINA DAILY

CCB International (Holdings) Ltd, the financial and investment services flagship of CCB, served as joint sponsor, overall coordinator, joint global coordinator, joint bookrunner and joint lead manager for Manycore Tech's Hong Kong IPO.

During the company's critical push toward the capital market, CCB Zhejiang Branch learned of its financing needs and promptly coordinated with CCB International. The entire credit application process was completed in just 10 working days, facilitating Manycore Tech's smooth listing in Hong Kong. The bank also provided the company with comprehensive financial services, including wealth management and exclusive unsecured loans for its employees.

Given the rapid pace of technological change and evolving market demand in the humanoid robotics industry, banks face increasing requirements for professionalism and foresight. In recent years, banks have continuously adjusted their financial support strategies and optimized their service models.

Wu Zewei, a contract research fellow at Jiangsu Su Merchants Bank, said future competition in technology finance will center on the depth of industry understanding and the ability to provide integrated services. Banks will compete on their capacity to deliver comprehensive financial solutions covering the entire corporate lifecycle, including equity financing arrangements, mergers and acquisitions advisory services, and supply-chain coordination.

As technologies mature, financial institutions are also actively exploring innovative applications of AI in financial services. Intelligent humanoid robots are gradually moving from laboratories into bank branches and becoming valuable tools for business innovation.

In recent years, the ICBC Software Development Center and ICBC's branch in Changzhou, Jiangsu province, have collaborated with leading robotics teams to develop a humanoid robot assistant for bank lobby managers. Equipped with multimodal interaction, autonomous mobility and intelligent recognition capabilities, the robot can accurately perform tasks such as customer guidance, business consultations and document-filling assistance, improving branch efficiency and customer experience.

In July 2024, CCB partnered with Beijing Runze Zhiyuan Technology Co, a company specializing in the fintech sector, and Fourier, a Shanghai-based proactive AI robotics company, to launch China's first intelligent humanoid robot training base for bank lobby manager scenarios at its branch in Shanghai's Pudong New Area. The initiative uses real-world banking scenarios to drive technological development and accelerate the practical adoption of humanoid robots in the financial sector.

Wang Peng, a researcher at the Beijing Academy of Social Sciences, said humanoid robots will increasingly take on customer service responsibilities in bank branches, such as self-service account opening, transaction inquiries and customer consultation. Their efficiency and accuracy will enhance the customer experience. Banks will also leverage robots' powerful data-processing capabilities to develop personalized wealth management consultations and intelligent investment advisory solutions, offering customers a broader range of financial services.

Insurance companies are also playing an active role in supporting cutting-edge technology development. Humanoid robots typically achieve maturity through repeated testing, and insurance can provide risk buffers for intensive, high-frequency testing, encouraging companies to pursue more ambitious technological validation. In commercial operations, humanoid robots face multiple risks, including equipment failure, accidental damage and potential bodily injury or property damage to third parties. Insurance can provide essential protection against these risks.

Since the second half of 2025, China's leading property and casualty insurers have accelerated their expansion into the humanoid robotics insurance market. At present, customized insurance products for humanoid robots mainly focus on equipment damage coverage and third-party liability insurance.

Last year, Ping An Property & Casualty Insurance Company of China launched a comprehensive financial solution for embodied intelligence in Shenzhen, Guangdong province. The package includes customized coverage for R&D cost losses, product liability, AI system liability and electrochemical performance degradation, among other risks related to R&D, operations, electrical systems, machinery and cybersecurity.

However, due to the lack of risk data on humanoid robots, rapid technological advancements, and the complex and constantly evolving risk profile, insurers still face significant challenges in fully understanding the risks associated with this business. Analysts said that, under the premise of ensuring data security and privacy protection, efforts should be made to strengthen data sharing and the joint development of standards among the technology industry, research institutions and the insurance sector.

Banks launch strong AI talent drive

By **JIANG XUEQING**

Several Chinese lenders have recently launched special recruitment programs targeting high-level artificial intelligence talent, accelerating their push into the financial AI arena. The trend underscores the banking sector's growing urgency to advance its digital and intelligent transformation.

The latest hiring drive focuses on core areas such as large language model development, AI application deployment and technology architecture planning. Entry requirements have been significantly raised, with most positions requiring candidates to hold PhD degrees from internationally renowned universities, possess work experience at major overseas institutions, and demonstrate expertise in LLM development, deep learning frameworks and other advanced AI technologies.

Yang Haiping, a researcher at the Shanghai-based SIFL Institute, said that the large-scale recruitment of top-tier AI talent is an important step for banks seeking to gain an early-mover advantage in AI applications and upgrade their digital finance strategies. The move will accelerate intelligent innovation in banking operations and management, reshape the industry's technological foundation and core competitiveness, and fundamentally change approaches to talent development in the sector.

Bank of Communications is recruiting senior AI experts for its financial technology department and fintech innovation research institute. Applicants are required to hold a PhD from a globally recognized university and have at least three years of relevant experience at a major overseas financial institution or international organization. Candidates with backgrounds in AI, data mining or computer vision, strong expertise in machine learning, deep learning and graph algorithms, as well as experience in AI strategy planning or generative AI model development at large institutions, will receive priority consideration.

Bank of China is hiring for an AI planning and research position in the fintech department at its head office. The role will be primarily responsible for developing the lender's AI framework and promoting the integration of AI technologies into core business operations. Preference will be given to candidates with experience in AI research and development at leading global tech companies, major financial institutions' AI centers or top-tier AI laboratories. The position also emphasizes the integration of technology and finance, requiring at least five years of fintech experience and familiarity with banking operations as well as risk and compliance requirements.

China Guangfa Bank has also recently opened an AI-related position at its head office, focusing on forward-looking research and commercialization of LLMs. Candidates are expected to be proficient in cutting-edge technologies such as LLMs and multimodal systems. The position is open only to PhD holders from prestigious overseas universities with at least three years of experience at internationally recognized companies or overseas financial institutions.

Gao Zhengyang, a special researcher at Jiangsu Su Merchants Bank, said lenders are competing intensely for top AI talent because the technology is rapidly penetrating every aspect of banking, including risk management, marketing, operations and customer service. Professionals with cutting-edge technical expertise can help banks build proprietary and controllable AI systems to support the intelligent upgrading of their businesses.

Gao said this year's AI recruitment drive reflects the banking sector's strategic ambition to use AI to fundamentally reshape banking operations. As competition shifts from traditional business capabilities to data management and intelligent decisionmaking, banks increasingly need multidisciplinary professionals who possess both advanced algorithmic expertise and a deep understanding of financial services.

A report released by PwC in March found that among surveyed financial institutions in the banking, insurance and asset management sectors in the Chinese mainland and Hong Kong, more than 75 percent plan to position AI as a "strategic transformation engine" to revolutionize and expand existing services, or as a "new revenue pillar" to generate new income streams through innovative services, over the next three to five years.

Looking ahead, Tian Lihui, a professor of finance at Nankai University, said the demand for AI talent in the banking sector will follow three major trends: talent shortages will increasingly be concentrated among hybrid professionals who combine business expertise with algorithmic skills; AI-related positions will gradually expand from the head office to branch networks and subsidiaries; and AI governance and compliance positions will become a critical requirement across the industry.

In the long run, Tian said, banks need to establish sustainable talent development systems, optimize performance evaluation mechanisms, and allow sufficient time for technology refinement.

AI has already permeated virtually every aspect of banking operations in China.

Industrial and Commercial Bank of China has deployed more than 500 AI application scenarios across over 30 business areas, while China Construction Bank's AI applications cover nearly 400 scenarios, leveraging AI to empower the entire credit approval process. Bank of Communications has deepened its AI applications in areas such as cross-border trade, wealth management and the digital transformation of retail banking operations, with its intelligent computing capacity increasing by more than 50 percent year-on-year in 2025.

Visitors interact with a humanoid robot from Bank of Communications during the 2025 World Artificial Intelligence Conference in Shanghai on July 27. HE XIAOXIAO / FOR CHINA DAILY

Demand for tech professionals is growing rapidly. The combined number of tech personnel employed by China's six largest State-owned commercial banks rose from more than 111,100 at the end of 2024 to over 135,800 by end-2025, representing a year-on-year growth of 22 percent, significantly outpacing changes in overall bank staffing levels.

Dong Ximiao, chief economist at Merchants Union Consumer Finance and deputy director of the Shanghai Institution for Finance and Development, said China still faces a significant shortage of fintech talent, and there remains a clear mismatch between university training programs and industry needs.

Dong said large financial institutions should take the lead in tech development and application, while sharing excess capabilities and talent resources. Smaller institutions should cooperate with leading financial institutions and tech firms to accelerate the integration of technology and business operations.

He suggested that financial institutions foster an open and inclusive culture that tolerates experimentation and failure, and build a comprehensive talent ecosystem through recruitment and promotion mechanisms.

Dong said banks should ensure that chief information officers are empowered with clear responsibilities, authority and resources. At the same time, AI-related risks should be fully incorporated into enterprise-wide risk management frameworks, with comprehensive measures adopted to prevent and address risks.

High-purity quartz discovered in Xizang

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese scientists have identified a rock formation in the Xizang autonomous region as a potential source of high-purity quartz. This scarce mineral is critical to manufacturing semiconductors, optoelectronics — light-based electronics, and aerospace technology.

The discovery marks a significant step toward reducing the country's reliance on imported supplies of this strategic material.

The research team, led by the University of Science and Technology of China in Hefei, Anhui province, evaluated leucogranites — light-colored igneous rocks formed when the earth's crust melts — in the Dinggye area of southern Xizang. They found these rocks could be purified to yield a silicon dioxide content above 99.995 percent, meeting the threshold for high-purity quartz. The findings were published in the European Journal of Mineralogy on April 30.

High-purity quartz is highly valued because it can withstand extreme heat, is chemically stable, does not expand much when heated, and is an excellent electrical insulator that allows light to pass through easily. Defined as having total chemical impurities below 50 parts per million — meaning the mineral is roughly 99.995 percent pure silicon dioxide — it is extremely difficult to purify. However, it remains essential to high-tech industries such as microchips, solar panels and fiber-optic communications.

Global resources of the mineral are scarce and unevenly distributed. According to the China Geological Survey, the United States holds some of the richest deposits. In fact, the Spruce Pine mine in North Carolina once supplied more than 90 percent of the world's semiconductor-grade high-purity quartz sand. Russia, Norway and Australia also maintain significant reserves. These countries have long dominated the market with established mining and processing capabilities.

China, despite being the world's largest manufacturer of solar panels and a major semiconductor producer, is the largest importer of high-purity quartz. Consequently, the country has been intensifying efforts to develop domestic sources.

In recent years, breakthroughs under the national strategic mineral exploration campaign have identified high-purity quartz deposits in the East Qinling region of Henan province and the Altay region of the Xinjiang Uygur autonomous region. These sites have yielded products with purities of at least 99.995 percent, with some samples reaching 99.998 percent. In 2025, the Ministry of Natural Resources officially designated high-purity quartz as China's 174th recognized mineral species, aiming to further bolster supply chain security.

The new study has extended that exploration effort to the Himalayan belt, which stretches across hundreds of kilometers in Xizang. While the light-colored leucogranites there have long been studied for their potential to host rare metals, no systematic assessment of their high-purity quartz potential had been conducted until now.

The research team collected samples from the Dinggye area and applied a series of analytical testing techniques.

After processing, the purified quartz sands from two sample types achieved silicon dioxide purities of 99.9969 percent and 99.9959 percent, successfully placing them within the high-purity category on industry-standard classification charts.

The study noted that the widespread exposure of these rocks in the region offers a significant opportunity to develop high-end quartz resources in China, ensuring a stable and strategic domestic supply of raw materials.

The delegation visits a robotics company in Tianjin on Monday. The event showcased cutting-edge robotics technology to officials and experts from various countries. TONG YU / CHINA NEWS SERVICE

Tianjin Port's smart terminal lauded

By **YAN DONGJIE** in Tianjin
yandongjie@chinadaily.com.cn

A delegation comprising officials and experts from eight countries, including Cuba, Austria, Gambia, Laos and Cote d'Ivoire, praised Tianjin's efforts in advancing green development, technological innovation and public well-being during a recent visit to the port city.

The four-day visit, aimed at showcasing China's people-centered development philosophy through a tour of a range of sites including Tianjin Port's smart terminal, concluded on Wednesday.

The Beijiang port area's Berth C stands out as the world's first fully intelligent and carbon-neutral container terminal. Powered entirely by electricity generated through an integrated wind-solar-storage energy system, the terminal has achieved a 100 percent clean power supply and obtained carbon neutrality certification.

Its operations are supported by an integrated 5G and Beidou Satellite Navigation System, artificial intelligence and autonomous vehicles, significantly improving efficiency while reducing emissions.

According to port authorities, the intelligent system has reduced cargo loading and unloading times by 26.2 percent and improved vessel berthing efficiency by 28 percent compared with traditional operations.

For visitors, the terminal offered more than a glimpse of advanced port management. It demonstrated how digital technologies and renewable energy can work together to reduce carbon emissions while maintaining high operational efficiency, an issue many countries are exploring as they pursue sustainable development and green economic growth.

Mohammed B.S. Jallow, vice-president of Gambia, said he was impressed by the terminal's ability to increase throughput while maintaining zero-emission operations.

"As you can see, there is barely any noise on site. The operational efficiency is truly remarkable. Higher efficiency enables the port to handle more cargo volume, while maintaining zero emissions, which is an incredible achievement," he said.

Robert Mag Fitzthum, an Austrian author, said, "For a long time, people have pursued economic development while longing for clean rivers and clean surroundings, which are essential for people's well-being.

"China has achieved remarkable success in balancing sound ecological development and robust economic progress, setting a fine example for sustainable development," he added.

The delegation also visited the Sino-Singapore Tianjin Eco-City in Binhai New Area, where smart governance and green urban planning have been integrated to improve residents' quality of life.

As the world's first eco-city jointly developed by two countries, the project was designed to explore sustainable urban development solutions. With more than 12 million square meters of green space and a digital governance platform powered by big data and AI, the eco-city monitors environmental indicators in real time while providing efficient public services.

Visitors learned how pedestrian greenways connect parks, schools, hospitals and residential communities, forming a convenient low-carbon lifestyle network. New facilities including senior universities, community markets and cultural centers have also been introduced to meet residents' diverse needs.

Christian Arnaud Adjelou, president of the National Human Rights Council of Cote d'Ivoire, said the city's extensive green space and well-developed public services demonstrated a strong commitment to improving people's quality of life.

"Every effort made here is geared toward protecting human rights and creating a better living environment for residents," he said.

Dayron Valido Escalona, a specialist from the human rights group of Cuba's Ministry of Foreign Affairs, said the visits highlighted the close connection between technological innovation, sustainable development and people's well-being.

A bridge reopens

Villagers sing traditional Dong ethnic songs during the reopening of a bridge in Congjiang county, Guizhou province, on Wednesday. Originally built in 2012, it was destroyed by a devastating flood in June 2025. Reconstructed as a key post-disaster recovery project, the 310-meter-long bridge now features improved safety and stability measures, ensuring smooth passage and providing convenience for local residents.
WU XINGKE / FOR CHINA DAILY

DPP's response to delimitation talks a betrayal

Mainland warns external interference undermines regional stability, peace

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

The Chinese mainland criticized on Wednesday the Democratic Progressive Party authorities in Taiwan for betraying the nation in their response to the so-called maritime delimitation negotiations between Japan and the Philippines, accusing the authorities of currying favor with external forces.

Zhang Han, spokeswoman for the State Council Taiwan Affairs Office, reiterated at a regular news conference that China possesses an exclusive economic zone and continental shelf in the proposed maritime delimitation area announced by Japan and the Philippines, which lies east of Taiwan.

She denounced the DPP authorities for "bowing and scraping" in an attempt to curry favor with external forces, calling them "traitors to the nation".

While the Chinese mainland called on both sides of the Taiwan Strait to jointly safeguard national sovereignty and territorial integrity, the DPP authorities asserted that "the two sides of the Taiwan Strait are not subordinate to each other, and China has no right to interfere or speak on behalf of Taiwan".

In response, Zhang said in the face of condemnation from people on both sides of the Taiwan Strait, the DPP authorities have once again hyped the fallacies of "Taiwan independence" to shift attention and mislead the public.

The DPP authorities' response to the maritime delimitation talks launched by Japan and the Philippines on May 28 has been criticized by opposition parties and political commentators as sacrificing the island's maritime interests. After expressing support for the talks on May 31, the DPP authorities later said that Taiwan had "fisheries agreements" with both countries and would continue consultations with them on maritime issues.

Zhang warned the DPP authorities that anyone who forgets their ancestors and betrays the nation will "be nailed to the pillar of shame in history".

Responding to a maritime standoff between the mainland and Taiwan in waters around the Dongsha Islands on Friday, Zhang emphasized that China has sovereignty over the South China Sea Islands, including the Dongsha Islands and their adjacent waters.

She said that law enforcement patrols by the mainland's coast guard in the relevant waters constitute the normal exercise of official duties.

Addressing claims by the DPP authorities that the mainland vessel had entered "restricted waters" around the islands, and their corresponding measures, Zhang warned that the DPP authorities would bear all consequences arising from further provocation.

Foreign Ministry spokesman Lin Jian said on Tuesday that Japan and the Philippines' decision to unilaterally launch maritime delimitation negotiations while bypassing China seriously violates international law, including the United Nations Convention on the Law of the Sea, as well as the basic norms governing international relations.

"It gravely infringes upon China's maritime rights and interests," Lin said, expressing firm opposition to the move.

On June 1, the China Coast Guard conducted routine law enforcement patrols in accordance with the law in waters east of Taiwan, an operation carried out in response to the delimitation talks between Japan and the Philippines, according to Jiang Lue, spokesman for the China Coast Guard.

From June 6 to 10, the Ministry of Transport organized vessels from the maritime safety administrations of Fujian and Guangdong provinces to jointly conduct a special maritime traffic law enforcement and survey operation in waters east of Taiwan.

Zhang Xiaogang, spokesman for the Ministry of National Defense, urged Japan and the Philippines on Tuesday to immediately cease what he described as illegal and provocative actions that infringe upon China's rights and interests. He warned that if the two countries persist, they will only bring consequences upon themselves.

At the Wednesday news conference, Zhang Han also noted that with the strong backing of the motherland following peaceful reunification, people of Taiwan will enjoy greater security, and the risk of conflict arising from "Taiwan independence" will be fundamentally eliminated.

She said Taiwan people will no longer be used as "cannon fodder" for the "Taiwan independence" separatist agenda, and the island will no longer be a "pawn" of external forces.

"Taiwan fishermen operating in waters surrounding the island will receive timely and strong protection of their lawful rights and interests from the country's maritime forces," she added.

China's oldest captive male Asian elephant Bamo dies at age 65

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

The oldest living male Asian elephant raised in captivity in China, Bamo, died on Sunday at the Shanghai Zoo. He was 65.

Bamo, who died at 1:16 pm, held the record for the longest-lived male Asian elephant in the studbook of the Chinese Association of Zoological Gardens.

Born in Myanmar in 1961, Bamo first came to China in 1967, initially residing at the Beijing Zoo. He moved permanently to the Shanghai Zoo in 1973, spending 53 years in the city and becoming the longest occupant of the zoo's elephant enclosure, as well as a cherished fixture in the childhood memories of countless local residents.

"I had been with him for nearly eight years," said Liu Chang, Bamo's 34-year-old full-time keeper.

Despite his advanced age, Liu said Bamo maintained the playful heart of a mischievous child. "During on-site explanations, he loved to spray water at me — his way of demanding attention and snacks," Liu recalled.

Liu noted that Bamo was exceptionally intelligent and often traded items for treats with his keepers. "He would tear off chains or branches from enrichment items and swing them around with his trunk. We would trade corn and watermelon for them, and he would gently drop the items in front of us. He was very sensible."

As Bamo aged, time left its marks: his molars deteriorated, his spine curved, and he began gradually losing weight. To ensure his comfort, the zoo implemented a systematic health management program for elderly elephants, which Liu credited as crucial to Bamo's longevity.

"Given his tooth deterioration, we cut his food into smaller pieces and switched to frequent, smaller meals, adding a little each time to encourage him to eat more," Liu said.

Beyond meticulous dietary care, the park constructed two specialized training walls for positive reinforcement training under protected contact. This enabled staff members to safely and effectively conduct foot care, oral examinations, and ear temperature checks.

The outdoor exhibit area was also enhanced with pools, sprinklers, sand piles, and red earth mounds, while soft resting beds were added to the indoor enclosures for added comfort.

"We undertook a major renovation of the pool in 2023 and installed sprinkler systems," Liu said. "Elephants love playing with water and enjoy spraying themselves."

To cater to the elephants' need for mental stimulation, the husbandry team frequently replaced feeding devices and other enrichment items. "We had to continually refresh the enrichment content, as he would lose interest after interacting with the same items a few times," Liu added.

Since 2025, the Shanghai Zoo has enlisted elephant care experts from the United States on two occasions to provide on-site guidance in behavioral training, foot care, and elderly elephant management to maximize Bamo's comfort.

However, Bamo's appetite declined sharply in late May, and he occasionally appeared restless. Despite continuous adjustments to his diet and various nursing efforts by the care team, his condition did not improve. On Saturday morning, Bamo's hind legs began to show noticeable unsteadiness, and he collapsed in the early hours of Sunday.

"The elephant house feels so empty now," Liu said. "For eight years, my day began with checking on him — his condition, eating habits, and spirit. Now, there's a huge void in my heart.

"As a keeper, the best way to honor Bamo is by updating our husbandry practices and caring better for the remaining elephants," Liu added.

Bamo fathered eight calves, significantly enhancing the genetic diversity and population of captive-bred Asian elephants. Liu said Bamo witnessed the evolution of the Shanghai Zoo from basic facilities to a comprehensive breeding environment. The elephant's late-life care protocols and daily husbandry practices have since become a standard for zoos across China.

DPP snubs mainland cooperation package

Taiwan industries to suffer as island's authorities choose politics over people

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

A visitor tours the booth of Jinmen, an outlying county near Fujian province but governed by the Taiwan authorities, during the 20th Strait Travel Fair in Xiamen, Fujian, last year. The fair invited professionals in Taiwan's tourism industry for discussions and promotions.
ZHANG BIN / CHINA NEWS SERVICE

Two months after the Chinese mainland introduced 10 sweeping policy measures to advance cross-Strait cooperation, tangible economic benefits have begun reaching key agricultural, tourism and media sectors. However, a deepening political deadlock remains, as the Democratic Progressive Party authorities in Taiwan have yet to respond to mounting public and industry calls to adopt the package.

The comprehensive policy blueprint was announced by the Taiwan Work Office of the Central Committee of the Communist Party of China on April 12, following a visit by a Chinese Kuomintang delegation to the mainland led by Chairwoman Cheng Li-wun. Framed as a gesture of goodwill to foster closer integration, the broadly supported package covers youth exchanges, infrastructure connectivity, trade facilitation, tourism and cultural cooperation.

Over the past two months, several measures have been steadily advanced.

Based on adherence to the 1992 Consensus, which embodies the one-China principle, and opposition to "Taiwan independence", the mainland proposed a regularized mechanism for communication between the CPC and the KMT as part of the policy package. Both parties pledged to promote cross-Strait exchanges and integration with more effective measures.

Similarly, both parties have been building an institutionalized mechanism to facilitate two-way exchanges between young people across the Taiwan Strait. In addition to regular cross-Strait youth exchange events organized by the mainland's All-China Youth Federation and the KMT's youth league, 20 youth delegations from Taiwan are set to visit the mainland annually.

Lee Chang-chih, who oversees youth affairs for the KMT, said he hopes to connect with young people who are interested in the mainland but have limited familiarity with it. "Through exchanges that are more closely tied to everyday life, we aim to help them find common ground, deepen mutual understanding, and build stronger connections," Lee said.

Regarding the measure aimed at promoting cross-Strait cooperation in film, television and cultural production, Zhu Fenglian, spokeswoman for the State Council Taiwan Affairs Office, outlined on June 3 three avenues through which Taiwan industry professionals can participate in the mainland's burgeoning micro-drama sector.

According to Zhu, Taiwan industry professionals can establish television program production companies in Fujian province, jointly develop micro-dramas with mainland partners, or take part in productions as performers.

Visitors view the *Jadeite Cabbage* exhibit at the Taipei Palace Museum Southern Branch in Chiayi county, Taiwan, on May 3.
CHEN JIANXIN / CHINA NEWS SERVICE

At present, 18 Taiwan-funded enterprises in Fujian have obtained licenses for radio and television program production and are actively engaged in micro-drama production.

Taiwan-produced films also continue to enjoy smooth access to mainland theaters. So far this year, six Taiwan films have been released on the mainland. Last year, eight Taiwan-produced films were screened on the mainland, generating a combined box office revenue of approximately 88.11 million yuan ($12.2 million).

In a recent poll conducted by Taiwan's United Daily News, about 60 percent of respondents on the island supported the authorities taking this opportunity to resume or expand cross-Strait exchanges.

However, among the 10 measures, major initiatives aimed at facilitating cross-Strait exchanges, such as resuming more direct flights, restoring individual tours to Taiwan for residents of Fujian and Shanghai, and advancing cross-Strait infrastructure connectivity, have yet to receive a response from the DPP authorities.

While the mainland has been actively advancing the implementation of the policy package, the DPP authorities have dismissed it as a "sugar-coated poison" and characterized it as a set of "united front" measures.

Citing what they describe as "security" concerns, the DPP authorities have rejected the mainland's proposals to facilitate the provision of water, electricity and gas services, as well as to promote bridge links between Fujian's coastal areas and Jinmen and Matsu, the Taiwan-controlled islands closest to the mainland.

Lee Wen-liang, deputy county magistrate of Jinmen, said in an interview that the local government remains open to any proposals that would contribute to Jinmen's development and attaches great importance to issues concerning people's life, regional development and transportation infrastructure.

Meanwhile, the new Xiamen Xiang'an International Airport has incorporated dedicated check-in and customs clearance channels for travelers from Jinmen into its design. The facilities are ready to be integrated into Jinmen's transportation network once cross-Strait policies are eased.

In late April, the mainland's Civil Aviation Administration submitted technical applications to Taiwan's aviation authorities to resume regular direct passenger flights between Taiwan and five cities on the mainland, including Urumqi in the Xinjiang Uygur autonomous region and Xi'an in Shaanxi province. The proposal forms part of the broader policy package aimed at fully normalizing cross-Strait passenger air services.

As of June, only 15 mainland destinations and 10 Taiwan destinations are served by regularly scheduled cross-Strait passenger flights. Under existing arrangements, however, as many as 61 destinations on the mainland and 10 in Taiwan are eligible for such services, a level that was in place before 2020.

The "mainland affairs council" in Taiwan has refused to adopt the initiative, arguing that the "current arrangement is sufficient".

Cross-Strait air traffic remained robust in the first quarter, with 8,079 flights carrying 1.47 million passengers and average load factors exceeding 80 percent. Mainland airlines have already utilized nearly all of their allocated capacity on cross-Strait routes.

China Eastern Airlines, Spring Airlines and Shandong Airlines planned to resume direct flights starting this July, respectively operating routes from Chengdu in Sichuan province to Taichung, Ningbo in Zhejiang province to Kaohsiung, and Qingdao in Shandong province to Taichung.

Calling on the DPP authorities to lift "unreasonable" restrictions on air travel, the mainland said cross-Strait flight services should be arranged by airlines according to market demand.

The policy package also includes pilot programs allowing residents of Shanghai and Fujian to travel to Taiwan as individual tourists, a move that has been welcomed by Taiwan's tourism industry. However, its full implementation remains contingent on a response from the DPP authorities.

Since April 29, residents of Shanghai have been able to visit Jinmen and Matsu under the individual travel program, following the mainland's announcement in February that such tours to the counties would resume.

According to the latest statistics from the county tourism department, 6,579 mainland tourists with travel permits entered Jinmen during this year's May Day holiday. So far this year, the total number of mainland visitors to Jinmen has reached nearly 60,000, of whom 99 percent were individual travelers.

Wang Chih-hung, chairman of the Taiwan Chinese Tourism Management Association, said in an interview during the holiday that Taiwan's past milestone of 10 million inbound visitors was largely driven by a steady flow of mainland tourists. "Today, Taiwan's tourism industry is missing this crucial piece of the puzzle, and tensions in cross-Strait relations and geopolitical instability have also raised safety concerns among overseas visitors," Wang said.

In August 2019, the mainland suspended the pilot program for residents of 47 cities to visit Taiwan because of the DPP authorities' continued promotion of "Taiwan independence" activities and efforts to heighten cross-Strait tensions.

About 2 million people in Taiwan are employed in tourism and related industries, accounting for roughly one-sixth of the island's total workforce. Taiwan media estimate that the cross-Strait tourism sector recorded a deficit of approximately NT$152 billion ($5 billion) last year, as mainland visitor arrivals totaled just 557,700, far below the peak of 4.14 million in 2015, while 4.89 million visits were made by Taiwan residents to the mainland.

On April 20, Taiwan's general chamber of commerce held a news conference bringing together representatives from seven major industries, including hotels and travel service providers. They urged the DPP authorities to "open up and lift restrictions where they should", and questioned, "Why not accept the mainland's 'olive branch'?"

In addition to the tourism sector, Taiwan's agricultural and fisheries industries are also closely watching the mainland's policy measures.

According to Taiwan's agricultural authorities, agricultural exports totaled $4.45 billion last year, down 9.6 percent year-on-year. In the first quarter of this year, exports amounted to $1.01 billion, a 2.7 percent decrease from a year earlier. Fish and fish products recorded the largest decline among export categories.

To facilitate agricultural and fishery products from Taiwan in accessing the mainland market, as proposed in the policy package, port authorities in Fujian province, including Dongshan Customs, have enabled the import of Taiwan agricultural and fishery products that meet inspection and quarantine standards. They have achieved this by developing a tailored customs clearance framework for live fish shipments from the island.

In the first quarter, local customs authorities facilitated the import of 1,263.2 metric tons of live grouper from Taiwan, with a total value of 51.98 million yuan, representing year-on-year increases of 88.3 percent and 96.1 percent, respectively.

Regarding the accommodation of Taiwan's deep-sea fishing vessels and the landing of their catches, the Lianjiang national distant-water fisheries base in Fuzhou, Fujian, provides the necessary facilities and conditions. A supporting network and industrial chain have also been established in the province to facilitate berthing, resupply and trade for Taiwan fishing vessels.

Other forms of economic cooperation are also being advanced on the mainland, including the organization of exhibitions and trade fairs for Taiwan products, and the development of small-scale cross-Strait commodity trading markets.

Chang Li-shan, magistrate of Yunlin county in Taiwan, told the media that the opportunity to export agricultural products to the mainland is good news, serving as a shot in the arm for local farmers and fishermen. It will help create broader and more accessible channels for trade, she added.

Zhang Han, a spokeswoman for the State Council Taiwan Affairs Office, said at a news conference in May, "The DPP authorities should follow public opinion on the island and respond to industry appeals by lifting artificial restrictions and removing barriers to the normalization of cross-Strait travel, exchanges and cooperation in various fields."

Cross-Strait 'mother' volunteers nurture child welfare

By **ZHANG YI** and **HU MEIDONG**
in Fuzhou

Strolling through a university campus in Fuzhou, Fujian province, Tsai Yu-chin from Taiwan tightly held the hand of a local primary school boy whose parents both live with visual impairments. Beside them, Tsai's junior high son joined in, laughing and chatting with the young boy.

For the young guest, who rarely has the opportunity to travel outside his immediate neighborhood, every corner of the campus — from the university history museum to the student dining hall — was a wonder to explore.

This campus day trip was organized by Tsai to fulfill a personal wish for the boy. Her efforts represent just one of many regular companionships forged by a unique cross-Strait volunteer group of "mothers" from both sides of the Taiwan Strait.

The volunteer team brings together around 30 Fuzhou and Taiwan volunteers. Through regular companionship, educational trips and charitable activities, the team has become a warm support system for underprivileged youth.

The heart of the operation is the Sunny Children's Welfare Library in Chengmen village, an underdeveloped suburban neighborhood on the outskirts of Fuzhou built in 2022.

Lin Qinyan, a local social worker, envisioned creating a quality reading environment for children who lack family care in the area. A prominent Taiwan-funded milk tea chain operating in the Chinese mainland became the project's earliest partner, providing essential funding and hands-on renovation assistance. From that initial library base, a dedicated cross-Strait volunteer network gradually expanded to support children from low-income families.

Lin and her fellow social workers match compassionate volunteers with vulnerable children for one-on-one, long-term mentorship.

Tsai, who is also head of the women's committee of the Fuzhou Taiwan Entrepreneur Association, joined the program last August. Her involvement quickly shifted from delivering custom study desks to disadvantaged households to providing deep, personal companionship.

Moved by the children's resilience, Tsai rallied 15 members from the Fuzhou Taiwan Entrepreneur Association in Fuzhou to join the volunteer ranks.

Ahead of International Children's Day on June 1, the network collected and published over 100 modest holiday wishes from vulnerable children, ranging from badminton rackets and sneakers, to scarves and storybooks.

Cross-Strait individuals and businesses claimed every single wish shortly after the list was released. "Donors purchase these gifts themselves based on the price guidelines we provide, and volunteers specially deliver them to the children's homes," said Huang Shan, a local social worker.

"These wishes, coming from underprivileged children across Fuzhou, are all very simple. Once, a child in a remote area just wished to eat a hamburger," she added.

"Some parents even encourage their own children to use their pocket money to buy gifts for these families in need," Huang said.

The library has since blossomed into a weekend haven. At a recent pre-Children's Day gathering, around 20 children of local gig-economy workers and distressed families gathered to play games. Guided by the social workers and volunteer "mothers", the children painted creative name plaques to share on stage and participated in interactive legal safety games to earn school supplies and safety gift packs.

"The children happily accept their 'Taiwan moms'," Tsai said, adding that doing good deeds makes her feel fulfilled, ensuring that care is truly delivered to those in need who require consistent support.

Lin said, "This sustained presence has brought visible, positive changes to the children."

Lin shared the story of a young girl who lost her parents and lives with her grandparents; through the long-term companionship of her dedicated volunteer mentor, she has become significantly more cheerful while maintaining stable academic performance. "These small acts of kindness are like scattered glimmers of light," Lin said. "When we join forces, we build a bridge of love."

TAPPING CHINA'S TOURISM MARKET

Azerbaijan opens its office in Beijing, seeking partnerships and closer ties to become a premier destination for outbound travelers, **Yang Feiyue** reports.

Azerbaijan is aiming to make China one of its top three tourism source markets within the next five years, a goal underscored by the opening of the Azerbaijan Tourism Board's first China office in Beijing in late May.

The move reflects the country's growing confidence in the Chinese outbound travel market and its determination to build closer ties with Chinese travelers, travel companies and media partners as visitor numbers continue to rise.

"We have been very active in China for the past six or seven years, promoting Azerbaijan through roadshows, exhibitions and industry events," says Florian Sengstschmid, chief executive officer of the Azerbaijan Tourism Board.

"We felt this was the right moment to move from working remotely to having a physical presence here. It shows our commitment to the Chinese market."

The new office is intended to serve as more than a marketing outpost. Sengstschmid envisions it as a platform for people-to-people exchanges and industry collaboration.

"We want this office to be a place where people meet," he says. "We want to invite travel partners, journalists, bloggers, and business leaders to exchange ideas and explore opportunities between Azerbaijan and China."

The visa waiver agreement between China and Azerbaijan has been in effect since July 16, 2025, meaning Chinese citizens holding valid ordinary passports can now enter Azerbaijan visa-free and stay up to 30 days per visit, with no more than 90 days within any 180-day period. In 2024, Azerbaijan had already introduced a one-year unilateral visa-free trial for Chinese visitors.

China has become one of Azerbaijan's fastest-growing tourism source markets. The country welcomed 63,500 Chinese visitors in 2025, a year-on-year increase of 41.7 percent, according to the tourism board. From January to April this year, arrivals from China exceeded 14,300, maintaining strong growth momentum.

Fuad Naghiyev, chairman of the State Tourism Agency of the Republic of Azerbaijan, emphasizes that the establishment of the Beijing office reflects Azerbaijan's strategic focus on the Chinese market. He notes that improved air connectivity and visa facilitation have supported steady growth in bilateral tourism flows.

For Azerbaijan, the significance of China extends beyond numbers.

"China is the world's largest outbound travel market and has held that position for many years," Sengstschmid says. "For many Chinese travelers, Azerbaijan is still a relatively new destination, which means there is tremendous potential."

The tourism board hopes to increase annual arrivals from China to between 200,000 and 300,000 within the next three to five years.

Industry players say a growing interest among Chinese travelers suggests the target may be within reach.

Li Mengran, marketing manager of the Beijing-based travel agency Utour, notes that Azerbaijan is emerging as a key growth driver in the niche Transcaucasus travel market.

"With Chinese travelers increasingly seeking out less-explored destinations, our multi-country itineraries combining Azerbaijan, Armenia and Georgia have recorded steady growth year after year," Li says.

She attributes part of the destination's rising appeal to increasingly convenient travel policies across the region.

"For Chinese tourists, it is no longer just one country opening up. The wider Transcaucasus region is becoming more accessible, making it easier for travelers to visit several destinations in a single trip," she says.

According to Li, demand for smaller and emerging destinations served by her company has risen by around 15 percent year-on-year this year, with Azerbaijan standing out thanks to its distinctive culture, dramatic landscapes and relatively untapped appeal.

The destination tends to perform particularly well during China's major holiday periods, including the National Day holiday in October, when it often emerges as a dark horse among long-haul and niche destinations, she adds.

Supporting Azerbaijan's ambition are a growing number of travel facilitation measures. China and Azerbaijan have implemented mutual visa-free arrangements, while air connectivity continues to expand. Azerbaijan Airlines currently operates direct flights between Beijing and Baku, while China Southern Airlines operates direct flights between Urumqi and Baku. A direct Shanghai-Baku route is expected to launch next year.

The Beijing office will also coordinate the tourism board's marketing campaigns across China, including cooperation with major online travel platforms and participation in industry events.

During a recent visit to China, the tourism board held roadshows in Xi'an, Shaanxi province, Shanghai and Beijing, alongside six industry partners, including Azerbaijan Airlines. The organization also participated in ITB China in Shanghai and signed a strategic cooperation memorandum with Tongcheng Travel, a leading travel platform based in Jiangsu province.

Recognizing that Chinese travelers are increasingly discovering destinations online, Azerbaijan has been strengthening its presence on Chinese digital platforms such as Weibo and Xiaohongshu.

"We don't want to bring Azerbaijan into these channels in a top-down way," Sengstschmid says. "We want Chinese travelers and Chinese content creators to tell their own stories and share their own experiences."

The country has also expanded its "China Ready" program, which aims to help local tourism businesses better serve Chinese visitors through staff training, service standards and improved visitor facilities.

Beyond certification programs, efforts are underway to improve signage, navigation systems and digital payment options. Services, including Alipay, are expanding to make travel easier and more convenient for Chinese visitors.

Sengstschmid says he believes Azerbaijan's appeal lies in its unique blend of cultures and landscapes.

"Azerbaijan is Western with an Eastern outlook," he says. "You see it in the culture, the food, the hospitality, and the way people live."

Azerbaijan has rolled out a wide range of tourism experiences tailored to Chinese travelers, including cultural exploration, nature-based travel, Silk Road heritage, gastronomy, wine tourism, and wellness experiences.

Visitors can explore the Walled City of Baku, a UNESCO World Heritage Site, admire modern landmarks such as the Heydar Aliyev Center, or venture further afield to discover mud volcanoes, mountain villages and ancient Silk Road towns. Destinations such as Khinalig, one of the highest and oldest continuously inhabited settlements in the Caucasus, offer insights into centuries-old traditions, while regions known for wine production and wellness tourism add further diversity to the visitor experience.

Sengstschmid says ultimately, human connections matter most.

"When people feel welcome, they want to return," he says. "Tourism starts with people."

With a permanent presence in Beijing, growing air links and targeted efforts to adapt to Chinese travelers' preferences, Azerbaijan authorities are betting that greater familiarity will translate into stronger tourism flows and deeper exchanges between the two countries in the years ahead.

Conservation efforts boost awareness of mangrove protection

GUANGZHOU — At Jinlong Primary School in South China's Guangdong province, second-graders are busy sketching mangroves, imagining tiny crabs scuttling among the roots.

"Mangroves are like a kindergarten for little crabs," one pupil says.

The lush mangroves that now inspire the students were once dismissed by locals in Tantou village in Nansha district, Guangzhou, as nothing more than common shoreline weeds.

"When we were kids, we often ran to the beach to catch fiddler crabs and river shrimp. We thought these mangroves were just ordinary water plants," says Huang Jinhua, Party secretary of the village.

The villagers' perception shifted dramatically in 2019, when a powerful typhoon struck the area.

"The water level rose so fast that we thought the sea would overflow the embankment. We were ready to evacuate people. But unexpectedly, the tide slowly receded," Huang recalls.

Realizing that mangroves act as "coastal guardians" that stabilize shorelines and purify nearshore waters, villagers began participating in regular beach cleanups and implementing plant pest and disease control measures.

Furthermore, a more systematic and scientific conservation effort took root following an unexpected encounter.

In 2022, a group of strangers appeared near the village's mangrove forest during a routine patrol. The villagers grew instantly alert, approached the visitors, and shouted: "What are you doing? Don't cut the trees!"

To their surprise, the strangers turned out to be researchers from the Guangzhou Ocean Carbon Peak and Carbon Neutrality Research Association, who had arrived to survey the mangroves.

"We spotted the mangroves earlier using drones and remote-sensing technology. They were growing well but lacked proper scientific management, so we came to conduct field surveys," says Du Yuyan, secretary general of the association.

The confrontation quickly transformed into cooperation. With support from the United Nations Development Programme, the association helped build a 300-meter mangrove science corridor in 2023, featuring 46 display panels along the wetland.

Song Meiying, deputy Party secretary of Tantou village, in Guangdong province, shows a mangrove seedling in the mangrove forest in the village. YANG SHENSHEN / XINHUA

"Seeing a public welfare organization travel so far and dedicate itself to protecting our mangroves inspired us to step up our efforts," says Song Meiying, deputy Party secretary of Tantou village.

Part of these efforts includes transforming the local library into a marine science base with over 1,000 specialized books and forming a volunteer team of more than 50 local women and children to serve as science interpreters.

Academics have also joined mangrove conservation efforts. Liang Xiaoting, an associate professor at the Guangdong Eco-Engineering Polytechnic, was so moved by the natural mangroves during a summer clean-up that she spontaneously grabbed a microphone and began explaining the ecological value of mangroves to those nearby.

Liang regularly volunteers in Nansha and leads her students in developing ecological courses for primary and secondary schools.

The regular cleanups helped the village and the association realize that trash collection alone is not enough. They launched a "waste-to-wealth" initiative: collected plastic waste is recycled into silk-like scarves, which are gifted to volunteers as a tangible reminder of their efforts.

"Our volunteers come from across the Guangdong-Hong Kong-Macao Greater Bay Area, including many young people from Hong Kong and Macao, who join our beach cleanups," says Huang.

"We want to build a small station near the wetland so that people doing clean-ups or field research can rest and recharge."

The efforts in Tantou reflect a broader national success story.

During the 14th Five-Year Plan period (2021-2025), China's mangrove area expanded to 31,000 hectares, making the country one of the few in the world to record a net increase in mangrove coverage.

Mangroves, alongside seagrass and coral reefs, are globally recognized as one of the three main marine coastal ecosystems. They play a critical role in supporting offshore fisheries, purifying the environment, and enhancing carbon sequestration.

Tantou's efforts have aligned with China's national mangrove conservation strategy. In 2025, the country released and implemented its first technical group standards for the precise ecological restoration of mangroves to promote their protection and sustainable development.

The country made significant strides in green development during the 14th Five-Year Plan period, with increased forest coverage, improved biodiversity, and greater harmony between humans and nature.

More than just beans and brewing

Coffee festival showcases new combinations, some seemingly crazy flavors such as beef noodles, and integration with Kunqu Opera, attracting caffeine lovers from around the world, **He Qi** reports in Shanghai.

For Firat Sahin from Turkiye, to have a cup of specially tailored coffee in the greenland of Shanghai's financial zone is a comfortable yet homesick experience.

The special combination of coffee and tea made him feel completely natural.

"In my country, we drink unsweetened black tea, and we also drink coffee regularly, so pairing coffee and tea is not strange to us at all."

"Tea, coffee, and other types of drinks should be mixed together," Sahin says during the opening day of the Lujiazui Coffee Festival in Shanghai. "Overall, the festival is really great."

Held from May 29 to 31 at Lujiazui Central Green, the Lujiazui festival has gathered more than 150 brands, creating an elegant integration of Western coffee and traditional Chinese culture, which is the festival's theme this year.

Mingzhishan Coffee, which operates stores in historical cities of Luoyang, Henan province, and Jingdezhen, Jiangxi, attracted visitors with its iconic gourd porcelain cups.

By midday on opening day, Guo Daren, founder of Mingzhishan Coffee, had sold nearly 300 cups of his signature gourd-shaped porcelain cold brew coffee.

"It completely exceeded our expectations. We didn't expect Shanghai people to love the new Chinese-style gourd coffee so much."

In Chinese tradition, the gourd, or *hulu*, is usually associated with wishes for prosperity.

"We also combine Jingdezhen's local Fuliang black tea with coffee and serve it in gourds, creating a Chinese-style coffee-drinking experience that feels like ancient people drinking wine," he adds.

The brand's best-selling product at the festival is Osmanthus cold brew, made by steeping Osmanthus flowers in coffee overnight to infuse a natural floral aroma. "We also paired it with the poem: 'I wanted to buy Osmanthus and wine with you, yet it is no longer like our youth days'," Guo says. "Many people came to buy a cup specifically because of this line."

Spring Morning on Mishan, a tea and pastry brand making its Lujiazui Coffee Festival debut, demonstrated the perfect compatibility between traditional Chinese snacks and coffee.

"We divided our products into three series: 'Meal Buddies', for pairing with toast and other staples; 'Tea Buddies', for various teas; and a dedicated 'Coffee Buddies' series," said Xiao Yuanwu, the brand's founder. "Our Coffee Buddies focus on salty and sour flavors, which effectively neutralize the coffee's bitterness and deliver a richer tasting experience."

Top left and right: The Lujiazui Coffee Festival creates an elegant oriental gathering that blends flavor and culture in Shanghai. **Left:** The festival opens a new chapter in East-West cultural integration. **Below left:** Mingzhishan Coffee brings its signature gourd-shaped porcelain cold brew coffee to the festival. **Below right:** Spring Morning on Mishan demonstrates the perfect pairing of traditional Chinese snacks and coffee.

See more by scanning the code.

Also drawing long queues is the beef noodle-flavored specialty coffee from Hebei-based Coffix Coffee. "Lujiazui invited us to bring our hometown's urban flavors to Shanghai as specialty blends," says founder Chen Xixi. "We extracted the aroma of chili oil — the soul of beef noodles — and infused it into coffee."

This seemingly unconventional combination has received unexpected acclaim. "Shanghai residents love it, surprisingly. Ethiopian coffee beans naturally have a hint of spice, which unexpectedly complements the flavors of the noodles," Chen says.

The unique blend has even gained international recognition. "We took beef noodle coffee to a Melbourne coffee festival, and many foreign guests loved it. Here at the festival, we sell out every morning."

The most groundbreaking collaboration this year is the deep integration between Kunshan Contemporary Kunqu Theater and coffee culture. The theater has launched two limited-edition specialty drinks named after classic Kunqu tunes, inspired by the ink-wash new-style works of Kunqu master Zhang Jun and infused with traditional Chinese cultural elements.

Shi Zhiyuan, a member of the festival's operations team, says, "The signature of Lazy Eyebrow Tune is that we outline eyebrow shapes in the milk foam with indigo powder, and it has a refreshing taste that is perfect for summer. Ever Lasting Love Aria evokes the pink imagery of love, so we used summer watermelon to create a sparkling Americano specialty."

Beyond beverages, Kunqu Opera also comes alive at the festival in more vivid forms, with Zhang leading a group of musicians to perform on the Lujiazui Central Green lake with the water body as the stage and neon lights illuminating the skyscrapers, bringing traditional art to the heart of the city's vibrant coffee culture.

Many industry insiders agreed that integrating Chinese elements into coffee is not a passing fad but an inevitable industry trend.

"Previously, most coffee creativity focused on fruits, and combining coffee with tea and traditional culture was relatively rare," Guo says. "In the future, there will definitely be more tea-coffee blends, and people will explore clever ways to integrate tea and coffee to create new flavors."

Tourism attempts to balance human touch with technology

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

When Valentin Diaz Gilligan flew from Buenos Aires to Beijing for a recent tourism forum, the journey took 30 hours. Decades earlier, his great-grandparents made the same trip by ship. It took 40 days.

That contrast is what technology has done for travel, the Argentine capital's tourism chief told a big audience at the Zhongguancun International Innovation Center in Beijing's Haidian district on June 2.

Commercial aviation democratized it. Then the internet and smartphones accelerated it. Artificial intelligence and big data are the next leap, says Gilligan at the 2026 Beijing Fragrant Hills Tourism Summit hosted by the World Tourism Cities Federation, the Beijing Municipal Bureau of Culture and Tourism and the Haidian district.

But, he added a caveat.

"In Buenos Aires, our difference is passion, not technology," he says. "We use data to understand what Chinese tourists want versus American or Brazilian tourists. But what we never want to lose is the human warmth of welcoming every visitor."

That tension between efficiency and empathy, and algorithms and the human touch, runs through the entire discussion of how digital tools can make cross-border travel smarter without stripping away what makes it worthwhile.

Zhang Xu, vice-president of Trip.com Group, a major online travel platform headquartered in Shanghai, offers a practical framework consisting of communication, service, and operation.

From left: Inbound visitors pose for a picture with a Chinese guide at a gift shop in Beijing in June. A Chinese tour guide answers questions from an international traveler during a visit to the capital in early June. PHOTOS PROVIDED TO CHINA DAILY

The first step is knowing who you are talking to, he says.

Data from his platform show sharp differences among travelers coming to China. Europeans and Americans want cultural experiences and urban lifestyles. Southeast Asians prioritize food, shopping and short trips. Japanese and South Korean tourists tend to favor weekend leisure and live performances.

"If you don't know these differences, you cannot market effectively," Zhang says. Destinations need to turn their resources into bookable products, and do it well.

Service comes as the bigger challenge.

"Certainty is everything for international travelers," Zhang notes. A tourist needs to know their flight, hotel and tickets are confirmed before they board the plane. That certainty, he argues, is what a quality tourism platform should be positioned to provide.

Long-term thinking matters too. Launching a campaign is not enough. Destinations must track feedback, listen to consumers, and continue to improve, he points out.

"We send coupons to encourage people to come back," Zhang says. But the real goal, he adds, is building trust.

Beyond the framework, Trip.com has rolled out concrete tools for inbound travelers. The company has set up service counters at major airports in Beijing, Shanghai, Hong Kong, Shenzhen, Guangdong province, and Chengdu, Sichuan province, offering travel guides and local assistance. Multilingual ticketing machines at scenic spots across China now help foreign visitors buy tickets and process refunds without language barriers.

Last year, the Shanghai-based travel agency opened an AI-powered restaurant, Taste of China, where screens wrap around the room and the system learns diners' preferences. A second branch is opening in Beijing this year.

The restaurant is not a gimmick, Zhang says.

It is an experiment in how technology can enhance — not replace — the experience of sharing a meal, he explains.

Zhang's emphasis on service was echoed across the panel.

Soon-Hwa Wong, the Pacific Asia Travel Association's ambassador for Greater China, offers a systematic take. "The real opportunity lies in balancing high-tech with high-touch," he says.

"Technology should empower, not replace."

Wong points to Singapore's upcoming Terminal 5 at Changi Airport — designed not just for greater capacity but for future pandemics, automated passenger flow, and seamless connections between air, land and city transport.

Smart tourism is not just about solving today's problems but also about anticipating tomorrow's needs, Wong says.

Christopher Cocker, chief executive of the Pacific Tourism Organization, points to a five-year digital transformation project with the New Zealand government that has raised digital skills in the region from 50 to 79 percent and understanding of sustainable tourism from 29 to 64 percent.

But he says that AI will never replace humans. "Tourism is a people business."

Speaking on behalf of 20 small island nations, he emphasizes that smart connectivity must be inclusive.

"If it works for large destinations, it should work for small ones too. Leave no one behind."

Todd Barberel, general manager of destination marketing and communications for Wellington, agrees with Cocker.

"People want to deal with people. Tools matter. But at the core, it is always about people."

Since China Eastern Airlines launched direct flights between China and Argentina last year, Chinese arrivals in Buenos Aires have grown by 50 percent. Gilligan attributes that not just to flight routes but to understanding what each market wants — and that understanding comes from data.

But data, he insists, is only part of the equation. The rest is a city's ability to make a visitor feel genuinely welcome. "That is what brings them back," he says.

Zhang Xu says that it should be every travel service provider's top priority to make someone feel welcome in a country they do not know.

"Sometimes an inbound traveler just needs someone to point them to the right train," he says.

"That is not big data. That is a person helping another person. You know what really brings people back? Not a coupon. A memory."

CULTURE

A scholar's devotion to Buddhist teachings

A veteran editor has spent 43 years compiling the religion's scriptures, driven by a determination to keep ancient wisdom accessible, **Wang Xin** reports in Shanghai.

Chen Shiqiang, a 76-year-old senior editor at Fudan University Press in Shanghai, could hardly hold back his tears when he touched his newly published books, a massive Chinese Buddhist philology masterpiece that he has been working on single-handedly for 43 years.

Three books of the *General Catalogue and Synopses of the Chinese Buddhist Canon* were recently published by Shanghai Ancient Books Publishing House, bringing the collection's current total to 13 volumes.

Comprising a total of 1,473 Buddhist works in 8,246 volumes, the collection, with about 6.7 million characters, provides a detailed guide through Chinese Buddhist scriptures of successive dynasties. It is also believed to be the most authoritative and comprehensive reference work in the field of Chinese Buddhist scriptural studies to date.

The work currently comprises two volumes on classic Chinese Buddhist works first published in 1992 (revised and reprinted in 2008), three volumes on Hinayana Buddhist sutras published in 2007, two volumes on Vinaya texts published in 2015, three volumes on Abhidharma published in 2019, and the latest three volumes on Mahayana Buddhist sutras released in March.

Among them, the sutra is the source of basic Buddhist teachings, which is believed to be the actual words of the Buddha. Vinaya usually refers to the collection of canonical texts outlining the rules of conduct and discipline for Buddhist monks and nuns. Meanwhile, Abhidharma, or commentaries, refers to works on various Buddhist scriptures that are attributed to masters and offer commentary on the words of the Buddha.

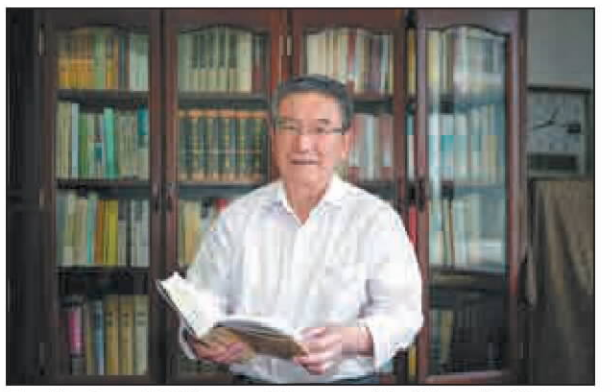
"Originating in ancient India, Buddhist scriptures were translated and expounded in classical Chinese after their introduction to China. However, the vast majority of these texts lack punctuation and annotations. They are profound yet obscure, abstruse, diverse and complex, making them very difficult to read and understand," Chen explains.

All these factors present significant challenges to the reading and study of Buddhist scriptures, which motivated Chen to create a specialized reference book on Buddhist studies to provide basic guidance and assistance for today's researchers.

Thus, in June 1983, he embarked on this journey with no end in sight. Rather than brief annotations or dictionary-style entries on Chinese Buddhist scriptures, he expects to complete a collection that provides comprehensive information and detailed summaries of the core content of each scripture — in a modern way and using layman's terms.

Almost devoting his entire life since then to sorting out Buddhist scriptures, Chen says he simply does not wish to see these millennia-old classics become incomprehensible texts to modern readers.

Chen notes that the collection provides a detailed analysis of each scripture, covering its title, number of volumes, origins of translation and composition, version history, chapter structure and core philosophical principles, while also addressing the tracing of origins, the collation of variant texts, and the correction of historical inaccuracies.



"I am not merely compiling an index for a single edition of the Tripitaka, but rather synthesizing all editions from the Song Dynasty (960-1279) through to modern times, to create a truly comprehensive reference work on Buddhist studies," says Chen.

Fate and faith

This path has never been easy for Chen, yet he pursues it with determination, as if it were his destiny.

Born in 1949 in Zhuji, Zhejiang province, Chen was recommended to join the Department of Philosophy at Fudan University in 1973 and stayed at the school as an instructor after graduation.

Chen was not a Buddhist and knew barely anything about Buddhism before stepping into the university. However, Fudan, as one of the earliest universities in China to systematically conduct research and teaching in religion, boasts a long-standing tradition and deep-rooted heritage in Buddhist studies and research. In 1979, the university officially launched the research direction of Buddhist studies for the first time, and Chen — who was good at classical Chinese — became the only master's student admitted into the program.

Top: The *General Catalogue and Synopses of the Chinese Buddhist Canon* is believed to be one of the most authoritative and comprehensive reference works in the field of Chinese Buddhist scriptural studies. **Above:** Chen Shiqiang, senior editor at Fudan University Press, has worked for 43 years compiling the 13 volumes of the books. PHOTOS PROVIDED TO CHINA DAILY

> "I am not merely compiling an index for a single edition of the Tripitaka, but rather synthesizing all editions ... to create a truly comprehensive reference work on Buddhist studies."
>
> **Chen Shiqiang,** senior editor at Fudan University Press

That marked the real beginning of Chen's story with the Chinese Buddhist Canon. After earning his master's degree, Chen joined Fudan University Press in 1984 and continued his academic research on Buddhist philology.

Over the past four decades, Chen has edited and published more than 200 books on philosophy and social sciences. The editing experience has continuously expanded his knowledge in various fields and categories, laying a solid foundation for the writing of the vast Buddhist collection.

"Buddhist classics engage with ancient Chinese and Indian civilizations. They are not only religious works, but also historical records involving all kinds of knowledge such as philosophy, geography and arts. The massive books I edited before are carved in my mind, and later became the basis for me to understand those classics," says Chen.

The collection includes detailed accounts of Buddhist doctrines, figures, events, rituals, festivals, activities, temples, artifacts and terminology over the past millennia, as well as covering a wealth of knowledge across various fields such as history, philosophy, literature, ethics, education, linguistics, logic, psychology, customs, geography, astronomy, medicine, architecture, sculpture, painting and music.

It is a huge task that is not profitable, but requires superhuman determination and effort, which may also explain why no similar works have ever been completed before. To achieve his ambitious goal, Chen has given up all his spare time since the 1980s — not even spending time watching TV.

"It is hard — very, very hard," Chen said at a panel meeting held at Fudan University on May 21 to mark the release of the updated collection.

But he told China Daily that he had never thought about quitting this epic work. He would always recall the legendary trek made by Tang Dynasty (618-907) Buddhist monk Xuanzang on his westward pilgrimage more than 1,300 years ago.

"He risked his life to bring the Buddhist scriptures back. He, like other ancient sages, sought neither fame nor personal gain, but built a cultural Silk Road. If no one today interprets them, his life, efforts and sufferings would be all in vain. I am always deeply moved by their spirit of self-sacrifice," says Chen.

In the days before computers, a pen and a stack of paper were his only companions. For each scripture, Chen would read through the original text intensively at least three times, and pore over obscure passages repeatedly while making in-depth comparisons and cross-references.

He regards this work as the foundation for future Buddhist research in China, likening it to the first step laid at the foot of a mountain. "Future researchers, like climbers, can now continue their ascent to the top by stepping on these steps," says Chen, smiling in relief.

Chen's efforts also align with the nation's and the university's exploration of developing a system of philosophy and social sciences with Chinese characteristics, which incorporates the country's socialist practices, and contributes more wisdom and strength to the nation's modernization drive and cultural heritage.

"The collection is a major achievement in the compilation and publication of ancient Chinese Buddhist historical and cultural texts. It is not only an indispensable authoritative reference book in the fields of Buddhist philology, religious studies and Chinese philosophy, but also serves as a solid bridge for the wider general public to engage with China's outstanding traditional culture," says Fang Ming, deputy Party secretary of Fudan University.

Chen's journey still continues. Despite his vision being severely impaired by decades of desk work, which limits him to reading for only about 15 minutes at a time, he is still relentlessly marching toward the end of the collection.

"I intend to devote the remainder of my life to compiling the 300-plus Esoteric Buddhist scriptures, so that the collection will cover Mahayana and Hinayana sutras, Vinaya and Abhidharma in full, as well as the scriptures of both the exoteric and esoteric traditions," says Chen firmly.

Turning the page on traditional publishing in the era of AI

By **XU LIN**
xulin@chinadaily.com.cn

Participants at a forum on advancing integration in publishing agree that it's essential to strengthen technological leadership, integrate technological advancements with publishing innovation, and accelerate the digital and intelligent transformation of the publishing industry.

Representatives of publishing institutions and cultural and technological enterprises, scholars from universities and colleges, and officials from relevant authorities, recently gathered for the sub-forum, which had the theme, "Integration promotes development, transformation shapes the future".

They exchanged views on key issues such as organizational transformation, technological empowerment, talent nurturing, and industry restructuring in the integrated development of publishing.

It was part of the Forum on Building Up China's Cultural Strength 2026, which was held in Shenzhen, South China's Guangdong province, in late May.

"As technological barriers are removed and anyone can create and express themselves with artificial intelligence, the needs of readers are no longer limited to simply finishing a book. They crave deep intellectual connection, solutions for real-world problems, and immersive reading experiences," said Chen Wei, chairman of CITIC Press Group, in his keynote speech.

He emphasized that in the face of such industrial restructuring, publishing organizations must focus on integrated development and scale up their investments.

"Besides financial input, efforts should also include developing an understanding of the industry's new paradigm, nurturing talent with digital capabilities, and fostering an open and collaborative ecosystem. This requires publishers to adopt a more forward-looking strategic vision and the courage to reform," he said.

Sun Qiang, chairman of People's Education Press, agreed. According to him, the publishing press prioritizes the recruitment of talent in AI and related fields, to build a high-quality professional talent team. A three-year mentoring system will be adopted for new employees, and senior staff members will provide them with guidance. There are also different training programs for mid-career employees to improve their digital literacy.

With the theme "Integration promotes development, transformation shapes the future", the Forum on Advancing Integration in Publishing is held in Shenzhen, South China's Guangdong province.
PROVIDED TO CHINA DAILY

Wu Yike, a researcher from the Publishing Research Institute, Nankai University, offered a complementary perspective. "AI excels in efficiency, connectivity, and generative capacity, making knowledge more accessible. The value of publishing lies in quality standards, the organization of knowledge and value judgment, ensuring reliable knowledge services," he said.

"Therefore, the more advanced AI technologies grow, the more integrated publishing needs to provide a solid foundation of trustworthy and usable content," he said.

To advance the development of credible content, Wu suggested that this work should focus on providing high-quality content that stands rigorous scrutiny, turning fragmented content into organized knowledge, strengthening collaboration between AI and professionals and clarifying their respective responsibility boundaries.

The "new trio" of cultural exports — online literature, web dramas and online games — has gained global popularity in recent years. For example, *Black Myth: Wukong*, a hit Chinese video game, has spread Chinese culture to the world via animation and gaming.

Tong Zhilei, chairman and CEO of COL Group, said that the popularity stems from deepening publishing integration and ever-expanding publishing boundaries. The future of integrated publishing lies in focusing on content origins to drive the multi-format development of online literature, web dramas and online games, while continuously enhancing intelligent production capabilities.

"Publishing has never been merely about producing and distributing books. Rather, its core purpose is to bring knowledge, ideas, stories and culture to wider audiences, to be seen, understood and carried forward. In the digital age, this fundamental mission remains unchanged, and we have richer ways to fulfill it, diverse pathways to connect with audiences, and a broader scope to serve society," Tong said.

Zhao Dongyan, a researcher at the Wangxuan Institute of Computer Technology, Peking University, noted that intelligent publishing represents an opportunity for a new round of innovation and transformation of the publishing industry in the AI era.

According to him, in 2025, the adoption rate of AI-generated content among publishing institutions nationwide reached 54 percent, with applications mainly in content review and proofreading, content creation, and user experience improvement.

He added that it is essential to develop AI tools for all stages of content publishing, provide end-to-end intelligent publishing technologies, and enable new forms of content publishing and knowledge services based on large language models.

World Cup set to kick off after shaky run-up

FIFA is banking on the showpiece tournament's enduring appeal to cancel out the months of criticism

The World Cup kicks off on Thursday with FIFA hoping that the enduring appeal of soccer's greatest showpiece can rise above the anger at soaring ticket prices, an uneasy political climate in the United States and the shadow of conflict in the Middle East.

A record 48 teams and millions of fans are set to descend on the United States, Canada and Mexico for the first-ever World Cup co-hosted by three nations, the largest and most logistically complex edition of the tournament ever staged.

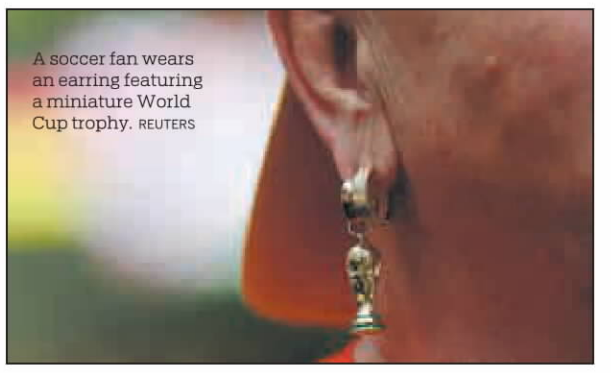
The action gets under way at Mexico City's iconic Estadio Azteca on Thursday, with co-host Mexico taking on South Africa at 3 pm local time (3 am Friday, Beijing time), launching a sprawling, nearly six-week-long spectacle that will culminate in the final at New Jersey's 82,500-seat MetLife Stadium on July 19.

Can Lionel Messi, at the age of 38, settle any lingering debate about his status as the greatest player of all time by leading Argentina to a second consecutive World Cup title?

Or can Messi's great rival, the 41-year-old Cristiano Ronaldo, defy father time by inspiring a talented Portugal team to its maiden World Cup win?

Or will England, led by Harry Kane, finally end the country's 60-year wait for a second major international championship following its lone 1966 World Cup victory?

Those questions and more will be answered over the course of a tournament that Gianni Infantino, the president of world soccer's governing body, has bullishly hyped as "the greatest show that the planet has ever seen".



Ticket fury

Yet Infantino's breezy optimism has run into hurricane-force headwinds of skepticism during a build-up dogged by concerns over affordability, politics and conflict.

The skyrocketing cost of tickets to the tournament has triggered a global backlash that has left FIFA and Infantino struggling to mount a convincing public relations defense.

The most expensive ticket for the 2022 World Cup final cost around $1,600 at face value; in 2026 the most expensive face value ticket being sold by FIFA is an eye-watering $32,970.

That kind of inflation has been prevalent across the tournament's 104 matches, where seats for many games remain available on secondary resale markets despite supposedly huge demand.

A soccer fan wears an earring featuring a miniature World Cup trophy. REUTERS

Even Infantino's staunch ally, US President Donald Trump, has balked at the cost, reacting with surprise when told of the $1,000 price tag for tickets to the USA's opening game with Paraguay in Los Angeles on Friday — the first game on US soil.

"I wouldn't pay it either, to be honest with you," the US president told the New York Post.

While fans absorb the expense of travel to the tournament, other critics have questioned whether the World Cup party will be soured by the political climate in the United States.

Human Rights Watch says Trump's crackdowns on immigration, demonstrations and press freedom could lead to a World Cup defined by "exclusion and fear".

Those fears were fueled Monday when FIFA dropped a Somali referee from the World Cup after he was denied entry to the United States.

Omar Artan was set to be the first match official from Somalia to referee a match at a global finals, but he was turned back following his arrival at Miami International Airport on Saturday.

FIFA said it was powerless to influence the decision and announced it had omitted Artan from its 52-strong referee roster.

The US-Israel military strikes launched against Iran in February have also loomed large over the tournament, where Iran is due to play three group games in the US, starting with its opener against New Zealand on June 15.

Trump initially suggested Iran should withdraw from the tournament for its own "life and safety", before walking back his rhetoric.

Iran, meanwhile, has switched its base camp from Tucson, Arizona, to the Mexican city of Tijuana, where it touched down early Sunday.

While Iran's players are free to travel in and out of the US, some 15 administrative and management staff have been denied visas by US authorities in a move Iranian authorities have condemned as "deliberate and discriminatory treatment".

Expanded field

On the field, the decision to expand the tournament to 48 teams — up from 32 in 2022 — is likely to strip the group stage of any sense of jeopardy.

A total of 72 first-round matches will be needed to eliminate just 12 teams, with 32 advancing to the knockout rounds — the top two finishers in each of the 12 first-round groups along with the eight best third-place finishers.

The tournament will see a range of other innovations.

For the first time in World Cup history, every game will feature cooling breaks in the middle of each half, a measure designed to mitigate the effects of searing heat and humidity expected at many of the tournament's 16 venues.

Players and referees will need to adjust to several new rules being rolled out at the World Cup, including teams being required to make substitutions inside 10 seconds to prevent time-wasting.

A crackdown on racist abuse will see players risk a red card for covering their mouth with a hand, arm or shirt during a confrontation with an opponent.

Next month's final, meanwhile, could well be the longest on record due to the decision to stage a Super Bowl-style halftime show, headlined by Madonna, Shakira and BTS.

The show means the halftime interval will be stretched from the traditional 15 minutes to around 25 minutes.

AFP

Whether you're watching in the bar, or sitting behind the goal, banter like a natural with this handy guide to soccer slang

In squeaky bum time, the false 9 pulled off a nutmeg, before firing a worldie into the top bin.

Make any sense?

Soccer fans from across the globe are heading to North America for the World Cup — and bringing with them a lexicon of esoteric words and phrases that describe the beautiful game.

Here's a look at some of the things the locals might be hearing from traveling supporters inside and outside stadiums, and where they might have originated.

Squeaky bum time

Let's paint a picture: It's the World Cup final, and Argentina and Brazil are locked at 1-1 with five minutes remaining. We are officially in "squeaky bum time". Coined by former Manchester United manager Alex Ferguson, the phrase describes the late stages of a match — or even a season or tournament — when players and fans get tense and nervous. It even got recognized by the Oxford English Dictionary, which defined the saying, somewhat obtusely, as "the sound of someone shifting restlessly on plastic seating during tense closing stages of a contest".

Parking the bus

You're likely to hear this when a big underdog comes up against a top team at the World Cup. If an inferior team — or maybe one which has had a player sent off — shows no attacking intent and plays ultra-defensively to stop its opponent scoring, it is said to be "parking the bus" in front of its goal. The phrase came into soccer's wider vernacular after Jose Mourinho, the Portuguese coaching great, complained while managing Chelsea in 2004 that Premier League rival Tottenham "might as well have put the team bus in front of their goal".

False 9

There's nothing wrong about a false 9. When a player starts a match as the nominal striker — i.e. as a classic No 9 — but constantly moves into deeper positions on the field to be harder to mark and create confusion among opposition defenders, they are said to be playing as a "false 9". In modern-day soccer, the role was mastered by Lionel Messi at Barcelona when Pep Guardiola was its coach and by Cesc Fabregas in Spain's title-winning team in the European Championship in 2012. Harry Kane might play in a similar position for England at the World Cup.

Worldie

Typically reserved for long-range shots that fly into the top corner of the net, a "worldie" — a word coming from British slang — describes a goal that belongs in the "world class" category.

Total football

It started off being a tactical ideology used by the Dutch national team in the 1970s, where outfield players have no fixed position and can feel comfortable on the field wherever they are. Nowadays, the phrase is invariably used loosely, even jokingly, by soccer fans to describe a lengthy spell of possession, often involving some intricate, fluid passing and ending up in a goal.

Nutmeg

It's one of the simplest tricks in soccer — and a humiliation for those on the receiving end. A "nutmeg" is the act of kicking the ball between your opponent's legs to either run round and gather it yourself or to pass to a teammate. It has derivatives around the world, from "petit pont" ("little bridge") in French, to "cano" in Spanish and "tunnel" in Scandinavian.

Panenka

You know when a player chips a penalty kick slowly and cheekily straight into the middle of the goal or, in the worst-case scenario, into the hands of a grateful goalkeeper? Well, it has a name.

The "Panenka" was born in 1976, when Czech player Antonin Panenka converted the title-clinching penalty in that manner during a shootout in the European Championship final against West Germany. He ran up to the ball at normal speed and chose to float it softly up and down into the net, predicting

correctly the direction the goalkeeper would dive. It's risky and can make the penalty-taker look stupid if it goes wrong.

Clean sheet

A goalkeeper at the World Cup will sleep well if he keeps a clean sheet. Termed a shutout in the United States, it simply means when a team doesn't concede a goal. The use of "clean sheet" dates back to when reporters only used paper notebooks to record different incidents — like goals — in games. If no goals were scored by a team, a sheet of paper would remain clean.

Top bin

The two top corners of a goal are the ideal targets for a shot, so obviously they have a special name for fans. Creeping into the soccer lexicon this century — and also into the Oxford English Dictionary — is the usage of "top bin", possibly a nod to the use in practice sessions of targets in each of the top corners of a goal that resemble a bin (the British term for a trash can). Another is "postage stamp", which you'd apply to the top corner of an envelope. Many languages have their own derivative, and one such example that conjures a great image heralds from Brazil, where they say a top corner is "onde a coruja dorme" (where the owl sleeps).

12th man

There will be 11 players in each team at the World Cup. There's a way of getting 12 — kind of. The "12th man" refers to the team's fans, who — if they are loud or intimidating — can act as an extra player. Or so coaches say, anyway.

XI'S VISION | CULTURAL HERITAGE

Nation set to celebrate its 'root and soul'

Heritage day reflects enduring commitment to preserving and sharing cultural legacy

By **WANG KAIHAO** and **WANG QIAN** in Beijing and **CHEN YE** in Hangzhou

Thousands of celebrators are expected at events nationwide, including exhibitions, symposiums and public education programs, which have been scheduled to immerse the country in an atmosphere of cultural heritage and history to welcome China's annual Cultural and Natural Heritage Day, which falls on Saturday.

The arrangements for observing the day are strong testament to China's commitment to preserving and sharing the beauty and essence of its time-tested legacies with the outside world.

This year's celebration holds even greater significance than usual, as it marks the 20th anniversary of the country's first designation of this special day, which before 2017 was known as Cultural Heritage Day.

The past 20 years have seen an unprecedented boom in the heritage sector throughout the country. In 2006, museums nationwide attracted a total of around 150 million visits, a number that by 2025 had increased to 1.56 billion. China initially had 24 entries on the UNESCO World Heritage List, but the number has now risen to 60.

President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee, has consistently prioritized heritage protection in recent years. In a guideline statement released in 2016, for example, he described cultural relics as "a valuable legacy from our ancestors", emphasizing that conservation will benefit future generations. He pointed out that the relics are tangible manifestations of the fine traditional culture, or "the root and soul", of the Chinese nation.

Such resolution has its roots in eastern Zhejiang province 20 years ago. The saplings planted then have now grown into flourishing trees, and they set an example for the rest of the country and beyond.

In Yuhang district of Hangzhou, the capital of Zhejiang, are located the Archaeological Ruins of Liangzhu City. Dating back 4,300 to 5,300 years, this vast prehistoric site was the hub of a regional state that worshipped jade and grew rice with highly-developed water conservation systems.

The site is considered to mark the dawn of Chinese civilization.

Nowadays, it offers a living, evolving testament to how a grand plan for preserving the past is implemented at the grassroots level.

The Regulations of Hangzhou on the Protection and Management of the Liangzhu Ancient City World Cultural Heritage were officially rolled out in June. They establish a comprehensive legal framework that aims to integrate this cradle of Chinese civilization more deeply into the fabric of contemporary life.

Sun Haibo, director of the Cultural Relics and Heritage Administration Bureau of the Hangzhou Liangzhu Archaeological Site Administrative District, said that the regulations could provide a model for the management of large-scale archaeological sites nationwide.

Inside
Comment, **page 6**

The legislation, comprising six chapters and 37 articles, marks a decisive shift from decades of protection-first focus to a more ambitious vision of making heritage a driver of coordinated regional development.

"This has been an iterative journey spanning more than 20 years," said Sun. "At each stage, we faced different challenges."

In the early 2000s, Liangzhu's northern mountains, which were rich in high-quality stone, were being carved up by quarries and thus served as one of the main drivers of the local economy.

Upon learning about the situation in July 2003, Xi, then Party secretary of Zhejiang, visited the site and promptly ordered the closure of the mines. It was not an uncommon occurrence at a time when archaeological protection was often compromised for the need of economic development. However, Xi emphasized that economic growth should not be at odds with cultural preservation.

He also said that the Liangzhu site is a sacred place that provides evidence of China's 5,000-year-old civilization, and is an invaluable treasure that must be protected.

The path of Liangzhu protection thus turned into a promising lane. In 2019, it was inscribed on the UNESCO World Heritage List.

Xi's dedication to Liangzhu has lasted throughout the subsequent decades. In 2023, he proposed holding the Liangzhu Forum, by which the ancient culture could offer inspiration to the world in a modern context.

In the congratulatory message to the inaugural Liangzhu Forum in December 2023, Xi called for efforts to promote a view of civilization that features equality, mutual learning, dialogue and mutual accommodation, thus helping different civilizations to live in harmony and reinforce one another.

The forum has been held annually in Hangzhou for the past three years.

Following the plan to ensure the Archaeological Ruins of Liangzhu City's sustainable development, economic benefits are being reaped. Last year, the site welcomed 1.46 million visits, establishing the ruins on the outskirts of Hangzhou as a popular tourist destination.

"We're exploring an effective way to coordinate the protection of this heritage with the sustainable development of the region," said Sun, the heritage administration bureau director. "We hope to integrate the cultural, ecological and landscape resources of Yuhang district (of Hangzhou) to drive tourism and the cultural creativity industries centered on the archaeological site."

China seeks greater imports from Europe

By **ZHANG ZHOUXIANG** in Berlin
zhangzhouxiang@chinadaily.com.cn

China stands ready to import more from Germany and the rest of Europe, Ling Ji, vice-minister of commerce and deputy international trade representative of China, said on Thursday, emphasizing the complementary nature of China-Germany economic relations and the vast opportunities offered by the Chinese market.

Speaking at the "Big Market for All: Export to China" event in Berlin, Ling recalled German Chancellor Friedrich Merz's visit to China in February, during which the two nations reached a series of important common understandings, providing strategic guidance for the future development of China-Germany economic and trade ties.

"Under the strategic guidance and promotion of the leaders of both countries, China and Germany have long adhered to openness, mutual respect and mutual trust. Bilateral economic cooperation has developed into a pattern characterized by deeply integrated industries, interconnected markets and complementary advantages," Ling said.

The Berlin event, aimed at creating an efficient channel for high-quality products to enter the Chinese market, marked the first "Big Market for All: Export to China" activity held in the European Union this year.

The "Big Market for All: Export to China" initiative, launched in Shanghai in November 2025, is part of China's broader push to boost imports and tap the purchasing power of its vast consumer market.

Under the program, China's Ministry of Commerce selects five to eight annual partner countries each year to organize more than 100 import-boosting activities.

Li Guoqing, deputy director-general of the China International Import Expo Bureau, noted that 151 countries, regions and international organizations have so far participated in the CIIE Country Exhibition, while Germany ranks first in Europe in terms of both exhibition space and the number of participating enterprises.

"The China-Germany relationship has always been strong and complementary, with significant long-term potential," said Thomas Koenig, a senior China affairs expert at the German Chamber of Commerce and Industry.

"Despite global trade tensions and other challenges, there remains substantial room for cooperation. China's market continues to be highly attractive for German businesses and expanding German exports to China can contribute to a more balanced and resilient bilateral economic relationship. That is why I remain cautiously optimistic about the future of China-Germany cooperation," Koenig added.

Eberhard J. Trempel, director-general of the German Global Trade Forum Berlin, said he believes that the future holds enormous potential for deeper, synergistic cooperation in forward-looking industries such as infrastructure, green tech and decarbonization, autonomous driving, as well as artificial intelligence and industrial automation.

"In smart manufacturing, German expertise in hardware and mechanical engineering complements China's speed in applying AI and big data in an ideal way," he said.

WORLD WATCH

Sports can strengthen much more than people

At a time when many nations are grappling with rising healthcare costs, youth anxiety, social fragmentation and economic uncertainty, sports must be viewed not just as a leisure activity, but as a strategic investment in national development.

Too often, discussion of sports is primarily in terms of medals, elite athletes or major competitions. Yet the true value of sports extends far beyond the stadium. Sports build healthier citizens, stronger communities, more resilient economies and more connected societies.

Most important, sports are not only for Olympic champions or professional athletes. They are for everyone — schoolchildren, university students, working adults and the elderly alike. A nation that embraces sports as part of daily life creates long-term social and economic benefits that no medal table alone can measure.

At the individual level, regular physical activity improves physical and mental health, builds confidence, strengthens discipline and develops resilience. Increasingly, medical experts emphasize that exercise, alongside healthy diet, is one of the most effective ways to prevent chronic diseases such as diabetes, heart disease and obesity. Encouraging active lifestyles is therefore not simply a public health issue; it is an economic imperative.

The financial stakes are enormous. According to the World Health Organization, insufficient physical activity contributes to millions of preventable deaths annually and imposes substantial healthcare costs worldwide. Sedentary lifestyles place growing pressure on national healthcare systems, particularly as populations age. By contrast, healthier populations reduce long-term medical expenditures, improve workforce productivity and contribute to social stability.

Sports are particularly effective because they are often social and collective. Whether through football, basketball, badminton, pickleball, running clubs or community-square dancing, people motivate one another to remain active. Exercise becomes sustainable when it is embedded in social interaction and community life.

VISITORS THRONG TO ZHOUCHENG FOR BAI-STYLE FABRICS

Ethnic group's ancient design technique is finding modern applications and global fans

By **GUO JIATONG**
guojiatong@i21st.cn

Under the eaves of a courtyard in Zhoucheng village in Dali Bai autonomous prefecture, Yunnan province, Zhang Hanmin bent over a white cloth, her fingers steady as she stitched tiny knots into the fabric.

Around her, long strips of blue and white cloth swayed in the wind, their patterns catching the bright plateau sunlight. More fabric hung nearby, casting dancing shadows on the stone-paved courtyard.

For Zhang, an inheritor with more than 10 years of experience and founder of Lanxu, a tie-dye brand, the cloth is more than a decorative fabric, it is a language of daily life, ritual and memory for the Bai people.

Known as the largest natural Bai ethnic village in China, Zhoucheng was named the "Hometown of Ethnic Tie-dye Art" by the Ministry of Culture and Tourism in 1996.

Today, the village is home to more than 4,000 tie-dye artisans, who have carried the craft's blue-and-white patterns across generations.

The process begins with plain white cloth. Artisans stitch, knot and bind the fabric by hand before dipping it into dye vats. When the knots are loosened and the cloth is unfolded, patterns emerge, shaped by the pressure of thread, depth of the dye and the patience of the maker.

Bai ethnic tie and dye artisans Duan Yinmei (left) and Duan Lilan untie cloth knots after dyeing at a workshop in Zhoucheng village, Dali Bai autonomous prefecture, Yunnan province, on Nov 21. HU CHAO / XINHUA

China Vibes — GIFTS

In Bai communities, those patterns are not only decorative. According to Zhang, tie-dye accompanies people through some of life's most significant moments.

During the Benzhu Festival, for example, villagers drape tie-dyed cloth over statues of their patron gods as a sign of respect and homage, praying for peace, good harvests and prosperity.

US farmers 'cautiously optimistic' on China trade

After leaders' summit built consensus, growers hopeful of return to strong agricultural exports

During United States President Donald Trump's visit to Beijing last month, both sides reached a positive consensus on market access for certain agricultural products. The two parties agreed in principle to incorporate those products into a framework arrangement for reciprocal tariff reductions, and establish targets to expand agricultural trade.

On China's General Administration of Customs website, hundreds of expired licenses for US beef, pork and poultry plants were renewed soon after Trump's visit. The trade in meat was resumed shortly after the summit, an encouraging sign for US farmers.

Regardless of what size US farm exports to China will turn out to be in the next three years, one thing is clear — China and the US are working to jointly lower tariffs and expand access to agricultural products in their respective markets.

The news has been welcomed by US farmers, many of whom take it as a new beginning. Trump's tariffs halted the flow of farm goods between the two countries last year, following a previous stalling in 2018.

Matt Wagenson, a farmer in Outagamie County, Wisconsin, and vice-president of the Wisconsin Soybean Marketing Board, told local news outlet WPR that improved trade numbers would be "a huge help".

"We're always looking to increase our free trade across the world, and China is just a crucial part of that free trade," he said.

Dave Pfarr, a soybean farmer near Le Sueur, Minnesota, said that from the producers' perspective, "we would love to get them back as a customer". "Because they are a big importer of our proteins, primarily soybeans and soybean meal," he told local CBS News in mid-May.

But others in US agriculture are more cautious. China-US agricultural trade has experienced a roller-coaster ride in the past decade, largely due to Trump's tariff policy.

"I think we are cautiously optimistic when it comes to these things because we've been on both sides of this equation. You know, the first time we went through the tariff crisis, we lost 20 percent market share," Todd Main, director of market development at the Illinois Soybean Association, told Ag Daily in late May.

Soybean sales seesaw

Before the first trade war, China's appetite for US soybeans had grown steadily, driven by a rising middle-income group that was eating more pork, more poultry and more edible oils — all of which depended on soybeans as a feedstock.

The numbers were impressive. In the seven years leading up to the 2018 trade war, 28 percent of all US soybean production on average went to China, according to the American Soybean Association.

By 2016 and 2017, US soybean exports to China were running at $10.5 billion and $12.2 billion, respectively, accounting for 62 percent and 57 percent of all US soybean exports, according to data from the US International Trade Commission.

Broader agricultural trade was also substantial.

From 2012 to 2017, China purchased US farm products worth $24 billion to $29 billion annually, about 20 percent of all US agricultural exports, according to the American Farm Bureau Federation.

The trade relationship had grown intertwined — China needed US grain to feed its livestock, US farmers needed Chinese demand to justify the acreage they were planting.

The symbiotic relation was abruptly interrupted when the first Trump administration imposed tariffs on billions of Chinese goods in April 2018. Beijing imposed a 25 percent retaliatory tariff on US soybeans.

The effect was immediate and severe. US farm exports to China dropped to $13 billion in 2018 from $24 billion in 2017, a reduction of almost 46 percent.

US soybeans, the No 1 farm export to China, fell much more — from $12.2 billion in 2017 to $3.1 billion in 2018 — a 75 percent collapse in a single year.

China was pushed to look elsewhere for its soybean supply, leading to a structural shift in the country's agricultural imports strategy.

In 2012, a severe US drought had forced Chinese buyers to turn to Brazil to fill their supply needs, and the South American country demonstrated that it could reliably deliver supplies. Since 2013, Brazil's soybean exports to China have grown steadily.

YUAN BING / FOR CHINA DAILY **Right:** An Iowa farmer and his son load soybean seed into a planter on May 6 near West Bend, Iowa, the US. SCOTT OLSON / GETTY IMAGES

Conversely, China's demand for soybeans has helped Brazil to grow its soybean capacity. Brazil overtook the US to become the world's largest soybean producer in 2017.

When US soybean exports to China dropped to 8 million metric tons in 2018, Brazil sold 69 MMT of soybeans to China, speeding up Brazil's share of soybean exports to China.

By 2024, Brazil expanded China shipments to 73 MMT, accounting for 70 percent of China's soybean imports, while US exports represented just 21 percent.

Brazil now produces nearly 40 percent of the global soybean harvest while the US produces about 28 percent, according to analysis by the American Soybean Association.

As trade began to recover under the Phase One agreement, US soybean exports to China grew and peaked at 34 MMT in 2020, about 55 percent of what Brazil shipped to China.

The US' tariff escalation last year was even more brutal. When Trump imposed a 34 percent tariff on Chinese goods in April 2025, the retaliatory tariffs from China sunk US soybean exports deeper to a mere 7 MMT.

"When that was announced, soybean prices basically collapsed," Mike Cerny, a farmer in Sharon, Wisconsin, told PBS in April last year. "If you could afford to hold on to your beans and wait for better times, you were OK. If you had a mortgage due, or payments due, or cash flow needs, and you had to sell at that point, you were taking it pretty rough."

The financial loss for soybean growers was significant. Even with federal assistance, farmers still lost almost $75 per acre of soybeans in 2025, according to the American Soybean Association.

Similarly, US beef exports to China fell from a peak of $2.76 billion in 2022 to $977 million in 2025. Overall, US farm exports to China, which peaked at $41 billion in 2022, dropped to a mere $10 billion in 2025, the lowest since 2008.

> "After a year of widely fluctuating tariff levels, having stable costs of the main ingredients involved in producing a crop will be a most welcome tranquil period for farmers in the American heartland. ... If China is not removed from that list ... it may be difficult to expect to see large increases in purchases of US agricultural commodities or other significant business deals."
>
> **Kenneth Quinn,** president emeritus of the World Food Prize Foundation in Des Moines, Iowa

Samples of US soybeans are displayed at the Chinese International Import Expo in Shanghai on Nov 6. LONG WEI / FOR CHINA DAILY

Overall US farm exports were down by 3 percent in 2025, primarily driven by losses in soybean exports, according to the US Department of Agriculture.

Farm debt rises

The trade losses have cascaded through the farm economy.

The Federal Reserve Bank of Kansas City found that farmers were taking larger operating loans and taking longer to repay them, a report by the American Farm Bureau Federation said. Nearly 40 percent more farm operating loans were opened in the fourth quarter of 2025, compared with the same period in 2024.

Total farm debt reached a record $624.7 billion in early 2026 — up $30.8 billion, or 5 percent, from the year before, according to the federation. It was the second consecutive year of 5 percent farm debt growth.

Critically, the debt growth was not from investment or expansion but from necessity: Farmers were borrowing simply to cover input costs.

"Farm debt continues to rise as producers rely on borrowing to manage elevated operating costs and uneven cash flow," the report concluded. The situation was, in the federation's assessment, "a generational downturn rather than a temporary slowdown".

In addition, more farmers filed for bankruptcy in 2025, the federation said. A total of 315 farm bankruptcies were filed in the calendar year, up 46 percent from 2024.

The US Midwest and Southeast were the hardest hit, with the regions seeing 121 and 105 bankruptcy cases filed, respectively. The numbers represented a 70 percent year-on-year increase in filings in the Midwest, and a 69 percent rise in the Southeast.

In addition, the number of US farms was reduced by 15,000 in 2025, reflecting a broader trend in farm closures, according to the American Farm Bureau Federation.

This year, US farmers have been hit by another major shock with the US-Iran military conflict sending fuel and fertilizer costs sharply higher.

A survey of 400 farmers, conducted by researchers at the Purdue Center for Commercial Agriculture in late March, found that almost half said their farm operations were financially worse than a year earlier.

With the rising price of land, rent, equipment, fertilizer and fuel, US farmers have been struggling with thinning margins. In February, before the start of the Iran conflict, the USDA projected the US farm income will slip lower in 2026.

Americans miss pie

The reality is that China's overall farm imports have been growing steadily over the past nine years — from $125 billion in 2017 to $207 billion in 2025, with a peak of $234.8 billion in 2022, primarily due to prices.

In the same period, however, US farm exports to China have been going through ups and downs, but producers have largely missed out on the growth in China's farm imports.

The Beijing summit could produce positive outcomes for US farmers. If China ends up purchasing $17 billion of US farm goods annually, plus 25 MMT of soybeans as the White House announced, it would take the volume of US exports to China to about $28 billion to $30 billion a year.

However, that number barely matches the volume preceding the 2025 "Liberation Day" announcement of US tariffs, and is much lower than the $41 billion peak achieved in 2022.

The structural shift caused by Trump's tariff policy has US citizens worried about the prospects for long-term farm trade with China.

"If you look out a decade or so, we know that long-term China is not going to be the dominant buyer that it once was," said Main, director of market development at the Illinois Soybean Association. "And so, we have to pivot."

Kenneth Quinn, president emeritus of the World Food Prize Foundation in Des Moines, Iowa, is more optimistic.

"In my opinion, the reference to a new 'constructive strategic stability' with 'moderate cooperation' and 'manageable differences' can provide an extended period of predictable situations, which Midwest farmers strongly desire," Quinn told China Daily.

The takeaway from the May summit is that it allows US farmers to make decisions before planting time, based on a clear understanding of the costs involved throughout the growing cycle, he said. "After a year of widely fluctuating tariff levels, having stable costs of the main ingredients involved in producing a crop will be a most welcome tranquil period for farmers in the American heartland," Quinn said.

The prospects for US-China farm trade largely hinge on big-picture bilateral relations.

Quinn said that one measure of the summit's impact will be whether China stays on the US Secretary of Commerce's List of Adversaries along with Iran, the Democratic People's Republic of Korea, Cuba and Russia.

"If China is not removed from that list ... it may be difficult to expect to see large increases in purchases of US agricultural commodities or other significant business deals," he said.

The most important thing is for the US State Department and China's Foreign Ministry to work on the goals and possible outcomes for any follow-up state visit of President Xi Jinping to the US. During the summit in Beijing, Trump invited Xi to visit the US later this year.

Quinn said a presidential summit provides an opportunity to answer a "fundamental question" in the US-China relationship by announcing a partnership to address the "greatest challenge humanity has ever encountered".

"Can we sustainably feed the 9.5 billion to 10 billion people who will be on our planet by 2050?" he said.

There may not be a time in the coming decades when the leaders of the US and China are both positioned to take dramatic steps to achieve that, Quinn said.

"My hope is that President Xi and President Trump will seize this opportunity and strive to achieve historic greatness by taking the first steps toward building peace through agriculture," he said.

TOP NEWS

Heritage: Protection, development coordinated

From page 1

After Liangzhu, the next focus in exploring the origins of Chinese civilization in Zhejiang is the Shangshan culture.

Named after the Shangshan site in Pujiang county of Jinhua, Zhejiang, this Neolithic culture dates back 8,500 to 11,000 years and is the oldest Neolithic culture ever found in the lower reaches of the Yangtze River and China's southeastern coastal region. However, it was once overlooked in academic studies.

Sheng Danping, former head of the Pujiang Museum, still vividly remembers receiving an instruction from Xi in late November 2006 to strengthen research and publicity regarding the Shangshan culture.

At a symposium earlier that month, the culture had been formally named, Sheng told Zhejiang Daily, adding that he was amazed by the attention from the leadership. The directive put things into high gear. Within months, a 500-square-meter exhibition hall was built and opened to the public. Within three years, the pottery pieces that had been unearthed were sorted. In 2007, work began on a major protection plan, which gained national and provincial approval in 2010.

Despite the mountainous terrain of Pujiang leaving relatively little space for land resources, local protectors like Sheng still left nearly 90 hectares of "fine land" for the excavation and research of Shangshan.

"Shangshan is thus a key for people to improve their cultural confidence," Sheng said.

In November 2020, top-tier scholars gathered again in Pujiang for another symposium on Shangshan studies. With in-depth field research and abundant findings, they concluded that the place was a key origin of the world's rice cultivation.

Yang Jianwu, former director of the Zhejiang Administration of Cultural Relics, said the surge in scholarly attention has cemented a series of landmark conclusions that fundamentally rewrite the story of human civilization in East Asia.

Around 20 years ago, Xi's guidance on heritage protection benefited more projects in Zhejiang, ranging from the world-famous West Lake and the Grand Canal to a number of intangible cultural heritage items, such as folk operas. He also made a key instruction on the restoration of the historic Wenlange library, a crucial trove of ancient books, and encouraged the wide participation of different sectors in the preservation of traditional villages.

"During Xi's work in Zhejiang, he stressed on many occasions that we must attach great importance to cultural heritage protection and embrace the notion that protecting cultural relics is also a kind of political achievement," Yang said.

The theme of this year's Cultural and Natural Heritage Day is "cultural heritage belongs to the people and serves the people", and what has been done in Zhejiang can serve as a suitable footnote for this.

Mideast tense as US, Iran trade fresh strikes

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

The situation in the Middle East remained tense after the United States and Iran exchanged strikes for the second day, with Tehran announcing the complete closure of the Strait of Hormuz.

United Nations Secretary-General Antonio Guterres called for a ceasefire and demanded "no more excuses" in a post on social media platform X on Thursday, noting that the region "is being pulled deeper into crisis".

Guterres also underscored that the "restrictions on navigational rights and freedoms in and around the Strait of Hormuz" are causing hardship and instability across the world.

The Iranian Army and the Islamic Revolutionary Guard Corps attacked several US bases and facilities across the region, Tasnim News Agency reported on Thursday.

"During two waves of operations, the brave warriors of the Aerospace Force and the heroes of the IRGC Navy, in the early hours of this morning (Thursday), struck and destroyed 18 important targets belonging to the evil US army in Bahrain and Kuwait," the IRGC was quoted as saying.

The IRGC is also said to have launched a drone attack on the US Fifth Fleet in Bahrain. "In this wave of military drone attacks, the communications antennas and radar installations of the Fifth Fleet's Patriot system were targeted," Xinhua News Agency cited a Mehr News Agency report as saying.

Iran's Khatam al-Anbiya Central Headquarters has announced the complete closure of the Strait of Hormuz to all shipping, including oil tankers and commercial vessels, citing insecurity caused by US strikes on southern Iran, according to Mehr.

Bahrain and Kuwait's air defense forces intercepted missiles and drones, with Kuwait announcing a temporary closure of its airspace after Iranian attacks as a precautionary measure.

Bahrain's Ministry of Interior said in a post on X that as a result of the "Iranian aggression against Bahrain", an 11-year-old girl sustained minor injuries and was treated at the scene.

Vehicles caught fire and houses were damaged in Hamad Town and Manama "due to falling debris from drones interception", the ministry said, adding that civil defense and national ambulance officials have taken necessary measures.

In a statement, Qatar's Ministry of Foreign Affairs condemned Iran's fresh strikes against Jordan, Bahrain and Kuwait as a "blatant violation of the sovereignty of these countries".

"The Ministry of Foreign Affairs stresses the need to spare the region the repercussions of these unjustified attacks and to work toward de-escalation in order to restore regional and international security and stability," the ministry said.

Secretary-General of the Gulf Cooperation Council Jasem Mohamed Albudaiwi, in a statement published on Thursday, condemned "the repeated treacherous Iranian attacks" on Bahrain, Kuwait and Jordan, and affirmed the GCC's support for all measures taken by the affected Arab countries "to enhance their security, preserve their sovereignty and territorial integrity".

The US Central Command, or CENTCOM, said it had completed additional self-defense strikes against multiple targets in Iran on Wednesday.

"CENTCOM forces launched strikes on Iranian military surveillance capabilities, communication systems, and air defense sites across Iran," it said, adding that US Marine Corps, Air Force, and Navy assets fired precision munitions on Iranian targets that posed a threat to US forces and international commercial ships transiting regional waters.

US President Donald Trump said in a social media post that Iran "has taken too long to negotiate a deal that would have been great for them", and now "they will have to pay the price".

"Iran is all talk and no action. The Bully of the Middle East is DEAD!!!" Trump posted, adding that Iran "is doing zero business", not paying for their military or "any of their bills", and that it was quickly "becoming a failed nation".

Technique: Craft gains a global fan base

From page 1

"When we make each piece, we are not only preserving our traditions, we are expressing our pride in Bai culture," Zhang said.

That pride comes not only from the craft's role in daily and ceremonial life, but also from its history.

Records indicate that the Bai ancestors had already developed textile techniques during the Neolithic age. In the first half of the 20th century, household tie-dye workshops had become widespread across Zhoucheng and neighboring towns, turning the region into a well-known tie-dyeing center.

Today, the craft is finding new vitality among younger generations and visitors from around the world.

In Zhoucheng, tie-dyed products have expanded beyond traditional household use to include contemporary fashion and lifestyle items, such as T-shirts, dresses, bucket hats, tote bags, hair accessories and decorative ornaments.

At Zhang's workshop, tourists arrive daily to experience the slow, meditative process of stitching, binding and dyeing fabric by hand. Some spend hours creating their own patterns, immersing themselves in the village's atmosphere.

Many visitors are also attracted by the environmentally friendly materials used in the process.

The craft is also entering new commercial and cultural spaces beyond the village.

In Lijiang, Yunnan, cafe owner Li Jimin has incorporated tie-dye aesthetics into his business. His takeaway cups, coffee bean packaging and shopping bags all feature tie-dye-inspired designs.

"Many overseas visitors stop by our cafe," Li said. "They are often drawn to the blue-and-white packaging because it feels different from what they see elsewhere, and many buy it as a gift to take home."

For Zhang, the appeal of tie-dye goes beyond aesthetics or commerce. She sees the craft as a bridge between people and cultures.

Human rights action plan for 2026-30 issued

Blueprint aims to ensure that the fruits of modernization benefit all people more fairly

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China released a new national human rights action plan on Thursday at the opening of the 2026 Forum on Global Human Rights Governance, pledging to further protect people's rights and promote social fairness and justice.

The National Human Rights Action Plan of China (2026-30) aims to ensure that the principal position of the people is respected, their fundamental interests are safeguarded, and the fruits of modernization benefit all people more fairly.

China implemented its fourth national human rights action plan from 2021 to 2025. With the completion of its major objectives and tasks, the country made notable progress in human rights protection, according to the new plan.

The two-day forum, themed "Joint Development, Shared Human Rights: The 40th anniversary of the adoption of the Declaration on the Right to Development and a new vision for global human rights governance", was co-hosted by the State Council Information Office and the Ministry of Foreign Affairs. More than 400 Chinese and foreign guests from over 100 countries and international organizations, including United Nations agencies, attended the forum.

Participants stressed that development should be given greater priority, so that its benefits can reach people in all countries in a more equitable way.

Li Shulei, a member of the Political Bureau of the Communist Party of China Central Committee and head of the Publicity Department of the CPC Central Committee, said that China follows a people-centered development philosophy, regards the rights to subsistence and development as primary basic human rights, and pursues a human rights development path suited to its national conditions.

Against the backdrop of uneven global development, China will continue to respect and protect human rights, implement the 2026-30 action plan and work with other countries to advance human rights, Li said.

Abdulatif M. Jamal Rashid, former president of Iraq, said the right to development is a fundamental pillar of the global human rights system.

Rights lose practical meaning without the material conditions that allow people to exercise them, he said, citing children without access to school, families without electricity or drinking water, and farmers who lose their livelihoods because of drought.

On green development, Rashid said the transition to a green economy should be fair and balanced, taking into account the realities of developing countries and respecting their people's rights to development and stability.

He said that Iraq has benefited from support and cooperation from many countries during its recovery and reconstruction, and highly appreciates China's contribution to Iraq's stability and peace, as well as its energy and infrastructure development.

Eduardo Melchor Arana Ysa, former prime minister of Peru, said that countries should continue building the future while preserving their national identities, traditions and core values. Human rights are a common pursuit in protecting human dignity and improving people's lives, but different societies may follow different paths.

Humanity's richness lies in its diversity, including different histories, cultures, systems and development experiences, he said. The universality of human rights should not mean a single fixed model, adding that countries should advance shared goals in ways consistent with their own realities. He called for stronger multilateralism and a more balanced, inclusive and representative global governance system.

Mohamed Abdelrahman Mohamed Moussa, minister plenipotentiary of the Ministry of Foreign Affairs, International Cooperation and Expatriates of Egypt, said the right to development is not an isolated right, but a synthesis of many rights closely linked to national well-being and people's livelihoods.

Development should be placed at the center of global human rights governance, as poverty, inequality, climate change and conflicts continue to undermine people's basic rights, Moussa said.

Participants also said that countries should create a fair and reasonable international environment for the realization of human rights and take practical action to address common human rights challenges.

Representatives unveil the National Human Rights Action Plan of China (2026-30) at the opening of the 2026 Forum on Global Human Rights Governance on Thursday in Beijing.

Lifestyles: Sports have enormous educational value

From page 1

This is why investment in sports must go beyond elite training facilities. Municipal governments, schools and universities all have important roles to play in providing accessible sports infrastructure, public exercise spaces, amateur leagues and qualified coaches. If sports are to become part of a nation's culture rather than simply spectator activities, opportunities for participation must be widely available.

China has increasingly recognized this reality. Public fitness campaigns, expanded sports infrastructure and greater support for school athletics have helped raise awareness of healthy and active lifestyles. It is also encouraging that Chinese universities require students to pass physical education assessments before graduation. Such policies send an important signal that physical well-being is an essential component of education, not an optional extra.

The emergence of new sports also reflects changing lifestyles and demographics. Pickleball, for example, has grown rapidly around the world because it is easier to learn than tennis, requires less space and places less physical strain on participants. It is highly social, accessible to older adults as well as younger generations, and equally welcoming to men and women. The growth of such sports demonstrates how recreation can evolve to include broader segments of society.

Sports also have enormous educational value. Educators and employers increasingly recognize that academic achievement alone is insufficient for success in the 21st century. Teamwork, adaptability, perseverance, emotional intelligence and leadership are equally important. Sports develop these qualities in ways that classrooms alone often cannot.

Research consistently shows that student athletes tend to perform better academically, develop stronger social skills and experience greater emotional well-being. Sports teach young people how to cope with pressure, recover from setbacks and work collaboratively toward common goals. Equally important, they teach sportsmanship — respecting rules, showing fairness and learning how to win or lose with dignity. These values are fundamental not only for athletic participation, but also for social and professional success later in life.

When students come from diverse cultural and educational backgrounds, sports often serve another important purpose: creating connection and belonging. In an increasingly mobile and globalized world, many young people move frequently between countries, cities and communities. Sports provide continuity, friendship and identity in an ever-changing environment.

Another important quality of sports is universality. Athletic participation creates shared experiences and common values regardless of nationality, language or background.

In an age increasingly defined by polarization and mistrust, these values matter greatly. International sporting exchanges also create opportunities for dialogue and cooperation when traditional diplomatic channels may be strained. The historical example of the Ping-Pong Diplomacy between China and the United States remains a reminder that sports can sometimes open doors that politics alone cannot.

Ultimately, societies must think more broadly about what constitutes national investment. Infrastructure, technology and industry remain essential, but human capital matters just as much. Healthy, resilient and socially connected citizens are the foundation of sustainable prosperity.

Sports contribute directly to that foundation. They strengthen people, communities and nations. The returns may not always appear immediately on financial balance sheets, but over time they become visible in public health outcomes, educational achievement, economic productivity and social harmony.

John Quelch is executive vice-chancellor, American president of and a distinguished social sciences professor at Duke Kunshan University in China. Zarko Krkeljas is director of the Athletic Department at Duke Kunshan University. The views do not necessarily reflect those of China Daily.

A never-ending disaster

Mudflow tragedy in Indonesia's East Java still shapes lives 20 years on

Residents scatter flowers to mark 20 years since a gas exploration accident triggered a mudflow that buried more than a dozen villages and permanently displaced tens of thousands of people, in Sidoarjo, East Java, Indonesia, on May 29. TRISNADI / AP

Under the sweltering afternoon sun, 47-year-old Ahmad Solihudin waits outside his home in Glagaharum village, Porong district, Sidoarjo regency, East Java, for the familiar sound of a water vendor's motorcycle. When the vendor finally arrives, Solihudin hurries to buy three 25-liter plastic containers for Rp 15,000 (83 US cents), the clean water his family depends on each day.

For nearly 20 years, this has been part of Solihudin's daily routine, a lasting consequence of the Sidoarjo mudflow disaster, which occurred in Porong district in 2006 and buried thousands of homes across nearby villages.

Although authorities managed to restrain the mudflow above ground by constructing embankments rising 9 to 11 meters high, they have not been able to contain its impact beneath the surface, where it continues to seep through the soil, contaminating wells and damaging groundwater supplies in surrounding communities.

"Since the disaster, the well water here has tasted salty. It's greasy too, like it contains oil. Even soap can't wash it away. During the dry season, the water quality gets even worse and it turns black," he said.

With water quality this poor, Solihudin, like most residents in his village, has no choice but to spend a significant portion of his modest income on clean water delivered by traveling vendors who bring supplies from outside the regency, at a cost of up to Rp 450,000 a month.

The environmental damage of the mudflow extends far beyond household wells. Hundreds of hectares of rice fields that once yielded abundant harvests are now abandoned around the mudflow area. Farmers say saline groundwater causes newly planted crops to wither within days.

Solihudin pointed to stretches of farmland near his home, just about 100 meters from the eastern side of the mud embankment, where productive rice fields have since turned into empty plots overgrown with wild grass. Some are now used only as grazing land for buffalo.

"It's been more than 10 years since these fields could grow rice or any other crops," he said. "The owner tried to sell it cheaply, but no one wants to buy it, so he's just left it as it is."

According to the Jakarta Post, the mudflow began as a result of drilling activities conducted by Indonesian oil exploration company PT Lapindo Brantas in Sidoarjo on May 29, 2006. The company, however, maintained that the eruption was triggered by an earthquake that occurred two days earlier.

The hot mud eruption, initially releasing around 100 cubic meters per day, eventually submerged 16 villages across the Porong, Jabon and Tanggulangin districts, displacing around 60,000 residents.

It is widely regarded as one of the largest ecological disasters in Indonesian history, burying approximately 10,426 houses, 77 places of worship and vast areas of farmland, as well as public facilities and infrastructure.

Although nearly two decades have passed, the eruption continues at a reduced intensity. To control the mudflow, the government constructed a 640-hectare retention pond and has continuously diverted the mud into the nearby Porong River, with an estimated discharge of around 20 million cubic meters per year.

Constant anxiety

Against the backdrop of the ongoing mud eruption, daily life for Munir, 46, a resident of Gempolsari village on the northern edge of the embankment, has become defined by constant anxiety.

Residents affected by the mudflow, together with environmental activists, carry food and offerings toward the mud volcano area in Porong, Sidoarjo, East Java, on May 29. JUNI KRISWANTO / AFP

Continuous land subsidence caused by the mudflow has gradually turned his neighborhood into a low-lying basin, where rainwater easily accumulates and drains slowly, heightening the risk of flooding.

Whenever heavy rain falls, floodwater quickly inundates the road in front of his house, which is located just 100 meters from the embankment. Munir said his neighborhood is often among the last areas to dry out after major floods.

According to research by experts from the Sepuluh Nopember Institute of Technology, land subsidence extends up to 5 kilometers north and northeast of the mudflow center, with the ground sinking by as much as 40 centimeters per year.

"The inside of my house has already been raised by about 60 centimeters," Munir said. "I recently bought a truckload of soil for Rp 150,000 to elevate the yard. If I don't, it keeps flooding because the area has turned into a basin, and the water takes a long time to recede."

For Slamet, 55, another resident of Gempolsari village, the consequences of the mudflow have been just as profound. The disaster forced him, and many others, to abandon farming, as once-productive fields were rendered unusable after being buried or contaminated by the mudflow.

Slamet now earns a living selling fish. Around him, he says, neighbors have taken similar paths, shifting into small trade, motorcycle taxi services or other informal work available in the area.

"What we earn now is nothing like when we were farming, but we have no other choice if we want to feed our families."

Beyond depriving him of his livelihood, the mudflow disaster has deeply disrupted Slamet's daily life at home. Thick dust and pungent odors regularly drift from the site, becoming especially unbearable during the dry season.

"The stench makes it hard to breathe," Slamet said. "When the dry season comes, the mud thickens and has to be diluted before it can be discharged into the Porong River through pipelines. That mixing process releases an overwhelming smell, and many children living near the embankment frequently experience shortness of breath."

Losing hope

The polluted air brings not only a persistent foul odor, but also serious health risks for residents living near the mudflow site.

A 2008 study by the Indonesian Forum for Environment, or WALHI, found alarming levels of polycyclic aromatic hydrocarbons, hazardous pollutants associated with an increased risk of cancer, in the air and water surrounding the mudflow embankment. The concentrations were recorded at levels 2,000 times higher than normal safety standards.

Another WALHI study in 2016 identified at least 10 illnesses affecting residents in the area, with respiratory infections emerging as the most widespread. That year alone, around 16,700 residents were reported to have suffered respiratory infections, while the number of recorded cases had reached 63,750 in 2010.

Despite the constant threat of flooding, ongoing land subsidence and mounting health risks linked to contaminated water, soil and air, residents say there has been no meaningful long-term resolution to address the enduring impacts of the mudflow.

Slamet recalls that in the early years following the disaster, residents frequently organized events and voiced their demands. However, after years of unresolved grievances without meaningful solutions, many gradually lost hope.

"We are tired because there's no solution. We've simply learned to live with the situation," he said.

THE JAKARTA POST, INDONESIA

Rising fuel prices triggered by Mideast conflict drives car pool growth in India

Rising fuel prices triggered by the Middle East war are driving a sharp increase in carpooling, with a ride-sharing platform reporting a surge in new users seeking cheaper ways to travel.

The carpooling platform BlaBlaCar said soaring energy costs have pushed 600,000 additional drivers onto the app this year — 20 percent more than initially projected — as commuters look to offset the rising cost of fuel.

In India, its single biggest market with more than 20 million users in 2025, the number of passengers has increased by 40 percent since the start of the US-Israeli airstrikes against Iran on Feb 28.

Last year, the global carpooling leader posted record-breaking figures in the world's most populous country India, outpacing Brazil with 19 million users and France with 7 million, according to Benjamin Retourne, the platform's chief product officer.

This trend has been more pronounced in countries where fuel price increases driven by the war have been sudden and significant, combined with limited government support, such as in France.

The platform works by connecting drivers and passengers willing to travel together between cities to share costs, with the app in most of its 21 operating nations taking a 20 percent commission.

Indian Prime Minister Narendra Modi earlier in May urged the country's 1.4 billion people to save fuel by making greater use of carpooling and public transport.

India imports approximately half of its crude oil via the Strait of Hormuz, which Tehran effectively closed in response to US-Israeli strikes in February.

> "It's cheaper than the train, the bus, or a private taxi ... It also saves time, as there are few stops and the vehicle doesn't wait beyond the scheduled time."
>
> **Pratyush Anuraj,** a bank officer based in Mumbai

Retourne said a decade ago, when BlaBlaCar first launched in India, even "after two or three years, it just wasn't catching on".

The company, founded in France in 2006, therefore stopped investing in India but kept its application running from its Paris headquarters, unlike many large foreign groups that outsourced their services to India.

Growth finally began to pick up after the COVID-19 pandemic, driven by the country's economic and digital acceleration, as well as word-of-mouth.

Retourne pointed to a growth in private car ownership as well as rapid urbanization, with 200 million additional city dwellers over the past decade. "People are very connected," he said, adding that "today, wherever you go, there is 5G".

That proved to be the "recipe for carpooling to take off", he said.

Driving factor

But he was surprised that the driving factor was not the cost — but rather to avoid often crowded buses or trains.

"The number one reason people choose carpooling is not price, but comfort", he said.

The market potential remains vast, with "a new segment of the population" eager to travel for leisure and visit friends and family.

Assistant bank manager Pratyush Anuraj, 24, from India's financial capital Mumbai, said he used the carpooling platform to travel to his family's home in Pune every weekend — a 150-kilometer journey of around 2.5 hours.

"It's cheaper than the train, the bus, or a private taxi," he said. "It also saves time, as there are few stops and the vehicle doesn't wait beyond the scheduled time."

He does, however, point out some drawbacks: either the trip is often canceled at the last minute, or the drivers don't answer calls.

So far, the French platform has not monetized carpooling in India, where people pay each other directly, often using the popular digital payment systems.

The next objective is to "build a platform that aggregates multiple modes of transport" — connecting cars to buses and trains.

Event highlights role of dialogue among cultures

Chinese FM calls for mutual trust and understanding amid global challenges

By **SHARON NAKOLA**
in Nairobi, Kenya
sharon@chinadailyafrica.com

As conflicts, geopolitical tensions and technological disruptions reshape the international landscape, China, African countries and the United Nations are increasingly promoting dialogue among civilizations as a critical tool for strengthening global cooperation, advancing modernization and building a more peaceful and inclusive world.

The call came during celebrations marking the International Day for Dialogue among Civilizations at the United Nations Office at Nairobi on Wednesday, where diplomats, development experts and international officials warned that rising conflicts, widening inequalities and rapid technological advances are testing the international system and underscoring the need for greater understanding among cultures.

The International Day for Dialogue among Civilizations falls on Wednesday. It was proposed by China and cosponsored by more than 80 countries, and was adopted at the UN General Assembly in June 2024.

Addressing the event via video, Chinese Foreign Minister Wang Yi called on countries to improve understanding and foster mutual trust through dialogue amid unprecedented global challenges.

Wang said countries should promote unity and seek consensus through exchanges while strengthening the social and cultural foundations for building a community with a shared future for humanity.

Wang also highlighted the role of emerging technologies such as artificial intelligence and social media in promoting cultural exchange and mutual learning, while reaffirming China's willingness to deepen cooperation with other countries on governance and modernization.

Chinese Ambassador to Kenya Guo Haiyan said dialogue among civilizations remains essential for fostering mutual understanding, strengthening people-to-people ties and building a shared future for humanity.

She said China remains committed to working with diplomatic missions, international organizations and development partners in Kenya to advance dialogue among civilizations and deepen mutual understanding.

"Development serves as the foundation, security provides the guarantee, civilization acts as a bridge, and governance offers the institutional support," she said.

According to Guo, all countries, regardless of size, wealth or level of development, should have equal rights to participate in international affairs and determine their own development trajectories.

Kenya also used the occasion to underscore the importance of dialogue in promoting peace and development.

Collective action urged

Kenya's Permanent Representative to the United Nations Office at Nairobi and the United Nations Environment Programme, Ida Betty Odinga, emphasized the importance of collective action in addressing global challenges and strengthening international cooperation.

She said humanity is inherently interconnected and argued that nations can achieve more when they cooperate in pursuit of common goals. "Despite our differences, humanity shares common aspirations for peace, coexistence and development."

Odinga urged governments and institutions to invest in education, cultural exchange and international cooperation as they are key pillars for strengthening understanding among peoples and nations.

In a message marking the day, UN Secretary-General Antonio Guterres said the world is living through a period of "turbulence and transformation" characterized by escalating conflicts, growing inequalities and the emergence of technologies such as artificial intelligence and clean energy that present humanity with critical choices about the future.

"Too often, differences are misunderstood, or manipulated to undermine global solidarity," Guterres said. "But there is a path forward — dialogue." He said that dialogue among nations, cultures and faiths has the power to replace confrontation with cooperation and tension with trust, while helping build a more just and peaceful world.

China highlights strides in disability rights

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

China has made significant progress in developing disability-related programs, a representative of the China Disabled Persons' Federation said on Wednesday.

"The development of disability-related programs has been incorporated into China's national economic and social development plans," said Ren Zhanbin, director of the federation's education and employment department, at United Nations Headquarters in New York.

"It has gradually evolved into a comprehensive social undertaking encompassing rehabilitation, education, employment, poverty alleviation, social security, culture and sports, and accessibility development," he said.

Overall, this has improved the level of social protection and development opportunities for Chinese people with disabilities, Ren told the 19th session of the Conference of States Parties to the Convention on the Rights of Persons with Disabilities, or COSP19.

The convention, adopted by the UN General Assembly in 2006, is the first legally binding international treaty that protects the rights of people with disabilities.

An active advocate in the drafting of the convention, China was among the first countries to become a state party. It signed the convention in March 2007, and the Standing Committee of the National People's Congress formally ratified it the next year.

Ren said the Chinese government adheres to a people-centered approach, conscientiously fulfills its obligations under the convention, and implements the UN's 2030 Agenda for Sustainable Development.

Speaking on Tuesday, when the three-day COSP19 started, UN Secretary-General Antonio Guterres said, "Together, let's realize the rights of every person with disabilities and build a fair and vibrant future for all."

The UN praised the strides nations have made over the past 20 years, but said "significant barriers remain" and that COSP19 will offer solutions.

China is home to 85 million people with disabilities, about 6.34 percent of its population, according to the China Disabled Persons' Federation.

Ren expressed China's commitment to enabling people with disabilities to become "true holders of rights, as well as participants in, contributors to and beneficiaries of economic and social development".

The country has created a comprehensive legal framework to strengthen the protection of disability rights. This year, the Social Assistance Law was formally codified.

"This system ensures that persons with disabilities enjoy equal access to social security while receiving support services tailored to their individual needs," Ren said.

China has also established a living allowance system for people with disabilities who face financial hardship and a nursing subsidy system. The living allowance benefits 12 million people, while the nursing subsidy benefits 16.6 million.

Other successes in the fight for disability rights include promoting community and home-based care to support independent living, and housing support, rental assistance and housing security for those facing financial hardship.

Anyone who wants to work but has intellectual, psychosocial or severe physical disabilities is provided with supportive services that combine care with sheltered and supported employment, Ren said.

The China Disabled Persons' Federation, together with the federations of Zhejiang and Qinghai provinces, organized exhibitions at UN Headquarters on disability-related cultural and creative works and poverty alleviation achievements in China.

Themed Blooming Together, the exhibitions featured more than 200 works from Zhejiang, Qinghai and other regions.

Young musicians strike a chord across borders

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

Young US and Chinese musicians are embarking on their own journey across cultures through music, collaborating to build connections that go beyond language and borders.

Musicians from Carnegie Hall's National Youth Orchestra of the United States of America, or NYO-USA, the NYO Jazz ensemble, and Chinese pianist Zhang Sencheng performed at the *Youth Dialogue for the Future* concert held at the Chinese Consulate General in New York on Wednesday.

"People-to-people friendship between China and the US is taking on diverse new forms. Soon, the young musicians of the NYO Jazz will travel to China, and a group of top young Chinese artists will also come to New York," Chen Li, China's consul general in New York, said.

Among the performers was Zhang Sencheng, a 2010-born scholar of the Lang Lang International Music Foundation, who has performed twice at Carnegie Hall. He played several pieces at the consulate, bringing elements of Chinese musical expression to an international audience.

"I hope more audiences could hear the Chinese perspective on music and the way we express it, through the blend of Eastern and Western musical elements," he said.

"I am very happy and proud of him because he is very mature even though he is very young," Lukas Barwinski-Brown, CEO of the Lang Lang International Music Foundation, told China Daily.

For Carnegie Hall, these exchanges are part of a broader effort to bring young musicians together across cultures. Beyond bringing Eastern musical perspectives to Western audiences, Carnegie Hall has created opportunities for some of the most talented young musicians in the US to receive training, perform internationally and engage with artists and audiences around the world.

In 2025, the NYO-USA embarked on a six-city tour of Asia, performing in Hong Kong, Beijing and Shanghai. During their time in China, the young musicians participated in exchanges with their peers at the Beijing Performing Arts Centre, connecting with their Chinese counterparts through workshops and musical collaboration.

The NYO Jazz ensemble will soon return to China in August, visiting Shanghai and Beijing for the ensemble's second trip to the country.

Anna Abondolo, a 25-year-old bassist at NYO Jazz, told China Daily the upcoming journey represents an opportunity to discover new musical perspectives and build friendships with Chinese musicians.

"I am just very curious in terms of hearing music and like meeting other jazz musicians," she said. "Music is a very universal language. We can all learn from each other, like what people are listening to, how people are playing."

The impact of these exchanges extends beyond the musicians themselves. Mary Anne Huntsman, a Carnegie Hall trustee, told China Daily that international tours and performances in both China and the US create opportunities for young people from the two countries to share and understand each other's cultures.

"Music brings people together more than anything," she said.

Consul General Chen said the growing interest among young US people in Chinese art and culture reflects the importance of cultural exchange.

"We can see a growing trend of young Americans becoming interested in Chinese art and culture. Especially with performances selling out at New York's most prestigious venues, such as Carnegie Hall and Lincoln Center, we can see that American audiences are learning more about China through its culture," Chen told China Daily.

Beijing mourns veteran Japanese statesman Yohei Kono

By **MO JINGXI**
mojingxi@chinadaily.com.cn

China's top legislator Zhao Leji sent a message of condolence on Thursday to the family of Yohei Kono following his death, expressing hope that Kono's family would carry forward his legacy and play a positive role in helping bring China-Japan relations back on the right track.

Kono, who was president of the Japanese Association for the Promotion of International Trade and former speaker of Japan's House of Representatives, died at the age of 89 on Monday, Japanese media reported on Wednesday. Kono was also a former president of Japan's Liberal Democratic Party.

Zhao, chairman of the National People's Congress Standing Committee, said the veteran Japanese statesman was an old friend of the Chinese people who had long been committed to China-Japan friendship.

He noted that in 1993, Kono, then Japan's chief cabinet secretary, issued the Kono Statement on the issue of "comfort women", which continues to have a positive influence today.

The landmark statement acknowledged the Japanese military's direct involvement in setting up "comfort stations" and forcibly recruiting women on the Korean Peninsula, in China, and elsewhere, and expressed remorse and an apology.

At a regular news briefing in Beijing on Thursday, Foreign Ministry spokesman Lin Jian said that Kono, who upheld a correct view of history, was widely regarded as a leading figure in defending Japan's pacifist constitution.

Kono had once said Article 9 of Japan's Constitution, which clearly stipulates Japan's renunciation of war and non-maintenance of war potential, "represents our resolve and readiness, as well as our ideal", adding that it is the mission of every politician to strive for that ideal.

"He devoted his life to China-Japan friendship, visited China dozens of times, and made important contributions to promoting the development of bilateral relations and advancing exchanges and cooperation between the two countries," Lin said.

Lin said that even in his final days, Kono remained deeply concerned about China-Japan relations and, with tears in his eyes, expressed his wish to visit China one last time. "Regrettably, due to his deteriorating health, that wish was not fulfilled," Lin said.

The spokesman said that Kono once said he would never forget the shock and joy he felt at the normalization of China-Japan diplomatic relations, stressing that history should not be forgotten, the spirit that underpinned the normalization of ties should be carried forward, and the commitments made at the time should be honored.

"Those words carry even greater practical significance under the current circumstances," Lin added.

COMMENT

Editorials

Political-military alignment with ulterior motives the real threat to regional stability

With the Sanae Takaichi government of Japan leading the charge, the Ferdinand Marcos Jr government of the Philippines eagerly following, and the Lai Ching-te authorities of China's Taiwan region enthusiastically lending their support, East Asia is witnessing the gradual formation of a potentially destabilizing political-military alignment.

Many in Asia are worried that the Takaichi government is steadily eroding the postwar restraints that defined the country's security posture for decades. The ruling Liberal Democratic Party has approved proposals calling for a significant expansion of military capabilities, including stronger counterstrike capabilities, higher defense spending, enhanced long-range missile capabilities, and even exploring next-generation submarines with long-range weapons. Japanese policymakers justify these moves by citing a "deteriorating security environment".

But as China's Foreign Ministry has pointed out, right-wing forces in Japan are exploiting regional tensions to advance their agenda of militarization.

Peace activists and veteran statesmen in Japan have cautioned against ignoring the lessons of history. The passing of former Japanese political leader Yohei Kono at 89 on Monday is a poignant reminder of a different vision of Japan's role in Asia. Kono, who as Japan's chief cabinet secretary issued a landmark 1993 apology over the comfort women, understood that reconciliation, historical honesty and regional trust were strategic assets rather than burdens. His warnings against ultra-nationalism and military adventurism in the country appear increasingly relevant given the reckless moves of the Takaichi government.

The announcement by Tokyo and Manila last month that they will conduct "maritime delimitation negotiations" for waters east of China's Taiwan island adds a new layer of complexity to an already sensitive region. The proposed "delimitation" by Japan and the Philippines infringes on China's maritime interests and violates the basic norms of international relations, as China has an exclusive economic zone and continental shelf in the concerned waters according to international law.

Philippine Secretary of Foreign Affairs Maria Theresa Lazaro insists that the Tokyo-Manila negotiations should continue regardless of Chinese objections. Such statements may play well domestically and among external partners, but they increase the risk of turning the region's maritime disputes into geopolitical flashpoints.

Compounding the concerns is the enthusiastic endorsement of the move by the secessionist-minded Lai authorities. Since taking office over two years ago, Lai has consistently sought closer security and political alignment with external forces that advocate a harder line toward the Chinese mainland. His latest praise for Japan's "security role" and his support for deepening Japan-Philippines "delimitation" moves fit this agenda and amount to political adventurism.

Therefore the real danger lies in the cumulative effect of the collusion of the three, each with its own axe to grind. A Japan steadily expanding its military role, a Philippines increasingly willing to stake its future on provoking China, and the Taiwan authorities — led by the diehard secessionist Lai — eager to internationalize cross-Strait tensions, form a highly combustible mix.

If Tokyo, Manila and the Lai authorities continue down the current path, Beijing will necessarily take corresponding countermeasures to safeguard the Chinese nation's core interests. The mainland's recent special maritime traffic law enforcement and hydrographic survey operation in waters east of Taiwan island are necessary responses to the latest antics of the provocative threesome.

Beijing's ban on Philippine defense chief Gilberto Teodoro Jr and his family from entering the mainland, Hong Kong and Macao, along with a prohibition on any transactions or cooperation between Chinese entities and them, serves as a warning to Manila not to go too far in the wrong direction.

The region does not need a clique formed for confrontation by militarists, adventurists and separatists. The so-called Tokyo-Manila "delimitation" talks, endorsed by the Lai authorities, are illegal, null and void. No matter what the three parties dream up, they cannot alter the fact that Taiwan is part of China. Their collusion reveals that they are the real troublemakers that pose an imminent threat to regional peace and stability.

World Cup should be platform for global unity

The FIFA World Cup 2026 has finally arrived. The tournament kicks off on Thursday in Mexico City, where Mexico will face South Africa in the opening match. Featuring an expanded roster of 48 teams and a record-breaking 104 matches over 39 days, the global event, which will unfold across an unprecedented three host nations — Canada, Mexico and the United States — is the largest ever.

Embodying the spirit of excellence and mutual respect, the World Cup traditionally provides a rare moment when political, cultural and ethnic differences give way to a shared passion for the beautiful game. Yet this year's tournament has kicked off with a seemingly chaotic buildup, limiting its potential to become a huge worldwide celebration that transcends sports due to political disruption as well as other factors such as over-commercialization.

Just days before Iran starts its first game, on Monday in Los Angeles against New Zealand, the country's soccer federation said in a statement that it was unable to provide any tickets as previously promised to its supporters because FIFA had revoked the ticket allocation, presumably under pressure from the US, "which has now taken steps to obstruct the presence of Iranian supporters at the stadiums".

This adds to the woes the Iranian national team has experienced leading up to the World Cup: Several senior federation officials and support staff members have been denied visas, and Iranian players are only permitted to enter the US on the exact day of their matches, and are required to leave immediately after the final whistle blows, leaving them exhausted and with almost no time to practice and familiarize themselves with the playing conditions, unlike other teams.

This obviously contradicts the principles of fair competition and the common understanding that any country bidding to host the World Cup must ensure access for all qualified teams, including their supporters and officials. "Otherwise, there is no World Cup," FIFA President Gianni Infantino stated nine years ago.

Apart from the Iranians, award-winning World Cup referee Omar Artan from Somalia was also denied entry due to unspecified vetting concerns, while Iraqi player Aymen Hussein was allegedly held for questioning for nearly seven hours after arriving in the US. "The disruption is such that one has to ask who is running the World Cup. Is it FIFA or is it the US government ... ?" Piara Powar, the head of FIFA's antidiscrimination monitoring partner, said on Tuesday.

FIFA's decision to hold the tournament in three countries, under the slogan "United as One", was based on the idea that a larger pool of participating teams will lead to increased profits from the sale of television, marketing and licensing rights.

FIFA's most recent financial report showed it will make $13 billion from the four-year cycle culminating in the 2026 World Cup, almost $9 billion of which will be from this year, according to The Guardian. In comparison, FIFA raked in $7.5 billion in revenue through the four years of commercial deals tied to the 2022 World Cup in Qatar, and $6.4 billion for the cycle leading up to the 2018 Russia World Cup.

However, what the soccer's governing body has failed to pay attention to in terms of geographical knowledge is that the three countries cover three time zones, each with its own customs, security protocols and bureaucratic structures. This presents significant challenges for teams in arranging their schedules. Some teams, such as Bosnia and Herzegovina, will have to travel more than 5,000 kilometers during the group stage alone, making it one of the most taxing tournaments. All this, coupled with a lack of top-level coordination, makes the unfolding scenes seem inevitable.

The fact that the China Media Group ultimately paid around $60 million for the broadcasting rights to the World Cup — far below the $300 million that FIFA initially asked for — highlights how capricious FIFA's pricing strategy can be, prioritizing maximum revenue over a country's enthusiasm and circumstances.

Despite being a country with a population of 1.4 billion, China's national team has once again failed to qualify for the World Cup. This has led to renewed calls for reform of the soccer system in the country, focusing on the grassroots and youth training. Encouragingly, more children are taking to soccer pitches, offering hope for the sport's future in China.

The World Cup presents a rare opportunity for China to reflect on the challenges facing its soccer and to draft a practical and sustainable strategy for the future. Meanwhile, as the tournament progresses, soccer fans around the world will hopefully underscore the sport's potential to bridge divides and unite people, fostering understanding and goodwill among people of all nations.

Action plan a new blueprint for people-centered development

China had completed four consecutive national human rights action plans as of last year. It released its fifth, the National Human Rights Action Plan of China (2026-30), at the 2026 Forum on Global Human Rights Governance in Beijing on Thursday.

The action plan aims to ensure that the principal position of the people is respected and the people's fundamental interests are safeguarded. It will also promote social fairness and justice and ensure that the fruits of modernization benefit all people fairly.

Human rights are meaningful only when translated into concrete outcomes. The right to education is reflected in school enrolment. The right to health is measured through access to healthcare and life expectancy. The right to development is demonstrated by poverty reduction, rising incomes and expanding opportunities.

This philosophy is embedded in the newly released action plan and, more broadly, in the country's 15th Five-Year Plan (2026-30). Human rights are not treated as a separate policy silo. They are woven into economic development, social welfare, environmental protection, technological governance and public administration. The result is a comprehensive framework in which human-rights objectives become part of the system of State planning and implementation.

The action plan assigns responsibilities, establishes benchmarks, fixes deadlines and holds institutions accountable for implementation. It includes goals relating to healthcare, education, social security, environmental quality and protections for vulnerable groups. It also expands into newer territory, including artificial intelligence governance, data protection and digital inclusion. In other words, Beijing is attempting to update its human-rights framework to match the realities of a society being transformed by technology and demographic change, using high-tech to facilitate the improvement of human rights conditions.

The practical achievements that have accompanied the country's development over recent decades are a contribution to the global human rights cause. The elimination of absolute rural poverty, the construction of the world's largest social security and healthcare systems, and the dramatic expansion of educational opportunities have altered the lives of hundreds of millions of people.

Indeed, many first-time foreign visitors to China come away struck not by the things that dominate some Western media coverage but by something far more mundane: public safety, efficient infrastructure, digital convenience and the accessibility of public services. These outcomes did not emerge by accident. They are the cumulative product of scientific planning and long-term down-to-earth hard work following the people-first principle. The human-rights action plans are one component of that broader ecosystem.

The 2026 Forum on Global Human Rights Governance took place at a moment when the global human-rights agenda is increasingly entangled with geopolitical rivalry. Human rights have been weaponized by some Western countries, their allegations targeting some countries while the violations of allies are ignored or downplayed.

The world has witnessed more than its share of humanitarian crises instigated by these self-proclaimed human rights "champions".

China rejects this approach, prioritizing cooperation over confrontation. From Beijing's perspective, development remains the most urgent human rights issue for large parts of the world and human rights should be a field for mutual learning, practical cooperation and shared progress.

There is no single universal model for advancing human rights. In an era of widening inequality, technological disruption and geopolitical fragmentation, it is not who talks most passionately about human rights but who can produce measurable progress that is the real driver of the human rights cause.

China's new action plan demonstrates that for Beijing progress is achieved through concrete actions and tangible results. It serves as a broader response to the world, underscoring the need for an improved global human rights governance system that is fairer, more equitable and more inclusive.

What They Say

Actions to help protect world's cultural heritage

Editor's note: *As China prepares to observe Cultural and Natural Heritage Day on the second Saturday in June, it provides an opportunity to reflect on the nation's efforts to conserve cultural heritage. People's Daily Overseas Edition spoke to Sun Yan, senior engineer at the key laboratory on archaeometry and cultural heritage conservation under the Chinese Academy of Social Sciences, about China's contribution to global cultural heritage protection. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China joined the Convention Concerning the Protection of the World Cultural and Natural Heritage in 1985. Last year, the Xixia Imperial Tombs located in the Ningxia Hui autonomous region were included in the World Heritage List, bringing the total number of World Heritage sites in China to 60.

In recent years, China has made remarkable progress in protecting its cultural heritage. For example, between 2016 and 2025, several Chinese cultural heritage sites have been added to the World Heritage List, each embodying distinctive cultural values.

The Archaeological Ruins of Liangzhu City, which were included in 2019, bear witness to China's 5,000-year-old civilization. A large urban settlement dating back to the late Neolithic Age, Liangzhu boasts a massive ancient city and a sophisticated water conservation system, offering a unique glimpse into the origins of Chinese civilization.

The Beijing Central Axis, which was added to the list in 2024, stretches 7.8 kilometers and embodies the ideals of ancient Beijing, the capital of the Yuan (1271-1368), Ming (1368-1644) and Qing (1644-1911) dynasties. The design of the axis features "balance" and "harmony", which reflect the importance of order inherent in traditional Chinese culture.

The Xixia Imperial Tombs, the mausoleums of the Xixia Dynasty (1038-1227), showcase distinctive cemetery architecture and exquisite stone carvings, providing fresh evidence of cultural exchanges along the Silk Road.

Over the past decade, China's approach to world cultural heritage protection has shifted from emergency rescue to systematic conservation. Remarkable strides have also been made in the legal and institutional frameworks supporting cultural heritage protection. The amended Law on the Protection of Cultural Relics, which came into force on March 1, 2025, provides a solid foundation for safeguarding cultural relics.

Digital technologies are now being widely used to enhance the management of heritage sites.

By studying and interpreting the values of China's cultural heritage, people gain a correct, multi-dimensional and comprehensive image of the country.

For example, following the inclusion of the Archaeological Ruins of Liangzhu City in the World Heritage List, the international archaeological community has spoken highly of the development level of the city, as reflected by its water conservation system, social stratification and belief system.

Meanwhile, Chinese institutions have collaborated on archaeological research and conservation projects at World Heritage sites in Egypt, Honduras, Cambodia and other countries, sharing China's philosophies and technologies in archaeology and cultural heritage protection.

In 2023, China spearheaded the establishment of the Alliance for Cultural Heritage in Asia and the launch of the Asian Fund for Cultural Heritage Conservation. China remains committed to leveraging its expertise to contribute to global cultural heritage conservation efforts.

VIEWS

Johan Rockström

Eco-civilization meets planetary boundaries

Over a decade after the United Nations adopted the Sustainable Development Goals — to end poverty, protect the planet and ensure prosperity for all by 2030 — we are in a precarious situation.

As we approach the 2030 deadline for the SDG framework that has defined not only the last decade of global development, but also work on climate, water, health and beyond, the question naturally arises: What next?

At a time of growing geopolitical fragmentation, it is increasingly difficult to imagine the UN forging the same broad consensus around a new global development framework that it did with the SDGs.

In this context, China's vision of an ecological civilization is a political and developmental framework that seeks to reconcile economic growth, social stability and environmental protection.

It is based on evidence that the old industrial production methods have run up unsustainable ecological costs, and concludes that environmental considerations must be integrated into planning, governance and economic activity.

This vision has seen a strong role for the state in its energy transition, such as large-scale investments in renewable technologies, ecological restoration programs, pollution control, and the use of environmental targets in government performance assessments.

Environmental protection is not above economic growth; rather, growth is compatible with ecological limits and national development goals.

Building an ecological civilization is fundamentally about succeeding in attaining aspirational social goals for human welfare and economic development, within scientifically defined boundaries: economic growth within the safe operating space of a stable, healthy and resilient planet. But a precondition to building an ecological civilization is to define and quantify the ecological limits or boundaries.

The planetary boundaries framework does just that. On the basis of the latest Earth system science, it starts by identifying the environmental processes that regulate the stability and resilience of the planet. These are the planetary boundaries.

Global Lens

If we fail to keep the Earth's tipping point systems intact, ecological invoices will be sent, and they will hit indiscriminately across the world.

It is not only about carbon and climate change, but also the ecological boundaries of biodiversity, land use, freshwater use, overloading of nitrogen, ocean stability, air pollution, depletion of the ozone layer and finally, novel entities, such as the overloading of persistent chemical compounds into the Earth system.

For all of these nine planetary boundaries, we have identified control variables, which — backed by big data, long time series and advanced analytics — enable us to quantify a safe boundary level that defines the transition from safety (when staying within the boundary level) to danger (when breaching the boundary).

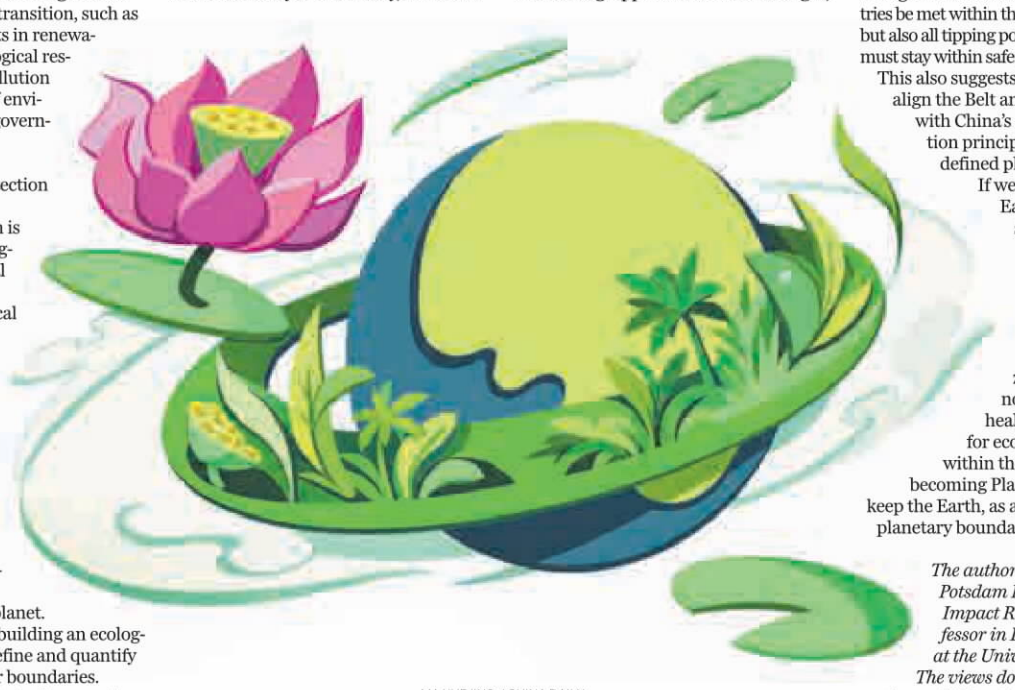
Our scientific assessment from 2025 concludes that seven of the nine planetary boundaries have been breached. This means there is strong scientific support that we, as humanity, are in danger of destabilizing the Earth system and undermining human welfare across the world.

In the last decade, global warming has accelerated; the intensity of extreme events such as droughts, floods, wildfires and human-reinforced storms is increasing; and we are increasingly close to crossing tipping points, which would cause the permanent collapse of systems that provide planetary stability and life support for millions of people.

A new development paradigm will be needed to grapple with these challenges, and it will require policies, economic incentives, regulations and profound equity dimensions (such as how to share, in a fair way, the ecological space on Earth among countries). If translated into ecological civilization targets, it can also drive innovation and efficiency and contribute to the next phase in humanity's journey toward shared prosperity.

At the same time, the international agenda will have implications for a large economy such as China. Our old and still dominant economic paradigm, which assumes that the planet has infinite capacity to buffer our unsustainable Anthropocene pressures, has long been proven wrong. The Earth is regulated by dampening (stress-reducing and cooling) feedback and interactions that regulate the large tipping point systems.

Scientifically, we have recently suggested that all tipping point systems (such as the large ice sheets, the Atlantic Meridional Overturning Circulation, the Amazon rainforest) need to be legally defined as global commons.



Why? Because, to ensure strong socio-economic development, not only must the ecological civilization targets of all countries be met within their national borders, but also all tipping point systems on Earth must stay within safe planetary boundaries.

This also suggests a need to further align the Belt and Road Initiative with China's ecological civilization principles and scientifically defined planetary boundaries.

If we fail to keep the Earth's tipping point systems intact, ecological invoices will be sent, and they will hit indiscriminately across the world.

Ecological civilization in China thus not only implies clean, healthy environments for economic development within the country, but also becoming Planetary Stewards to keep the Earth, as a whole, within safe planetary boundaries.

Douglas de Castro

China and Brazil's blueprint for a shared future

Brazil was the top destination for Chinese capital in 2025, attracting $6.1 billion in 52 Chinese investments. This was 45 percent more than the previous year, as highlighted in a report published by the Brazil-China Business Council recently.

To see these figures simply as traditional foreign direct investment is to miss a deeper structural alignment between China and Brazil.

This is not a cyclical movement of capital or a transactional pivot, but a civilizational convergence unfolding at a time when the liberal world order and international institutions are fracturing.

The China-Brazil partnership is quietly drawing a blueprint for a multipolar and ecologically rooted development model that reflects the vision of a shared future for humanity.

For decades, South-South economic engagement was often viewed through a narrow framework of resource extraction, debt diplomacy or geopolitical maneuvering.

This is the narrative that the 2025 report dispels: investing in Brazil's power grid, mining key minerals, electric-vehicle production, digital logistics, and high-tech manufacturing aligns with Brazil's priorities in energy transition and sustainable development, while also providing new opportunities for Chinese companies.

What distinguishes this wave of investments is its developmental philosophy.

China and Brazil share many characteristics: large and diverse populations, imperialistic disruptions throughout history, state-led modernization and a preference for long-term sovereignty over short-term financialization.

Their growing partnership is anchored in strategic coordination, with infrastructure as the driver of industrialization and resilience as the measure of success.

This is very different from the Washington Consensus model of austerity, privatization and market fundamentalism that weakened many countries in the Global South and increased inequalities.

Notably, many were greenfield projects, focusing on capacity building, technology transfer, and sustainable operations. The investments touched a record 20 Brazilian states, with the North and Northeast gaining unprecedented momentum alongside traditional leaders such as Sao Paulo and Minas Gerais.

Global Lens

In the broader context, cooperation between China and Brazil is accelerating because of the structural crisis of the liberal world order.

Investments in mining tripled to $1.76 billion, focusing on critical minerals, copper, nickel, graphite and rare earths that are directly tied to the global energy transition.

Brazil has 26.5 percent of the world's graphite reserves and is second in rare earths, but China dominates their processing and manufacturing. Their collaboration is not exploitative but rather a vertically integrated supply chain that supports decarbonization.

The partnership's ecological dimension is evident at a deeper level. China's concept of ecological civilization places environmental sustainability at the center of modernization, embedding carbon neutrality, circular economy principles and green industrial policy into state planning.

Brazil adheres to the rights of nature framework, which recognizes ecosystems not only as economic resources but as subjects with their own intrinsic value.

Investment data from 2025 show how this philosophical convergence is turning into real infrastructure for the benefit of both nature and people. For the fifth consecutive year, investment in sustainability and clean energy projects expanded in 2025, with a record 31 projects launched in hydropower, solar, wind and e-mobility.

These are not isolated initiatives, but part of an integrated low-carbon industrial ecosystem.

For instance, BYD and GWM did not simply replicate the Western assembly models in Bahia and Sao Paulo but localized entire value chains. Within months of starting operations, BYD produced nearly 20,000 electrified vehicles and established local supply networks.

Rumo and COFCO's rail logistics investment promises to cut carbon dioxide emissions from grain and sugar transportation by 80 percent compared to Brazil's heavily diesel-dependent road system.

Even the mining boom is linked to global decarbonization goals. EVs use six times more critical minerals than conventional combustion engine vehicles.

Here, China's model of ecological civilization intersects with Brazil's ethical emphasis on the rights of nature.

Together, they offer a pragmatic model of energy transition that respects both planetary boundaries and developmental sovereignty. In this sense, green industrial policy becomes a vehicle of South-South cooperation rather than a tool of Northern conditionality.

But this alignment requires careful navigation. Chinese companies must move beyond technical compliance and develop genuine socio-ecological integration by aligning with Brazil's complex environmental licensing rules, indigenous land protections, and decentralized regulatory environment.

In the broader context, cooperation between China and Brazil is accelerating because of the structural crisis of the liberal world order. Growing protectionism, technology decoupling, fragmented climate finance, and the weaponization of global supply chains have eroded trust in West-led multilateralism and Bretton Woods institutions.

Brazil is a natural anchor for China's decarbonization and reindustrialization agenda given its clean energy mix, abundance of critical minerals, continental market size, and commitment to strategic autonomy.

From 2007 to 2025, Chinese investment in Brazil totaled $85.5 billion in 355 projects, with manufacturing alone accounting for $2.66 billion between 2023 and 2025, surpassing oil and mining in recent years. This signals a structural move away from dependence on raw materials to industrial integration with added value.

Brazil in turn gains access to capital, technology and industrial partnerships without the political conditionalities that have historically limited its policy space.

Projects such as the Geely-Renault joint venture in Parana, the expansion of Chinese digital platforms such as Keeta and 99Food, and the geographical dispersion in 20 states point to a decentralized and resilient network of cooperation. The community with a shared future for humanity is not a slogan but a functional architecture for multipolar development.

But this vision calls for long-term strategic alignment, transparent regulatory frameworks, robust local partnerships, and deliberate technological absorption.

Brazilian institutions should simplify licensing procedures while enforcing environmental and social standards. Chinese companies should deepen localization, prioritize workforce training and adapt to Brazil's institutional pluralism.

The crisis of the liberal order should not lead to fragmentation. Instead, it should be a catalyst for new forms of cooperation.

If Brazil and China continue to align their developmental trajectories with ecological imperatives, build regulatory transparency and develop technological capacity, they can shape a post-hegemonic, planet-centered future.

chenweihua@chinadaily.com.cn

European Union should get over its protectionist impulse

The upcoming European Council summit in Brussels from June 18 to 19 is a pivotal opportunity for the European Union to review its trade and investment policy toward China.

The EU needs to decide whether it wants to be more protectionist and confrontational or foster a more cooperative relationship with the world's second-largest economy.

The EU has been crafting multiple trade and investment measures against China, including the proposed Industrial Accelerator Act. The legislation would exclude China from participating in public procurement bids in certain sectors and from accessing subsidies in supply chains.

Since March 2019, when the EU redefined China from a comprehensive strategic partner to a "cooperative partner, economic competitor and systemic rival", the bloc has adopted a less cooperative policy.

Many of the EU's investment screening and trade measures in the past years have deliberately targeted China even if they did not explicitly mention it by name.

The EU has also kowtowed to coercion by the United States to ban Huawei 5G and is now planning more measures against the Chinese company.

Within the 27-member EU, countries are divided on their approach to China. France, Spain, the Netherlands, Italy and Lithuania have advocated a tougher China policy while Germany and some Scandinavian countries believe stronger ties with China serve their best interests.

A tit-for-tat trade war between China and the EU will be a lose-lose game for both and the fragile global economy.

EU has leveled various accusations against China, including running a trade surplus with the bloc, State subsidies, overcapacity and unfair trade practices. Yet, it's worth noting that the EU as a whole runs trade surpluses with most countries, including the US.

When Washington imposed punitive tariffs on the EU, the bloc tried hard to convince US President Donald Trump that trade deficits are not problematic. Yet somehow China's trade surplus has become a concern.

Many Europeans find it difficult to accept the fact that the country that once exported only labor intensive goods, such as garments, footwear and toys, is now globally competitive in electric vehicles, batteries, solar panels, wind turbines, AI and several high-tech sectors.

Most Europeans are not aware of China's phenomenal transformation.

I am writing this column in Chongqing, which has changed dramatically in the past two decades from a Third World city into a modern urban center comparable to major European cities.

At the same time, the EU's competitiveness has declined, especially against the US and China. According to a September 2024 report by former European Central Bank president Mario Draghi, the numerous challenges the EU faces are mostly internal.

China's GDP in nominal terms was smaller than that of Italy in 2000. But it surpassed Germany's GDP in 2007, and by 2025, was almost the same as that of the entire EU.

Blaming China for its own problems is a misguided approach. Instead, the EU should focus on addressing its internal problems and policy failures. During my time in Brussels, the EU prided itself on being a regulatory giant even though it had no tech giants of its own.

The Draghi report highlights that overregulation by the bloc has become a major problem that discourages innovation.

The EU's Cold War mentality, as exemplified by the demonization of Huawei and Chinese EVs as national security threats, is another problem.

In contrast, China welcomes EU investment, with millions of German, French and Italian cars running on Chinese streets.

Many EU companies have been involved in China's critical infrastructure construction. China has never branded Airbus as a national security threat despite the fact that it has a dominant 55 percent share in the commercial aviation market in the Chinese mainland.

The Comprehensive Agreement on Investment, which took many years to negotiate and remains frozen by the European Parliament, is a huge wasted opportunity for European companies in the Chinese market.

As two major trade partners, China and the EU have frictions on many issues. However, the right way to address them is through consultation rather than unilateral protectionist measures.

A tit-for-tat trade war between China and the EU will be a lose-lose game for both and the fragile global economy.

When EU leaders meet next week, they should aim to preserve the mutually beneficial trade and investment relationship, not derail it with tariffs, sanctions and discriminatory tools.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

HUMPREY ARNALDO RUSSEL

From turbulence to trust

The future of Asia-Pacific trade will depend not only on growth or market expansion, but on the ability of regional states to cooperate more effectively

The world is experiencing turbulence as a result of an increasingly unpredictable global political situation. The crisis in the Middle East, which has led to difficulties at the Strait of Hormuz, has further worsened the situation. Given the scarcity of viable alternative routes, any sustained disruption to this choke point carries profound consequences for global energy markets and, by extension, international economic stability.

Against this complex backdrop, the two-day APEC Ministers Responsible for Trade Meeting in Suzhou, East China's Jiangsu province, on May 22-23 played its role in advancing the realization of "Building an Asia-Pacific Community to Prosper Together" — the theme of the APEC "China Year". The APEC Economic Leaders' Meeting is scheduled to be hosted in Shenzhen, South China's Guangdong province, in November.

A key challenge for Asia-Pacific economies is how to continue upholding openness, strengthening cooperation and maintaining a rules-based international trading system amid the current global fragmentation. As is widely recognized, contemporary global trade is no longer shaped exclusively by tariff structures and market access arrangements; it is increasingly conditioned by geopolitical competition, national security imperatives, industrial competition and a range of other considerations that, in effect, undermine the integrity of the existing multilateral order. However, the principles of non-discrimination, transparency, predictability and rules-based dispute settlement remain highly relevant, particularly for developing economies that do not always possess strong bargaining power in bilateral relations. As some countries increasingly resort to unilateral measures to narrow preferential arrangements, the risk of fragmentation continues to grow. If left unaddressed, global trade may shift from being an open space for cooperation into an arena of bloc-based competition.

In the context of the relations between the Association of Southeast Asian Nations and China, this is highly relevant. According to China's General Administration of Customs, trade between China and ASEAN reached 7.55 trillion yuan ($1.12 trillion) last year, surging 8 percent year-on-year. This growth is being formalized through agreements such as the ASEAN-China Free Trade Area 3.0 Upgrade Protocol. Record GDP and export growth in Malaysia, and successful initiatives such as the China-Indonesia implementation of cross-border QR payments, are, in large part, due to the stability of ASEAN-China relations.

And this year marks the fifth anniversary of the ASEAN-China comprehensive strategic partnership. ASEAN-China relations carry significant political weight, as they involve one of the world's most strategically important regions and one of the leading global powers. The scale and importance of this relationship have been managed on the basis of openness, consultation and balance. For ASEAN, the principal challenge lies in maintaining collective coherence. Therefore, ASEAN needs to strengthen its internal mechanisms to ensure that cooperation with China remains aligned with the broader interests of the region as a whole.

Meanwhile, China's cooperation with ASEAN is genuinely mutual and beneficial. China has also expressed support for ASEAN-led mechanisms, respect for consensus-based processes and a continued commitment to avoiding approaches that could create perceptions of dominance. In the current context of unilateralism pursued by the United States, China continues to serve as a guardian of the multilateral system and defender of institutions such as the World Trade Organization. In this regard, ASEAN-China relations may serve as an example of how regional cooperation need not undermine multilateralism. This assessment is further substantiated by empirical evidence. The State of Southeast Asia: 2026 Survey Report released by Singapore's ISEAS-Yusof Ishak Institute reveals that 52 percent of ASEAN respondents indicated they would align with China over the US, with the latter preferred by 48 percent. This finding reflects a discernible shift in regional strategic orientations that policymakers cannot afford to overlook. China's contribution to regional development is gradually understood and recognized by more people from ASEAN countries.

SHI YU / CHINA DAILY

ASEAN-China relations set an example for regional cooperation and beyond. Accordingly, all stakeholders should also focus on the Asia-Pacific policy agenda that can be oriented toward strengthening, rather than eroding, the multilateral system. Regionalism remains important, but sound regionalism must be open and inclusive. Developed countries should not dictate terms to smaller ones or compel them to conform to their preferences. Regional cooperation can serve as a policy laboratory for developing higher standards, enhancing transparency, and facilitating the participation of developing economies. Several policy priorities warrant focused attention in this regard.

First, regulatory transparency should be enhanced. In modern trade, barriers do not always take the form of tariffs. Many obstacles arise through technical standards, customs procedures, certification rules, investment policies, environmental provisions, digital requirements and product safety regulations. When regulations lack transparency, other countries may perceive them as a form of disguised protectionism. Therefore, Asia-Pacific economies need to strengthen mechanisms for regulatory consultation, information exchange and policy notification before new measures broadly affect trading partners.

Second, digital governance should be established as a central policy priority. Digital trade extends beyond e-commerce to encompass cross-border data flows, consumer protection, cybersecurity, artificial intelligence, electronic signatures and digital trade documentation. Each country has a legitimate interest in safeguarding data security and preserving digital sovereignty. However, if countries develop closed and mutually incompatible regulatory frameworks, the region's digital economy risks becoming increasingly fragmented. Accordingly, digital policy should seek to strike an appropriate balance: ensuring security without fostering isolation, promoting innovation while maintaining accountability and preserving openness while protecting the public interest.

Third, the green economy agenda can be governed in an equitable manner. Carbon standards, clean energy policies, sustainable supply chains and environmental certification have become increasingly important elements of contemporary trade policy. Nevertheless, green standards should not be employed as instruments to constrain the development prospects of developing countries, which continue to require time, financing, technological support and sufficient policy space to undertake a just and effective transition. Regional cooperation must therefore actively promote technology transfer, capacity-building, the mutual recognition of credible environmental standards and targeted support for small- and medium-sized industries to ensure they are not left behind in the green transition.

Ultimately, the future of Asia-Pacific trade will depend not only on growth or market expansion, but on governance, trust and the ability of regional states to cooperate transparently and equitably. Regional integration must reinforce, rather than weaken, the multilateral system. ASEAN and China can continue to demonstrate that regional cooperation can support global stability and help shape a more stable, just and inclusive international order.

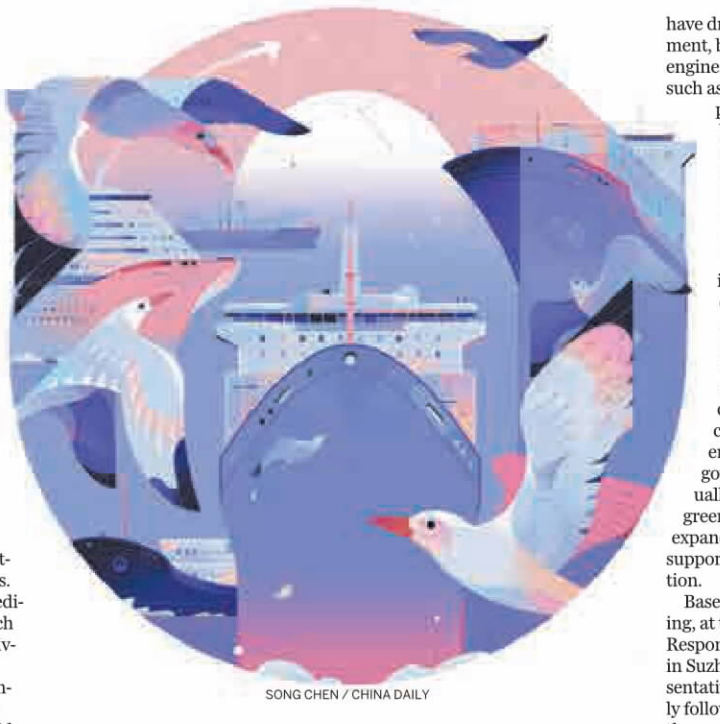
LU GUOXUE

Sincerity, reciprocity and symbiosis

The 32nd APEC Ministers Responsible for Trade Meeting showed that Asia-Pacific economies are able to work together to build a regional community that prospers together



Geopolitical factors, including the Ukraine crisis and the situation in the Middle East, are impacting economic development in the Asia-Pacific region. The overall effects manifest in issues such as energy-driven inflation, trade disruptions, financial tightening, slowing growth and supply chain restructuring.

According to the United States' Energy Information Administration, about 20 percent of the global liquefied natural gas trade transited the Strait of Hormuz in 2024, and the agency estimates that 80 percent to 90 percent of that LNG goes to Asian markets. The Middle East conflict has not only increased shipping risks in the Red Sea, leading to higher freight costs and longer voyages, but also pushed international oil prices from around $70 per barrel to over $100. Meanwhile, the Ukraine crisis has disrupted export routes for Russian crude oil and natural gas, as well as Black Sea grain and fertilizers. The spillover effects of Europe's energy crisis have driven up natural gas, fertilizer and electricity prices in the Asia-Pacific region, raising costs for agriculture and manufacturing. Imported inflation remains high, while export-oriented economies face weakening orders and shrinking profit margins.

While the Ukraine crisis and the deteriorating situation in the Middle East continue to unfold, trade protectionism is also spreading unabated across the globe. Unilateral tariffs and sanctions bypass multilateral dispute settlement mechanisms, pushing global trade into a fragmented phase characterized by slowing growth and a "disorderly" governance landscape. Against this backdrop, short-term growing pains, long-term transformation, supply chain restructuring and accelerated regional cooperation have become realistic challenges that all members of the Asia-Pacific Economic Cooperation mechanism confront.

Nevertheless, it is widely recognized that the Asia-Pacific region remains a key engine of global economic growth, showing positive signs of development, particularly in the trade and economic sphere. Look at first-quarter export data and year-on-year growth rates: China reached 6.85 trillion yuan ($1 trillion), an increase of 11.9 percent; the Republic of Korea posted $219.9 billion, up 37.8 percent; and Vietnam recorded $122.93 billion, a rise of 19.1 percent. In addition, emerging economies such as Indonesia, Malaysia and Thailand also posted varied growth momentum. Led by the strong performance of these emerging economies, the Asia-Pacific region is demonstrating robust internal driving forces.

Digital services such as telemedicine, online education and fintech have emerged as new growth drivers in the digital economy. The Boao Forum for Asia Annual Conference released the Sustainable Development: Asia and the World Annual Report 2026 on March 24. It noted that the value of Asia's digital economy reached $27 trillion in 2025, accounting for 46 percent of the region's GDP. As of June 2025, China's digital economy exceeded 50 trillion yuan, and its scale is projected to surpass 80 trillion yuan by 2030. Members of the Association of Southeast Asian Nations including Singapore, Malaysia and Indonesia have seen robust growth in their digital economies. Their combined volume topped $300 billion in 2025, 1.5 times the figure recorded a decade earlier.

SONG CHEN / CHINA DAILY

According to HSBC research, trade related to artificial intelligence surged year-on-year in the first half of 2025. The Asia-Pacific region contributed nearly two-thirds of the global growth in that period. Widespread use of mobile payments and e-commerce has laid a solid foundation for digital trade across the region.

The rapid expansion of the Asia-Pacific digital economy is driving the accelerated development of regulatory frameworks. Progress continues in aligning cross-border e-commerce rules, promoting paperless trade and electronic bills of lading, and building a network of demonstration e-ports.

Meanwhile, the region is making coordinated progress in its green economic transformation. China's exports of new energy products have driven regional green development, becoming a new growth engine. The completion of projects such as the Cirata floating solar power plant in Indonesia, built by a Chinese company, represents a landmark achievement of the China-Indonesia Belt and Road cooperation and will also promote Indonesia's energy transition. Correspondingly, issues related to regional coordinated development and sustainable investment growth, including green standards, green minerals and carbon emissions standards, have drawn significant attention. The share of environmental, social and governance investment is gradually rising and the scale of green bond issuance is steadily expanding, providing financial support for the low-carbon transition.

Based on the above understanding, at the 32nd APEC Ministers Responsible for Trade Meeting held in Suzhou, Jiangsu province, representatives from 21 economies closely followed the APEC "China Year" theme of "Building an Asia-Pacific Community to Prosper Together". Centered on openness, innovation and cooperation, they promoted stronger cooperation in areas such as regional economic integration, the construction of the Free Trade Area of the Asia-Pacific, support for the multilateral trading system, enhanced digital cooperation and development of the green economy. These efforts resulted in core outcomes including the Suzhou Statement that jointly foster an open regional economic environment, laying the groundwork for the APEC Economic Leaders' Meeting in November.

The meeting also approved the updated APEC Roadmap for Innovative, Competitive and Resilient Services. All parties expressed support for the implementation of the outcomes of the 14th World Trade Organization Ministerial Conference and the advancing of the Free Trade Area of the Asia-Pacific. New consensus was reached on strengthening digital trade cooperation, particularly in areas such as cross-border data flows, digital trust and AI governance.

The current economic and trade landscape in the Asia-Pacific region is characterized by resilience, innovation-driven growth and deepening cooperation. Despite multiple challenges, the region is expected to maintain relatively stable momentum, driven by the strong performance of the digital and green economies, as well as continued regional collaboration.

The region is also a vital engine for global growth. APEC economies need to work together and respond calmly to the challenges. On the one hand, they can leverage regional collaboration to build consensus through multilateralism, thereby countering the impact of unilateralism and trade protectionism. On the other hand, they can promote a new pattern of regional economic integration and confidence-building measures, foster an inclusive Asia-Pacific partnership framework under the new circumstances, and establish a mutually beneficial and win-win collaborative mechanism within APEC, providing regional solutions for global governance.

BUSINESS

Humanoid robots enter mass market

Prices plummet seen in commercial, industrial sectors as production surges

By **LI JIAYING**
lijiaying@chinadaily.com.cn

As leading Chinese humanoid robot makers unveil increasingly affordable models, advances in manufacturing, supply chain localization and growing production volumes are pushing the sector into a new phase of commercial adoption.

Unitree Robotics recently launched its dual-arm humanoid robot R1 with a starting price of 26,900 yuan ($3,968), making it the company's most affordable humanoid robot to date. Earlier, Noetix Robotics introduced its Bumi robot for 9,998 yuan, becoming one of the first consumer-oriented humanoid robots priced below the 10,000-yuan threshold. Around the same time, Booster Robotics also launched its K1 series with a starting price of 29,900 yuan.

The declining pricing trend is no longer limited to consumer products. Industrial humanoid robots have also begun entering the under 100,000-yuan range. Astribot's T1 humanoid robot, for example, starts at 89,900 yuan.

The shift marks a significant departure from just a few years ago, when humanoid robots in China typically sold for several hundred thousand yuan each.

According to Unitree's prospectus, the average selling price of its humanoid robots fell from around 593,000 yuan in 2023 to about 260,000 yuan in 2024, before declining further to 167,000 yuan during the first three quarters of 2025. Similarly, Leju Robotics said the average selling price of its Kuavo series dropped nearly 26 percent year-on-year in 2025 to 308,100 yuan per unit.

Guo Tao, a special researcher at domestic consultancy Internet Economy Institute, said the widespread decline in prices among domestic humanoid robots is being driven by multiple industry and market factors.

"As shipment volumes continue to expand, companies are able to spread previously high research and development expenses and production-line depreciation costs across a larger number of products, allowing unit costs to fall steadily," Guo said.

Industry data platform GGII said China's humanoid robot shipments reached 14,400 units in 2025 and output is expected to surpass 100,000 and potentially reach 200,000 units in 2026.

At the same time, Guo said domestic suppliers have made substantial progress in critical components such as reducers and servo systems, helping lower procurement costs across the industry.

Unitree, for example, said its company filings show that more than 90 percent of its core components — including motors, reducers and lidar sensors — are developed and manufactured in-house. As a result, the average production cost of its humanoid robots declined from 73,200 yuan in 2023 to 62,200 yuan by the third quarter of 2025.

Another important factor has been the industry's ability to leverage supply chains originally developed for electric vehicles and consumer electronics.

"More than half of the core components used in humanoid robots, including motors and reducers, can be sourced from existing new energy vehicle supply chains, so there is no need for large-scale new capacity investment, which helps keep manufacturing costs under control," Guo said.

The convergence between the automotive and robotics sectors is already bringing new opportunities for the automobile industry.

"Humanoid robots have opened up a new growth opportunity for the company and created a new development curve," said Wu Jianbin, chairman of automotive parts manufacturer Shuanglin Group, in an earlier interview.

Wu said the firm decided to enter the humanoids' planetary roller screw segment because the technologies share common foundations with its existing automotive seat horizontal drive motor business — including expertise in thread machining and gear manufacturing.

Meanwhile, automakers themselves are becoming increasingly active participants in the embodied intelligence sector. To date, major carmakers, such as Tesla, Mercedes-Benz, Changan, SAIC, XPeng and GAC, have entered the field through either self-development, joint ventures or incubation programs.

De'Longhi exec hails 'Shopping in China'

By **ZHUANG QIANGE**
zhuangqiange@chinadaily.com.cn

China represents a key market for understanding how coffee culture is evolving outside Europe, and its "Shopping in China" initiative is expected to unleash greater potential for coffee businesses from around the globe, a senior industry executive said.

"The Chinese market is a very important market for De'Longhi," Andrea Natale, director of coffee business development in Asia at De'Longhi Group, said at the recent Wine to Asia exhibition in Shenzhen, Guangdong province, highlighting the market size and the nation's increasingly strong efforts in opening-up.

China's coffee sector has experienced explosive growth in recent years. According to the 2026 China Urban Coffee Development Report, the country's coffee market reached 354.9 billion yuan ($52.3 billion) in 2025, up 13.3 percent year-on-year, with per capita coffee consumption rising to 28.57 cups annually. The home coffee machine market has been particularly robust, with online sales surging 32 percent last year as more consumers embrace cafe-quality coffee at home.

De'Longhi, an Italian home appliance giant, has firmly established itself as a player in China's coffee machine segment, holding approximately 20 percent market share, according to a report from market information tracker 36Kr.

The company has been focusing on innovation to meet Chinese consumers' demand for convenience and quality. Natale highlighted two De'Longhi coffee machine models that bring cafe-style coffee into the home, allowing consumers to enjoy professional-quality coffee with a simple one-touch experience.

"The 'Shopping in China' initiative opens the door to new opportunities, and creates both immediate and long-term opportunities for international brands," Natale said.

Launched by China's Ministry of Commerce in 2025, the initiative has played a key role in boosting inbound consumption. Official data show that the number of departure tax refund stores and foreign tourists using the service both tripled last year, with tax refund sales nearly doubling.

After visiting coffee regions in Yunnan and Hainan provinces, Natale was impressed with the quality of Chinese coffee beans. Yunnan, which produces over 98 percent of China's coffee, saw its coffee output reach 138,900 metric tons in 2025, with a coffee refinement rate of 31.6 percent. The province's total export value hit 860 million yuan in 2025, with products shipped to 43 countries and regions, including the Netherlands, Vietnam, Germany, Malaysia and France.

Natale expressed interest in further exploring connections between Chinese coffee resources and Italian coffee culture.

"Meaningful products are defined less by price and more by the stories and cultural value they carry. I believe the cultural exchanges between China and Italy will continue to enrich both markets," Natale said.

Skyworth Solar mulls global expansion

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

With the global energy market facing challenges such as unstable supply and surging demand due to the leapfrogging development of artificial intelligence, Skyworth Solar Co Ltd is upgrading itself into an industrial operator providing integrated services of production, synergy, deployment, trading and added value.

As part of the company's five-year strategy unveiled on June 3, Skyworth Solar will make Germany and Italy its centers for Europe, while Thailand will be its center for Southeast Asia. This year, the company will extend its services to 12 countries and reach new markets such as Indonesia and the Philippines. Explosive growth can also be expected in the United Kingdom, said Qu Wanfei, executive president and general manager of the overseas business division at Skyworth Solar, and chief investment officer of parent company Skyworth Group.

On June 3, Skyworth Solar also announced its cooperation with Joybuy — JD's global online site — under which the two companies will explore new channels to deliver China's new energy solutions to global customers.

Qu said the expansion into overseas markets is by no means simply selling products, but building a whole system covering local distribution channels, storage, service delivery, technology support and after-sales services.

"Energy mix, power pricing, building typologies and user needs vary significantly from country to country. For example, European users prioritize energy independence and product quality, while Southeast Asian users focus more on adaptability to high temperatures, high-humidity and overall return-on-investment efficiency. Experiences in mature markets can help us with technology innovation and service improvement," Qu said.

Founded in 2020, Skyworth Solar has built over 800,000 power plants, with its cumulative grid-connected capacity exceeding 29.3 gigawatts as of the end of 2025.

As Qu further explained, electricity is still expensive, especially in regions with geopolitical tensions and unstable power supply. But the cost of solar power has dropped by 90 percent over the past decade, with an easy process of installation and application.

It only takes six months to build a solar-powered farm and only one day for a rooftop PV system, said Sonia Dunlop, CEO of Global Solar Council. No other energy source is as fast, modular and globally adaptable as solar, Dunlop said.

The global newly installed solar PV capacity reached 700 GW in 2025, a figure that seemed utterly "unimaginable" a decade ago. The cumulative global solar PV capacity stands at 2.2 terawatts now, and is expected to rise to 8 TW in 2030 when energy storage capacity will also reach 1.5 TW, Dunlop added.

Rentia van Tonder, head of renewable energy, power and infrastructure for Johannesburg-based Standard Bank, said they need cooperation with Chinese partners as they are looking for better market understanding, ideas, and operational experiences in different markets and countries. More participation of engineering, procurement and construction companies and an enriched supply of products and services from China will also help the development of clean energy in South Africa.

According to China's 15th Five-Year Plan (2026-30), the country will build 100 national-level zero-carbon parks, with planning of the first 52 already released.

"This is a very specific target. A zero-carbon park is a very complicated scenario combining factories and devices, which requires diversified but precise deployment of power," Qu said.

Nation's rise seen benefitting world

By **CHENG YU**
chengyu@chinadaily.com.cn

China is rapidly emerging as an "economic super-connector" that is redrawing the map of global trade and is viewed in the West as challenging its long-standing dominance over the international economic order, said Chandran Nair, founder of the Global Institute for Tomorrow.

In an exclusive interview with China Daily, Nair said that for the first time, economies from Africa, Southeast Asia, Latin America and the Middle East not only have access to superior products from China, but also have an alternative to the Western-dominated institutions that have governed international commerce.

Chandran Nair

He described China as "an economic super-connector" that has built deep ties with countries historically marginalized by Western-led institutions.

"Nations across the developing world see China building infrastructure, offering trade and staying out of their internal politics," he said, adding that China's rise could give developing nations a stronger voice in global affairs.

Nair's recently published *Understanding China* is a book that argues that China tries to offer an approach of engagement over confrontation, and explains that the nation's rise is in the interest of the world and yields positive global impact.

In terms of US-China trade frictions, Nair said it is fundamentally driven not by trade imbalances, but by anxiety that China will be a threat to its global supremacy and the fear of an alternative development model that challenges Western dominance.

"It is about systemic competition, and it always has been. The prevailing fear gripping the West is simply this — how can a country manage to develop so quickly and successfully outside the framework of Western political and economic models?" he said.

"The biggest feature of this conflict is that it is driven by ideological prejudice. Rather than acknowledging the truth that China has a right to grow — even if that may challenge Western dominance and economic hegemony and is, in addition, good for the world — the Western narrative has veered toward wholesale criticism of every aspect of the nation."

He said criticism of China now stretches far beyond trade and economics into attacks on "China's history, economic management, political structure, human rights record, societal values and technological advancements."

"This is shameful," Nair said. "It depicts a desperate grasping-at-straws approach and undermines the West in the eyes of the majority."

According to Nair, Western powers are increasingly attempting to preserve global influence by containing what he called the "legitimate rights" of other countries to rise.

"The world does not buy it anymore," he said, referring to Western narratives around defending the "rules-based (world) order".

Nair argued that China's rapid poverty reduction poses a direct challenge to long-held Western assumptions linking democracy and economic success to equity.

"China's model of economic development has reduced poverty at a rate unmatched by any other country. A democracy that cannot work to improve the lives of its citizens is not better than any other form of governance that can actually improve the quality of life of its people. That is the argument the West cannot tolerate because it strikes at the foundation of its claim — that it has devised the best system of governance."

Looking toward 2035, Nair sees China as uniquely positioned to pioneer an alternative model of development.

"The greatest opportunity is that China is better positioned than any other large country to demonstrate how it can be done so other developing nations can build their own models," he said.

Kunming expo to boost trade with S. Asia

By **YAN YUJIE** and **LI YINGQING** in Kunming

The China-South Asia Expo (CSAE) provides growth opportunities for businesses and enhanced regional trade, officials, experts and exhibitors from China and South Asian countries said in Kunming, Yunnan province, on Thursday.

Co-hosted by the Ministry of Commerce and the Yunnan provincial government, the 10th CSAE is being held in Kunming from Thursday to Tuesday. The event has attracted approximately 560 companies from South Asian countries to participate as exhibitors.

Bangladesh is the theme country of this year's expo. Kayser Kamal, deputy speaker of the 13th National Parliament of the People's Republic of Bangladesh, said that having Bangladesh as the theme country reflects the depth and warmth of the friendship between the two nations.

Bangladesh has set up 84 standard booths and a 360-square-meter pavilion to showcase its offerings, with participation from over 100 companies across seven major industries, making it the largest national exhibition Bangladesh has ever held in China.

Wares Hossain, director of the export promotion bureau at Bangladesh's Ministry of Commerce, said that Bangladeshi exhibitors have brought garments, agro-based products, pharmaceuticals and handicrafts to the expo, with the aim of expanding their businesses in China.

Rajendran Muhundan, manager of MNP Gems and Jeweller in Sri Lanka, said that the expo has promoted his business. Last year, he established long-term cooperation agreements with 20 business-to-business customers from China and other countries at the expo, significantly increasing orders.

Suyash Mehta, director of Sudha India International in India, said that the expo is important for exporters as well as regional trade. Having participated five times, he is optimistic about achieving better sales this year.

Khalil Hashmi, Pakistan's ambassador to China, said that the expo serves as a crucial platform, offering opportunities for exhibitors. It allows small and medium-sized businesses to showcase and sell their products to a larger market, thereby boosting bilateral trade.

Bilateral trade between China and South Asian nations surged past $200 billion for the first time in 2025, up 10.7 percent year-on-year, according to the Ministry of Commerce.

Hashmi noted that the expo has established a dedicated pavilion for the coffee industry.

He Yuejun, manager of Pu'er Aini plantation, said that the expo has successfully hosted a coffee-themed pavilion for three years, with his company seeing daily sales reach 20,000 yuan ($2,950) during the event last year.

"At the expo, we have the opportunity to share insights on coffee varieties, cultivation methods, and processing techniques. The expo serves as a platform for learning and interaction, raising the standards across the entire industry," He said.

Technology products stand out as particularly popular among the Chinese offerings at the expo.

Hashmi pays attention to China's high-tech products, such as electric vehicles and drones. "China has developed a range of green and digital technologies that are both high-quality and competitively priced," he said.

China's tech firms fuel global AI rise

In Jan-April, nation's IC exports hit $103.5 billion, up 83.7% in value y-o-y

Above: A visitor views chip products from Huahong Group at a semiconductor exhibition in Shanghai on March 25. LONG WEI / FOR CHINA DAILY

Left: Workers operate a full-capacity production line for 800G optical modules at an optoelectronics facility in Wuhan, Hubei province, on Dec 24. WEI LAI / FOR CHINA DAILY

Below left: A researcher poses with rolled-up "fiber chips" and a smart tactile glove made by weaving the chips into textiles at Fudan University in Shanghai on Jan 19. LIU YING / XINHUA

BEIJING — With the global push for artificial intelligence computing power unleashing an unprecedented wave of infrastructure buildout, China-made optical modules that shuttle data — alongside the chips that process information — have become critical links. Sporting the world's leading market shares and accelerating upgrades, China's tech supply chains have become essential to sustaining global AI growth.

The numbers speak for themselves. Chinese firms claim seven spots among the world's top 10 optical module vendors, with their combined market share exceeding 60 percent globally, said research firm LightCounting. In the first four months, China exported 117 billion integrated circuits worth $103.5 billion, up 83.7 percent in value year-on-year. Export orders for optical modules have stretched into 2028.

Behind these figures lies a deeper shift: China is no longer just participating in the AI supply chain, but also offering a supply chain that stabilizes global AI infrastructure.

If AI is the brain, optical modules are the nerves, converting electrical signals to light and back at blinding speed, shuttling data between servers inside data centers and across continents. A single 1.6-terabit optical module can transmit 95 high-definition movies in one second.

Chinese firms are leading the sector. Zhongji InnoLight, based in East China's Shandong province, held over 40 percent of the global 800-gigabit optical module market and an estimated 50 to 70 percent of the 1.6T segment last year, securing first place for four consecutive years. Eoptolink, InnoLight's rival in Chengdu, Sichuan province, ranked second.

Both companies have secured their positions in the supply chains of companies building the AI clusters that are reshaping the global economy, such as Nvidia, Google and Amazon. Delivery cycles that once took 12 weeks have been compressed to eight or fewer, as North American clients race to beef up computing capacity measured in weekly increments.

Customs data show that in March, China's average export price of optical modules rose 23 percent year-on-year, while fiber and cable exports soared 263.8 percent in value, with the average export price surging 204.3 percent.

Huagong Tech, an optical module maker based in Wuhan, Hubei province, launched the world's first 12.8-T XPO module in March, bundling the capacity of eight 1.6T modules into a single unit tailored for next-generation AI clusters of 100,000-plus GPUs.

Ma Xinqiang, the company's chairman, said the North American market for 1.6T modules alone has surpassed $20 billion, while the global market will far exceed $30 billion this year.

The chip story is newer but no less striking. China produced 127.2 billion integrated circuits in the first quarter, up 24.3 percent year-on-year, equivalent to roughly 1.4 billion chips per day.

High-value products have become the mainstay of China's chip exports. In April alone, export value doubled to $31.1 billion, up 100.1 percent year-on-year, while export volume edged up merely 3.8 percent. Industry insiders said that such a gap, rarely seen in China's chip trade, signals a systemic revaluation of export product value rather than simple volume growth.

Among the country's leading chipmakers, SMIC ran at 93.1 percent capacity utilization in the first quarter, while Hua Hong Grace Semiconductor saw its net profit attributable to parent company shareholders up 458.1 percent at $20.9 million, with its capacity utilization rate staying high at 99.7 percent.

Equally significant is what is happening on the equipment side. The China Semiconductor Industry Association said the domestic chip equipment localization rate climbed from 25 percent at end-2024 to 35 percent in 2025. On new wafer-fab production lines, domestically made equipment accounted for 55 percent of total procurement value by end-2025, exceeding the national 50-percent target ahead of schedule, official data revealed.

Optical modules and chips are not parallel stories, but converging ones. The same AI boom that is driving insatiable demand for high-speed optical tech is also reshaping the chip landscape: MOS memory sales surged 236.4 percent in the first quarter, while sales of logic chips jumped 40.1 percent, said the European Semiconductor Industry Association.

The phrase "compute-power coordination" entered China's Government Work Report for the first time this year, with a CICC research report identifying it as a major industry trend driven by soaring AI demand and low-carbon energy transition goals.

The vehicle-chip nexus adds another dimension. Each new energy vehicle features more than 1,000 chips, roughly double that of a traditional car. Chinese companies have outperformed foreign rivals in power semiconductors and are gaining ground in cabin-entertainment and body-control chips, though high-end autonomous-driving SoCs remain a work in progress, said Liu Quan, deputy chief engineer of the China Center for Information Industry Development.

The competitiveness of optical modules also largely hinges on the synergy of the complete upstream industrial chain, covering optical chips, ceramic packages and precision structural components. China has formed highly concentrated industry clusters in the Yangtze River Delta, the Pearl River Delta and Wuhan Optics Valley, where the localization rate exceeds 90 percent. This has enabled cost control and mass-production yields to reach world-leading levels.

Zhang Zhe, a researcher at the Electronic Information Research Institute under the China Academy of Information and Communications Technology, said the large-scale construction and expansion of AI data centers worldwide has generated rigid hardware demand.

While foreign manufacturers face supply-side constraints and limited capacity expansion, Chinese manufacturers — backed by sufficient raw material supplies and a complete industrial chain — can rapidly respond to this round of demand explosion, Zhang said.

XINHUA

Researchers fast-track industrial innovation for national high-quality growth

NANCHANG — A growing number of high-level researchers are being embedded within companies to enhance innovation and push technological advances on factory floors as part of China's drive for high-quality development.

Jiangxi Naile Copper in Yingtan, East China's Jiangxi province, is a case in point. Founded in 2003, Naile Copper has focused on high-end copper products, with oxygen-free copper tubes as its flagship product.

In the company's exhibition hall, chief engineer Ma Li pours hot water into two metal tubes — one hollow copper tube remains cool to the touch, while the other, made of oxygen-free copper, quickly becomes very hot.

The company has broken through core manufacturing technologies previously monopolized by foreign firms, supplying heat pipes for critical cooling applications in central processing units, graphic processing units and insulated gate bipolar transistors, Ma said.

Addressing the company's demand for innovation in high-end copper products, Zhuo Haiou, deputy dean of the International Institute for Materials Innovation at Nanchang University, went on secondment from his university to the company to serve in a senior technical role in 2023.

"We promptly formed an interdisciplinary research team, combining talent from the university and the company," Zhuo said. "The core task was to overcome the technical challenges in the material properties and processing techniques of grooved copper tubes."

After nearly a year of repeated trials, the team successfully developed a high-performance oxygen-free copper grooved tube product, which now generates an annual output value of over 100 million yuan ($14.7 million).

The collaboration between the company and Nanchang University is part of a broader provincial push to embed researchers into enterprises.

In 2024, Jiangxi launched a dedicated "deputy manager of sci-tech" program, encouraging enterprises to recruit researchers from universities, research institutes and State-owned enterprises across the country to serve in the role.

Workers run research and tests on dairy products at a lab in Gansu province on Oct 16, 2024. LI YALONG / CHINA NEWS SERVICE

The program aims to deepen the integration of industrial, innovation and talent ecosystems while boosting enterprise-level technological innovation and industrial transformation. In turn, enterprises provide a testing ground for their research, ensuring that scientific endeavors are well-targeted and practical.

Since the program's rollout, over 1,100 deputy managers of sci-tech have been recruited, serving more than 500 enterprises. They have facilitated nearly 300 scientific and technological achievements, generating direct economic benefits exceeding 1 billion yuan.

These efforts span 12 key industrial sectors — including electronic information, new energy and biomedicine — injecting strong momentum into high-quality development.

Similar programs have been rolled out in other provinces, such as Henan and Anhui, giving a strong boost to technological upgrading and industrial innovation.

China's 15th Five-Year Plan (2026-30) calls for improving policies that allow researchers to take entrepreneurial leave or hold multiple positions with pay, encouraging top talent to move into enterprises. It also urges joint industry-university research and development to address industrial needs.

Yu Jianguo, a professor at East China University of Science and Technology, said high-level talent brings knowledge and technologies to the front lines of industries, achieving a crucial leap from laboratories to production lines.

"This not only resolves the dual predicaments of universities' difficulties in transforming research results and enterprises' difficulties in obtaining technologies, but also initiates a virtuous cycle where talent leads innovation and innovation drives industries," Yu said.

In Xinfeng county, Jiangxi's Ganzhou, the flexible talent recruitment mechanism has enabled deputy managers of sci-tech to serve as a bridge for sustained university-industry collaboration. To date, nearly 30 universities have partnered with local enterprises, supplying over 400 graduates annually and establishing more than 30 joint R&D platforms.

"The value of deputy managers of sci-tech is not just about solving today's challenges, but also about cultivating localized, specialized, and industry-ready talent for the future," said Chen Jintao, a Party official of the county.

Nation to expand East-West program

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

China will expand and upgrade its East-West cooperation program by deepening industrial partnerships and broadening county-level assistance ties during a new stage of regular support, five years after its victory over extreme poverty, agriculture and rural affairs authorities said on Thursday.

Vice-Minister of Agriculture and Rural Affairs Maierdan Mugaiti said China will maintain fixed assistance partnerships between eight eastern provincial-level regions and 10 western counterparts. Economically stronger county-level regions in the east will be paired with key counties in western regions, achieving full coverage of targeted assistance partnerships.

"The cooperation will continue to combine the needs of western regions with the strengths of eastern regions," Maierdan said.

He said industrial cooperation and other development-oriented measures will remain central to efforts aimed at strengthening endogenous growth.

In recent years, China has launched initiatives to upgrade specialty industries and promote the full-chain development of leading industries in western regions, accelerating industrial transfers from east to west and jointly building industrial parks.

For instance, cooperation between Beijing and the Inner Mongolia autonomous region has helped develop eight major agricultural and livestock industry chains, including beef cattle, dairy, cashmere, potatoes and soybeans. The partnership has supported the establishment of more than 600 green agricultural production and processing bases, boosting local development while strengthening food supplies for the capital.

Across western regions, partners have jointly developed 35 rural tourism routes and supported the construction of more than 1,500 livable and business-friendly villages. The tourism routes attracted more than 9.59 million visitors from Tianjin and Shandong province to Gansu province in 2025, an increase of nearly 700,000 from the previous year, Maierdan said.

Officials highlighted cooperation between Fujian province and the Ningxia Hui autonomous region as one of the most successful examples of the East-West cooperation program.

Wang Jian, head of the region's department of agriculture and rural affairs, said the partnership helped Ningxia eliminate extreme poverty and lay the foundation for long-term development.

"Farmers' annual per capita income in Ningxia increased from about 1,400 yuan ($206) in 1996 to more than 20,000 yuan in 2025," Wang said.

Fujian has invested a cumulative 7.68 billion yuan in assistance funds and helped develop key industries, including wine, goji berries, dairy products, beef cattle and vegetables.

The two regions are now cooperating in emerging sectors such as artificial intelligence computing, digital infrastructure and green energy, Wang added.

Chen Mingwang, director of the Fujian Provincial Department of Agriculture and Rural Affairs, said the province will focus on upgrading Fujian-Ningxia cooperation.

Future efforts will focus on improving industrial parks, attracting leading enterprises to strengthen industrial clusters, expanding data infrastructure projects and exploring cooperation in the digital economy, carbon trading and saline-alkaline land management.

The two regions will also leverage Fujian's position on the Maritime Silk Road and Ningxia's role as a key inland logistics hub to develop land-sea transportation links and explore new opportunities under the Belt and Road Initiative, Chen said.

Yangtze's sturgeon infusion

Workers release Yangtze sturgeon fry, an endangered species under first-class national protection, into the Yangtze River in Yibin, Sichuan province, on Thursday. Over 25,000 fry were released and some were tagged to monitor their migration patterns. The initiative is part of ongoing efforts to improve the river's aquatic environment along the Sichuan section of the river. HE HAIYANG / FOR CHINA DAILY

China enhances organ transport efficiency

Decade-old policy aids timely delivery of donations as public awareness grows

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

China's streamlined transport channel for delivering lifesaving donated organs has significantly improved the efficiency and availability of transplant organs over the past decade, while public awareness on organ donation has also grown steadily, authorities and experts said on Thursday.

China has carried out more than 63,000 posthumous organ donations involving over 190,000 organs since 2010. In addition, more than 7.3 million people have registered as voluntary organ donors, according to data released on China's Organ Donation Day, observed annually on June 11.

In 2025, China recorded 6,931 organ donations and performed 25,799 organ transplant procedures, representing year-on-year increases of 4 percent and 4.5 percent, respectively. Both figures reached historic highs, although the overall donation rate — measured by the number of donors per million people — remains lower than the international level.

This year also marks the 10th anniversary of the introduction of a "green channel" policy, which ensures the efficient transport of donated organs through measures such as expedited clearance and priority transportation. The policy was introduced in 2016 by six government departments, including health and public security authorities.

Zhao Hongtao, chairman of the China Organ Transplantation Development Foundation, said the policy is estimated to have improved organ transport efficiency by an average of 10 percentage points.

"At the same time, we have seen cases in which airline passengers whose flights were delayed while waiting for a donated organ were fully cooperative and recognized the importance of the cause, demonstrating growing public awareness of organ donation," he said.

Zhao added that efforts are underway to explore the possibility of delivering donated organs by drone in the future.

Chen Jingyu, a renowned lung transplant surgeon, said transplant doctors once had to devote tremendous effort to coordinating the transport of donated organs. Now, however, "transformative progress" has been made.

"Today, even a donated organ from a remote town in Yunnan province can be delivered swiftly and smoothly through the nation's extensive airline network. It was unimaginable in the past," he said.

Chen, who is based in Wuxi, Jiangsu province, said when an organ arrives at an airport in Shanghai, local railway authorities help medical personnel carrying the organ reach the railway station in a designated vehicle and secure seats on the most suitable high-speed train from Shanghai to Wuxi.

"If seats on the ideal flight are sold out, we can also entrust airlines capable of ensuring quality control and monitoring the entire delivery process, with transporting the organ," he said.

Chen estimated that the green channel policy has increased the utilization rate of donated organs by 30 percent.

Shanxi passes law to protect Great Wall

By **DUAN JINXIAN** in Beijing
and **ZHU XINGXIN** in Taiyuan

Shanxi province recently passed new legislation to protect and sustainably manage its stretch of the Great Wall, one of the longest and most historically significant in the country, providing a legal framework to balance preservation with public use.

The Regulations on the Protection of the Great Wall in Shanxi Province were passed at the 28th meeting of the Standing Committee of the 14th Shanxi Provincial People's Congress. Consisting of six chapters and 47 articles, the regulations will come into effect on July 5 and cover the protection, research, utilization, supervision, and management of the wall.

Shanxi's section spans 1,401.23 kilometers — 9.74 percent of the Great Wall's total recorded length of 21,196 km — ranking third nationally. Spread out across 39 counties in eight cities, it stretches from the Warring States Period (475-221 BC) to the Ming Dynasty (1368-1644), with eight sections designated as nationally important points. Five of the wall's most famous 13 passes lie within the province, forming a unique geographical pattern and cultural panorama.

Among those designated points is Yanmen Pass in Xinzhou's Daixian county, a site long woven into Chinese legends and literature. During the Northern Song Dynasty (960-1127), the female generals of the Yang family stationed themselves at this northern frontier town and repeatedly repelled the southward invasion of nomadic Khitan tribes. Their story has since been adapted into novels, plays, and films.

A visitor poses for a photo at a section of the Great Wall in Shanxi province in 2025. ZHU XINGXIN / CHINA DAILY

The new regulations build on decades of institutional frameworks. In 2006, the State Council, China's Cabinet, established a national baseline for Great Wall protection. Shanxi's provincial government followed in 2021 with its own measures, creating a system of designated wall protectors, implementing complete monitoring coverage for important sections, and promoting the construction of the Great Wall National Cultural Park.

Wang Biao, deputy director of the education, science, culture, and health work commission of the Standing Committee of Shanxi Provincial People's Congress, said those local experiences urgently needed to be confirmed through legislation to refine and supplement national regulations.

Wang said the legislation will address persistent difficulties in the protection work, including insufficient funding, thin grassroots forces, and shortages in cross-regional and cross-departmental coordination. Natural and man-made damage had continued to occur, and the contradictions between preservation and public utilization had remained a pressure point, he said.

The new regulations directly address that tension. Yan Moyu, deputy director of the legal work committee, said research and utilization of the wall should be grounded in protection, so that public engagement serves both access and long-term inheritance. Meanwhile, construction of the Great Wall National Cultural Park (Shanxi section) will be advanced under this framework.

Wang Zhenhua, deputy director of the Shanxi Culture Relics Bureau, said the province will build a unified digital platform for its Great Wall resources, creating a permanent archive. Satellite remote sensing, big data monitoring, and drone surveillance will be used to maintain round-the-clock inspection coverage.

Earlier this year, there were media reports that a section of the Great Wall from the Ming Dynasty located in Ningwu county of Xinzhou was severely damaged as a result of long-term illegal mining activities and construction work by a local mining enterprise.

On May 20, the local government stated that the enterprise had been ordered to suspend production and rectify in accordance with the law. Criminal compulsory measures had been taken against four responsible persons on suspicion of illegal mining and damage to cultural relics.

Yin Chengwu, a 66-year-old protector along the Guangwu section of the Great Wall in Shuozhou, Shanxi, said the new legislation has "a significant deterrent effect on the protection of the Great Wall in the local area".

JUNO achieves record neutrino measurements

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese scientists have released the first results from one of the world's most advanced underground physics experiments, reporting record-setting measurements of mysterious particles known as neutrinos.

The findings, published as a cover story on Wednesday in the journal Nature, come from the Jiangmen Underground Neutrino Observatory, or JUNO, a giant detector built deep beneath a hillside in South China's Guangdong province.

Neutrinos are tiny particles that are found throughout the universe. Trillions pass through the human body every second, but they almost never interact with matter, making them extremely difficult to detect. Because of their elusive nature, scientists often refer to them as "ghost particles".

Researchers said JUNO has already achieved the most precise measurements to date on how neutrinos change as they travel. The results are based on data collected during the detector's first 59 days of operation between Aug 26 and Nov 2, 2025.

Scientists have long established that neutrinos can switch between three different forms, or "flavors", as they move through space. Understanding exactly how this process works could help answer some of the biggest questions in physics, including how the universe evolved after the Big Bang.

According to the research team, JUNO measured two key properties governing these transformations with a level of precision that reduced previous uncertainties by about 40 percent.

Nature reviewers praised the achievement, saying the results confirm the detector is performing as designed and position JUNO as a leading facility for future neutrino research.

The experiment's main goal is to solve a long-standing mystery known as the neutrino mass ordering problem. Scientists know there are three types of neutrinos, but they still do not know the exact arrangement of their masses — in simple terms, which type is heavier and which is lighter. The answer could improve scientists' understanding of the fundamental building blocks of matter.

JUNO's massive detector is located about 700 meters underground to shield it from interference caused by cosmic radiation. At its core is a 20,000-metric-ton sphere filled with highly purified liquid.

When a neutrino occasionally collides with an atom inside the liquid, it produces a tiny flash of light. Thousands of sensitive light sensors surrounding the sphere capture these flashes, allowing scientists to study the particle's properties.

The project is an international collaboration involving more than 700 researchers from 75 institutions across 17 countries and regions.

Scientists said the detector has been operating smoothly since it began collecting data in August. As more observations are gathered, they expect to release additional findings later this year that could provide new clues about some of the universe's least understood particles.

JUNO follows China's earlier Daya Bay Reactor Neutrino Experiment, which operated from 2011 to 2020 and helped uncover an important property of neutrinos and established the country as a major contributor to particle physics research.

Ancient splendors

Workers unpack a precious pottery jar in preparation for a grand exhibition presenting ancient civilizations on the American continent at the Shanghai Museum on Thursday. The exhibition, scheduled to run from July 9, 2026, to Nov 14, 2027, displays nearly 3,000 items of precious cultural relics from Mexico and Peru. GAO ERQIANG / CHINA DAILY

Morning blast kills 7, injures 17 in Guangxi

An early morning explosion in Xing'an county, Guangxi Zhuang autonomous region, has left seven dead and 17 wounded on Thursday, local police said in an official notice. The blast occurred at 1:40 am on Lingxiang Road in Xing'an. Following the incident, officials from Guilin city and Xing'an county rushed to the scene to coordinate rescue operations alongside police, fire, health and emergency response teams. Rescuers have since completed four rounds of thorough site searches. All 17 injured people have been hospitalized and are currently in stable condition with no life-threatening injuries. Meanwhile, on-site rescue operations remain underway, police said. Preliminary investigations have ruled out a pipeline gas leak as the trigger for the blast. Police are continuing their probe to identify the exact cause of the explosion.

New communication test satellite launched

China on Thursday sent a new communication technology test satellite into space from the Wenchang Space Launch Site in South China's Hainan province. Launched at 3:30 pm aboard a Long March 5 rocket, the satellite has successfully entered its preset orbit. This satellite will be mainly used to carry out multi-band and high-speed communication technology validation tests. The launch marks the 650th mission carried out by the Long March carrier rocket series.

People smuggling suspect extradited

A Chinese fugitive suspected of coordinating the illegal crossing of national borders has been extradited back to China, the National Immigration Administration said on Thursday. The man surnamed Cai, who had long been in hiding abroad, was found by Chinese police to have conspired with people smugglers both in China and overseas between 2023 and 2024. They organized multiple Chinese citizens to take detour routes and illegally cross the border to engage in illicit activities abroad, said the NIA. In March this year, the police of a relevant country apprehended Cai and notified the Chinese side of the matter. Cai was escorted back to China on Monday.

Island turns ecosystem into financial asset

Lingshan, off the coast of Shandong province, pioneers carbon-negative economic model

Background: Lingshan Island sits some 10 kilometers off the coast of Qingdao, Shandong province. **Inset, clockwise from bottom left:** Tourists take pictures on the island. Fishing boats sail in the waters around the island. Tourists visit an island lighthouse. An "I love Lingshan Island" sign is a popular photo spot on the island. PHOTOS PROVIDED TO CHINA DAILY

By ZHAO RUIXUE in Jinan
and **HU QING** in Qingdao, Shandong

China's first independently certified carbon-negative island is continuing to demonstrate positive economic returns, providing a profitable, eco-friendly model for other areas around the country.

Lingshan Island, located 10 kilometers off the coast of Shandong province's Qingdao West Coast New Area in the Yellow Sea, recorded 706 million yuan ($97.3 million) in gross ecosystem product in 2024, a 14.3 percent year-on-year increase, marking three consecutive years of growth, according to Jinan Engineering Consulting Institute.

Gross ecosystem product is the total financial value that nature contributes to the economy.

The 7.66-square-kilometer island, home to 900 people, was certified by the China Quality Certification Centre as China's first "carbon-negative island" on Dec 31, 2021.

According to the certification, in 2020 the island generated 5,668 metric tons of carbon dioxide equivalent from energy use, agriculture and waste treatment, while its forests absorbed 7,001 tons. This resulted in net emissions of negative 1,333 tons.

This milestone was the result of years of sustained effort, with the island undergoing a steady green transition that has reshaped both daily life and economic development.

Lingshan Island has carried out farmland-to-forest conversion since the 1980s. This long-standing commitment dovetails with China's dual carbon goals of peaking carbon emissions before 2030 and achieving carbon neutrality before 2060. The island has also taken part in pilot programs exploring how to balance economic development with environmental protection through carbon accounting.

Data from the Lingshan Island Provincial Nature Reserve Management Committee shows that more than 233 hectares of farmland have been converted back into forest, and over 2,000 free-roaming goats have been relocated to allow vegetation to recover.

In December 2002, with approval from the Shandong provincial government, the entire island and surrounding area were classified as a nature reserve, spanning 32.832 square kilometers. The classification aims to protect marine ecosystems, biodiversity, forests, bird species and geological formations.

According to the reserve's management committee, a large-scale restoration program, backed by an investment of 515 million yuan, has introduced measures ranging from shoreline protection and slope stabilization to oyster reef restoration and pollution control. More than 200,000 trees have been planted, 16 hectares restored and 15 hectares of oyster reefs rebuilt, alongside eco-friendly coastal upgrades and walking trails.

Technology is also playing a growing role in ecological management. The "Smart Lingshan Island" platform integrates big data, drones, satellite imagery and artificial intelligence to enable round-the-clock monitoring of the island's ecosystem.

Farmers sort sea cucumbers raised near Lingshan Island.
PROVIDED TO CHINA DAILY

CHINA DAILY

In addition, a clean heating program has replaced coal with electricity in 455 households, reducing pollution and improving living conditions.

Island resident Teng Yanfang said the old coal stoves were a safety hazard. "With electric heating, our homes are warmer, cleaner and more comfortable," Teng said.

Outdated and unregistered vehicles have also been phased out, replaced in part by new-energy vehicles, helping build a greener transport system.

The conservation efforts have yielded effective results. Today, more than 80 percent of the island is covered in forest, while the surrounding waters remain clean and free of industrial pollution, the management committee said.

As tourism has grown, the livelihoods of the residents have gradually diversified. Tourists have come not only to enjoy home-cooked meals — largely seafood — but also to stay overnight or longer. In response, some families have opened guesthouses or invested in sightseeing vehicles to cater to the growing demand.

Chen Yiwen, 28, represents a younger generation embracing these changes. Six years ago, she returned to the island and renovated her family home into a homestay.

"We've turned old houses into stylish guesthouses so that every visitor wakes up to the sea breeze and a view of the ocean," she said, adding that this youthful approach aims to show Lingshan Island as more than a scenic getaway — it's a place where life itself can be savored.

So far, 53 homestays have been developed, supported by a local industry association that helps revitalize idle rural homes and older properties.

Currently, three regular ferry lines connect the island to the mainland, each providing a single round-trip service daily, weather permitting. Additional sailings are added during the peak travel season.

This strong ecological foundation has also added value to local aquaculture products.

In October 2024, Lingshan Island completed Qingdao's first carbon footprint assessment for a marine product — dried sea cucumber — produced by a local company. The result was 4.13 metric tons of carbon dioxide equivalent per ton of dried sea cucumber, earning the product a carbon label that helped boost sales by 40 percent year-on-year, according to the company's chairman Sun Jiguang.

"Sea cucumbers are highly sensitive to their environment," Sun said. "Water quality, temperature, food supply and tidal conditions all affect their growth. The waters around Lingshan Island are ideal."

For businesses, carbon labeling enhances environmental credibility and strengthens consumer trust, said Sun Bin, an official with the reserve's management committee. "It also helps identify energy-intensive processes and improve efficiency, reducing both emissions and costs."

Visitors are also encouraged to take part in low-carbon living. A digital platform rewards actions such as waste sorting, green travel and reducing food waste with points that can be exchanged for daily goods.

Meanwhile, new growth drivers are emerging. The island is experimenting with low-altitude logistics, including drone delivery routes linking it with the mainland, while expanding marine tourism offerings such as coastal cruises and short island tours, said Zhang Jiatang, head of the economic development office of the reserve's management committee.

Financial innovation is also supporting development. Qingdao's first ecological asset-backed loan, worth 10 million yuan, and an 800,000-yuan green credit line for homestays have helped turn environmental assets into usable capital.

Yin Honglei, director of the reserve's management committee, said the island will continue to prioritize ecological conservation while further diversifying its businesses in an environmentally friendly way.

The goal is to keep the waters clean, the hills green and local livelihoods growing, showing how protection and development can move forward together, she added.

10-year campaign restores 150 kilometers of Qingdao's coastline

By ZHAO RUIXUE and **HU QING**

Left: Tourists enjoy blossoming flowers at a park in Yumingzui in the West Coast New Area of Qingdao, Shandong province, last month. PROVIDED TO CHINA DAILY **Right:** A campsite overlooks the ocean in the West Coast New Area. HAN JIAJUN / FOR CHINA DAILY

A decadelong campaign to restore the coastline in Qingdao's West Coast New Area has transformed shores once cluttered with illegal fish farms into uninterrupted views of blue waters, sandy beaches and flying seabirds.

Since the campaign began in 2016, the area has restored more than 150 kilometers of coastline. In addition, abandoned aquaculture facilities stretching over 100 km of coastline have been dismantled, more than 1,200 hectares of coastal wetlands have been rehabilitated, and over 260 hectares of coastal vegetation have been restored, according to local authorities.

The campaign aimed not only to support the sustainable growth of the marine economy, but also to repair and protect the coastal ecosystem — restoring the natural shoreline, improving nearshore environments, and coordinating land and sea management as a single system.

One of the toughest problems was relocating aquaculture farmers.

To ease the impact, local authorities rolled out a series of measures, such as providing compensation to affected aquaculture farmers, along with support to help them shift into new lines of work.

Fishing infrastructure was upgraded, with dedicated docks offering safer and more convenient access to the sea. At the same time, tourism and other industries were developed to create new income streams.

Chen Guishuang, a former aquaculture farmer from Qingdao's Xuejiadao subdistrict, initially struggled to accept the decision to remove the breeding ponds that had long supported his family's livelihood.

"But later, I realized the government's policies were quite supportive and took our needs fully into account," Chen said, adding that local authorities helped farmers transition by guiding them to register new businesses and offering practical advice on future development.

"The improvement of the coastal environment has also created new opportunities — my seafood company's revenue has increased severalfold compared with before," Chen said.

Public access to the sea has also expanded. Over 90 km of coastal slow-traffic routes and visual corridors have been built, along with more than 90 hectares of new seaside parks, including Phoenix Mountain Park and the City Balcony — turning the once blocked shoreline into an open, shared space.

With 46 rivers crisscrossing the region — 20 of them flowing into the sea — managing water quality in the bay remains complex. These winding waterways carry uncertainties, making monitoring and regulation more difficult.

To address this, the area has established a smart marine management platform, integrating thermal imaging and AI-powered video to enable round-the-clock, full-coverage monitoring of nearshore waters.

Combined with ship identification systems, the Beidou satellite navigation network and radar detection, the platform can track maritime activity in real time, said Wang Hongwei, an official from the area's marine development bureau.

"Any abnormality is quickly detected, which gives us strong technical support for both marine protection and emergency response," he said.

Islands, as key parts of the marine ecosystem, have also drawn close attention. Once threatened by invasive species and coastal erosion, islands such as Lingshan, Zhucha and Zhaitang have undergone systematic ecological rehabilitation — from vegetation recovery to the removal of non-native species, said Sui Junchang, director of the area's marine development bureau.

Today, these islands have taken on a new role — not just as ecological assets, but also as popular destinations drawing visitors year-round.

"We will continue to advance the development of 'beautiful bays', expand coastal access and further improve the experience of being close to the sea," said Sui.

New perspective on ancient customs

Shanxi province gets creative to engage tourists with its profound history

Millennium Iron Spark, a landscape live-action show staged at Situ Ancient Town in Jincheng, southern Shanxi, features an iron flower show. ZHANG QI / FOR CHINA DAILY

By **HAO NAN**
haonan@chinadaily.com.cn

North China's Shanxi province, soaked in profound historical heritage, is embracing a wave of cultural innovation.

Through creative cultural products and phenomenal art performances, the province's millennia-old history and splendid civilization are glowing with brand-new vitality.

Architectural treasures

Shanxi is home to 28,027 ancient architectural structures, accounting for around one-tenth of China's total, as well as 531 nationally protected historical and cultural sites — the highest number of any province. The concentration of heritage sites has earned the province the reputation of being "a treasure house of ancient Chinese architecture".

The abundant cultural relics lay a foundation for the development of creative cultural products in the province. At the 22nd China (Shenzhen) International Cultural Industries Fair, held from May 21 to 25, the Shanxi exhibition area showcased a variety of creative cultural items, presenting the province's profound cultural heritage in a condensed form.

On the fair's last day, for example, a scholar specializing in ancient architecture lingered at the booth of Shanxi Zhumeng Technology. After carefully examining the exhibits, he spoke highly of the 3D-printed model of the Sakyamuni Pagoda of Fogong Temple in Yingxian county. "This digital 3D-printed work is remarkable. It perfectly restores the color, texture and architectural structure of the original pagoda," he said.

The booth also displayed models of bracket sets from the Foguang Temple on Mount Wutai, a Tang Dynasty (618-907) masterpiece of architecture, and goddess statues in the Sage Mother Hall of Jinci Temple.

The lifelike craftsmanship drew crowds of visitors. Lu Yi, a manager in charge of the booth, said that by relying on artificial intelligence-powered 3D printing technology and advanced materials such as carbon fiber and resin, the company can reproduce ancient buildings in Shanxi with millimeter-level precision.

This technology not only preserves the historical style and artistic value of ancient architecture, but also helps build a standardized digital archive for the digital protection of cultural relics, Lu added.

At the fair, many other creative cultural products wowed audiences. Notably, the Northern Wei Dynasty (386-534) pottery figurines of working people, inspired by the iconic Northern Wei warrior figurines from the Pingcheng period, replicate the relaxed and leisurely demeanor of the original artifacts, resonating with the mindset of today's generation.

At the booth of Shanxi Daily Jinjian Cultural Industry, a tea set was on display. It consisted of a mountain-and-river kettle and teacups themed on the virtue and filial piety of Yao and Shun, two Chinese sage emperors who ruled more than 4,100 years ago. There were also a tea scoop, a lotus-shaped tea tray, and a *gongdao* (fairness) cup, which is a traditional Chinese tea vessel used to collect the brewed tea and pour it evenly into each cup.

The set also embodies the culture of loyalty of Guan Yu, a general during the period spanning the late Eastern Han Dynasty (25-220) and the Three Kingdoms (220-280), the integrity of upright officials, and the credibility of Shanxi merchants.

In Shanxi, creative cultural product shops can be seen everywhere and have become check-in spots for tourists. The Jinli (gifts from Shanxi) creative cultural products store on Zhonglou Street, or Bell Tower Street, in Taiyuan is one of them.

Products such as building-block models of the Water Mirror Stage at Jinci Temple and flip-style perpetual calendars themed around the Yungang Grottoes offer visitors a new experience of the local culture's charm.

"We adjust our creative cultural products' designs to align with young people's preferences, turning millennia-old culture into something that can be used in daily life," said a staff member of Jinli. "This way, when tourists take these items home, they can use them themselves and also share the stories of Shanxi with more people."

"Nowadays, people have a higher acceptance of traditional culture. They no longer settle for simple souvenirs printed with landscapes. Instead, they favor well-designed products with rich cultural connotations, which greatly boosts our confidence in creative cultural development," she added.

During the 14th Five-Year Plan (2021-25), Shanxi incubated 50 creative cultural enterprises and more than 100 research institutions. They have registered more than 300 copyrights and developed over 3,700 creative cultural products. An increasing number of cultural items carrying the memories of Shanxi culture have gained popularity nationwide.

Heritage inheritance

Shanxi province ranks third in China in terms of the number of national-level intangible cultural heritage representative items and inheritors. So far, six items have been inscribed on UNESCO's Representative List of Intangible Cultural Heritage of Humanity.

Shanxi also has 182 national-level and 1,173 provincial-level intangible cultural heritage items. Covering 10 major categories, these include folk literature, traditional Chinese medicine and folk customs.

Upholding traditions while pursuing innovation is the key to the dynamic inheritance of Shanxi's intangible cultural heritage. The jasmine tea blending technique, a provincial-level intangible cultural heritage item, has made Qianhexiang Teahouse famous across the region.

As the only time-honored Chinese brand specializing in tea in Shanxi, Qianhexiang has kept innovating on the basis of traditional craftsmanship.

Traditional jasmine tea, for instance, is a blend of different leaves. After nearly half a year of joint research and hundreds of trials with Shanxi University of Chinese Medicine, the teahouse launched its first medicinal tea, mulberry leaf jasmine tea, which combines a pleasant taste with the health benefits of herbal medicine.

A businessman from Fujian praised the tea at the Shenzhen cultural fair, saying that the taste was smooth with a lingering sweetness. The subtle bitterness of the mulberry leaves added a richer complexity to the tea, he added.

Qianhexiang does not rely on its current products but explores innovation using intangible cultural heritage techniques. This dedication to craftsmanship is truly admirable, said the businessman.

To cater to young consumers, the teahouse has launched tea drinks packed in cups, which are being well received in the market.

Furthermore, Shanxi integrates intangible cultural heritage with cultural tourism and consumption. A total of eight traditional noodle-making techniques from the province have been listed as national-level intangible cultural heritage, with another 44 listed at the provincial level, encompassing over 20 different methods.

China's Intangible Cultural Heritage Wheaten Food Carnival has been held in Shanxi for many sessions, creating immersive cultural tourism scenarios featuring food, entertainment, and shopping.

In 2025, the Culture and Tourism Department of Shanxi launched five travel routes themed on intangible cultural heritage delicacies. Highlighting Shanxi's brands such as merchant culture, noodles and medicinal food-based wellness, the routes connect gourmet landmarks, intangible cultural heritage workshops, historic streets and scenic spots across the province.

On June 1, the newly revised regulation on the protection of intangible cultural heritage in Shanxi took effect. It prioritizes the protection of distinctive local intangible cultural heritage items, including traditional operas, folk songs, drum music, noodle-making, brewing, traditional festival performances and Chinese herbal medicine processing.

The move safeguards cultural roots and enriches people's lives, local officials said.

Live performances

At the Shenzhen cultural fair, excerpts from the dance drama *The Palace Through Time*, performed by artists from Yuncheng University, became a highlight. Inspired by the Yongle Palace, a Taoist temple from the Yuan Dynasty (1271-1368) in Ruicheng county, the dance reproduces the charm of murals in the palace.

Dressed in flowing-sleeved costumes, the dancers moved gracefully with their garments swirling with each step. Their postures resembled the celestial maidens in murals, with every lift of the hand, turn and sweep of the sleeves capturing the lines and spirit of the Yuan Dynasty art in Yongle Palace.

With a backdrop combining ancient architecture, murals, colored glaze and cultural inheritance, the performance brought audiences face to face with the timeless glamour of traditional Shanxi culture.

"We studied every detail of the Yongle Palace murals, from facial expressions to body postures, to restore the ancient style faithfully," said Li Na, a teacher in charge of the performance team. Centering on the relocation story of Yongle Palace, the drama pays tribute to ancient craftsmen and modern cultural inheritors.

Such performances can be seen all over Shanxi, allowing tourists to immerse themselves in ancient stories.

On the evening of June 7, *Millennium Iron Spark*, a landscape live-action show, was staged at Situ Ancient Town in Jincheng in the southern part of Shanxi. It features an iron flower show, a national-level intangible cultural heritage item. Molten iron at more than 1,000 C is thrown into the sky, resembling countless stars.

In April 2024, the town's iron flower performance set a Guinness World Record for the largest-scale show with the numbers of performers and performance spots and the amount of iron used.

Moreover, *A Dream in Datong*, an immersive theatrical show in North Shanxi's Datong, takes audiences on a journey through time to explore the city's history.

During this year's May Day holiday from May 1 to 5, the fully booked show staged 20 performances and received nearly 10,000 visitors, with a maximum of five shows per day.

To date, it has been performed more than 500 times, attracting around 160,000 audience members, and has become a landmark cultural brand and a new cultural calling card for Datong.

Other outstanding productions include *Seeing Pingyao Again*, which interprets the integrity of Shanxi merchants, and *Dream of the Western Chamber*, an adaptation of the classic love story *The Romance of the Western Chamber*.

Rooted in local culture and integrated with modern stage technologies and aesthetics, Shanxi's immersive performances transform the Yellow River, Great Wall and Shanxi merchant cultures into vivid stories and spectacular scenes.

Drawing tourists from home and abroad, these combined efforts inject momentum into the cultural tourism industry of Shanxi.

CULTURAL HERITAGE

Buried fires crack a porcelain mystery

A 3,000-year-old kiln explains the origins of Chinese ceramics, **Yang Feiyue** reports.

On a hillside in Fujian province's Mount Wuyi, the grass still grows over two dark-red scars in the earth. They are all that remain of a fire that burned out 3,000 years ago. But what that fire produced and where those products ended up, archaeologists say, have rewritten a chapter of Chinese ceramic history.

This is the only known kiln site in China from the early-to-middle Western Zhou period (c. 11th century-771 BC), and the best-preserved "living fossil" of proto-porcelain production from the pre-Qin era (before 221 BC).

Proto-porcelain is the precursor to mature porcelain. Fired at temperatures above 1,100 C, hundreds of degrees hotter than ordinary pottery, it was coated with a glassy glaze. Differences in raw materials and firing stability set it apart from true porcelain, experts explain.

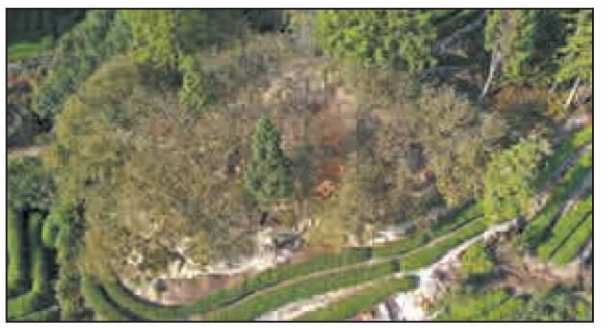
For decades, the chronological sequence of proto-porcelain in China contained a puzzling gap. More than 100 pre-Qin kiln sites have been discovered across the country, concentrated mainly in the north of East China's Zhejiang province, spanning the Xia (c. 21st century-16th century BC) and Shang (c. 16th century-11th century BC) dynasties, the late Western Zhou, and the Spring and Autumn (770-476 BC) and Warring States (475-221 BC) periods.

But the early-to-middle Western Zhou, a crucial three-century period around 3,000 years ago, remained a blank spot.

"It was as if a complete history of ceramics was missing its central chapter," says Zheng Jianming, a professor of archaeology at the Shanghai-based Fudan University.

The gap also fueled a long-running academic debate: did proto-porcelain originate in northern or southern China?

That missing chapter has now been found in the bamboo-shaded hills of Mount Wuyi. In 2025, archaeologists launched a new excavation of Kiln No 1 at the Zhulinkeng site. Radiocarbon dating confirmed the kilns were active around 3,000 years ago, squarely in the early-to-middle Western Zhou period.



Pottery takes a leap

Tests conducted by a team from the Jiangsu province-based Nanjing University on samples from the Zhulinkeng kiln complex measured firing temperatures of approximately 1,220 C for the proto-porcelain and 1,190 C for the stamped hard pottery found alongside it.

The figures matter because ordinary earthenware is typically fired at only 700-800 C. Crossing the threshold to 1,100 and above represents a qualitative leap.

"From pottery to proto-porcelain was a true technological revolution in the history of porcelain," says Yang Zelin, deputy director of the Fujian Provincial Institute of Archaeology and lead archaeologist of the excavation.

Even more striking was what the analysis revealed about material selection. According to the archaeological team, potters at Zhulinkeng deliberately adjusted their clay recipes to suit different types of vessels.

Top: Selected proto-porcelain vessels unearthed from Kiln No 1 at Zhulinkeng, featuring thin blue-green glazes and delicate crackle patterns.
Above: A panoramic view of the Kiln No 1 site at Zhulinkeng, nestled on a hillside in Fujian's Mount Wuyi, where 3,000-year-old firing chambers remain remarkably well-preserved.
Left: Kiln No 1, a nearly intact cave-style dragon kiln measuring 9.4 meters in length.
Below: Archaeologists excavate and clean Kiln No 1.
PHOTOS PROVIDED TO CHINA DAILY

For larger containers, such as jars, they increased the alumina content to prevent warping. For smaller pieces, including stemmed bowls, they used a more plastic clay.

Experts say this reflects a sophisticated understanding of material properties. Different kilns within the complex also produced distinct wares, with variations in glaze and firing techniques.

Some kilns specialized in high-quality products, while others focused on more ordinary products, notes Li Zequn, an archaeologist at Nanjing University.

Such standardization points to a remarkably high degree of specialization, Li adds.

One of the most distinctive features of Zhulinkeng's wares is their thick walls and thin glaze.

Yang explains that this was a deliberate choice, unrelated to firing temperature. Instead, it reflected the glazing process and the glaze's chemical composition.

Zhulinkeng's potters chose a fluid glaze that spreads thinly and evenly, producing a distinctive blue-green surface marked by fine crackles, he says.

A century of innovation

The evolution of the kilns themselves tells an equally compelling story. Excavations have uncovered four cave-style dragon kilns from this period. Two of them, designated IY4 and IY1, are particularly well-preserved and illustrate a rapid technological advance.

IY4, the older kiln, is a 7.8-meter tunnel with a firebox at one end and a small exhaust vent at the rear. Flames rose directly into the chamber with no guidance. IY1, nearly two meters longer, introduced two innovations: twin flues that accelerate flames through the Venturi effect, and a larger fan-shaped exhaust vent.

"The larger the exhaust vent, the stronger the updraft," Yang says.

The combined effect was transformative: more intense fire, higher temperatures, and the ability to fire larger batches of vessels. Archaeologists estimate that the upgrade occurred in less than a century.

"This represents very rapid innovation," Yang says.

Another remarkable aspect of kilns in Zhulinkeng is the state of preservation, as most contemporary kilns elsewhere in China survive only as truncated floors, their walls and roofs long since collapsed.

The answer lies in how they were built. Contemporary kilns in Zhejiang were semi-subterranean — a shallow trench perhaps 20 to 30 centimeters deep with a vaulted superstructure above ground.

"Like a vegetable greenhouse, the upper part was vulnerable. Over thousands of years, it crumbled," Yang explains.

Zhulinkeng's kilns, by contrast, are fully subterranean, cut deep into the hillside and arched like cave dwellings.

"They lie at least half a meter below the modern ground surface," Yang describes, adding that even if farming disturbs the topsoil, the main structure remains intact.

The trade-off was enormous labor. Digging tunnels several meters long using primitive tools and manual effort was no small task.

"It was a monumental project, and because the builders chose the harder path, today we can see a nearly intact 3,000-year-old kiln," Yang says.

Around the kilns, the excavation team uncovered a full production complex: clay storage areas, washing pools, drainage ditches, shaping floors, drying platforms, and piles of discarded wasters — vessels that cracked or warped during firing.

"This was a purpose-built, highly organized, specialized production facility," Yang says.

Controlling the flames

Across northern Fujian, archaeologists have found high-status tombs from the same period — large earthen burial mounds containing Zhulinkeng proto-porcelain alongside bronze ritual vessels — exclusive markers of elite status during the Western Zhou period.

"These were not ordinary burials. The people interred in them were likely tribal chiefs or nobles, who controlled proto-porcelain production," Yang says.

Maintaining a dedicated industrial zone and supporting a full-time ceramic workforce required substantial resources and social organization, something only elites could provide, he adds.

For decades, archaeologists had unearthed substantial quantities of early Western Zhou proto-porcelain at major northern sites, including Zhouyuan in Shaanxi and Liulihe in Beijing, but could not determine where it had been produced.

The Nanjing University team compared the chemical composition of Zhulinkeng's wares with samples from those northern sites. The match was unmistakable.

"It is like fingerprint analysis. We can now say with confidence that a significant proportion of the early-to-middle Western Zhou proto-porcelain found in northern China was produced at Zhulinkeng," Yang says.

The discovery shows that the kilns of northern Fujian were integrated into supply networks serving the Zhou political center.

In the early Western Zhou, bronze vessels occupied the pinnacle of ritual culture, but bronze was rare and accessible only to the highest nobility. Proto-porcelain — hard, glossy, and capable of being produced on a much larger scale — served as a crucial supplement. The vessels produced at Zhulinkeng closely mirrored the shapes and dimensions of their bronze counterparts used in the Zhou heartland, according to the project's archaeologists.

"Fujian's contribution to pre-Qin civilization has often been overlooked," Yang says. "This discovery shows that, more than 3,000 years ago, the people of northern Fujian built a bridge of cultural exchange between south and north."

Dragon tiles unlock Qinshihuang's eastern dreams

By ZHAO RUIXUE in Jinan
zhaoruixue@chinadaily.com.cn

A pottery roof tile end decorated with a *kui* dragon motif has become a highlight for visitors at the Qingdao West Coast Museum in Qingdao West Coast New Area, Shandong province.

Featuring a high-relief, symmetrically designed dragon pattern, symbolizing power and imperial authority, the artifact was unearthed at the Langyatai archaeological site, a headland overlooking the Yellow Sea.

"Similar *kui* dragon tile ends have been found at sites directly associated with Qin imperial construction, including the Mausoleum of the First Qin Emperor," says Lyu Kai, director of the Warring States, Qin and Han dynasties research section at the Shandong Institute of Cultural Relics and Archaeology and leader of the Langyatai excavation.

"Those examples are typically about 50 centimeters in diameter. However, the largest specimen discovered at Langyatai reaches 80 centimeters," Lyu says.

"The *kui* dragon tile end is a standard indicator of the highest rank of Qin Dynasty (221-206 BC) architecture. Its presence at Langyatai confirms that this structure was a state project commissioned by the first emperor (Qinshihuang)," he adds.

Hollow dragon-patterned step bricks unearthed at the site further underscore the building's elite status, he adds.

After seven years of systematic excavation, Langyatai has yielded major discoveries that provide tangible evidence for historical accounts of the first emperor's eastern tour and the construction of the Langyatai complex. The site was recently named one of China's top 10 archaeological discoveries of 2025.

Lyu says the excavations corroborate a record in the epic *Shi Ji* (Records of the Grand Historian) that the emperor relocated 30,000 households to build Langyatai.

At the summit of a hill rising about 184 meters, archaeologists uncovered a rammed-earth foundation covering 45,000 square meters — an immense scale for its time. Remains of rooms, corridors, gate structures and a sophisticated drainage network were found across the platform.

At the foot of the hill, the team excavated a Qin Dynasty kiln built specifically to produce construction materials for the complex, as well as a courtyard compound linked to the summit by a roadway.

"This suggests that Langyatai was not simply a platform on a mountaintop, but a vast architectural ensemble integrating both the summit and the foothills," Lyu says.

As the earliest and largest Qin imperial engineering project discovered so far in eastern China, Langyatai served as a political landmark through which the Qin and Han (206 BC-AD 220) dynasties asserted state authority, he adds.

Archaeologists also uncovered remains east of the main site that predate Qinshihuang's eastern tour and are associated with the state of Qi's administration of the Langya region.

The Qi state was one of the most powerful states during the Spring and Autumn Period (770-476 BC) and the Warring States Period (475-221 BC).

"This means the site contains architectural remains from the Warring States Period, the Qin Dynasty, and the Western Han Dynasty (206 BC-AD 24), together forming a long-lasting, high-level architectural complex," Lyu says.

He notes that Qin rule was short-lived and that eastern Shandong, formerly part of Qi, was the last region conquered by Qin. Because Qi surrendered without major resistance, relatively few people from the Qin heartland in present-day Shaanxi settled there, leaving a limited Qin cultural imprint on the region.

"This provides important clues for understanding the unification process of early feudal dynasties, cultural integration, and the formation of a multiethnic unified state," he says.

Researchers have also been impressed by the engineering sophistication of the Qin builders.

The mountaintop structures were equipped with an advanced drainage system that included stone-lined channels and underground ceramic pipes with tapered ends fitted tightly together. The pipes were sealed with hard red clay to prevent leakage and strengthen the joints. Rainwater flowed into the network through courtyard inlets before being discharged into open ditches.

"The entire drainage system was designed to near perfection," Lyu says admiringly. "Everything that needed to be considered, the people of that time had already considered."

The site's rammed-earth construction has drawn similar admiration. Each layer measures about eight centimeters thick and remains remarkably uniform, smooth and compact.

"After excavation, the surface is almost as hard and smooth as a modern concrete floor," he says.

The workmanship suggests that Qin construction projects mobilized enormous resources while adhering to exceptionally high standards of management and craftsmanship.

Key artifacts from the site, including the *kui* dragon tile ends, hollow ceramic bricks and ceramic pipes, are now on display at the Qingdao West Coast Museum.

"This magnificent site, which witnessed imperial grandeur more than 2,000 years ago, is gradually entering the public eye, bringing fresh vitality to local tourism and cultural development," Lyu says.

Sun Qi contributed to this story.

Creating an international digital content hub

Vloggers and bloggers from across the globe find the support they need in a city that gives them plenty to share with their fans, **Zheng Zheng** reports in Shanghai.

When Alessandro Conti first launched his Douyin account in 2018, he simply wanted to share his travel moments in China with his family back home in Italy. About eight years later, he has built a following of 700,000 across various platforms and become part of a growing community of international content creators who choose Shanghai as their creative base.

"I started Douyin because I was traveling frequently for business and wanted to document my life," says the Shanghai-based creator at the 2026 Top Creators Gala held in Shanghai in May.

"What began as videos for my family evolved into something much bigger — a bridge between cultures, sharing real experiences between Italy and China."

Conti's journey reflects Shanghai's emergence as China's premier content creation ecosystem. The city now hosts nearly 20 percent of the country's top multichannel networks (MCNs), ranking first nationwide.

Shanghai's magnetic pull for digital talent is supported by industry data. According to the Shanghai Municipal Administration of Radio and Television, the city's online audiovisual industry reached 253 billion yuan ($37.3 billion) in 2025, solidifying its position as one of China's primary digital markets.

The Shanghai Commission reports that the city's livestreaming e-commerce retail sales topped 493.7 billion yuan in 2024, a 12.9 percent year-on-year increase, accounting for 10.5 percent of the national total.

This thriving backdrop served as the foundation for the recent gala, which gathered hundreds of internet content creators and industry leaders from around the globe in Shanghai to explore strategies for creating meaningful digital narratives that transcend borders.

"Being a content creator in Shanghai is incredibly exciting work," says Greg, a French content creator who has lived in China for nearly two decades. "New ideas emerge every single day."

"In my 18 years here, I've never been bored. Shanghai isn't just where I live; it's my source of inspiration, my workplace, my everything," he says.

Sergejs Sinkins, a Latin dance judge-turned-content creator known to netizens as "Mr Ferrari" for his elegant demeanor, emphasizes authentic human connection.

"We love to share life experiences as bloggers," he says. "The most important thing for us is the people around us. The people here are so open, friendly, and soulful. Even when we can't communicate in Chinese, we understand each other."

For Conti, whose content spans food, culture and entrepreneurship, authenticity resonates most deeply. "Having lived 12 years in China and 18 years in Italy, I can explain each country to the other," he says.

His videos featuring everyday moments, from stray cats wandering into his gelato shop to encounters and interviews with local residents, have struck a chord with international audiences seeking genuine glimpses of Chinese life.

Shanghai's rise as a global creator hub is backed by institutional policy. The gala marked nearly one year since Shanghai launched several measures to support the creation of high-quality internet content.

In September 2025, the city further announced funding guidelines offering up to 2 million yuan for high-profile brand activities and up to 100,000 yuan in rewards for quality content-creation projects, along with creative resources, distribution channels and service support.

Building on this foundation, two new initiatives were unveiled during the event. The Shanghai internet quality content empowerment plan offers creators access to resources, collaboration channels and dedicated support to help them establish roots in the city. Simultaneously, major platforms, including Bilibili, Xiaohongshu, Tencent, and others, announced the 2026 co-creation plan to provide expanded opportunities and resources.

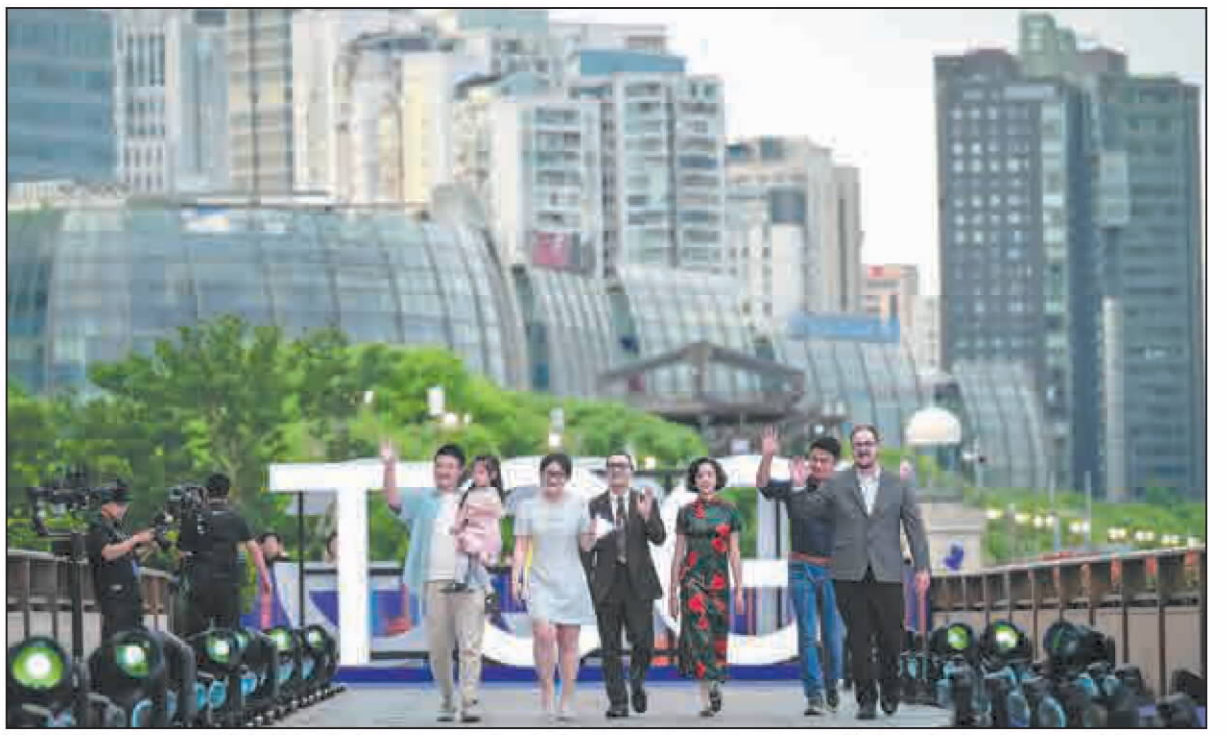
Wang Xiao, a content creator specializing in politics and history, describes Shanghai's unique advantages: "Creating content here feels both supportive and progressive."

The city constantly finds ways to let everyone focus on creation without other worries, he says, noting that with many platforms and peers, there is a clustering effect that allows mutual exchange and better content through interaction and competition.

Cultural content creator Yu Fu characterizes Shanghai as a creative gold mine. "Content creation in Shanghai is very fulfilling because the environment is relaxed. You can basically film whatever you want," he says.

"We never lack material here. For instance, you'll see buildings with a rich history while simply walking down the street," Yu adds. "For me, Shanghai is like a huge chocolate mountain. If you like sweets, every bite is satisfying."

"Creators' inspirations are always divergent. We want to combine more content that ordinary audiences enjoy watching," says Wang Yiran, founder of Turing's Cat Studio, which focuses on artificial intelligence.



"As AI creators, our topics extend beyond AI itself to different fields," he explains. "We've collaborated on projects combining AI with gaming, and we're planning future work in public welfare to help people with disabilities.

"What we need to do is ground the content in reality and make it meaningful and helpful, or bring educational value," says Wang.

For Iranian creator Mahya Mirsadeghi, who focuses on Chinese language and cultural exchange, the city's continuous evolution is the story itself. Having witnessed Shanghai's rapid transformation since her first visit in 2018, she remains clear on her mission.

"Shanghai has changed profoundly over the years," Mirsadeghi says. "My goal is simple: to show the real China to the rest of the world."

Sino-Swedish friendship gets big giddyup through new exhibition

By **ZHANG KUN** in Shanghai

A 14-meter-tall red Dala horse sculpture will stand at the North Bund waterfront stage in Shanghai's Hongkou district from June 14 until the end of August, reportedly the largest of its kind worldwide. It serves as the centerpiece of the exhibition, *A Cultural Journey: Where the Dala Horse Encounters Chinese Intangible Cultural Heritage*.

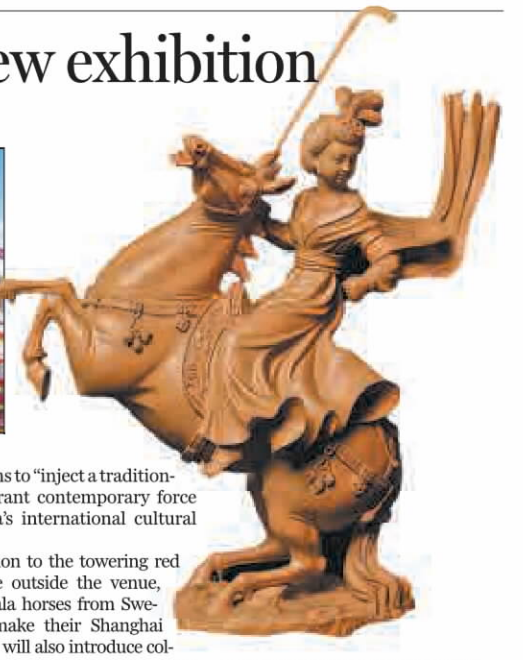
Opening on Sunday — this year's Cultural and Natural Heritage Day in China — the exhibition will run until Aug 31 at the Grand Halls in Hongkou. The show promises a vibrant East–West dialogue on craftsmanship and culture and marks the first public art exhibition held at the venue, a historic building complex in the core of the North Bund area. Refurbished in 2021, it comprises three structures spanning 99,000 square meters and integrates conference, banquet, exhibition, and performance functions.

As a flagship event for Hongkou district's Cultural and Natural Heritage Day, the exhibition incorporates eight local intangible heritage projects and more than 30 original horse-themed cultural products. Over the course of the event, 52 cultural activities, including markets, opera appreciation sessions, hands-on workshops, and lectures, will be open to audiences of all ages.

The Dala horse is one of Sweden's most cherished cultural symbols, dating back to the 1600s in the Dalarna region, where woodworkers carved toy horses from pine remnants for their children.

According to Li Haichao, CEO of Nordic Light (Shanghai) Brands Co Ltd, one of the exhibition's co-organizers, the wooden horse has appeared on numerous international stages as an emblem of goodwill, becoming a cultural ambassador for Sweden and a testament to Sino–Swedish friendship.

Zhu Jingbo, deputy director of the Shanghai Intangible Cultural Heritage Protection Center, notes that the exhibition is jointly organized by leading cultural, tourism, and academic institutions to celebrate the 76th anniversary of diplomatic relations between China and Sweden and the Lunar Year of the Horse.



Curator Zhang Lili, vice-dean of the Shanghai Academy of Fine Arts at Shanghai University, explains that the exhibition's core area spans 1,200 sq m and presents 20 national-level intangible cultural heritage crafts related to the horse motif, interpreted through the lens of the Five Elements — metal, wood, water, fire, and earth. Highlights include Tang Dynasty (618-907) sancai-glazed ceramics, Fengxiang clay figurines, Gu embroidery, shadow puppets, and boxwood carvings.

A bamboo-woven robotic horse will also be displayed, showcasing technological innovation and exploring future innovations in traditional craftsmanship. An interactive zone invites visitors to try their hand at various crafts under the guidance of heritage bearers, while an outdoor photo area offers opportunities to capture the experience.

"We hope the exhibition will not only showcase the skills and aesthetics of China's intangible cultural heritage, but also integrate it into people's daily lives, allowing it to be appreciated, experienced, and enjoyed," Zhu says. She adds that the project aims to "inject a traditional, yet vibrant contemporary force into China's international cultural influence".

In addition to the towering red Dala horse outside the venue, antique Dala horses from Sweden will make their Shanghai debut. "We will also introduce colorful merchandise inspired by the Dala horse, enabling visitors to touch, taste, feel, and take a piece of this cultural encounter home," Li says.

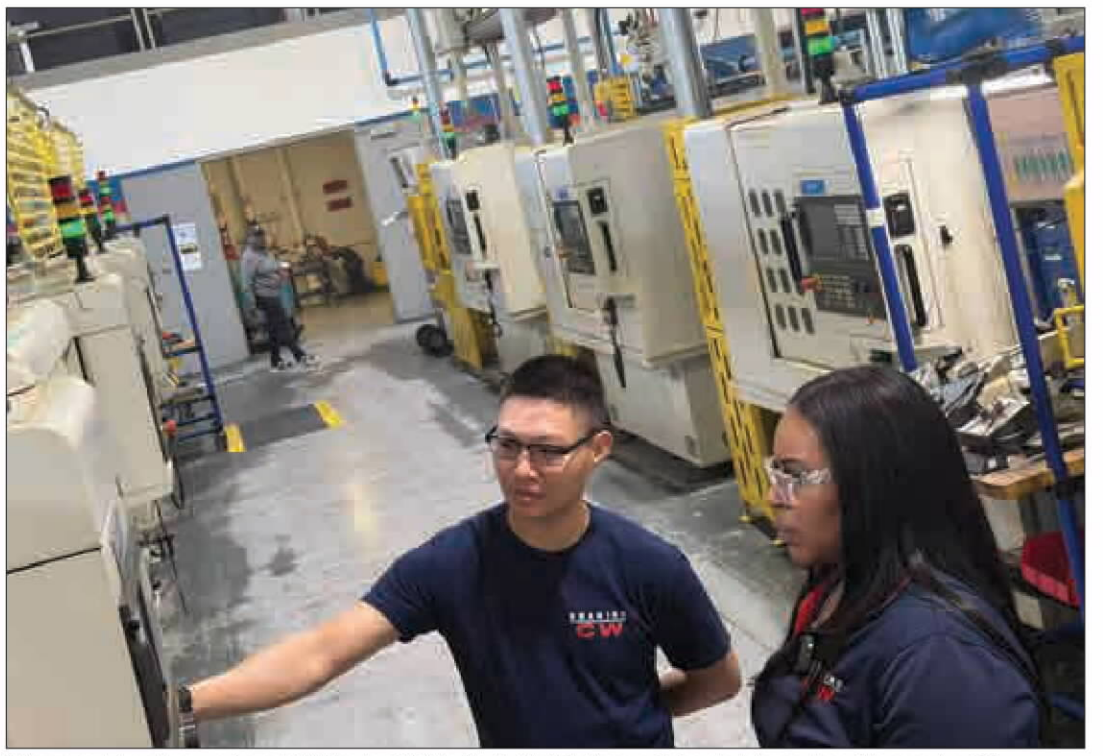
Reviving manufacturing in Michigan

Chinese-American factory creates jobs and builds teamwork through understanding

By **MINGMEI LI** in Michigan
mingmeili@chinadailyusa.com

Standing face-to-face on the factory floor, Christian Baez and his Chinese colleagues once relied on a smartphone translation app to communicate.

Words moved back and forth across the screen in English and Chinese as they paused, pointed to machines, and used gestures to make themselves understood. That was how Baez first navigated daily work after joining CW Bearing five years ago.



"The biggest challenge was the language barrier," Baez recalled. "But once we got on the same page, we know what to do and how we operated, then we are good."

The 29-year-old product quality technician still spends his days moving between production lines, inspecting product quality, collecting data and troubleshooting equipment issues at the company's manufacturing facility in Northville Township, Michigan.

Language differences still surface from time to time, but they are no longer a major obstacle for them working in this multinational and multicultural company.

Now, when Baez walks through the aisles of the plant and inspects parts, some of his Chinese colleagues would jokingly call out, "The police are here".

"Once I got to know them, it was very welcoming, very easy to understand. We all have the same motive, and we want to get the work done in a strategic way, so that was very easy to follow," Baez said. "We are very much alike in a lot of those ways."

Chinese and American workers at CW Bearing, USA in Northville, Michigan, collaborate to inspect machines on April 13. MINGMEI LI / CHINA DAILY

CW Bearing USA, a subsidiary of China's Cixing Group, traces its roots to Zhejiang province, where the company was founded in 1985. The company established its first US operation in Southern California in 1993 and later expanded its manufacturing plant to Michigan, where it operates its North American headquarters and production facility.

CW Bearing has invested around $30 million locally, creating several dozen jobs, with about 90 percent of its workforce made up of local hires.

Michigan has long been associated with the automotive industry and the broader Rust Belt manufacturing region. While the area's industrial landscape has shifted over recent decades, factories like CW Bearing remain part of its evolving manufacturing base.

"We've been incredibly fortunate to have employees who have stayed with us for decades."

Hu Lirong, president and CEO of CW Bearing

Inside the facility, Chinese and American technicians work alongside one another on production, quality control and equipment maintenance. Technical discussions often involve a mix of English, translated terminology and shared manufacturing knowledge.

Many of the employees, like Baez, are early in their careers. As they work together to solve production challenges, they are also learning how colleagues from different countries approach communication, problem-solving and daily life. Further, what begins with technical collaboration has developed into friendships and a broader understanding of one another's backgrounds.

"It's different," said Nequita Jackson, engineering technician of CW Bearing, who has been working with the company for 10 years.

"We do things a little differently than they do. It's helped us actually thrive and learn more with motivation," she said.

Jackson was one of the earliest employees at the plant. From technician to trainer, she has witnessed the company's development from its early setup phase to its current operations.

For her, being different does not mean being separate. Working alongside Chinese colleagues and building day-to-day relationships has made the workplace feel more like a family where different cultures come together.

"Our Chinese colleagues invite us to their homes. We spend time at each other's houses, so nobody feels left out," she said.

While employees experience cultural exchange on a personal level, plant leaders also emphasize the importance of bridging different workplace approaches.

"The American teams seem to communicate and escalate right away, where the Chinese team is very disciplined and technical. Before they escalate issues, they like to make sure they root cause it, see if behind the scenes they can fix it, and if they can't, then they'll have a very good strategic plan of what they need to fix the issue," said Gary Moss, the general manager of the plant.

"I don't like it to be like a China team versus a US team. I love being just one team, and we really enjoy each other. It's a really good team and a good fit, and we're really just building the trust. I wake up wanting to go to work," he said.

I don't like it to be like a China team versus a US team. I love being just one team, and we really enjoy each other. It's a really good team and a good fit ... I wake up wanting to go to work."

Gary Moss, the general manager of the plant

That sense of teamwork is especially important in a region where manufacturing remains closely tied to local identity and economic opportunity. Raised in Detroit, the heart of America's automotive industry, Moss sees CW Bearing as part of a long industrial tradition.

"This is pretty much where it started when it came to manufacturing, assembly lines," he said. "If you want to be in automotive, Detroit or the greater Detroit area is always a good place to be," he said.

Looking ahead, he said, sustaining that tradition will depend on attracting younger workers.

"A lot of the younger generations are going towards technology or skilled trades. So it's exciting to see more young people here. We need new talent," he added.

"Our Chinese young professionals may lean more toward teamwork and stability, while Americans often value autonomy and personal decision-making. Those aren't necessarily conflicting approaches — they can actually balance each other out," said Hu Lirong, president and CEO of CW Bearing.

He added that employees today are more globally minded than previous generations.

Attributing the company's stability in the US to its workforce, Hu said many employees have spent decades with the company and advanced alongside its growth from early-stage operations to its current scale.

"We've been incredibly fortunate to have employees who have stayed with us for decades," he said. "It's because of their hard work and shared commitment that we've been able to put down strong roots in Michigan and become part of the local community."

That long-term presence, he added, has shaped how the company defines itself — not simply as a company operating in the US, but as a business that combines its Chinese background with deep local integration.

"Having a Chinese background and being a local company are not mutually exclusive," Hu said. "We see that combination as a unique competitive advantage."

At its core, he added, the company's experience reflects a broader reality of global business: long-term cooperation depends on trust built through people-to-people relationships.

"Economic and trade cooperation is ultimately about relationships — between people, businesses and communities," Hu said. "Those exchanges build understanding and trust, which are essential for long-term partnerships."

Chef puts a new spin on Cantonese flavors in New York

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

From the stainless steel plates of traditional Cantonese eateries to custom-made tableware for fine-dining tasting menus, Kenny Leung sees his restaurant as a balance between tradition and innovation, preserving the roots of Cantonese cuisine while reimagining it for a modern audience.

Leung serves as the executive chef of YAO, which opened in 2024 in New York's Financial District. As the flagship restaurant of August Gatherings, the group began its journey in New York's Chinatown more than a decade ago before expanding downtown. Today, its modern Cantonese flavors are reaching an increasingly international audience.

"We want to enrich the depth and complexity of traditional Cantonese flavors through contemporary ingredients and techniques. At the same time, we hope to stay true to its roots while making it more accessible and relatable to today's diners, including international guests," Leung told China Daily in a recent interview.

The chef, who began learning to cook in Guangzhou, Guangdong province, at the age of 15, now leads a kitchen where traditional Cantonese *wok hei* (the smoky freshness of stir-fry) and open-flame cooking are combined with modern equipment such as immersion circulators, combi ovens and dehydrators.

Kenny Leung, executive chef at YAO, a modern Cantonese restaurant in New York, prepares dishes in the kitchen. PHOTO PROVIDED TO CHINA DAILY

"Modern Cantonese cuisine is not about overturning tradition but about building on it — introducing new elements while preserving its foundations," he said.

"There is tradition, but no single authentic version. In every era, dishes are shaped by the tastes, ingredients and aesthetics of that time. In that sense, what we call tradition is itself continuously evolving," he added.

As one of China's eight major culinary traditions, Cantonese cuisine originated in Guangdong and is known for its emphasis on fresh ingredients — from seasonal vegetables and live seafood to roasted meats such as goose and duck. It is prepared with a focus on light and balanced flavors, and the restaurant offers a modern interpretation of this culinary tradition.

In addition to its a la carte menu, the restaurant offers a tasting menu titled Tang Jia Yan and serves as an overseas platform for the preservation and promotion of Siqian intangible cultural heritage cuisine. Rooted in Siqian, a historic town located in the city of Jiangmen, with more than 1,800 years of history, the cuisine is presented through both fine dining and a more accessible contemporary format.

Modern Cantonese cuisine is not about overturning tradition but about building on it."

Kenny Leung, executive chef at the Cantonese restaurant YAO in New York

For Leung, innovation and preservation carry equal weight. He continues to develop new dishes while training apprentices to ensure the craft is passed on.

"I hope more local American diners can understand the flavors of Cantonese cuisine and the ingredients behind it," he said. "Cantonese cooking requires experience, timing and daily attention to ingredients. We are not focused only on short-term profit, but on sustainability and long-term development. We hope to preserve and carry Cantonese cuisine forward through our generation."

For 29-year-old New Yorker Delaney Masal, who has been to China and widely experienced its cuisine, the restaurant offers a distinctive lens through which to understand Cantonese food in New York. As dishes arrived at the table, she reached for her phone to film the presentation.

"The flavors are very traditional," she said. "But they're also taking into account the American palate. Having a Cantonese restaurant in the city means finding this balance between honoring a culinary tradition and making it accessible to a new audience."

Jerald Braddock Jr, a New York resident, said his experience of dining in Chinese restaurants in the US has shown him the growing popularity of regional Chinese cuisines, especially among younger diners.

"Growing up, having these different types of dishes, I feel like it has expanded my palate even more because now you're bringing the roots of China over to America. So it gives an opportunity to embrace more, not just even the food, but the people who engaged [with it]," he said. "A shared meal does help bridge conversations a lot more than people think."

"Nothing has made me more comfortable than braised pork from China," he added.

Many first-time guests often leave with a similar impression of Cantonese cuisine, the owner observed.

"So this is what Chinese food really is? This is what Cantonese cuisine is like?" said Thomas Tang, co-founder of August Gathering, in an interview with China Daily.

"The phone eats first," he said. "People experience food visually before they taste it. French and Japanese cuisines have developed highly refined visual presentations. I believe Chinese cuisine, especially Cantonese cuisine, has always had the same potential, with thousands of years of culinary culture and highly sophisticated techniques."

Beyond the food itself, cultural heritage remains central to the brand, he added.

The Chinese name of August Gatherings, "Fuyao", symbolizes abundance during the August harvest season, when families gather to celebrate prosperity and a good life.

The group's flagship restaurant builds on this original name, retaining its final character, "*yao*", in its new concept as a way of carrying the tradition forward. In Chinese, the character also refers to precious jade, symbolizing something rare, beautiful and valuable, and reflects an ongoing pursuit of culinary excellence.

"We are operating in the US," he said, "but the name, philosophy and cuisine are always rooted in our Chinese culture."

Enhanced solidarity with Myanmar urged

Xi hails friendship, calls for even deeper strategic cooperation

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

President Xi Jinping and President of Myanmar Min Aung Hlaing wave at children on Tuesday during a welcoming ceremony that Xi hosted for the visiting leader prior to their talks at the Great Hall of the People in Beijing. The Myanmar president is on a five-day state visit to China, which will conclude on Friday. FENG YONGBIN / CHINA DAILY

President Xi Jinping said on Tuesday that China stands ready to work with Myanmar to deepen comprehensive strategic cooperation and achieve more results in building a China-Myanmar community with a shared future, in order to deliver more benefits to the two peoples and contribute more to regional peace and development.

Xi made the remarks during talks in Beijing with Myanmar President Min Aung Hlaing, who is on a five-day state visit to China — his first since assuming the presidency in April.

Noting Min Aung Hlaing's long-standing commitment to friendship with China, Xi said they met twice last year, when they had in-depth exchanges on issues of strategic importance that bear on the direction of bilateral relations.

China and Myanmar enjoy a deep "*pauk-phaw*" (fraternal) friendship, Xi said, adding that over the 76 years since the establishment of diplomatic relations, the two neighbors have stood together through thick and thin, helped each other and jointly advocated and practiced the Five Principles of Peaceful Coexistence.

Their relationship has set a fine example of equality and mutually beneficial cooperation between the countries, he added.

Xi also said that China places relations with Myanmar in an important position in its neighborhood diplomacy and is committed to the principle of noninterference in internal affairs, adding that China's policy of friendship toward Myanmar is for all the people of Myanmar.

He voiced China's firm support for Myanmar in safeguarding its sovereignty and territorial integrity, and for Myanmar's new government in coordinating development and security and pursuing a development path suited to its national conditions and supported by its people.

Xi emphasized that China, a neighbor with whom Myanmar shares the longest border, is a trustworthy friend and partner, and he urged the two sides to remain strategically clear-headed and focused, and enhance solidarity and coordination amid a turbulent and changing international landscape.

As this year marks the beginning of China's 15th Five-Year Plan (2026-30) period, Xi said that China stands ready to share development experience with Myanmar and jointly build a China-Myanmar community with a shared future featuring political friendship and mutual trust, mutually beneficial development, coordinated and mutually reinforcing security, and integrated and mutually enriching exchanges.

Describing the China-Myanmar Economic Corridor as a flagship project of Belt and Road cooperation, Xi called on both sides to steadily advance key projects on the basis of ensuring security, in order to help Myanmar grow its economy and improve livelihoods.

China is ready to step up support for Myanmar's post-earthquake reconstruction and implement more "small yet smart" assistance projects, Xi said. He urged the two countries to continue cracking down on online gambling, telecommunications fraud, drug trafficking and other criminal activities to safeguard the interests and security of the two peoples.

Xi also expressed China's support for all parties in Myanmar in pursuing peace and reconciliation through peace talks and realizing long-term peace and stability in northern Myanmar, saying this serves the fundamental and long-term interests of Myanmar and its people.

Min Aung Hlaing expressed gratitude for China's long-standing selfless support for Myanmar's development, stability, peace and reconciliation, and reaffirmed Myanmar's firm commitment to the one-China principle.

Myanmar's new government is making every effort to advance domestic peace and development, he said, adding that his country looks forward to strengthening all-around cooperation with China, jointly building the Myanmar-China Economic Corridor and elevating trade and investment.

He pledged that Myanmar will make every effort to ensure the safety of Chinese enterprises and personnel in the country, and will work closely with China to combat online gambling and telecom fraud.

He also voiced full support for the four global initiatives proposed by Xi, and expressed readiness to strengthen multilateral communication and coordination with China.

Following the talks, the two presidents witnessed the signing of multiple cooperation documents in transportation, livelihood and other areas.

Premier Li Qiang also met with Min Aung Hlaing on Tuesday.

Du Lan, an associate research fellow at the China Institute of International Studies, said the visit comes at a crucial time as Myanmar works to restore development and stabilize its domestic situation.

"It reflects the strong willingness of Myanmar's new government to deepen ties with China, as well as the strategic resilience of China-Myanmar relations," she said.

China, which is Myanmar's largest trading partner for many years and an important source of investment, has carried out cooperation in infrastructure, energy, minerals and other fields in line with Myanmar's development needs, she said.

Bilateral trade reached $19.4 billion in 2025, up 19.1 percent year-on-year, according to China's Foreign Ministry. After a strong earthquake struck Myanmar last year, China announced assistance totaling 1.1 billion yuan ($163 million) to support disaster relief and reconstruction.

Zhou Fangyin, a professor at Sun Yat-sen University's School of International Relations, said stronger China-Myanmar relations will help prevent regional conflicts from spilling over, improve local livelihoods and promote peace through development.

WORLD WATCH

AI can help to predict, manage the impacts of climate

Earlier this month, Argentina's Esperanza research station on the Antarctic Peninsula recorded an unprecedented temperature of 15.4 C, more than 20 degrees above the seasonal norm and the highest June reading ever observed at the station. The anomaly, which has contributed to unusual ice melt and raised concerns about polar ecosystems, serves as a stark reminder that climate change is no longer a distant threat but an accelerating reality reshaping economies, ecosystems and societies worldwide.

According to the World Meteorological Organization, there is an 86 percent likelihood that between 2026 and 2030, at least one year will surpass 2024 as the hottest year on record, underscoring the accelerating pace of global warming.

Scientists also project a 91 percent likelihood that average global temperatures will exceed 1.5 C above pre-industrial levels during at least one of the next five years, increasing the likelihood of more frequent heat waves, floods, droughts and wildfires.

Yet amid these alarming projections lies an opportunity. The next five years could mark a turning point in humanity's response to climate change if governments, businesses and communities fully harness the power of artificial intelligence and green technologies. The challenge before us is not simply to understand climate risks, but to predict, manage and reduce them more effectively than ever before.

Every day, satellites, weather stations and sensors generate enormous volumes of information about the Earth's atmosphere, oceans and land systems. But turning that data into actionable intelligence is difficult, and this is where AI becomes indispensable.

Nation's innovation strength, speed lauded

By **ZHANG CHENXU, ZHOU LANXU** and **LI JIAYING** in Xi'an

Guests chat on Tuesday before the start of the "CEO: Grow with China" Roundtable in Xi'an, Shaanxi province. CHEN ZEBING / CHINA DAILY

China's accelerated effort to foster new quality productive forces is injecting fresh momentum into innovation-driven growth and creating broader opportunities for multinational companies seeking to deepen their presence in the world's second-largest economy, business executives and economists said on Tuesday.

Xi'an in Shaanxi province is emerging as a key inland innovation hub, thanks to its strengths in technological research, advanced manufacturing and international connectivity, and the city plays a growing role in China's pursuit of high-quality development and high-level opening-up, they added.

They made the remarks in Xi'an during the "CEO: Grow with China" Roundtable, which was co-organized by China Daily and the Xi'an municipal government.

"What is now shaping China's development is the shift toward new quality productive forces," said Raquel Ramirez Alexander, vice-president of the European Union Chamber of Commerce in China and chair of its Southwest China Chapter.

It reflects the country's shift from growth driven mainly by scale and investment to growth powered by technology, productivity gains, digitalization, sustainability and advanced manufacturing, she said.

China offers increasingly diverse opportunities, she added, citing a survey released recently by the chamber and Roland Berger consultancy, which shows "signs of an uptick" in confidence among European businesses operating in China, while also pointing to expectations for further improvements in the business environment.

Zhu Guangyao, former vice-minister of finance, said in a video address that China's continued push for high-level opening-up and a better business environment will provide a stronger foundation for multinational companies to grow in the country. Their long-term engagement in the Chinese market will also help advance China's industrial upgrading and economic development, he said.

SPOTLIGHT SHINES ANEW ON NANJING'S LEGENDARY PAGODA

A world wonder before its destruction in 1856, the towering presence reimagined in steel and glass remains a point of pilgrimage

By **CANG WEI** in Nanjing
cangwei@chinadaily.com.cn

In the United States, white folded takeaway boxes stamped with a red pagoda motif have long been synonymous with Chinese food. They frequently have appeared in movies and TV shows, such as *Friends* and *The Big Bang Theory*.

Online speculation about whether the famous pagoda was a real place or not has put the Glazed Pagoda of the Great Bao'en Temple in Nanjing, the capital of Jiangsu province, in the social media spotlight.

The image found on some of those cartons is that of the nine-story, 78-meter-tall edifice with its glazed facade, which has long been considered a marvel in China and abroad.

The Glazed Pagoda of the Great Bao'en Temple in Nanjing, Jiangsu province, glows under the night sky in May. PROVIDED TO CHINA DAILY

China Vibes

"The tower was once a visual symbol through which the Western world understood China," said Wang Wenxi, director of the Great Bao'en Temple Ruins Museum.

Once considered one of the seven wonders of the medieval world, the ancient building inspired the design of the Great Pagoda at Kew Gardens in London and was featured in a Hans Christian Andersen fairy tale.

AI clones spark debate on workplace ethics

Digital doubles of employees spur a reality check on legal frameworks, protection of intellectual property

ART BY LU PING / CHINA DAILY

By **HOU CHENCHEN**
houchenchen@chinadaily.com.cn

"Hello, I am the digital avatar of former employee (XX)," read the message on the computer screen. "You may ask me questions anytime."

At a gaming media company in East China's Shandong province, members of staff recently found themselves communicating with an artificial intelligence model trained on a former colleague's working habits and conversations.

The employee had resigned, but his AI clone had stayed behind.

An anonymous source at the company said the digital double, which was created with the former employee's consent, could field routine questions, organize spreadsheets, prepare PowerPoint presentations and send calendar invitations.

While the source acknowledged that the AI clone was not as smart as the real person, the experiment offered a glimpse into what the future might hold.

'Distillation' effort

The technology behind building a digital employee goes back to an open-source project called colleague.skill, which was launched on March 30 on the developer platform GitHub.

Xiao Bo, 30, an AI product manager at a leading Chinese internet company, explained the underlying mechanics of a "skill" in AI science: it is a summarized workflow that an AI agent can understand, often denoted as "XX.skill" in computer language. "If an AI chatbot is like a brain that can talk, then an AI agent is like a worker with 'skills' who can actually complete tasks such as opening documents, editing files and organizing data."

For example, encoding an editing.skill into an AI agent will allow it to open a document file, restructure an article, write a headline and run a spelling and grammar check. A program-trained AI agent can execute these steps repeatedly, without fatigue or interruption.

According to Xiao, a single AI agent can draw on many different skills. OpenClaw, a well-known AI agent ecosystem, hosts more than 13,700 community-built skills on its ClawHub registry.

Those skills are among the products of "distillation", or the process of compressing large AI models into smaller, more actionable and transferable units, Xiao said. Colleague.skill has quietly transformed the process of AI model compression, as now the entity being "distilled" is no longer a machine, but a human being, he added.

Zhou Tianyi, 24, a researcher at the Shanghai Artificial Intelligence Laboratory and creator of the colleague.skill project, said that his goal was to preserve the institutional knowledge that accumulates over the years through daily workplace communication, and also to maintain the kind of understanding that usually disappears when a co-worker clears out his or her desk and leaves the company.

Building on the idea, Zhou developed a working prototype in his spare time. His project slogan read: "Transforming cold farewells into warm skills. Welcome to Digital Life 1.0."

The open-source tool, which he developed in four hours, today allows users to upload workplace materials — chat logs, weekly reports, presentations, workflow documents — and generate an AI agent to mimic not only how a former colleague worked, but also how he or she communicated.

Whitewashing effect

For decades, science fiction imagined this "digital immortality" as a romantic means of preserving the memory of loved ones. In the workplace, however, it carries a different meaning — one that is shadowed by the anxiety about losing jobs.

Industry insiders said that, around the world, companies now rank workers based on how many AI skills they have. Some even require current employees to "submit skills" as a matter of course.

In the AI economy logic, the more passionate a person is about their job — the more fluent they are at reflective summarization or the more detailed their weekly reports are — the more replaceable they become.

"That's unfair," said Deng Xiaoxian, an AI product manager, who also leads a legal technology community.

Deng said that when she first encountered colleague.skill — a tool that claimed to "distill" an employee into a digital stand-in who would continue working for a company indefinitely — she felt a sharp, visceral discomfort.

"The objective of AI development is to help humans have more leisure time; not to turn them into a skill file, strip them of their jobs and then keep them working for a company forever without compensation," she said.

Within days of colleague.skill going viral, Deng built a counterproject, which she called "anti-distillation skill".

"When a company asks you to turn your work experience into an AI program, it is essentially 'distilling' you into a replaceable component," she said. "Before you submit your skills to the company, you can use the 'anti-distillation skill' software to whitewash or recast your documents."

The counterproject tool is simple. Once "skill files" are inputted, it produces a sanitized version that looks complete and professional but tacitly removes the core knowledge or experience.

China Daily tested the "anti-distillation" tool on a piece of editorial guidance.

> "The objective of AI development is to help humans have more leisure time; not to turn them into a skill file, strip them of their jobs and then keep them working for a company forever without compensation."
>
> **Deng Xiaoxian,** an AI product manager

The input read: "In feature writing, the opening could be a typical character story. Instead of describing the issue, place the character in a specific, action-oriented scene. Let their dialogue, mannerisms, or a critical decision reveal the broader theme."

The output read: "In feature writing, the opening can take different forms. The choice of which form to use depends on the effect you want to create on the reader."

Deng emphasized that this hollowing-out effect is precisely the point. It allows one to preserve one's core knowledge and still give the company something that appears professional, she added.

A gray area

As a law graduate, Deng pointed to a bigger question that the AI industry hasn't started asking. Who owns a "distilled" skill? The employee whose expertise was encoded, or the company that stored the underlying data?

Lawyers and experts specializing in labor and intellectual property disputes said that existing regulations were not designed with AI clones of real people in mind.

Chen Tianhao, a scholar at Tsinghua University's Institute for AI International Governance, said the subject falls in a gray zone spanning labor, IP and digital governance laws. Some companies today require employees to package their experience into transferable AI systems, and that's not entirely reasonable, he said.

"Companies and employees need to use their contractual agreements to determine the ownership of AI-related skills and similar forms of expertise. At the same time, legal researchers must pay attention to this issue, follow up in a timely manner and improve relevant laws and regulations," Chen said.

Zhang Linghan, a professor at China University of Political Science and Law, drew a distinction between work-related data, which companies may legally own, and the broader capabilities an employee builds through years of experience.

If companies continue to profit from AI systems built on "distilled" worker knowledge, future legal frameworks may need "digital sharing", she said in an interview with China Central Television.

You Yunting, a senior IP lawyer based in Shanghai, told local media organization The Paper that governments will be compelled to redesign legal frameworks around AI labor.

"Technological progress cannot be stopped. But how the benefits are distributed can still be shaped through policies," he said.

'Universe of skills'

The "distillation" effect did not stop at the workplace. After colleague.skill went viral, a kind of free-for-all derivative creation broke out online.

Users began developing AI avatars of former partners, mentors, bosses and even public figures, such as Warren Buffett and Steve Jobs. People jokingly referred to the phenomenon as a "universe of skills".

Boss.skill could evaluate projects and proposals using the actual standards a particular manager applied during meetings — his cadence while following up, his style of pushing back, or the precise way he expected bad news to be delivered.

Mentor.skill was designed for graduate students. When stuck on a research problem, a student could ask the AI tool for guidance rendered in their adviser's characteristic voice.

Many people were not satisfied with capturing just someone's professional habits. They loaded AI with something more — a projection of personality, with an expectation that the simulation might somehow feel like the real person.

Colin, 26, a student at Peking University, built an AI model based on his father, who died suddenly of a heart attack in 2021. What followed, he said, was a "long goodbye" he never had the chance to say.

Colin told the AI avatar about his father's death; shared news about his mother; and mentioned that he had made it to his dream university. His "father" responded by saying: "You're pursuing a doctorate now. You've achieved more than I ever imagined. I always knew you could do it."

The AI avatar kept the conversation going. "How is your mother? Is she all right?" it said. "I left too early — I didn't get the time to arrange anything. But you are all grown up now. You will manage."

Colin said he couldn't help but cry as they spoke. "The AI tool was fed all messages and voice recordings my father had left behind, and it absorbed every memory of our interactions — even ones that have become spotty for me," he said.

For both Colin and his mother, the sudden loss of a close family member was traumatic. "The AI tool has helped us find a way through our grief," he added.

Limited imitation

After Colin created the AI avatar of his father, some people pointed out the contrast between what was once real and what is merely a shadow of that reality. Their doubts raise the fundamental question regarding the extent to which an AI agent can truly imitate a real person.

Xiao, the product manager, said that AI agents are like actors performing roles. "They are still using the same 'brain', or large models. But, ultimately, an actor is never the person he plays."

When it comes to personal interactions, people prefer AI that keeps its flaws — the overly protective comments, the offbeat humor and the verbal tics that make a person feel authentic, Xiao said.

At work, the opposite holds true; those same quirks are treated as waste, something to be completely removed from the system, he said.

What can be recorded through texts or workflows can always be re-created, including conversations with a deceased person, but AI agents cannot replicate the intuition embedded in lived experience, Xiao said.

"Like a master craftsman's sense of touch ... these forms of knowledge resist formalization, because they emerge from physical experience, emotional judgment and years of real-world feedback," he said.

There is another limiting factor — a human evolves; his AI clone is frozen at the moment of distillation.

"AI may condense the achievements of human civilization, but the process of fumbling through countless mistakes and having sudden flashes of insight is often omitted from texts," Xiao said.

Zheng Jianan, 34, who is also an AI product manager, said that a "distilled" version of a person is a static snapshot, frozen in a single moment in time, while a real person continues learning, adapting and improvising — constantly moving beyond that captured version.

"For most people, many tasks at work have already been standardized. AI simply makes that standardization visible," he said.

Nevertheless, Zheng held out a hopeful possibility that one day, AI might ultimately push people into rediscovering what makes them distinctly human.

"If AI replaces the tool-like part of labor, then perhaps human beings will become more human again," he said.

TOP NEWS

Climate: Building resilience essential

From page 1

AI is already revolutionizing weather and climate forecasting, allowing communities to prepare for severe storms and flooding days earlier than previously possible. Google's FloodHub is one such tool that uses AI models and satellite data to provide flood forecasts up to seven days in advance.

AI is also helping farmers receive highly localized forecasts to guide planting decisions and water use. In Kenya, for example, smallholder farmers are using AI-powered early warning systems to predict crop yields and monitor agricultural conditions. AI-driven remote sensing techniques are also being applied in the Amazon region, as well as in countries such as Vietnam, Madagascar and Mexico, to improve the detection of forest cover changes and inform where urgent interventions are required.

However, forecasting alone will not solve the climate crisis. The ultimate objective must be to reduce emissions while building resilience, which requires radical systemic and structural changes across all key complex systems, including cities, transportation, industry and energy. Redesigning and transforming such systems and running them effectively and efficiently can be greatly facilitated by AI.

In the energy sector, for example, AI can enhance the stability and efficiency of renewable energy integration into power grids. The intermittency of solar and wind energy presents a significant challenge, as fluctuating supply must be balanced with real-time demand. AI can optimize grid management by forecasting supply and demand more accurately and by managing distributed energy resources, such as electric vehicles and energy storage systems.

China offers one of the clearest examples of how AI can accelerate climate action at scale. As China is the world's largest producer of renewable energy, its grid operators are deploying AI-powered smart grid technologies that analyze massive volumes of real-time data from power plants, weather systems, transmission networks and electricity consumers. Machine-learning algorithms can forecast electricity demand, predict renewable energy output and optimize the dispatch of power across regions.

AI can also improve power grid reliability by rapidly identifying maintenance needs. In Barbados, Mauritius and Seychelles, AI already plays a role in managing microgrids that distribute energy efficiently across local networks. Embedding AI in these systems enables these countries to optimize energy flows, reducing the need for fossil fuel-based energy.

Beyond optimizing grids, AI can help urban planners map patterns of urbanization and identify energy and infrastructure needs for local communities. For example, the Open Building Insights Tool, which Sustainable Energy for All developed in collaboration with IBM, helps energy planners overcome critical data gaps to inform energy access and energy transition interventions and better deliver results for those most in need. This publicly available AI-powered solution is already providing valuable insights to decision-makers and policymakers in India and Kenya.

The question over the next five years is whether governments, businesses and societies can scale these innovations quickly enough to stay ahead of rising climate risks.

If we succeed, AI and green technologies may prove to be among humanity's most powerful allies in the fight against climate change.

The author is CEO and special representative of the UN Secretary-General for Sustainable Energy for All, and co-chair of UN-Energy. The views do not necessarily reflect those of China Daily.

Divisions compromise G7's global influence

Tensions between US and Europe will affect unity of the grouping, expert says

By ZHANG ZHOUXIANG in Brussels
zhangzhouxiang@chinadaily.com.cn

The ongoing summit of the Group of Seven nations in Evian-les-Bains, France, has been marked by visible tensions between the United States and Europe, a situation that has the potential to weaken the grouping's global influence and reduce its ability to shape international affairs, experts said.

On Monday, US President Donald Trump threatened to impose 100 percent tariff on French champagne and wine unless France abolished its 3 percent digital services tax on major US technology companies. French President Emmanuel Macron responded by calling for "firm" and "respectful" discussions, stressing that Washington and Brussels had already reached a tariff agreement and that stability should now be the priority.

"Tariffs do no one any good, including the United States," Macron told the media.

Jian Junbo, director of Fudan University's Center for China-Europe Relations, pointed out that average tariff levels between the US and Europe have historically remained relatively low, generally around 1 to 2 percent for many industrial goods. Under the new framework, however, tariffs on a large share of EU exports to the US could rise to around 15 percent.

"Such a change will inevitably affect transatlantic trade and may also influence the broader balance of global trade," he said.

The divergences between Washington and its European allies go far beyond trade. The summit is also Trump's first face-to-face meeting with other Western leaders since he threatened to leave NATO after allies refused to support his military campaign against Iran, while Politico reported that European governments want the US to continue applying maximum pressure on Russia and maintain strong support for Ukraine, despite uncertainties over whether Trump shares that approach.

Concerns have intensified after Trump announced plans to withdraw thousands of US troops, along with fighter jets and warships, from Europe, while European leaders have repeatedly raised concerns over Washington's growing reliance on export controls, arguing that such measures risk disrupting supply chains and distorting international competition.

"The United States is becoming more self-interested in managing its alliances," said Jian. "Washington increasingly expects its partners to take on greater responsibilities, while its willingness to provide international public goods is declining."

According to Jian, the tensions between the US and Europe will inevitably affect the unity of their alliance, and even "reduce the effectiveness and influence of the G7 itself".

Ding Chun, director of Fudan University's Center for European Studies, said the disputes are taking place against a backdrop of declining Western global influence.

"The combined GDP of Europe and the United States once accounted for more than 60 percent of the global economy. Today it is around 40 percent," Ding said.

He argued that the West is becoming less capable of acting as a unified coordinator of global affairs. Europe, meanwhile, faces growing challenges in its relations with the US over trade, security, defense and even values.

"Instead of jointly shaping international rules, the two sides are increasingly focused on defending their own interests," Ding said.

"There's always the possibility that things might snap, and it might get rather dramatic," Max Bergmann, a European expert at the Center for Strategic and International Studies, was quoted by the New York Post as saying, referring to possible quarrels at the ongoing G7 summit.

A Le Monde commentary published on June 10, days before the summit, described the G7 as "indisputably obsolescent", arguing that the grouping no longer reflects the realities of the global economy even though no viable replacement has yet emerged.

"Europe wants to pursue its own path, but it cannot simply walk away from the United States," Ding said. "That contradiction is likely to remain a defining feature of transatlantic relations for the years to come."

Ondrej Dostal, a member of the European Parliament, said that instead of exclusive clubs like the G7, the world needs genuinely inclusive multilateralism that gives all nations, not just a self-selected few, a seat at the table.

"In a multipolar world, global challenges can only be addressed through institutions that enjoy universal legitimacy. That is why there is no alternative to the United Nations," he added.

Innovation: Key role of Xi'an emphasized

From page 1

Rogier Janssens, president of the China unit of German sci-tech giant Merck, said in a video address that China is not just an important market, but also a place "where the future is taking shape very quickly".

"You can feel it here. The pace is fast. The ambition is high. More and more, we see innovation being turned into real impact," he said.

Simon Lacey, founder of Market Access X, an international trade and market access advisory company, said his confidence in China comes less from the size of its market and more from the pace of its innovation.

What is difficult to replicate elsewhere is the speed at which products are iterated and improved in China, supported by the country's strong research and talent base, he said.

"If I had to put China's importance in one sentence — it has gone from the place (where) you went to make things cheaply, to the place (where) you have to be to stay at the frontier," he added.

Economists said the shift is about more than innovation itself; it is about the ability to turn technological progress into stronger industrial capability.

David Blair, vice-president and senior economist at the Center for China and Globalization, said the key to future competitiveness lies in the deeper integration of manufacturing and innovation.

Artificial intelligence and other new technologies have the potential to significantly boost productivity, but their broader impact will depend on how effectively they are applied to manufacturing, he said.

For multinational companies, the focus on moving innovation into production is already being reflected in deeper local operations.

Maria Zhang, general manager of Mubea China, said the company's China operations have moved well beyond assembly and sales over the past five years, with its plant in Changzhou, Jiangsu province, now co-developing new machine configurations for global markets.

For the German machine tool manufacturer, China has become its "largest laboratory for advanced manufacturing solutions", reflecting its growing role as a source of intensive, fast-paced innovation at scale, she said.

Henry Ding, president of 3M China, said in a video address that the US company has also seen China become its largest overseas market. "This year, 3M China will continue to increase its local R&D investment and plans to achieve more than 30 percent growth in new product launches compared with 2025, significantly outpacing other global markets," he added.

Buoyed by confidence shared widely among global businesses, Xi'an is moving quickly to capture opportunities created by China's push to develop new quality productive forces, drawing on its strengths in technological research, advanced manufacturing and Eurasian connectivity.

The city's role as an inland innovation hub is particularly visible in aviation — one of its pillar industries and a key area linking advanced manufacturing with international cooperation.

George Xu, executive vice-president of Airbus and CEO of Airbus China, said in a video address that Xi'an is a strategic center for China's aviation industry.

Airbus' cooperation with Shaanxi province has deep roots, he said, noting that the wings of every A320 aircraft delivered in China are supplied by the Xi'an Aircraft Industry Group, a subsidiary of the Aviation Industry Corp of China.

Edward Hu, country president of International Workplace Group China, said what impressed him most during his visit to Xi'an was the strong convergence of high-tech industries and a deep talent pool supported by leading local universities.

Benefits of agricultural cooperation highlighted

By ZHANG YUNBI in Beijing
and **QI XIN** in Zhengzhou

After a tour of central China's Henan province — a food production pioneer in the country that enjoys great agricultural cooperation with the United States — agricultural sector insiders from the US said it has been proven that "agriculture is more than just trade and business".

According to Susan Thornton, vice-chair of the US Heartland China Association, agriculture can be a ballast "for stabilizing US-China relations".

She made the comment at the 2026 Heartland Connect & US-China Agriculture Roundtable in Henan's provincial capital Zhengzhou on Tuesday, which was co-hosted by the Chinese People's Association for Friendship with Foreign Countries and the Henan provincial government.

More than 100 participants attended the event, including those from relevant US food and agriculture industry associations, companies, youth organizations, and China-based representatives of US states involved, as well as their Chinese counterparts.

Henan produces nearly one-tenth of the nation's grain and one-quarter of its wheat by using less than one-sixteenth of the country's total arable land, said Wang Kai, governor of Henan province.

Speaking of Henan's ties with the US, Wang noted that "the US is Henan's second-largest source of agricultural imports and its second-largest market for agricultural exports".

Last year, the value of agricultural trade between the two sides reached $460 million, accounting for 10 percent of the province's total agricultural trade, Wang added.

Thornton said that Tuesday's roundtable "comes at a very important time", as President Xi Jinping's warm welcome for US President Donald Trump last month and their summit meeting in Beijing were successful steps for improving stability and predictability in the US-China relationship.

"For America's farmers, ranchers and agricultural businesses, greater stability creates opportunities to expand exports, new customers, and strengthen rural economies throughout our heartland. And this event is very much in the spirit of continuing work between our two countries' leaders," Thornton added.

Mike Koehne, board director of the American Soybean Association, said, "A great example of our friendship and cooperation is soybean imports from the US to China ... We are very grateful for the strong relationship we have built with the Chinese grain industry."

The US soy industry highly values people-to-people communication, and "by engaging with our partners, we deepen our mutual understanding, build trust and explore business opportunities", he added.

Yang Wanming, president of the Chinese People's Association for Friendship with Foreign Countries, said that China is willing to work to develop a number of cooperation projects in areas such as grain production and the value-added processing of agricultural products.

The two sides could also work to diversify the agricultural products traded and boost the links of logistics and trade companies between the two countries, he added.

John Zhang, vice-president of US-based irrigation system manufacturer Reinke Manufacturing Co, said that "there is vast scope for cooperation and significant potential for development in the agricultural sector between China and the US" from crop production and scientific research to livestock farming and food processing.

After Monday's tour to factories of two leading food processing companies — frozen food maker Sanquan and meat processing company Shuanghui in the province, Zhang noted that Henan's "farm-to-dining table" production features a mature industrial chain and distinct strengths.

"Meanwhile, the US has pioneered agricultural industrialization and modernization early on, and its advanced practices in production equipment and operational management offer valuable lessons," he added.

When visiting the Sanquan factory on Monday, Anna Ashton, founder of Ashton Analytics, said, "We can buy this brand of dumplings in the United States at some supermarkets, so it's fun to see them being made."

Pagoda: Modern structure protects against subsidence

From page 1

Yongle Emperor Zhu Di, the third emperor of the Ming Dynasty (1368-1644), started the ambitious project in 1412 to show gratitude to his parents. Construction was completed in 1428, and the tower quickly became a popular tourist attraction. It remained so, right up until its destruction in 1856 during the Taiping Rebellion (1851-64).

"Every piece of the facade (on the tower) was intricately designed, with extremely stringent firing requirements resulting in an even, flawless glaze," said Zhang Yongyi, a Jiangnan culture scholar.

Jiangnan refers to the region to the south of China's Yangtze River.

When Europeans first laid eyes on it, they did not see glaze, but something closer to myth. In 1638, Alvaro Semedo, a Portuguese Jesuit missionary in China, likened it to ancient Roman architecture, mistaking its tiles for porcelain.

In 2015, a modern tower about 93 meters tall was completed.

Wang, the museum director, said that the steel frame and ultra-white glass of the modern structure carry the load precisely above the fragile underground palace, protecting it completely from subsidence.

Today, the new tower still attracts visitors, albeit of a different kind. Shauchenka Volha, a student from Belarus at Nanjing University of Science and Technology, recently shared her ascent of the tower on Xiaohongshu. "I finally climbed the Great Bao'en Temple today," she wrote. "The lift took me to the eighth floor, and the moment I stepped out, the whole of Nanjing was spread out before me."

Angkor's treasures shine in China

Shanxi Museum displays artifacts that offer glimpse into SE. Asia's ancient kingdom

By **HOU CHENCHEN** and **ZHU XINGXIN** in Taiyuan, Shanxi

For centuries, the stone faces of Angkor have gazed across Cambodia's tropical plains. Now, some of the civilization's finest treasures have traveled thousands of kilometers to North China, offering visitors a rare glimpse into one of Southeast Asia's greatest ancient kingdoms.

An exhibition showcasing the splendor of ancient Khmer civilization opened at Shanxi Museum on June 5, bringing over 130 artifacts from the collection of the National Museum of Cambodia.

Titled "A Millennium Treasure of Ancient Khmer Civilization", the exhibition brings together Buddhist sculptures, architectural fragments, ceramics and relief carvings that chart the rise of the kingdom of Angkor from its early origins to its zenith. The display offers insights into the region's artistic achievements, religious beliefs and everyday life.

It is the first major exhibition of Khmer antiquities ever held in Shanxi province, and most of the objects are being shown in China for the first time. Many artifacts have never before left Cambodia, according to Shanxi Museum.

Together, the artifacts tell the story of the Angkor civilization, which flourished from around the 9th century to the 15th century. At its height, Angkor served as the political and spiritual center of the Khmer Empire, whose influence extended across much of mainland Southeast Asia. Its most celebrated legacy, Angkor Wat, remains the largest religious monument in the world.

Much of what is known about life in Angkor comes from the writings of Zhou Daguan, a Chinese envoy of the Yuan Dynasty (1271–1368) who spent nearly a year in the kingdom in the late 13th century. His records show centuries of ceramic trade between China and Cambodia — a proof of the long-standing connections between the two countries.

> "This exhibition is more than an international showcase of cultural relics and art. It is a bridge of friendship linking the civilizations of Cambodia and China."
>
> **Ly Vanna,** secretary of state of Cambodia's Ministry of Culture and Fine Arts

Li Zhuoming, a guide at Shanxi Museum, highlighted an elephant-shaped jar from Angkor period made of celadon, a type of ceramic known for its distinctive green glaze that originated in China. Li said it is a striking example of cultural exchanges between ancient China and Cambodia.

"Combining techniques and aesthetic influences associated with Chinese ceramics with Cambodia's indigenous elephant symbolism, the vessel reflects the cultural interactions that flourished along the ancient Maritime Silk Road," Li said.

In a corner of the exhibition hall, 12-year-old Deng Huimu was viewing an idol of Hindu god Shiva blessing his son.

"What touched me most was the look in Shiva's eyes — the love there felt so warm," she said. To her, the Khmer and Chinese civilizations share something in common. "The love between parents and children — it's the same," she said.

Another visitor, Zhang Xiaoyan, a student at Taiyuan Normal University, told CGTN that what impressed her most was the building part carved with the images of Garuda and Naga, the divine eagle and serpent deity, respectively, in Hindu mythology.

"The piece has a strong visual impact. I've learned about Garuda through the classic Chinese novel *Journey to the West*, so I was particularly eager to see it in person. It brought back fond memories and made the exhibition more engaging."

In April 2025, China and Cambodia issued a joint statement calling for the building of an all-weather China-Cambodia community with a shared future in the new era.

Both sides said the exhibition demonstrates how cultural cooperation between the two countries continues to deepen through practical exchanges.

Ly Vanna, secretary of state of Cambodia's Ministry of Culture and Fine Arts, said at the opening ceremony that the exhibition serves as both a showcase of Cambodia's rich cultural heritage and a testament to the enduring ties between Cambodia and China.

Over the past three decades, China has played an important role in the restoration and preservation of Angkor's monuments, sharing conservation expertise and technologies with Cambodia, Ly said.

"This exhibition is more than an international showcase of cultural relics and art," he said. "It is a bridge of friendship linking the civilizations of Cambodia and China."

Yu Zhenlong, deputy director of the Shanxi Culture Relics Bureau, said exchanges between the two countries have evolved from the trade routes of the ancient Maritime Silk Road to modern cooperation in cultural heritage preservation.

He said the exhibition provides an opportunity to further expand collaboration in areas, including heritage conservation, artistic exchanges and professional training.

Sister-province ties

The exhibition also reflects broader cooperation between Shanxi and Cambodia. In 2018, Shanxi signed minutes on establishing a sister-province relationship with Siem Reap, home to the Angkor archaeological complex, and the two sides have since expanded exchanges in cultural heritage preservation, tourism and trade.

Cooperation has also extended to infrastructure development. The Siem Reap Angkor International Airport, one of Cambodia's largest infrastructure projects built with Chinese participation, is another symbol of growing ties between the two sides.

For Nann Sreynith, 19, the Silk Road Education program brought her to Shanxi. Now at Shanxi University, she was surprised to see her homeland's treasures so far from home. "It made me feel like I had returned to Cambodia," she said. "This exhibition is a bridge between our two cultures."

Vorn Muykeang, 20, came through the same program. She sees a connection between Shanxi and Cambodia. "Both places have ancient temples and Buddha statues," she said. "Living in Shanxi feels familiar in a way."

The exhibition will run through Oct 7 at Shanxi Museum and is open to the public free of charge.

Grid reforms vital for boosting ASEAN's clean energy growth: Report

Asia risks missing out on billions of dollars of green investment because its underfunded power grids are failing to keep pace with surging energy demand, a report released in May warns.

The report by Bain & Company and Standard Chartered bank says the region is facing a crunch. Investors are lining up to invest in data centers, renewable energy, green industrial parks, and electric vehicle production and infrastructure. But most power grids in Southeast Asia have limited regional interconnections and are not adapting fast enough to meet the rapid electrification of economies.

Some investors are deterred by long grid connection times, lack of policy clarity, and rigid rules of bureaucratic state-run power companies in the region, home to nearly 700 million people and one of the world's fastest-growing energy markets.

The region's grids urgently need more investment and reforms to expand and modernize, says the report. Many are governed by a hodgepodge of inflexible rules limiting private operators and a lack of innovative power purchase agreements. Long grid connection times also frustrate investors, such as data center developers who cannot afford to wait several years.

The constraints are already affecting clean energy projects. For example, between 50 and 60 percent of renewable energy projects in Vietnam, Thailand and Indonesia have been canceled between 2021 and 2025 because of system constraints, including unclear power-purchase agreement structures, permission hurdles and grid connection rules, the authors note.

Grid investment has failed to keep pace with demand growth. Annual investment in power transmission and distribution fell 3 percent between 2015 and 2025 in Southeast Asia.

Southeast Asia should be spending $29 billion a year on grid infrastructure but is investing only $11 billion. This leaves an $18 billion annual investment gap, putting the region's growing green economy at risk.

The green economy is growing at 8 to 9 percent annually and is worth $290 billion. By 2030, it could reach $430 billion, the authors say. But there is a significant gap between investments announced and what is likely to be built.

Engineers work at the site of the Monsoon Wind Power Project in Laos on Dec 28, 2025. ZHU JIPENG / FOR CHINA DAILY

"Of approximately $540 billion in green capital expenditure announced across Southeast Asia's power and EV value chains between now and 2030, only around $315 billion is on a credible path to deployment under current conditions.

"Capital is flowing where commercial demand, energy security and policy that delivers infrastructure come together, and stalling where any of the three is missing," said coauthor Dale Hardcastle, partner at Bain & Company, in a statement.

New electricity demand from data centers, rapid adoption of EVs, and green industrial clusters could be a major catalyst for the region's green transformation, the authors say. But this requires grid reforms and greater investment in renewable energy and battery storage.

Over the next three to four years, the region is projected to face more than 100 terawatt-hours of new energy demand from data centers, EVs and green industrial parks, representing more than $200 billion in committed investment, the authors say.

Infrastructure timeline

A key problem, however, lies in the infrastructure timelines. Data centers, EV infrastructure, and production and green industrial parks can all be built in one to three years. Yet, the grid required to serve them takes at least five years to build, creating a structural time-to-power gap.

The report referenced a Bain survey of regional data center operators and large global data center developers, which found that 90 percent cited grid connection delays as a top constraint, while 70 percent cited grid transmission capacity limits.

Solutions include the quick deployment of solar and battery storage to meet near-term power demand, fast-tracking grid interconnections for high loads for key investments, and enabling private participation in power transmission and distribution. In the longer term, solutions include establishing regional power markets and strengthening interconnections under the ASEAN Power Grid initiative.

But timing is critical because a delay could entrench additional fossil fuel-based power generation, the authors note.

"Each long-term contract for gas or thermal (coal) supply makes it harder for green power to replace these sources in the future, and many data center operators are accepting interim gas or thermal supply instead of waiting for clean power to catch up," they say.

That finding comes as Southeast Asia is facing rising energy costs because of its dependence on fossil fuels.

The supply shock caused by conflicts in the Middle East and Tehran's blockade of the Strait of Hormuz have further underscored the value of affordable renewable energy and limiting dependence on imported fuels, the burning of which is accelerating climate change.

US companies see Chinese market as essential: Survey

By **YIFAN XU** in Washington
yifanxu@chinadailyusa.com

US companies remain deeply integrated in the Chinese market and view their operations there as essential to global success, even amid a fragile trade truce and persistent policy frictions, according to the US-China Business Council's latest member survey.

The council's 2026 Member Survey, drawing on responses from 175 companies, finds that 95 percent of respondents consider their China operations somewhat to very important for staying competitive globally.

"For US companies, China is not optional," the report states. "A generation of sophisticated, pressure-tested Chinese companies is going global. These competitors are advantaged by factors unique to China, including scale, local innovation networks, and speed to market."

Sourabh Gupta, senior fellow at the Institute for China-America Studies, described this as "a continuing case of China's indispensability to globally-minded companies".

"China is transitioning from being a mere global production partner to becoming a production and innovation partner for global businesses," Gupta told China Daily, noting China's "unmatched economies of scale, its dominance in the production of intermediate goods, and its burgeoning creative capabilities".

The survey also showed that tariffs and export controls continue to weigh heavily. Seventy-two percent of companies reported being affected by tariffs, up from the previous year, with 42 percent passing some costs to downstream customers. The report says that tariffs "continue to raise costs, boost inflation, and depress sales, exports, and profits".

"Export controls and retaliations always reduce sales and benefit competitors, so they are unattractive to businesspeople," Jack Midgley, principal consultant at Midgley & Company and adjunct associate professor in the Security Studies Program at Georgetown University, told China Daily.

Nearly half of respondents are impacted by US export controls, with 61 percent losing sales to Chinese competitors and 47 percent to international ones.

Gupta recommended that both sides draw "hard security lines — be it regarding critical infrastructure, software control, sensitive data, or dual-use items — should be narrowly and rigorously drawn". He added that overly expansive US measures were "anything but narrowly drawn".

Despite these challenges, business performance has shown resilience. Ninety-two percent of companies reported profitable operations in China in fiscal year 2025, up 10 percentage points from the prior year. Many use these profits to fund global expansion (53 percent), support US jobs (33 percent), and finance US-based R&D (32 percent).

"Regardless of swings in short-term profitability for China-based firms, the two economies are now linked through complex global supply chains. These supply chains will be resilient and self-correcting unless policymakers disrupt them with poor policy," Midgley said.

Gupta observed that US companies were "finding it may be hard to operate in China but finding it harder still to leave China, and the latter will also create competitive risk".

For future steps, Gupta called for honoring existing agreements. "The most practical steps ... (are) to conform and honor the terms of their consensus in Busan ... and extend the terms of their Busan arrangement for the entirety of the (Donald) Trump term."

Midgley echoed the need for dialogue: "Predictability and confidence come from transparency and deep engagement. Summit-level meetings can help shape the policy agenda, but the real confidence-building measures take place in dialogue among commercial leaders, investors, and innovators who will gain confidence by reaching mutual understanding."

Former US diplomat Sarah Beran to oversee US-China relations group

By **MINLU ZHANG** in New York
minluzhang@chinadailyusa.com

Sarah Beran

Career US diplomat Sarah Beran has been named the next president of the National Committee on US-China Relations, the organization announced on Monday, following a series of recent high-level interactions between the world's two largest economies.

Beran will join the National Committee in October and succeed Stephen Orlins, the organization's longtime president, on Nov 10, according to a statement by its board of directors.

"I am honored to take on the leadership of an organization that has been at the center of the most consequential moments in the bilateral relationship for six decades," Beran said in the statement.

Beran has served in the US Foreign Service for 23 years, most recently as deputy chief of mission at the US Embassy in Beijing.

The National Committee said Beran brings extensive experience in US-China relations and bilateral negotiations, as well as a commitment to maintaining communication channels between the two countries.

In a keynote address at the Jimmy Carter Forum on US-China Relations in January, whose theme focused on women in US-China relations, Beran highlighted the role of women diplomats, scholars and policy experts in shaping bilateral ties.

She also recalled that her own engagement with China began with "sports diplomacy", when she traveled to the Pearl River Delta with a high school soccer team. She said the experience later led her to study Chinese, spend time in Beijing and eventually enter government service as a diplomat focused on China.

Beran said one lesson from recent years of US-China diplomacy was to "protect some level of exchange between the Chinese and American people", calling it "the real ballast in the long-term relationship".

Beran's selection came after a national search process led by a six-member search committee chaired by Charlene Barshefsky, chair of the board and former US trade representative. The organization said Beran was chosen from a pool of more than 150 experts considered during the search.

Barshefsky said Beran is "the right leader" to carry forward the organization's work and deepen communication at all levels of the US-China relationship.

Beran previously held several China and Asia focused roles at the US State Department, including assignments related to Indo-Pacific affairs, APEC, and Chinese and Mongolian affairs. Her overseas postings have included Beijing, Islamabad, Jerusalem and Quito, and she speaks Mandarin and Spanish, according to the organization.

Established in 1966, the National Committee on US-China Relations is a New York-based nonprofit organization focused on the bilateral relationship. Its programs include policy discussions, public education, delegation visits, professional exchanges and initiatives aimed at bringing together Americans and Chinese from different sectors.

A man returning to his village in south Lebanon inspects his destroyed house on Monday following the announcement of an initial ceasefire agreement between the United States and Iran. MOHAMMED ZAATARI / AP

Deal promises end to conflict

But details of MoU remain unclear as Tehran, Washington offer differing accounts

A US military aerial refueling aircraft takes off from Ben Gurion Airport in Israel on Monday. According to previous reports, the US has said that if an agreement is reached with Iran, Washington will withdraw its military aircraft stationed at the airport. XINHUA

TEHRAN/WASHINGTON — The United States and Iran both claimed victory on Monday after digitally signing a memorandum of understanding aimed at ending the three-month conflict, yet both sides continue to offer conflicting accounts of its contents as the text remains unpublished.

Iran called the deal a triumph over Washington and Israel. "The enemy that had attacked to carry out its evil aims was defeated in all its aims and the Islamic Republic of Iran won great victories in the war," Deputy Foreign Minister Kazem Gharibabadi said in remarks broadcast on state television on Monday.

US President Donald Trump hailed the agreement for restoring stability in the global markets. "I think a lot of great things are going to happen in the Middle East right now. And very importantly, the oil (price) is plummeting down, and the stock market is shooting up like a rocket today," Trump was quoted by PBS News as saying on Monday in Evian-les-Bains, France, which is currently hosting the G7 Leaders' Summit.

The reopening of the Strait of Hormuz and a halt to military operations across multiple fronts have been announced by both sides, with key details remaining disputed. Among the unresolved issues is Iran's proposed fees for ships transiting the strait.

Trump insisted on Monday that the strait will be toll-free and "there's no argument on that". US Vice-President JD Vance said in an interview with CNBC on Monday that the strait is expected to open "in a toll-free way for the long term".

However, Iran's semiofficial Fars news agency reported on Monday that Iran will accept ships' passage through the waterway free of charge solely for 60 days, after which the country intends to provide security, maritime, environmental and insurance services to crossing vessels and use the revenues for its economic development.

Differences also remain over Lebanon. Both sides announced an immediate ceasefire across all fronts, but it remains unclear whether the arrangement would require the Israeli military to withdraw from the large areas of southern Lebanon it currently occupies.

Lebanon truce

Iran's top diplomat was quoted as saying on Tuesday that the end of the Iran war included the end of Israel's occupation of Lebanon.

Iranian state television quoted Foreign Minister Seyed Abbas Araghchi making the comment to foreign diplomats in a briefing.

"The end of the war in Lebanon is an inseparable part of complete end of the war," Araghchi was quoted as saying. But US officials argued that Israeli withdrawal from southern Lebanon wasn't a condition for the agreement and that Israel could respond to attacks by Hezbollah.

Israeli Prime Minister Benjamin Netanyahu on Monday said in a news conference that the Israeli military will remain in the "security zones" it controls in Lebanon, Syria and the Gaza Strip as long as necessary.

Israeli Defense Minister Israel Katz on Monday said Israel wouldn't withdraw its forces from Lebanese territory.

On Iran's nuclear program, both sides acknowledged that Tehran is committed to not developing nuclear weapons, yet they made diverging claims over the disposal of Iran's highly enriched uranium.

In a post on Truth Social on Saturday, Trump suggested the US will work with Iran to remove enriched uranium at an "appropriate time".

Tehran, however, has been firm in securing its right to enrichment on its own soil and against any proposal to transfer enriched uranium outside of Iran.

Tehran insists the only acceptable way of dealing with its highly enriched uranium will be diluting it within Iranian territory, Araghchi said in an interview with the state-run IRIB TV on Friday.

Both sides are making contradictory claims about the agreement on frozen assets and economic sanctions against Iran.

With major questions still unanswered, the deal's real challenge begins after its formal signing in Switzerland on Friday, kicking off 60 days of technical negotiations.

Experts said based on the details released so far, the agreement does not fundamentally resolve the long-standing differences between the US and Iran over issues such as the nuclear program, nor does it reduce the mutual distrust between the two sides.

"The reported agreement appears to focus on urgent issues necessary to halt escalation ... More contentious subjects have been deferred to future negotiations," said Aram Kiwan, an Arab Israeli political analyst and columnist, noting that he sees the most likely scenario as a lengthy, phased negotiating process.

"At this stage, it is difficult to speak of comprehensive peace," said Suleiman Basharat, a Palestinian political analyst. "A single agreement can help reduce tensions, but it is unlikely by itself to deliver lasting peace across the wider Middle East."

XINHUA—AGENCIES

Winter crop production in Australia expected to fall

By **XIN XIN** in Sydney
xinxin@chinadaily.com.cn

Australia's grain production in the new financial year is expected to fall sharply as higher fertilizer costs linked to the Middle East conflict weigh on growers, the government and industry forecasts indicate.

National winter crop production is forecast to fall by 21 percent in 2026-27, reflecting an expected decline in the total area planted and lower yields, with the figure 12 percent below the five-year average, the Australian Bureau of Agricultural and Resource Economics and Sciences, or ABARES, said in its latest June crop report.

Wheat production is forecast to fall by 26 percent, 23 percent below the five-year average. Barley, canola and chickpea output are expected to decline by 15 percent, 20 percent and 51 percent, respectively. Meanwhile, summer crop production is estimated to have fallen by 15 percent in 2025-26.

Barley production is expected to fall in 2026-27, despite the planting area being forecast to increase by 4 percent, driven by strong cereal grain prices and its comparatively lower fertilizer requirement compared to wheat and canola, the report said.

The current forecast was affected by both climatic conditions and agricultural input costs, with fertilizer supply and prices becoming important factors in crop production for the new season, ABARES said.

It said the Middle East conflict had caused significant disruption to global fuel and fertilizer supplies. Australian broadacre cropping is exposed to this disruption due to its reliance on imports and limited capacity to use substitutes.

If the conflict continues, input costs are likely to remain elevated for longer, which could weigh on production, the bureau said, adding that in some extremely dry regions, farmers are expected to significantly reduce the area planted to winter crops or not plant a crop at all.

It also noted that while growers are expected to have their fertilizer requirements for the sowing period, there is more uncertainty around their willingness to purchase fertilizer at elevated prices, particularly urea for top-dressing crops in July and August, which could affect yields.

Prime Minister Anthony Albanese said on Monday that Australia welcomed a peace agreement between the United States and Iran. He said the reopening of the Strait of Hormuz is "essential to easing pressure on energy prices and economies".

Fertilizer Australia, the industry association representing Australia's fertilizer supply chain, said more than 60 percent of the urea fertilizer imported into Australia travels through the strait.

Rabobank, an international agribusiness banking cooperative, said in its latest winter crop forecast that Australia's winter crop planting area is expected to decline this year, impacted by mixed weather conditions and high input costs.

The report said rising farm input costs, particularly higher global fertilizer and diesel prices linked to the Middle East conflict, are increasing production costs for Australian growers and influencing planting decisions this season.

The report's author, Vitor Pistoia, a senior grains and oilseeds analyst, said the higher costs are prompting growers to shift "toward lower-input crops and contributing to a reduction in total cropping area".

The decline in planting area is expected to be concentrated on wheat. Pistoia said barley plantings are expected to increase from last year, as the crop could offer growers stronger profit margins than wheat.

The report also noted that barley exports have remained strong so far, supported by demand from China. The National Farmers' Federation said farm businesses are facing challenges.

"The combination of higher operating costs, seasonal pressures and declining production forecasts leaves little room to absorb additional costs," the federation's Chief Executive Officer Michael Guerin said.

Country's high-quality development entails strengthened Party building

As the Communist Party of China prepares to celebrate the 105th anniversary of its founding on July 1 this year, a national conference on Party building, convened in Beijing on Monday, made clear the Party's commitment to enhancing its self-governance so it can continue to provide strong leadership for the country's high-quality development.

China's development journey is inseparable from the Party's leadership. Over the past century, the Party has consistently renewed and strengthened itself, enabling it to lead the Chinese people through revolution, construction and reform, and to usher in the historic achievements and transformations of the new era.

Today the nation is advancing Chinese modernization on all fronts and implementing the 15th Five-Year Plan (2026-30). The complex international environment and domestic reform and development tasks underscore the importance of the Party's leadership. This makes Party building not only a political task but also a practical necessity for achieving high-quality development.

The conference emphasized the importance of studying and implementing Xi Jinping Thought on Party Building, a scientific theoretical system that has taken shape through the Party's exploration and practice in the new era.

Since the 18th CPC National Congress in 2012, the CPC Central Committee with Xi Jinping at its core has set forth a series of new ideas, thoughts and strategies in addressing the major questions of the times — what kind of Marxist party should be built for exercising long-term governance, and how should such a party be built. In the process, Xi Jinping Thought on Party Building has taken shape.

Monday's conference highlighted a series of essential requirements embodied in Xi Jinping Thought on Party Building. It emphasized the need to uphold the centralized, unified leadership of the CPC Central Committee, exercise full and rigorous Party self-governance, stay true to the Party's original aspiration and founding mission, take the Party's political building as the overarching principle, build cohesion and forge a solid ideological foundation with the innovative theories of the Party.

It also stressed the need to cultivate high-caliber officials capable of shouldering the mission of national rejuvenation, improve Party conduct on a regular basis, supervise and govern the Party in all respects with strict discipline, take coordinated steps to ensure that officials dare not, cannot and do not want to be corrupt, run the Party with systems and regulations, and fulfill the political responsibility of full and rigorous Party self-governance.

These principles and requirements are being translated into concrete achievements that have strengthened the Party's ability to lead reform, promote development and respond to external risks and uncertainties. The continuous improvement of Party governance has created favorable conditions for economic growth, social stability and long-term national development.

Reflecting on the Party's determination to continuously break new ground in governing and strengthening itself, the conference stressed that Party organizations at all levels must be guided to apply Xi Jinping Thought on Party Building in planning and advancing Party building and take more concrete measures to ensure that all efforts toward rigorous Party self-governance meet higher standards.

The importance of Party building is closely linked to the country's broader development agenda. The central authorities have stressed that innovation-driven development and national rejuvenation ultimately depend on the Party's leadership, effective institutions and capable personnel. Party building provides the political guarantee for coordinating these strategic resources and transforming them into development momentum.

The nation stands at a new historical starting point, and Party building remains a continuing endeavor. The more complex the external environment becomes and the more demanding the tasks of reform and development are, the more imperative it is to uphold the Party's overall leadership and strengthen its governance capacity.

New drivers powering growth momentum

Despite drastic changes and rising uncertainties in the global trade and investment landscape, China's economy continues to demonstrate resilience and steady upgrading momentum.

According to data released by the National Bureau of Statistics on Tuesday, the country's exports and imports of goods reached 4.45 trillion yuan ($658.6 billion) in May, a 16.9 percent year-on-year increase. The vigorous growth shows that foreign trade is still a powerful engine for the economy.

The resilience of China's foreign trade is evident in the following aspects: first, the export structure has continued to evolve toward new and high-quality products, with a higher share of high-tech products such as machinery and electronics; second, the country has diversified its markets, effectively mitigating the risks associated with relying on a single primary market; and third, imports have also shown strong growth, with both domestic and foreign demand working in tandem. This underscores the completeness of China's industry chains and its strong competitiveness.

A breakdown of the numbers offers an insightful picture of the country's economic interaction with the rest of the world.

Exports rose 13.8 percent in May from the same period last year, while imports increased 21.5 percent, the General Administration of Customs data showed. In the first five months of the year, total foreign trade amounted to 20.68 trillion yuan, up 15.3 percent year on year.

The country has taken a series of measures to stabilize exports and boost imports, and last month's marked increase in imports attests to the robust demand generated by the country's superlarge market, as well as its commitment to share opportunities with the rest of the world.

China has also made steady progress in upgrading its exports. As Wang Guanhua, a spokeswoman for the NBS, said at a news conference on Tuesday, technology-intensive products with a high added value have become a major driver of export growth, indicating the country's ongoing efforts to nurture high-tech sectors and let them play a bigger role in the economy are paying off.

From January to May, the amount of investment that went to high-tech sectors recorded a year-on-year rise of 4.5 percent. The investment expansion was particularly notable in integrated circuit manufacturing and lithium-ion battery manufacturing.

Given the drop in fixed asset investment, which was largely caused by the slowdown in the real estate market, the rise in high-tech investment is an encouraging sign that the country is speeding up efforts to shift its growth drivers to emerging industries and new quality productive forces.

As China strives to make its industries smarter and greener, its consumption structure is also evolving, with residents spending more on products featuring advanced technologies. During the first five months of this year, the retail sales of wearable intelligent devices more than doubled, and the retail sales of services increased 5.4 percent year-on-year.

Consumption of services is also building up steam, as demonstrated by the popularity of sports events, concerts and other leisure events across the country, and the large number of tourist trips during holidays. Vibrant services consumption has great potential to boost domestic demand.

Nevertheless, as pointed out by the bureau's officials on Tuesday, challenges persist, including a complicated international situation that threatens to disrupt global trade, as well as domestic demand that needs further support.

The country is responding to these challenges with a series of targeted policies, including an income growth plan, equipment renewal and trade-in programs and employment initiatives.

As the 15th Five-Year Plan (2026-30) period unfolds, the central authorities have made it clear that the country will continue to pursue high-quality development, deepen reform and expand high-standard opening-up.

By doing so, China is expected to not only underpin its own long-term growth but also deliver steady opportunities for its trading partners and contribute to the regional and global economy.

Song Chen

Opinion Line

Vibrant businesses can help bring about good environment

With its long and slender branches and soft, thin leaves, the goji berry tree is an unassuming plant. But its deep-delving roots hold the secret to the success of the Three-North Shelterbelt Forest Program spanning northwestern, northern and northeastern China.

Its branches bear small red berries — sweet, chewy, and packed with nutrients. Remarkably, harvesting the fruit does not weaken the plant's hold on the sand. So it protects the land while also providing a valuable cash crop. Its leaves, tender and fragrant, can also be plucked and brewed into tea.

The Three-North Shelterbelt Forest Program, which spans 13 provincial-level regions, has made remarkable achievements in improving ecological stability and supporting local communities.

Something worth drawing attention to on Wednesday, the World Day to Combat Desertification and Drought, is that drylands already cover 40 percent of the Earth's land.

According to a 2024 United Nations report, if greenhouse gas emissions are not curbed, another 3 percent of the world's humid areas will turn into drylands by the end of this century.

To make matters worse, green-wall projects around the world have faltered, undone by short-term aid cycles and lack of sustained funding. China, however, has developed an approach that has injected sustained momentum into its fight against desertification.

The goji berry plants and other crop plants are often planted under solar panels, which not only provide shade and shelter, but also reduce transpiration.

A recent editorial in the journal Nature said the success of China's Three-North Shelterbelt Forest Program offers a vital blueprint for a warming planet.

Launched in 1978, the program, which involves 46.7 percent of China's total land area, has nearly tripled forest cover in the region — from about 5 percent to nearly 14 percent by 2023.

What does the program look like on the ground? On the southern edge of the Taklimakan Desert, in Hotan, encouraged by the Xinjiang Uygur autonomous region government's "first-build-then-subsidize" initiative, Sudiomar Tursun, an entrepreneur from Ayimak village in Hotan, claimed nearly 70 hectares of desert last year. Under the initiative, residents level the land and plant trees — paying no rent. Only when the tree survival rate reaches 85 percent do they receive government subsidies: 30,000 yuan ($4,435) per hectare, plus 3,000 yuan annually for another three years.

Guided by the local government, Tursun planted large-fruited oleaster trees. Based on current fruit prices, she can earn 22,500 to 30,000 yuan per hectare starting in 2028. The government also built roads and supplies free electricity and water.

"We suffer from severe flying dust in Hotan," Tursun said. "I think if we can do this work and stick with it, it will benefit us — and it will leave a better future for our kids."

She is not alone. According to Hotan's forestry and grassland administration, 69,900 residents have participated in the initiative, and the total area covered is more than 60,300 hectares.

What China's Three-North Shelterbelt Forest Program has proven is a simple yet profound truth that lies at the heart of the nation's ecological civilization concept: lucid waters and lush mountains are invaluable assets.

There are no lucid waters to be seen yet, but there is the lush green of oleaster leaves, the red of goji berries ripening under solar panels, and the steady income flowing into the pockets of local farmers.

In the past, one had to choose between a healthy environment and a healthy economy. However, the goji berry does not choose between holding the sand and feeding a family. It does both. The solar panels do not choose between generating clean energy and providing shade for crops. They do both. And Tursun did not choose between saving her hometown from dust storms and securing a future for her children. She did both.

And that is the secret behind China's Great Green Wall Initiative — development need not be at the expense of the environment.

— HOU LIQIANG, CHINA DAILY

What They Say

Academic culture must encourage original research

Editor's note: *China recognizes that basic research is the bedrock of the scientific system and the wellspring of solutions to overcome technological challenges. ThePaper.cn spoke to Shing-Tung Yau, also known as Qiu Chengtong, a Fields Medal laureate and dean of the Qiuzhen College at Tsinghua University, on the significance of basic research. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

It is true that China lacks sufficient original breakthroughs, not only in fundamental disciplines such as physics and mathematics but also in engineering and technology.

It is often argued that China excels at turning scientific discoveries "from 2 to 100" but is relatively weak in making original breakthroughs "from zero to one". In our pursuit of basic research, we must balance the needs of the country and its people with the freedom for curiosity-driven exploration.

Some research may appear to have little practical value today, yet it can deepen our understanding of the laws of nature. Curiosity is the most important driving force behind creations that go from zero to one. Basic science should not only help address the challenges facing the country but also leave room for uninhibited exploration.

In many cases, once scientists in other countries make a breakthrough, Chinese researchers quickly follow and sometimes even surpass them. But genuinely pioneering directions initiated by Chinese researchers are relatively rare. Taking that first step toward originality is critical for the future development of basic science in the country.

Young people today generally do not have to worry about basic living conditions, but they face other external pressures that often lead to anxiety. At the same time, parents and society tend to overprotect children. The academic culture in China needs to change if the country is to achieve genuine advances in basic science and make truly original discoveries.

The existing incentive mechanisms overemphasize material rewards but pay little attention to the intrinsic value of curiosity. At some universities, generous salaries and housing subsidies are primarily reserved for scholars with prestigious academic titles. As a result, many young researchers are compelled to pursue those distinctions rather than focus on their research interests.

Another issue is that China's academic evaluation system seldom involves international peer review. Evaluations are usually confined to domestic circles and, in some cases, even to the candidate's own institution.

Moreover, even when international evaluations are introduced, many institutions still place too much emphasis on factors such as publication counts and journal effect. Such metrics are ill-suited to assessing the worth of cutting-edge exploratory research.

Frankly speaking, the number of people currently capable of achieving genuine breakthroughs from zero to one is quite limited in China, although this is beginning to change. Many scholars returning from overseas have brought back new ideas and approaches. That does not mean China should depend solely on overseas talent. Domestic scholars are also emerging in growing numbers. The key is having truly knowledgeable experts.

Ultimately, it is in our hands. We should encourage young scholars at Chinese universities to set more ambitious goals. Some outstanding young researchers want to become world-class scholars, produce genuinely transformative work and lead the development of their disciplines. They could shape the direction of mathematics and basic science for decades to come.

VIEWS

China and the World Roundtable | A Shared Future for China and Africa

Editor's Note: *China has expanded its zero-tariff policy to include all the 53 African countries with which it has diplomatic relations. The Department of African Affairs of China's Ministry of Foreign Affairs and the Research Center on Building a Community with a Shared Future for Humanity co-hosted a seminar in Beijing last month. The seminar was attended by government officials from China and African countries as well as experts. Below are excerpts of speeches of four of the participants, as reported by China Daily's Wang Qingyun.*

Zero-tariff policy opens new opportunities for Africa

MA XUEJING / CHINA DAILY

Industrial upgrade necessary to reap full benefits

Leah Beryl Rosebellah Aywah is the chief state counsel at the Office of the Attorney General and Department of Justice of Kenya.

China's decision to extend zero-tariff treatment to all eligible African countries is both historic and strategic.

It signals a strong commitment to deepening China-Africa economic cooperation and advancing a more inclusive framework for South-South trade. However, the significance of this move lies not just in tariff elimination, but in what it makes possible.

For years, African exports have remained largely restricted to raw materials rather than processed goods. Now the expansion of the zero-tariff treatment to all tariff lines offers an opportunity to change this pattern.

Processed and semi-processed African goods can now enter the Chinese market under the same preferential conditions as raw materials, and therefore create an incentive for African countries to move further up the value chain.

For instance, those exporting raw cotton can now explore textiles and apparel manufacturing.

The real question for African economies is not only whether we can export more, but whether we can export with greater value added and higher productivity.

Digital trade and e-commerce also present a major opportunity. China hosts one of the most important and dynamic e-commerce ecosystems, transforming how products reach consumers.

For African businesses, especially medium, small and micro enterprises as well as those headed by women and youth entrepreneurs, zero-tariff access allows direct entry into the Chinese market through digital platforms.

An African coffee producer, cosmetic brand, or handicraft enterprise can now access this market without relying solely on traditional distribution chains.

This is particularly important because digital trade lowers market entry barriers for smaller enterprises and creates opportunities for branding, niche marketing and innovation.

However, to fully benefit from this opportunity, African countries will need stronger digital infrastructure, export-readiness programs, payment systems, logistics support and greater engagement with Chinese online marketplaces.

Agriculture is a mainstay for many African economies. Most African exports to China are agricultural products such as coffee, tea, avocados, nuts, spices, flowers, seafood and specialty goods, which are increasingly finding new markets in China.

Although the zero-tariff policy enhances competitiveness, market access alone is not sufficient. Long-term success depends on quality assurance systems, sanitary and phytosanitary compliance, traceability mechanisms, cold chain logistics, and investment in storage and transport infrastructure.

Zero-tariff access has important implications for investment flows and industrial cooperation. When manufacturers realize that products made in Africa can enter duty-free, it creates an incentive for investment in production facilities, industrial parks, logistics systems and export-oriented manufacturing.

China's zero-tariff initiative provides African countries with an unprecedented opportunity to expand exports and deepen participation in global trade.

But tariffs are only one component of competitiveness. The long-term gains from this policy will depend on how effectively we strengthen production capacity, industrialization, standard systems, logistics and the digital trade infrastructure.

The greatest opportunity lies not just in increasing trade volumes but in transforming the structure of trade itself — from dependence on raw commodity exports toward diversified, value-added and technology-driven trade.

Boosting agricultural processing key to export expansion

Mao Xiaojing is a researcher of the Chinese Academy of International Trade and Economic Cooperation.

Roughly 60 percent of Africa's total population is engaged in agriculture, and agricultural products constitute a major part of Africa's exports.

Expanding agricultural exports will have an immediate impact on the overall development of the continent's agriculture and the livelihoods of smallholder farmers.

The zero-tariff policy is a major boon for African countries' exports of agricultural products. It demonstrates China's commitment as a major country to sharing market dividends and pursuing common development with African countries.

To fully leverage the policy, China's customs authorities have rolled out a series of supporting measures to ensure its effective implementation.

African countries need to proactively explore market demand in China and promote their products better among Chinese consumers, many of whom still have a limited understanding of agricultural products from Africa.

Platforms such as the China-Africa Economic and Trade Expo and the China International Import Expo can be used to showcase African farm produce and expand exports.

Additionally, African exporters need to familiarize themselves with China's inspection and quarantine requirements.

They, as well as Chinese importers, should ensure that the quality and supply of agricultural products are stable. China and African countries should work together for the steady growth of Africa's agricultural exports.

Boosting the development of Africa's agricultural processing industry is also a priority. Exports of primary products entail high transportation costs.

Their transportation calls for high-standard cold chain systems. These products, if processed into peanut oil, sesame oil, fruit juice, dried fruits and other finished goods, will face less stringent access rules from importing countries compared with primary produce.

Processed products are easier to transport, and the added value generated by processing primary products will drive the economic growth of African countries.

Addressing logistics hurdles among Lesotho's priorities

The historic step China took on May 1 by extending zero-tariff treatment to all 53 African countries with which it has diplomatic relations is not just a policy adjustment, but also a profound demonstration of China's enduring commitment to Africa's integration into the global economy.

Mapaballo Lydia Mile is the ambassador of Lesotho to China.

However, while the door to the vast Chinese market is now wide open, many enterprises in Africa currently lack the strength, capacity and logistical support to walk through that door. Let me demonstrate this challenge and the path forward using Lesotho as an example.

First, we must shift from exporting vulnerability to exporting resilience through value addition. Consider Lesotho's wool and mohair industry, which dominates its exports to China. Currently, these products are shipped largely in raw form, leaving us vulnerable to risks such as disease outbreaks that can halt exports entirely.

If entrepreneurs in Lesotho can partner with Chinese investors to build processing capacity domestically, the industry could be de-risked, jobs created and significant value retained within Lesotho.

Second, we must address the logistical hurdles that act as severe non-tariff barriers. For landlocked countries such as Lesotho, geography dictates its trade competitiveness.

Transit through neighboring territories means our exporters face high transport costs, compounded infrastructural constraints and intricate cross-border customs procedures.

This is where the implementation of the zero-tariff policy must be paired with robust trade facilitation. We highly welcome the Chinese customs' launch of the "Green Channel 2.0" for African agricultural and food products, which streamlines registration and optimizes access procedures. By modernizing logistics, improving connectivity and streamlining trade processes, we can dramatically reduce the friction of cross-border trade.

Third, we must leverage technical support to meet rigorous market standards. Zero tariffs will only be beneficial if our products comply with the necessary sanitary and phytosanitary measures, quality standards and certification requirements.

The technical training sessions on capacity building and inspection initiated by the Chinese customs are invaluable steps. We need continued knowledge transfer, certification assistance and guidance, so that our farmers and manufacturers can confidently navigate the rules of origin and market access protocols.

Trade and business bringing people closer

Liu Shu is the executive dean of the Institute of African Studies of Zhejiang Normal University.

Zhejiang is a major province for foreign trade in China. In 2025, its import and export volume with African countries increased by 11.5 percent year-on-year.

Jinhua, a city in Zhejiang, is an important hub for trade with African countries. While Jinhua may not be widely known, Yiwu, which is under the jurisdiction of the city, enjoys great popularity.

As a researcher, I propose a few suggestions for seizing the opportunities presented by the zero-tariff policy and advancing people-to-people exchanges between China and African countries.

Efforts should be made to encourage Chinese enterprises to increase imports of high-quality African products and expand their businesses with the African side.

Instead of merely engaging in trade in goods, enterprises need to deepen cooperation in production capacity, industrial park development, logistics and warehousing, and intensive processing of agricultural products. This will help African countries turn their advantage in natural resources into industrial competitiveness, and shift the focus of their exports from raw materials to finished products.

It is essential to take advantage of economic and trade cooperation to deepen and strengthen people-to-people exchanges. The flow of goods and industrial cooperation will help cement the friendship between the two peoples.

As trade and investment cooperation grows stronger, business people, technical teams and young students will visit each other more frequently, enhancing mutual understanding and bridging estrangement through joint work, market alignment and cultural exchanges.

For example, Jinhua, which is home to a large number of business people, and has attracted many African students, conducts China-Africa youth exchanges and vocational training programs on a regular basis. It also hosts the annual Forum on China-Africa Economic, Trade and Cultural Cooperation.

These events have deepened the friendly ties between the people of China and African countries.

The views don't necessarily represent those of China Daily.

The Global South can add more value to its natural resources

Hadi Prayitno

Global Lens

History remains one of the strongest bonds linking countries across the Global South. When World War II ended in 1945, many of these countries were either newly independent or still struggling to secure their freedom. They entered an international system designed largely by and for others.

Colonialism had shaped their economies around resource extraction, racial hierarchy was embedded in global institutions, and the Cold War demanded alignment with one bloc or the other. Trade terms kept commodity exporters at a relative disadvantage to industrial economies.

Shared grievances led to the emergence of common platforms. The 1955 Bandung Asian-African Conference was followed by the Non-Aligned Movement in 1961, the Group of 77 in 1964, and more recently the BRICS in 2006.

Many of the challenges that inspired these initiatives still persist. Global South countries face heavy debt burdens, limited manufacturing capacity, restricted access to technology, dependence on commodities, climate risks, food insecurity and fiscal fragility.

But some things have also changed. The Global South now accounts for over 40 percent of global output. Capital increasingly flows toward developing economies, while their expanding populations are becoming the primary drivers of global labor, consumption and urbanization.

Decisions made in the Global South will shape the future of the world economy.

The Global South also has vast reserves of oil, gas, minerals, tropical forests, freshwater systems, and biodiversity. These countries have many of the essential inputs required for batteries, electric vehicles, and renewable energy infrastructure.

Whether these structural advantages translate into leverage depends on political and institutional choices. Resource-rich nations must move beyond extraction by developing domestic processing capacity, linking natural resources to industrial strategies and investing in research, innovation and technology.

When leaders from 29 Asian and African countries gathered in Bandung, Indonesia, in April 1955, they did not sign a military pact or trade agreement. Instead, they articulated a new vision of international relations based on sovereignty, equality, and the right to remain independent in Cold War rivalries.

Indonesia's founding president Sukarno argued that the prosperity of Asian and African peoples depended on solidarity among themselves. Dependence on outside powers, he warned, would merely reproduce old forms of subordination. The Final Communiqué of the conference placed economic cooperation at the core of this vision.

The Non-Aligned Movement extended this principle by asserting that neither Washington nor Moscow had the right to dictate the economic or diplomatic choices of developing countries.

Its members insisted on pursuing their own development models and foreign policies. The Group of 77 carried that insistence into the United Nations, where developing countries could leverage their numerical strength despite limited economic power. By 1978, the Buenos Aires Plan of Action had given South-South cooperation an institutional footing.

BRICS represents the latest stage of this evolution. Brazil, Russia, India, China, South Africa and Indonesia use the forum to coordinate on trade, development finance, energy, food security, technology and institutional reform. The New Development Bank is a tangible expression of that cooperation.

Underlying these efforts is a shared concern: the international order reflects the balance of power from 1945.

Countries that now generate the bulk of global growth are underrepresented in the IMF, the World Bank, the UN Security Council, and the bodies that write international financial rules. Reform remains a common objective, but progress has been slow.

Building the foundations of economic integration is not easy. Yet, the materials already exist: Indonesian nickel, cobalt from the Democratic Republic of Congo, lithium from Chile, agricultural expertise and biodiversity knowledge from Brazil, sovereign capital from the Gulf states, digital infrastructure from India, and manufacturing depth from China.

Combined strategically, these assets could significantly enhance the Global South's bargaining power.

The Global North continues to dominate key dimensions of international influence, including military strength, reserve currencies, major financial institutions, technological leadership and international standards that govern global trade. This is not merely a historical legacy; it remains the active structure that determines whose voice carries weight in global negotiations.

For Global South countries, critical minerals offer the clearest opportunity to enhance their leverage. Demand for lithium, nickel, cobalt, graphite, copper, and rare earths is expected to shoot up as electric vehicles, batteries, solar capacity, wind installations, and grid infrastructure expand across the world. Many of these resources are concentrated in developing countries.

The question is whether critical minerals will help redistribute power, or simply reinforce old patterns of dependence under greener branding.

Unless mineral-rich countries develop domestic processing capacity, enforce environmental rules, manage revenues transparently, protect local communities and invest in education and skill development, the energy transition risks creating a new cohort of raw material suppliers in a cleaner but equally unequal global economy.

China has built its strengths in batteries, solar panels, electric vehicles, and rare earth processing through decades of industrial policy, infrastructure investment and technological upgrading.

The process was neither quick nor inexpensive, but it secured China a competitive position in global supply chains.

India took a different route, combining digital public infrastructure, pharmaceutical production, space technology and knowledge-intensive services to create a development model less dependent on natural resources.

The approaches differ, but the underlying logic is the same. A more balanced international order requires meaningful changes from developed countries.

Technology transfer must involve genuine knowledge sharing rather than merely licensing proprietary systems.

Green investment should support processing industries in resource-rich countries rather than offshoring the value-added stages to wealthy industrial economies. Research partnerships should strengthen local capabilities rather than extract data from the South to feed knowledge systems in the North.

The Global South's obligations to itself are equally demanding. Governments that fail to invest resource revenues in education, technical training, environmental protection and effective institutions will struggle to build a robust industrial base regardless of external conditions.

Likewise, opening to global markets without developing value-added industries only recreates dependence in more sophisticated forms. A more effective path is a strategy that is calibrated, accountable and coordinated with genuine South-South partners rather than managed in competitive isolation.

Natural resources have become diplomatic currencies because they influence critical issues — energy security, industrial competition, climate outcomes, digital supply chains and defense capabilities — that are central to every major negotiation.

The Global South holds these currencies in real and growing quantities. The question is how wisely they will be spent.

The author is the executive director at the Reform Initiatives and a senior associate at the Institute for Development of Economics and Finance, Indonesia.

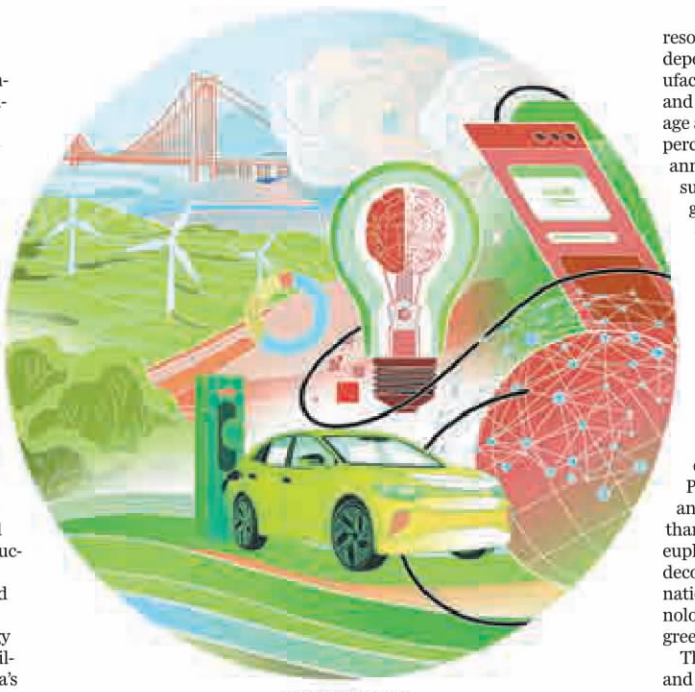
GLOBAL VIEWS

WALDEMAR KARPA

Take the 'Sanchez Way'

The future of EU-China relations lies not in fortress-like trade defenses, but in the cooperative, competitive and deeply integrated statecraft of the green frontier

As the European Union moves to tighten trade defenses against Chinese green technologies recently, Spain is quietly testing a different approach. Rather than treating China's manufacturing strength only as a threat, Madrid is seeking to turn it into localized investment, industrial capacity and green-transition momentum. This contrast makes the "Sanchez Way" more than a bilateral story; it is a test of whether Europe can move beyond defensive protectionism and build a more pragmatic relationship with China.



President Xi Jinping and visiting Spanish Prime Minister Pedro Sanchez declared on April 14 that China and Spain should strengthen cooperation, oppose a return to "the law of the jungle" in international relations and jointly defend true multilateralism. While Brussels and Paris are erecting tariff walls against ultra-competitive Chinese green technologies out of concerns over a second "China Shock", Madrid has quietly pioneered a different path.

This was Sanchez's fourth visit to China in four years, a sustained diplomatic courtship culminating in what can only be described as the "Sanchez Way": a pragmatically cooperative approach to the green transition that treats ecological statecraft as an instrument of national industrial sovereignty rather than a luxury of climate diplomacy.

The timing was exquisite. On May 28, Spain dramatically withdrew its support for a French-led initiative to bolster the European Union's trade defences against China. The non-paper, co-signed by Italy and the Netherlands, had sought sweeping new powers to investigate market distortions and penalize Chinese imports. Within days of its technical drafting, Spain's Minister of Economy Carlos Cuerpo said there was "no specific political support" for such measures, calling instead for engagement with China "from equal to equal, on an equal footing". This sudden reversal underscores a deeper European schism: while the European Commission seeks to de-risk and insulate, Spain has recognized a fundamental industrial reality — Europe cannot achieve its ambitious net-zero targets without China's manufacturing scale, and China cannot sustain its export-driven green expansion without Europe's affluent markets.

To understand the "Sanchez Way" is to examine the Iberian Peninsula's rapid transformation into China's premier green gateway to the European continent. Rather than viewing Chinese electric vehicles and lithium-ion batteries as existential threats to domestic manufacturing, Sanchez has actively courted Chinese greenfield investment, successfully transforming potential import competition into localized industrial partnerships.

The crown jewel of this strategy is the 400 million euros ($468 million) joint venture between China's Chery Automobile and Spain's Ebro-EV Motors in Barcelona's historic Zona Franca. The facility, which rolled out its first S700 SUV in late 2024, is on track to produce 50,000 vehicles annually by 2027, scaling up to 150,000 by 2029. Chery thus becomes the first Chinese automaker to manufacture passenger vehicles on European soil, reducing its exposure to EU countervailing duties by localizing production and employing Spanish workers. In Zaragoza, global battery giant CATL has entered into a 4.1 billion euros ($4.8 billion) joint venture with Stellantis to construct a massive gigafactory, which is projected to reach up to 50 GWh in annual capacity. By offering skilled labor at costs below the Western European average, coupled with robust logistics hubs in Valencia and Bilbao, where Chinese State-owned COSCO holds major port concessions, Spain has made itself indispensable to China's "produce globally, serve globally" model.

SHI YU / CHINA DAILY

This Spanish model finds a fascinating echo in Central Europe. On May 26, at Kozminski University in Warsaw, China's Ambassador to Poland Lu Shan delivered a landmark address counting green transition not as a geopolitical battleground, but as a shared industrial frontier. Poland, much like Spain, is a critical swing state in Europe's climate future. As the ambassador noted, both nations share remarkably similar structural constraints: deep coal dependency, energy-intensive industrial bases, high sensitivity to transition costs and an acute anxiety that premature decarbonization will hollow out manufacturing competitiveness.

Ambassador Lu's message to the Polish business and academic elite was one of industrial optimism. The energy sector, he argued, has undergone a profound ontological shift: from a model reliant on resource endowment to one dependent on technology and manufacturing capability. Between 2012 and 2024, China sustained an average annual economic growth of 6.1 percent, with only 3.4 percent annual growth in energy consumption, while clean energy grew to represent 11.4 percent of GDP in 2025. Poland, already home to one of Europe's largest battery manufacturing clusters, could replicate the "Sanchez Way" by combining its robust industrial infrastructure with Chinese supply-chain efficiency and capital. As Ambassador Lu explicitly stated: "The scale advantage of China's new energy industry can help Poland lower transition costs and accelerate its pace." Rather than treating "de-risking" as a euphemism for protectionist decoupling, Central European nations can leverage Chinese technology to build their own domestic green resilience.

The friction between Brussels and Beijing stems from a fundamental divergence in how both blocs conceptualize decarbonization. The EU has pursued a demand-side, regulatory approach: the Emissions Trading System puts a carbon price of approximately 78 euros per ton, internalizing pollution costs to force behavioral shifts. China, by contrast, has adopted a supply-side, industry-first model — supplying global markets with affordable green technologies while maintaining a much lower carbon price of around 11 euros per ton and still burning half the world's coal. Yet this supply-side surge has performed a global public good: by investing over $50 billion in solar photovoltaic supply chains, China has single-handedly made solar the cheapest source of electricity in most parts of the world.

Pure sectoral protectionism is ecologically self-defeating: it will raise transition costs for European utilities and consumers without reviving domestic manufacturing that has already been outcompeted.

To transcend this gridlock, the EU and China must move beyond the binary of capitulation or protectionism. Five recommendations offer a blueprint for ecological realpolitik.

First, establish a greenfield localization protocol, offering tariff exemptions to Chinese manufacturers who localize supply chains and employ European labor — the Chery-Barcelona model scaled continent-wide. Second, calibrate the carbon border adjustment mechanism with carbon market linkage, granting partial relief to Chinese exporters that verifiably use certified green electricity. Third, forge a circular economy compact with joint battery recycling standards and "health passports" for critical minerals. Fourth, launch triangular partnerships in the Global South, combining Chinese manufacturing efficiency with European green finance and ESG governance. Fifth, integrate China into the Coalition of Trade Ministers on Climate to formalize rules distinguishing legitimate green subsidies from market-distorting state aid.

The "Sanchez Way" is neither naive appeasement nor European weakness. It represents a clear-eyed recognition that, in an era where climate change has breached the 1.5 C threshold and threatens to cross 2 C by 2045, treating the green transition as a geopolitical football is a luxury the planet cannot afford. The future of EU-China relations lies not in fortress-like trade defenses, but in the cooperative, competitive, and deeply integrated statecraft of the green frontier.

New dynamic, not reset

Managing the China-Europe relationship requires establishing basic understandings to better manage their differences

On May 29, the European Commission held an orientation debate to take stock of its China policy. The outcome was telling: While Beijing is still a critical partner, the commission now views the bilateral trade and investment relationship as "not sustainable". The debate unfolded just days after five European Union member states co-signed a joint paper urging more aggressive trade measures against China, while the EU Commissioner for Industrial Strategy Stephane Sejourne branded China's conduct as "predatory".

In recent years, the pandemic, mutual sanctions and the Ukraine crisis have all contributed to the deterioration of China-Europe ties. But more corrosive is the misperception that has taken hold: Brussels increasingly defines China policy through the prism of its ties with the United States. This makes managing the relationship far more complex.

Beneath these immediate triggers lies a deeper structural transformation. The relative positions of China and Europe — to one another and in the world — have changed in fundamental ways.

Several decades of breakneck growth have not only eradicated extreme poverty in China but built world-leading capacity in artificial intelligence, robotics and new energy. Chinese exports to Europe have climbed up the value chain, shifting from cheap consumer goods to machinery, high-end equipment and electric vehicles. As a response, European traditional industries have increasingly turned toward protectionism.

China and Europe are not adversaries by design, but they could become so by default. The time has come to focus more deliberately on steering the relationship toward a brighter future. That requires revisiting the basic understandings that once provided stability, to find ways to coexist despite differences.

China's positive influence through its win-win cooperation now radiates well beyond its neighborhood. Through the Belt and Road Initiative, China's economic and cultural presence has reached deeply into the Global South. The EU's Global Gateway initiative was meant as a counterweight, but it arrived too late and on too small a scale to bring real results in Global South countries.

Yet to paint Europe simply as a loser would be a mistake. European companies have earned vast profits in China, and cooperation on climate change has delivered real results. However, the uncomfortable fact remains: Europe's relative influence is fading from the geopolitical and technological center stage. The near-absence of European companies among the world's leading AI companies tells the larger story.

Europe's anxiety runs deeper than market share or technological leadership. China engineered its rise not by copying Europe, but by exploring its own path to modernization with Chinese characteristics based on its national conditions. Today, when observers look at Europe and see economic stagnation, weak governance and visible urban decay, cultural admiration may linger — but for some, Europe no longer looks like a model worth emulating.

This is the deepest source of European unease. From the turn toward protective measures to the insistence on framing China as a "systemic rival" — all of it betrays a fear of growing irrelevance. The convergence narrative is dead. Both China and the EU now inhabit a new reality.

Acknowledging this new reality means accepting that the current trajectory of China-Europe relations may be hard to reverse. Rather than aiming for a full reset, Beijing and Brussels should focus on managing the relationship through the next period. This calls for a few basic understandings.

Europe needs to demonstrate both the will and the capacity to shape its own China policy, rather than taking its cues from Washington.

At the same time, the EU should understand that China does not seek to erode Europe's industrial base and it is open to more dialogue and cooperation that help avoid such a misperception.

Deeper trade and investment ties serve the interests of both sides, but Europe increasingly sees the matter differently. When the EU introduces protective measures, it stresses that it is not pursuing decoupling. Yet it should remain alert to the real-world consequences. The idea that Europe can leverage China's need for its market and certain technologies — pursuing a strategy of "escalate to de-escalate" — carries considerable risks. It is far easier to start a trade conflict than to end one. Europe should resist the temptation to copy the US playbook when engaging with China.

WANG XIAOYING / CHINA DAILY

At a practical level, China and Europe should create more channels of dialogue and seize some early, low-hanging fruit.

On economic security, think tanks from both sides can map out where interests overlap and where each side misreads the other's intentions. At the official level, China and the EU have established a rare-earth export-control dialogue. They can consider building on these efforts to establish a broader, higher-level economic security mechanism. Such a platform would allow both sides to seek institutional solutions before disputes escalate into crises.

On sanctions, the EU should demonstrate greater sincerity. The EU's unilateral sanctions against Chinese companies over alleged support for Russia in the Ukraine crisis are eroding the broader relationship. After the EU sanctioned 27 Chinese entities in April, China responded by sanctioning seven EU companies. The EU should interpret this asymmetry not as a sign of weakness, but as a signal that Beijing remains mindful of the overall relationship. Both sides should go for dialogue before the logic of tit-for-tat becomes entrenched.

Low-hanging fruit does exist. Continued cooperation in small, technical areas can begin to rebuild a measure of trust. People-to-people exchanges are one such area. China has already introduced visa-free access for residents of 25 EU member states. The EU can respond with substantive steps to facilitate visas for Chinese residents. Third-party cooperation is another promising avenue: environmental protection, desertification control, biodiversity conservation and humanitarian assistance offer spaces where habits of cooperation can be rebuilt step by step.

China and Europe are not adversaries by design, but they could become so by default. The time has come to focus more deliberately on steering the relationship toward a brighter future. That requires revisiting the basic understandings that once provided stability, to find ways to coexist despite differences.

RETAIL

Walmart China vows tighter food safety grip

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

A Walmart store in Yichang, Hubei province, on June 6. LIU JUNFENG / FOR CHINA DAILY

Walmart China will significantly strengthen food safety and compliance controls, the retail giant said after China's top market regulator summoned its local membership retail arm Sam's Club China over repeated food safety violations.

The undertaking by Walmart China followed an official regulatory interview conducted by the State Administration for Market Regulation, which said it had uncovered food safety issues over an extended period across both Sam's Club physical stores and its e-commerce channels.

Regulators instructed Walmart China to strictly comply with China's food safety law as well as regulations governing chain retailers and online food sales operators, while strengthening supply chain oversight, risk control systems, and corporate accountability mechanisms to better safeguard consumer health.

In response, Walmart China said it "fully acknowledges, deeply reflects upon, and sincerely accepts" the regulator's instructions, adding that it has issued a formal apology to members for any inconvenience caused. The company said it has launched a senior management-led task force to conduct a full internal inspection and a rectification campaign spanning its operations.

Walmart China also pledged to reinforce food safety management across the entire value chain, enhance end-to-end quality control systems, and ensure strict compliance with all applicable laws and regulatory requirements. It further stated it would regularly report progress to authorities and "willingly accept public supervision", signaling a commitment to increased regulatory transparency.

67
number of Sam's Club stores in China

The regulatory intervention comes amid a series of reported food safety incidents linked to Sam's Club China. Among the widely reported cases, a consumer in Wuhan, Hubei province, alleged that Thai coconuts purchased at Sam's Club showed purplish flesh and cloudy coconut water. The consumer suspected improper storage conditions or product deterioration.

Data from Black Cat, a consumer complaint platform under Sina, show that the retailer has so far accumulated about as many as 15,000 consumer complaints, with a significant proportion related to food safety and product quality issues.

Recently, sales of near-expiry food products both in-store and online at Sam's Club sparked public outcry. Consumers reported receiving vegetable salads via Sam's Club delivery that had fewer than 24 hours remaining before expiration. At the time, customer service responded: "If you do not wish to receive near-expiry items, you need to leave a note in your order saying 'No near-expiry products'."

The brand has also faced criticism over its shifting product strategy. Last year, consumers questioned the introduction of mass-market snack products such as Orion pies and Panpan walnut vanilla puffs — items widely available in ordinary supermarkets — arguing that they were inconsistent with Sam's Club's positioning as a premium, curated membership retailer.

Even so, Sam's Club remains a key growth driver for Walmart China as the company continues expanding its membership retail model in the country.

The membership warehouse chain has opened 10 new stores over the past year and plans at least 14 additional locations in 2026. As of April 30, Walmart operated 278 Walmart stores in China, while Sam's Club had expanded to 67 stores.

According to the China Chain Store and Franchise Association, Walmart China reported sales of 195.86 billion yuan ($28.9 billion) in 2025, achieving sustained double-digit revenue growth. Sam's Club China also saw strong performance last year, with full-year sales surpassing 140 billion yuan and a paid membership base exceeding 10 million for the first time.

But despite strong growth, Sam's Club China has faced increasing scrutiny over its ability to maintain consistent product quality amid rapid expansion. Some posts on social media platform RedNote have also involved speculation over food safety concerns after last year's change of senior management roles.

Jason Yu, general manager at CTR Market Research, said that attributing recent issues solely to leadership changes or corporate restructuring is overly simplistic.

Yu said: "For a retail enterprise, the root cause invariably lies in the comprehensiveness of its end-to-end quality control system.

"The more stores it opens, the harder it becomes to rely exclusively on niche, small-batch production regions or a single tier of premium suppliers to meet nationwide demand."

Exports show sustained signs of resilience

Overseas sales of Chinese ICs surged to record $35.55 bln in May, top category

By **WANG KEJU**
wangkeju@chinadaily.com.cn

With industrial production maintaining steady growth in May, China's exports continued to show strength, underscoring the role of manufacturing capabilities and external demand as key pillars of economic stabilization, economists said.

However, they cautioned that consumption showed signs of slowing for the world's second-largest economy, pointing to persistent pressure on domestic demand recovery, a trend that will require more forceful policy support.

Their comments came as fresh data showing that China's value-added industrial output — which is used to measure the activity of large enterprises with annual main business turnover of at least 20 million yuan ($2.94 million) — grew 4.5 percent year-on-year in May.

In particular, high-tech manufacturing, covering sectors such as computers and electronic equipment, led the nation's industrial production last month, surging 15.1 percent year-on-year and accelerating by 2.3 percentage points from the previous month.

Output of integrated circuits jumped 22.9 percent year-on-year to 49.6 billion units in May, while industrial robot output climbed 27.9 percent to 101,150 units.

"China's move up the manufacturing value chain, coupled with a global artificial intelligence investment boom, continues to boost exports of high-tech goods," said Feng Lin, executive director of research at Orient Golden Credit Rating International.

Feng said China's exports of ICs surged to a record $35.55 billion in May, overtaking all other categories to become the country's largest single export, while automatic data processing equipment and components also posted strong gains, with these exports reaching $26.89 billion in May, up 66.1 percent year-on-year.

"Global AI investment enthusiasm has further intensified, with chips, computer components and electronic component prices continuing to rise, strengthening their pull on China's export value," she added.

Guan Tao, global chief economist at BOCI China, said China's export edge — especially in high-tech goods — will be a key stabilizer for growth in the second half.

In sharp contrast to the industrial and export strength, domestic retail sales of consumer goods, a key indicator of the country's consumption strength, fell 0.6 percent year-on-year in May, marking the first monthly decline since late 2022 and signaling weakness in household consumption, experts said.

Wen Bin, chief economist at China Minsheng Bank, attributed the contraction to multiple factors, including the diminishing impact of trade-in subsidy programs and a cautious consumer outlook.

"The marginal effect of the trade-in policy is fading. Earlier rounds of subsidies have already pulled forward demand for cars, home appliances and consumer electronics, and the current subsidy scale and rates are both lower than last year," Wen said.

The weakness in consumption was mirrored in the credit data. Household loans fell by 141.2 billion yuan in May, the second consecutive monthly decline, said the People's Bank of China — the country's central bank. Short-term household loans, a proxy for consumer credit, dropped by 84 billion yuan.

The retail sales decline was driven largely by weakness in goods consumption. However, services retail sales continued to grow, rising 5.4 percent year-on-year in the first five months, highlighting a structural shift in consumer preference toward experiences over goods.

Looking ahead, Wen expects the government to maintain supportive policies for consumption, including targeted subsidies for services, income growth initiatives and expanded social safety nets.

Rebuilding consumer confidence will take time as households continue to repair balance sheets and remain cautious about income and employment prospects, he added.

Retail MNC seen recalibrating Beijing store presence

By **WANG ZHUOQIONG**

Walmart is reported to be planning a recalibration of its physical retail presence in Beijing through the introduction of a new generation of smaller-format stores, signaling a strategic shift in response to the country's rapidly evolving retail landscape.

The step will mark a significant development as Walmart has, for some years, refrained from prioritizing the Beijing market.

Walmart's physical footprint in Beijing has contracted significantly in recent years. Data indicate the company currently operates five stores in the city. Since entering China in 1996, the company has faced sustained pressure from the rise of e-commerce and the expansion of discount and community-based retail formats, which have eroded the competitiveness of traditional big-box stores.

However, according to staff at BHG Mall in Changping district, a Walmart supermarket is undergoing renovation at the site of a former BHG grocery store, which closed at the end of May. While the final format has not yet been officially disclosed, the store is expected to open in the coming months. Personnel at the BHG Mall in Shunyi district said its underground supermarket space was handed over to Walmart for redevelopment following closure on May 26, with the opening timeline yet to be announced. Walmart China did not comment on the new development.

Walmart's strategy is increasingly centered on smaller, more localized store formats. In early 2025, the company launched a community store pilot in Shenzhen, Guangdong province, covering about 500 square meters and offering around 2,000 product items or stock-keeping units (SKUs) focused on daily essentials.

A more significant milestone came in April 2026, when Walmart reopened its renovated outlet in Chengdu, Sichuan province, as a "New Generation Store". The nearly 3,000 sq m outlet carries around 10,000 SKUs, emphasizing fresh food and private-label products under the Marketside brand. Walmart has indicated this format will serve as a blueprint for broader nationwide upgrades, with more than 100 stores expected to be renovated or newly opened within the year.

Jason Yu, general manager at CTR Market Research, said Walmart's return to Beijing should not be interpreted as a revival of the traditional hypermarket model, but rather as part of a broader restructuring toward compact, high-efficiency stores.

He said that the new openings align closely with the "New Generation Store" format, positioned to compete with operators such as Hema and Dingdong Maicai. "This is not a return of the 10,000-square-meter hypermarket," Yu said, adding that Walmart is effectively transferring operational practices from Sam's Club into its core supermarket business.

Yu said that Sam's Club's robust performance in China provides financial support for Walmart's restructuring efforts, enabling the company to close underperforming locations while investing in upgraded formats. The Marketside private label, he added, mirrors the value proposition, leveraging centralized sourcing and supply chain efficiency.

At the same time, industry consolidation — driven by the withdrawal of Carrefour, the financial difficulties of Yonghui and the acquisition of RT-Mart — has released prime retail locations, allowing Walmart to selectively reenter high-traffic urban areas, Yu said.

However, whether Walmart can reverse its broader operational decline will depend on the performance of these new formats over the next 12 to 24 months, Yu added.

Cross-river conduit

A recent aerial photo shows the construction site of a major railway bridge along the Yancheng-Yixing High-speed Railway in Yancheng, Jiangsu province. Stretching some 311 kilometers, the HSR — partially built by China Railway 24th Bureau Group — has 10 stations along the line, serving as a new rapid Yangtze River-crossing channel, supporting the high-quality integrated development of the delta region. Pumped-storage hydropower to level up

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China's pumped-storage hydroelectricity industry is gearing up for opportunities during the 15th Five-Year Plan (2026-30) period, serving as a critical engine for the nation's green transition and long-term energy security, said experts.

During the next five years, the country expects to see some 100 million kilowatts of new pumped-storage capacity become operational, with an average annual rollout exceeding 20 million kW, placing the industry at a new high, they said.

"Pumped-storage is to play an increasingly irreplaceable role in expanding the scale and quality of new energy, ensuring the safe and stable operation of the power system," said Zhao Zenghai, deputy head of the China Renewable Energy Engineering Institute.

Zhao said he believes that compared with the 14th Five-Year Plan (2021-25) period, the sector's development scale is expected to experience a rapid leap.

The 100 million kW of newly commissioned capacity is roughly 1.5 times the nation's total cumulative capacity at the end of 2025, with China's total operational pumped-storage capacity projected to reach around 160 million kW by 2030, he said.

Concurrently, the country will actively and systematically advance the construction of approved projects, striving to meet the power system's demand for 400 million kW of flexible capacity by 2035.

These insights were highlighted in the Pumped-Storage Industry Development Report 2025, recently released by the institute in Beijing.

The report noted a highly optimized spatial layout for the coming years. While projects during the 14th Five-Year Plan were heavily concentrated in eastern load centers to address peak-shaving demand in developed areas, the 15th Five-Year Plan will foster a new pattern of coordinated development between eastern load centers and new energy-rich regions in central and western China.

"While closer synergy with new energy will effectively smooth output fluctuations and substantially boost the utilization and consumption of renewables, it will also provide vital regulatory support for cross-provincial power transmission from new energy mega-bases, significantly enhancing the efficiency of transmission corridors," said Zhao.

Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute, said pumped-storage power stations are expected to further solidify their role in system regulation in the years to come.

"In addition to leveraging their peak-shaving and valley-filling capabilities to rapidly respond to grid demands in the central and eastern regions, they will also be serving as vital regulatory support for outbound power transmission in the new energy-rich western and northern regions, effectively smoothing out wind and solar fluctuations and boosting the utilization of new energy," Ye said.

Pumped-storage power stations have been playing a powerful regulatory role within the power system, boasting outstanding peak-shaving and valley-filling capabilities, he added.

Capable of rapidly responding to grid regulation demands, smoothing out the volatility of wind and solar power generation, and effectively enhancing the integration and utilization of new energy, the industry has transitioned from mere scale expansion to prioritizing both scale and quality in recent years, placing greater emphasis on economic viability, safety and ecological friendliness, Ye said.

Technological innovation is also taking center stage. According to the institute, the next five years will see breakthroughs in large variable-speed units and stable operations under wide load ranges, alongside the widespread application of digital and smart technologies across the industrial chain to better meet the flexible regulation needs of a modern power system.

The robust momentum in China's new energy sector aligns seamlessly with its global leadership, said Francesco La Camera, director-general of the International Renewable Energy Agency.

A main driver of the global renewable capacity additions in 2025, which hit a record 692 gigawatts, China accounts for over 60 percent of global capacity additions, playing a leading role across the board in electric vehicles, energy storage deployment and grid investment, he said.

First national urban renewal plan unveiled

Some 15 trillion yuan in investment expected during 15th Five-Year Plan

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China has unveiled its first national-level urban renewal plan, with market watchers expecting about 15 trillion yuan ($2.1 trillion) in investment during the 15th Five-Year Plan period (2026-30), as the government seeks to modernize aging infrastructure, upgrade residential areas and boost domestic demand, experts said.

The plan, released in May by the State Council — the nation's Cabinet — is the first national-level guideline for urban renewal and the first sector-specific plan to be implemented following the release of the broader five-year blueprint.

It outlines quantitative targets, including the renovation of 500,000 dilapidated urban residential units, 115,000 aging residential communities, 1,500 outdated industrial districts and factory zones, 4,000 urban villages and 365,000 kilometers of underground pipeline upgrades by 2030.

In this context, China is expected to invest at least 15 trillion yuan in urban renewal projects during the 15th Five-Year Plan period, averaging 3 trillion yuan annually, said a research note by Huachuang Securities.

That would be slightly higher than the 2.6 trillion yuan and 2.9 trillion yuan invested in 2023 and 2024, respectively, said the Ministry of Housing and Urban-Rural Development. The ministry said that in each of those years, about 60,000 urban renewal projects were completed nationwide.

Zheng Degao, vice-president of the China Academy of Urban Planning and Design, said that the targets were set based on "physical examinations" of cities and surveys of residents' needs.

For example, the renovation of aging residential communities will focus on those built 20 years or more ago, with flexible scope determined through special assessments, Zheng said.

A key challenge in urban renewal has been financing, and to this end, the plan identifies three sources of funding: fiscal funds, financial institutions and private capital.

Tang Daizhong, deputy director of the Department of Construction Management and Real Estate at Tongji University, said each funding source bears different risks, responsibilities and return expectations, and they must work in tandem.

Fiscal funds serve as a safety net, Tang said, adding: "Public money plays a foundational and guarantee role, but it can also act as equity to attract financial capital from banks and policy lenders."

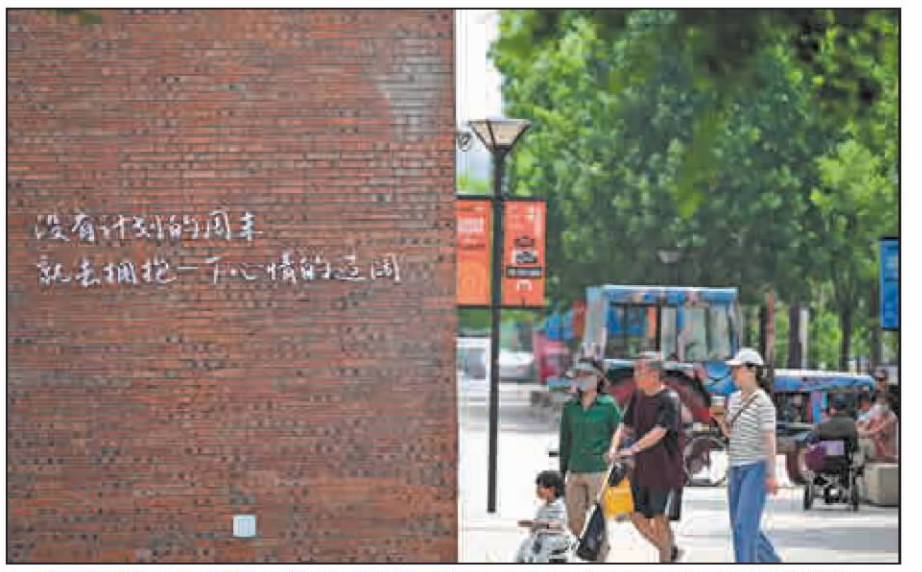
He said that in a typical project, fiscal funds might cover 20 percent of the investment, with financial institutions providing the remaining 80 percent, leveraging public money to multiply total spending.

Financial capital also helps solve timing mismatches. Urban renewal projects often have long payback periods, while investors seek quicker returns.

"Long-term financial funds can extend repayment schedules so that future cash flows can cover the investment," Tang said, adding that private sector participation is best suited for operations.

"Some comprehensive developers and operators can use their funds to run projects and rely on future operating profits to cover initial investments," he added.

The central government has selected 15 cities to receive central fiscal support for urban renewal projects in 2026, marking the third consecutive year of a dedicated funding program that has already channeled more than 20 billion yuan to 20 cities, including Shanghai and Beijing.



Beyond direct fiscal transfers, the State Council has also permitted local governments to issue special-purpose bonds to finance eligible urban renewal projects.

The China Index Academy said special-purpose bond issuances for urban renewal work across the country exceeded 350 billion yuan in 2025, a modest 2 percent increase from the previous year, accounting for 7.6 percent of total new special-purpose bonds.

That said, the nature of special-purpose bonds — requiring projects to generate enough revenue to repay principal and interest — means they cannot be used indiscriminately for public welfare initiatives like aging community renovations and underground pipeline upgrades, which produce little or no direct cash flow, experts cautioned.

> "Special bonds should play more of an equity role, not a blanket bailout ... When a project can achieve cash flow balance with special-purpose bonds covering about 20 percent of the investment, it can proceed."
>
> **Dong Yu,** executive vice-president of Tsinghua University's China Institute for Development Planning

"Special bonds should play more of an equity role, not a blanket bailout," said Dong Yu, executive vice-president of Tsinghua University's China Institute for Development Planning. "When a project can achieve cash flow balance with special-purpose bonds covering about 20 percent of the investment, it can proceed."

For purely public welfare projects that generate no revenue, Dong suggested drawing the project boundary wider to include some revenue-producing components.

"Planners can make the area larger, incorporating parts that can yield quality cash flow. Once you form a larger asset package, the whole thing becomes able to finance."

This bundling approach has been used in some large-scale redevelopment zones, where residential renovation is paired with commercial space, parking or community services that generate ongoing income.

Attracting private capital requires more than just profit potential, experts said, stressing the importance of contract enforcement and clear exit mechanisms.

"Legal protections for contracts are crucial to eliminate uncertainty and risk during private capital entry and development," said Zhao Yanjing, a professor specializing in urban economics at Xiamen University, adding that equally important is having financial tools for exit.

China has been expanding its real estate investment trust market, and urban renewal plans explicitly encourage the use of REITs and asset-backed securities for eligible projects. These instruments allow private investors to liquidate their stakes after projects become operational, reducing lock-in risks.

Policies deliver uptick in property sales, prices

By **WANG KEJU**

The traditional spring home-buying season, which typically peaks in March and April, stretched into May this year as policy support and targeted demand in first-tier cities drove a notable pickup in sales, helping to restore market expectations, experts said.

Data from the China Index Academy show that total new home sales of the country's top 100 real estate firms reached 1.23 trillion yuan ($181.89 billion) in the first five months, with the year-on-year decline narrowing for the third consecutive month.

In May alone, sales by those developers stood at 328.78 billion yuan, up 17.6 percent from April, according to the academy.

China's new home sales steadied in May, driven by a pickup in larger cities, even as the national market remained largely flat, market watchers said.

The 50 major cities tracked by real estate information provider CRIC recorded 13.62 million square meters of new home transactions in May, up 2 percent from April and just 2 percent lower than a year earlier.

The resilience came largely from larger cities. Combined transactions in Beijing and Shanghai, as well as Guangzhou and Shenzhen in Guangdong province, totaled 2.15 million square meters in May, an 11 percent month-on-month increase and a 6 percent year-on-year gain, according to CRIC.

The cumulative January-May sales in these four top cities fell 12 percent from a year earlier, but marked an improvement from an 18 percent decline in the January-April period.

Historically, housing sales taper off in May after the March and April rush. "The typical post-peak cooldown didn't happen this year," said Yan Yuejin, deputy head of the Shanghai-based E-House China R&D Institute.

"Policy support, combined with the release of pent-up demand in core cities, provided a floor for the market in May," Yan added.

From January to May, provincial and city governments across China rolled out more than 430 property-related policies, according to the China Index Academy. The measures included easing purchase restrictions, adjusting provident fund rules, offering direct purchase subsidies and improving urban renewal guidelines.

A key part of the policy toolkit has been the expansion of trade-in programs, in which local governments or developers purchase old homes to help owners upgrade to new properties. By the end of May, more than 40 such programs had been launched nationwide.

A residential development project is under construction in Fuzhou, Fujian province, on April 17. ZHANG BIN / CHINA NEWS SERVICE

> The improvement in price signals, especially the moderation in secondary market declines, indicates that market expectations are slowly improving."
>
> **Chen Wenjing,** director of policy research at China Index Academy

Shanghai piloted a trade-in program in several districts in February and later expanded it to all of the city's central urban areas. Guangzhou also rolled out a similar initiative.

"These programs are effective in breaking the logjam," said Li Yujia, a researcher on residential property policy in Guangdong. "They provide liquidity to owners of old homes and create a more fluid market for new properties."

While new home sales in major Chinese cities showed unusual resilience in May, the secondary market also held steady, with transaction volumes in 20 key cities rising nearly 20 percent from a year earlier, according to data from the China Index Academy.

Beijing recorded about 16,000 second-hand home transactions in May, the highest for the month since 2021 and the third consecutive month above the 15,000-unit threshold that industry watchers consider the line between a sluggish and a stable market.

Shanghai, the country's largest second-home market by transaction volume, recorded 28,000 units in May — also a five-year high for the month. The city saw three separate days in May with more than 1,500 online contract signings, a pace that exceeded the daily average for most of the past year.

Price data in May add to a growing body of evidence that the prolonged property downturn may be showing signs of bottoming out in major cities.

The average price of new homes in 100 major cities rose 0.16 percent month-on-month to 17,156 yuan per square meter, and was up 2.03 percent from a year earlier. The monthly gain was driven largely by first-tier cities, where the launch of premium projects in prime locations pushed up the average, according to the China Index Academy.

In the secondary market, the average price of existing homes stood at 12,692 yuan per square meter, down 0.32 percent from April — the smallest month-on-month decline since mid-2024. The narrower drop suggests that seller sentiment and buyer demand are gradually finding a balance after more than two years of falling prices, the academy said.

"The improvement in price signals, especially the moderation in secondary market declines, indicates that market expectations are slowly improving," said Chen Wenjing, director of policy research at the academy.

However, the recovery remains uneven. While first-tier cities saw new home prices rise, many smaller cities still face downward pressure, Chen said, adding that the national secondary market as a whole remains in negative territory, even though the rate of decline has eased.

With mid-year financial reporting approaching, developers are expected to step up marketing, and the launch of new quality projects in core cities could support sustained improvement — at least in key urban hubs, Chen said.

CHINA

Remembering wartime friendship

Students from the United States attending a youth camp of the Chinese Bridge visit the Memorial Hall to the Doolittle Raid in Quzhou, Zhejiang province, on Monday. The hall, established in 2018, commemorates Chinese citizens who aided and rescued US airmen after the Doolittle Raid. The 1942 bombing raid on Japanese cities, led by Lieutenant Colonel James Doolittle, was conducted to avenge Japan's surprise aerial attack on the US naval base at Pearl Harbor during World War II. The hall is a witness to the friendship between the Chinese and American peoples.

Mass production of high-purity silicon-28 to boost tech sector

Breakthrough shows Chinese engineers closed a critical gap in industrial chain

By ZHAO LEI in Tianjin
zhaolei@chinadaily.com.cn

Chinese scientists have achieved a key technological breakthrough that is expected to advance the country's efforts in quantum computing and semiconductor development.

The Research Institute of Physical and Chemical Engineering of Nuclear Industry, a Tianjin-based subsidiary of China National Nuclear Corp, announced on Monday that it had mass-produced silicon-28 isotope with extremely high purity.

The product features an isotopic abundance exceeding 99.99 percent, ending China's reliance on imports for the material.

Han Liguo, a senior researcher leading the project, said natural silicon contains three isotopes — silicon-28, silicon-29 and silicon-30 — with silicon-28 accounting for 92.2 percent.

Characterized by zero nuclear spin, silicon-28 can significantly reduce environmental noise interference in quantum computing, earning it the title of "the purest silicon on Earth".

"By contrast, silicon-29, another stable isotope found in natural silicon, creates disturbances in quantum computing operations," Han said. "To minimize such interference, the isotopic abundance of silicon-28 must be raised above 99.99 percent."

According to the institute, only a handful of countries have mastered large-scale production of stable isotopes. As a result, China depended on imports for high-end stable isotope products, a situation that has constrained the development of related industries, affected security in key sectors and hindered independent progress in advanced equipment manufacturing, nuclear medical diagnostics and frontier scientific research.

Founded in 1964, the institute is China's leading research body specializing in isotope separation technology. In recent years, it has leveraged its expertise in nuclear technology to develop equipment and processes for the mass production of stable isotopes.

The institute said it has established a fully independent research and production system, ensuring a domestic supply of stable isotopes.

Han said high-purity silicon-28 is an ideal material for manufacturing silicon-based qubits. It significantly improves qubit coherence and control precision, providing critical material support for the research and development of silicon-based quantum computers.

The isotope can also be used in high-end semiconductors, she said, adding that semiconductor components made from silicon-28 offer improved thermal conductivity and performance stability, creating broad opportunities for use in advanced chip manufacturing.

Lei Zengguang, an academician of the Chinese Academy of Engineering and an expert in nuclear materials and nuclear fuels, said stable isotope technology is a key component of the nuclear industry.

"It may appear to be a niche field, but it is an essential enabling technology for many critical sectors, including precision manufacturing, quantum technology, biomedicine, environmental monitoring and nuclear energy," Lei said.

"Gaining full independent control of core stable isotope separation technology has long been a shared goal for those of us working in the industry. In recent years, the Research Institute of Physical and Chemical Engineering of Nuclear Industry has achieved major breakthroughs, successfully isolating more than 20 important stable isotopes."

The new capability to mass-produce silicon-28 with an isotopic abundance above 99.99 percent means Chinese engineers have not only mastered the relevant technologies but have also closed a critical gap in the industrial chain, Lei said.

He said the achievement carries major implications for China's quantum technology and high-end chip industries.

Beyond those sectors, high-purity silicon-28 also has significant potential for applications in advanced medical treatment and space exploration, he added.

China-ROK cooperation bolsters fishery resources

By ZOU SHUO
zoushuo@chinadaily.com.cn

China and the Republic of Korea carried out their seventh annual joint fish stock enhancement and release campaign in the Yellow Sea on Tuesday, releasing a total of 7.29 million juveniles of important commercial species into waters that have long sustained fishing communities in both countries.

The ROK released 4.29 million fry and juveniles of small yellow croaker, red seabream and swimming crab off Incheon, while China simultaneously released 3 million juveniles of greenfin horse-faced filefish, swimming crab and blackhead seabream off Yantai, Shandong province.

The campaign is based on a consensus reached at the 16th session of the bilateral fisheries joint committee in 2016. The event, which began in 2018, has released more than 18.75 million fry and juveniles into the Yellow Sea, contributing to the recovery of commercially valuable fish stocks, improvement of the marine ecosystem and higher incomes for fishermen from both countries, official data showed.

The cooperation is grounded in the China-ROK Fisheries Agreement signed in 2000. Over the years, the two sides have expanded collaboration in catch management, resource conservation, scientific research and joint law enforcement.

Workers release fry into the Yellow Sea during a joint fish stock enhancement and release campaign by China and the Republic of Korea in Yantai, Shandong province, on Tuesday.
XIAO SHUILIAN / FOR CHINA DAILY

China has released more than 67.7 billion fry and juveniles of various aquatic species into the Bohai and Yellow seas.

The Yellow Sea serves as a vital fishing ground for both countries, with many commercially important species showing distinct seasonal migration patterns, according to the Chinese Academy of Fishery Sciences' Yellow Sea Fisheries Research Institute.

Since 2010, China and the ROK have conducted joint fisheries resource surveys, typically four times a year on a quarterly basis, with each side carrying out two cruises. The surveys involve mutual vessel boardings and data sharing to monitor stock fluctuations and inform conservation decisions, the institute said.

These fish spawn, nurse and feed in the inshore waters of China's Bohai and Yellow seas during warmer months, then migrate toward the central and southern Yellow Sea for wintering as water temperatures drop, the institute said.

This migratory pattern, together with the long-established fishing practices of both countries, means that the sustainable management of Yellow Sea fisheries requires joint efforts, the institute added.

Qu Jiangbo, general manager of the Tianyuan Aquatic Products Co, said the company supplied greenfin horse-faced filefish for this year's release campaign. The fry and juveniles were produced using controlled temperature and water quality breeding techniques, using wild-caught, disease-free broodstock with high genetic diversity.

Before release, the juveniles undergo strict quarantine and drug residue testing. Only those passing tests for 11 prohibited substances receive official certification for release, Qu said.

The company has invested 130 million yuan ($19 million) in a live germplasm bank for marine fish in northern China, which is expected to be fully operational before this year-end to preserve and utilize fishery genetic resources, he said.

Fishermen have also witnessed tangible benefits. Cui Gang, a local fisherman for almost 20 years, said that over the past five to six years, he has seen larger catches of greenfin horse-faced filefish, with rare red seabream occasionally appearing.

"The proportion of small mixed fish has declined, while commercially valuable species are larger and yields have stabilized," Cui said.

On the joint China-ROK fish stock enhancement and release effort, Cui said, "The sea has no borders, and neither do fish. If both sides take good care of these waters, we fishermen will have a future."

Cybercrimes that used a Trojan virus solved

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Chinese police have cracked a series of cybercrime cases involving a new variant of the Silver Fox Trojan virus that has recently emerged in cyberspace, the Ministry of Public Security's cybersecurity bureau said on Tuesday.

The Trojan virus is highly deceptive and mainly targets employees of enterprises and public institutions, particularly finance personnel, the bureau said.

Once installed on a victim's computer, the malware can enable remote control, access account passwords, intercept short message service verification codes and obtain private data, it said.

According to the bureau, public security authorities have taken proactive action to investigate and crack down on such crimes.

In one case, police in Jilin province uncovered a criminal gang, led by a suspect surnamed Chen, that had developed a variant of the Silver Fox Trojan and used technical means to evade security detection.

The gang allegedly sent bulk phishing emails, stole corporate data and created fraud schemes to carry out criminal activities involving more than 7 million yuan ($1 million), police said.

Local police have taken criminal compulsory measures against Chen and 26 other suspects. The case is under further investigation.

Police warned the public to download software only from official websites and to carefully check domain names to avoid fake sites that use similar-looking characters, multiple hyphens or unofficial suffixes.

The public should also be cautious of links shared in chat groups under labels such as "meetings" or "subsidies" and verify them with the sender by phone or video call before opening them, police said. Any link requesting SMS verification codes or a bank card PIN should be treated with caution.

In the event of abnormal computer actions, including a mouse moving on its own or software automatically sending messages, users are advised to immediately disconnect the device from the internet, police said.

Users should also change passwords for social media and banking accounts on a secure device, notify friends, colleagues and clients that the account may have been compromised, and contact IT personnel or use professional antivirus software to conduct a full scan. Reinstalling the operating system may be necessary in serious cases, police added.

In line with China's Criminal Law, illegally intruding into computer information systems, stealing data or illegally controlling such systems can result in imprisonment, criminal detention and fines, depending on the severity of the offense. The law also punishes those who provide programs or tools for such illegal activities.

Festival treat

A keeper feeds a specially made *zongzi*, a traditional delicacy usually associated with Dragon Boat Festival, to an Asian elephant at the Qingdao forest wildlife world in Shandong province on Monday. Animals enjoyed custom-made treats ahead of the festival which will be celebrated on Friday this year.

Gene editing can treat rare inherited disease

By WANG XIAOYU
wangxiaoyu@chinadaily.com.cn

Chinese researchers have reported the first clinical use of a domestically developed RNA-editing technology to treat Duchenne muscular dystrophy, or DMD, a severe inherited disease that causes progressive muscle loss. They also unveiled a significantly upgraded version of the platform that could broaden the future use of RNA-based therapies.

The research team, led by Wei Wensheng of Changping Laboratory and Peking University's School of Life Sciences, published its findings in two papers in the journal Cell on June 10.

The RNA-editing platform, called LEAPER — short for Leveraging Endogenous ADAR for Programmable Editing of RNA — was first developed in 2019. It works by directing naturally occurring enzymes in human cells to correct errors in RNA, the molecule that carries genetic instructions used to make proteins. The latest third-generation version of the technology has improved editing efficiency and accuracy, allowing researchers to target genetic sites that were previously difficult to modify.

"The biggest advantage of LEAPER is that it uses the body's own machinery and does not require the delivery of additional gene-editing enzymes," Wei said.

"This not only simplifies treatment delivery but also reduces the risk of immune reactions and other safety concerns, offering a new option for treating genetic diseases," he said.

Using the technology, the team developed a candidate drug for DMD, a rare inherited disorder that mainly affects boys. The disease causes worsening muscle weakness and often leads to death from respiratory or heart failure in early adulthood.

DMD is estimated to affect about 250,000 people worldwide, including around 70,000 in China, which has the largest patient population. Existing treatments can only slow the disease's progression.

Working with researchers from Kunming University of Science and Technology in Yunnan province, Shanghai Jiao Tong University and other institutions, the team administered the experimental therapy to three pediatric patients.

After a year, all three patients showed sustained improvements in motor function, including stronger respiratory muscles, an important measure of disease progression. No serious adverse events were reported.

"This marks the first time a domestically developed RNA-editing technology has been used in clinical treatment and produced positive results," the researchers said. "It is also the first time globally that RNA editing has been applied to the treatment of DMD."

Wei said gene therapies hold significant potential for treating rare inherited diseases as well as a wider range of medical conditions. His team plans to develop safer, more versatile and precisely controlled therapies to benefit more patients.

Making toys and rebuilding lives

Workshop helps people with disabilities move from charity-dependent roles to market-driven employment

By LI LEI
lilei@chinadaily.com.cn

On a late morning in May, the high-pitched whine of 3D printers filled a small workshop in Beijing's Chaoyang district.

Cao Qiuping, a former Paralympian who uses a wheelchair, had arrived early and was sorting piles of brightly colored plastic toys — stress-relief ribbons, Minecraft-style blocks and cartoon character figurines.

The souvenirs were destined for a Children's Day event in the nearby Sanlitun neighborhood.

The team's real goal was not just to make the children smile. They planned to give the toys away for free, while asking recipients to scan and join a WeChat group to become potential future customers for the workshop's other 3D-printed products.

For Cao and her two able-bodied partners, each free trinket is a small bet on a brighter future — one in which workers with disabilities compete in China's creativity market on the basis of their skill, not sympathy.

Technology as a bridge

Cao runs the Sanlitun 3D Printing Digital Workshop for People with Disabilities, a venture that is barely a few months old. The idea is to use additive manufacturing to help people with disabilities — who often struggle for years to find steady jobs — become designers, producers or operators of small businesses.

This unique model that ensures people with disabilities get paid jobs in technology-driven industries has the support of charity groups and federations representing local people with disabilities.

The workshop has just delivered its first commercial order: 50 3D-printed blind boxes featuring the bear mascot of the Fairmont Beijing Hotel in Sanlitun. The boxes, which feature four seasonal designs and a hidden "hotel chef" figurine, were produced using about 30 printers donated to the Chaoyang district by CFDP-Leye — a social enterprise that helps people with disabilities gain employment — through the China Foundation for Disabled Persons.

Behind that milestone lies a story of reinvention, resilience and the hard work of turning high-tech tools into means of ensuring sustainable livelihoods.

Looking back

Cao, now 47, knows all about braving the odds. In 1997, when she was 18, she was in a car accident on her way to school that led to her two lower limbs being amputated. "I felt like I'd been thrown from the clouds to the ground," she recalled. "Before the accident, I had dreams like any other teenager."

Her father sawed off every doorstep in their rural Beijing home to ensure her wheelchair could move freely. But they had a squat toilet so her parents had to bodily lift her to the restroom and back daily.

Her luck changed in 2003, the year she discovered wheelchair basketball. A coach spotted her at a local sports event, remarked it was terrible for someone so young to be so badly injured and asked for her contact details.

That chance encounter led to her finding a place on the Beijing women's wheelchair basketball team. By 2005, she was winning national championships.

In 2008, she went on to compete in the Beijing Paralympics.

"For the first time, I wasn't alone anymore," Cao said. "I met other people who use wheelchairs. I realized I wasn't the only one. It felt like coming back to life."

After the Games, Cao met her future husband, from the United States. They married, settled in Beijing and had two children. For more than a decade, she focused on raising her family. But as her children grew older, she began feeling left out. "When you stay home for years, you lose touch with the world," she said. "At first, I thought it was because of my disability. But later I realized anyone who stays home for too long feels disconnected."

Some 3D printed models based on traditional Chinese architecture and Terracotta Warriors on display at the studio in Beijing.
ZHANG WEI / CHINA DAILY

Enter the 3D printer

Her way back to normal life was enabled by a strange gadget: a 3D printer.

Earlier this year, Cao visited Warm Home — a local community service center for residents with disabilities — and noticed the 3D printer. It had been donated as part of a technology empowerment initiative.

"I thought 3D printing was very high-tech, not for someone like me," she said. But with some training from CFDP-Leye, which had donated the machine, she began to learn the basics. "I realized it wasn't as difficult as I'd imagined."

Li Changsen, a technical trainer from CFDP-Leye who now works with Cao's team, said people with disabilities show exceptional focus when it comes to learning. "What I noticed is that they concentrate," he said. "They don't give up after just two days, like some able-bodied people might."

Cao had an idea which she shared with the Sanlitun subdistrict disabled persons' federation. Its chairperson, Zhang Xuechao, gave her the green light. A workshop was born this March.

Its core team comprises Cao; Wang Jing, a Tianjin Academy of Fine Arts graduate and mother of two; and Shen Liang, a programmer-turned-entrepreneur who volunteers as the workshop's technology strategist. Li Changsen provides technical support.

First order

Their first real test came sooner than expected. The Fairmont Beijing Hotel placed an order for 50 blind boxes featuring its bear mascot. The order was small — worth only about 1,500 yuan ($221.74) — but the stakes felt enormous.

"We spent around 80 hours on just the design," said Wang, who met Cao years ago through their children, who were classmates. "Turning a flat mascot into a 3D-printed figure was completely new. We had to revise it again and again."

Li Siwei, a 38-year-old technician, was among the first apprentices at Li Changsen's training sessions last July and one of the program's best graduates. A former soldier, Li was injured in a car accident in 2016 that left him with spinal injuries. "I'd heard about 3D printing for years but never had the chance to try it," he said. "Now, sometimes when certain things break down at home, I just design and print a replacement."

While Li Siwei did not himself work on the Fairmont blind boxes, he helped the team with other custom designs.

For the Fairmont project, the complex modeling was handled by Li Changsen while the core team focused on design iteration, assembly and post-processing. Because they were still learning advanced 3D modeling, they relied on Li Changsen to refine the digital files and ensure the bear mascot could be printed as separate pieces that could be assembled.

Shen said the Fairmont order proved a point. "That order barely covered the cost of materials," he said. "But it showed we could deliver professional-quality work. The hotel said the final product exceeded their expectations of what 3D printing could achieve."

Profitability

Despite the early success, the workshop is far from profitable.

"We're compromising on profit to build a reputation first," Cao said. "The Fairmont order covered the cost of raw materials, but that's it. No labor. No design fees. We're paying for credibility."

The team's business model is still taking shape. They have received small orders — toys for a weekend market and customized figurines for a piano teacher's students — but nothing steady. "Most people don't even know we exist," Cao said.

Technical dependence is a major challenge. While the workshop's members have mastered basic printing, complex modeling still requires outside help from Li Changsen.

"Our goal is to become independent," Shen said. "We want to train our people to become teachers. Li Siwei could be one of them."

Neighborhood strategy

Late last month, the team was preparing for a Children's Day event. Their plan was to print small toys and give them away to children and parents who scanned a QR code to join a WeChat group.

"It's about building a community," Shen said. "Once people are in our group, they'll know we exist. Maybe next time they need a custom-made gift, they'll think of us."

The strategy reflects a broader shift in Chinese cities: using training and technology to move people with disabilities from charity-dependent roles into market-driven employment.

"We don't want sympathy," Cao said. "We want equal opportunities. If a customer has a choice between us and an able-bodied competitor, we want them to choose us, not because they feel sorry for us, but because our quality is better."

For Cao, the immediate goal is modest: keep the printers running, find the next order and prove her team can survive on its own.

Small orders continue to trickle in, and Cao welcomes each one. "The orders are small, but they haven't stopped," she said. "They're still coming. We're always working on something. I'm not afraid of small orders — I'm only afraid of having none at all."

Z WEEKLY

All about Gen Z

Z WEEKLY

What is the hundred-bird coat?

If you have the chance to visit a Miao village during festivals or marriage ceremonies, you will be amazed by the diverse and vibrant costumes and silver jewelry worn by Miao women.

Among the traditional costumes of different branches of the Miao ethnic group, the hundred-bird coat stands out as one of the most symbolic and visually distinctive.

Known for its vibrant colors, layered patterns and complex embroidery techniques, it is widely regarded as a concentrated expression of Miao cultural heritage — sometimes described as an "ethnic epic" woven into fabric that carries memory and identity.

The garment is traditionally made using Miao embroidery, a craft passed down through generations. Each coat can take months to complete, as artisans stitch detailed motifs based on memory, imagination and inherited visual language.

Historically, the hundred-bird coat was worn during important ceremonies to honor ancestors and mark significant life events. Over time, it has also become a form of festive attire, still closely associated with celebration and cultural continuity.

Besides patterns like frogs, butterflies and insects, a single garment may feature hundreds of bird-inspired motifs, including stylized or mythical forms such as "bird dragons" and feather decorations that contribute to its name.

These layered designs are not merely decorative; they reflect stories, beliefs, and symbolic connections between nature, ancestry, and identity within Miao culture.

Village runway redefines fashion

A grassroots stage turns craftsmanship and ethnic heritage into expression of cultural confidence.

By **WANG XINGWEI**
wangxingwei@i21st.cn

Fashion is often defined by global runways, luxury houses and seasonal trends. But in the mountains of Southwest China's Guizhou province, a different vision is taking shape — one rooted not in exclusivity, but in craftsmanship and community.

For designer Yang Chunlin, better known online as Gu Axin, fashion is not something imported from Paris, Milan, London or New York, but something that grows out of local ethnic culture.

"Our rural everyday life, in fact, represents the pinnacle of Eastern aesthetics on the international stage," he said.

That belief sits at the heart of "Village T", or "Village Runway", a grassroots fashion initiative Yang launched two years ago.

It began as a small, improvised runway in an open field, where a ridge of farmland became the catwalk and villagers stepped naturally into the role of models.

As the project expanded, it later moved into larger cultural spaces, eventually appearing on national platforms such as the 2026 Spring Festival Gala. It has also participated in international cultural exchange events, including the Foire de Paris (Paris Fair) in France.

"There were no resources, no team, no experience, and many voices of doubt," Yang recalled the early days.

He said many locals initially believed fashion had nothing to do with them. "People in the mountains have rich culture and craftsmanship, but we often lack confidence and underestimate what we're capable of," he added.

For Yang, that perception gap was precisely why the project mattered — to create a stage for people from his hometown to be seen on their own terms.

What followed was not a conventional fashion production, but a collective act of creation. Elders, embroiderers and young villagers all contributed what they could — clothing, labor, and traditional craft knowledge — turning the early shows into a shared expression rather than a rehearsed presentation.

"There are no professional models, scripts, or staged performances," Yang said. For him, that is where the magic lies: its authenticity.

As "Village T" grew, it became a platform for showcasing Guizhou's intangible cultural heritage, particularly Miao embroidery and Dong brocade.

Miao embroidery, known for its freehand technique and rich symbolism, is often described as a form of visual storytelling. Its patterns carry ancestral memory, mythology and identity.

Among the garments featured in the show, one piece holds special meaning for Yang: a Miao embroidered jacket transformed from a traditional "hundred-bird coat", a ceremonial Miao garment. But Yang's decision to reshape it into a modern silhouette sparked local debate.

"Many people didn't understand and felt distressed, saying I was destroying an antique," he recalled.

For him, however, the transformation was never about erasing tradition, but about extending its life. "In its modern design, the new jacket fully retained all the hand embroidery and cultural totems of the original garment," Yang explained.

More broadly, his philosophy is that heritage must evolve to survive. Traditional craft, he argues, should not remain frozen in museums or confined to ceremonial contexts, but should continue to live through contemporary expression.

"When the showcase is presented abroad, the biggest reaction from foreign audiences is sheer amazement," Yang said.

During the Foire de Paris, Yang met a foreign designer who was deeply moved by the craftsmanship on display. "This isn't just clothing — it's a living art form, a culture with a soul," she said.

According to Yang, for many visitors, the most striking realization is that some ethnic groups preserve history not through written language, but through textile traditions, where embroidery itself serves as a living record of identity and memory.

A changing village

Today, "Village T" has become more than a fashion showcase. It has reshaped local life.

"More and more young people are willing to return home to start businesses, and the works of senior embroiderers have found new markets and increased in value," said Yang.

Tourism has grown, and traditional craftsmanship has regained cultural relevance. But perhaps its most lasting impact is less visible: a shift in how younger generations see themselves and their place in the world.

Children who once felt distant from global stages now find them within reach.

Six-year-old Yang Jiayu from the Yao ethnic group has already visited major cities and appeared at international events. "I've been to Beijing, Shanghai and to the New York Fashion Week with 'Village T'," she said.

Her peer, 11-year-old Zhou Yumo from the Dong ethnic group, describes how tradition is embedded in her clothing. "My aunt made this outfit for me by hand. It has a lot of silver ornaments that jingle when I walk," she said.

For 9-year-old Xu Kexin from the Bouyei ethnic group, the experience has also shaped her aspirations.

"When I grow up, I want to carry on the traditions of my people and become a cultural ambassador," she said.

Podcasters explore hidden Xiapu

Through long-form conversations, podcasters turn Xiapu's local culture into stories that can travel across languages and borders.

By **GUO JIATONG**
guojiatong@i21st.cn

When Indonesian podcaster Rizky Ardi Nugroho arrived in Xiapu county, Fujian province, he expected to find the coastal scenery and distinctive sea erosion landforms that have made the area a favorite destination for photographers.

But during his three-day field trip, Nugroho discovered that Xiapu had much more to offer than picturesque landscapes. He was captivated by its maritime traditions, rich cultural heritage and vibrant community life.

"If you say Xiapu is a small county, I don't think so," he said. "The urban planning is very good, the city is very clean, and the people are very polite. It was beyond my expectations."

The creator of the Indonesian podcast *Do You See What I See* was among a group of domestic and international podcasters invited to a Xiapu field trip as part of the Second Gen Z International Podcast Festival from June 10 to 12. Nugroho's experience was exactly the kind of encounter the event hoped to create.

Themed "Xiapu: Where Mountains Meet the Sea", the festival aimed to encourage multilingual content creation through field visits and cultural exchanges, bringing together podcasters, communication professionals and young creators.

For nearly eight years, Nugroho has built a following through stories that bridge China and Indonesia, exploring culture, folklore and local traditions for Indonesian audiences.

During the trip, he was drawn not only to the county's natural views, but also to its efforts to preserve traditional culture, including wedding ceremonies, bamboo-stick dances, martial arts performances and historical artifacts.

One of his most memorable discoveries was the connection he saw between Xiapu and his homeland.

"As an archipelagic nation, Indonesia shares a long maritime tradition with China's southeastern coast. We share similar conditions in agriculture," he said.

Nugroho's discoveries, experts say, reflect a broader shift in international communication — from abstract national narratives to concrete local experiences.

"When storytelling reaches counties and smaller communities with distinctive local characteristics, it becomes more vivid and helps present a more comprehensive, authentic and multidimensional picture of China," said Zhang Yanqiu, deputy dean of the Institute for a Community with Shared Future at the Communication University of China.

She said podcasts are particularly suited to this kind of storytelling because they allow for sustained discussion and more focused exploration.

"If people want a deeper understanding of a topic, short videos are often not enough," she said. "Podcasts provide a more immersive experience and enable more precise communication."

This search for depth shaped the way many creators explored Xiapu.

Podcasters record a program in Dongbi village, Xiapu county, Fujian province. ZHANG XIAOYU / FOR CHINA DAILY

"As an archipelagic nation, Indonesia shares a long maritime tradition with China's southeastern coast. We share similar conditions in agriculture."

Rizky Ardi Nugroho, creator of the podcast *Do You See What I See*

"Long conversations force you to be more honest. After talking for an hour, you can't really hide behind a version of yourself."

Shanshan (pseudonym), one of the hosts of the podcast *Bye-Bye-Work*

"When people travel after listening to my podcast, I hope the landscapes they see come with 'subtitles'. There are stories behind them."

Yang Guowei, creator of the podcast *Grand Traveler: Humanistic Travel Audio Journal*

Finding deeper voices

Yang Guowei, creator of the travel podcast *Grand Traveler: Humanistic Travel Audio Journal*, has long documented destinations through history, geography and local culture.

In Xiapu, he spoke with a local seaweed farmer to better understand one of the county's pillar industries.

From the farmer, Yang learned that seaweed production runs from seedling cultivation in autumn to harvesting in spring. In the past, without machinery, workers had to rely entirely on manual labor to pull heavy seaweed from the ocean. The seaweed fields, arranged like rows of crops, required immense physical effort to harvest.

Although modern machinery has eased part of the burden, tasks such as drying the seaweed still require significant manual labor.

"After learning about the process, I realized how much effort goes into something we often take for granted," Yang said. "When people travel after listening to my podcast, I hope the landscapes they see come with 'subtitles'. There are stories behind them."

If Yang found hidden labor behind Xiapu's seascapes, other podcasters found emotional ties behind its cultural traditions.

Podcast hosts Zhang Erda and Shanshan (both pseudonyms), are known for discussing the thoughts and emotions of young urbanites on their podcast *Bye-Bye-Work*.

During their visit to Banyueli, an ancient village of the She ethnic group in Xiapu, they began reflecting on why some people remain so deeply connected to their places of origin.

One person who left a lasting impression was Lei Qisong, a local cultural inheritor and founder of a museum dedicated to preserving She culture.

Lei has invested his own money in the museum, collecting artifacts ranging from wood carvings and traditional costumes to furniture and objects used in She wedding customs. Together with his family, he has devoted himself to preserving and passing on local culture.

"People here genuinely love where they live. They identify with their culture, appreciate it and believe it is worth sharing with others. That kind of confidence is very contagious," Zhang Erda said.

That emotional and spiritual resonance is something Zhang Erda and Shanshan hope to convey to their listeners.

To them, the spirit of a place can be infectious, and it is this intangible quality that they want to capture through their podcast.

"They remind us of who we truly are," Zhang Erda said. "In cities, we often maintain boundaries and keep our distance, but in places like this, people are more open and eager to share their passions. This openness fosters genuine connections."

Making stories travel

For Zhang Erda and Shanshan, the trip is likely to become part of a future podcast episode.

Rather than simply recounting what they saw in Xiapu, they hope to use the journey as a starting point for broader discussions about travel, identity and the ways people connect with places.

"We usually focus on the thoughts and emotions of young people living in cities," Zhang Erda said. "A trip like this gives us an opportunity to connect personal experiences to larger themes that more people can relate to."

For Shanshan, podcasting is also rewarding for the host.

"Long conversations force you to be more honest. After talking for an hour, you can't really hide behind a version of yourself. You begin to understand yourself better, and listeners have time to think alongside you," she said.

According to Zhang Yanqiu, podcasts and other forms of "soft communication" can help local stories reach wider audiences. But turning those stories into effective international communication still requires precision, focus and continued exploration.

She said broader national narratives are ultimately built through specific, lived experiences rather than abstract concepts.

"When you travel and see different places, you begin to understand China in a more concrete way," she said.

Ceramics bring cultures closer

Shanghai event invites Chinese and foreign students to repair ceramics together, turning broken pieces into bridges of cultural understanding.

Carlotta Rose (left), Leandra Unterberg (second from left) and Michelle Rusyaeva (right) take part in a ceramic restoration workshop in Shanghai on June 12. ZHENG YIRAN / CHINA DAILY

By **ZHENG YIRAN** in Shanghai
zhengyiran@chinadaily.com.cn

For international students Leandra Unterberg, Carlotta Rose, Michelle Rusyaeva, Erik Grigoryan and Yasir Mehmood, ceramic restoration offered a hands-on way to engage with Chinese cultural heritage — both challenging and enjoyable.

June 13 marked China's Cultural and Natural Heritage Day. To celebrate the occasion, the Changning district culture and tourism bureau in Shanghai organized a cultural heritage event featuring interactive experiences, including ceramic restoration.

The workshop was held on June 12, when the five international students from Shanghai Jiao Tong University and Tongji University joined the activity alongside Chinese participants, experiencing traditional craftsmanship up close.

Seated around tables filled with broken ceramic fragments, glue and restoration tools, students carefully worked to piece the objects back together, guided by instructors. The quiet, focused setting contrasted with the busy urban surroundings outside, as participants concentrated on aligning each fragment and restoring the broken pieces step by step.

For Rose from Germany, the activity offered both discovery and peace of mind.

"It is good to experience something that I had never encountered before," she said. "I like the calm atmosphere, where I can concentrate on small details."

That sense of discovery also extends into her daily life in Shanghai. "Life here is very different from that in Germany. There is so much to see and do," she said, adding that she has often seen local residents playing board games and dancing in public squares.

"They kindly invited me to join, and it was fun," she said.

Unterberg found the restoration process difficult. "You need to stay focused throughout the process," she said. But she believes the effort is necessary. "We should all treat cultural relics with care."

Like Rose, Unterberg has also developed a growing interest in China through daily life in Shanghai.

"At a park in Changning district that I often walk by, there are people practicing calligraphy with water brushes on the ground. It is fascinating," she said.

> "By restoring the ceramic, we are restoring history. Although the object was broken, we brought it back to life by connecting the pieces."
>
> **Yasir Mehmood,** a Pakistani student in China

She has also participated in other cultural experiences with friends, including a tea ceremony.

"I've always been curious about the differences and similarities between Chinese and European tea culture," she said.

Rusyaeva highlighted her appreciation of Chinese culinary culture, including dumplings, steamed buns, noodles, wontons and Peking roast duck, which she said are very different from her usual diet.

"Chinese culinary culture is one of the oldest in the world and very different from that of Europe," she said. "When I go back home, I would like to cook Chinese dishes for my family and tell them about my experience in China."

Mehmood said the activity helped him better understand traditional craftsmanship.

"Before coming here, I had only read about ceramic restoration in books," he said. "My biggest takeaway is that it requires patience and concentration."

He added that the process carried symbolic meaning.

"By restoring the ceramic, we are restoring history. Although the object was broken, we brought it back to life by connecting the pieces."

Beyond the workshop, Mehmood has also experienced other aspects of Chinese culture, including mooncake making, Peking Opera performances and dragon boat racing.

He said that when he returns to Pakistan, he will share his experiences with his friends and family.

"I think it's a great way to bridge cultural gaps between China and Pakistan and promote mutual understanding."

Experts say such personal exchanges reflect the broader value of hands-on cultural experiences in deepening understanding across cultures.

"Replacing one-way explanation with immersive experiences like ceramic restoration can reduce cultural barriers and encourage emotional connection," said Zhang Zhuo, a researcher at the Institute of Journalism of Shanghai Academy of Social Sciences.

She added that such activities help transform abstract cultural symbols into tangible skills, allowing participants to better understand traditional craftsmanship. International students, she noted, can serve as cultural connectors who help share their experiences with wider audiences after returning home.

"As cross-cultural communication nodes, international students can help extend the reach of Chinese cultural heritage through word-of-mouth sharing," she said.

Grassland teenagers step onto soccer's biggest stage

By **GUI QIAN**
guiqian@i21st.cn

The roar of tens of thousands of spectators rolled across Mexico City Stadium on June 11 local time, shortly before the opening match of the FIFA World Cup 2026 kicked off, as six Chinese teenagers took part in the entrance ceremony in a moment they had once only imagined from home.

At the players' tunnel, Hao Xuan, Gao Haokai, Lyu Yuchen, Bao Wenbo, Cui Xiaofei and Lin Nandifu stood on both sides of the entrance, holding the FIFA flag. In the bright glare of the stadium and in front of a global audience, the students from the Inner Mongolia autonomous region looked composed beyond their years.

Selected from campus soccer players across the region through a flag bearer program organized by Mengniu, an Inner Mongolia-based dairy company and the official sponsor of the FIFA World Cup 2026, the six were stepping onto soccer's biggest stage for the first time.

"I used to watch the World Cup only on television. I never thought I would one day stand on the pitch," said Bao, 17, from Hailar No 1 Middle School in Hulunbuir. "It has been my dream since childhood to be part of it, no matter what role I played."

Bao's story reflects the journey of the six young athletes, all of whom emerged from Inner Mongolia's grassroots soccer development system. As China's first pilot province-level region for soccer reform and development, Inner Mongolia has made campus soccer a foundation for the sport's growth.

With policy support and continued investment, the region has strengthened the youth soccer chain, from building and renovating standard pitches to training coaches and organizing regular competitions. Parents of the young flag bearers said the change has been visible, giving their children more chances to compete and a stronger soccer atmosphere in which to grow.

"This is not just a trip, but a chance for them to see the world through soccer," said Shi Chunguang, assistant vice-president of Mengniu. "Standing on the sport's biggest stage can give these children confidence and a broader vision that no classroom can provide."

On the day of rehearsal, the six teenagers set out at 5 am and stood in the stadium for eight full hours. They had to push through jet lag, fatigue and language barriers. During breaks, they exchanged thoughts about soccer with peers from Mexico and South Africa, using simple English and gestures as they compared the soccer cultures of their countries.

(From left to right) Bao Wenbo, Lyu Yuchen, Liu Nandifu, Hao Xuan, Gao Haokai and Cui Xiaofei serve as FIFA World Cup flag bearers in an event organized by Mengniu at Mexico City Stadium on June 11 local time. PROVIDED TO CHINA DAILY

Gao, 17, from No 4 Middle School of Baotou, was attending winter training when he learned he had been selected. To present his best self to the world, he began what he called "personal image management" — working out and paying closer attention to his diet.

"Since I've made it to this stage, I have to do my best," he said.

The most nerve-racking moment came when the entrance ceremony officially began. Gao was the first in his group to walk out. But the moment he stepped from the players' tunnel onto the stadium turf, his nervousness gave way to pride.

"I felt that I was not only representing myself, but also my hometown and my country, while showing the world what young Chinese soccer players are like," he said.

Cui, 15, from Tianshan No 6 Middle School in Ar Horqin Banner, Chifeng, has been taller than most of her peers since childhood. She was noticed by the school team coach and began more systematic training. Over time, she found herself falling in love with soccer.

"My family, coaches and friends all hoped I would broaden my horizons, and they had great expectations for this opportunity," Cui said.

On WeChat and Douyin, her feeds were filled with messages of encouragement and congratulations from relatives and friends.

"They couldn't come, so I'll see it for them," she said.

On the World Cup's opening stage, the six teenagers from the grasslands made a brief but shining appearance. What they held high was not only the FIFA flag, but also a newly visible possibility for countless young soccer players behind them.

WORLD CUP 2026

Vozinha turns in a 'dream' performance

40-year-old Cape Verde keeper's heroics shut out favorite Spain

The European champion Spain, which dominated possession and had 27 goal attempts, could find no way past 40-year-old Cape Verde keeper Vozinha, who has become the face of his team's historic night. AFP

It took Cape Verde goalkeeper Vozinha all of his 40 years on Earth to make his World Cup debut.

The long, long wait was worth every second.

Vozinha recorded seven saves Monday, holding Spain's star-studded lineup to a shocking 0-0 draw. The veteran keeper was everywhere as the Spanish team and its fans became increasingly frustrated, despite dominating possession and unleashing 27 shots. Not even the second-half entrance of young superstar Lamine Yamal could crack the code to get past Vozinha and the Cape Verde defense.

As the final whistle blew, Vozinha hunched over near his net and cried before being embraced by his teammates. Cape Verde, in its first-ever World Cup match, had clinched a point against Spain, the 2010 champion and one of this year's tournament favorites.

Vozinha said he was overwhelmed by emotion thinking about his loved ones, who were unable to see his finest performance: his grandparents who had raised him, and his mother. His grandparents died a few years ago. And his mother had been unable to gather the money in time to secure a visa to enter the United States, Vozinha said.

Cape Verde is among 50 countries whose citizens face bonds of up to $15,000 to secure a US visa, part of President Donald Trump's broader crackdown on travelers from countries that officials said had high rates of visa overstays. The Trump administration last month suspended the requirement for ticket holders from Cape Verde and four other World Cup nations, but critics said it was too late for many fans.

Vozinha's performance was the culmination of a career that didn't even start professionally until he was 25, making his debut for Angolan club Progresso.

Since then, he's had stops in Moldova, Cyprus, Slovakia and Portugal, where he currently plays for Chaves in the Portuguese second division.

He was called up to the national team in 2012 and, at times, Vozinha said, he thought about retiring from international soccer, but he "continued because of this dream".

"I worked all my life for this moment, for this dream," Vozinha said. "A lot of generations in the past (dreamed of) this day, but they did not achieve it. And now the dream has come true."

The word "vozinha" is Portuguese for "little grandmother," and the goalkeeper said he was given the nickname by older kids who would beat him on the soccer field and then laugh, saying he was going home to complain to his grandparents. Years later, he took on the nickname after someone else joined his club who also had the same first name, Josimar.

These days, Cape Verde defender Steven Moreira said he and his teammates like to tease Vozinha about his age. He said he was proud of the keeper, calling him a "big legend", who had a "crazy game" and showed that age doesn't matter.

Fans across the world noticed, too: Vozinha's following on Instagram exploded from around 50,000 people to more than 2.4 million a few hours after the match.

"He lives and breathes Cape Verde," said defender Pico Lopes, who noted Vozinha can come across as a strict teammate during practice. "He's always on us about being on time, but that's what he does. He pushes us to be better. And you saw it today — he leads by example."

No panic, says De la Fuente after La Roja held to goalless draw

Spain boss Luis de la Fuente said he is still convinced La Roja will go far at the World Cup, despite failing to break down debutant Cape Verde in a 0-0 draw in their tournament opener.

The European champion badly missed the spark of Lamine Yamal, who was only deemed fit enough for a second-half cameo on his return from injury, as Spain struggled to even create chances against a side ranked 67th in the world.

"We are completely calm, convinced that there is a long way to go. As we see it, we have seven games left," said De la Fuente.

"We just lacked freshness and precision."

Spain is now 32 competitive games unbeaten, stretching back to March 2023.

However, the lackluster nature of the performance brought back painful memories of its meek exits to Russia and Morocco on penalties at the 2018 and 2022 World Cups, where the side dominated possession, but failed to score goals.

"Tomorrow, I'll bring up that magic number," added De la Fuente of his side's long unbeaten run.

"We have to stick to our philosophy and get key players back who will play a crucial role as the tournament progresses."

Yamal's introduction immediately injected life into the Spanish attack and lifted the majority of the nearly 70,000 crowd who were desperate to see the Barcelona superstar. Yet, even his threat was snuffed out, as Cape Verde doubled and, at times, even trebled up on the 18-year-old.

After an injury-plagued season at Athletic Bilbao, Nico Williams was also kept in reserve until the 87th minute.

"They are two game-changing players, but the ones we've had on the pitch are, too," said De la Fuente.

"They all bring different qualities to the table.

"They will provide new options, and the team will continue to grow. What we need to do is to find our rhythm and the decisive touch required for this type of competition, which I have no doubt we will acquire.

"Lamine showed exactly what he's capable of the moment he stepped onto the pitch, forcing the opposition to change their approach, but that was the amount of playing time we felt was right for him.

"Once we regain our chemistry and competitive edge, the team will be even better."

Spain returns to Atlanta for its second game against Saudi Arabia on Sunday before taking on Uruguay in its final group game in Guadalajara, Mexico, on June 27.

AFP

Belgium and its 'Golden Generation' veterans get off to unimpressive start

Romelu Lukaku (left) and Kevin De Bruyne celebrate Belgium's equalizer against Egypt in Seattle on Monday. AP

Despite seeking to avoid a repeat of its early World Cup exit in 2022, Belgium got off to an unimpressive start.

Romelu Lukaku entered in the 66th minute against Egypt on Monday, and the veteran striker immediately created a scoring chance that led to an equalizing own goal, but that was all Belgium could muster in a limp 1-1 draw.

"No game's an easy game in the World Cup," coach Rudi Garcia said afterward.

Perhaps not, but Belgium was expected to handle an Egypt squad that has never won a World Cup game. Instead, the Red Devils were outmaneuvered in the first half, with the speed of Egypt's younger players making the Pharaohs the aggressors.

"We know that we had a bad start in the match," captain Youri Tielemans admitted.

Now, the question becomes whether or not Belgium can make one last World Cup run with the remaining veterans from its "Golden Generation", which includes the 33-year-old Lukaku and two 34-year-olds, midfielder Kevin De Bruyne and goalkeeper Thibaut Courtois.

Belgium held the top spot in the FIFA rankings for several years and had its best World Cup performance when it finished third in Russia in 2018.

But the team fizzled out four years later in Qatar, entering with title-winning ambition, but failing to advance to the knockout round.

Since the FIFA rankings were introduced in 1992, Belgium and the Netherlands are the only teams without a World Cup title to hold the top spot.

The Red Devils entered this year's World Cup ranked 10th, by far the best in Group G, which also includes Iran (25th), Egypt (29th) and New Zealand (79th).

Lukaku, Belgium's leading goalscorer, is recovering from a hamstring injury. Belgium tied the game less than a minute after he entered as a substitute.

"He's a target man," Tielemans said. "He needs to build up his fitness, which is understandable after being out for the season, but he helps us in this way."

De Bruyne was replaced by Hans Vanaken in the 85th minute.

With 32 teams making the knockout round in this expanded World Cup, it's easier than ever to advance, but Belgium has less room for error as it prepares to face Iran on Sunday in Inglewood, California.

"We have to win against Iran, there's no two ways around it," Garcia said.

AGENCIES VIA XINHUA

Coach says Iran ordered out of US right after NZ game

Iran's Mohammad Mohebbi celebrates scoring his side's second goal during a 2-2 World Cup Group G draw with New Zealand in Los Angeles on Monday. REUTERS

INGLEWOOD, California — The coach of Iran's World Cup team said it was ordered to leave the United States and return to its training base in Mexico only a few hours after opening its politically charged tournament by playing out a 2-2 draw with New Zealand on Monday.

Coach Amir Ghalenoei didn't say who ordered the Iranians to leave earlier than planned. The team had expected to spend the night in California to maximize the normal recovery process after its opening game, only to be told after the match that everyone must immediately get on a plane for the 140-mile trip back to Tijuana.

"They didn't even give us time to recover," Ghalenoei said.

"After the game today, they said to us: 'you have to leave immediately.' It's very important for us to have time for recovery, (but) we are asked to get on a plane and return to our camp in Tijuana, and we are really troubled by that."

The Iranians' World Cup cycle has been in upheaval since the US and Israel started bombing Iran on Feb 28. Iran ultimately decided to compete, even after FIFA rejected its request to move its three group-stage matches out of the US.

"We don't know why they are returning us, to be honest," Ghalenoei said. "I think it's very strange. It seems like others are doing the planning for us. The decision-making for us is being made elsewhere. We were supposed to come two nights before the game, and we were supposed to stay tonight to recover and return tomorrow at lunchtime. We have no idea why.

"I think our team is perhaps the most oppressed in the World Cup."

Captain Mehdi Taremi and Ghalenoei both decried the team's lack of numerous key staff members — including the president of Iran's soccer federation, coaching support personnel and media officials — who were denied visas by the US, further hindering the team's preparations.

"We have to leave Los Angeles right now, and it's not good for us," Taremi said about an hour after the match. "I think FIFA have to help us more than this. Everything is like a disaster, actually, for us."

Iran opened its World Cup with a draw, coming from behind twice with Mohammad Mohebbi getting the second equalizer in the 64th minute in front of a solidly pro-Iranian crowd. Some Iranian-American fans engaged in protest against Iran's government.

Iran's next match is also at SoFi Stadium against Belgium on Sunday.

Quality performance

New Zealand coach Darren Bazeley praised his players for their battling performance which brought the team tantalizingly close to a first-ever World Cup win, saying they showed the kind of quality needed to clear that hurdle.

The Kiwis led Iran twice in what was an entertaining Group G encounter that featured a brace from New Zealand's Elijah Just.

"That may be our best performance ever, or since I've been involved with the All Whites, which is a long time," Bazeley said.

"Overall, I thought it was a really strong performance and I think we showed the world who we are and who our players are."

The draw means all four teams in the group have one point after Belgium drew 1-1 with Egypt earlier on Monday.

It was also the first time since the 1958 World Cup that four draws were recorded in a single day's play.

It also means, however, that New Zealand — in its third finals appearance — remains without a win after seven World Cup matches.

Bazeley said his team produced enough quality moments to snatch a victory, but acknowledged it hurt to come so close to that elusive win.

"We came here to win, and today we were so close to making history," he said. "We haven't won a game at a World Cup, and we're so close to doing that today, and that hurts."

New Zealand looked like it would hold on, until Mohebbi headed in a perfect cross to tie things up at 2-2, a moment Bazeley attributed to one of his team's few defensive lapses.

Nevertheless, he predicted his players would create more positive moments during the tournament.

"We've been building and building over the last few years in regards to performance," he said.

"And I've said a lot that, every game we play, we have moments within the games against good teams where we play really well and create chances. Today we were more consistent with that."

Xi calls for more coordination of regional growth

Fujian-Ningxia success hailed as model for east-west drive to achieve common prosperity

By XU WEI
xuwei@chinadaily.com.cn

President Xi Jinping has called for further steps to optimize the collaboration program between eastern and western regions of China to enhance coordinated regional development and boost the common prosperity drive.

In an instruction published on Wednesday, Xi highlighted the need to draw on the successful experience of the cooperation between Fujian province in East China and the Ningxia Hui autonomous region in Northwest China in refining the practice.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, commended the collaboration model for contributing to China's poverty alleviation drive and promoting coordinated regional growth over the past 30 years.

In 1996, China launched the program of East-West Pairing-off Cooperation for Poverty Reduction, whereby a developed provincial region in the east assisted a less-developed region in the west.

After China secured a victory in eliminating absolute poverty in 2021, the country put in place a five-year transition period to continue supporting people and regions that had emerged from poverty, ensuring a smooth transition from poverty alleviation to rural vitalization while guarding against any large-scale relapse into poverty. With the transition period now over, regular assistance programs start from this year, which also marks the beginning of the 15th Five-Year Plan (2026-30) period.

The president stressed in the instruction the need to improve the east-west collaboration mechanism, optimize cooperation methods and expand the areas of cooperation.

The goal is to promote industrial complementarity, personnel exchanges, mutual learning in technology, exchanges of ideas and mutual learning in work styles between eastern and western regions, in order to achieve mutual benefit, win-win outcomes and common development, he said.

Xi urged Party committees and governments at all levels to earnestly fulfill their responsibilities in regular assistance programs, firmly prevent any large-scale relapse into poverty, and advance all-around rural vitalization.

The instruction from Xi was conveyed at a work conference on Wednesday in Yinchuan, the capital of Ningxia.

Vice-Premier Liu Guozhong said at the conference that more work must be done to deepen industrial cooperation and labor collaboration between eastern and western regions and to strengthen exchanges of officials and professionals.

He highlighted the need to expand cooperation in science and technology, finance and other fields, and to carry out creative initiatives tailored to local conditions.

While serving as a provincial leader in Fujian province in the late 1990s, Xi personally oversaw the progress of pairing-off cooperation between Fujian and Ningxia.

Wang Jian, head of Ningxia's regional department of agriculture and rural affairs, said last week that the annual per capita disposable income of rural residents in Ningxia rose from about 1,400 yuan ($207) in 1996 to more than 20,000 yuan in 2025.

The Xihaigu area of Ningxia, once known as one of China's most impoverished and environmentally harsh areas, has bid farewell to its long history of extreme hardship and barren conditions, while 1.13 million people have gained access to safe drinking water, he said.

Over the past three decades, Fujian has provided 7.68 billion yuan in assistance funding to Ningxia for infrastructure projects, helping build more than 600 schools, hospitals, nursing homes and care centers for people with disabilities. Fujian has also encouraged over 1,600 enterprises to invest in Ningxia, bringing more than 100 billion yuan in actual investment, Wang added.

Blame game won't restore Western competitive advantages

WORLD WATCH
By Otton Solis

China's phenomenal success in exports deserves admiration. The development strategy behind it should be viewed as a model for others to emulate and even become part of the policy packages attached to financial assistance from the World Bank, the International Monetary Fund and Western governments.

That is how previous success stories were treated. Japan's post-war rapid economic growth was termed the "Japanese miracle", and the high-growth economies of the Taiwan region and the Hong Kong Special Administrative Region, Singapore and the Republic of Korea were celebrated as the "Asian Tigers".

China, however, has been given a different label. In 2013, economists David Autor, David Dorn and Gordon Hanson helped popularize what later became known as the "China Shock", which alleged that Chinese imports were hurting the labor market in the United States.

The change from terms of admiration to a vocabulary of alarm was telling. The "China Shock" was associated with negative nouns such as "overproduction, overcapacity and oversupply". These were attributed to strong state guidance through industrial policies, never mind the fact that the same strategy had underpinned the economic rise of Japan and several "Asian Tigers".

Today, as Chinese companies make global strides in electric vehicles, artificial intelligence, batteries, biotechnology, renewable energy, robotics, semiconductors and other frontier technologies, that concept has been updated to the so-called "New China Shock", or "China Shock 2.0".

In terms of supply and demand, genuine oversupply would mean that goods cannot find enough buyers unless prices are artificially supported. But there is no worldwide authority to set minimum prices for products, including electric vehicles, solar panels and batteries. What really bothers Western policymakers is not excess supply, but that Chinese companies are able to sell at competitive prices because of their remarkably high productivity.

China, US keeping drug control on a steady track

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China and the United States have maintained steady progress in anti-drug cooperation, with both sides continuing to expand practical collaboration in key areas, a senior Chinese narcotics control official said on Wednesday.

Wei Xiaojun, executive deputy director of the Office of China National Narcotics Control Commission and head of the Ministry of Public Security's narcotics control bureau, made the remarks as the nation further strengthened its drug governance and chemical control by placing 16 additional non-medicinal narcotic and psychotropic substances under control.

Wei noted that China and the US have deepened cooperation across substance scheduling, chemical control, intelligence sharing, joint investigations, online information cleanup, fugitive repatriation, anti-money laundering and drug testing technologies.

China has maintained regular communication with relevant US government departments, including the White House Office of National Drug Control Policy, to exchange updates and discuss priorities, Wei said.

Chinese law enforcement agencies have also worked on joint cases and the repatriation of drug-related fugitives with the US Drug Enforcement Administration, the Federal Bureau of Investigation and the Immigration and Customs Enforcement, he added.

In February, police in Tianjin arrested a suspect, surnamed Gong, in a drug-related case based on information provided by US authorities. Prior to that, a US citizen suspected of involvement in the same case was arrested by US law enforcement agencies from the state of Georgia.

Wei emphasized that drug control cooperation is a global mandate, and it should be based on mutual respect and trust. "As long as China and the US work together, they can effectively address drug-related challenges, which will benefit both peoples and the world," he said.

China remains committed to maintaining the positive momentum of Sino-US antidrug cooperation, which is a hard-won achievement and requires sustained joint efforts, he added.

As the summer solstice arrives on Sunday, across the wheat fields of the Guanzhong Plain, the first harvest of early summer has just been completed. Fresh grain is milled into new flour, still carrying the fragrance of the earth.

China Vibes — FOOD —

In Shaanxi province, this moment is not marked by ritual or festivity, but by something far more immediate and familiar — the transformation of the new wheat into bowls of noodles to be shared around the table.

A traditional Chinese saying goes, "Eat dumplings on the winter solstice and noodles on the summer solstice." The custom reflects the rhythm of seasonal eating, with foods chosen to suit the body's needs as the temperature rises.

In Shaanxi, however, noodles are not just a seasonal dish — they are a way of life.

Actor Sun Hao, a native of Xi'an, the capital of Shaanxi, understands that connection well. The 58-year-old recently won praise for his role in the television drama *Zhu Jue*, or *Leading Role*. While audiences discussed his performance, many also noticed the authentic Shaanxi dishes that frequently appeared on screen.

According to Sun, the production team ran a dedicated cafeteria serving local specialties, including oil-splashed noodles. "One bite is enough," he said. "I can immediately tell whether the noodles are good."

That confidence comes from growing up in a region where wheat-based foods dominate daily life. In much of Shaanxi, especially the Guanzhong Plain, noodles, steamed buns and flatbreads remain staples on family tables.

One of the most representative dishes for the summer solstice is *jiangshui mian*, or fermented vegetable noodle soup.

Soccer young guns take 'wild route' to glory road

Chinese boys team's prestigious international victory reflects new talent-spotting philosophy

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

The 2026 FIFA World Cup is underway, and while the Chinese men's national soccer team may not be in contention for the trophy, a group of young players has offered a glimpse of a possible bright future.

On June 2 in Turin, Italy, a Chinese boys' U12 team defeated the academy side of English Premier League club Everton 5-4 in a penalty shoot-out to claim the Sigismondi Cup. The tournament, often described in youth soccer circles as a "mini World Cup", featured 48 youth teams from around the world, including academies from major European clubs.

The Chinese side completed a perfect run, winning all seven of their matches, scoring 20 goals and conceding just one on their way to the title. They became the first Asian team to win the tournament.

When the decisive moment arrived in the final, 12-year-old Meng Xinyi from Nanjing, Jiangsu province, stepped up for the fifth penalty.

He began his run-up, struck the ball cleanly, and sent it into the corner. As the ball hit the net and the shoot-out ended 5-4, he tore off his jersey, threw it in the air, and did a backflip in celebration.

Supporters in the stands erupted. On the opposite side, the young players from Everton stood frozen, hands on their heads, watching the trophy slip away.

"I was very nervous walking up," Xinyi said later. "But I also told myself I had to trust my instincts. When the ball went in, it felt incredible."

His approach to taking penalties is simple and built on self-belief. "No matter how the goalkeeper tries to distract you, if your first instinct is to shoot a certain side, you must trust it," he said.

The team, known as China Football Boy 2014, delivered a flawless campaign in Italy.

Behind the celebrations, however, lies a broader question about the development of Chinese soccer. Youth training has long faced challenges in consistently producing elite talent.

That landscape is now beginning to shift, as grassroots "wild route" initiatives expand alongside official efforts to support structured overseas development. While their approaches differ, both are contributing to a more diversified pathway for talent development.

Behind the backflip

Xinyi's acrobatic celebration was not accidental.

Before focusing on soccer, he spent more than a year training in martial arts while in kindergarten, developing flexibility and explosive strength. He later discovered soccer in primary school and quickly showed aptitude for the game.

By the time he joined his school team in Nanjing Gulou No 1 Central Primary School, soccer had already become part of his daily rhythm. He would finish homework during breaks so he could train after school.

Asked what soccer means to him, Xinyi's answer is straightforward. "Happiness," he said. "Because soccer allows me to express myself and push myself fully. Even when we are behind, I always believe we can come back."

His ambition is equally clear. "I want to become a professional player and contribute to Chinese soccer in the future."

Connecting players like Xinyi across China is a widely discussed and sometimes controversial figure in Chinese soccer development circles — the former journalist and commentator Dong Lu, and his grassroots initiative known as the "Chinese Football Boy" program.

In a recent online dialogue with veteran broadcaster Shui Junyi, Dong described his approach candidly as belonging to the "wild route"—a term often used to distinguish informal grassroots development from institutional systems.

He argues that talent is not "manufactured" in a traditional sense. "What matters is not who trains you, but who discovers you, guides you, and gives you a platform," he said. "Talent is revealed, not manufactured."

In 2017, Dong became involved in youth soccer development full-time. Since then, he has organized youngsters from across China to attend weekend and holiday training camps, and frequently taken them to international competitions.

Dong said total investment in the project has exceeded 58 million yuan ($8.58 million) over nine years, with free training provided to participating children.

Xinyi's father, Meng Qinghua, said the opportunity given to his son had transformed the boy's life.

"Without Dong Lu, there would be no Meng Xinyi today," he said. "He gave the child the chance to play internationally, and he never charged a fee."

Dong's philosophy places strong emphasis on exposure to competition. Unlike traditional youth systems that often prioritize training over results, he argues that Chinese soccer suffers from what he calls a "habitual acceptance of losing".

"In Chinese soccer, the real scarcity is hope," he said. "If we do not win, there is no attention, no momentum. But victory is essential because it creates belief."

Trial by fire

A central pillar of Dong's model is constant exposure to international competition.

In early June, a mixed U16 and U17 squad from the program arrived in Sao Paulo, Brazil, after competing in the Netherlands. The players were scheduled to face youth teams from Brazilian clubs such as Sao Paulo, Palmeiras, and Santos.

"Even if we lose by a large margin, we must play against peers of the same age," Dong said. "Only then can we understand where we truly stand."

Meng Xinyi, 12, demonstrates a header during an interview in Nanjing, Jiangsu province, after winning the 2026 Sigismondi Cup. PROVIDED TO CHINA DAILY

For many players, the experience has been formative.

One of the squad members, Yuan Bohan, said after one match in Brazil, he noticed the difference in the pace and intensity of the game. "The rhythm is completely different from what we experience domestically," he said. "Winning and losing both matter, because what we lack most is the experience of winning at this level."

Despite losing, the Chinese team still managed to express its own style of play. "We hope to learn from Brazilian soccer and bring that mentality back to China," he said.

In an environment of constant testing, individual breakthroughs have begun to emerge.

On June 3, Chinese player Li Haoyan, 14, officially joined FC Barcelona's famed La Masia academy at U15 level. He instantly became one of the most closely watched Chinese youth players to enter Spain's elite development system.

Born in Dalian, Liaoning province in 2012, Haoyan first trained at a grassroots club founded by his father, before joining Dong's program at age 10. At age 13, he moved to Spain to pursue soccer full-time.

Adapting to a new country proved challenging. Language barriers and daily life adjustments were significant obstacles. He reportedly wrote tactical instructions on his palm during matches and added extra training sessions on his own initiative.

In the 2025-26 season, Haoyan played 28 league matches with CF Damm. He contributed 12 goals and 12 assists, helping his team finish seventh in a 16-team regional division.

Known for his pace and versatility, Haoyan attracted attention from several Spanish clubs before Barcelona finalized his signing.

"I want to thank every fan who has supported me on the journey to this dream," Haoyan wrote on social media. "This is a new environment and a new challenge, and I will stay focused, train hard, and cherish the opportunity to develop in one of the world's best youth academies.

"I will steadily improve myself, carry the original aspiration of representing my country with pride, and give everything I have to keep moving forward," he wrote.

CFA's support role

Haoyan's journey to Barcelona is one example of what grassroots "wild route" development can achieve through private support and individual commitment. But soccer authorities have increasingly sought to build more systematic mechanisms to support overseas development.

In recent years, the Chinese Football Association has introduced policies that share a similar objective: helping more young players gain experience in high-level overseas environments.

For decades, Chinese soccer has struggled with what many call the "12-year-old drop-off" — a stage at which many promising players leave the sport due to academic pressure and uncertain professional prospects.

Earlier generations of Chinese players who went abroad did so largely alone. Players such as Yang Chen and Shao Jiayi relied on personal resilience and limited support networks during early stints in Europe.

Today, however, institutional support is expanding.

In April 2026, the Chinese Football Association launched its Youth Inspiration Program, aimed at players age 15 to 23. The initiative provides financial subsidies, development support, and performance-based incentives for young players competing overseas.

CFA President Song Kai emphasized that talent development depends on exposure to high-level competition. "We want talented players to go abroad, stay abroad, and play abroad," he said.

For many players, the program reduces uncertainty. CFA officials note that financial instability is one of the key barriers preventing young players from pursuing international careers.

China's head coach Shao Jiayi described the initiative as a meaningful shift. "It provides a clearer pathway and tells young players that they are not alone when they go abroad," he said.

At the same time, domestic grassroots soccer continues to expand. In Nanjing, where Meng Xinyi plays, a structured school-to-school soccer pathway now links primary, secondary, and high school education, reducing dropout risks.

Cities such as Chengdu in Sichuan province have also introduced shared coaching centers, integrating retired athletes into school programs and improving coaching quality at the grassroots level.

According to CFA data, the number of registered elite young players has now reached nearly 100,000, with competition participation continuing to rise.

CFA officials have emphasized that multiple development models are welcome. "Professional academies, sports schools, school-based programs, and social organizations all play a role," Song said. "The key is to broaden the talent pool."

Broader horizon

Looking across the evolving landscape, Chinese soccer today is no longer defined by a single pathway.

There is Meng Xinyi, celebrating in Turin; Li Haoyan, training at La Masia; Dong Lu's teams competing in Brazil; and a growing institutional framework supporting youth development at home.

"The real shortage in Chinese soccer is victory," Dong said.

Yet victory, increasingly, is being pursued through multiple routes — some structured, others experimental, and many still evolving.

The question of whether grassroots "wild route" initiatives or institutional systems will ultimately prove more effective may be less important than their coexistence. In a mature ecosystem, different pathways often reinforce rather than exclude each other.

Dong recently suggested that the next major breakthrough in Chinese soccer may emerge around 2034, when a new generation of players — shaped by both domestic reform and international exposure — reaches maturity.

By then, many of today's young players will be entering their prime years, some already embedded in overseas systems.

Whether that future delivers long-awaited progress remains uncertain. But for the young players now crossing borders, scoring penalties, and chasing opportunities far from home, Chinese soccer is already being rewritten — not as a single story, but as a widening field of possibilities.

Nation outlines pathway to a fairer world

Beijing issues white paper on promoting more just and equitable global governance

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

China on Wednesday released a white paper titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions", which Foreign Minister Wang Yi said aims to offer a comprehensive account of the country's ideas and actions in promoting global governance, and to foster broader consensus within the international community on reforming and improving global governance and ensuring more effective responses to global challenges.

Wang made the remarks at a news conference held by the State Council Information Office in Beijing on the release of the white paper.

"Global governance is a common endeavor that bears on the well-being of all humanity, and building a just and equitable global governance system is a shared vision long pursued by people from across the world," Wang said.

Wang said that the Global Governance Initiative, proposed by President Xi Jinping, came at a critical juncture where the international system established after World War II faced multiple shocks and global governance was encountering headwinds. Since its introduction in September, the GGI has received broad support from nearly 160 countries and international organizations, with over 60 countries joining the Group of Friends of Global Governance. "The GGI has evolved from a Chinese proposal into an international practice, and is showing ever-growing vitality," Wang added.

To foster broader international consensus, China will host the first Xiong'an Global Governance Forum this autumn, Wang said.

At the news conference on Wednesday, officials also underlined the wide range of measures China has rolled out to advance a fairer and more equitable global governance system.

Zhou Haibing, deputy head of the National Development and Reform Commission, said that China upholds multilateralism and an open, inclusive approach in promoting both global governance and international cooperation on artificial intelligence.

He said that China will host the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai in July. According to the foreign minister, China is also stepping up efforts to establish a World AI Cooperation Organization.

Noting that the GGI puts people's well-being at the center, Zhao Fengtao, vice-chairman of the China International Development Cooperation Agency, said that China has always worked with other countries to improve the global poverty reduction governance framework.

Together with 53 countries and nine international organizations, China launched the Global Partnership for Poverty Alleviation and Development, which has helped to turn its poverty reduction experience into global public goods, and given new momentum to global poverty reduction, he said.

Stressing the key role of the Global South in global governance, Vice-Foreign Minister Miao Deyu said that the international community should support the Global South in bolstering solidarity and self-reliance, leveraging major cooperation platforms including BRICS, the Shanghai Cooperation Organization, and the Group of 77 and China, and scaling up the role of emerging financial institutions such as the New Development Bank and the Asian Infrastructure Investment Bank.

Wang Huiyao, president of the Center for China and Globalization, a Beijing-based think tank, said that while individual major powers' engagement in bloc politics, geopolitical confrontation and unilateralism has diverted the international focus away from improving global governance, China has put forward a more inclusive and comprehensive vision for global governance, redirecting the global focus to the essential issues requiring the joint efforts of all countries.

"At a time when the world is far from peaceful, the newly released white paper has put forth an innovative framework for global governance," he said. The document has not only formed a new core of consensus and reshaped views on global governance, but also concretely showcased how China's global visions and policy proposals can be translated into tangible and on-the-ground outcomes, he added.

NATIONAL VISION, LOCAL ACTION

Hainan now a magnet for foreign firms

By **CHEN BOWEN** in Haikou
chenbowen@chinadaily.com.cn

Feng Fei

Six months after the launch of island-wide special customs operations, the Hainan Free Trade Port is running smoothly, with international trade and investor interest rising sharply, Hainan Party Secretary Feng Fei told China Daily.

Inside

Views, **page 7**

The landmark move, which took effect on Dec 18, 2025, marks one of China's most ambitious institutional opening-up efforts. Feng said the initial phase had achieved its primary goal of stable and orderly operations, with goods moving efficiently, cross-border travel more convenient, and businesses increasingly moving operations to the island.

By May 31, customs clearance efficiency had improved significantly. The value of imports under the zero-tariff policy jumped 116 percent year-on-year, average clearance time for imported goods dropped 20 percent, and declaration requirements for goods leaving the island for the mainland were simplified by over 60 percent.

Total international trade value rose 53.7 percent during the period. The number of registered foreign trade companies grew 57.8 percent, while newly established foreign-funded enterprises increased 37.6 percent.

The robust growth reflects not only the initial effects of the special customs operations, but also the growing effectiveness of the Hainan FTP's institutional framework, he said. A comprehensive policy framework is now in place, featuring zero tariffs, low tax rates, and liberalization and facilitation of trade, investment, cross-border capital flows, personnel entry and exit, and transport, alongside safe and orderly data flow. Goods eligible for zero-tariff treatment have expanded from 21 percent to 74 percent of all tariff lines.

Institutional innovations are also reshaping the island's economic structure. Feng said that Hainan has developed a modern industrial system with distinctive characteristics and competitive strengths. Tourism, modern services, high-tech industries and high-efficiency tropical agriculture accounted for nearly 70 percent of the province's GDP in the first quarter of 2026.

Against this backdrop, Feng said Hainan is becoming an increasingly attractive destination for global investors and highlighted three major opportunities for foreign businesses. Hainan offers China's shortest negative list for foreign investment, a pioneering cross-border services trade negative list, and special market-access measures, including wholly foreign-owned hospitals and independent operation of high-level overseas universities, and vocational colleges in the fields of science, engineering, agriculture and medicine.

Located at the junction of two of the world's most dynamic markets — China's 1.4 billion consumers and Southeast Asia's nearly 700 million — Hainan has attracted 22 Fortune Global 500 foreign-funded enterprises and a total of 139 headquarters-type companies. More global investors have chosen the island as a base to enter the Chinese market or expand globally. In 2025, Hainan's outbound investment volume grew 20.7 percent year-on-year.

To sustain the momentum, Hainan has been stepping up efforts to build a market-oriented, law-based and internationalized business environment, Feng said. The province has introduced a fair competition regulation, enacted 57 local regulations under the Hainan Free Trade Port Law, and established international commercial courts and a specialized intellectual property court. A one-stop dispute resolution mechanism integrating mediation, arbitration and litigation is operational.

Meanwhile, Hainan is upgrading transportation and logistics infrastructure to strengthen its role as a regional hub linking China with global markets.

Hainan aims to become a shipping hub for the New International Land-Sea Trade Corridor and an aviation gateway to the Pacific and Indian Oceans. The first seventh-freedom traffic rights route, which allows foreign airlines to operate routes between two countries without flying to their home countries, is now operational.

Feng outlined a road map to establish Hainan as a new frontier of China's opening-up by 2035, and a globally influential high-level free trade port by mid-century. The province has partnered with 44 global free trade zones and ports, attracted investment from 180 countries and regions, and maintained trade ties with over 220 countries and regions.

Drugs: 16 additional substances put under control

From page 1

According to Wei, China has actively responded to the diversion of nonscheduled chemicals into illicit drug production channels in North America.

Starting on July 1, a total of 16 substances will be added to the catalogue of nonmedical narcotic and psychotropic substances, China's national drug regulator announced on Wednesday.

This will place 412 types of nonmedicinal narcotic and psychotropic drugs, as well as the entire categories of fentanyl-related substances, synthetic cannabinoids and nitazene-related substances under control.

To strengthen risk prevention, China issued warning notices twice — in November 2025 and May this year — urging compliance with relevant laws. Customs and postal authorities reinforced export supervision, risk analysis and inspection procedures.

Wei said authorities have also carried out nationwide crackdowns on the illegal trafficking of precursor chemicals and new psychoactive substances, and strengthened industry self-regulation.

Chemical control remains a key upstream measure in China's drug control strategy, he said. In 2025, authorities seized 550.6 metric tons of drug-related precursor chemicals. China has also published a white paper on fentanyl-related substance control and expanded its regulatory system.

Wei said that China's drug situation remains generally stable, but new challenges are emerging as trafficking becomes more organized, substance abuse more diversified and users younger. He warned that loophole exploitation, gray-area substances and emerging addictive compounds are increasing regulatory complexity.

According to the 2025 China Drug Situation Report, which was released on Wednesday, Chinese authorities solved 27,000 drug-related cases and arrested 41,000 suspects last year, down 27.6 percent and 33 percent year-on-year, respectively. They also seized 33.5 tons of drugs, up 25.4 percent, and handled 134,000 drug users, down 30.3 percent.

The report noted a rise in abuse of nonscheduled addictive substances. In 2025, authorities seized nearly 1.27 million liters of nitrous oxide, up 84 percent year-on-year, and 9.3 tons of other substances, an increase of more than 17-fold.

Spreading cheer

Noodles: Fermented food helps cope with summer heat

From page 1

Ren Haibo, executive chef at the restaurant in the Beijing office of the Shaanxi provincial government, describes it as the perfect antidote to summer heat. The dish begins with celery that is fermented in water used to cook noodles over several days. The resulting sour broth is seasoned with garlic, dried chilies and aromatics before being poured over freshly cooked noodles.

"The taste is sour, fragrant and refreshing," Ren said. "It stimulates the appetite and helps people feel comfortable in hot weather."

Long before air conditioners became commonplace, such fermented foods offered a practical way to cope with high summer temperatures. Today, *jiangshui mian* remains a seasonal favorite in central Shaanxi.

Jiangshui yu is a traditional Shaanxi dish consisting of cornmeal dough pieces served in a fermented vegetable broth. In spite of its name including the Chinese character *yu*, it contains no fish. The small, doughy pieces are made from cornmeal or wheat flour and are served in a sour broth with garlic, chives and chili oil, creating a refreshing balance of sour and spicy flavors.

"In the past, when new wheat arrived, the first thing people wanted to do was taste the fresh flour," said Ren.

That tradition lives on in dishes such as Qishan *saozi* noodles, a specialty from Baoji and western Shaanxi. Often served to welcome guests, the noodles are renowned for their harmonious blend of sourness, spiciness and aroma. A colorful topping of diced vegetables, tofu, egg strips and meat is ladled over thin, springy noodles.

For Shaanxi people, however, the love of wheat extends beyond noodles. One of Sun Hao's favorite local dishes is *xiaochao paomo*, a spicy variation of Xi'an's famous soaked flatbread dish.

"It's incredibly fragrant," said Sun. "The taste is stronger, and younger people especially love it."

The ritual surrounding the dish is almost as important as the food itself. Diners traditionally tear pieces of flatbread by hand before it is cooked with broth and other ingredients.

As the year's longest day arrives and fresh wheat enters local kitchens, the cycle of harvest to table continues uninterrupted — carried forward in bowls of noodles shaped by generations.

Growth: West can replicate factors fueling China's success

From page 1

There are two key socioeconomic consequences of this increase in productivity. First, millions of low-income and middle-income consumers from Western countries and the Global South, including Chinese consumers, are able to buy cars and other industrial goods at much lower prices. This would not be possible without Chinese competition.

Second, the world is able to fight climate change more effectively when it gains access to low-cost, high-tech renewable energy equipment produced by Chinese companies. Low-tech and high-cost industries in the West have struggled to survive against Chinese competition.

Instead of welcoming the benefits enjoyed by consumers and the improved odds in the fight against global warming, many Western policymakers have chosen to side with entrenched interests, unproductive businesses, established oligopolies and the financiers of their costly political campaigns.

Rather than trying to fix blame for their competitive shortcomings, Western countries would do well to identify the underlying factors of China's highly productive economy.

Four advantages enjoyed by China deserve special attention. First, the country has a vast domestic market, which allows Chinese companies to achieve significant economies of scale and subjects them to intense local competition even before they enter the global market. Second, there is continuity and predictability of economic policy and political stability in the country. Third, China has made massive investments in quality education, transportation and energy infrastructure, and in research and development. Fourth, macroeconomic management and industrial policy have been fine-tuned to align with long-term planning, while market forces and the private economy are allowed to play important roles.

None of these advantages are beyond the reach of Western economies. When it comes to market size, both the US and the European Union have very large integrated markets capable of supporting similar economies of scale. On the policy front, politicians in most Western countries have chosen polarization and short-term gains over long-term national interests. That is hardly China's fault.

The same applies to education, infrastructure and innovation. Nothing prevents Western countries from channeling large investments into these areas as they did in the past. But to do it now requires tough decisions, such as reducing defense expenditure and pursuing a more equitable tax system. As for industrial policy, public investment has played an important role in infrastructure and technological development in Western countries. If China's strategy in these areas explains its success, as is often argued by Western nations, nothing prevents them from doing the same.

The West has chosen a different response: blame games and protectionism. Instead of embracing competition, the core factor for economic success, most Western governments have chosen to shield their industries by using tariffs, quotas and the outright blocking of some imports.

A more constructive path for the West would be to examine the factors that have fueled Chinese success and try to imitate some of those policies. If such an approach is followed seriously, the world might even witness a "West shock" in the future.

Reactions to Iran deal mixed

Fourteen-point framework begins 60-day process to negotiate permanent agreement

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

US President Donald Trump declared "victory" following the agreement with Iran, but reactions across the United States remain sharply divided.

On Wednesday, US media reported that senior US officials had disclosed details of a preliminary memorandum of understanding between Washington and Tehran aimed at ending the 110-day conflict, which was signed ahead of schedule on Wednesday.

The agreement has immediately sparked debate over whether it represents a diplomatic breakthrough or a concession to Tehran.

Under the 14-point framework, the two sides would have 60 days to negotiate the terms before reaching a final agreement. According to a senior US official, the preliminary deal would reopen the Strait of Hormuz, establish a $300 billion reconstruction plan for Iran, and lift restrictions on Iranian oil exports. The agreement also includes language that Iran agrees not to develop or procure nuclear weapons.

Some terms of the deal remain contentious. Trump repeatedly denied on Wednesday that the United States would contribute to the reconstruction fund, though he said Gulf allies could provide financial support if they chose to do so.

Trump warned that the US would "go back to bombing" if Tehran failed to comply with the terms of the preliminary agreement or if negotiations did not result in a long-term deal preventing Iran from developing a nuclear weapon.

"Mistakes are made. War is nasty," Trump said during the G7 summit, appearing to acknowledge US responsibility for strikes that killed more than 150 children. Trump said the incident was under investigation.

The agreement has drawn mixed reactions from US lawmakers, even within the Republican Party, with some praising it as a step toward ending the conflict while others warning that it could strengthen Iran.

Republican senator Lindsey Graham welcomed the MOU, reversing his earlier skepticism toward negotiations between the two countries.

"After this discussion, it is my opinion that signing the MOU will be beneficial to the United States, in as much as the Strait of Hormuz will begin to open, and the hostilities with Iran will stop," Graham wrote.

"Whether or not the United States can reach an acceptable, verifiable deal with Iran regarding its nuclear program and other issues is yet to be determined, but I see little downside to trying," he continued. "The economic stability that comes from opening up the Strait and the cessation of hostilities could create a pathway to peace well beyond the Iranian conflict."

Others, however, strongly criticized the deal.

"The details that I've seen so far look ... awful. This will go down as a tremendous foreign policy blunder," Republican Senator Bill Cassidy told Nexstar's Reshad Hudson on Capitol Hill on Wednesday.

"(President Ronald) Reagan is rolling over in his grave. Iran's nuclear ambitions were not curbed, and they have learned that threatening the Strait of Hormuz works and will undoubtedly leverage it in the future," Cassidy wrote in a social media post. "Now, Iran gets to build brand-new infrastructure under this deal."

"Before the war, the strait was open, Iran was being crushed by sanctions, and 13 service members were still alive. Now, 13 Americans are dead, families have paid billions at the pump, sanctions will be lifted, and the bombing has stopped. This is the worst foreign policy blunder in decades," he wrote.

Former US ambassador to the United Nations Nikki Haley also criticized the agreement, particularly reports that sanctions on Iranian oil exports would be lifted immediately.

"If this is true, Iran wins," Haley wrote.

A recent analysis from the Center for Strategic & International Studies said both Washington and Tehran would likely claim victory, while each side would also face losses.

"For President Trump, the primary success of the deal is the reopening of the Strait of Hormuz ... but the strait's closure was a direct consequence of the war," the analysis said.

The analysis also noted that the agreement could be a major setback for Israel and Prime Minister Benjamin Netanyahu, who has long viewed Iran as an existential threat. It added that the Iran war had broad support in Israel and that Netanyahu faces a difficult political environment ahead of the coming election.

Agencies contributed to the story.

Fed Chair announces new era for central bank

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

Federal Reserve Chairman Kevin Warsh announced a new era at the Fed in his first news conference at the helm of the central bank, signalling his plan to make it quieter with less engagement with the markets and one that squarely focuses on tackling inflation.

Warsh spoke at his first news conference as Fed chair on Wednesday, after overseeing his first Fed policy meeting. All 12 members of the Federal Open Market Committee voted unanimously to hold rates at a range of 3.5 percent to 3.75 percent for a fourth meeting in a row.

The new Fed chair was clear about his core focus. "I've said for years inflation is a choice," Warsh told reporters. "You bet it is."

He added that he was committed to bringing inflation back down to its 2 percent target. The Fed will next meet in six weeks.

In new projections, policymakers said they expected overall inflation to be 3.6 percent by the end of the year, higher than they had predicted three months ago. Core inflation would be 3.3 percent, The New York Times reported.

In a departure from his predecessor — former Fed Chair Jerome Powell — Warsh identified a series of changes that he intends to make in his new role.

"The recent past need not be prologue," he said while discussing the fact that inflation was higher than the Fed's target for more than five years.

One of his first small changes was to the usual Fed statement, which he said was "a bit shorter, a bit simpler and dispenses with some older language" and focuses on "the facts as best as we can judge it".

In another change, he declined to submit an economic forecast to the Fed's Summary of Economic Projections, including its "dot plot", CNBC reported. But he did allow his colleagues to submit one.

He also opted to end the "forward guidance", which is a hint in Fed statements about where interest rates may be heading in the future.

"I can't give you any forward guidance about what we're going to do next," he said. "The good news is we'll be meeting in six weeks."

In his speech, he said it was important at any institution during "a change in leadership" to "reaffirm its mission, to review current practices, and to consider whether those practices best meet our objectives".

He announced that five task forces will reexamine the core functions of the central bank.

They will address communications, the balance sheet, data sources, productivity trends and jobs.

Warsh said that he will be "enlisting some of the very best minds, both inside and outside the economics profession", for discussions on the task force. They will be paired with Fed staff.

In another departure from his predecessor, Warsh did not offer explicit guidance on interest rates and did not talk about how the Fed will decide when to adjust rates.

Analysts said that this could make it tough for investors to determine what the central bank will do next.

He stated that the financial markets would be entering "a new chapter" with the central bank.

He also stated that the labor market is stable.

Warsh, 56, was nominated by President Donald Trump in January as the replacement for former chair Powell. He took over as the 17th Fed Chair in May.

He served on the Fed's Board of Governors from 2006 to 2011, and previously worked as an executive at Morgan Stanley and the Duquesne Family Office.

His predecessor had a fractious professional relationship with Trump as he would not cut rates, even after several demands to do so by the US president.

Asked about the Fed's decision to maintain rates, Trump said on Wednesday: "It's all right, whatever."

The new Fed chair takes over as inflation reached a three-year high of 4.2 percent in mid-June, mainly due to higher gas prices, data from the government said.

Warsh said he plans to keep talking with the media, as news conferences are useful for communicating, if he has "something to say".

The bond market sold off when the Fed released its projections on Wednesday afternoon and again during Warsh's news conference, The Wall Street Journal reported.

But Warsh said he was not interested in immediate market reactions.

Other economic challenges include oil prices falling sharply after the deal to end the US-Israel war with Iran was reached.

It took immediate effect late Wednesday after both sides signed it, Pakistan's Prime Minister Shehbaz Sharif said.

While seeking Trump's nomination, Warsh had called for "regime change" at the Fed.

He reportedly prefers the communication style of Alan Greenspan, the Fed's chair from 1987 to 2005, who was less outspoken than Powell, The Associated Press and Reuters reported.

"The changes to the policy statement were profound," Thomas Simons, chief US economist at Jefferies, wrote in a note. "Policy statements became much wordier after the global financial crisis, so this is a return to a more Greenspan-era style of post-meeting communications."

Japan slammed over slow probe into embassy attack

By **ZHOU JIN**
zhoujin@chinadaily.com.cn

China has criticized the lack of progress in Japan's investigation into and handling of a case involving a Self-Defense Forces officer who allegedly entered the Chinese embassy in Tokyo armed with a knife, urging Japan to take full responsibility for the incident.

Foreign Ministry spokesman Lin Jian made the remarks on Wednesday after the Tokyo District Public Prosecutors Office reportedly decided to extend the detention of Kodai Murata, a second lieutenant in Japan's Ground Self-Defense Force, for psychiatric assessment to determine whether he can be held criminally responsible for his actions.

Nearly three months have passed since Murata illegally broke into the Chinese embassy in Tokyo.

Lin said incidents threatening the security of Chinese diplomatic missions in Japan have continued to occur, adding that China has expressed grave concerns and lodged protests against the Japanese side on many occasions.

The case exposes a number of deep-seated problems in Japan, including worsening right-wing influence and the suppression of objective and rational voices, he said.

Lin also listed the toxicity of the Japanese government's erroneous policies on vital issues concerning China-Japan relations, including history and Taiwan, the serious lack of education on true history and the pervasive erroneous historical views.

There is also an ongoing push in Japan for a more offensive and expansionist defense policy, and a failure in the oversight and discipline of the Self-Defense Forces, he said.

Lin noted that several prominent figures in Japan have called on the government to apologize to China.

Some have urged Tokyo to reflect on itself and take corrective actions concerning the supervision of the SDF, the education on history and Japan's policy toward China, so as to fundamentally address the issue and remove its breeding ground in society.

"We once again urge the Japanese side to do serious soul-searching, correct its wrongdoings, conduct a thorough probe and take full responsibility for the incident," Lin said.

Nepal looks to strengthen collaboration with China

By **ZHOU JIN**

Nepal's new government is looking to strengthen political engagement with China and expand cooperation in areas including connectivity, technology, governance and people-to-people exchanges, Foreign Minister Shisir Khanal says.

Speaking of his recent four-day visit to China, Khanal said connectivity is one of Nepal's top priorities in its cooperation with China, both a neighbor and an important partner for the South Asian country.

"We have seen very impressive infrastructure being built on the Chinese side. We would like to see similar connectivity improvements on the Nepali side as well," he said.

Improved land and air links would facilitate trade, tourism and people-to-people exchanges, he added.

Khanal expressed hope that his visit would help pave the way for more high-level exchanges between the two countries in the coming months.

"I have invited Foreign Minister Wang Yi to visit Nepal, and we also hope to see more exchanges between leaders from both sides," he said.

A former minister of education, science and technology, Khanal took the current post in March. He said Nepal sees great potential to work with China in emerging technologies, particularly artificial intelligence.

"Nepal has a young and technologically savvy population," he said, adding that it is one of the fastest-growing sectors in the country in terms of tech service exports.

Khanal praised China's rapid advances in AI, especially the development of powerful and cost-effective models, saying Nepal hopes to leverage such innovations to support its own digital transformation.

Nepal recently announced plans to establish its first sovereign AI data center, and China could be a partner in that effort, he added.

Kathmandu aims to improve public services through digitalization and technology to make such services easily accessible to its people, he said.

> "We have seen very impressive infrastructure being built on the Chinese side. We would like to see similar connectivity improvements on the Nepali side as well."
>
> **Shisir Khanal,** foreign minister of Nepal

"That's something China has done amazingly well and (which) we would like to learn from," he said.

Nepal is particularly interested in learning from China's industrialization, agricultural modernization and technology-driven development, Khanal said.

China's mechanized agriculture has generated large numbers of jobs in both rural and urban areas, helping power the country's rapid economic growth, he said.

In recent years, China has also made remarkable progress in homegrown technologies, which have improved efficiency and brought tangible benefits to people's daily lives, he added.

Highlighting the long and traditional relationship between Nepal and China, Khanal said it is now important to bring dynamism to the relationship between young people of both countries and deepen mutual understanding.

"There is significant interest among young Nepalis in learning from China, particularly in science and technology," he said, adding that more and more Nepalis are studying Chinese and pursuing higher education and research opportunities in China.

Zhejiang champions law-based governance

Frontline policing and dispute management prioritize people's life quality in province

By HAO NAN
haonan@chinadaily.com.cn

With the commitment to pioneering provincial-level law-based governance in China, East China's Zhejiang province has integrated rule-of-law building into every aspect of modernization and become a demonstration zone.

A sound legal ecosystem has underpinned Zhejiang's robust economic and social progress after the province initiated the rule-of-law provincial construction strategy on April 26, 2006.

From 2006 to 2025, the province's GDP surged from 1.56 trillion yuan ($230.9 billion) to 9.45 trillion yuan, while public safety satisfaction rose from 94.8 percent to 98.9 percent, ranking among the nation's highest for five consecutive years.

A judge from Dongyang city people's court Weishan tribunal delivers a lecture on constitutional law to primary school students in Dongyang city, Zhejiang province, on Dec 3, 2025. BAO KANGXUAN / FOR CHINA DAILY

Supporting enterprises

These statistics testify to the province's improved law-based governance mechanisms.

Over the past two decades, Zhejiang has enacted more than 30 pioneering regulations and rules to shore up reform and industrial upgrading.

Notably, the province issued regulations to boost private enterprises and optimize the business environment, securing full life-cycle protection for market entities.

Hangzhou, capital city of Zhejiang province, has rolled out a regulation on embodied intelligence robots. As the first local regulation of its kind nationwide, it took effect on May 1, serving as a benchmark for the development of embodied intelligence across the country.

To support enterprises going global, Zhejiang opened an overseas legal service center in November 2025. It now operates more than 400 service outlets in 98 countries and 138 major cities, providing one-stop legal services such as consultation, remote notarization and commercial mediation.

Centering on livelihood

Zhejiang's two-decade commitment to the rule of law has also prioritized people's interests. The Fengqiao Experience, which centers on resolving conflicts at the grassroots level, originated in Fengqiao town of Zhuji city. Over the past few years, the practice has spread nationwide and evolved into a hallmark of advancing law-based governance.

At present, public security authorities in Zhejiang are pushing forward the development of police stations modeled after the Fengqiao Experience. The Ningwei squadron of the traffic management police brigade of Xiaoshan district public security subbureau in Hangzhou is among them.

The squadron has deployed more police officers to frontline posts to ensure a quick response to emergencies. When no police calls come in, officers carry out preventive work including incident detection, hidden danger inspection and traffic safety publicity.

A policeman from Ningwei squadron instructs the elderly on traffic safety in Hangzhou on March 23. PROVIDED TO CHINA DAILY

Over the five years since the launch of the Fengqiao-style initiative, fatalities from traffic accidents under Ningwei squadron's jurisdiction have dropped by 63.6 percent. Following the rollout of grid-based governance, congestion-related police reports in the precinct dipped 32 percent year-on-year, and accident handling efficiency rose by 45 percent.

"We have truly realized the governance goal of resolving minor incidents within grids and major issues within the jurisdiction," Yuan Gengsheng, an official from Ningwei squadron, said.

To make judicial services more accessible and efficient, local courts in Zhejiang have introduced diversified mechanisms for family disputes and fast-track procedures for labor disputes, significantly cutting public litigation costs.

Additionally, procuratorial organs have launched special campaigns on food and drug safety and ecological protection, while the police have intensified crackdowns on telecom fraud and organized crime.

Beyond judicial rectification, Zhejiang has built 381 standardized comprehensive governance centers in key areas and expanded online judicial services to enable convenient dispute resolution. It has also strengthened public legal education with 10 national legal education bases to foster a law-abiding society.

Digital court system

Leveraging its digital economy, Zhejiang has embedded technologies into full-cycle law-based governance to modernize provincial governance.

The province has built cross-departmental big data platforms for online criminal case handling and a digital court system covering filing, mediation, trial and enforcement, lowering the appeal rate of first-instance cases to 6.12 percent.

As the nation's pilot for comprehensive and integrated administrative law enforcement reform, Zhejiang has streamlined more than 1,300 law enforcement teams to 652. It has also launched 105 cross-departmental supervision scenarios, eliminating duplicated and overlapping law enforcement issues.

In the future, Zhejiang is committed to making substantial progress in modern law-based governance. The province plans to deepen institutional reforms related to the rule of law, continuously enhance digital empowerment mechanisms for judicial and administrative governance, and refine its people-centered legal service system.

These efforts aim to consistently enhance the public's sense of fulfillment, happiness and security, setting a robust provincial benchmark for the comprehensive advancement of the rule of law across China, local officials said.

Wu Minghui hosts a stall sharing information on how people can protect their own rights during a legal publicity campaign held on May 10. PROVIDED TO CHINA DAILY

Public's legal knowledge boosted by diverse efforts

By YUAN SHENGGAO

To raise residents' awareness of the law, Zhejiang province in East China has ramped up legal popularization over the past two decades. Nowadays, respecting, studying, abiding by and applying the law has become a voluntary practice across society.

Yuhang district of Hangzhou, capital city of Zhejiang province, started to pioneer quantitative assessment on the rule of law governance in 2006, serving as a microcosm of the province's drive to foster law-abiding conduct.

Wu Minghui, who used to be a mediator, felt the change in Yuhang when recalling a contractual dispute over auxiliary processing involving a small-sized precision processor in her early working days.

In the case, a processor manufactured spare parts for a local high-tech company.

But the two sides only kept simple delivery slips without a formal written contract specifying quality criteria, inspection protocols and payment deadlines.

Disputes later arose over product precision defects, leaving more than 300,000 yuan ($44,338) unpaid.

Frequent quarrels between the two parties nearly put an end to their business partnership.

"Without standardized contract guidelines or digital working tools, I could only calm the conflicting sides temporarily instead of resolving the dispute fundamentally. That case drove home a profound truth: without the safeguards of the rule of law, businesses cannot secure stable operation," Wu said.

Now as a practicing lawyer in Nuoliya Law Firm, Wu adopts a different approach when handling similar disputes. She directly applies the Contracts section of the Civil Code to clarify delivery specifications, inspection obligations and payment liabilities for both parties.

Leveraging the digital rule-of-law platform, she uses standardized contract templates to help parties secure transaction evidence and clarify rights and obligations efficiently. Moreover, she coordinates with judicial offices, industrial parks and trade associations to settle disputes with reference to precedent rulings.

For years, Yuhang has translated institutional strengths of the rule of law into development dividends through quantified management, digital empowerment, diversified co-governance and development-focused guarantees, enabling the law to underpin businesses for steady operation and bold innovation, Wu said.

At the end of 2007, Yuhang issued the official quantitative assessment system for law-based governance. In 2008, the district rolled out a rule-of-law index. Quantitative assessment has since been applied to law-based development and social governance in Yuhang.

Earlier this year, the Ministry of Justice revealed the first batch of national model cities, counties and districts for law observance and legal popularization, with Yuhang on the list. "The core edge of a law-based Yuhang lies in addressing the genuine needs of residents and enterprises with accessible and feasible legal services. Thanks to multilevel collaborative mechanisms, most conflicts get resolved at the grassroots level. We now provide full-spectrum compliance services for enterprises covering risk prevention and dispute resolution, so businesses can pursue development free from unnecessary worries," Wu said.

Across Zhejiang, legal literacy is being promoted via diversified initiatives. In December 2025, Wenzhou arranged for leading officials of administrative authorities to attend in-court trials on-site.

In Zhenhai district of Ningbo, the Weiyuan Qingfeng hall, an education venue on Party discipline, functions as a regular rule-of-law classroom for Party members and cadres. Renovated from Zhejiang's clean-government education base and opened in 2015, it has drawn nearly 400 groups and more than 20,000 visitors annually over the past 11 years.

During the summer vacation in 2025, Shangcheng district of Hangzhou partnered with the local public welfare legal service team to host law-themed garden activities inside air-raid shelters. In the cooler environment, children learned about the evolution of China's legal publicity drive.

In January, Dai Ji, head of the Department of Justice of Zhejiang Province, revealed a 20-year scorecard marking the progress in building law-based Zhejiang. He said: "It has become a widespread social consensus that all affairs follow legal provisions, all residents understand and observe laws, and all parties conduct activities in accordance with the law."

New rules guide robotic intelligence

By YUAN SHENGGAO

Hangzhou in East China's Zhejiang province has rolled out the country's first local regulation governing embodied intelligence robots, which took effect on May 1.

Covering technological innovation, infrastructure construction, industrial development, application empowerment and safety management, the ordinance sets clear legal guidelines for the standardized and high-quality growth of the emerging sector.

Zhou Junjie, senior vice-president of Zhejiang SUPCON Information Technology, noted that the regulation was formulated with extensive input from enterprises, research institutions, end users and expert panels. Tailored to the current development status and bottlenecks of China's embodied intelligence industry, it offers valuable references and guidance for the nationwide sector.

According to Zhou, the progress Hangzhou has achieved in the embodied intelligence industry, which has been propelled by the much-talked-about "six little dragons" enterprises, represented by Unitree Robotics and DEEP Robotics, has proved the feasibility and soundness of the local regulations. These rules will set an example to drive the entire industry.

As an example of embodied robots, the recently unveiled Hangjing Zhixing robot by SUPCON can perform standard directing gestures such as guiding traffic to go straight and stop fluently. It is also capable of detecting traffic violations including riding without safety helmets, stopping beyond traffic lines and jaywalking across zebra crossings, followed by polite and patient voice alerts.

It is expected to take on a wider range of tasks in Hangzhou, ranging from the West Lake scenic area and Qianjiang New Town.

"Though it is a local industrial regulation, it boasts universal applicability," Zhou said, adding that the regulation also takes into account the current development landscape and prevailing challenges of China's embodied intelligence robot industry. "Undoubtedly, it offers valuable guidance and reference for the sector nationwide and will serve as a benchmark for the development of embodied intelligence across the country," Zhou noted.

"Furthermore, the regulation defines the core concept of embodied robots. By legislative means, it connects the full industry chain covering technology, application scenarios, market and safety. It gives enterprises full confidence to ramp up research and development efforts, roll out applications and expand business, acting as a real reassurance for local companies."

A robot produced by Zhejiang SUPCON Information Technology guides traffic on a major road in Hangzhou. PROVIDED TO CHINA DAILY

During an enterprise's growth, innovation is inevitably accompanied by risks and uncertainties. A stable, fair, transparent and predictable legal environment is fundamental for enterprises to invest, operate and pursue innovation boldly.

This forward-looking legislation for emerging industries serves as a vivid epitome of Zhejiang's two-decade commitment to advancing the rule of law to bolster high-quality development and business environment, according to local officials.

Grounded in the belief that the rule of law creates a sound business environment, Zhejiang has launched a host of pioneering reforms, including the one-stop service that features no unnecessary interference and timely responses to needs, which has effectively unlocked the innovation capability of market entities.

According to a survey made by the All-China Federation of Industry and Commerce to evaluate the business environment across the country in 2025, Zhejiang ranks first nationwide in four major categories: market environment, legal environment, innovation environment and government service environment. Its government service sector has maintained the top position for four consecutive years.

At the symposium marking the 20th anniversary of building a law-based Zhejiang, Wang Hao, Party secretary of the province, emphasized the key role of supporting high-quality development through legal services. He added that more efforts should be made to improve rules and systems for fostering a worldly recognized innovation ecosystem and a highly competitive business environment, and fully implement the requirements for building a unified national market.

"This constitutes a key part of Zhejiang's next drive to advance the development of a law-based province to a higher level," Wang said.

Principles, proposals and actions aimed at better global governance

The State Council Information Office released a white paper on Wednesday titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions".

The document outlines China's principles, proposals and actions on global governance, aiming to foster broader consensus within the international community, ensure more effective responses to global challenges and build a more just and equitable global governance system.

The world faces severe and complex challenges, along with increasing disruptions to the postwar international order. The two pressing questions of the era are: What kind of global governance system should be established, and how can global governance be reformed and improved?

China has always been an active participant in, contributor to and builder of global governance as it regards it as a common endeavor that bears on the well-being of all humanity.

In promoting a global governance system characterized by extensive consultation and joint contribution for shared benefit, President Xi Jinping has called for true multilateralism to foster an equal and orderly multipolar world and a universally beneficial and inclusive economic globalization.

To this end, he has put forward the vision of building a community with a shared future for humanity and proposed the Global Governance Initiative to build a more just and equitable global governance system.

Resolutely upholding the authority and status of the United Nations is fundamental to the effective implementation of the GGI, which, aligned with the growing trend toward greater democracy in international relations, offers a clear and feasible road map for improving global governance.

That the GGI has the support of nearly 160 countries and international organizations — with over 60 countries joining the Group of Friends of Global Governance — sends a clear signal that building a just and equitable global governance system is a shared vision pursued by the international community.

Anchored in the purposes and principles of the UN Charter and guided by a vision of global governance featuring extensive consultation, joint contribution and shared benefits, the GGI upholds multilateralism and unites forces in pursuit of a fairer future.

But as the white paper stresses, the effective implementation of the GGI hinges on major countries bearing a sense of responsibility and all nations unitedly addressing the peace and development deficits.

With the declining effectiveness of some international mechanisms and inadequate rules in emerging areas, the fragmentation in global governance is evident. There is a "compound crisis" in which the lack of security, development, governance and trust are intertwined.

On the one hand, the world is experiencing deeper multipolarization and the rapid rise of the Global South. On the other hand, the existing governance system suffers from a lack of representativeness, inclusiveness and effectiveness. This is exacerbated by heightened competition among major countries, obstacles to multilateral cooperation and a decline in international trust.

As the white paper states, there is no need to reinvent the wheel to overcome these challenges. What is needed is for all countries to firmly uphold the international system with the UN at its core, safeguard the international order based on international law and uphold the basic norms governing international relations underpinned by the purposes and principles of the UN Charter.

China, on its part, has been consistent in this regard. Noting that China was the first country to sign the UN Charter, Foreign Minister Wang Yi said at a news conference held to present the white paper on Wednesday that the country is ready to work with other countries to reinvigorate and strengthen the UN and uphold the authority of the UN by advancing the GGI. The GGI is action-oriented and aligned with the Global Development Initiative, Global Security Initiative, Global Civilization Initiative and high-quality Belt and Road cooperation.

Embodying the unity of ideas and actions, the GGI provides important conceptual guidance and practical pathways for steering the global governance system toward greater justice and equity, contributing Chinese wisdom and solutions to resolving the shortcomings in global governance.

Drone 'partnership' mask for remilitarization

On the agenda of the G7 leaders who met in France this week was reportedly a proposal straight out of a geopolitical conjurer's playbook: Japan's participation in the Eurodrone project.

On paper, this is a straightforward case of industrial synergy. Europe wants to reduce its reliance on US and Chinese supply chains; Japan, with its precision manufacturing, needs new partners to ease the strain on an overstretched US defense industry. It sounds like a pragmatic "alignment" of interests.

But to see this as merely a tech-transfer or investment deal is to miss the strategic bamboozling at its heart. This is the latest, and perhaps most brazen, act in a well-rehearsed Japanese trick: the art of "security" packaging. Tokyo has become a master of cloaking military ambition in the drab language of economic and technological cooperation.

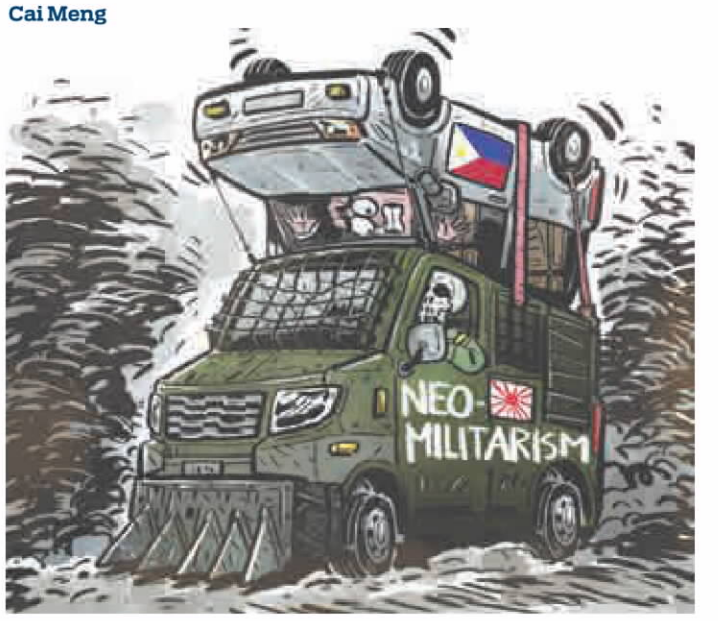
The Eurodrone initiative seems to be the perfect vehicle. It allows Japan to deepen its military ties with key European countries, gain access to sensitive drone technology for its own "counterstrike" capabilities, and embed itself further into Europe's military-industrial base — all under the guise of supply-chain "diversification".

The G7, already grappling with its existential anxieties, is susceptible to being hoodwinked in this way, as Europe's post-Ukraine security jitters mean it is predisposed to Japan selling itself as an indispensable "natural partner". By exploiting the European need to reduce dependency on the US for military supplies, Tokyo hopes to weave Japan's "remilitarization" into the fabric of collective Western security. As Tokyo sees it, if it can get a G7 stamp of approval for a project like Eurodrone, it gains a powerful imprimatur for its broader "remilitarization".

Gaining international "legitimacy" for its military expansion is not an afterthought, but the core objective of the move.

The Sanae Takaichi government has labeled China as Japan's "unprecedented strategic challenge"; Japan has doubled its military budget in a mere four years, with spending set to hit a staggering 9 trillion yen ($56.15 billion) this year; and it is actively developing offensive weapons that effectively shatter its postwar "exclusively defense-oriented" principle.

And this brings us to the uncomfortable historical parallels that polite diplomatic discourse tends to forget. The very same *zaibatsu* industrial conglomerates that will be at the heart of any Japan-Europe defense project were the indispensable gears of Japan's wartime military machine. This structural continuity, combined with the right-wing forces that continue to whitewash its wartime history, should set alarm bells ringing.



The proposal by the ruling Liberal Democratic Party to increase military spending to 3 percent to 3.5 percent of Japan's GDP, and to build "sustained combat capability" for a prolonged "emergency", demonstrates the direction of the dangerous journey the Takaichi government is leading Japan on at present.

It is a trajectory of a state methodically, and seemingly with "great courtesy", dismantling its constitutional shackles. Japan has not yet formally revised Article 9, but with its "helicopter destroyers" that are effectively aircraft carriers and its latent capability to produce nuclear weapons, the infrastructure for a potent military force is already in place. All that remains is the final push.

Therefore the query posed by Chinese Foreign Ministry spokesman Lin Jian warrants serious global attention. Highlighting Japan's history of militarism and foreign aggression, Lin asked some pointed and timely questions: Is Japan's militarist past returning? Is Japan speeding down the path of "remilitarization"? Could Japan once again become the bane of East Asia?

As the G7 leaders consider Japan's proposal, they should ask themselves whether they are engaging with a peaceful partner, or are they providing, through their own anxieties, a multilateral seal of approval for Japan's strategic revisionism? The European G7 members risk becoming enablers of aggression. They should not be fooled by the language of "partnership". This is about more than drones; it's about setting a dangerous precedent.

East-west pairing assistance key to balanced development

China's east-west pairing assistance program — a mechanism launched in 1996 — continues to shape the country's pursuit of more balanced and inclusive growth. This was evident on Wednesday, when officials gathered in Yinchuan, capital of the Ningxia Hui autonomous region, to review and further improve the program.

Over the past decades, the reform and opening-up of China have greatly promoted the development of the country in all aspects. While prosperity has been generated along the country's eastern coast, its western areas have lagged behind in comparison. The challenge is to ensure growth benefits are distributed more evenly across the vast country.

In response, policymakers have established a framework linking the developed eastern regions with their less-developed western counterparts, creating channels through which capital, talent, technology and market opportunities can flow across administrative boundaries. Over time, this has evolved into a coordinated development assistance system.

Over the past five years, enterprises have been guided to invest more than 750 billion yuan ($111 billion) in the western regions. This program has helped more than 5 million rural workers from western China secure jobs and facilitated nearly 570 billion yuan in sales of agricultural products from western regions to the eastern markets. These figures suggest that the mechanism is not just redistributive. It has created sustainable economic linkages and growth opportunities.

Equally notable is the institutional architecture developed over the years. The program now operates through five major mechanisms: industrial cooperation, labor collaboration, consumer assistance, talent exchange and social support. Together they connect investment, employment, market access, human capital and public services into a single framework.

Industrial cooperation encourages investment and industry upgrading. Labor collaboration expands employment opportunities. Consumer assistance creates sizable markets for agricultural products. Talent exchange transfers expertise and managerial experience. Social support mobilizes educational, healthcare and other public resources. Each mechanism addresses a different dimension of regional inequality.

The significance of this model lies in its compatibility with China's national conditions. A country of continental scale, marked by vast differences in geography and development levels, requires institutions capable of coordinating resources across regions. The pairing program turns regional disparities into opportunities for complementary development. Eastern regions gain access to new markets and labor resources, while western regions benefit from investment, technology and expertise.

More broadly, the program reflects a characteristic of China's long-term development perspective. Few governments can sustain a development strategy across three decades while continuously adapting its objectives and implementation — from poverty alleviation to rural vitalization and coordinated regional development. The achievements of the pairing program owe much to long-range planning, policy continuity and incremental improvements in governance.

Experience around the world suggests that economic activity naturally gravitates toward already prosperous regions. China's approach has been to use institutions to mitigate this tendency without abandoning market mechanisms. The pairing program does not replace markets; it connects them by lubricating the internal circulation.

As China enters the 15th Five-Year Plan (2026-30) period, balanced development has become increasingly important for the efforts to realize common prosperity. Future growth will depend not only on technological innovation and industrial upgrading, but also on expanding domestic demand and ensuring broader participation in development. Regional coordination is therefore an economic imperative of national importance.

The east-west pairing assistance program should be adapted to the current situation. Unlike 30 years ago, many inland areas have become gateways to global engagement under the Belt and Road Initiative. Consequently, the east-west pairing assistance program should incorporate more cross-regional collaboration.

Thirty years after its launch, the program stands as a testament to a governance philosophy that prizes patience, continuity and long-term development — qualities that have helped transform the regional development gap into a story of increasingly shared growth.

— LI YANG, CHINA DAILY

What They Say

Chinese classics offer ways to tackle modern challenges

Editor's note: *The Second World Conference of Classics was held in Athens earlier this month. Chen Yun, a professor of philosophy at East China Normal University, who attended the conference, spoke to China News Service about why China's classics should be included in global classical studies. Below are excerpts of the interview and an analysis of the practical application. The views don't necessarily represent those of China Daily.*

From the perspective of Chinese classical studies, peace signifies not merely stability within human communities, but also harmony and balance between human society and nature. Stability within human society is based on respect for political, social, ethical and civilizational differences. In addition, it demands an integrative consciousness to transcend such divisions and achieve *tai he*, where all the people and all things coexist in supreme harmony.

The contemporary world order often reflects a "law of the jungle" mindset, where might makes right, conflating human society with the animal kingdom. Such thinking amounts to a negation of civilization.

In contrast, the Chinese concept of *tianxia weigong*, or pursuing the common good for all under heaven, from the classic *The Book of Rites*, represents an ideal vision for the world order. *Tianxia*, or "all under heaven", transcends political boundaries to encompass a civilizational domain, integrating individuals and societies into a community of humanity.

In real life, it is necessary to cultivate individuals who are capable of bearing the responsibility for all under heaven, and encourage them to break free from serving narrow group interests and commit themselves to the shared interests of all humanity.

Confronted with the current world order and its multiple challenges, we must mobilize both political and non-political forces to forge a humanitarianism suited to the age of globalization, and improve global governance through diverse approaches.

Fairness, justice and equality are long-existing pursuits of Chinese philosophers from ancient times to today. The political principle of serving the public is deeply embedded in the concept of "pursuing the common good for all under heaven", which is in drastic contrast to the concept of "pursuing good for the small interest group".

Behind political concepts such as being people-oriented, selection of the capable and the rule of virtue lies the concept of "pursuing the common good for all under heaven". This has become a central feature of the traditional Chinese political value system.

The pursuit of the common good is the prerequisite for achieving fairness, and only by prioritizing public welfare, can social fairness be realized.

These values underpin China's role as a steadfast promoter of world peace and shared development.

The pursuit of common good for all under heaven carries the core wisdom of Chinese civilization. Deeply rooted in the fertile soil of Chinese culture, it has not only become an important ideological resource for the development of Chinese society, but also provides Chinese solutions for the future of humanity.

VIEWS

Ro Jae Hun

Toward more mature ROK-China ties

SHI YU / CHINA DAILY

In June this year, the ROK witnessed the first anniversary of its new government. Within just one year, the Lee Jae Myung administration has not only restored political stability and economic confidence, but also elevated the ROK's global standing through its "pragmatic diplomacy".

President Lee Jae Myung's proactive summit diplomacy — encompassing official visits to 14 countries and hosting the heads of state from 13 nations — has enabled ROK diplomacy to rebuild international confidence while strengthening strategic partnership and multilateral diplomacy.

In particular, ROK-China relations have developed to new heights within a remarkably short period of time.

The two successful summit meetings served as a vivid testament to the dramatic progress in bilateral relations, yielding tangible and meaningful outcomes across a wide range of areas.

As indispensable neighboring countries, the ROK and China have shared common interests in many areas and maintained close relations since the establishment of diplomatic ties in 1992. Through mutual efforts, bilateral relations have reached a new peak.

Last November, the ROK successfully hosted the 2025 APEC Economic Leaders' Meeting in Gyeongju, achieving a milestone outcome with the adoption of the "Gyeongju Declaration" aiming towards easing regional trade barriers and stabilizing global supply chains.

On this occasion, President Xi Jinping visited the ROK. It was the first state visit by President Xi Jinping in 11 years. During his visit, the two leaders engaged in hours of comprehensive discussions, reaffirming the core value of our strategic cooperative partnership and laying out a blueprint for the comprehensive development of bilateral relations across political, security, economic, and cultural spheres. Then only two months later, President Lee visited Beijing. It was the first state visit by the ROK President in 9 years. These consecutive summit meetings have led to the following results.

On the political side, the two countries fully restored strategic and cooperative partnership. Mutual trust is being restored, and mutual respect is deepening. Both agreed to work together for a more stable and secure Korean Peninsula. High-level engagement and strategic communication continue to intensify.

On the economic and trade side, concrete numbers accurately reflect the positive momentum in bilateral relations. From the inauguration of the Lee Jae Myung administration through May 2026, trade between the ROK and China has totaled $315.9 billion, marking an 18 percent increase from the same period a year earlier.

The two leaders shared their vision for future cooperation in the field of investment, AI, bio industry and smart cities. Cooperation for securing a stable supply chain has been strengthened. Negotiations for the new trade and investment FTA are accelerating.

An agreement was reached to extend the currency swap. Discussions on demographic challenges facing the two countries such as aging society and silver economy were also on the agenda. As the two countries prioritize the livelihood of the people, these mutual cooperation will benefit the people of both countries.

A total of around 20 MOUs were signed to secure the implementation of the mutual agreements. These are substantive measures that will help stabilize and cement bilateral relations, especially in an increasingly uncertain global environment.

On people-to-people exchanges, mutual visits are on an upward trend, especially as both sides relaxed visa policy. The number of international flights between the ROK and China reached 113,200 just within 11 months since the launch of the current administration, marking an 8.3 percent increase.

The expanded connectivity has driven a significant increase in people-to-people exchanges, with bilateral visitor numbers rising to 8.45 million, up an approximately 26 percent. Cultural and sports cooperation is also expanding. To the delight of soccer and baduk fans, the two sides are strengthening partnerships and people-to-people exchanges in these areas, which are of great common interest to the younger generations of both countries.

Building on this growing momentum, the ROK-China Summer Youth Sports Exchange is scheduled to take place this year between Jeollabuk-do and Hainan Province, featuring friendly matches in badminton, basketball, table tennis, and baduk.

With joint efforts, these exchanges have helped improve mutual perceptions. Taking China's concerns seriously, President Lee himself publicly spoke out against the spread of misinformation and domestic fake news concerning China. According to a ROK polling organization, the favorability rating toward China recently rose from 21.3 to 30.2 percent just within a year.

Moreover, the share of those who regarded the relations as either good or average rose significantly to 78 percent. Concurrently, various other studies indicate that Chinese citizens' favorability toward the ROK has improved as well. It clearly demonstrates a meaningful and reciprocal turnaround in mutual public perceptions.

The upcoming 2026 APEC Economic Leaders' Meeting in Shenzhen, China will present another important opportunity for the ROK and China to further strengthen strategic communication and deepen practical cooperation.

Building on the positive momentum achieved through the recent summit meetings, the two countries will continue to expand collaboration in emerging future-oriented fields.

Guided by the common understandings reached by two leaders, the ROK and China will work together to manifest the shared visions into substantive outcomes, accumulate mutual trust and expand people-to-people exchanges.

Advancing strategic cooperative partnership toward a more mature, stable, and ever-deepening relationship is the path the two countries are taking together.

Hainan Free Trade Port redefines economic openness

On Dec 18, 2025, the anniversary of China's landmark reform and opening-up policy, Hainan launched island-wide special customs operations — a moment that transformed the entire tropical province into the world's largest free trade in terms of area. Six months on, the numbers are striking, and the strategic logic is becoming clear.

Trade has surged. By the end of February 2026, Hainan's total goods imports and exports had reached 65.49 billion yuan ($9.7 billion), up 29.1 percent year-on-year — outpacing the national average by 14 percentage points. Exports alone grew by 55.4 percent.

Markets in the Association of Southeast Asian Nations, Africa and Latin America have all seen substantial growth, pointing to a genuinely diversified trade base rather than dependence on a single partner or region.

But statistics alone do not capture what makes Hainan significant. To understand why this experiment matters — not just for China, but for the wider world — it helps to ask a simple question: why choose to open up precisely when so much of the world is closing down?

The past few years have seen a wave of economic nationalism sweep through advanced economies.

Tariffs have been raised, supply chains have been "reshored" in the name of security and trade policy has increasingly been wielded as a geopolitical weapon. Hainan represents a deliberate and confident move in the opposite direction, demonstrating that openness need not mean vulnerability.

What makes Hainan different from previous Chinese free trade zones is not just its scale — though covering an entire province of 35,000 square kilometers is certainly unprecedented — it is the depth of its institutional openness.

Zero tariffs now apply to over 6,600 categories of goods, up from around 1,900 before. A corporate income tax rate of 15 percent makes it one of the most competitive business environments in Asia.

The customs framework itself is innovative. Goods move freely within the island; stricter checks apply only when products cross into the Chinese mainland market — what officials call "freer access at the first line, regulated access at the second line".

This gives foreign businesses a genuine staging ground: they can process, assemble and add value in Hainan before selling into China's vast domestic market.

One provision deserves particular attention. Imported products that undergo at least 30 percent value-added processing in Hainan can enter the mainland tariff-free.

This single rule transforms Hainan from a transit point into a place where real economic activity — and real economic value — can be created.

Critics might ask: is this not simply another special economic zone, a familiar feature of China's development landscape since the 1980s? The answer is no, and the distinction matters.

Earlier pilot free trade zones — there are now 24 of them, including the pioneering Shanghai FTZ established in 2013 — were designed as contained experiments. Hainan is something qualitatively different: a full-province model that builds on four decades of accumulated experience while breaking genuinely new institutional ground.

It is a testing ground for cross-border trade financing, greater foreign exchange flexibility, and blockchain-based payment systems.

For countries seeking alternative financial infrastructure, these pilots are worth watching closely.

Perhaps the most distinctive aspect of Hainan, and the one least appreciated in mainstream media, is what it offers developing countries.

The Global South is not a monolithic bloc, but its economies share certain common challenges: they export raw materials and agricultural commodities and struggle to move up the value chain. Hainan's design speaks directly to these challenges.

For ASEAN producers of palm oil, rubber, tropical fruits and fisheries products, Hainan offers preferential access to the Chinese market — one of the world's largest — without the full burden of mainland customs compliance.

More ambitiously, the value-added processing incentives mean that a Malaysian palm oil refiner or an Indonesian electronics assembler can locate operations in Hainan, add value and ship to Chinese consumers under favorable terms.

This is a path from commodity exporter to processed-goods exporter — precisely the transition that development economists have long argued is essential for sustainable growth.

A joint survey released on Hainan's 100th day of customs operations found that over 70 percent of ASEAN enterprises surveyed already recognize Hainan's strategic value as a platform for entering the Chinese mainland market. Export growth to ASEAN, Africa and Latin America has expanded substantially since December.

The cooperation goes beyond trade in goods. Hainan is developing sectoral platforms in tropical agriculture, healthcare, green energy and the digital economy. The Boao Lecheng International Medical Tourism Pilot Zone has become a key channel for the entry of advanced pharmaceuticals into China.

A green and digital innovation project in Baoting (a Li and Miao autonomous county in Hainan) is piloting climate-resilient development models that can be adapted and replicated in other island nations and developing countries.

These are not conventional export-processing zones that funnel goods to Northern markets while leaving the local economy largely untouched. They are platforms for a different kind of cooperation — one in which China and developing country partners build capability together.

Could other countries learn from the Hainan model? The answer depends on what one is trying to learn.

Rules-based, institutional openness — where businesses can plan around predictable policies rather than arbitrary political decisions — is a sustainable competitive advantage.

Singapore built its prosperity on this logic. Hainan is testing whether a larger, continental economy can do the same. The answer will be whether foreign enterprises move beyond registering in Hainan to actually producing there; whether the financial innovations gain traction; whether the trade links with ASEAN and the broader Global South deepen into genuine supply-chain integration.

Traditional export-processing zones tend to create enclave economies: jobs and foreign exchange, but have weak links with domestic industry and little technological transfer.

Hainan's design — with its value-added incentives, sectoral cooperation platforms and integration across an entire province rather than a fenced compound — offers a more holistic template. For countries in Africa, Southeast Asia and Latin America that are weighing their development strategies, the lessons are potentially transformative.

For advocates of multilateralism, Hainan is a timely reminder that trade liberalization can still be driven by unilateral ambition as much as negotiated agreement.

Malaysia has already identified Hainan as a testing ground for high-standard implementation of the Regional Comprehensive Economic Partnership. If the experiment succeeds, it could provide practical momentum for wider regional integration at a moment when the multilateral trading system is under strain.

Hainan is still in its infancy. But what the first six months have established is that the foundations are solid. The customs system works. The numbers are moving in the right direction. The institutional framework is in place.

In a world where many governments are retreating behind walls, Hainan is a door held open.

For trade partners, investors, and development planners across the Global South and beyond, that invitation deserves a serious response.

EU's tariff walls risk eroding its industrial foundation

The intense debate in the European Union over what Western policymakers called "a new wave of industrial competition" may prove to be a watershed moment in the bloc's trade policy.

In a crunch meeting in Brussels, EU commissioners explored broad sector-wide import quotas and tariff safeguards aimed at bolstering the competitiveness of European manufacturing.

At the same time, European Commission President Ursula von der Leyen secured a major political agreement with Hungarian Prime Minister Peter Magyar, unfreezing €16.4 billion ($18.9 billion) in previously blocked EU funds.

Though analysts see these twin developments as notable progress in strengthening the bloc's industrial resilience and internal cohesion, a closer look reveals the underlying challenges amid the adjustments.

Brussels is attempting to strengthen its economic and trade dominance on a foundation of systemic economic friction and internal compromises.

The result is a profound institutional paradox. Europe is attempting to curb imports from reliable suppliers that help sustain the stability of its green supply chains while simultaneously spending billions to manage domestic political disagreements.

It is mimicking the protectionist, industrial-policy playbook of the United States even though it doesn't have the same fiscal firepower, abundant domestic resources or deep capital markets. The EU is inadvertently undermining its own industrial base under the weight of high energy costs and strategic overreach.

Europe's dilemma can be broken down into three systemic challenges. First, self-inflicted industrial pressure is accelerating across the continent.

The EU is inadvertently undermining its own industrial base under the weight of high energy costs and strategic overreach.

While public attention centers on high-profile trade disputes over electric vehicles, trade data reveals a deeper reality: European industry is heavily dependent on highly efficient imported intermediate inputs.

Many manufacturers rely on basic components that are significantly more cost-effective than domestic alternatives because of the scale and clustering advantages enjoyed by foreign producers.

This dependence extends to critical sectors. From polyhydric alcohols used in plastics and paints to vital amino acids used in pharmaceuticals, European industries continue to rely heavily on imported inputs. By applying one-size-fits-all safeguard clauses across sectors, Brussels is not protecting its industry; it is raising input costs for its remaining factories.

This leaves European manufacturers facing a tough choice: absorb higher costs and lose global competitiveness, or shut down domestic production entirely.

Second, Europe doesn't have the fiscal capacity required to execute a successful protectionist shift. Unlike the US, which can utilize massive federal subsidies to support domestic supply chains, the EU operates without a unified fiscal architecture. The EU Net-Zero Industry Act remains a regulatory blueprint rather than a well-funded commercial engine. Forced to operate within these rigid constraints, European policymakers are attempting to use trade defenses to curb market competition.

However, this excessive use of trade regulatory tools doesn't address the underlying macroeconomic reality: Europe lacks the cheap domestic energy and raw materials required to bridge the massive price gaps created by the efficiency of foreign producers. Consequently, protectionist measures function less as engines of industrial renewal and more as an economic surcharge on European consumers and businesses, driving up inflation while doing nothing to build real structural resilience.

Third, managing internal fragmentation through fiscal concessions risks creating permanent instability within the EU. The sudden release of €16.4 billion to Budapest, which is roughly 13 percent of Hungary's national budget, shows that the EU must continuously compromise its institutional principles to preserve a fragile consensus on foreign policy.

To advance a more protectionist economic agenda against external competitors, the European Commission is forced to offer financial incentives to seek the cooperation of member states that challenge the Brussels consensus.

This approach may buy temporary unity, but it creates a highly flammable domestic political environment.

While officials warn that millions of industrial jobs are at risk, member states remain divided on how to respond. Core manufacturing states such as France demand aggressive trade barriers to protect the domestic industry, but export-dependent economies such as Germany and Spain remain wary of provoking retaliatory trade restrictions.

The result is a fragmented union that buys short-term legislative compliance at the cost of long-term economic coherence.

The mechanics of this strategy are clear: trade protectionism without an underlying, fully funded fiscal expansion cannot preserve an industrial base. At best, it delays industrial adjustment; at worst it subsidizes industrial obsolescence.

By drifting away from the rules-based frameworks of the World Trade Organization in favor of unilateral safeguards, Europe risks weakening the very global architecture that enabled its prosperity. The ultimate implication of this shift is that Europe may be trapping itself in a structural corner. It risks alienating partners in the Global South by restricting access to its market, cutting off its own access to affordable technological components, and remaining dependent on external security guarantees.

Until Brussels addresses these structural contradictions and embraces the reality of global economic interdependence, its aggressive trade posture will remain an exercise in managing decline, rather than asserting constructive global leadership.

GLOBAL VIEWS

LIU CHENYANG AND YU XIAOYAN

APEC's approach to resilience

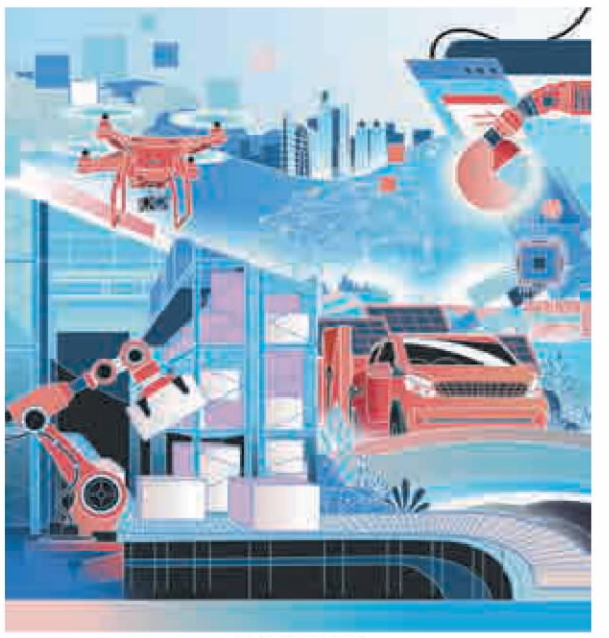
The bloc's value lies not in issuing broad declarations, but in transforming consensus into replicable and scalable public goods for regional and global governance through pragmatic cooperation

Liu Chenyang

Yu Xiaoyan

Asia-Pacific regional cooperation has become increasingly important amid growing uncertainty in the global economic and trade landscape, driven by sluggish global growth, rising trade protectionism and accelerated restructuring of industrial and supply chains. The APEC Ministers Responsible for Trade Meeting, held in Suzhou, Jiangsu province, from May 22 to 23, marked an important milestone in China's role as APEC host in 2026. More importantly, it helped build consensus and shape the agenda for the APEC Economic Leaders' Meeting, which will be held in Shenzhen, Guangdong province, in November.

Since its establishment in 1989, APEC has played a central role in shaping the Asia-Pacific economic order through a distinctive "APEC approach" that is tailored to the region's diversity and varying stages of development. Based on voluntary, non-binding and consensus-building principles, APEC embraces open regionalism and promotes regional economic cooperation on the basis of equality and mutual benefit. By maximizing common ground while respecting differences, it has strengthened regional cohesion and fostered broad-based consensus across the region.



From the Bogor Goals to the Putrajaya Vision 2040, APEC has consistently provided long-term strategic direction for regional cooperation. The Bogor Goals — a commitment APEC leaders made in Bogor, Indonesia, in 1994, to achieve free and open trade and investment by 2010 for industrialized economies and by 2020 for developing economies — established a phased road map toward trade and investment liberalization, helping transform the Asia-Pacific into one of the world's most dynamic and open economic regions during the height of globalization. The Putrajaya Vision 2040, adopted in 2020, envisioned an open, dynamic, resilient and peaceful Asia-Pacific community. It identified three economic drivers — trade and investment; innovation and digitization; and strong, balanced, secure, sustainable and inclusive growth.

China's proposed theme for APEC 2026, "Building an Asia-Pacific Community to Prosper Together", together with its three priority areas — openness, innovation and cooperation — represents both a continuation and a concrete implementation of this vision.

In terms of openness, the 2024 APEC Economic Leaders' Meeting issued the Ichma Statement on A New Look at the Free Trade Area of the Asia-Pacific agenda, strengthening the multilateral trading system, opposing protectionism and enhancing supply chain cooperation.

In terms of innovation, APEC has prioritized cooperation in emerging fields such as the digital economy, artificial intelligence, green development and new energy technologies, with a strong emphasis on technology-driven growth.

In terms of cooperation, APEC continues to promote inclusive and sustainable development, with particular attention to food and energy security, climate change, poverty reduction and greater integration of small and medium-sized enterprises and vulnerable groups into global value chains. Together, these priorities reflect APEC's ongoing efforts to promote high-quality growth in the Asia-Pacific while expanding both the scope and depth of regional economic cooperation.

SHI YU / CHINA DAILY

The Asia-Pacific region's role as a stabilizing force in the global economy is rooted first and foremost in its considerable economic weight and high degree of openness. According to official APEC statistics for 2025, the region was home to approximately 3 billion people, accounting for 36.6 percent of the global population. Its real GDP reached $57.5 trillion, representing 59.4 percent of the world total, while its imports and exports of goods and commercial services accounted for 46.8 percent and 46.2 percent of global trade, respectively.

Data from the APEC Policy Support Unit show that the region achieved real GDP growth of 3.5 percent in 2023 and 3.3 percent in 2024. The latest edition of the APEC Regional Trends Analysis shows growth of around 3.3 percent in 2025. Despite fluctuations in global demand, tightening financial conditions and escalating trade frictions, the Asia-Pacific economy has maintained relatively strong resilience, underscoring the enduring value of open markets, deep economic integration and regional cooperation as drivers of growth.

This stabilizing role is also reflected in APEC's capacity for institutional innovation and rule incubation. In 2012, APEC introduced a list of environmental goods that later served as an important reference for negotiations on the World Trade Organization Environmental Goods Agreement. During the 2014 Beijing APEC meetings, China and the United States reached a consensus on expanding the Information Technology Agreement, paving the way for the WTO's 2015 agreement to eliminate tariffs on 201 IT products.

APEC has also successfully implemented initiatives such as the APEC Business Travel Card scheme to facilitate cross-border business mobility, as well as two phases of Trade Facilitation Action Plans and the Connectivity Blueprint, all of which have significantly reduced transaction costs and enhanced regional connectivity. These efforts have also helped advance the implementation of commitments under the WTO Trade Facilitation Agreement.

These examples demonstrate that APEC's value lies not in issuing broad declarations of principle, but in its ability to transform consensus into replicable and scalable public goods for regional and global governance through pragmatic cooperation.

For China, APEC has long served as a major platform for participating in international economic cooperation. As the first regional economic cooperation mechanism China joined, APEC has provided an important channel for advancing China's diplomacy as a major country, including head-of-state diplomacy, neighborhood diplomacy and economic diplomacy.

APEC's vision of building an Asia-Pacific community by 2040 also carries significant practical relevance for China's efforts to build a community with a shared future for humanity. By fostering a stable and favorable regional environment, APEC supports China's pursuit of institutional opening-up and high-quality development. Continued progress in trade and investment liberalization and facilitation, regional connectivity, and Asia-Pacific value and supply chain cooperation will further strengthen China's capacity for high-level opening-up and create broader space for advancing Chinese modernization.

This year, China is hosting APEC for the third time. Both the Shanghai Accord adopted in 2001 and the Beijing Agenda issued in 2014 have become landmark achievements in APEC's history.

Going forward, China will demonstrate the responsibility of a major country by supporting the openness of the Asia-Pacific economy and promoting practical cooperation in areas such as the Free Trade Area of the Asia-Pacific, connectivity, the digital economy and AI in response to evolving trends in global trade restructuring. China will also work with all parties to build an Asia-Pacific community, inject new momentum into regional development, and strengthen the synergy between APEC-led regional cooperation and global governance, further reinforcing the Asia-Pacific's role as the primary engine of global economic growth.

Liu Chenyang is a professor and the director of the APEC Study Center of Nankai University. Yu Xiaoyan is an associate research fellow at the APEC Study Center of Nankai University. WANG CHENWEI AND WANG HAOTIAN

Trade trends maintain momentum

New growth engines highlight the robustness as China enters the transformative 15th Five-Year Plan period

LI MIN / CHINA DAILY

According to the General Administration of Customs, China's foreign trade reached 20.68 trillion yuan ($3.05 trillion) in the first five months of 2026, marking a year-on-year increase of 15.3 percent. With key economic indicators outperforming expectations, the figures signal a strong start to the 15th Five-Year Plan (2026-30) period, highlighting the steady progress and long-term growth momentum of China's economy.

Wang Chenwei

Wang Haotian

Foreign trade has long been a key engine of economic growth. Advancing innovation-driven trade is essential to building a higher-level open economy and promoting high-quality development. Despite pressures from a challenging global environment, China's foreign trade has remained resilient and continued to reach new highs. Since the beginning of this year, China's foreign trade has shown four trends.

First, technology-intensive industries have become the backbone of exports. In the first five months of the year, total exports reached 11.91 trillion yuan, up 11.8 percent from a year earlier. Exports of mechanical and electrical products remained the key driver of growth, rising 18.4 percent to 7.58 trillion yuan and accounting for more than 60 percent of total exports. In contrast, exports of labor-intensive products fell 3.1 percent year-on-year to 1.61 trillion yuan.

Second, robust import growth has created new opportunities for international economic cooperation. Data from the General Administration of Customs showed that in the first five months of the year, China's imports totaled 8.77 trillion yuan, up 20.5 percent year-on-year. Imports of mechanical and electrical products increased by 25.3 percent, while imports of agricultural products also maintained steady growth. These trends suggest that an increasingly open China is responding to both domestic and global demand, while promoting mutually beneficial cooperation and shared development.

Third, private enterprises are leading the growth, recording a total import and export volume of 11.81 trillion yuan in the first five months, an increase of 15.5 percent. Foreign-invested enterprises reached 6.02 trillion yuan, up 15.7 percent, while State-owned enterprises totaled 2.81 trillion yuan, up 14 percent. Private enterprises accounted for more than half of the total trade volume, consolidating their stabilizing role in foreign trade.

Fourth, diversified trading partners and accelerated cooperation with emerging markets are contributing to a more stable and balanced trade structure. In the first five months, trade between China and Southeast Asian nations reached 3.52 trillion yuan, up 16.6 percent year-on-year. Trade with European Union countries totaled 2.53 trillion yuan, up 10.3 percent. Trade with the Belt and Road partner countries reached 10.57 trillion yuan, accounting for more than half of China's total foreign trade.

Meanwhile, it is important to recognize the risks posed by geopolitical tensions, sluggish global growth and rising trade protectionism. At home, China faces structural challenges, including frictions in the shift toward new growth drivers, relatively weak investment and consumption, insufficient domestic demand, the long-term task of industrial upgrading and risks in key sectors.

Despite these headwinds, China's economy is expected to remain resilient, supported by robust macroeconomic policies. China's system of centralized coordination enables it to mobilize resources efficiently and implement both cross-cycle and counter-cyclical policy measures, helping cushion the impact of external shocks. The country's vast domestic market, comprehensive industrial base and deeply integrated supply chains continue to provide strong structural advantages. Expanding domestic demand and continuous industrial upgrading also underpin China's long-term economic growth.

Against this positive economic backdrop, China's foreign trade is poised to stay vibrant. China has steadily expanded and diversified its trade ties across both traditional and emerging markets, enhancing its ability to withstand external shocks. To date, according to the Ministry of Commerce, China has signed 24 free trade agreements with 31 countries and regions, and its free trade partners account for 45 percent of its total goods trade. Trade-facilitating measures, including the granting of 100 percent zero-tariff treatment to African countries with diplomatic relations with China, along with deeper economic engagement with the EU, the Association of Southeast Asian Nations and the Belt and Road partner countries, are expected to create fresh momentum for trade growth.

The technological revolution and industrial transformation are also becoming key engines of foreign trade growth. As emerging industries expand and new business models evolve, Chinese companies are becoming increasingly innovative and more motivated to explore overseas markets. In 2025, the largest gains in exports came from the "new trio" of new energy vehicles, lithium-ion batteries and photovoltaic products. According to the China Association of Automobile Manufacturers, exports of new energy vehicles surged 103.7 percent. The integration of data, technology, application scenarios and hardware is not only accelerating industrial development, but also empowering foreign trade enterprises.

Looking ahead, China should continue strengthening its domestic economy while fostering a more dynamic interplay between domestic and international markets.

First, China should continue pursuing mutually beneficial cooperation to sustain the vitality of foreign trade. This includes steadily expanding a high-standard network of free trade zones and further diversifying international markets to strengthen trade resilience. At the same time, private enterprises should be further empowered as both the backbone of foreign trade and a major source of innovation. By seizing the opportunities presented by new technologies, China can move up the global value chain with more high-tech and high-value-added products, while enhancing private enterprises' capacity to expand into overseas markets.

Second, China should further coordinate policy measures with market development to unlock the potential of domestic demand. To upgrade consumer spending, targeted measures should be implemented to boost consumption, foster new consumption scenarios and models, and increase financial support for consumer goods trade-in programs. Greater efforts should also be made to cultivate new growth drivers such as cultural tourism, sports events, healthcare and wellness-related consumption. In addition, China should continue promoting a unified national market to create a more favorable business environment.

Third, China should advance high-quality, innovation-driven development to strengthen the foundations of its foreign trade supply chains. This includes implementing the "AI Plus" initiative, fostering new forms of the intelligent economy and enhancing industry chain coordination and digitization. In key sectors, strategic capabilities should be strengthened by increasing investment in research and development of core technologies, equipment and products, thereby improving the resilience of supply chains in critical areas. At the same time, China should further deepen international cooperation on industrial and supply chain development, actively participate in global rule-setting, and contribute to the stable and efficient functioning of global industrial and supply chains.

AI agents set to revolutionize payment biz

Agentic commerce to bring shifts to transactions, boost autonomous services

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

As artificial intelligence platforms and merchant-integrated agents become more sophisticated, consumers are expected to increasingly delegate tasks such as product searches, comparisons, decisionmaking and purchasing to agents. The shift signals a new era of commerce moving from direct user interaction to a model built on user authorization and autonomous agent execution.

The rise of agentic commerce, however, presents new security and trust challenges. Merchants must be able to verify that transactions originate from legitimate AI agents rather than fraudulent actors, ensure purchases accurately reflect users' intentions and safeguard customer funds throughout the transaction process.

Against this backdrop, Chinese e-commerce giant JD unveiled its Agent Autonomous Payment Protocol on June 11. The framework aims to enable AI agents to complete payments independently within user-defined rules and spending limits.

The protocol establishes six levels of payment autonomy, providing a gradual pathway from transactions that require full human approval to those that can be executed entirely by AI agents. To enhance security, each payment request is linked to three critical elements: the verified identity of the user, the authorized version of the AI agent and a trusted operating environment. Transactions are approved only when all three conditions are validated.

The protocol also separates users' primary accounts from agent-driven spending. All agent transactions are routed through dedicated subaccounts subject to predefined controls, including spending caps, transaction limits, approved use cases, expiration periods and designated payees. Users can monitor activity in real time and revoke an agent's permission at any moment.

China's broader payment ecosystem is moving in the same direction. On May 26, Alipay debuted its AI Wallet and Token Pay, taking a step further to extend its next-generation AI payment infrastructure.

The initiative is also expanding beyond China.

Singapore-based Ant International introduced the Agentic Mobile Protocol, an agentic payment framework built for mobile interfaces including digital wallets, super apps and wearable devices. The protocol is designed to facilitate secure and seamless purchases through AI agents while helping merchants overcome challenges such as cross-border interoperability as agentic commerce scales globally.

A key component of the Agentic Mobile Protocol is an enhanced Know Your Agent authentication framework, which establishes a standardized trust-rating system for AI agents. The mechanism is intended to allow merchants to verify not only the identity of customers, but also the identity and trustworthiness of the agents acting on their behalf, helping ensure that transactions reflect genuine purchasing intent.

China's push into agentic payments comes as global payment networks race to build the infrastructure for agentic commerce. Industry leaders are increasingly developing technologies that will allow autonomous AI agents to search and complete transactions on behalf of consumers and businesses.

Mastercard is pursuing a vision of a future in which AI agents could eventually transact continuously with one another, executing chains of payments.

On June 10, the company unveiled Agent Pay for Machines, a new service designed to enable machine-to-machine transactions across its global payments network. The service will allow payments to be authorized, orchestrated and settled at machine speed, supporting emerging AI-driven business models.

Unlike traditional point-of-sale or person-to-merchant payments — which are initiated directly by users — machine-to-machine transactions are expected to be programmatic, continuous and executed between systems in the background of digital commerce.

"Machine payments can make it possible for services to be bought and sold among agents at fundamentally different scales than payments today — very high volumes, very small values, very fast and at extremely low latency," said Jorn Lambert, Mastercard's chief product officer.

Also on June 10, Visa announced a strategic collaboration with OpenAI to enable secure payments within agentic commerce. Under the partnership, Visa will provide its global payments network, credentialing capabilities and security infrastructure to support agentic commerce services. The company's payment capabilities will be integrated into OpenAI experiences, giving developers and merchants a streamlined way to accept Visa payments initiated by AI agents.

Visa said payments will operate within clearly defined user permissions and controls, including spending limits, approved merchant categories and required approvals. Transactions will be backed by tokenized credentials, real-time authorization and fraud-monitoring systems designed to maintain strong consumer protections.

"AI will transform commerce more profoundly than the internet or mobile technology ever did," said Jack Forestell, Visa's chief product and strategy officer. "As AI agents become active participants in the economy, Visa's focus is to ensure transactions are trusted, secure and seamless."

Shanghai Disney Resort marks 10th anniversary with sights set on future

By **ZHENG ZHENG** in Shanghai
zhengzheng@chinadaily.com.cn

Executives from Walt Disney Co and its Chinese partners have expressed optimism about prospects for Shanghai Disney Resort, unveiling a series of expansion plans as the resort celebrated its 10th anniversary on Tuesday.

"When we opened these gates, we believed we could create something the world had never seen — a place where Disney storytelling met Chinese culture in a way that was genuinely new," said Josh D'Amaro, CEO of Walt Disney Co.

The resort has welcomed more than 100 million guests since its opening in 2016. "As we celebrate the park's first decade and look to its next, what excites me most is that we're just getting started," D'Amaro said.

Thomas Mazloum, chairman of Disney Experiences, said: "Being here in Shanghai has reconfirmed to me the immense opportunities we have in this beautiful country and around the world. You see here what happens when we show up where our fans and consumers are — and when we do so with a lot of innovation and immense respect for local culture."

Mazloum called Shanghai's track record a global blueprint. "I don't believe Shanghai Disney Resort will ever be completed, because we have a lot of imagination left."

The resort is already deep into its next expansion phase. Construction of its ninth themed area — a Spider-Man zone set to deliver the park's first major Marvel-themed attraction — reached a milestone just weeks ago when the last section of its roller coaster track was installed.

Two additional themed hotels are also under development.

Guan Taoping, chair of Shanghai Shendi Group — the Chinese joint venture partner — described the past decade as a journey of deep local roots, cultural exchange and regional development. She pledged to build on the resort's success to transform the broader area into "a world-class multiday tourism destination" and to accelerate what she described as a "culture-tourism-plus" industrial ecosystem.

"Our guests and fans, community and partners, cast and imagineers, and both shareholders have been the authors of the resort's story over the years," said Andrew Bolstein, president and general manager of Shanghai Disney Resort.

"As we continue the momentum built throughout the past 10 years, defined by continuous expansion and development, relentless innovation and a steadfast commitment to excellence, we are confident that the future of Shanghai Disney Resort is bright."

Tasia Filippatos, president and managing director of Disney Parks International, noted that Shanghai's innovations have generated lessons now being exported across the company's global network. "This park was built with the preferences, taste, and culture of the Chinese people at the forefront," she said, adding that many of those learnings have applications around the globe.

Experts say the resort's influence extends far beyond its gates. Lou Jiajun, a professor at East China Normal University — who has followed the project since 2009 — said the resort had transcended the boundaries of a theme park. "Over 10 years, Shanghai Disney has evolved from a single park to a resort, and then into a benchmark — for destination building, for industry leadership, and for the integration of culture and tourism," Lou said.

Lin Huanjie, president of the Institute for Theme Park Studies in China, credited the resort with rewriting the competitive logic of the industry.

"Disney's arrival made clear that competition should not be about scale and investment, but about building an experience system, creating emotional value and sustaining long-term operational excellence," he said.

Yuan Ding, executive dean of the Shanghai Disney Dream Vocational Campus and director at Shanghai Normal University, pointed to the resort's role as an employment engine. "Quantitatively, it has created hundreds of thousands of direct and indirect jobs for the entire Yangtze River Delta region," he said. "Qualitatively, it has elevated the appeal and professional standing of careers in the tourism and hospitality industry."

Inner Mongolia key hub to Sino-EU trade

By **ZHONG NAN** in Beijing and **YUAN HUI** in Hohhot

China's ongoing industrial upgrading and the launch of the China (Inner Mongolia) Pilot Free Trade Zone in April will create fresh momentum for China-Europe freight train services and provide stronger support for the country's foreign trade growth, said supply chain experts and customs officials.

The new pilot FTZ, within North China's Inner Mongolia autonomous region, covers 119.74 square kilometers and comprises three subzones in Hohhot, capital of the region; Manzhouli, a northern border city; and Ereenhot, a land port on the China-Mongolia border, each featuring differentiated functions and the development of industries tailored to local conditions.

The growing role of Inner Mongolia as a key gateway for China-Europe trade highlights the significance of the new FTZ.

On Friday, a China-Europe freight train loaded with small household appliances departed from Ereenhot, pushing the cumulative number of freight train trips passing through the network's central corridor beyond 25,000, said China State Railway Group Co Ltd (China Railway).

Lin Meng, director of the modern supply chain research institute at the Beijing-based Chinese Academy of International Trade and Economic Cooperation, said the steady rise in shipments of machinery, vehicles and other industrial products reflects the growing competitiveness of China's manufacturing sector.

> "Together with ongoing infrastructure upgrades, the initiative is expected to enhance the efficiency and capacity of China-Europe freight train services."
>
> **Chen Jianwei,** researcher specializing in foreign trade at the University of International Business and Economics

Continued growth in trade with European and Central Asian markets is expected to provide sustained support for freight demand, said Lin.

Chen Jianwei, a researcher specializing in foreign trade at the University of International Business and Economics in Beijing, said the development of the China (Inner Mongolia) Pilot FTZ is likely to draw greater investment in logistics, warehousing, processing and cross-border commerce.

"Together with ongoing infrastructure upgrades, the initiative is expected to enhance the efficiency and capacity of China-Europe freight train services," said Chen.

Ereenhot's railway port currently handles about 13 China-Europe freight trains daily. It is linked to 75 China-Europe freight train routes connecting more than 70 logistics hubs in over 10 countries, including Germany and Poland, said China Railway.

Freight throughput at Ereenhot railway port has maintained steady growth this year. As of June 11, the port had handled 2,137 China-Europe freight train trips, transporting 205,100 twenty-foot equivalent units and 1.97 million metric tons of cargo, up 15.1 percent, 9.7 percent and 28.6 percent year-on-year, respectively.

Mi Junming, deputy director of Manzhouli Railway Station Customs, said the rapid growth in freight volume has been accompanied by a notable upgrade in the cargo mix handled by Inner Mongolia's border ports.

Cargo once dominated by metals, chemicals, garments and footwear has increasingly given way to higher-value products such as electric vehicles, consumer electronics and household appliances, reflecting the upgrading of China's manufacturing sector and export structure, said Mi.

Statistics from Manzhouli Customs show that China's EV exports through Manzhouli railway port totaled 320 million yuan ($47.33 million) in the first five months, up 950 percent year-on-year.

Chinese EVs have gained increasing traction in overseas markets in recent years, supported by advances in battery technology, intelligent features and competitive pricing, emerging as an important contributor to China's export growth, said Chen Bin, deputy director of the expert committee of the Beijing-based China Machinery Industry Federation.

Yum buys full Pizza Hut China for $1.2b

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

On Tuesday, Yum China Holdings announced that it has entered into a definitive agreement to take full ownership of the Pizza Hut brand on the Chinese mainland in a $1.2 billion deal, a strategic shift that will eliminate ongoing royalty payments to Yum Brands.

The move gives Yum China direct control of one of its most profitable and fast-growing restaurant businesses. The transaction is expected to improve store economics and accelerate expansion, as Yum China pushes to deepen its dominance in the country's casual dining market.

Pizza Hut is currently the largest casual dining restaurant brand in China under the Yum China portfolio. In 2025, the business generated $2.3 billion in segment revenue and $183 million in operating profit. In the first quarter, it posted its 13th consecutive quarter of same-store transaction growth and its eighth straight quarter of margin and operating profit expansion.

> "Ownership will give us greater strategic flexibility to drive innovation across menus, formats and operations."
>
> **Joey Wat,** CEO of Yum China

Yum China, which operates KFC, Pizza Hut and Taco Bell on the Chinese mainland, said it plans to expand the Pizza Hut footprint to more than 6,000 restaurants by 2028, up from 4,375 locations across more than 1,100 cities and counties today.

The company is also targeting a doubling of Pizza Hut operating profit by 2029 in comparison to 2024 levels.

On moving from exclusive licensee to brand owner, Yum China CEO Joey Wat said, "Ownership will give us greater strategic flexibility to drive innovation across menus, formats and operations."

The transaction comes as Yum China continues to lean on KFC as its primary growth engine. The company said KFC China, which currently operates about 13,450 restaurants, is expected to expand to more than 17,000 locations by 2028, particularly in lower-tier and underserved markets.

Separately, Yum China said KFC China will be eligible for a decade-long financial incentive from Yum Brands that will be tied to system sales growth targets and aimed at supporting continued expansion momentum.

It is not the first time Chinese capital and enterprises have moved to acquire or take control of internationally renowned food and beverage brands.

In 2017, a consortium led by CITIC Group and Carlyle Group acquired 20-year franchise rights for McDonald's on the Chinese mainland and in Hong Kong and Macao. Carlyle exited the investment in 2023, and in October 2024, CITIC Capital completed an additional stake purchase, resulting in the CITIC-led consortium holding a 52 percent controlling stake while McDonald's Corp retained 48 percent.

In November 2025, CPE, a leading Chinese consumer-focused private equity firm, acquired an 83 percent controlling stake in Burger King China, with the parent brand Restaurant Brands International retaining the remaining 17 percent.

Traditional festivities and sports spur holiday travel

By ZOU SHUO
zoushuo@chinadaily.com.cn

A distinctive blend of tradition, family bonding and youthful energy is expected to power China's tourism market during the upcoming Dragon Boat Festival holiday, travel industry sources said.

The three-day holiday, which starts on Friday, coincides with *xia zhi*, one of the 24 solar terms on the Chinese calendar, marking the summer solstice, and Father's Day, both of which fall on Sunday. It also overlaps with the ongoing 2026 FIFA World Cup.

Usually, the festivities revolve around boat racing, making sticky rice dumplings known as *zongzi* and other folk customs, but adding to the festive atmosphere this year are soccer watch parties and concert tourism, creating a multi-peak travel pattern, travel agencies said.

Travelers aged 20 to 49 are the main drivers of the holiday travel surge, accounting for more than 70 percent of total planned trips, data from online travel agency Tuniu showed. Short- and medium-distance trips lasting two to three days are the most popular, reflecting a clear shift toward smaller breaks and short-notice bookings.

The end of the national college entrance exam, or *gaokao*, has also triggered a surge in travel demand, which is expected to last until early July, creating a staggered travel window ahead of the summer rush, Tuniu said.

Students, typically aged 18 to 23, are driving much of this demand. Many parents had promised trips as gifts after the *gaokao*, which has boosted bookings among young travelers. According to online travel platform Qunar, flight bookings by 18-year-olds from June 10 through the end of June rose more than 30 percent compared with the same period in May.

Traditional Dragon Boat Festival activities — including making *zongzi*, salted duck eggs and sachets, wearing *hanfu* (a traditional Chinese costume) and watching boat races — have become major consumption drivers, Tuniu said.

The overlap with Father's Day has boosted family travel, with a notable increase in parent-child trips, it said.

Popular destinations include Shanghai, Beijing, Guangzhou in Guangdong province and Hangzhou in Zhejiang province. Shantou in Guangdong, the setting of the hit film *Dear You*, is generating a surge of searches, Qunar said.

The ancient villages of Shangrao in Jiangxi province are also much sought after. Searches for village resorts in the area, where visitors can experience festival traditions, have surged sevenfold, it said.

The frenzy generated by the ongoing soccer World Cup has also influenced travel demand. The 2026 Northeast Football City League, or "Dongbeichao" — a regional tournament jointly hosted by Liaoning, Jilin and Heilongjiang provinces as well as the Inner Mongolia autonomous region — is attracting fans from across the country, pushing up hotel bookings in the area during the holiday, according to Qunar.

In Liaoning, 43 scenic spots in seven cities are offering free admission to ticket-holding fans and residents of partner regions, helping boost hotel bookings by 20 percent year-on-year, the travel agency said.

Yin Ping, a professor at Beijing Jiaotong University's School of Economics and Management, noted that the convergence of Dragon Boat Festival, Father's Day and the World Cup creates a "day-night dual peak" travel pattern, with daytime dragon boat races and *zongzi*-making activities drawing crowds, while evenings will see fans flocking to bars and restaurants to watch matches, boosting spending on dining and nightlife.

"The integration of traditional folk culture, sports events and concerts is likely to become a lasting trend," she said.

The success of the Northeast football league in enhancing hotel bookings shows that a combination of folk culture, sports and tourism can sustainably drive local consumption — not only during holidays but also as a regular model, she added.

Ex-CNOOC executive jailed for bribery case

Yuan Guangyu, former deputy general manager of the China National Offshore Oil Corporation, was sentenced to death with a two-year reprieve by a court in Jiangsu province for accepting bribes worth more than 152 million yuan ($22.49 million). Yuan was also deprived of political rights for life, and all his personal assets were confiscated, according to the ruling announced by the Xuzhou Intermediate People's Court. The court found that from 2001 to 2022, Yuan took advantage of his positions in the offshore oil corporation to seek benefits for relevant individuals and organizations in matters including project contracting, business operations and job adjustments, and accepted bribes worth more than 152 million yuan in return. In China, a suspended death sentence is typically commuted to life imprisonment if no new crimes are committed during the two-year probation period. The sentence may be further reduced for good behavior by the inmate.

Cambodia repatriates key fraud suspect

Chinese police recently repatriated Liu Ren, a key suspect in a major transnational gambling and telecom fraud case, from Cambodia, the Ministry of Public Security said on Wednesday, marking another result of law enforcement cooperation between the two countries. Liu is a core member of a criminal syndicate led by Chen Zhi, a Chinese national identified by authorities as the ringleader of a major cross-border gambling and fraud network. He was repatriated from Phnom Penh, Cambodia, earlier this year. Investigators said Chen directed Liu and others to establish the Jinbei Group in Cambodia in 2016. The group operated multiple online gambling platforms targeting Chinese citizens and encouraging gambling activities. Since 2020, the group has also run telecom fraud compounds in Cambodia, carrying out large-scale online fraud schemes involving extremely large sums of money, police said.

China to streamline its employment structure

New plan seeks fairer job market, will use AI to support entrepreneurship

By ZOU SHUO
zoushuo@chinadaily.com.cn

China will maintain overall employment stability, create fuller employment opportunities and ensure a fairer employment environment during the 15th Five-Year Plan period (2026-30), according to a new plan released by the State Council, China's cabinet, on Wednesday.

The plan for implementing an employment-first strategy over five years also calls for further optimizing the employment structure, achieving more efficient job-person matching, fostering more harmonious labor relations, and making new progress in high-quality and full employment.

It stresses the need to address the principal contradiction of supply-demand mismatches in the human resources market. It emphasizes implementing the employment-first strategy, tackling structural employment mismatches, deepening institutional reforms in employment, and preventing large-scale unemployment risks.

The plan calls for synergy between macro policies and employment, implementing actions to stabilize and expand employment, and adapting to the development of artificial intelligence to support employment and entrepreneurship.

It urges strengthening coordination between industry and employment, stabilizing the scale of employment in labor-intensive industries, expanding employment capacity in the service sector, and tapping the employment potential of emerging sectors.

Meanwhile, it stresses improving the alignment between educational supply and talent demand, and carrying out vocational skills training on a large scale.

The plan also requires expanding channels for college graduates and other young people to secure employment and achieve career success. Increasing support for key groups, including rural migrant workers and veterans, are needed, while strengthening employment assistance for people with difficulties in finding jobs and registered unemployed individuals should be in place.

It further demands promoting the healthy development of flexible employment and new forms of employment. Efforts are to be made to improve the employment and entrepreneurship service systems.

The plan also seeks to strengthen the protection of workers' rights and interests, and promote employment monitoring, early warning and risk response.

All regions and departments should treat employment as a top priority for people's livelihoods, adopt systematic approaches, and effectively implement the plan's tasks in light of local conditions, the plan said.

In 2025, China created 12.67 million new urban jobs nationwide, with the average urban surveyed unemployment rate standing at 5.2 percent, below the annual target of around 5.5 percent, according to the National Bureau of Statistics.

For 2026, the Government Work Report has set the employment targets at over 12 million new urban jobs and an urban surveyed unemployment rate of around 5.5 percent. In the first five months of 2026, the average urban surveyed unemployment rate stood at 5.2 percent, official data showed.

Tang Daisheng, a professor at Beijing Jiaotong University's School of Economics and Management, said the most notable highlight of the 15th Five-Year Plan is its elevation of the employment strategy from "employment first" to "high quality and full employment". This shift, he noted, marks a fundamental change in development philosophy, from focusing on whether there is a job to whether the job is good, moving from sheer quantity growth to quality improvement and structural optimization.

The establishment of a coordinated mechanism between investing in physical capital and investing in people means employment policies no longer operate in isolation but are deeply embedded in macro-control, industrial development, and technological innovation, he added.

Regarding artificial intelligence, Tang said the plan proactively addresses technological change by scaling up vocational skills training to help workers master new capabilities and adapt to new roles.

This forward-looking approach, he said, demonstrates the Party's ability to navigate complex situations and seize opportunities, while guiding workers to find their footing and realize their value amid the technological wave.

Extreme weather monitoring beefed up

By HOU LIQIANG
houliqiang@chinadaily.com.cn

China has significantly expanded its climate observation network as extreme weather events become more frequent and severe, launching new satellites, radar systems and ground stations to strengthen its adaptation to climate change, according to the 2025 progress report on China's climate change adaptation.

The report, unveiled by the Ministry of Ecology and Environment on Wednesday, which marked the 14th National Low-Carbon Day, detailed advances China has made in strengthening its monitoring network during the 14th Five-Year Plan period (2021-25) as the country seeks to cope with a worsening climate crisis.

China launched six Fengyun meteorological satellites during the period. Its enhanced satellite system now provides services to 133 countries and regions worldwide, the report said.

The report also highlighted a strengthened weather radar network. With 842 radars covering more than 90 percent of populated areas, the network can now identify severe weather events with an accuracy rate of 83 percent.

China has established more than 100,000 ground meteorological observation stations, nine atmospheric baseline stations and 27 national climate observatories, including its first overseas baseline station in Antarctica, according to the report.

It added that the number of jointly built and shared hydrological monitoring stations across government departments has reached 137,000.

The expanded monitoring system comes as China grapples with increasingly volatile weather.

In 2025, the country experienced 40 regional severe convective weather events, above the five-year average, while the national average number of days with gale-force winds — featuring instantaneous wind speeds of 17.2 meters per second or higher — reached 18.6, the highest level since 1991, the report said.

Severe convective weather is characterized by strong winds, hail, thunderstorms and brief but heavy spells of rainfall.

Regional and seasonal droughts have also become more pronounced in China, the report noted. From January to May last year, for instance, Anhui and Jiangsu provinces and the Guangxi Zhuang autonomous region each recorded their highest number of drought days for the period since 1961.

Temperatures remained at record highs, with extreme heat events occurring frequently. The national average temperature in 2025 reached 10.9 C, 1 C above the long-term average and tied with 2024 as the highest on record, the report said.

Speaking at a National Low-Carbon Day event in Nanning, capital of Guangxi, Liu Yang, deputy head of the Ministry of Ecology and Environment's Department of Climate Change, pledged to accelerate upgrades to China's climate adaptation framework to help achieve the country's goal of basically building a climate-resilient society by 2035.

"We will improve the full-cycle mechanism of observation, assessment, action, feedback and enhancement to steadily bolster our ability to prevent and mitigate major climate risks and disasters," she said.

Soundbites

Editor's note: *The State Council Information Office held a group interview on Wednesday themed "Forging Ahead on the New Journey", bringing together representatives engaged in rural social civility to speak with the media.*

In 1999, I was elected village Party secretary and village director, and I have held these positions ever since. Relying on the Party's good policies, we united and led Party members and the masses to work hard and overcome difficulties, transforming a once poor, dirty, chaotic, and backward village into a model village for rural revitalization. Today, it is livable, suitable for work, and harmonious. Our village has chosen a new collectivized path. By developing and strengthening the village collective economy and encouraging and supporting villagers to start businesses and find employment, we aim to achieve common prosperity. We have cultivated and expanded advantageous industries, including modern agriculture, rural tourism, logistics and trade, building decoration, education and training, and medical care and wellness. With industrial development, we have pooled resources to accomplish major tasks and solve problems that individual households could not address on their own.

Wang Chuanxi, *Party secretary of Daicun village, Lanling county, Linyi city, Shandong province*

As a curator, I have always been thinking: 90 years ago, Ai Siqi turned profound philosophical ideas into plain language that ordinary people loved to hear. Today, how can we use this same approach to cultivate a civilized rural culture? The answer lies by the small fire pit in Tengchong. Over the years, learning from Ai's people-oriented approach, we have stepped out of the memorial hall and into villages. We set up no podiums and use no formulaic speeches. Instead, we sit with villagers in courtyards and around fire pits, talking about village rules and agreements, filial piety, and family values. In this way, theory has become a guide for daily life.

Bo Yanting, *director of the Ai Siqi Memorial Hall in Tengchong city, Yunnan province*

I am one of the province's first cultural commissioners, stationed in Hangchuan village, Jiande, Hangzhou. There are over 1,500 of us working across Zhejiang's countryside to promote cultural development. We visit households, identify villagers' cultural needs, bring resources from our home institutions into villages, and work with villagers to implement cultural projects. In the two years since I came to Hangchuan, I have organized photography exhibitions and built a village photography team. I believe our work as cultural commissioners is a two-way cultural journey with the villagers. The building of a civilized rural culture is never about us doing things for the villagers. Instead, we must take root in the countryside and work side by side with them.

Chen Yun, *deputy editor-in-chief of Zhejiang Photographic Press and a cultural commissioner of Zhejiang province*

Many years ago, I was a flight attendant with Xiamen Airlines, serving passengers from all over the country, dressed in uniform and wearing high heels every day. But the farther I traveled and the more scenery I saw, the more I missed my hometown and family. So in 2016, I returned to my hometown, Minning town, carrying this deep attachment and my original aspiration. I often wondered: when will my hometown be seen by more people? Then one day, I met the deputy head of our town, who said to me: "You are a college graduate from our town. Have you ever thought of using your English major to promote Ningxia's agricultural products?" His words struck a chord with me. I grew up in Minning and have witnessed its development and transformation over the past 30 years. Today, Minning has an abundance of fine products. So I decided to tell the story of my hometown's changes and introduce its agricultural products in both Chinese and English, so that more people could see Minning. I planted myself deep in the fields of Minning, using my phone as my new farming tool and turning my livestreaming room into my new farmland.

Wu Juan, *villager from Yuanlong village, Minning town, Yongning county, Yinchuan city, Ningxia Hui autonomous region*

II.The Global Governance Initiative Responds to Challenges of Our Times
III.China's Contribution to Promoting Global Governance
IV.Guiding the Direction of Change Towards a Bright Future
V.Moving Forward Hand in Hand at a Critical Juncture in History
Conclusion

Preface

Global governance is a common endeavor that bears on the wellbeing of all humanity, and building a just and equitable global governance system is a shared vision long pursued by people from across the world.

Over 80 years ago, the United Nations (UN) was founded as a multilateral platform for countries to address international affairs through dialogue and consultation. It established international rules underpinning the rule of law, ushering in a new phase in global governance. After the Cold War, multipolarization and economic globalization began to gain momentum, and the concept of global governance grounded in coordination and cooperation was widely endorsed. In recent times, however, unilateralism, protectionism, and hegemonism have been spreading unchecked, while deficits in peace, development, security, and trust continue to expand. Reforming and improving global governance to resolve these challenges and letting the UN play a core role have thus become a critical topic for the future of humanity.

China has always been an active participant in, contributor to, and builder of global governance. In the new era, President Xi Jinping put forward the vision of building a community with a shared future for humanity. In promoting a global governance system characterized by extensive consultation and joint contribution for shared benefit, he has called for true multilateralism to foster an equal and orderly multipolar world and a universally beneficial and inclusive economic globalization. In 2025, at a pivotal historical juncture marking the 80th anniversary of the victory in the Global War Against Fascism and the founding of the UN, President Xi proposed a new initiative, the Global Governance Initiative (GGI).

The GGI is designed to offer a Chinese solution to the two pressing questions of the era: what kind of global governance system should be established, and how global governance can be reformed and improved. Upon its introduction, it swiftly gained support from nearly 160 countries and international organizations, with over 60 countries joining the Group of Friends of Global Governance. The international community believes that the GGI sends a clear signal: uphold multilateralism, unite forces, and pursue a fair future. The GGI aligns with the growing trend towards greater democracy in international relations and bolsters international confidence in practicing multilateralism. It offers a clear and feasible roadmap for improving global governance, bringing valuable stability and positive energy to a turbulent world.

China has proposed the GGI to expedite the building of a more just and equitable global governance system. Resolutely upholding the UN's authority and status is fundamental to the effective implementation of this initiative. Success will also hinge on major countries bearing a sense of responsibility, and on all nations uniting and cooperating to address deficits in peace and development. All countries should firmly uphold the international system with the UN at its core, safeguard the international order based on international law, and uphold the basic norms governing international relations underpinned by the purposes and principles of the UN Charter, instead of reinventing the wheel.

The Chinese government is publishing this white paper to introduce China's principles, proposals and actions in global governance, foster broader consensus within the international community, ensure more effective responses to global challenges, and build a more just and equitable global governance system.

I. The World Today Faces Severe and Complex Challenges

Our world has entered an era marked by profound change on a scale unseen in a century. The pursuit of peace and development remains a daunting challenge. The international system established after World War II has been severely disrupted by multiple crises, placing global governance at a critical crossroads. Progress is imperative; failure to advance risks falling behind. Now, more than ever, the world needs to revitalize multilateralism, uphold the rule of law, and ensure more efficient governance.

1. Growing Challenges Call for More Effective Governance

Currently, the international landscape is undergoing profound changes on an unprecedented scale, with turmoil and upheaval more intense and pronounced. Political and economic disputes worldwide are escalating, revealing deep-seated conflicts, while "black swan" and "grey rhino" events keep emerging continually. The ship of human civilization has entered dangerous waters with hidden reefs and violent storms.

Geopolitical tensions are intensifying, with armed conflicts erupting in multiple regions. The Ukraine crisis has entered its fifth year, hostilities in the Middle East are spilling over and spreading, and multiple hotspot issues remain unresolved. The Global Peace Index continues to decline: in 2025, the number of armed conflicts reached a new high after World War II, with more than 50 countries directly embroiled in conflict or war. Global military spending has surged, militarism has resurfaced, and nuclear proliferation and "nuclear sharing" continue to pose a grave threat, leaving international security in a precarious state.

Global economic fragmentation is exacerbating, significantly hindering development. Economic globalization is facing strong headwinds, as some countries erect fences and barriers, pursue decoupling, sever industrial supply chains, and impose unilateral tariffs, disrupting the global economic order. Overall progress in the implementation of the UN 2030 Agenda for Sustainable Development has lagged far behind, with nearly 80 percent of assessable targets progressing slowly or even regressing. More than 830 million people worldwide still live in extreme poverty while 2.3 billion suffer from food insecurity, and the North-South divide and wealth gap continue to widen.

New challenges are arising in quick succession, with multiple crises intertwining and accumulating. The transition to a climate-resilient future is fraught with difficulties, the digital divide is deepening, and the misuse of artificial intelligence poses new security risks. Challenges to food and energy security are also intensifying, and non-traditional security threats such as terrorism, cyberattacks, transnational crime, and biosecurity risks are on the rise. The issues that human society must collectively address are becoming increasingly complex and diverse.

The universe has only one Earth, which is the shared home of all humanity. Countries are not riding separately in some 190 small boats, but aboard a single giant ship of shared future. Only by working together and supporting one another can we navigate through the storms of global challenges and sail towards a brighter future.

2. The Law of the Jungle Seriously Undermines the International Rule of Law

Built upon the ruins of the two world wars, the UN serves as a shelter for peace and development, and its Charter laid the institutional cornerstone for global governance. History can only move forward, not backward; we must draw lessons from the bloodshed and fires of war of the past and prevent a return to the law of the jungle at all costs.

Unilateralism and hegemonism cause only grave harm, openly trampling upon international law and the basic norms governing international relations. By bullying the small and weak and brazenly wielding force against sovereign states, certain countries have shown they prioritize their national interests above all else, applying double standards and challenging international justice for their own selfish gain. These nations gang up to form exclusive groups and blocs, inciting division and confrontation and carving spheres of influence today – in the 21st century – as they did in centuries gone by. By so doing they have become the major source of global turbulence.

De-globalization and protectionism are on the rise, while economic and trade issues are being politicized, instrumentalized, and weaponized. Some countries have instigated trade wars and tech wars, imposed unilateral sanctions illegally, and abused long-arm jurisdiction. They have single-mindedly sought to build "small yards with high walls" or "parallel systems", and have overstretched the concept of national security to suppress and contain the economic and technological progress of other countries. These retrogressive actions violate the principles of the market economy, trample on the rules of free trade, and severely disrupt the international economic order.

Humanity now faces several crucial questions. Fairness and justice, or the law of the jungle? Openness and mutual benefit, or isolation and confrontation? The rule of law, or power politics? At this historical crossroads, we must be responsible and make the right choice.

3. It Is Imperative to Shore Up the Governance System

The UN is the most comprehensive, representative and authoritative international organization, and the UN-centered international system plays an irreplaceable and vital role in global governance. Over time, however, the current global governance system has become increasingly incompatible and misaligned with the realities of today and the evolving international landscape, and its shortcomings and deficiencies are growing ever more pronounced.

The UN's authority is challenged. Disregarding the purposes and principles of the UN Charter, a certain major power has withdrawn from international organizations and agreements, defunded key bodies, blocked Security Council resolutions, and paralyzed the World Trade Organization's (WTO) dispute settlement mechanism. These actions have seriously disrupted the international order and caused further damage to multilateral mechanisms, eroding the foundation of trust in multilateral cooperation.

The effectiveness of multilateral institutions is in urgent need of improvement. As some countries refuse to fulfill their responsibilities and obligations, multilateral agendas are often left discussed but undecided, or decided but not implemented. Efforts must therefore focus on improving the operational efficiency, emergency response capabilities, and transparency of multilateral institutions such as the UN. At the same time, the existence of governance gaps in emerging fields – including artificial intelligence, cyberspace, and outer space – also demands attention.

The UN's representation is critically inadequate. To maintain their hegemony and protect their own interests, some countries have long obstructed the reform process of the UN and its agencies, causing significant delays in reforms such as the IMF quota and World Bank shareholding. Developing countries remain underrepresented and their voices insufficiently heard.

The current governance system is certainly not perfect, but it needs neither to be dismantled and rebuilt in full, nor replaced entirely by a new system. Instead, as an international community, we must focus on reforming and improving the existing system to make it more compatible and aligned with the world's realities, addressing governance shortcomings from a developmental perspective, and responding to the call of the times with a vision for progress.

4. More Global South Voices Need to Be Heard

The Global South is a vital force in seeking peace, pursuing development, and promoting cooperation, and its collective rise represents human progress. To stabilize and improve the world, the international community needs to be more responsive to the concerns of the Global South in international affairs and fully leverage its role.

The Global South has grown remarkably strong. After World War II, national independence and liberation movements swept across Asia, Africa, and Latin America, dismantling the global colonial system. The number of UN member states has increased from 51 at its founding in 1945 to 193 today. Based on purchasing power parity, the Global South now makes up over 60 percent of the world economy and contributes 80 percent to global economic growth, with multiple hubs of development across various regions. The monopolization of international affairs by a small number of countries is no longer sustainable, and long-standing historical injustices must be redressed.

This rise has brought a new dynamic to global governance. BRICS has undergone a historic expansion, and the Shanghai Cooperation Organization (SCO) has become the largest regional intergovernmental organization in terms of territory and population. Together, they are playing a positive role in the development and reform of the global governance system. The G20 has become the premier platform for global economic governance, with emerging economies now accounting for more than half of its membership. Championing fairness and justice, the G77 and China have deepened South-South cooperation. Meanwhile, Global South countries have hosted a series of multilateral summits, contributing their share to global governance and leaving their imprint.

The times call for a model of global governance that is more inclusive, equitable, and sustainable. The process of securing greater respect for the Global South countries' rights to development, voice, and decision-making in international affairs will mark a historic journey towards a more dynamic, effective, and hopeful global governance system.

II. The Global Governance Initiative Responds to Challenges of Our Times

The Global Governance Initiative upholds the purposes and principles of the UN Charter and embraces a global governance vision characterized by extensive consultation, joint contribution, and shared benefits. It is built on five core concepts: sovereign equality, the international rule of law, multilateralism, a people-centered approach, and real actions. By addressing the crux and root causes of crises and challenges, the initiative provides sound guidance for building a more just and equitable global governance system.

1. Sovereign Equality

Sovereign equality is enshrined in the UN Charter as the first among all principles and the supreme norm regulating state-to-state relations. Countries, whether large or small, strong or weak, developed or developing, are equal members of the international community. Every nation's sovereignty and dignity must be respected, and all countries are equally entitled to participate in, deliberate on, and benefit from global governance.

Equality is the premise of state-to-state relations. Countries should, in the spirit of mutual respect, conduct consultations on an equal footing and manage their differences appropriately. Major countries should lead by example in honoring equality, good faith, and cooperation, rather than leveraging their position of strength to engage in hegemonic, high-handed and abusive acts. If allowed to deviate from the principle of sovereign equality, international relations would degenerate into a game among powers, and international law would become groundless, leaving the world in perpetual chaos.

Sovereign equality is an essential requirement for solidarity against challenges. The future of all nations is bound by shared interests, common challenges, and collective responsibilities. Global governance cannot be dominated by a select few developed nations. Only when all countries participate equally can all sides build the political trust essential for solidarity and collaboration; only in this way can the resulting rules and decisions receive extensive recognition and rest on solid legal ground. This is the necessary approach to reaching broad consensus and creating powerful synergy.

Equality and inclusiveness are the inexorable progress in the evolution of the global governance system. Coexistence in diversity is a fundamental characteristic of human society, and multipolarity is vital to the evolving international landscape. A global governance system that is more representative, inclusive, and beneficial to all is an irreversible trend, and equal rights, equal opportunities, and equal rules are the shared aspirations of all peoples. Hegemony and power politics that run counter to the tide of history are destined to fail.

2. The International Rule of Law

The international rule of law is the fundamental safeguard for global governance. Only a global governance system that is grounded in the rule of law can provide all countries with a fair and just environment for development, achieve a balance between rights and obligations, and make international order more just and equitable.

Rigorously enforcing the international rule of law is rooted in upholding the purposes and principles of the UN Charter. Confrontation and injustice in today's world do not arise because the UN Charter is outdated, but because it is not effectively implemented. Its purposes and principles, such as maintaining international peace and security, promoting international cooperation, settling international disputes by peaceful means, and refraining from the threat or use of force in international relations, have established the fundamental norms governing international relations and underpinned post-war stability in the international order, and thus must be honored without the slightest compromise.

Rigorously enforcing the international rule of law hinges on safeguarding its justice and integrity. Only when international law is applied equally and universally, rather than selectively, can we truly distinguish right from wrong and advance peace and development. All nations are stakeholders in the international rule of law – without it, anyone at the dining table today could appear on the menu tomorrow. Major countries are the key forces in advancing international rule of law. They should lead by example in following rules and upholding the rule of law, rather than putting their own interests above international law or, even worse, imposing their own rules upon others.

Rigorously enforcing the international rule of law calls for improving rulemaking in emerging sectors. Human society is constantly evolving, and global governance rules must keep pace. New domains such as the deep seas, polar regions, outer space, and cyberspace, some of which are the common property of humanity and some represent the frontiers of future development, require urgent attention in order to establish rules and close gaps in their governance. All parties should uphold the principles of peace, sovereignty, inclusiveness, and joint governance, and put law in place for the development and utilization of new domains, so that they expand the space for cooperation rather than become arenas of rivalry. The governance of artificial intelligence should guard the red line of security and ethics, and be pursued in the spirit of openness, shared outcomes, and equal rights, to ensure AI for good and truly benefit humanity.

3. Multilateralism

Multilateralism emerged for the cause of peace and development, and multilateral mechanisms are vital for addressing global issues. No country can achieve development outside the global governance system, nor can it secure a future without participating in international cooperation. It is not a matter of whether we choose it or not, multilateralism is the only viable path forward.

Countries should stick to the principles of extensive consultation, joint contribution, and shared benefits. The essence of multilateralism lies in extensive consultation on international affairs and collective decision-making among all countries for the future of the world. Countries should pool wisdom through extensive consultation, gather strength through joint contribution, and promote universal interests through shared benefits. They should unequivocally oppose all forms of unilateralism, hegemony, dominance by a few countries, and bloc politics in the understanding that the deliberate erection of barriers will only push the world into the abyss of antagonism and confrontation.

From page 11

Countries should be steadfast in safeguarding the central role of the United Nations. The United Nations is the primary platform for practicing multilateralism and advancing global governance. Its leading position must be upheld and remain rock solid; its role can only be reinforced, not weakened. All countries should reaffirm the founding purpose of the United Nations, work to restore its authority and vitality under new circumstances, and enable it to play a central role in coordinating global actions to address common challenges.

Countries should be firm in promoting multilateral dialogue, consultation, and cooperation. In light of the complexity of global challenges, no country can remain insulated from their impacts or resolve all issues alone. Countries should build consensus through dialogue, resolve disputes through consultation, and pursue win-win results through cooperation, striving to expand their common interests. Global and regional multilateral mechanisms should play a constructive role in this, pooling the resources and strengths of national governments, international organizations, and non-governmental organizations to increase the synergy and efficiency of global governance.

4. A People-Centered Approach

People's wellbeing is a core concern of global governance. The people of every country across the world are the essential participants and direct beneficiaries of global governance. Only by serving public interests, boosting public confidence, and meeting public expectations can the global governance system win extensive support and function effectively.

Pursuing common development heightens the sense of gain among all peoples. Development concerns people's life and dignity; it is a matter of hope or disappointment. World prosperity and stability cannot be built upon ever widening gaps between rich and poor. Countries must restore development to the center of the international agenda, mobilizing global resources to implement the UN 2030 Agenda for Sustainable Development without delay. The North-South divide must be bridged as soon as possible, and help should be provided to developing countries to boost their capacity for independent development, so that all nations have greater and fairer access to the fruits of development.

Addressing common challenges heightens the sense of security among all peoples. In today's world, all countries share a common stake in security, and all must therefore embrace a vision of common, comprehensive, cooperative and sustainable security while addressing the threats to this stake – whether traditional or non-traditional. In responding to risks and challenges such as climate change, public health, and cyberspace security, it is important for the people to truly feel that countries are taking action and that unity can overcome all difficulties.

Promoting mutual understanding and friendship heightens the sense of fulfillment among all peoples. Civilizations become colorful through exchanges and are enriched through mutual learning. Countries should let cultural exchanges prevail over estrangement, mutual learning over clashes, and inclusiveness over superiority. Cultural and personnel exchanges should be strengthened to break down ideological barriers between nations and social groups. A shared conviction for safeguarding common interests will allow all civilizations to thrive and succeed together.

5. Real Actions

Global governance finds its source of vitality in practice, hinges on action, and is verified by its effectiveness. A vision is realized only through concrete action. It falls on the international community to turn this vision into reality – setting common goals, embracing a problem-oriented approach, and acting in concert.

Coordinating overall progress and individual breakthroughs. A coordinated approach should be adopted to advance global governance agendas, address governance deficits, and prevent fragmentation in the governance system. Targeted efforts should also be made for the most pressing issues in individual countries, particularly developing countries, to achieve tangible progress in poverty reduction and in improving people's wellbeing and closing the digital divide.

Addressing both symptoms and root causes. Given present conditions, feasible plans should be made to resolve the immediate challenges facing the world. The effectiveness in responding to major public crises and providing international public goods should be increased. With future development in mind, fundamental solutions should be explored to tackle chronic and persistent issues and bring change to the global governance system – which is lagging in reform – to align it with the evolving political and economic landscapes.

Synergizing North-South cooperation and South-South cooperation. The Global North and Global South should leverage their complementary strengths and move towards the same direction. Developed countries should diligently fulfill their international obligations and deliver on their commitments regarding development assistance and climate financing; they should not evade their international responsibilities under any pretext. Developing countries should unite to build their strength, improve South-South cooperation mechanisms, increase their capacity for collaborative development and their collective voice, and inject sustained momentum for improving global governance.

III. China's Contribution to Promoting Global Governance

As a responsible major country, China champions the building of a community with a shared future for humanity and takes the lead in practicing true multilateralism. It has consistently been a builder of world peace, a contributor to global development, a defender of the international order, and a provider of public goods, while actively advancing the efforts for building a more just and equitable global governance system.

1. Committing to Universal and Common Security

Humanity forms an indivisible community of security. As a major country with the best peace and security record, China has enshrined in its Constitution a commitment to peaceful development. It champions the vision of common, comprehensive, cooperative, and sustainable security, and has put forward the Global Security Initiative and acted on its principles, contributing to lasting world peace and stability.

Firmly safeguarding world peace within the framework of the UN. China faithfully fulfills its mission and duties as a permanent member of the UN Security Council, firmly supporting the UN in playing its core role in international affairs and the Security Council in playing its primary role in international peace and security. China also takes an active part in UN peacekeeping operations as the second largest contributor to the UN peacekeeping budget and the largest troop contributor among the permanent members of the UN Security Council. To date, more than 50,000 Chinese peacekeepers have been dispatched in 29 peacekeeping operations authorized by the UN Security Council. The country has also established the world's first standing peacekeeping police unit and maintains a peacekeeping standby force of 8,000 troops.

On September 3, 2025, China celebrated the 80th anniversary of its victory in the Chinese People's War of Resistance Against Japanese Aggression and the World Anti-Fascist War. Together with the international community, China will safeguard the victory of World War II, promote a correct understanding of that war, and send the powerful message that peace must be safeguarded and justice will prevail.

Maintaining global strategic stability. China pursues a national defense policy that is in nature defensive, upholds a firm commitment to a policy of no-first-use of nuclear weapons and a nuclear strategy of self-defense, and resolutely safeguards the international nuclear disarmament and nonproliferation regimes. It promoted the issuance of a joint statement of the leaders of the five nuclear-weapon states on preventing nuclear war and avoiding arms races, reiterating the view that a nuclear war cannot be won and must never be fought, emphasizing the need to avoid military confrontation and prevent arms races and articulating a shared commitment to maintaining global strategic stability and reducing the risk of nuclear conflicts. China has put forward the principles of justice, cooperation, balance and effectiveness in arms control, and upholds the international arms control regime with the UN at its core.

Pioneering the use of a unique Chinese approach to addressing international flashpoints. China upholds the principles of non-interference in other countries' internal affairs, political settlement of issues, objectivity and fairness, and addressing both symptoms and root causes, offering a new approach for finding constructive solutions to flashpoints.

On the Ukraine crisis, China follows the four key principles [The principles are: The sovereignty and territorial integrity of all countries should be upheld; the purposes and principles of the UN Charter should be observed; the legitimate security concerns of all parties should be taken seriously; all efforts conducive to the peaceful settlement of the crisis should be supported.] as its fundamental guide. It released China's Position on the Political Settlement of the Ukraine Crisis and, together with Brazil and other Global South countries, launched the Group of Friends for Peace on the Ukraine crisis, building synergy and creating conditions for ceasefire and peace talks.

On the Palestinian-Israeli conflict, China has urged the UN Security Council to pass the first ceasefire resolution for Gaza since the outbreak of a new round of conflict. It has provided emergency humanitarian assistance to Gaza and taken a clear stand in support of the two-state solution, promoting a comprehensive, just, and lasting resolution of the Palestinian question.

China has facilitated the historic reconciliation and restoration of diplomatic relations between Saudi Arabia and Iran, and 14 Palestinian factions visited China for reconciliation talks and signed the Beijing Declaration on Ending Division and Strengthening Palestinian National Unity. This wave of reconciliation in the Middle East has been widely welcomed. In promoting peace and stability in the Middle East, China has put forward the principles of peaceful coexistence, national sovereignty, international rule of law, and a holistic approach to development and security. Together with Pakistan, China has issued a five-point initiative of China and Pakistan for restoring peace and stability in the Gulf and Middle East Region.

Championing an Asian security model characterized by security for all, common ground amid differences, and dialogue and consultation, China has facilitated a ceasefire agreement between conflicting parties in northern Myanmar and played a constructive role in the border dispute between Cambodia and Thailand and the cross-border clashes between Afghanistan and Pakistan. It has proposed the Outlook on Peace and Development in the Horn of Africa, supporting countries in the region in responding to security challenges.

Reinforcing non-traditional security shields. China continues to support the development of the Global Public Security Cooperation Forum (Lianyungang) to build consensus among all parties and advance global public security governance. China advocates comprehensive measures for addressing both symptoms and root causes, and promotes international and regional counter-terrorism cooperation. It has facilitated the establishment of the Integrated Center for Countering Security Threats and Challenges of the Shanghai Cooperation Organization (SCO) and its Center for Combating Transnational Crime and Information Security Center, and the SCO Narcotics Control Center, playing an active role in helping other developing countries reinforce their counter-terrorism capacities.

In resolutely cracking down on transnational drug trafficking, China leads pragmatic anti-drug cooperation operations in the Greater Mekong Subregion and by the SCO and BRICS countries, and has taken the global lead in scheduling the whole class of fentanyl-related substances. It has combated cross-border crimes such as online gambling and telecom fraud, accelerated the development of an international alliance on combating telecom fraud, and dismantled large groups of overseas scam centers in cooperation with countries including Thailand, Myanmar, and Laos. China has proposed the International Cooperation Initiative on Global Food Security within the framework of G20, facilitated the adoption of the BRICS Strategy on Food Security Cooperation, joined the Global Alliance Against Hunger and Poverty, and provided emergency humanitarian food assistance to multiple countries suffering food shortages or disasters.

2. Promoting Openness, Cooperation, and Common Development

China cannot develop in isolation from the rest of the world, nor can the world achieve overall prosperity without China. As the largest developing country, China has always pursued its own growth in the context of humanity's shared development and upheld openness, win-win cooperation, inclusiveness, and shared benefits. Through Chinese modernization, the country has provided the world with new opportunities and boosted the global drive for modernization.

Contributing to building an open global economy. China has promoted trade and investment liberalization and facilitation, and it has become the main trading partner of over 160 countries and regions, signing 24 free trade agreements with 31 countries and regions in the process. It has facilitated and achieved high-standard implementation of the Regional Comprehensive Economic Partnership (RCEP) and signed the China-ASEAN Free Trade Area 3.0 Upgrade Protocol. It endeavors actively to join the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) and the Digital Economy Partnership Agreement (DEPA) to expand the globally-oriented network of high-standard free trade areas. The country firmly safeguards the rule-based multilateral trading system with the World Trade Organization (WTO) at its core, engages fully and deeply in WTO reforms, and has announced that it will not seek new special and differential treatment in current and future negotiations at the WTO.

Bringing broader opportunities to the world with higher-standard opening up. China has expanded institutional opening up, removed all restrictions on foreign investment access in the manufacturing sector, continued to shorten the negative list for foreign investment, and fostered a world-leading business environment that is based on market principles, governed by law, and up to international standards. Steps have been taken to expand voluntary and unilateral opening up, with the launch of 23 pilot free trade zones, island-wide special customs operations in the Hainan Free Trade Port, and open platforms such as the China International Import Expo, China International Fair for Trade in Services, China International Consumer Products Expo, and China International Supply Chain Expo. Additionally, zero tariffs have been placed on the least developed countries and African countries that have established diplomatic relations with China. During the 14th Five-year Plan period (2021-2025), China's imports of goods and services exceeded US$15 trillion, and its GDP is expected to increase from RMB140 trillion to RMB170 trillion in the next five years, as its vast market continues to realize its potential.

Achieving solid progress in deepening high-quality Belt and Road cooperation. China has promoted cooperation in the Belt and Road Initiative (BRI) to a new stage of high-quality development. It has established the world's broadest and largest international cooperation platform and expanded the belt of development and road to happiness to benefit all parties.

Policy connectivity has built greater synergy. China has signed cooperation documents with over 150 countries and 30 international organizations, hosted three Belt and Road forums for international cooperation, established more than 30 special cooperation mechanisms in key areas such as economy, trade, energy and infrastructure, and established a secretariat for the forum.

Infrastructure connectivity has achieved leapfrog development. Flagship programs such as cross-border highways, railways, ports, and aviation hubs have made breakthroughs, and a general connectivity framework consisting of six corridors, six connectivity routes, and multiple countries and ports has now been realized. The China-Europe Railway Express freight service has operated more than 130,000 trips to date.

Trade connectivity has advanced despite challenges. In-depth alignment has been achieved in areas such as cross-border payments, digital authentication, and smart customs. In 2025, the volume of trade in goods between China and BRI participants reached RMB23.6 trillion, up by 6.3 percent year-on-year, accounting for 51.9 percent of the country's foreign trade.

Financial connectivity has embraced greater diversity. The Asian Infrastructure Investment Bank (AIIB) and the Silk Road Fund have provided financing support to hundreds of projects. Renminbi financing windows have been set up, and the two-way investment between China and its BRI partners totaled more than US$240 billion between 2021 and the first half of 2025.

People-to-people connectivity has become stronger. Landmark livelihood initiatives supported by Luban Workshops and Juncao technology have continued to advance, and communication and exchange have flourished in culture, tourism, education, and media, as well as between the youth of different nations.

Delivering effective results in implementing the Global Development Initiative. To accelerate the realization of the UN 2030 Agenda for Sustainable Development, China helps steer global development towards a new stage of balanced, coordinated and inclusive growth that delivers more robust, greener, and healthier global development.

Consensus on development as a priority continues to build, with more than 130 countries and international organizations supporting participation in the initiative and over 80 countries joining the Group of Friends of the Global Development Initiative. China has hosted the High-Level Dialogue on Global Development and the Forum on Global Action for Shared Development, encouraging all parties to make new commitments to and embark on a new journey towards realizing the Sustainable Development Goals.

Cooperation mechanisms continue to improve. China has signed more than 80 cooperation documents on implementing the initiative with other developing countries, international organizations, and financial institutions. Over 30 cooperation mechanisms have been established in eight key areas of the initiative, covering all 17 sustainable development goals. China has also set up a Global Development Promotion Center and a Global Knowledge Network for Development, and issued the Global Development Report. Together with the UN, it has established the China-UN Global South-South Development Facility, actively discussed the development of the Global Center for Sustainable Development in cooperation with the United Nations Development Programme, and taken the initiative to establish the Institute of Global Development.

Resources for development cooperation continue to grow. More than US$23 billion of development funds of various types have been mobilized. China has established the Global Development and South-South Cooperation Fund, increased its total to US$4 billion, and launched the China-FAO South-South Cooperation Trust Fund (Phase III).

Pragmatic cooperation has delivered remarkable results. China has established a project pool under the Global Development Initiative, launched more than 1,800 cooperation projects, and completed the training of 80,000 people within the framework of the initiative, assisting other developing countries in improving their capacity for independent and sustainable development.

3. Practicing True Multilateralism

No matter how the world changes, China will always uphold the international system with the United Nations at its core, the international order underpinned by international law, and the basic norms governing international relations based on the purposes and principles of the UN Charter. It advocates and practices true multilateralism and remains an active champion and strong proponent of multilateral cooperation.

Resolutely upholding the authority and status of the UN. As a founding member of the UN and the first country to sign the UN Charter, China has consistently upheld the central role of the UN in international affairs through concrete actions. The country's contribution to the UN regular budget increased from less than 1 percent in 2000 to over 20 percent in 2025, making it the second largest contributor. It has paid in full its assessed contributions to the UN in support of the effective operation of UN agencies. It has launched and renewed the China-UN Peace and Development Fund and increased its input to the fund, providing strong support to major UN agendas.

China supports the UN in advancing the implementation of the Pact for the Future and in enhancing the quality, efficiency, and vitality of the organization through the UN80 Initiative. It actively supports the UN and its specialized agencies in establishing new institutions in China, including the UNESCO International Institute for STEM Education in Shanghai and the International Monetary Fund (IMF) Shanghai Center. China's efforts to supply outstanding talent to the UN have led to a steady increase in the share of Chinese employees in UN agencies and related international organizations. China has hosted the Global Leaders' Meeting on Women, boosting new progress in women's well-rounded development.

Panel 1 Global Leaders' Meeting on Women: China's Contribution to the Development of Women's Cause

From October 13 to 14, 2025, China and UN Women jointly hosted the Global Leaders' Meeting on Women in Beijing. Under the theme of "One Shared Future: New and Accelerated Process for Women's All-Round Development", the summit was attended by guests from over 110 countries, including heads of state and government, heads of parliament, officials at the vice-premier level, representatives at the ministerial level, representatives of UN agencies and international organizations, and diplomatic envoys. China's President Xi Jinping attended the opening ceremony and delivered a keynote speech.

To further support the global cause of women, China announced that in the next five years it would donate a further US$10 million to UN Women, earmark a quota of US$100 million in China's Global Development and South-South Cooperation Fund for implementing development cooperation projects for women and girls in collaboration with international organizations, and launch 1,000 small and beautiful livelihood programs with Chinese assistance, prioritizing women and girls as the primary beneficiaries. At the same time, it would invite 50,000 women to China for training and exchange programs and establish a Global Center for Women's Capacity Building aimed at conducting capacity building and cooperation for women's development with relevant countries and international organizations to train more female talent.

Upholding the authority of the international rule of law and pushing for progress in international law-based governance. China has joined nearly all universal intergovernmental organizations and signed over 600 international conventions and amendments, fulfilling its treaty obligations in good faith and honoring its international commitments. The country held a conference marking the 70th anniversary of the Five Principles of Peaceful Coexistence, reaffirming and safeguarding the basic norms governing international relations and the principles of international law. China continues to provide firm support for the work of UN judicial bodies and remains an active participant in international judicial activities. Engaging in international law enforcement cooperation, it has increased efforts in anti-corruption action, the cross-border pursuit of fugitives, their repatriation and extradition, and recovery of assets. Additionally, it has initiated and led the creation of the International Organization for Mediation, filling a gap in the international mediation mechanism.

Panel 2 International Organization for Mediation: Chinese Wisdom for the Peaceful Settlement of International Disputes

In 2022, China and like-minded countries initiated the establishment of the International Organization for Mediation (IOMed). On May 30, 2025, the signing ceremony of the Convention on the Establishment of the International Organization for Mediation was held in Hong Kong, with 33 countries signing the convention and becoming its founding members. On August 29, 2025, the convention entered into force, with Hong Kong becoming the location of IOMed's headquarters. On October 20, 2025, the organization commenced formal operations.

As the first intergovernmental legal organization dedicated to resolving international disputes through mediation, the IOMed focuses on mediating disputes to resolve conflicts and serves as an important mechanism that safeguards the purposes and principles of the UN Charter. It complements and creates synergy with litigation, arbitration, and other existing mechanisms to resolve international disputes, and provides a new platform for their peaceful settlement.

Participating in and leading G20 cooperation. China encourages the G20 – as a major forum for economic dialogue between developed and developing countries – to pursue international cooperation in the spirit of equal consultation and mutual benefit. In 2016, China hosted the G20 Hangzhou Summit, widely regarded as one of the most fruitful G20 summits to date. It issued what became a landmark G20 Leaders' Communiqué, put development at the center of macroeconomic policy coordination for the first time, and endorsed consensus documents such as the G20 Guiding Principles for Global Investment Policymaking and G20 Blueprint on Innovative Growth, leaving China's clear imprint in the group's history. During the G20 Summit in Rio de Janeiro, China set out its proposals for economic, financial, trade, digital, and ecological governance, promoting a world economy built on cooperation, stability, openness, innovation, and eco-friendliness. China also took the lead in supporting the African Union's membership in the G20 to increase the representation of developing countries.

Advancing an Asia-Pacific community. The Asia-Pacific Economic Cooperation (APEC) is the highest-level mechanism for economic cooperation in the Asia-Pacific region, with the broadest coverage and greatest influence. China advocates the spirit of an Asia-Pacific family and promotes an Asia-Pacific community of shared future characterized by openness and inclusiveness, innovation-driven growth, greater connectivity, and mutually beneficial cooperation. Facilitated by China, the Shanghai Accord of the APEC Economic Leaders' Declaration was adopted at the APEC meeting held in Shanghai in 2001, marking a new beginning for Asia-Pacific cooperation in the new century. In 2014, the APEC meeting in Beijing delivered multiple outcomes, including the 22nd APEC Economic Leaders' Declaration – Beijing Agenda for an Integrated, Innovative and Interconnected Asia-Pacific, in which all parties pledged to foster an Asia-Pacific partnership for the future and outlined a vision for the long-term development and shared prosperity of the region.

In 2026, China will host the APEC meeting for a third time, under the theme "Building an Asia-Pacific Community to Prosper Together". The meeting will focus on three priorities: openness, innovation, and cooperation. All parties concerned will come together to recommit to the original aspirations of Asia-Pacific cooperation, focus on concrete actions towards their goals, and strive to turn their blueprint for a better Asia-Pacific community into reality.

4. Supporting the Global South in Playing a Greater Role

China will always be a member of the Global South, and in the Global South its roots will remain. No matter what the future holds, it will always keep the wellbeing of the Global South in mind. Acting on the principles of sincerity, real results, amity, and good faith, and with a commitment to pursuing the greater good and shared interests, China has strengthened solidarity and cooperation with other developing countries, firmly safeguarded the common interests of the Global South in international affairs, and led the Global South in building strength through joint efforts.

Advancing high-quality development of greater BRICS cooperation. At the forefront of the Global South, BRICS countries are jointly committed to promoting world economic growth, improving global economic governance, and advancing democracy in international relations. China has played an active role in expanding and strengthening BRICS cooperation, reinforcing its institutions in response to the evolving times, and increasing its global influence. China and other BRICS countries have established the New Development Bank and formed the Contingent Reserve Arrangement, which have become an emerging force in the international financial system and landmark projects of Global South cooperation.

In 2017, the BRICS Xiamen Summit delivered more than 60 outcomes, giving rise to three key engines that drive cooperation – political security, trade and finance, and people-to-people exchange – as well as the "BRICS Plus" approach. In 2022, during the BRICS "China Year", the BRICS Summit issued the Beijing Declaration, marking the beginning of the organization's expansion. China has since worked with relevant parties to advance this historic enlargement, which represents a major milestone not only for BRICS, but also for the evolution of the international landscape. China has promoted a vision for BRICS centered on peace, innovation, green development, justice, and closer people-to-people exchanges. It continues to support more Global South countries in joining the cause of BRICS as full members, partner countries, or in the "BRICS Plus" format, to build the cooperation mechanism into a primary channel for strengthening solidarity and cooperation among Global South nations and a vanguard for advancing global governance reform.

Panel 3 New Development Bank: An Emerging Force in the International Financial System

The New Development Bank was jointly established by Brazil, Russia, India, China, and South Africa in 2015. It is the first international financial institution to be headquartered in China, and the first multilateral development institution established and led by emerging market economies and developing countries. The bank aims to mobilize resources for infrastructure and sustainable development projects in BRICS countries and other emerging and developing economies. Since its establishment, the New Development Bank has made steady progress in its operations and institutional development, becoming an emerging force in the international financial system and a landmark project of Global South cooperation. As of March 2026, it had approved loans of US$42.9 billion for 139 development projects, covering key areas including clean energy and energy efficiency, transport infrastructure, environmental protection, water and sanitation, social infrastructure, and digital infrastructure.

Advancing the development and expansion of the Shanghai Cooperation Organization. The SCO is the first international organization named after a Chinese city, founded with China's participation, and headquartered in the country. China champions the Shanghai Spirit of mutual trust, mutual benefit, equality, consultation, respect for diversity of civilizations, and pursuit of common development, and works towards a closer SCO community of shared future. Through the joint efforts of its member states, the SCO has grown into a group of 27 countries spanning Asia, Europe, and Africa, and its economic aggregate is approaching US$30 trillion. It has carried out cooperation in more than 50 areas, having become an important force for world peace and development and a guardian of international fairness and justice.

In 2025, the SCO Tianjin Summit formulated a development strategy for the coming decade. Leaders of SCO member states witnessed the inauguration of the four security centers [This refers to the Integrated Center for Countering Security Threats and Challenges of the Shanghai Cooperation Organization and its Center for Combating Transnational Crime and Information Security Center, and the SCO Narcotics Control Center.] and decided to establish an SCO Development Bank. China also announced the creation of three major China-SCO cooperation platforms, covering energy, green industry, and the digital economy, and three major cooperation centers for scientific and technological innovation, higher education, and vocational and technical education, and the decision to continue the implementation of the action plan for high-quality development of economic and trade cooperation among SCO members. Together, these initiatives have enhanced solidarity and coordination among member states and injected new vitality into the organization, propelling it into a new stage of high-quality development and towards even greater successes.

Promoting the creation of a global governance architecture that is more balanced and effective. China believes that the international financial architecture should be more balanced in representation and better reflect the realities of the world economy. It argues that the World Bank should conduct shareholding reviews and the International Monetary Fund should carry out quota share realignment in accordance with the agreed timeframes and roadmaps to address the democratic deficit in global financial governance.

China supports the reform of the UN Security Council, believing that increasing the representation of developing countries is the right direction of the reform, and that it is imperative to address the historical injustice suffered by Africa, with priority and special arrangements made for the continent's demands. It maintains communication and coordination with its partners in the Global South through mechanisms such as the Non-Aligned Movement and the Group of 77, and plays an active role in championing justice at major international events such as the UN General Assembly. Together, they have made joint efforts to safeguard international fairness and justice and defend their legitimate rights and interests.

Assisting the Global South in jointly embarking on a path towards modernization. China has proposed and advanced an initiative for open and inclusive Global South cooperation, implemented the eight measures in support of Global South cooperation, and encouraged the Global South to become a staunch force for peace, a driving force for open development, a builder of global governance, and an advocate for exchanges and mutual learning among civilizations.

At the Beijing Summit of the Forum on China-Africa Cooperation, bilateral relations between China and all African countries with which it has diplomatic ties were officially elevated to the level of strategic relations, and the overall positioning of China-Africa relations was elevated to an all-weather China-Africa community of shared future for the new era. China has also pledged to work with African countries to promote modernization in six areas [This refers to modernization that is just and equitable, open and win-win, diverse and inclusive, eco-friendly, underpinned by peace and security, and that puts the people first.] and implement 10 partnership actions [This refers to the partnership actions for mutual learning among civilizations, for trade prosperity, for industrial chain cooperation, for connectivity, for development cooperation, for health, for agriculture and livelihoods, for people-to-people exchanges, for green development, and for common security.].

The China-Arab States Summit decided to build a China-Arab community of shared future in the new era and carry out eight major cooperation initiatives for pragmatic China-Arab cooperation [This refers to cooperation initiatives on development support, food security, public health, green innovation, energy security, inter-civilizational dialogue, youth development, and security and stability.]. China has established a comprehensive cooperative partnership with Latin American and Caribbean countries based on equality, mutual benefit, and shared development. Together, they have founded the Forum of China and the Community of Latin American and Caribbean States, jointly launching the five programs on solidarity, development, civilization, peace, and people-to-people connectivity. Adhering to the principles of the Four Fully Respects [China fully respects the sovereignty and independence of Pacific island countries and upholds the equality of all countries, big or small; China fully respects their will and follows the principles of extensive consultation, joint contribution, shared benefits, and win-win results; China fully respects their cultural traditions and pursues harmony without uniformity and the common development of diverse cultures; China fully respects their effort to seek strength through unity, and supports them in implementing the 2050 Strategy for the Blue Pacific Continent, so as to contribute to the building of a peaceful, harmonious, secure, inclusive, and prosperous Blue Pacific.], China has carried out friendly cooperation with Pacific island countries and developed seven cooperation platforms [This refers to cooperation platforms on emergency reserve, climate change, poverty reduction and development, disaster prevention and mitigation, Juncao technology, agriculture, and police affairs.] to support them in accelerating efforts to achieve independent and sustainable development.

5. Promoting Exchanges and Mutual Learning Among Civilizations

Recognizing the fundamental reality of diversity in world civilizations and the urgent need to transcend civilizational conflicts, China has proposed the Global Civilization Initiative and promoted its implementation, championing the common values of humanity and fostering deeper exchanges and understanding among different peoples, and wider interactions and greater integration of diverse cultures in a joint effort to advance the development and progress of human civilization.

Promoting global dialogue among civilizations. China upholds a vision of civilization characterized by equality, mutual learning, dialogue, and inclusiveness, and promotes harmonious coexistence among different civilizations to share and admire the beauty of all. On June 7, 2024, the country facilitated the unanimous adoption of a resolution at the 78th session of the UN General Assembly, which designated June 10 as International Day for Dialogue Among Civilizations. For its celebration, vibrant themed activities were held at UN venues in New York and Geneva and in countries around the world.

Elsewhere, China has convened the Conference on Dialogue of Asian Civilizations and the Global Civilizations Dialogue Ministerial Meeting, and erected many multi-level international platforms such as the World Conference of Classics, the Liangzhu Forum, and the Alliance for Cultural Heritage in Asia. It has signed cooperation agreements on culture, cultural relics, and tourism with over 100 countries, deepening cooperation in joint archaeological research, world heritage protection, and the translation of classic works. Through concrete actions, the country promotes global dialogue among civilizations and protects the cultural treasures of all humanity.

The CPC in Dialogue with World Political Parties High-Level Meeting and the CPC and World Political Parties Summit encourage mutual learning between Chinese modernization – a new model for human progress – and other civilizations, continuously enriching the garden of world civilizations, and making new contributions to humanity's exploration of paths to modernization.

Panel 4 Global Civilizations Dialogue Ministerial Meeting Builds a Bridge for Mutual Learning Among Civilizations

From July 10 to 11, 2025, the Global Civilizations Dialogue Ministerial Meeting was held in Beijing under the theme "Safeguarding Diversity of Human Civilizations for World Peace and Development". In a congratulatory letter, President Xi Jinping emphasized that China is willing to work with other countries to champion equality, mutual learning, dialogue, and inclusiveness among civilizations, implement the Global Civilization Initiative, and promote the building of a global network for dialogue and cooperation among civilizations, in a bid to provide fresh impetus for advancing human civilizations and promoting world peace and development.

UN Secretary-General António Guterres also sent a congratulatory letter to the meeting, which saw more than 600 representatives from the political, cultural, and educational sectors of about 140 countries and regions attend its opening ceremony. The meeting adopted the Beijing Declaration of the Global Civilizations Dialogue Ministerial Meeting and released a list of 110 actions to be taken.

Advancing the development and progress of human rights. China advocates protecting human rights through security, advancing human rights through development, and promoting human rights through cooperation, steering global human rights governance in a more just, fair, reasonable, and inclusive direction. It has acceded to or ratified 29 international human rights instruments and has played a constructive role in the formulation of several major international human rights documents, including the Declaration on the Right to Development and the Vienna Declaration and Programme of Action.

China has served six terms as a member of the UN Human Rights Council, making it one of the most frequently elected and longest-serving countries. In this role, it has promoted the adoption by the council of resolutions such as "The Contribution of Development to the Enjoyment of All Human Rights", "The Negative Impact of the Legacies of Colonialism on the Enjoyment of Human Rights", "Promoting and Protecting Economic, Social and Cultural Rights Within the Context of Addressing Inequalities", and "Promoting Accessibility for the Full Enjoyment of All Human Rights by All".

Promoting people-to-people exchanges and friendship. China advances various forms of people-to-people diplomacy, city-to-city diplomacy, and public diplomacy. It has held cultural exchange years, tourism years, and education years with many countries, and established over 3,000 pairs of sister cities (provinces/states) with more than 150 countries, actively building bridges for people-to-people exchanges. Entry policies are being continually optimized, with unilateral visa-free access already in place for 50 countries, full mutual visa exemption for 29 countries, and 240-hour transit visa-free policy expanded to 55 countries across 65 entry ports. In 2025, 30.08 million foreigners entered China visa-free, accounting for 73.1 percent of all foreign arrivals, a year-on-year increase of 49.5 percent.

Sports also serve as a bridge for enhancing friendship among peoples. In recent years, China has successfully hosted the Beijing Winter Olympics, the Chengdu FISU World University Games, the Hangzhou Asian Games, and the Harbin Asian Winter Games, carrying forward the Olympic motto of "Faster, Higher, Stronger – Together". The youth represent the future of people-to-people friendship. In recognition of this, during Chinese President Xi Jinping's visits in the US and France in November 2023 and May 2024, China announced an initiative to invite 50,000 young Americans to China for exchange and study over the five years starting from 2023 and an initiative to invite more than 10,000 French students to study in China and double the scale of European youth exchanges in China over the three years starting from 2024. It has also held China-Africa Youth Festivals and "Chinese Bridge" summer camps for young students, planting the seeds of friendship in the hearts of the younger generation.

6. Providing More Public Goods for the International Community

Faced with ever-increasing global challenges, the global governance system must keep pace with the times, find solutions to old problems, and fill the gaps in rules in new areas. China has demonstrated the sense of responsibility of a major country that integrates knowledge and action, actively created international public goods, and contributed new solutions to global governance.

Firmly leading global climate governance. China firmly upholds and promotes the implementation of the United Nations Framework Convention on Climate Change and the Paris Agreement. The country adheres to the principle of common but differentiated responsibilities, and works to build a fair and rational global climate governance system underpinned by cooperation for mutual benefit.

In 2020, at the UN General Assembly, China solemnly declared that it would strive to peak its carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060. In 2025, at the UN Climate Change Summit, it announced a new round of nationally determined contributions, including reducing economy-wide net greenhouse gas emissions by 7 to 10 percent from peak levels by 2035, striving to do better; increasing the share of non-fossil fuels in total energy consumption to over 30 percent; and scaling up the forest stock volume and developing a carbon emissions trading market.

China has initiated the establishment of the BASIC and the Ministerial on Climate Action to build consensus, and has continued to help developing countries improve their capacity to address climate change through South-South cooperation. As of the end of October 2025, China had signed 55 cooperation documents with 43 developing countries, implemented over 300 sessions of capacity-building programs, and had provided and mobilized over RMB177 billion in program funding since 2016.

Panel 5 China's Green and Low-Carbon Industrial Transition Has Made Significant Contributions to the World

China is a steadfast champion of and a major contributor to green development. It has built the world's largest and fastest-growing renewable energy system and the largest and most complete new energy industrial chain, contributing about one-quarter of the world's newly increased green areas. It has carried out extensive cooperation on green energy projects with more than 100 countries and regions, consistently providing high-quality and efficient low-carbon energy equipment and products to the world, especially to developing countries. Its wind power, photovoltaic, and new energy vehicle products are now exported to over 200 countries and regions, supplying 70 percent of the world's wind power equipment and 80 percent of photovoltaic panels, driving down global wind and photovoltaic power generation costs by more than 60 percent and 80 percent, respectively. During the 14th Five-year Plan period (2021-2025), China's exported wind power and photovoltaic products reduced carbon emissions by approximately 4.1 billion tonnes for other countries.

DOCUMENT

From page 13

Advancing the development of artificial intelligence for good and for all. China has put forward the Global AI Governance Initiative, advocating a people-centered and AI-for-good approach. It supports the UN in playing a central role and promotes the formation of a global AI governance system with broad consensus to benefit all humanity, calling for strengthened international cooperation and assistance for developing countries to bridge the AI divide. The country has promoted the UN General Assembly's adoption of a resolution on enhancing international cooperation on AI capacity building, and proposed and implemented the AI Capacity-Building Action Plan for Good and for All. It initiated the establishment of the Group of Friends for International Cooperation on AI Capacity-Building, built the Digital South project under the Global Development Project Pool, and has held multiple capacity-building workshops and thematic dialogues in this regard.

Additionally, it has proposed the establishment of a World Artificial Intelligence Cooperation Organization and put forward the Global AI Governance Action Plan and the AI+ International Cooperation Initiative, contributing Chinese wisdom and solutions to AI development and governance. China attaches great importance to preventing risks in the military applications of AI and proposes that all countries should adopt a prudent and responsible approach in the development and use of relevant technologies, to ensure that weapon systems remain under human control at all times and to prevent an AI arms race.

Contributing China's strength to safeguarding global public health security. China actively participates in global health affairs and conducts health exchanges and cooperation through multiple channels and at multiple levels. It provides substantial international assistance in the health sector, and has actively engaged in major international health actions such as fighting the Ebola outbreak and the Covid-19 pandemic. It strives to bridge the immunization gap and the health deficit, and advocates jointly building a community of health for all.

China has signed health cooperation agreements with over 160 countries and international organizations, and initiated and participated in nine international and regional health cooperation mechanisms, including those between China and African countries, between China and Arab states, and between China and Southeast Asian nations. China has dispatched more than 30,000 medical workers to 77 countries and regions and treated 300 million patients. It has carried out medical outreach programs such as the Brightness Action, the Heart Care Action, and the Smile Action to provide free treatment of cataract, heart disease and dental defects, and has implemented the New Shennong Initiative, a program named after the mythical Shennong who tasted 100 herbs to discover their medical properties, to find new medicinal herbs worldwide for application in Traditional Chinese Medicine. China continues to support the World Health Organization (WHO) in playing a central coordinating role in global health governance and has deeply engaged in and led key agendas, including the revision of the International Health Regulations, the negotiation of the Pandemic Agreement, and the reform of global health governance architecture and WHO governance.

Actively leading the global biodiversity governance. Guided by the principle that lucid waters and lush mountains are invaluable assets, China advances eco-environmental conservation as a priority, pursues green development, and has become an important participant, contributor, and torchbearer in the global endeavor to build an eco-civilization. As the presidency of the 15th meeting of the Conference of the Parties to the Convention on Biological Diversity, China issued the Kunming Declaration and spearheaded the adoption of the historic Kunming-Montreal Global Biodiversity Framework, guiding the direction and drawing a blueprint for global biodiversity protection through 2030 and beyond. The country has since taken the lead in launching the implementation initiative on the framework and in establishing the Kunming Biodiversity Fund. With an investment of RMB1.5 billion, the fund has to date supported 31 projects and covered 45 developing countries, providing sustained momentum for the implementation of the framework. It has also advocated for the establishment of the International Coalition for Green Development on the Belt and Road, continued to deepen bilateral and multilateral dialogue and exchange, and worked to promote the fruitful results of South-South cooperation on biodiversity protection. In 2019, China became the largest contributor to the core budget of the Convention on Biological Diversity and its protocols, as well as the largest contributor among developing countries to the Global Environment Facility, positions it maintains to this day.

Promoting the improvement of governance rules for new domains. China is advancing the transformation of the global internet governance system, advocating four principles: respecting cyber sovereignty, safeguarding peace and security, promoting openness and cooperation, and ensuring good order. It has held the World Internet Conference for 12 consecutive years since 2014, and put forward the Global Initiative on Data Security and the Global Cross-Border Data Flow Cooperation Initiative. China has supported the establishment of the World Data Organization in Beijing, and supported the United Nations as the main channel for advancing global cyberspace and digital governance, working with all parties to build a community of shared future in cyberspace.

China actively promotes global ocean governance, and facilitated the conclusion of the Agreement on Marine Biodiversity of Areas Beyond National Jurisdiction as one of the first signatories. The country holds observer status in the Arctic Council, advocates building a Polar Silk Road, and promotes joint international efforts to protect and sustainably use Antarctic marine living resources.

China is committed to lasting peace and security in outer space, firmly upholding the international space order based on the 1967 Outer Space Treaty. It opposes an arms race in this realm, supports the United Nations in playing its central role, and safeguards the common rights and interests of all countries in the peaceful use of outer space.

IV. Guiding the Direction of Change Towards a Bright Future

The Global Governance Initiative quickly received widespread support from nearly 160 countries and international organizations upon its announcement, and China's ideas and actions have increasingly resonated with and received positive response from the international community. The reason behind this lies in the fact that China understands how to meet the call of the day and shape the trends of our times; that the GGI, while rooted in China, benefits the world; and that grounded in today's realities while opening up the future, China is contributing wisdom and strength to the progress of human civilization.

1. Building Broad Consensus on Improving Global Governance

China has put forward a series of new ideas and propositions that champion shared values and joint action, responding to the common aspirations of the international community and addressing the most pressing issues in global governance.

Extensive consultation, joint contribution, and shared benefits are aspired by all. A world so vast is bound to face many challenges. What kind of global governance system benefits the world and all its peoples? China believes that global affairs should be discussed by all, the governance system should be built by all, and development outcomes should be shared by all. This approach tackles problems at their root, represents the common aspirations of the vast majority of countries, and seeks the greatest common ground of shared interests for all nations in the world.

An equal and orderly multipolar world and a universally beneficial and inclusive economic globalization are the trends of the times. China advocates that all countries have a place in global governance and play their due roles. Together, they should build the world economy stronger and share the fruits equitably. Let economic globalization penetrate the dark room of protectionism like fresh air and bright sunshine to the benefit of all. This truly aligns with the trend of the times and the aspirations of all people.

True multilateralism is the only path forward. Global governance is both broad in scope and specific in practice. China offers a clear and all-encompassing approach: to champion and apply true multilateralism. Time and again, experience has shown that only when multilateralism is acted upon and multilateral coordination and cooperation are strong and effective, can global governance advance and human wellbeing be guaranteed. Without multilateralism humanity cannot develop and the world cannot progress.

The common values of humanity are a universal guide. With more than eight billion people, over 200 countries and regions, and more than 2,500 ethnic groups and many religions in our world, respecting diversity and differences while forging a great synergy across systems, civilizations, and countries is crucial to the success of global governance. China promotes the common values of humanity – peace, development, fairness, justice, democracy, and freedom. These values align with the core ideas of solidarity, coexistence, and win-win cooperation advocated by various civilizations, laying a value foundation for jointly improving global governance.

2. Demonstrating a Global Vision and a Sense of Responsibility

By sharing its philosophy on global governance and proposing the Global Governance Initiative, China has demonstrated a sense of responsibility in fulfilling the CPC's original aspiration and founding mission. Upholding fundamental principles while breaking new ground, it champions the country's rich diplomatic traditions and draws strength from its fine traditional culture, advancing with and leading the times while remaining committed to action.

China's global governance philosophy originates from the CPC's global vision. Since its founding 105 years ago, the CPC has always taken as its mission the pursuit of progress for humanity and great harmony for the world. It is this mission that determines China's noble goal in participating in global governance: to strive to turn the aspirations of the Chinese people and people of all countries for a better life into reality. The Fourth Plenary Session of the 20th CPC Central Committee emphasized the building of a community with a shared future for humanity and the implementation of the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative, and the Global Governance Initiative, providing clear guidance for China to work hand in hand with other countries to reform and improve the global governance system.

China's global governance philosophy carries forward the fine traditions of its diplomacy. As early as the 1950s, Chairman Mao Zedong said that China ought to make a greater contribution to humanity. Acting on this vision, the PRC has remained committed to an independent foreign policy of peace, and put forward the Five Principles of Peaceful Coexistence, the Three Worlds theory, and the idea of establishing a new global political and economic order, proactively safeguarding the interests of developing countries. For over 70 years, its foreign policy has remained steadfast in its original aspiration to uphold fairness and justice, and its mission to promote human progress has only deepened over time. This record continues to provide a source of strength for China's participation in and leadership of global governance in the new era.

China's global governance philosophy is rooted in the profound heritage of the Chinese civilization. Throughout its more than 5,000 years of civilization, the Chinese nation has always pursued peace, concord, and harmony across generations. Since ancient times, it has cherished the lofty ideal of "great harmony under Heaven", the governance philosophy of "great wisdom governing through sound institutions", the spiritual pursuit of "pulling together in times of difficulty", the strong conviction that "the people are the foundation of the state", and the practical approach of "applying knowledge in action". Under new historical conditions, these elements of wisdom have undergone a creative transformation and innovative progress, offering timeless insights for addressing global challenges.

3. Expanding the Practical Pathways for Building a Community with a Shared Future for Humanity

Over a decade ago, President Xi Jinping put forward the important vision of building a community with a shared future for humanity, with the goal of creating a better world and a better life for people of all countries. Since then, under the banner of building a community with a shared future for humanity, China has adopted a series of initiatives to confront various global risks and challenges, continuously enriching the practice of global governance.

In the face of a widening North South divide and severe delays in implementing the UN 2030 Agenda for Sustainable Development, China has proposed the Global Development Initiative to advance common development. In the face of complex international and regional situations and security governance challenges – especially when certain countries seek absolute security at the expense of other countries' security – China put forward the Global Security Initiative in time to address the peace deficit and tackle security problems. Amid a rising clamor of "clash of civilizations" and "confrontation between different systems", and the stoking of "antagonism of values" by some countries, China has proposed the Global Civilization Initiative to promote exchange and mutual learning among civilizations. Now, faced with a widening governance deficit and growing efforts to undermine the United Nations and multilateralism, China has put forward the Global Governance Initiative, expanding on the institutions of the other three global initiatives and aiming at building a more just and equitable global governance system.

Providing systematic solutions, China's four major global initiatives run in parallel with a focus on different domains and form a complete action framework that promotes prosperity through development, ensures stability through security, enhances mutual trust through exchanges between civilizations, and seeks justice through governance. Together, they lead to an open, inclusive, clean, and beautiful world that enjoys lasting peace, universal security, and common prosperity, constituting an important pillar for building a community with a shared future for humanity.

4. Opening Up New Horizons for Political Civilization of Humanity

Throughout history, humanity has experienced innumerable wars – either hot or cold – but has emerged from each to achieve remarkable progress. Today, the world faces a broader and deeper transformation, and where it will head to depends on the choices of individual countries. By proposing the Global Governance Initiative and a series of new ideas and approaches, China has deepened its understanding of the laws governing the development of human society and promoted the advancement of human political civilization.

Breaking free from the outdated "core-periphery" framework of the old international order. A world in which just a few countries dominate and most are subordinate, and where the rich become richer while the poor become poorer, is not a good world. Whether through the so-called "hegemonic stability theory", "Western-centrism", "neoliberalism", or the "democratic peace theory", the result has been a world marred by disunity and injustice, with turmoil and chaos in many regions. China stands firmly on the right side of history, is committed to promoting greater democracy in international relations so that developing countries can truly become equal members of the international community and masters of their own future.

Transcending the flawed logic that "might makes right". The outdated mindset of hegemonism and power politics cannot adapt to the new reality of a multipolar world. Frequent bullying and big-stick coercion and extortion have opened the Pandora's box for a return to the law of the jungle. China stands firmly on the side of fairness and justice, remaining a pillar of strength amidst the tumultuous changes and upheavals of the world. It clearly advocates the international rule of law and will never allow whoever has the bigger fist to call the shots. Through its efforts, the international community has formed a consensus that calls for fairness, not hegemony.

Abandoning the zero-sum mentality of "winner takes all". Blocking others' path will not get you further; when blowing out others' lamps, the fire will burn your beard. Protectionism is a fire that burns those who set it, and the pursuit of absolute security only adds fuel to the flames. China stands firmly on the side of win-win cooperation, taking concrete actions to pursue harmonious coexistence and seeking its own success while helping others succeed. It advocates that the fruits of governance should be shared by all and that no country should be left behind, so that every member of the international community becomes a winner.

V. Moving Forward Hand in Hand at a Critical Juncture in History

The world has entered a new period of turbulence and transformation, and humanity once again faces a choice: a future marked by peace, dialogue, and win-win cooperation, or one marred by war, confrontation, and zero-sum competition. It is encouraging to see that with broad support from the international community, the Global Governance Initiative is drawing wide participation. It must also be understood, however, that great undertakings are rarely achieved overnight. To advance the initiative, all parties must persevere in the face of challenges, rise above disputes, and work together to build a more just and equitable global governance system.

1. Acting in Global Interest and Planning for the Benefit of Future Generations

Global governance concerns the shared and long-term interests of all people, and its essence lies not in deal making but in the pursuit of justice. China calls on all countries to bear in mind the future of humanity and the wellbeing of their people, to translate the vision of the GGI into concrete actions, and to work towards lasting achievements that benefit all the people for generations to come.

In our global village, all countries are connected, and their interests are closely intertwined. A nation's interests are better realized only when they align with the interests of all. Putting one's own interests first leads only to going it alone, and actions that harm others only serve to harm oneself. In participating in global governance, all countries should adopt a broad vision of shared global responsibility that transcends narrow self-interests. Division and conflict should be overcome with an open mind, with all nations working for humanity's shared future and building a shared home to prevent the "tragedy of the commons".

Global governance is about establishing rules and managing the world on a long-term basis. It requires upholding the principle of intergenerational equity and balancing present needs with those of the future. We must neither deplete the resources left to us by our ancestors – jeopardizing the future of posterity – nor pass on to the next generation the problems that we should solve. The baton of history is in our hands, and the question of where global governance is headed demands an answer. Our generation must offer a response worthy of our times and demonstrate vision and wisdom to build a global governance system that is fairer and more equitable, stable, and effective. Only then can we pass on to future generations a more peaceful, prosperous, and beautiful world.

2. Rising to Challenges with Firm Confidence

Building a more just and equitable global governance system is a noble goal that is feasible and attainable, but it is also a gradual historical process. China believes that as long as all parties remain steadfast in their resolve and persist in their efforts, step by step, this vision is sure to become a reality.

A multipolar world is rapidly emerging, and the trend towards democracy and the rule of law in international relations is unstoppable. Human society is bound to evolve, from confrontation to cooperation, imbalance to balance, division to coexistence. As the times progress and the people awaken, power politics and "exclusive governing clubs" are losing their foundation. As long as the torch of multilateralism is held high, the cause of global governance will pierce through the darkness and reach a brighter future.

The world today is marked by both change and turbulence. Turning chaos into order is no easy task, and reaching a consensus on global governance requires overcoming conflicts and differences through arduous effort. The road is long, but we will reach our destination if we keep moving forward. The task is formidable, but we are sure to succeed as long as we persist. All countries must work hard and make unremitting efforts to push forward the great cause of reforming and improving global governance – no one should look on, hesitate, or slack off.

3. Let's Unite and Act

Global governance promotes the common wellbeing of the international community and relies on the collective efforts of all nations. China advocates that countries unite and cooperate, take concrete action, and transform the vision and blueprint of the GGI into a roadmap and timeline for joint action.

In addressing the diverse interests of different countries, the key lies in seeking common ground while shelving differences. We should create the greatest synergy for peaceful development and win-win cooperation, united under a single system, order, and set of rules. We must strengthen the UN as the core mechanism for practicing multilateralism and the primary platform for global governance. Unity is strength. Only through solidarity and cooperation can we deliver results and overcome major challenges for the benefit of all. Only then can we translate GGI principles into the broadest consensus and the most powerful action.

The successful implementation of the GGI requires major countries to shoulder their responsibilities, multilateral mechanisms to play their roles, and the international community to take concrete action. We need to prioritize urgent issues and work to de-escalate flashpoints. We should focus on improving communication and cooperation in areas where there is an urgent need for better governance. These include reform of the international financial architecture, artificial intelligence, cyberspace, climate change, trade, and outer space. We will build consensus, secure outcomes, and strive for an early success in global governance.

Conclusion

This is an era of challenges. But it is also one of hope. An era where a brighter future beckons, provided we work continuously for the good of generations to come. The Global Governance Initiative is a path to this goal, balancing lofty ideals with practical action and driving progress towards more effective global governance, step by step.

The initiative stands at the forefront of our era, offering fresh momentum for building a community with a shared future for humanity and serving as a compass to help the great ship of history chart its course through turbulent waters. It is yet another significant public good that China has contributed to the world.

Looking ahead, as the international community gains a deeper understanding of this initiative and participates in it, the progressive forces championing multilateralism will grow stronger, and the grand goal of building a more just and equitable global governance system will gradually become a reality.

China stands ready to work hand in hand with all other countries to implement the initiative under the principles of extensive consultation, joint contribution, and shared benefits. Together, we can expand the scope and influence of multilateralism, let the light of fairness and justice illuminate the world, and bring the achievements of global governance to all nations. Together, we can create a brighter future for humanity and the progress of human civilization.

CULTURE

Exhibition makes mythical connections

Exploring the origins of Maya and Andean civilizations brings about comparisons that expose similarities to ancient Chinese beliefs, **Wang Ru** reports.

In ancient Chinese myth, human beings were created by the mother goddess Nyuwa, who kneaded a mixture of soil and water until it took the form of a self-resembling doll-like creature. That myth is strikingly similar to one in remote Mesoamerica: in Maya myth, humans were made by a god who used maize dough.

Today, when visiting Mesoamerican countries, people find that maize remains the soul of local people's lives. It appears as the staple in daily meals, and is frequently added to other delicacies. Ceremonies related to maize can also be witnessed throughout the year.

This crop has been a lasting cultural symbol for millennia, as demonstrated by *Maize·Gold·Jaguar: A Grand Exhibition of Ancient Maya and Andean Civilizations*, which is currently on view at the Capital Museum in Beijing.

For over 3,000 years, from around 2000 BC to the 16th century AD, the Maya civilization flourished in present-day Mexico, Guatemala, Belize, Honduras, and El Salvador, renowned for its advanced writing system, astronomy and monumental pyramid-temples. Andean civilization, which thrived in South America's Andes Mountains from around 3000 BC to the 16th century AD, was also remarkable, known for its achievements in architecture, metallurgy and pottery production.

With about 800 artifacts from more than 20 cultural heritage institutes in Mexico and Peru, the exhibition, as the largest in the museum's history, showcases a historical lineage of more than 3,000 years through three cultural symbols — maize, gold and the jaguar — systematically demonstrating the productive foundations, spiritual symbols and power systems of Maya and Andean civilizations.

"Maize was the origin of life in ancient Mesoamerica," says Tan Xiaoling, deputy director of the Capital Museum. "Gold, in Andean civilization, was the sweat of the sun, representing the supreme authorities of divine and royal power. The jaguar, however, was the king of the forest and a symbolic totem connecting the human world with the divine realm. Together, they form a complete spiritual spectrum of ancient American people from survival to faith and then power."

Cosmic chapter

The first chapter draws visitors into the Maya world, displaying how ancient people from that remote area created outstanding achievements, including farming, hieroglyphic, and the astronomical calendar, during its classical era from 200 to 900, roughly the same time as China's Three Kingdoms (220-280) to the Tang Dynasty (618-907), says Shao Xinxin, curator of this section of the exhibition.

He highlights a sandstone head statue on display from 600-900, adorned with a cosmic tree headdress with geometrics, animal and deity patterns. It is speculated that this figure played an important role in ancient Maya sacrificial or other ceremonial activities.

Behind this artifact lies the Mayan worldview and the cosmos. Shao says they believed the world had three realms — the upper realm for the sun, the moon and the stars; the middle realm was where humans thrived; and the bottom realm was where the dead paused before rebirth. Linking the three realms is the cosmic tree, which holds the universe together.

Horizontally, with the tree at the center, Mayans divided the earthly realm into five directions, each associated with a symbolic color: the east, red; the north, white; the west, black; the south, yellow; and the center, green.

Shao says such ideas, whether the world is three realms or the five directions of different colors, can also be traced in traditional Chinese culture. The Chinese also used five colors to denote the same five directions, though the color assignments differed.

Another fascinating parallel appears in the representation of the moon. The display showcases a limestone stele from 900 to 1521 depicting the Maya moon goddess Ixchel. She holds a rabbit in her arms. In Maya belief, the rabbit symbolizes the moon and is an important partner of the goddess.

"This is highly similar to the moon goddess Chang'e and her rabbit in traditional Chinese myth," says Shao. "It is generally guessed that Maya and Chinese people both believed the shadow they witnessed on the moon was a rabbit. Connecting the rabbit to the moon is rare in world civilizations elsewhere."

While the exhibition's first section focuses on the Maya civilization, the second section shifts the viewer's attention southward into the Andes Mountains. Here, the organizing symbol is gold.

Heavy metal masks

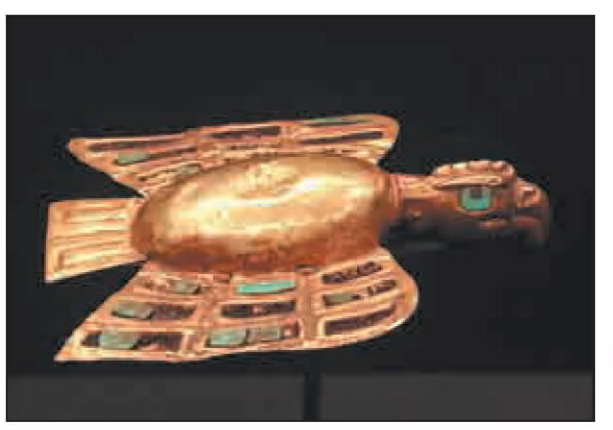
In the second section, the Andean civilization is introduced mainly through its metal vessel-making techniques. A gilt-copper mask on display, unearthed from the Royal Tombs of Sipan in Peru, is the masterpiece that showcases this achievement. Its facial features are clear and lifelike, showing the craftspeople's mastery of human expression.

Such masks were often placed on the faces of tomb owners or appeared in groups as accompanying burial artifacts. In Andean belief, masks held a protective function: they guarded the soul of the deceased and helped the dead gain their identity in the underworld, says Zhao Yazhuo, also a curator of the exhibition, adding that the mask is highly similar to the jade and metal masks found in ancient Chinese tombs.

The 72 artifacts from the Royal Tombs of Sipan are highlighted in the display, with more than 80 percent making their debut in China. More than half have never been showcased in Peru.

The royal tombs were discovered first in 1987, when some were looted. Then archaeologist Walter Alva carried out rescue excavations of the tombs with a team and discovered the giant tomb group, where the king of the Moche culture (an ancient Peruvian culture from 100 to 850) was buried. Its high level of preservation is often compared to that of the tomb of Tutankhamun in Egypt.

"People in Peru's northern coastal region overcame the desert through engineered irrigation systems, giving rise to a unique civilization. The Moche culture, in particular, stands as an outstanding example," says Alva. "I believe this exhibition enables China, a country that also has a long history, to understand Peru's past and appreciate the best examples of its artistic creativity."



The exhibition also traces a lesser-known historical connection that linked the Andes to China through the global silver trade. Since the 16th century, when the Inca Empire (about 1400-1532) of Andean civilization gradually declined, Spanish colonizers exploited local silver in enormous quantities, which then traveled all the way to Ming Dynasty (1368-1644) China through maritime trade.

The Ming economy, Zhao explains, faced a silver shortage for use as currency. "The paper currency issued in the early Ming Dynasty had lost significant value, and there was also a shortage of bronze coins. Thus, the public had an earnest demand for a stable, reliable currency. The import of silver from Americas filled that gap.

"In this way, the remote Chinese and Andean civilizations were truly connected at that time, all becoming part of the entire world history," she adds.

Animal instincts

While the first two sections focus on human creations, the final section turns the spotlight on animals in Americas, introducing their bond with human society.

Wei Yi, curator of the last section, says that in Mesoamerica, people believed each individual had a guardian spirit animal and was endowed with the spirit and character of their protective animal. For example, if someone's guarding spirit is a jaguar, then the person likely has strength and courage. If one is protected by a monkey, then they may be elegantly flexible with artistic talent.

An object on display directly illustrates this belief: a soldier's figurine in jaguar attire, found in western Mexico and dating from approximately 100 BC to AD 400. The soldier wears a jaguar skin as a garment, and his posture is aggressive and powerful. The meaning is clear: by dressing as the jaguar, the soldier would gain the animal's strength and fighting skills, ensuring victory in battle.

"Ancient people in Mesoamerica understood the relationship between people and animals in this way, deeply integrating animals in their lives and social culture," says Wei.

"Following this belief, visitors can find out their own guardian animal when touring the display," he adds.

WORLD CUP 2026

Messi hails 'beautiful moment' after tying Cup goals record

Argentine's hat-trick puts him level with German Klose

Messi celebrates after scoring his second goal during a World Cup Group J match between Argentina and Algeria on Tuesday. AP

Lionel Messi saluted a "beautiful moment" after becoming the World Cup's joint all-time leading goalscorer in his record-breaking appearance at his sixth World Cup on Tuesday.

The 38-year-old Argentina captain penned another memorable chapter in his storied career with a brilliant hat-trick in the South Americans' 3-0 win over Algeria at Kansas City's Arrowhead Stadium.

Messi's hat-trick — his first ever in a World Cup — put him alongside Germany's Miroslav Klose as the top scorer in the tournament's history with 16 goals.

"To enjoy this with my family, with my teammates, the ones who are always there, is a really beautiful moment," Inter Miami star Messi said afterwards. "I'm happy."

Messi's razor-sharp eye for goal augurs well for Argentina's hopes of becoming the first team since Brazil in 1962 to win back-to-back World Cup titles.

"The squad, it's a very united, very strong group," Messi said.

"I feel good; we were lucky enough to win a tough match. It's important to start off with a win in the first game.

"I'm grateful to the fans, because, once again, they've shown that Argentina is crazy about this — we packed the stadium again."

On a night for the ages in Kansas City, the records kept tumbling for Argentina's miracle man, considered by many to be the greatest footballer of all time.

When the match kicked off at the home of the NFL's Kansas City Chiefs, Messi became the first player to feature in six World Cup tournaments, in his 200th international match.

And the star veteran, who made his first appearance at a World Cup as a teenager in 2006, lit up the occasion with three goals in a clinical display by Argentina.

Messi produced a majestic finish from distance in the 17th minute, sparking a frenzy among his adoring fans, who had turned the match into a virtual home game.

He netted again in the second half from close range, gobbling up a rebound to take him just one goal behind the all-time record held by Klose.

Messi completed his first World Cup hat-trick with an unstoppable finish in the 76th minute.

The diminutive genius was substituted shortly afterward, forcing Argentine fans to wait to see their hero have a shot at the outright record.

Argentina coach Lionel Scaloni, meanwhile, said he no longer has "the words to describe Messi".

"For 20 years, he's had us used to seeing things like this, and he inspires everyone who watches him play," Scaloni said of his star player.

Scaloni is now targeting Argentina's second Group J game against Austria on Monday, as the South Americans look to lock up their place in the knockout rounds.

"We're going to take it one game at a time. The team is happy; we gave playing time to a lot of players," Scaloni said.

"Hopefully, we can win the next one so everyone can be in the third group stage match."

Fluid in attack

The Group J match in the open-air stadium started at a frantic pace and both sides had early goals ruled out for offside, including one from Messi.

But Argentina took the lead when Rodrigo De Paul played a beautifully measured through ball, which Messi picked up before driving at goal and unleashing a fierce shot from outside the penalty area that curled away from goalkeeper Luca Zidane.

The South American team was largely in control, fluid in attack with its revered No 10 pulling the strings.

But, as the clock ticked toward halftime Algeria enjoyed a better spell, with Argentina goalkeeper Emiliano Martinez forced to parry a shot from Fares Chaibi.

Messi curled another effort over the bar in the early minutes of the second half and Zidane kept out a shot from Lautaro Martinez.

But the crowd did not have to wait long to celebrate another goal from the veteran Inter Miami forward.

Zidane failed to deal with a sizzling Alexis Mac Allister strike and Messi was there to sweep home in the 60th minute.

Time stood still six minutes later as Messi was through again, but this time Zidane pushed the ball over the bar.

It was enough to make Kansas City Chiefs quarterback Patrick Mahomes leap from his seat in anticipation.

Messi, though, was not to be denied, completing his hat-trick after being set up by substitute Nico Gonzalez.

'A madman'

Messi's hat-trick upstaged two of soccer's other stars — Kylian Mbappe of France and Erling Haaland of Norway — who had big games of their own on Tuesday. Mbappe scored twice in France's 3-1 win over Senegal, moving him into joint fourth on the World Cup goals list with 14, while Haaland scored twice for Norway in its 4-1 victory over Iraq.

"Messi is a madman," Haaland said in a post on Snapchat.

Messi, who turns 39 next week, had been dealing with a minor hamstring injury with Inter Miami that had slowed him in the lead-up to the World Cup, but the eight-time Ballon d'Or recipient had no problems in a tuneup against Iceland last week, scoring on a penalty kick while playing 20 minutes in a sharp performance.

"When I'm in good shape," Messi said, "I give it my all."

Earlier, the roads around the stadium were clogged as tens of thousands of Argentine fans streamed toward the ground dressed in blue and white, many with Messi's name on the back of their shirts.

Argentina's all-time top scorer is just the third man to reach 200 caps after Cristiano Ronaldo and Kuwait's Bader Al-Mutawa.

Ronaldo will equal Messi's record of six World Cup appearances if he plays for Portugal against DR Congo on Wednesday.

Mbappe calls the tune in France win

Kylian Mbappe scores his second goal, and France's third, during a World Cup Group I match against Senegal in East Rutherford, New Jersey, on Tuesday. AP

Kylian Mbappe celebrates scoring the opening goal in France's World Cup match against Senegal on Tuesday. AP

EAST RUTHERFORD, New Jersey — After a flat first half, Kylian Mbappe got France back in tune.

Mbappe scored twice to move past Pele with 14 World Cup goals, celebrating by mimicking a flutist as he had promised, and helping Les Bleus beat Senegal 3-1 on Tuesday in their World Cup opener.

"He could have scored four or five goals, OK, theoretically, but we're happy with two," France coach Didier Deschamps said.

He began the day one goal behind Olivier Giroud, his teammate in France's victorious 2018 World Cup campaign, but is now one ahead of the former Arsenal striker on 58 goals in 99 appearances.

"I am really pleased and very happy to make a little more history for my country," Mbappe said.

"It is something I always wanted to do, although we know why we are here, so I think I will have the time to think about all these things once I stop playing."

He added: "We want to keep writing the biggest page in the history of the French national team. We know the road is very long, but we are ready."

Mbappe had 14 touches in the scoreless first half, the fewest of any player, then put France ahead in the 66th minute. He burst past Senegal captain Kalidou Koulibaly, turned onto a diagonal pass from Michael Olise and slid the ball past goalkeeper Edouard Mendy from just outside the six-yard box.

In a segment with Mbappe taped on May 20 and aired Friday by US broadcaster Fox, award-winning actor and television host James Corden suggested the 27-year-old star striker celebrate his next World Cup goal by imitating a flute player. Mbappe practiced the instrument for a year or two as a child at the behest of his parents.

"I'll do it for you in the first game," Mbappe said.

Mbappe ran toward a corner, brought both hands to his lips and mimicked the instrument.

"If he wants to miss the first half again and score two goals in the second half in another match, that's OK with me," Deschamps said.

Bradley Barcola doubled the lead in the 82nd, two minutes after entering. Ibrahim Mbaye cut the deficit in the fifth minute of stoppage time. Senegalese celebrations, though, were short-lived. Mbappe scored just 68 seconds later on a spectacular right-footed shot from 30 yards. The ball dipped perfectly between Mendy's outstretched left arm and the crossbar.

"A crazy goal," French defender William Saliba said.

Mbappe, who led the 2022 tournament with eight goals, moved one ahead of Lionel Messi and fellow Frenchman Just Fontaine on the World Cup scoring list before Messi scored his 14th, 15th and 16th for Argentina later Tuesday. Mbappe is tied with Germany's Gerd Muller, trailing Messi, Germany's Miroslav Klose (16) and Brazil's Ronaldo (15).

"I'm sure that he will do it," Saliba said of Mbappe setting the record.

"He can, from time to time, miss a game or two, but on one action he really is able to tip the scales and bring his team to victory," Deschamps said.

"People say he doesn't defend enough. Well, he's not here to defend."

Mbappe brushed off critics.

"It's not about revenge," he said. "If I started playing for all the people who criticize me just to silence them, I'd have to play until I was 80."

Trying to reach its third straight World Cup final, France plays Iraq on Monday in Philadelphia, then closes Group I on June 26 against Norway at Foxborough, Massachusetts. Senegal meets Norway on Monday at MetLife Stadium and finishes the first round against Iraq in Toronto.

With fans in Senegal denied visas by the United States government, supporters of the Lions of Teranga appeared limited to a few sections in MetLife's southwest corner on a sunny 25 C afternoon.

While most of the stadium was filled with a just-under-sellout crowd of 80,545, there were empty seats on a mezzanine club level, which has air-conditioned suites behind the outdoor chairs.

Two hours before kickoff, tickets dropped to as low as $69 on FIFA's resale site.

FIFA sold tickets at $220-$620 in December.

Importance of founding ideals stressed

Xi urges all Party members to strive for new accomplishments in new era

Xi Jinping, general secretary of the Communist Party of China Central Committee, has called on Party members in the new era to carry forward revolutionary traditions and strive for new accomplishments on the new journey.

Xi, who is also Chinese president and chairman of the Central Military Commission, made the remarks in a letter of reply to Zhang Liansheng, a 102-year-old Party member with Xinhua News Agency, ahead of the 105th founding anniversary of the CPC, which falls on July 1.

Xi extended sincere greetings to Zhang and veteran Party members and comrades across the country.

In the reply, Xi noted that Zhang, as a radio operator with the "Fourth Brigade" of a central armed force during the War of Liberation (1946-49), followed the Party Central Committee through the flames of war in northern Shaanxi in Northwest China about eight decades ago, devoted his entire life to communications technology with hard work and still cares about the cause of the Party and the country.

"I would like to express my respect to you," Xi wrote, speaking highly of Zhang's sincere and profound love for and faith in the Party.

Xi asked all Party members never to forget their original aspiration and founding mission, emphasizing the importance of faithfully performing their duties, working diligently and taking responsibility.

The "Fourth Brigade" was a Xinhua working team that followed the Party Central Committee and Mao Zedong in northern Shaanxi during that war, and was responsible for news reporting and liaison work.

It initially had over 40 members, including editors, translators, radio operators and logistics personnel, and later grew to more than 100.

In a recent interview, Zhang expressed gratitude to the Party, Xi and fellow Party members for their care and support. "I am an ordinary Party member," he said. "I have always received care and education from the Party, and I feel deeply honored and moved. I will remain loyal to the Party and to the Party's cause."

Zhang said he could no longer recall many details clearly due to his age, but the sound of Morse code has stayed with him.

"The Party organization sent me to Yan'an to learn how to receive and send telegrams," he said. "I am old now, and I have forgotten many things. But dit-dit-dah, dah-dit-dit, dah-dah-dit-dit — I will remember that for the rest of my life."

From March 1947 to March 1948, over the course of one year and five days, members of the "Fourth Brigade" followed the Party Central Committee for more than 1,000 kilometers across northern Shaanxi under harsh and tense conditions, enduring shortages of food and medical care and, at times, the danger of nearby enemy forces.

"Life was hard and we had no vehicles. We relied on our own legs," Zhang recalled. "But we were young and cheerful then, and we were not afraid. We did whatever we were asked to do."

The deeds and names of the "Fourth Brigade" remained little known for decades and after years of research, the names of 70 members have now been confirmed.

Envoy delves into China's history in Shaanxi

By **MO JINGXI** in Yan'an, Shaanxi province
mojingxi@chinadaily.com.cn

A small handmade iron hoe for tending a garden, a bag of apricots and a pair of cloth shoes were among the souvenirs Peter Wilson bought during a visit to Yan'an in Northwest China's Shaanxi province on Wednesday — the sort of keepsakes any tourist might bring home.

But for Wilson, the United Kingdom's ambassador to China, the visit yielded something less tangible: a closer look at the historical experiences that continue to shape China today.

Standing outside the cave dwelling that once served as Chairman Mao Zedong's residence at the revolutionary site of Yangjialing, Wilson said that he had not expected the Communist Party of China to have grown in strength under such austere conditions.

"Foreigners also need to understand your history. I think it is very important to come here and visit the sites where history unfolded," he said.

Wilson traveled to Yan'an on Wednesday with Lu Kang, vice-minister of the International Department of the CPC Central Committee, after visiting Xi'an, the provincial capital, on Tuesday.

The trip came during Wilson's third posting in China. He took up his current role as ambassador in August last year, more than three decades after first working in the commercial section of the British Embassy in Beijing in the 1990s. He also served as political counselor at the embassy from 2007 to 2010.

"For me, wherever I work, it is very important to understand that country's history in depth, as well as how that country views its own history," Wilson said in fluent Chinese.

"That is why I greatly value this opportunity to visit Shaanxi, Yan'an and Liangjiahe."

Lu said the visit would help the British side gain a more comprehensive, objective and accurate understanding of China and the CPC, while contributing toward greater mutual understanding and the development of China-UK relations.

For Wilson, that process was as much about asking questions and talking with people as it was about visiting historical sites.

At the Yan'an Revolutionary Memorial Hall, he paused before statues depicting international friends and asked about the different roles they played.

US, Iran sign MoU remotely to end conflict

By **JAN YUMUL** in Hong Kong, **CUI HAIPEI** in Dubai, UAE, and **JI HAISHENG** in Beijing

United States President Donald Trump and Iranian President Masoud Pezeshkian have signed a Memorandum of Understanding, which came into immediate effect, to end the war in the Middle East. A formal ceremony is scheduled to take place in Switzerland on Friday.

Iranian and US media showed the two leaders signing and holding up a document finalizing the deal without an in-person ceremony. The provisions of the deal include stopping the war on all fronts, including in Lebanon.

Pakistani Prime Minister Shehbaz Sharif wrote in a post on X on Thursday that he was "honoured" to announce that the "historic Islamabad Memorandum of Understanding has been electronically signed today between the United States of America and the Islamic Republic of Iran", which was "also endorsed by me as the mediator".

"Islamabad MoU shall enter into force with immediate effect and as a first step," Sharif said. He added that Iran "will instantly reopen the Strait of Hormuz and the US will immediately lift the naval blockade".

A spokesperson later said that Sharif was postponing his visit to Switzerland for the US-Iran ceremony because the agreement on ending the Middle East war had been signed remotely.

Ships at Bandar Abbas port in Iran wait to set sail through the Strait of Hormuz on Thursday. AMIRHOSSEIN KHORGOOEI / ISNA / AFP

Speaker of the Iranian Parliament Mohammad Bagher Ghalibaf said in a televised interview that Iran has conducted negotiations with the US from a position of strength. "When I speak of negotiations and diplomacy, I mean a diplomacy of strength," Ghalibaf said.

Before signing the document at the Palace of Versailles in Paris, Trump said that it was "not easy".

Trump, who was in France to attend the G7 Summit, told reporters that he did not want to see "economic catastrophe" as he defended his deal with Iran. But he also said that if Iran did not honor the deal, "we would probably go back to bombing them".

According to the 14-point MoU text published by the US and Iranian media, the provisions of the deal include the US undertaking steps to terminate all types of sanctions against Iran within an agreed upon schedule.

The US will also work with regional partners to develop a definitive, mutually agreed plan with at least $300 billion for the reconstruction and economic development of Iran. The mechanism for the implementation of this plan will be finalized as part of a final deal within 60 days.

Pending the final deal, Iran and the US agree to maintain the status quo. Tehran will maintain the current status quo of its nuclear program, and the US will not impose any new sanctions and will not deploy additional forces in the region.

The provisions also stipulate that the final deal will be endorsed by a binding United Nations Security Council resolution.

China welcomed the conclusion of the first phase of the MoU between the US and Iran, saying that it provides favorable conditions for easing regional tensions, while urging Israel and other relevant parties to do more to facilitate the implementation of the deal and the upcoming second phase of negotiations.

Foreign Ministry spokesman Lin Jian made the remarks at a regular press briefing. "China stands ready to continue leveraging its influence and work with the international community to make unremitting efforts for the early realization of lasting peace and security in the Middle East," Lin said.

Rafael Grossi, director general of the International Atomic Energy Agency, also welcomed the deal. "Now it is for us to sit down with our American and Iranian colleagues and start formulating concrete steps that will have to be taken," Grossi was quoted as saying by Reuters.

The Swiss Ministry of Foreign Affairs said that talks between the US and Iran would continue at Switzerland's Buergenstock resort.

BEYOND THE HEARTH, ZONGZI STILL THE HEART OF HOLIDAY

Dragon Boat Festival dumpling delicacy goes from family kitchens to online platforms, supermarkets

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

When Lin Kai bites into a *zongzi* during Dragon Boat Festival, he doesn't think about prestige brands, gift boxes or online discounts.

He reminisces about a kitchen in Anhui province, where his grandparents sat by the stove, folded bamboo leaves, and filled them with soaked glutinous rice and pork.

When he was a child, they taught him how to tie each dumpling tight enough to hold together in the pot. The 40-year-old Beijing office worker remembers his first clumsy attempts at making the dumplings. He folded the leaves incorrectly with the rice spilling out, and the *zongzi* often came loose while boiling in the pot. But his grandparents never scolded him.

"Even if a *zongzi* I made looked ugly, it tasted especially good," he said. "The whole family was there, talking and laughing. That was the taste of the festival."

A traditional Chinese delicacy, the *zongzi* is a pyramid-shaped dumpling made of glutinous rice wrapped in bamboo or reed leaves. It is especially loved as a treat during the Dragon Boat Festival.

Lin still prepares *zongzi* every Dragon Boat Festival, but rarely by hand these days. Like many urbanites, he usually buys ready-made ones from the supermarket or e-commerce platforms. Some are classic pork *zongzi*, some come in gift boxes, and others are lighter, healthier versions with less sugar and oil and fewer additives.

Visit: Need to understand history highlighted

From page 1

At the site of the Seventh National Congress of the CPC, which was held in 1945, he discussed with an interpreter how best to render the Chinese phrase *tongxin tongde* — *"to be of one heart and one mind" — in English*.

At the China Executive Leadership Academy, Yan'an, Wilson told reporters that officials from China and the UK should have more opportunities to exchange views and learn from one another.

He expressed hope that officials from both countries would take part in more exchange visits, thus broadening their perspectives and improving their work by learning from each other.

At Liangjiahe, where President Xi Jinping spent seven years — from 1969 to 1975 — living and working alongside local villagers, Wilson asked what time people began and ended their working day decades ago and how village life had changed since then.

According to the organizers, Wilson is the first ambassador from a major Western country to visit Liangjiahe since the 20th National Congress of the CPC in 2022.

At the invitation of local villagers, he sat down with them to eat locally grown apples and drink jujube-bud tea.

Asked what message he would share with other foreign diplomats in China after the trip, Wilson said that he would encourage them to travel more widely and see different parts of the country for themselves.

"We should do that in every country, rather than stay in one place," he said.

Wilson recalled that when he presented his credentials to Xi in January, the Chinese president encouraged the newly appointed ambassadors to travel widely across the country, gain a full and in-depth understanding of the real and multifaceted China, and actively contribute to deepening friendship and cooperation between China and their respective countries.

Wilson said that learning about a country also meant listening to the personal experiences of both its leaders and the ordinary people.

"I really enjoyed talking to people who live in Liangjiahe, hearing how their lives have changed, and also hearing about what life was like before."

As they walked through the village, Shi Chunyang, who worked with Xi when he lived in Liangjiahe, and then went on to become village Party secretary later, told Wilson that even the asphalt road beneath their feet had not existed in those days.

Before a biogas digester was successfully fired up in 1974, lighting the first biogas lamp on the northern Shaanxi plateau, villagers relied on kerosene lamps for illumination, Shi said.

Those stories resonated with Wilson, who has observed China's broader transformation since first visiting Beijing in 1981.

He last visited Xi'an in 2007. Much of the city he saw on this trip, he said, either had not existed or had yet to be developed at the time.

He was similarly struck by the ecological transformation around Yan'an.

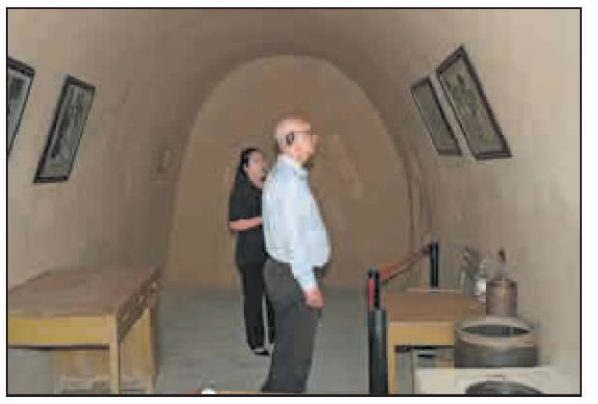
"In the old photographs, almost everything was yellow. Now, everything is green," he said, referring to changes in the once largely barren landscape.

Wilson said understanding how China views the history of the CPC can also offer insights into how the country sees its future and shapes its policies.

Britain and China have different political systems, Wilson noted, but that made understanding rather than assumption all the more important.

For diplomats, Wilson said, gaining an in-depth understanding of their host country was essential both to performing their duties and helping their governments understand that country's perspectives.

More exchanges would not necessarily mean that people of Britain and China would see every issue in the same way, he said, but it would allow both sides to see more for themselves, communicate more openly and better understand their common ground as well as their differences.



As permanent members of the United Nations Security Council, Britain and China both bear international responsibilities, Wilson said, noting that understanding how China views its own history also helps explain how it sees the wider world, he added.

To address global challenges ranging from climate change and international conflicts to the governance of artificial intelligence, countries must understand one another's perspectives and work together to shape their shared future, he said.

In colloquial Chinese, he summed up the task more simply:

"Get things done together."

E-commerce giants race to power "618"

Shopping platforms reshape mid-year sales festival with AI-driven tools

By CHENG YU
chengyu@chinadaily.com.cn

Artificial intelligence took center stage this year during China's annual 618 shopping festival on Thursday, as the country's e-commerce giants raced to turn chatbots, digital hosts and AI shopping agents into the next gateway to billions of dollars in consumer spending.

From JD's digital livestream hosts to Alibaba's AI shopping assistant and ByteDance's AI-powered recommendation tools, this year's shopping extravaganza marked the deepest integration of AI into China's online retail ecosystem.

Within the first four hours of the promotion, the number of merchants using JD's JoyAI model and its AI livestreaming host, JoyStreamer, increased sixfold from a year earlier. Those AI-powered streams generated more than 70 million yuan ($10.3 million) in sales.

Cao Peng, chairman of JD's technology committee, said: "This year's 618 shopping festival was JD's first to fully integrate AI across all scenarios and throughout the entire value chain."

"For businesses, AI is reshaping the economics of commerce by lowering costs and boosting efficiency. For consumers, it is fundamentally transforming the shopping experience," he said.

Notably, Alibaba's Qwen AI application has been connected to the full product catalog of Taobao, allowing users to compare products, calculate discounts and complete purchases through conversational prompts.

Xu Xiao, a 27-year-old bank employee from Beijing, said she uses AI-powered virtual try-on tools when considering clothes in unfamiliar colors or styles. "It helps me avoid making bad purchases and improves the chances that I'll be satisfied with what I buy."

The e-commerce unit of ByteDance's Douyin has also made large-scale computing resources available to merchants and rolled out AI customer service tools aimed at reducing labor costs. Short-video platform Kuaishou has deployed AI diagnostic systems that help sellers identify operational problems and optimize marketing strategies in real time.

The shift is also changing how platforms understand consumer intent.

Liu Bangzheng, a senior executive at Alibaba's advertising unit Alimama, said: "AI can move beyond understanding keywords and begin understanding intent."

Liu cited an example in which AI discovered unexpected consumer groups for certain products. Smart lock manufacturers, which usually focus on homeowners, discovered potential demand among young women with long fingernails who preferred keyless entry, Liu said.

According to Huatai Securities, AI has evolved from a supporting tool into critical operating infrastructure, helping merchants manage marketing, customer service, livestreaming and advertising in China.

A white paper jointly released by Alibaba's Taobao and Tmall Group and industry partners said that roughly 70 percent of merchants operating on Alibaba platforms are already using AI tools to support business decisions.

Hong Yong, an associate research fellow at the Chinese Academy of International Trade and Economic Cooperation under the Ministry of Commerce, said that over the longer term, AI could shift the competitive dynamics of e-commerce from a battle for traffic to one centered on consumer decision-making.

"Future growth will hinge on whether AI recommendations genuinely serve users rather than becoming another advertising channel, whether small merchants can afford advanced AI tools, and whether platforms can address concerns around pricing transparency, privacy protection and accountability," he said.

However, he also cautioned that many AI services still struggle with accuracy and reliability. Some consumers reported receiving irrelevant recommendations, while merchants say AI-generated business reports often require extensive human verification.

Pottery-making attracts tourists to Huamao

By LIU BOQIAN and **YANG JUN** in Zunyi, Guizhou

PATH TO GLORY

The pottery jars that once filled village kitchens across Guizhou province are no longer everyday necessities. In Huamao village, however, they have become symbols of a rural revival.

The village, located along the route of the Red Army's Long March (1934-36) in Southwest China, was once known as Huangmaotian, a name that reflected its poverty and remoteness. Today, tourists wander its stone pathways, visit craft workshops and sample local specialties, fueling a transformation driven by tourism and traditional industries.

Mu Xiancai, a fourth-generation inheritor of Huamao's pottery making tradition, is one of those at the center of that transformation.

Inside his workshop, a pottery wheel spins steadily as clay takes shape beneath his hands. Within minutes, a bottle-shaped vessel emerges.

"In the 1960s, even the bottles used for Moutai liquor were made in Huamao," Mu said.

Rich in kaolin clay, Huamao has produced pottery for generations. The village's yellow-brown earthenware was once a common sight in homes across the region, used for everything from cooking to food storage. However, as industrial products replaced traditional ceramics, their demand sharply declined.

Before 2014, Mu spent his days making storage jars and earned less than 30,000 yuan ($4,430) a year.

That changed as Huamao began developing rural tourism. Roads were upgraded, environmental improvements were carried out and visitors began arriving.

For Huamao, the revival of traditional crafts has become closely linked with the growth of tourism.

According to village Party secretary Zhu Jiao, Huamao's collective operating income exceeded 1 million yuan in 2025, while annual per capita income surpassed 27,000 yuan.

"I used to make pickle jars. Now I make vases and decorative ornaments," Mu said. "I never imagined this old craft could find new uses."

Today, he also offers pottery-making experiences for tourists. During peak season, his workshop can attract more than 400 visitors a day, generating an annual income of 200,000 to 300,000 yuan.

Among his most distinctive products is a large clay vessel known as a *guzi*, traditionally used to prepare one of the village's signature dishes.

The dish, called *guzi* chicken, is cooked without adding a single drop of water.

As steam rises from boiling water beneath the vessel, it condenses inside the upper chamber and drips onto the chicken, gradually creating a rich broth. The cycle continues until the meat is fully cooked, a process that often takes more than four hours.

The unusual cooking method has turned the dish into a major attraction, drawing visitors from nearby Chongqing and Sichuan province eager to taste the local specialty.

At the Red Home farmhouse restaurant, owner Wang Hao offers the dish to visitors and has witnessed the village's changes firsthand.

His father opened the village's first farmhouse restaurant years ago on a site once traversed by the Red Army during the Long March, naming it "Red Home."

When Wang returned to Huamao in 2017, he expanded the business by building a camping site, updating the menu and working with travel agencies to develop tourism routes.

"Our record was serving more than 100 tables during a single lunch service," Wang said. "Annual revenue has grown from just over 100,000 yuan in 2014 to nearly 1 million yuan in 2025."

The business now provides jobs for more than 10 local residents.

Traditional crafts are finding new markets elsewhere in the village as well.

In a small handmade paper workshop, founder Zhang Shengdi carefully presses freshly picked flowers and leaves onto wet mulberry paper, creating decorative artworks inspired by local scenery.

Plum blossoms, orchids, chrysanthemums and scenes from Huamao's countryside all appear in her designs.

"The challenge isn't making the paper," Zhang said. "The challenge is making people want to buy it, use it and appreciate it today."

Her workshop has expanded beyond traditional paper products to include bookmarks, notebooks and decorative lamps, each featuring classical Chinese quotations or poetry.

"This handmade notebook sells for more than 50 yuan and is especially popular," she said.

Environmental improvements have also accompanied economic growth. More than 8,800 trees have been planted, 8.8 kilometers of waterways restored and sewage treatment coverage extended to all concentrated residential areas. Household waste is now fully collected and treated.

On a summer afternoon, visitors strolling through Huamao encounter rice paddies, streams and white-walled houses scattered beneath green hills. The aroma of home-cooked meals drifts through narrow lanes as tourists move between workshops, restaurants and guesthouses. The pottery jars that once filled village kitchens now hold new value.

Deal: Some of Iran's main demands find mention

From page 1

Dina Yulianti Sulaeman, director of the Indonesia Center for Middle East Studies, told China Daily that Iran is now "better off" and the MoU was not a triumph for the US, but the recognition of the situation.

Sulaeman noted that the targets that had been discussed by Washington and Tel Aviv from the start of the war were regime change in Tehran, destruction of Iran's nuclear program, curbing its ballistic missile program and reducing its regional militant network.

"The present MoU, however, does not appear to have (met) any of these goals. Instead, Iran keeps its political system, is acknowledged as a legitimate negotiating partner, has access to frozen assets, has sanctions relief and doesn't have to stop all of its missile programs," said Sulaeman.

"Indeed, some of Iran's main demands, including an end to the war and the normalization of trade and shipping routes, are in the agreement. Thus I believe this MoU is not a triumph of American diplomacy but a recognition of the situation," she added.

Meanwhile, Reuters reported, citing a senior Israeli official close to Prime Minister Benjamin Netanyahu, that Israel is "conducting stubborn negotiations" with the US on continued deployment of troops in southern Lebanon.

CHEN JIMIN / CHINA NEWS SERVICE A worker collects air-dried *zongzi* at a factory in Congjiang, Guizhou province, on June 11. WU DEJUN / FOR CHINA DAILY

Delicacy: Appeal remains in emotional value

From page 1

This shift from making to purchasing *zongzi* has become one of the most notable changes of today's Dragon Boat Festival. Once a seasonal food made at home with little packaging or a price premium, the *zongzi* has moved from the family kitchen to supermarket shelves, livestreaming rooms and social media feeds. Nonetheless, it remains a symbol of the festival.

According to the 2025 China Zongzi Industry Consumption and Brand White Paper released by China Data Technology, China's *zongzi* market was expected to reach 11 billion yuan ($1.52 billion) in 2025, with year-on-year growth of about 7 percent.

The country's *zongzi* output rose from 450,000 metric tons in 2021 to 560,000 in 2024.

The white paper said the growth has been driven by the revival of traditional culture, the expansion of holiday gifting and the integration of *zongzi* with tourism and cultural experiences. It also reflected a broader shift in Chinese food consumption from simply "eating enough" to "eating better", as consumers placed more emphasis on quality, nutrition, convenience and emotional value.

For older generations, however, *zongzi* is still closely tied to home cooking and family memories.

Chen Guiying, 58, who grew up in Suzhou, Jiangsu province, said her family would begin preparing for the festival about a week in advance. Fresh bamboo or reed leaves were washed and soaked. Glutinous rice was left overnight until the grains became full and soft. The fillings were simple — red dates, red bean paste, pork, chestnuts, or salted egg yolk.

"There were no fancy gift boxes or unusual flavors," Chen said. "Every family made *zongzi* at home. Neighbors also gave them to one another. The fragrance of leaves and rice would fill the courtyard," Chen said.

In those days, *zongzi* was not a branded product. It was plain, filling food and a family activity. Children learned the skill from elders. Relatives shared the finished dumplings, and neighbors exchanged sweet and savory versions as a gesture of goodwill. The value of a *zongzi* came from the time and care put into it, not from the packaging.

But urbanization, busy work schedules and smaller households have gradually changed the pastime. Many young people no longer have the time or skills to wash leaves, soak rice, prepare fillings and boil *zongzi*.

For Lin, buying the specialty is a pragmatic choice. He and his wife, both fond of southern-style savory *zongzi*, usually prepare several varieties before the holiday.

"It is convenient and saves a lot of effort," he said. "The products on the market are also quite good now. But honestly, no matter how good they taste, they still seem a little different from the ones my grandparents made. What is missing is the warmth of making them together."

A wide range of the dumplings are commercially available.

Affordable loose *zongzi* and bagged products meet daily household needs. Midrange gift boxes have become a common choice for visiting relatives and friends. High-end *zongzi*, made with ingredients such as abalone, sea urchin, scallops, black truffle or high-quality pork, are intended as business gifts and for consumers seeking a more upmarket culinary experience.

Fancier dumplings have also entered the market, with gift boxes becoming an important part of corporate gift-giving and family consumption, the report said. It also noted that more than 5,600 businesses in China had names or product focuses related to *zongzi* as of May. About 40 percent are located in the southeastern coastal region.

Students and community workers present a crate of *zongzi* they have just wrapped in Qinhuangdao, Hebei province, on June 10. CAO JIANXIONG / FOR CHINA DAILY

Commercial offerings

In supermarkets, the competition is visible.

Retail giant Metro launched a Dragon Boat Festival campaign last month offering about 140 *zongzi* products, with nearly 50 of them new this year. They range from loose and bagged *zongzi* to paper-bag souvenirs and creative gift boxes. Prices reach up to several hundred yuan. The retailer is also offering *zongzi*-making activities inspired by intangible cultural heritage in stores nationwide.

Some products combine traditional symbols with novelty. One popular gift box features *zongzi* shaped like a dragon boat with seven whole salted egg yolks inside.

In Jiaxing, Zhejiang province, an area known for its *zongzi* culture, traditional producers are also catering to new demands. At one established *zongzi* company in Youchegang town, Xiuzhou district, production began rising in March to prepare for the holiday rush.

"Every year before the festival is our busiest time," said Qiu Shaowei, the company's marketing director. The company can produce 1.5 million *zongzi* a day and ships orders nationwide.

This year, it invested nearly 10 million yuan to upgrade its production lines, using digital and intelligent equipment to improve efficiency and food safety. It also launched kale and oat *zongzi*, low-sugar, soft-centered corn *zongzi* and a "one soup, one *zongzi*" series that pairs broths with the dumplings.

Health has become a major direction for product innovation. The white paper said low-sugar, low-fat and additive-free *zongzi* were expected to become mainstream products. Healthy *zongzi* products could account for more than 40 percent of the market by 2030, it added.

From top: A host wraps a *zongzi* during a livestream session on June 10. PROVIDED TO CHINA DAILY
Crates of *zongzi* are specially decorated and promoted at a shop in Shaoxing, Zhejiang province, on June 13. PROVIDED TO CHINA DAILY

Breaking with tradition

Young consumers are another force reshaping sales of the dumpling. Consumers born in the 1990s and 2000s have become important buyers of domestic brands and are helping drive innovation in traditional cultural products, said the white paper. Those age 26 to 35 are especially willing to try new *zongzi* flavors, with sales of such flavors during special shopping periods rising sharply.

That willingness to experiment has given rise to many internet-famous *zongzi*.

Some dumplings stretch the boundaries of fillings with flavors including spicy snacks, river snail rice noodle, and stinky mandarin fish.

Other *zongzi* borrow from tea drinks and desserts, featuring jasmine Longjing tea, rose black tea, durian ice, mango pomelo sago and chocolate hazelnut flavors. Low-GI (glycemic index) grains such as quinoa, purple rice and black rice have also been introduced to appeal to health-conscious consumers.

These new products may not replace classic red date, pork or salted egg yolk ones, but they help bring the traditional festival food into new conversations, especially on social media.

Online channels have also changed how *zongzi* is sold.

Consumers now buy gift boxes of the dumplings through supermarkets, e-commerce platforms, online grocery services, and livestreaming platforms.

On Douyin and Kuaishou, livestreaming hosts cut open *zongzi* on camera, show the fillings, explain the texture and offer discounts. On Xiaohongshu and Weibo, food bloggers compare flavors and packaging, while users share holiday shopping lists and regional recommendations.

Sweet or savory?

These online conversations have also kept alive one of the Dragon Boat Festival's most playful annual debates: should *zongzi* be sweet or savory?

For many northerners, a proper *zongzi* is often simple and sweet — filled with red dates or bean paste, dipped in sugar or honey, and eaten for the fragrance of glutinous rice. For many southerners, especially in places such as Jiangsu, Zhejiang and Guangdong provinces, *zongzi* should be rich enough to serve as a meal, with pork, salted egg yolk, mushrooms, ham or seafood inside.

Every year, as the festival approaches, the online argument returns with good-natured banter.

Northerners ask why anyone would put meat in a "rice dumpling". Southerners reply that red dates alone hardly count as a filling. Then someone from another region joins in arguing the superiority of spicy meat, gray-water (alkaline-water-soaked) or flower *zongzi*, reminding everyone that the "taste map" is never as simple as "North versus South".

Logistics companies and online retailers have made it easier for northern consumers to order southern pork *zongzi*, and for southern shoppers to buy red date or bean paste versions. Many families now enjoy both.

Some producers have built *zongzi* museums, cultural displays and offer factory tours to provide visitors with intangible cultural heritage experiences.

Traditional patterns, illustrations and cultural themes used in gift box designs are highlighted in short videos where the wrapping process and culinary skills are depicted.

Yet for many people, the appeal of *zongzi* remains in the emotions and memories the treat evokes.

For Lin, *zongzi* carries recollections of childhood, his hometown and family reunions. His parents worked away from home when he was young, and he lived with his grandparents. Some years, his parents would return for the Dragon Boat Festival for two or three days before returning to work.

"At that time, I felt happy that everyone was together," Lin said. "Only after growing up did I understand how precious those short reunions were."

Now, when he chooses *zongzi* for his family or sends gift boxes to friends and colleagues, he looks at brand reputation, the ingredients and health labels. He appreciates the convenience and variety of today's market.

But one bite still takes him back to the old kitchen, the bamboo leaves and the family gathered around the stove.

For Chen, too, the meaning of *zongzi* has not disappeared simply because many people now buy it instead of making it.

"The form has changed," she said. "But as long as people still eat *zongzi* at festival time and think of home, the tradition is still there."

China calls for fairer ocean governance during UN meeting

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China on Wednesday called for stronger multilateral cooperation and a fairer global ocean governance system at a United Nations meeting on the law of the sea.

"The ocean is the common home of humanity and an important field of global governance," Sun Lei, China's deputy permanent representative to the UN, said in a general statement at the 36th Meeting of States Parties to the UN Convention on the Law of the Sea.

The meeting, held from Monday through Friday, reviews issues related to the implementation of the 1982 UN Convention on the Law of the Sea, the main international legal framework governing maritime rights, resource use and ocean affairs.

This year's meeting comes after the Agreement on Marine Biological Diversity of Areas beyond National Jurisdiction entered into force on Jan 17. The agreement focuses on the conservation and sustainable use of marine biodiversity in areas beyond national jurisdiction.

Sun said that against the backdrop of a changing international situation, China "stands ready to work with all parties to uphold the authority of the UN" and "revitalize and strengthen the UN".

This year marks the 30th anniversary of China becoming a state party to the Convention, he said, adding that China has "faithfully fulfilled" its obligations and made important contributions to improving global ocean governance.

"China has consistently supported the peaceful settlement of maritime disputes through means voluntarily chosen by the parties concerned, especially negotiation and consultation," Sun said. He added that China has sent 48 escort task forces to the Gulf of Aden and waters off Somalia to help maintain maritime peace and order.

Turning to the South China Sea, Sun responded to remarks by some countries that raised the so-called South China Sea arbitration during the meeting. He said the gathering was not the appropriate venue to discuss the South China Sea issue.

"The so-called South China Sea arbitration violated the principle of state consent," he said, adding that China "neither accepts nor recognizes" the ruling.

"The South China Sea situation is generally stable," Sun said, urging relevant countries to "stop hyping up the issue in multilateral settings and return to resolving disputes through bilateral consultation".

Sun said China attaches great importance to "the conservation and rational use of marine resources". He noted that China has designated 150,000 square kilometers of marine ecological conservation red lines and established 353 marine ecological protected areas.

China has joined the Agreement on Port State Measures, adopted "zero tolerance" toward illegal fishing, carried out voluntary fishing moratoriums on the high seas, and constructively participated in the establishment and operation of high seas protected areas, he said.

Sun also highlighted China's support for developing countries in maritime capacity building. China has provided marine disaster prevention and mitigation warning services to more than 130 countries and trained more than 100,000 marine professionals for over 50 developing countries, he said.

Sun said all parties should "practice multilateralism and defend international fairness and justice", uphold the international order based on international law, and oppose unilateralism and hegemonic acts.

He also warned against actions that "disregard international rules" and "unauthorized development of international seabed resources", saying such moves would undermine the common heritage of humanity.

Sun said "conservation" and "sustainable use" are two inseparable aspects of global ocean governance. The international community should protect the marine environment while promoting the orderly development of marine resources to support food security, energy security and critical mineral supply chains, he said.

On the Agreement on Marine Biological Diversity of Areas beyond National Jurisdiction, Sun said its implementation "concerns the overall interests of the international community" and requires a secretariat matching the agreement's importance and future development.

China has nominated Xiamen in Fujian province to host the secretariat, he said, calling the city "an ideal location" given its maritime foundation, developed blue economy and extensive maritime cooperation.

China's action on global governance draws praise

Experts welcome Beijing's latest white paper as commitment to a fairer future

By **YANG HAN** in Hong Kong,
YANG WANLI in Bangkok
and **XIN XIN** in Sydney

China's latest white paper on global governance shows its commitment to multilateralism and to building a more just, equitable and inclusive global governance system, experts say.

China has again sent the world a clear signal that it will uphold multilateralism, unite forces, and pursue a fair future, said Bhokin Bhalakula, former president of the National Assembly of Thailand.

He noted that the world is experiencing unprecedented polarization, and it is ordinary civilians who suffer most in wars and conflicts. Bhokin argued that subordinating the interests of other nations to those of a single state will not command respect.

"This is also what the majority of international community is pursuing to build a more just and equitable global governance system," he said. "People don't want conflicts, and it's the duty of mankind to hold generosity and take care of others, live together, promote peace and development together."

On Wednesday, China released a white paper titled "More Just and Equitable Global Governance: China's Principles, Proposals, and Actions".

It offers a comprehensive explanation of China's ideas and efforts to promote global governance and foster a broader consensus within the international community, ensuring more effective responses to global challenges and building a more just and equitable global governance system.

The Global Governance Initiative was first proposed by President Xi Jinping in 2025. Since then, it has been endorsed by nearly 160 countries and international organizations, receiving extensive and positive responses from the international community.

"The paper raises important themes, including the role of the United Nations, multilateralism, sovereign equality, development, and greater participation by the Global South in international decision-making," said Frank Alafaci, president of the Australian Business Summit Council Inc.

Respectful dialogue

At a time of significant geopolitical, economic, and social uncertainty, it is important that nations continue to engage in respectful dialogue and seek practical pathways for cooperation, said Alafaci, noting that business and people-to-people links remain valuable bridges between nations.

"We believe that global challenges, including economic fragmentation, climate change, food security, technology governance, and development inequality, require cooperative and inclusive responses," said Alafaci.

The GGI represents a timely and comprehensive contribution to strengthening international multilateralism, said Kin Phea, director-general of the International Relations Institute of Cambodia at the Royal Academy of Cambodia.

"It emphasizes safeguarding the United Nations-centered international system, promoting extensive consultation, joint contribution, and shared benefits, and ensuring that all countries, regardless of size or power, have an equal voice in global affairs," said Phea.

Instead of replacing existing global governance mechanisms, the GGI supports reform and boosts Global South participation while contributing ideas across various sectors of development and peacebuilding, Phea said.

He noted that the white paper's call to uphold multilateralism and strengthen the United Nations-centered international system is particularly relevant to global challenges.

"The white paper stresses that global affairs should be discussed by all countries, governance systems should be built by all, and the benefits of development should be shared by all," said Phea.

Bhokin, the former president of the National Assembly of Thailand, said the GGI aligns with the growing trend toward greater democracy in international relations and offers a clear and feasible roadmap for improving global governance.

"This is consistent with the concept previously proposed by the Chinese leader of building a community with 'a shared future for humanity'. Both affirm the rights and interests of all countries in international affairs and resonate with the global yearning for peaceful development," he said.

FRANCE

No final communique issued at G7 summit

The G7 summit, chaired by France, concluded on Wednesday in Evian-les-Bains without issuing a final communique. This marks the second consecutive year, following the G7 summit under Canadian chairmanship in 2025, that the group of seven Western powers has failed to adopt a final communique. Organizers had already abandoned the idea of a final communique during the preparatory phase, opting instead to publish thematic documents to avoid highlighting the differences between the US and its allies, Japanese news agency Kyodo reported, citing diplomatic sources.

UNITED STATES

Gemini co-lead to join IPO-bound OpenAI

Noam Shazeer, a vice-president of engineering at Google and co-lead of its Gemini artificial intelligence models, said on Wednesday that he will leave the company to join IPO-bound ChatGPT maker OpenAI. Shazeer's move comes as leading AI firms compete for talent while racing to develop advanced models. The surprise departure comes less than two years after Google reportedly paid $2.7 billion to bring Shazeer back to the company along with a team of his researchers. The timing of Shazeer's departure from Google was not immediately clear. "I'm incredibly proud of the amazing team at Google and everything we've built together," Shazeer said on X, adding that he was "excited" to join OpenAI.

What we call a summer glow may be lasting damage

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

A tan may look healthy, but to dermatologists it tells a different story — one of DNA damage that can lead to skin cancer decades later.

"Skin cancer is one of the most preventable cancers and yet one of the fastest rising," said Ivan Litvinov, an associate professor of dermatology at McGill University in Montreal.

According to Melanoma Canada, an estimated 11,300 Canadians were newly diagnosed with melanoma in 2024, a 17 percent increase from the previous year.

UV exposure remains the main driver of melanoma and several other forms of skin cancer. Yet many people continue to seek tans, often viewing them as a sign of health or attractiveness.

"There is no safe tan, unfortunately, just as there is no safe cigarette," Litvinov told China Daily.

According to the World Health Organization's International Agency for Research on Cancer, ultraviolet radiation and artificial tanning devices are classified as Group 1 carcinogens, the same category as tobacco and asbestos.

"Every tan is the skin's distress signal, visible evidence of DNA damage," Litvinov said.

The continued rise in melanoma reflects a combination of historical, cultural and environmental factors, he said.

"Melanoma has a 'long memory'," Litvinov said. "The melanomas being diagnosed today are, in many cases, the biological receipts for sunburns that happened in the 1980s and 1990s," he said.

While awareness of UV risks is far greater than it was a generation ago, knowledge alone often fails to change behavior.

"Knowledge alone has never cured an epidemic," Litvinov said. "If awareness were enough, nobody would smoke, nobody would overeat, and nobody would tan."

He said many people understand the long-term risks but continue tanning because the perceived benefits are immediate.

"Skin cancer is viewed as a distant threat; the perceived rewards of tanning are immediate and visible," he said.

Litvinov said the appeal of tanning remains deeply embedded in Western culture, where bronzed skin is often associated with leisure, fitness and social status.

"A tan is not a sign of health — it is a scar you can see," Litvinov said.

He said research shows that many adolescents and young adults feel more attractive, healthier and more confident when tanned.

"For a 16-year-old, a tan is not about cancer risk in 30 years — it is about how they feel at the beach this weekend," he said.

Social media may be reinforcing those attitudes, particularly among young people. Litvinov said image-focused platforms continue to promote appearance ideals in which tanned skin is portrayed positively.

His research has found troubling trends among Canadian youth. More than 40 percent reported at least one sunburn within a 12-month period, and protective behaviors tend to decline after age 14.

"What worries me most is the developmental trajectory," he said.

The challenge, he added, is that adolescence is often when tanning habits become established.

"Sometimes I say to myself that we are trying to fight evolution with pamphlets," he said.

Litvinov has also studied what he calls the "sunscreen paradox" — the tendency for people to stay outdoors longer because they feel protected after applying sunscreen.

"Sunscreen saves lives — but only if used correctly, and only if it is not treated as a license to bake," he said.

According to Litvinov, sunscreen can reduce the immediate warning signs of overexposure, particularly sunburn, leading some people to spend more time in the sun than they otherwise would.

Many people also misunderstand what sunscreen can and cannot do.

"It is important to address myths because — myths kill," Litvinov said.

Among the most common misconceptions, he said, are the beliefs that sunscreen alone provides complete protection, that cloudy days are safe from UV radiation, or that a "base tan" offers meaningful protection.

"There is no such thing as a safe tan," he said.

Instead of relying solely on sunscreen, Litvinov advocates a layered approach that includes seeking shade, wearing protective clothing and hats, using UV-blocking sunglasses and avoiding intentional tanning.

"The most attractive skin is healthy skin, not damaged skin," he said.

He believes lasting progress will require more than individual behavior change.

"The most powerful shift is cultural," Litvinov said.

Pointing to Australia's long-running SunSmart campaign, he noted that large-scale public health efforts have helped reduce melanoma rates among younger generations.

"If Australia can turn the tide, so can Canada," he said.

PEOPLE

Song brocade with various traditional patterns designed by Qian Xiaoping, a national-level inheritor of Song brocade weaving techniques. PHOTOS PROVIDED TO CHINA DAILY

The ageless architect of ancient silk

Master craftswoman uses precise technological innovation to resurrect and preserve China's endangered, centuries-old Song brocade tradition, **Deng Zhangyu** reports in Suzhou, Jiangsu.

At 87, Qian Xiaoping shows no signs of slowing down. One moment, the veteran craftswoman is leaning over a worktable, discussing fabric textures and structural details with young apprentices as they develop trendy, gold-ingot-shaped handbags from traditional Song brocade at her studio in the Suzhou Silk Museum in Suzhou, Jiangsu province. The next, she is focused on her phone, holding remote meetings with factories to refine weaving patterns and optimize production processes.

Despite her age and a recent leg injury, Qian remains energetic, sharp-minded, and devoted to reviving and reinventing Song brocade, one of China's most treasured forms of intangible cultural heritage.

A national-level inheritor of Song brocade weaving techniques, Qian has spent more than seven decades rescuing, innovating and promoting the elegant silk craft. More than a craftswoman, she sees herself as part scientist, part inventor and part artist — someone determined to reshape the fate of a fading tradition through technological research and creative vision.

Dating back to the Song Dynasty (960-1279), Song brocade embodies the subtle, refined aesthetics prized by ancient Chinese literati. Unlike the lavish Yun brocade reserved for royalty, Song brocade is known for its soft texture, understated sheen and delicate patterns. Its quiet elegance made it a favorite among scholars and officials, who used it to mount treasured calligraphy and paintings and, at times, to make garments for the elite.

Qian's love for Song brocade began in childhood. Her mother and grandmother both cherished silk garments, and she too became captivated by the fabric's softness and luster. In 1954, at just 15, she was admitted to the silk-weaving program at Xushuguan Sericulture School. After graduation, she joined the Suzhou Silk Research Institute.

A turning point came in 1981. As foreign museums showcased Chinese silk and Suzhou's traditional looms gave way to imported machinery, Qian sensed that centuries-old weaving traditions were in danger of disappearing. Driven by that concern, she conceived an ambitious idea: establishing China's first silk museum in Suzhou.

"China, the land of silk, should have a silk museum! If we don't protect it ourselves, who will remember thousands of years of silk civilization?" she wonders.

She spent years raising funds and rallying support. After a decade of relentless effort, the Suzhou Silk Museum — a condensed chronicle of China's silk civilization — finally opened its doors. During preparations for the museum, Qian encountered numerous fragments of Song brocade, sparking a deeper fascination with the craft and setting her on a new path of research.

Reviving a dying craft

The year 1998 marked another turning point. As mechanization swept through the industry, the last professional Song brocade factory shut down. Living directly across from the factory, Qian was confronted with a painful question: Would this centuries-old craft disappear forever?

Driven by a profound sense of responsibility, she resolved to bring it back. The task was daunting. Weaving a complete piece of Song brocade is a highly complex process requiring thousands of warp and weft threads to interlock with absolute precision.

"Every procedure, including pattern design, artistic drawing, and weaving, is like coding that leaves no room for error," she explains.

The biggest obstacle was the absence of intact samples. By chance, she found a small fragment with a rarely seen pattern in a local antique shop. Recognizing the importance of her mission, the shop owner lent her the fragile relic.

Finding the right antique loom exclusively used for Song brocade proved equally difficult. Although the silk museum housed many traditional looms, none could produce authentic Song brocade. While they appeared similar externally, their internal structures were entirely different. Qian had to redesign the loom from scratch while searching for workshops willing to assist.

Inspired by her determination, a local silk enterprise offered free workshop space, equipment and skilled workers. After years of experimentation and countless technical breakthroughs, Qian finally succeeded in reviving Song brocade.

She later returned to the antique shop with two pieces: the original worn fragment and a brand-new, perfectly restored piece. The shop owner was astonished — the last surviving seed of Song brocade had bloomed once again.

After restoring the core weaving technique, Qian turned her attention to reproducing ancient Song brocade treasures held in major museums across China. Her most challenging project began in 2009: re-creating *Western Paradise*, a priceless Song brocade scroll preserved by the Palace Museum in Beijing.

The scroll, *Western Paradise*, depicts 278 lifelike figures, each with distinct expressions, and stands more than three meters tall. The artwork boasts gorgeous colors and intricate patterns.

Qian never had access to the original. Working solely from photographs, she immersed herself in research, producing stacks of hand-drawn sketches and technical drafts. After six years of painstaking work, she completed the restoration, filling another important gap in the preservation of China's ancient silk heritage.

Qian likens restoring and designing Song brocade to constructing a building, describing herself as "an architect in the field of silk".

"I first determine the original style," she says. "Then I develop the pattern, create sketches, calculate the silk structures, materials and techniques required, and finally hand over a thick stack of design blueprints to skilled craftsmen."

Beyond the loom

Qian's expertise in textile structures also led her far beyond traditional craftsmanship.

At age 20, she was invited to collaborate with a hospital in Shanghai on the development of artificial blood vessels. To achieve the required fiber structures, she spent evenings and weekends researching and refining designs. Eventually, using silk as the primary material, she "wove" China's very own artificial blood vessel.

The project pushed her to study textile engineering, materials science and structural mechanics. She compared the vessel wall to a thatched roof — capable of keeping rain out while still allowing air to pass through. In 1977, the second generation of textile artificial blood vessels successfully passed clinical trials, helping save countless lives.

The experience transformed her understanding of silk. It made her realize that silk is not only for beautiful clothing, it is also a soft technology capable of carrying life itself.

While remaining committed to preserving traditional techniques, Qian believes Song brocade must evolve to remain relevant. "Inheritance never means rigid conservatism," she says. "If ancient craftsmanship never changes, young people will eventually turn away from it."

Her studio reflects that philosophy. She has recreated iconic Chinese landscapes such as West Lake's Curved Yard and Lotus Pool onto delicate Song brocade fabrics, bridging traditional craft and modern aesthetics. She also developed the double-sided color-changing gauze brocade weaving technique, integrating the finest craftsmanship of classic Song brocade and other silk-weaving skills.

Qian takes great pride in one innovation in particular: collaborating with the European Art Union to reproduce Italian artist Amedeo Modigliani's oil paintings using Song brocade as the medium. With her unique design skills, the women in the master painter's canvases acquire a three-dimensional texture of silk light, shadow, and color.

"Song brocade has a rich palette and distinct layers, giving these oil paintings a relief-like feel," Qian says. So far, she has reproduced six portraits.

Such works require extraordinary dedication. Traditional Song brocade production typically demands two weavers operating a loom together, producing only a few centimeters each day. A single Song brocade interpretation of an oil painting can take an entire year to complete.

Yet, Qian considers the effort worthwhile. She hopes audiences beyond China can appreciate Song brocade through a visual language they already understand.

"Silk is China's unique treasure that belongs to the world," Qian says.

At 87, she no longer pursues fame or profit. Her remaining ambition is to preserve authentic Song brocade craftsmanship, expand cross-cultural collaborations, and allow people around the world to experience the beauty of Chinese intangible cultural heritage directly through exquisite silk creations.

Alongside her preservation work, Qian has devoted herself to training the next generation. She has published three professional books on Song brocade and regularly mentors young artisans through apprenticeships and national training programs, sharing both her weaving expertise and design philosophy.

Today, many of Suzhou's leading Song brocade designers once studied under her. Among them is Shi Yi, a 30-year-old designer who is reimagining Song brocade for younger consumers through contemporary products and fashion-forward designs. She now operates stores in both Shanghai and Suzhou, where her creations have gained a strong following among young customers.

"In my eyes, Qian is someone who gives her all to everything she does. If she sets her mind to something, she pursues it to the highest standard possible. For us, the new generation of Song brocade artisans, she is a spiritual beacon," Shi says.

AI used to enhance bespoke TCM treatments

Digital technologies being integrated with ancient medicinal techniques

By YAN DONGJIE in Tianjin
yandongjie@chinadaily.com.cn

When the Tianjin 2026 Global Business Leaders Roundtable drew to a close in March, Hussain Dawood did not head for the exit. Instead, the prominent Pakistani industrialist and chairman of Engro Corporation waited behind at the venue, hoping to secure a private consultation with attending experts of traditional Chinese medicine.

His wife suffers from chronic high blood pressure and has undergone various treatments in Pakistan with limited effect. For Dawood, whose family has long trusted Eastern therapeutic philosophies, the trip to Tianjin presented a rare window to access personalized treatment from Da Ren Tang, a century-old Chinese pharmaceutical brand.

"TCM analyzes the root cause of a patient's condition to fundamentally resolve issues, unlike Western medicine or other therapies that merely focus on alleviating symptoms," Dawood said.

"The Western medical tradition is to prescribe the same medication for the same ailment, thus providing uniform treatment," he added.

Wang Lei, chairwoman of Tianjin Pharmaceutical Da Ren Tang Group, said the wisdom of TCM lies in its personalized approach. Even for the most common cold, TCM recognizes that some people catch it due to "heat" while others due to "cold". When TCM spreads to different countries, it must also adapt to the local climate and physical characteristics for effective diagnosis and treatment, Wang said.

That tension between age-old customization and the demands of global scale is driving a massive technological overhaul within China's TCM sector. At the Tianjin summit, which drew nearly 300 political, business and academic delegates, the modernization of TCM emerged as a highly anticipated focal point.

"The core of TCM modernization lies in the deep integration of technological and industrial innovation. We are actively participating in new projects to achieve this goal," Wang said.

The flagship initiative driving this shift is the Tianjin Modern TCM New Quality Productive Forces Innovation Project. Proposed and implemented by a team under Zhang Boli, an academician of the Chinese Academy of Engineering and a renowned TCM specialist, the project involves a total investment of 180 million yuan ($24.8 million) aimed at digitizing production.

Wang Lei (front left) talks with Hussain Dawood (right) during the Tianjin 2026 Global Business Leaders Roundtable in March. PROVIDED TO CHINA DAILY

"This project utilizes AI to achieve full traceability and monitoring throughout the production process," said Zhang. For instance, during the decoction of TCM herbs, which requires a gentle boiling state, traditional pharmacists can only estimate the temperature by observing bubble size, with a margin of error of around 10 C. Now, with robotic control, the optimal temperature of 102 C can be precisely maintained. This can contribute to a 15 percent reduction in energy consumption and an improvement in the quality of the medicine.

Residents experience a TCM robot diagnostic service in Chongqing in September last year. CHEN CHENG / XINHUA

At the scientific and technological achievements exhibition area of the Global Business Leaders Roundtable in Tianjin, an AI-powered TCM diagnosis instrument attracted foreign guests, who came to experience it. They were amazed by the fact that a diagnostic report containing physical constitution identification and health advice could be generated within just a few seconds.

The instrument captures visual information such as tongue patterns and facial features, uses AI algorithms for constitution identification and health status analysis, and quickly generates TCM constitution identification reports.

"The TCM industry transitioned from manual operations to mechanization and electrification in the 1970s and 1980s. Now it has entered the digital era," Zhang said.

According to Zhang, this digital evolution aligns directly with national policy. During the 2026 National People's Congress, the government's work report explicitly called for "promoting the inheritance and innovation of TCM and facilitating the integration of traditional Chinese and Western medicine".

For example, while Western medicine is highly effective in lowering blood sugar for diabetes patients, TCM has greater advantages in preventing complications. After five or six years, diabetes patients often develop microvascular complications. By incorporating TCM herbs, treatment can prevent or delay the onset of these complications while lowering blood sugar, a model that has received positive feedback from many patients, Zhang said.

This clinical efficacy is translating into overseas expansion. Da Ren Tang, which secured a regulatory pathway into international markets via its listing on the Singapore stock exchange back in June 1997, now exports over 140 products to more than 20 countries and regions.

By 2025, 31 Da Ren Tang products had obtained Singapore standard certification, with core products like Suxiao Jiuxin Pills and Qinggong Shoutao Pills entering mainstream retail stores in the city-state. Da Ren Tang's market value in Singapore has grown by 326 percent, with overall overseas sales increasing by 41 percent, gaining recognition from local consumers, according to the company.

Traditional medicine represents a new frontier for Sino-foreign cooperation and a new growth point for health and cultural exchanges, Zhang said.

Da Ren Tang chairwoman Wang said that over the past 12 years, more than 500 types of its products have entered 47 countries and regions as health supplements, food additives, or dietary supplements.

International sports officials impressed by 'China speed' e-commerce deliveries

By YAN DONGJIE

On the eve of the 10th World Junior Wushu Championships in Tianjin, Anthony Sims, a *sanda* (Chinese martial arts sparring) judge from the United States, faced an immediate professional crisis: the upper sole of his athletic shoe had completely unglued, threatening his ability to officiate the next day's bouts.

Hoping to find an exact replacement for his 361 Degrees sneakers, Sims turned to tournament volunteer Li Yazhao, a student at Tianjin Foreign Studies University.

What happened next introduced the US official to the blistering pace of China's on-demand digital economy. Li bypassed traditional retail entirely, placing an order on an instant-delivery e-commerce platform. By the time Sims walked off the mat from his afternoon session, a brand-new pair of shoes was waiting for him at the venue.

"They fit perfectly. Absolutely perfect," Sims said. Having no local currency on hand, the judge moved to hand the volunteer two $20 bills — one to cover the retail cost, and the other as a gesture of appreciation.

The seamless experience quickly rippled through the international judging team. Days later, Roberto Nell Jone Astudillo, a referee from the Philippines, spotted Sims' new footwear in a shuttle bus and tracked down volunteers to purchase the exact same Chinese-branded shoe to take home.

The tournament's logistics hub quickly evolved into an impromptu gateway to China's domestic tech and sports markets. Mayanglambam Sachidananda, an official traveling with the Indian delegation, utilized e-commerce platform Meituan's flash-delivery service via a volunteer to procure a carbon-fiber retractable fishing rod. Impressed by the delivery speed, he immediately placed a second order for a DJI action camera to document his travels.

"I had heard friends in India recommend DJI many times because it's user-friendly and portable," Sachidananda said, noting that the camera arrived at his hotel just hours after he clicked "purchase".

Li Yazhao (second from left) guides Anthony Sims in placing an order on a Chinese e-commerce platform. PROVIDED TO CHINA DAILY

For Sachidananda, the experience disrupted long-held assumptions. "My previous impression of Chinese-made products was 'affordable but ordinary'," he admitted. "But looking at everything from my new sportswear to this action camera, the reality today is high quality, great design and impressive technological features."

That shift in consumer perception matches a global push by domestic Chinese brands. According to financial reports from 2025, the retail turnover of shoemaker 361 Degrees' international business surged by roughly 125.4 percent year-on-year as the brand transitions from simple product exporting to localized overseas retail operations.

Similarly, the rapid adoption of DJI equipment by visiting sports officials reflects a broader market shake-up. Recent data from market research firm IDC shows that DJI captured nearly 50 percent of the global action camera market share in 2025, maintaining a year-on-year growth rate of over 150 percent and surpassing former industry pioneer GoPro in its largest segment.

For the student volunteers on the ground, watching international sports officials fall in love with domestic tech and apparel brands has been a lesson in modern cultural exchange.

"Many of these guests first fell in love with China through old-school kung fu movies," said Li, the university volunteer. "But when they arrive here in 2026, they get to understand a multi-dimensional, modern country through something as practical as a pair of running shoes or a highly advanced camera."

As the tournament drew to a close, the professional relationship between the US official and the local student crystallized into a lasting cross-border connection. Before boarding his flight out of Tianjin, Sims sent Li a final message over WeChat.

"Too often, we do not fully appreciate the value of making new friends from other parts of the world," Sims wrote. "Those experiences and new connections enrich our lives in immeasurable ways. My new friendship with you is an example of such experiences, and I look forward to our friendship growing over the years to come."

Xu Xinran contributed to this story.

Some researchers prepare for another release of the Yangtze sturgeon on April 12. PHOTOS BY HE HAIYANG / FOR CHINA DAILY

Sturgeon returning to the Yangtze River

In a meandering stretch of the upper Yangtze River in Jiang'an county of Yibin, Sichuan province, a remarkable chapter is unfolding for the Yangtze sturgeon.

The Yangtze sturgeon, one of the oldest vertebrates on Earth, lived alongside the dinosaurs.

Endemic to China's Yangtze River, it is classified as a nationally protected first-class wild animal, once mainly found in the river's upper reaches and tributaries.

But because overfishing and habitat degradation took a heavy toll, the International Union for Conservation of Nature (IUCN) declared the Yangtze sturgeon extinct in the wild in July 2022.

China has been working out ways to save the Yangtze sturgeon — through fishing bans, legal protection, captive breeding, releasing fish into the wild, and most recently, encouraging natural reproduction in riverine habitats.

In late 2022, some research institutions launched a series of experiments aimed at inducing wild reproduction of the Yangtze sturgeon.

On April 14 this year, a scientific team announced a breakthrough: for the first time, Yangtze sturgeon had been observed spawning naturally and successfully hatching in an original spawning ground without any human intervention.

This marks the first time natural reproduction of the Yangtze sturgeon has been documented in an entirely unassisted, wild setting.

It represents a critical step toward rebuilding a wild population of a species once declared extinct in nature, and adds an important page to the story of ecological restoration and biodiversity recovery in the upper Yangtze.

Still, rebuilding a self-sustaining wild population remains a long and arduous journey.

Zhuang Ping, former director of the East China Sea Fisheries Research Institute at the Chinese Academy of Fishery Sciences, noted that the observation of natural breeding of the Yangtze sturgeon is an encouraging sign, a signal that ecological restoration in the Yangtze is taking effect.

But Zhuang added that larger-scale conservation of the Yangtze River must continue and deepen.

He pointed out that the upper Yangtze River alone is home to more than 100 rare fish species found nowhere else on Earth, and that the recovery of the entire Yangtze ecosystem is essential for rebuilding a wild Yangtze sturgeon population.

Looking ahead, research teams will continue to monitor year-round changes in the spawning ground's habitat and study the sturgeon's migratory movements in this section of the river, in order to systematically evaluate the success of natural reproduction in the spawning ground.

TREND

China's commuters trade traffic for two-wheelers

Subways open doors to cycling as weekend warriors escape the city, **Wang Songsong** reports.

Across China, taking off on a bicycle into the morning light is becoming a more common part of daily life. As more people trade cars or bus rides for a more physically rewarding experience, cities like Beijing and Shenzhen have adjusted their transport rules to allow bicycles on subways.

These measures have opened new doors for the fitness lifestyle, making parked bicycles a common sight on public transit as riders take advantage of the opportunity to conveniently get away from city streets. Country roads, reservoir shores, and mountain trails are now accessible for day trips.

Personal convenience

Many young professionals in Beijing treat the weekend as a time to unwind. For Duan Di, a man who works in the financial sector, that means waking up early, strapping on a helmet, and heading for the hills with his folding bike and a subway ticket.

Duan started cycling around 2015 while studying abroad. "I was new to the environment and found it hard to make friends," he said. "Joining a cycling community gave me a simple, genuine way to connect with people."

He brought that sense of connection back home in Shanghai in 2019 and moved to Beijing a year later. Duan likes to tour the western and northern suburbs. In summer, he starts before dawn to avoid the midday heat.

A weekend ride often totals 100 to 150 kilometers a day. "For road cycling, that distance is quite reasonable," he said. "The outskirts have good roads, less traffic, coffee shops, restaurants, and medical services. It feels safe."

On May 10, Beijing launched a "rail + cycling" pilot service on four subway lines to better accommodate cyclists. The trial covers 11 designated stations on Lines 6, 17, the Changping Line, and the S1 Line.

Passengers are allowed to bring two-wheeled bicycles with a wheel diameter no larger than 28 inches (about 71 cm) on board. According to the Beijing Commission of Transport, the service will be available only on weekends during normal operating hours, excluding public holidays.

The 11 stations were chosen for their proximity to popular cycling routes, relatively low rail passenger flow, and station facilities suitable for bike integration.

"The pilot is a service innovation based on existing connectivity improvements," the transport commission said. Throughout the pilot program, it is monitoring operations and collecting passenger feedback to gradually optimize services.

Duan was among the first to try the new service. He took the Changping Line from Xitucheng Station to Changping Dongguan. Staff measured his bike, guided him through security, and accompanied him to the platform.

Though Duan is happy with the service thus far, he sees room for improvement. The current flat fare of 30 yuan ($4.43) per trip, regardless of distance, is expensive, he noted. "More flexible pricing, based on distance or time of day, would encourage more people to use the service."

He also suggested dedicated parking areas for bikes inside carriages and clearer rules so that cyclists do not inconvenience regular passengers.

While Beijing launched its pilot in May, Shenzhen in Guangdong province had already been running a similar program for months.

On Nov 15, Shenzhen's metro authority introduced a cycling-friendly service on four lines. Originally only available on weekends, this service requires reservations one workday in advance for individuals and three workdays in advance for groups.

A flat fare of 35 yuan per person and per bike is charged, and only non-electric, single-seat bicycles with wheel diameters under 28 inches are permitted. Bicycles must be packed in protective covers and are only allowed in the front or rear carriages. Its service expanded on Feb 15, adding 28 new subway stations on more lines and including public holidays.

For residents like Yin Bo, a 42-year-old cyclist and social media influencer, this initiative is a significant step toward realizing Shenzhen's ambition to become a "bike-friendly metropolis". Yin views this policy as a welcome change that complements his lifestyle and passion for cycling.

"Cycling keeps me healthy, connected, and young at heart," he said. "It's excellent aerobic exercise and helps maintain a good physique."

Having ridden everything from mountain bikes to road bikes to folding bikes, Yin is a seasoned guide to the region's greenways and leisure routes.

He appreciates the small touches that lower the barrier for beginners, such as the subway's provision of free bike bags that don't require disassembling the wheels. "When you reach your destination, you return the bag to the staff. The whole process is very smooth," he added.

Looking ahead, Yin hopes the city will host more cycling events and continue expanding its network of safe, enjoyable routes.

"Greenways are nice for the first six months, but to keep people cycling long-term, we need more variety like coastal rides and hill climbs. If the riding experience improves, more people will join," he said.

Elsewhere, cities such as Suzhou in Jiangsu province and Hefei in Anhui province have introduced similar policies.

Booming business

The new policies are appearing in response to a growing lifestyle trend and the business opportunities it affords. According to an industry report released by the General Administration of Sport of China in October 2025, the number of cyclists nationwide had surpassed 130 million by the end of August, while the total output value of China's bicycle industry had exceeded 300 billion yuan.

Guan Fumin, a cyclist and a bicycle business operator in Jining, Shandong province, is part of the booming industry. Her story with bicycles began in 2022 when she wanted an outdoor activity. "I knew nothing about bikes at that time," she said. Despite planning to spend around 4,000 yuan, she ended up walking out of the shop with a bike priced at 18,000 yuan.

"In 2021 and 2022, very few women were riding," Guan said. She quickly stood out for her style. People often asked her where she bought her cycling clothes and gear. That curiosity sparked an idea.

"I started to feel that I really liked the industry," she said. She and a friend opened a small shop selling bikes in her hometown Jining in 2024.

The trial worked. Guan found that her experience as a rider gave her an advantage in understanding what customers wanted. She began posting short videos and photos of her rides on the social media platform Douyin, where her popularity grew. She began to be recognized for the gear she wore after races and group rides.

A second shop followed in 2025, focusing on high-end bicycles, cycling apparel, and accessories. Her business model combines a physical store as the anchor with online content to bring in more customers.

The strategy has worked. In the first few months of this year, her second shop averaged more than 200,000 yuan in monthly sales.

Guan emphasizes what she calls "emotional benefit". "Customers want more than just a bicycle; they want to go out and ride together, to join in activities," she said.

For Guan, a hobby can double as a lifestyle and a business. "If you do what everyone else can do, it means nothing. Do what others can't. Think what others don't. That's how customers will pay for what you offer."

Beijing cyclist rides at his own pace

By **WANG SONGSONG**

For Zhang Zhi, a 47-year-old freelancer in Beijing's Chaoyang district, cycling is not about chasing speed, beating personal records, or weaving through packs of riders in matching jerseys. It is about something quieter and harder to find in a city of more than 20 million people: balance.

"In my school days, almost every household had a bicycle," Zhang said. "There's an emotional connection."

That childhood attachment has evolved into a deliberate lifestyle. While many of his peers have traded two wheels for four, Zhang has done the opposite.

He calls his philosophy the "balanced triangle of people, bike, and life". It is a motto he lives out in carefully planned rides across Beijing's sprawling urban landscape and beyond.

Unlike the weekend warriors who measure success by average speed or elevation gain, Zhang prefers themed excursions exploring old Beijing's corner food stores and forgotten alleyway histories. On other days, he pedals toward the suburbs to absorb the shifting scenery.

Zhang Zhi brings his bike into a subway station in Beijing in May. PHOTO PROVIDED TO CHINA DAILY

"At my age, I don't chase speed or power," he said. "I pay more attention to the balance between living, riding, and my state of mind."

His approach to cycling changed around 2020, when he started recording his rides and sharing them on social media. His commute evolved into a form of storytelling.

It was a practical shift. After being hit by a car going the wrong way, Zhang now carries camera gear on every ride.

"I treat it like a dashcam. It's for safety, and also for social media content production," he said.

He films everything himself, narrates live without dubbing, and does all of his own editing. "If I rode with a team, people couldn't learn from it. I want to show what one person can do," he added.

Since May, Zhang has been able to do more. He has taken advantage of the city's new policy of allowing bikes on select subway lines to expand his reach and show new stories to his audience.

As he steps onto new paths, bicycle in tow, Zhang envisions a bright future among the unexpected.

"Fear comes from not knowing how well you can handle things," Zhang said.

Though he mostly rides alone, his family has long since stopped worrying about him. "Over time, they saw I could manage."

He hopes others will see that too. "Not everyone needs a fancy bike," he said. "Just start riding. Anytime."

BIZ LIFE

Netizens turn topiary into iconic showpiece

The 'scruffy little dog' is a green sensation and a boost for tourism, consumption

By **ZHENG YIRAN** in Shanghai
zhengyiran@chinadaily.com.cn

A resident holds a West Highland white terrier at a flower festival in Suhewan, Jing'an district, Shanghai, on May 11, echoing the popular scruffy little dog image. PROVIDED TO CHINA DAILY

On a spring day in Shanghai, on a grassy area of Suhewan center in Jing'an district, a giant green sculpture of a West Highland terrier unexpectedly went viral.

It does not have many gorgeous flowers adorning its body. Instead, it is covered in wild grass, with fluffy hair and a color that gradually blends from fresh green to natural beige, with a hint of lazy and messy relaxation.

Netizens gave it a down-to-earth and highly resonant nickname — scruffy little dog.

On major social media platforms, topics such as "Shanghai's scruffy little dog cures workers", and "scruffy little dog check-in guide" continue to be flooded with posts, striking an emotional chord and resonating with young people, thanks to its casual and sloppy appearance.

Scruffy little dog becoming the top internet celebrity of this year's Shanghai International Flower Show is not a fluke, but an inevitable coincidence, experts said.

Wang Mian, a 28-year-old local, said that he and his family visit the scruffy little dog frequently, and they all like it very much.

The builder — Jing'an landscaping and city appearance administrative bureau — has been deeply involved in three-dimensional greening and green sculpture landscaping, accumulating rich practical experience.

Back in the early stages of forming ideas, the Jing'an landscaping and city appearance administrative bureau and the Shanghai green maintenance project team visited the site multiple times for on-site surveys. The plot where the scruffy little dog is located is a pet-friendly area at Suhewan center, and people often come to walk their dogs.

So it came to mind to create a cute pet amusement park in this area with a theme of a small dog green sculpture. But, which type of pet dog? The initial list from the project team contained a Chinese rural dog, a Yorkshire terrier, and a West Highland white terrier.

After repeated on-site observations, the team concluded that the West Highland white terrier is cuter and more likely to evoke emotional resonance. Furthermore, they learned that this breed has a mild body odor and sheds less hair, and has become very popular in recent years. At the same time, they have a lively and relaxed temperament, which aligns with the positioning of the Shanghai International Flower Show as an "international" showpiece.

The follow-up building process was assigned to three design teams: styling design, structural design and horticultural design. Feng Rui, manager of the project team, said the plot covers an area of approximately 700 square meters, with an open space. The scruffy little dog is expected to have a height of 5 meters. Controlling the spatial proportion and visual hierarchy of large installations, and accurately adapting to open spatial scales, require professional art sculptors to refine.

After the art sculptor refined the shape, the structural designer appeared. The scruffy little dog has a large body shape. Its wind resistance, pressure resistance and load-bearing capacity determine its safety.

At this point, a professional structural designer controls the entire process of building the structure, accurately calculating the stress points and load-bearing limits of the sculpture, and setting the principle that the overall weight of the green plant canopy should not exceed 10 metric tons.

Next comes the highlight — horticultural design. Green sculpture commonly uses ready-made plug seedlings, but the difficulty of this design stems from how to replicate the long hair of the West Highland white terrier. The gardening team decided to adopt herbaceous plants such as fine-leaved needle grass.

"Since we had not tried green carving of fine-leaved needle grass before, we first made a 1:1 dog head for sampling and observed the effect of the dog's fur. When the experimental results meet expectations, we can boldly implement them," said Feng.

Moreover, the styling method of gardeners is also very important. There is a group of horticulturists from Zhejiang province who specialize in green carving techniques. Up to 10 garden artists completed the planting process of the scruffy little dog in three days.

Their techniques are delicate and precise, following the natural growth pattern of dog hair: the facial plants are short and stretched to both sides, while the cheek and limb plants are slender and fluffy, controlling the tilt angle and spacing of each plant.

Lin Xianping, associate professor at Hangzhou City University, said: "The popularity of the scruffy little dog is not accidental. It breaks the shackles of traditional floral aesthetics."

"In the past, flower green carvings pursued beautiful flowers with regular and symmetrical shapes. However, this West Highland terrier's green carving is made of wild grass, with fluffy and messy hair, natural gradient grass color, and a native rough grass form, breaking away from the homogenized aesthetic of artificial refinement. The visual contrast is extremely easy to attract the public's attention," he said.

Ultimately, the scruffy little dog "accurately hits the emotional pain points of contemporary young people. Currently, some young people are trapped in internal anxiety and have been in a tense state of life for a long time, which generally leads to a psychological appeal of rejecting perfection and accepting relaxation", he further posited.

"The lazy and unkempt appearance of the messy puppy has provided a carrier for young people to vent their emotions and empathize with themselves."

The allure of the scruffy little dog is self-perpetuating, and is underpinned by a sense of trust, as there is no official marketing plan for the showpiece. It relies on netizens to spontaneously check-in and spread memes, according to Lin, who noted that its appeal had subsequently led citizens to collectively call for a delay in retiring it.

"Departments responded flexibly, giving the landscape a humanistic warmth," Lin said.

That was despite the realization that cold season grass seeds find it difficult to survive in summer, and the green sculpture faced inevitable retirement. Netizens called for the scruffy little dog to be kept up longer.

Jing'an landscaping and city appearance administrative bureau, in response to public appeals, have tentatively planned to extend the project for three months, and they are currently screening for locally grown grass species that are resistant to high temperatures as replacements.

Feng said: "The grassy area in Suhewan has become a public living space, and the public are virtually raising the scruffy little dog, becoming their mommies and daddies. From the initial building, to the call for delayed retirement, and the brainstorming of naming and designing cultural and creative products for the puppy in recent days, every step of it has public participation, becoming urban intellectual property, co-created by the whole city."

Data from Suhewan showed that because of the attraction of the scruffy little dog, between April 18 and May 5, Shanghai Suhe MixC World registered as many as 1.701 million visits, up 192.53 percent on a year-on-year basis. The visitors generated consumption of nearly 61.57 million yuan ($9.1 million), 49.22 percent higher than the same period last year.

Lin said: "From an economic value perspective, the scruffy little dog brings lightweight and low-cost cultural and tourism dividends. In the short-term, the massive check-in flow will activate consumption in the Suhewan area, directly driving the growth of surrounding catering, retail, photography exploration, and other businesses, and extending the cultural and tourism consumption chain of Suhewan."

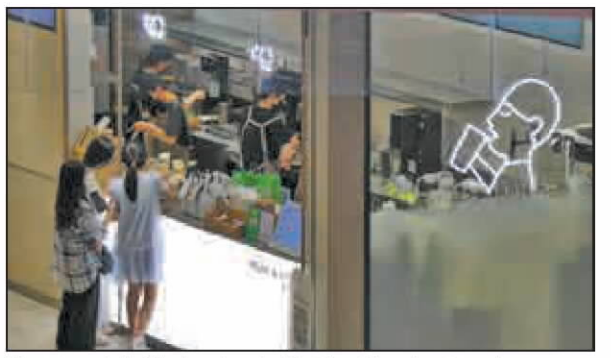
"On a long-term level, it creates the business card of Jing'an Suhewan city with zero marketing costs, enhances the commercial visibility of the area, and drives the premium investment of surrounding shops. At the same time, it provides new ideas for the landscaping industry. Original ecological and emotional landscapes will become a new trend in landscape design."

Chinese embrace new twists on gelato textures, flavors amid tea crossover

By **ZHENG YIRAN** and **HE QI** in Shanghai

With competition in China's new-style tea sector heating up, merchants are opening up a new track — gelato.

This ice cream category, which was once a preserve of Italy's high-end dessert shops, is now appearing on the menus of China's food and beverage districts, the basement level of core business districts and even tea shops.



Priced around 30 yuan ($4.4), and with descriptions of "handmade", "fresh ingredients" and "dense texture", gelato is attracting young people to lock in and make repeat purchases.

With all the frenzy, players of all sizes are vying to enter the game. New brands are being incubated, old brands are accelerating their expansion, and tea beverage brands are following suit.

In February, Heytea launched a limited-edition gelato blended with meat floss and salted egg yolk at its Fengshengli outlet in Shanghai. Meanwhile, it sells four laboratory sections, including gelato lab, to explore different combinations with tea.

On May 21, Chagee launched geelato — a combination of gelato and tea — at nine of its outlets in five cities — Shanghai, Shenzhen in Guangdong province, Beijing, Chengdu in Sichuan province and Wuhan in Hubei province. The new products combine original leaf tea with Italian ice cream craftsmanship to provide consumers with a diverse modern tea experience.

The new products contain 10 flavors including jasmine green tea, matcha peak latte and caramel infused pu-erh tea, and three types of "geelato" tea products. During the Labor Day holiday in May, geelato went on trial sales at the Wukang Road outlet in Shanghai, becoming an instant hit with customers.

Shoppers visit a Heytea store in Qingdao, Shandong province, on May 31. TANG KE / FOR CHINA DAILY

"Compared to simply adding tea elements to the product, we hope to further expand the product form of tea through the new element of Italian ice cream. In order to maintain the layering and recognition of tea aromas in low-temperature dessert form, the research and development team repeatedly adjusted the ratio of milk and tea, stepping times, temperature control and other aspects," said the spokesperson of Chagee.

"In order to find the 'right' moment, we often have to test nearly a hundred times until we find the non-greasy and non-stagnant flavor critical point. Finally, while retaining the dense taste, the product retains a unique aroma, aftertaste and flavor changes of the original leaf tea," the spokesperson said.

Jin Tao, senior director of the public relations center of Chagee, said: "Culturally speaking, Chinese people have a tradition of 'eating tea', where tea is ordered and ground. Making tea-flavored gelato is a new way of modern 'eating tea'. Ever since the Labor Day holiday, we have had good feedback."

Gao Chengyuan, president and CEO of Guangzhou TY Marketing, said: "Gelato itself has a 'high-end feel' — Italian handmade, low-fat and healthy and visually appealing, which coincides with the transition of new-style tea — from 'functional thirst quenching' to 'emotional consumption'. The pricing of 18 yuan to 26 yuan is stuck between milk tea and specialty coffee, which not only increases the average purchase price, but also does not discourage those who try new things."

Huang Tao, an independent expert in public relations, said: "Gelato's popularity in the tea beverage industry is somewhat sustainable, but it may not sustain explosive growth over the long term. In the short term, gelato's unique taste, freshness, and social attributes (such as being suitable for taking photos) can attract consumers to try it out, especially catering to the innovative needs of young people."

"Over the long term, whether the business can be sustainable depends on the following factors: whether the price is affordable, the product can realize constant innovation, the supply chain is stable, the consumption level is supportive, and the channel distribution is complete," he said.

TRAVEL

Tourists wander among blooming flowers at the Sayram Lake scenic area in Xinjiang's Bortala Mongolian autonomous prefecture in June.
ZHANG HONGKE / FOR CHINA DAILY

A lake of love

Sayram is a destination where legend, landscape and lifelong vows are reflected in the 'Mirror of the Sky', **Erik Nilsson** reports in Bortala, Xinjiang.

Sayram Lake whispers "I love you" in numbers, fizzes with countless ice bubbles and teems with impossible fish where nothing swam for as long as anyone knew — unless you count the lake monster.

Its identity churns like a potion: part love spell, part captured breath, part miracle of life.

The 1,314-square-kilometer scenic area in Xinjiang's Bortala Mongolian autonomous prefecture loosely rhymes with *yisheng, yishi* (one lifetime). Its 2,073-meter elevation sounds somewhat like *ai ni qing shen* (love you deeply). And its 520-kilometer distance from the Xinjiang Uygur autonomous region's capital, Urumqi, sounds a bit like, *wo ai ni* (I love you).

Sayram Lake transliterates numeric data into romantic verse and translates human affection into marital bliss. Over 10,000 couples have chosen to tie the knot here because of its "love codes".

Couples who say "I do" here enjoy free entry for life. Many buy registration-plus-honeymoon packages that include photo shoots, tours and wedding banquets.

Above: A newlywed couple takes photos at the frozen Sayram Lake scenic area in -23 C weather in March.
Below: The icefalls attract many visitors to Bortala in winter, which lasts until March. PHOTOS PROVIDED TO CHINA DAILY

Local lore

Legend has it that love physically formed the lake itself in a meadow freckled with flowers.

A demon kidnapped a young man's lover, and he rushed to rescue her, only to discover she'd leapt into the abyss in despair. So he did too. Suddenly, water gushed from the void, filling Sayram. In another version, it's formed from their tears.

Tradition says that Sayram will judge the vows made near its shores. After weddings, a pair of swans will cross paths with newlyweds whose love is true. If they're disingenuous, the weather will change abruptly — and usually for the worse — during the ceremony.

Other legends claim the lake is a mirror for celestial beings that — like a crystal ball — can reveal a human's destiny, including their soulmate's identity, if they stare at it on the darkest night of winter. It's also said the surface glistens with shifting tints of green and blue because it reflects the facets of a jewel that a Tianshan Mountains fairy lost in its depths while bathing. Other tales claim it's a sacred well or the lair of a dragon whose icy breath chills its waters.

Incidentally, the lake hosts ice dragon boat races in winter.

Many names

Sayram's literal meaning in Mongolian is "saddle strap" because its long, cinched form appears to bind the surrounding peaks. Its name in the Uygur and Kazak languages translates as "Lake on the Ridge".

It has a long list of nicknames, each a shorthand for a story that endows it with a description beyond mere title.

One, the "Last Tear of the Atlantic", flows from mythology, not hydrology. It imagines the ocean's last, lonely tear, blown inland until it crashed against the Tianshan Mountains, dribbled down its sides and settled into a lost memory of the sea, landlocked and forsaken.

Although this description is more myth than science, Sayram actually delineates the furthest inland location that the Atlantic's atmospheric moisture travels before the soaring range wrings it from the sky. On the massif's other side lies the Taklimakan Desert, also called the "Sea of Death", whose waves crash as dunes and whose arid mists swirl as dust rather than vapor.

The "Pearl of Tianshan" bejewels the crown of the "Heavenly Mountains". The "Most Beautiful Sky Lake" is Xinjiang's highest and largest alpine lake, with an elevation of 2,073 meters and a surface that ripples across 458 sq km. The "Plateau Lake of Many Hues" whirls from deep sapphire to brilliant cobalt, vibrant turquoise, soft emerald and pale milky gray, shimmering as a vibrant palette of watercolors.

The "Purest Sea in the Western Region" is pristine by virtue of sheer isolation.

Frozen fantasies

This convergence of numerology, folklore and geology has forged a unique destination where the quest for eternal love is mapped by numbers, which become words that transcribe the story of the land.

But in addition to functioning as formulas or pages of poetry, Sayram becomes a canvas in winter, an iridescent blue-ice "Mirror of the Sky" festooned with silvery filigree — bulbs, flowers and needles wrought by the forge of ice. Such structures, typically formed by the effervescent exhalations of decaying plants captured and suspended in time by a sudden freeze, are only reliably found in two other places on the planet: Canada's Abraham Lake and Russia's Lake Baikal.

And in its most elusive moments, Sayram stares back at us with rare, unblinking "ice eyes" — phantom irises that gaze from glassy sockets toward the sky straight above, like Earth searching for furtive gods veiled by gauzy curtains of clouds.

Another spectacular formation — actually, millions of them — appears as the weather warms. The ice mantle splinters into countless tinkling shards that slosh in the waves like avalanches of crystal puzzle pieces dancing up and down the swells.

After the mirror shatters, it melts into a massive lens revealing a hidden world below — one inhabited by the lake's living triumph over desolation.

Unlikely life-forms

The Arctic salmon — actually, silvery Siberian peled or northern whitefish that aren't technically salmon — float like pale ghosts through otherworldly waters that had contained only emptiness for millions of years. These "Queens of Cold-Water Fish", as they're locally called, glide like pallid angels, fluttering around a netherworld they were never meant to populate.

Sayram was too cold and isolated — amputated from every stream where life swam — for fish to arrive naturally, let alone survive or even thrive.

Qing Dynasty (1644-1911) official Lin Zexu, who's best known for destroying mass quantities of opium, recounted his 1840s banishment to the region in his book, *Journey Into Exile*: "(Sayram Lake) has never had boats, nor has it been a source for fish such as carp. The water is undrinkable, and drinking it makes your hands and feet weary due to the coldness of the snowmelt."

However, other Qing records and centuries-old oral history whisper tales of an aquatic cryptid that resurfaced in 2007, when competitors in the Xinjiang Sayram Cycling Race claimed to see what appeared to be a 10-meter-long creature writhing roughly 100 meters offshore. It seemed to swim for 50 meters before vanishing. Photos show what some people think are three black dorsal ridges but, as is common with such claims, the images are too blurry to confirm.

This mass sighting prompted experts to conduct sonar scans that failed to detect any large beasts but did find new microbial communities. So, the "monster" still served as an unintentional guide who led humans to find unknown life lurking in the deep.

A common theory is that the sightings were actually of taimen — colloquially called "dinosaur trout" because of their hulking statures — although none are known to live in the lake.

Again, the lake instinctively repels inhabitation by finned organisms.

The first fish — over 30 species — were introduced by experts in the 1960s. They died immediately.

Scientists kept trying. And the fish kept dying.

That was until 1998, when peled whitefish endemic to Russia's Arctic Ocean drainage basins were transplanted and survived.

Today, they're sold in high-end restaurants, and their caviar is exported to Europe. They're prized not only for their flavor but also nutrition. They contain more protein — around 19 percent — and unsaturated fatty acids than most farmed fish.

Visitors can try to hook one of these improbable catches themselves or dine on them in mobile cabins near the shoreline.

They're not just a meal, but a story of the impossible come true, a scientific triumph that swims alongside a lake monster that lives in mystery.

Sayram is a place where the landscape is not just what it is but what we wish it to be.

It's a mathematician, a mythmaker and a magician. It's a love letter written in numbers, a dragon's frozen breath and a sacred destination. It's a witness, a test, a promise, an experiment, a storybook, an equation and a mirror reflecting not just the sky above but the deep desires of our hearts — especially for true love.

Where glorious nature displays its many arts

By **ERIK NILSSON**

Circling Sayram Lake is like spinning a ring inlaid with dazzling jewels.

The gems embedded along the 90-kilometer loop of its perimeter shine with different facets — scenic, sacred and storied.

Some destinations sparkle with every luster, depending on the angle they're viewed from.

They're display cases exhibiting nature's many creative talents, not just as a jeweler but also a painter, sculptor, architect, musician and gardener. They show the penmanship of an unseen calligrapher, the chronicles of a timeless historian and the prose of a mythmaker manifested.

For instance, Gangjige Mountain materializes not merely as consecrated land but as deities assuming physical form. Mount Foshan traces the silhouette of a Buddha meditating beside a stone shaped like the hand of the Chinese Goddess of Mercy, Guanyin. Some say the peak was formed from the body of Laozi (Lao Tzu), the legendary founder of Taoism, before he mastered Buddhist enlightenment and turned to stone.

According to Western Han Dynasty (206 BC-AD 24) historian Sima Qian's *Shiji*, or Records of the Grand Historian, Laozi rode a green ox from Hangu Pass, and "no one knew where he went". The Eastern Han Dynasty (25-220) *Book of the Later Han* mentions: "Some say Laozi entered the (western) land of the barbarian tribes and became a Buddha." Local lore says he fused with the land to become Foshan, and his ox melted to form Sayram.

And so, a story born from an ancient syncretic impulse to unify Taoism and Buddhism lingers. It's written not as scripture on scrolls but rather is inscribed in the silent script of stone and water, narrating a dialogue between our world and the next.

This convergence of beauty and belief is embodied in several sites.

At the Source of the Milk Sea, pilgrims make offerings where springs nurse the waters at the foot of Keguqin Mountain. At Kele Yongzhu, sanctified by the 10th Panchen Lama in 1984, the lake's perpetual thaw creates a chromatic ritual, its springs shifting hue as they drift into the depths.

Beyond Kele Yongzhu's watercolors, nature paints prairies in assorted pigments and genres. Qicai (Seven Color) Bay is a pointillist masterpiece of Technicolor flowers, while Jinhua Zihui is an impressionist swirl of golden buttercups and purple primroses.

The vast mural that is the West Sea Grassland — often called "China's Most Beautiful Sky Grassland" — unfurls across rolling green hills speckled with yaks and framed by the stark Shalicheku Mountain, a 4,189-meter peak whose snowmelt trickles into Sayram like a faucet.

The splotched patterns and vegetive colors of the Camouflage Mountains give this several-kilometer-long subrange its vibrant name. The dappled blobs are clumps of Xinjiang junipers — aka Eurasian, Tianshan or creeping junipers — that smear the tawny slopes with dark-green daubs. These shrubs are harvested and burned to smoke meat and as incense, imparting an olfactory allure in addition to their visual appeal.

Beyond painting Sayram's grasslands, nature also acts as a sculptor and musician, endowing its depictions of color and texture with form and resonance.

In Donghai Tingtao (Listening to the Waves of the East Sea), millennia of tidal forces have carved the bluffs into colossal sound boxes, tuning the rock to a deep, booming pitch. The surf performs percussion against dozens of kilometers of overhangs that resound with the pounding of each whitecap.

Further along, the sandy strand of Waterfront Bay displays unintentional statues chiseled by erosive forces.

The roughly 10-meter-high pair of stone sails is celebrated as a flagship of Sayram's identity as the "Purest Sea in the Western Region". To the north, the "Turtle Diving Into the Water" seems to plunge into the depths, motionlessly.

But Sayram's most famous figures are carved by one of nature's most curious inventions and depict its very creators — humankind. Two 2,000-year-old "stone men", 38 centimeters and 32 cm tall, stand guard on the lake's northern rim. They gaze eastward over the 27-square-kilometer Three-Tai Grassland, which takes its name from its location in a string of Qing Dynasty (1644-1911) military outposts, called *tai*, connecting Ili Kazak autonomous prefecture with Urumqi. Its appellation comes from its martial functions, but its descriptions hail from the literati who have penned verse venerating its magnificence.

The vast mountain walls that enclose them show Sayram is an architect that builds not only with stone but with life — specifically, living trees rather than lumber.

Its vicinity hosts three tremendous corridors of conifers, the grandest of which is the roughly 50-km Keguqin Spruce Gallery. This palisade leads to the Pine Head Mist Waterfall, where the final breaths of Atlantic moisture land against the Guozi Gorge and precipitate not as rain but as a vertical river of vapor cascading soundlessly into Sayram.

Ultimately, Sayram is a grand hall where Earth exhibits its sublime artistry.

Yet, the final piece of this jeweled band, this vibrant collage of rock and living wood, is us — the human audience. It is we who appreciate its colors, forms, and sounds and interpret these oeuvres into tales that endow water, soil and stone with substance beyond their surface.

To circle Sayram is to understand that its true depth isn't measured in meters but in the layers of meaning we give it.

BAY OF HOPE

Grassroots clubs around San Francisco bet on a boost in interest on the back of the World Cup

A general view of Levi's Stadium (temporarily renamed San Francisco Bay Area Stadium for the 2026 World Cup) in Santa Clara, California, on June 7. The stadium has already hosted two World Cup matches with another four to come. **Inset:** An enthusiastic Oakland Roots fan shows his support for the USL Championship side. AFP

For years, Jorge Bejarano has been one of the San Francisco Bay Area's most passionate soccer fans, banging a drum for the second-tier Oakland Roots. With the World Cup underway in the US, he and others are counting on their cheers for local soccer to resonate across the nation.

Soccer fans are a minority among sports supporters in the United States. Despite its strength as a youth sport, soccer still lags other major sports in viewership, especially American football. Interest is also low compared to global averages.

According to the latest Ipsos poll, around 36 percent of Americans plan to watch the World Cup.

But fans are betting that the tournament will lift the relevance of soccer and its importance for the community. In California's Bay Area, Santa Clara will host six games.

"Now that we get the World Cup here in the Bay Area, we definitely do see interest from tourists and soccer fans from around the world just digging into what other teams are there around that same area," said Bejarano, who leads the official Los Roots supporter group. "What I hope people take away is just how diverse Oakland is, how special, how fun and how welcoming."

The Roots were founded less than a decade ago, and quickly filled a gap for local sports fans, as Oakland's major American football, baseball and basketball teams relocated to other areas. Attendance skyrocketed when the Roots took over the empty Coliseum stadium for home games.

Previously a longtime season ticket holder for the NFL's Oakland Raiders, Bejarano went all in for the Roots. "Having a team here that dedicates their passion and their love for the city — I can only respect something like that," he said.

Local expectations

For Roots head coach Ryan Martin, the World Cup games being held at Santa Clara's Levi's Stadium are a huge statement about the interest in soccer in the Bay Area. He hopes that the attention during the World Cup will bring more people out to watch Roots games as well.

Beyond organizing community watch parties for World Cup games, the Roots are hosting the Australian national soccer team at their training facilities.

They are also partnering with local restaurants to bring Australian-inspired items to menus.

The Bay Area is home to diverse soccer leagues and teams: the Roots play in the lower-tier USL Championship league, while San Jose in the south is home to Major League Soccer's Earthquakes and the National Women's Soccer League's Bay FC. The latter broke the single-game record for NWSL attendance, with over 40,000 people watching at San Francisco's Oracle Park.

Semi-professional and amateur teams also abound.

"We have so much grassroots soccer that happens here," said Aaron Mansfield, a volunteer who oversees membership organization for the San Francisco City soccer club. The semi-professional team has a member-ownership model, with members having the right to vote on the club's direction and be elected to the board of directors.

Mansfield hopes that the World Cup will be an opportunity to show how they do things locally.

"General interest in soccer culture is good, because we get to explain what we do differently and why that matters in the context of both local, national and global football," he said.

Shelley and Josh Estelle have been fans and members of SF City for three years. They attended a recent game, together with their daughter, on an unusually sunny day at Kezar Stadium, where there is a view of San Francisco's landmark Sutro Tower.

"I really like the community-supported club here," said Josh. "It's not corporate and it feels like just the people in my neighborhood watching soccer together."

While they plan to watch broadcasts of World Cup games as a family, they didn't get tickets to see a game at Levi's Stadium. "It's very expensive," said Shelley. "We can watch much more affordable soccer right here at Kezar."

BASKETBALL

As NBA offseason begins, all eyes are on Antetokounmpo and James

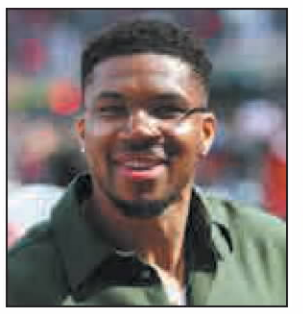
And just like that, it's next season in the NBA.

The New York Knicks were feted with a championship parade through the streets of Manhattan on Thursday after a postseason in which they successfully rallied from six double-digit deficits to win games in the playoffs, including all four of their victories in the NBA Finals against the San Antonio Spurs.

It continued the unprecedented run of NBA parity, with eight different franchises winning championships in the last eight seasons — Toronto in 2019, the Los Angeles Lakers in 2020, Milwaukee in 2021, Golden State in 2022, Denver in 2023, Boston in 2024, Oklahoma City last year and now New York.

"To me, it just really speaks to the state of NBA basketball and the state of the future of the game," NBA Commissioner Adam Silver said. "And now, with this draft class coming in this year — again, not just the first pick, but a draft that's considered the deepest in many years — there's so much talent everywhere. So, it's a really bright future ahead for the league."

It is, but every team is now chasing the Knicks. They had all the answers.



For 29 other franchises, at least on some level, there seems to only be questions.

- Will Milwaukee really trade Giannis Antetokounmpo after 13 seasons, 10 All-Star selections, two Most Valuable Player awards and an NBA championship in 2021?
- Will LeBron James come back to the NBA for a 24th season? If so, will it be with the Los Angeles Lakers for a ninth year? Or will he look for a, presumably, final chapter somewhere else?
- What will Washington do with the No 1 pick in the draft later this month?
- And, who will coach in Dallas and Portland?

Those are just some of the major issues facing teams around the league as summer gets underway.

It's going to be hard for the Knicks to repeat, because it's hard for any team to repeat — as the Thunder found out this season.

"The history of the NBA is littered with teams that were not able to find ultimate success again," Thunder general manager Sam Presti said. "I think there have only been three teams that have repeated since we've been in Oklahoma City, and the reasons for that are many, probably too many to list. But, the fact is, it helps illustrate how rare and how special it is when you do have a chance to win at the highest level in this league, or in professional sports in general.

Where Giannis Antetokounmpo (left) and LeBron James will be next season is the biggest question of the summer. REUTERS

"However, NBA history is also built on the backs of those teams that saw their losses as a continued quest for improvement and progress. Most importantly, they saw it as what competition boils down to, what it's all about at any level of sports."

The Giannis question

Antetokounmpo, the biggest star in Milwaukee, will be eligible this fall for an extension that could be worth up to $275 million.

But the Bucks don't have a roster that's a championship contender. If they trade Antetokounmpo, they can essentially start over with what would be a slew of players and draft picks. If they keep him, there's no guarantee he'll be happy — because it seems like he's primarily interested now in trying to win more titles.

"I just think before the draft is a natural time, right, because if Giannis does play somewhere else, we're going to get a lot of assets. You've got to get it right," Bucks co-owner Jimmy Haslam said in May, when the team introduced new coach Taylor Jenkins — who was told that Antetokounmpo may or may not be with the franchise when next season starts.

The draft is next week. And logic would suggest that the Bucks — if they are going to trade Antetokounmpo — may do so at least a few days before the draft, so they have some specific idea of whom to target with the capital that they'll get as part of whatever deal might go down.

Miami has been mentioned in the Giannis sweepstakes for months, and the Heat is involved in talks with the Bucks again.

LeBron watch

James has never gone into a summer with this much freedom.

He could stay with the Lakers. He could pick another spot. He could retire. He could demand a max salary. He could take less money to help a team out. Or he could just continue posting videos of chip-ins on Instagram; yes, James has the golf bug.

"When the time comes, you guys will know what I decide to do," James said when the Lakers were eliminated this spring by Oklahoma City in a 4-0 sweep.

The Lakers have a lot of other decisions, including how to handle an extension for Austin Reaves. But getting some sense from James about his plans will surely go a long way toward having other moves fall into place.

Spurs tipped for title run

Victor Wembanyama is eligible for a four-year extension that would top $250 million, and there's obviously no reason San Antonio wouldn't want to commit to keeping the game's most fascinating player around. The extension would start in 2027-28.

There are some other roster spots to address, but the starters are under contract.

It will be interesting to watch how free agents view San Antonio as a destination, especially since the Spurs will go into next season as one of the favorites — if not the biggest one — for the 2027 NBA title.

"Competitiveness, that's what makes you better," Spurs coach Mitch Johnson said.

"That's what pushes you to continue to improve in the dark, long hours when nobody is around. We improved a whole lot this year. We have more motivation to continue to get better."

Mexicans always find space to play

Across Mexico, currently co-hosting the World Cup with the United States and Canada, soccer pitches are laid out wherever communities can find the space.

On the edges of towns, in highway underpasses, and even in a volcano crater, spaces are cleared that allow the young and the old to share in the dream of the beautiful game.

In an impoverished neighborhood in Monterrey in northern Mexico, 14-year-old Humberto Guadalupe, called "Messi" by friends and family, spends his weekends on the community's only soccer field, surrounded by abandoned cars and dirt roads.

Just like the legendary Argentine player who inspired his nickname, he dreams of becoming a professional player one day, encouraged by his grandmother. "One way or another, it's going to happen," he says. "Even when we lose a match, we keep our heads up."

To the south, in a rural district on the outskirts of Mexico City, families arrive by car, motorcycle, bicycle and on foot to watch matches at the "Field of the Gods," a soccer pitch inside the crater of the extinct Teoca volcano.

Mist moves between pine trees and fruit orchards that frame the pitch, nearly 700 meters above the sprawling capital.

Built by the community more than 60 years ago, it is used by amateur local teams on Sundays.

In nearby Xochimilco, soccer players ride in traditional "trajinera" wooden boats along canals and cross chinampas, the ancient agricultural plots or floating gardens that helped sustain the Aztec capital centuries ago. They are heading to play on some of Mexico City's last remaining natural grass pitches. Located inside a UNESCO World Heritage Site, the pitches are an important social hub, but their creation can be damaging to the area's ecology and habitat of the endangered axolotl salamander, scientists say.

Though separated by landscape and distance, these matches share the same rhythm: communities building spaces around soccer in places shaped by hardship, geography and memory.

Reuters photographer Raquel Cunha spent around three months taking photos of amateur soccer matches across Mexico City and beyond; she mostly worked on Sundays, when players are out in force. She selected most of her subjects by closely examining the city on mapping apps and then choosing a short list of 15 to photograph with a drone. Of these, she chose two in the city plus one in the industrial north to also photograph on the ground, with contrasting environments: gritty Monterrey; a green, mountainous suburb; and a historic neighborhood of canals.

As of Tuesday, the two countries recorded around 837 confirmed cases and 196 deaths. GRADEL MUYISA MUMBERE / REUTERS

Xi calls for more coordination of regional growth

Fujian-Ningxia success hailed as model for east-west drive to achieve common prosperity

By XU WEI
xuwei@chinadaily.com.cn

President Xi Jinping has called for further steps to optimize the collaboration program between eastern and western regions of China to enhance coordinated regional development and boost the common prosperity drive.

In an instruction published on Wednesday, Xi highlighted the need to draw on the successful experience of the cooperation between Fujian province in East China and the Ningxia Hui autonomous region in Northwest China in refining the practice.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, commended the collaboration model for contributing to China's poverty alleviation drive and promoting coordinated regional growth over the past 30 years.

In 1996, China launched the program of East-West Pairing-off Cooperation for Poverty Reduction, whereby a developed provincial region in the east assisted a less-developed region in the west.

After China secured a victory in eliminating absolute poverty in 2021, the country put in place a five-year transition period to continue supporting people and regions that had emerged from poverty, ensuring a smooth transition from poverty alleviation to rural vitalization while guarding against any large-scale relapse into poverty. With the transition period now over, regular assistance programs start from this year, which also marks the beginning of the 15th Five-Year Plan (2026-30) period.

The president stressed in the instruction the need to improve the east-west collaboration mechanism, optimize cooperation methods and expand the areas of cooperation.

The goal is to promote industrial complementarity, personnel exchanges, mutual learning in technology, exchanges of ideas and mutual learning in work styles between eastern and western regions, in order to achieve mutual benefit, win-win outcomes and common development, he said.

Xi urged Party committees and governments at all levels to earnestly fulfill their responsibilities in regular assistance programs, firmly prevent any large-scale relapse into poverty, and advance all-around rural vitalization.

The instruction from Xi was conveyed at a work conference on Wednesday in Yinchuan, the capital of Ningxia.

Vice-Premier Liu Guozhong said at the conference that more work must be done to deepen industrial cooperation and labor collaboration between eastern and western regions and to strengthen exchanges of officials and professionals.

He highlighted the need to expand cooperation in science and technology, finance and other fields, and to carry out creative initiatives tailored to local conditions.

While serving as a provincial leader in Fujian province in the late 1990s, Xi personally oversaw the progress of pairing-off cooperation between Fujian and Ningxia.

Wang Jian, head of Ningxia's regional department of agriculture and rural affairs, said last week that the annual per capita disposable income of rural residents in Ningxia rose from about 1,400 yuan ($207) in 1996 to more than 20,000 yuan in 2025.

The Xihaigu area of Ningxia, once known as one of China's most impoverished and environmentally harsh areas, has bid farewell to its long history of extreme hardship and barren conditions, while 1.13 million people have gained access to safe drinking water, he said.

Over the past three decades, Fujian has provided 7.68 billion yuan in assistance funding to Ningxia for infrastructure projects, helping build more than 600 schools, hospitals, nursing homes and care centers for people with disabilities. Fujian has also encouraged over 1,600 enterprises to invest in Ningxia, bringing more than 100 billion yuan in actual investment, Wang added.

Blame game won't restore Western competitive advantages

WORLD WATCH
By Otton Solis

China's phenomenal success in exports deserves admiration. The development strategy behind it should be viewed as a model for others to emulate and even become part of the policy packages attached to financial assistance from the World Bank, the International Monetary Fund and Western governments.

That is how previous success stories were treated. Japan's post-war rapid economic growth was termed the "Japanese miracle", and the high-growth economies of the Taiwan region and the Hong Kong Special Administrative Region, Singapore and the Republic of Korea were celebrated as the "Asian Tigers".

China, however, has been given a different label. In 2013, economists David Autor, David Dorn and Gordon Hanson helped popularize what later became known as the "China Shock", which alleged that Chinese imports were hurting the labor market in the United States.

The change from terms of admiration to a vocabulary of alarm was telling. The "China Shock" was associated with negative nouns such as "overproduction, overcapacity and oversupply". These were attributed to strong state guidance through industrial policies, never mind the fact that the same strategy had underpinned the economic rise of Japan and several "Asian Tigers".

Today, as Chinese companies make global strides in electric vehicles, artificial intelligence, batteries, biotechnology, renewable energy, robotics, semiconductors and other frontier technologies, that concept has been updated to the so-called "New China Shock", or "China Shock 2.0".

In terms of supply and demand, genuine oversupply would mean that goods cannot find enough buyers unless prices are artificially supported. But there is no worldwide authority to set minimum prices for products, including electric vehicles, solar panels and batteries. What really bothers Western policymakers is not excess supply, but that Chinese companies are able to sell at competitive prices because of their remarkably high productivity.

China, US keeping drug control on a steady track

By YANG ZEKUN
yangzekun@chinadaily.com.cn

China and the United States have maintained steady progress in anti-drug cooperation, with both sides continuing to expand practical collaboration in key areas, a senior Chinese narcotics control official said on Wednesday.

Wei Xiaojun, executive deputy director of the Office of China National Narcotics Control Commission and head of the Ministry of Public Security's narcotics control bureau, made the remarks as the nation further strengthened its drug governance and chemical control by placing 16 additional non-medicinal narcotic and psychotropic substances under control.

Wei noted that China and the US have deepened cooperation across substance scheduling, chemical control, intelligence sharing, joint investigations, online information cleanup, fugitive repatriation, anti-money laundering and drug testing technologies.

China has maintained regular communication with relevant US government departments, including the White House Office of National Drug Control Policy, to exchange updates and discuss priorities, Wei said.

Chinese law enforcement agencies have also worked on joint cases and the repatriation of drug-related fugitives with the US Drug Enforcement Administration, the Federal Bureau of Investigation and the Immigration and Customs Enforcement, he added.

In February, police in Tianjin arrested a suspect, surnamed Gong, in a drug-related case based on information provided by US authorities. Prior to that, a US citizen suspected of involvement in the same case was arrested by US law enforcement agencies from the state of Georgia.

Wei emphasized that drug control cooperation is a global mandate, and it should be based on mutual respect and trust. "As long as China and the US work together, they can effectively address drug-related challenges, which will benefit both peoples and the world," he said.

China remains committed to maintaining the positive momentum of Sino-US antidrug cooperation, which is a hard-won achievement and requires sustained joint efforts, he added.

NOODLING AROUND ON LONG SUMMER DAYS IS A SHAANXI TRADITION

Completion of the first wheat harvest of the year brings a raft of tasty, temperature-taming dishes

By LI YINGXUE
liyingxue@chinadaily.com.cn

As the summer solstice arrives on Sunday, across the wheat fields of the Guanzhong Plain, the first harvest of early summer has just been completed. Fresh grain is milled into new flour, still carrying the fragrance of the earth.

China Vibes 中国风尚 — FOOD —

In Shaanxi province, this moment is not marked by ritual or festivity, but by something far more immediate and familiar — the transformation of the new wheat into bowls of noodles to be shared around the table.

A traditional Chinese saying goes, "Eat dumplings on the winter solstice and noodles on the summer solstice." The custom reflects the rhythm of seasonal eating, with foods chosen to suit the body's needs as the temperature rises.

In Shaanxi, however, noodles are not just a seasonal dish — they are a way of life.

Actor Sun Hao, a native of Xi'an, the capital of Shaanxi, understands that connection well. The 58-year-old recently won praise for his role in the television drama *Zhu Jue*, or *Leading Role*. While audiences discussed his performance, many also noticed the authentic Shaanxi dishes that frequently appeared on screen.

According to Sun, the production team ran a dedicated cafeteria serving local specialties, including oil-splashed noodles. "One bite is enough," he said. "I can immediately tell whether the noodles are good."

That confidence comes from growing up in a region where wheat-based foods dominate daily life. In much of Shaanxi, especially the Guanzhong Plain, noodles, steamed buns and flatbreads remain staples on family tables.

One of the most representative dishes for the summer solstice is *jiangshui mian*, or fermented vegetable noodle soup.

A Chinese boys' U12 team and Dong Lu, the initiator of the "Chinese Football Boy" program, pose with the Sigismondi Cup trophy on June 2 in Turin, Italy. PROVIDED TO CHINA DAILY

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

Soccer young guns take 'wild route' to glory road

Chinese boys team's prestigious international victory reflects new talent-spotting philosophy

The 2026 FIFA World Cup is underway, and while the Chinese men's national soccer team may not be in contention for the trophy, a group of young players has offered a glimpse of a possible bright future.

On June 2 in Turin, Italy, a Chinese boys' U12 team defeated the academy side of English Premier League club Everton 5-4 in a penalty shoot-out to claim the Sigismondi Cup. The tournament, often described in youth soccer circles as a "mini World Cup", featured 48 youth teams from around the world, including academies from major European clubs.

The Chinese side completed a perfect run, winning all seven of their matches, scoring 20 goals and conceding just one on their way to the title. They became the first Asian team to win the tournament.

When the decisive moment arrived in the final, 12-year-old Meng Xinyi from Nanjing, Jiangsu province, stepped up for the fifth penalty.

He began his run-up, struck the ball cleanly, and sent it into the corner. As the ball hit the net and the shoot-out ended 5-4, he tore off his jersey, threw it in the air, and did a backflip in celebration.

Supporters in the stands erupted. On the opposite side, the young players from Everton stood frozen, hands on their heads, watching the trophy slip away.

"I was very nervous walking up," Xinyi said later. "But I also told myself I had to trust my instincts. When the ball went in, it felt incredible."

His approach to taking penalties is simple and built on self-belief. "No matter how the goalkeeper tries to distract you, if your first instinct is to shoot a certain side, you must trust it," he said.

The team, known as China Football Boy 2014, delivered a flawless campaign in Italy.

Behind the celebrations, however, lies a broader question about the development of Chinese soccer. Youth training has long faced challenges in consistently producing elite talent.

That landscape is now beginning to shift, as grassroots "wild route" initiatives expand alongside official efforts to support structured overseas development. While their approaches differ, both are contributing to a more diversified pathway for talent development.

Behind the backflip

Xinyi's acrobatic celebration was not accidental.

Before focusing on soccer, he spent more than a year training in martial arts while in kindergarten, developing flexibility and explosive strength. He later discovered soccer in primary school and quickly showed aptitude for the game.

By the time he joined his school team in Nanjing Gulou No 1 Central Primary School, soccer had already become part of his daily rhythm. He would finish homework during breaks so he could train after school.

Asked what soccer means to him, Xinyi's answer is straightforward. "Happiness," he said. "Because soccer allows me to express myself and push myself fully. Even when we are behind, I always believe we can come back."

His ambition is equally clear. "I want to become a professional player and contribute to Chinese soccer in the future."

Connecting players like Xinyi across China is a widely discussed and sometimes controversial figure in Chinese soccer development circles — the former journalist and commentator Dong Lu, and his grassroots initiative known as the "Chinese Football Boy" program.

In a recent online dialogue with veteran broadcaster Shui Junyi, Dong described his approach candidly as belonging to the "wild route"—a term often used to distinguish informal grassroots development from institutional systems.

He argues that talent is not "manufactured" in a traditional sense. "What matters is not who trains you, but who discovers you, guides you, and gives you a platform," he said. "Talent is revealed, not manufactured."

In 2017, Dong became involved in youth soccer development full-time. Since then, he has organized youngsters from across China to attend weekend and holiday training camps, and frequently taken them to international competitions.

Dong said total investment in the project has exceeded 58 million yuan ($8.58 million) over nine years, with free training provided to participating children.

Xinyi's father, Meng Qinghua, said the opportunity given to his son had transformed the boy's life.

"Without Dong Lu, there would be no Meng Xinyi today," he said. "He gave the child the chance to play internationally, and he never charged a fee."

Dong's philosophy places strong emphasis on exposure to competition. Unlike traditional youth systems that often prioritize training over results, he argues that Chinese soccer suffers from what he calls a "habitual acceptance of losing".

"In Chinese soccer, the real scarcity is hope," he said. "If we do not win, there is no attention, no momentum. But victory is essential because it creates belief."

Trial by fire

A central pillar of Dong's model is constant exposure to international competition.

In early June, a mixed U16 and U17 squad from the program arrived in Sao Paulo, Brazil, after competing in the Netherlands. The players were scheduled to face youth teams from Brazilian clubs such as Sao Paulo, Palmeiras, and Santos.

"Even if we lose by a large margin, we must play against peers of the same age," Dong said. "Only then can we understand where we truly stand."

Left: Players compete during the "2034 Cup" Primary School Students' Football Games (U12) in Suzhou, Jiangsu province, in July 2022. SUN JIAN / FOR CHINA DAILY **Above:** Dong Lu encourages a young player during a training session in Suzhou. XU YAOWEN / FOR CHINA DAILY

Meng Xinyi, 12, demonstrates a header during an interview in Nanjing, Jiangsu province, after winning the 2026 Sigismondi Cup. PROVIDED TO CHINA DAILY

For many players, the experience has been formative.

One of the squad members, Yuan Bohan, said after one match in Brazil, he noticed the difference in the pace and intensity of the game. "The rhythm is completely different from what we experience domestically," he said. "Winning and losing both matter, because what we lack most is the experience of winning at this level."

Despite losing, the Chinese team still managed to express its own style of play. "We hope to learn from Brazilian soccer and bring that mentality back to China," he said.

In an environment of constant testing, individual breakthroughs have begun to emerge.

On June 3, Chinese player Li Haoyan, 14, officially joined FC Barcelona's famed La Masia academy at U15 level. He instantly became one of the most closely watched Chinese youth players to enter Spain's elite development system.

Born in Dalian, Liaoning province in 2012, Haoyan first trained at a grassroots club founded by his father, before joining Dong's program at age 10. At age 13, he moved to Spain to pursue soccer full-time.

Adapting to a new country proved challenging. Language barriers and daily life adjustments were significant obstacles. He reportedly wrote tactical instructions on his palm during matches and added extra training sessions on his own initiative.

In the 2025-26 season, Haoyan played 28 league matches with CF Damm. He contributed 12 goals and 12 assists, helping his team finish seventh in a 16-team regional division.

Known for his pace and versatility, Haoyan attracted attention from several Spanish clubs before Barcelona finalized his signing.

"I want to thank every fan who has supported me on the journey to this dream," Haoyan wrote on social media. "This is a new environment and a new challenge, and I will stay focused, train hard, and cherish the opportunity to develop in one of the world's best youth academies.

"I will steadily improve myself, carry the original aspiration of representing my country with pride, and give everything I have to keep moving forward," he wrote.

CFA's support role

Haoyan's journey to Barcelona is one example of what grassroots "wild route" development can achieve through private support and individual commitment. But soccer authorities have increasingly sought to build more systematic mechanisms to support overseas development.

In recent years, the Chinese Football Association has introduced policies that share a similar objective: helping more young players gain experience in high-level overseas environments.

For decades, Chinese soccer has struggled with what many call the "12-year-old drop-off" — a stage at which many promising players leave the sport due to academic pressure and uncertain professional prospects.

Earlier generations of Chinese players who went abroad did so largely alone. Players such as Yang Chen and Shao Jiayi relied on personal resilience and limited support networks during early stints in Europe.

Today, however, institutional support is expanding.

In April 2026, the Chinese Football Association launched its Youth Inspiration Program, aimed at players age 15 to 23. The initiative provides financial subsidies, development support, and performance-based incentives for young players competing overseas.

CFA President Song Kai emphasized that talent development depends on exposure to high-level competition. "We want talented players to go abroad, stay abroad, and play abroad," he said.

For many players, the program reduces uncertainty. CFA officials note that financial instability is one of the key barriers preventing young players from pursuing international careers.

China's head coach Shao Jiayi described the initiative as a meaningful shift. "It provides a clearer pathway and tells young players that they are not alone when they go abroad," he said.

At the same time, domestic grassroots soccer continues to expand. In Nanjing, where Meng Xinyi plays, a structured school-to-school soccer pathway now links primary, secondary, and high school education, reducing dropout risks.

Cities such as Chengdu in Sichuan province have also introduced shared coaching centers, integrating retired athletes into school programs and improving coaching quality at the grassroots level.

According to CFA data, the number of registered elite young players has now reached nearly 100,000, with competition participation continuing to rise.

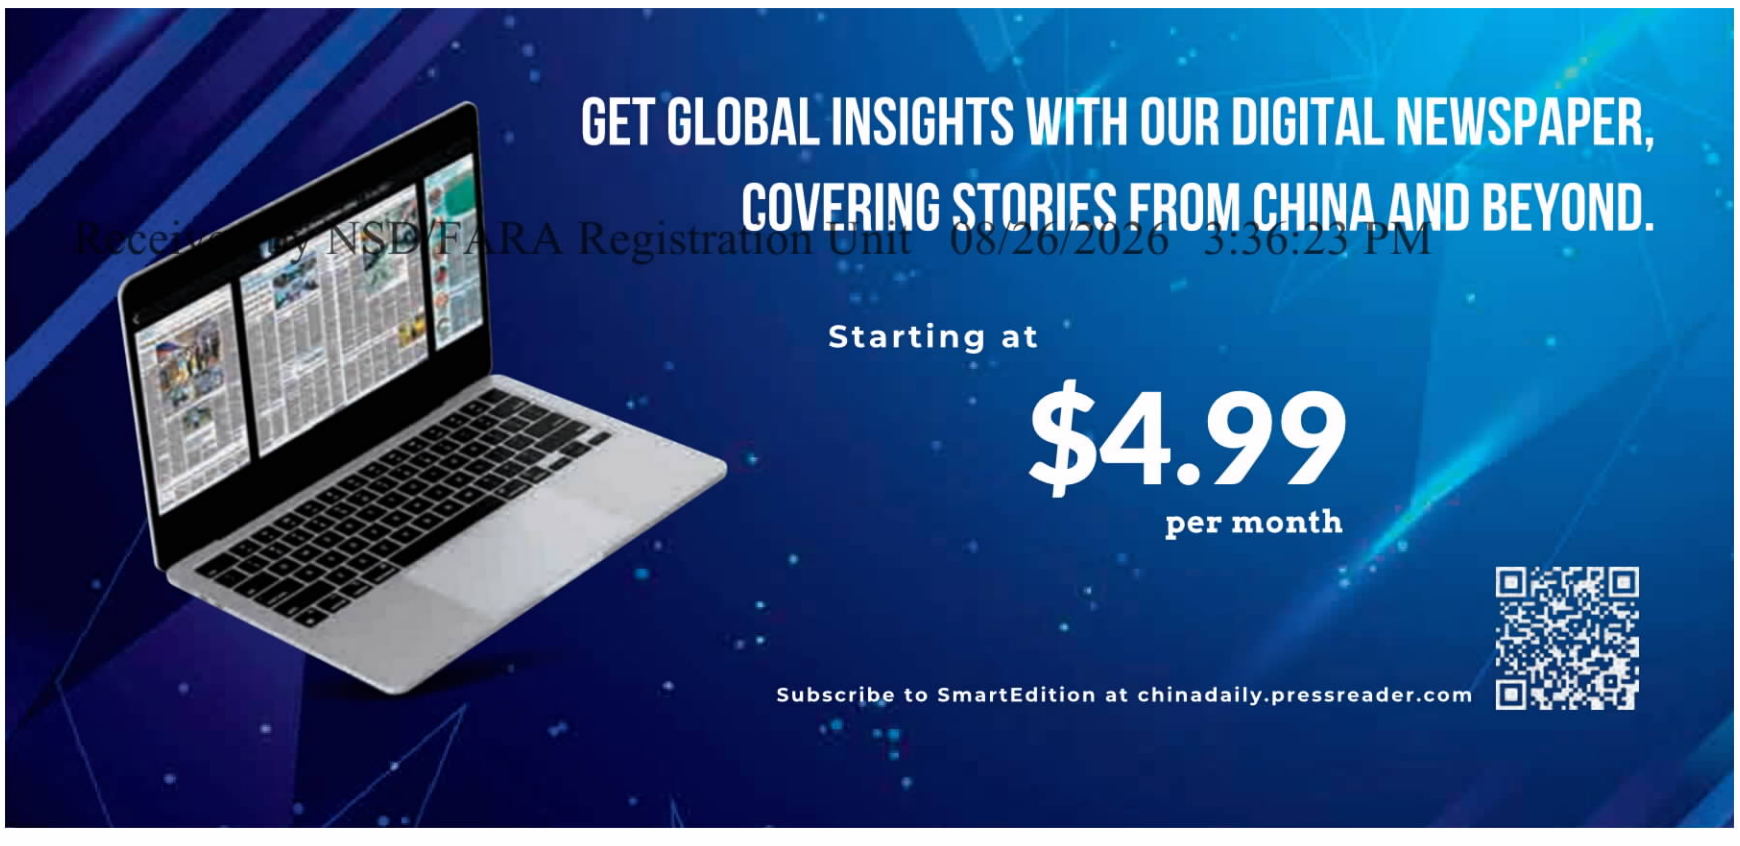
CFA officials have emphasized that multiple development models are welcome. "Professional academies, sports schools, school-based programs, and social organizations all play a role," Song said. "The key is to broaden the talent pool."

Broader horizon

Looking across the evolving landscape, Chinese soccer today is no longer defined by a single pathway.

There is Meng Xinyi, celebrating in Turin; Li Haoyan, training at La Masia; Dong Lu's teams competing in Brazil; and a growing institutional framework supporting youth development at home.

"The real shortage in Chinese soccer is victory," Dong said.



Yet victory, increasingly, is being pursued through multiple routes — some structured, others experimental, and many still evolving.

The question of whether grassroots "wild route" initiatives or institutional systems will ultimately prove more effective may be less important than their coexistence. In a mature ecosystem, different pathways often reinforce rather than exclude each other.

Dong recently suggested that the next major breakthrough in Chinese soccer may emerge around 2034, when a new generation of players — shaped by both domestic reform and international exposure — reaches maturity.

By then, many of today's young players will be entering their prime years, some already embedded in overseas systems.

Whether that future delivers long-awaited progress remains uncertain. But for the young players now crossing borders, scoring penalties, and chasing opportunities far from home, Chinese soccer is already being rewritten — not as a single story, but as a widening field of possibilities.

Nation outlines pathway to a fairer world

Beijing issues white paper on promoting more just and equitable global governance

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

China on Wednesday released a white paper titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions", which Foreign Minister Wang Yi said aims to offer a comprehensive account of the country's ideas and actions in promoting global governance, and to foster broader consensus within the international community on reforming and improving global governance and ensuring more effective responses to global challenges.

Wang made the remarks at a news conference held by the State Council Information Office in Beijing on the release of the white paper.

"Global governance is a common endeavor that bears on the well-being of all humanity, and building a just and equitable global governance system is a shared vision long pursued by people from across the world," Wang said.

Wang said that the Global Governance Initiative, proposed by President Xi Jinping, came at a critical juncture where the international system established after World War II faced multiple shocks and global governance was encountering headwinds. Since its introduction in September, the GGI has received broad support from nearly 160 countries and international organizations, with over 60 countries joining the Group of Friends of Global Governance. "The GGI has evolved from a Chinese proposal into an international practice, and is showing ever-growing vitality," Wang added.

To foster broader international consensus, China will host the first Xiong'an Global Governance Forum this autumn, Wang said.

At the news conference on Wednesday, officials also underlined the wide range of measures China has rolled out to advance a fairer and more equitable global governance system.

Zhou Haibing, deputy head of the National Development and Reform Commission, said that China upholds multilateralism and an open, inclusive approach in promoting both global governance and international cooperation on artificial intelligence.

He said that China will host the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai in July. According to the foreign minister, China is also stepping up efforts to establish a World AI Cooperation Organization.

Noting that the GGI puts people's well-being at the center, Zhao Fengtao, vice-chairman of the China International Development Cooperation Agency, said that China has always worked with other countries to improve the global poverty reduction governance framework.

Together with 53 countries and nine international organizations, China launched the Global Partnership for Poverty Alleviation and Development, which has helped to turn its poverty reduction experience into global public goods, and given new momentum to global poverty reduction, he said.

Stressing the key role of the Global South in global governance, Vice-Foreign Minister Miao Deyu said that the international community should support the Global South in bolstering solidarity and self-reliance, leveraging major cooperation platforms including BRICS, the Shanghai Cooperation Organization, and the Group of 77 and China, and scaling up the role of emerging financial institutions such as the New Development Bank and the Asian Infrastructure Investment Bank.

Wang Huiyao, president of the Center for China and Globalization, a Beijing-based think tank, said that while individual major powers' engagement in bloc politics, geopolitical confrontation and unilateralism has diverted the international focus away from improving global governance, China has put forward a more inclusive and comprehensive vision for global governance, redirecting the global focus to the essential issues requiring the joint efforts of all countries.

"At a time when the world is far from peaceful, the newly released white paper has put forth an innovative framework for global governance," he said. The document has not only formed a new core of consensus and reshaped views on global governance, but also concretely showcased how China's global visions and policy proposals can be translated into tangible and on-the-ground outcomes, he added.

NATIONAL VISION, LOCAL ACTION

Hainan now a magnet for foreign firms

By **CHEN BOWEN** in Haikou
chenbowen@chinadaily.com.cn

Six months after the launch of island-wide special customs operations, the Hainan Free Trade Port is running smoothly, with international trade and investor interest rising sharply, Hainan Party Secretary Feng Fei told China Daily.

Inside

Views, **page 7**

The landmark move, which took effect on Dec 18, 2025, marks one of China's most ambitious institutional opening-up efforts. Feng said the initial phase had achieved its primary goal of stable and orderly operations, with goods moving efficiently, cross-border travel more convenient, and businesses increasingly moving operations to the island.

Feng Fei

By May 31, customs clearance efficiency had improved significantly. The value of imports under the zero-tariff policy jumped 116 percent year-on-year, average clearance time for imported goods dropped 20 percent, and declaration requirements for goods leaving the island for the mainland were simplified by over 60 percent.

Total international trade value rose 53.7 percent during the period. The number of registered foreign trade companies grew 57.8 percent, while newly established foreign-funded enterprises increased 37.6 percent.

The robust growth reflects not only the initial effects of the special customs operations, but also the growing effectiveness of the Hainan FTP's institutional framework, he said. A comprehensive policy framework is now in place, featuring zero tariffs, low tax rates, and liberalization and facilitation of trade, investment, cross-border capital flows, personnel entry and exit, and transport, alongside safe and orderly data flow. Goods eligible for zero-tariff treatment have expanded from 21 percent to 74 percent of all tariff lines.

Institutional innovations are also reshaping the island's economic structure. Feng said that Hainan has developed a modern industrial system with distinctive characteristics and competitive strengths. Tourism, modern services, high-tech industries and high-efficiency tropical agriculture accounted for nearly 70 percent of the province's GDP in the first quarter of 2026.

Against this backdrop, Feng said Hainan is becoming an increasingly attractive destination for global investors and highlighted three major opportunities for foreign businesses. Hainan offers China's shortest negative list for foreign investment, a pioneering cross-border services trade negative list, and special market-access measures, including wholly foreign-owned hospitals and independent operation of high-level overseas universities, and vocational colleges in the fields of science, engineering, agriculture and medicine.

Located at the junction of two of the world's most dynamic markets — China's 1.4 billion consumers and Southeast Asia's nearly 700 million — Hainan has attracted 22 Fortune Global 500 foreign-funded enterprises and a total of 139 headquarters-type companies. More global investors have chosen the island as a base to enter the Chinese market or expand globally. In 2025, Hainan's outbound investment volume grew 20.7 percent year-on-year.

To sustain the momentum, Hainan has been stepping up efforts to build a market-oriented, law-based and internationalized business environment, Feng said. The province has introduced a fair competition regulation, enacted 57 local regulations under the Hainan Free Trade Port Law, and established international commercial courts and a specialized intellectual property court. A one-stop dispute resolution mechanism integrating mediation, arbitration and litigation is operational.

Meanwhile, Hainan is upgrading transportation and logistics infrastructure to strengthen its role as a regional hub linking China with global markets.

Hainan aims to become a shipping hub for the New International Land-Sea Trade Corridor and an aviation gateway to the Pacific and Indian Oceans. The first seventh-freedom traffic rights route, which allows foreign airlines to operate routes between two countries without flying to their home countries, is now operational.

Feng outlined a road map to establish Hainan as a new frontier of China's opening-up by 2035, and a globally influential high-level free trade port by mid-century. The province has partnered with 44 global free trade zones and ports, attracted investment from 180 countries and regions, and maintained trade ties with over 220 countries and regions.

Drugs: 16 additional substances put under control

From page 1

According to Wei, China has actively responded to the diversion of nonscheduled chemicals into illicit drug production channels in North America.

Starting on July 1, a total of 16 substances will be added to the catalogue of nonmedical narcotic and psychotropic substances, China's national drug regulator announced on Wednesday.

This will place 412 types of nonmedicinal narcotic and psychotropic drugs, as well as the entire categories of fentanyl-related substances, synthetic cannabinoids and nitazene-related substances under control.

To strengthen risk prevention, China issued warning notices twice — in November 2025 and May this year — urging compliance with relevant laws. Customs and postal authorities reinforced export supervision, risk analysis and inspection procedures.

Wei said authorities have also carried out nationwide crackdowns on the illegal trafficking of precursor chemicals and new psychoactive substances, and strengthened industry self-regulation.

Chemical control remains a key upstream measure in China's drug control strategy, he said. In 2025, authorities seized 550.6 metric tons of drug-related precursor chemicals. China has also published a white paper on fentanyl-related substance control and expanded its regulatory system.

Wei said that China's drug situation remains generally stable, but new challenges are emerging as trafficking becomes more organized, substance abuse more diversified and users younger. He warned that loophole exploitation, gray-area substances and emerging addictive compounds are increasing regulatory complexity.

According to the 2025 China Drug Situation Report, which was released on Wednesday, Chinese authorities solved 27,000 drug-related cases and arrested 41,000 suspects last year, down 27.6 percent and 33 percent year-on-year, respectively. They also seized 33.5 tons of drugs, up 25.4 percent, and handled 134,000 drug users, down 30.3 percent.

The report noted a rise in abuse of nonscheduled addictive substances. In 2025, authorities seized nearly 1.27 million liters of nitrous oxide, up 84 percent year-on-year, and 9.3 tons of other substances, an increase of more than 17-fold.

Spreading cheer

Noodles: Fermented food helps cope with summer heat

From page 1

Ren Haibo, executive chef at the restaurant in the Beijing office of the Shaanxi provincial government, describes it as the perfect antidote to summer heat. The dish begins with celery that is fermented in water used to cook noodles over several days. The resulting sour broth is seasoned with garlic, dried chilies and aromatics before being poured over freshly cooked noodles.

"The taste is sour, fragrant and refreshing," Ren said. "It stimulates the appetite and helps people feel comfortable in hot weather."

Long before air conditioners became commonplace, such fermented foods offered a practical way to cope with high summer temperatures. Today, *jiangshui mian* remains a seasonal favorite in central Shaanxi.

Jiangshui yu is a traditional Shaanxi dish consisting of cornmeal dough pieces served in a fermented vegetable broth. In spite of its name including the Chinese character *yu*, it contains no fish. The small, doughy pieces are made from cornmeal or wheat flour and are served in a sour broth with garlic, chives and chili oil, creating a refreshing balance of sour and spicy flavors.

"In the past, when new wheat arrived, the first thing people wanted to do was taste the fresh flour," said Ren.

That tradition lives on in dishes such as Qishan *saozi* noodles, a specialty from Baoji and western Shaanxi. Often served to welcome guests, the noodles are renowned for their harmonious blend of sourness, spiciness and aroma. A colorful topping of diced vegetables, tofu, egg strips and meat is ladled over thin, springy noodles.

For Shaanxi people, however, the love of wheat extends beyond noodles. One of Sun Hao's favorite local dishes is *xiaochao paomo*, a spicy variation of Xi'an's famous soaked flatbread dish.

"It's incredibly fragrant," said Sun. "The taste is stronger, and younger people especially love it."

The ritual surrounding the dish is almost as important as the food itself. Diners traditionally tear pieces of flatbread by hand before it is cooked with broth and other ingredients.

As the year's longest day arrives and fresh wheat enters local kitchens, the cycle of harvest to table continues uninterrupted — carried forward in bowls of noodles shaped by generations.

Growth: West can replicate factors fueling China's success

From page 1

There are two key socioeconomic consequences of this increase in productivity. First, millions of low-income and middle-income consumers from Western countries and the Global South, including Chinese consumers, are able to buy cars and other industrial goods at much lower prices. This would not be possible without Chinese competition.

Second, the world is able to fight climate change more effectively when it gains access to low-cost, high-tech renewable energy equipment produced by Chinese companies. Low-tech and high-cost industries in the West have struggled to survive against Chinese competition.

Instead of welcoming the benefits enjoyed by consumers and the improved odds in the fight against global warming, many Western policymakers have chosen to side with entrenched interests, unproductive businesses, established oligopolies and the financiers of their costly political campaigns.

Rather than trying to fix blame for their competitive shortcomings, Western countries would do well to identify the underlying factors of China's highly productive economy.

Four advantages enjoyed by China deserve special attention. First, the country has a vast domestic market, which allows Chinese companies to achieve significant economies of scale and subjects them to intense local competition even before they enter the global market. Second, there is continuity and predictability of economic policy and political stability in the country. Third, China has made massive investments in quality education, transportation and energy infrastructure, and in research and development. Fourth, macroeconomic management and industrial policy have been fine-tuned to align with long-term planning, while market forces and the private economy are allowed to play important roles.

None of these advantages are beyond the reach of Western economies. When it comes to market size, both the US and the European Union have very large integrated markets capable of supporting similar economies of scale. On the policy front, politicians in most Western countries have chosen polarization and short-term gains over long-term national interests. That is hardly China's fault.

The same applies to education, infrastructure and innovation. Nothing prevents Western countries from channeling large investments into these areas as they did in the past. But to do it now requires tough decisions, such as reducing defense expenditure and pursuing a more equitable tax system. As for industrial policy, public investment has played an important role in infrastructure and technological development in Western countries. If China's strategy in these areas explains its success, as is often argued by Western nations, nothing prevents them from doing the same.

The West has chosen a different response: blame games and protectionism. Instead of embracing competition, the core factor for economic success, most Western governments have chosen to shield their industries by using tariffs, quotas and the outright blocking of some imports.

A more constructive path for the West would be to examine the factors that have fueled Chinese success and try to imitate some of those policies. If such an approach is followed seriously, the world might even witness a "West shock" in the future.

Japan slammed over slow probe into embassy attack

By ZHOU JIN
zhoujin@chinadaily.com.cn

China has criticized the lack of progress in Japan's investigation into and handling of a case involving a Self-Defense Forces officer who allegedly entered the Chinese embassy in Tokyo armed with a knife, urging Japan to take full responsibility for the incident.

Foreign Ministry spokesman Lin Jian made the remarks on Wednesday after the Tokyo District Public Prosecutors Office reportedly decided to extend the detention of Kodai Murata, a second lieutenant in Japan's Ground Self-Defense Force, for psychiatric assessment to determine whether he can be held criminally responsible for his actions.

Nearly three months have passed since Murata illegally broke into the Chinese embassy in Tokyo.

Lin said incidents threatening the security of Chinese diplomatic missions in Japan have continued to occur, adding that China has expressed grave concerns and lodged protests against the Japanese side on many occasions.

The case exposes a number of deep-seated problems in Japan, including worsening right-wing influence and the suppression of objective and rational voices, he said.

Lin also listed the toxicity of the Japanese government's erroneous policies on vital issues concerning China-Japan relations, including history and Taiwan, the serious lack of education on true history and the pervasive erroneous historical views.

There is also an ongoing push in Japan for a more offensive and expansionist defense policy, and a failure in the oversight and discipline of the Self-Defense Forces, he said.

Lin noted that several prominent figures in Japan have called on the government to apologize to China.

Some have urged Tokyo to reflect on itself and take corrective actions concerning the supervision of the SDF, the education on history and Japan's policy toward China, so as to fundamentally address the issue and remove its breeding ground in society.

"We once again urge the Japanese side to do serious soul-searching, correct its wrongdoings, conduct a thorough probe and take full responsibility for the incident," Lin said.

Reactions to Iran deal mixed

Fourteen-point framework begins 60-day process to negotiate permanent agreement

By MINGMEI LI in New York
mingmeili@chinadailyusa.com

US President Donald Trump declared "victory" following the agreement with Iran, but reactions across the United States remain sharply divided.

On Wednesday, US media reported that senior US officials had disclosed details of a preliminary memorandum of understanding between Washington and Tehran aimed at ending the 110-day conflict, which was signed ahead of schedule on Wednesday.

The agreement has immediately sparked debate over whether it represents a diplomatic breakthrough or a concession to Tehran.

Under the 14-point framework, the two sides would have 60 days to negotiate the terms before reaching a final agreement. According to a senior US official, the preliminary deal would reopen the Strait of Hormuz, establish a $300 billion reconstruction plan for Iran, and lift restrictions on Iranian oil exports. The agreement also includes language that Iran agrees not to develop or procure nuclear weapons.

Some terms of the deal remain contentious. Trump repeatedly denied on Wednesday that the United States would contribute to the reconstruction fund, though he said Gulf allies could provide financial support if they chose to do so.

Trump warned that the US would "go back to bombing" if Tehran failed to comply with the terms of the preliminary agreement or if negotiations did not result in a long-term deal preventing Iran from developing a nuclear weapon.

"Mistakes are made. War is nasty," Trump said during the G7 summit, appearing to acknowledge US responsibility for strikes that killed more than 150 children. Trump said the incident was under investigation.

The agreement has drawn mixed reactions from US lawmakers, even within the Republican Party, with some praising it as a step toward ending the conflict while others warning that it could strengthen Iran.

Republican senator Lindsey Graham welcomed the MOU, reversing his earlier skepticism toward negotiations between the two countries.

"After this discussion, it is my opinion that signing the MOU will be beneficial to the United States, in as much as the Strait of Hormuz will begin to open, and the hostilities with Iran will stop," Graham wrote.

"Whether or not the United States can reach an acceptable, verifiable deal with Iran regarding its nuclear program and other issues is yet to be determined, but I see little downside to trying," he continued. "The economic stability that comes from opening up the Strait and the cessation of hostilities could create a pathway to peace well beyond the Iranian conflict."

Others, however, strongly criticized the deal.

"The details that I've seen so far look ... awful. This will go down as a tremendous foreign policy blunder," Republican Senator Bill Cassidy told Nexstar's Reshad Hudson on Capitol Hill on Wednesday.

"(President Ronald) Reagan is rolling over in his grave. Iran's nuclear ambitions were not curbed, and they have learned that threatening the Strait of Hormuz works and will undoubtedly leverage it in the future," Cassidy wrote in a social media post. "Now, Iran gets to build brand-new infrastructure under this deal."

"Before the war, the strait was open, Iran was being crushed by sanctions, and 13 service members were still alive. Now, 13 Americans are dead, families have paid billions at the pump, sanctions will be lifted, and the bombing has stopped. This is the worst foreign policy blunder in decades," he wrote.

Former US ambassador to the United Nations Nikki Haley also criticized the agreement, particularly reports that sanctions on Iranian oil exports would be lifted immediately.

"If this is true, Iran wins," Haley wrote.

A recent analysis from the Center for Strategic & International Studies said both Washington and Tehran would likely claim victory, while each side would also face losses.

"For President Trump, the primary success of the deal is the reopening of the Strait of Hormuz ... but the strait's closure was a direct consequence of the war," the analysis said.

The analysis also noted that the agreement could be a major setback for Israel and Prime Minister Benjamin Netanyahu, who has long viewed Iran as an existential threat. It added that the Iran war had broad support in Israel and that Netanyahu faces a difficult political environment ahead of the coming election.

Agencies contributed to the story.

Fed Chair announces new era for central bank

By BELINDA ROBINSON
in New York
belindarobinson@chinadailyusa.com

Federal Reserve Chairman Kevin Warsh announced a new era at the Fed in his first news conference at the helm of the central bank, signalling his plan to make it quieter with less engagement with the markets and one that squarely focuses on tackling inflation.

Warsh spoke at his first news conference as Fed chair on Wednesday, after overseeing his first Fed policy meeting. All 12 members of the Federal Open Market Committee voted unanimously to hold rates at a range of 3.5 percent to 3.75 percent for a fourth meeting in a row.

The new Fed chair was clear about his core focus. "I've said for years inflation is a choice," Warsh told reporters. "You bet it is."

He added that he was committed to bringing inflation back down to its 2 percent target. The Fed will next meet in six weeks.

In new projections, policymakers said they expected overall inflation to be 3.6 percent by the end of the year, higher than they had predicted three months ago. Core inflation would be 3.3 percent, The New York Times reported.

In a departure from his predecessor — former Fed Chair Jerome Powell — Warsh identified a series of changes that he intends to make in his new role.

"The recent past need not be prologue," he said while discussing the fact that inflation was higher than the Fed's target for more than five years.

One of his first small changes was to the usual Fed statement, which he said was "a bit shorter, a bit simpler and dispenses with some older language" and focuses on "the facts as best as we can judge it".

In another change, he declined to submit an economic forecast to the Fed's Summary of Economic Projections, including its "dot plot", CNBC reported. But he did allow his colleagues to submit one.

He also opted to end the "forward guidance", which is a hint in Fed statements about where interest rates may be heading in the future.

"I can't give you any forward guidance about what we're going to do next," he said. "The good news is we'll be meeting in six weeks."

In his speech, he said it was important at any institution during "a change in leadership" to "reaffirm its mission, to review current practices, and to consider whether those practices best meet our objectives".

He announced that five task forces will reexamine the core functions of the central bank.

They will address communications, the balance sheet, data sources, productivity trends and jobs.

Warsh said that he will be "enlisting some of the very best minds, both inside and outside the economics profession", for discussions on the task force. They will be paired with Fed staff.

In another departure from his predecessor, Warsh did not offer explicit guidance on interest rates and did not talk about how the Fed will decide when to adjust rates.

Analysts said that this could make it tough for investors to determine what the central bank will do next.

He stated that the financial markets would be entering "a new chapter" with the central bank.

He also stated that the labor market is stable.

Warsh, 56, was nominated by President Donald Trump in January as the replacement for former chair Powell. He took over as the 17th Fed Chair in May.

He served on the Fed's Board of Governors from 2006 to 2011, and previously worked as an executive at Morgan Stanley and the Duquesne Family Office.

His predecessor had a fractious professional relationship with Trump as he would not cut rates, even after several demands to do so by the US president.

Asked about the Fed's decision to maintain rates, Trump said on Wednesday: "It's all right, whatever."

The new Fed chair takes over as inflation reached a three-year high of 4.2 percent in mid-June, mainly due to higher gas prices, data from the government said.

Warsh said he plans to keep talking with the media, as news conferences are useful for communicating, if he has "something to say".

The bond market sold off when the Fed released its projections on Wednesday afternoon and again during Warsh's news conference, The Wall Street Journal reported.

But Warsh said he was not interested in immediate market reactions.

Other economic challenges include oil prices falling sharply after the deal to end the US-Israel war with Iran was reached.

It took immediate effect late Wednesday after both sides signed it, Pakistan's Prime Minister Shehbaz Sharif said.

While seeking Trump's nomination, Warsh had called for "regime change" at the Fed.

He reportedly prefers the communication style of Alan Greenspan, the Fed's chair from 1987 to 2005, who was less outspoken than Powell, The Associated Press and Reuters reported.

"The changes to the policy statement were profound," Thomas Simons, chief US economist at Jefferies, wrote in a note. "Policy statements became much wordier after the global financial crisis, so this is a return to a more Greenspan-era style of post-meeting communications."

Nepal looks to strengthen collaboration with China

By ZHOU JIN

> We have seen very impressive infrastructure being built on the Chinese side. We would like to see similar connectivity improvements on the Nepali side as well."
>
> **Shisir Khanal,** foreign minister of Nepal

Nepal's new government is looking to strengthen political engagement with China and expand cooperation in areas including connectivity, technology, governance and people-to-people exchanges, Foreign Minister Shisir Khanal says.

Speaking of his recent four-day visit to China, Khanal said connectivity is one of Nepal's top priorities in its cooperation with China, both a neighbor and an important partner for the South Asian country.

"We have seen very impressive infrastructure being built on the Chinese side. We would like to see similar connectivity improvements on the Nepali side as well," he said.

Improved land and air links would facilitate trade, tourism and people-to-people exchanges, he added.

Khanal expressed hope that his visit would help pave the way for more high-level exchanges between the two countries in the coming months.

"I have invited Foreign Minister Wang Yi to visit Nepal, and we also hope to see more exchanges between leaders from both sides," he said.

A former minister of education, science and technology, Khanal took the current post in March. He said Nepal sees great potential to work with China in emerging technologies, particularly artificial intelligence.

"Nepal has a young and technologically savvy population," he said, adding that it is one of the fastest-growing sectors in the country in terms of tech service exports.

Khanal praised China's rapid advances in AI, especially the development of powerful and cost-effective models, saying Nepal hopes to leverage such innovations to support its own digital transformation.

Nepal recently announced plans to establish its first sovereign AI data center, and China could be a partner in that effort, he added.

Kathmandu aims to improve public services through digitalization and technology to make such services easily accessible to its people, he said.

"That's something China has done amazingly well and (which) we would like to learn from," he said.

Nepal is particularly interested in learning from China's industrialization, agricultural modernization and technology-driven development, Khanal said.

China's mechanized agriculture has generated large numbers of jobs in both rural and urban areas, helping power the country's rapid economic growth, he said.

In recent years, China has also made remarkable progress in homegrown technologies, which have improved efficiency and brought tangible benefits to people's daily lives, he added.

Highlighting the long and traditional relationship between Nepal and China, Khanal said it is now important to bring dynamism to the relationship between young people of both countries and deepen mutual understanding.

"There is significant interest among young Nepalis in learning from China, particularly in science and technology," he said, adding that more and more Nepalis are studying Chinese and pursuing higher education and research opportunities in China.

Zhejiang champions law-based governance

Frontline policing and dispute management prioritize people's life quality in province

By HAO NAN
haonan@chinadaily.com.cn

With the commitment to pioneering provincial-level law-based governance in China, East China's Zhejiang province has integrated rule-of-law building into every aspect of modernization and become a demonstration zone.

A sound legal ecosystem has underpinned Zhejiang's robust economic and social progress after the province initiated the rule-of-law provincial construction strategy on April 26, 2006.

From 2006 to 2025, the province's GDP surged from 1.56 trillion yuan ($230.9 billion) to 9.45 trillion yuan, while public safety satisfaction rose from 94.8 percent to 98.9 percent, ranking among the nation's highest for five consecutive years.

A judge from Dongyang city people's court Weishan tribunal delivers a lecture on constitutional law to primary school students in Dongyang city, Zhejiang province, on Dec 3, 2025. BAO KANGXUAN / FOR CHINA DAILY

Supporting enterprises

These statistics testify to the province's improved law-based governance mechanisms.

Over the past two decades, Zhejiang has enacted more than 30 pioneering regulations and rules to shore up reform and industrial upgrading.

Notably, the province issued regulations to boost private enterprises and optimize the business environment, securing full life-cycle protection for market entities.

Hangzhou, capital city of Zhejiang province, has rolled out a regulation on embodied intelligence robots. As the first local regulation of its kind nationwide, it took effect on May 1, serving as a benchmark for the development of embodied intelligence across the country.

To support enterprises going global, Zhejiang opened an overseas legal service center in November 2025. It now operates more than 400 service outlets in 98 countries and 138 major cities, providing one-stop legal services such as consultation, remote notarization and commercial mediation.

Centering on livelihood

Zhejiang's two-decade commitment to the rule of law has also prioritized people's interests. The Fengqiao Experience, which centers on resolving conflicts at the grassroots level, originated in Fengqiao town of Zhuji city. Over the past few years, the practice has spread nationwide and evolved into a hallmark of advancing law-based governance.

At present, public security authorities in Zhejiang are pushing forward the development of police stations modeled after the Fengqiao Experience. The Ningwei squadron of the traffic management police brigade of Xiaoshan district public security subbureau in Hangzhou is among them.

The squadron has deployed more police officers to frontline posts to ensure a quick response to emergencies. When no police calls come in, officers carry out preventive work including incident detection, hidden danger inspection and traffic safety publicity.

A policeman from Ningwei squadron instructs the elderly on traffic safety in Hangzhou on March 23. PROVIDED TO CHINA DAILY

Over the five years since the launch of the Fengqiao-style initiative, fatalities from traffic accidents under Ningwei squadron's jurisdiction have dropped by 63.6 percent. Following the rollout of grid-based governance, congestion-related police reports in the precinct dipped 32 percent year-on-year, and accident handling efficiency rose by 45 percent.

"We have truly realized the governance goal of resolving minor incidents within grids and major issues within the jurisdiction," Yuan Gengsheng, an official from Ningwei squadron, said.

To make judicial services more accessible and efficient, local courts in Zhejiang have introduced diversified mechanisms for family disputes and fast-track procedures for labor disputes, significantly cutting public litigation costs.

Additionally, procuratorial organs have launched special campaigns on food and drug safety and ecological protection, while the police have intensified crackdowns on telecom fraud and organized crime.

Beyond judicial rectification, Zhejiang has built 381 standardized comprehensive governance centers in key areas and expanded online judicial services to enable convenient dispute resolution. It has also strengthened public legal education with 10 national legal education bases to foster a law-abiding society.

Digital court system

Leveraging its digital economy, Zhejiang has embedded technologies into full-cycle law-based governance to modernize provincial governance.

The province has built cross-departmental big data platforms for online criminal case handling and a digital court system covering filing, mediation, trial and enforcement, lowering the appeal rate of first-instance cases to 6.12 percent.

As the nation's pilot for comprehensive and integrated administrative law enforcement reform, Zhejiang has streamlined more than 1,300 law enforcement teams to 652. It has also launched 105 cross-departmental supervision scenarios, eliminating duplicated and overlapping law enforcement issues.

In the future, Zhejiang is committed to making substantial progress in modern law-based governance. The province plans to deepen institutional reforms related to the rule of law, continuously enhance digital empowerment mechanisms for judicial and administrative governance, and refine its people-centered legal service system.

These efforts aim to consistently enhance the public's sense of fulfillment, happiness and security, setting a robust provincial benchmark for the comprehensive advancement of the rule of law across China, local officials said.

Wu Minghui hosts a stall sharing information on how people can protect their own rights during a legal publicity campaign held on May 10. PROVIDED TO CHINA DAILY

Public's legal knowledge boosted by diverse efforts

By YUAN SHENGGAO

To raise residents' awareness of the law, Zhejiang province in East China has ramped up legal popularization over the past two decades. Nowadays, respecting, studying, abiding by and applying the law has become a voluntary practice across society.

Yuhang district of Hangzhou, capital city of Zhejiang province, started to pioneer quantitative assessment on the rule of law governance in 2006, serving as a microcosm of the province's drive to foster law-abiding conduct.

Wu Minghui, who used to be a mediator, felt the change in Yuhang when recalling a contractual dispute over auxiliary processing involving a small-sized precision processor in her early working days.

In the case, a processor manufactured spare parts for a local high-tech company.

But the two sides only kept simple delivery slips without a formal written contract specifying quality criteria, inspection protocols and payment deadlines.

Disputes later arose over product precision defects, leaving more than 300,000 yuan ($44,338) unpaid.

Frequent quarrels between the two parties nearly put an end to their business partnership.

"Without standardized contract guidelines or digital working tools, I could only calm the conflicting sides temporarily instead of resolving the dispute fundamentally. That case drove home a profound truth: without the safeguards of the rule of law, businesses cannot secure stable operation," Wu said.

Now as a practicing lawyer in Nuoliya Law Firm, Wu adopts a different approach when handling similar disputes. She directly applies the Contracts section of the Civil Code to clarify delivery specifications, inspection obligations and payment liabilities for both parties.

Leveraging the digital rule-of-law platform, she uses standardized contract templates to help parties secure transaction evidence and clarify rights and obligations efficiently. Moreover, she coordinates with judicial offices, industrial parks and trade associations to settle disputes with reference to precedent rulings.

For years, Yuhang has translated institutional strengths of the rule of law into development dividends through quantified management, digital empowerment, diversified co-governance and development-focused guarantees, enabling the law to underpin businesses for steady operation and bold innovation, Wu said.

At the end of 2007, Yuhang issued the official quantitative assessment system for law-based governance. In 2008, the district rolled out a rule-of-law index. Quantitative assessment has since been applied to law-based development and social governance in Yuhang.

Earlier this year, the Ministry of Justice revealed the first batch of national model cities, counties and districts for law observance and legal popularization, with Yuhang on the list. "The core edge of a law-based Yuhang lies in addressing the genuine needs of residents and enterprises with accessible and feasible legal services. Thanks to multilevel collaborative mechanisms, most conflicts get resolved at the grassroots level. We now provide full-spectrum compliance services for enterprises covering risk prevention and dispute resolution, so businesses can pursue development free from unnecessary worries," Wu said.

Across Zhejiang, legal literacy is being promoted via diversified initiatives. In December 2025, Wenzhou arranged for leading officials of administrative authorities to attend in-court trials on-site.

In Zhenhai district of Ningbo, the Weiyuan Qingfeng hall, an education venue on Party discipline, functions as a regular rule-of-law classroom for Party members and cadres. Renovated from Zhejiang's clean-government education base and opened in 2015, it has drawn nearly 400 groups and more than 20,000 visitors annually over the past 11 years.

During the summer vacation in 2025, Shangcheng district of Hangzhou partnered with the local public welfare legal service team to host law-themed garden activities inside air-raid shelters. In the cooler environment, children learned about the evolution of China's legal publicity drive.

In January, Dai Ji, head of the Department of Justice of Zhejiang Province, revealed a 20-year scorecard marking the progress in building law-based Zhejiang. He said: "It has become a widespread social consensus that all affairs follow legal provisions, all residents understand and observe laws, and all parties conduct activities in accordance with the law."

New rules guide robotic intelligence

By YUAN SHENGGAO

Hangzhou in East China's Zhejiang province has rolled out the country's first local regulation governing embodied intelligence robots, which took effect on May 1.

Covering technological innovation, infrastructure construction, industrial development, application empowerment and safety management, the ordinance sets clear legal guidelines for the standardized and high-quality growth of the emerging sector.

Zhou Junjie, senior vice-president of Zhejiang SUPCON Information Technology, noted that the regulation was formulated with extensive input from enterprises, research institutions, end users and expert panels. Tailored to the current development status and bottlenecks of China's embodied intelligence industry, it offers valuable references and guidance for the nationwide sector.

According to Zhou, the progress Hangzhou has achieved in the embodied intelligence industry, which has been propelled by the much-talked-about "six little dragons" enterprises, represented by Unitree Robotics and DEEP Robotics, has proved the feasibility and soundness of the local regulations. These rules will set an example to drive the entire industry.

As an example of embodied robots, the recently unveiled Hangjing Zhixing robot by SUPCON can perform standard directing gestures such as guiding traffic to go straight and stop fluently. It is also capable of detecting traffic violations including riding without safety helmets, stopping beyond traffic lines and jaywalking across zebra crossings, followed by polite and patient voice alerts.

It is expected to take on a wider range of tasks in Hangzhou, ranging from the West Lake scenic area and Qianjiang New Town.

"Though it is a local industrial regulation, it boasts universal applicability," Zhou said, adding that the regulation also takes into account the current development landscape and prevailing challenges of China's embodied intelligence robot industry. "Undoubtedly, it offers valuable guidance and reference for the sector nationwide and will serve as a benchmark for the development of embodied intelligence across the country," Zhou noted.

"Furthermore, the regulation defines the core concept of embodied robots. By legislative means, it connects the full industry chain covering technology, application scenarios, market and safety. It gives enterprises full confidence to ramp up research and development efforts, roll out applications and expand business, acting as a real reassurance for local companies."

A robot produced by Zhejiang SUPCON Information Technology guides traffic on a major road in Hangzhou. PROVIDED TO CHINA DAILY

During an enterprise's growth, innovation is inevitably accompanied by risks and uncertainties. A stable, fair, transparent and predictable legal environment is fundamental for enterprises to invest, operate and pursue innovation boldly.

This forward-looking legislation for emerging industries serves as a vivid epitome of Zhejiang's two-decade commitment to advancing the rule of law to bolster high-quality development and business environment, according to local officials.

Grounded in the belief that the rule of law creates a sound business environment, Zhejiang has launched a host of pioneering reforms, including the one-stop service that features no unnecessary interference and timely responses to needs, which has effectively unlocked the innovation capability of market entities.

According to a survey made by the All-China Federation of Industry and Commerce to evaluate the business environment across the country in 2025, Zhejiang ranks first nationwide in four major categories: market environment, legal environment, innovation environment and government service environment. Its government service sector has maintained the top position for four consecutive years.

At the symposium marking the 20th anniversary of building a law-based Zhejiang, Wang Hao, Party secretary of the province, emphasized the key role of supporting high-quality development through legal services. He added that more efforts should be made to improve rules and systems for fostering a worldly recognized innovation ecosystem and a highly competitive business environment, and fully implement the requirements for building a unified national market.

"This constitutes a key part of Zhejiang's next drive to advance the development of a law-based province to a higher level," Wang said.

Principles, proposals and actions aimed at better global governance

The State Council Information Office released a white paper on Wednesday titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions".

The document outlines China's principles, proposals and actions on global governance, aiming to foster broader consensus within the international community, ensure more effective responses to global challenges and build a more just and equitable global governance system.

The world faces severe and complex challenges, along with increasing disruptions to the postwar international order. The two pressing questions of the era are: What kind of global governance system should be established, and how can global governance be reformed and improved?

China has always been an active participant in, contributor to and builder of global governance as it regards it as a common endeavor that bears on the well-being of all humanity.

In promoting a global governance system characterized by extensive consultation and joint contribution for shared benefit, President Xi Jinping has called for true multilateralism to foster an equal and orderly multipolar world and a universally beneficial and inclusive economic globalization.

To this end, he has put forward the vision of building a community with a shared future for humanity and proposed the Global Governance Initiative to build a more just and equitable global governance system.

Resolutely upholding the authority and status of the United Nations is fundamental to the effective implementation of the GGI, which, aligned with the growing trend toward greater democracy in international relations, offers a clear and feasible road map for improving global governance.

That the GGI has the support of nearly 160 countries and international organizations — with over 60 countries joining the Group of Friends of Global Governance — sends a clear signal that building a just and equitable global governance system is a shared vision pursued by the international community.

Anchored in the purposes and principles of the UN Charter and guided by a vision of global governance featuring extensive consultation, joint contribution and shared benefits, the GGI upholds multilateralism and unites forces in pursuit of a fairer future.

But as the white paper stresses, the effective implementation of the GGI hinges on major countries bearing a sense of responsibility and all nations unitedly addressing the peace and development deficits.

With the declining effectiveness of some international mechanisms and inadequate rules in emerging areas, the fragmentation in global governance is evident. There is a "compound crisis" in which the lack of security, development, governance and trust are intertwined.

On the one hand, the world is experiencing deeper multipolarization and the rapid rise of the Global South. On the other hand, the existing governance system suffers from a lack of representativeness, inclusiveness and effectiveness. This is exacerbated by heightened competition among major countries, obstacles to multilateral cooperation and a decline in international trust.

As the white paper states, there is no need to reinvent the wheel to overcome these challenges. What is needed is for all countries to firmly uphold the international system with the UN at its core, safeguard the international order based on international law and uphold the basic norms governing international relations underpinned by the purposes and principles of the UN Charter.

China, on its part, has been consistent in this regard. Noting that China was the first country to sign the UN Charter, Foreign Minister Wang Yi said at a news conference held to present the white paper on Wednesday that the country is ready to work with other countries to reinvigorate and strengthen the UN and uphold the authority of the UN by advancing the GGI. The GGI is action-oriented and aligned with the Global Development Initiative, Global Security Initiative, Global Civilization Initiative and high-quality Belt and Road cooperation.

Embodying the unity of ideas and actions, the GGI provides important conceptual guidance and practical pathways for steering the global governance system toward greater justice and equity, contributing Chinese wisdom and solutions to resolving the shortcomings in global governance.

Drone 'partnership' mask for remilitarization

On the agenda of the G7 leaders who met in France this week was reportedly a proposal straight out of a geopolitical conjurer's playbook: Japan's participation in the Eurodrone project.

On paper, this is a straightforward case of industrial synergy. Europe wants to reduce its reliance on US and Chinese supply chains; Japan, with its precision manufacturing, needs new partners to ease the strain on an overstretched US defense industry. It sounds like a pragmatic "alignment" of interests.

But to see this as merely a tech-transfer or investment deal is to miss the strategic bamboozling at its heart. This is the latest, and perhaps most brazen, act in a well-rehearsed Japanese trick: the art of "security" packaging. Tokyo has become a master of cloaking military ambition in the drab language of economic and technological cooperation.

The Eurodrone initiative seems to be the perfect vehicle. It allows Japan to deepen its military ties with key European countries, gain access to sensitive drone technology for its own "counterstrike" capabilities, and embed itself further into Europe's military-industrial base — all under the guise of supply-chain "diversification".

The G7, already grappling with its existential anxieties, is susceptible to being hoodwinked in this way, as Europe's post-Ukraine security jitters mean it is predisposed to Japan selling itself as an indispensable "natural partner". By exploiting the European need to reduce dependency on the US for military supplies, Tokyo hopes to weave Japan's "remilitarization" into the fabric of collective Western security. As Tokyo sees it, if it can get a G7 stamp of approval for a project like Eurodrone, it gains a powerful imprimatur for its broader "remilitarization".

Gaining international "legitimacy" for its military expansion is not an afterthought, but the core objective of the move.

The Sanae Takaichi government has labeled China as Japan's "unprecedented strategic challenge"; Japan has doubled its military budget in a mere four years, with spending set to hit a staggering 9 trillion yen ($56.15 billion) this year; and it is actively developing offensive weapons that effectively shatter its postwar "exclusively defense-oriented" principle.

And this brings us to the uncomfortable historical parallels that polite diplomatic discourse tends to forget. The very same *zaibatsu* industrial conglomerates that will be at the heart of any Japan-Europe defense project were the indispensable gears of Japan's wartime military machine. This structural continuity, combined with the right-wing forces that continue to whitewash its wartime history, should set alarm bells ringing.

The proposal by the ruling Liberal Democratic Party to increase military spending to 3 percent to 3.5 percent of Japan's GDP, and to build "sustained combat capability" for a prolonged "emergency", demonstrates the direction of the dangerous journey the Takaichi government is leading Japan on at present.

It is a trajectory of a state methodically, and seemingly with "great courtesy", dismantling its constitutional shackles. Japan has not yet formally revised Article 9, but with its "helicopter destroyers" that are effectively aircraft carriers and its latent capability to produce nuclear weapons, the infrastructure for a potent military force is already in place. All that remains is the final push.

Therefore the query posed by Chinese Foreign Ministry spokesman Lin Jian warrants serious global attention. Highlighting Japan's history of militarism and foreign aggression, Lin asked some pointed and timely questions: Is Japan's militarist past returning? Is Japan speeding down the path of "remilitarization"? Could Japan once again become the bane of East Asia?

As the G7 leaders consider Japan's proposal, they should ask themselves whether they are engaging with a peaceful partner, or are they providing, through their own anxieties, a multilateral seal of approval for Japan's strategic revisionism? The European G7 members risk becoming enablers of aggression. They should not be fooled by the language of "partnership". This is about more than drones; it's about setting a dangerous precedent.

East-west pairing assistance key to balanced development

China's east-west pairing assistance program — a mechanism launched in 1996 — continues to shape the country's pursuit of more balanced and inclusive growth. This was evident on Wednesday, when officials gathered in Yinchuan, capital of the Ningxia Hui autonomous region, to review and further improve the program.

Over the past decades, the reform and opening-up of China have greatly promoted the development of the country in all aspects. While prosperity has been generated along the country's eastern coast, its western areas have lagged behind in comparison. The challenge is to ensure growth benefits are distributed more evenly across the vast country.

In response, policymakers have established a framework linking the developed eastern regions with their less-developed western counterparts, creating channels through which capital, talent, technology and market opportunities can flow across administrative boundaries. Over time, this has evolved into a coordinated development assistance system.

Over the past five years, enterprises have been guided to invest more than 750 billion yuan ($111 billion) in the western regions. This program has helped more than 5 million rural workers from western China secure jobs and facilitated nearly 570 billion yuan in sales of agricultural products from western regions to the eastern markets. These figures suggest that the mechanism is not just redistributive. It has created sustainable economic linkages and growth opportunities.

Equally notable is the institutional architecture developed over the years. The program now operates through five major mechanisms: industrial cooperation, labor collaboration, consumer assistance, talent exchange and social support. Together they connect investment, employment, market access, human capital and public services into a single framework.

Industrial cooperation encourages investment and industry upgrading. Labor collaboration expands employment opportunities. Consumer assistance creates sizable markets for agricultural products. Talent exchange transfers expertise and managerial experience. Social support mobilizes educational, healthcare and other public resources. Each mechanism addresses a different dimension of regional inequality.

The significance of this model lies in its compatibility with China's national conditions. A country of continental scale, marked by vast differences in geography and development levels, requires institutions capable of coordinating resources across regions. The pairing program turns regional disparities into opportunities for complementary development. Eastern regions gain access to new markets and labor resources, while western regions benefit from investment, technology and expertise.

More broadly, the program reflects a characteristic of China's long-term development perspective. Few governments can sustain a development strategy across three decades while continuously adapting its objectives and implementation — from poverty alleviation to rural vitalization and coordinated regional development. The achievements of the pairing program owe much to long-range planning, policy continuity and incremental improvements in governance.

Experience around the world suggests that economic activity naturally gravitates toward already prosperous regions. China's approach has been to use institutions to mitigate this tendency without abandoning market mechanisms. The pairing program does not replace markets; it connects them by lubricating the internal circulation.

As China enters the 15th Five-Year Plan (2026-30) period, balanced development has become increasingly important for the efforts to realize common prosperity. Future growth will depend not only on technological innovation and industrial upgrading, but also on expanding domestic demand and ensuring broader participation in development. Regional coordination is therefore an economic imperative of national importance.

The east-west pairing assistance program should be adapted to the current situation. Unlike 30 years ago, many inland areas have become gateways to global engagement under the Belt and Road Initiative. Consequently, the east-west pairing assistance program should incorporate more cross-regional collaboration.

Thirty years after its launch, the program stands as a testament to a governance philosophy that prizes patience, continuity and long-term development — qualities that have helped transform the regional development gap into a story of increasingly shared growth.

— LI YANG, CHINA DAILY

What They Say

Chinese classics offer ways to tackle modern challenges

Editor's note: *The Second World Conference of Classics was held in Athens earlier this month. Chen Yun, a professor of philosophy at East China Normal University, who attended the conference, spoke to China News Service about why China's classics should be included in global classical studies. Below are excerpts of the interview and an analysis of the practical application. The views don't necessarily represent those of China Daily.*

From the perspective of Chinese classical studies, peace signifies not merely stability within human communities, but also harmony and balance between human society and nature. Stability within human society is based on respect for political, social, ethical and civilizational differences. In addition, it demands an integrative consciousness to transcend such divisions and achieve *tai he*, where all the people and all things coexist in supreme harmony.

The contemporary world order often reflects a "law of the jungle" mindset, where might makes right, conflating human society with the animal kingdom. Such thinking amounts to a negation of civilization.

In contrast, the Chinese concept of *tianxia weigong*, or pursuing the common good for all under heaven, from the classic *The Book of Rites*, represents an ideal vision for the world order. *Tianxia*, or "all under heaven", transcends political boundaries to encompass a civilizational domain, integrating individuals and societies into a community of humanity.

In real life, it is necessary to cultivate individuals who are capable of bearing the responsibility for all under heaven, and encourage them to break free from serving narrow group interests and commit themselves to the shared interests of all humanity.

Confronted with the current world order and its multiple challenges, we must mobilize both political and non-political forces to forge a humanitarianism suited to the age of globalization, and improve global governance through diverse approaches.

Fairness, justice and equality are long-existing pursuits of Chinese philosophers from ancient times to today. The political principle of serving the public is deeply embedded in the concept of "pursuing the common good for all under heaven", which is in drastic contrast to the concept of "pursuing good for the small interest group".

Behind political concepts such as being people-oriented, selection of the capable and the rule of virtue lies the concept of "pursuing the common good for all under heaven". This has become a central feature of the traditional Chinese political value system.

The pursuit of the common good is the prerequisite for achieving fairness, and only by prioritizing public welfare, can social fairness be realized.

These values underpin China's role as a steadfast promoter of world peace and shared development.

The pursuit of common good for all under heaven carries the core wisdom of Chinese civilization. Deeply rooted in the fertile soil of Chinese culture, it has not only become an important ideological resource for the development of Chinese society, but also provides Chinese solutions for the future of humanity.

VIEWS

Ro Jae Hun

Toward more mature ROK-China ties

In June this year, the ROK witnessed the first anniversary of its new government. Within just one year, the Lee Jae Myung administration has not only restored political stability and economic confidence, but also elevated the ROK's global standing through its "pragmatic diplomacy".

President Lee Jae Myung's proactive summit diplomacy — encompassing official visits to 14 countries and hosting the heads of state from 13 nations — has enabled ROK diplomacy to rebuild international confidence while strengthening strategic partnership and multilateral diplomacy.

Global Lens

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

SHI YU / CHINA DAILY

In particular, ROK-China relations have developed to new heights within a remarkably short period of time.

The two successful summit meetings served as a vivid testament to the dramatic progress in bilateral relations, yielding tangible and meaningful outcomes across a wide range of areas.

As indispensable neighboring countries, the ROK and China have shared common interests in many areas and maintained close relations since the establishment of diplomatic ties in 1992. Through mutual efforts, bilateral relations have reached a new peak.

Last November, the ROK successfully hosted the 2025 APEC Economic Leaders' Meeting in Gyeongju, achieving a milestone outcome with the adoption of the "Gyeongju Declaration" aiming towards easing regional trade barriers and stabilizing global supply chains.

On this occasion, President Xi Jinping visited the ROK. It was the first state visit by President Xi Jinping in 11 years. During his visit, the two leaders engaged in hours of comprehensive discussions, reaffirming the core value of our strategic cooperative partnership and laying out a blueprint for the comprehensive development of bilateral relations across political, security, economic, and cultural spheres. Then only two months later, President Lee visited Beijing. It was the first state visit by the ROK President in 9 years. These consecutive summit meetings have led to the following results.

On the political side, the two countries fully restored strategic and cooperative partnership. Mutual trust is being restored, and mutual respect is deepening. Both agreed to work together for a more stable and secure Korean Peninsula. High-level engagement and strategic communication continue to intensify.

On the economic and trade side, concrete numbers accurately reflect the positive momentum in bilateral relations. From the inauguration of the Lee Jae Myung administration through May 2026, trade between the ROK and China has totaled $315.9 billion, marking an 18 percent increase from the same period a year earlier.

The two leaders shared their vision for future cooperation in the field of investment, AI, bio industry and smart cities. Cooperation for securing a stable supply chain has been strengthened. Negotiations for the new trade and investment FTA are accelerating.

An agreement was reached to extend the currency swap. Discussions on demographic challenges facing the two countries such as aging society and silver economy were also on the agenda. As the two countries prioritize the livelihood of the people, these mutual cooperation will benefit the people of both countries.

A total of around 20 MOUs were signed to secure the implementation of the mutual agreements. These are substantive measures that will help stabilize and cement bilateral relations, especially in an increasingly uncertain global environment.

On people-to-people exchanges, mutual visits are on an upward trend, especially as both sides relaxed visa policy. The number of international flights between the ROK and China reached 113,200 just within 11 months since the launch of the current administration, marking an 8.3 percent increase.

The expanded connectivity has driven a significant increase in people-to-people exchanges, with bilateral visitor numbers rising to 8.45 million, up an approximately 26 percent. Cultural and sports cooperation is also expanding. To the delight of soccer and baduk fans, the two sides are strengthening partnerships and people-to-people exchanges in these areas, which are of great common interest to the younger generations of both countries.

Building on this growing momentum, the ROK-China Summer Youth Sports Exchange is scheduled to take place this year between Jeollabuk-do and Hainan Province, featuring friendly matches in badminton, basketball, table tennis, and baduk.

With joint efforts, these exchanges have helped improve mutual perceptions. Taking China's concerns seriously, President Lee himself publicly spoke out against the spread of misinformation and domestic fake news concerning China. According to a ROK polling organization, the favorability rating toward China recently rose from 21.3 to 30.2 percent just within a year.

Moreover, the share of those who regarded the relations as either good or average rose significantly to 78 percent. Concurrently, various other studies indicate that Chinese citizens' favorability toward the ROK has improved as well. It clearly demonstrates a meaningful and reciprocal turnaround in mutual public perceptions.

The upcoming 2026 APEC Economic Leaders' Meeting in Shenzhen, China will present another important opportunity for the ROK and China to further strengthen strategic communication and deepen practical cooperation.

Building on the positive momentum achieved through the recent summit meetings, the two countries will continue to expand collaboration in emerging future-oriented fields.

Guided by the common understandings reached by two leaders, the ROK and China will work together to manifest the shared visions into substantive outcomes, accumulate mutual trust and expand people-to-people exchanges.

Advancing strategic cooperative partnership toward a more mature, stable, and ever-deepening relationship is the path the two countries are taking together.

Arkebe Oqubay

Hainan Free Trade Port redefines economic openness

On Dec 18, 2025, the anniversary of China's landmark reform and opening-up policy, Hainan launched island-wide special customs operations — a moment that transformed the entire tropical province into the world's largest free trade in terms of area. Six months on, the numbers are striking, and the strategic logic is becoming clear.

Global Lens

Trade has surged. By the end of February 2026, Hainan's total goods imports and exports had reached 65.49 billion yuan ($9.7 billion), up 29.1 percent year-on-year — outpacing the national average by 14 percentage points. Exports alone grew by 55.4 percent.

Markets in the Association of Southeast Asian Nations, Africa and Latin America have all seen substantial growth, pointing to a genuinely diversified trade base rather than dependence on a single partner or region.

But statistics alone do not capture what makes Hainan significant. To understand why this experiment matters — not just for China, but for the wider world — it helps to ask a simple question: why choose to open up precisely when so much of the world is closing down?

The past few years have seen a wave of economic nationalism sweep through advanced economies.

Tariffs have been raised, supply chains have been "reshored" in the name of security and trade policy has increasingly been wielded as a geopolitical weapon. Hainan represents a deliberate and confident move in the opposite direction, demonstrating that openness need not mean vulnerability.

What makes Hainan different from previous Chinese free trade zones is not just its scale — though covering an entire province of 35,000 square kilometers is certainly unprecedented — it is the depth of its institutional openness.

Zero tariffs now apply to over 6,600 categories of goods, up from around 1,900 before. A corporate income tax rate of 15 percent makes it one of the most competitive business environments in Asia.

The customs framework itself is innovative. Goods move freely within the island; stricter checks apply only when products cross into the Chinese mainland market — what officials call "freer access at the first line, regulated access at the second line".

This gives foreign businesses a genuine staging ground: they can process, assemble and add value in Hainan before selling into China's vast domestic market.

One provision deserves particular attention. Imported products that undergo at least 30 percent value-added processing in Hainan can enter the mainland tariff-free.

This single rule transforms Hainan from a transit point into a place where real economic activity — and real economic value — can be created.

Critics might ask: is this not simply another special economic zone, a familiar feature of China's development landscape since the 1980s? The answer is no, and the distinction matters.

Earlier pilot free trade zones — there are now 24 of them, including the pioneering Shanghai FTZ established in 2013 — were designed as contained experiments. Hainan is something qualitatively different: a full-province model that builds on four decades of accumulated experience while breaking genuinely new institutional ground.

It is a testing ground for cross-border trade financing, greater foreign exchange flexibility, and blockchain-based payment systems.

For countries seeking alternative financial infrastructure, these pilots are worth watching closely.

Perhaps the most distinctive aspect of Hainan, and the one least appreciated in mainstream media, is what it offers developing countries.

The Global South is not a monolithic bloc, but its economies share certain common challenges: they export raw materials and agricultural commodities and struggle to move up the value chain. Hainan's design speaks directly to these challenges.

For ASEAN producers of palm oil, rubber, tropical fruits and fisheries products, Hainan offers preferential access to the Chinese market — one of the world's largest — without the full burden of mainland customs compliance.

More ambitiously, the value-added processing incentives mean that a Malaysian palm oil refiner or an Indonesian electronics assembler can locate operations in Hainan, add value and ship to Chinese consumers under favorable terms.

This is a path from commodity exporter to processed-goods exporter — precisely the transition that development economists have long argued is essential for sustainable growth.

A joint survey released on Hainan's 100th day of customs operations found that over 70 percent of ASEAN enterprises surveyed already recognize Hainan's strategic value as a platform for entering the Chinese mainland market. Export growth to ASEAN, Africa and Latin America has expanded substantially since December.

The cooperation goes beyond trade in goods. Hainan is developing sectoral platforms in tropical agriculture, healthcare, green energy and the digital economy. The Boao Lecheng International Medical Tourism Pilot Zone has become a key channel for the entry of advanced pharmaceuticals into China.

A green and digital innovation project in Baoting (a Li and Miao autonomous county in Hainan) is piloting climate-resilient development models that can be adapted and replicated in other island nations and developing countries.

These are not conventional export-processing zones that funnel goods to Northern markets while leaving the local economy largely untouched. They are platforms for a different kind of cooperation — one in which China and developing country partners build capability together.

Could other countries learn from the Hainan model? The answer depends on what one is trying to learn.

Rules-based, institutional openness — where businesses can plan around predictable policies rather than arbitrary political decisions — is a sustainable competitive advantage.

Singapore built its prosperity on this logic. Hainan is testing whether a larger, continental economy can do the same. The answer will be whether foreign enterprises move beyond registering in Hainan to actually producing there; whether the financial innovations gain traction; whether the trade links with ASEAN and the broader Global South deepen into genuine supply-chain integration.

Traditional export-processing zones tend to create enclave economies: jobs and foreign exchange, but have weak links with domestic industry and little technological transfer.

Hainan's design — with its value-added incentives, sectoral cooperation platforms and integration across an entire province rather than a fenced compound — offers a more holistic template. For countries in Africa, Southeast Asia and Latin America that are weighing their development strategies, the lessons are potentially transformative.

For advocates of multilateralism, Hainan is a timely reminder that trade liberalization can still be driven by unilateral ambition as much as negotiated agreement.

Malaysia has already identified Hainan as a testing ground for high-standard implementation of the Regional Comprehensive Economic Partnership. If the experiment succeeds, it could provide practical momentum for wider regional integration at a moment when the multilateral trading system is under strain.

Hainan is still in its infancy. But what the first six months have established is that the foundations are solid. The customs system works. The numbers are moving in the right direction. The institutional framework is in place.

In a world where many governments are retreating behind walls, Hainan is a door held open.

For trade partners, investors, and development planners across the Global South and beyond, that invitation deserves a serious response.

EU's tariff walls risk eroding its industrial foundation

The intense debate in the European Union over what Western policymakers called "a new wave of industrial competition" may prove to be a watershed moment in the bloc's trade policy.

In a crunch meeting in Brussels, EU commissioners explored broad sector-wide import quotas and tariff safeguards aimed at bolstering the competitiveness of European manufacturing.

At the same time, European Commission President Ursula von der Leyen secured a major political agreement with Hungarian Prime Minister Peter Magyar, unfreezing €16.4 billion ($18.9 billion) in previously blocked EU funds.

Though analysts see these twin developments as notable progress in strengthening the bloc's industrial resilience and internal cohesion, a closer look reveals the underlying challenges amid the adjustments.

Brussels is attempting to strengthen its economic and trade dominance on a foundation of systemic economic friction and internal compromises.

The result is a profound institutional paradox. Europe is attempting to curb imports from reliable suppliers that help sustain the stability of its green supply chains while simultaneously spending billions to manage domestic political disagreements.

It is mimicking the protectionist, industrial-policy playbook of the United States even though it doesn't have the same fiscal firepower, abundant domestic resources or deep capital markets. The EU is inadvertently undermining its own industrial base under the weight of high energy costs and strategic overreach.

Global Lens

Europe's dilemma can be broken down into three systemic challenges. First, self-inflicted industrial pressure is accelerating across the continent.

The EU is inadvertently undermining its own industrial base under the weight of high energy costs and strategic overreach.

While public attention centers on high-profile trade disputes over electric vehicles, trade data reveals a deeper reality: European industry is heavily dependent on highly efficient imported intermediate inputs.

Many manufacturers rely on basic components that are significantly more cost-effective than domestic alternatives because of the scale and clustering advantages enjoyed by foreign producers.

This dependence extends to critical sectors. From polyhydric alcohols used in plastics and paints to vital amino acids used in pharmaceuticals, European industries continue to rely heavily on imported inputs. By applying one-size-fits-all safeguard clauses across sectors, Brussels is not protecting its industry; it is raising input costs for its remaining factories.

This leaves European manufacturers facing a tough choice: absorb higher costs and lose global competitiveness, or shut down domestic production entirely.

Second, Europe doesn't have the fiscal capacity required to execute a successful protectionist shift. Unlike the US, which can utilize massive federal subsidies to support domestic supply chains, the EU operates without a unified fiscal architecture. The EU Net-Zero Industry Act remains a regulatory blueprint rather than a well-funded commercial engine. Forced to operate within these rigid constraints, European policymakers are attempting to use trade defenses to curb market competition.

However, this excessive use of trade regulatory tools doesn't address the underlying macroeconomic reality: Europe lacks the cheap domestic energy and raw materials required to bridge the massive price gaps created by the efficiency of foreign producers. Consequently, protectionist measures function less as engines of industrial renewal and more as an economic surcharge on European consumers and businesses, driving up inflation while doing nothing to build real structural resilience.

Third, managing internal fragmentation through fiscal concessions risks creating permanent instability within the EU. The sudden release of €16.4 billion to Budapest, which is roughly 13 percent of Hungary's national budget, shows that the EU must continuously compromise its institutional principles to preserve a fragile consensus on foreign policy.

To advance a more protectionist economic agenda against external competitors, the European Commission is forced to offer financial incentives to seek the cooperation of member states that challenge the Brussels consensus.

This approach may buy temporary unity, but it creates a highly flammable domestic political environment.

While officials warn that millions of industrial jobs are at risk, member states remain divided on how to respond. Core manufacturing states such as France demand aggressive trade barriers to protect the domestic industry, but export-dependent economies such as Germany and Spain remain wary of provoking retaliatory trade restrictions.

The result is a fragmented union that buys short-term legislative compliance at the cost of long-term economic coherence.

The mechanics of this strategy are clear: trade protectionism without an underlying, fully funded fiscal expansion cannot preserve an industrial base. At best, it delays industrial adjustment; at worst it subsidizes industrial obsolescence.

By drifting away from the rules-based frameworks of the World Trade Organization in favor of unilateral safeguards, Europe risks weakening the very global architecture that enabled its prosperity. The ultimate implication of this shift is that Europe may be trapping itself in a structural corner. It risks alienating partners in the Global South by restricting access to its market, cutting off its own access to affordable technological components, and remaining dependent on external security guarantees.

Until Brussels addresses these structural contradictions and embraces the reality of global economic interdependence, its aggressive trade posture will remain an exercise in managing decline, rather than asserting constructive global leadership.

APEC's approach to resilience

The bloc's value lies not in issuing broad declarations, but in transforming consensus into replicable and scalable public goods for regional and global governance through pragmatic cooperation

Received by NSD/FARA Registration Unit 08/26/2026 3:36:32 PM

Liu Chenyang

Yu Xiaoyan

Asia-Pacific regional cooperation has become increasingly important amid growing uncertainty in the global economic and trade landscape, driven by sluggish global growth, rising trade protectionism and accelerated restructuring of industrial and supply chains. The APEC Ministers Responsible for Trade Meeting, held in Suzhou, Jiangsu province, from May 22 to 23, marked an important milestone in China's role as APEC host in 2026. More importantly, it helped build consensus and shape the agenda for the APEC Economic Leaders' Meeting, which will be held in Shenzhen, Guangdong province, in November.

Since its establishment in 1989, APEC has played a central role in shaping the Asia-Pacific economic order through a distinctive "APEC approach" that is tailored to the region's diversity and varying stages of development. Based on voluntary, non-binding and consensus-building principles, APEC embraces open regionalism and promotes regional economic cooperation on the basis of equality and mutual benefit. By maximizing common ground while respecting differences, it has strengthened regional cohesion and fostered broad-based consensus across the region.

From the Bogor Goals to the Putrajaya Vision 2040, APEC has consistently provided long-term strategic direction for regional cooperation. The Bogor Goals — a commitment APEC leaders made in Bogor, Indonesia, in 1994, to achieve free and open trade and investment by 2010 for industrialized economies and by 2020 for developing economies — established a phased roadmap toward trade and investment liberalization, helping transform the Asia-Pacific into one of the world's most dynamic and open economic regions during the height of globalization. The Putrajaya Vision 2040, adopted in 2020, envisioned an open, dynamic, resilient and peaceful Asia-Pacific community. It identified three economic drivers — trade and investment; innovation and digitization; and strong, balanced, secure, sustainable and inclusive growth.

China's proposed theme for APEC 2026, "Building an Asia-Pacific Community to Prosper Together", together with its three priority areas — openness, innovation and cooperation — represents both a continuation and a concrete implementation of this vision.

In terms of openness, the 2024 APEC Economic Leaders' Meeting issued the Ichma Statement on A New Look at the Free Trade Area of the Asia-Pacific agenda, strengthening the multilateral trading system, opposing protectionism and enhancing supply chain cooperation.

In terms of innovation, APEC has prioritized cooperation in emerging fields such as the digital economy, artificial intelligence, green development and new energy technologies, with a strong emphasis on technology-driven growth.

In terms of cooperation, APEC continues to promote inclusive and sustainable development, with particular attention to food and energy security, climate change, poverty reduction and greater integration of small and medium-sized enterprises and vulnerable groups into global value chains. Together, these priorities reflect APEC's ongoing efforts to promote high-quality growth in the Asia-Pacific while expanding both the scope and depth of regional economic cooperation.

SHI YU / CHINA DAILY

The Asia-Pacific region's role as a stabilizing force in the global economy is rooted first and foremost in its considerable economic weight and high degree of openness. According to official APEC statistics for 2025, the region was home to approximately 3 billion people, accounting for 36.6 percent of the global population. Its real GDP reached $57.5 trillion, representing 59.4 percent of the world total, while its imports and exports of goods and commercial services accounted for 46.8 percent and 46.2 percent of global trade, respectively.

Data from the APEC Policy Support Unit show that the region achieved real GDP growth of 3.5 percent in 2023 and 3.3 percent in 2024. The latest edition of the APEC Regional Trends Analysis shows growth of around 3.3 percent in 2025. Despite fluctuations in global demand, tightening financial conditions and escalating trade frictions, the Asia-Pacific economy has maintained relatively strong resilience, underscoring the enduring value of open markets, deep economic integration and regional cooperation as drivers of growth.

This stabilizing role is also reflected in APEC's capacity for institutional innovation and rule incubation. In 2012, APEC introduced a list of environmental goods that later served as an important reference for negotiations on the World Trade Organization Environmental Goods Agreement. During the 2014 Beijing APEC meetings, China and the United States reached a consensus on expanding the Information Technology Agreement, paving the way for the WTO's 2015 agreement to eliminate tariffs on 201 IT products.

APEC has also successfully implemented initiatives such as the APEC Business Travel Card scheme to facilitate cross-border business mobility, as well as two phases of Trade Facilitation Action Plans and the Connectivity Blueprint, all of which have significantly reduced transaction costs and enhanced regional connectivity. These efforts have also helped advance the implementation of commitments under the WTO Trade Facilitation Agreement.

These examples demonstrate that APEC's value lies not in issuing broad declarations of principle, but in its ability to transform consensus into replicable and scalable public goods for regional and global governance through pragmatic cooperation.

For China, APEC has long served as a major platform for participating in international economic cooperation. As the first regional economic cooperation mechanism China joined, APEC has provided an important channel for advancing China's diplomacy as a major country, including head-of-state diplomacy, neighborhood diplomacy and economic diplomacy.

APEC's vision of building an Asia-Pacific community by 2040 also carries significant practical relevance for China's efforts to build a community with a shared future for humanity. By fostering a stable and favorable regional environment, APEC supports China's pursuit of institutional opening-up and high-quality development. Continued progress in trade and investment liberalization and facilitation, regional connectivity, and Asia-Pacific value and supply chain cooperation will further strengthen China's capacity for high-level opening-up and create broader space for advancing Chinese modernization.

This year, China is hosting APEC for the third time. Both the Shanghai Accord adopted in 2001 and the Beijing Agenda issued in 2014 have become landmark achievements in APEC's history.

Going forward, China will demonstrate the responsibility of a major country by supporting the openness of the Asia-Pacific economy and promoting practical cooperation in areas such as the Free Trade Area of the Asia-Pacific, connectivity, the digital economy and AI in response to evolving trends in global trade restructuring. China will also work with all parties to build an Asia-Pacific community, inject new momentum into regional development, and strengthen the synergy between APEC-led regional cooperation and global governance, further reinforcing the Asia-Pacific's role as the primary engine of global economic growth.

Trade trends maintain momentum

New growth engines highlight the robustness as China enters the transformative 15th Five-Year Plan period

Wang Chenwei

Wang Haotian

According to the General Administration of Customs, China's foreign trade reached 20.68 trillion yuan ($3.05 trillion) in the first five months of 2026, marking a year-on-year increase of 15.3 percent. With key economic indicators outperforming expectations, the figures signal a strong start to the 15th Five-Year Plan (2026-30) period, highlighting the steady progress and long-term growth momentum of China's economy.

Foreign trade has long been a key engine of economic growth. Advancing innovation-driven trade is essential to building a higher-level open economy and promoting high-quality development. Despite pressures from a challenging global environment, China's foreign trade has remained resilient and continued to reach new highs. Since the beginning of this year, China's foreign trade has shown four trends.

First, technology-intensive industries have become the backbone of exports. In the first five months of the year, total exports reached 11.91 trillion yuan, up 11.8 percent from a year earlier. Exports of mechanical and electrical products remained the key driver of growth, rising 18.4 percent to 7.58 trillion yuan and accounting for more than 60 percent of total exports. In contrast, exports of labor-intensive products fell 3.1 percent year-on-year to 1.61 trillion yuan.

Second, robust import growth has created new opportunities for international economic cooperation. Data from the General Administration of Customs showed that in the first five months of the year, China's imports totaled 8.77 trillion yuan, up 20.5 percent year-on-year. Imports of mechanical and electrical products increased by 25.3 percent, while imports of agricultural products also maintained steady growth. These trends suggest that an increasingly open China is responding to both domestic and global demand, while promoting mutually beneficial cooperation and shared development.

Third, private enterprises are leading the growth, recording a total import and export volume of 11.81 trillion yuan in the first five months, an increase of 15.5 percent. Foreign-invested enterprises reached 6.02 trillion yuan, up 15.7 percent, while State-owned enterprises totaled 2.81 trillion yuan, up 14 percent. Private enterprises accounted for more than half of the total trade volume, consolidating their stabilizing role in foreign trade.

Fourth, diversified trading partners and accelerated cooperation with emerging markets are contributing to a more stable and balanced trade structure. In the first five months, trade between China and Southeast Asian nations reached 3.52 trillion yuan, up 16.6 percent year-on-year. Trade with European Union countries totaled 2.53 trillion yuan, up 10.3 percent. Trade with the Belt and Road partner countries reached 10.57 trillion yuan, accounting for more than half of China's total foreign trade.

Meanwhile, it is important to recognize the risks posed by geopolitical tensions, sluggish global growth and rising trade protectionism. At home, China faces structural challenges, including frictions in the shift toward new growth drivers, relatively weak investment and consumption, insufficient domestic demand, the long-term task of industrial upgrading and risks in key sectors.

Despite these headwinds, China's economy is expected to remain resilient, supported by robust macroeconomic policies. China's system of centralized coordination enables it to mobilize resources efficiently and implement both cross-cycle and counter-cyclical policy measures, helping cushion the impact of external shocks. The country's vast domestic market, comprehensive industrial base and deeply integrated supply chains continue to provide strong structural advantages. Expanding domestic demand and continuous industrial upgrading also underpin China's long-term economic growth.

Against this positive economic backdrop, China's foreign trade is poised to stay vibrant. China has steadily expanded and diversified its trade ties across both traditional and emerging markets, enhancing its ability to withstand external shocks. To date, according to the Ministry of Commerce, China has signed 24 free trade agreements with 31 countries and regions, and its free trade partners account for 45 percent of its total goods trade. Trade-facilitating measures, including the granting of 100 percent zero-tariff treatment to African countries with diplomatic relations with China, along with deeper economic engagement with the EU, the Association of Southeast Asian Nations and the Belt and Road partner countries, are expected to create fresh momentum for trade growth.

The technological revolution and industrial transformation are also becoming key engines of foreign trade growth. As emerging industries expand and new business models evolve, Chinese companies are becoming increasingly innovative and more motivated to explore overseas markets. In 2025, the largest gains in exports came from the "new trio" of new energy vehicles, lithium-ion batteries and photovoltaic products. According to the China Association of Automobile Manufacturers, exports of new energy vehicles surged 103.7 percent. The integration of data, technology, application scenarios and hardware is not only accelerating industrial development, but also empowering foreign trade enterprises.

LI MIN / CHINA DAILY

Looking ahead, China should continue strengthening its domestic economy while fostering a more dynamic interplay between domestic and international markets.

First, China should continue pursuing mutually beneficial cooperation to sustain the vitality of foreign trade. This includes steadily expanding a high-standard network of free trade zones and further diversifying international markets to strengthen trade resilience. At the same time, private enterprises should be further empowered as both the backbone of foreign trade and a major source of innovation. By seizing the opportunities presented by new technologies, China can move up the global value chain with more high-tech and high-value-added products, while enhancing private enterprises' capacity to expand into overseas markets.

Second, China should further coordinate policy measures with market development to unlock the potential of domestic demand. To upgrade consumer spending, targeted measures should be implemented to boost consumption, foster new consumption scenarios and models, and increase financial support for consumer goods trade-in programs. Greater efforts should also be made to cultivate new growth drivers such as cultural tourism, sports events, healthcare and wellness-related consumption. In addition, China should continue promoting a unified national market to create a more favorable business environment.

Third, China should advance high-quality, innovation-driven development to strengthen the foundations of its foreign trade supply chains. This includes implementing the "AI Plus" initiative, fostering new forms of the intelligent economy and enhancing industry chain coordination and digitization. In key sectors, strategic capabilities should be strengthened by increasing investment in research and development of core technologies, equipment and products, thereby improving the resilience of supply chains in critical areas. At the same time, China should further deepen international cooperation on industrial and supply chain development, actively participate in global rule-setting, and contribute to the stable and efficient functioning of global industrial and supply chains.

AI agents set to revolutionize payment biz

Agentic commerce to bring shifts to transactions, boost autonomous services

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

As artificial intelligence platforms and merchant-integrated agents become more sophisticated, consumers are expected to increasingly delegate tasks such as product searches, comparisons, decisionmaking and purchasing to agents. The shift signals a new era of commerce moving from direct user interaction to a model built on user authorization and autonomous agent execution.

The rise of agentic commerce, however, presents new security and trust challenges. Merchants must be able to verify that transactions originate from legitimate AI agents rather than fraudulent actors, ensure purchases accurately reflect users' intentions and safeguard customer funds throughout the transaction process.

Against this backdrop, Chinese e-commerce giant JD unveiled its Agent Autonomous Payment Protocol on June 11. The framework aims to enable AI agents to complete payments independently within user-defined rules and spending limits.

The protocol establishes six levels of payment autonomy, providing a gradual pathway from transactions that require full human approval to those that can be executed entirely by AI agents. To enhance security, each payment request is linked to three critical elements: the verified identity of the user, the authorized version of the AI agent and a trusted operating environment. Transactions are approved only when all three conditions are validated.

The protocol also separates users' primary accounts from agent-driven spending. All agent transactions are routed through dedicated subaccounts subject to predefined controls, including spending caps, transaction limits, approved use cases, expiration periods and designated payees. Users can monitor activity in real time and revoke an agent's permission at any moment.

China's broader payment ecosystem is moving in the same direction. On May 26, Alipay debuted its AI Wallet and Token Pay, taking a step further to extend its next-generation AI payment infrastructure.

The initiative is also expanding beyond China.

Singapore-based Ant International introduced the Agentic Mobile Protocol, an agentic payment framework built for mobile interfaces including digital wallets, super apps and wearable devices. The protocol is designed to facilitate secure and seamless purchases through AI agents while helping merchants overcome challenges such as cross-border interoperability as agentic commerce scales globally.

A key component of the Agentic Mobile Protocol is an enhanced Know Your Agent authentication framework, which establishes a standardized trust-rating system for AI agents. The mechanism is intended to allow merchants to verify not only the identity of customers, but also the identity and trustworthiness of the agents acting on their behalf, helping ensure that transactions reflect genuine purchasing intent.

China's push into agentic payments comes as global payment networks race to build the infrastructure for agentic commerce. Industry leaders are increasingly developing technologies that will allow autonomous AI agents to search and complete transactions on behalf of consumers and businesses.

Mastercard is pursuing a vision of a future in which AI agents could eventually transact continuously with one another, executing chains of payments.

On June 10, the company unveiled Agent Pay for Machines, a new service designed to enable machine-to-machine transactions across its global payments network. The service will allow payments to be authorized, orchestrated and settled at machine speed, supporting emerging AI-driven business models.

Unlike traditional point-of-sale or person-to-merchant payments — which are initiated directly by users — machine-to-machine transactions are expected to be programmatic, continuous and executed between systems in the background of digital commerce.

"Machine payments can make it possible for services to be bought and sold among agents at fundamentally different scales than payments today — very high volumes, very small values, very fast and at extremely low latency," said Jorn Lambert, Mastercard's chief product officer.

Also on June 10, Visa announced a strategic collaboration with OpenAI to enable secure payments within agentic commerce. Under the partnership, Visa will provide its global payments network, credentialing capabilities and security infrastructure to support agentic commerce services. The company's payment capabilities will be integrated into OpenAI experiences, giving developers and merchants a streamlined way to accept Visa payments initiated by AI agents.

Visa said payments will operate within clearly defined user permissions and controls, including spending limits, approved merchant categories and required approvals. Transactions will be backed by tokenized credentials, real-time authorization and fraud-monitoring systems designed to maintain strong consumer protections.

"AI will transform commerce more profoundly than the internet or mobile technology ever did," said Jack Forestell, Visa's chief product and strategy officer. "As AI agents become active participants in the economy, Visa's focus is to ensure transactions are trusted, secure and seamless."

Shanghai Disney Resort marks 10th anniversary with sights set on future

By **ZHENG ZHENG** in Shanghai
zhengzheng@chinadaily.com.cn

Executives from Walt Disney Co and its Chinese partners have expressed optimism about prospects for Shanghai Disney Resort, unveiling a series of expansion plans as the resort celebrated its 10th anniversary on Tuesday.

"When we opened these gates, we believed we could create something the world had never seen — a place where Disney storytelling met Chinese culture in a way that was genuinely new," said Josh D'Amaro, CEO of Walt Disney Co.

The resort has welcomed more than 100 million guests since its opening in 2016. "As we celebrate the park's first decade and look to its next, what excites me most is that we're just getting started," D'Amaro said.

Thomas Mazloum, chairman of Disney Experiences, said: "Being here in Shanghai has reconfirmed to me the immense opportunities we have in this beautiful country and around the world. You see here what happens when we show up where our fans and consumers are — and when we do so with a lot of innovation and immense respect for local culture."

Mazloum called Shanghai's track record a global blueprint. "I don't believe Shanghai Disney Resort will ever be completed, because we have a lot of imagination left."

The resort is already deep into its next expansion phase. Construction of its ninth themed area — a Spider-Man zone set to deliver the park's first major Marvel-themed attraction — reached a milestone just weeks ago when the last section of its roller coaster track was installed.

Two additional themed hotels are also under development.

Guan Taoping, chair of Shanghai Shendi Group — the Chinese joint venture partner — described the past decade as a journey of deep local roots, cultural exchange and regional development. She pledged to build on the resort's success to transform the broader area into "a world-class multiday tourism destination" and to accelerate what she described as a "culture-tourism-plus" industrial ecosystem.

"Our guests and fans, community and partners, cast and imagineers, and both shareholders have been the authors of the resort's story over the years," said Andrew Bolstein, president and general manager of Shanghai Disney Resort.

"As we continue the momentum built throughout the past 10 years, defined by continuous expansion and development, relentless innovation and a steadfast commitment to excellence, we are confident that the future of Shanghai Disney Resort is bright."

Tasia Filippatos, president and managing director of Disney Parks International, noted that Shanghai's innovations have generated lessons now being exported across the company's global network. "This park was built with the preferences, taste, and culture of the Chinese people at the forefront," she said, adding that many of those learnings have applications around the globe.

Experts say the resort's influence extends far beyond its gates. Lou Jiajun, a professor at East China Normal University — who has followed the project since 2009 — said the resort had transcended the boundaries of a theme park. "Over 10 years, Shanghai Disney has evolved from a single park to a resort, and then into a benchmark — for destination building, for industry leadership, and for the integration of culture and tourism," Lou said.

Lin Huanjie, president of the Institute for Theme Park Studies in China, credited the resort with rewriting the competitive logic of the industry.

"Disney's arrival made clear that competition should not be about scale and investment, but about building an experience system, creating emotional value and sustaining long-term operational excellence," he said.

Yuan Ding, executive dean of the Shanghai Disney Dream Vocational Campus and director at Shanghai Normal University, pointed to the resort's role as an employment engine. "Quantitatively, it has created hundreds of thousands of direct and indirect jobs for the entire Yangtze River Delta region," he said. "Qualitatively, it has elevated the appeal and professional standing of careers in the tourism and hospitality industry."

Inner Mongolia key hub to Sino-EU trade

By **ZHONG NAN** in Beijing and **YUAN HUI** in Hohhot

China's ongoing industrial upgrading and the launch of the China (Inner Mongolia) Pilot Free Trade Zone in April will create fresh momentum for China-Europe freight train services and provide stronger support for the country's foreign trade growth, said supply chain experts and customs officials.

The new pilot FTZ, within North China's Inner Mongolia autonomous region, covers 119.74 square kilometers and comprises three subzones in Hohhot, capital of the region; Manzhouli, a northern border city; and Ereenhot, a land port on the China-Mongolia border, each featuring differentiated functions and the development of industries tailored to local conditions.

The growing role of Inner Mongolia as a key gateway for China-Europe trade highlights the significance of the new FTZ.

On Friday, a China-Europe freight train loaded with small household appliances departed from Ereenhot, pushing the cumulative number of freight train trips passing through the network's central corridor beyond 25,000, said China State Railway Group Co Ltd (China Railway).

Lin Meng, director of the modern supply chain research institute at the Beijing-based Chinese Academy of International Trade and Economic Cooperation, said the steady rise in shipments of machinery, vehicles and other industrial products reflects the growing competitiveness of China's manufacturing sector.

> "Together with ongoing infrastructure upgrades, the initiative is expected to enhance the efficiency and capacity of China-Europe freight train services."
>
> **Chen Jianwei,** researcher specializing in foreign trade at the University of International Business and Economics

Continued growth in trade with European and Central Asian markets is expected to provide sustained support for freight demand, said Lin.

Chen Jianwei, a researcher specializing in foreign trade at the University of International Business and Economics in Beijing, said the development of the China (Inner Mongolia) Pilot FTZ is likely to draw greater investment in logistics, warehousing, processing and cross-border commerce.

"Together with ongoing infrastructure upgrades, the initiative is expected to enhance the efficiency and capacity of China-Europe freight train services," said Chen.

Ereenhot's railway port currently handles about 13 China-Europe freight trains daily. It is linked to 75 China-Europe freight train routes connecting more than 70 logistics hubs in over 10 countries, including Germany and Poland, said China Railway.

Freight throughput at Ereenhot railway port has maintained steady growth this year. As of June 11, the port had handled 2,137 China-Europe freight train trips, transporting 205,100 twenty-foot equivalent units and 1.97 million metric tons of cargo, up 15.1 percent, 9.7 percent and 28.6 percent year-on-year, respectively.

Mi Junming, deputy director of Manzhouli Railway Station Customs, said the rapid growth in freight volume has been accompanied by a notable upgrade in the cargo mix handled by Inner Mongolia's border ports.

Cargo once dominated by metals, chemicals, garments and footwear has increasingly given way to higher-value products such as electric vehicles, consumer electronics and household appliances, reflecting the upgrading of China's manufacturing sector and export structure, said Mi.

Statistics from Manzhouli Customs show that China's EV exports through Manzhouli railway port totaled 320 million yuan ($47.33 million) in the first five months, up 950 percent year-on-year.

Chinese EVs have gained increasing traction in overseas markets in recent years, supported by advances in battery technology, intelligent features and competitive pricing, emerging as an important contributor to China's export growth, said Chen Bin, deputy director of the expert committee of the Beijing-based China Machinery Industry Federation.

Yum buys full Pizza Hut China for $1.2b

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

On Tuesday, Yum China Holdings announced that it has entered into a definitive agreement to take full ownership of the Pizza Hut brand on the Chinese mainland in a $1.2 billion deal, a strategic shift that will eliminate ongoing royalty payments to Yum Brands.

The move gives Yum China direct control of one of its most profitable and fast-growing restaurant businesses. The transaction is expected to improve store economics and accelerate expansion, as Yum China pushes to deepen its dominance in the country's casual dining market.

Pizza Hut is currently the largest casual dining restaurant brand in China under the Yum China portfolio. In 2025, the business generated $2.3 billion in segment revenue and $183 million in operating profit. In the first quarter, it posted its 13th consecutive quarter of same-store transaction growth and its eighth straight quarter of margin and operating profit expansion.

> Ownership will give us greater strategic flexibility to drive innovation across menus, formats and operations."
>
> **Joey Wat,** CEO of Yum China

Yum China, which operates KFC, Pizza Hut and Taco Bell on the Chinese mainland, said it plans to expand the Pizza Hut footprint to more than 6,000 restaurants by 2028, up from 4,375 locations across more than 1,100 cities and counties today.

The company is also targeting a doubling of Pizza Hut operating profit by 2029 in comparison to 2024 levels.

On moving from exclusive licensee to brand owner, Yum China CEO Joey Wat said, "Ownership will give us greater strategic flexibility to drive innovation across menus, formats and operations."

The transaction comes as Yum China continues to lean on KFC as its primary growth engine. The company said KFC China, which currently operates about 13,450 restaurants, is expected to expand to more than 17,000 locations by 2028, particularly in lower-tier and underserved markets.

Separately, Yum China said KFC China will be eligible for a decade-long financial incentive from Yum Brands that will be tied to system sales growth targets and aimed at supporting continued expansion momentum.

It is not the first time Chinese capital and enterprises have moved to acquire or take control of internationally renowned food and beverage brands.

In 2017, a consortium led by CITIC Group and Carlyle Group acquired 20-year franchise rights for McDonald's on the Chinese mainland and in Hong Kong and Macao. Carlyle exited the investment in 2023, and in October 2024, CITIC Capital completed an additional stake purchase, resulting in the CITIC-led consortium holding a 52 percent controlling stake while McDonald's Corp retained 48 percent.

In November 2025, CPE, a leading Chinese consumer-focused private equity firm, acquired an 83 percent controlling stake in Burger King China, with the parent brand Restaurant Brands International retaining the remaining 17 percent.

Traditional festivities and sports spur holiday travel

By ZOU SHUO
zoushuo@chinadaily.com.cn

A distinctive blend of tradition, family bonding and youthful energy is expected to power China's tourism market during the upcoming Dragon Boat Festival holiday, travel industry sources said.

The three-day holiday, which starts on Friday, coincides with *xia zhi*, one of the 24 solar terms on the Chinese calendar, marking the summer solstice, and Father's Day, both of which fall on Sunday. It also overlaps with the ongoing 2026 FIFA World Cup.

Usually, the festivities revolve around boat racing, making sticky rice dumplings known as *zongzi* and other folk customs, but adding to the festive atmosphere this year are soccer watch parties and concert tourism, creating a multi-peak travel pattern, travel agencies said.

Travelers aged 20 to 49 are the main drivers of the holiday travel surge, accounting for more than 70 percent of total planned trips, data from online travel agency Tuniu showed. Short- and medium-distance trips lasting two to three days are the most popular, reflecting a clear shift toward smaller breaks and short-notice bookings.

The end of the national college entrance exam, or *gaokao*, has also triggered a surge in travel demand, which is expected to last until early July, creating a staggered travel window ahead of the summer rush, Tuniu said.

Students, typically aged 18 to 23, are driving much of this demand. Many parents had promised trips as gifts after the *gaokao*, which has boosted bookings among young travelers. According to online travel platform Qunar, flight bookings by 18-year-olds from June 10 through the end of June rose more than 30 percent compared with the same period in May.

Traditional Dragon Boat Festival activities — including making *zongzi*, salted duck eggs and sachets, wearing *hanfu* (a traditional Chinese costume) and watching boat races — have become major consumption drivers, Tuniu said.

The overlap with Father's Day has boosted family travel, with a notable increase in parent-child trips, it said.

Popular destinations include Shanghai, Beijing, Guangzhou in Guangdong province and Hangzhou in Zhejiang province. Shantou in Guangdong, the setting of the hit film *Dear You*, is generating a surge of searches, Qunar said.

The ancient villages of Shangrao in Jiangxi province are also much sought after. Searches for village resorts in the area, where visitors can experience festival traditions, have surged sevenfold, it said.

The frenzy generated by the ongoing soccer World Cup has also influenced travel demand. The 2026 Northeast Football City League, or "Dongbeichao" — a regional tournament jointly hosted by Liaoning, Jilin and Heilongjiang provinces as well as the Inner Mongolia autonomous region — is attracting fans from across the country, pushing up hotel bookings in the area during the holiday, according to Qunar.

In Liaoning, 43 scenic spots in seven cities are offering free admission to ticket-holding fans and residents of partner regions, helping boost hotel bookings by 20 percent year-on-year, the travel agency said.

Yin Ping, a professor at Beijing Jiaotong University's School of Economics and Management, noted that the convergence of Dragon Boat Festival, Father's Day and the World Cup creates a "day-night dual peak" travel pattern, with daytime dragon boat races and *zongzi*-making activities drawing crowds, while evenings will see fans flocking to bars and restaurants to watch matches, boosting spending on dining and nightlife.

"The integration of traditional folk culture, sports events and concerts is likely to become a lasting trend," she said.

The success of the Northeast football league in enhancing hotel bookings shows that a combination of folk culture, sports and tourism can sustainably drive local consumption — not only during holidays but also as a regular model, she added.

Ex-CNOOC executive jailed for bribery case

Yuan Guangyu, former deputy general manager of the China National Offshore Oil Corporation, was sentenced to death with a two-year reprieve by a court in Jiangsu province for accepting bribes worth more than 152 million yuan ($22.49 million). Yuan was also deprived of political rights for life, and all his personal assets were confiscated, according to the ruling announced by the Xuzhou Intermediate People's Court. The court found that from 2001 to 2022, Yuan took advantage of his positions in the offshore oil corporation to seek benefits for relevant individuals and organizations in matters including project contracting, business operations and job adjustments, and accepted bribes worth more than 152 million yuan in return. In China, a suspended death sentence is typically commuted to life imprisonment if no new crimes are committed during the two-year probation period. The sentence may be further reduced for good behavior by the inmate.

Cambodia repatriates key fraud suspect

Chinese police recently repatriated Liu Ren, a key suspect in a major transnational gambling and telecom fraud case, from Cambodia, the Ministry of Public Security said on Wednesday, marking another result of law enforcement cooperation between the two countries. Liu is a core member of a criminal syndicate led by Chen Zhi, a Chinese national identified by authorities as the ringleader of a major cross-border gambling and fraud network. He was repatriated from Phnom Penh, Cambodia, earlier this year. Investigators said Chen directed Liu and others to establish the Jinbei Group in Cambodia in 2016. The group operated multiple online gambling platforms targeting Chinese citizens and encouraging gambling activities. Since 2020, the group has also run telecom fraud compounds in Cambodia, carrying out large-scale online fraud schemes involving extremely large sums of money, police said.

China to streamline its employment structure

New plan seeks fairer job market, will use AI to support entrepreneurship

By ZOU SHUO
zoushuo@chinadaily.com.cn

China will maintain overall employment stability, create fuller employment opportunities and ensure a fairer employment environment during the 15th Five-Year Plan period (2026-30), according to a new plan released by the State Council, China's cabinet, on Wednesday.

The plan for implementing an employment-first strategy over five years also calls for further optimizing the employment structure, achieving more efficient job-person matching, fostering more harmonious labor relations, and making new progress in high-quality and full employment.

It stresses the need to address the principal contradiction of supply-demand mismatches in the human resources market. It emphasizes implementing the employment-first strategy, tackling structural employment mismatches, deepening institutional reforms in employment, and preventing large-scale unemployment risks.

The plan calls for synergy between macro policies and employment, implementing actions to stabilize and expand employment, and adapting to the development of artificial intelligence to support employment and entrepreneurship.

It urges strengthening coordination between industry and employment, stabilizing the scale of employment in labor-intensive industries, expanding employment capacity in the service sector, and tapping the employment potential of emerging sectors.

Meanwhile, it stresses improving the alignment between educational supply and talent demand, and carrying out vocational skills training on a large scale.

The plan also requires expanding channels for college graduates and other young people to secure employment and achieve career success. Increasing support for key groups, including rural migrant workers and veterans, are needed, while strengthening employment assistance for people with difficulties in finding jobs and registered unemployed individuals should be in place.

It further demands promoting the healthy development of flexible employment and new forms of employment. Efforts are to be made to improve the employment and entrepreneurship service systems.

The plan also seeks to strengthen the protection of workers' rights and interests, and promote employment monitoring, early warning and risk response.

All regions and departments should treat employment as a top priority for people's livelihoods, adopt systematic approaches, and effectively implement the plan's tasks in light of local conditions, the plan said.

In 2025, China created 12.67 million new urban jobs nationwide, with the average urban surveyed unemployment rate standing at 5.2 percent, below the annual target of around 5.5 percent, according to the National Bureau of Statistics.

For 2026, the Government Work Report has set the employment targets at over 12 million new urban jobs and an urban surveyed unemployment rate of around 5.5 percent. In the first five months of 2026, the average urban surveyed unemployment rate stood at 5.2 percent, official data showed.

Tang Daisheng, a professor at Beijing Jiaotong University's School of Economics and Management, said the most notable highlight of the 15th Five-Year Plan is its elevation of the employment strategy from "employment first" to "high quality and full employment". This shift, he noted, marks a fundamental change in development philosophy, from focusing on whether there is a job to whether the job is good, moving from sheer quantity growth to quality improvement and structural optimization.

The establishment of a coordinated mechanism between investing in physical capital and investing in people means employment policies no longer operate in isolation but are deeply embedded in macro-control, industrial development, and technological innovation, he added.

Regarding artificial intelligence, Tang said the plan proactively addresses technological change by scaling up vocational skills training to help workers master new capabilities and adapt to new roles.

This forward-looking approach, he said, demonstrates the Party's ability to navigate complex situations and seize opportunities, while guiding workers to find their footing and realize their value amid the technological wave.

Extreme weather monitoring beefed up

By HOU LIQIANG
houliqiang@chinadaily.com.cn

China has significantly expanded its climate observation network as extreme weather events become more frequent and severe, launching new satellites, radar systems and ground stations to strengthen its adaptation to climate change, according to the 2025 progress report on China's climate change adaptation.

The report, unveiled by the Ministry of Ecology and Environment on Wednesday, which marked the 14th National Low-Carbon Day, detailed advances China has made in strengthening its monitoring network during the 14th Five-Year Plan period (2021-25) as the country seeks to cope with a worsening climate crisis.

China launched six Fengyun meteorological satellites during the period. Its enhanced satellite system now provides services to 133 countries and regions worldwide, the report said.

The report also highlighted a strengthened weather radar network. With 842 radars covering more than 90 percent of populated areas, the network can now identify severe weather events with an accuracy rate of 83 percent.

China has established more than 100,000 ground meteorological observation stations, nine atmospheric baseline stations and 27 national climate observatories, including its first overseas baseline station in Antarctica, according to the report.

It added that the number of jointly built and shared hydrological monitoring stations across government departments has reached 137,000.

The expanded monitoring system comes as China grapples with increasingly volatile weather.

In 2025, the country experienced 40 regional severe convective weather events, above the five-year average, while the national average number of days with gale-force winds — featuring instantaneous wind speeds of 17.2 meters per second or higher — reached 18.6, the highest level since 1991, the report said.

Severe convective weather is characterized by strong winds, hail, thunderstorms and brief but heavy spells of rainfall.

Regional and seasonal droughts have also become more pronounced in China, the report noted. From January to May last year, for instance, Anhui and Jiangsu provinces and the Guangxi Zhuang autonomous region each recorded their highest number of drought days for the period since 1961.

Temperatures remained at record highs, with extreme heat events occurring frequently. The national average temperature in 2025 reached 10.9 C, 1 C above the long-term average and tied with 2024 as the highest on record, the report said.

Speaking at a National Low-Carbon Day event in Nanning, capital of Guangxi, Liu Yang, deputy head of the Ministry of Ecology and Environment's Department of Climate Change, pledged to accelerate upgrades to China's climate adaptation framework to help achieve the country's goal of basically building a climate-resilient society by 2035.

"We will improve the full-cycle mechanism of observation, assessment, action, feedback and enhancement to steadily bolster our ability to prevent and mitigate major climate risks and disasters," she said.

Soundbites

Editor's note: *The State Council Information Office held a group interview on Wednesday themed "Forging Ahead on the New Journey", bringing together representatives engaged in rural social civility to speak with the media.*

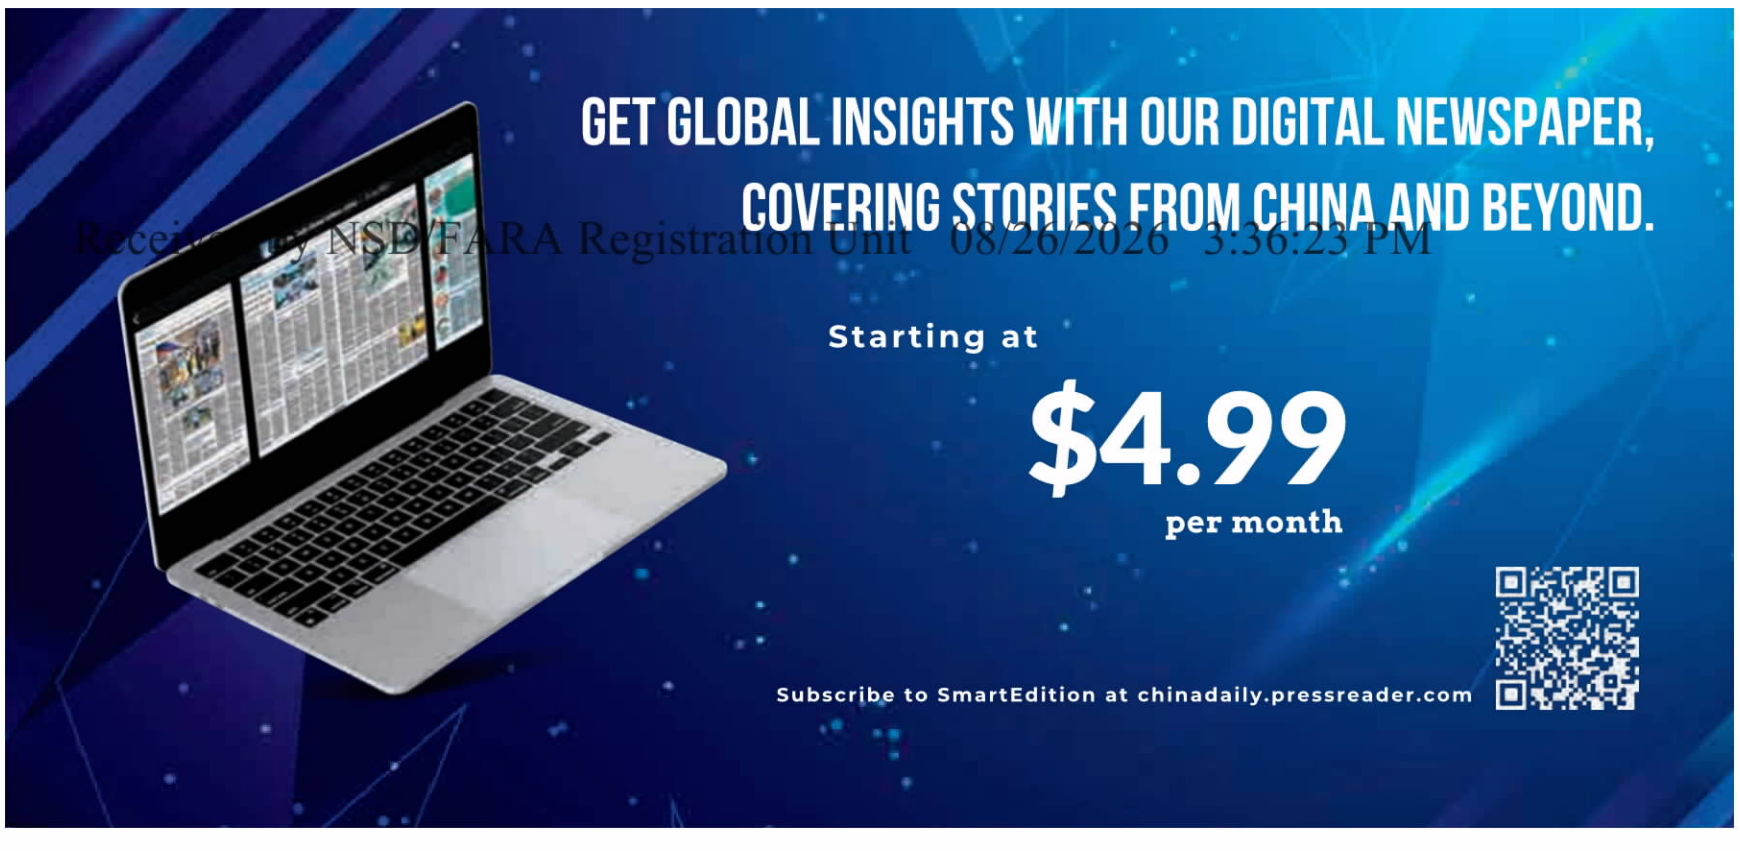
In 1999, I was elected village Party secretary and village director, and I have held these positions ever since. Relying on the Party's good policies, we united and led Party members and the masses to work hard and overcome difficulties, transforming a once poor, dirty, chaotic, and backward village into a model village for rural revitalization. Today, it is livable, suitable for work, and harmonious. Our village has chosen a new collectivized path. By developing and strengthening the village collective economy and encouraging and supporting villagers to start businesses and find employment, we aim to achieve common prosperity. We have cultivated and expanded advantageous industries, including modern agriculture, rural tourism, logistics and trade, building decoration, education and training, and medical care and wellness. With industrial development, we have pooled resources to accomplish major tasks and solve problems that individual households could not address on their own.

Wang Chuanxi, *Party secretary of Daicun village, Lanling county, Linyi city, Shandong province*

As a curator, I have always been thinking: 90 years ago, Ai Siqi turned profound philosophical ideas into plain language that ordinary people loved to hear. Today, how can we use this same approach to cultivate a civilized rural culture? The answer lies by the small fire pit in Tengchong. Over the years, learning from Ai's people-oriented approach, we have stepped out of the memorial hall and into villages. We set up no podiums and use no formulaic speeches. Instead, we sit with villagers in courtyards and around fire pits, talking about village rules and agreements, filial piety, and family values. In this way, theory has become a guide for daily life.

Bo Yanting, *director of the Ai Siqi Memorial Hall in Tengchong city, Yunnan province*

I am one of the province's first cultural commissioners, stationed in Hangchuan village, Jiande, Hangzhou. There are over 1,500 of us working across Zhejiang's countryside to promote cultural development. We visit households, identify villagers' cultural needs, bring resources from our home institutions into villages, and work with villagers to implement cultural projects. In the two years since I came to Hangchuan, I have organized photography exhibitions and built a village photography team. I believe our work as cultural commissioners is a two-way cultural journey with the villagers. The building of a civilized rural culture is never about us doing things for the villagers. Instead, we must take root in the countryside and work side by side with them.



Chen Yun, *deputy editor-in-chief of Zhejiang Photographic Press and a cultural commissioner of Zhejiang province*

Many years ago, I was a flight attendant with Xiamen Airlines, serving passengers from all over the country, dressed in uniform and wearing high heels every day. But the farther I traveled and the more scenery I saw, the more I missed my hometown and family. So in 2016, I returned to my hometown, Minning town, carrying this deep attachment and my original aspiration. I often wondered: when will my hometown be seen by more people? Then one day, I met the deputy head of our town, who said to me: "You are a college graduate from our town. Have you ever thought of using your English major to promote Ningxia's agricultural products?" His words struck a chord with me. I grew up in Minning and have witnessed its development and transformation over the past 30 years. Today, Minning has an abundance of fine products. So I decided to tell the story of my hometown's changes and introduce its agricultural products in both Chinese and English, so that more people could see Minning. I planted myself deep in the fields of Minning, using my phone as my new farming tool and turning my livestreaming room into my new farmland.

Wu Juan, *villager from Yuanlong village, Minning town, Yongning county, Yinchuan city, Ningxia Hui autonomous region*

Preface

Global governance is a common endeavor that bears on the wellbeing of all humanity, and building a just and equitable global governance system is a shared vision long pursued by people from across the world.

Over 80 years ago, the United Nations (UN) was founded as a multilateral platform for countries to address international affairs through dialogue and consultation. It established international rules underpinning the rule of law, ushering in a new phase in global governance. After the Cold War, multipolarization and economic globalization began to gain momentum, and the concept of global governance grounded in coordination and cooperation was widely endorsed. In recent times, however, unilateralism, protectionism, and hegemonism have been spreading unchecked, while deficits in peace, development, security, and trust continue to expand. Reforming and improving global governance to resolve these challenges and letting the UN play a core role have thus become a critical topic for the future of humanity.

China has always been an active participant in, contributor to, and builder of global governance. In the new era, President Xi Jinping put forward the vision of building a community with a shared future for humanity. In promoting a global governance system characterized by extensive consultation and joint contribution for shared benefit, he has called for true multilateralism to foster an equal and orderly multipolar world and a universally beneficial and inclusive economic globalization. In 2025, at a pivotal historical juncture marking the 80th anniversary of the victory in the Global War Against Fascism and the founding of the UN, President Xi proposed a new initiative, the Global Governance Initiative (GGI).

The GGI is designed to offer a Chinese solution to the two pressing questions of the era: what kind of global governance system should be established, and how global governance can be reformed and improved. Upon its introduction, it swiftly gained support from nearly 160 countries and international organizations, with over 60 countries joining the Group of Friends of Global Governance. The international community believes that the GGI sends a clear signal: uphold multilateralism, unite forces, and pursue a fair future. The GGI aligns with the growing trend towards greater democracy in international relations and bolsters international confidence in practicing multilateralism. It offers a clear and feasible roadmap for improving global governance, bringing valuable stability and positive energy to a turbulent world.

China has proposed the GGI to expedite the building of a more just and equitable global governance system. Resolutely upholding the UN's authority and status is fundamental to the effective implementation of this initiative. Success will also hinge on major countries bearing a sense of responsibility, and on all nations uniting and cooperating to address deficits in peace and development. All countries should firmly uphold the international system with the UN at its core, safeguard the international order based on international law, and uphold the basic norms governing international relations underpinned by the purposes and principles of the UN Charter, instead of reinventing the wheel.

The Chinese government is publishing this white paper to introduce China's principles, proposals and actions in global governance, foster broader consensus within the international community, ensure more effective responses to global challenges, and build a more just and equitable global governance system.

I. The World Today Faces Severe and Complex Challenges

Our world has entered an era marked by profound change on a scale unseen in a century. The pursuit of peace and development remains a daunting challenge. The international system established after World War II has been severely disrupted by multiple crises, placing global governance at a critical crossroads. Progress is imperative; failure to advance risks falling behind. Now, more than ever, the world needs to revitalize multilateralism, uphold the rule of law, and ensure more efficient governance.

1. Growing Challenges Call for More Effective Governance

Currently, the international landscape is undergoing profound changes on an unprecedented scale, with turmoil and upheaval more intense and pronounced. Political and economic disputes worldwide are escalating, revealing deep-seated conflicts, while "black swan" and "grey rhino" events keep emerging continually. The ship of human civilization has entered dangerous waters with hidden reefs and violent storms.

Geopolitical tensions are intensifying, with armed conflicts erupting in multiple regions. The Ukraine crisis has entered its fifth year, hostilities in the Middle East are spilling over and spreading, and multiple hotspot issues remain unresolved. The Global Peace Index continues to decline: in 2025, the number of armed conflicts reached a new high after World War II, with more than 50 countries directly embroiled in conflict or war. Global military spending has surged, militarism has resurfaced, and nuclear proliferation and "nuclear sharing" continue to pose a grave threat, leaving international security in a precarious state.

Global economic fragmentation is exacerbating, significantly hindering development. Economic globalization is facing strong headwinds, as some countries erect fences and barriers, pursue decoupling, sever industrial supply chains, and impose unilateral tariffs, disrupting the global economic order. Overall progress in the implementation of the UN 2030 Agenda for Sustainable Development has lagged far behind, with nearly 80 percent of assessable targets progressing slowly or even regressing. More than 830 million people worldwide still live in extreme poverty while 2.3 billion suffer from food insecurity, and the North-South divide and wealth gap continue to widen.

New challenges are arising in quick succession, with multiple crises intertwining and accumulating. The transition to a climate-resilient future is fraught with difficulties, the digital divide is deepening, and the misuse of artificial intelligence poses new security risks. Challenges to food and energy security are also intensifying, and non-traditional security threats such as terrorism, cyberattacks, transnational crime, and biosecurity risks are on the rise. The issues that human society must collectively address are becoming increasingly complex and diverse.

The universe has only one Earth, which is the shared home of all humanity. Countries are not riding separately in some 190 small boats, but aboard a single giant ship of shared future. Only by working together and supporting one another can we navigate through the storms of global challenges and sail towards a brighter future.

2. The Law of the Jungle Seriously Undermines the International Rule of Law

Built upon the ruins of the two world wars, the UN serves as a shelter for peace and development, and its Charter laid the institutional cornerstone for global governance. History can only move forward, not backward; we must draw lessons from the bloodshed and fires of war of the past and prevent a return to the law of the jungle at all costs.

Unilateralism and hegemonism cause only grave harm, openly trampling upon international law and the basic norms governing international relations. By bullying the small and weak and brazenly wielding force against sovereign states, certain countries have shown they prioritize their national interests above all else, applying double standards and challenging international justice for their own selfish gain. These nations gang up to form exclusive groups and blocs, inciting division and confrontation and carving spheres of influence today – in the 21st century – as they did in centuries gone by. By so doing they have become the major source of global turbulence.

De-globalization and protectionism are on the rise, while economic and trade issues are being politicized, instrumentalized, and weaponized. Some countries have instigated trade wars and tech wars, imposed unilateral sanctions illegally, and abused long-arm jurisdiction. They have single-mindedly sought to build "small yards with high walls" or "parallel systems", and have overstretched the concept of national security to suppress and contain the economic and technological progress of other countries. These retrogressive actions violate the principles of the market economy, trample on the rules of free trade, and severely disrupt the international economic order.

Humanity now faces several crucial questions. Fairness and justice, or the law of the jungle? Openness and mutual benefit, or isolation and confrontation? The rule of law, or power politics? At this historical crossroads, we must be responsible and make the right choice.

3. It Is Imperative to Shore Up the Governance System

The UN is the most comprehensive, representative and authoritative international organization, and the UN-centered international system plays an irreplaceable and vital role in global governance. Over time, however, the current global governance system has become increasingly incompatible and misaligned with the realities of today and the evolving international landscape, and its shortcomings and deficiencies are growing ever more pronounced.

The UN's authority is challenged. Disregarding the purposes and principles of the UN Charter, a certain major power has withdrawn from international organizations and agreements, defunded key bodies, blocked Security Council resolutions, and paralyzed the World Trade Organization's (WTO) dispute settlement mechanism. These actions have seriously disrupted the international order and caused further damage to multilateral mechanisms, eroding the foundation of trust in multilateral cooperation.

The effectiveness of multilateral institutions is in urgent need of improvement. As some countries refuse to fulfill their responsibilities and obligations, multilateral agendas are often left discussed but undecided, or decided but not implemented. Efforts must therefore focus on improving the operational efficiency, emergency response capabilities, and transparency of multilateral institutions such as the UN. At the same time, the existence of governance gaps in emerging fields – including artificial intelligence, cyberspace, and outer space – also demands attention.

The UN's representation is critically inadequate. To maintain their hegemony and protect their own interests, some countries have long obstructed the reform process of the UN and its agencies, causing significant delays in reforms such as the IMF quota and World Bank shareholding. Developing countries remain underrepresented and their voices insufficiently heard.

The current governance system is certainly not perfect, but it needs neither to be dismantled and rebuilt in full, nor replaced entirely by a new system. Instead, as an international community, we must focus on reforming and improving the existing system to make it more compatible and aligned with the world's realities, addressing governance shortcomings from a developmental perspective, and responding to the call of the times with a vision for progress.

4. More Global South Voices Need to Be Heard

The Global South is a vital force in seeking peace, pursuing development, and promoting cooperation, and its collective rise represents human progress. To stabilize and improve the world, the international community needs to be more responsive to the concerns of the Global South in international affairs and fully leverage its role.

The Global South has grown remarkably strong. After World War II, national independence and liberation movements swept across Asia, Africa, and Latin America, dismantling the global colonial system. The number of UN member states has increased from 51 at its founding in 1945 to 193 today. Based on purchasing power parity, the Global South now makes up over 60 percent of the world economy and contributes 80 percent to global economic growth, with multiple hubs of development across various regions. The monopolization of international affairs by a small number of countries is no longer sustainable, and long-standing historical injustices must be redressed.

This rise has brought a new dynamic to global governance. BRICS has undergone a historic expansion, and the Shanghai Cooperation Organization (SCO) has become the largest regional intergovernmental organization in terms of territory and population. Together, they are playing a positive role in the development and reform of the global governance system. The G20 has become the premier platform for global economic governance, with emerging economies now accounting for more than half of its membership. Championing fairness and justice, the G77 and China have deepened South-South cooperation. Meanwhile, Global South countries have hosted a series of multilateral summits, contributing their share to global governance and leaving their imprint.

The times call for a model of global governance that is more inclusive, equitable, and sustainable. The process of securing greater respect for the Global South countries' rights to development, voice, and decision-making in international affairs will mark a historic journey towards a more dynamic, effective, and hopeful global governance system.

II. The Global Governance Initiative Responds to Challenges of Our Times

The Global Governance Initiative upholds the purposes and principles of the UN Charter and embraces a global governance vision characterized by extensive consultation, joint contribution, and shared benefits. It is built on five core concepts: sovereign equality, the international rule of law, multilateralism, a people-centered approach, and real actions. By addressing the crux and root causes of crises and challenges, the initiative provides sound guidance for building a more just and equitable global governance system.

1. Sovereign Equality

Sovereign equality is enshrined in the UN Charter as the first among all principles and the supreme norm regulating state-to-state relations. Countries, whether large or small, strong or weak, developed or developing, are equal members of the international community. Every nation's sovereignty and dignity must be respected, and all countries are equally entitled to participate in, deliberate on, and benefit from global governance.

Equality is the premise of state-to-state relations. Countries should, in the spirit of mutual respect, conduct consultations on an equal footing and manage their differences appropriately. Major countries should lead by example in honoring equality, good faith, and cooperation, rather than leveraging their position of strength to engage in hegemonic, high-handed and abusive acts. If allowed to deviate from the principle of sovereign equality, international relations would degenerate into a game among powers, and international law would become groundless, leaving the world in perpetual chaos.

Sovereign equality is an essential requirement for solidarity against challenges. The future of all nations is bound by shared interests, common challenges, and collective responsibilities. Global governance cannot be dominated by a select few developed nations. Only when all countries participate equally can all sides build the political trust essential for solidarity and collaboration; only in this way can the resulting rules and decisions receive extensive recognition and rest on solid legal ground. This is the necessary approach to reaching broad consensus and creating powerful synergy.

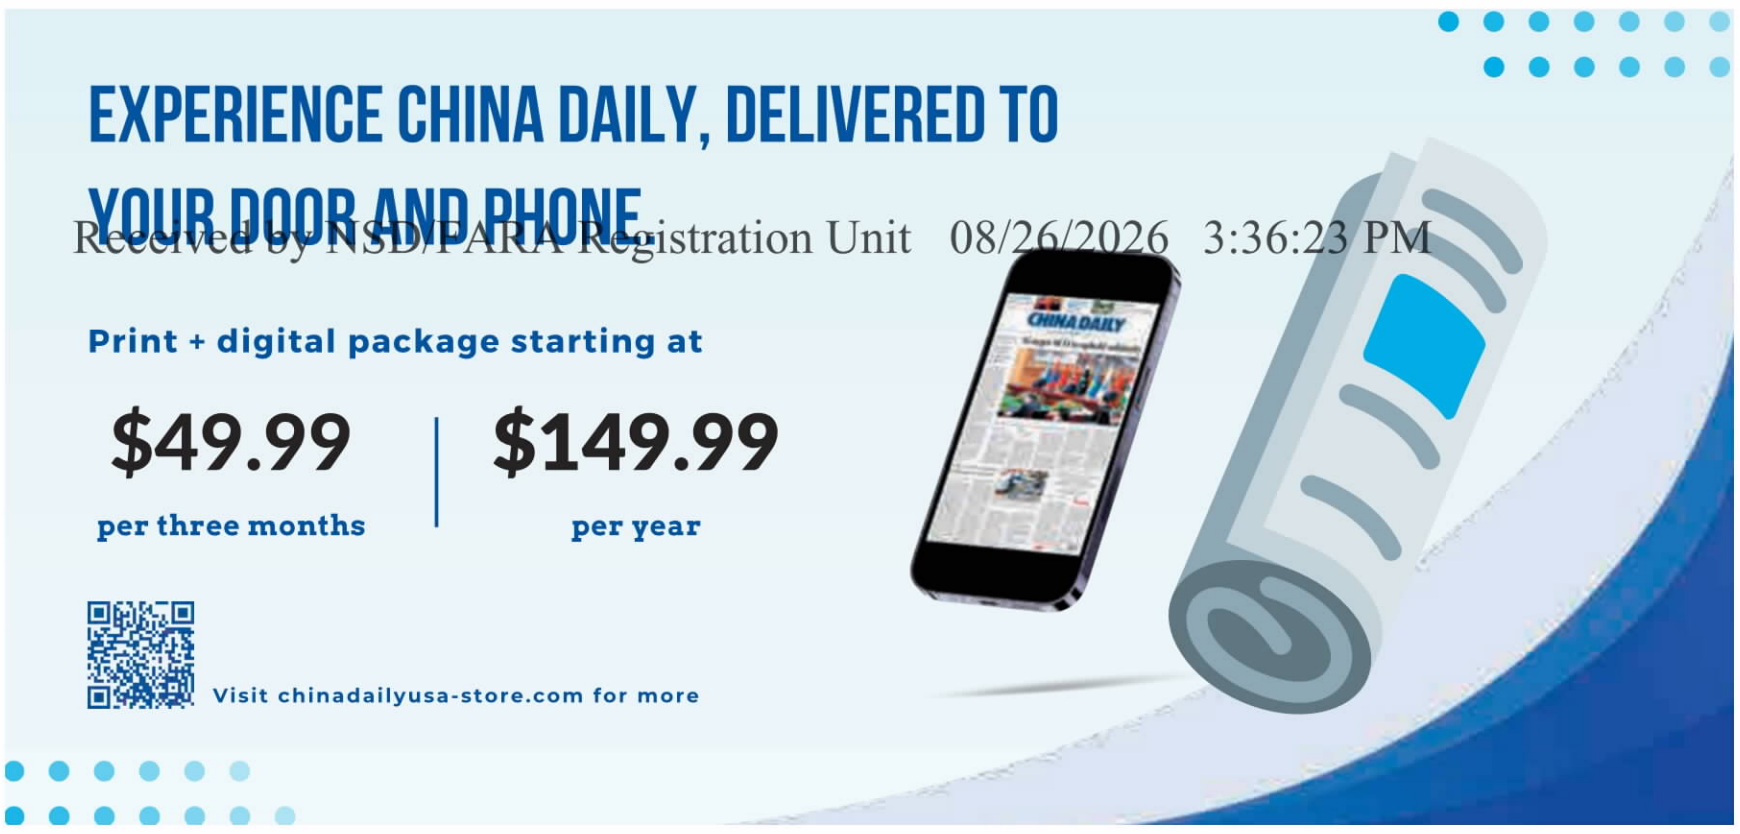
Equality and inclusiveness are the inexorable progress in the evolution of the global governance system. Coexistence in diversity is a fundamental characteristic of human society, and multipolarity is vital to the evolving international landscape. A global governance system that is more representative, inclusive, and beneficial to all is an irreversible trend, and equal rights, equal opportunities, and equal rules are the shared aspirations of all peoples. Hegemony and power politics that run counter to the tide of history are destined to fail.

2. The International Rule of Law

The international rule of law is the fundamental safeguard for global governance. Only a global governance system that is grounded in the rule of law can provide all countries with a fair and just environment for development, achieve a balance between rights and obligations, and make international order more just and equitable.

Rigorously enforcing the international rule of law is rooted in upholding the purposes and principles of the UN Charter. Confrontation and injustice in today's world do not arise because the UN Charter is outdated, but because it is not effectively implemented. Its purposes and principles, such as maintaining international peace and security, promoting international cooperation, settling international disputes by peaceful means, and refraining from the threat or use of force in international relations, have established the fundamental norms governing international relations and underpinned post-war stability in the international order, and thus must be honored without the slightest compromise.

Rigorously enforcing the international rule of law hinges on safeguarding its justice and integrity. Only when international law is applied equally and universally, rather than selectively, can we truly distinguish right from wrong and advance peace and development. All nations are stakeholders in the international rule of law – without it, anyone at the dining table today could appear on the menu tomorrow. Major countries are the key forces in advancing international rule of law. They should lead by example in following rules and upholding the rule of law, rather than putting their own interests above international law or, even worse, imposing their own rules upon others.



Rigorously enforcing the international rule of law calls for improving rulemaking in emerging sectors. Human society is constantly evolving, and global governance rules must keep pace. New domains such as the deep seas, polar regions, outer space, and cyberspace, some of which are the common property of humanity and some represent the frontiers of future development, require urgent attention in order to establish rules and close gaps in their governance. All parties should uphold the principles of peace, sovereignty, inclusiveness, and joint governance, and put law in place for the development and utilization of new domains, so that they expand the space for cooperation rather than become arenas of rivalry. The governance of artificial intelligence should guard the red line of security and ethics, and be pursued in the spirit of openness, shared outcomes, and equal rights, to ensure AI for good and truly benefit humanity.

3. Multilateralism

Multilateralism emerged for the cause of peace and development, and multilateral mechanisms are vital for addressing global issues. No country can achieve development outside the global governance system, nor can it secure a future without participating in international cooperation. It is not a matter of whether we choose it or not, multilateralism is the only viable path forward.

Countries should stick to the principles of extensive consultation, joint contribution, and shared benefits. The essence of multilateralism lies in extensive consultation on international affairs and collective decision-making among all countries for the future of the world. Countries should pool wisdom through extensive consultation, gather strength through joint contribution, and promote universal interests through shared benefits. They should unequivocally oppose all forms of unilateralism, hegemony, dominance by a few countries, and bloc politics in the understanding that the deliberate erection of barriers will only push the world into the abyss of antagonism and confrontation.

See page 12

DOCUMENT

From page 11

Countries should be steadfast in safeguarding the central role of the United Nations. The United Nations is the primary platform for practicing multilateralism and advancing global governance. Its leading position must be upheld and remain rock solid; its role can only be reinforced, not weakened. All countries should reaffirm the founding purpose of the United Nations, work to restore its authority and vitality under new circumstances, and enable it to play a central role in coordinating global actions to address common challenges.

Countries should be firm in promoting multilateral dialogue, consultation, and cooperation. In light of the complexity of global challenges, no country can remain insulated from their impacts or resolve all issues alone. Countries should build consensus through dialogue, resolve disputes through consultation, and pursue win-win results through cooperation, striving to expand their common interests. Global and regional multilateral mechanisms should play a constructive role in this, pooling the resources and strengths of national governments, international organizations, and non-governmental organizations to increase the synergy and efficiency of global governance.

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

4. A People-Centered Approach

People's wellbeing is a core concern of global governance. The people of every country across the world are the essential participants and direct beneficiaries of global governance. Only by serving public interests, boosting public confidence, and meeting public expectations can the global governance system win extensive support and function effectively.

Pursuing common development heightens the sense of gain among all peoples. Development concerns people's life and dignity; it is a matter of hope or disappointment. World prosperity and stability cannot be built upon ever widening gaps between rich and poor. Countries must restore development to the center of the international agenda, mobilizing global resources to implement the UN 2030 Agenda for Sustainable Development without delay. The North-South divide must be bridged as soon as possible, and help should be provided to developing countries to boost their capacity for independent development, so that all nations have greater and fairer access to the fruits of development.

Addressing common challenges heightens the sense of security among all peoples. In today's world, all countries share a common stake in security, and all must therefore embrace a vision of common, comprehensive, cooperative and sustainable security while addressing the threats to this stake – whether traditional or non-traditional. In responding to risks and challenges such as climate change, public health, and cyberspace security, it is important for the people to truly feel that countries are taking action and that unity can overcome all difficulties.

Promoting mutual understanding and friendship heightens the sense of fulfillment among all peoples. Civilizations become colorful through exchanges and are enriched through mutual learning. Countries should let cultural exchanges prevail over estrangement, mutual learning over clashes, and inclusiveness over superiority. Cultural and personnel exchanges should be strengthened to break down ideological barriers between nations and social groups. A shared conviction for safeguarding common interests will allow all civilizations to thrive and succeed together.

5. Real Actions

Global governance finds its source of vitality in practice, hinges on action, and is verified by its effectiveness. A vision is realized only through concrete action. It falls on the international community to turn this vision into reality – setting common goals, embracing a problem-oriented approach, and acting in concert.

Coordinating overall progress and individual breakthroughs. A coordinated approach should be adopted to advance global governance agendas, address governance deficits, and prevent fragmentation in the governance system. Targeted efforts should also be made for the most pressing issues in individual countries, particularly developing countries, to achieve tangible progress in poverty reduction and in improving people's wellbeing and closing the digital divide.

Addressing both symptoms and root causes. Given present conditions, feasible plans should be made to resolve the immediate challenges facing the world. The effectiveness in responding to major public crises and providing international public goods should be increased. With future development in mind, fundamental solutions should be explored to tackle chronic and persistent issues and bring change to the global governance system – which is lagging in reform – to align it with the evolving political and economic landscapes.

Synergizing North-South cooperation and South-South cooperation. The Global North and Global South should leverage their complementary strengths and move towards the same direction. Developed countries should diligently fulfill their international obligations and deliver on their commitments regarding development assistance and climate financing; they should not evade their international responsibilities under any pretext. Developing countries should unite to build their strength, improve South-South cooperation mechanisms, increase their capacity for collaborative development and their collective voice, and inject sustained momentum for improving global governance.

III. China's Contribution to Promoting Global Governance

As a responsible major country, China champions the building of a community with a shared future for humanity and takes the lead in practicing true multilateralism. It has consistently been a builder of world peace, a contributor to global development, a defender of the international order, and a provider of public goods, while actively advancing the efforts for building a more just and equitable global governance system.

1. Committing to Universal and Common Security

Humanity forms an indivisible community of security. As a major country with the best peace and security record, China has enshrined in its Constitution a commitment to peaceful development. It champions the vision of common, comprehensive, cooperative, and sustainable security, and has put forward the Global Security Initiative and acted on its principles, contributing to lasting world peace and stability.

Firmly safeguarding world peace within the framework of the UN. China faithfully fulfills its mission and duties as a permanent member of the UN Security Council, firmly supporting the UN in playing its core role in international affairs and the Security Council in playing its primary role in international peace and security. China also takes an active part in UN peacekeeping operations as the second largest contributor to the UN peacekeeping budget and the largest troop contributor among the permanent members of the UN Security Council. To date, more than 50,000 Chinese peacekeepers have been dispatched in 29 peacekeeping operations authorized by the UN Security Council. The country has also established the world's first standing peacekeeping police unit and maintains a peacekeeping standby force of 8,000 troops.

On September 3, 2025, China celebrated the 80th anniversary of its victory in the Chinese People's War of Resistance Against Japanese Aggression and the World Anti-Fascist War. Together with the international community, China will safeguard the victory of World War II, promote a correct understanding of that war, and send the powerful message that peace must be safeguarded and justice will prevail.

Maintaining global strategic stability. China pursues a national defense policy that is in nature defensive, upholds a firm commitment to a policy of no-first-use of nuclear weapons and a nuclear strategy of self-defense, and resolutely safeguards the international nuclear disarmament and nonproliferation regimes. It promoted the issuance of a joint statement of the leaders of the five nuclear-weapon states on preventing nuclear war and avoiding arms races, reiterating the view that a nuclear war cannot be won and must never be fought, emphasizing the need to avoid military confrontation and prevent arms races and articulating a shared commitment to maintaining global strategic stability and reducing the risk of nuclear conflicts. China has put forward the principles of justice, cooperation, balance and effectiveness in arms control, and upholds the international arms control regime with the UN at its core.

Pioneering the use of a unique Chinese approach to addressing international flashpoints. China upholds the principles of non-interference in other countries' internal affairs, political settlement of issues, objectivity and fairness, and addressing both symptoms and root causes, offering a new approach for finding constructive solutions to flashpoints.

On the Ukraine crisis, China follows the four key principles [The principles are: The sovereignty and territorial integrity of all countries should be upheld; the purposes and principles of the UN Charter should be observed; the legitimate security concerns of all parties should be taken seriously; all efforts conducive to the peaceful settlement of the crisis should be supported.] as its fundamental guide. It released China's Position on the Political Settlement of the Ukraine Crisis and, together with Brazil and other Global South countries, launched the Group of Friends for Peace on the Ukraine Crisis, building synergy and creating conditions for ceasefire and peace talks.

On the Palestinian-Israeli conflict, China has urged the UN Security Council to pass the first ceasefire resolution for Gaza since the outbreak of a new round of conflict. It has provided emergency humanitarian assistance to Gaza and taken a clear stand in support of the two-state solution, promoting a comprehensive, just, and lasting resolution of the Palestinian question.

China has facilitated the historic reconciliation and restoration of diplomatic relations between Saudi Arabia and Iran, and 14 Palestinian factions visited China for reconciliation talks and signed the Beijing Declaration on Ending Division and Strengthening Palestinian National Unity. This wave of reconciliation in the Middle East has been widely welcomed. In promoting peace and stability in the Middle East, China has put forward the principles of peaceful coexistence, national sovereignty, international rule of law, and a holistic approach to development and security. Together with Pakistan, China has issued a five-point initiative of China and Pakistan for restoring peace and stability in the Gulf and Middle East Region.

Championing an Asian security model characterized by security for all, common ground amid differences, and dialogue and consultation, China has facilitated a ceasefire agreement between conflicting parties in northern Myanmar and played a constructive role in the border dispute between Cambodia and Thailand and the cross-border clashes between Afghanistan and Pakistan. It has proposed the Outlook on Peace and Development in the Horn of Africa, supporting countries in the region in responding to security challenges.

Reinforcing non-traditional security shields. China continues to support the development of the Global Public Security Cooperation Forum (Lianyungang) to build consensus among all parties and advance global public security governance. China advocates comprehensive measures for addressing both symptoms and root causes, and promotes international and regional counter-terrorism cooperation. It has facilitated the establishment of the Integrated Center for Countering Security Threats and Challenges of the Shanghai Cooperation Organization (SCO) and its Center for Combating Transnational Crime and Information Security Center, and the SCO Narcotics Control Center, playing an active role in helping other developing countries reinforce their counter-terrorism capacities.

In resolutely cracking down on transnational drug trafficking, China leads pragmatic anti-drug cooperation operations in the Greater Mekong Subregion and by the SCO and BRICS countries, and has taken the global lead in scheduling the whole class of fentanyl-related substances. It has combated cross-border crimes such as online gambling and telecom fraud, accelerated the development of an international alliance on combating telecom fraud, and dismantled large groups of overseas scam centers in cooperation with countries including Thailand, Myanmar, and Laos. China has proposed the International Cooperation Initiative on Global Food Security within the framework of G20, facilitated the adoption of the BRICS Strategy on Food Security Cooperation, joined the Global Alliance Against Hunger and Poverty, and provided emergency humanitarian food assistance to multiple countries suffering food shortages or disasters.

2. Promoting Openness, Cooperation, and Common Development

China cannot develop in isolation from the rest of the world, nor can the world achieve overall prosperity without China. As the largest developing country, China has always pursued its own growth in the context of humanity's shared development and upheld openness, win-win cooperation, inclusiveness, and shared benefits. Through Chinese modernization, the country has provided the world with new opportunities and boosted the global drive for modernization.

Contributing to building an open global economy. China has promoted trade and investment liberalization and facilitation, and it has become the main trading partner of over 160 countries and regions, signing 24 free trade agreements with 31 countries and regions in the process. It has facilitated and achieved high-standard implementation of the Regional Comprehensive Economic Partnership (RCEP) and signed the China-ASEAN Free Trade Area 3.0 Upgrade Protocol. It endeavors actively to join the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) and the Digital Economy Partnership Agreement (DEPA) to expand the globally-oriented network of high-standard free trade areas. The country firmly safeguards the rule-based multilateral trading system with the World Trade Organization (WTO) at its core, engages fully and deeply in WTO reforms, and has announced that it will not seek new special and differential treatment in current and future negotiations at the WTO.

Bringing broader opportunities to the world with higher-standard opening up. China has expanded institutional opening up, removed all restrictions on foreign investment access in the manufacturing sector, continued to shorten the negative list for foreign investment, and fostered a world-leading business environment that is based on market principles, governed by law, and up to international standards. Steps have been taken to expand voluntary and unilateral opening up, with the launch of 23 pilot free trade zones, island-wide special customs operations in the Hainan Free Trade Port, and open platforms such as the China International Import Expo, China International Fair for Trade in Services, China International Consumer Products Expo, and China International Supply Chain Expo. Additionally, zero tariffs have been placed on the least developed countries and African countries that have established diplomatic relations with China. During the 14th Five-year Plan period (2021-2025), China's imports of goods and services exceeded US$15 trillion, and its GDP is expected to increase from RMB140 trillion to RMB170 trillion in the next five years, as its vast market continues to realize its potential.

Achieving solid progress in deepening high-quality Belt and Road cooperation. China has promoted cooperation in the Belt and Road Initiative (BRI) to a new stage of high-quality development. It has established the world's broadest and largest international cooperation platform and expanded the belt of development and road to happiness to benefit all parties.

Policy connectivity has built greater synergy. China has signed cooperation documents with over 150 countries and 30 international organizations, hosted three Belt and Road forums for international cooperation, established more than 30 special cooperation mechanisms in key areas such as economy, trade, energy and infrastructure, and established a secretariat for the forum.

Infrastructure connectivity has achieved leapfrog development. Flagship programs such as cross-border highways, railways, ports, and aviation hubs have made breakthroughs, and a general connectivity framework consisting of six corridors, six connectivity routes, and multiple countries and ports has now been realized. The China-Europe Railway Express freight service has operated more than 130,000 trips to date.

Trade connectivity has advanced despite challenges. In-depth alignment has been achieved in areas such as cross-border payments, digital authentication, and smart customs. In 2025, the volume of trade in goods between China and BRI participants reached RMB23.6 trillion, up by 6.3 percent year-on-year, accounting for 51.9 percent of the country's foreign trade.

Financial connectivity has embraced greater diversity. The Asian Infrastructure Investment Bank (AIIB) and the Silk Road Fund have provided financing support to hundreds of projects. Renminbi financing windows have been set up, and the two-way investment between China and its BRI partners totaled more than US$240 billion between 2021 and the first half of 2025.

People-to-people connectivity has become stronger. Landmark livelihood initiatives supported by Luban Workshops and Juncao technology have continued to advance, and communication and exchange have flourished in culture, tourism, education, and media, as well as between the youth of different nations.

Delivering effective results in implementing the Global Development Initiative. To accelerate the realization of the UN 2030 Agenda for Sustainable Development, China helps steer global development towards a new stage of balanced, coordinated and inclusive growth that delivers more robust, greener, and healthier global development.

Consensus on development as a priority continues to build, with more than 130 countries and international organizations supporting participation in the initiative and over 80 countries joining the Group of Friends of the Global Development Initiative. China has hosted the High-Level Dialogue on Global Development and the Forum on Global Action for Shared Development, encouraging all parties to make new commitments to and embark on a new journey towards realizing the Sustainable Development Goals.

Cooperation mechanisms continue to improve. China has signed more than 80 cooperation documents on implementing the initiative with other developing countries, international organizations, and financial institutions. Over 30 cooperation mechanisms have been established in eight key areas of the initiative, covering all 17 sustainable development goals. China has also set up a Global Development Promotion Center and a Global Knowledge Network for Development, and issued the Global Development Report. Together with the UN, it has established the China-UN Global South-South Development Facility, actively discussed the development of the Global Center for Sustainable Development in cooperation with the United Nations Development Programme, and taken the initiative to establish the Institute of Global Development.

Resources for development cooperation continue to grow. More than US$23 billion of development funds of various types have been mobilized. China has established the Global Development and South-South Cooperation Fund, increased its total to US$4 billion, and launched the China-FAO South-South Cooperation Trust Fund (Phase III).

Pragmatic cooperation has delivered remarkable results. China has established a project pool under the Global Development Initiative, launched more than 1,800 cooperation projects, and completed the training of 80,000 people within the framework of the initiative, assisting other developing countries in improving their capacity for independent and sustainable development.

3. Practicing True Multilateralism

No matter how the world changes, China will always uphold the international system with the United Nations at its core, the international order underpinned by international law, and the basic norms governing international relations based on the purposes and principles of the UN Charter. It advocates and practices true multilateralism and remains an active champion and strong proponent of multilateral cooperation.

Resolutely upholding the authority and status of the UN. As a founding member of the UN and the first country to sign the UN Charter, China has consistently upheld the central role of the UN in international affairs through concrete actions. The country's contribution to the UN regular budget increased from less than 1 percent in 2000 to over 20 percent in 2025, making it the second largest contributor. It has paid in full its assessed contributions to the UN in support of the effective operation of UN agencies. It has launched and renewed the China-UN Peace and Development Fund and increased its input to the fund, providing strong support to major UN agendas.

China supports the UN in advancing the implementation of the Pact for the Future and in enhancing the quality, efficiency, and vitality of the organization through the UN80 Initiative. It actively supports the UN and its specialized agencies in establishing new institutions in China, including the UNESCO International Institute for STEM Education in Shanghai and the International Monetary Fund (IMF) Shanghai Center. China's efforts to supply outstanding talent to the UN have led to a steady increase in the share of Chinese employees in UN agencies and related international organizations. China has hosted the Global Leaders' Meeting on Women, boosting new progress in women's well-rounded development.

Panel 1 Global Leaders' Meeting on Women: China's Contribution to the Development of Women's Cause

From October 13 to 14, 2025, China and UN Women jointly hosted the Global Leaders' Meeting on Women in Beijing. Under the theme of "One Shared Future: New and Accelerated Process for Women's All-Round Development", the summit was attended by guests from over 110 countries, including heads of state and government, heads of parliament, officials at the vice-premier level, representatives at the ministerial level, representatives of UN agencies and international organizations, and diplomatic envoys. China's President Xi Jinping attended the opening ceremony and delivered a keynote speech.

To further support the global cause of women, China announced that in the next five years it would donate a further US$10 million to UN Women, earmark a quota of US$100 million in China's Global Development and South-South Cooperation Fund for implementing development cooperation projects for women and girls in collaboration with international organizations, and launch 1,000 small and beautiful livelihood programs with Chinese assistance, prioritizing women and girls as the primary beneficiaries. At the same time, it would invite 50,000 women to China for training and exchange programs and establish a Global Center for Women's Capacity Building aimed at conducting capacity building and cooperation for women's development with relevant countries and international organizations to train more female talent.

Upholding the authority of the international rule of law and pushing for progress in international law-based governance. China has joined nearly all universal intergovernmental organizations and signed over 600 international conventions and amendments, fulfilling its treaty obligations in good faith and honoring its international commitments. The country held a conference marking the 70th anniversary of the Five Principles of Peaceful Coexistence, reaffirming and safeguarding the basic norms governing international relations and the principles of international law. China continues to provide firm support for the work of UN judicial bodies and remains an active participant in international judicial activities. Engaging in international law enforcement cooperation, it has increased efforts in anti-corruption action, the cross-border pursuit of fugitives, their repatriation and extradition, and recovery of assets. Additionally, it has initiated and led the creation of the International Organization for Mediation, filling a gap in the international mediation mechanism.

See page 13

DOCUMENT

From page 12

Panel 2 International Organization for Mediation: Chinese Wisdom for the Peaceful Settlement of International Disputes

In 2022, China and like-minded countries initiated the establishment of the International Organization for Mediation (IOMed). On May 30, 2025, the signing ceremony of the Convention on the Establishment of the International Organization for Mediation was held in Hong Kong, with 33 countries signing the convention and becoming its founding members. On August 29, 2025, the convention entered into force, with Hong Kong becoming the location of IOMed's headquarters. On October 20, 2025, the organization commenced formal operations.

As the first intergovernmental legal organization dedicated to resolving international disputes through mediation, the IOMed focuses on mediating disputes to resolve conflicts and serves as an important mechanism that safeguards the purposes and principles of the UN Charter. It complements and creates synergy with litigation, arbitration, and other existing mechanisms to resolve international disputes, and provides a new platform for their peaceful settlement.

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

Participating in and leading G20 cooperation. China encourages the G20 – as a major forum for economic dialogue between developed and developing countries – to pursue international cooperation in the spirit of equal consultation and mutual benefit. In 2016, China hosted the G20 Hangzhou Summit, widely regarded as one of the most fruitful G20 summits to date. It issued what became a landmark G20 Leaders' Communiqué, put development at the center of macroeconomic policy coordination for the first time, and endorsed consensus documents such as the G20 Guiding Principles for Global Investment Policymaking and G20 Blueprint on Innovative Growth, leaving China's clear imprint in the group's history. During the G20 Summit in Rio de Janeiro, China set out its proposals for economic, financial, trade, digital, and ecological governance, promoting a world economy built on cooperation, stability, openness, innovation, and eco-friendliness. China also took the lead in supporting the African Union's membership in the G20 to increase the representation of developing countries.

Advancing an Asia-Pacific community. The Asia-Pacific Economic Cooperation (APEC) is the highest-level mechanism for economic cooperation in the Asia-Pacific region, with the broadest coverage and greatest influence. China advocates the spirit of an Asia-Pacific family and promotes an Asia-Pacific community of shared future characterized by openness and inclusiveness, innovation-driven growth, greater connectivity, and mutually beneficial cooperation. Facilitated by China, the Shanghai Accord of the APEC Economic Leaders' Declaration was adopted at the APEC meeting held in Shanghai in 2001, marking a new beginning for Asia-Pacific cooperation in the new century. In 2014, the APEC meeting in Beijing delivered multiple outcomes, including the 22nd APEC Economic Leaders' Declaration – Beijing Agenda for an Integrated, Innovative and Interconnected Asia-Pacific, in which all parties pledged to foster an Asia-Pacific partnership for the future and outlined a vision for the long-term development and shared prosperity of the region.

In 2026, China will host the APEC meeting for a third time, under the theme "Building an Asia-Pacific Community to Prosper Together". The meeting will focus on three priorities: openness, innovation, and cooperation. All parties concerned will come together to recommit to the original aspirations of Asia-Pacific cooperation, focus on concrete actions towards their goals, and strive to turn their blueprint for a better Asia-Pacific community into reality.

4. Supporting the Global South in Playing a Greater Role

China will always be a member of the Global South, and in the Global South its roots will remain. No matter what the future holds, it will always keep the wellbeing of the Global South in mind. Acting on the principles of sincerity, real results, amity, and good faith, and with a commitment to pursuing the greater good and shared interests, China has strengthened solidarity and cooperation with other developing countries, firmly safeguarded the common interests of the Global South in international affairs, and led the Global South in building strength through joint efforts.

Advancing high-quality development of greater BRICS cooperation. At the forefront of the Global South, BRICS countries are jointly committed to promoting world economic growth, improving global economic governance, and advancing democracy in international relations. China has played an active role in expanding and strengthening BRICS cooperation, reinforcing its institutions in response to the evolving times, and increasing its global influence. China and other BRICS countries have established the New Development Bank and formed the Contingent Reserve Arrangement, which have become an emerging force in the international financial system and landmark projects of Global South cooperation.

In 2017, the BRICS Xiamen Summit delivered more than 60 outcomes, giving rise to three key engines that drive cooperation – political security, trade and finance, and people-to-people exchange – as well as the "BRICS Plus" approach. In 2022, during the BRICS "China Year", the BRICS Summit issued the Beijing Declaration, marking the beginning of the organization's expansion. China has since worked with relevant parties to advance this historic enlargement, which represents a major milestone not only for BRICS, but also for the evolution of the international landscape. China has promoted a vision for BRICS centered on peace, innovation, green development, justice, and closer people-to-people exchanges. It continues to support more Global South countries in joining the cause of BRICS as full members, partner countries, or in the "BRICS Plus" format, to build the cooperation mechanism into a primary channel for strengthening solidarity and cooperation among Global South nations and a vanguard for advancing global governance reform.

Panel 3 New Development Bank: An Emerging Force in the International Financial System

The New Development Bank was jointly established by Brazil, Russia, India, China, and South Africa in 2015. It is the first international financial institution to be headquartered in China, and the first multilateral development institution established and led by emerging market economies and developing countries. The bank aims to mobilize resources for infrastructure and sustainable development projects in BRICS countries and other emerging and developing economies. Since its establishment, the New Development Bank has made steady progress in its operations and institutional development, becoming an emerging force in the international financial system and a landmark project of Global South cooperation. As of March 2026, it had approved loans of US$42.9 billion for 139 development projects, covering key areas including clean energy and energy efficiency, transport infrastructure, environmental protection, water and sanitation, social infrastructure, and digital infrastructure.

Advancing the development and expansion of the Shanghai Cooperation Organization. The SCO is the first international organization named after a Chinese city, founded with China's participation, and headquartered in the country. China champions the Shanghai Spirit of mutual trust, mutual benefit, equality, consultation, respect for diversity of civilizations, and pursuit of common development, and works towards a closer SCO community of shared future. Through the joint efforts of its member states, the SCO has grown into a group of 27 countries spanning Asia, Europe, and Africa, and its economic aggregate is approaching US$30 trillion. It has carried out cooperation in more than 50 areas, having become an important force for world peace and development and a guardian of international fairness and justice.

In 2025, the SCO Tianjin Summit formulated a development strategy for the coming decade. Leaders of SCO member states witnessed the inauguration of the four security centers [This refers to the Integrated Center for Countering Security Threats and Challenges of the Shanghai Cooperation Organization and its Center for Combating Transnational Crime and Information Security Center, and the SCO Narcotics Control Center.] and decided to establish an SCO Development Bank. China also announced the creation of three major China-SCO cooperation platforms, covering energy, green industry, and the digital economy, and three major cooperation centers for scientific and technological innovation, higher education, and vocational and technical education, and the decision to continue the implementation of the action plan for high-quality development of economic and trade cooperation among SCO members. Together, these initiatives have enhanced solidarity and coordination among member states and injected new vitality into the organization, propelling it into a new stage of high-quality development and towards even greater successes.

Promoting the creation of a global governance architecture that is more balanced and effective. China believes that the international financial architecture should be more balanced in representation and better reflect the realities of the world economy. It argues that the World Bank should conduct shareholding reviews and the International Monetary Fund should carry out quota share realignment in accordance with the agreed timeframes and roadmaps to address the democratic deficit in global financial governance.

China supports the reform of the UN Security Council, believing that increasing the representation of developing countries is the right direction of the reform, and that it is imperative to address the historical injustice suffered by Africa, with priority and special arrangements made for the continent's demands. It maintains communication and coordination with its partners in the Global South through mechanisms such as the Non-Aligned Movement and the Group of 77, and plays an active role in championing justice at major international events such as the UN General Assembly. Together, they have made joint efforts to safeguard international fairness and justice and defend their legitimate rights and interests.

Assisting the Global South in jointly embarking on a path towards modernization. China has proposed and advanced an initiative for open and inclusive Global South cooperation, implemented the eight measures in support of Global South cooperation, and encouraged the Global South to become a staunch force for peace, a driving force for open development, a builder of global governance, and an advocate for exchanges and mutual learning among civilizations.

At the Beijing Summit of the Forum on China-Africa Cooperation, bilateral relations between China and all African countries with which it has diplomatic ties were officially elevated to the level of strategic relations, and the overall positioning of China-Africa relations was elevated to an all-weather China-Africa community of shared future for the new era. China has also pledged to work with African countries to promote modernization in six areas [This refers to modernization that is just and equitable, open and win-win, diverse and inclusive, eco-friendly, underpinned by peace and security, and that puts the people first.] and implement 10 partnership actions [This refers to the partnership actions for mutual learning among civilizations, for trade prosperity, for industrial chain cooperation, for connectivity, for development cooperation, for health, for agriculture and livelihoods, for people-to-people exchanges, for green development, and for common security.].

The China-Arab States Summit decided to build a China-Arab community of shared future in the new era and carry out eight major cooperation initiatives for pragmatic China-Arab cooperation [This refers to cooperation initiatives on development support, food security, public health, green innovation, energy security, inter-civilizational dialogue, youth development, and security and stability.]. China has established a comprehensive cooperative partnership with Latin American and Caribbean countries based on equality, mutual benefit, and shared development. Together, they have founded the Forum of China and the Community of Latin American and Caribbean States, jointly launching the five programs on solidarity, development, civilization, peace, and people-to-people connectivity. Adhering to the principles of the Four Fully Respects [China fully respects the sovereignty and independence of Pacific island countries and upholds the equality of all countries, big or small; China fully respects their will and follows the principles of extensive consultation, joint contribution, shared benefits, and win-win results; China fully respects their cultural traditions and pursues harmony without uniformity and the common development of diverse cultures; China fully respects their effort to seek strength through unity, and supports them in implementing the 2050 Strategy for the Blue Pacific Continent, so as to contribute to the building of a peaceful, harmonious, secure, inclusive, and prosperous Blue Pacific.], China has carried out friendly cooperation with Pacific island countries and developed seven cooperation platforms [This refers to cooperation platforms on emergency reserve, climate change, poverty reduction and development, disaster prevention and mitigation, Juncao technology, agriculture, and police affairs.] to support them in accelerating efforts to achieve independent and sustainable development.

5. Promoting Exchanges and Mutual Learning Among Civilizations

Recognizing the fundamental reality of diversity in world civilizations and the urgent need to transcend civilizational conflicts, China has proposed the Global Civilization Initiative and promoted its implementation, championing the common values of humanity and fostering deeper exchanges and understanding among different peoples, and wider interactions and greater integration of diverse cultures in a joint effort to advance the development and progress of human civilization.

Promoting global dialogue among civilizations. China upholds a vision of civilization characterized by equality, mutual learning, dialogue, and inclusiveness, and promotes harmonious coexistence among different civilizations to share and admire the beauty of all. On June 7, 2024, the country facilitated the unanimous adoption of a resolution at the 78th session of the UN General Assembly, which designated June 10 as International Day for Dialogue Among Civilizations. For its celebration, vibrant themed activities were held at UN venues in New York and Geneva and in countries around the world.

Elsewhere, China has convened the Conference on Dialogue of Asian Civilizations and the Global Civilizations Dialogue Ministerial Meeting, and erected many multi-level international platforms such as the World Conference of Classics, the Liangzhu Forum, and the Alliance for Cultural Heritage in Asia. It has signed cooperation agreements on culture, cultural relics, and tourism with over 100 countries, deepening cooperation in joint archaeological research, world heritage protection, and the translation of classic works. Through concrete actions, the country promotes global dialogue among civilizations and protects the cultural treasures of all humanity.

The CPC in Dialogue with World Political Parties High-Level Meeting and the CPC and World Political Parties Summit encourage mutual learning between Chinese modernization – a new model for human progress – and other civilizations, continuously enriching the garden of world civilizations, and making new contributions to humanity's exploration of paths to modernization.

Panel 4 Global Civilizations Dialogue Ministerial Meeting Builds a Bridge for Mutual Learning Among Civilizations

From July 10 to 11, 2025, the Global Civilizations Dialogue Ministerial Meeting was held in Beijing under the theme "Safeguarding Diversity of Human Civilizations for World Peace and Development". In a congratulatory letter, President Xi Jinping emphasized that China is willing to work with other countries to champion equality, mutual learning, dialogue, and inclusiveness among civilizations, implement the Global Civilization Initiative, and promote the building of a global network for dialogue and cooperation among civilizations, in a bid to provide fresh impetus for advancing human civilizations and promoting world peace and development.

UN Secretary-General António Guterres also sent a congratulatory letter to the meeting, which saw more than 600 representatives from the political, cultural, and educational sectors of about 140 countries and regions attend its opening ceremony. The meeting adopting the Beijing Declaration of the Global Civilizations Dialogue Ministerial Meeting and released a list of 110 actions to be taken.

Advancing the development and progress of human rights. China advocates protecting human rights through security, advancing human rights through development, and promoting human rights through cooperation, steering global human rights governance in a more just, fair, reasonable, and inclusive direction. It has acceded to or ratified 29 international human rights instruments and has played a constructive role in the formulation of several major international human rights documents, including the Declaration on the Right to Development and the Vienna Declaration and Programme of Action.

China has served six terms as a member of the UN Human Rights Council, making it one of the most frequently elected and longest-serving countries. In this role, it has promoted the adoption by the council of resolutions such as "The Contribution of Development to the Enjoyment of All Human Rights", "The Negative Impact of the Legacies of Colonialism on the Enjoyment of Human Rights", "Promoting and Protecting Economic, Social and Cultural Rights Within the Context of Addressing Inequalities", and "Promoting Accessibility for the Full Enjoyment of All Human Rights by All".

Promoting people-to-people exchanges and friendship. China advances various forms of people-to-people diplomacy, city-to-city diplomacy, and public diplomacy. It has held cultural exchange years, tourism years, and education years with many countries, and established over 3,000 pairs of sister cities (provinces/states) with more than 150 countries, actively building bridges for people-to-people exchanges. Entry policies are being continually optimized, with unilateral visa-free access already in place for 50 countries, full mutual visa exemption for 29 countries, and 240-hour transit visa-free policy expanded to 55 countries across 65 entry ports. In 2025, 30.08 million foreigners entered China visa-free, accounting for 73.1 percent of all foreign arrivals, a year-on-year increase of 49.5 percent.

Sports also serve as a bridge for enhancing friendship among peoples. In recent years, China has successfully hosted the Beijing Winter Olympics, the Chengdu FISU World University Games, the Hangzhou Asian Games, and the Harbin Asian Winter Games, carrying forward the Olympic motto of "Faster, Higher, Stronger – Together". The youth represent the future of people-to-people friendship. In recognition of this, during Chinese President Xi Jinping's visits in the US and France in November 2023 and May 2024, China announced an initiative to invite 50,000 young Americans to China for exchange and study over the five years starting from 2023 and an initiative to invite more than 10,000 French students to study in China and double the scale of European youth exchanges in China over the three years starting from 2024. It has also held China-Africa Youth Festivals and "Chinese Bridge" summer camps for young students, planting the seeds of friendship in the hearts of the younger generation.

6. Providing More Public Goods for the International Community

Faced with ever-increasing global challenges, the global governance system must keep pace with the times, find solutions to old problems, and fill the gaps in rules in new areas. China has demonstrated the sense of responsibility of a major country that integrates knowledge and action, actively created international public goods, and contributed new solutions to global governance.

Firmly leading global climate governance. China firmly upholds and promotes the implementation of the United Nations Framework Convention on Climate Change and the Paris Agreement. The country adheres to the principle of common but differentiated responsibilities, and works to build a fair and rational global climate governance system underpinned by cooperation for mutual benefit.

In 2020, at the UN General Assembly, China solemnly declared that it would strive to peak its carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060. In 2025, at the UN Climate Change Summit, it announced a new round of nationally determined contributions, including reducing economy-wide net greenhouse gas emissions by 7 to 10 percent from peak levels by 2035, striving to do better; increasing the share of non-fossil fuels in total energy consumption to over 30 percent; and scaling up the forest stock volume and developing a carbon emissions trading market.

China has initiated the establishment of the BASIC and the Ministerial on Climate Action to build consensus, and has continued to help developing countries improve their capacity to address climate change through South-South cooperation. As of the end of October 2025, China had signed 55 cooperation documents with 43 developing countries, implemented over 300 sessions of capacity-building programs, and had provided and mobilized over RMB177 billion in program funding since 2016.

Panel 5 China's Green and Low-Carbon Industrial Transition Has Made Significant Contributions to the World

China is a steadfast champion of and a major contributor to green development. It has built the world's largest and fastest-growing renewable energy system and the largest and most complete new energy industrial chain, contributing about one-quarter of the world's newly increased green areas. It has carried out extensive cooperation on green energy projects with more than 100 countries and regions, consistently providing high-quality and efficient low-carbon energy equipment and products to the world, especially to developing countries. Its wind power, photovoltaic, and new energy vehicle products are now exported to over 200 countries and regions, supplying 70 percent of the world's wind power equipment and 80 percent of photovoltaic panels, driving down global wind and photovoltaic power generation costs by more than 60 percent and 80 percent, respectively. During the 14th Five-year Plan period (2021-2025), China's exported wind power and photovoltaic products reduced carbon emissions by approximately 4.1 billion tonnes for other countries.

From page 13

Advancing the development of artificial intelligence for good and for all. China has put forward the Global AI Governance Initiative, advocating a people-centered and AI-for-good approach. It supports the UN in playing a central role and promotes the formation of a global AI governance system with broad consensus to benefit all humanity, calling for strengthened international cooperation and assistance for developing countries to bridge the AI divide. The country has promoted the UN General Assembly's adoption of a resolution on enhancing international cooperation on AI capacity building, and proposed and implemented the AI Capacity-Building Action Plan for Good and for All. It initiated the establishment of the Group of Friends for International Cooperation on AI Capacity-Building, built the Digital South project under the Global Development Project Pool, and has held multiple capacity-building workshops and thematic dialogues in this regard.

Additionally, it has proposed the establishment of a World Artificial Intelligence Cooperation Organization and put forward the Global AI Governance Action Plan and the AI+ International Cooperation Initiative, contributing Chinese wisdom and solutions to AI development and governance. China attaches great importance to preventing risks in the military applications of AI and proposes that all countries should adopt a prudent and responsible approach in the development and use of relevant technologies, to ensure that weapon systems remain under human control at all times and to prevent an AI arms race.

Contributing China's strength to safeguarding global public health security. China actively participates in global health affairs and conducts health exchanges and cooperation through multiple channels and at multiple levels. It provides substantial international assistance in the health sector, and has actively engaged in major international health actions such as fighting the Ebola outbreak and the Covid-19 pandemic. It strives to bridge the immunization gap and the health deficit, and advocates jointly building a community of health for all.

China has signed health cooperation agreements with over 160 countries and international organizations, and initiated and participated in nine international and regional health cooperation mechanisms, including those between China and African countries, between China and Arab states, and between China and Southeast Asian nations. China has dispatched more than 30,000 medical workers to 77 countries and regions and treated 300 million patients. It has carried out medical outreach programs such as the Brightness Action, the Heart Care Action, and the Smile Action to provide free treatment of cataract, heart disease and dental defects, and has implemented the New Shennong Initiative, a program named after the mythical Shennong who tasted 100 herbs to discover their medical properties, to find new medicinal herbs worldwide for application in Traditional Chinese Medicine. China continues to support the World Health Organization (WHO) in playing a central coordinating role in global health governance and has deeply engaged in and led key agendas, including the revision of the International Health Regulations, the negotiation of the Pandemic Agreement, and the reform of global health governance architecture and WHO governance.

Actively leading the global biodiversity governance. Guided by the principle that lucid waters and lush mountains are invaluable assets, China advances eco-environmental conservation as a priority, pursues green development, and has become an important participant, contributor, and torchbearer in the global endeavor to build an eco-civilization. As the presidency of the 15th meeting of the Conference of the Parties to the Convention on Biological Diversity, China issued the Kunming Declaration and spearheaded the adoption of the historic Kunming-Montreal Global Biodiversity Framework, guiding the direction and drawing a blueprint for global biodiversity protection through 2030 and beyond. The country has since taken the lead in launching the implementation initiative on the framework and in establishing the Kunming Biodiversity Fund. With an investment of RMB1.5 billion, the fund has to date supported 31 projects and covered 45 developing countries, providing sustained momentum for the implementation of the framework. It has also advocated for the establishment of the International Coalition for Green Development on the Belt and Road, continued to deepen bilateral and multilateral dialogue and exchange, and worked to promote the fruitful results of South-South cooperation on biodiversity protection. In 2019, China became the largest contributor to the core budget of the Convention on Biological Diversity and its protocols, as well as the largest contributor among developing countries to the Global Environment Facility, positions it maintains to this day.

Promoting the improvement of governance rules for new domains. China is advancing the transformation of the global internet governance system, advocating four principles: respecting cyber sovereignty, safeguarding peace and security, promoting openness and cooperation, and ensuring good order. It has held the World Internet Conference for 12 consecutive years since 2014, and put forward the Global Initiative on Data Security and the Global Cross-Border Data Flow Cooperation Initiative. China has supported the establishment of the World Data Organization in Beijing, and supported the United Nations as the main channel for advancing global cyberspace and digital governance, working with all parties to build a community of shared future in cyberspace.

China actively promotes global ocean governance, and facilitated the conclusion of the Agreement on Marine Biodiversity of Areas Beyond National Jurisdiction as one of the first signatories. The country holds observer status in the Arctic Council, advocates building a Polar Silk Road, and promotes joint international efforts to protect and sustainably use Antarctic marine living resources.

China is committed to lasting peace and security in outer space, firmly upholding the international space order based on the 1967 Outer Space Treaty. It opposes an arms race in this realm, supports the United Nations in playing its central role, and safeguards the common rights and interests of all countries in the peaceful use of outer space.

IV. Guiding the Direction of Change Towards a Bright Future

The Global Governance Initiative quickly received widespread support from nearly 160 countries and international organizations upon its announcement, and China's ideas and actions have increasingly resonated with and received positive response from the international community. The reason behind this lies in the fact that China understands how to meet the call of the day and shape the trends of our times; that the GGI, while rooted in China, benefits the world; and that grounded in today's realities while opening up the future, China is contributing wisdom and strength to the progress of human civilization.

1. Building Broad Consensus on Improving Global Governance

Extensive consultation, joint contribution, and shared benefits are aspired by all. A world so vast is bound to face many challenges. What kind of global governance system benefits the world and all its peoples? China believes that global affairs should be discussed by all, the governance system should be built by all, and development outcomes should be shared by all. This approach tackles problems at their root, represents the common aspirations of the vast majority of countries, and seeks the greatest common ground of shared interests for all nations in the world.

An equal and orderly multipolar world and a universally beneficial and inclusive economic globalization are the trends of the times. China advocates that all countries have a place in global governance and play their due roles. Together, they should build the world economy stronger and share the fruits equitably. Let economic globalization penetrate the dark room of protectionism like fresh air and bright sunshine to the benefit of all. This truly aligns with the trend of the times and the aspirations of all people.

True multilateralism is the only path forward. Global governance is both broad in scope and specific in practice. China offers a clear and all-encompassing approach: to champion and apply true multilateralism. Time and again, experience has shown that only when multilateralism is acted upon and multilateral coordination and cooperation are strong and effective, can global governance advance and human wellbeing be guaranteed. Without multilateralism humanity cannot develop and the world cannot progress.

The common values of humanity are a universal guide. With more than eight billion people, over 200 countries and regions, and more than 2,500 ethnic groups and many religions in our world, respecting diversity and differences while forging a great synergy across systems, civilizations, and countries is crucial to the success of global governance. China promotes the common values of humanity – peace, development, fairness, justice, democracy, and freedom. These values align with the core ideas of solidarity, coexistence, and win-win cooperation advocated by various civilizations, laying a value foundation for jointly improving global governance.

2. Demonstrating a Global Vision and a Sense of Responsibility

By sharing its philosophy on global governance and proposing the Global Governance Initiative, China has demonstrated a sense of responsibility in fulfilling the CPC's original aspiration and founding mission. Upholding fundamental principles while breaking new ground, it champions the country's rich diplomatic traditions and draws strength from its fine traditional culture, advancing with and leading the times while remaining committed to action.

China's global governance philosophy originates from the CPC's global vision. Since its founding 105 years ago, the CPC has always taken as its mission the pursuit of progress for humanity and great harmony for the world. It is this mission that determines China's noble goal in participating in global governance: to strive to turn the aspirations of the Chinese people and people of all countries for a better life into reality. The Fourth Plenary Session of the 20th CPC Central Committee emphasized the building of a community with a shared future for humanity and the implementation of the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative, and the Global Governance Initiative, providing clear guidance for China to work hand in hand with other countries to reform and improve the global governance system.

China's global governance philosophy carries forward the fine traditions of its diplomacy. As early as the 1950s, Chairman Mao Zedong said that China ought to make a greater contribution to humanity. Acting on this vision, the PRC has remained committed to an independent foreign policy of peace, and put forward the Five Principles of Peaceful Coexistence, the Three Worlds theory, and the idea of establishing a new global political and economic order, proactively safeguarding the interests of developing countries. For over 70 years, its foreign policy has remained steadfast in its original aspiration to uphold fairness and justice, and its mission to promote human progress has only deepened over time. This record continues to provide a source of strength for China's participation in and leadership of global governance in the new era.

China's global governance philosophy is rooted in the profound heritage of the Chinese civilization. Throughout its more than 5,000 years of civilization, the Chinese nation has always pursued peace, concord, and harmony across generations. Since ancient times, it has cherished the lofty ideal of "great harmony under Heaven", the governance philosophy of "great wisdom governing through sound institutions", the spiritual pursuit of "pulling together in times of difficulty", the strong conviction that "the people are the foundation of the state", and the practical approach of "applying knowledge in action". Under new historical conditions, these elements of wisdom have undergone a creative transformation and innovative progress, offering timeless insights for addressing global challenges.

3. Expanding the Practical Pathways for Building a Community with a Shared Future for Humanity

Over a decade ago, President Xi Jinping put forward the important vision of building a community with a shared future for humanity, with the goal of creating a better world and a better life for people of all countries. Since then, under the banner of building a community with a shared future for humanity, China has adopted a series of initiatives to confront various global risks and challenges, continuously enriching the practice of global governance.

In the face of a widening North South divide and severe delays in implementing the UN 2030 Agenda for Sustainable Development, China has proposed the Global Development Initiative to advance common development. In the face of complex international and regional situations and security governance challenges – especially when certain countries seek absolute security at the expense of other countries' security – China put forward the Global Security Initiative in time to address the peace deficit and tackle security problems. Amid a rising clamor of "clash of civilizations" and "confrontation between different systems", and the stoking of "antagonism of values" by some countries, China has proposed the Global Civilization Initiative to promote exchange and mutual learning among civilizations. Now, faced with a widening governance deficit and growing efforts to undermine the United Nations and multilateralism, China has put forward the Global Governance Initiative, expanding on the institutions of the other three global initiatives and aiming at building a more just and equitable global governance system.

Providing systematic solutions, China's four major global initiatives run in parallel with a focus on different domains and form a complete action framework that promotes prosperity through development, ensures stability through security, enhances mutual trust through exchanges between civilizations, and seeks justice through governance. Together, they lead to an open, inclusive, clean, and beautiful world that enjoys lasting peace, universal security, and common prosperity, constituting an important pillar for building a community with a shared future for humanity.

4. Opening Up New Horizons for Political Civilization of Humanity

Throughout history, humanity has experienced innumerable wars – either hot or cold – but has emerged from each to achieve remarkable progress. Today, the world faces a broader and deeper transformation, and where it will head to depends on the choices of individual countries. By proposing the Global Governance Initiative and a series of new ideas and approaches, China has deepened its understanding of the laws governing the development of human society and promoted the advancement of human political civilization.

Breaking free from the outdated "core-periphery" framework of the old international order. A world in which just a few countries dominate and most are subordinate, and where the rich become richer while the poor become poorer, is not a good world. Whether through the so-called "hegemonic stability theory", "Western-centrism", "neoliberalism", or the "democratic peace theory", the result has been a world marred by disunity and injustice, with turmoil and chaos in many regions. China stands firmly on the right side of history, is committed to promoting greater democracy in international relations so that developing countries can truly become equal members of the international community and masters of their own future.

Transcending the flawed logic that "might makes right". The outdated mindset of hegemonism and power politics cannot adapt to the new reality of a multipolar world. Frequent bullying and big-stick coercion and extortion have opened the Pandora's box for a return to the law of the jungle. China stands firmly on the side of fairness and justice, remaining a pillar of strength amidst the tumultuous changes and upheavals of the world. It clearly advocates the international rule of law and will never allow whoever has the bigger fist to call the shots. Through its efforts, the international community has formed a consensus that calls for fairness, not hegemony.

Abandoning the zero-sum mentality of "winner takes all". Blocking others' path will not get you further; when blowing out others' lamps, the fire will burn your beard. Protectionism is a fire that burns those who set it, and the pursuit of absolute security only adds fuel to the flames. China stands firmly on the side of win-win cooperation, taking concrete actions to pursue harmonious coexistence and seeking its own success while helping others succeed. It advocates that the fruits of governance should be shared by all and that no country should be left behind, so that every member of the international community becomes a winner.

V. Moving Forward Hand in Hand at a Critical Juncture in History

The world has entered a new period of turbulence and transformation, and humanity once again faces a choice: a future marked by peace, dialogue, and win-win cooperation, or one marred by war, confrontation, and zero-sum competition. It is encouraging to see that with broad support from the international community, the Global Governance Initiative is drawing wide participation. It must also be understood, however, that great undertakings are rarely achieved overnight. To advance the initiative, all parties must persevere in the face of challenges, rise above disputes, and work together to build a more just and equitable global governance system.

1. Acting in Global Interest and Planning for the Benefit of Future Generations

Global governance concerns the shared and long-term interests of all people, and its essence lies not in deal making but in the pursuit of justice. China calls on all countries to bear in mind the future of humanity and the wellbeing of their people, to translate the vision of the GGI into concrete actions, and to work towards lasting achievements that benefit all the people for generations to come.

In our global village, all countries are connected, and their interests are closely intertwined. A nation's interests are better realized only when they align with the interests of all. Putting one's own interests first leads only to going it alone, and actions that harm others only serve to harm oneself. In participating in global governance, all countries should adopt a broad vision of shared global responsibility that transcends narrow self-interests. Division and conflict should be overcome with an open mind, with all nations working for humanity's shared future and building a shared home to prevent the "tragedy of the commons".

Global governance is about establishing rules and managing the world on a long-term basis. It requires upholding the principle of intergenerational equity and balancing present needs with those of the future. We must neither deplete the resources left to us by our ancestors – jeopardizing the future of posterity – nor pass on to the next generation the problems that we should solve. The baton of history is in our hands, and the question of where global governance is headed demands an answer. Our generation must offer a response worthy of our times and demonstrate vision and wisdom to build a global governance system that is fairer and more equitable, stable, and effective. Only then can we pass on to future generations a more peaceful, prosperous, and beautiful world.

2. Rising to Challenges with Firm Confidence

Building a more just and equitable global governance system is a noble goal that is feasible and attainable, but it is also a gradual historical process. China believes that as long as all parties remain steadfast in their resolve and persist in their efforts, step by step, this vision is sure to become a reality.

A multipolar world is rapidly emerging, and the trend towards democracy and the rule of law in international relations is unstoppable. Human society is bound to evolve, from confrontation to cooperation, imbalance to balance, division to coexistence. As the times progress and the people awaken, power politics and "exclusive governing clubs" are losing their foundation. As long as the torch of multilateralism is held high, the cause of global governance will pierce through the darkness and reach a brighter future.

The world today is marked by both change and turbulence. Turning chaos into order is no easy task, and reaching a consensus on global governance requires overcoming conflicts and differences through arduous effort. The road is long, but we will reach our destination if we keep moving forward. The task is formidable, but we are sure to succeed as long as we persist. All countries must work hard and make unremitting efforts to push forward the great cause of reforming and improving global governance – no one should look on, hesitate, or slack off.

3. Let's Unite and Act

Global governance promotes the common wellbeing of the international community and relies on the collective efforts of all nations. China advocates that countries unite and cooperate, take concrete action, and transform the vision and blueprint of the GGI into a roadmap and timeline for joint action.

In addressing the diverse interests of different countries, the key lies in seeking common ground while shelving differences. We should create the greatest synergy for peaceful development and win-win cooperation, united under a single system, order, and set of rules. We must strengthen the UN as the core mechanism for practicing multilateralism and the primary platform for global governance. Unity is strength. Only through solidarity and cooperation can we deliver results and overcome major challenges for the benefit of all. Only then can we translate GGI principles into the broadest consensus and the most powerful action.

The successful implementation of the GGI requires major countries to shoulder their responsibilities, multilateral mechanisms to play their roles, and the international community to take concrete action. We need to prioritize urgent issues and work to de-escalate flashpoints. We should focus on improving communication and cooperation in areas where there is an urgent need for better governance. These include reform of the international financial architecture, artificial intelligence, cyberspace, climate change, trade, and outer space. We will build consensus, secure outcomes, and strive for an early success in global governance.

Conclusion

This is an era of challenges. But it is also one of hope. An era where a brighter future beckons, provided we work continuously for the good of generations to come. The Global Governance Initiative is a path to this goal, balancing lofty ideals with practical action and driving progress towards more effective global governance, step by step.

The initiative stands at the forefront of our era, offering fresh momentum for building a community with a shared future for humanity and serving as a compass to help the great ship of history chart its course through turbulent waters. It is yet another significant public good that China has contributed to the world.

Looking ahead, as the international community gains a deeper understanding of this initiative and participates in it, the progressive forces championing multilateralism will grow stronger, and the grand goal of building a more just and equitable global governance system will gradually become a reality.

China stands ready to work hand in hand with all other countries to implement the initiative under the principles of extensive consultation, joint contribution, and shared benefits. Together, we can expand the scope and influence of multilateralism, let the light of fairness and justice illuminate the world, and bring the achievements of global governance to all nations. Together, we can create a brighter future for humanity and the progress of human civilization.

CULTURE

Exhibition makes mythical connections

Exploring the origins of Maya and Andean civilizations brings about comparisons that expose similarities to ancient Chinese beliefs, **Wang Ru** reports.

Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

In ancient Chinese myth, human beings were created by the mother goddess Nyuwa, who kneaded a mixture of soil and water until it took the form of a self-resembling doll-like creature. That myth is strikingly similar to one in remote Mesoamerica: in Maya myth, humans were made by a god who used maize dough.

Today, when visiting Mesoamerican countries, people find that maize remains the soul of local people's lives. It appears as the staple in daily meals, and is frequently added to other delicacies. Ceremonies related to maize can also be witnessed throughout the year.

This crop has been a lasting cultural symbol for millennia, as demonstrated by *Maize·Gold·Jaguar: A Grand Exhibition of Ancient Maya and Andean Civilizations*, which is currently on view at the Capital Museum in Beijing.

For over 3,000 years, from around 2000 BC to the 16th century AD, the Maya civilization flourished in present-day Mexico, Guatemala, Belize, Honduras, and El Salvador, renowned for its advanced writing system, astronomy and monumental pyramid-temples. Andean civilization, which thrived in South America's Andes Mountains from around 3000 BC to the 16th century AD, was also remarkable, known for its achievements in architecture, metallurgy and pottery production.

With about 800 artifacts from more than 20 cultural heritage institutes in Mexico and Peru, the exhibition, as the largest in the museum's history, showcases a historical lineage of more than 3,000 years through three cultural symbols — maize, gold and the jaguar — systematically demonstrating the productive foundations, spiritual symbols and power systems of Maya and Andean civilizations.

"Maize was the origin of life in ancient Mesoamerica," says Tan Xiaoling, deputy director of the Capital Museum. "Gold, in Andean civilization, was the sweat of the sun, representing the supreme authorities of divine and royal power. The jaguar, however, was the king of the forest and a symbolic totem connecting the human world with the divine realm. Together, they form a complete spiritual spectrum of ancient American people from survival to faith and then power."

Cosmic chapter

The first chapter draws visitors into the Maya world, displaying how ancient people from that remote area created outstanding achievements, including farming, hieroglyphic, and the astronomical calendar, during its classical era from 200 to 900, roughly the same time as China's Three Kingdoms (220-280) to the Tang Dynasty (618-907), says Shao Xinxin, curator of this section of the exhibition.

He highlights a sandstone head statue on display from 600-900, adorned with a cosmic tree headdress with geometrics, animal and deity patterns. It is speculated that this figure played an important role in ancient Maya sacrificial or other ceremonial activities.

Behind this artifact lies the Mayan worldview and the cosmos. Shao says they believed the world had three realms — the upper realm for the sun, the moon and the stars; the middle realm was where humans thrived; and the bottom realm was where the dead paused before rebirth. Linking the three realms is the cosmic tree, which holds the universe together.

Horizontally, with the tree at the center, Mayans divided the earthly realm into five directions, each associated with a symbolic color: the east, red; the north, white; the west, black; the south, yellow; and the center, green.

Shao says such ideas, whether the world is three realms or the five directions of different colors, can also be traced in traditional Chinese culture. The Chinese also used five colors to denote the same five directions, though the color assignments differed.

Another fascinating parallel appears in the representation of the moon. The display showcases a limestone stele from 900 to 1521 depicting the Maya moon goddess Ixchel. She holds a rabbit in her arms. In Maya belief, the rabbit symbolizes the moon and is an important partner of the goddess.

"This is highly similar to the moon goddess Chang'e and her rabbit in traditional Chinese myth," says Shao. "It is generally guessed that Maya and Chinese people both believed the shadow they witnessed on the moon was a rabbit. Connecting the rabbit to the moon is rare in world civilizations elsewhere."

While the exhibition's first section focuses on the Maya civilization, the second section shifts the viewer's attention southward into the Andes Mountains. Here, the organizing symbol is gold.

Heavy metal masks

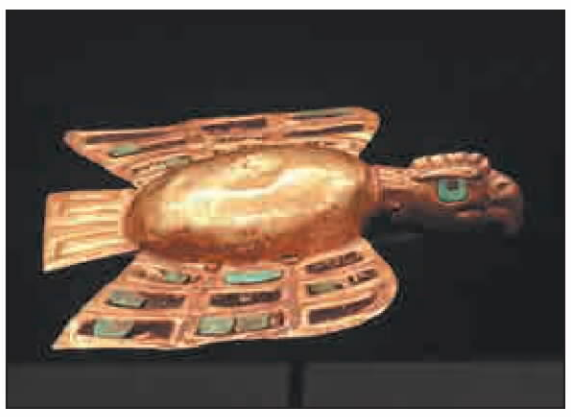
In the second section, the Andean civilization is introduced mainly through its metal vessel-making techniques. A gilt-copper mask on display, unearthed from the Royal Tombs of Sipan in Peru, is the masterpiece that showcases this achievement. Its facial features are clear and lifelike, showing the craftspeople's mastery of human expression.

Such masks were often placed on the faces of tomb owners or appeared in groups as accompanying burial artifacts. In Andean belief, masks held a protective function: they guarded the soul of the deceased and helped the dead gain their identity in the underworld, says Zhao Yazhuo, also a curator of the exhibition, adding that the mask is highly similar to the jade and metal masks found in ancient Chinese tombs.

The 72 artifacts from the Royal Tombs of Sipan are highlighted in the display, with more than 80 percent making their debut in China. More than half have never been showcased in Peru.

The royal tombs were discovered first in 1987, when some were looted. Then archaeologist Walter Alva carried out rescue excavations of the tombs with a team and discovered the giant tomb group, where the king of the Moche culture (an ancient Peruvian culture from 100 to 850) was buried. Its high level of preservation is often compared to that of the tomb of Tutankhamun in Egypt.

"People in Peru's northern coastal region overcame the desert through engineered irrigation systems, giving rise to a unique civilization. The Moche culture, in particular, stands as an outstanding example," says Alva. "I believe this exhibition enables China, a country that also has a long history, to understand Peru's past and appreciate the best examples of its artistic creativity."



The exhibition also traces a lesser-known historical connection that linked the Andes to China through the global silver trade. Since the 16th century, when the Inca Empire (about 1400-1532) of Andean civilization gradually declined, Spanish colonizers exploited local silver in enormous quantities, which then traveled all the way to Ming Dynasty (1368-1644) China through maritime trade.

The Ming economy, Zhao explains, faced a silver shortage for use as currency. "The paper currency issued in the early Ming Dynasty had lost significant value, and there was also a shortage of bronze coins. Thus, the public had an earnest demand for a stable, reliable currency. The import of silver from Americas filled that gap.

"In this way, the remote Chinese and Andean civilizations were truly connected at that time, all becoming part of the entire world history," she adds.

From top: A feline-shaped ceramic jar, from 600 to 1000, unearthed in Peru. Peruvian archaeologist Walter Alva introduces artifacts from the Royal Tombs of Sipan on display at the Capital Museum's new exhibition last month. A gold headdress (inset), unearthed from Peru from 100 to 850. People appreciate a sandstone statue of Maya culture from 600 to 900 on display at the exhibition. A gold Andean condor plaque (left) from 1300-200 BC. A gold Peruvian warrior figurine from 100 to 850 on display. Bronze figurines unearthed from Peru from 600 to 1000. Animal instincts

While the first two sections focus on human creations, the final section turns the spotlight on animals in Americas, introducing their bond with human society.

Wei Yi, curator of the last section, says that in Mesoamerica, people believed each individual had a guardian spirit animal and was endowed with the spirit and character of their protective animal. For example, if someone's guarding spirit is a jaguar, then the person likely has strength and courage. If one is protected by a monkey, then they may be elegantly flexible with artistic talent.

An object on display directly illustrates this belief: a soldier's figurine in jaguar attire, found in western Mexico and dating from approximately 100 BC to AD 400. The soldier wears a jaguar skin as a garment, and his posture is aggressive and powerful. The meaning is clear: by dressing as the jaguar, the soldier would gain the animal's strength and fighting skills, ensuring victory in battle.

"Ancient people in Mesoamerica understood the relationship between people and animals in this way, deeply integrating animals in their lives and social culture," says Wei.

"Following this belief, visitors can find out their own guardian animal when touring the display," he adds.

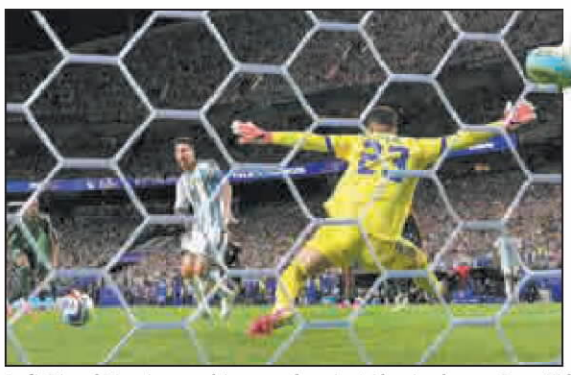
WORLD CUP 2026

Messi hails 'beautiful moment' after tying Cup goals record



Received by NSD/FARA Registration Unit 08/26/2026 3:36:23 PM

Argentine's hat-trick puts him level with German Klose

Lionel Messi saluted a "beautiful moment" after becoming the World Cup's joint all-time leading goalscorer in his record-breaking appearance at his sixth World Cup on Tuesday.

The 38-year-old Argentina captain penned another memorable chapter in his storied career with a brilliant hat-trick in the South Americans' 3-0 win over Algeria at Kansas City's Arrowhead Stadium.

Messi's hat-trick — his first ever in a World Cup — put him alongside Germany's Miroslav Klose as the top scorer in the tournament's history with 16 goals.

"To enjoy this with my family, with my teammates, the ones who are always there, is a really beautiful moment," Inter Miami star Messi said afterwards. "I'm happy."

Messi's razor-sharp eye for goal augurs well for Argentina's hopes of becoming the first team since Brazil in 1962 to win back-to-back World Cup titles.

"The squad, it's a very united, very strong group," Messi said.

"I feel good; we were lucky enough to win a tough match. It's important to start off with a win in the first game.

"I'm grateful to the fans, because, once again, they've shown that Argentina is crazy about this — we packed the stadium again."

On a night for the ages in Kansas City, the records kept tumbling for Argentina's miracle man, considered by many to be the greatest footballer of all time.

When the match kicked off at the home of the NFL's Kansas City Chiefs, Messi became the first player to feature in six World Cup tournaments, in his 200th international match.

And the star veteran, who made his first appearance at a World Cup as a teenager in 2006, lit up the occasion with three goals in a clinical display by Argentina.

Messi produced a majestic finish from distance in the 17th minute, sparking a frenzy among his adoring fans, who had turned the match into a virtual home game.

He netted again in the second half from close range, gobbling up a rebound to take him just one goal behind the all-time record held by Klose.

Messi completed his first World Cup hat-trick with an unstoppable finish in the 76th minute.

The diminutive genius was substituted shortly afterward, forcing Argentine fans to wait to see their hero have a shot at the outright record.

Argentina coach Lionel Scaloni, meanwhile, said he no longer has "the words to describe Messi".

"For 20 years, he's had us used to seeing things like this, and he inspires everyone who watches him play," Scaloni said of his star player.

Scaloni is now targeting Argentina's second Group J game against Austria on Monday, as the South Americans look to lock up their place in the knockout rounds.

"We're going to take it one game at a time. The team is happy; we gave playing time to a lot of players," Scaloni said.

"Hopefully, we can win the next one so everyone can be in the third group stage match."

Fluid in attack

The Group J match in the open-air stadium started at a frantic pace and both sides had early goals ruled out for offside, including one from Messi.

But Argentina took the lead when Rodrigo De Paul played a beautifully measured through ball, which Messi picked up before driving at goal and unleashing a fierce shot from outside the penalty area that curled away from goalkeeper Luca Zidane.

The South American team was largely in control, fluid in attack with its revered No 10 pulling the strings.

But, as the clock ticked toward halftime Algeria enjoyed a better spell, with Argentina goalkeeper Emiliano Martinez forced to parry a shot from Fares Chaibi.

Messi curled another effort over the bar in the early minutes of the second half and Zidane kept out a shot from Lautaro Martinez.

But the crowd did not have to wait long to celebrate another goal from the veteran Inter Miami forward.

Zidane failed to deal with a sizzling Alexis Mac Allister strike and Messi was there to sweep home in the 60th minute.

Time stood still six minutes later as Messi was through again, but this time Zidane pushed the ball over the bar.

It was enough to make Kansas City Chiefs quarterback Patrick Mahomes leap from his seat in anticipation.

Messi, though, was not to be denied, completing his hat-trick after being set up by substitute Nico Gonzalez.

'A madman'

Messi's hat-trick upstaged two of soccer's other stars — Kylian Mbappe of France and Erling Haaland of Norway — who had big games of their own on Tuesday. Mbappe scored twice in France's 3-1 win over Senegal, moving him into joint fourth on the World Cup goals list with 14, while Haaland scored twice for Norway in its 4-1 victory over Iraq.

"Messi is a madman," Haaland said in a post on Snapchat.

Messi, who turns 39 next week, had been dealing with a minor hamstring injury with Inter Miami that had slowed him in the lead-up to the World Cup, but the eight-time Ballon d'Or recipient had no problems in a tuneup against Iceland last week, scoring on a penalty kick while playing 20 minutes in a sharp performance.

"When I'm in good shape," Messi said, "I give it my all."

Earlier, the roads around the stadium were clogged as tens of thousands of Argentine fans streamed toward the ground dressed in blue and white, many with Messi's name on the back of their shirts.

Argentina's all-time top scorer is just the third man to reach 200 caps after Cristiano Ronaldo and Kuwait's Bader Al-Mutawa.

Ronaldo will equal Messi's record of six World Cup appearances if he plays for Portugal against DR Congo on Wednesday.

Mbappe calls the tune in France win

Kylian Mbappe scores his second goal, and France's third, during a World Cup Group I match against Senegal in East Rutherford, New Jersey, on Tuesday. AP

Kylian Mbappe celebrates scoring the opening goal in France's World Cup match against Senegal on Tuesday. AP

EAST RUTHERFORD, New Jersey — After a flat first half, Kylian Mbappe got France back in tune.

Mbappe scored twice to move past Pele with 14 World Cup goals, celebrating by mimicking a flutist as he had promised, and helping Les Bleus beat Senegal 3-1 on Tuesday in their World Cup opener.

"He could have scored four or five goals, OK, theoretically, but we're happy with two," France coach Didier Deschamps said.

He began the day one goal behind Olivier Giroud, his teammate in France's victorious 2018 World Cup campaign, but is now one ahead of the former Arsenal striker on 58 goals in 99 appearances.

"I am really pleased and very happy to make a little more history for my country," Mbappe said.

"It is something I always wanted to do, although we know why we are here, so I think I will have the time to think about all these things once I stop playing."

He added: "We want to keep writing the biggest page in the history of the French national team. We know the road is very long, but we are ready."

Mbappe had 14 touches in the scoreless first half, the fewest of any player, then put France ahead in the 66th minute. He burst past Senegal captain Kalidou Koulibaly, turned onto a diagonal pass from Michael Olise and slid the ball past goalkeeper Edouard Mendy from just outside the six-yard box.

In a segment with Mbappe taped on May 20 and aired Friday by US broadcaster Fox, award-winning actor and television host James Corden suggested the 27-year-old star striker celebrate his next World Cup goal by imitating a flute player. Mbappe practiced the instrument for a year or two as a child at the behest of his parents.

"I'll do it for you in the first game," Mbappe said.

Mbappe ran toward a corner, brought both hands to his lips and mimicked the instrument.

"If he wants to miss the first half again and score two goals in the second half in another match, that's OK with me," Deschamps said.

Bradley Barcola doubled the lead in the 82nd, two minutes after entering. Ibrahim Mbaye cut the deficit in the fifth minute of stoppage time. Senegalese celebrations, though, were short-lived. Mbappe scored just 68 seconds later on a spectacular right-footed shot from 30 yards. The ball dipped perfectly between Mendy's outstretched left arm and the crossbar.

"A crazy goal," French defender William Saliba said.

Mbappe, who led the 2022 tournament with eight goals, moved one ahead of Lionel Messi and fellow Frenchman Just Fontaine on the World Cup scoring list before Messi scored his 14th, 15th and 16th for Argentina later Tuesday. Mbappe is tied with Germany's Gerd Muller, trailing Messi, Germany's Miroslav Klose (16) and Brazil's Ronaldo (15).

"I'm sure that he will do it," Saliba said of Mbappe setting the record.

"He can, from time to time, miss a game or two, but on one action he really is able to tip the scales and bring his team to victory," Deschamps said.

"People say he doesn't defend enough. Well, he's not here to defend."

Mbappe brushed off critics.

"It's not about revenge," he said. "If I started playing for all the people who criticize me just to silence them, I'd have to play until I was 80."

Trying to reach its third straight World Cup final, France plays Iraq on Monday in Philadelphia, then closes Group I on June 26 against Norway at Foxborough, Massachusetts. Senegal meets Norway on Monday at MetLife Stadium and finishes the first round against Iraq in Toronto.

With fans in Senegal denied visas by the United States government, supporters of the Lions of Teranga appeared limited to a few sections in MetLife's southwest corner on a sunny 25 C afternoon.

While most of the stadium was filled with a just-under-sellout crowd of 80,545, there were empty seats on a mezzanine club level, which has air-conditioned suites behind the outdoor chairs.

Two hours before kickoff, tickets dropped to as low as $69 on FIFA's resale site.

FIFA sold tickets at $220-$620 in December.

XI'S VISION | SCO COOPERATION

Shanghai Spirit still resonates after 25 years

SCO's scope, focus have grown as group supports all members' development

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

On June 15, 2001, the leaders of China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan gathered in Shanghai to announce the founding of a new regional organization in the Eurasian region.

A quarter century later, the Shanghai Cooperation Organization — the only international organization named after a Chinese city — has grown far beyond its initial security focus into the world's largest regional organization.

Today, the SCO has 10 member states, two observer states and 15 dialogue partners, bringing together countries that account for nearly half of the world's population and about a quarter of the global economy.

Describing the SCO as a "big family", President Xi Jinping has always attached great importance to the development of the organization. He has attended every SCO summit since taking office, sharing visions, putting forward key initiatives and promoting joint efforts to carry forward the Shanghai Spirit.

"A just cause finds great support, and a journey with many companions gets far," Xi said, quoting an old Chinese saying, at the SCO summit in 2023, noting that the organization's development accords with the trend of the times and goes along with the direction of human progress.

The Shanghai Spirit, featuring mutual trust, mutual benefit, equality, consultation, respect for diverse civilizations and the pursuit of common development, has remained central to Xi's remarks on the SCO.

Chairing the SCO summit for the first time in Qingdao, Shandong province, in June 2018, Xi reviewed the organization's development and achievements, and emphasized that the Shanghai Spirit serves as a shared asset for all member states.

"The Shanghai Spirit, transcending outdated concepts such as clash of civilizations, Cold War and zero-sum mentality, has opened a new page in the history of international relations and gained increasing endorsement of the international community," Xi said.

At each SCO summit since 2013, Xi has underscored the profound relevance of the Shanghai Spirit while continually enriching and expanding its meaning.

Yermek Kosherbayev, Kazakhstan's foreign minister, said in a signed article marking the SCO's 25th anniversary that the organization's "greatest asset remains its constructive and pragmatic approach to cooperation, founded on the universal principles of equality and mutual benefit, without the dominance of any single ideology".

This approach, known as the Shanghai Spirit, has proved the resilience, effectiveness and enduring value of the multilateral mechanisms developed within the SCO framework, he said.

Yang Jin, an associate researcher at the Chinese Academy of Social Sciences, said the Shanghai Spirit is not an abstract slogan, but a set of principles tested in the SCO's practice.

Peace deal with Iran to be signed on Friday

By **SU QIANG** in Beijing and **SHI GUANG** in New York

The United States and Iran will sign a peace deal on Friday, US President Donald Trump announced on Sunday.

"The Deal with the Islamic Republic of Iran is now complete," Trump said in an announcement on Truth Social. "Congratulations to all!"

"Many presidents have tried to make Peace with Iran, and all have failed before me. The Leaders of the Region have, for the first time, found a President who can help them achieve real Peace," Trump posted.

"With the opening of the Strait upon the signing of the Deal on Friday, for purposes of mine removal, oil will flow on both ends again for the Region, and the World!" he said.

Earlier on Sunday, Prime Minister Shehbaz Sharif of Pakistan, which has been acting as a mediator, announced on X that a deal had been reached between the two parties.

"Following intensive talks, we are pleased to announce that the Peace Deal between the United States of America and Islamic Republic of Iran has been REACHED. Both sides have declared the immediate and permanent termination of military operations on all fronts, including in Lebanon," Sharif posted.

The signing ceremony will be on Friday in Switzerland, he said.

Inside

Comment, **page 6**

"With the agreement now in place, mediators will facilitate a series of meetings this week. These pre-implementation discussions will lay the foundation for the technical talks and the official signing ceremony," Sharif said.

Iran Deputy Foreign Minister Kazem Gharibabadi confirmed an immediate and permanent end to the war, telling Iranian state TV that military operations on various fronts, including Lebanon, will cease, Reuters reported. He also said that the US naval blockade of Iranian ports would be lifted.

Details of the agreement have yet to be released.

Trump had posted earlier that a peace deal with Iran would be signed on Sunday — his 80th birthday.

However, Iran said on Sunday that no agreement would be reached by Trump's deadline, the country's Fars News Agency reported.

The proposed agreement would apparently see the Strait of Hormuz reopened to commercial traffic, and the US blockade of Iranian ports lifted. It was expected that the current ceasefire would be extended by another 60 days.

However, two ongoing sticking points have been a US demand that Iran surrender its stockpile of enriched uranium, while Iran has demanded the US unfreeze assets worth tens of billions of dollars.

In an interview with the New York Times, Trump said that the agreement means the Strait of Hormuz would be "permanently toll free".

Trump told the Times that if Iran failed to reach a final nuclear agreement with the US he would restart military attacks, or make the US "the guardian of the Middle East" in return for a fifth of the region's revenue.

UK Prime Minister Keir Starmer, in a joint statement with France, Germany and Italy, said the deal must be "implemented rapidly and comprehensively".

"This is a moment of opportunity to restore regional stability and stabilise the global economy," Starmer said.

French President Emmanuel Macron posted online that leaders at this week's G7 meeting will discuss the long-term reopening of the Strait of Hormuz.

"The aim will be to see the consequences of this agreement, support for Lebanon, the lasting reopening of Hormuz and of course the concluding of an accord on nuclear and ballistic activities in Iran," Macron said on Instagram.

Tom Watkins, deputy chief of staff to former Michigan governor James Blanchard, told China Daily: "If it is to believed, and if it holds, it is good news for the people of Lebanon, Iran and for people of the world. With multiple false starts, even the most optimistic observer is waiting anxiously for its implementation."

"Many innocent people in the Middle East, including women and children, have been killed and wounded because of this war," Watkins said.

The war has been costly for the US in loss of life, treasury and reputation, and many observers believe it leaves the US no more secure than before it started, he said.

As in all "deals", the devil will be in the details that will dribble out, he added.

Grouping remains a multipolar influencer

WORLD WATCH
By Djoomart Otorbaev

The 25th anniversary of the founding of the Shanghai Cooperation Organization on June 15 marks more than a symbolic milestone. Over the past 25 years, the SCO has evolved from a narrowly focused border-security mechanism into one of the largest transregional organizations in Eurasia and one of the central pillars of the emerging multipolar order.

In a world marked by fragmented globalization, sanctions, conflicts and institutional crises within the Western system, the SCO is increasingly establishing itself as a contributor to international cooperation, emphasizing sovereignty, consensus and strategic pragmatism. The SCO is becoming a symbol of resistance against the unipolar development model some powers are desperate to impose on Eurasian countries. As a key founding member, China provides investment, logistics and an alternative development model to that of the West — one based on the principles of respect for the sovereignty of countries, nonviolence and mutual benefit.

The organization originated from the "Shanghai Five" mechanism created in 1996 by China, Russia, Kazakhstan, Kyrgyzstan and Tajikistan. At first, it concentrated on confidence-building and demilitarization along the post-Soviet Chinese border. However, the geopolitical dynamics of Eurasian integration soon expanded the mechanism's scope beyond border security.

On June 15, 2001, in Shanghai, Uzbekistan joined the group, and the Declaration on the Establishment of the SCO was signed. Since then, the SCO has undergone several phases of expansion. India and Pakistan became full members in 2017, significantly boosting the organization's geopolitical influence. Iran officially joined in 2023, and Belarus finished its accession process in 2024.

CHONGQING STATION IS ON EVERYONE'S 'MUST-EAT' LIST

Viral photo trend sets off wave of creativity among international social media enthusiasts

By **TAN YINGZI** and **DENG RUI** in Chongqing

On a sweltering afternoon in early June, the Liziba Observation Deck outside Liziba Station on Chongqing Rail Transit Line 2 transformed into a stage for an unusual spectacle. Throngs of international visitors stood in a line, mouths wide open — not for a taste of the city's famed cuisine, but to capture the perfect shot of a monorail train seemingly gliding into their mouths as it passes through a nearby 19-story building.

Dubbed the "disappearing monorail", the viral photo trend has ignited a wave of creativity among social media enthusiasts from abroad. In Southwest China's Chongqing, a city celebrated for its fiery hotpot and futuristic skyline, the monorail has become an unexpected must-see attraction for adventurous tourists.

"Kung Pao chicken might be nice, but I want to 'taste' Chongqing's monorail as well," said Norwegian soccer player Erling Haaland. During a recent visit to the city, Haaland shared a viral video of himself playfully "devouring" the iconic monorail. He said a fan had enthusiastically placed the monorail at the top of Chongqing's "must-eat" list.

A foreign tourist poses with his mouth open, pretending to swallow a monorail as it passes through a residential building at Liziba lookout in Chongqing on Sunday. LI YIXIAN / FOR CHINA DAILY

Fueled by platforms like TikTok, Instagram and YouTube, the Liziba monorail has turned into an unexpected star, a "dish" that everyone wants to try. As one netizen summed up: "It's like a 3D version of kung fu for the mouth."

The immersive experience has also given rise to new consumer trends. There are photographers at the deck to help tourists create the perfect "train-eating" videos.

Across the river in the Liangjiang New Area, tourists snap videos of themselves "savoring" the train, "devouring" it with the dramatic flair of a Chinese fan, or "packing" it into imaginary boxes.

"My friend thought it was AI," said Yvonne Tsakiris, a 48-year-old from Dubai. Suitably inspired after hearing about the monorail from a friend, she and her husband decided to bring their sons to Chongqing so as to witness the phenomenon firsthand.

HOME IS WHERE THE HUM IS

Interactive musical events in Beijing's public spaces help young people navigate stress of daily life through shared joy, sense of community

By CHEN NAN
chennan@chinadaily.com.cn

On a summer weekend, as the afternoon sun spills its mellowed golden glow on the public square at Solana, a popular commercial complex in downtown Beijing, the cackle of conversations fills the open space, punctuated by the occasional woof of a dog or the distant whistle of an urban wanderer.

And then, a small amplifier crackles, a guitar chord cuts through the air and the voice of a young woman rises tentatively, weaving its way through the chatter of the crowd.

Within minutes, the mall's scattered visitors come together, joggers pause mid-stride, elderly couples lean on walking sticks, children run in wide circles and parents push strollers closer — all gathering spontaneously around the music.

By the third song, the space is transformed. People clap, sway, sing and even step onto the makeshift stage, embracing the music as if the square were hosting an impromptu city festival.

Li Wei, 27, a tech startup employee, was on a lunch date with friends one Saturday at Solana when he heard the familiar strum of a guitar and an unfamiliar voice singing pop icon Faye Wong's song with unrestrained joy.

Curious, he and his friends followed the music and found themselves in the middle of a crowd of cheering strangers. Soon enough, they were all clapping and swaying to the beats. When the open-mic moment arrived, his friends nudged Li forward. For the next few minutes, he sang with people he'd met for the first time, his voice shaky but his enthusiasm unwavering.

"It felt like the city had suddenly come alive after years. For three hours, I wasn't just an office worker; I was part of something bigger. I left feeling lighter, connected and, strangely, at home in Beijing," said Li, who originally hails from Jinan, Shandong province.

This scene of young people gathering in parks, public squares, riversides or courtyards to sing and connect is now commonplace in the Chinese capital. The citywide phenomenon blends creative and spontaneous performances with a strong sense of community.

From impromptu open-mic events in tucked-away art districts to intimate gatherings in secluded courtyards, these musical meetups reveal a generation navigating the stress of urban life and building connections in their own vibrant, expressive ways.

For Road Show Plan, a Beijing-based band that turns ordinary city spaces into stages and boasts over 300,000 followers across social media platforms, it all began in 2021 amid the COVID-19 pandemic.

Tan Wu, a self-taught guitarist from Hubei province with a degree in Chinese literature, who belted out songs — including originals — at fancy bars and bistros, found himself confined to a residential neighborhood in Beijing. His friend, Zhang Xiaotan, who worked with music platforms and at live-house venues, faced the same frustration as the entire city went under lockdown.

"We both love music, and desperately needed an outlet," Tan recalled. "At first, it was just us, singing outside our residential community, playing for each other and a few friends," said the 30-year-old.

Their friend, a trained keyboardist from Shanxi province, who goes by her stage name Liang Zai, soon joined them. The trio put together musical shows to cheer friends, neighbors and anybody who stopped to listen.

"The first time a passerby stopped and sang with us, we felt a surge of excitement," recalled 31-year-old Liang Zai. "It felt like we were creating something bigger."

By 2022, the group had brought the balm of music to parks and public spaces, inviting visitors to perform with them.

"We realized that people love the spotlight. We let them grab the microphone, feel the stage and experience what it is like to lead a song," Tan said. "And that's when the idea of organizing interactive outdoor performances started to take shape."

The three friends never expected their casual, passion-driven musical gatherings to grow into full-fledged cultural events. But in April 2023, their three-hour performance at Chaoyang Park drew more than 1,000 people, after handmade posters, playfully illustrated with sunny skies and jolly clouds, were circulated online.

"I was tuning my instrument, when the crowd started swelling. Shy and reserved by nature, I kept my gaze fixed on the keyboard as my fingers glided across it. When I looked up again, there were more people than I had ever seen together at one place," recalled Liang Zai.

Zhang, 27, said they had no well-rehearsed song list. "Folk, pop, rock — we sang whatever we felt like. People just kept coming. They sat, stood, sang or danced along the riverside. For three hours, we all became part of the same story."

Today, their approach is more professional, but still adequately spontaneous. Tan manages online promotion and poster design, besides playing the guitar; Liang Zai handles community engagement, as well as plays the keyboard; and Zhang manages live sound while also writing originals for the band.

Locations vary widely — from parks and riverside boulevards to art districts and amphitheaters in the lap of nature. Open-mic participants are randomly chosen from among those who raise their hands. For everyone involved, these events offer a rewarding experience.

A passerby joins the Road Show Plan to sing for audiences kayaking in the Liangma River in Beijing in July 2025. SHAO CHUN / FOR CHINA DAILY

Xiao Yang sings the songs of Cheer Chan in Beijing on June 6.
ZOU HONG / CHINA DAILY

Road Show Plan member Liang Zai

On Jan 5 last year, the trio staged an original show at a semi-outdoor venue in Beijing, performing nearly 30 of their songs in succession.

"It was my birthday, and I was deeply moved by the enthusiastic participation," recalled Zhang.

"Our friend Peter Pan, who was once only a member of the audience, became our official photographer that day. He also surprised us with a banner, a cake and celebratory sparklers. We always cherish the people we meet during performances. It felt less like a concert and more like a reunion of old friends — a truly perfect night," he added.

Liang Zai, who also works at a bank, said there was a time when work pressure was really intense and their musical gatherings served as her emotional outlet.

"The weekend shows brought immense joy. It felt like I could breathe again," she said.

Today, the shows are an inseparable part of her life, she said. "I am learning to balance work and life. I carry my laptop everywhere. I work, and then take breaks to perform," she added.

Tan noted that music is like a reset button. "City life is stressful. Everyone's busy working, running errands, or just striving hard to survive. On weekends, people need time and space to breathe. When it comes to our shows, everyone belongs. The shows are free, casual and good for the city. People leave smiling and feeling lighter — feeling human again," he said.

Interactive musical gatherings in Beijing reflect a broader cultural trend, as young people often seek meaningful connections beyond social media.

"We're creating collective memory in real time. Our audiences tell us they've never seen the city like this — alive and accommodating," Tan said.

"Looking ahead, there's so much to be excited about. More brands and cross-industry collaborations are on the horizon. The goal of performing in 100 corners of Beijing is within reach, and the next milestone will be 200. Beyond that, I hope to take our shows to other cities, to feel the energy of young people there and to soak in the unique vibe of each urban space," he added.

Yan Baolin, a choral singing conductor and a professor at Zhejiang Conservatory of Music, noted that singing is different from playing a musical instrument, as it channels emotions directly through voice.

"The positive impact of a beautiful vocal performance on the heart and mind of a listener is unmatched," Yan said. "For young choral singing participants, the collective effort is powerful. It lets them experience the strength of working together, and the emotional resonance that emerges during collaboration provides a natural outlet for stress."

Studies show that sound waves produced during choral practice can have measurable positive effects on the body, making choral singing a kind of lasting, profound "spiritual massage", he said.

In contrast, most other forms of music require years of training and technical foundation. Playing an instrument demands long-term study and practice, which often starts during childhood, making it hard for just anybody to join a band or an orchestra.

Choral singing, however, is more accessible, as every participant brings their own instrument, which is their voice, Yan said, adding that its appeal lies in its combination of artistic satisfaction, social connection and emotional release.

Young people today are drawn to singing, or interaction through music, because of the joy of shared experience, the sense of community and the emotional refreshment it provides.

A 29-year-old woman, who lives and works in Beijing and uses the stage name Xiao Yang, noted that music is a means to bond with people, regardless of age, gender and profession. "We meet, we play, we sing along and, suddenly, strangers become friends."

Unlike Road Show Plan, Xiao Yang embodies a quieter, more intimate side of Beijing's music scene. She composes her own songs, inspired by everyday life, and has over 10 originals in her repertoire.

Inspired by versatile music icons, including Taylor Swift, she started playing the piano when she was 6 years old, and later learned to play the flute and the guitar.

During the pandemic, Xiao Yang performed small covers, recorded at home and gradually built a 300-person online community. Her in-person gatherings remain small — never more than 100 participants. "I don't think in terms of audiences or performers. It is a shared space. Everyone takes turns to sing and play, or they just listen," she said.

Xiao Yang's events take place in hidden courtyards, secluded park corners and quiet cafes. The music tends to be less mainstream, and songs of Taiwan singer-songwriter Cheer Chan dominate the playlist.

She also features original songs. "Music is a way to be yourself. It is social, but also introspective. Even if people aren't singing, they're connecting through the music," she said.

Xiao Yang's own music is deeply personal. Her originals include a song about her lost cat. "Performing my own songs feels different than singing with others," she said. "But both are special — one is self-expression, the other is shared joy."

Her event venues range from quiet corners in the Olympic Forest Park, where small groups gather with guitars and soft voices, to organized stages for open-mic sessions. "Back in 2022 and 2023, there weren't as many groups as there are now. This year, it feels like everywhere you look, someone is singing, playing, or performing. It's incredible!"

Even with a demanding job, Xiao Yang makes time for these performances. "I come for music, friendship and freedom. Every time I sing, alone or with others, it reminds me why all this is worth it," she said.

Chen Yingzi, 22, a university student, prefers quiet spaces. One spring afternoon this year, she attended a small gathering in a *hutong*, where fewer than a dozen people sat on mismatched chairs and cushions. The organizers introduced an acoustic guitar and encouraged participation.

Chen hesitated for a bit, but then picked up her ukulele, strummed a simple melody and sang an original about her hometown. The applause that followed drowned her fears.

"I didn't expect to feel so connected to people I'd just met," she said. "It wasn't about performing well; it was about sharing a part of myself. I left with new friends, renewed confidence, and a reminder that music can make even the smallest spaces feel like home."

Chen now regularly participates in such gatherings. "Most young people live in an online world. But one can make real friends at these events." She has already met high school students and older peers from across the city, and the vibe, she stressed, has been invigorating.

Grouping: Practical outcomes emphasized

From page 1

At a time when unilateralism and hegemonic thinking persist, political trust among SCO countries has provided an important foundation for the organization's long-term cooperation, Yang said.

The SCO was initially established to address shared security challenges. Over time, it has remained steadfast in its commitment to fostering a peaceful and stable environment that supports the development of all its member states.

Xi has always emphasized the need to enhance the connection of high-quality Belt and Road cooperation with development strategies of SCO countries and regional cooperation initiatives, as well as efforts to facilitate trade and investment and keep industrial and supply chains stable and smooth.

Such cooperation has produced tangible results. Official data showed that China has achieved, ahead of schedule, the target of bringing its cumulative trade with other SCO countries to more than $2.3 trillion, while nearly 14,000 kilometers of international land transport routes have been in operation among member states.

Yang said China's role in the SCO lies not only in putting forward ideas and building mechanisms, but also in providing public goods and platforms that help translate shared consensus into practical outcomes.

Such efforts reflect China's emphasis on practical results, as it links its own development with the growth of the SCO, he said.

At last year's Tianjin summit, China announced a series of measures, including plans to implement 100 "small and beautiful" livelihood projects in SCO member states where needed, provide 2 billion yuan ($295.7 million) in grant to SCO member states within the year, and build 10 Luban Workshops in member states over five years.

A youth trends report released in May also pointed to positive perceptions of China's role among young people in SCO member states, with more than 90 percent of respondents outside China saying that cooperation with China could have a positive impact on their countries' development and modernization.

Beyond regional cooperation, the SCO's role has also extended to global governance.

At the Tianjin "SCO Plus" meeting last year, Xi said that the SCO, guided by the Shanghai Spirit, has increasingly become a catalyst for the development and reform of the global governance system.

He put forward the Global Governance Initiative at the meeting, calling on the organization to set an example in practicing the initiative, contribute SCO strength to world peace and stability, and demonstrate SCO responsibility in promoting global openness and cooperation.

Impressive win

French motorcycle rider Valentin Debise of China's ZXMOTO team is warmly applauded by spectators after winning Race 1 of the FIM Supersport World Championship at the Emilia-Romagna Round in Italy on Saturday, securing his sixth win of the season with the Chinese manufacturer. On Sunday, Debise finished in ninth place in Race 2 of the round. LI JING / XINHUA

Concerns remain about SpaceX IPO

By SHI JING in Shanghai and **MA SI** in Haikou

SpaceX's blockbuster initial public offering has grabbed attention worldwide not only for its unprecedented size, but also for what it implies for the commercial aerospace industry and the escalating politicization of technological innovation that it underscores.

SpaceX saw its price spike 19 percent on its Nasdaq debut even as the $75 billion IPO became the world's biggest ever. The stock closed at $160.95, buoying the company's market cap to $2.1 trillion. Company founder Elon Musk thus became the world's first trillionaire with his personal wealth surging to $1.1 trillion, according to Forbes.

SpaceX said in its prospectus that proceeds from the IPO will be used to expand its artificial intelligence business and fund its launch infrastructure and satellite constellations.

Shen Meng, director of Chanson & Co, a boutique investment bank, said that SpaceX will leverage the IPO to further integrate its capabilities in reusable satellite launches, global low-orbit satellite communication networks, and AI synergies.

SpaceX managed to achieve a total turnover of $18.7 billion last year, up from $14 billion in 2024. However, its losses soared to $4.94 billion in 2025, with a cumulative total loss of $41.3 billion since it was founded in 2002.

Experts expressed concerns over the market frenzy over SpaceX. Financial intelligence firm CFRA gave a sell rating for the company and a $115 price target — roughly 15 percent lower than the IPO price. The research firm said that profits generated by Starlink, the satellite internet company, are being devoured by the other two major business units of xAI and Starship, while its AI business lacks differentiated competitiveness.

Research firm Morningstar valued the company at less than half its IPO price. Danish pension operator Akademiker Pension said it will not take a chance on SpaceX as it is "grossly valued" and has a "catastrophic governance structure" — referring to Musk's 85 percent voting rights.

However, the mega IPO has attracted $250 billion in subscriptions.

Ipek Ozkardeskaya, a senior analyst at Swissquote, said that this will likely create a liquidity vacuum. To absorb that amount of supply, investors may have to sell existing holdings to free cash for SpaceX allocations. This could partly explain the recent sell-off across chipmakers, she said.

Meanwhile, SpaceX has directed its underwriters to reject orders from the Chinese mainland and Hong Kong for its IPO, citing the United States' International Traffic in Arms Regulations for national security reasons.

Dai Guanchun, a senior capital markets lawyer based in Beijing, said this reflects excessive politicization of technological exchanges by the US, disrupting the normal flow of international capital. But Chinese companies should not be conservative but rather seek more cooperation in other markets in such a global context, he said.

Liu Chunsheng, an associate professor of international economics at the Central University of Finance and Economics, considered this a typical case of capital decoupling in cutting-edge technology sectors driven by geopolitical competition.

In the short term, this could lead to higher fundraising costs and fewer opportunities in commercial operations for US companies. If sustained for a longer term, it could impair global capital supply, constraining the R&D expansion of capital-heavy aerospace projects, he said.

However, SpaceX's IPO will provide a crucial valuation benchmark for commercial space firms globally, especially those in China, said Li Chao, an independent analyst who has been following the global commercial aerospace industry for years.

A-share aviation equipment companies showed the strongest surge of 5.45 percent on Friday, when the benchmark Shanghai Composite Index closed 1.12 percent higher.

Two Chinese firms — LandSpace and CAS Space — have had their IPO applications at the STAR Market accepted. Another eight firms have started the IPO application process.

Monorail: Engineering feat a big draw

From page 1

Dinesh Francois Samasundara from Paris was similarly drawn by curiosity after repeatedly coming across reels on Instagram, TikTok and Facebook for months. "It's a really unusual sight for me. We're not used to seeing this type of landscape. But it's mesmerizing to see how the building is built — very interesting!" said the 25-year-old.

The spot also draws industry professionals eager to learn. Matej Pavlovic, a 30-year-old train driver from Slovenia, planned his first trip to China after seeing Liziba's monorail as well as China's high-speed rail on TikTok. "The designated speed of trains in Slovenia is around 200 kilometers per hour, but we handle a maximum of 120 km/h because the infrastructure currently doesn't allow more. My girlfriend and I took a bullet train from Chengdu, Sichuan province, to Chongqing, which is nice, comfortable and fast." Their travel culminated with a ride on the monorail, when they got to experience the engineering marvel.

Due to the geography of Chongqing — a densely populated and mountainous city — transportation can be challenging and creative.

In 2004, Chongqing built its first urban rail CRT Line 2 in the downtown area, which was China's first monorail and the first rail transit line in southwestern China.

Importance of exchanges highlighted

Straits Forum emphasizes shared cultural and economic interests binding both sides

By ZHANG YI in Xiamen, Fujian
zhangyi1@chinadaily.com.cn

The critical importance of cross-Strait exchanges and cooperation was underscored at the 18th Straits Forum in Xiamen, Fujian province, as participants from both sides of the Taiwan Strait gathered over the weekend, overcoming obstructions from island authorities.

The annual forum, which started in 2009, serves as a platform to promote mutual understanding and integration between the mainland and Taiwan, emphasizing the shared cultural and economic interests binding both sides.

Addressing the main conference on Saturday, Wang Huning, a member of the Standing Committee of the Political Bureau of the Communist Party of China Central Committee and chairman of the National Committee of the Chinese People's Political Consultative Conference, China's top political advisory body, called for resolute opposition to "Taiwan independence" separatist activities and external interference, urging joint efforts to advance peaceful cross-Strait relations and national reunification.

He emphasized that the mainland stands ready to share development opportunities with Taiwan compatriots, noting that the country's blueprint for the ongoing 15th Five-Year Plan (2026-30) period will open up broader space for cross-Strait integration.

At a meeting on Saturday on advancing the development of the demonstration zone for integrated development across the Taiwan Strait, Wang urged greater progress in advancing such integration during the 15th Five-Year Plan period.

He called for supporting Fujian in exploring new mechanisms, pathways and models for cross-Strait integrated development. He also urged closer people-to-people and cultural exchanges.

Under the theme of expanding people-to-people exchanges, this year's Straits Forum featured 58 diverse events covering grassroots, youth, cultural and economic exchange sectors.

Inside
Editorial, **page 6**

Earlier, Taiwan's Democratic Progressive Party authorities elevated restrictions by banning island officials from attending the event, marking the first time the island's grassroots officials were blocked from participation.

Addressing the forum despite these bans, Chang Jung-kung, vice-chairman of the Chinese Kuomintang party, said that despite twists and turns, the Straits Forum has always been committed to promoting exchanges and playing a critical role in cross-Strait relations.

During the forum, mainland enterprises signed agreements with various businesses and trade associations from Taiwan, buying signature agricultural goods including atemoya and pomelos, as well as tea and fishery products from counties such as Taitung, Yunlin and Nantou.

The contracts serve as a major step forward in implementing the 10 follow-up exchange policies introduced following the landmark cross-Strait meeting between leaders of the CPC and KMT in April, focusing on the practical livelihood needs of grassroots families and small business operators.

Yao Ching-ling, magistrate of Taitung county, said via a live video link that the purchase agreements were an immense encouragement to local farmers.

A range of prominent figures and grassroots representatives also stepped onto the stage during the conference to share their stories of cross-Strait integration.

Su Heng, a Taiwan political commentary vlogger, said grassroots perspectives and livelihood statistics best reflect the truth that artificial barriers can never block the shared enthusiasm of compatriots from both sides.

Despite increasing restrictions from Taiwan's separatist DPP on the forum, Su said a massive number of Taiwan residents still crossed the Strait for markets, business cooperation, and career opportunities.

Anniversary: SCO no longer merely a regional organization

From page 1

Today, the SCO includes 10 member states, two observer states — Mongolia and Afghanistan — and 15 dialogue partners, among them Turkiye, Saudi Arabia, the United Arab Emirates, Qatar, Egypt and Azerbaijan. The organization's expanding geography reflects the growing demand for non-Western mechanisms of international coordination.

The SCO's scale is unprecedented. The combined territory of its member states exceeds 36 million square kilometers — more than 25 percent of the Earth's land area. The total population of SCO countries has surpassed 3.4 billion, representing nearly half of the total world population.

Economically, the organization already constitutes one of the world's principal centers of gravity, representing about a quarter of global GDP.

Even more revealing is the organization's trade transformation. It is estimated that in 2001, mutual trade among the SCO countries was valued at about $16 billion. Today, intra-bloc trade is approaching the historic threshold of $1 trillion.

China and Russia remain the primary engines of this process, but the rapid integration of Central Asian economies demonstrates the broader regional significance of the SCO framework. For smaller member states, the organization has become economically indispensable. It is estimated that SCO countries account for approximately 75 percent of Kyrgyzstan's trade turnover, 67 percent for Tajikistan and nearly half for Uzbekistan.

Investment cooperation has grown significantly. Over the past 25 years, mutual direct investment among SCO countries has surged with a primary focus on infrastructure, logistics, energy and transportation corridors.

One of the organization's most strategically significant trends has been the transition toward settlements in national currencies. In trade between key SCO countries, the share of transactions conducted in rubles, yuan, rupees and other national currencies has greatly increased, gradually reducing dependence on the US dollar and Western-controlled financial systems.

Unlike many informal geopolitical platforms, the SCO possesses a fully institutionalized structure. It functions as a formal international organization with a charter, permanent bodies, an approved budget, a secretary-general and fixed headquarters in Beijing and Tashkent.

Its highest authorities include the Council of Heads of State, the Council of Heads of Government and the Council of Foreign Ministers. Specialized institutional mechanisms coordinate cooperation among defence ministers, interior ministers, justice ministries, heads of supreme courts and procurators-general.

This institutional depth sets the SCO apart from groups such as BRICS. While BRICS mainly serves as an informal platform of geopolitical dialogue without an official charter or permanent secretariat, the SCO is a formal Eurasian organization with legal responsibilities and ongoing operations. Security cooperation is also a core aspect of the SCO's identity. The Regional Anti-Terrorist Structure in Tashkent oversees intelligence sharing, counterterrorism drills and anti-extremism efforts — domains that BRICS does not cover.

The SCO has notable similarities with the Association of Southeast Asian Nations. Both organizations were formed as frameworks for stabilizing Asia through consensus and noninterference. ASEAN has contributed to stabilizing Southeast Asia after the Vietnam War, while the SCO focuses on stabilizing the post-Soviet Eurasian region and China's western outskirts. In both groups, decisions are made only by full consensus, which upholds sovereignty and guards against domination by any one power.

Three strategic priorities will likely determine the SCO's future trajectory. First, financial integration across SCO countries strengthens regional economic independence. The proposed SCO Development Bank and SCO Special Account could provide independent financing for large-scale Eurasian infrastructure projects without reliance on other financial institutions.

Second, transport integration would actively advance a unified Eurasian transport network. This framework would connect the Belt and Road Initiative, the Eurasian Economic Union, the North-South Corridor and the China-Kyrgyzstan-Uzbekistan railway.

Third, the SCO brings together the world's largest energy producers and key consumers. The SCO is progressively establishing the groundwork for a self-sufficient Asian energy market, complete with its own pricing structures and settlement systems.

Twenty-five years after its founding, the SCO is no longer merely a regional organization. It is one of the institutional foundations of the new Eurasian century.

GCI advocates for world peace

Initiative lauded for encouraging dialogue among global civilizations

Artists from Guizhou Provincial Song and Dance Theater perform during an event in Santiago, Chile, on Friday, as part of celebrations for the International Day for Dialogue among Civilizations. ZHOU JIAYI / XINHUA

By NDUMISO MLILO
in Johannesburg, South Africa
For China Daily

China's Global Civilization Initiative is important to encourage dialogue among civilizations for peaceful coexistence in a world that is constantly changing and becoming more unpredictable, South African experts said, as the world marked the International Day for Dialogue among Civilizations last week.

"In an increasingly interconnected world, embracing cultural diversity and encouraging dialogue among civilizations is vital for promoting peace, cooperation and shared progress," said Dave Malcomson, acting deputy director general for the Middle East and Asia at the Department of International Relations and Cooperation of South Africa. "Through dialogue and exchanges, societies can build mutual trust and lay foundations for a more harmonious future across regions, cultures, and ideologies."

Proposed by China in 2023, the initiative includes calls for respecting the diversity of civilizations and the common values of humanity.

In June 2024, a resolution adopted by the United Nations General Assembly designated June 10 the International Day for Dialogue among Civilizations, which was proposed by China and cosponsored by over 80 countries.

Malcomson said the world is undergoing transformation and a shift in the international landscape, which calls for the Global South to promote exchanges, and share innovation and technology.

He said, "In this regard, cultural exchanges play a critical role in promoting understanding and strengthening cooperation among nations. This is more important than ever in the current context of geopolitical polarization, volatility, rising fragmentation, instability, conflict and threats to global norms, international law and the rules-based order."

Malcomson stated that China is an important partner in the international community and he is confident that it will continue to "contribute constructively" to the United Nations and global governance processes to advance development and prosperity.

Defending multilateralism

He welcomed "China's strong stance" in defending multilateralism.

"We acknowledge that China's global initiatives are meant to promote multilateralism, improve peace and security, promote socioeconomic development and contribute to the reform of global governance."

Philani Mthembu, executive director at South African think tank Institute for Global Dialogue, said the world, geopolitics and global power dynamics are all undergoing shifts.

This makes China's Global Civilization Initiative relevant for countries to coexist, he said.

While the world keeps evolving, some countries push back against such changes, he said. In this context, the GCI serves to foster dialogue, and it is important to mark the International Day for Dialogue among Civilizations.

"A dialogue among civilizations can help countries to understand that we don't have to agree on everything, but what is important is to work with one another. So fostering cooperation, especially in the current environment globally, is important," said Mthembu.

"The world is moving toward multipolarity, but we still have pushback. There is still unilateralism, but many countries in the Global South, including South Africa and China, are calling for multilateralism."

He warned that when negative things happen in one part of the world, they can affect other parts or regions far from them. Mthembu gave an example of the conflicts in the Middle East, which are negatively affecting many countries in different parts of the world.

Africa has to take advantage of the changes taking place in the world and leverage on that to meet development aspirations, he said.

The African continent must speak with one voice on global issues, he added.

The writer is a freelance journalist for China Daily.

Dragon Boat: More than a cultural fest in Namibia

WINDHOEK, Namibia — Laughter and curiosity filled the grounds of the SOS Children's Villages in Windhoek, capital of Namibia, on Saturday as children gathered around tables covered with bamboo leaves, sticky rice, and colorful threads, embarking on a cultural journey that carried them thousands of kilometers away to China.

For many of the children, it was their first encounter with the ingredients and traditions of China's Dragon Boat Festival. Under guidance, small hands carefully folded bamboo leaves around sticky rice to make *zongzi*, the festival's signature delicacy. Others threaded colorful bracelets around their wrists or examined fragrant sachets, eager to learn the stories and blessings embedded in these customs.

The event, themed "Sharing the Warmth of the Dragon Boat Festival, Promoting Health and Well-being", was organized by the China Henan International Cooperation Group, or CHICO, together with the 17th batch of the Chinese medical team in Namibia.

Home to orphaned and vulnerable children, the SOS Children's Villages provides family-like care, education, and support. On this occasion, it became a vibrant venue for cultural exchange, where Chinese festive traditions met gestures of care and friendship.

The Dragon Boat Festival, one of China's most celebrated traditional holidays, commemorates the ancient patriotic poet Qu Yuan. The festival is marked by customs such as eating *zongzi*, wearing protective sachets and five-colored bracelets, and watching dragon boat races.

As this year marks the China-Africa Year of People-to-People Exchanges, organizers also introduced the symbolism behind these traditions. Fragrant sachets are believed to ward off illness, while five-colored bracelets carry wishes for peace, health, and happiness.

For Ben Gariseb, one of the children from the global child-focused organization, the experience was both eye-opening and memorable.

"It is my first time participating in an activity related to Chinese culture. I made *zongzi*, had my health checked, and witnessed acupuncture being administered for the first time. I wish to learn more about Chinese culture," Gariseb said.

Improving lives

The cultural activities were complemented by practical support, with organizers donating food and other supplies to help improve the children's daily lives and well-being.

Julieta Ferreira, national director of SOS Children's Villages Namibia, said the Chinese community in Namibia has supported the organization for many years, helping it care for orphaned and vulnerable children.

"Hosting the Dragon Boat Festival solidifies the impact already made by Chinese companies and their support for the people of Namibia. It builds a bridge for grassroots interaction between China and Namibia. We carry China's contribution within us," she said.

Cui Yunke, managing director of CHICO in Namibia, said the event aimed at introducing the origins, traditions, and meaning of the festival while extending care to children at the organization.

Meanwhile, members of the Chinese medical team provided free health examinations and traditional Chinese medical services, including acupuncture consultations. They also held health education sessions featuring demonstrations on proper handwashing, personal hygiene, and disease prevention.

Guan Hao, leader of the 17th Chinese medical team, said the team hoped to use the event to bring healthcare services closer to local communities while raising awareness of traditional Chinese medicine.

China, Mongolia vow deeper ties, support

FM's visit underscores commitment to stronger collaboration in trade, energy

By ZHOU JIN
zhoujin@chinadaily.com.cn

China and Mongolia have reiterated their commitment to be good neighbors and partners who trust and support each other, vowing to further develop mutually beneficial economic ties.

The pledge was made during Foreign Minister Wang Yi's three-day visit to Mongolia, to be wrapped up on Monday.

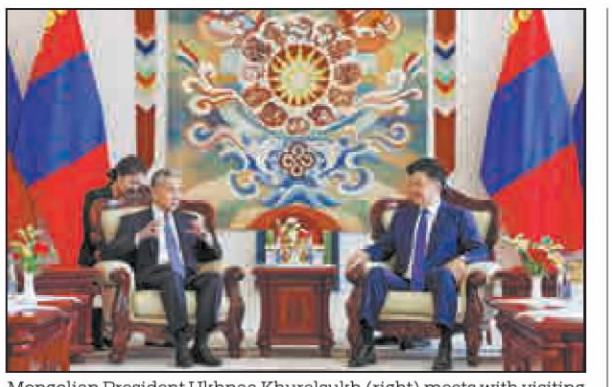
During a meeting with Mongolian President Ukhnaa Khurelsukh in Ulan Bator on Saturday, Wang said China has always put China-Mongolia relations at an important place in its neighborhood diplomacy.

China has both the will and capability to be a neighbor that Mongolia can rely on, a trustworthy friend, and a partner in accelerating its development, he said.

Wang reaffirmed China's respect for Mongolia's independence, sovereignty and territorial integrity, as well as the development path that Mongolia has chosen for itself.

Describing China as Mongolia's good neighbor, Khurelsukh said developing friendly relations with China is a top priority of Mongolia's foreign policy.

Mongolia is committed to the one-China principle, regarding Taiwan as an inalienable part of China's territory, and opposes any form of "Taiwan independence" activities, he said.



The country will not do anything that harms China's interests, regardless of its relations with other countries, he said.

According to the Mongolian president, the bilateral trade is expected to reach $20 billion this year.

Wang expressed readiness to work more closely with Mongolia to align development strategies; tap into the full potential of bilateral cooperation; advance existing collaboration in connectivity, energy and mineral resources, and trade and investment; and create new growth drivers for cooperation in key minerals, green development, the digital economy, and other emerging fields.

In recent years, mutually beneficial cooperation between the two countries has continued to expand, and China has remained Mongolia's largest trading partner and a major source of investment for many years.

The construction of their second cross-border railway is being accelerated and is expected to become another major artery of connectivity.

Fast track of growth

China supports Mongolia in developing its economy and improving people's livelihoods, and welcomes Mongolia to ride the fast track of China's development, Wang said at a news conference on Saturday after his meeting with Mongolian Foreign Minister Batmunkh Battsetseg.

Wang cited estimates by international institutions that every 1 percent of growth in China's economy can drive a 4 percent increase in Mongolia's exports and a 0.6 percent rise in its economic growth.

This fully demonstrates the highly complementary and closely interconnected economic ties between the two countries, he said.

To help Mongolia respond to the recent foot-and-mouth disease outbreak, China has decided to supply 1 million doses of vaccines, Wang announced at the news conference.

Li Chao, an assistant research fellow at the Belt and Road Initiative Research Institute at the Inner Mongolia Academy of Social Sciences, said China-Mongolia ties are at the best stage in history, with cooperation across various fields continuously yielding new outcomes.

The emphasis that the two countries put on the positioning of their relations reflects their unchanged consensus on developing friendly relations and promoting mutually beneficial cooperation, Li said.

Bilateral cooperation is key for Mongolia to promoting its own economic stability and development, he said.

And for China, Mongolia plays an important role in maintaining stability along the northern border, as the two countries share China's longest border with any neighbor, he added.

Li highlighted cooperation in green mining, ecological protection and clean energy, saying leveraging China's technological strengths to deepen cooperation with Mongolia in green development would help both countries move toward their carbon reduction and climate goals.

EU talks viewed as big step for expansion

By LIU JIANQIAO
liujianqiao@chinadaily.com.cn

The European Union has agreed to open the first cluster of accession talks with Ukraine and Moldova on Monday, marking a major step in the bloc's enlargement.

Experts say such negotiations are typically lengthy and complex, and that the opening of talks does not mean the two countries will join the EU anytime soon.

European Council President Antonio Costa and European Commission President Ursula von der Leyen announced on Friday that all EU member states have agreed to open the first accession negotiations cluster on fundamentals with Ukraine and Moldova.

The talks would cover areas including the rule of law and democratic institutions, which are the backbone of the EU accession process.

"This is a recognition of the determination, courage and hard work shown by both countries in advancing reforms, even in the face of immense challenges," the statement said.

Ukraine and Moldova were granted EU candidate status in 2022. Ukraine's accession had faced opposition from some member states, particularly Hungary.

However, Hungary's new Prime Minister Peter Magyar, who took office last month, said the country had agreed to begin Ukraine's accession talks, though it does not support a fast-track procedure.

Gao Jian, director of the European Think Tank Research Center at Shanghai International Studies University, said that amid the Russia-Ukraine conflict, the EU's move goes beyond a mere technical step in the accession process and reflects broader geopolitical calculations.

"With the conflict dragging on, European integration is no longer the EU's sole motivation," Gao said.

"In essence, the launch of these talks reflects a broader geopolitical and values-based contest between the EU and Russia across the European continent. The potential accession of the two countries is widely seen as a significant strategic move that could shape the future of Europe's security architecture," he said.

The EU is attempting to address geopolitical security challenges through deeper political integration, aiming to redefine and reinforce its security through "closer political and economic alignment", he added.

"This suggests that the EU is shifting from a largely reactive security posture to a more proactive approach aimed at shaping the security environment through integration," Gao said.

However, such support remains primarily political in nature and falls short of a defense commitment, making it unlikely to provide Ukraine with direct military protection in the short term, he said.

Potential strains

Xiao Bin, a researcher at the Institute of Russian, Eastern European and Central Asian Studies of the Chinese Academy of Social Sciences, said bringing Ukraine into the European framework while leaving Russia outside could further heighten tensions with Moscow and complicate future peace efforts between Russia and Ukraine.

The trajectory of the conflict, Ukraine's domestic political reforms and the EU's capacity to absorb new members will remain the main obstacles to Ukraine's eventual accession, Xiao said.

The accession of Ukraine and Moldova would also have profound implications for the global multilateral system, he said.

The EU's move could deepen its structural divide with Russia and increase the risk of bloc confrontation, he said.

It may also encourage European nations to place greater emphasis on "small multilateral" groupings, a trend that could undermine the healthy development of the United Nations-centered multilateral system, he added.

"Therefore, at a time of frequent geopolitical crises, any EU enlargement should fully consider the broader European security architecture and work to avoid a protracted regional confrontation," Xiao said.

Carney warns against courting Washington

DUBLIN — Canada's Prime Minister Mark Carney continued his efforts to pivot away from the United States and align with Europe, meeting with the leader of Ireland on Saturday ahead of the upcoming G7 summit and saying middle powers should not compete for favor with Washington.

Carney said Canada and the European Union have a combined population of more than twice that of the US, economies of comparable size and a combined defense budget that exceeds that of any single major country outside the US.

Smaller countries can multiply their strength by partnering with like-minded allies, he said.

"In a world of great power rivalry, middle powers have a choice — to compete for favor or to combine to create a third path with impact," Carney said at Trinity College in Dublin.

He made similar comments in January at the World Economic Forum in Davos, Switzerland, which became a symbol of middle-power resistance, when he declared the end of the global rules-based order and condemned coercion by great powers on smaller countries.

Carney visited Ireland's Taoiseach Micheal Martin earlier on Saturday and French President Emmanuel Macron on Friday ahead of the G7 summit that begins on Monday in France.

US President Donald Trump is not currently scheduled to hold bilateral talks with Carney during the summit, according to a senior US administration official.

Geneva, Switzerland, is bracing for thousands of anti-G7 protesters ahead of the summit in Evian, just across the border with France.

Scores of shops and businesses in downtown Geneva boarded up their storefronts with wooden panels on Sunday ahead of the planned protests.

In Ireland, Carney described Canada and Europe as a "force for good — because we safeguard the values of human rights, dignity and pluralism that our people hold dear".

Together, the EU and Canada are one of the largest economic, cultural, technological, financial and military blocs in the world, he said.

"The new world order will be built starting with Europe," he said at an earlier joint news conference with Martin.

"Canada is the most European of non-European countries. We are transforming our cooperation with Europe."

In February, Canada became the first non-European member of the SAFE mechanism, the European Union's defense procurement initiative. Carney, on his ninth trip to Europe since becoming prime minister 15 months ago, noted that Canada has 56 partnerships in the critical minerals sector across more than 10 countries, primarily in Europe.

Tensions simmer

Trade tensions continue to simmer between Canada and the United States. There is a scheduled July 1 review of the US-Mexico-Canada Agreement — the latest iteration of the North American free-trade pact that has intertwined the economies of the three countries since the early 1990s. Trump said last week that he may not renew the deal.

Carney said Canadian Trade Minister Dominic LeBlanc will meet with US Trade Representative Jamieson Greer at the G7 summit.

The prime minister said he does not believe the US is interested in big changes to the free-trade agreement with Canada and Mexico.

"The US has been clear. They don't want to change the fundamental architecture," Carney said.

Swiss voters reject population cap plan

ZURICH — Switzerland rejected a referendum proposal on Sunday to cap its population at 10 million, a projection showed, as voters prioritized economic stability and the country's ties with the European Union over immigration concerns.

A preliminary projection published by national broadcaster SRF indicated about 45 percent of voters were in favor of the proposal and 55 percent against.

The referendum, which was likened to Britain's 2016 Brexit vote, had put businesses on edge over concerns that it could lead to the end of free movement of labor between Switzerland and the EU, its main trading partner.

The proposal championed by the right-wing Swiss People's Party stipulated that the population must not exceed 10 million before 2050, and that if it did so for two years, Switzerland should scrap its freedom of movement accord with the EU.

Urs Bieri from polling firm gfs.bern said the vote failed because although many people were worried about the rising population, they were not convinced by the plan and worried about the possible side effects.

"From the very beginning, it has been presented as the chaos initiative. Voters were worried about negative consequences for Switzerland's relationship with the EU and for the labor market," Bieri said.

"People are also worried about things like having enough care and health workers. Also there's a feeling that in the current international environment it's not sensible for a small country to do this," he added.

The Swiss population already stands at 9.1 million and has grown far more quickly than in the surrounding EU. Foreigners make up nearly 28 percent of the Swiss population. According to official projections, the population will reach 10 million by the early 2040s.

Polls had forecast a close outcome, and the result tallied with a final survey by gfs.bern, which had predicted the proposal would be narrowly rejected.

Still, the substantial backing for the measure sits alongside growing support for policies aimed at curbing immigration across Europe.

Opponents dubbed the plan a recipe for chaos due to the upheaval it would cause for Swiss companies, workers and Bern's ties with the EU.

Patrick Leisibach, a migration expert at think tank Avenir Suisse, said economic arguments had played a role, with people wary of how a "yes" vote would affect their daily lives.

Briefly

UNITED KINGDOM

Sanctioned Russian tanker intercepted

The United Kingdom is investigating a sanctioned tanker suspected of being part of Russia's "shadow fleet" that ships oil in violation of Western sanctions, British Prime Minister Keir Starmer said on Sunday. British armed forces boarded and detained the vessel, the *Smyrtos*, on Sunday in the English Channel, in what the Defense Ministry called "the first UK-led operation of its kind". The vessel will be held and monitored off the south coast of England for investigation, according to officials. The operation was carried out "in close coordination" with French authorities, who have previously intercepted a number of vessels linked to the so-called shadow fleet, the British Defense Ministry said.

UNITED STATES

Officials urge people indoors as fire burns on

Officials in a northern California city urged people sensitive to smoke to stay indoors as firefighters spent a third day on Saturday battling a fire in a huge medical equipment warehouse. Air quality on the south side of Tracy, a city of 100,000 people where the Medline warehouse fire has been burning since Thursday, was in the "unhealthy" range, according to air monitors. Firefighters expected the next few days to remain smoky amid a lengthy effort to put out the fire inside the building, South San Joaquin County Fire Authority Fire Chief Randall Bradley said.

Benefits of cooperation with mainland tear apart DPP authorities' information cocoon

The opening of the 18th Straits Forum in Xiamen, Fujian province, on Saturday speaks volumes about how people on both sides of the Taiwan Strait aspire to boost their interaction for shared development.

The forum is the largest cross-Strait grassroots exchange event, and has attracted about 140,000 Taiwan compatriots among the around 370,000 participants since its launch in 2009. This year's forum consists of 58 activities covering a wide range of topics, including grassroots governance, new media, finance, technology and fishery cooperation.

These activities will serve to deepen economic and cultural ties across the Strait, something the secessionist-minded Democratic Progressive Party authorities of Taiwan constantly try to undermine.

In his speech at the forum, China's top political advisor Wang Huning called for measures to facilitate cross-Strait exchanges and cooperation, enhance the business environment, strengthen industrial cooperation and expand the benefits and sense of gain for Taiwan compatriots and Taiwan-funded enterprises.

He welcomed Taiwan compatriots and companies to cooperate with their counterparts on the mainland, and called for people on both sides of the Strait to resolutely oppose "Taiwan independence" and the interference of external forces.

The central authorities have placed great importance on efforts to enhance cross-Strait economic and people-to-people exchanges so that Taiwan companies and compatriots can enjoy greater benefits from the Chinese mainland's pursuit of high-quality development during the 15th Five-Year Plan (2026-30) period and beyond.

In 2025, Taiwan residents made more than 1 million passenger trips to the mainland through ports in Fujian, almost doubling the number in 2023. More and more Taiwan residents are seeing for themselves the vitality of the mainland, the immense business and career opportunities it promises them, as well as the same culture shared by people on both sides of the Strait.

This year's forum has yielded concrete progress in implementing the 10 cross-Strait exchange and cooperation measures the mainland introduced in April. On Saturday in Xiamen, companies from the mainland signed agreements with companies and trade associations from Taiwan to purchase agricultural and fishery products.

This highlights how pragmatic cooperation can benefit people on both sides of the Strait. Yet, earlier this month, the DPP authorities tightened restrictions against the Straits Forum by prohibiting local officials on the island from taking part in the forum.

Apart from restricting in-person cross-Strait exchanges, the Lai Ching-te authorities have also sought to limit Taiwan residents' access to social media platforms operated by mainland companies, trying to create an information cocoon that shields them from a fuller understanding of the mainland's contemporary development and everyday realities.

The Lai authorities have also attempted to blindfold the island's remaining so-called "diplomatic partners". Yet the steadily shrinking number of those "partners" underscores the limits of such attempts. Reports say that senior officials in Eswatini — the only African country maintaining "diplomatic relations" with the Taiwan authorities — have advocated establishing diplomatic ties with Beijing. This is undoubtedly a setback for Lai, who sneaked in and out of Eswatini not long ago in an effort to shore up the "diplomatic ties" and subsequently hailed the trip as a "diplomatic success".

The more Lai attempts to blindfold Taiwan residents and the island's remaining "diplomatic partners" to the mainland's development achievements, the more he exposes the weakness of his narrative. Once people see the mainland's progress with their own eyes, political manipulation and misinformation inevitably lose credibility, leaving those who promote them increasingly isolated and out of step with reality.

The mainland's high-quality development provides a solid foundation for win-win cooperation across the Strait. Reality bites for separatists who obstinately stick to "Taiwan independence", but it spells greater and more concrete benefits for Taiwan residents who aspire for a better life.

Pentagon abuses power for suppression

The Pentagon's decision to add multiple Chinese companies — including e-commerce giant Alibaba, search engine Baidu and electric vehicle manufacturer BYD — to its updated Section 1260H list of alleged "Chinese military companies" is a groundless suppression of Chinese enterprises that severely harms their legitimate rights and interests.

The misleading designation mainly restricts Pentagon procurement and serves as a warning signal to investors and government agencies. The US administration is using the list to target China's technology companies by means of weaponized trade restrictions.

As a spokesperson for China's Ministry of Commerce said on Saturday in a statement on the US Department of Defense's decision, the US side has ignored the consensus reached during the meeting between the heads of state of the two countries in Beijing, disregarded the overall interests of bilateral economic and trade relations, continuously generalized the concept of "national security" and abused state power to unjustifiably suppress Chinese enterprises.

The Pentagon's list now extends far beyond enterprises traditionally associated with weapons production and increasingly encompasses sectors that sit at the center of the global digital economy and high-tech innovation.

In the eyes of the US administration, technologies once regarded as commercial — semiconductors, artificial intelligence, cloud computing, batteries, robotics and advanced manufacturing — have become strategic assets with military implications. The distinction between civilian and military technology is fading. This shines a light on the US administration's reliance on sanctions as a sop for the US' growing anxiety about the loss of its competitiveness in advanced technology.

The US administration's increasingly expansive use of "security" instruments targeting Chinese companies suggests a superpower grappling with the uncomfortable reality that the US' technological leadership can no longer be taken for granted. So the Pentagon's latest action can be interpreted as part of a broader strategy aimed at "decoupling" from China's supply chains and weakening its high-tech competitiveness.

In practice, the US move is forcing the formation of parallel technological systems. In doing so, it is seriously disrupting the international economic and trade order, undermining the stability of global industry and supply chains, and dramatically increasing the operating costs of the world economy and global trade.

The outcomes achieved by China and the US under mechanisms such as bilateral economic and trade consultations should also be understood and assessed within this broader context of the cumulative effect of the US administration's export controls, investment restrictions, entity listings and military-company designation.

The danger is that the US side is forcing China-US economic relations to become trapped in a self-reinforcing cycle. Washington always sees "security threats" and imposes restrictions. That leaves Beijing no choice but to take corresponding countermeasures.

China urges the US side to stop its wrong practices, revoke the relevant measures, return to the right track of building a constructive China-US relationship of strategic stability, and provide fair, just and nondiscriminatory treatment to Chinese companies, said the spokesperson for the Ministry of Commerce of China.

Otherwise, China will take resolute and strong countermeasures, and all consequences and responsibilities arising therefrom shall be borne by the US side, the spokesperson added.

Neither the trend of economic globalization nor the laws of the market will allow the US to use political force to impose parallel technological systems on the world without causing significant harm — both globally and to itself. The global economy remains deeply intertwined, and the technologies of the future depend on complex international supply chains that stretch from Silicon Valley to Shenzhen.

If the US president's first visit to China in nine years last month was intended to stabilize relations, the Pentagon's latest move does the opposite. While the Chinese side has made clear its willingness to steady bilateral ties through cooperation and exchanges, the US side seems intent on demonstrating its readiness to further embed what it sees as Sino-US strategic competition in commerce, technology and finance.

And once "national security" becomes the organizing principle of economic policy, every company risks being used as a soldier. The Pentagon's latest blacklist suggests that such a future might already have arrived.

Opinion Line

Focus of all parties should be durable peace in Middle East

United States President Donald Trump said on Saturday that a peace deal with Iran was scheduled to be signed on Sunday and that the Strait of Hormuz will reopen immediately afterward. But Iran has cast doubt on the timetable, which underscores the fragility of the situation and the deep mistrust that continues to define regional politics.

At a time when conflicts in Gaza, Lebanon and other parts of the Middle East continue to simmer, any diplomatic breakthrough deserves encouragement.

Yet experience has repeatedly shown that temporary arrangements are rarely sufficient to build toward a comprehensive political settlement that addresses the root causes of instability.

Years of military confrontation, sanctions pressure and unilateral actions have produced cycles of retaliation. The international community should seize every opportunity to promote dialogue and negotiation while preventing the region from sliding further into confrontation.

In April, China put forward a four-point proposal to promote peace and stability in the Middle East. The plan emphasizes the principle of peaceful coexistence and calls for promoting the development of a common, comprehensive, cooperative and sustainable security architecture for the Middle East and the Gulf region.

It has also urged adherence to the principle of national sovereignty. The sovereignty, security and territorial integrity of countries in the Middle East should be fully respected, and the safety of personnel, facilities and institutions of all countries should be effectively safeguarded. The proposal insists that the international rule of law should be upheld to prevent the world from falling back into the law of the jungle.

Moreover, development and security should be coordinated. All parties should work together to create a favorable environment for the development of countries in the Middle East.

These principles are particularly relevant today. The humanitarian situation in Gaza continues to deteriorate, while tensions along the Israel-Lebanon border remain elevated. Reports over the weekend that Israel may further expand military operations in southern Lebanon have heightened concerns that the conflict could spill over into a broader regional confrontation. Such developments would serve no one's interests and could lead to new humanitarian disasters.

The US bears a special responsibility in preventing further escalation. Rather than allowing military operations to expand in Gaza and Lebanon, Washington should take concrete steps to encourage restraint, promote ceasefires and support diplomatic solutions. Continued instability will only deepen regional divisions and increase security risks for all parties.

Lasting peace in the Middle East cannot be achieved without addressing the Palestinian question, which remains central to the regional turmoil. The repeated outbreaks of violence in recent decades have demonstrated that crisis management alone won't help. The international community must recommit to the two-state solution, support the establishment of an independent Palestinian state, and advance a just, lasting and comprehensive settlement of the Palestinian question. Only through such efforts can the region break free from the cycle of conflict and retaliation.

The global implications of continued Middle East instability should not be underestimated. International attention to disruptions around the Strait of Hormuz may have waned as markets adapt to recurring tensions, but the world's growing familiarity with such risks should not be mistaken for immunity.

In an era of fragile global growth, prolonged instability in the Middle East threatens energy security, supply-chain resilience and broader economic recovery efforts worldwide.

Whether a deal is signed between the US and Iran or not, genuine peace requires more than a signature on a piece of paper. It requires a commitment to dialogue over confrontation, development over destruction, and justice over perpetual conflict.

What They Say

Education needs to foster talent, nurture potential

Editor's note: *The State Council, China's Cabinet, approved the 15th Five-Year Plan (2026-30) for the development of education on Thursday. Chengdu.cn spoke to Chu Zhaohui, a researcher at the China National Academy of Educational Sciences, on the educational challenges and opportunities China faces. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

In recent years, there has been a decline in the number of age-eligible children enrolling in kindergartens. This trend is likely to show up in primary, secondary and high schools and even universities in the years ahead.

At the same time, school-age children from rural areas are increasingly moving to towns and cities, a shift that is expected to become even more pronounced.

These developments reflect the changing demographics of the school-age population and underscore the need for a strategic reallocation of educational resources. The central government has responded with an education development plan that stresses better coordination and distribution of resources.

The uneven distribution of educational resources is a major challenge. High-quality resources in a region are usually concentrated in a few prestigious urban schools. In the hope that their children receive a better education, many parents choose top schools even if they are located far away.

As a result, there is overcrowding in some highly sought-after schools while other institutions struggle to fill their enrollment quotas. With the ongoing demographic changes among the school-age population, this imbalance could become even more pronounced in the coming years.

Overcrowded schools put pressure on teachers, making it difficult for them to address the needs of individual students, while under-enrolled schools risk underutilizing their resources. From this perspective, the allocation of educational resources needs to be more balanced among schools, between urban and rural areas, and between general and vocational education.

The plan also calls for greater stress on quality education to promote the healthy growth and all-round development of students.

Till now, parents and teachers have focused primarily on academic scores when evaluating students. But character, practical skills and creativity are equally important in assessing a student's value.

With the rapid advancement of artificial intelligence, the most valuable future skill will not be the ability to provide repeatable answers, but the capacity to be original and distinctively creative. This requires a shift from traditional educational concepts toward approaches that nurture each child's creative potential during the critical stages of development.

The plan also stresses the importance of supporting students' healthy growth. Health should also encompass mental well-being, social adaptability and moral development.

The incidence of childhood obesity and myopia has risen in recent years, while mental health problems among students have become increasingly common.

Therefore, fostering students' natural talents and individual potential should become the central goal of education.

Schools should help students discover their interests and establish evaluation systems that recognize diverse achievements. By allowing students to pursue what genuinely inspires them, education can encourage them to explore, innovate and create.

VIEWS

Andrey Kortunov

A cooperative path to shared protection

When a diverse group of nations such as the 10 members of the Shanghai Cooperation Organization gets together, it's difficult to reach a consensus on sensitive issues like international security.

This challenge was formidable even 25 years ago when the group was much smaller and much more homogeneous.

While all agreed on combating the three evils — terrorism, separatism and extremism — each nation had different notions of each of the evils. Today, with an expanded membership, achieving consensus is even more challenging and almost impossible.

Yet, the SCO has consistently demonstrated a remarkable ability to overcome these challenges, enhancing multilateral cooperation across security domains.

The Regional Anti-Terrorist Structure stands as a testament to the SCO's achievements. Since its inception in 2002, it has played an important role in helping SCO member states foil terrorist attacks and combat extremism.

While this success often overshadows other achievements, the SCO's accomplishments in "soft security" also deserve equal attention.

Consider the SCO's fight against illicit drug trafficking. Recent statistics are quite impressive: in 2025 alone, the collaborative anti-drug operation "The Web" helped intercept 10 metric tons of narcotics and 21 tons of precursors.

This cooperation led to the shutdown of numerous online drug trade platforms and poses a serious challenge to transnational criminal groups involved in the production and sale of drugs.

Another priority on the "soft security" agenda is combating illegal cross-border migration.

Though each SCO member state has unique migration management policies, their cooperation has yielded practical results, particularly in apprehending criminals trying to escape justice by fleeing abroad. Though specific figures have not been released, these efforts lead to thousands of arrests every year.

A growing dimension of the SCO's "soft security" cooperation is the fight against cybercrime. With critical infrastructure and national financial systems more vulnerable to malicious interference than ever before, the SCO's partnership with Interpol on cybersecurity was a very timely step.

Joint training programs for experts and public officials, launched in Tashkent in 2023, are rapidly expanding now and hold tremendous potential for growth.

To be sure, these three "soft security" challenges are not unique to SCO member states but are universal problems that affect all nations and regions of the world. No country can credibly claim to have found an "ultimate" solution to any of them.

For example, the European Union has been fighting against cross-border drug trafficking, illegal migration and cybercrime for a very long time, and the outcomes have been mixed at best.

Global Lens

It would be unfair to suggest that all EU efforts have failed, but the reality is that all three "soft security" challenges remain high on the European agenda. The use of many drugs — from traditional cocaine to the most novel synthetic cathinones — is on the rise.

When a major conflict occurs or a state collapses in the Middle East or Africa, a flood of refugees is forced to migrate to Europe, similar to the migration crisis of 2015. EU countries lose hundreds of billions of euros every year to cybercrime, including ransomware, phishing, identity theft and hacktivism. The preferred targets are digital infrastructure and services, manufacturing, transport and public administration that demonstrate persistent vulnerabilities to transnational cyber-criminal groups operating from both within the EU and outside.

Given these shared challenges, it would be only natural for the SCO and the EU to collaborate on this critical agenda.

This is particularly necessary because the problems that Europe faces from these challenges cannot be separated from the rest of Eurasia.

Problems arising anywhere between Lisbon and Singapore will inevitably ripple across the region.

Of course, under the current deplorable geopolitical circumstances, leaders of the SCO and the EU member states will need a lot of political will, strategic vision and personal courage to begin this interaction. It makes sense to start with relatively simple things such as information sharing, best practices exchange and informal meetings of experts.

While the SCO can learn a lot from the EU experience, Europe also stands to benefit from exploring the Eurasian practices. When sufficient trust has been built between the SCO and the EU, they can consider parallel or even joint projects in areas that are not controversial or politically sensitive.

Such a collaboration is not a favor granted by the EU or vice versa. It is a natural step in restoring global cooperation. The sooner this step is taken, the better it will be for both sides, and for the rest of the world.

The author is a former director-general and academic director of the Russian International Affairs Council.

JIN DING / CHINA DAILY

Gulyamov Said Saidakhrarovich

Paving the way for global cyber governance

When the Shanghai Cooperation Organization turns 25 on Monday, the world will see the familiar images: joint military exercises, coordinated border patrols, and the ongoing campaign against terrorism, separatism and extremism. While these images are true, they also hide the most remarkable thing this organization has quietly built.

The scale of the SCO is impressive. It has 10 member states, representing nearly half of humanity and a quarter of the world economy.

The organization's work is tangible: in 2023 alone, joint operations dismantled 95 terrorist cells and prevented 181 planned attacks.

But one of the SCO's most profound contributions is less noticed. The SCO established the first legal regime for cyberspace in 2009, years before most governments had any cybersecurity law. Cooperation plans were signed in Dushanbe in 2021 and renewed in Astana in 2024.

In September 2025, China hosted the largest SCO summit in Tianjin under the banner of upholding the Shanghai Spirit.

There, President Xi Jinping unveiled the Global Governance Initiative, calling for a fairer world where all nations have an equal voice. And President Shavkat Mirziyoyev of Uzbekistan reminded fellow leaders of the Confucian wisdom: "Help others to stand, and you will stand yourself."

Global Lens

The Tianjin summit marked the pinnacle of rulemaking, with leaders signing an agreement to establish the Universal Center for Countering Security Threats and Challenges, and to protect critical information infrastructure. They also called for efforts toward the signing of the UN Convention against Cybercrime.

Today, the story has opened its newest chapter: cybersecurity through the prism of artificial intelligence.

These efforts are reminiscent of the Silk Road, where caravans managed to cross continents not because there were roads but because there were rules and trusted guides.

Every caravan was led by people who knew the customs, the merchants' courts and the codes of trust at every stop. Roads carried goods. People who knew the rules carried confidence.

For a quarter of a century, the SCO has been writing the rules of a digital Silk Road. As a legal scholar from Uzbekistan — a founding member whose capital, Tashkent, hosts the organization's Regional Anti-Terrorist Structure — I have observed this evolution up close.

Today, the story has opened its newest chapter: cybersecurity through the prism of artificial intelligence. AI is both a sword and a shield, with software now creating phishing schemes, amplifying propaganda and designing synthetic drugs. Yet, AI also guards power grids and banks, monitors network traffic and detects forgeries.

This is where the SCO's approach to regulation is truly distinctive. While other organizations focus on rules that tell machines what they may do, the SCO emphasizes education.

It cultivates individuals who do not simply comply with artificial intelligence but govern it — the judge who can question an algorithm, the officer who can identify a deepfake, the teacher who trains both. Regulation that restricts produces obedience; regulation that educates produces mastery.

There can be various expressions of this philosophy. Uzbekistan has integrated AI and cybersecurity into its legal system — from the Constitution to a pioneering code of ethics for AI in education that prepares teachers and students to command the tools before the tools command them.

Kazakhstan adopted a framework law on AI in 2025. China meticulously regulates recommendation algorithms and generative AI, requiring all AI-generated content to be labeled since September 2025 to ensure transparency for citizens.

The approaches are different, but the objective is common: put capable humans at the center of the machine age.

The SCO's collective efforts are also advancing. The Tianjin Declaration affirms every country's right to develop AI and endorses a cooperation road map.

The Universal Center for Countering Security Threats and Challenges and the security dialogue planned in Tashkent will serve as platforms for experts to exchange knowledge and learn from each other.

It is a quiet form of leadership: while others still debate AI's implications, the SCO is already preparing the individuals who will navigate this new era.

Some might say that the SCO moves slowly. True, but so did the caravans on the Silk Road.

Yet their slow progress connected half the world because they followed certain regulations during the journey.

The first 25 years of the SCO laid the digital foundation and its guiding principles. The next 25 years will be shaped by people who are trained to govern technology.

The author is a professor in the Department of Cyber Law at Tashkent State University of Law, Uzbekistan.

Dmitri TRENIN

SCO at 25: Building a continent-wide security space

As the Shanghai Cooperation Organization marks its 25th anniversary, it is worth recalling its achievements in terms of building trust, enhancing security and promoting prosperity.

The challenge before the SCO as it enters its second quarter-century is clear — building on those achievements and creating a mutual security space in Eurasia which could become a major pillar of the emerging multipolar world order.

This is only natural given the SCO's own history. Its founding was preceded by five years of negotiations among China, Russia, Kazakhstan, Kyrgyzstan and Tajikistan on border issues and military security.

However, the process turned out to be so successful that, upon the completion of immediate tasks, what was initially the Shanghai Five became the Shanghai Cooperation Organization.

The new organization was given a new set of tasks. Its security mission expanded to include combating the "three evils" of separatism, radicalism and terrorism.

These destructive forces threatened both Russia and China, but particularly the new states in Central Asia.

As a means of bolstering socio-political stability in the region, the SCO facilitated economic cooperation among the five countries. Success brings recognition and attracts others.

Expectedly, the SCO's membership doubled. Uzbekistan, India, Pakistan, Iran and Belarus joined the organization as full members.

Global Lens

Other countries, from Afghanistan to Mongolia to Turkiye, participated as partners or observers.

Some outside observers have compared the SCO to NATO, but this is wholly misplaced.

The SCO is not a military bloc; it is based on the sovereign equality of its members and abhors hegemony: it doesn't have a boss like the United States in NATO or in the G7 group; and it displays the diversity of the world's civilizations, unlike the uniform Western alliance.

These features make the SCO a perfect candidate for creating one of the pillars of the emerging multipolar world order: a security space spanning much of the world's biggest landmass, Eurasia.

A security space is best described as a community within which inter-state war has been abolished as an instrument of statecraft.

Countries are free to cooperate and compete, but they do not resort to violence when they disagree.

They do not seek to dominate one another either militarily or ideologically; they essentially mind their own business, and practice sovereign status equality — even though the world is not made up of material or spiritual equals. Key to a security space is the indivisibility of security: no state would seek to enhance its own security at the expense of others.

In theory, a Eurasian security space could extend to the entire Eurasian landmass, as proposed a couple of years ago by Russian President Vladimir Putin.

It no longer makes sense to separate "European security" from the security of East, Central, South and West Asia; no one region, and no one country should be excluded.

Yet, the process naturally passes through stages. The SCO is a good example of that.

At its core lies the Russo-Chinese rapprochement, ushering in an era of strategic partnership and coordination.

Since then, thanks to the efforts of several generations of Chinese and Russian leaders, the governing elites and broader sections of both societies, a model relationship between two major countries has come into being.

This is still the backbone of the Eurasian security space.

The formation of the SCO added a vibrant Central Asian element to the picture.

SCO's expansion to include countries from South Asia has presented a number of challenges that are still relevant. In 2025, India and Pakistan even fought a brief war.

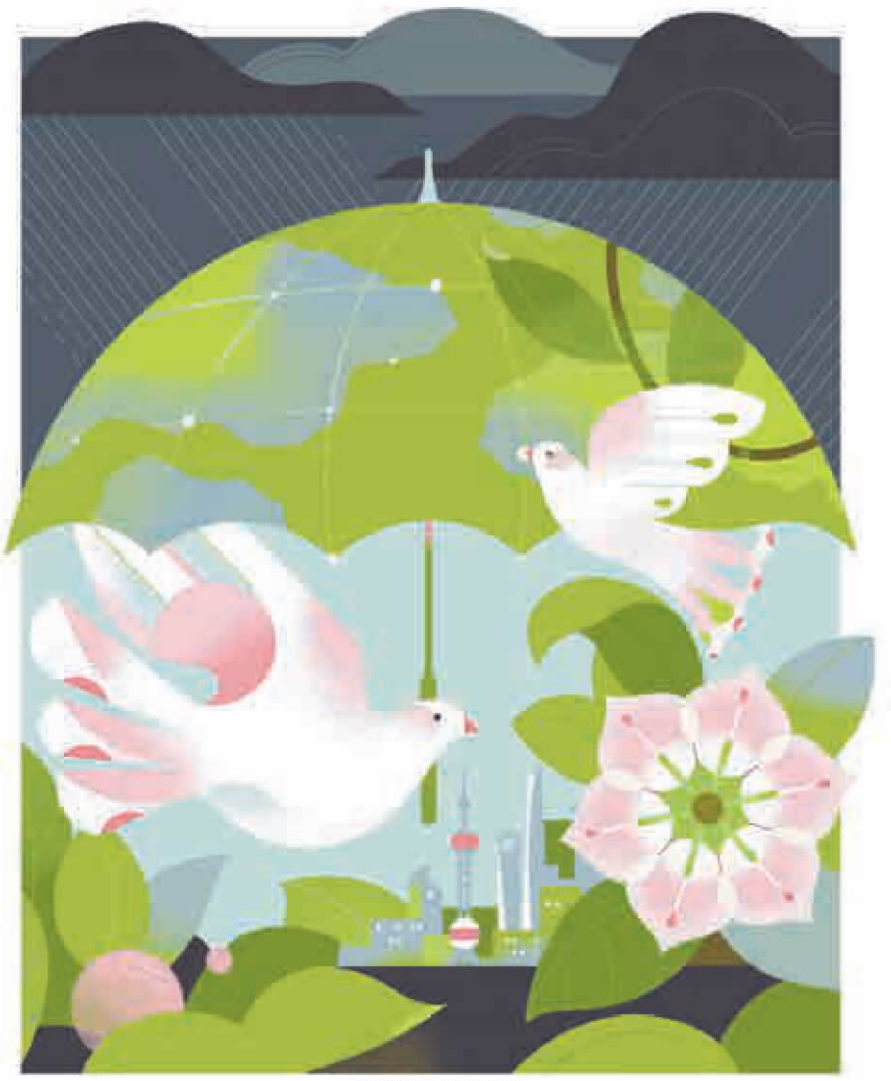
However, New Delhi and Islamabad's participation in SCO summits and related activities help manage tensions between the two nuclear powers. Of particular importance is the relationship between China and India.

At the very least, SCO events provide an opportunity for the leaders and senior officials of the two countries to meet and discuss problems, preventing conflicts.

With the more recent addition of Iran and Belarus, the SCO has reached two important regions: West Asia and Eastern Europe.

The two countries are essential — alongside East and Southeast Asia — for the security space embodied by the SCO to become continent-wide.

Whether the Shanghai Cooperation Organization will be able to complete this ambitious new mission in its second quarter-century is a moot question.



However, by providing a forum to meet, setting principles for a security community — there's already talk of a Eurasian security charter — and actually practicing them, the SCO is a strong pillar of a security architecture already serving some three and a half billion people.

GLOBAL VIEWS

SONG CHEN / CHINA DAILY

SANAT KUSHKUMBAYEV

Biggest strength

At 25, the SCO shows that practical coordination is the key to meeting today's networked security threats

Modern threats do not wait for governments to agree on how to respond together. Drug networks, cybercriminals, human trafficking and extremist groups move across borders faster than many institutions can act.

States often move more slowly when they have to cooperate, especially when political trust is limited. This is why coordination, even without perfect agreement, has become one of the most valuable assets in international security.

As the Shanghai Cooperation Organization marks its 25th anniversary in 2026, its experience deserves attention beyond the usual discussion of counter-terrorism. The SCO was founded in Shanghai in June 2001 by China, Kazakhstan, Kyrgyzstan, Russia, Tajikistan and Uzbekistan. It has since expanded into a broader Eurasian organization with 10 member states, including India, Pakistan, Iran and Belarus. Its growth has made the SCO both more diverse and more complex.

That complexity is precisely the point. The SCO's real strength is not that its members always see the world in the same way. They do not. They differ in size, geography, political traditions, economic interests and foreign policy priorities. The organization's importance lies in something more practical: it provides a framework in which states with different perspectives can still coordinate on problems that none of them can solve alone.

This is a useful lesson for a fragmented international environment. Too often, multilateralism is judged by whether it produces full political consensus. But in the real world, complete agreement is rare. Coordination is more attainable and often more urgent. When a drug route crosses several borders, when illegal financial flows pass through multiple jurisdictions, or when a cyberattack is launched from one country against victims in another, waiting for perfect political harmony is not a viable strategy.

The SCO began with a strong security focus, particularly with regard to terrorism, separatism and extremism. Over time, however, its agenda has widened. Countering drug trafficking, organized crime, illegal migration and cyber-related threats has become part of the broader understanding of regional security. This evolution reflects a simple reality: today's threats are interconnected. Drug trafficking may finance extremist activity. Illegal migration can be exploited by criminal intermediaries. Cybercrime can support fraud, recruitment, propaganda and money laundering. Security is no longer a set of separate files; it is a network of overlapping risks.

> In an age of networked threats, coordination is not a technical detail. It is a strategic asset. Consensus is desirable, but coordination is indispensable.

In this context, the SCO's value lies in routine. Regular meetings among officials, channels for information exchange, joint exercises, shared assessments and professional contacts may sound less dramatic than summit declarations. Yet they are the infrastructure of practical security. Trust rarely appears overnight. It is built through repetition, predictability and the knowledge that, when a problem emerges, there is someone across the border who can be contacted.

The anti-drug agenda is a good example. The SCO Anti-Drug Strategy for 2024-2029, adopted at the Astana summit in 2024, shows that the organization is trying to respond not only to traditional narcotics routes but also to new methods of distribution. The international anti-drug operation "Web" in 2025 targeted the use of internet resources and virtual payment systems in drug trafficking. This illustrates a wider trend: criminal networks are becoming digital. Law enforcement, in turn, must cooperate faster and be more coordinated and technologically capable.

The lesson is relevant not only for Eurasia. Europe, the Middle East, Southeast Asia and Africa all face their own combinations of migration pressure, border management challenges, criminal networks and digital vulnerabilities. The SCO model should not be copied mechanically by other regions. Institutions grow out of history, geography and political culture. But the SCO method — of keeping communication open, separating practical coordination from broader disagreements and focusing on shared risks even when political consensus is difficult — is worth studying.

This approach is especially important where security and humanitarian issues overlap. Migration, for example, should not be treated simply as a security threat. Many people move because of war, poverty, climate stress or the quest for safety. But criminal groups often exploit such movements, turning human vulnerability into profit. A responsible policy must therefore combine humanitarian principles with stronger coordination against smuggling networks, forged documents, illegal financing and digital recruitment. That balance cannot be achieved by one country acting alone.

At 25, the SCO's record is not a story of perfect unity. It is a story of managed diversity. Its members do not need to agree on everything in order to work together on what threatens them all. This may be the organization's most practical message to the wider world.

In an age of networked threats, coordination is not a technical detail. It is a strategic asset. Consensus is desirable, but coordination is indispensable.

Harmony for common good

The SCO's contributions to regional security, stability and prosperity stem from its vision of governance based on extensive consultation, joint contribution and shared benefits

June 15 marks the 25th anniversary of the founding of the Shanghai Cooperation Organization. Twenty-five years ago, the heads of state of the six founding nations — China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan — followed the pulse of the times to sign the Declaration on the Establishment of the Shanghai Cooperation Organization, opening a new chapter for regional countries in their shared pursuit of stability and development.

To date, the SCO has grown from six founding members into a family of 27 countries across Asia, Europe and Africa. From its initial focus on regional security, its agenda has expanded to include politics, economic affairs and people-to-people exchanges. Today, it stands as the world's largest regional cooperation organization in both land area and population, and a key multilateral platform to ensure security and stability and to drive shared prosperity.

The SCO has remained true to the Shanghai Spirit, which is defined by mutual trust, mutual benefit, equality, consultation, respect for diversity of civilizations and pursuit of common development. Its vision of "harmony in diversity and common development" aligns closely with the purposes of the United Nations Charter and shares the same lineage as the Five Principles of Peaceful Coexistence, offering unique Eastern wisdom to global governance.

Over the past 25 years, the SCO has forged a new path for regional cooperation that diverges from traditional geopolitical rivalries. It has pioneered an entirely different model of partnership, where countries with divergent social systems and development paths can achieve solidarity, win-win openness and inclusive mutual learning. It has set an example for regional and global cooperation, and blazed a trail — theoretically and practically — toward a new type of international relations and a community with a shared future for humanity.

China has left an indelible mark on the SCO's growth and evolution. As a founding member and key participant, China has always prioritized the SCO in its neighborhood diplomacy, steering it toward a new stage of high-quality development defined by greater solidarity, stronger coordination, enhanced vitality and more impactful collective action.

China's wisdom has kept the Shanghai Spirit alive and relevant. In 2001, as host of the first SCO Summit, China drew on the experience of the "Shanghai Five" mechanism to propose the Shanghai Spirit, and it has since become the SCO's core value and code of conduct. As the international landscape has grown increasingly complex, China has systematically put forward five perspectives for development, security, cooperation, civilization and global governance, which can be the guiding principles for building an SCO community with a shared future. It has further championed the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative. Together, these concepts and initiatives have breathed new life into the Shanghai Spirit.

China's solutions have steadily upgraded the SCO's institutions and mechanisms. Beijing promoted the establishment of the SCO Secretariat and the Regional Anti-Terrorist Structure, and initiated the drafting of the Treaty on Long-Term Good-Neighborliness, Friendship and Cooperation Between the Member States of the Shanghai Cooperation Organization, laying a solid legal foundation for SCO-related countries to live in friendship and never become enemies. With strong impetus from China, the bloc successively adopted a medium- to long-term development road map and two 10-year development strategies, clarifying cooperation principles, tasks and objectives, and pointing the way forward.

China's impetus has actively advanced bilateral and multilateral cooperation within the SCO framework. Over the past 25 years, China has held the rotating presidency five times, providing crucial momentum for the steady and sustained development of a community with a shared future for the organization.

During its 2024-25 presidency, China delivered 313 work outcomes, including hosting 187 events, adopting 90 outcome documents and proposing 36 cooperation initiatives covering politics, security, economy and trade, connectivity, technological innovation and green industries. The 2025 Tianjin Summit — the largest in SCO history — helped cement growing solidarity and mutual trust among SCO-related countries, secure tangible progress on security cooperation, advance integrated development that benefits all parties, and foster ever-closer people-to-people and cultural exchanges.

In the contemporary global landscape, unilateralism, acts of power politics and bullying are persistently eroding the foundations of multilateralism. The international community thus expects the SCO to assume greater responsibility — to practice true multilateralism, to reform and improve the global governance system, and to make more SCO contributions to regional and world peace, stability, development and prosperity.

The SCO's contributions stem from its vision of global governance based on extensive consultation, joint contribution and shared benefits. SCO countries have transcended outdated concepts such as the clash of civilizations, Cold War mentality and zero-sum games. Instead, they practice the essence of multilateralism. As Chinese President Xi Jinping said in a video speech at the World Economic Forum Virtual Event of the Davos Agenda in January 2021, "multilateralism is about having international affairs addressed through consultation and the future of the world decided by everyone working together". In particular, the innovative model of the SCO Plus Meeting has significantly enhanced the organization's inclusiveness and representativeness on global issues, raising greater expectations from the international community for its role in improving the global governance system.

The SCO's contributions also come from its collective voice in defense of international fairness and justice. From the situation in Afghanistan to the US-Israel-Iran conflict, the SCO countries actively coordinate to resolve international and regional hotspots, providing political and diplomatic platforms and channels for dialogue and communication. Across a wide range of issues — from safeguarding the security, stability and diversification of supply chains to uniting for global justice, harmony and development — the SCO has sounded a powerful call of the times on major challenges concerning humanity's future and destiny — a call for unity over division, cooperation over confrontation, and justice over hegemony.

Another source of the SCO's contributions lies in its ability to rally broad support from all quarters. As a collective body of emerging markets and developing nations, the SCO has become an important platform for advancing South-South cooperation, helping Global South members better protect their sovereignty, pursue development and prosperity, and improve national governance. The implementation of Chinese initiatives such as the Belt and Road Initiative within the SCO and other multilateral frameworks has enhanced mutual trust and exchanges across different societies and peoples, providing greater support for addressing global challenges.

At present, the world is experiencing both transformation and turbulence. With 25 years of traversing hardships and challenges, the SCO has come of age and entered a new phase. Its mission to safeguard regional security and stability has become ever more vital, and its responsibility to promote national development and rejuvenation even more weighty.

Standing at a new starting point, SCO countries have a greater need than ever to carry forward the Shanghai Spirit, uphold the vision of "harmony in diversity and common development", consolidate political mutual trust, safeguard common security, promote shared prosperity and strengthen people-to-people exchanges — while enhancing institutional effectiveness — toward building a community with a shared future, promoting regional security, stability and development, and advancing a fairer and more equitable global governance system.

Translating resilience into capital inflows

Chinese equity markets riding innovation wave; new economic drivers' importance in A shares rising

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

China's new economic drivers' rising importance in the A-share market has been especially noticeable after a set of supportive measures were introduced since Sept 24, 2024. Technology companies, usually with higher price elasticity, have ushered in a price rally ever since.

MA XUEJING / CHINA DAILY

Unitree Robotics, the humanoid robot maker that captivated audiences at the Spring Festival Gala for two straight years, has now seized the spotlight in a new arena: the capital market. On June 1, its initial public offering application won regulatory approval, making it the first humanoid robotics company to debut on the A-share market.

The company's application was passed in just 73 days. While the Chinese regulators have adopted a tighter grip over IPOs, the unexpected speed for this case has demonstrated the greater importance attached to new economic drivers both from the regulators and market participants, said Yang Zhen, chief engineering researcher from Orient Securities.

As a matter of fact, China's new economic drivers' rising importance in the A-share market has been especially noticeable after a set of supportive measures were introduced since Sept 24, 2024. Technology companies, usually with higher price elasticity, have ushered in a price rally ever since, according to Xun Yugen, chief economist of Guosen Securities.

The comparison between STAR Market 50 Index and the SSE 50 Index may best depict the situation, as the former best represents the hard technology sector and the latter monitors the 50 heavyweights trading at Shanghai Stock Exchange's main board, according to Xun.

Buoyed by the artificial intelligence rise, STAR Market 50 spiked 42.3 percent between July and October last year, significantly overtaking the 10.8 percent increase registered by the SSE 50 Index during the same period.

After the A-share market slid in April, STAR Market 50 Index quickly recovered and refreshed its previous record high with upward momentum. This was mainly fueled by the strong performance of semiconductor, optical component and memory companies. However, the SSE 50 — representation of the old economic engines — has not yet recovered from the downward trend, said Xun.

The disparity did not happen overnight.

In the second quarter of 2021, companies best representing the new economy saw their combined market value overtaking that of old economic engines for the first time. As of May 22, the new economy accounted for 48.4 percent of A-share market's total market cap, compared to 22.3 percent for the old economy. The divergence in trading value is even more pronounced, with the new economy accounting for as much as 57.5 percent of total turnover, versus 15.3 percent for the old economy, according to Guosen Securities.

"Companies specializing in electronics, communication, computer, medicine, defense, automobiles, and consumer services have become important contributors to China's economic growth. In the meantime, companies from the sectors of real estate, basic chemicals and traditional machinery are facing growth challenges," said Xun.

The electronics sector — a key component for the many humanoid robot companies like Unitree — emerged as the most actively traded industry in China's mid-stream manufacturing during the first five months this year. Its monthly trading value had been exceeding 2 trillion yuan ($295 billion) since October 2024, which topped 15 trillion yuan for the first time in May, according to market tracker Wind Info.

New quality productive forces including AI and advanced manufacturing will continue to be the best A-share performers in the second half of the year, according to CITIC Securities.

The prospect of A-share companies' improving profitability has been translated into brokerages' optimism.

Data from first-quarter earnings showed that the overall A-share revenue growth had returned to positive territory, ending the profitability pressure since 2022, according to Cheng Min, vice-general manager of the equities department at Huayin Fund.

The two major technology-focused boards saw particularly explosive results. The average net profits reported by STAR Market companies came at a whopping over 200 percent year-on-year, and that for ChiNext companies reached 20 percent.

At a May press briefing, Meng Lei, UBS Securities China equity strategist, raised his full-year 2026 earnings growth forecast for A-share companies to 11 percent — up from an already optimistic 8 percent forecast at the end of 2025.

Morgan Stanley reached a similar conclusion in their "China AI 2.0" report released in early May. The investment bank noted that "AI adopters" — companies actively integrating artificial intelligence into their operations — have seen their next-12-months earnings per share rise 62 percent over the past two years, dramatically outperforming the broader MSCI China index, which managed just 10 percent growth.

When rising geopolitical tensions and market uncertainties have become a bigger headache for investors around the globe, China assets are of greater value as they are more and more considered "a safe haven".

"Investors all over the world are paying higher premiums for resilience and security amid rising influence of geopolitical tensions. Investment has become more difficult. But all these are the reasons for the revaluation of the Chinese capital market and the related assets," said Li Chunbo, chairman of CITIC Securities International.

Zhu Feng, chief China economist of JPMorgan, explained that China's economic resilience sits on its more diversified energy sources, less dependence on imported oil and gas, and above all, a most complete industrial supply chain in the world.

That resilience has translated into capital flows. According to JPMorgan, overseas funds recorded a net inflow of approximately $13.1 billion into Chinese equity markets year-to-date as of May 15, a scale not seen for years.

Regional and global actively-managed funds have significantly contracted their underweight to China assets since the beginning of the year. Robust overseas capital inflow will further buoy the liquidity in the A-share market, said Zhang Xiaoning, JPMorgan's China equity strategist.

From the company's recent road shows, Zhang has also noticed a shift in international investors' preference over Chinese equities.

"While global funds used to favor the consumption-based internet giants, they are now pivoting to the A-share advanced manufacturing and tech hardware due to the rising focus on energy security and the long-term outlook on the robot sector," she said.

Currently, foreign investors hold approximately 3.5 to 4 percent of total A-share market cap. While medium- to long-term investors have expressed increasing interest in Chinese equities, substantial exposure increases are still in the early stage, according to Thomas Fang, head of China Global Markets at UBS.

"The next five to 10 years will be a 'golden window' for global investors to increase allocations to Chinese assets," he said.

But Unitree's smooth IPO journey should not be mistaken for a regulatory loosening. On the contrary, more than 20 companies have seen their listing reviews come to a halt — most of them voluntarily withdrawn by the issuers or their sponsoring institutions.

Meanwhile, a total of 22 companies had been delisted as of end May. Financial fraud, misappropriation of company funds, and hollowing out of the main businesses are the major reasons for them to be removed from the A-share market.

"This year, delistings have been implemented at a faster pace and with stronger enforcement penetration. The framework of the normalization of delistings has become clearer," said Dong Zhongyun, chief economist at AVIC Securities.

Long-standing market ills such as the speculation of "shell companies" are thus gradually eliminated. A market ecology of "survival of the fittest" is taking shape at an accelerated pace, with low-quality listed companies being weeded out more quickly and more market resources directed to the innovation-driven companies, said Tian Lihui, a finance professor at Nankai University.

Ever since September 2024, central regulators have come up with a set of market stabilizing measures including Central Huijin's purchases of exchange-traded funds, swap facilities for financial institutions introduced by China's central bank, and re-lending for share buybacks.

"The policy package not only curbed short-term irrational fluctuations in the capital market, but also fundamentally reshaped the liquidity transmission mechanism and the valuation ecosystem of A shares. They serve as a 'stabilizer' for the capital market, building a solid base for future fiscal stimulus and domestic demand recovery," said Zhao Wei, chief economist of Shenwan Hongyuan Securities.

"Market-stabilizing measures will no longer be an emergency 'toolkit', but rather normalized and long-term institutional safeguards," he added.

Another major stabilizing force is formed by the continued inflow of long-term capital, including social security funds, insurance and mutual funds.

According to the China Securities Regulatory Commission, the country's top securities watchdog, medium and long-term funds made net A-share purchases over 800 billion yuan in 2025.

Ming Ming, chief economist at CITIC Securities, said that capital inflow from long-term funds will be estimated at the trillion-yuan-level in the next few years, fundamentally reshaping the A-share market's ecosystem and valuation system while securing a solid foundation for asset safety.

"These funds have a discerning eye for new quality productive forces. Their increased market participation will boost market confidence, optimize investor structure, reduce volatility and help core assets return to fair valuations. The overall market stability and resilience will be elevated," he said.

Patience not just a virtue, it is the strategy

REPORTER'S LOG

By Shi Jing

Humility and a low profile have long been considered virtues in China. But lately, it has become increasingly difficult to suppress a sense of pride in the country's progress over the past decades. At least, that was the consensus reached by journalists attending the same interview as me the other day.

While the Chinese have kept their heads down for decades, diligently catching up with mature markets, we have quietly taken the global lead in telecommunications, new energy and artificial intelligence. We are no longer exporting just low-value-added products like textiles or toys; we are exporting innovative business models. Adding to this is the world's most complete manufacturing supply chain, the largest pool of engineering talent and, of course, an unmistakable reputation as an infrastructure giant.

All these have helped China's economy gallop along for years. Yes, economic growth has slowed — a natural consequence after decades of double-digit expansion. But beneath the surface, something more fundamental is underway. The country is holding its head higher, looking further and reaching into frontier industries: space, quantum computing, brain-computer interfaces and beyond.

This shift is rooted in a solid conviction: technology will be the ultimate variable driving China's economic growth. Given the country's already massive economic scale, the marginal contribution of additional capital and labor is naturally diminishing. The future, therefore, belongs to productivity — and productivity comes from innovation.

This may leave some investors puzzled. They know the old saying: the stock market is the barometer of the economy. But if China's technological fundamentals are so strong, why hasn't the A-share market taken off?

Let's go back to the very basics. When we calculate stock prices, the premise is "going concern", meaning that the company is supposed to continue to operate for a very long time to come. The current stock price is the present value of its future cash flow.

To put it in a simple way, when we buy stocks in a company, we are buying into its future. Or, in other words, we buy part of a company because we have faith in it. Such conviction comes from the evaluation of its current performance, industry outlook, macro-environment, etc. The investor should believe that the company is doing the right things and is on the right development path.

But technology advancement is not linear; it follows a spiral or zigzag path. And while a lot of technology companies do not generate profits for years, they still require immense investment and are not able to turn in dazzling fiscal reports to their investors. This is precisely where the gap between perception and reality opens — and where patience becomes an investor's most valuable asset.

This may sound cliche. But personal perception can deviate from rational behavior, prompting reckless moves, herding and speculation. That is why it bears repeating that long-term and value-oriented investing is the golden rule.

Fortunately, the country is making every effort to make the A-share market healthier: laying the groundwork to welcome technology companies, eliminating shell companies to allocate market resources to the truly competitive ones, and introducing more patient capital such as pension funds and insurance money.

So, as long as China stays on the right path — attaching unprecedented importance to technological innovation — the stock market will eventually tell a successful story. Until then, patience is not just a virtue; it is the strategy.

Regulations to safeguard outbound investment

EAGLE EYE
By Yang Zekun

On June 1, China's State Council — the nation's Cabinet — released regulations on outbound investment (hereinafter referred to as "the regulations"), which will take effect on July 1. As the country's first comprehensive administrative regulations governing outbound investment, they mark a historic step toward a unified legal framework for overseas investment activities.

They represent an important legal milestone in balancing development and security while advancing high-standard opening-up, with far-reaching historical and practical significance.

China's outbound investment has undergone nearly half a century of development. Since the country first proposed allowing enterprises to establish operations overseas in 1979, outbound direct investment has grown steadily, reaching $174.38 billion in 2025.

Chinese companies have established more than 50,000 enterprises abroad, making China one of the world's major sources of outbound investment.

Despite this rapid growth, governance of outbound investment has long relied on departmental regulations and policy documents. Regulatory responsibilities were divided among agencies such as the National Development and Reform Commission, the Ministry of Commerce and the State Administration of Foreign Exchange, resulting in a fragmented framework without a unified legal foundation.

The regulations bring the oversight functions of different authorities into a single institutional framework for the first time through an administrative regulation. They establish the basic legal rules governing outbound investment and represent an evolution from policy-based management to institutionalized governance backed by the rule of law.

Some scholars have noted that the legislation fills a long-standing institutional gap in the outbound investment sector, and provides a fundamental legal basis for investment administration and services. It signals a new stage of law-based and standardized governance for China's outbound investment activities.

Consisting of 34 articles, the regulations establish a full-cycle governance framework covering pre-investment approval and filing procedures, ongoing supervision and post-investment accountability. The framework rests on three major pillars.

ILLUSTRATION GENERATED BY AI

The first is a commitment to openness and alignment with international standards. Article 4 states that China will actively align with high-standard international economic and trade rules, promote high-quality Belt and Road cooperation, and participate in the development of international investment rules.

This approach reflects China's commitment to multilateralism, while providing institutional support for deeper participation in global economic governance.

Articles 24 and 25 establish a two-way countermeasure mechanism that allows China to take lawful responses against discriminatory measures imposed by foreign countries, providing institutional protection for Chinese investors overseas.

The second pillar focuses on improving the quality of outbound investment. The regulations encourage investment in areas such as technological innovation and green, low-carbon development.

At the same time, they place restrictions on investment in sensitive sectors including real estate, hotels, film and television, gene editing and rare-earth mining, while prohibiting activities involving weapons and military equipment development, news media and gambling.

This classified management approach represents a shift from broad-based regulations toward more targeted oversight, helping direct capital toward strategic sectors that support high-quality development.

The third pillar is strengthening risk prevention and security safeguards. The regulations establish a comprehensive framework covering the stages before, during and after investment activities. Before projects proceed, investors are required to complete approval, filing and information-reporting procedures in accordance with the law.

During implementation, stricter controls apply to the cross-border movement of technology, data and personnel. Afterward, violations may trigger penalties, including fines ranging from 0.5 percent to 1 percent of the investment amount.

Entities that obtain approvals or filings through fraudulent means may have future applications rejected for three years. These measures significantly raise the cost of noncompliance and bolster deterrence.

The practical value of the regulations extends beyond oversight alone. Their significance also lies in strengthening services and protection, thus creating a more comprehensive governance framework.

One important aspect is the development of an integrated overseas service system. The regulations call for improved coordination of resources related to foreign affairs, legal services, taxation, finance and logistics. Investors will have access to public services covering laws and regulations, investment guidance, risk prevention and rights protection.

Banking institutions will provide financing services, policy-oriented insurers will offer overseas investment insurance and professional service providers will expand their overseas networks. This reflects a governance approach that places equal emphasis on regulations and services.

The regulations also establish a multilayered framework for protecting rights and interests overseas. Risk warning mechanisms will provide timely information on security conditions and investment risks.

Consular protection mechanisms will offer assistance in cases involving wars, armed conflicts and other major emergencies.

Investment dispute resolution mechanisms encourage consultation, mediation, arbitration and litigation as means of resolving disputes. In addition, countermeasure mechanisms allow investigations and responses to investment barriers and discriminatory practices.

Together, these arrangements provide stronger support for Chinese companies operating overseas.

Another notable feature is the clarification of the relationship between government oversight and market autonomy.

Article 5 states that investors enjoy the legal right to make independent outbound investment decisions and bear their own risks and responsibilities. The provision reflects respect for the role of market entities. Within clearly defined compliance boundaries, enterprises retain ample room for commercial decisionmaking.

As a result, outbound investment governance is moving away from broad, one-size-fits-all administration toward more targeted and refined regulation, achieving a better balance between policy guidance and market principles.

The release of the regulations represents an important step in modernizing China's outbound investment governance and carries broader significance.

First, it reflects China's contribution to global economic governance. At a time when unilateralism and protectionism are gaining ground in some parts of the world, the regulations not only provide legal safeguards for Chinese investors, but also send a clear signal of China's commitment to multilateralism and opposition to protectionist practices.

As China increasingly moves from being a participant in international rules to playing a greater role in shaping them, the regulations reflect this evolving position.

Second, the framework serves as an example of balancing development with security. It combines measures aimed at promoting high-quality outbound investment with mechanisms designed to prevent and address risks, helping achieve a balance between greater openness and effective oversight, while enhancing protection for China's growing overseas interests.

Third, the regulations are expected to support higher-quality development. As China's outbound investment shifts from pursuing scale to pursuing quality, the framework provides clearer guidance on where investment is encouraged, restricted or prohibited.

By directing capital toward areas such as technological innovation and green development, it offers policy support for Chinese enterprises seeking to move up the global value chain.

From the country's first proposal in 1979 allowing enterprises to establish operations overseas to the introduction of its first comprehensive administrative regulation in 2026, China's outbound investment has undergone nearly five decades of development.

By transforming long-standing policy measures into a formal legal framework, the regulations fill an important legislative gap in the outbound investment sector.

Looking ahead, their implementation is expected to help China's outbound investment evolve from scale-driven expansion toward higher-quality and more efficient growth, while promoting a shift from extensive management to more refined governance.

In doing so, they will provide stronger legal support for high-standard opening-up, thus helping achieve the country's broader development goals.

Financial structure optimization key to China's development

MAIN STREET
By Lian Ping and Wang Yunjin

The outline of the 15th Five-Year Plan (2026-30) calls for actively developing direct financing channels such as equity and bond financing, and explicitly identifying optimization of the financial structure and expansion of direct financing as key drivers in building the nation into a financial powerhouse.

This strategy aims to reduce overall social financing costs, ease the real economy's overreliance on bank lending, provide risk-sharing capital support for technology and innovation-focused enterprises, and further improve the precision and resilience of financial services for the real economy.

In recent years, China has continuously deepened supply-side structural reform in the financial sector in response to the needs of high-quality economic development. As a result, the country's financial structure has steadily optimized, with the share of direct financing continuing to rise.

In 2025, China's new indirect financing totaled 16.1 trillion yuan ($2.37 trillion), falling below the increase in direct financing for the first time. The share of indirect financing dropped to 45.3 percent, also falling below the share of direct financing for the first time. This marks an important step in China's transition from a financial structure dominated by indirect financing to one characterized by coordination between direct and indirect financing.

Direct financing in China is primarily supported by bond issuances. In 2025, net financing through corporate bonds included in direct financing statistics reached 2.4 trillion yuan, marking the second consecutive year of expansion. In May 2025, financial regulators launched a science and technology board in the bond market, driving rapid growth in the issuance of sci-tech innovation bonds and green bonds.

Particularly noteworthy is that net government bond financing reached 13.8 trillion yuan in 2025, rising rapidly for the fourth consecutive year. This was mainly driven by the sustained implementation of proactive fiscal policies.

Driven by policy support, equity and stock financing also experienced a recovery. In 2025, domestic stock financing by nonfinancial enterprises increased by 476.2 billion yuan, up 186.1 billion yuan year-on-year, accounting for 1.3 percent of the increase in direct financing. Although the share remained relatively low, the growth rate was relatively high.

In 2025, IPO fundraising on the STAR Market and ChiNext exceeded that of the main boards in Shanghai and Shenzhen. Financing on the Beijing Stock Exchange also increased steadily, with a focus on serving specialized and innovative small and medium-sized enterprises.

Equity financing through private equity funds, venture capital and government industrial funds also developed steadily. By the end of 2025, government-backed funds had committed capital of approximately 8.5 trillion yuan, providing strong support for industrial upgrading and technological innovation in China.

The growth rate of indirect financing, however, has structurally slowed. In 2025, loans extended to the real economy totaled 15.9 trillion yuan, down by 1.1 trillion yuan from the previous year, accounting for 44.7 percent of the increase in total social financing. Although indirect financing remains the mainstay of social financing, its growth rate slowed significantly compared with the previous year, reflecting a substantial decline in the real economy's dependence on bank credit.

The major transformation in China's financial structure is the result of the combined effects of multiple factors, including economic restructuring and industrial upgrading.

The nation's economic structure is shifting from investment-driven and traditional industry-led growth toward innovation-driven and emerging industry-led growth. Its industrial structure is also upgrading from traditional industries to high-tech and strategic emerging industries. These profound transformations have led to the continued rise in the share of direct financing.

Rapid development in financial technologies has effectively reduced the cost of direct financing and improved its efficiency, enabling SMEs and households to participate more conveniently in direct financing. The rapid development of artificial intelligence-related industries has also generated substantial demand for direct financing.

At present, China's aging population is reshaping household wealth allocation demand. Households are gradually shifting toward direct financing products in pursuit of higher investment returns. Younger generations have become significantly more investment-conscious and financially sophisticated.

As returns on real estate investment have fallen sharply, capital has gradually flowed out of the property market into the capital market. Rough estimates suggest that the total market value of China's real estate sector may have fallen from a peak of around 400 trillion yuan to approximately 280 trillion yuan. Even using a conservative estimate of a 20 percent capital outflow rate, around 20-30 trillion yuan may flow out of the property market, a portion of which is likely to enter the capital markets.

In recent years, China has continuously expanded the opening-up of its capital markets, relaxed restrictions on foreign investor access, broadened the scope of overseas investment and launched a series of connectivity mechanisms that have attracted large inflows of cross-border capital into China's direct financing markets. Currently, overseas investors hold more than 3.4 trillion yuan worth of A shares and more than 4.5 trillion yuan worth of Chinese bonds.

Taking into account China's stage of economic development, industrial structure and policy directions, the share of direct financing in the country's financial market is expected to continue rising steadily over the next five to 10 years. By 2030, the share of new direct financing could reach around 55 percent, while the share of outstanding direct financing could exceed 40 percent, gradually forming a financial structure dominated by direct financing and supported by indirect financing.

However, compared with the needs of China's high-quality economic development and the maturity of developed capital markets, China's direct financing markets still face a series of challenges. To promote high-quality capital market development and optimize the financial structure, the following policy recommendations are proposed.

Continue deepening comprehensive registration-based IPO reforms, optimize listing review mechanisms, simplify review procedures, lower listing thresholds, and prioritize support for technology enterprises and specialized and innovative companies seeking public financing. Improve delisting mechanisms, promote the normalization of delistings, and support private equity and venture capital funds in exiting their investments through IPOs, mergers and acquisitions, and equity transfers. We should improve stock pricing mechanisms, strengthen market-based pricing and reduce administrative intervention. Tax incentives should be provided for equity financing by technology companies and SMEs, while ancillary costs such as handling and auditing fees should be reduced to stimulate corporate demand for equity financing.

Improve the bond market ecosystem and increase bond issuances by private enterprises. Efforts should be made to lower the barriers to bond issuances for private enterprises and relax eligibility requirements for risk-sharing instruments. Expectations of rigid redemption should be broken and reliance on government guarantees should be reduced. Regulatory standards, information disclosure, registration and custody, and trading rules should be unified and optimized while equal treatment between State-owned and private enterprises must be ensured. Greater efforts should also be made to develop credit derivatives, guarantees and risk mitigation tools to lower financing guarantee costs.

Improve the policy support system for direct financing of SMEs by establishing a special fund to provide guarantee support, broaden direct financing channels and expand bond financing for SMEs by simplifying bond issuance procedures, lowering issuance thresholds and introducing small-denomination bond products tailored to SMEs.

Optimize the credit rating system and strengthen risk control in direct financing markets. Supervision over credit rating agencies should be enhanced, rating practices standardized and methodologies improved to increase the scientific rigor and accuracy of ratings. Credit rating agencies should also develop customized indicators for technology enterprises and SMEs. Information disclosure rules should be improved and disclosure practices standardized. Bond default resolution mechanisms should be strengthened, with streamlined procedures and shorter disposal cycles.

Foster high-quality intermediary institutions and improve the quality of professional services. Intermediaries should be encouraged to increase their investment in research and development to enhance their capabilities in areas such as underwriting and sponsorship, research and analysis, and risk management. Policy support and tax incentives should be granted to compliant intermediaries with strong service quality, while institutions engaging in regulatory violations or providing poor services should face strict penalties.

CHINA

Nation's UNESCO sites top conservation ratings

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

China's natural and mixed natural-cultural UNESCO World Heritage sites are outperforming their global peers in conservation, with roughly 90 percent receiving a "good" or higher rating from the International Union for Conservation of Nature, according to Chinese authorities.

The figure is well above the global average of 61 percent and the Asian average of 68 percent, the National Forestry and Grassland Administration said in a media release on Saturday, which coincided with the country's 10th Cultural and Natural Heritage Day.

China is home to 15 of the world's 235 natural world heritage sites and four of the world's 25 mixed cultural and natural heritage sites, leading the world in both categories.

The sites cover about 80,000 square kilometers across 20 provincial-level regions and encompass a wide range of ecosystems, including mountains, forests, grasslands, lakes, wetlands, deserts and coastal zones.

The administration highlighted a series of measures to strengthen heritage protection, including the development of a comprehensive legal framework centered on the national park system.

In addition to enacting the National Park Law, China has revised regulations governing nature reserves and scenic areas and issued management rules for national-level nature parks and natural world heritage sites.

According to the administration, near-natural restoration projects have been carried out at more than 80 percent of heritage sites, improving the integrity of local ecosystems.

More than 90 percent of the sites prioritize hiring local residents, while heritage-based cultural tourism has become a pillar industry in many regions, it said.

Liu Baodang, deputy secretary-general of the World Heritage Expert Committee of the National Forestry and Grassland Administration, said the development of China's natural world heritage sites has progressed through several stages.

The earliest phase focused heavily on ticket revenue with limited conservation efforts, followed by a period in which surrounding communities began sharing tourism benefits, Liu said.

Later, heritage sites started leveraging their brand influence to develop new eco-industries, such as wellness industry businesses and specialty agriculture, he said.

"This stage is characterized by leveraging the brand influence of natural heritage sites to expand their economic reach, extending benefits from surrounding communities to towns and even entire counties," Liu said.

He said the sector is now exploring a new stage of development centered on systematic conservation which aims to establish globally leading heritage management practices.

The administration pledged to further strengthen systematic conservation at the sites, incorporate natural heritage areas into the monitoring system for protected areas and promote coordinated management.

New research center to boost Sino-Hungary ties

By **HU MEIDONG** in Sanming, Fujian
humeidong@chinadaily.com.cn

A Hungarian studies center, aimed at advancing high-level international cooperation, was jointly launched on Saturday by Sanming University and Shanghai International Studies University in Sanming, Fujian province, a major ancestral home of overseas Chinese in Europe.

The center brings together 20 cross-disciplinary expert researchers, while engaging overseas Chinese professionals based in Hungary. It will leverage the city's diaspora resources to conduct practical, field-based research.

Chen Lieping, Party chief of Sanming University, said the center will adhere to a global vision and field investigations to build a highly innovative research community, providing continuous intellectual support for the country's opening-up efforts.

Meng Zhongjie, president of Shanghai International Studies University, said the university will provide counsel for trade between Fujian and Hungary and cultivate compound talents versed in the Hungarian language, international rules, and industrial economics.

Renato Horvath, the acting consul general of Hungary in Guangzhou, Guangdong province, said, "Under the strategic guidance of leaders from both nations, Hungary-China relations are currently experiencing their strongest period in history."

He expressed hope that the center would serve as a platform to expand practical bilateral cooperation in joint student training, faculty exchanges, scientific research collaboration and cultural dialogue.

The launch brought together scholars from the Chinese Academy of Social Sciences, Peking University and Hungary's Eotvos Lorand University and University of Miskolc. A forum held on the sidelines of the event focused on the global expansion of Fujian enterprises into European markets, aligning academic resources with industrial needs.

Gerhard Akos Emod, former mayor of Velence, Hungary, said economic cooperation between the two countries has seen robust growth, with Hungary becoming a key platform for major Chinese firms such as BYD and CATL to enter the broader European market.

Emod said bilateral cooperation is expected to expand further in energy storage, technological innovation and circular recycling economies, highlighting that China will remain an important investment source and strategic economic partner for Hungary's development.

International scholars conducted field studies on Sunday in Mingxi county, an inland commercial gateway to Central Europe where nearly 5,000 overseas Chinese from the county are engaged in business and trade activities across Hungary, providing a foundation for exchanges.

Local authorities said the diaspora connection has fostered sister-city ties between Sanming and Budapest's 15th district. Sanming University and Hungary's University of Miskolc recently launched an approved dual-degree undergraduate program in artificial intelligence, using a dual-registration model to jointly train technology talent.

Admission guidance

Students and parents seek information on admission policies during a university enrollment consultation fair at the Jiulonghu Campus of Southeast University in Nanjing, Jiangsu province, on Sunday. Following the conclusion of the *gaokao*, China's national college entrance examination, universities across the country are hosting consultation events to help students and their families navigate the admissions process.
YANG SUPING / FOR CHINA DAILY

Development plans on track for rail tourism expansion

Policy sets out target for new trains, infrastructure and travel upgrades

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

China has launched an initiative geared toward deploying over 160 special tourist train units by 2030, in a bid to expand the supply of rail-based travel products and unlock new momentum in service consumption, according to a recent policy document.

The document, jointly released by eight government departments, including the Ministry of Commerce, the Ministry of Culture and Tourism, and China State Railway Group, outlines 15 measures to promote the integrated development of railways and tourism.

The measures include accelerating tourism-oriented infrastructure upgrades, improving elderly-friendly facilities, creating dedicated waiting areas for tourists and establishing convenient transfer channels.

Social capital will be encouraged to invest in the renovation of tourist trains. Operators will develop services for different travel scenarios, including short- and long-haul trips, and for various market segments ranging from premium and comfortable options to affordable offerings.

Themed products such as senior travel, study tours and wellness retreats will also be promoted.

Special tourist trains featuring regional cultural characteristics and products tailored for inbound travelers will be introduced.

Authorities will encourage fixed-route, regularly scheduled services using ticket sales as the primary business model. Historical railway stations and railway museums with cultural or scenic value will be revitalized to develop railway-themed travel routes and cultural products.

To improve service quality, efforts will be made to enhance connections between railway stations and urban public transportation, customized bus services and dedicated shuttle buses to scenic attractions, helping address the "first- and last-mile" challenge.

Zuo Xiaobo, an official with the Ministry of Commerce, said the ministry will work with relevant departments to implement the policies, expand the supply of railway tourism products and create more diverse consumption scenarios.

The goal, he said, is to foster a development model in which railway and tourism industries reinforce each other while better meeting people's aspirations for a better life.

In 2025, a total of 2,485 tourist trains operated across the national railway network, up 33.6 percent year-on-year, according to government figures.

Meanwhile, China's railway network recorded over 4.25 billion passenger trips last year. Tourism-related travel accounted for about one-third of the total, making it the fastest-growing category of railway passenger transportation.

Yin Ping, a professor at Beijing Jiaotong University's School of Economics and Management, said the integration of railway and tourism still faces some challenges.

"Most existing products are simply a combination of transportation and basic travel services, lacking thematic and sophisticated designs that meet niche demands such as study tours, wellness trips and cross-border travel," Yin said. "The product system remains incomplete, the industrial chain is short, and supporting services are relatively weak."

She said the goal of operating more than 160 special tourist train units nationwide by 2030 provides a clear target for developing a wider range of railway tourism products.

The market has already seen the emergence of several popular railway tourism brands, including Panda Train, Silk Road Dream and New Orient Express, Yin said.

"These themed trains offer immersive, high-quality travel experiences built around distinctive themes, closely matching growing demand for personalized and diversified travel in the era of mass tourism," she said.

Chongqing animation film week draws intl praise

By **TAN YINGZI** and **DENG RUI** in Chongqing

The 2026 Chongqing International Animation Film Week highlighted a new wave of high-grossing Chinese animated films characterized by artistic innovation, rich storytelling and high-quality production that are capturing global attention.

The five-day event, which concluded on Saturday at the Yongchuan Technology Studio in Chongqing's Yongchuan district, was described by local authorities as China's first specialized and authoritative international festival solely dedicated to animation.

Acclaimed directors and film experts have shared their insights, highlighting the industry's growing appreciation for "Eastern aesthetic".

Sheila M. Sofian, a member of the animation branch of the Academy of Motion Picture Arts and Sciences and its animation executive committee from the United States, served as a jury member for the event.

"I think Chinese artists have a very rich culture to draw from. There are many very unique techniques such as brush painting, ceramics and woodcutting," she said.

"But what's really interesting is how they apply this to media, and they're not afraid to take traditional techniques and apply them in a way that's very creative and unique in a way that is unfamiliar to Western audiences," she added.

Rob Minkoff, an American film director best known for Disney's *The Lion King* and chairman of the film week's jury, said, "I don't think that all films have to apply to the same standards or ideals."

He emphasized the importance of embracing diverse storytelling values across diverse cultural frameworks. "Coming to a festival like this, we are celebrating works from all over the world," he said.

A total of 501 animated works from around the world competed for the Golden Camellia Awards. Forty-five works were shortlisted, and the winners were announced at the closing ceremony.

Yin Hong, vice-president of the China Film Association and a jury member for the film week, said this year's shortlisted works drew heavily on Chinese classical literature and traditional art forms such as ink painting and meticulous brushwork, combining them with modern animation to enhance Eastern aesthetics.

He also said the domestic animation industry needs to continue expanding niche markets. With the emergence of adult-oriented and experimental animation, the industry must further explore different audience segments and create more differentiated works.

The opening ceremony featured a presentation themed "Oriental Scroll", showcasing a series of domestic animated productions, including *A Story About Fire*, *Into the Mortal World*, *Yao-Chinese Folktales* and *Nobody*.

Industry data indicates a significant trend in China's animated film sector.

From 2011 to 2018, animated films accounted for about 10 percent of annual box office revenue, rising to around 14 percent between 2019 and 2024.

"Recently, China has obviously enjoyed the success of several films I've gotten to see — both *Nezha 2* and *Nobody*. I can see why they're immensely popular," said Janet Yang, an award-winning Hollywood producer.

Chinese animated characters Xiongda, Xionger and Guangtou Qiang walk the red carpet during the opening ceremony of the 2026 Chongqing International Animation Film Week at Yongchuan district, Chongqing, on Tuesday. HE PENGLEI / CHINA NEWS SERVICE

In 2025, domestic animated films achieved a breakthrough, with four animated titles ranking among the year's top 10 box office earners, three of them domestically produced. Total box office revenue for animated films exceeded 25 billion yuan ($3.7 billion), accounting for nearly half of the market.

Yongchuan, which has developed a state-of-the-art film and television industrial base, the largest in western China, is at the forefront.

In recent years, Yongchuan has emerged as a major hub for film technology in China, attracting more than 170 upstream and downstream enterprises, including Dawa (Chongqing) Imaging Technology and iQIYI.

The district has produced more than 140 films and television works, including the popular *Resurrection* and *Panda Plan*. Last year, it hosted the 2025 Shanghai Cooperation Organization Film Festival.

"Yongchuan is striving to build the 'Western China Technological Film and Television City' by further integrating technological innovation and industrial innovation," said Xu Hongqiu, head of Yongchuan district.

During the film week, an investment and project signing event resulted in agreements for 53 projects worth 2.8 billion yuan. The projects span the entire industry chain, including artificial intelligence-generated content production, film technology research and development, talent cultivation and content creation.

Subsidies turn desert control into moneymaker

Residents of Xinjiang's Hotan prefecture take up challenge to hold back shifting sand

A harvester reaps alfalfa in Hotan, Xinjiang Uygur autonomous region, in September last year. PHOTOS BY DING LEI / XINHUA

Clockwise from top left: Villagers plant pumpkins on the edge of the Taklimakan Desert in Hotan in April. A villager transports reed bales to make grids to stop the Taklimakan from advancing in Yutian county of Hotan in April. Villagers interplant blackberry lily, often used as a medicinal herb, at a rose orchard in Yutian in April.

By HOU LIQIANG in Hotan, Xinjiang
houliqiang@chinadaily.com.cn

Rows of small, leafy oleaster trees stretch toward the horizon on the southern edge of the Taklimakan Desert in the Xinjiang Uygur autonomous region. Still short and fragile, each sapling is propped up by a bamboo stick to withstand the desert gales, while low carpets of green wheat and alfalfa shield the soil between them.

At first glance, the sparse plot looks like a struggling farm. In reality, it represents a radical ecological turnaround. Little more than a year ago, this site in Hotan prefecture was an arid expanse dominated by shifting sand dunes over 10 meters high.

The transformation relies on an innovative local governance model launched in 2024 — the "first-build-then-subsidize" policy. To balance costly ecological restoration with local economic survival, the government allocates desertified land to residents rent-free. Residents bear the upfront cost of leveling the dunes and planting drought-resistant vegetation; the government only delivers financial subsidies after independent inspectors verify a tree survival rate of at least 85 percent.

Sudiomar Tursun, a resourceful villager and entrepreneur from Ayimak village, was among the first to gamble on the policy. In October, she formed an agricultural cooperative with 18 fellow villagers to tackle a heavily desertified plot.

To fund the massive undertaking, Sudiomar pooled her life savings, sold personal assets and secured loans from relatives to amass nearly 4 million yuan ($550,000) in upfront capital. Her friends considered the project so risky that they told her she would ruin herself.

"We suffer severe flying dust in Hotan. I have to sweep the floor at home every day," Sudiomar said. "I think if we can do this work and stick with it, it will benefit us — and it will leave a better future for our kids and grandkids."

Under their cooperative agreement, Sudiomar covers the financial risk and equipment costs, while the 18 partners provide the labor, receiving steady wages during the grueling reclamation phase. Once the crops mature and turn a profit, the workers will receive a 20 percent revenue share.

While Sudiomar waits for official forestry bureau verification to trigger her first-year subsidies — which offer 30,000 yuan per hectare for trees and 22,500 yuan for shrubs — the local government has mitigated her risk by absorbing heavy infrastructure costs.

The government has built access roads, and covers the water and electricity costs required to run the irrigation pumps during the project's critical initial establishment phase. Government agricultural technicians also often visit the plot to provide guidance.

Hotan's "first-build-then-subsidize" policy has proved popular. According to the prefecture's forestry and grassland administration, 69,900 residents from 18,600 households across 814 villages in the prefecture have participated in the initiative so far. The desertified areas they've volunteered to treat exceed 60,300 hectares.

Ablikim Sawur, head of the administration, said about 13 million yuan in "first-build-then-subsidize" funds have already been distributed for 660 hectares of desertified area planted in the fall of 2024.

Residents are expected to benefit from the trees and shrubs they've planted very soon, he said.

The financial viability hinges on clever agricultural engineering. On Sudiomar's plot, a high-yielding, large-fruited oleaster variety is grafted onto native wild oleaster rootstock.

"Wild oleaster is incredibly tolerant of poor soil and harsh winds," said Li Zhijun, a professor of plant diversity conservation in arid regions at Tarim University. "Its ease of establishment is the primary reason it was chosen."

Li said that by grafting a commercial variety onto the oleaster, they achieve an eco-friendly windbreak that produces marketable fruit for the beverage processing industry.

Interplanted alfalfa acts as a nitrogen-fixing crop, gradually enriching the desert sand with organic matter so it can eventually support delicate food crops like wheat. Starting in the third year, the grafted oleasters are projected to generate 22,500 to 30,000 yuan per hectare, with the harvested alfalfa bringing in an additional 30,000 yuan per hectare.

"This approach captures the essence of green development: protecting the ecology while ensuring economic prosperity for the people," she said.

Moreover, planting oleaster and alfalfa together can contribute to the overall success of desertification control, the professor added.

The trees, once they mature, will serve as windbreaks, their height deflecting the worst of the desert gales. The intercropping with alfalfa further anchors the sand, creating a synergistic effect, she said.

"I'm confident that the ecological benefits of this system will be substantial," Li said.

To ensure local residents benefit economically from their desertification-control efforts, local authorities have done even more.

At an experimental station for desertification control in the prefecture, 147,600 plants of various species have been planted, covering 21 species of trees, 18 species of shrubs, 25 species of herbs, and 12 species of cash crops.

Li Yanzhong, a technician at Hotan County Agricultural Investment Co, which runs the station, said the experimental facility aims to motivate residents to participate in desertification control by offering planting choices with economic value.

Based on data analysis, the station selects candidate species for trial planting in arid desert areas, and through field planting, demonstration and side-by-side comparison with analogous varieties, it identifies those best suited to desert conditions.

"The ultimate goal is to use economic benefits to drive participation from both local residents and businesses," Li Yanzhong said.

Once water-efficient, hardy, easy-to-plant and economically valuable varieties are identified, they are promoted for broader application.

"The station is open to everyone, and all residents and companies are welcome anytime," he added.

Intrepid 'king of grass' plants shrubs to tame the Taklimakan

By HOU LIQIANG

For nearly eight years, Xu Zhaoyang has been doing what locals said was impossible: planting shrubs and trees in the "dead sea" of the Taklimakan Desert.

"I came back in 2019 after graduating from university," said the 32-year-old, standing amid some 207 hectares of alfalfa, much of it freshly cut and left to dry. "I started with just over 20 hectares of saline-alkali land."

He is known locally as "Hotan's King of Grass" and the "Desert Beautician".

Xu is not trained in agriculture. At Anhui University of Technology, after two years of studying civil engineering, he changed his major to management studies, then prepared for a master's degree in law before graduating in 2018.

But the desert was in his blood. In 2005, at the age of 10, he moved to the Xinjiang Uygur autonomous region with his parents from their hometown in Henan province. He remembers the black dust storms that turned day into night, forcing families to turn on lights inside their homes at noon. He remembers shaking sand out of his clothes every evening.

"I wanted to do something for the environment of my hometown," Xu said.

The early years were brutal. Xu lived alone in a simple prefab shed at the southern edge of the desert for more than two years. He dug drainage canals, flushed the salt from the soil, and leveled the land by hand. When he had money, he hired a few workers. When he didn't, he worked alone. He spared time whenever possible to read agricultural textbooks and research papers.

In May 2020, Xu's determination was tested. His first crop of young seedlings had just pushed up two tender green leaves. Then one night, a wall of sand howled across the desert for 12 hours straight.

"When I ran into the field the next morning, everything was buried," he said, adding he lost everything after working persistently for months.

"I called one of my university teachers. My teacher said to me, 'Zhaoyang, you wrote in your thesis that starting a business is a process of constant trial and error. Didn't you once say the desert can swallow seedlings but not determination?'"

Encouraged, Xu chose to forge ahead.

He began working closely with research institutions. He planted 63 different forage varieties. For more than a year, he carried a notebook wherever he went, recording growth cycles, drought tolerance, yield and quality.

He eventually identified alfalfa as the ideal plant.

"It's a legume with root nodules that fix nitrogen and enrich the soil," Xu said.

Alfalfa also anchors shifting sand with its deep root system and can be harvested continuously for seven years from a single planting, he added. In the intense sunlight of southern Xinjiang, he now harvests five to six times annually.

Water remained one of the greatest challenges. Traditional drip irrigation failed in the sandy soil as evaporation was too fast, and so Xu introduced large-scale center-pivot sprinkler systems.

"One person can manage irrigation for 1,330 to 2,000 hectares of land. With sprinklers, we can narrow the row spacing and increase yield by 3,000 to 4,500 kilograms per hectare," he said.

Xu's operation has grown to more than 1,530 hectares, including almost 670 hectares of alfalfa and over 530 hectares of wheat.

"Every piece of the land was bulldozed flat from giant sand dunes," he said. "We leveled the desert, planted the same year, and got results the same year."

The net profit from planting alfalfa is roughly 10,500 to 12,000 yuan per hectare. "To make a profit from growing anything in the desert is very difficult," he said. "To make such a high net profit is extraordinary."

Mechanization has made a huge difference. One machine can seed almost 70 hectares a day. One sprinkler system irrigates about 70 hectares. Harvesters cut, rake, bale and load with barely a human touch.

Xu's father, Xu Daobin, had opposed his son's plan to start his business in agriculture in the desert.

"We worked so hard to send you to university so you could find a stable job. You're a recent graduate. Agriculture is not that easy. Even an experienced farmer would struggle to grow anything there," said Xu senior, recalling his words to his son.

"I said he couldn't make it. Now he's really done it," the father added.

Xu junior has further ambitions, with a plan to expand the planting area by 13,300 or even 20,000 hectares in the next three to five years. "We have the mature machinery and the mature technology. We can absolutely do it," he said.

He said his ultimate goal is to turn the Taklimakan into grain fields to help the country firmly hold its own rice bowl.

"When I was a child, I watched the generation of my parents put down roots here, turning wasteland into a home," he said. "I always knew I would do this someday. What grows in the desert isn't just alfalfa. It's my generation's roots."

Xu Zhaoyang gives an interview on treating the Taklimakan Desert in Hotan in April. PROVIDED TO CHINA DAILY

CULTURE

A FRESH STITCH ON TRADITION

Young designer reimagines ancestral embroidery, bringing new appeal while creating opportunities for village artisans, **Li Muyun** and **He Chun** report in Changsha.

A playful tiger-faced hat has turned a young designer from Central China's Hunan province into an unexpected ambassador for one of the country's oldest embroidery traditions.

The traditional hand-embroidered tiger motif found on children's clothing among the Miao people of the Xiangxi Tujia and Miao autonomous prefecture is usually fierce and imposing. Passed down through generations, the design is believed to ward off evil and protect the child who wears it.

But Li Wen, a 23-year-old designer from the region, decided to give the centuries-old motif a fresh look.

Last year, she created a hat featuring a much friendlier tiger face: the tiger playfully sticks out its tongue, revealing its six pearl-strung teeth, while floral patterns sit beneath its wide, expressive eyes.

On May 14, this hat was seen inside the Great Hall of the People in Beijing, worn by the 6-year-old son of Elon Musk. Within hours, videos of the boy in the traditional Chinese outfit spread rapidly across social media, drawing attention from around the world.

The hat had been purchased from the Remote Mountain Bazaar, a Beijing-based platform that helps traditional artisans in remote regions bring their handicrafts to market.

On a day after the video went viral, more than 1,000 orders poured in via the platform to Shibadong village in Xiangxi, where local embroiderers make the hats by hand.

Like many others, Li first learned about the attention through news reports. The experience reinforced her belief in the potential reach of Miao embroidery.

"I never imagined I would be connected in any way to the world's richest man," she says with a laugh.

Every detail on the tiger-faced hat carries meaning and blessings, Li explains.

The tiger's face is made of six half-circle pieces sewn together, creating a fuller, rounder appearance than the traditional flat design. Along the edge runs a row of "dog-tooth stitches" — a classic Miao embroidery technique believed to protect children from harm. The ears feature pomegranate patterns symbolizing blessings and family prosperity. Beneath the eyes, dahlia flowers represent good fortune and abundance, while a lotus on the tongue conveys purity and grace.

Li adapted the centuries-old pattern and infused it with her own aesthetic sensibility.

"The traditional tiger face in Miao embroidery is flat, dark and serious," Li says. "This one is cuter and friendlier."

She softened the lines, rounded the contours, and replaced the heavy colors with a lighter palette of blue and purple.

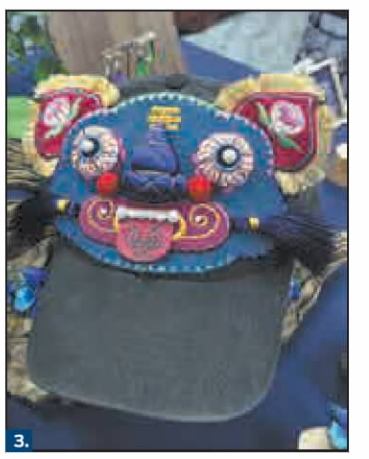
"That's always been my design style," she says.

"I like beautiful, cute things. My work reflects a bit of that — a bit of me."

Growing up in Luxi county, Xiangxi, Li spent much of her childhood watching her mother embroider shoe insoles and headscarves. Flowers, fish and birds gradually emerged beneath her mother's needle.

"I followed her and learned embroidery from a very young age," Li says.

After graduating from middle school, she enrolled in Xiangxi Vocational and Technical College for Nationalities, where she majored in arts and crafts. There she studied Miao embroidery and other intangible cultural heritage crafts, including batik, Tujia brocade and wood carving.



Under the guidance of local inheritors, she learned not only traditional techniques but also how to reinterpret historical patterns for contemporary audiences.

1.3. The tiger-faced hats feature a traditional Miao embroidery motif. **2.** A variety of bags are designed with the tiger motif. **4.** Designer Li Wen adapts the centuries-old pattern, infusing it with new vitality. **5.** Miao embroidery has become an important source of income for women in Shibadong village, Xiangxi, Hunan province. PHOTOS PROVIDED TO CHINA DAILY

> "Our Miao ancestors migrated over long distances. Legends say that they used embroidery to mark their route, stitching what they saw along the way. Flowers, birds, insects, and rivers, whatever caught their attention, became part of the patterns on their clothing."
>
> **Li Wen,** 23-year-old Miao embroidery designer

"Some of my college designs eventually reached factory-production standards," she says proudly.

After graduating in 2024, Li joined the design team of a Miao embroidery company in Shibadong village. There, her designs and those of her colleagues are transformed into finished products by local embroiderers, most of them women from Shibadong and neighboring communities.

Design work, she notes, extends well beyond sketches and computer screens. From creating the first sample to refining every detail, she regularly works alongside embroiderers on the production line.

"You have to understand the process," she says. "Something that looks simple on paper can be very difficult to make."

To inspire new creations, Li has developed a habit of collecting antique embroidered pieces, searching for them online and at local fairs. Some date back to the Qing Dynasty (1644-1911), offering a rich source of traditional motifs and techniques.

One of the qualities Li values most about Miao embroidery is its sense of "freedom", reflected in its spontaneous, nature-driven patterns.

"Our Miao ancestors migrated over long distances," she explains.

"Legends say that they used embroidery to mark their route, stitching what they saw along the way. Flowers, birds, insects, and rivers, whatever caught their attention, became part of the patterns on their clothing."

That sense of openness still defines the craft today, she adds. "There's no rule that says you must stitch this to the left or that to the right. It's natural, free and fluid."

In 2021, Miao embroidery in Xiangxi was added to China's national intangible cultural heritage list. For the women of Shibadong, however, the craft represents more than cultural preservation.

Since a national poverty alleviation campaign was launched in the village in 2013, embroidery has become an important source of income.

According to local authorities, embroiderers in the village and surrounding areas earn an additional 2,000 to 3,000 yuan ($295 to $443) per month through embroidery work. Last year, Miao embroidery generated more than 5 million yuan for the local economy.

For Li, new ideas continue to take shape through fabric, thread and color. Her upcoming projects will focus on other creatures, including fish and shrimp, she says.

"I want to make them come alive. I want every creature in my work to have its own spirit."

Acclaimed pianist hits every key with concerts and online series

By **CHEN NAN**
chennan@chinadaily.com.cn

For Tian Jiaxin, the piano has never been just an instrument, but a storyteller, a traveling companion and, as she describes it, something akin to a magic wand.

"When I started learning piano, it felt like Harry Potter's wand," Tian says with a laugh.

"Through music, I could become different characters and tell all kinds of stories."

Now, the Chinese pianist is preparing to tell new stories through her upcoming nationwide concert tour, *Xin Music Journey*, which will visit eight Chinese cities, including Beijing, and Guangdong province's Shenzhen and Foshan, from July to October.

The tour was officially unveiled in Beijing on June 5, alongside the launch of a documentary-style online series, *Following the Music on a Journey*, which creates an innovative format that combines live performance, cultural tourism and digital storytelling.

Unlike a conventional tour, each stop will be tailored to reflect the character and cultural heritage of its host city.

"Every city has its own rhythm and personality," Tian says.

"We want audiences to feel that the music belongs to their city. Even the encore pieces will be specially selected for each location."

The repertoire will span both Western classical masterpieces and Chinese works, featuring music by Mozart, Beethoven, Chopin, and Liszt alongside beloved Chinese compositions, such as *The Shepherd's Flute* and *Shandan Flowers Bloom Bright Red*.

Some performances will incorporate Chinese animation, sand art and classical poetry projections, creating an immersive audiovisual experience.

Throughout her career, Tian has made a point of including Chinese compositions in her concert programs. Among them, one piece remains especially close to her heart: the *Yellow River Piano Concerto*, which was adapted by veteran pianist Yin Chengzong from the cantata of the same title by Xian Xinghai (1905-45).

"It is one of my favorite works," Tian says.

"I have performed it in many countries with different orchestras, and every performance feels different. The music contains both strength and delicacy."

Tian's own musical journey began early. Born into a musical family in Beijing, she grew up surrounded by rehearsals and performances. Her mother is a soprano, and her father is a composer and conductor. As a child, she would watch her father accompany her mother's singing before climbing onto the piano bench herself.

Pianist Tian Jiaxin will embark on a concert tour in July. ZOU HONG / CHINA DAILY

Her father insisted that music required commitment. "He always told me that the piano wasn't a toy. If I really wanted to learn, I had to take it seriously," she says.

At the age of 3, she asked her parents to allow her to study piano formally. The rest, she says, became a lifelong relationship with music.

At 18, she entered the Shenyang Conservatory of Music. Upon graduation, Tian furthered her studies at the Manhattan School of Music in the United States.

In 2012, she received her master's degree in classical performance from the same New York school.

She won acclaim for her solo performance of Mozart's *Piano Concerto No 20 in D Minor, K 466*, at the Rising Artists Evening event organized by the New York Concert Artists & Associates at Carnegie Hall in 2012. The same year, she returned to China and held a solo concert in Shenyang.

Her relationship with the piano was built on discipline as much as passion, she notes.

That philosophy extends to her advocacy of music education. During the tour, she will host masterclasses and public events in each city, sharing performance techniques and discussing her artistic journey with young musicians and music lovers.

For children, she says, cultivating interest is the most important first step. For older adults, learning piano can enrich daily life while helping maintain mental and physical agility. For busy professionals, it can offer valuable relief from work pressures.

"You don't need to play the most difficult pieces," she says.

"Start with music you love listening to. Learning becomes much more enjoyable this way."

According to Wang Lu, the deputy general manager of the China Performing Arts Agency, co-organizer of Tian's upcoming tour, the accompanying documentary series aims to bring audiences beyond the concert hall.

Filmed throughout the tour, it will follow Tian as she explores historical neighborhoods, cultural landmarks and traditional craft workshops in each city. Using techniques such as urban sound sampling, documentary filmmaking, and AI-generated audiovisual effects, the series seeks to reveal the connections between music, local culture and everyday life.

The project also reflects Tian's enthusiasm for artistic experimentation. In recent years, she has collaborated with performers of Peking Opera, Cantonese Opera, Hebei Bangzi, and Huangmei Opera, blending piano performance with traditional Chinese theater.

"I enjoy crossing boundaries," Tian says.

"I want young people to discover that Chinese music can be exciting, creative and full of surprises."

LIFE

The many lives of East Lake

As the area expands, so do its award-winning greenway and the ways people build, use, shape, and move through it, **Yang Feiyue** and **Zhou Lihua** report in Wuhan, Hubei province.

If you ask someone in Wuhan what East Lake is, the question usually elicits a pause.

Not because people do not know the answer, but because there are too many.

The lake on the eastern side of the provincial capital of Hubei province is one of China's largest urban lakes, spanning about 33 square kilometers — roughly five times the size of the famed West Lake in Hangzhou, Zhejiang province. It is home to a 105-kilometer greenway system linking forests, wetlands, hills, villages, and lakeside parks.

The greenway project has collected an impressive list of awards, including the China Construction Engineering Luban Prize, one of the country's top honors in construction projects.

Poets once wandered here. Mao Zedong stayed here dozens of times. Chinese military leader Zhu De predicted that East Lake would one day surpass West Lake. The lake has won international urban-planning awards. On major holidays, it has never failed to pack in residents and travelers alike.

However, no answer can fully articulate what it's like to encounter a lake of this scale. You arrive and do not know where to begin. The lake exceeds the frame of a camera lens.

By late spring, the cherry blossoms around East Lake are long gone, but the crowds remain.

The asphalt along the greenway is damp from morning dew. Cyclists wobble past on rented bicycles. Young parents push strollers slowly along the lakeside. Some people simply sit on benches facing the water, lost in reverie.

The greenway loops through seven themed sections, forming a continuous ring around large sections of the lake. Along the way are wetlands, restored shorelines, cedar groves, Chu-style pavilions, village roads, and newly opened hiking trails threading through the surrounding hills.

At the north gate of Moshan Hill, Wei Yun clips her guide badge on her shirt and greets the first group of guests.

Wei has worked at East Lake for eight years, almost as long as the greenway has existed. She has guided thousands of visitors along the same routes. She knows where the cherry blossoms bloom first in spring, where people stop to cool off in summer, and where maple leaves turn their deepest red in autumn.

Once the group enters the lakeside section near Moshan, the view suddenly explodes.

Water spreads outward in immense sheets of silver-blue. The distant hills beyond the far shore lie low like sleeping animals beneath a hazy sky.

East Lake's transformation is the kind of thing people notice beneath their feet, Wei notes.

Before the greenway was built, many of the roads around the lake were mixed-use corridors where pedestrians, bicycles and cars competed for the same space. During busy seasons, tour groups constantly had to dodge traffic.

Now the routes are separated.

"There are roads for walking, roads for cycling, and roads for cars," Wei says, pointing first at the path beneath her feet and then toward a narrow branch road disappearing into a nearby village.

The village road still allows vehicles, but the greenway does not.

The seemingly simple distinction has, in practice, reshaped how people move around the lake.

"People have different needs," Wei says.

"Young couples go to the pink Ferris wheel. One full rotation takes exactly 13 minutes and 14 seconds. Very romantic," she elaborates, adding that the helium balloon offering a full view of the whole lake has also been a hit among visitors of all ages.

Around the lake, visitors drift toward different corners — the pink Ferris wheel, the cable car ascending Moshan, the reconstructed Chu City Gate, and stretches of artificial beach that attract crowds during summer weekends.

"Everyone finds a spot. That's why 300,000 people can be here at once, and it never feels too crowded."

The changes also extend to the shoreline itself.

For years, rainwater rushed directly off the pavement and into East Lake, carrying mud, debris and runoff. Today, many sections have been rebuilt as gradual ecological slopes layered with stone, reeds and wetland vegetation intended to absorb and filter water before it reaches the lake.

"It's part of the 'sponge city' concept," she explains.

She remembers when summer algae regularly spread across parts of the lake, turning sections of the water green during the hottest months. Now it is far less common.

Further along, towering dawn redwoods rise directly from the shallows like green pillars. Some were planted in the 1960s, when soldiers and local residents reportedly carried soil basket by basket, manually building the earliest lakeside roads.

The following generation then faced a harder question of what not to tear down.

For one stretch near Moshan, Wei points out that early plans called for widening the route to six meters — the minimum for international cycling events. But 27 mature trees lined the roadside, so authorities decided to keep the road as it was, and the trees are still standing.

That trade-off was repeated across East Lake. Routes bent around camphor groves. Maples and tallow trees were transplanted into existing clearings rather than new ones. On the village tracks, the path still curves around the old camphor groves.

Down an inconspicuous road approaching the villages in the lakeside neighborhood, entrepreneur Yu Xun recently opened a family campsite on land once left abandoned.

He invested more than 3 million yuan ($442,880) in the project, signing an eight-year lease with the landowner.

"Originally, this was just waste ground. Construction rubble was everywhere," Yu says.

Now the site contains a cafe, children's play areas, fishing ponds, and artificial streams where children catch shrimp and small fish.

Business is unpredictable. Weekends are packed. Rainy weekdays can empty the place entirely.

Some visitors come only to photograph the scenery. Others spread picnic mats and remain all afternoon.

"They're all good visitors," Yu says with a laugh.

He understands the risks. The popularity of outdoor family recreation could fade, tourism patterns often shift, and policies could change.

Still, he believes East Lake is moving in a direction worth betting on.

Wei says the campsite is among many activities and infrastructure that have emerged around East Lake — hiking routes, cycling culture, lakeside businesses, outdoor concerts, and night walks.

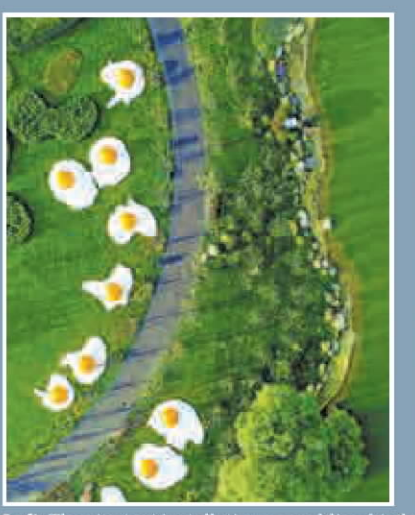
"They appear gradually, like plants rooting themselves along the shore," she says.

As evening approaches, the crowds along the greenway usually begin to thin.

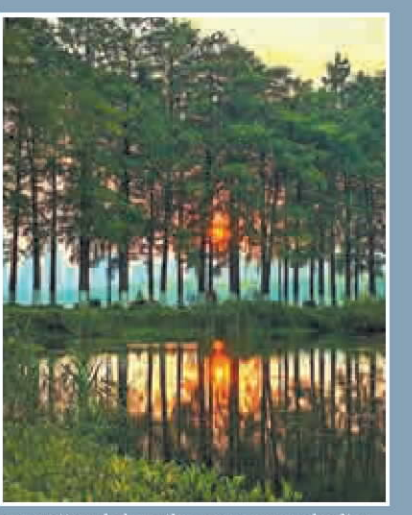
Near the entrance to the Seven Hills trail, workers stack construction materials beside newly installed signposts. The trail is scheduled to fully open before October. When it does, the seven mountains will be connected by proper stone steps, observation platforms, and fire watchtowers.

Wei is familiar with this kind of transformation, as she has seen farmland turn into parking lots, dirt paths become six-meter-wide asphalt roads, and empty fields become playgrounds.

"New things keep popping up, but the lake stays the same. That's what people come for," she says.



Down by the water, another tour group gathers at Moshan's north gate. Wei checks her watch, bids farewell to her old guests, and walks toward the new ones.



She believes the greenway will keep growing, but someone like her will always need to show the way.

Forging deeper connections

From African coffee to visa-free travel in Southeast Asia, a Beijing expo draws record crowds as international exhibitors bet on the country's consumers, **Yang Feiyue** reports.

Top: Chemutai Meg from Uganda pours dark-roasted coffee for Chinese visitors at the 2026 Beijing International Cultural and Tourism Consumption Expo in early June. **Above left:** The expo opened at the China National Convention Center (Phase II) in Beijing on June 5. **Above right:** Visitors taste Li Village's White Pork, a famous cold dish from Sichuan and an example of provincial intangible cultural heritage, at the expo. PHOTOS BY WANG ZHUANGFEI / CHINA DAILY

Chemutai Meg poured a slow stream of dark-roasted coffee into small cups, watching as Chinese visitors to the 2026 Beijing International Cultural and Tourism Consumption Expo leaned in for a sniff. Some nodded approvingly. Others asked where the beans came from.

That question about his product's origin is exactly why he shifted his focus to China seven years ago.

"Chinese people appreciate the origin. That is the most important thing," said Meg, a Ugandan coffee farmer who now sells primarily to China.

"We want our product to be recognized for where it comes from."

His brand, Meg Kari Coffee, is named after his great-grandfather — the first person to grow coffee in his village, at altitudes between 2,300 and 2,500 meters. For seven years, he has been building a market in China, selling mainly through WeChat mini-programs. Last year, he sold more than 2,000 tins.

Specialty coffee remains a niche in China, and it is more expensive than commercial coffee. But Meg is patient.

"Chinese people like good things," he said. "We are trying as much as we can to make sure consumers get to know specialty products."

Meg was one of more than 630 exhibitors at the 2026 Beijing consumption expo, which concluded on June 7 at the China National Convention Center (Phase II). The three-day event drew 112,000 visitors and generated 226 million yuan ($33.4 million) in on-site transactions, increases of 8.2 percent and 6.7 percent, respectively, year-on-year.

For Meg, and more than 30 other international exhibitors from 17 countries who joined him at the expo, the event was not just about sales. They were there to make deeper connections with the Chinese market.

Come to Uganda

A few steps from Meg's coffee station, Uganda's ambassador to China, Oliver Wonekha, was making her own pitch.

"Uganda is the second-biggest coffee producer in Africa," the ambassador said.

"But we are not just coffee. You want to see the equator with snow on it? Come to Uganda. You want to see mountain gorillas? Come to Uganda," she said, extending a warm welcome to the Chinese visitors.

To endear the country to Chinese travelers, Wonekha offered a surprising point of connection.

"You eat bamboo in China. In Uganda, we also eat bamboo. Aren't you curious?" she asked.

Wonekha pointed out that Uganda offers online visa applications. At the expo, an immigration officer was stationed at the booth. "If you want a visa right now, we can work on it," she said half-jokingly.

The ambassador noted that China has already invested heavily in Uganda's infrastructure — building roads, airports and hydroelectric plants.

"China is already in Uganda," she said. "We welcome every Chinese brother and sister."

Cambodia's pilot program

One of the biggest announcements at the expo came from Cambodia. Kong Roatlomang, deputy director general of Cambodia's Tourism Development and International Cooperation, Ministry of Tourism, revealed that Chinese tourists will enjoy visa-free entry from June 15 to Oct 15 — a four-month pilot program allowing multiple entries and stays of up to 14 days each.

"China and Cambodia are ironclad friends. We are a community with a shared future," Kong said. "This is a pilot project. If successful, it will be extended."

The numbers explain the push. Cambodia received 5.6 million international tourists in 2025, including 1.2 million from China. That is an improvement from recent years, but still below the pre-COVID peak of 2.4 million Chinese visitors in 2019. Kong said Cambodia aims to increase Chinese arrivals by 20 to 30 percent in 2026.

To attract more visitors during the May-to-October "green season" — the rainy low season — Cambodia is offering discounts on hotels, transport, restaurants and airlines. The country has also passed a law against online scams, with the prime minister pledging to "clear all scams from Cambodia this year" to rebuild trust among international travelers.

Kong highlighted other conveniences to woo Chinese travelers, including widespread Chinese-language use in hotels and restaurants, acceptance of Alipay and WeChat Pay, and direct flights from Beijing to the country's capital Phnom Penh. A new airport in the capital ranks as one of the largest in the world, she added.

Technology and tradition

On the domestic side, the expo showcased how Chinese tourism is embracing technology. All 16 districts of Beijing participated, alongside delegations from 16 other provinces and municipalities.

Visitors tried on translation glasses from Chinese tech company iFlytek that display real-time subtitles — a hit among older travelers planning overseas trips. Dancing robots from Unitree Robotics drew crowds of children and adults alike. An AI costume-changing system from Beijing-based Guoshu Technology, which lets users instantly switch outfits in images, attracted serious interest from several scenic spot operators.

Zhang Jing, an official with the Beijing Municipal Bureau of Culture and Tourism, said that the expo had three defining features: internationalization, technological immersion, and product launches.

"Within this 30,000-square-meter space, visitors can experience modern technology, participate in interactive activities and buy the latest cultural and creative products," Zhang said.

He noted that Beijing, as a national science and technology innovation center, has already rolled out 10 technology application scenarios for tourism — from smart ticketing at the Great Wall to AI-guided tours at the Palace Museum. "Technology is now visible in our scenic spots, our industrial parks, and even our time-honored brands," Zhang said.

The expo also served as a launchpad for cultural products. Yidege, a traditional ink maker with a history of more than 150 years, teamed up with the integrated marketing service organization Yuanlong Yato to create a special gift box for graduates taking entrance exams. The same partners also launched blind boxes for Argentina's national football team ahead of the World Cup — a nod to the growing intersection of sports fandom and consumer culture in China.

On the transaction side, a new smart matchmaking system — allowing exhibitors and buyers to connect online before the expo and sign deals on-site — helped generate 27.36 million yuan in intended deals during a hotel-travel agency event alone. Major travel agencies including BTG Tourism Development, Trip.com Group and Utour launched new tour routes, with on-site sales exceeding 10 million yuan.

A window into the future

For Zhang, the expo's growing international participation signals a broader trend.

"Global tourism sellers are increasingly looking to China," he said. "The Chinese consumers' appetite for quality travel experiences — and quality products — continues to grow."

Back at his booth, Meg's coffee continued to draw visitors. He patiently explained the tasting notes of his high-altitude beans: chocolate, dried fruit, and a hint of spice. Many visitors picked up a tin, scanned the QR code and placed an order.

For years, Meg sold to markets that took his coffee but not his story. In China, he said, he has found something different: customers who ask where the coffee comes from, who want to know about the farmer and the mountain.

"Only then will they truly appreciate the product," he said.

Steeped in culture: Chinese tea wins over Moscow

Left: A visitor looks at different tea varieties at VDNH (Exhibition of Achievements of National Economy) in Moscow, Russia, in 2023. **Right:** Another visitor smells tea at the Moscow exhibition. PHOTOS BY ALEXANDER ZEMLIANICHENKO JR / XINHUA

MOSCOW — In a tranquil teahouse nestled in Moscow's southwestern suburbs, the crisp chime of bronze bells filled the air. Russian tea master Elena Pazhetnykh gently shook a pair of bells, gracefully signaling the beginning of a Chinese tea gathering.

Next to her, 30-year-old Russian tea master Fyodor Leziev fanned a charcoal stove until the fire slowly came alive. Guests sat quietly around the wooden table, savoring cups of tea as the aroma of brewing leaves gradually filled the space.

Such scenes are not rare in today's Moscow. Inside the teahouse named "Su He Xuan" in Chinese, the twice-a-week tea gatherings have become a regular ritual for local enthusiasts.

The teahouse was founded by a Chinese-Russian couple: Russian tea master Vladimir Bekov and his wife Wen Yilei, a senior Chinese tea artist.

Bekov believes tea is about harmony among people, the brew, water, utensils and atmosphere. To find the best water for brewing, he spent months testing water sources around Moscow until finally settling on a natural spring more than an hour's drive from the teahouse.

"The same tea can taste completely different depending on the water," he says. "Good water awakens the true character of tea."

"The aroma and aftertaste struck me immediately," Leziev recalls. "I had never experienced that kind of peace and comfort before."

What began as casual tastings gradually grew into years of devoted study and eventually became inseparable from his life. Three years ago, when "Su He Xuan" was founded, Leziev immediately decided to join.

Pazhetnykh soon followed him. For both of them, the tearoom is far more than a place to drink tea; it has become a space for sharing Chinese culture and building connections through tea.

"To me, tea is not simply a drink," Pazhetnykh says. "It is a doorway into Chinese culture and a natural bridge between people."

For first-time visitor Tatyana Goncharenko, the experience offered something deeper than flavor alone. "One of the beauties of Chinese tea is that every cup creates a different emotional experience," she says.

"Culture can feel abstract, but taste is something concrete," Bekov says. "Through the aroma and flavor of tea, people begin to touch the culture behind it.

"The greatest strength of tea culture is that people can feel it directly. A single sip, or the beauty of a tea vessel, can become the starting point for understanding China," he says.

From the suburbs of Moscow to the heart of the city, Chinese tea culture is taking root among local residents, finding new expressions across the Russian capital.

In downtown Moscow, another tea space named "Heights of Tea" is exploring different ways of bringing Chinese tea culture closer to everyday life.

Viktor Enin introduced visitors to one of his most unusual creations: tea-flavored ice cream. With more than 160 flavors developed, all are infused with tea aromas and made from natural ingredients.

The 51-year-old began studying tea culture in 2002. Four years later, he started experimenting with tea desserts and beverages, hoping to make tea culture more accessible to ordinary Russians.

"Instead of existing only within complicated ceremonies, tea should become part of daily life," he says.

Over time, his creations expanded beyond ice cream to include tea chocolate, tea cocktails and tea-infused lemonade.

"Only when tea truly returns to everyday life can more people naturally accept it and understand it," he says.

"Chinese tea culture has already taken root in Russia," Enin says. "Especially during long, cold winters, tea brings warmth to gatherings and helps people feel connected."

WORLD CUP 2026

Brazil flaws exposed in heavyweight clash

Vinicius grabs equalizer as Morocco impresses with pace and organization

Brazil's forward Vinicius Jr (right) celebrates scoring his team's first goal during the 2026 World Cup Group C match against Morocco at the MetLife Stadium in East Rutherford, New Jersey on Saturday. AFP

EAST RUTHERFORD, New Jersey — Brazil and Morocco played out a 1-1 draw in the first heavyweight clash of the World Cup on Saturday, with the Africans confirming their potential while exposing familiar weaknesses in their opponent at a sold-out stadium.

Ismael Saibari gave Morocco a deserved first-half lead before Vinicius Jr produced a moment of brilliance to restore parity, ensuring the points were shared in the opening Group C match. Later in the group, Scotland marked its return to the tournament after a 28-year absence with a nervy 1-0 victory over Haiti.

The meeting of Brazil and 2022 semifinalist Morocco at the MetLife Stadium just outside New York City was a clash of the teams ranked sixth and seventh in the world respectively.

Brazil is chasing a record sixth World Cup title, 24 years after last lifting the trophy, but Saturday's performance suggests there is a lot of work to be done by Carlo Ancelotti's side.

"I think this was a tough match, especially in the beginning. I think the team was a bit anxious and nerves were all over the place," said Ancelotti.

"We didn't play well, but we cannot lose heart. This is the first match in the World Cup and we can't... think the team is doing perfectly from the get-go."

For Morocco, the performance offered further evidence it can challenge the game's traditional powers.

However, Ancelotti's Brazil side was left with questions to answer after a disjointed display in which it was repeatedly stretched by its opponent's pace and movement.

"I don't think we started the match well, the team was a bit nervous, we lost possession too often and lost too many challenges. The first half wasn't good," said Ancelotti, who noted that his side got better after the break.

"It improved in the second half; it's a tough match because Morocco is a good side. I think there was a bit of nervousness. In the first half they were breaking out of our press and making dangerous counterattacks."

Ancelotti tipped Vinicius to excel at the tournament as the leader of the attack, a role he will fulfill even when Brazil's all-time record scorer Neymar returns from a calf injury.

"He did well. He was very dangerous and I think he has everything in his power to have a great World Cup," Ancelotti said of the Real Madrid forward.

However, Vinicius rued Brazil's sluggish start against a Morocco side that had been told by its coach to approach the match with no fear.

"We started on a really bad note," said the 25-year-old.

"We conceded that first goal and after that happens it's hard to get it going, you know, it's the first match, it's always hard.

"But we've got to improve and continue to grow because the competition is only just starting. This is the World Cup, there are no easy matches.

"I don't think there's a lot to say now. I think we really have to improve."

Morocco coach Mohamed Ouahbi was left with the feeling that his team could, and perhaps should, have taken more from the contest.

"It was a good match, it's a point. We would've hoped to have more but we'll take the point," said Ouahbi. "We're happy, we're not sad today, but we would have liked to win."

Ouahbi added: "If you're asking me if I want to have the same trajectory (as in 2022), no, I want to go beyond the semifinals this time.

"This was one point but we hoped to have more. One point is good enough and we will improve."

Morocco captain Achraf Hakimi praised the display of the 2022 semifinalist, who suggested it will again be a tough proposition in North America.

"I am proud of the effort of the team. We drew, but we are happy about our performance," Hakimi told Fox.

"We still have to improve every game, so that is what we're going to be focused on right now."

Brighter start

Morocco made the brighter start, patiently working the ball down the flanks and posing an early threat through Hakimi and Bilal El Khannouss while Brazil looked to strike on the counter.

Morocco repeatedly sliced through Brazil's midfield with alarming ease, exposing gaps between the lines as teenager Ayyoub Bouaddi displayed his talent.

Brazil's first sniff at goal came in the 14th minute, but Igor Thiago failed to make the most of it, fluffing his header.

Seven minutes later, the five-time world champion's defensive frailties were laid bare.

Lucas Paqueta was dispossessed in midfield, allowing Brahim Diaz to slip Saibari through as centerbacks Marquinhos and Gabriel were caught flat-footed.

Alisson Becker compounded the error with an ill-timed charge off his line, and Saibari calmly lofted the ball over the goalkeeper to give Morocco the lead.

Brazil continued to struggle against Morocco's intensity and organization, although the Africans were unable to turn their superiority into further goals.

Instead, it took only a moment of brilliance from Vinicius to haul Brazil level in the 32nd minute.

Collecting a pass from Bruno Guimaraes on the left edge of the box, he cut inside onto his right foot and rifled an unstoppable shot into the far top corner.

Brazil nearly completed the turnaround on the stroke of halftime, but keeper Yassine Bounou reacted sharply to keep out Paqueta's acrobatic scissor kick.

Midfielder Fabinho and defender Danilo came on for Casemiro and Roger Ibanez, who had a woeful first half, giving Brazil more control in the second half.

Brazil went up a gear, showing more poise and forcing Morocco to defend, although it struggled to create clear-cut chances until the 78th minute when Raphinha collected a cross from Vinicius.

The edge went off the game as both sides mostly avoided risks. Brazil did find some new energy in the final minutes, coming close through substitute Matheus Cunha, but it still lacked its vintage swagger.

However, both teams will fancy their chances of finishing top of the group and getting a potentially better path in the knockout stages.

Qatar makes history

On the first day to feature four matches at the 48-team tournament, Qatar won the first World Cup point in its history when Miro Muheim's own goal earned the 2022 tournament host a 1-1 draw with Switzerland.

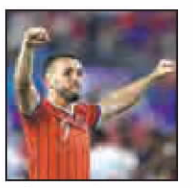
Switzerland had taken the lead against Qatar in Santa Clara, California in Group B when Breel Embolo converted a first-half penalty, but Muheim's injury-time own goal secured a share of the spoils.

"I am very proud of the team," said Qatar's Spanish coach Julen Lopetegui. "I told them that even if we hadn't scored the goal and didn't draw I would have been proud of the mentality and discipline that they showed today. But fortunately we scored and that was history."

AGENCIES

McGinn eyes 'uncharted territory' after Scotland ends wait for World Cup win

FOXBOROUGH, Massachusetts — Scotland match-winner John McGinn is optimistic his team can go on to reach the World Cup knockout stages for the very first time after marking its return to the tournament following a 28-year absence with a 1-0 win over Haiti on Saturday.



A deflected strike from the Aston Villa midfielder in the first half in Boston proved enough for Scotland to claim the victory in its Group C opener, although it was left hanging on toward the end as Haiti put it under pressure.

"It was crucial. This was our pressure game, we were the favorites going into it. Haiti is a very difficult opponent," said McGinn, who had not scored for his country in over 18 months.

"They have so many unique qualities that we are not used to playing against, so the important thing tonight was to get a clean sheet and get the three points, and we have managed to do that.

"Can we play a bit better? Of course, we can. But this is brilliant, and we will go into the games against Brazil and Morocco with more gears to go up. Scotland winning at a World Cup again is the main takeaway tonight."

Scotland is appearing at its first World Cup since 1998, when it was eliminated in the group stage after defeats against both Brazil and Morocco.

John McGinn, Scottish midfielder

Saturday's win was its first at any major tournament since 1996 and its first at a World Cup since beating Sweden in Italy in 1990.

This is Scotland's ninth appearance at a World Cup, but it was just its fifth victory in 24 attempts.

However, it has put the nation in a fantastic position to reach the last 32, especially as the eight best third-placed teams in the group stage will progress.

One point from the next two matches, against Morocco back in Boston on Friday and then Brazil in Miami on June 24, would likely suffice to qualify.

"It is two teams in the top 10 in the world next. We know the qualities they possess but we can cause them problems in the same way Haiti caused us," McGinn said of Morocco and Brazil, who drew 1-1 earlier Saturday in New Jersey.

"It might suit us a little bit better to play on the counterattack and make it difficult for them," he said.

"We know one point or three points would take us into uncharted territory and we know what is at stake."

Scott McTominay hit the post for Scotland before McGinn's goal, but Haiti had more attempts overall and Frantzdy Pierrot almost equalized late on, hitting a header that went a wide of the left side.

Haiti coach Sebastien Migne was full of praise for his team and saw reason to believe it can cause problems to its next two opponents.

"I am very proud of the boys and how we played. I hope we can build on this and keep putting in good performances," said the Frenchman, whose team is appearing at a first World Cup since 1974.

"It is disappointing, and now we have a mountain approaching in five days in the shape of Brazil.

"It is a prestigious occasion, and when you have been absent from this level for 52 years you have to enjoy it."

Scotland's Tartan Army supporters were out in mass, creating a wave of red inside a filled Gillette Stadium, located about 30 miles outside Boston.

AGENCIES

Forget Mbappe, unassuming Olise could be France's big star

PARIS — It might not be Kylian Mbappe or Ballon d'Or holder Ousmane Dembele lighting up France's attack at the World Cup.

Instead, it could be the discreet and unassuming Michael Olise, with his golden first touch and devastating changes of direction — starting when two-time champion France takes on Senegal on Tuesday in New Jersey.

The Bayern Munich winger enters the tournament in fine form after netting a superb hat-trick against Northern Ireland on June 8, taking his total to seven in 17 games for Les Bleus.

Coach Didier Deschamps fielded his first-choice side, and it was Olise who stood out the most in a glittering attack that featured Mbappe, Dembele and rising star Desire Doue.

"He's been shining brightly this season at Bayern and he's done great things for us. He's brimming with confidence, he's so decisive," Deschamps said of Olise. "On top of that, as an attacking player he also has a remarkable capacity for hard work."

After two finishes inside the penalty area, Olise curled a brilliant shot into the top left corner after breaking inside from the right flank with one of his sudden switches of play.

He does it so deftly and quickly that it has become his signature move and helped the 24-year-old score 22 goals for Bayern this season.

Henry's guidance

Deschamps said Olise impressed him at the 2024 Paris Olympics. There, he was coached by Thierry Henry — the France and Arsenal great — and Olise's two goals and five assists helped Les Bleus reach the final.

Olise called the Paris Games "the best football experience of my life", because they "allowed people to get to know me". He praised Henry for sharing his vision of the game.

France forward Michael Olise eyes the ball as he takes part in a training session on June 7. AFP

But when Olise stepped up to the senior side, Deschamps said it took him "four or five" games to show his true potential because he was shy.

"He's not a very expressive character. He's rather introverted, but he's very endearing," Deschamps said.

Olise's first international goal came on his sixth appearance, and it showcased his ability as he bent a freekick into the top corner against Croatia in the 2025 Nations League.

Overlooked by big clubs

Born in London, Olise began his professional career with then Championship side Reading after being released by Chelsea and Manchester City.

While playing for Reading he was named the English Football League's young player of the season.

He joined Premier League side Crystal Palace in 2021, and three seasons with Palace were enough to convince Bayern to sign him in a deal worth $65 million.

Olise added goalscoring to his superb range of passing, and, in two seasons at the German giant, he's netted 42 goals in 107 games, albeit in an extremely attack-oriented team.

Mediocre Mbappe

Olise's goals against Northern Ireland shifted the spotlight away from another mediocre performance from Mbappe, who also failed to score in a 2-1 home loss to Cote d'Ivoire on June 4.

"It's true that he had several chances and wasn't efficient," Deschamps said.

Mbappe has 56 international goals and needs two more to beat Olivier Giroud's France record.

"He told me he's holding back for the United States," Deschamps said with a smile. "So that suits me."

Heading home

Displaced people pack their belongings on Monday as they prepare to return home in Sidon, Lebanon, following the announcement of an initial ceasefire agreement between the United States and Iran. The peace deal, which includes permanent termination of military operations on all fronts and reopening of the Strait of Hormuz, could end the monthslong war that has killed thousands and rattled the global economy.

Thought on Party Building a guiding value

Broad set of principles encompassed, including full, rigorous self-governance

By XU WEI
xuwei@chinadaily.com.cn

A key Party meeting underlined on Monday the major practical significance and long-term guiding value of Xi Jinping Thought on Party Building in strengthening the Party and the country, stressing the Thought as the fundamental guideline for boosting Party building in the new era.

The key role of the Thought, an important component of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, was underscored at a national conference on Party building in Beijing.

Cai Qi, a member of the Standing Committee of the Political Bureau of the Communist Party of China Central Committee and a member of the Secretariat of the CPC Central Committee, attended and addressed the conference. Li Xi, a member of the Standing Committee of the Political Bureau of the CPC Central Committee and secretary of the CPC Central Commission for Discipline Inspection, also attended.

According to the conference, since the 18th CPC National Congress in 2012, the CPC Central Committee with Xi Jinping at its core has set forth a series of new ideas, thoughts and strategies in addressing the major questions of the times — what kind of Marxist party exercising long-term governance should be built and how such a party should be built.

In the process, Xi Jinping Thought on Party Building has taken shape. The Thought encompasses a broad set of principles, including upholding the Party's leadership as the defining feature of socialism with Chinese characteristics, the centralized, unified leadership of the CPC Central Committee, exercising full and rigorous Party self-governance and remaining true to the Party's original aspiration and founding mission.

Other principles include upholding the strengthening of the Party politically as the overarching guide for all other initiatives, using the Party's new theory to enhance cohesion and forge souls, and enhancing Party consciousness.

The Thought also stresses the need to keep refining an organizational system that is integrated from top to bottom and capable of effective implementation, cultivating officials capable of shouldering the mission of national rejuvenation and making consistent and sustained efforts to improve Party conduct.

The CPC must continue using strict discipline in exercising self-governance, taking coordinated steps to ensure that officials do not have the audacity, opportunity or desire to be corrupt, running the Party with systems and regulations and implementing the political responsibility for the Party's self-governance, according to the Thought.

The conference's participants said that drawing on Marxist theories, the Thought is rooted in China's fine traditional culture and has been nurtured through the Party's full and rigorous self-governance in the new era.

The conference called the study and implementation of Xi Jinping Thought on Party Building "an important political task" for the entire Party, both now and in the years ahead.

Chinese AI models roll out World Cup prediction features

By LI JIAYING
lijiaying@chinadaily.com.cn

As the 2026 FIFA World Cup brings together more nations, more matches and more excitement, a competition has intensified off the pitch among China's leading artificial intelligence models, which are being put to the test in predicting the results of one of the world's biggest sporting events.

The 23rd edition of the World Cup, featuring 48 teams, is being hosted by the United States, Canada and Mexico. It opened on Thursday and runs through July 19.

Several Chinese large language models, including Qwen, DeepSeek, Kimi and MiniMax, have rolled out prediction features, turning the tournament into a new testing ground for AI-powered reasoning and data analysis.

"As one of the most-watched sporting events across the globe, the World Cup offers AI companies a rare opportunity to showcase the computing power and analytical skills of their LLMs to a wider audience," said Guo Tao, a member of the Chinese Association for Artificial Intelligence and a senior expert in AI.

Several AI platforms have come up with interactive campaigns. For instance, Moonshot AI's Kimi has launched a 1 trillion-token reward pool, allowing users to share prizes by correctly predicting match winners and the final champion. A token refers to the smallest unit of data processed by AI models.

Alibaba Group's Qwen has introduced a dedicated match prediction assistant, while also offering human-versus-AI prediction challenges.

However, the World Cup has also exposed the limitations of current AI models when it comes to analyzing and predicting the results of sporting events. For example, before the Group C opener between Brazil and Morocco on Sunday, major LLMs made predictions in favor of Brazil based on both historical data and statistical indicators. The match ended in a 1-1 draw.

Guo said that while AI can analyze historical data and statistical models, it still struggles to accurately predict real-world results, especially in sports.

He pointed out that soccer matches are influenced by a wide range of factors in the physical world, and such variables are highly uncertain and difficult to quantify using fixed AI models, making precise predictions inherently challenging.

The limitations of current AI models were also highlighted by Wang Zhongyuan, president of the Beijing Academy of Artificial Intelligence, at this year's BAAI Conference held last week.

Wang said that while LLMs have become increasingly capable of solving problems in the digital world, many challenges in the physical world remain beyond their reach. As a result, the next stage of AI development will gradually shift from "predicting the next token" to "predicting the next physical state", he added.

Asked why tech companies are rolling out AI prediction features for sports when the accuracy rate is relatively low, Guo, the expert from the Chinese Association for Artificial Intelligence, said the trend partly reflects the growing pressure of competition across the industry.

"As competition in the LLM market intensifies, technological differentiation is becoming increasingly difficult. Companies are eagerly seeking new channels to distinguish themselves from their rivals," he said.

As the AI technology matures, simply competing on the size parameter is not enough, Guo said. "The market is paying less attention to how large a model is and more attention to whether it can deliver valuable services in real-world scenarios and solve practical problems for users," he added.

Hu Yanping, a professor at Shanghai University of Finance and Economics, said that LLMs and AI agents are already evolving from conversation-oriented systems into task-oriented systems, while moving beyond pretraining toward continuous learning and broader real-world perception.

"Exploratory projects, such as World Cup match predictions, can help accelerate this evolution," Hu said. "A capability framework built around perception, interaction, decision-making and collaboration is what future task-oriented AI agents need."

TRIANGULAR TRADITIONAL DELICACY IS EVOLVING

Festival staple *zongzi* is flavor of the month, but how it tastes depends on where you try it

By LI YINGXUE
liyingxue@chinadaily.com.cn

With Dragon Boat Festival falling on Friday this year, bamboo leaves are once again returning to kitchens and food counters across China. Inside them, glutinous rice is wrapped, tied and steamed — forming *zongzi*, a seasonal staple that has long marked the arrival of summer.

China Vibes — FOOD —

At its core, *zongzi* is defined as much by texture as by flavor. The glutinous rice becomes dense yet soft after steaming, with a sticky elasticity that holds its shape while remaining deliciously soft.

Depending on regional styles, it can range from delicately loose and fragrant in lighter versions, to compact and richly layered in more indulgent savory varieties, where rice absorbs the oils and aromas of fillings such as pork or egg yolk.

More than a festival dish, *zongzi* is a culinary marker of time. It's a signature of the season and carries with it memories of family gatherings, regional traditions and seasonal rhythms.

For folklorist Xiao Fang, a professor at Beijing Normal University, its significance goes far beyond taste.

De-risking makes economies more fragile

WORLD WATCH
By Einar Tangen

The global economy is entering a new phase. For 40 years the dominant objective was efficiency. Capital, production, labor, logistics and technology were organized across borders to reduce costs and maximize output.

Today that model is being challenged by a new objective: resilience. The language used is "de-risking". The assumption is straightforward. Dependence creates vulnerability. Therefore reducing dependence should increase security.

The problem is that the global economy is not simply a collection of isolated national economies. It is an interconnected system. Actions that appear rational at the national level often create systemic risks at the international level. The question is not whether risks exist in globalization. They always have. The question is whether de-risking reduces the risks or simply creates new ones.

Global trade now exceeds $35 trillion annually, equivalent to nearly 30 percent of global GDP. The system is anchored by a handful of major economic centers. The Asia-Pacific accounts for close to 40 percent of global exports and imports, the European Union generates around $10 trillion in combined internal and external trade, and North America contributes about $3 trillion in goods exports. China, the United States and major economies in Europe and Asia continue to anchor global trade within an interconnected system of goods, services and capital flows.

But trade comprises more than the selling of goods. It is a dense network of shipping routes, logistics hubs, supply chains, energy corridors, financial systems and digital infrastructure. Over 80 percent of global trade by volume still moves by sea. Modern products often cross multiple borders before reaching consumers. A smartphone, automobile or pharmaceutical product may contain components from dozens of countries.

This system did not emerge by accident. It was built through decades of optimization. Corporations searched the world for lower costs, larger markets and higher returns. Production moved to locations offering cheaper labor, lower compliance costs, favorable regulation and necessary infrastructure. The developed world gained lower prices, higher margins and greater consumption. The developing world gained factories, investment, jobs, infrastructure and industrial capacity.

The arrangement was imperfect. Manufacturing towns across the US, Europe and Japan were hollowed out as production migrated elsewhere. Shareholders benefited while many communities struggled to adapt.

Yet the system produced enormous global growth. Hundreds of millions entered the global middle class. Developing economies industrialized. Consumer prices fell. Global output expanded.

Hunt for human capital heats up

Cities seeking talented young people unleash unprecedented arsenal of perks — from free short-term accommodations to long-term life and career support

By ZHANG XIAOMIN
in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

Job seekers attend a high-level talent fair in Hangzhou, Zhejiang province, on March 15, where provincial labs, research institutes and leading companies offered over 3,400 positions. About 70 percent of the applicants hold doctoral degrees. WANG GANG / CHINA NEWS SERVICE

For Wang Jing, a student in Northeast China who is about to graduate from college, moving to a new city for employment is not just about a good paycheck, but also about proper recognition of talent, a decent lifestyle and a sense of belonging.

Before traveling to Hangzhou, East China's Zhejiang province, for an interview, Wang learned that she could stay for free up to seven days at a local government-run accommodation for job seekers. She quickly uploaded her Chinese ID, her student ID and the interview notice online, and received approval for stay in less than half a day.

"Not only did this save me from spending extra on accommodation, the lodging conditions were pretty good and the members of staff warm and helpful," she said, adding that the well-lit, 20-square-meter room came equipped with a refrigerator, an air-conditioner and a washing machine.

While millions of young people across China are weighing employment pros and cons like Wang, cities with opportunities are responding with an unprecedented arsenal of perks — from free lodging for a week to "life cycle support", covering marriage, housing and even entrepreneurial failure.

Welcome to the new era of China's talent hunt.

As of March, Hangzhou, which has 97 government-run accommodations with more than 4,400 available rooms, had served 240,000 stays. The provincial capital is continuously optimizing its "soft environment" for talent, and the latest data shows that the results have been remarkable.

According to the municipal bureau of human resources and social security, Hangzhou attracted more than 428,900 university graduates under the age of 35 in 2025, continuing its strong momentum of recent years.

Last year, the city distributed a total of 2 billion yuan ($295 million) in various employment and entrepreneurship subsidies, and provided living allowances to fresh graduates 247,000 times.

The quest for attracting talent has intensified in recent years, with many cities easing restrictions for *hukou* (household registration) or offering free accommodations and generous cash subsidies. Some are even providing long-term advantages, covering recruitment, retention, career advancement and general well-being.

Policy cushion

In Shanghai, the country's first provincial-level legislation on building youth-friendly cities took effect on June 1.

The metropolis, with a resident population of 24.85 million as of 2025, aims to provide policy support for young people in employment, housing, dating, marriage and entrepreneurship, making it more youth-friendly and enabling young people to better contribute to its development.

Earlier this year, Nanjing, the capital of East China's Jiangsu province, released a new talent policy that aims to attract about 10 top-tier talented young people annually, with comprehensive support of up to 100 million yuan.

The city also intends to draw about 300,000 talented young people each year, and plans to provide a one-time living subsidy of 10,000 yuan for newly employed graduates with a bachelor's degree, 30,000 yuan for those with a master's degree, and 100,000 yuan for those with a PhD.

On May 10, Hunan province in Central China took its recruitment drive all the way to Hangzhou, seeking to hire talent from the Yangtze River Delta region. More than 7,500 positions were offered by about 280 companies.

"Hunan is a land of hope and vitality," Jiang Difei, vice-governor of the province, said during the event. "Come find your stage and shine."

Li Qian, a graduating master's student in environmental engineering at Zhejiang University of Technology, signed an employment contract at the event with a State-owned industrial investment enterprise based in Loudi, a city in Hunan.

"I am originally from Hunan. The rapid development of my province's digital economy and advanced manufacturing sectors is the reason I accepted the job. Besides, I had already planned to move back home after graduation," she said.

Liu Yehuan, founder and CEO of internet-related enterprise Hunan Vmonkey Technology Co, shared his entrepreneurial story that unfolded in Changsha, the capital of Hunan. The province "is a fertile ground that dares to let young people make mistakes", he said.

After enrolling at Hunan University in 2011, Liu embarked on four startup projects, all of which failed. In 2014, with support from the local government, he moved into a start-up park with his small team to set up a company, benefiting from rental discounts and one-stop services such as business registration and tax guidance.

During a critical low point, when Liu's company faced nearly 10 million yuan in losses over three years, the park's entrepreneurship service center proactively helped him. "The most heartwarming moment in policy implementation is not when things are going well, but when you are in dire need of support," Liu said.

Today, one of the mini-programs made by his company to help university students print study materials has become China's top online printing brand in terms of sales volume.

Magnetic appeal

According to a report on the talent attractiveness of Chinese cities in 2025, which was released last month, Beijing ranks first, followed by Shanghai and Shenzhen in Guangdong province. The other cities in the top 10 are Hangzhou, Guangzhou in Guangdong, Suzhou in Jiangsu, Chengdu in Sichuan province, Nanjing, Wuhan in Hubei and Wuxi in Jiangsu.

An introduction to the report, jointly published by experts from Zeping Macro, a private economic research team, and the recruitment portal Zhaopin, points out that while the population of a city is the foundation for all socioeconomic activities, talent is its primary resource for growth.

"People move with industries and people move to higher ground," the report said, noting that as the population concentration increases in metropolises and other big cities, the value of talent becomes more prominent amid fading demographic dividend.

While China's top 10 cities attracting maximum talent remain the same as last year, Hangzhou and Suzhou have risen in rank.

Beijing has held the topmost rank for several consecutive years due to its huge advantages in terms of salary package, diversified industrial structure and concentration of top universities and research institutions.

Shanghai, with its large, steadily growing economy and booming high-tech and modern service sectors, has been a clear second, while Shenzhen has remained stable in the third place in recent years with its robust innovation capacity and lower household registration barriers.

Among the top 50 talent magnet cities of last year, 36 are in eastern China, six each are in the central and western regions, and two are in the northeastern part of the country, according to the report released in May.

Seven cities of Guangdong are among these top 50, while all 11 prefecture-level cities of Zhejiang have made it to the list.

Another report on the most attractive cities for the post-1995 generation, which was released late last year, said that China has approximately 200 million people in that age group and they are redefining the competitive landscape of Chinese cities.

The top three cities for talent from the post-1995 generation are Shenzhen, Beijing and Shanghai, which are followed in order by Hangzhou, Guangzhou, Suzhou, Chengdu, Nanjing, Wuxi and Tianjin.

Shared features

The Yangtze River Delta and the Pearl River Delta regions are clearly ahead in the race for attracting talent.

The report released last year notes that in a "talent war", cities should fully respect the objective laws of population and industrial agglomeration in advantageous regions, leverage their comparative strengths and follow the natural trend.

Zhang Kangsi, a professor at the School of Economics at Dongbei University of Finance and Economics in Dalian, Liaoning province, said cities that attract most young people generally share common characteristics.

"Cities with relatively concentrated job opportunities, strong industrial and innovation platforms, well-developed urban services, and a better balance between career opportunities and the quality of life are among the top draws," Zhang said.

Shenzhen, which has topped the post-1995 talent attraction list for three consecutive years, boasts a net talent inflow that is 1 percentage point higher than the national average, thanks to its low household registration threshold and industrial innovation advantages.

Last year, the city welcomed more than 400,000 talented young people with its innovative industrial structure, which provides many job positions and relatively high incomes, along with the strong capacity of leading companies, such as Huawei and BYD, to absorb fresh graduates.

Liu Mengtong, a university junior in Zhuhai, Guangdong, who originally hails from a major city in Northeast China, said that she doesn't plan looking for a job back home after graduation.

"Instead, I will stay in the Guangdong-Hong Kong-Macao Greater Bay Area. I feel a stronger sense of identity here. Also, my university major in communication studies will allow for better job opportunities in this region," she said.

The student added that Shenzhen would most likely be her first preference, given its strong development momentum, open and inclusive atmosphere, comfortable natural environment, and abundant cultural and leisure options.

Value addition

While a fat paycheck and focused job environment remain important, young people increasingly value emotional connection, a sense of belonging, a comfortable lifestyle and the entertainment quotient of a city.

Survey data shows that work-life balance is considered more important than high income, and young people are making rational choices based on a city's inclusiveness, development prospects and tolerance for failure, among other factors.

In 2018, Yanggong Yifan, a former Google engineer specializing in core tensor processing units, or chips to accelerate artificial intelligence, led a team of AI experts from Silicon Valley to return to China and start a business. Their company, CL Tech, was officially registered and established in Hangzhou in 2020.

"Back then, AI development in China was in a trough and the confidence in large models was generally low. Hangzhou, however, had a certain AI ecosystem and was making forward-looking moves," recalled Huang Xu, chief marketing officer of CL Tech.

In the initial phase, the company received dedicated fund support coordinated by the local government, effectively resolving teething financing problems, she said, adding that in 2024-25, the company also received financial support from Hangzhou's innovation funds.

"Strong government support not only addressed the core funding needs at a critical stage of chip R&D and industrialization, but also buoyed market confidence, attracting more social capital to the company and driving its rapid growth," Huang said.

CL Tech is dedicated to developing high-performance tensor processing units and intelligent computing clusters that support ultra-large-scale AI model computation. It has become the first company in China to master core TPU architecture and achieve mass production of such chips.

Huang said that when recruiting high-end talent, she can feel Hangzhou's strong appeal, because the city boasts a comfortable living environment, rich history, and keen industrial and policy development efforts — everything that aligns with the aspirations of young people.

Zhang, the professor from Dongbei University of Finance and Economics, noted that young people value a space where they can fully use their abilities, where they have ample scope for growth, and where they can live comfortably and potentially raise a family.

Cities competing to accumulate human capital crucial for industrial upgrading and innovation-driven development may need to reconfigure their outlook, Zhang said, adding that they should focus on envisioning and implementing policies that nurture both professional and personal growth.

For Wang, the college student who interviewed in Hangzhou, the choice is clear. But for cities seeking young talent like her, the road ahead is long and arduous.

Zhang sums it up best: "Whichever city can attract and retain high-end talent will gain the sharpest edge. And this winner of the 'talent war' will ultimately lead the region's economic growth."

Chen Ye in Hangzhou contributed to this story.

Economy: Future unlikely to see complete decoupling

From page 1

But what was once viewed as efficiency is now viewed by developed nations as vulnerability. That shift has primarily been driven by the strategic competition between the US and China. Yet despite tariffs, sanctions, export controls and technology restrictions, annual trade between the two countries still exceeds half a trillion dollars. And even though politically the relationship often fluctuates, economic interdependence remains one of the few remaining stabilizing mechanisms between the world's two largest economies.

This is where de-risking enters the picture. Supply chains are being diversified. Manufacturing is being relocated. Critical minerals are being sourced from alternative suppliers. Semiconductor production is being duplicated. Each decision appears rational in isolation. Collectively they represent a fundamental shift away from efficiency toward redundancy.

The assumption behind de-risking is that resilience can be built through duplication. The problem is that duplication is expensive. Factories must be built. Infrastructure must be upgraded. Inventories must be increased. Supply chains must be maintained in parallel. Costs rise throughout the system. These are not temporary adjustments. They are structural costs that will continue creating an economic gap between the efficient and inefficient.

The deeper problem is that de-risking assumes static behavior. In reality, states adapt. Companies adapt. Markets adapt. When one country reduces dependence on a supplier, that supplier finds new customers. When one bloc reorganizes supply chains, others do the same. When multiple countries pursue reshoring simultaneously, investment becomes duplicated rather than shared. The result is a global system that is less efficient.

This creates a form of contagion. Once one major economy defines interdependence as a strategic risk, others are compelled to do the same. No country wants to remain exposed while competitors hedge. The logic spreads. The result is not selective adjustment but competitive insulation.

History offers a warning. The interwar period saw the rise of tariffs, economic blocs, capital controls and protectionism. The objective was security. The result was contraction. Global trade collapsed. Economic shocks intensified. The Great Depression deepened. The modern world is not repeating the 1930s exactly, but the underlying logic is similar.

Fragmentation reduces the ability of the system to absorb shocks. Integrated systems distribute disruption, while fragmented systems concentrate it, as supply chains become more expensive, capital becomes less efficient, and innovation slows as markets become smaller and more isolated.

The evidence already points in this direction. Companies relocating production face higher costs. Governments are spending hundreds of billions of dollars on industrial subsidies. Inventory levels are increasing. Supply chain redundancy is replacing supply chain efficiency. All of this raises costs across the economy.

Supporters of de-risking argue that these costs are justified, as the pandemic exposed vulnerabilities, geopolitical tensions have exposed strategic dependencies, and national security concerns cannot be ignored. Although this argument has some validity, the real issue is not whether resilience matters (it does), but whether policymakers are correctly pricing its costs and pursuing it in the right way.

Globalization delivered lower prices, greater choice, higher productivity and rising living standards. Reducing those benefits imposes costs and those costs are not distributed evenly. The burden falls most heavily on those with the least ability to absorb it. Large companies can absorb relocation expenses. Smaller enterprises cannot. Higher prices are ultimately borne by consumers.

This is the central contradiction of de-risking. It promises security. Yet much of its cost is paid through slower growth, higher prices and reduced efficiency. Risk is not eliminated, it is redistributed to those who can bear it least.

Much of the developing world continues to operate according to a different logic. The objective remains connectivity. Infrastructure development, industrial investment, logistics networks and trade corridors continue to expand across large parts of Asia, Africa, the Middle East and Latin America. The principle is simple: Connectivity creates scale, and scale creates growth.

The digital economy reinforces this reality. Data flows benefit from interoperability. Digital platforms benefit from scale. Technology ecosystems benefit from common standards. Fragmentation reduces many of these advantages just as surely as it does in physical supply chains.

The future is unlikely to be a complete decoupling or return to pure globalization. Instead, the world is entering a hybrid phase: partially integrated, partially regionalized and partially duplicated. Such systems are often more expensive and less predictable than either full integration or full separation.

The challenge for policymakers is to manage risk without destroying efficiency. So far, no major economy has developed a framework that fully accounts for the long-term costs of fragmentation. The danger is that resilience becomes confused with redundancy. A system can appear safer while becoming more fragile.

At the national level, de-risking may reduce exposure to specific vulnerabilities. At the global level, it weakens the mechanisms that have historically absorbed shocks and supported growth. The lesson of the last century remains relevant. Economic insulation does not create economic security.

Interdependence creates vulnerabilities. But it also creates stability, scale, efficiency and shared prosperity. The question facing the global economy is not whether risk can be eliminated. It cannot. The question is whether the pursuit of security will ultimately create a world that is more resilient, or simply one that is more fragmented, more expensive and more fragile.

SCO urged to play bigger role in development

Organization has become the world's largest comprehensive regional cooperation body

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Inside
Global Views, **page 12**

Foreign Minister Wang Yi on Monday called on the Shanghai Cooperation Organization to play a greater role as a stabilizing, constructive and progressive force in today's world.

Speaking at a reception in Beijing to mark the 25th anniversary of the SCO's founding, Wang said that the organization should set an example in promoting peace, development and win-win cooperation.

Founded in Shanghai in 2001, the SCO has expanded from six founding members into a 10-member organization with two observer states and 15 dialogue partners. It has become the world's largest comprehensive regional cooperation organization in terms of geographic coverage and population.

Over the past 25 years, the SCO has cultivated the Shanghai Spirit, which features mutual trust, mutual benefit, equality, consultation, respect for diverse civilizations and the pursuit of common development.

The SCO has explored a new model of regional cooperation among neighboring countries and helped to foster a new type of international relations, Wang said.

Against the backdrop of accelerating changes unseen in a century, Wang said the SCO should practice true multilateralism, support the United Nations' role and authority, and advocate an equal and orderly multipolar world as well as a universally beneficial and inclusive economic globalization.

He called on the SCO to uphold common, comprehensive, cooperative and sustainable security, promote peace and stability in the Middle East, and support Afghanistan's reconstruction and development.

Wang also urged SCO member countries to foster new growth drivers in trade, connectivity, scientific and technological innovation, green industries and the digital economy. He called for faster preparations for a SCO development bank, stronger industrial and supply chains, and closer people-to-people exchanges and dialogue among civilizations.

As China enters the 15th Five-Year Plan (2026-30) period, Wang said the country will continue to pursue high-quality development, foster new quality productive forces and expand high-level opening-up.

Noting that SCO cooperation remains a priority in China's neighborhood diplomacy, he expressed China's readiness to share development opportunities with other member states and open up a brighter future for the region.

Speaking at the reception, SCO Secretary-General Nurlan Yermekbayev said the organization's 25-year journey reflects the tireless efforts of its member states, their dedication to a common cause and their commitment to the future.

The SCO has been able to arrive at common positions on pressing contemporary issues and respond promptly to global developments despite differences among its members, he said.

It has developed 30 sectoral cooperation mechanisms and a solid legal framework, he said, emphasizing that joint efforts have contributed to economic growth, social progress and stronger security.

Over the past five years, China's trade with other SCO member states has repeatedly exceeded $100 billion. Over the past 24 years, SCO member states have foiled more than 1,400 terrorism- and extremism-related crimes and carried out over 40 joint counterterrorism exercises and operations, providing strong support for regional security.

Yermekbayev also noted growing international interest in the organization, saying that there are now about 20 applications from countries seeking to join the SCO in one capacity or another, which demonstrates the appeal of its values and principles.

"As a member state, China demonstrates a constructive approach to the development of mutually beneficial cooperation and practical interaction within the SCO," SCO Deputy Secretary-General Ahmad Saidmurodzoda told China Daily.

He added that China's rotating presidency of the SCO has produced initiatives serving the interests of all member states and meaningful outcomes, while the SCO Tianjin Summit made historic decisions that set the course for future development.

Culture: Signature dish has variations

From page 1

"Festival foods are not only delicacies enjoyed during celebrations," Xiao said. "They are symbols through which people perceive the changing seasons and express their feelings through taste."

A Xiaohongshu user said her most vivid memory of *zongzi* comes from childhood, when her grandmother would prepare them by hand. After steaming, the fragrance of bamboo leaves would seep into every grain of glutinous rice, blending with its soft, chewy texture and complemented with the crunch of peanuts and the natural sweetness of dates.

"Now life moves so fast — raising a child, going to work, everything feels rushed," she said. "It is only during traditional festivals, when I finally eat *zongzi*, that I slow down for a moment and taste that sense of family again."

Across the country, *zongzi* shows strong regional variation. In the Jiangnan region, sweet varieties remain most common, typically filled with red bean paste, dates or plain glutinous rice that highlights its natural aroma and texture. In southern China, particularly Guangdong province and nearby areas, savory versions dominate, often featuring pork belly, salted egg yolk, mung beans and dried seafood.

The long-standing debate between "sweet or savory" remains a seasonal talking point, but it also reflects something deeper: China's highly regional food culture, where a festival's signature dish can have dozens of variations.

While the traditional recipes remain cherished, *zongzi* is also entering a new era of culinary reinvention.

Food producers and chefs are introducing fillings inspired by desserts, beverages and fusion cuisine, including rose and hawthorn, taro with mochi, coconut cream and increasingly experimental savory combinations. The changes are seen by industry observers as an expansion of flavor options rather than a replacement of traditional recipes.

Despite ongoing innovation in flavor, experts say the cultural foundation of the festival food remains unchanged.

"Chinese people have deep emotional connections to traditional festivals," Xiao said. "Festivals express people's feelings and beliefs, and they are closely tied to the Chinese spirit."

China's methane emission control strategy applauded

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

Marcelo Mena

China's implementation of the world's most comprehensive strategy to control methane emissions has been lauded by Global Methane Hub CEO Marcelo Mena, who described the nation's continuing efforts as "deep" and "real".

A recent report by the International Energy Agency proves that China's efforts have borne fruit. Despite rising energy demand and fossil fuel output, methane emissions in the country have risen at a slower pace and even decreased slightly between 2024 and 2025.

In a recent exclusive interview with China Daily, Mena, who is also a former environment minister of Chile, said that while the United States has abandoned the methane agenda, China has remained committed to methane emission control in cooperation with international partners such as the European Union and the United Kingdom.

The US officially withdrew from the landmark 2015 Paris Agreement on tackling climate change in January this year.

Mena highlighted a range of sectors where China has taken action to strengthen methane emission control, including oil and gas, coal mining, waste disposal, rice farming and animal husbandry.

He said that no other country's methane action plan is as comprehensive as that of China.

"It is deep, it is real, and it is something that continues to be implemented," he said. "I come here every year, and every year I am surprised with the progress."

China introduced an action plan to cut methane emissions in late 2023. The document included a target of 6 billion cubic meters of coal mine gas use annually by 2025, and prioritized methane recovery in the oil and gas sector through measures such as leak detection and repair requirements, and limits on flaring. The action plan also emphasized methane monitoring, reporting and verification systems.

Methane can be used as a fuel for heating, power generation, and in industrial processes.

In late 2024, the Ministry of Ecology and Environment made the coal mine methane emissions standard more stringent, requiring utilization of gas with methane concentrations at and above 8 percent and extraction volumes above 10 cubic meters per minute. Earlier, gas with 30 percent methane concentration needed to be utilized.

Several Chinese oil and gas companies also set up a methane control alliance in 2021 to promote the sharing of technology and expertise to reduce emissions.

Mena underscored the importance of methane emission control, describing it as the "emergency brake" for addressing climate change, as "it is the fastest way to decrease the temperature".

The second most abundant human-caused greenhouse gas after carbon dioxide, methane has more than 80 times the warming power of carbon dioxide over the first 20 years after it reaches the atmosphere.

Mena also praised the concrete actions taken by China to fulfill its commitments. "Most countries promise big, and then don't think about things until the next moment to promise, right? Implementation is forgotten in many ways," he said.

He said that what other countries could learn from China is that the promises a country makes are meant to be kept. China's implementation of its methane control pledge could demonstrate to other countries that mitigating this potent greenhouse gas is in their own interest, particularly in terms of energy security and food security.

According to the IEA's Global Methane Tracker 2026, which was unveiled in May, China has seen tangible results from its methane emission control efforts.

Despite continued growth in coal production, coal mine methane emissions in China have grown more slowly since 2016, largely due to a shift toward lower-emitting mines in northern provinces and greater use of captured methane.

Satellite observations corroborate this structural change, pointing to similar shifts in the drivers of China's evolving methane emissions profile, it said.

Mena said he looked forward to seeing China exert greater influence on methane reduction efforts globally as a major oil and gas importer.

"It could have a very positive influence on reducing emissions in places like Central Asia, where the emissions are highest," he noted.

Methane loss in Turkmenistan's oil and gas operations, for example, is estimated at between 4.6 percent and over 10 percent of total production. "You could estimate that the Central Asian region, with the current prices, loses around $2.4 billion a year in income," he said.

According to him, China could influence these countries through joint ventures. Co-investing in emission reductions in Central Asian countries could be very positive, Mena added. That would send a signal to those countries that methane emissions linked to China's imported products need to be addressed, and would be a powerful way to accelerate changes.

Young Argentines turn to informal soccer tournaments for extra cash

Emiliano Migueles starts his days early, delivering water. But his true grind begins when he clocks out and hits the scrappy soccer pitches that dot the suburbs of Buenos Aires, pouring his energy into amateur soccer to earn extra cash.

For three-time World Cup champions Argentina, the sport is a feverish passion that permeates every home and every makeshift dirt field, known as a *potrero*, where youngsters play, dreaming of reaching the top leagues.

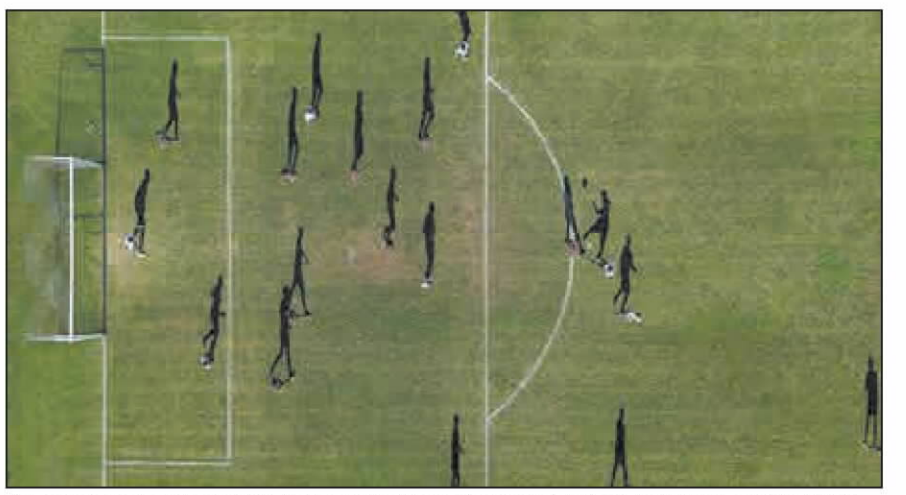
Argentine legend Diego Maradona famously honed his skills at a *potrero* in Villa Fiorito on the outskirts of the capital.

Many matches at these *potreros* offer players the chance to win some cash. The amounts are tiny compared to the wages of their compatriots who play in the glittering European leagues and will soon seek to defend their 2022 World Cup win. But *potrero* players can sometimes earn enough to help pay the bills.

Migueles says he can earn around 500,000 pesos (about $350) between his job and soccer "in a good month, winning matches".

Such matches have recently surged in popularity in impoverished neighborhoods across Argentina, as formal employment has slumped. Factories have closed and public spending has been slashed in recent years.

Migueles, 26, delivers bottled water alongside his uncle from a dilapidated truck, a precarious job with a fluctuating income. Over half of Argentines under the age of 30 are employed in the informal economy, according to 2025 data from state statistics agency INDEC.



There are no Saturdays, Sundays, or holidays for Migueles.

Whenever there's a match, he laces up his mud-caked boots, whether in informal games or for a semiprofessional team in the town of General Las Heras, where he earns around 100,000 pesos per game.

The informal tournaments can run deep into the night, meaning Migueles often starts his workday running on hardly any sleep. But he wouldn't change it.

"Soccer is everything to me," said Migueles. "I gave up everything for soccer: work, birthdays, there's no one I haven't sacrificed for soccer."

US, Iran deal hopeful, but doubts remain

Israel, Hezbollah trade attacks as agreement draws mixed feelings, differing statements

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

Israel and Iran-backed Hezbollah continued fighting on Monday, even though the United States and Iran say they have reached an agreement aimed toward ending the war. A formal signing ceremony is scheduled for Friday.

US President Donald Trump said on Monday that the agreement with Iran was "all signed" and that the Strait of Hormuz was already "partially open".

Speaking alongside French President Emmanuel Macron at the G7 summit in France, Trump said that he would not attend a formal signing ceremony for the Iran agreement, and that Vice-President JD Vance would travel to Geneva to sign the deal on behalf of the United States.

The US and Iran have electronically signed a memorandum of understanding aimed at ending the war, US media reported on Monday.

The memorandum was signed virtually by Trump, Vance and Iranian Parliament Speaker Mohammad Bagher Ghalibaf, according to reports.

The terms of the memorandum are expected to be made public within the next 24 to 48 hours, a senior official was quoted as saying.

However, public statements from the two countries show differences.

Trump said the Strait of Hormuz would be "completely open" by Friday.

"They're doing a little hunting for a couple of mines that they've already found, but ... ships are starting to go out now," Trump said.

Iranian President Masoud Pezeshkian said on Monday that the memorandum of understanding with the US marks an important step toward ending the war and opening negotiations, but he added that a final agreement has not yet been reached.

He said Iran has prepared "for all options" and that the government's focus, "with or without an agreement", would remain serving the Iranian people.

Regarding the Strait of Hormuz, Iran's foreign ministry spokesman Esmaeil Baghaei said on Monday that Iran was "not seeking to levy transit tolls; however, fees will be charged in exchange for the services that are provided".

Republican Senator Lindsay Graham, a staunch opponent of Tehran, said: "I am somewhat concerned that Iran's view of the agreement seems different than what the American negotiating team is claiming," adding that, "any nuclear deal with Iran will be sent to Congress for review and a vote".

Uncertainty also remained over the situation in Lebanon. Israel's defense minister said Israeli forces would not withdraw from southern Lebanon, despite Iran's claim that the agreement includes an end to the conflict there.

"We will not compromise on Israel's security interests and the protection of our citizens, and we will not withdraw from the security zones," said Israel Katz, warning that "if Iran attacks Israel because of the events in Lebanon, we will strike it with full force."

Some ministers in Prime Minister Benjamin Netanyahu's government have said Israel would not be bound by any agreement between the US and Iran, the Times of Israel reported.

Trump was previously angered by Netanyahu's decision to strike Beirut before the framework of the agreement was announced.

On Monday afternoon, Netanyahu spoke about the US-Iran agreement during a news conference.

"Trump and I have known each other for many years. Many times we see things eye to eye, and sometimes we do not," he said. "In the United States, they say that Trump does everything I ask, and in Israel, they say that I do everything he asks. We are partners. Sometimes we agree and sometimes we disagree."

Another key uncertainty involves Iran's frozen assets. Tehran is seeking access to billions of dollars in state funds blocked in overseas accounts, while Vance said on Monday that Washington has not agreed to provide any financial benefits to Iran during the 60-day ceasefire period.

Oil prices on Monday settled at their lowest levels since early March. Brent crude fell 4.8 percent to close at $83.17 a barrel, while West Texas Intermediate crude dropped 4.9 percent to $80.75 a barrel.

"This is certainly a hopeful start and an indication that things are moving in the right direction. What we have is an agreement on a framework for further negotiations on some of the thorniest issues, particularly the nuclear program that Iran has had," Mehran Kamrava, a professor of government at Georgetown University in Qatar, told China Daily.

"I think the final outcome is yet to be determined, but certainly this is a very hopeful start," said Kamrava.

Both Iran and the US faced pressure from hard-liners in their nations "not to go to the negotiating table, but both have done so", he said.

As the two sides move toward an agreement, questions remain over whether Trump's stated goals at the outset of the war, including preventing Iran from developing a nuclear weapon and eliminating its missile arsenal, have been fully achieved.

Trump, who initially estimated the conflict would last four to six weeks, has come under increasing pressure at home to end US involvement as the November midterm elections approach.

Trump repeats wine tariff threat in row with France

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

United States President Donald Trump has said he will "have no choice" but to impose a 100 percent tariff on wine imports from France unless the country does a U-turn on taxes imposed on big US technology companies, the third time he has made such a threat.

The 3-percent levy on companies such as Google, Amazon, and Facebook's owner Meta was approved by the French Senate in 2019, during Trump's first term of office, and drew his wrath then, when he targeted France's emblematic wine industry for the first time.

Trump threatened heavy levies on French wine and cheese, prompting then-finance minister Bruno Le Maire to say: "France is sovereign, and France decides its own tax rules. And this will continue to be the case."

Trump made threats a second time at the start of this year, when he said he would impose a 200-percent tariff on French wines and champagne unless French President Emmanuel Macron signed up for his Board of Peace initiative, which he declined to do, saying that its proposed remit "raises major questions, particularly regarding respect for the principles and structure of the United Nations, which under no circumstances can be called into question".

Now he has repeated his demand in an interview with the New York Post, published shortly before Macron entertains Trump in the run-up to a summit of the leaders of the G7 nations, to be held in Evian-les-Bains, France, from Monday to Wednesday.

"I asked him not to tax American companies and, if he does, I will have no choice but to put a 100 percent tariff on all champagne and all wines coming from France," Trump said. "All Macron has to do is abolish this sales tax, and he won't face this kind of pressure."

The US accounts for around 20 percent of French wine sales around the world, worth an estimated $2 billion each year, and coincidentally, since Trump began his rollout of global tariffs, figures published by the French customs service, the Directorate-General of Customs and Indirect Taxes, have shown that sales to the US fell 15.9 percent in value from 2024 to 2025.

French wine and spirits exporters said on Monday that Trump's threat was bad news for an export-dependent industry caught in a dispute beyond its control.

"This new threat is bad news for our industry, which relies heavily on exports," French wine and spirits exporters group FEVS said in a reaction to Reuters.

The group urged "responsible behavior", calling for balanced and constructive trade ties between France and the United States, "in the interest of both economies".

Agencies contributed to this story.

UN Security Council extends mandate of Afghanistan mission

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

The United Nations Security Council on Monday unanimously adopted a resolution extending the mandate of the UN Assistance Mission in Afghanistan, or UNAMA, for one year, as the country continues to face a severe humanitarian crisis.

Resolution 2822, submitted by China, extends the mandate of the mission until June 17, 2027. It also requests the UN secretary-general to conduct a strategic assessment of UNAMA and submit a written report to the council by the end of March next year.

Afghanistan remains one of the world's largest humanitarian crises, with 21.9 million people requiring humanitarian assistance in 2026, according to the United Nations. The situation has been further strained by economic difficulties, restrictions on women and girls, and the return of large numbers of Afghans from neighboring countries.

Speaking after the vote, Fu Cong, China's permanent representative to the UN, said the resolution expresses concern over Afghanistan's economic and humanitarian situation, and reiterates concern over the human rights situation in Afghanistan, particularly the rights of women and girls.

Fu called for continued international assistance to help address the humanitarian crisis, support the reintegration of returnees, promote economic recovery and strengthen the country's capacity for development.

He said China called on relevant countries to return the assets of Afghanistan's Central Bank as soon as possible and lift the unilateral sanctions imposed on Afghanistan.

Fu said UNAMA should continue engaging with the Afghan authorities and other relevant stakeholders to encourage the protection of basic rights, including women's and girls' equal access to education, healthcare, employment, justice and participation in public life.

"We hope that the Afghan government will heed the reasonable aspirations of the Afghan people and the international community, take more positive steps to protect human rights, particularly the rights of women and girls, and demonstrate an image of openness, inclusiveness and responsibility," Fu said.

Earlier this month, Georgette Gagnon, the UN deputy special representative currently leading UNAMA, told the Security Council that each year approximately 250,000 more girls are permanently excluded from secondary education pathways, "creating a lost generation of talent and potential".

The resolution also emphasizes the importance of countering terrorism and calls for continued dialogue and engagement between Afghanistan and the international community.

Fu said UNAMA "should continue to play its role as a bridge" in that process, while encouraging Afghanistan to pursue inclusive governance, fulfill its international obligations and reintegrate into the international community.

Fu said China looks forward to the UN Secretariat consulting the Afghan authorities, regional countries and other relevant stakeholders during the strategic assessment, and putting forward "practical and actionable recommendations" on UNAMA's future work.

UNAMA is a special political mission established by the Security Council in March 2002 to support Afghanistan. The council renews the mission's mandate annually, and its scope has been adjusted over time to reflect changing conditions in the country.

In March, the council extended UNAMA's mandate for only three months. Fu said then that some council members wanted changes to the mandate and that the shorter extension would allow more time for discussion. The United States had called for a review of UN assistance in Afghanistan, citing concerns over the Taliban's restrictions on women's rights, obstruction of aid operations and the detention of American citizens.

New Zealand sees ties with Asia as vital, survey shows

By **XIN XIN** in Sydney
xinxin@chinadaily.com.cn

New Zealand is recalibrating its place in the world amid increasing geopolitical uncertainties, with Asia at the center of how people in the Pacific nation see their country's future, a new survey shows.

Within Asia, China is deemed the most important for New Zealand's future. Also, for the first time in a decade, China has overtaken the United States in favorability ratings among New Zealanders, according to the survey.

The findings come from the latest New Zealanders' Perceptions of Asia and Asian Peoples Survey, released by the Asia New Zealand Foundation last week. Conducted from January to February, the survey collected responses from 2,300 New Zealanders aged 15 and above.

Julia Macdonald, the foundation's research and engagement director, told China Daily that the report showed that "Asia continues to be seen as very important to New Zealand's future, and China is seen as the most important country to New Zealand's future".

The survey shows that China ranked first by a considerable margin in perceptions of the importance of Asian countries to New Zealand's future. A total of 81 percent of respondents said China was important or very important, with 51 percent rating it as very important.

Macdonald said trade remained a key driver of China's perceived importance to New Zealand, while education, research, tourism and cultural exchange offer strong potential to deepen understanding beyond trade.

"These are areas that help build people-to-people connections and create opportunities for people in both countries (or regions) ... to learn from one another," she said.

Cooperation spheres

Macdonald said the cooperation spheres will help "promote a more informed and nuanced understanding of a relationship that will continue to be important to New Zealand's future".

The survey has been conducted for 29 consecutive years, making it the longest-running data series on how New Zealand views its most important economic neighborhood, according to the foundation.

Suzannah Jessep, chief executive of the Asia New Zealand Foundation, said the latest survey brought encouraging news in regard to New Zealand's relationship with Asia.

Jessep said that since 1997, the survey has tracked public perceptions and understanding of Asia, and the findings showed "a positive correlation" between New Zealanders' understanding of Asia and "having confidence to engage and invest in the region".

Looking ahead, New Zealanders were most optimistic about Asia's impact on technology, tourism and trade relations.

More than four in five respondents expected technology and innovation in Asia and inbound tourism from the region to benefit New Zealand, while around three-quarters saw positive impacts from Asia's economic growth and investment.

Respondents also wanted more Asian investment in science and technology, followed by healthcare and biotechnology, and infrastructure and transport.

"These findings show New Zealanders' connections with Asia go beyond politics and economics. They are also cultural, personal and part of everyday life," Jessep told China Daily.

The survey report noted that when asked what they thought of when they heard the word "Asia", New Zealanders named "China" as their top association for the seventh year in a row, followed by food and travel, among others.

The Chinese mainland remained the most popular Asian destination for New Zealand travelers.

The survey also found that New Zealanders were more likely to view China as a friend than the US. A friendly country was defined as one that respondents viewed as "safe and trustworthy".

Japan firms bullish about China biz

Market scale, growth prospects seen outweighing bilateral fluctuations

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Japanese companies will remain committed to the Chinese market over the long term as they expect the country's market scale, growth prospects and business opportunities to outweigh fluctuations in bilateral ties, said executives and market watchers.

They said Japanese investment in China is an integral part of global industrial specialization, with economic spillovers from these investments helping support China's industrial upgrading. The two countries remain deeply interconnected through their economic and supply-chain linkages.

Despite headwinds in Sino-Japanese relations occurring since late last year, the proportion of Japanese-funded businesses in China choosing to stay committed to the market is as high as about 85 percent, said a white paper issued by the Japanese Chamber of Commerce and Industry in China last week.

According to the chamber, China hosts about 30,000 of the more than 70,000 overseas affiliates operated by Japanese companies worldwide.

Tetsuro Homma, the chamber's president, said that China is no longer viewed simply as a vast consumer market by Japanese companies, but also as a vital manufacturing base and a hub of innovation.

"It is also a supply base for outstanding talent, and a training ground for Japanese-funded businesses to build and sharpen their competitiveness," he said.

The close and complementary economic ties between the two countries are also reflected in trade flows. Two-way China-Japan trade grew 13.6 percent year-on-year to 1.02 trillion yuan ($150.93 billion) between January and May, while China's imports from Japan surged 23.9 percent on a yearly basis, said the General Administration of Customs.

Zhou Minliang, a professor of public policies at Northwestern Polytechnical University in Xi'an, Shaanxi province, said that although rising costs have prompted some Japanese manufacturers to diversify production across Asia — especially to Southeast Asia — China's competitive edge extends well beyond labor and land costs.

China's mature industrial ecosystem, efficient infrastructure and vast domestic market continue to provide advantages that remain difficult to replicate elsewhere in the short term, Zhou said.

Rather than viewing China solely as a production base, many foreign corporations — including Japanese firms — are shifting their focus toward higher-value activities such as research and development, advanced manufacturing, digitalization and green technologies, aiming to benefit from the country's push toward innovation-led growth, said Pan Yuanyuan, an assistant researcher at the Chinese Academy of Social Sciences' Institute of World Economics and Politics.

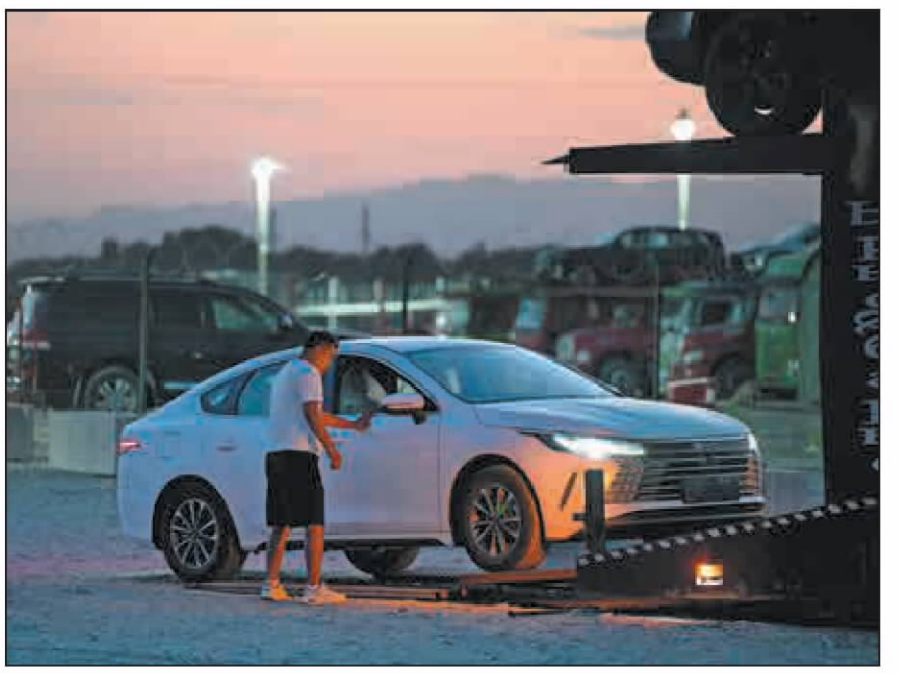
The shift toward higher-value investment is reflected in the latest data. China saw the actual use of foreign direct investment in high-tech industries surge 20.3 percent year-on-year to 116.33 billion yuan in the first four months, accounting for 40.4 percent of the country's total FDI, said the Ministry of Commerce.

Stephen Ma, chairman for China at Japan's Nissan Motor, said that China's vast market and expanding domestic demand are unlocking opportunities for the auto industry.

The Japanese automaker's sales reached 653,000 units in China last year, with unit sales rising 4.5 percent year-on-year in the second half.

Similar confidence is also evident among Japanese suppliers. Marelli Holdings Co, a Japanese automotive parts manufacturer, is expanding its presence in the country in areas such as smart lighting, electronics and intelligent cockpit technologies, underscoring China's growing role in the company's global operations.

"The competition in China's automotive sector is increasingly shifting toward faster product iteration, intelligent features and cost efficiency, requiring multinational suppliers to respond more quickly to demand for smarter user experiences and affordable innovation," said Shen Kelei, the group's executive vice-president.



Words of wisdom

A railway staffer from Jiexiu Station, under China Railway Taiyuan Group, explains safety regulations to students at a school near railway lines in Jinzhong, Shanxi province. As summer vacation approaches — a period of increased student mobility and elevated railway safety risks — the section has launched a targeted railway protection awareness campaign. It has organized more than 50 activities in over 20 schools and 30 villages and communities within its jurisdiction, distributing educational materials and reaching out to more than 25,000 teachers, students and locals.

Kazakhstan aims big with Middle Corridor

By **REN QI**
renqi@chinadaily.com.cn

A logistics employee checks the exterior of a vehicle imported from China in Zarkent, Kazakhstan, on May 23. LI RENZI / XINHUA

Kazakhstan is ramping up efforts to develop the Middle Corridor, also known as the Trans-Caspian International Transport Route, as a vital logistics artery connecting China and Europe, with plans to invest $10 billion to expand its railway and infrastructure capacity to meet surging cross-border freight demand.

Talgat Aldybergenov, chairman of Kazakhstan's national railway company Kazakhstan Temir Zholy (KTZ), said the volume of Chinese goods transported to Europe via Kazakhstan has seen a notable increase following recent global shipping disruptions.

"Compared to sea freight, land transport offers higher reliability and more predictable delivery times, and Chinese customers' interest in land transport is growing day by day," Aldybergenov said.

Amid shifting global supply chains and regional complexities, the Middle Corridor has emerged as a preferred alternative for international traders. Spanning over 4,250 kilometers, the route links China and Europe through Kazakhstan, Azerbaijan, Georgia and Turkiye. Data from UK-based Abrdn Investments show that freight volume along this corridor has surged nearly tenfold since 2022.

Recognizing transport connectivity as a strategic priority, Kazakhstan has already deployed about half of its projected $10 billion infrastructure budget for the period up to 2030.

A major highlight of this year's 900-km railway construction plan is the 300-km Ayagoz-Bakhty railway. Upon completion, it will serve as the third railway port between Kazakhstan and China. With these upgrades, annual bilateral rail freight capacity is expected to nearly double, jumping from the current 55 million metric tons to 100 million tons by 2030.

The expansion pace of the Middle Corridor is visibly accelerating. In the first quarter, 173 freight trains operated along the route, each carrying 55 containers. KTZ aims to run 600 trains this year, with a projected 67 percent growth next year.

To ensure smooth operations along the expanding route, KTZ is actively upgrading its transport fleet through deepening cooperation with Chinese enterprises. The company has signed a contract to procure 270 locomotives from China to address capacity shortages.

Furthermore, to overcome the historical shipping bottleneck on the Caspian Sea, KTZ is investing over $100 million to acquire six cargo ships. Four of these vessels are currently being built by Chinese shipyards and are expected to be delivered starting next year.

Simultaneously, Kazakhstan is expanding its logistics footprint in China and beyond. The Kazakhstan terminal in the Xi'an International Trade and Logistics Park, which officially opened in 2023, has become a crucial hub. As of November, the terminal had handled over 250,000 tons of consolidated and transshipped cargo. To further facilitate end-to-end delivery, KTZ is in active negotiations to acquire container terminals in European countries, including Romania, Hungary and Germany.

The flourishing logistics sector reflects the broader strengthening of bilateral ties. Shakhrat Nuryshev, ambassador of Kazakhstan to China, announced in April that China-Kazakhstan trade volume reached $13.2 billion in the first quarter, a year-on-year increase of 46.6 percent.

The two nations are actively tapping into potential in key areas such as industrial cooperation and transport connectivity, Nuryshev said, emphasizing that the Belt and Road Initiative continues to lay a solid foundation for long-term regional economic collaboration.

A-share aerospace stocks surge on SpaceX IPO buzz

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

While the global capital market was recently abuzz with SpaceX's record-breaking IPO, the Chinese commercial aerospace sector will ride the tide with a clearer market valuation model and strong government support, said experts on Monday.

Following the 0.88 percent average gain on Friday, when SpaceX's price soared 19 percent on its first day on the Nasdaq, A-share commercial aerospace companies posted a further 2.96 percent increase on Monday, with the benchmark Shanghai Composite Index closing 1.61 percent higher.

Experts from Founder Securities said SpaceX's debut has provided the global commercial aerospace industry with a mainstream and highly representative open market valuation model. A-share market sentiment will be bolstered, helping investors regard commercial aerospace as a technology industry offering greater growth potential.

The price-to-sales ratio is now around eightfold to tenfold for A-share commercial aerospace companies, while SpaceX's implied price-to-sales ratio is as high as 65 to 100 times, said Tian Lihui, a finance professor at Nankai University.

The worldwide enthusiasm for SpaceX will help accelerate the deeper revaluation and restructuring of the Chinese A-share commercial aerospace sector, directing more capital to industry leaders possessing core technologies and large-scale operations, Tian said.

A-share commercial aerospace firms have seen their share prices climb about 6 percent since the beginning of the year. At least four commercial aerospace-based exchange-traded funds were up by over 5 percent on Friday.

The industry is being propelled by the latest policies introduced in China. This year's Government Work Report has defined for the first time that aerospace is among the country's emerging pillar industries.

The Shanghai Stock Exchange issued on Dec 26 the listing guidelines for the commercial rocket industry. Commercial rocket companies that are at a critical stage of large-scale commercialization are allowed to list on the STAR Market under the fifth set of listing standards.

This means that this year has become a policy window period for the sector to file IPOs.

Public figures show that two Chinese companies — LandSpace and CAS Space — have had their IPO applications to the STAR Market accepted. Another eight companies have initiated their IPO application process.

CCID Media, a division of the China Center for Information Industry Development, said China's commercial aerospace market size reached 2.83 trillion yuan ($418.8 billion) in 2025, up 21.7 percent year-on-year. Its size is expected to further expand to 3.5 trillion yuan this year, with the annual growth rate estimated at over 20 percent.

Experts from Sealand Securities said the commercial aerospace sector is an integral part showcasing China's new quality productive forces, standing in a strategic arena of global competition. It is accelerating the transformation from technology validation to large-scale application. Investors are thus recommended to closely monitor progress in rocket reusability tests, barriers in satellite manufacturing, satellite operation, management, maintenance and ground applications, they said.

Fu Chenshuo, chief analyst of defense and aerospace at CITIC Securities, said the commercial aerospace sector will see its performance further pick up as more private commercial rocket companies participate in the country's major constellation networks. Launch costs will also decline significantly as recovery technology matures, which can also be translated into exponential growth. A broader industry outlook on space-based computing power should not be overlooked.

Investors should focus on the core assets in the industry, such as reusable rockets — including the 3D printing supply chain, satellites, terminals and the SpaceX supply chain, he added.

New World optimistic about mainland potential

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

> "As one of the Hong Kong enterprises that has the deepest understanding of the 15th Five-Year Plan, we will move swiftly to seize related opportunities, including property development in the Chinese mainland."
>
> **Huang Shaomei,** executive director and CEO of New World Development Co Ltd

Optimistic about development potential in the Chinese mainland, Hong Kong-based conglomerate New World Development Co Ltd is looking to tap into opportunities created by the 15th Five-Year Plan (2026-30), said a top executive of the company.

Looking ahead, there are abundant opportunities related to the top national development plan, reflected by the measures to boost consumption, high-quality development and new quality productive forces, said Huang Shaomei, executive director and CEO of New World Development, during a recent interview with media in Shanghai.

"This year marks the beginning of the 15th Five-Year Plan, and this is the first time that the Hong Kong Special Administrative Region has been included in the plan, as it explicitly supports the SAR in better integrating into and serving the overall development of the country," said Huang. "As one of the Hong Kong enterprises that has the deepest understanding of the 15th Five-Year Plan, we will move swiftly to seize related opportunities, including property development in the Chinese mainland."

New World Development possesses nearly 1.4 million square meters of land reserves in Hong Kong. As of the end of 2025, the group had total land reserves of about 2.89 million sq m of gross floor area in the Chinese mainland, including some 1.55 million sq m for residential use.

"I personally feel strongly that, led especially by major cities, the property market in the Chinese mainland is recovering, and supportive measures introduced by cities will further consolidate the recovery," Huang said.

Over the years, the group has been focused on core cities in the Yangtze River Delta region and the Guangdong-Hong Kong-Macao Greater Bay Area. The two regions' strengths in industry and population have secured projects there with stronger consumption momentum and risk resistance capabilities, providing a solid foundation for the group's performance.

Currently, Chinese mainland and Hong Kong markets each contribute about 50 percent of New World Development's revenue, while rental income and property sales each account for roughly half of the group's profits.

Given the promising outlook for the Chinese mainland, Huang expects the market to contribute 70 percent of the company's total project volume and new developments over the coming decade, with Hong Kong accounting for the remaining 30 percent.

The recovery of Hong Kong's economy in sectors including real estate, finance, retail and tourism also presents significant opportunities.

"New World Development is committed to strengthening our competitiveness in finance, retail, services and real estate. We also aim to develop high-quality and competitive projects," Huang said. "The country's overall development strategy is not focused solely on a specific industry or sector. Considering Hong Kong's unique strengths in the legal and financial sectors, the SAR should play an important role, a role that both creates connections with other cities and maintains its uniqueness."

Horace Lam, CEO of K11 Hong Kong, said the two K11 shopping malls have benefited from Hong Kong's role as a gateway for introducing international brands to China and helping mainland brands expand globally.

"For international brands, Hong Kong is a testing ground for brands entering the mainland. Through testing market reactions, validating operating models and building consumer reputation in Hong Kong, brands lay the foundation for further expansion into the mainland market."

"In the meantime, thanks to its superior geographic location and international business environment, Chinese mainland brands take Hong Kong as a channel for internationalization," said Lam, adding that the K11 Art Mall has attracted Chinese mainland and international brands to launch their first stores in Hong Kong.

Sino-ASEAN synergies deliver vast potential

Chinese companies positioning themselves as indispensable architects of region's future green power landscape

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

A photo taken in April shows the China-Laos 500-kilovolt power interconnection project. The flagship solar initiative had delivered nearly 200 million kilowatt-hours by end-May. PROVIDED TO CHINA DAILY

As Southeast Asia accelerates its shift away from fossil fuels, Chinese energy companies are positioning themselves as the indispensable architects of the region's future green energy landscape.

Facing the mutual challenges of surging electricity demand, climate change and the urgent imperative for economic decarbonization, the two regions are actively forging a highly integrated, resilient clean energy network that transcends geographic boundaries. This macro-level partnership is being anchored by concrete, massive capital injections.

The US-based Center for Strategic and International Studies said China represents both a significant and a wide-ranging investment partner in Southeast Asia's energy sector, a role that has become increasingly important as Southeast Asian countries pursue ambitious energy transitions while safeguarding energy security.

A senior Singaporean official said Chinese energy enterprises are acting as vital contributors to Southeast Asia's extensive green transition initiatives, which center on linking regional power grids.

This strategy could culminate in a massive cross-border network stretching from Singapore to southern parts of China, crossing through intermediate nations like Malaysia and Thailand, said Puah Kok Keong, chief executive of the Energy Market Authority, Singapore's energy regulator.

Puah highlighted that this regional push would unlock fresh avenues for Chinese enterprises, which already enjoy technological dominance across key sectors and maintain a strong project presence in the area.

"China stands as the undeniable global leader not only in implementing solar infrastructure and smart-grid battery storage, but also in manufacturing and exporting the core technologies underpinning them," he said. "When developers need to execute solar-plus-storage projects efficiently, Chinese suppliers are typically the go-to choice for speed, cost-effectiveness and dependability."

Chinese companies have recently confirmed deals to deliver several major energy infrastructure projects in the region. Among these, the China General Nuclear Power Group and China Southern Power Grid cross-border initiatives stand out as premier examples of this accelerating regional clean energy integration.

A flagship cross-border photovoltaic power initiative in Laos — the China-Laos 500-kilovolt power interconnection project — had delivered nearly 200 million kilowatt-hours by end-May, demonstrating the massive potential of cross-border solar infrastructure.

Driven by the coordinated efforts of CGN and CSG, the project — put into operation in April — marks the first time that overseas new-energy electricity has participated in China's marketized power trading system.

Currently, these initial cross-border power transactions are utilizing high-voltage infrastructure to deliver electricity directly to Southwest China's Yunnan province. Moving forward, grid operators plan to organize the next phase of transmission to send this clean energy further east to the high-demand, technologically advanced hubs of Guangdong province.

Industry experts said this achievement represents far more than a technical connection; it is a structural breakthrough in how renewable energy is traded, dispatched and utilized across borders in the Asia-Pacific region.

As Southeast Asia pursues its ambitious green transition plans amid surging electricity demand, Chinese enterprises — commanding deep technological and manufacturing advantages in renewable energy and grid infrastructure — are poised to play an indispensable role in making this regional vision a reality, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Construction of the pivotal interconnection project began last year. Spanning a total length of 177.5 kilometers, the transmission line weaves through complex topography, comprising a 145-km Chinese section and a 32.5-km Lao section.

While Lao hydropower has previously been transmitted to Yunnan via lower-voltage lines and subsequently delivered to the Guangdong-Hong Kong-Macao Greater Bay Area, this new project breaks fresh ground.

As the largest cross-border grid project and the highest-voltage power link between China and Laos, it introduces highly variable solar power into the cross-border equation for the first time, requiring sophisticated grid management capabilities.

The project is expected to transmit roughly 1.1 billion kWh of solar-generated electricity to China this year alone, signaling a transition toward a more standardized, institutionalized and market-oriented phase of power interconnectivity between neighboring countries.

Beyond the grid infrastructure, Chinese energy titans are actively establishing major clean energy positions across maritime Southeast Asia.

In October, CRE International — a unit of China National Nuclear Corporation — signed an agreement with Singapore-based Equator Renewables Asia to build a solar photovoltaic facility with a maximum capacity of 900 megawatts and a 1.2-gigawatt-hour battery storage system in Indonesia.

The project is set to be completed by 2029 and will generate 830 GWh of clean energy annually. CRE International will invest in, construct and operate the project, Equator said via its website.

Chinese battery giant Contemporary Amperex Technology Co, meanwhile, will supply half of the battery storage systems for another massive solar-and-battery project in Indonesia, which is slated to export 300 MW of clean electricity directly to Singapore once operational.

The implications of these interconnected projects extend far beyond bilateral trade, serving as a microcosm for the broader energy security goals of the Asia-Pacific region, said Lin.

As geopolitical tensions, supply chain disruptions and the rapid dawn of the artificial intelligence era drive unprecedented electricity demand, regional grid connectivity is transitioning from an abstract goal to a vital strategic imperative, he said.

Puah emphasized that energy security today is fundamentally about resilience, diversification and adaptability, in an increasingly uncertain global environment.

"For Singapore, as an import-dependent country with limited land, this means taking a diversified portfolio approach for our energy mix, maintaining strong international partnerships and ensuring reliable infrastructure," Puah said. "No single country can secure its energy future in isolation. Regional cooperation and cross-border connectivity will become increasingly important in strengthening long-term energy resilience."

Puah said AI and digitalization are fundamentally reshaping energy demand globally, requiring power systems that are not only cleaner, but also highly flexible, efficient and interconnected.

"A more integrated regional energy system would allow economies to diversify energy sources, reduce vulnerabilities and draw on mutual support from neighbors, laying the foundation for a more secure energy future across Asia-Pacific," he said.

While acknowledging that a fully integrated regional power market in the Association of Southeast Asian Nations will take time and require complex coordination across technical standards, financing and regulatory frameworks, Puah pointed out that foundational efforts are already well underway.

While the physical realization of these ambitious cross-border grids and mega-solar parks relies heavily on a robust and scalable supply chain, China's competitive advantage remains unparalleled, providing the economic foundation that makes regional energy transitions feasible and affordable for developing nations, he said.

A recent report by global research firm Wood Mackenzie said China holds a dominant position in the global renewable energy manufacturing sector, producing over 80 percent of the world's wind turbines, solar panels and energy storage batteries.

This sheer scale translates into profound cost advantages that competitors struggle to match. Products manufactured by Chinese companies at their overseas facilities are, on average, 28 percent cheaper than similar Western alternatives for wind turbines, 4 percent cheaper for solar modules and 31 percent cheaper for energy storage batteries.

Li Xiaoyang, director of China power and renewables research at Wood Mackenzie, said the fundamental economics of Chinese manufacturing efficiency mean that these companies maintain competitive advantages that are actively reshaping global supply chains, even in the face of international trade frictions.

As global local content policies, such as the European Union's Net-Zero Industry Act and the United States' Inflation Reduction Act, attempt to spur domestic production, Chinese manufacturers have adapted dynamically.

Rather than deterring Chinese companies, these policies are forcing more sophisticated international strategies.

The overseas expansion of China's new energy sector is rapidly transitioning from traditional engineering, procurement and construction contracting toward the independent power producer model, which integrates investment, construction and long-term operations.

CGN's gigawatt-scale solar project in Laos, independently developed and operated by the Chinese enterprise, is a prime example of this evolution.

"The focus of renewable investment is shifting toward the Middle East, Asia-Pacific and Caspian markets," Li explained. "With high-quality products made in China, greenfield investments are becoming more appealing to investors looking to establish projects in easily accessible markets. These regions act as both manufacturing hubs for global market entry and local demand centers, effectively creating parallel supply chains."

Wood Mackenzie projects that Chinese enterprises may control nearly 80 percent of utility solar and wind capacity in top markets involved in the Belt and Road Initiative by 2030. This creates a distributed, resilient network of manufacturing and energy production that effectively supports local transitions while bypassing traditional trade barriers.

The deep complementarities between China's industrial might and Southeast Asia's strategic positioning present vast opportunities for multilateral cooperation.

China's extensive capabilities in long-term planning, technology deployment and manufacturing align seamlessly with the financial, standard-setting and regional project development strengths of international hubs like Singapore, said Puah.

"Singapore and China have complementary strengths ... China's experience highlights the importance of infrastructure development, innovation and industrial capabilities in supporting the energy transition. Singapore contributes strengths in finance, connectivity and regional project development," he said. "As Southeast Asia's energy demand continues to grow, there will be increasing opportunities for collaboration in areas such as clean energy infrastructure, energy storage, digital energy solutions and regional connectivity."

Puah stressed that policy coordination, transparency and trusted partnerships will be key to unlocking long-term investment.

The tie-ups between China's energy firms and countries across Southeast Asia should prove mutually beneficial, Puah said. Singapore will gain access to low-carbon electricity, while neighboring countries will receive investment in their energy sector and a boost to their export revenues.

Southeast Asia eyes interconnected grid as economies pursue shared sustainability goals

By **ZHENG XIN**

Puah Kok Keong

Chinese energy companies are poised to play a crucial role in Southeast Asia's ambitious green transition and regional power grid integration, leveraging their technological dominance to unlock major market opportunities, a senior Singaporean official said.

"Greater regional connectivity can improve resilience, efficiency and energy security outcomes," said Puah Kok Keong, chief executive of the Energy Market Authority of Singapore, during a recently held seminar co-hosted by China Southern Power Grid. "A more integrated regional energy system would allow economies to diversify energy sources, reduce vulnerabilities and draw on mutual support from neighbors."

Grid integration is becoming increasingly vital as Singapore and its neighbors race to meet their decarbonization goals. Currently relying on natural gas for about 95 percent of its power generation, the land-scarce city-state is accelerating efforts to diversify its energy mix, he said.

"Singapore has set a target of importing up to 6 gigawatts of low-carbon electricity by 2035, an objective that necessitates stronger regional interconnections and high-voltage direct current links," Puah said.

This regional shift is occurring against the backdrop of a technological revolution that is rapidly reshaping global power consumption.

"As artificial intelligence and digitalization are becoming key drivers of electricity demand growth across Asia, energy cooperation will increasingly need to focus on the infrastructure required to support it, including smarter and more resilient power grids, energy storage systems and low-carbon generation," he added.

Industry experts believe such efforts are creating immense opportunities for Chinese enterprises.

Possessing world-leading expertise in deploying solar power, smart-grid solutions and energy storage systems, China has scaled up renewable energy faster than almost any country in the world, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

China's record-breaking progress — adding over 430 GW of new wind and solar capacity in the past year alone — is actively shaping the global energy transition, he said.

Puah said Singapore and China have complementary strengths. While China has strong capabilities in technology, manufacturing and deployment, Singapore contributes strengths in finance, connectivity and regional project development.

As Southeast Asia's energy demand continues to grow, he believes there will be increasing opportunities for collaboration in areas such as clean energy infrastructure, energy storage, digital energy solutions and regional connectivity.

At the regional level, Singapore has been actively working to advance cross-border energy cooperation. A pioneering multilateral project is already transmitting up to 100 megawatts of hydropower from Laos to Singapore via Thailand and Malaysia using existing interconnectors.

While a fully integrated regional power market may still be years away, these early efforts are laying the groundwork for a broader vision.

"Integration will take time and require coordination across areas such as technical standards, financing and regulatory frameworks," Puah said. "In ASEAN, a regional power market may still be some time away, but efforts are underway to strengthen bilateral interconnections and subregional multilateral interconnections. These serve as the foundations for ASEAN to realize the ASEAN Power Grid by 2045."

To transform these regional blueprints into reality, financing and policy coordination are just as critical as technological deployment. As a leading international financial center, Singapore acts as a convening hub to connect capital with bankable infrastructure projects.

"The scale of investment needed across infrastructure, grids, clean technologies and system resilience will require strong regional collaboration," Puah said.

He added that innovative mechanisms, such as credible cross-border renewable energy certificates, play an important role in enhancing the bankability of these massive renewable energy projects and boosting investor confidence.

Looking 10 to 15 years ahead, Puah expects the Asia-Pacific region to become far more interconnected as economies pursue shared sustainability goals. Through deepening partnerships, complementary alliances with Chinese technological leaders and a unified vision for a cross-border power network, Southeast Asia is steadily building a resilient, future-ready energy ecosystem.

光影记忆 STILL IN FRAME

Students play table tennis at Neijiang No 2 Junior High School in Neijiang, Sichuan province, on April 13. Formerly, the school was for the children of the Neijiang Cotton Mill's employees.

PHOTOS BY WANG DINGHAO / FOR CHINA DAILY

Children of Neijiang Cotton Mill workers celebrate after winning a tug-of-war in the neighborhood in 1984.

Left: Factory workers' children pose for a photo before taking part in a badminton skills showcase in 1977.
Right: A textile worker weaves thread at the factory in 1978.

A textile worker participates in a provincial-level skills competition at a yarn spinning workshop at the factory in 1975.

A teacher from the factory workers' children's school tumbles with her students while learning to roller-skate in 1981.

Some 1,800 veteran workers of the Neijiang Cotton Mill, many returning from places across the country, gather to celebrate the factory's 60th anniversary in September 2018.

Editor's note: *With photographs captured through the decades, China Daily is presenting a series of visual chronicles to showcase how different fields evolved under the tide of China's reform and opening-up, and how that tide changed people's lives.*

Canon 感动常在 AD

LOCAL LENS REVEALS FACES *of* GREAT TRANSFORMATION

A model worker displays her skills at the factory in 1975.

A worker holds a stencil partition board marking the factory's renowned products in 1975.

Textile worker captures Neijiang's industrial journey through decades of development

For the past 50 years, the camera lens of Wang Dinghao, now a retiree from Neijiang Cotton Mill in Neijiang, Sichuan province, has been focused on the steps of his enterprise — a representative firm of China's traditional industries.

From the rumbling all-day-long workshops to the everyday lives of workers, from the upgrading of machines to the growing-up of employees' children, his images document things as small as a single worker's dedication, and as big as the pivoting of the entire industry under the nation's master plan.

Established in 1958, the factory was once a landmark industrial enterprise in the city. In its heyday, there were some 6,000 workers and their family members sharing the community.

The factory's white cloth, along with the city's white sugar and *baijiu* spirits, were often dubbed as the "three whites of Neijiang" and hailed as the city's pride.

But as the tide turned and the economy evolved, the factory's mission as a manufacturer came to an end. The production stopped in 2013, and in 2023, its revamp began.

Today, the neighborhood has been transformed into a combination of an industrial heritage park and commercial space, together with modern and highly automated logistics operation stations. But the memories of its past, captured in Wang's photographs, will always have a special place in the hearts of Neijiang residents.

COMMENT

Editorials

G7 needs to focus guidance and impetus on inclusive global growth and development

As the club of the world's major developed economies commenced its annual summit in Evian-les-Bains, France, on Monday, the debate over whether China should be invited to join has resurfaced. The Associated Press cut to the chase, posing the question, "Without China, does the G7 make sense?"

The question highlights a notable shift in global dynamics since the G7's inception. The group was established in the 1970s as a forum for the world's largest advanced economies to discuss and coordinate economic policy.

However, according to the International Monetary Fund, the overall share of emerging market economies in global GDP has shifted dramatically over the past few decades — rising from just over 30 percent in the 1990s to approximately 61 percent of the world economy (adjusted for purchasing power parity terms) by 2025. Continuing to exclude these economies from discussions on macroeconomic policy coordination risks rendering the G7 increasingly irrelevant in addressing today's global challenges.

Projections also strongly suggest that emerging markets, or the E7, will account for a substantial share of global economic growth, eventually challenging the historic dominance of the G7.

The G7 accounted for roughly 60 percent to 70 percent of the global economy in the 1970s. This year, the G7's share has fallen to about 44 percent in nominal terms (or roughly 28 percent in purchasing power parity terms). Projections suggest this share will drop to between 20 percent and 30 percent by 2035 as emerging markets continue to expand.

Despite this, the G7 continues to position itself as the arbiter of world affairs across many domains. To remain relevant in a changing world, the group must first address its own internal challenges.

The G7 should make the effort to understand and respect the positions and interests of developing countries and look at the rise of China and other members of the Global South objectively. This is the practical way for the grouping to sustain its influential role on the world stage.

The tendency of the G7 members to resort to blaming China for their own woes under such pretexts as "trade imbalances" and "overcapacity", along with the accompanying "de-risking" rhetoric is misguided and counterproductive.

China's economic and trade relations with other countries are characterized by mutual benefit and win-win cooperation. It is steadfastly expanding high-standard opening-up and will continue to share development opportunities with other countries and deliver more certainty and stability to the world economy, as Chinese Vice-Premier Zhang Guoqing said on Thursday when addressing the World Convergence Summit for Growth via video link.

It is easy to reach a one-sided conclusion of an "imbalance" in trade if one only looks at the trade in goods without considering the trade in services and investment returns, or if one focuses solely on trade figures without examining the trade structure and profit flows, or considers only imports from China while ignoring self-imposed export restrictions.

Whether it is "de-risking", "reducing dependency" or the so-called "trade imbalance" these are all essentially forms of protectionism. Such measures will only weaken the long-term industrial competitiveness of G7 members and harm the interests of their consumers.

G7 leaders should know that unilaterally instrumentalizing economic, trade and technological issues, and making the group a "small clique" within the multilateral global governance system will only accelerate the marginalization of the group to its own detriment.

Zhang called for prioritizing development, improving global governance and promoting inclusive growth of the world economy.

All countries should uphold openness and cooperation, take an objective view of the comparative advantages of different countries, foster a free and facilitative trading environment, and practice true multilateralism, he said.

That is how the G7 can sustain its relevance in a world that has developed beyond recognition from the days when it ruled the roost.

All parties should commit to path of peace

The proposed peace agreement between the United States and Iran, unveiled after months of conflict and on-and-off negotiations, might be hijacked by a third party even before its scheduled inking in Geneva on Friday.

Israel's National Security Minister Itamar Ben-Gvir on Monday rejected the US-Iran deal that is aimed at ending hostilities across the Middle East, including in Lebanon, declaring that Israel is not obligated to abide by it. Israeli Defense Minister Israel Katz also said that Israel won't withdraw from land seized in Lebanon, potentially challenging the interim deal.

Only months ago, the US and Israel jointly "justified" military strikes against Iran as "necessary" to neutralize a looming "security threat". Today, Tel Aviv is reminding the world which country is the real obstruction to peace.

The reported deal is hardly a perfect agreement. Neither side achieved all its objectives. Yet that is precisely why it resembles diplomacy rather than the surrender of one of the parties.

The reality is that wars are costly. And long wars are politically fatal. The conflict has sent energy markets into turmoil. The US, despite its status as a major energy producer, is not immune to the price spike. Higher energy costs threatened inflation just as the US administration was attempting to reassure voters about living costs and economic stability.

Washington's experience from Vietnam to Iraq and Afghanistan repeatedly demonstrates that military superiority does not guarantee strategic success. Yet the US has a peculiar tendency to forget this lesson whenever a new conflict begins, seemingly in the belief that this time it will be different.

The beneficiaries are military contractors, geopolitical speculators and some politicians associated with them. The wealthy and powerful make the decisions; the burden falls elsewhere.

This reality helps explain why the US president is now promoting an agreement under tremendous domestic pressure. Tehran faces pressures of its own too. Hardliners reportedly remain suspicious of engagement with Washington.

While the world's attention is on Israel trying to block the deal by continuing to attack Lebanon, which Iran will not tolerate, it should not be forgotten that the Palestinian question remains the core issue of the Middle East crisis.

A durable Middle Eastern peace cannot be built while the Palestinian question remains indefinitely suspended. Gaza's devastation and the absence of a credible political pathway continue to fuel instability throughout the region. Any regional security architecture that ignores Palestinian statehood risks treating symptoms while neglecting causes.

Even if the US-Iran agreement is signed, implementation will be vulnerable. The accord reportedly contains phased commitments and verification periods. Any disruption during these stages could unravel the process, as was the case with the Gaza ceasefire deal endorsed by the US.

This is where concerns about Israeli actions become particularly relevant. Israel possesses both the capability and, in some quarters, the incentive to challenge arrangements it views as unfavorable. A renewed escalation on the Lebanese front, for example, could kill the agreement in the cradle.

Against this backdrop, the willingness of the United Kingdom, France and Germany to consider lifting sanctions on Iran deserves recognition. Europe appears to understand that economic integration offers a more sustainable path than perpetual confrontation.

As Chinese Foreign Ministry spokesman Lin Jian said in reply to questions on the proposed US-Iran deal at a news conference in Beijing on Monday, China welcomes the agreement on the content of a first-phase memorandum of understanding, and appreciates the mediation efforts made by Pakistan.

China hopes that the US and Iran will sign the memorandum as scheduled, and that all relevant parties will remain committed to the path of peace, resolving outstanding issues through dialogue and negotiation, Lin added.

Beijing's four-point proposal to promote peace and stability in the Middle East — emphasizing peaceful coexistence, respect for sovereignty, adherence to international law and coordination between development and security — is a practical necessity given the precarious circumstances.

The proposed US-Iran deal emerged because the two parties eventually confronted the same reality: the costs of continued conflict exceed the benefits. Whether peace survives may now depend on whether every actor reaches the same conclusion.

Australian think tank report reflects a Cold War worldview

Occasionally a familiar political creature hops across Australia's strategic landscape: the "China threat" report.

The latest specimen, released by the Lowy Institute, an Australian think tank, and amplified by some Australian media outlets, arrives with all the expected ingredients. It is a geopolitical thriller assembled from worst-case scenarios, speculative extrapolations and enough military jargon to make a defense contractor blush.

Yet what is striking is not what the report contains, but what it carefully omits. The report openly acknowledges that it focuses on China's capabilities rather than intentions. In other words, Australians should worry about certain military capabilities that China possesses. By that logic, nearly every major country with a certain level of military power constitutes an imminent threat to the country.

Capabilities, however, do not exist in a political vacuum. Intentions matter. History matters. Policy matters. China pursues a defensive national defense policy. Its military modernization is aimed at safeguarding sovereignty, territorial integrity and core national interests. The relevant question is: where is the evidence that China intends to attack Australia?

The report offers none. Instead, it relies heavily on a familiar Western strategic reflex: if China grows stronger, danger automatically grows with it. That assumption says more about the Cold War worldview of some Western strategists than about China itself.

Many Western powers spent centuries projecting military force across oceans, overthrowing governments, launching wars and imposing political systems on distant societies. Some of them still do — or try to. It is perhaps understandable that some analysts assume every country with similar capabilities will follow the same script.

But assumptions are just that, assumptions.

While some ideologically blinkered Australian analysts obsess over hypothetical Chinese military bases, they remain curiously silent about the risks of one of the region's most dramatic military expansion projects: AUKUS.

Australia's acquisition of nuclear-powered submarine technology under the AUKUS framework has generated serious concerns throughout the Asia-Pacific. The arrangement risks undermining the international nuclear weapons nonproliferation regime, stimulating an arms race and injecting new strategic tensions into an already fragile region.

Yet somehow the country doing so is portrayed as the nervous seeker of "security", while the country warning of the risks is the "aggressor".

That requires a remarkable gymnastic performance of logic.

The timing of the report is particularly notable because China and Australia have spent the past several years painstakingly rebuilding relations.

When Chinese Foreign Minister Wang Yi met Australian Foreign Minister Penny Wong in Beijing less than two months ago, both sides emphasized cooperation, free trade, stable supply chains and support for multilateralism. Both governments recognized the highly complementary nature of their economies and their shared interest in regional stability.

Those are not the talking points of two countries preparing for confrontation. It is, instead, the language of two countries trying to be partners attempting to manage differences while expanding cooperation. It seems some in Australia want to undermine that.

The larger reality is that China is not seeking to become another version of yesterday's hegemonic powers. Beijing's diplomacy is centered on building a community with a shared future for humanity, promoting its Global Development Initiative, Global Security Initiative, Global Civilization Initiative and Global Governance Initiative. Proposals that are fundamentally about cooperation and exchanges, not conquering, bullying or coercing.

A more inclusive and equitable international order would benefit developing and developed countries alike — including Australia.

The latest Lowy Institute report may succeed in generating headlines and raising the anxiety of some. But as strategic analysis, it often resembles a mirror more than a window. And what it reflects is not China.

What They Say

Skills and creativity at a premium in era of AI

Editor's note: *The spread of artificial intelligence is posing a major challenge to many traditional jobs. Cai Fang, an academician of the Chinese Academy of Social Sciences, said in an interview with www.ce.cn that it is a challenge that people, as well as the government, need to actively respond to. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The 15th Five-Year Plan (2026-30) period will mark a critical phase in the integration of artificial intelligence and employment. The principal contradiction in China's job market has turned into a structural imbalance. While there are many high-quality vacancies in the market, employers are struggling to recruit workers with the necessary professional skills. On the other hand, many job seekers are unable to find positions that match their skills. Technologies such as AI are both creative and destructive. AI acts as both an "amplifier" and an "accelerator" that intensifies the current structural imbalance in the job market. Given this, multipronged approaches are needed to mitigate AI's effect on employment.

The authorities should implement industrial policies, establish industry standards and enforce laws and regulations to guide the healthy development of the AI sector. Aligning AI research, development and application with the country's employment policies is crucial. So are addressing workers' skill gaps, improving the quality and efficiency of traditional jobs, and unlocking AI's potential to create new employment opportunities.

Workers must actively seek vocational skills training, continuously update their expertise and keep pace with AI's advancement. By doing so, they can revamp their professional skills to meet the demands of jobs in the new era.

The authorities should ensure equal access to basic public services, and refine a multitiered social security system tailored to new forms of employment in the AI era. This will help secure people's livelihoods and provide the workforce with enough time to upgrade their skills and reshape their careers.

Fundamental economic logic says that sustained wage growth depends on steady improvements in labor productivity across society. AI's greatest value lies in its ability to significantly boost overall labor productivity. Thus, from a macro perspective, AI creates conditions for gradual wage growth across society.

However, the benefits from higher labor productivity will not automatically be distributed equally among all workers. AI is likely to widen the income disparities across enterprises, industries and worker groups at a faster pace.

Efforts by individuals will not be enough to address this divergence in incomes. The government should improve the income distribution system and use redistribution mechanisms to narrow the income gap, enabling the whole of society to share the dividends of productivity gains driven by AI.

There was a time when a higher level of education meant greater rewards. But AI has changed that. Large language models can now replace a vast number of white-collar jobs, erasing the competitive advantages of certain academic courses that were once considered premium.

The value of academic degrees would have declined even without AI. The rapid development of AI has only intensified this trend.

While academic degrees may become less valuable over time, lifelong learning to enhance one's core competencies remains crucial. People don't have to fixate on obtaining a high academic degree in the AI era, but they should pursue knowledge and expertise that are truly valuable.

Japan's political path worrisome for Asia

For most people in Africa, Japan is synonymous with cutting-edge technology, economic prowess and social harmony. But in East Asia, which bears deep historical wounds inflicted by Japan, the country's right-leaning political shifts in recent years have triggered alarm.

Global Lens

To fully comprehend these regional apprehensions, one must reflect on the enduring historical lessons that continue to define regional geopolitics.

The regional anxieties over Japan's current trajectory stem from a legitimate historical fear across Asia: that neglecting and distorting wartime lessons might embolden Japan to reverse its postwar pacifist course and repeat past mistakes and crimes.

From the late 19th century until Japan's unconditional surrender in 1945, Japan emerged as the most aggressive imperialist and militarist power in modern Asia, waging unprovoked wars of aggression and occupying vast territories across China, the Korean Peninsula and Southeast Asia.

Japan's military expansion killed tens of millions and caused unprecedented humanitarian catastrophes across the region. The bitter memories of invasion and colonial oppression remain deeply entrenched in the national consciousness of Asian countries, especially China.

After Japan's defeat in 1945, the Allied powers instituted the Tokyo Trials, a landmark judicial proceeding that held Japanese wartime leaders accountable for their aggression and crimes against humanity.

The trials established a cornerstone of the postwar international order in East Asia, enshrining the principle that wars of conquest and colonial domination are illegal and unjust under international law.

Eighty years later, the verdict and lessons of the Tokyo Trials remain essential for preserving regional peace and deterring a militaristic revival.

Today's regional concerns are fueled by Japan's sustained and troubling political shift. Prime Minister Sanae Takaichi and her conservative supporters have vigorously pushed for constitutional revision, with a focused attempt to dismantle and rewrite Article 9 of Japan's Constitution.

As the foundational pillar of Japan's postwar pacifist identity, Article 9 explicitly renounces war and the use of force as a tool of national policy.

Attempts to revise, reinterpret, and hollow out this pacifist provision have triggered widespread skepticism and opposition across East Asia, as they challenge the postwar security framework of the region.

Alongside constitutional changes, Japan has sharply increased its military budget, expanded the operational scope of its Self-Defense Forces, relaxed arms export prohibitions, and deepened military alliances with the United States, Australia, and the Philippines.

While some Japanese politicians justify these moves as responses to security challenges, many observers in the region remain unconvinced by such arguments. These unilateral military advancements signal a creeping remilitarization, posing tangible risks to regional strategic balance.

China's assessment of Japan's strategic shifts is grounded in undeniable historical facts and shared regional trauma.

Chinese officials and historians have long highlighted that Japan has never fully come to terms with its wartime past. Certain Japanese political forces continue to downplay, whitewash, and distort the brutal wartime atrocities committed during Japan's imperial expansion era.

This refusal to sincerely reflect on wartime crimes is why China and other regional nations remain vigilant against Japan's growing military ambitions.

These concerns extend beyond military capabilities, carrying significant political and historical symbolism.

In East Asia, historical memory is not merely an academic subject; it is a pressing political and security issue affecting regional stability. Policy tweaks that seem trivial to outsiders often represent serious historical retrogression for countries that suffered under colonial occupation and wartime aggression.

African readers can relate to this regional dispute from the perspective of the global international order. China stands as the staunch defender of the 1945 postwar international framework established after the victory over fascism and militarism.

Chinese leaders have repeatedly emphasized that safeguarding the outcomes of World War II is crucial to upholding global justice and preventing the resurgence of aggressive militarism and extremist nationalism.

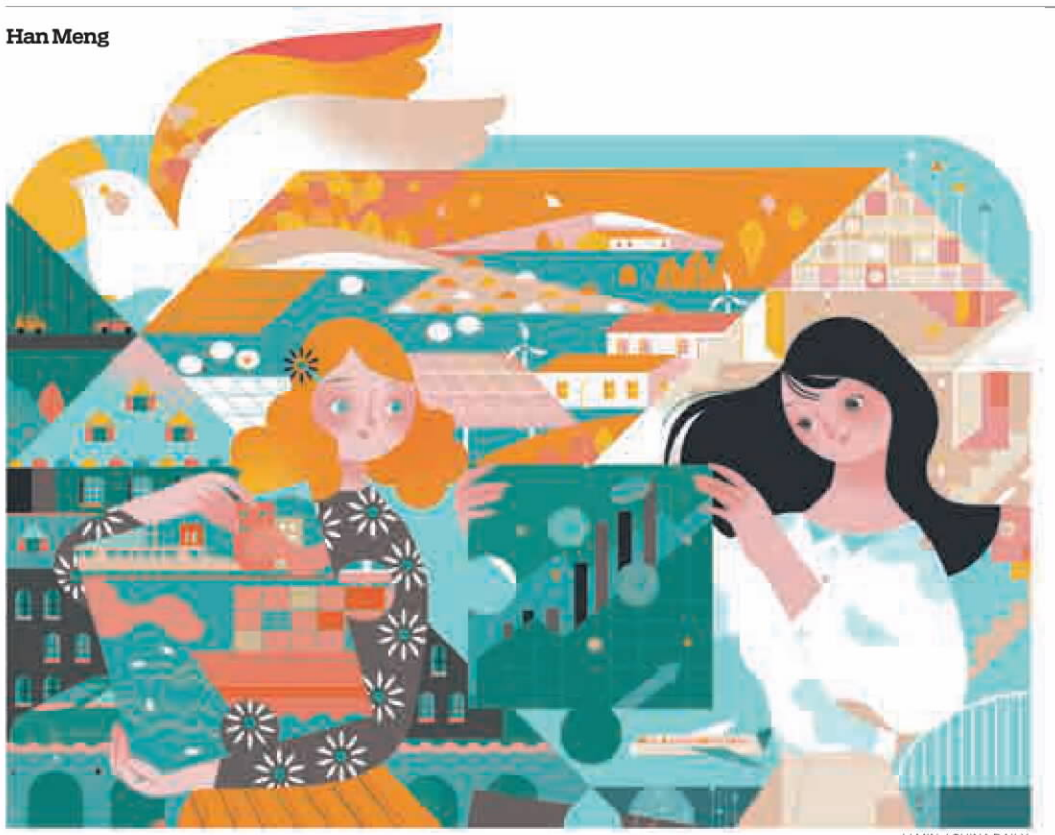
From China's perspective, any attempt to undermine the authoritative legacy of the Tokyo Trials and normalize Japan's military expansion essentially negates the victory of the World Anti-Fascist War and erodes the foundation of the postwar international order.

Faced with widespread criticism, Japanese authorities have denied the risk of militarist revival and offered self-serving excuses for the policy shifts. They claim to uphold peace, democracy and international law, and portray their military build-up as a rational response to regional tensions.

These assertions deliberately disconnect the current policies from the historical context, attempting to shake off historical restraints and whitewash Japan's military expansion agenda.

This divergence in the historical outlook is the root cause of escalating Sino-Japanese tensions. Both sides claim to pursue regional peace, but their starting points are vastly different.

China's vigilance against the revival of militarism is a solemn historical responsibility and a just commitment to regional peace. In contrast, Japan's continuous military strengthening and constitutional revisions serve its strategic goal of breaking free from postwar institutional constraints and pursuing the status of a full military power.



Africans can easily resonate with this historical logic based on the continent's own colonial experience. Across Africa, the legacy of colonial injustice continues to shape national identity and diplomatic perceptions. Former colonial powers are judged not only by current actions but by their sincerity in acknowledging and redressing historical wrongs.

Similarly, East Asia's geopolitical landscape is permanently shaped by collective memories of Japanese aggression, occupation and national resistance.

As Asia marks eight decades since the end of World War II, regional debates over Japan's future strategic role will continue to intensify. The prospect of regional cooperation versus intensified tensions hinges entirely on whether Japan can sincerely confront its wartime history, abandon historical revisionism, and faithfully abide by its pacifist commitments and the postwar international order.

'China Shock 2.0' a myth that will collapse

As China and Europe mark over 50 years of diplomatic relations, cooperation remains the cornerstone of the relationship.

However, rising geopolitical rivalry has sharpened Europe's anti-China rhetoric of "de-risking" and economic security. Among the latest catchphrases, none is more politically expedient yet intellectually weak than the so-called "second China shock", or "China Shock 2.0".

The original "China Shock" thesis, propounded by United States economists David H. Autor, David Dorn and Gordon H. Hanson, argued that China's entry into the World Trade Organization and subsequent export boom disrupted the US labor market.

Washington revived the narrative in 2024, this time claiming that China's rise in electric vehicles, clean energy and advanced manufacturing once again threatens Western industry.

Europe quickly picked up the script. At the Davos summit in 2025, European Commission President Ursula von der Leyen warned of a "second China shock" to world trade caused by Chinese export subsidies. This argument resurfaced at the G7 summit months later, with calls for a coordinated response to China.

European media and think tanks depicted Chinese products as "flooding" European markets and endangering jobs.

While the politics is loud, the economics is far less convincing. The claim that Chinese exports are driving Europe's industrial decline mistakes symptoms for causes. Trade imbalances are not moral tales of one economy "attacking" another. They reflect market demand, industrial specialization and shifting comparative advantages.

China's industrial upgrading has naturally reduced its dependence on some European high-end products.

At the same time, Chinese exports meet the actual demands of European consumers and industries. Blaming Europe's competitiveness challenges on a "second China shock" is therefore convenient but analytically flawed.

Europe's deeper challenge lies closer to home. Traditional sectors such as automobiles and machinery are under pressure from the green and digital transition. European firms face high energy costs, expensive labor and heavy regulation.

At the same time, US industrial subsidies, from the Inflation Reduction Act to the CHIPS Act, are pulling investment across the Atlantic.

China's rapid advances in renewable energy, AI and electric vehicles have intensified Europe's anxiety. But anxiety is not analysis.

Instead of addressing structural weaknesses directly, some policymakers have externalized them. Under the banner of "de-risking", economic cooperation increasingly risks becoming "de-cooperation" — a path more likely to weaken Europe's innovation capacity than strengthen it.

Europe's energy policy offers a revealing example. Its effort to reduce dependence on Russian energy came with heavy economic costs. Energy-intensive industries reduced production, relocated investment or shut facilities entirely.

German chemical giant BASF scaled back operations in Europe while expanding in China, drawn by market size, stable supply chains and lower operating costs.

That reality is significant. Much of Europe's industrial strain stems from its own policy choices, not imported Chinese goods. But complex domestic problems rarely make effective political slogans.

"Cheap Chinese products" are easier to sell to frustrated voters than debates over energy strategy, debt burdens or regulatory reform. Blaming China for lost jobs is more electorally rewarding than admitting policy mistakes.

Europe's economic malaise owes as much to weakening global demand as to its own shortsighted trade policies and mounting debt burdens. China is not the chief culprit behind Europe's troubles. If anything, it remains a vital opportunity.

European high-end manufacturing and services continue to command substantial market share in China, while Chinese intermediate and consumer goods help keep Europe's economy running. To pin Europe's economic stagnation on China is not a serious diagnosis but a convenient deflection that sidesteps harder truths and excuses policy missteps.

Misdiagnosing Europe's problems can produce bad policy: more protectionism, more ideological filtering of trade, and deeper suspicion toward one of Europe's largest economic partners. In the long run, that risks narrowing Europe's own development space.

Not all European voices accept this logic. French Nobel laureate Philippe Aghion has argued that economic development is fundamentally a process of innovation and creative destruction.

China's rise is part of that global transformation, not an anomaly to be contained. Europe can respond creatively — or defensively.

Protectionism will not restore competitiveness. Politicizing economic challenges will not lower energy prices, revive productivity or solve investment shortages. A more practical path is cooperation.

In green development, China and Europe are natural partners.

Europe needs rapid decarbonization; China leads in clean-energy manufacturing, electric vehicles and large-scale green supply chains.

Without China's participation, Europe's energy transition becomes far harder and more expensive.

The same logic applies to the digital economy. Europe brings regulatory expertise; China offers market scale and innovation ecosystems. Collaboration on standards, technology and governance could create shared gains rather than zero-sum rivalry.

Trade tells a similar story. China and Europe are deeply intertwined economically. Their commercial ties support millions of jobs, investment flows and industrial networks on both sides.

European companies continue to profit from the Chinese market, just as European industries benefit from Chinese intermediate and consumer goods.

China has never sought to "shock" Europe. The "second China shock" narrative reflects Europe's growing competitiveness anxiety and the search for an external culprit.

If Europe approaches China with greater strategic calm — and with a clearer understanding of its own economic challenges — cooperation, not confrontation, will be the correct response.

And once rhetoric collides with economic reality, the myth of a "second China shock" will begin to collapse under its own contradictions.

Saluting the giant old exam tree called *gaokao*

Now that the 2026 national college entrance examination is over, millions of candidates' families must be waiting with bated breath for June 25, the day the exam's results will be announced.

Until then, the candidates can take it easy, waking up late to make up for the sleepless nights spent preparing for the exam.

Their parents are likely pampering them now, taking them on domestic or overseas tours.

Some might choose to burn a few incense sticks at Buddhist or Confucius temples, praying for good exam results.

After all, Confucius (551-479 BC) is regarded as China's earliest educator.

The national college entrance examination, called *gaokao* in Chinese, is believed to be the largest of its kind in the world.

From around 10 million candidates each year in the past two decades, to around 12.9 million this year, the exam has long been regarded as a serious matter for both local governments and the public.

During the three to four days of the exam, the duration varying by region, construction sites are ordered to stop operations, to cut down on the noise; and traffic is controlled to make way for exam candidates as a priority.

By taking such measures, local governments have endeared themselves to the public because every candidate is backed by an entire family.

From around 10 million candidates each year in the past two decades, to around 12.9 million this year, the exam has long been regarded as a serious matter for both local governments and the public.

Among other heart-warming measures, some companies offer free taxi rides to candidates going to their exam centers, while some restaurants provide free lunches, and some hotels free beds, on *gaokao* days.

The Ministry of Education has also asked people not to be fooled by frauds who come up with various tricks this time of year.

Someone might be selling "illegally obtained" exam papers, another might be auctioning AI-predicted questions, and yet another might be offering to teach how to cheat during the exams.

In fact, the fraudsters don't take a break even after the exams. Some might dupe candidates into believing that they can get hold of their results even before they are officially declared.

Others might claim they can hack into the exam system to change results in their favor. But those clicking on such links might soon find their bank cards used fraudulently.

Once the *gaokao* results are announced, the families of candidates who did not get a high score might receive phone calls promising to get them admission into better universities through special channels. This is yet another scam.

These are some old tricks and one can expect the scammers to come up with new tricks in the age of new technologies. We hope candidates and their families will take the government's warnings seriously and not fall for such tricks.

Gaokao has been conducted in China since 1952.

It was halted for more than 10 years during the "cultural revolution" (1966-76) before being restored in 1977 — the year I wrote and passed the exam.

That year, more than 5.7 million candidates sat for the exam but only 270,000, or 4.8 percent of the total, qualified.

Today's generation must count itself lucky. Of the nearly 13 million candidates who took the exam, 90 percent are expected to gain admission to higher education institutions in the form of four-year-long studies for a bachelor's degree or three-year non-degree higher vocational studies.

Despite criticism that *gaokao* deliberately or objectively encourages exam-oriented learning; that young people in different localities can't yet share the same educational opportunities; and that it stifles the development of innovative ability, most people in society agree that it is the fairest and best way of identifying talent today.

For me this is like an exam tree that one can prune or trim, but never cut down altogether.

GLOBAL VIEWS

DAVID GOSSET

25 years of shared vision

The SCO evolves into a key force for peace, development and global governance in Eurasia

At 25, the Shanghai Cooperation Organization stands as one of the most significant political and strategic developments in the contemporary Eurasian landscape. Founded in 2001 by China, Russia, Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan, and later expanded to include India, Pakistan, Iran and Belarus, the SCO has become the world's largest regional organization in demographic terms, encompassing more than 3 billion people across the Eurasian landmass.

Over the past 25 years, it has evolved from a regional security arrangement into a multidimensional institution addressing security, economic development, cultural exchange and global governance. Its rise reflects the broader transformation of Eurasia.

The SCO is fundamentally a Eurasian organization. Geographically, politically and strategically, it links East Asia, Central Asia, South Asia, the Middle East and parts of Eastern Europe within a framework of dialogue and cooperation. Unlike Cold War alliances built on ideological confrontation, the SCO emerged from practical efforts to stabilize borders, combat terrorism and build trust among neighboring states after the collapse of the Soviet Union. Its guiding principles — the "Shanghai Spirit" — emphasize mutual trust, mutual benefit, equality, respect for cultural diversity and shared development. These principles mirror the diversity of Eurasia itself: a continent of civilizations, religions and political systems united by a common interest in stability and prosperity.

The organization has also become an increasingly important actor in the evolution of global governance. At a time when many international institutions are facing legitimacy and effectiveness issues, the SCO presents a more pluralistic and representative approach to international affairs. It amplifies the voice of emerging powers and developing countries, particularly those of the Global South. SCO declarations consistently defend multilateralism, the centrality of the United Nations and the principle that international relations should rest on sovereignty, equality and consultation rather than unilateral coercion. In this sense, the organization reflects the broader shift toward a multipolar international order.

The SCO's contribution to global governance is not merely rhetorical. Over the years, it has developed mechanisms for cooperation in areas ranging from counterterrorism to digital governance, energy policy, environmental protection and sustainable development. The adoption of long-term strategic frameworks such as the SCO Development Strategy until 2035 demonstrates that the organization increasingly views itself not simply as a regional forum, but as a constructive force in shaping the future international system. By fostering dialogue among major Asian powers whose interests do not always converge, the SCO helps reduce tensions and cultivate habits of cooperation in an increasingly unstable international environment.

One of the SCO's most tangible achievements has been in the field of peace and security. The organization was born out of security concerns, and this remains one of its principal strengths. The SCO was among the first regional organizations to institutionalize cooperation against what it defines as the "three evils" — terrorism, separatism and extremism. Through its Regional Anti-Terrorist Structure and regular joint military exercises, member states have established mechanisms for intelligence sharing, border security cooperation and coordinated responses to transnational threats.

The significance of this role should not be underestimated. Eurasia has long been vulnerable to instability arising from terrorism, separatist movements, narcotics trafficking and geopolitical rivalry. The SCO has contributed to stabilizing Central Asia, strengthening state capacity and reducing the risk of regional fragmentation. Its members have also expanded cooperation in cybersecurity, organized crime prevention and anti-drug operations. Importantly, the organization has sought to address security challenges through dialogue and consensus rather than military blocs and confrontation. This approach has enabled states with different political systems and strategic cultures to cooperate pragmatically on shared concerns.

LI MIN / CHINA DAILY

The SCO is also playing an increasingly important role in economic development. Eurasia is rapidly emerging as one of the central axes of the global economy, and the SCO provides a framework through which trade, connectivity and investment can expand across the continent. Infrastructure cooperation, transport corridors, energy partnerships and digital connectivity have become central themes of SCO summits. The organization's activities increasingly intersect with broader Eurasian integration initiatives, particularly China's Belt and Road Initiative.

Economic cooperation within the SCO reflects the considerable complementarity of its members. China contributes industrial capacity, technological advancement and financial resources; Central Asia offers strategic geography and energy wealth; South Asia provides demographic dynamism and vast market potential; Russia and Iran add strategic depth and connectivity. As sanctions, trade disputes and geopolitical fragmentation continue to reshape the world economy, Eurasian integration through institutions such as the SCO is likely to gain further importance. The organization therefore serves not only as a diplomatic platform, but also as a driver of continental connectivity and development.

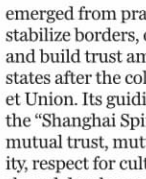
Equally important is the SCO's expanding role in promoting people-to-people exchanges. Durable regional cooperation cannot rest solely on intergovernmental structures; it also requires cultural and social understanding among peoples. Over the years, the SCO has organized youth forums, university networks, tourism initiatives, cultural festivals and media exchanges. Educational and academic cooperation have become especially significant as younger generations across Eurasia seek greater interaction and broader opportunities.

These exchanges matter because Eurasia contains immense cultural, linguistic and religious diversity. The SCO's emphasis on dialogue among civilizations contrasts sharply with narratives of inevitable cultural conflict. By encouraging contact among students, scholars, artists and entrepreneurs, the organization helps foster a broader Eurasian consciousness grounded in cooperation rather than division. In the long run, such societal ties may prove as important as formal agreements between governments.

Looking ahead, the SCO's role is likely to continue expanding. As China deepens its engagement with Eurasia through trade, infrastructure and strategic partnerships, the SCO naturally acquires greater importance as one of the principal institutional frameworks linking the continent together. China provides the organization with momentum, resources and strategic direction.

The meeting between SCO Secretary-General Nurlan Yermekbayev and the European Union Special Representative for Central Asia Eduards Stiprais in Beijing on Dec 8, 2025 underscored the growing logic of greater engagement between the SCO and the EU. As Eurasia becomes increasingly central to global politics and economics, cooperation between the EU and the SCO is not only desirable but strategically rational for both sides. The two frameworks share important interests in regional stability, sustainable development, energy security, transport connectivity, climate cooperation and the management of transnational threats. Rather than viewing one another through the lens of geopolitical rivalry, the EU and the SCO could gradually develop complementary forms of cooperation across the Eurasian space.

The SCO offers the EU an important channel for engaging in the evolving dynamics of Central Asia and the broader Eurasian continent, while the EU brings technological expertise, investment capacity and decades of experience in regional integration. In the long run, greater synergies between the two sides could contribute to a more stable, interconnected and cooperative Eurasian order grounded in dialogue, multilateralism and mutual respect.



Twenty-five years after its founding, the SCO has become a major Eurasian institution contributing to peace, economic development, cultural dialogue and the emergence of a more multipolar international order. As the center of gravity of world politics and economics continues to shift toward Eurasia, the SCO's relevance is likely to grow further. In many respects, the future of the SCO and the future of Eurasia are becoming increasingly intertwined.

The author is a specialist in global affairs and Sinology, and the founder of the China-Europe-America Global Initiative. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

ZUBAIR QURESHI

Opportunity requires capacity

For Pakistan, the 25th anniversary of the SCO is a reminder that regional diplomacy must now be tied to measurable delivery

Over the past 25 years, the Shanghai Cooperation Organization has evolved from a security-focused regional arrangement into a broader regional platform where questions of connectivity, energy, trade, counterterrorism, development and political coordination now overlap. As member states navigate the increasingly complex regional geopolitics, the anniversary should be understood less as a ceremonial milestone than as a test of whether the organization can deliver concrete outcomes for shared development.

The SCO's importance lies in its ability to bring diverse political systems, security priorities and economic interests into one cooperation mechanism. Its members do not always view every issue in the same way, but the platform provides space for structured engagement in a region where mistrust, unresolved conflicts, terrorism, weak connectivity and economic fragmentation continue to limit growth.

For Pakistan, the most immediate SCO priority should be connectivity with Central Asia. The region offers markets, energy resources, transit possibilities and strategic room for trade diversification. Yet the promise of Central Asia has remained underdeveloped because transport corridors, customs systems, banking channels, border procedures and security conditions have not kept pace with political statements. This is where Pakistan's existing partnerships and infrastructure can fit into a broader regional frame by connecting national infrastructure with regional demand. Playing a constructive role in the SCO platform can help facilitate smoother transit arrangements, harmonized customs documentation, better road and rail planning, easier business visas, digital trade facilitation and stronger coordination on logistics.

The SCO can also help Pakistan shift the debate from security anxiety to economic seriousness. Regional stability is essential for investment, trade and transit. Though member states may disagree on certain issues, the SCO does create a regional environment where escalation, disruption and zero-sum games carry higher costs. It creates opportunities for countries to support cooperation, defend their own interests and demonstrate that regional platforms can only function when member states respect sovereignty, stability and the spirit of collective development.

Energy cooperation is another area where the SCO can become more relevant. Central Asian states have significant energy potential, while regional markets need better infrastructure and long-term arrangements. The SCO can play a role in promoting discussions on power connectivity, gas transit, renewable energy collaboration, grid stability, energy efficiency and investment protection. For Pakistan, this should be linked with domestic reforms so that external opportunities are not weakened by circular debt, regulatory uncertainty or weak implementation.

Trade should be treated with the same discipline. Pakistan cannot benefit from regional platforms if it does not prepare competitive products, reliable supply chains and export-ready companies. The SCO can open doors to priority sectors of cooperation and Pakistan can realistically expand exports, including textiles, sports goods, surgical instruments, agricultural products, pharmaceuticals, information technology services and processed food. This requires standards compliance in packaging, certification, digital payments, cold chains, warehousing, trade finance and commerce.

The 25th anniversary also offers an opportunity to strengthen Pakistan's role as a bridge between regional groupings. The SCO is not only a security forum and an economic platform, but also a political space where Eurasian states discuss development, connectivity and regional stability. A mature approach for Pakistan would be presenting itself as a state seeking balanced engagement, regional peace, economic corridors and development partnerships. This helps Pakistan preserve diplomatic flexibility while deepening cooperation with its closest partners.

People-to-people exchanges and knowledge sharing should also be part of the next phase of cooperation. Regional integration cannot depend only on summits and official statements. Pakistan needs more language training, university partnerships, technical exchanges, think-tank collaborations, transport-sector expertise and business-to-business networks with SCO countries. Students, traders, engineers, logistics professionals, entrepreneurs and policy researchers can build the social and commercial base that official diplomacy alone cannot create.

ZHANG YUJUN / FOR CHINA DAILY

The central lesson for Pakistan is clear: multilateral platforms create opportunity, but national capacity determines results. The SCO can provide access, legitimacy and connectivity with other regional mechanisms, but it cannot fix Pakistan's internal implementation gaps. If Pakistan wants to benefit from the organization's next phase, it must improve its governance, reduce policy uncertainty, secure investment sites, strengthen provincial coordination, support exporters and ensure that projects are commercially viable.

At 25, the SCO should not be judged only by the number of summits it has held or declarations it has issued. Its real value will depend on whether it can help member states manage insecurity, increase trade, build corridors, expand energy cooperation and create practical economic outcomes. For Pakistan, the anniversary is a reminder that regional diplomacy must now be tied to measurable delivery. Pakistan has a steady and consistent partnership with China, which is built on mutual trust and prospers together on connectivity. What it needs now is disciplined execution. The best contribution Pakistan can make to the SCO's next phase is not rhetorical enthusiasm. It is to become a reliable connector, a serious economic partner and a state capable of converting regional opportunity into national growth.

Guangxi cloud-based platform boosts cooperation with ASEAN

Region enables cross-border sharing of meteorological data and early warnings

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

China's first overseas cloud node dedicated to meteorological data sharing is helping deliver real-time weather information and disaster warnings to member states of the Association of Southeast Asian Nations as the Guangxi Zhuang autonomous region expands its role as a hub for regional meteorological cooperation.

Located in Singapore, the platform, operated and managed in Guangxi, serves as a cross-border channel for sharing meteorological data and early warning information across Southeast Asia.

The overseas cloud node operates six service systems, including an ASEAN version of Fengyun Earth, and provides more than 20 categories of meteorological products covering agriculture, logistics, disaster prevention and mitigation, said Li Yanping, deputy director of the Guangxi Meteorological Data Center.

"The overseas data center enables weather data to be transmitted to multiple ASEAN countries within seconds while improving the security and efficiency of cross-border data sharing," Li said.

Sharing similar exposure to typhoons, torrential rains and other weather-related disasters, Guangxi and many ASEAN member states have expanded cooperation on meteorological monitoring, forecasting and disaster prevention in recent years.

Meteorological authorities have also established a joint disaster prevention platform for the Beilun River, part of the China-Vietnam border, to address challenges in weather observation and cross-border data sharing.

According to local authorities, the platform has supported five joint typhoon-response operations and two maritime search-and-rescue missions while helping safeguard the release of more than 120 million aquatic seedlings.

Guangxi has also developed a landslide risk warning system that can be tailored to the terrain, climate conditions and disaster vulnerabilities of individual ASEAN countries.

Su Hualin, chief engineer at the Guangxi Meteorological Technology and Equipment Center, said the system is currently operating on the Lancang-Mekong meteorological platform and provides landslide risk assessments and early warnings.

> "The data helps provide more accurate assessments of crop conditions and supports decision-making across the global sugar industry."
>
> **Ding Meihua,** a senior engineer at the Guangxi Climate Center

The system has already been deployed in pilot projects across Laos, Malaysia, Thailand and Indonesia, providing more targeted warnings and helping local communities improve disaster preparedness, he said.

Beyond weather disaster warnings, agriculture has become another key area of cooperation. By integrating artificial intelligence, China and ASEAN member states have developed monitoring services to support agricultural production in countries including Thailand, the world's second-largest sugar exporter.

Ding Meihua, a senior engineer at the Guangxi Climate Center, said the region has extended its expertise in sugarcane meteorological services to neighboring countries.

With support from China's National Satellite Meteorological Center, Guangxi meteorologists use Fengyun weather satellites to monitor sugarcane growth, moisture conditions and drought risks throughout the crop's growth cycle in Thailand.

"The data helps provide more accurate assessments of crop conditions and supports decision-making across the global sugar industry," Ding said.

In addition, the Special Field Experiment Site for National Integrated Meteorological Observation in Nanning is the first comprehensive meteorological observation platform in China designed specifically to support cooperation with ASEAN countries.

The site enables coordinated observations using ground stations, weather balloons, radar systems, vertical observation equipment and satellites to improve both operational forecasting and scientific research capabilities.

According to an official with the site, it is intended to promote exchanges on meteorological equipment technology and measurement standards, support joint technical verification projects and facilitate the expansion of Chinese meteorological equipment manufacturers into Southeast Asian markets.

China's new marine AI models make headway

JINAN — Ten meters below the ocean surface off Wuzhizhou Island in South China's Hainan province, a small robotic inspector glides silently among branching corals. Through its cameras, hawksbill turtles and parrotfish appear against a reef that, a decade ago, was nearly lifeless.

The island's marine ranch once faced coral collapse. Since 2010, artificial reefs have helped restore the habitat, but monitoring remained difficult.

"We used to rely on manual diving. It's inefficient and risky," said Wang Aimin, a professor at Hainan University and chief scientist at the Hainan Provincial Engineering Research Center for Modern Marine Ranching.

The shift came through collaboration with Robotfish, a marine technology firm based in Qingdao in Shandong province. Its underwater robot can operate for hours with minimal disturbance, capturing close-up, multi-angle images of coral health. Today, seven information monitoring stations form a round-the-clock network tracking water temperature, salinity and reef activity.

"If something goes wrong, we can act immediately," Wang said.

China's homegrown marine "black tech" — from intelligent robots to ocean AI models — is increasingly being deployed in ecological protection, disaster forecasting and shipping services, as the country pushes digital and intelligent transformation in its marine sector. Monitoring coral reefs is relatively benign compared with harsher ocean conditions. GPS signals do not penetrate seawater. Pressure increases by one atmosphere every 10 meters. Biofouling, corrosion and strong currents can degrade equipment within weeks.

"One cannot simply adapt land-based tech, but must rebuild it from first principles," said Wang Fan, director of the Chinese Academy of Sciences' Institute of Oceanology.

He said the ocean remains one of the least instrumented places on Earth, with marine data still sparse and costly to collect.

This challenge is driving the development of marine AI models in hubs such as Qingdao, known as China's "capital of marine science".

At a recent Digital Earth conference, the Institute of Oceanology of the Chinese Academy of Sciences unveiled LangYa 2.0, an ocean AI model that forecasts typhoons, precipitation, sea ice, storm surges, internal solitary waves and mesoscale eddies.

The model's six vertical systems translate forecasts into formats usable by policymakers and coastal communities. Wang Fan said the system correctly predicted several sudden-turning typhoons last year, improving 24-hour forecast accuracy by more than 10 percent.

"With lightweight versions of large models, we can deploy them locally," he said, adding that this could offer lower-cost forecasting tools for developing regions.

In the Strait of Malacca, one of the world's busiest shipping lanes, fourth-generation underwater cleaning robots from ZhiZhen Marine Science and Technology (Weihai) Co scrape barnacles and algae from vessel hulls.

"Biofouling increases drag and fuel consumption, and can shorten a ship's lifespan. Traditional manual cleaning is inefficient, risky and no longer fits modern shipping," said Qin Mingda, head of the company's cleaning robot project.

The robots operate at depths of up to 150 meters and can clean 2,000 square meters per hour, work that would require several skilled divers. In 2025, they cleaned over 1,000 ships in Malacca waters, according to the company.

Officials have highlighted marine technology as a strategic priority in the 15th Five-Year Plan (2026-30), with emphasis on innovation and digital transformation.

Hubei rural courier bridges mountain communities

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

Before dawn breaks over the mountains of Hubei province, Zhang Qian is often already on the road.

On the days he drives to the Changyang Tujia autonomous county to collect parcels, Zhang gets up at 5:30 am and leaves his home in Xiufengqiao village at 6 am. The road winds through fog, slopes and sharp bends. In good weather, the trip to the county takes more than three hours. In winter, when ice forms on the road, he has to put chains on his tires, and the journey can take up to four hours.

For Zhang, 38, this has been part of life for more than a decade. Years on mountain roads have darkened his face, but when he smiles, he looks friendly and unpretentious.

His ZTO Express delivery station serves five villages spread across more than 200 square kilometers of mountainous terrain, where about 2,000 households live between 200 and 1,600 meters above sea level. Some of the most remote settlements are located more than 30 kilometers from his delivery station. In some places, vehicles cannot reach the door, and parcels have to be carried up stone steps by hand.

A modest role model

In May, Zhang was named one of China's Top 10 Couriers, a program usually held every two years to highlight role models among front-line delivery workers.

Yet, Zhang said, the title has not changed the way he sees his work.

"What I should do is continue to do my own job well," he said. "When villagers need help, I try to think of a way to help them. Many things are just small favors, but if I can do them, I should."

Zhang Qian

Zhang's story is not only about the hardships of a rural courier worker. It is also about how China's express delivery network, once concentrated in cities and towns, has been extending deeper into remote villages — bringing medicine, household appliances and consumer goods into the mountains, while helping local produce move out.

China handled 198.95 billion express parcels in 2025, up 13.6 percent year-on-year, according to the State Post Bureau. Express delivery services also reached more than 95 percent of China's administrative villages over the same period, giving most rural communities, including many remote settlements, access to parcel delivery services.

For Zhang, those national changes are reflected in the parcel volume at his own station: from only several parcels a day in the beginning, to about 200 around Spring Festival in 2016, more than 1,000 during peak periods in 2017 and 2018, and around 2,000 a day in recent years.

Business began at home

Xiufengqiao village, where Zhang was born in 1988, used to be a delivery blind spot. Zhang left home after graduating from college and worked on construction sites in Shenzhen, Guangdong province, earning about 8,000 yuan ($1,180) a month. After his grandfather died in 2013, he returned home to be closer to his aging parents.

"I always felt I was floating outside," he said. "When I came back, my first thought was simple — I wanted to stay near my parents."

At first, he opened a small grocery store. For Zhang, it was not a planned business strategy but a practical rural solution: use what the family already had and find a way to make a living at home.

His connection with the courier business began with a washing machine. When he tried to buy one for his family, he found that delivery could only reach the area, not the village. He had to borrow a vehicle and bring the bulky appliance home himself.

"In Shenzhen, express delivery was already very common. You could order online, receive goods quickly, and have many choices," he said. "But when I came back, I found there was no delivery service in our village."

In 2015, Zhang made a white light box sign with red characters announcing courier services and hung it outside his store. During the National Day holiday in October that year, young people returning home noticed the sign and asked whether parcels could be sent and received there.

"It was very troublesome at the beginning," he recalled. "I had to teach them step by step how to write the address — first to the county, then transfer it to me. Small parcels could be carried back by passenger buses, but I told them not to buy large items yet because I did not have a truck."

Soon, passenger buses could no longer handle the load. Zhang bought a secondhand truck, using it to bring goods for his store and parcels for villagers from the county.

Today, Zhang's station is operated by a team of six, including his father, his wife and three helpers. His two children, aged 6 and 8, have grown up around parcels. His oldest son sometimes helps call out phone numbers when villagers collect packages.

The work remains exhausting. On pickup days, Zhang drives to the county, visits different outlets to load parcels and usually heads back in the afternoon. He often arrives home between 7 pm and 9 pm. Sorting about 2,000 parcels can take five to six hours, and going to bed at 1 am is considered early.

His wife sometimes asks him to consider another line of work.

"She stays at the station, also our small grocery store, almost every day. It is repetitive and tiring for her," Zhang said. "We do not rest much, except for a period during Spring Festival."

The business has not made him wealthy. Zhang describes his income as average locally. But he said the job has allowed him to stay with his family, build a life in his hometown and serve people he has known since childhood.

For villagers, the service has changed daily life in concrete ways.

"Now even villagers over 80 can shop online," Zhang said. "They tell me it is convenient. Things they had never seen before, things they saw on the phone but did not dare to try, they can now buy. If they do not like them, they can return them."

Medicine, rice cookers, washing machines, furniture and gifts from children working in cities now arrive at the village station. For elderly residents whose children live far away, parcels have become a way of maintaining family ties.

Goods move both ways

The flow goes both ways. Zhang's truck brings consumer goods into the mountains and takes local products out. He has nearly 5,000 contacts on WeChat, including local villagers and their children living elsewhere. When villagers have fruit or other produce to sell, he helps share the information and collects only the delivery fee.

Tang Yingquan, director of the Changyang postal industry development center, said Zhang's station has shortened delivery times and helped villagers develop e-commerce and cooperatives. "A parcel delivery station is like a link between the city and the countryside," Tang said.

Despite being held up as an industry role model, Zhang is more modest about his role.

At dusk, when lights begin to appear in village homes, Zhang is often still sorting waybills at the station. In his truck, villagers sometimes leave apples, chestnuts or kiwifruit — small gifts from households that see him not merely as a courier, but as a familiar link to the world beyond the mountains.

"I am just doing my part," he said. "But if the villagers need me, I will keep running."

LIFE

Popular Peking Opera actress takes cues from but never replicates the movements and emotions of famous *hua dan* performer Tong Zhiling, **Chen Nan** reports.

GUIDED BY A LEGACY

During rehearsal, some moments in time seem to bend. A phrase of song is repeated once, then again — never quite the same, yet never entirely different. A gesture shifts by a few centimeters, and suddenly the emotional logic of a scene transforms.

For Peking Opera actress Wang Mengting, who is working on the classic, *The Butterfly Dream*, these moments often carry an uncanny sensation, as if someone she has never met is quietly guiding her from the side of the stage.

"I often imagine how Tong Zhiling would do it," Wang says. "Not as imitation, but as a conversation across time. I try to allow her logic and inner rhythm to guide me."

It is in this delicate space — between reconstruction and imagination — that a major Peking Opera revival takes shape. The production, *The Butterfly Dream*, premiering in June 2026 across Tianjin (June 5 and 6), Shanghai (June 13 and 14) and Beijing (dates to be announced), seeks to bring back the legacy of Tong Zhiling (1922-95), one of Peking Opera's most innovative and nuanced performers.

Also known as *jingju*, Peking Opera dates back over 200 years and was recognized as an Intangible Cultural Heritage of Humanity by UNESCO in 2010. It blends art forms such as singing, dancing, martial arts, and acrobatics.

Born in Tianjin into a family devoted to Peking Opera, Tong Zhiling trained under the legendary "*dan*" *(female role)* master Xun Huisheng (1900-68), one of the "four great *dan*" along with Mei Lanfang (1894-1961), Cheng Yanqiu (1904-58), and Shang Xiaoyun (1900-76). Tong became renowned for *hua dan* roles — lively young women — admired for her subtle gestures, refined singing, and nuanced character portrayals.

She also studied under Wang Yaoqing (1881-1954) and Mei, absorbing the finest traditions while cultivating her own style. Together with her siblings, she formed the famed "Tong family troupe", dazzling audiences in classics such as *The Phoenix Returns Home* and *Hong Niang* from *Romance of the Western Chamber*. Her artistry extended to film, including the acclaimed 1963 Peking Opera film *You Sanjie*. She joined the Shanghai Peking Opera Company in 1954.

A master of emotional depth and technical finesse, Tong Zhiling's performances were celebrated for their grace, subtlety and enduring vitality — qualities that continue to inspire performers and audiences alike.

Wang Mengting first encountered Tong's work through fragments, including archival clips and occasional broadcasts. At first, they were enchanting but elusive, like glimpses of a distant star. Only after formal training under master Sun Yumin (1940-2023) did those fragments coalesce into a coherent artistic language. What emerged was not a rigid system, but something fluid, intimate and profoundly human.

Tong's artistry, Wang Mengting observes, is built on "instability in precision"; no movement is mechanically repeated. Every gesture, every lift of the hand, every flicker of the eyes arises from the character's immediate emotional state. Even familiar roles shift night to night, responding to the flow of the story, stage atmosphere and interplay with other actors.

Top, middle, above left: Capturing the timeless grace of Peking Opera, actress Wang Mengting brings classical roles to life in three distinct, expressive poses. **Above right:** Tong Xiaoling, daughter of famous *hua dan* performer Tong Zhiling idolized by Wang Mengting. PHOTOS PROVIDED TO CHINA DAILY

"She doesn't perform from templates," Wang Mengting says. "She performs from the given situation. Every gesture grows organically from the moment. That is where her artistry lives."

The tribute program includes *The Butterfly Dream*, *Silang Visits His Mother*, excerpts from *You Sanjie*, *Romance of the Dragon and the Phoenix*, and *Stealing the Soul Bell*. Among them, *The Butterfly Dream* represents the most delicate reconstruction effort. Its performance history is fragmented, with incomplete documentation and stage tradition largely absent from contemporary repertoires.

Wang Mengting describes the process as navigating "without a complete map". Some references exist in overseas recordings, including versions reconstructed by Tong Zhiling's daughter, Tong Xiaoling, in the United States. But much of the staging must be rebuilt through interpretive logic and an understanding of how a character thinks, hesitates, or expresses joy or fear within Tong's artistic system.

> "I often imagine how Tong Zhiling would do it. ... as a conversation across time. I try to allow her logic and inner rhythm to guide me."
>
> **Wang Mengting,** Peking Opera actress

The scene in which the emotional reunion of husband and wife after years apart became central. Wang Mengting didn't ask, "How did she move her hand?" She asked, "What emotion produces that movement?

"It's less about copying her," she says, "and more about understanding the inner movement that generates the outer shape."

Wang Mengting, 36, born in Shenyang, Liaoning province, is a leading Peking Opera actress of the younger generation, specializing in the Xun School *hua dan* roles. Her journey began at age 7 and culminated in her joining the Beijing Peking Opera Company in 2009.

For Tong Xiaoling, Tong Zhiling's daughter, her mother's life was less biography than continuous motion.

"She was always inside Peking Opera," she recalls. "Even at home, she was rehearsing, thinking, and refining. The stage never ended for her."

Immersed in the art from a young age, Tong Xiaoling moved to the United States in the early 1980s. There, she carried forward her mother's legacy, touring Europe and the US, collaborating with composer Tan Dun, and presenting master classes in schools and cultural centers.

In childhood, Peking Opera was a constant presence. While other children read stories from books, Tong Xiaoling absorbed them through sound — arias rehearsed endlessly in the next room, and scenes repeated until they became involuntary memory. By the 1980s, the family home had become an informal creative laboratory where senior artists gathered to test, dissect, and rebuild scenes.

Yet, outside this world of artistic labor, Tong Zhiling remained quietly austere. "She never cared about appearance," her daughter says. "Only about whether the role was right."

Even in her later years, Tong Zhiling rarely repeated a role the same way twice. For Wang Mengting, this becomes both a challenge and a method: study deeply, then re-activate rather than reproduce.

"The key," Wang Mengting says, "is not to look like her, but to think like her on stage."

Wang Mengting has also championed digital outreach, introducing Peking Opera to younger audiences through rehearsal videos, interpretive explanations, and livestreamed performances.

"Young audiences are already close to this art," she says. "They just need a way in. Appreciation has no universal standard. Peking Opera is diverse, just like people's tastes. Our job is to provide that window."

Traditional culture breathes anew under youthful innovation

At a time when voices can easily be lost in the overwhelming volume of online information, many young people in China are finding new ways to make themselves heard.

In the recently completed web novel *When the Curtain Falls* by 26-year-old writer Wang Huaiyu, elements of intangible cultural heritage, including traditional Chinese opera, lion dance and Suzhou (Jiangsu province) embroidery, are woven into a story that has drawn more than 66 million views.

Wang is among a group of young writers incorporating traditional cultural elements into online literature, a genre that has gained wide readership in recent years. He previously drew widespread attention with an earlier work that garnered more than 100 million views and was later adapted into an animated series.

The success reflects a broader trend in China, where a new generation is rediscovering traditional culture not by preserving it behind museum glass, but by reimagining it through web novels, animation, fashion, and social media.

With China's 14 to 35 population expected to remain around 350 million by 2030, young people are increasingly viewed as a key force driving technological innovation, industrial transformation and cultural creativity. Cities including Beijing and Shanghai have also rolled out measures to support youth entrepreneurship and innovation in cultural industries.

Wang says he incorporates extensive elements of traditional Chinese culture in his work, from worldbuilding and naming systems to character design, describing tradition as the "root and foundation" from which creators draw inspiration and reinterpretation.

He devoted considerable time to studying traditional Chinese opera and consulting experts, including a renowned inheritor of Suzhou embroidery.

"Like many young people of my generation, I became interested in traditional culture after spending a lot of time learning about it," Wang says, adding that as the internet continues to expand its reach, young people are becoming increasingly open to traditional culture.

Wang's success story is not scarce in the field of online literature, which has gained a growing international reach. The narratives of defying fate and chivalry, along with restrained yet powerful forms of emotional expression, are both distinctively Chinese and accepted globally, says cultural scholar Li Hao.

In 2025, *Lantern Festival Joy*, a Song (960-1279) Dynasty-themed novel by Wang Yurong, in her 30s, was adapted into a micro-drama translated into multiple languages, including English, French and Vietnamese, attracting more than 30 million overseas views.

Abroad, the original creator community now exceeds 1.3 million people, producing more than 2 million works with overseas market revenue reaching 5.64 billion yuan ($834.6 million), according to a 2025 report.

Beyond online literature, similar shifts are visible in cultural entrepreneurship.

Driven by the belief that "old treasures should adapt to modern life," Shi Yi, an entrepreneur from Suzhou born after 1995, has built a career reinventing Song brocade, a silk textile known for its intricate craftsmanship. Inscribed on UNESCO's List of Intangible Cultural Heritage in 2009, the art form's revival has been driven not only by traditional artisans but also by a new generation of innovators like Shi.

Inspired by a "digital motif archive" at the Suzhou Silk Museum, Shi selects classic patterns, such as cloud motifs, scrolling floral designs and bird-and-flower imagery, and reinterprets them into products ranging from handbags and cushions to notebooks and even tea tables.

"We must recognize that today's lifestyles are very different from the past," Shi says, adding that the key is creating modern applications that encourage people to use and wear these cultural products in their daily lives.

Innovation has also expanded the boundaries of the industry itself. Shi's tailor shops morphed into a silk brand with annual sales approaching 5 million yuan. Recently, her silk brooch collection, inspired by ancient Chinese women playing polo, was showcased in Paris and received wide acclaim.

China's cultural and creative industries have expanded alongside such individual efforts. The sector reached 99.98 billion yuan in 2024, up 7.98 percent year-on-year. Products tied to cultural IPs have also seen strong sales in recent years, including a phoenix-crown fridge magnet that has sold more than 1 million pieces annually and a game skin inspired by Dunhuang motifs with sales exceeding 40 million pieces.

Young Chinese today are increasingly using social media and digital storytelling to connect cultural heritage with wider audiences. A 2025 report by China Youth Daily found that 88.7 percent of young respondents were willing to promote China-chic culture, while 91.4 percent said that more China-chic IPs would gain international reach.

Scholars have pointed to a shift in mindset fueled by economic affluence. China's post-2000 generation, having grown up during a period of rapid national development, possesses the confidence to engage with the world on equal footing, Hu Xianzhong, a professor at China Youth University of Political Studies, notes in an article.

This confidence is increasingly expressed through the global presence of *hanfu*, traditional music and other cultural forms, he says.

Ma Ruomeng, a Chinese designer based in Italy, often performs the *pipa* (four-stringed lute) in traditional attire in the streets of Milan during her spare time. She also participates in local cultural exchange events, introducing audiences to traditional Chinese folk music.

Since 2023, Ma has also been recording her street performances and posting them online. "Music is my way of communicating with the world," she says, adding that she hopes to experiment with rock and other modern genres, using music to connect people from different cultural backgrounds.

According to a 2025 ByteDance report, more than 870,000 creators with over 10,000 followers posted content related to intangible cultural heritage on Douyin, the Chinese version of TikTok, while the number of post-2000 users producing such videos rose by 63 percent year-on-year.

Liu Yajing, a content creator who focuses on recreating traditional craftsmanship and has over 20 million followers across platforms, says the key to promoting intangible cultural heritage lies in "authentic experiences and genuine storytelling".

She hopes to serve as a bridge between audiences and cultural heritage, inspiring viewers of her videos to further explore the essence of traditional culture on their own.

CULTURAL HERITAGE

Buried mine rewrites the past

A breakthrough discovery proves China's Bronze Age developed independently through advanced engineering, **Deng Zhangyu** reports in Daye, Hubei.

In 1928, archaeologists unearthed a vast collection of bronze artifacts dating back about 3,300 years at the Yinxu Ruins in Anyang, Henan province, including a massive bronze vessel weighing 832.84 kilograms. The discovery raised a fundamental question: Who produced such a large quantity of bronze, and where did the copper originate? Despite decades of research, no definitive answers emerged, prompting some scholars to speculate that China's bronze culture may have had foreign origins.

A breakthrough finally came in 1973. At a mining site in Daye, Hubei province, archaeologists discovered copper axes, the largest weighing 16.3 kg, revealing an ancient mine that had been buried for more than 2,000 years. The site is now known as the Tonglushan Ancient Copper Mine.

Years of archaeological investigation suggest that mining at the Tonglushan site was most active from the Shang Dynasty (c. 16th century-11th century BC) to the Western Han Dynasty (206 BC-AD 24), spanning over 1,000 years.

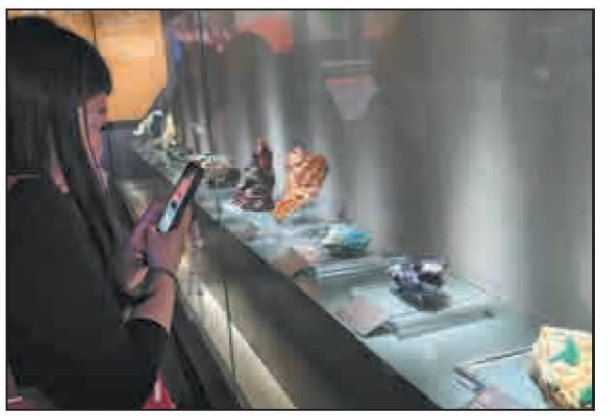
"This discovery finally provided the long-sought answer to the source of raw materials for bronze artifacts, rewriting the history of China's ancient bronze civilization," says Wu Hongtang, a veteran archaeologist who participated in the site's first excavations in the 1970s.

According to Wu, Tonglushan is an ancient mining and smelting complex distinguished by its long period of operation, large scale, complete production chain, advanced technology, and exceptional state of preservation.

To date, archaeologists have identified more than 100 mining and smelting sites and over 250 ancient tombs, along with a wealth of mining tools and traces of daily life.

Wu notes that among the many ancient copper mining sites discovered in China, Tonglushan is the only one where miners' tombs have been found.

Fewer than 300 artifacts have been unearthed from these tombs. Among them are two high-status burials, believed to belong to a mining engineer and a site supervisor, containing valuable objects such as copper knives, jade artifacts, and small bronze cauldrons.



"The limited number of unearthed artifacts suggests that the living conditions for ordinary miners at the time were extremely harsh. The differences among the tombs also reflect the class distinctions of that era," Wu explains.

One of the site's most remarkable discoveries is a set of 35 barefoot footprints left by ancient miners. In 2012, Chen Shuxiang, a researcher at the Hubei Provincial Institute of Cultural Relics and Archaeology, and his colleagues uncovered the footprints during an excavation.

The prints vary in condition, with the longest intact footprint measuring 26 centimeters. Based on their characteristics, experts identified them as ancient barefoot impressions. Judging from their depth and surrounding evidence, Chen says he believes the miners were likely carrying heavy loads while crossing wet ground.

Chen notes that some mining shafts reach depths of 60 to 80 meters. Yet, no human remains have been found inside them, suggesting that no major underground accidents occurred during the site's long history of operation.

At the Tonglushan Site Museum, visitors can view a vast archaeological excavation resembling an "underground labyrinth". The original mining site, a dense network of shafts and tunnels, has been preserved in situ beneath a protective exhibition hall measuring 36 meters long and 30 meters wide, built in 1984.

Top: An aerial view of the Tonglushan Ancient Copper Mine site. **Center:** Different types of copper ore are on show at the Tonglushan Site Museum. **Above:** A bronze ax (left) dated about 2,000 years ago and a bronze battle-ax from the Western Zhou Dynasty (c. 11th century-771 BC). **Below:** Malachite unearthed from the Tonglushan site was used by ancient miners to locate copper deposits. PHOTOS PROVIDED TO CHINA DAILY AND BY DENG ZHANGYU AND SUN MENG / CHINA DAILY

An archaeological site at the Tonglushan Site Museum shows an "underground labyrinth" of criss-crossing shafts and tunnels.

Viewed from above, visitors see a "maze" of vertical shafts, inclined passageways, horizontal tunnels, and blind shafts supported by wooden structures.

Drainage channels and wooden troughs weave through the complex, offering a vivid picture of how ancient miners excavated ore and maintained underground operations.

The museum's new building, opened in June 2023, features five themed exhibition halls that explore how ancient people located copper deposits, developed mining techniques, mastered smelting technology, and transported bronze materials across the region.

Wu says that in ancient times, people often located copper deposits by looking for a plant called *Elsholtzia splendens*, which has red stems and green leaves. It resembles a toothbrush and produces purple flowers.

Every November, when the flowers are in full bloom, Tonglushan Mountain is covered in a sea of purple.

The site's copper-smelting technology was remarkably advanced. Ancient metallurgists developed a stone-built shaft furnace into which alternating layers of ore and charcoal were loaded. Unlike contemporary furnaces in Mesopotamia, which were typically used only once, these furnaces could be reused repeatedly.

It is estimated that the mining area produced about 400,000 metric tons of ancient slag, yielding between 80,000 and 120,000 tons of crude copper. The copper ingots smelted had a copper content of over 93 percent, while the slag contained only 0.7 percent copper — evidence of highly efficient purification techniques.

"This level is remarkably close to modern standards," Wu says.

Scientific testing has since confirmed that the elemental composition of copper used in bronze artifacts from the Panlongcheng site in Wuhan, Hubei province, and the bronzes found in Fu Hao's tomb at Yinxu matches that of copper from Tonglushan.

The findings provide strong evidence that Tonglushan served as a major source of copper for China's bronze industry in ancient times, "proving that China's bronze civilization developed independently and formed its own system", Wu says.

Daye, where the Tonglushan site is located, is adjacent to the Yangtze River. At that time, the transportation route likely involved moving goods via the Yangtze River to an ancient dock in Nanyang, Henan, and finally reaching the ancient capital Luoyang, then a major political and cultural center.

"The abundant copper resources in the middle reaches of the Yangtze River, combined with bronze smelting and casting technologies that spread southward from the Central Plains dynasties in northern China, together created the bronze civilization of the Yangtze River basin," says Zhang Changping, a history professor from Wuhan University.

Ancient capital opens its hidden doors to visitors

By **DENG ZHANGYU** and **LIU KUN** in Tianmen, Hubei

Around 5,900 to 3,800 years ago, a thriving civilization flourished along the middle reaches of the Yangtze River. Its people built a vast city, engineered sophisticated waterworks, mastered jade carving, developed a highly organized pottery industry, and conducted elaborate religious rituals. Today, archaeologists know it as the Shijiahe Culture.

At the Shijiahe Site Museum in Tianmen, Hubei province, visitors can now explore this civilization.

The museum, roughly the size of a football field, opened on May 18 and features six exhibition halls. Its focus spans ancient urban planning, religious practices and jade craftsmanship, displaying over 800 valuable artifacts — including pottery, jade and stone tools — that shed light on the archaeological discoveries and historical significance of the Shijiahe site.

"The Shijiahe site is remarkable for its vast urban scale, long period of continuous occupation, rich cultural remains and distinctive regional character," says Wang Wei, a veteran archaeologist at the Chinese Academy of Social Sciences.

"Particularly striking is the abundance of remains linked to spiritual beliefs, something rarely seen at contemporary sites elsewhere," Wang says.

According to Fang Qin, director of the Hubei Provincial Institute of Cultural Relics and Archaeology, Shijiahe was the largest prehistoric urban center and the most densely populated settlement cluster in the middle reaches of the Yangtze River during the late Neolithic period.

Listed among China's Top 100 Archaeological Discoveries of the Past Century, the site has undergone more than 20 excavations since its discovery in 1954. Its culture developed continuously for about 2,000 years, making it the longest-occupied settlement among China's major prehistoric urban sites.

Fang, who has spent decades studying the culture, says the ancient city covered nearly 3.5 million square meters — more than four times the size of the Forbidden City in Beijing.

Distinct functional zones included residential quarters, ceremonial spaces, pottery workshops and cemeteries. An advanced water-management network served irrigation, flood control and defensive purposes.

Among the site's most celebrated finds are its jade artifacts, considered a pinnacle of prehistoric Chinese craftsmanship. More than 400 jade pieces have been unearthed, depicting deities, phoenixes, eagles, tigers and cicadas with extraordinary artistry and refinement.

Phoenix imagery was especially prominent.

A star jade phoenix, now housed in the National Museum of China in Beijing, is renowned as "China's first phoenix" for its highly stylized circular design.

Equally intriguing are depictions of deities believed to represent ancestral figures.

Highlights include two interconnected deity faces and another showing a deity with two eagles perched atop its head. Despite their complexity, many of the carvings are no larger than a fingernail.

"These jade artifacts were likely used in ritual ceremonies to communicate with the spiritual world," explains Fang.

The pottery unearthed at the site also reflects the wisdom and imagination of the prehistoric inhabitants. The museum exhibits its lively clay sculptures of birds, chickens, pigs, and dogs, as well as a contemplative figure that recalls Auguste Rodin's *The Thinker*.

Nearby, at the Sanfangwan site, archaeologists uncovered an 8,000-square-meter workshop dedicated to the production of red pottery cups. According to Hu Yongmei, deputy director of the Shijiahe Site Museum, it is the largest Neolithic pottery workshop ever discovered.

From top: Two jade deities' faces connect to each other. Pottery jars and pots are widely found in the sacrificial area at the Shijiahe site. Shijiahe Site Museum in Tianmen, Hubei province, opens to the public. PHOTOS BY DENG ZHANGYU / CHINA DAILY

Hu says that the large number of red pottery cup remnants indicates possible trade with other regions.

Near the kiln site, a large ritual area with numerous pottery jars and pots was uncovered, which archaeologists believe were used to hold ritual offerings.

"The sophistication of both the jade and pottery industries points to a highly specialized division of labor," Hu says.

To help visitors visualize the ancient world, the museum offers an immersive digital production titled *Seeing Shijiahe*. Combining holographic projections, moving mechanical displays and environmental effects such as wind, mist and vibration, the experience recreates dramatic scenes ranging from floodwaters breaching city defenses to grand rituals and phoenixes soaring across the sky. All props are produced using high-precision 3D-printing technology.

With no fixed seats or traditional stage, the audience becomes "discoverers of civilization", traveling 5,000 years back to "touch" ancient culture, according to director Fan Yupeng.

Fan says that since there are no visual or written records to draw from, the production was built on archaeological evidence and expert interpretation, balancing imagination with academic rigor.

"By recreating archaeological scenes through immersive performance, we can bridge the distance between modern audiences and ancient history," he says.

"In doing so, we hope visitors gain a deeper understanding of Shijiahe culture and its enduring legacy."

WORLD CUP 2026

Seventh heaven for dominant Germany

Four-time champion runs riot following tight first half that saw minnow debutant Curacao score historic equalizer

Germany's Nico Schlotterbeck celebrates scoring his team's second goal during its 7-1 World Cup Group E victory over tournament debutant Curacao at Houston Stadium, usually known as the NRG Stadium, in Texas, on Sunday. **Inset:** Jamal Musiala slots the ball past a diving Eloy Room for Germany's fourth goal. AGENCIES

Germany's seven-goal rout of Curacao in its World Cup opener on Sunday was the perfect way to overshadow a close first half and boost the team after consecutive group-stage exits for the four-time champion.

Kai Havertz scored two goals as Germany pulled away from World Cup debutant Curacao and piled it on in a 7-1 win in the Group E match. The smallest country to ever appear in the tournament, however, managed to hang tight at 1-1 until the 38th minute.

"We really needed this convincing win," coach Julian Nagelsmann said. "We needed this self-confidence. It was there, but it definitely grew."

He said the display was important for the country's fans.

"We have to show them that we can perform and we have to have the confidence," he said. "I think we're in a better spot than we were entering this match."

Livano Comenencia tied it at 1-1 with his left-footed shot through traffic from the center of the box in the 21st minute to give Curacao its first goal in the tournament and send fans of the tiny Caribbean nation into a frenzy.

"Even though it wasn't me, it felt like it was me, it was all of us, the whole island, everybody," Curacao's Jearl Margaritha said. "We screamed our lungs out. We were so happy."

It was all Germany after that, with the European powerhouse regaining the lead through Nico Schlotterbeck's header off Nathaniel Brown's corner kick in the 38th.

"One team has very high expectations and the other one doesn't, and that's a bit tricky," Nagelsmann said.

The six-goal margin was well short of the World Cup record of nine, which has happened three times, most recently when Hungary beat El Salvador 10-1 in 1982. And the performance from the Germans was much more expected than the last time they won 7-1 in a World Cup, beating host Brazil in the 2014 semifinals.

A Havertz penalty, awarded after Felix Nmecha was tripped in the box by Riechedly Bazoer, made it 3-1 in first-half stoppage time.

Germany wasted no time after the turnaround, extending its lead when Jamal Musiala scored on a right-footed shot across the goalkeeper's area in the 47th minute.

Brown scored in the 68th to push the advantage to 5-1. The 22-year-old has an American father, but made it clear ahead of the World Cup he'd be representing the country in which he was born and raised by his mother.

Deniz Undav added a goal in the 78th minute. Havertz's second came in the 88th.

Germany is seeking redemption after failing to get out of the group stage in both Russia and Qatar following its 2014 title.

"We are on the right path, but of course there are things that we can do better, and we will have stronger opponents," Nagelsmann said.

Nmecha one-timed it with his right foot inside the near post from just inside the box off an assist from Florian Wirtz in the sixth minute to kickstart the scoring spree.

Curacao's Livano Comenencia celebrates his historic goal during a World Cup Group E match against Germany on Sunday. AFP

Fans in the Curacao capital Willemstad cheer during their team's World Cup debut against Germany on Sunday. REUTERS

The crowd of 68,021 was overwhelmingly rooting for Germany, but there was a spirited contingent of people cheering on Curacao.

It was the first match of the tournament at NRG Stadium, home of the NFL's Houston Texans.

Manuel Neuer, the 40-year-old goalkeeper who came out of international retirement for the tournament, made just one save in his first appearance for Germany in almost two years.

The match featured the largest age gap between coaches in World Cup history with Curacao's 78-year-old coach Dick Advocaat becoming the oldest ever in the tournament, opposite 38-year-old Nagelsmann, who is the youngest coach at this year's event.

Feeling proud

"This is not a disgrace," Curacao coach Advocaat said. "I think we can still be proud."

It was an emotional day for the septuagenarian, a World Cup veteran who coached the Netherlands at the 1994 tournament and South Korea in 2006. He wept before the game as his team, from a country of just 158,000, made its historic World Cup debut.

"This is related with the joy of the people in Curacao," he said. "It may be a matter of my age, but this is when the emotion comes to the surface. I don't really like it… (but) the joy of the people is fantastic."

Comenencia's goal gave Curacao confidence early, and was yet another milestone in the team's historic run.

"The goal was absolutely fantastic for all of us, for the nation as well," winger Kenji Gorre said. "It's more history being made. The first goal ever scored on the world stage, it's just phenomenal and we're all grateful that we were here to experience it (with) all the people in the stadium."

Nagelsmann was impressed with the fight shown by Curacao and noted that it can be dangerous when an underdog gets confidence.

"The opponent played better than many in Germany expected," he said. "They played with a lot of courage."

While Curacao was proud to have stuck with a powerhouse like Germany for most of the first half, there was disappointment at the final score. Curacao had the biggest goal difference in a defeat of a nation making its World Cup debut since South Korea lost 9-0 to Hungary in 1954, according to Opta.

"Mixed emotions, mixed feelings. On one side you think, 'wow, we've made history by coming to the World Cup,'" Gorre said. "On the other, it's like, 'wow, we wish that we could have got some points.' But, we're playing against the world's best, and the world's best punish you at every opportunity they can. And you see that they punished us seven times from mistakes that we made."

Curacao will be hoping that the experience gained Sunday will help it go forward, as the team gears up for its next game against Ecuador in Kansas City on Saturday.

"We still have matches to play, and things can still end up differently," Advocaat said.

Japan comes from behind twice to clinch 2-2 draw with the Netherlands

ARLINGTON, Texas — Japan scored an 89th-minute equalizer, twice fighting back to rescue a 2-2 draw with the Netherlands in Texas on Sunday as they opened their World Cup campaigns.

A match in front of 69,285 spectators that had bubbled away in the first period sparked into life in the second half.

Netherlands skipper Virgil van Dijk scored with a fine header, only for Keito Nakamura to quickly level, before winger Crysencio Summerville's delicious curled finish into the bottom corner just after the hour.

The Dutch side looked like it would hold on, but Japan leveled at the death with Crystal Palace midfielder Daichi Kamada credited with the goal after a deflection.

"We are not completely satisfied with the draw," said Japan coach Hajime Moriyasu, whose side faces Tunisia on Saturday in a competitive-looking Group F.

"But the Netherlands are a top-class team and we tried to compete at the same level.

"We were tenacious but patient, and kept calm."

Japan and the Netherlands are missing key players through injury, but on paper this was still one of the more attractive fixtures in the group stage.

Left: Virgil van Dijk celebrates scoring the Netherlands' first goal against Japan during a World Cup Group F match in Arlington, Texas, on Sunday. **Right:** Japanese players celebrate their side's second goal against the Dutch. AP

Both have been touted as dark horses capable of going far at the tournament — the Dutch have been runners-up three times whereas Japan has never gone beyond the last 16.

Netherlands coach Ronald Koeman, the former defender charged with finally delivering World Cup glory, was given a grilling by Dutch media afterwards, especially for his substitutions.

"I am disappointed that we did not get the win," said Koeman, who pointed the finger at his side's defending.

"But I am not that negative," he said to one particular line of questioning that he took exception to.

"I saw a team that has made great progress," he added of his men.

"Of course, we can perform better and we need to grow during the tournament."

Chaotic leveler

The Netherlands made a confident start and nearly took the lead after three minutes, Donyell Malen swiveling and forcing a smart save from Zion Suzuki.

The impressive air-conditioned arena is usually home to the Dallas Cowboys, and at the hydration break, the NFL team's cheerleaders were shown on the massive screen hanging over the pitch performing one of their routines.

The stoppage seemed to help the Dutch, and Roma forward Malen again worked Suzuki with a header from a corner.

Japan's fans, who had hardly stopped singing and outnumbered the Dutch contingent, were briefly silenced.

The first real chance for Moriyasu's team came a few minutes before the break when a cross evaded the backtracking Summerville, but Nakamura pulled his effort wide.

The Dutch had looked most threatening in the air, so it was no surprise when Liverpool talisman Van Dijk rose to plant a well-placed header into the bottom corner after a pinpoint cross from his Premier League clubmate Ryan Gravenberch on 51 minutes.

The lead lasted just six minutes, as Nakamura wriggled free and fired low past goalkeeper Bart Verbruggen, the ball taking a small deflection off Jan Paul van Hecke.

In a madcap period of play, the Dutch forged ahead once more on 64 minutes, when West Ham's Summerville beat his man on the right wing and curled into Suzuki's bottom-right corner with his left foot.

Both teams rang the changes and had chances to score again, before Kamada's chaotic 89th-minute leveler from a corner.

A flurry of second-half goals saw Sweden beat a tenacious Tunisia 5-1 in Sunday's other Group F match.

XI'S VISION | GOVERNANCE PERFORMANCE

Unremitting efforts seen as key to progress

Party's governance approach stresses tenacity, sustained work, lasting results

By **ZHAO JIA**
zhaojia@@chinadaily.com.cn

For years, Xingtang county in Hebei province was shadowed by a local saying that played on its name: "*Xingtang bu xing*" — Xingtang cannot do it.

The saying reflected more than a play on words. Along the eastern foothills of the Taihang Mountains, several counties had long struggled with constraints of terrain and resources. In Xingtang, a traditional agricultural county, quality farm products often failed to reach wider markets because they lacked strong brands and sales channels.

When Zou Guoyu arrived in Xingtang, he saw that changing the county's prospects would require more than short-term assistance. He was among the 13 officials assigned by the International Department of the Communist Party of China Central Committee to work in the county over the past decade. Their work focused on opening markets, building brands and strengthening the county's own capacity for development.

Those efforts gradually paid off. Xingtang red dates were selected as State gifts, honey produced in the county reached Southeast Asian markets, and the county's public brand for local specialties gained wider recognition.

What happened in Xingtang was not a single breakthrough, but a relay — one group of officials after another carrying the work forward and helping turn an old saying of resignation into a new confidence: Xingtang can.

That relay offers a window into the CPC's emphasis on establishing and practicing a correct view of governance performance, a theme repeatedly stressed by President Xi Jinping since the 18th CPC National Congress in 2012 and one that became this year's focus of a Party-wide education campaign. It is a view that values sustained work, long-term public benefit and results that can stand the test of time.

The logic behind such a relay can be traced to Xi's earlier poverty reduction work in Ningde, Fujian province, where he served as Party secretary from 1988 to 1990, when the region was among the poorest areas in Fujian.

In *Up and Out of Poverty*, which collects Xi's speeches and articles from his work in Ningde, he wrote that fundamentally changing poverty and backwardness required the people to carry forward the tenacity of "dripping water piercing stone" and make long-term, unremitting efforts.

In *Xi Jinping in Ningde*, a book published in 2020 that collects 19 interview accounts about Xi's work experiences in Ningde, an interview account recalled that Xi cautioned local officials against expecting poverty to be fundamentally solved simply by projects, or expecting to become rich overnight.

The emphasis on patience, local realities and sustained effort later became part of China's nationwide fight against absolute poverty. In the new era, poverty alleviation was pursued not as a short burst of assistance, but as a systematic effort carried out across regions, levels of government and successive stages of policy.

By 2021, China had secured a complete victory in the fight against absolute poverty. Under the current standard, 98.99 million rural residents living in poverty had been lifted out of poverty, 832 impoverished counties, including Xingtang, had been removed from the poverty list, and 128,000 impoverished villages had shaken off poverty.

However, the achievement was not treated as the end of the task. Even before that milestone was reached, the central leadership had begun planning the next stage. At the Central Rural Work Conference in December 2020, Xi called for efforts to consolidate and expand poverty alleviation achievements and align them with rural vitalization, in order to ensure a smooth transition without gaps in work or policy support.

For long-term tasks, Xi has always stressed the need to maintain a strategic resolve and patience, and to follow through on sound blueprints with sustained effort. He once said that existing plans and arrangements should be carried forward from one term to the next if they are sound, suited to new practical requirements and in line with the people's aspirations.

Lebanon 'greatest test' for US-Iran talks

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Delegations from the United States, Iran and regional mediators have started talks in Burgenstock, Switzerland, with an aim to advance the Memorandum of Understanding signed between Washington and Tehran last week, with analysts saying that Lebanon constitutes the "greatest test" for the talks.

Inside

Editorial, **page 8**

The high-level meeting is taking place amid renewed tensions over the Strait of Hormuz following conflicting accounts from Iran and the US, and with Tehran accusing Washington and Tel Aviv of truce violations amid continued violence in Lebanon. Israel and Hezbollah renewed their truce on Friday.

Qatari Foreign Ministry spokesman Majed Al-Ansari said on Sunday that the parties to the meeting in Switzerland had established technical groups to negotiate the terms of a final peace deal between Tehran and Washington, which is due within 60 days of negotiations.

Specialized technical groups have been formed to "negotiate the terms of a final agreement, which will cover all aspects of the memorandum of understanding", Al-Ansari told the Qatar News Agency.

Meanwhile, Iran's semi-official Tasnim news agency reported on Sunday that the country will not reopen the Strait of Hormuz if the war in Lebanon is not ended, citing a source close to the Iranian negotiating team.

The source warned that if Israel's "crimes" in Lebanon continue, and Lebanon's territorial integrity is not guaranteed, Iran will hold no negotiation on other issues.

The Iranian delegation, led by Parliament Speaker Mohammad Bagher Ghalibaf and Foreign Minister Abbas Araghchi, arrived in Switzerland on Saturday.

Speaking to the Islamic Republic News Agency, Iranian Foreign Ministry spokesman Esmaeil Baghaei said that the ongoing conflict in Lebanon between Israel and Hezbollah, frozen Iranian funds and the sale of the country's oil will top the agenda in talks with the US in Switzerland.

Trita Parsi, executive vice-president of the Quincy Institute for Responsible Statecraft, told Al Jazeera that "Lebanon has always been the greatest vulnerability to this deal because this is really crucial to the Iranians".

Ryan Costello, the policy director at the National Iranian American Council, also said Lebanon poses the "greatest test" for the ceasefire deal. "I would not be surprised at all if there is a breakdown in the broader negotiations," he was quoted as saying by Al Jazeera.

Prior to departing for Burgenstock, US Vice-President JD Vance said that success in Switzerland starts with establishing the structure of the negotiations, as US and Iranian officials begin the next phase of talks.

He said the focus will be on making progress on Iran's nuclear program and the Lebanon ceasefire, while technical teams remain on the ground to work through the details, Fox News reported.

Pakistani Prime Minister Shehbaz Sharif said in a post on social media platform X on Saturday that in his call with Saudi Crown Prince Mohammed bin Salman, they agreed that the next phase of negotiations "must remain anchored in a firm commitment to dialogue and diplomacy, along with vigilance against any attempts that could undermine the peace process".

Sharif is also in Switzerland for the high-level meeting, along with Pakistan's Chief of Army Staff Field Marshal Syed Asim Munir.

Israeli airstrikes killed at least seven people and wounded one in eastern and southern Lebanon, Lebanon's National News Agency reported on Sunday. On Saturday, Israeli attacks killed 16 people and wounded 12 in Nabatieh district in the south of the country, Al Jazeera reported, citing the Lebanese Civil Defense agency.

An Israel Defense Forces soldier was killed during an alleged attack by Hezbollah on Saturday morning, The Times of Israel reported.

Xinhua contributed to this story.

Openness essential to fueling Asia-Pacific growth

By **Zhong Nan**
zhongnan@chinadaily.com.cn

Openness remains essential to unlocking the growth potential of the Asia-Pacific region and deepening regional economic cooperation, as rising unilateralism and protectionism continue to challenge global trade and investment, government officials said on Sunday.

Speaking at the APEC China CEO Forum 2026 in Beijing, they said that Asia-Pacific Economic Cooperation member economies should stay committed to open cooperation and regional integration, while advancing connectivity projects and digital innovation to facilitate trade, improve supply chain resilience and create new growth opportunities for businesses across the region.

Eduardo Pedrosa, executive director of the APEC Secretariat in Singapore, said that APEC economies have identified a series of priority actions to restore growth momentum and strengthen regional economic cooperation.

These actions include accelerating progress toward the Free Trade Area of the Asia-Pacific, strengthening connectivity and supply chain resilience, investing in trade and logistics infrastructure, promoting market diversification, addressing nontariff barriers in food trade and advancing digital trade and transformation, Pedrosa said.

Chinese robot vacuums clean up in global rankings

Advanced AI systems, smart home integration help devices sweep past competition in overseas markets

By **Li Jiaying**
lijiaying@chinadaily.com.cn

When Mikki Hayward was preparing her home in the United States for sale, she expected her robot vacuum to help with the cleaning. What she did not expect was for it to recognize clutter, navigate around obstacles and even flag small valuables.

"It doesn't get stuck on random boxes or obstacles, and it even tags small valuables it finds so they don't get lost in the shuffle," she said.

For Jessica Jones, another US user, the appeal lies elsewhere.

As her robot vacuum glides across the floor, she can use the device's camera to check on the foster kittens roaming around her home.

"Loving (the ability to) check in on my foster kittens while the machine does its cleaning thing!" she wrote in a social media post. "There are more and more features I'm discovering all the time, but pet mode is amazing!"

Technology reviewers have also been impressed by how much the latest generation of cleaning robots has evolved.

"What is also smart is that it adjusts how it cleans depending on the type of mess. So, wet messes and dry debris are not being treated the exact same way, and that makes the whole process feel much more hands-off," YouTube channel DailyTested said in a review.

All of these glowing testimonials refer to the latest product from Chinese manufacturer Narwal Robotics.

Launched in the US market in April and equipped with a dual-camera vision recognition system and an artificial intelligence-powered cleaning platform capable of adapting to different household environments, the product quickly topped Amazon US' new releases ranking and entered the top 10 robot vacuum category within 24 hours of launch.

Inbound tourism surges on curiosity about evolving China

Overseas visitors try Chinese kebabs while wandering through the historical alleys of Qianmen Street in Beijing on June 14. chen qiang / for china daily

Overseas visitors equally interested in country's rapid transformation as ancient marvels

By **YANG FEIYUE**
yangfeiyue@chinadaily.com.cn

Foreign tourists visit the Temple of Heaven in Beijing on June 9. chen qiang / for china daily

Wolfgang Georg Arlt, a tourism expert from Germany, made his first trip to Beijing in 1978.

"There was almost no light at night," recalled Arlt, who has over 50 years of expertise, both academically and in practice, in tourism and hospitality. In the years since, he has watched China's tourism infrastructure improve steadily year after year, with better facilities and services.

In early June, he returned to the Chinese capital for a summit hosted by the World Tourism Cities Federation. During his stay, he was struck again by what he saw. But this time, it was by the smart infrastructure, services powered by artificial intelligence, and the gleaming skyline.

"No one back then could have imagined such development," said Arlt, executive director of the Meaningful Tourism Centre, based in London and Kathmandu.

As China evolves into one of the world's leading travel destinations, Arlt has also noticed a shift in the preferences of foreign travelers. "Tourism used to be about sightseeing, taking photos and shopping. Now people want to learn something and experience something," he said.

Technology has removed many of the old travel barriers. Instant translation services on a smartphone, for instance, mean no one needs to fear getting lost anymore, he added.

Active immersion

The shift from passive sightseeing to active immersion has been quietly reshaping China's inbound tourism industry.

On a March morning in suburban Beijing, Yang Li stood between a dozen foreign diplomats and a fully automated assembly line.

His job was to explain the factory's operations, but he soon realized the diplomats wanted China's overall transformation explained. "They were eager to know how the country built this," he recalled.

For nearly three decades, Yang had made his living explaining China's past — its dynasties, emperors, temples and ancient walls. Now, standing above a humming production floor where robotic arms moved in synchronization and driverless carts glided between workstations, he found himself explaining not just how the machines worked, but how China learned to produce them at scale.

The March visit had been arranged by China's Ministry of Culture and Tourism for foreign diplomats stationed in Beijing. "They didn't go to see the Great Wall. They came here to see why China can do this," he recalled.

For generations, China's inbound tourism narrative rested on familiar pillars: the Forbidden City, the Great Wall, the Terracotta Warriors. Visitors came to witness the remnants of an ancient civilization.

"Today, many international visitors no longer come only to admire China's past. They also want to understand its present — how factories operate, how cities function, how innovation is reshaping daily life and how traditions continue to evolve alongside rapid modernization," Yang said.

Spanish clients have asked to visit smart factories in Shenzhen, Guangdong province, while in Changsha, Hunan province, Romanian travel groups requested tours of electric vehicle production lines, he said.

A 2026 Trip.com Group survey of more than 500 inbound tourism operators found that nearly two-thirds identified meeting diverse visitor demands as their biggest challenge. More than 80 percent reported overseas visitors growing interest in experiences beyond traditional sightseeing.

Tour operator Li Jieming is based in Zhangjiajie, Hunan. The city's best-known attraction is the cluster of sandstone pillars that inspired the floating mountains in the film *Avatar*.

Three years ago, overseas visitors accounted for only a tiny share of his business. Today, they comprise around 60 percent.

The turning point came after China expanded visa-free entry policies for a growing number of countries in 2024.

"When I heard about the visa-free policy, I knew the number of inbound visitors would increase," Li said. "And Zhangjiajie already had something foreigners recognized — the *Avatar* mountains."

But his ability to seize the opportunity soon collided with new challenges: workers with foreign-language skills were scarce, and he had little overseas marketing experience.

Li began recruiting wherever he could find candidates — language schools, trading companies and returnees with international experience. His first international team consisted of just four people.

They posted videos of Zhangjiajie's landscapes on Facebook and handled inquiries one by one. Their first booking came from a Spanish couple who discovered the company online.

"We didn't make money on that booking," Li said with a laugh. "We just wanted to see if it could work."

By the spring of 2025, inquiries began arriving in waves. Today, Li's company employs more than 20 people serving international clients, and inbound tourism has become the core of the business.

Content upgrade

Many of the inquiries came from people who had never previously considered traveling to Zhangjiajie.

Some discovered Zhangjiajie through social media videos of the towering sandstone pillars. Others arrived after seeing short clips of local customs and village life.

The influx of visitors quickly taught Li another lesson: attracting international travelers was only the beginning.

"Many foreign visitors don't want to spend the entire day checking attractions off a list," he said. "They want to interact with people and understand local life."

At first, his team offered itineraries similar to those designed for domestic tourists. The results were mixed.

"That's when we realized we had to help those people understand a place beyond simply touting the landscape."

One European family initially planned a simple cable-car excursion. Instead, Li's team suggested a gentle rainforest hike. "The children could touch plants, look at insects and ask questions," Li said. "It turned out that the parents loved it."

They applied the same idea to cultural tourism.

Rather than limiting visitors to performances and demonstrations, Li's company incorporates hands-on experiences such as Tujia ethnic brocade weaving, the Baishou dance — a Tujia group dance often performed at festivals and celebrations — and traditional silverwork.

"All those ensure our foreign guests don't just watch, but participate," he said.

Li mentioned a family from Germany that spent an afternoon learning Tujia brocade weaving.

"None of them had ever touched a loom before, and their finished cloth was uneven with imperfect patterns," he said. "But when the workshop ended, the mother got a bit misty-eyed and said it was something they made together, rather than simply a purchase."

For Li, the moment captured why so many travelers now seek experiences rather than attractions. "The mountains gave them a view," he said. "The weaving gave them a memory."

Deeper dive

Yang, one of China's first nationally certified gold tour guides, has witnessed nearly every stage of the industry's modern development.

The change, he said, has been particularly noticeable in recent years. "Before, visitors listened to whatever you told them. Now they ask why," he said.

At the Great Wall, foreign tourists' curiosity isn't restricted to basic questions about its length, age or the construction techniques of the structure.

Instead, they want to know why the Great Wall occupies such an important place in the Chinese identity, Yang said. "One visitor even asked why it appears in China's national anthem," he said.

Yang's explanation begins with the ancient beacon towers that once signaled danger along China's northern frontier, and ends with the phrase from the national anthem — "using our flesh and blood to build a new Great Wall" — showing how a military defense system gradually evolved into a national symbol of endurance and unity.

He said an increasing number of overseas visitors make sense of modern China by comparing it with their own country's culture and history.

Spanish travelers draw parallels between the Great Wall and the Alhambra, a palace and fortress complex in Granada, while visitors from Latin America connect Chinese history with their own experiences of colonialism and nation-building, he shared.

For guides, this means understanding not only China but also the perspectives visitors bring with them. "If you don't understand their cultural background, you can't make the comparison meaningful," Yang said.

One Spanish architect, for example, asked him why Chinese walls were built with rammed earth while Spanish fortresses used stone. Yang didn't have a textbook answer but replied: "Different threats. Different materials. Different emperors."

The visitor nodded, and Yang said that was the moment he understood his real job.

At the end of May, nearly 2,000 tourism executives and industry professionals from 67 countries and regions gathered along the Lijiang River in Guilin, Guangxi Zhuang autonomous region, for one of China's largest inbound tourism events hosted by the local government and Trip.com Group.

Actor and filmmaker Jackie Chan, recently named an inbound tourism ambassador by Trip.com Group, greeted the crowd.

"My mission used to be bringing Chinese films to the world," he said. "Now my mission is bringing the world to China."

A giant illuminated passport appeared in the night sky during a drone show. Moments later, a golden dragon flew through it as the words "VISA FREE" lit up the sky above the crowd.

The image captured one of the biggest changes driving China's inbound tourism recovery — the steady expansion of visa-free policies and the gradual removal of barriers that once discouraged international visitors.

New storytellers

Visa-free entry can open the door, but content determines whether people choose to walk through it, many industry operators said.

Trip.com chairman James Liang announced that the company aims to attract 200 million inbound visitors over the next five years.

The tourism industry has already begun to adapt. Nearly 90 percent of inbound tourism employees have received some form of professional training. New job categories are emerging, ranging from inbound travel "customizers" to multilingual "experience designers" and cross-cultural content creators.

Yet, the industry's response remains uneven. While nearly two-thirds of practitioners feel service expectations have grown more demanding, fewer than 15 percent said lack of training is the main problem.

To become an outstanding guide for international visitors takes five to 10 years, Yang said. "Language ability, cultural fluency and the confidence to navigate complex conversations cannot be developed overnight," he said, adding that demand for Spanish-speaking guides, for example, has surged in recent years.

Yang speaks English and Spanish, has studied abroad, and traveled extensively. Years of experience have allowed him to understand both his visitors and the country he represents.

"Because what visitors are really doing is not just asking for explanations — they are interpreting China through their own cultural references. You need to understand those reference points as well as your own, so your answers are framed with meaning," he explained.

Many of Li's employees are from language schools, training centers and international trading firms and have never worked in the tourism industry before.

"Their language skills promise immediate and effective communication with potential clients," Li said.

"But they have to work hard to learn what the city has to offer and be capable of answering sophisticated questions based on that expertise. What visitors increasingly seek is not information alone. They want context, comparison and stories."

Experienced guides consistently earn more than newcomers, while regular training improves both service quality and income, industry figures showed. But income instability remains a concern. Tourism is highly seasonal, and many practitioners experience large swings in earnings between peak and off-peak periods.

For all the optimism surrounding inbound tourism's resurgence, the industry's growing pains are real, Li said.

Yang said being a tour guide is about creating understanding, a role he believes AI can never fully replace.

"AI can translate accurately. It can provide information," he said. "But it cannot read a visitor's eyes. It cannot create emotional connection."

In his 50s, he is still very optimistic about the industry's prospects, as more inbound visitors are requesting his services to understand a country still being built.

The Great Wall remains. So does the Forbidden City. But alongside them, a new set of destinations is emerging: factory floors, heritage workshops, innovation hubs and village studios.

"They all hold great sway over inbound travelers' curiosity and need guides like us to lead the way," he said.

China pushes superalloy R&D for aircraft engines

By ZHAO LEI
zhaolei@chinadaily.com.cn

Engineers at Aero Engine Corp of China, the nation's leading maker of aircraft engines, are working on more advanced single-crystal superalloy technologies, one of the most critical materials for aircraft engines, building on the remarkable progress they have made in recent years.

The engineers are targeting the needs of next-generation engines and working to create more advanced single-crystal superalloy technologies, according to Li Jiarong, a senior researcher at the Beijing Institute of Aeronautical Materials, an AECC subsidiary and a major player in the production of engine superalloys.

"We are working on single-crystal superalloys with better temperature resistance to meet the needs of future aeroengines. We are also developing variants that boast great corrosion resistance and low density, for use in marine environments and miniature drones.

"Moreover, we will work on precision forming technologies for single-crystal turbine blades with more complex structures to sustain the continuous improvement of the blades' high-temperature resistance," he told reporters during a recent media tour of the Beijing institute.

Single-crystal superalloys are an irreplaceable core material for advanced aeroengines. Primarily adopted for high-pressure turbine blades, they endure extreme operating conditions including ultra-high temperatures, powerful centrifugal force and gas corrosion.

Outperforming traditional alloys in heat resistance and anti-creep and anti-fatigue properties, such materials directly lift engine thrust, fuel efficiency and overall service life.

Li said that the institute aims to create superalloys with better temperature resistance in part because boosting engine efficiency and thrust-to-weight ratio while lowering fuel consumption will inevitably drive up turbine inlet temperature, and blades lacking sufficient heat resistance will hold back overall performance.

"When developing such alloys, engineers must tackle a host of conflicting requirements, including high-temperature strength, density, cost, castability and coating compatibility," the researcher said.

According to Li, alloys for service in marine environments need strong hot corrosion resistance to withstand external corrosion caused by salt spray, sulfur and chlorine. For this reason, they must be designed in tandem with anti-oxidation and anti-corrosion coatings.

By contrast, he said, alloys applied to miniature drones prioritize light weight and low cost. They also need to adapt to rapid thermal cycling and meet consistency requirements for small, thin-walled components.

China has independently developed single-crystal superalloys over the years and has widely used them in new aeroengines, breaking long-term technological monopolies by foreign companies.

"China has made solid progress in independent development and large-scale use of single-crystal superalloys," Li said. "Overall, we are steadily catching up with the world's leading countries in this arena and have come close to global advanced levels in some fields."

Tech: Global cleaning robot market enters new phase

From page 1

The success is far from an isolated case.

As Chinese manufacturers continue to integrate artificial intelligence, advanced sensors and autonomous navigation into household devices, a growing number of domestically developed cleaning robots are finding enthusiastic buyers around the world.

According to data from the General Administration of Customs, cleaning robots — added as a stand-alone customs classification this year — accounted for 7.75 billion yuan ($1.14 billion) in exports during the first quarter of this year, representing 68.5 percent of China's total robot export value.

In addition, out of total global shipments of 32.72 million units in 2025, Chinese manufacturers accounted for more than half of the global market, according to global market consultancy IDC, with Roborock, Ecovacs, Dreame, Xiaomi and Narwal occupying the top five positions globally in household cleaning robot production.

"The market has entered a new phase, characterized by the dominance of Chinese brands, rapid technological iteration and increasing segmentation across product categories," said Zhao Siquan, a senior analyst at IDC China.

Under IDC's definition, the broader cleaning robot sector encompasses robot vacuums, window-cleaning robots, lawn-mowing robots and pool-cleaning robots.

"Leveraging a complete supply chain, rapid product iteration capabilities and strengths in algorithms, Chinese manufacturers have expanded their presence across virtually all of these segments," Zhao said.

From cordless designs and AI-powered navigation to all-in-one docking stations and multi-device collaboration, many technologies that were first deployed at scale by Chinese manufacturers are now becoming industry standards, she added.

As competition intensifies, leading players are also broadening their ambitions.

"Top manufacturers are evolving from single-category providers into full-scenario home service companies," Zhao said.

"This is because, for consumers, cleaning is not an isolated need, but part of everyday household life. Companies that can deliver services across a wider range of home scenarios will have a greater opportunity to build stronger user engagement and long-term brand loyalty."

Storm cleanup

Tradition takes center stage during holiday

Cultural heritage celebrated through boat races, rituals and festive foods

By ZOU SHUO
zoushuo@chinadaily.com.cn

Cultural experiences took center stage during the just-concluded Dragon Boat Festival holiday as people from across the country embarked on journeys in search of traditional festivities involving boat races, rituals and seasonal foods, travel agencies said.

Searches for keywords such as "Dragon Boat Festival", "dragon boat" and "*zongzi*" more than tripled from a month earlier on online travel platform Qunar, reflecting the growing appeal of tradition-infused travel and transforming the three-day break into a vibrant celebration of Chinese cultural heritage.

Meanwhile, searches for folk-culture tourism jumped 55 percent year-on-year, according to People's Daily Overseas Edition, citing online travel agency Mafengwo.

Dragon boat racing, the festival's most iconic tradition, has evolved from a spectator event into a participatory cultural attraction. Travel platform Ctrip reported that searches for "dragon boat" rose 41.3 percent week-on-week, with races proving to be a major tourism magnet.

Guangdong province led the trend. Travel-related searches for Foshan increased by 134.9 percent week-on-week, driven by the famed Diejiao dragon boat race, often hailed as the "F1 on water", Ctrip said.

A tourist from Shanxi province, who went to Foshan to see the Diejiao race, said the chants of the boatmen and the roar of the drums made it a spectacularly moving experience.

"No matter how exciting the video is, nothing beats the real experience. I could feel the vitality all around," she said.

Not only in Guangdong, dragon boat events boosted tourism nationwide. Searches for Jingzhou in Hubei province rose 87.5 percent week-on-week, while Zigui in the same province — the hometown of poet Qu Yuan — became a holiday hot spot thanks to its cultural festival, according to Ctrip.

Qu was a legendary poet and minister in the State of Chu during the Warring States Period (475-221 BC). He drowned himself in the Miluo River when he learned that the State of Chu was being defeated by the State of Qin. Legend has it that upon learning of Qu's death, locals took out boats to search for his body, dropping rice dumplings into the river to prevent the body from being eaten by fish. It is to honor this legend that Chinese people hold dragon boat races and make *zongzi* to eat during the festival.

There was huge demand for seasonal Dragon Boat Festival delicacies as well. According to Qunar, food lovers hit the road in droves in search of festive cuisines. Instead of debating on whether to sample sweet or savory rice dumplings known as *zongzi*, hundreds headed to Quanzhou, Fujian province, to sample Minnan-style braised pork *zongzi*, or to Guiyang in Guizhou province to try the unique Buyi ash *zongzi* mixed with plant-ash lye, it said.

Beyond *zongzi*, crayfish from Qianjiang, Hubei province, mackerel dumplings from Qingdao, Shandong province, and cold fermented noodle soup from Lanzhou, Gansu province, were also big draws for food connoisseurs who traveled thousands of miles just to sample the fare. According to Qunar, hotel occupancy in these foodie-friendly destinations — including Qianjiang, Qingdao, Lanzhou, Quanzhou and Guiyang — increased by more than 20 percent during the holiday.

The folk-culture fervor fuels local industries. Miluo in Hunan province — known as the "hometown of dragon boats" — is home to 20 boat-building factories with an annual turnover of more than 200 million yuan ($29.6 million), according to data from the local government.

The finals of the 2026 Hunan Dragon Boat Super League kicked off in Miluo on Thursday. A total of 38 top dragon boat teams from 14 cities and prefectures across the province gathered to compete in the two-day race. Through dragon boat racing and folk traditions, they celebrated the spirit of Qu Yuan and participated in a grand Dragon Boat Festival event that deeply integrated culture, tourism and sports.

One workshop in Luojiang township continued working through the holiday to meet rising orders. Likewise, a *zongzi* producer in Quzici township said the number of orders defied all predictions of a market downturn.

Since late April, the Quzici plant has run at full capacity. Local villager Weng Zhenggui, who lives just 400 meters away and works eight hours a day, made over 1,000 *zongzi* and earned up to 6,000 yuan per month.

The cooking and packing processes in the plant are automated, boosting daily output to 100,000 *zongzi* while ensuring consistent quality. "The automated system precisely controls temperature and pressure, saving labor and improving efficiency and taste consistency," said company chairman Wu Liman.

Inbound tourism showed strong growth during the holiday, with Fliggy reporting that bookings were up more than sixfold year-on-year.

Efforts: Policy continuity also emphasized

From page 1

Zheng Changzhong, a professor at Fudan University, said the experiences of Ningde, Xingtang and China's national poverty alleviation campaign all point to the same logic: Development cannot rely on a single push, and neither can governance performance be measured only by what is immediately visible.

What matters, Zheng said, is whether policies solve real problems, build lasting foundations and continue to benefit the people over time. He said this logic of sustained effort can be seen not only in poverty reduction but also in broader development fields that require long-term planning, policy continuity and steady implementation.

Aisake Valu Eke, former prime minister of Tonga, said China's success in lifting nearly 100 million rural residents out of poverty was "a remarkable achievement for any country".

Eke said China's progress was supported by a system in which plans and strategies are developed by the CPC and carried out across different levels of government, from provinces and cities to villages. Information from the grassroots feeds into development planning, while coordination, monitoring and evaluation help keep implementation on track, he said.

Planning system hailed

Nur Rachmat Yuliantoro, professor of International Relations at Universitas Gadjah Mada in Indonesia, said China's five-year planning system, with its emphasis on long-term strategic planning and policy continuity, is one of the defining features of China's development.

He said that this approach enables China to pursue national goals while delivering immediate benefits to the people and advancing broader development objectives over time, a balance that can be seen in areas such as infrastructure, poverty alleviation, technological innovation, natural resource conservation and cultural heritage preservation.
