"At the heart of this planning strategy and balance is sustainability," he said, adding that China has provided valuable experience for many countries, particularly those in the Global South.

Nichita Iris Liga, a member of the Executive Bureau of the Romanian Socialist Party, said that unlike some other countries, where systems and priorities may change every few years with electoral cycles, planning in China is not limited to a single five-year period, but is linked to longer-term goals, including the second centenary goal of building China into a great modern socialist country by the middle of the century.

Forum: APEC economies urged to make full use of regional FTAs

From page 1

Ren Hongbin, chairman of the China Council for the Promotion of International Trade, called on APEC economies to identify more areas of common interest and strengthen open cooperation in industrial and supply chains.

Citing the importance of strengthening regional connectivity, Ren said the APEC economies should make full use of regional free trade agreements such as the Regional Comprehensive Economic Partnership, while advancing an upgraded APEC connectivity blueprint to facilitate the safe and orderly flow of people, goods, capital and data, as well as foster closer industrial and supply chain cooperation across the region.

China remained the largest trading partner of 13 APEC economies in 2025, with the total value of trade with those economies reaching $3.7 trillion. It accounted for 57.8 percent of China's total foreign trade, data from the Ministry of Commerce showed.

The country has signed 24 free trade agreements or economic and trade deals with 31 countries and regions, including 15 APEC economies. In recent years, it has also completed upgrades to free trade agreements with APEC economies such as Singapore and Peru.

Addressing broader challenges facing the global trading system, Jiang Chenghua, deputy China international trade representative at the Ministry of Commerce, urged the APEC business community to exercise independent judgment, support the multilateral trading system and help safeguard the stability of global industrial and supply chains.

China will continue to expand opening-up in key areas including trade, investment and the cross-border flow of production factors, while the rapid advancement of digital, intelligent and green technologies will further reinforce its position as a long-term destination for global companies seeking investment and growth opportunities, said Jiang.

Key drivers of confidence

Ahead of the fourth China International Supply Chain Expo, which will run from Monday to Friday in Beijing, foreign business executives highlighted China's industrial ecosystem, market demand and supply chain advantages as key drivers of their long-term confidence in the country.

Jim Sutter, CEO of the US Soybean Export Council, said that China is expected to import about 25 million metric tons of soybean from the United States during the marketing year Sept 1, 2025 to Aug 31, 2026, up from 22.6 million tons in the previous marketing year, marking a meaningful recovery.

"The recent announcement regarding tariff reductions is a positive signal, and the US soybean industry looks forward to seeing those commitments translated into concrete policy measures," said Sutter. "Stability in the China-US trade environment benefits both sides, and we are confident in the long-term direction."

He said opportunities for bilateral cooperation extend beyond traditional feed applications to value-added food products and industrial uses, including bio-based plastics, adhesives, lubricants and sustainable construction materials.

A similar sentiment was expressed by Elodie Latour, vice-president for China at French multi-sports brand Decathlon. She said that China's comprehensive industrial ecosystem and complete value chain enable companies to bring products to market faster, creating advantages that are difficult to replicate elsewhere.

With 94.2 percent of the products it sells in the country already produced locally, the French company, backed by four plants and a network of 200 stores across more than 100 cities in China, plans to further increase local production to enhance the responsiveness, sustainability and resilience of its supply chains across the Asia-Pacific region and beyond.

Interventions spark decline in youth crime

Reduction in offenses against minors and juvenile cases recorded nationwide

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

The number of prosecutions for crimes against minors and reviews of juvenile crime cases by prosecuting agencies nationwide last year decreased by 2.2 percent and 9.8 percent year-on-year, respectively, marking the first "double decline" in the past five years.

Ying Yong, prosecutor-general of the Supreme People's Procuratorate, announced the figures at a symposium marking the 40th anniversary of the country's juvenile prosecution work, held in Shanghai recently.

Ying said he believes the improvements are closely related to a concept proposed by the SPP two years ago that "prevention is protection, and punishment is also a form of salvation".

The concept is based on a balanced approach to punishment and protection in handling juvenile crime cases. It emphasizes protecting minors in accordance with the law and implementing the principles of education, rehabilitation and salvation for juveniles involved in crimes, while also stressing the importance of lawful punishment as a deterrent.

In 2025, more than 16,000 minors nationwide were granted conditional non-prosecution, with 96.5 percent successfully reintegrating into society after completing their probation periods.

Prosecutors said the figure demonstrates prosecuting agencies' commitment to maximizing education and rehabilitation opportunities for juveniles involved in minor, first-time or occasional offenses.

During the same year, the SPP approved the prosecution of 24 juveniles aged 12 to 14 for serious violent crimes, continuing to send a clear message that being young is not a free pass from legal accountability.

Among the cases was one in Shenzhen, Guangdong province, in which a 14-year-old surnamed Zhong was sentenced to life imprisonment for intentionally killing a classmate. Motivated by unfounded suspicions, Zhong fatally stabbed the victim multiple times.

In recent years, prosecuting agencies in some regions have established graded intervention mechanisms in a bid to better prevent juvenile crime. Prosecutors noted that juvenile delinquency often follows a progressive path from minor misconduct to serious misbehavior and eventually to criminal activity.

Under a three-tier prevention mechanism explored in recent years, truancy and internet addiction are addressed by schools and families; serious misconduct, such as theft and provocation, is subject to specialized education; and criminal acts committed by individuals below the age of criminal responsibility may result in specialized corrective education when necessary.

Shanghai is the birthplace of juvenile prosecution work across China. The country's first juvenile prosecution group was established in the city's Changning district four decades ago.

Several mechanisms pioneered by Shanghai's prosecuting agencies — including social investigations into the status of minors' families and guardianship and the presence of appropriate adults during interrogations — have been adopted nationwide.

At the symposium, Li Jianjun, chief prosecutor of the Changning District People's Procuratorate in Shanghai, said that in response to a growing number of juvenile crimes committed by non-residents of Shanghai, local prosecuting authorities, together with public security, courts and judicial administrative agencies, have established a collaborative mechanism to build a corrective education network.

The annual number of juvenile crimes in Shanghai has fallen by more than 80 percent from its peak in 2007. The proportion of juvenile crimes among all criminal offenses has dropped from 9.8 percent to 1.4 percent.

Handcrafted dragon boats return to Zigui with ancient festival tradition

WUHAN — For nearly three months, 70-year-old boat builder Zheng Xianglong worked side by side with his son and a group of craftsmen, most of them in their 60s, transforming cedar wood into 14 dragon boats.

After the boats were finished, Zheng spent another three weeks on the riverbank in Zigui county in Central China's Hubei province. He watched crews train under the summer sun and inspected each vessel before practice sessions. His skin grew darker, but Zheng refused to slack off.

"These boats are my life's work," he said. "If the race wasn't a success, I wouldn't be able to sleep."

As the two-day dragon boat races started on Friday, Zheng witnessed something that he had feared might never happen again: the return of traditional handcrafted wooden dragon boat racing to Zigui, the hometown of the ancient Chinese poet Qu Yuan, after more than 20 years of absence.

Since 2000, lighter and more durable fiberglass boats, widely used in international-standard dragon boat races, have gradually replaced handcrafted wooden vessels across China.

This year, however, local authorities brought the traditional races back to Zigui, describing the move as both a return to cultural roots and a way to strengthen the region's cultural identity.

The revival reflects a broader trend across China, where centuries-old Dragon Boat Festival traditions are drawing new participants, preserving cultural heritage and creating fresh economic opportunities.

New audiences

For millennia, dragon boat racing has been at the heart of the Duanwu Festival, China's first traditional celebration to be inscribed on UNESCO's list of Intangible Cultural Heritage.

It is this iconic boat racing that has made the festival widely known around the world as Dragon Boat Festival.

Closely associated with Qu Yuan, a patriotic poet who lived more than 2,000 years ago, the tradition has long served as a cultural symbol that connects generations. Nowadays, dragon boat racing is finding audiences far beyond its traditional base.

This year, in Guangdong province alone, more than 500 dragon boat competitions involving nearly 100,000 participants were scheduled during the three-day festival break.

In Jiangxi province, teams from around the world gathered for the Nanchang International Dragon Boat Race. Among them was Andreas Willms from Germany, who has competed in the event three times.

"Everyone on a dragon boat has to pull their oars in perfect unison," said Willms, a manager at a German-funded company in Shanghai.

> "We don't have rivers this large in my hometown, but once I sat in the boat, I felt a connection with Qu Yuan. It's as if a culture from thousands of years ago came rushing toward me."
>
> **Zhang Pushao,** a student from Shaanxi province who took part in a competition on the Yangtze River

"This sport relies entirely on teamwork. We compete not just for ourselves, but for the whole team."

Dragon boat racing has been practiced in Germany for nearly four decades, increasingly serving as a cultural bridge between Chinese traditions and international enthusiasts.

Back in Zigui, local teams raced in handcrafted wooden boats while students from 12 Chinese universities competed about 30 kilometers downstream on the Yangtze River using fiberglass vessels.

For Zhang Pushao, a student from Shaanxi province, the experience carried a deeper meaning.

"We don't have rivers this large in my hometown," he said. "But once I sat in the boat, I felt a connection with Qu Yuan. It's as if a culture from thousands of years ago came rushing toward me."

Keeping traditions alive

In Zigui, dragon boat racing is more than a sport. For many residents, Dragon Boat Festival holds even greater significance than the Chinese New Year.

"Unlike most parts of China, where the festival centers on the fifth day of the fifth month of the Chinese calendar, Zigui observes a month-long festival in three stages," said Li Li, an official with Zigui's culture and tourism bureau.

According to Li, one of the most distinctive traditions in Zigui is the hanging of festival couplets, which often contain wishes for good health and references to Qu's patriotic spirit.

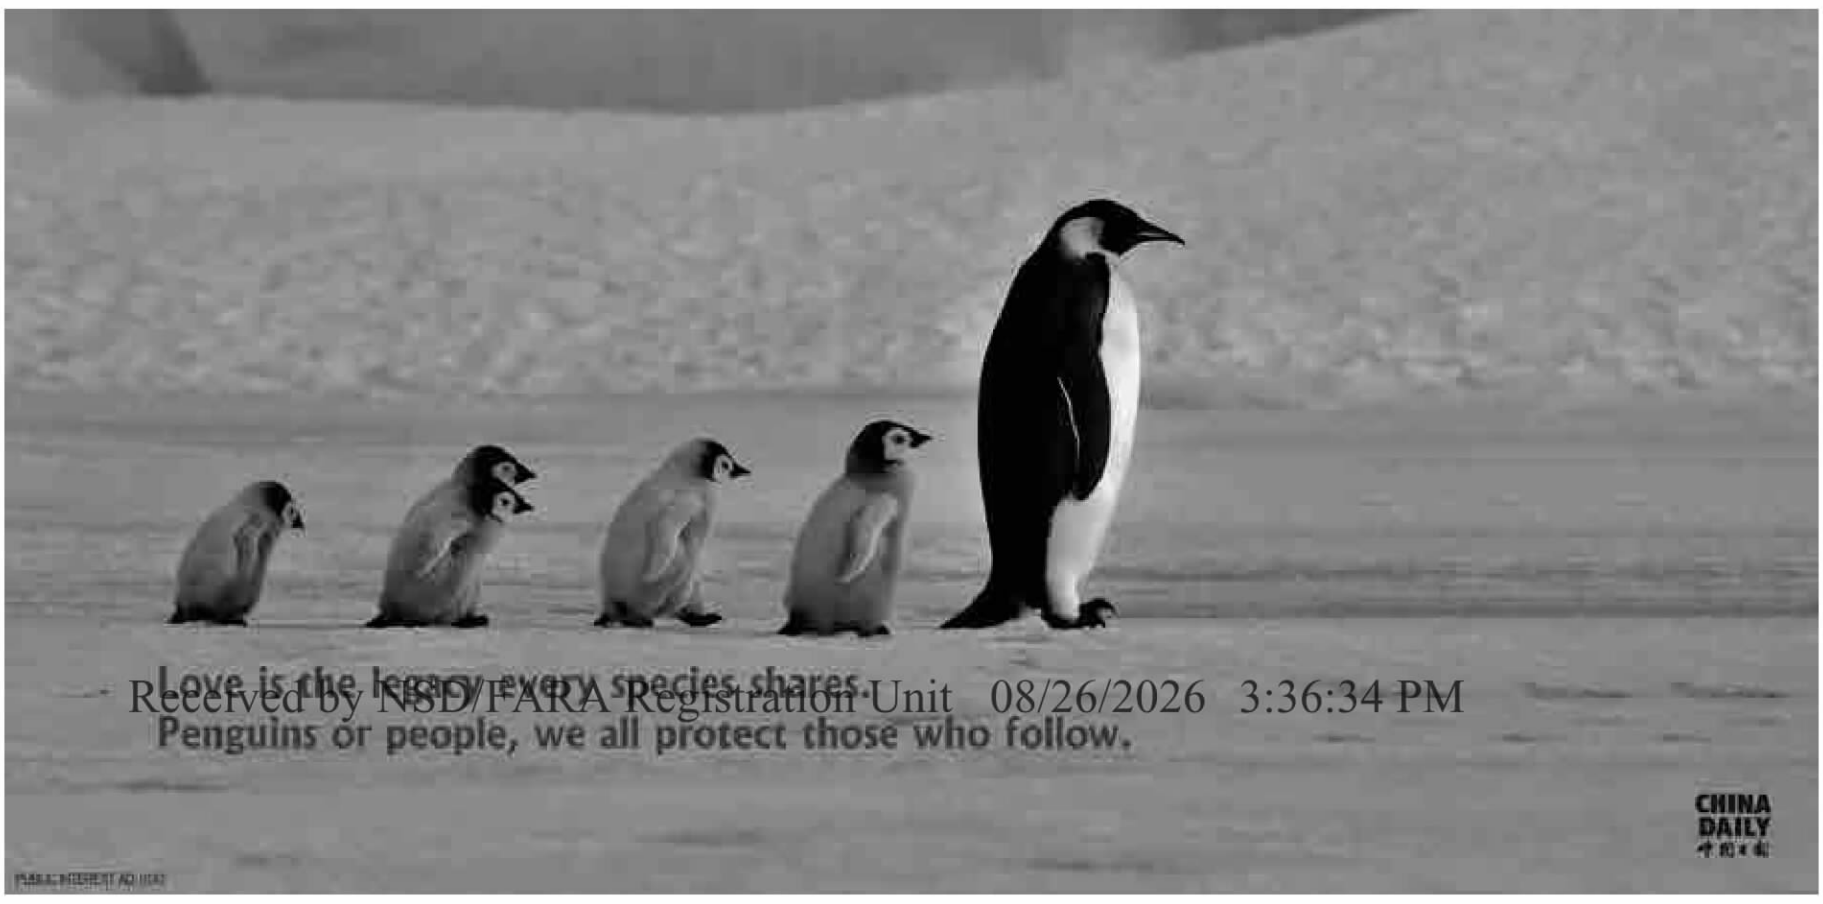
Qu's literary legacy also endures. Works, including *Li Sao* and *Tian Wen*, remain widely studied and recited, and annual poetry gatherings have been held in his hometown for generations during the Dragon Boat Festival holiday.

"The festival is also a precious opportunity for my family to get together. Relatives who live away from Zigui would come back. We can make *zongzi* (sticky rice dumplings), watch dragon boat races and enjoy the festive atmosphere," said Tan Guoqing, a local resident.

Beyond the riverbanks, visitors also participated in traditional activities such as making herbal sachets, hanging mugwort and learning Zigui embroidery, a local intangible cultural heritage craft.

Chen Yuqiang, a tourist from Fujian province, traveled to watch the races and visit sites connected to Qu in Zigui.

"In the past, I learned about him from textbooks," Chen said. "Coming here allows me to understand his patriotism and values in a much deeper way."



According to Xiang Siqing, a veteran folk dragon boat rower in Xiantao city, Hubei, the revival of traditional wooden dragon boats has also been witnessed in other cities.

"In recent years, more and more villages have restored the wooden dragon boats in Hubei. These traditional boats would gather to parade and compete, creating an incredible festive atmosphere for Dragon Boat Festival," he said.

Universities cater to AI study demand

Action plan fuels rapid expansion as the need for talent cultivation grows

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Artificial intelligence has become one of the most popular majors across China's institutions of higher education. More than 600 universities have launched AI undergraduate programs as of 2026, based on data from the Ministry of Education, marking explosive growth from just 35 institutions approved in 2018.

According to financial media outlet Yicai, among China's "Double First-Class" universities — the country's elite tier of institutions of higher education — at least 90 have launched AI-related schools or colleges.

The rapid expansion has been driven by a powerful convergence of national strategy and market demand.

In April, the Ministry of Education, together with four other central government departments, jointly issued an action plan outlining comprehensive measures for AI talent cultivation, application innovation, infrastructure development and ecosystem building.

The plan calls for making AI a public foundational course in higher education, creating new interdisciplinary programs and exploring new models for cultivating top-tier AI talent. The move followed the release of the 2026 undergraduate program catalog by the Ministry of Education in the same month. The catalog added 38 new undergraduate majors, including AI for business, embodied intelligence and brain-computer science and technology.

Universities are not merely adding new departments; they are fundamentally restructuring their academic ecosystems around AI. MyCOS, an education research institute, noted that when institutions establish AI schools, they often do not start from scratch. Instead, they consolidate existing computer science, big data and automation programs into new academic units.

Fudan University has rolled out a three-tiered AI curriculum system aimed at achieving 100 percent coverage across all undergraduate and graduate students, first-level disciplines and majors, according to a report from the university.

Ningbo University now requires every major to offer at least one "AI+" interdisciplinary course. Tsinghua University has emphasized an "AI+X" model that integrates AI across all disciplines, according to the official websites of both universities.

China's core AI industry was valued at more than 1.2 trillion yuan ($177 billion) in 2025, according to a Xinhua News Agency report quoting a senior Chinese official.

Yet demand for talent is far outstripping supply. Projections from McKinsey & Company suggest China could face a shortage of up to 4 million AI professionals by 2030. This "AI+" transformation extends beyond traditional technology fields.

Rao Yanting, an associate researcher at the China National Academy of Education Sciences, told China Central Television that AI is no longer just a major but is increasingly permeating every academic field, including not only science and engineering but also the humanities and social sciences.

However, as universities race to establish AI credentials, prominent voices in academia are raising concerns about sustainability and educational quality.

Fang Fuquan, president of Capital Normal University, told Beijing News that AI is a technology rather than a science.

Just as humanity's understanding of the universe relies on fundamental sciences such as the periodic table and Newton's laws, an excessive focus on technology at the expense of mathematics, physics, chemistry, biology and even humanities and the arts could have unintended consequences, he said.

He warned that people may lack the knowledge to distinguish truth from falsehood in AI-generated videos that defy physical laws.

Fang said that while there is widespread pursuit of quick results and greater emphasis on AI applications, universities must guide students to build a solid foundation in basic sciences alongside technological skills.

"Society should foster an ecosystem where not everyone needs to work on AI applications," he said. "Those who pursue basic sciences, humanities and the arts can also become outstanding talents."

"Science has its contingencies; a discipline that is obscure today may flourish in a few years," he said, calling for a more scientific and forward-looking evaluation system.

During the April action plan announcement, Jin Li, president of Fudan University, said AI models are iterating every few months, and what is popular today may become obsolete tomorrow.

"If universities are still training 'finished-product' talent, that's like clinging to a sword while crossing a river," he said.

Jin often uses a metaphor to describe the type of talent universities should cultivate.

"We should cultivate 'stem cell-style' talents — people who can quickly establish cognitive frameworks in unknown domains, integrate resources across disciplinary boundaries and continuously iterate in the face of failure," he said.

Rite of remembrance

Performers present a ceremonial music-and-dance tribute at a public memorial ceremony honoring Fuxi, the legendary ancestor of Chinese civilization, in Tianshui, Gansu province, on Sunday, which fell on the summer solstice. Known as the birthplace of Fuxi culture, the city hosts the annual rite, which was inscribed on China's national intangible cultural heritage list in 2006. feng lekai / for china daily

DPRK painters in Mudanjiang display artistic bonds

By **ZHOU HUIYING** in Harbin
zhouhuiying@chinadaily.com.cn

Over the past 15 years, more than 40 artists from the Democratic People's Republic of Korea have been invited to display their artistry on a canvas at "the creation base of the DPRK painters in China" in Mudanjiang, Heilongjiang province.

The base, which was established in August 2011, is the only one of its kind that the DPRK has set up overseas. It is used to create, exhibit and sell works of art from the DPRK, according to Cheng Wujun, the director of the base. The base serves as a bridge for cultural exchange between China and the DPRK, introducing authentic DPRK paintings to the Chinese market.

Since its establishment, DPRK artists have been stationed at the base for on-site creation and customized artworks tailored to the needs of collectors and businesses.

"The face-to-face creative exchange is unique in the DPRK foreign art cooperation, offering a unique cross-border artistic collaboration," said Cheng.

The DPRK paintings are known for their pure and simple creative philosophy, distinct artistic style and rigorous realism.

Their distinctness portrays realistic styles, unique emotional interpretation and strong feelings of national pride, all of which reflect the DPRK people's aspirations for peace, Cheng said.

The DPRK awards artists titles such as "People's Artist" and "Meritorious Artist", representing the highest standards in the country's art community.

"The base has always undertaken important functions such as the exhibition and sale of the DPRK works, authenticity identification, artist exchange and market regulation," Cheng added. "The base integrates high-quality works from major DPRK creation studios, providing collectors with authoritative certification, unified numbering certificates and authenticity identification services."

In 2012, Cheng was awarded the honorary title of "cultural ambassador for the DPRK-China art exchange" by the DPRK government — the only foreigner to receive the title to date.

Over the years, Cheng has brought contemporary DPRK paintings to exhibitions across various regions in China, including Harbin in Heilongjiang province, Xi'an in Shaanxi province, Guangzhou in Guangdong province, as well as Shanghai and Beijing.

"The DPRK paintings have distinct characteristics — bright and vivid colors, which give a positive and cheerful impression," he said. "The DPRK artists left me with the deepest impression of their professionalism and dedication."

"For instance, before returning to their accommodation after work every night, they ensure that the oil paints, paper and surrounding areas in front of the easel are clean," he said. "Their rigorous professionalism is evident. To paint a sunrise, they will ask the client what time he needs the sunrise to be depicted — 5, 6, or 7 am — as the sun's height, brightness, shadow effects and color differences are vastly different."

In April 2023, Cheng established a new creation base in Dalian, Liaoning province, and exhibited some DPRK paintings at the Dalian Wanzhongyuncang Technology Incubation Park.

"The works created by the DPRK artists displayed in our exhibition hall have attracted many visitors," said Jin Lin, director of the park's business development and operations department. "The natural scenery and folk customs depicted in the paintings are very detailed, with bright colors, making visitors feel calm and have a taste of life and history." According to Jin, nearly 100 works have been sold from the park so far.

Shang Shuke, an art collector in Dalian, started collecting the DPRK paintings around 10 years ago.

"In 2014, a friend introduced me to the base, so I traveled to Mudanjiang to visit the exhibition hall at the base and picked out some works by old DPRK artists from the 1950s and 1960s," he said. "The DPRK artists have deep artistic skills, with exquisite realism, delicate and lively brushwork and elegant and refined color tones."

"The creators are genuinely dedicated to art, not creating for profit, so the works are pure and simple in style, with strong artistic quality," he added.

Another collector, Peng Fengjiao, has expressed a fondness for the gentle and elegant artistic temperament of the DPRK paintings.

"They are not only exquisite art pieces for decorating life but also a stable collectible choice," she said. "Sometimes, I picked some of the DPRK works I collect as cultural gifts to my artistically-inclined friends, which were well received."

Yun Ju-hyok, the DPRK representative at the base, is now engaged in creative work in Dalian, leveraging his unique perspective to gradually introduce a series of outstanding modern and contemporary DPRK artworks to China.

"The DPRK art, based on subjective realism, uses concise, lively and realistic depictions, which are loved by both DPRK and Chinese people," he said. "After coming to China, the DPRK artists were also amazed by the profound influence of Chinese culture."

"In January 2019, I led five DPRK artists to hold an art exhibition in Taiyuan, Shanxi province," he said. "During the visit to the famous historical sites and museums in Taiyuan, they were full of praise for the breadth and depth of Chinese culture, which deeply touched them and gave them a new understanding and appreciation of China."

Visitors appreciate the DPRK paintings on display in the exhibition hall at the Dalian Wanzhong Yuncang Technology Incubation Park in Dalian, Liaoning province, in early June. Provided to China daily

Chifeng model offers insight on land rehabilitation

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

China's experiences in grassland ecosystem restoration and desertification control, particularly in Chifeng, Inner Mongolia autonomous region, have provided valuable insights for global land rehabilitation and grassland conservation, international experts said at a conference recently held in the city.

Experts highlighted the country's achievements in desertification prevention, related scientific research and the use of technologies such as artificial intelligence and multi-source remote sensing.

The three-day event, held last week, brought together experts from China, South Africa, Japan and the Netherlands.

Participants engaged in interdisciplinary and cross-regional dialogue to explore innovative approaches to grassland protection and comprehensive desertification control, seeking to contribute scientific solutions for land degradation management, ecological civilization building and global sustainable development.

The event was jointly organized by Shanghai Jiao Tong University's School of Design, the university's Inner Mongolia Research Institute and the desert scientific exploration committee of the China Association for Scientific Expedition.

Johns Muleso Kharika, a representative of the secretariat of the United Nations Convention to Combat Desertification, emphasized the need for the international community to support policymaking backed by scientific evidence. He called for stronger cooperation between the Global North and Global South, as well as among international partners, to advance practical actions in land protection and grassland restoration.

"Effective management of desertification requires integrating ecological restoration with innovation in social mechanisms. The ecological restoration practices in Inner Mongolia and China as a whole can serve as important references for global desert management," said Michael Meadows, former president of the International Geographical Union and an emeritus professor at the University of Cape Town in South Africa.

During the event, experts conducted field studies in the Horqin Sandy Land, where they observed innovative sand-control models that combine road construction, sand stabilization and industrial development. They also visited a cold and arid apple and pear breeding base in Chifeng that preserves more than 90 varieties of economic forest resources.

At a newly established cherry experimental field, experts discussed the introduction and collection of superior local varieties with staff members.

The field visits showcased Chifeng's innovative practices in sand control and seed breeding, providing references for regional ecological management and the high-quality development of the forestry and grassland industries, participants said.

Piao Ying, an official in Chifeng, said that despite notable progress, ecological management remains a challenging task for a city located at the junction of the Horqin and Hunshandake sandy lands.

"The city must make better use of technology to safeguard the northern ecological barrier, move from experience-based management to precision-targeted interventions and strive to develop governance models that are replicable and scalable," he said.

Some experts also proposed new governance pathways. Li Xiaosong, a researcher at the Chinese Academy of Sciences' Aerospace Information Research Institute, said large vertical models for sand control could help address issues such as insufficient scientific zoning, weak process supervision and inadequate decision-making support.

"By integrating remote sensing, monitoring, knowledge databases and socioeconomic data, such models can support sand hazard diagnosis, governance plan generation, process supervision and effectiveness evaluation, paving the way for a shift from experience-driven management to precision and intelligent sand-control governance," he said.

Micro-dramas reshape China's film economy

From streamlined production to AI, costs are being slashed industry-wide

By ZHAO RUINAN
in Shangrao, Jiangxi
zhaoruinan@chinadaily.com.cn

China's micro-drama industry has transitioned from a localized internet trend into a massive, industrialized economic driver, pulling in millions of yuan in regional investments while facing immediate disruption from generative artificial intelligence.

Driven by extreme turnaround times, regional manufacturing centers are rapidly converting idle infrastructure into high-capacity production hubs such as Jiangxi province's Guangfeng district, which alone generated an output value exceeding 500 million yuan ($74 million) in 2025 by transforming old factories into specialized, rapid-fire filming bases.

Pang Daoming needed five days, 600,000 yuan and dozens of background actors to finish a micro-drama set in China's Republican era in Shangrao, Jiangxi province.

The Shanghai-based producer had come to the micro-drama production hub in Guangfeng, where a former factory has been turned into rows of period streets, modern offices, hospital wards, villas, village houses and European-style sets.

Production hub

The production hub was converted from the former Guangfeng Cigarette Factory. The site covers more than 8 hectares and has over 360 filming scenes. It is designed to host up to 40 crews and more than 2,000 cast and crew members working at the same time.

For a business built on speed, the calculation was simple. The scenes were ready. Background actors could be found quickly. Different crews could shoot in different corners of the hub at the same time.

"The base has newly built scenes from the 1970s and 1980s, which fit the period drama we are shooting," Pang said.

His crew planned to finish the current production in five days, before moving on to another one that would take about six days.

Pang entered the micro-drama business in July 2023. His company has produced about 70 to 80 micro-dramas. A crew like his may need dozens of background actors a day, with daily pay generally ranging from 100 to 300 yuan.

One of the people who entered the industry through such jobs is Zhou Tao.

Before the micro-drama crews arrived, Zhou, 38, ran a small shop near the production hub. He had spare time, and as more crews came to Guangfeng, he decided to try working as a background actor.

His first role was a villager in a period drama. The job lasted three days.

"It felt new," Zhou said. "I never thought there would be a day when I would become an actor."

At first, he was nervous. By his fourth production, he had been given a role with lines. When he faced the camera, his mind went blank. But the shoot went smoothly, and the experience pulled him further into the work.

By the end of March 2025, Zhou had become a background actors coordinator, helping crews match background actors with different scenes. By July, he had put himself fully into the business. He tried different roles, auditioned for speaking parts, and began watching other micro-dramas and television series to study how people acted.

"I was never this hardworking when I was at school," he said.

At his busiest, Zhou said he spent more than 20 days a month on set, sometimes as many as 25. His monthly income could reach 8,000 to more than 10,000 yuan.

For some younger locals, the work is less stable but still attractive.

Ding Junyan, born in 2007 in Shangrao, joined the local actors' association after graduating from high school. She first saw the opportunity on a recruitment app.

"I wanted to be an actress when I was a child," Ding said. "Even though I only appear in micro-dramas for a few minutes, I am still happy."

A classroom set at micro-drama production hub in Guangfeng district, Shangrao, Jiangxi province.

She now works about 10 days a month on average and earns about 5,000 to 6,000 yuan.

Rao Wenhua, head of the Guangfeng Actors Association, said the association has more than 1,000 registered actors, over 80 percent of them from Shangrao. Ordinary background actors usually earn 100 to 300 yuan a day, while those with lines or specific performance requirements can earn at least 300 yuan, and sometimes up to 1,000 yuan per day.

The association helps organize actors, connect them with crews, provide free training and offer support in labor disputes, Rao said.

Impact of AI

What is happening in Guangfeng is one version of a wider industry shift.

At Hengdian World Studios in Dongyang, Zhejiang province, the rise of vertical-screen dramas has added a new layer to an established film industry. Hengdian received more than 2,300 vertical micro-drama crews in the first seven months of 2025, surpassing the total for the whole of 2024, according to data cited by Securities Times.

The pressure on space has changed how the film town is used. A service company official told the newspaper that micro-drama crews could be seen shooting outside his office window every day. Even an office building with a glass facade had been used repeatedly as a stand-in for airport and railway station scenes.

An actor identified by the newspaper as Chen Lin said schedules could be packed closely together. Sometimes, he said, he would finish one production one day and enter a new crew the next.

In Hangzhou's Linping district, the model looks different. There, the Linying Factory, a professional micro-drama production base, has more than 50 indoor filming scenes, along with dormitories, canteens, costume and makeup services and an actors' guild. The district has also linked the factory with old streets, ancient towns and other local locations to form a wider filming network.

The pattern is similar in different places: a short production cycle requires concentrated scenes, fast coordination and a local labor pool that can be called in quickly. For crews, the question is no longer only where a story should be set, but where it can be completed at the required speed and cost.

But the same industry that brought crews and actors into these bases is changing quickly.

Zhou said he has already felt the impact of AI this year.

"AI has indeed brought an impact to micro-dramas," he said. "It has shortened the production cycle and greatly reduced costs. The income of background actors has also been affected, and some people are getting fewer jobs."

Still, he does not think live performers will disappear.

"On the other hand, it is also pushing micro-dramas toward higher quality," he said. "Some platforms are also checking the AI content in dramas. I don't think AI performance can replace real people for now."

Fang Liqi, a producer at Damahou, a micro-drama production company shooting in Shangrao, sees the shift from the company side.

Fang's company moved into the Guangfeng hub at the end of February 2025 after spending about a year shooting in Yingtan, another city in Jiangxi. Before settling in Shangrao, the company had inspected locations across the country and chose Guangfeng for its scenes, policy support and overall production conditions.

The company produced more than 120 micro-dramas in Shangrao in 2025 and plans to produce about 200 this year. It is now also developing AI-generated micro-dramas.

Fang said an AI-produced costume drama may cost 200,000 to 300,000 yuan, while a live-action modern drama may cost 300,000 to 400,000 yuan. An AI version of a modern drama could cost just over 100,000 yuan, he said.

The debate is no longer only whether AI can make a drama. It is what kind of people and jobs will still be needed when parts of the process become cheaper and faster.

Wei Qintao, who is in charge of quality of micro-dramas at Hongguo, told People's Daily that the market had "over-worried or over-interpreted" the impact of AI micro-dramas on live-action productions.

"Live-action dramas are still our basic market," Wei said, adding that he did not believe they had reached the end of their growth or entered decline.

At the same time, Wei noted that mid-level actors, costume and makeup workers, lighting technicians and camera operators face uncertainty as AI changes the sector.

Shen Yang, a professor at Tsinghua University's School of Journalism and Communication, said that in the AI era, human value lies partly in the answers found by asking the right questions.

"What matters most is aesthetics and taste," Shen said.

Overseas market

For production companies, the pressure is also coming from platform policies.

Fang said that before this year, some platforms offered guaranteed payments of 300,000 to 500,000 yuan or more for approved projects. Some companies secured projects and then subcontracted production to others at lower prices. That could bring more projects into the market, but quality was often uneven. Many companies that relied on that model closed earlier this year, he said.

"We make live-action dramas, and we also make AI dramas," Fang said. "This market is still worth doing. In the future, content will still be king. As long as the content is good, whatever the form, audiences will pay for it."

For Pang, the next question is not only how to produce faster in China, but where the audience will come from.

His company has launched an overseas app carrying Chinese micro-dramas translated into Southeast Asian languages. The platform has more than 100,000 paying members, he said.

The overseas market is growing quickly. App data analysis firm Sensor Tower said global in-app purchase revenue for short-drama apps approached $700 million in the first quarter of 2025, nearly four times the level of a year earlier. Southeast Asia was one of the fast-growing markets, with downloads in the region rising 61 percent quarter-on-quarter to nearly 87 million in the same period.

For Pang's company, the next plan is to shoot locally in countries such as Indonesia and Thailand, using local actors and stories closer to local audiences.

"At the beginning, we put Chinese micro-dramas overseas after translating them into Southeast Asian languages," Pang said. "But later we still want to go there, shoot locally, use local actors and make stories that local audiences like."

Scientists deploy precision tools to revive mangrove wetlands nationwide

By Li Menghan in Xiamen, Fujian
limenghan@chinadaily.com.cn

The Ministry of Natural Resources has unveiled an accelerated ecological framework for the 15th Five-Year Plan period (2026–30), mandating a shift toward systematic governance and precision marine restoration powered by standardized, high-tech engineering toolkits.

At the center of this national strategy is a newly cataloged mangrove restoration technique developed by the Third Institute of Oceanography. The system was recently selected by the Ministry and the National Forestry and Grassland Administration as one of 35 proven innovations anchoring China's latest ecological catalog, which spans 10 critical fields from invasive species control to carbon monitoring.

Researchers in Fujian province are already employing this holistic "coastal armor" approach to ecological restoration.

When preparing to restore more than 13 hectares of mangrove forest on a mudflat in Ningde, they did not immediately reach for saplings. Instead, they began by giving the coastal area a comprehensive assessment.

"Just like a doctor running examinations before treatment, we test soil particle size, seawater salinity and tidal water levels, and measure the elevation of the mudflat," said Chen Shunyang, an engineer at the Third Institute of Oceanography of the Ministry of Natural Resources.

"Only by this physical checkup can we determine whether, where, and how to plant the mangrove — securing the survival and growth performance of mangroves," Chen said, adding that armed with these data, the team can draw up a customized restoration design for each site.

At the Xiatanwei restoration site in Xiamen, Fujian province, a composite plant community is well established. What was once a degraded shoreline is now a thriving marine ecosystem — a transformation that the researchers described as "putting multiple layers of armor on the shore" by combining tree-type and shrub-type mangrove species for plantation.

Technicians conduct an environmental survey for a mangrove restoration project in Ningde, Fujian province, on May 28.

PROVIDED TO CHINA DAILY

"In previous restoration practices, single-species plantation made the mangrove a solo fighter. Now, trees and shrubs resist waves together — the tall trees reduce the main force of wind and waves, while the shrubs further contribute to the wave attenuation, stabilizing the sediment and providing more habitats for benthic fauna," said Chen Guangcheng, a researcher at the institute.

The recognition of the mangrove restoration technique rests on a growing track record of ecological transformation. Chen Jiahui, an associate researcher of the institute, described the restored wetland as "a bustling marine paradise", with tree canopies serving as "top-floor terraces" for birds and insects, trunks and branches providing climbing corridors for snails and crabs, and understory shrubs offering more attachment space for snails.

Chen Guangcheng also emphasized the composite plant community's importance in enhancing carbon sequestration.

"Traditional single-species planting relied solely on the tree canopy for photosynthesis, leaving the space below unused. In the composite mangrove communities, both the upper canopy and understory shrubs contribute to photosynthetic carbon sequestration, while the complex aboveground structure reduces the tidal exportation of fallen leaves to increase organic matter supply for soil carbon accumulation, further enhancing the wetland's role in carbon sequestration," Chen Guangcheng said.

To measure soil carbon stock, the team developed a method to remove the roots from different depth layers along the soil cores, preventing living roots from being double counted as soil organic carbon.

This could improve the precision of mangrove carbon stock estimation, providing a reliable foundation for ecosystem carbon sequestration accounting.

Building on the long-term research and practices, researchers have established a carbon sequestration monitoring and accounting framework that underpins the national project methodology for mangrove afforestation under China's voluntary greenhouse gas emissions reduction program.

Former barren county transformed into beacon of sustainable economy

By **ZHU XINGXIN** in Youyu, Shanxi and **CHEN LIANG**

Seven decades ago, international environmental experts studying the wind-scoured plains of Youyu county in North China's Shanxi province reached a bleak conclusion: the area was entirely uninhabitable, and the total resettlement of its population was the only viable option. Whipped by brutal Siberian winds, blinding sandstorms routinely choked the air, burying entire villages under shifting desert dunes.

Today, that same desolate wasteland has been transformed into a lush, green oasis. This historic environmental reversal was globally spotlighted when, in 2024, Youyu county clinched the prestigious New Sustainable Cities and Human Settlements Award at the United Nations Headquarters in New York, recognized as a premier global blueprint for desertification control.

Youyu's transformation is a multigenerational epic of political discipline and human endurance. The story begins in 1949, with Zhang Ronghuai, Youyu's first Party secretary. He understood a simple truth: "If Youyu wants prosperity, we must stop the wind and sand. And to stop the wind and sand, we must plant more trees."

He initiated a series of patriotic tree-planting campaigns, rallying the people to action. The first sapling, a Chinese cottonwood (or Simon's poplar), was planted just outside the old county town gate, a defiant flag planted in the face of the encroaching desert.

However, the bitter winters and scorching summers made tree planting a constant battle. In the 1960s, the fourth and fifth county Party secretaries focused their efforts on the Huangshawa sand depression, a particularly challenging area.

Their initial attempts resulted in heartbreak, with over 90,000 saplings failing to survive because the non-native poplars planted drank too much water and died. But they learned from their mistakes, adapting their planting methods and persevering. By 1964, they had successfully planted more than 13,333 hectares, effectively stabilizing the shifting dunes.

Each subsequent leader built upon the work of their predecessors, innovating and adapting to the challenges.

In the 1970s, hardier tree species like pitch pine, larch and Mongolian scots pine were introduced as part of the Three-North Shelterbelt Forest Program, expanding the afforestation area to over 73,833 hectares.

According to the current Youyu Party secretary, Ma Zhanwen, 21 consecutive local leaders have maintained the same ecological priority, leading communities "one shovel and two hands at a time". To date, afforestation efforts have blanketed more than 113,000 hectares of Youyu with 130 million trees. The county's forest coverage rate has dramatically soared from a microscopic 0.3 percent in 1949 to an astonishing 57 percent, making it the first territory in Shanxi province to successfully reforest all its barren mountains.

Wang Zhanfeng, a 75-year-old villager, has planted 200 hectares of trees over the last 44 years. "My hands feel like tree bark," he said, gazing up at the towering trees he helped cultivate. "I've dedicated my life to this. I can't let all this effort go to waste. I have to keep planting, one tree after another, year after year."

The legacy continues with younger generations. Li Jie, a 31-year-old teacher at the Youyu Cadre Academy, has spent nearly a decade sharing the story of Youyu with thousands of visitors. "Shovels are heirlooms in every household in Youyu," she said. "They are a testament to the memory and legacy of generations of Youyu people."

She recounted that on her 10th birthday, her grandmother showed her the first small pine tree she had planted, introducing her to the legacy of Youyu's fight against the desert. That is what strengthened her decision to dedicate herself to this land and carry forward the Youyu spirit.

The transformation of Youyu has created new opportunities. The county is now using its lush environment, rich culture and cool climate to become a cultural tourism and health destination. Local businesses are developing innovative sea buckthorn products, boosting livestock farming and transforming ecological advantages into economic benefits.

"The development achievements of Youyu stem from the simple aspiration of allowing the people to survive and live a good life," said Liang Pengwei, assistant researcher at the Shanxi Provincial Academy of Social Sciences, who is also an editor of a book on the story of Youyu.

The school is the city's first to introduce marine ecology preservation into its curriculum. PHOTOS PROVIDED TO CHINA DAILY

Tri-city alliance launched to protect Xiamen's dolphins

Coordinated efforts aim to improve public awareness of 'sea pandas'

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

Three neighboring coastal cities in East China's Fujian province — Xiamen, Quanzhou and Zhangzhou — have recently launched a landmark cross-regional collaboration to protect the Chinese white dolphins in their shared waters.

Xiamen is China's only major city where these marine mammals, under first-class State protection and affectionately nicknamed the "giant pandas of the sea", live right alongside bustling urban life and can be spotted occasionally by residents. It is estimated that around 80 Chinese white dolphins inhabit Xiamen's waters.

"Protecting white dolphins requires pulling the entire society together," said Xu Jing, an official at the Xiamen Chinese White Dolphin and Amphioxus Nature Reserve Affairs Center. "We focus on mobilizing volunteers to join our rescue and monitoring teams."

As the dolphins frequently migrate out of Xiamen's waters into neighboring areas, local enforcement teams officially upgraded this cross-regional mechanism last month to formally institutionalize real-time data sharing, joint maritime patrols and emergency rescues, according to Xu.

The upgraded mechanism also aims to further raise public awareness, including educating citizens on what to do and how to call for help if they encounter a stranded dolphin.

In August 2024, people from both Xiamen and Quanzhou jointly handled the emergency rescue of Le Bao, a 4-year-old female dolphin that swam out of Xiamen and became stranded on a beach in Quanzhou's waters.

A docent introduces the Chinese white dolphin preservation work in Xiamen at a museum in the city.

Local residents reported the stranding, triggering a rapid emergency chain that brought experts from the dolphin reserve in Xiamen and the Third Institute of Oceanography, Ministry of Natural Resources, based in Xiamen, to the scene for a joint medical response.

Following more than 40 days of intensive care at a nearby aquatic rescue station, Le Bao fully recovered and was successfully released back into her home environment in Xiamen's waters in September 2024. She was later named Le Bao after the facility, a name that also carried the rescuers' wishes for her to live a joyful life in the future.

"Le Bao's survival was a miracle made possible by an unbroken chain of rapid actions across two cities," Xu said. "If any single link had failed, this successful release would not have been possible."

The dolphin population's stable presence also stems from Xiamen's long-term ecological initiatives, including a complete clearance of marine aquaculture facilities to restore the coastal ecosystem to its primitive state, she said.

The city even re-engineered a tunnel project from an original above-water bridge design into an underground tunnel, heavily increasing capital investments solely to preserve the dolphins' habitats, she added.

"As a flagship barometer of our marine ecosystem, their presence represents Xiamen's outstanding achievements in biodiversity conservation," Xu said.

Local paddleboarders, open-water swimmers and wildlife photographers in Xiamen have voluntarily established a grassroots monitoring network, capturing footage during unplanned encounters to support scientific research.

Chen Yu, a local open-water swimmer and photographer who has been tracking the species via aerial drone in recent years, said that public engagement is deeply rooted in local tradition. The dolphins are traditionally called "Mazu fish" after the sea goddess, and are regarded by residents as guardians of the waters.

"Since childhood, we have been told by our elders that the waters are safe wherever the white dolphins appear," Chen said. "For local residents, these animals are seen as traditional protectors of the sea."

These photographic sightings provide critical data for marine biologists. Images documenting maternal behaviors, such as a mother lifting her calf to breathe or teaching it to hunt, assist researchers in managing a digital profiling system that tracks family dynamics and newborn calves.

Star Chinese white dolphin Da Bai is seen swimming with her calf in Xiamen in 2020.

In April, an aerial drone photographer captured footage of a newborn calf swimming closely alongside Da Bai, a well-documented wild female dolphin frequently seen nursing newborns in Xiamen's waters.

"When we photograph a dolphin year after year and see it is still there, we know it is growing up healthy and strong," Chen said. "Every encounter still makes me feel incredibly lucky."

Marine experts have introduced a science-based maritime code of conduct, instructing water sports enthusiasts and photographers to maintain a respectful distance instead of chasing the animals.

Lin Yuan, a local middle school teacher who is a paddleboarder, regularly records her encounters with the animals in the sea to use as educational materials in her classroom.

"I bring my own dolphin encounter videos to share with my students," Lin said. "We must cultivate an awareness of biodiversity conservation in children so they can continue to see these marine creatures in their local environment in the future."

Digital drive supports planting of millions of trees

By **HOU LIQIANG** in Beijing and **HU DONGMEI** in Yinchuan

China's private-sector, internet-based afforestation efforts have reached a massive scale milestone, demonstrating how gamified digital incentives have been successfully integrated into the country's broader national ecological strategies.

Since 2017, under a partnership between tree planting initiative Ant Forest and the China Green Foundation, 386 million trees have been planted across about 44 projects spanning seven provincial-level regions, including Gansu and Qinghai provinces and the Inner Mongolia autonomous region, said Zhang Quanzhou, the foundation's secretary general.

According to Zhang, the partnership saw more than 200,000 hectares of desertified land treated in that time, with about 90 percent of it located in key areas of the country's Three-North Shelterbelt Forest Program, which is the world's largest afforestation endeavor.

"This program has transformed the 'green energy' of hundreds of millions of netizens into tangible ecological outcomes," he said.

Ant Forest was launched in August 2016 by internet financial services firm Ant Financial, an affiliate of Alibaba Group.

The app rewards users with virtual energy — which they can use to have trees planted — when they take low-carbon actions such as walking or using public transport instead of driving, or buying things online, which avoids the need for paper receipts.

The amount of energy needed to plant different trees varies. After receiving an application from an app user who has saved enough energy, Ant Forest will plant a real tree.

To ensure that digital goodwill translates into lasting ecological impact, Zhang said the foundation has built a long-term mechanism for public participation.

In collaboration with the National Greening Committee, it launched a nationwide online platform that allows citizens to adopt, monitor and track tree growth via their mobile phones, making voluntary tree-planting a year-round, regular activity.

Zhang also said that the foundation has established a clear responsibility chain, supported by technologies such as satellite remote sensing, third-party inspections and digital oversight.

Moreover, a collaborative governance model has taken shape in the country, featuring government guidance, corporate donations, public participation, foundation execution, and oversight by forestry and grassland authorities, he added.

A recent commentary in the journal Nature said that Ant Forest is an example of how digital incentives can be used to inspire the public and generate funding.

Since its launch, the gamified initiative with more than 500 million users has funded more than 619 million drought-resistant trees and shrubs, the article said.

Li Meng, a 28-year-old map data collector and dedicated Ant Forest user, embodies the power of digital incentives to drive lasting behavioral change. To date, Li has planted 1,120 trees across Ant Forest's forested areas since October 20, 2016.

His motivation is deeply rooted in a sense of shared responsibility.

"Western China has a sparse population yet silently protects the ecological environment of the eastern region," he said. "Whether we live in the east or the west, everyone should consciously protect the environment."

When personally participating in a tree planting activity in Alxa League in the Inner Mongolia autonomous region, Li observed saplings at different growth stages — from newly planted seedlings to mature, thickening saxaul trees.

"It's like the development of public welfare: gradual, persistent and built on dedicated effort," he said. "It will slowly grow stronger, better and better."

A decoration marking Ant Forest's collectible "green energy" is displayed at a green lifestyle fair in Shanghai in September 2024. XING YUN / FOR CHINA DAILY

Brussels' protectionist moves risk being costly backfiring gamble to EU

If a trade surplus is automatically interpreted as proof of unfairness, then many European Union exports — from automobiles to pharmaceuticals — could be subjected to the same logic elsewhere.

The EU justifies its trade surplus with the United States as a natural outcome of market forces, even as Washington accuses it of exploiting the US market. Yet, in a striking double standard, the EU now adopts the same logic in reverse. Framing its trade deficit with China as evidence of "victimhood", while overlooking the very market dynamics it so readily champions elsewhere.

The EU often lectures the world about the virtues of open markets, rules-based trade and economic integration. Yet Brussels' proposed Industrial Accelerator Act, along with other bills and policies, suggests that the bloc is increasingly tempted to abandon the very principles that helped build its prosperity.

Presented as a tool to "strengthen industrial competitiveness" and "accelerate the green transition", the IAA carries a less advertised objective: reducing China's role in Europe's strategic industries. Through public procurement restrictions, enhanced foreign investment screening and various "Made in Europe" preferences, the legislation marks a shift from openness toward industrial protectionism. It is nothing but an EU adaptation of "America First".

That is precisely why the concerns submitted by the China Chamber of Commerce to the EU on Thursday deserve serious consideration. The chamber, representing more than 1,000 Chinese enterprises operating in the EU, argues that several provisions of the IAA create legal uncertainty. More important, they threaten to make the EU's green transition slower and more expensive rather than faster and more competitive.

EU policymakers should realize that engaging with China brings opportunities to global enterprises. Multinational corporations are no longer peripheral players in China — they are integral to its industrial ecosystem. This is reflected in the numbers: foreign direct investment in the world's second-largest economy has topped $100 billion annually for 16 years running.

According to a report released at the seventh Qingdao Multinationals Summit on Tuesday, the surveyed multinational corporations in China allocated 14.3 percent of their global R&D spending to the country last year. At the same time, new foreign-invested enterprises in scientific research and technical services jumped 27.2 percent year-on-year to 14,000 — underscoring a deepening technological embrace of the Chinese market.

Divorced from the reality, however, the language of "de-risking", "reducing dependency" and correcting "trade imbalances" has become increasingly commonplace among some of the EU's political circles. Recent discussions among EU leaders have focused heavily on developing new restrictive trade instruments targeting China.

International trade is a matter of mutual choice. EU consumers purchase Chinese goods and EU companies source from Chinese supply chains because they are efficient and offer cost-performance advantages.

Trade balances are the outcome of market forces, industrial structures and consumer preferences. China has never deliberately sought a trade surplus with the EU. Treating a trade deficit as evidence of "economic victimhood" is a dangerous oversimplification.

The EU's competitiveness challenges stem from high energy costs, sluggish productivity growth, fragmented capital markets and regulatory burdens. Restricting Chinese investment will not solve these problems. Nor will excluding Chinese companies from procurement projects make European companies globally competitive.

Instead, it will lead to retaliatory measures, uncertainty and lost opportunities. China has made clear that it will take necessary measures to safeguard its legitimate rights and interests should discriminatory restrictions become EU policy.

But a more constructive path remains available. Despite growing tensions, China and the EU continue to maintain regular communication on economic and trade issues, as He Yadong, spokesman for China's Ministry of Commerce, said on Thursday. The talks in Brussels on June 9 between Ling Ji, vice-minister of commerce and deputy international trade representative of China, and Ditte Juul Jorgensen, director-general for trade and economic security at the European Commission, were "in-depth and comprehensive" and had helped lay the groundwork for ministerial consultations to be held soon, the Commerce Ministry spokesman added.

The ministerial consultations deserve strengthening to deepen mutual understanding.

A comprehensive and objective perspective is essential for the EU in managing its economic ties with China. Past efforts to resolve disputes, from electric vehicles to steel, have consistently shown that negotiation is the rational way forward in addressing bilateral trade frictions.

Should Brussels double down on a de facto "EU First" agenda, it may end up undermining the competitiveness it purports to protect. And when the dust settles, it will be EU businesses, consumers and future industrial strength that pay the price.

All relevant parties must uphold MoU terms

The signing of the first-phase Memorandum of Understanding between the United States and Iran offers not only hope for a ceasefire but also for further negotiations aimed at achieving lasting peace.

As the international community watches closely, it is imperative that all parties involved, including Israel, commit to upholding this agreement and work diligently toward regional stability.

The text of the MoU covers several key areas, including the cessation of hostilities, maritime security and navigation, reconstruction and economic assistance, sanctions relief, nuclear-related commitments and an executive mechanism. It states that the two sides commit to negotiating and achieving the final deal in a maximum of 60 days, extendable with mutual consent.

But the road to peace is rarely straight. Iran's announcement that it would close the Strait of Hormuz, citing Israel's continued attacks in Lebanon as a violation of the ceasefire deal, underscores the challenges in implementing the MoU.

The US-Iran negotiations that are scheduled to open in Burgenstock, Switzerland, are a testament to both parties' willingness to carry on the momentum of the MoU to continue dialogue. But much remains to be done to hold up the current fragile ceasefire and lay the groundwork for a final agreement.

The central question now is whether the US has both the genuine willingness and the practical capability to rein in Israel — especially given that Tel Aviv has made clear its determination to act of its own accord.

While Israel has agreed to a ceasefire in Lebanon, its refusal to withdraw from Lebanon poses a continued threat to peace. Reportedly, Israel is conducting negotiations with the US on maintaining its deployment of troops in southern Lebanon. For the MoU to succeed, Israel must cease its attacks and withdraw its forces, creating an environment conducive to negotiations.

Given the current challenges in implementing the 14-point memorandum and the fragile nature of the US-Iran ceasefire, the US-Iran negotiations, which were originally supposed to focus on the Iran nuclear issue, might now include discussions on the Lebanon ceasefire and the Strait of Hormuz.

The US-Iran talks may be in the spotlight, but their fate will be decided in the US-Israel negotiations. Tehran's revival of the Strait of Hormuz threat was to prompt the US to restrain Israel. The success of the talks in Switzerland hinges on the ability of all parties to adhere to their commitments and avoid actions that could derail the process.

China hopes that both the US and Iran will approach the second-phase negotiations with a rational and pragmatic attitude, working together toward positive outcomes.

Chinese Foreign Ministry spokesman Lin Jian said at a regular news briefing on Thursday that China welcomes the signing of the MoU and hopes that all relevant parties "will uphold the spirit of contract and implement it in good faith".

Beijing has been working for an end to the fighting since the outbreak of the conflict, demonstrating its commitment to peace through various diplomatic initiatives. The four-point proposal it put forward outlines a clear vision for safeguarding peace and stability, emphasizing good neighborliness, development, security and cooperation.

The path to lasting peace in the Middle East is fraught with challenges, but the MoU between the US and Iran offers a glimmer of hope as it provides the scaffolding for talks to end the conflict. For this hope to be translated into reality, all parties, including Israel, must prioritize peace and stability.

China stands ready to support these efforts, but the success of the forthcoming negotiations depends on the willingness of the parties directly involved to approach discussions with rationality and pragmatism.

New measures to enhance data security governance

China's digital economy has entered a stage in which data have become a key factor of production, an important strategic resource and a vital driver of innovation. Against this backdrop the release of measures to assess network data security risks marks a key step in strengthening the country's data security governance framework.

The measures, released on Thursday, will come into force on Aug 20. They aim to provide a systematic framework for identifying, analyzing and evaluating risks associated with network data and data-processing activities. The regulations require handlers of important data to conduct annual risk assessments while encouraging processors of general data to carry out assessments at least once every three years. They also establish clearer responsibilities for regulators, enterprises and third-party assessment institutions.

Since the enactment of the Data Security Law in 2021 and the issuance of regulations on network data security management, China has steadily built a comprehensive system for governing data resources. Yet a key question remained: how can enterprises effectively identify risks before incidents occur? The new measures answer that question by institutionalizing risk assessment as a routine and preventive mechanism. They transform data security governance from a reactive model focused on incident response into a proactive model centered on risk prevention and early warning.

The rapid expansion of artificial intelligence, cloud computing, industrial internet platforms and cross-border data flows has increased the complexity of data governance. As digital technologies penetrate every sector of the economy, data-related risks can quickly evolve into broader economic and social risks if left unchecked. The new measures therefore serve as an institutional safeguard for the high-quality development of the sectors concerned.

For industries and enterprises, the effect will be both immediate and long term.

For sectors that process large volumes of important data — including telecommunications, finance, energy, transportation, healthcare and industrial manufacturing — the measures will accelerate the establishment of more mature data governance systems. Enterprises will need to strengthen internal controls, improve data inventories, clarify data classification mechanisms and enhance monitoring of the entire data life cycle. While compliance costs may rise in the short term, the long-term benefits will include stronger resilience against cyberattacks, data leaks and operational disruptions.

The regulations are also expected to create new opportunities for China's cybersecurity and compliance service industries. By permitting enterprises to engage qualified third-party institutions to conduct assessments, the measures are likely to stimulate demand for professional services in risk evaluation, auditing, consulting, certification and security technology solutions. The development of a more standardized assessment ecosystem will further support the growth of specialized service providers and encourage technological innovation in data protection.

Importantly, the measures do not signal tighter restrictions on data utilization. Rather, they embody China's long-standing approach of balancing development and security. The objective is not to impede data circulation, but to create a more predictable and trustworthy environment in which data can be developed, shared and utilized safely. By clarifying assessment requirements and reducing uncertainty, the measures can help lower compliance burdens for many enterprises while enhancing confidence in data-driven innovation.

In an era when data security has become closely linked with economic security, social stability and national competitiveness, building robust risk management mechanisms is a must. The newly released measures represent important progress in China's effort to modernize data governance. By placing risk assessment at the forefront of security management, the country can lay a stronger foundation for the healthy growth of its digital economy.

— LI YANG, CHINA DAILY

What They Say

'Employment first' the key for social development

Editor's note: *China has issued an implementation plan for its employment-first strategy during the 15th Five-Year Plan (2026-30) period. China Media Group spoke to Zhang Chenggang, director of the research center for new forms of employment at Capital University of Economics and Business, on the goals, major tasks and policy measures for promoting high-quality and full employment. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

It is necessary to promote the quality and effectiveness of the service sector, which is the largest source of employment and offers a highly diverse range of jobs with varying entry requirements. Broadly speaking, it can be viewed from two perspectives — producer services and consumer services.

Producer services encompass the modern services that support manufacturing, such as finance, technology services and human resources services. Upgrading and expanding this sector hinges on whether it can generate a large number of high-value, well-paid jobs and continuously strengthen its competitiveness.

Consumer services account for a significant share of employment. In the past, many segments of the sector were characterized by small-scale and fragmented entities, uneven standards and relatively low entry barriers, resulting in wide variations in workforce quality.

The expansion of consumer services should be driven by organizations, enterprises and platforms that help raise service quality. Higher standards and better service quality will translate into an improved experience for consumers. In short, both producer and consumer services need to achieve growth in both quantity and quality.

A key message of the plan is that China must not only expand opportunities but also address existing shortcomings.

Expanding opportunities means continuing to support the development of new forms of employment and allowing the growth of the platform economy to play a greater role across both consumer and producer services. This, in turn, will create a wider variety of jobs, giving workers more choices and career paths.

At the same time, shortcomings in two key areas must be addressed. The first is social protection. Measures are needed to increase participation in social insurance among flexible workers and those in new forms of employment, while making enrollment more convenient. Occupational injury insurance should also be expanded to cover a broader range of workers in flexible employment.

The second area is public services. Service networks should become more extensive, ensuring that basic urban public services reach flexible workers and those engaged in new forms of employment. This will help them integrate more fully into urban life and share in the benefits of development.

It is also important to improve the alignment between educational provision and labor market demand. The establishment of a national big-data platform for talent demand will make workforce needs more visible and provide a stronger basis for educational institutions to adjust their academic programs.

A second priority is strengthening vocational education so that it becomes a respected pathway for career development rather than being viewed as a secondary option.

Also, academic disciplines must be adjusted in line with evolving industry needs. Educational institutions should closely follow the development of strategic emerging industries and future industries. Only by training people according to what the country and the market need can the education system better support economic and social development.

Remember past to safeguard future

A correct understanding of World War II history is necessary so that mistakes of the past are not repeated and both China and Russia are deeply committed to ensuring this. In a joint statement issued in May, both countries reaffirmed the commitment to safeguarding the outcomes of the victory embodied in the United Nations Charter and the charters and judgments of the Nuremberg Trials and the Tokyo Trials, and firmly opposing any attempt to deny or distort the history of WWII.

This stance is not just about preserving historical memory. Both China and Russia firmly uphold the UN-centered international system, reminding countries to avoid repeating historical mistakes and advocating for a fair and equitable global security governance system.

The postwar international order has institutionalized international relations and also established global organizations, including the UN, where major issues could be addressed with equal participation of member states. Under the postwar international order, international conduct has been regulated. The interconnected global economy necessitates shared behavioral standards. International law has gained prominence, providing a framework for dispute resolution, as exemplified by the World Trade Organization's role in shaping international trade rules.

At the same time, the international landscape gradually evolved from Cold War bipolarity to a multipolar structure, driven by the rise of developing countries and initiatives such as South-South cooperation and the Non-Aligned Movement. Nations increasingly engaged in multilateral cooperation to tackle global challenges, from climate change and environmental protection to counterterrorism.

Since the end of the Cold War, the postwar international order has faced significant challenges due to shifts in global power dynamics. Some Western countries are still clinging to outdated power politics because they don't want to relinquish their hegemonic positions and even distort historical facts. Besides, Japanese Prime Minister Sanae Takaichi has glorified militarism and refused to acknowledge Japan's history of aggression during WWII and the atrocities it inflicted on neighboring countries. These actions blatantly undermine fairness and justice and have drawn widespread condemnation from China, Russia and several Asian countries that suffered Japanese atrocities during the war.

The history of WWII offers crucial lessons for understanding today's international relations. An accurate view of that history is essential for preventing a relapse into large-scale conflict.

The war was a direct consequence of the lack of fairness and justice in the Versailles-Washington system established after the end of World War I. The Paris Peace Conference became a "looting assembly", with major powers redrawing their spheres of influence. The League of Nations was fundamentally flawed, and failed to maintain international peace and security.

Meanwhile, the global great economic turmoil in 1929-1933 created fertile conditions for the rise of fascism in Germany and Italy and militarism in Japan. They pursued aggressive military expansion and war preparations, ultimately leading to a global tragedy.

Today, the world once again stands at a critical juncture. Transformations unseen in a century are unfolding alongside intensified major-country rivalry and persistent regional conflicts. Deficits in peace, development, security and governance have become more pronounced, creating a vicious cycle.

Unilateralism and extremism have wantonly trampled on the sovereignty of other countries and blatantly violated the norms of international law centered on the UN Charter. The result has been sharp disagreements and confrontations between nations.

Calls from developing countries for peace and development have fallen on deaf ears. At the same time, globalization faces mounting challenges. Resources such as energy, food, and cyber capabilities are increasingly weaponized, while concerns over nuclear security have become more acute.

Addressing these challenges requires wisdom. The world is transitioning to a new landscape. While the US remains the sole superpower for the foreseeable future, emerging market economies and Global South countries are steadily expanding their influence across various fields — a trend that is set to strengthen further.

Developed countries maintain a clear edge in economic and technological competition, prolonging the transition period and resulting in asynchronous shifts in strengths across different areas. Economically, emerging markets have significantly expanded their share in international trade. However, shifts in security are slower, as the balance of military power, equipment and technology is unlikely to change anytime soon.

Culturally, the West continues to have a big advantage in this field due to modern means of communication and its control over mass media, but its influence is gradually diminishing. The trend toward civilizational diversity is strengthening, and resistance to Western cultural erosion is becoming more pronounced.

Against the backdrop of the prolonged Russia-Ukraine conflict, the spillover of the Middle East crisis, and certain Western countries attempting to maintain their grip on the steering wheel of international affairs, the advance of multipolarity must not devolve into factional confrontations.

In response to hegemonic headwinds, China and Russia have introduced a series of new security concepts within multilateral frameworks such as the UN, the Shanghai Cooperation Organization and BRICS. For instance, the Global Security Initiative proposed by China seeks to unite the international community in addressing global security challenges and maintaining world peace and stability. The SCO, advocating the "Shanghai Spirit", emphasizes common, comprehensive, cooperative, and sustainable security. It upholds equality among nations, favors partnerships over alliances, expands its cooperation network, and promotes dialogue to resolve disputes. This approach strives to turn the vision of "never again war" into reality.

Canada can drive down EV prices for buyers

For years, Canadians have been told that the electric vehicle revolution was just around the corner. The cars were getting better, charging infrastructure was expanding and the climate case was airtight. The only thing missing was a price that ordinary people could afford.

That barrier may soon come down.

Canada has slashed tariffs on Chinese EVs following Canadian Prime Minister Mark Carney's visit to Beijing, cutting them from the 100 percent surtax imposed in 2024 to 6.1 percent for an annual quota of 49,000 vehicles.

Chinese automakers wasted little time in responding. BYD, the world's largest EV manufacturer by sales volume, announced plans to open 20 dealerships across Canada within a year, starting in the Greater Toronto Area. Geely is assembling a Canadian leadership team, advertising senior roles in sales, marketing, legal and aftersales from a Toronto base. Other Chinese manufacturers, including Nio and Xpeng, may be coming too. At the same time, China has introduced an export licensing system this year for passenger EVs, creating a framework for expansion overseas.

For the first time, Canadian consumers will have real choices in the EV market, alongside healthy, market-driven price competition.

The timing is both significant and urgent. In late February, the military conflict in the Middle East effectively closed the Strait of Hormuz, the narrow waterway through which nearly 20 percent of the world's oil supply had been flowing. The impact on energy markets was immediate and severe. Brent crude, which began the year at roughly $61 a barrel, surged to above $120 a barrel in April, a level not seen since the Russia-Ukraine conflict broke out in 2022.

Canadians have felt that in every trip to the gas station. In Vancouver, which has the highest fuel prices in the country, it has now become common to see gasoline prices of C$2.20 ($1.58) per liter, the highest they have ever been and almost 40 percent higher than a few months ago.

Against this backdrop, the economics of driving an internal combustion engine have rarely looked worse while the case for switching to an EV has rarely looked better — provided you can actually afford one.

That has long been a barrier to owning an EV in Canada.

There are plenty of EVs on the streets across the country, but those vehicles are usually premium models in the high-priced segments. A market dominated by Tesla and a handful of established European and North American brands has faced limited pressure to compete on price. Consumers who wanted an electric vehicle but couldn't stretch to the average C$55,000 price of an EV were left with few options.

Chinese manufacturers bring a fundamentally different approach to the market. Take BYD's Seagull, which sells for the equivalent of roughly C$15,500 in China. It represents a category of affordable EVs that simply does not exist in Canada today. Even accounting for tariffs, shipping and local certification costs, Chinese EVs are expected to land in Canada at price points that will force established automakers to respond.

There are already indications that Canadians are responding to the changing market conditions.

Zero-emission vehicle (ZEV) sales jumped 74.7 percent in March compared with a year earlier as fuel prices started climbing. ZEVs accounted for 12.2 percent of all new vehicle sales that month, nearly double the 6.5 percent share recorded a year earlier.

That surge happened before a single Chinese showroom opened in Canada. When BYD's first Greater Toronto Area dealerships open later this year, the market will face its first real test of what genuine competition can do to an industry that has long been insulated from it.

The international context makes the Canadian opportunity even clearer. European Union EV sales rose 51 percent in March as competition and model diversity allowed buyers to easily shift away from traditional cars when oil prices spiked. In the United States, by contrast, EV sales fell yet again in March and have been falling for months as the federal government rolled back incentives and embraced an openly skeptical posture toward electrification.

Canada finds itself between those two trajectories, with an opportunity to choose which path to follow.

Some in Canada have voiced concerns over national security and the protection of domestic manufacturing. But the decision to grant an annual quota of 49,000 Chinese EVs at the most-favored-nation tariff rate — while China has adjusted countervailing measures — reflects bilateral efforts that will ultimately benefit Canadian consumers. In a year when the country lost more than 110,000 jobs in the first four months and consumer confidence has been sliding, the case for shielding a premium car market from competition has become untenable.

Fair and open competition can deliver tangible benefits to ordinary consumers. Chinese EVs will offer Canadian consumers more choices and lower prices, and may even play a role in shoring up the country's automotive industry.

This is not just about geopolitics or trade policy, though it involves both. It is about whether Canadians will be able to buy affordable, efficient vehicles at a time when the cost of the alternative continues to rise. The showrooms are not open yet, and the cars have not yet arrived on dealer lots. But the window that has been opened by this trade deal is real, and it should not be allowed to close.

Hibat-Allah Ezzahid

Adaptability of Chinese firms key to success abroad

Chinese companies are playing an increasingly important role in the global economy today. From advanced manufacturing and renewable energy to infrastructure, logistics, digital technologies, and industrial cooperation, they are transforming production systems and value chains across the world. As Chinese companies continue to expand internationally, the focus is shifting from merely entering foreign markets to operating effectively within diverse institutional, managerial, and cultural environments. While large-scale investments often attract attention, the day-to-day operational realities of globalization are becoming equally important for long-term success.

One major challenge that Chinese companies face is institutional complexity. Many international markets offer attractive macro-level conditions for investment, including political stability, industrial incentives, trade agreements, and strategic locations. However, once companies begin operations, they often face fragmented realities. Administrative procedures may involve multiple agencies with overlapping responsibilities, and regulatory implementation can vary across institutions or regions. Complexities in licensing systems, taxation procedures, labor regulations and documentation requirements may cause delays.

For instance, a Chinese automotive components company facing a three-month delay when importing machinery to Morocco due to complicated customs clearance processes involving several administrative entities suffered disrupted production planning and slowed local recruitment. In response, the company expanded its local legal and administrative team in the host country rather than relying solely on coordination from China.

Another challenge is cross-cultural and managerial coordination. Chinese companies have developed highly effective management systems characterized by organizational discipline, operational efficiency and strong operational commitment. These strengths have driven China's industrial transformation and global competitiveness. However, the workplace expectations, communication styles and professional cultures may differ significantly in global settings. Differences in approaches to hierarchy, communication, working rhythms, and work-life balance can create operational friction within multinational teams.

A Chinese manufacturing company introduced production schedules and overtime practices similar to those in China during a peak production period. But this led to tensions within local teams over overtime expectations and work-life balance. There were also misunderstandings because some local employees perceived the communication style of managers as too direct. In response, the company adjusted working schedules, localized certain HR practices and expanded the role of local middle managers.

Many companies are discovering that management systems cannot simply be transferred across borders. Therefore, Chinese companies are developing more adaptive and internationally integrated management approaches. They are not abandoning their organizational strengths, but combining them with greater local responsiveness and intercultural flexibility. This includes preparing managers for overseas environments, redesigning coordination mechanisms, adapting HR practices, and integrating local leadership into operations. This adaptability is becoming a strategic advantage for Chinese firms globally.

Human capital and localization present another challenge. During the early stages of international expansion, Chinese companies often rely heavily on expatriate teams for coordination and technology transfer. While this model facilitates early operations, long-term international integration requires stronger local participation. Local employees contribute essential knowledge of language, regulations, professional culture and market dynamics.

A Chinese manufacturing company initially depended heavily on expatriate teams for operational supervision, but later faced difficulties in communication with local workers and labor management practices. Misunderstandings often emerged regarding production instructions and workplace expectations because many local employees communicated in the local language rather than Chinese or English. In response, the company hired local supervisors and bilingual coordinators to improve communication and workforce management. Similarly, many Chinese companies are investing more deeply in local talent development, managerial training, and long-term integration.

In several international operations, Chinese companies are also introducing cross-border learning systems that help local employees understand corporate structures, operational standards and organizational culture. Moroccan employees receive technical or managerial training in China before they are given greater responsibilities locally.

This reflects a broader transformation in the globalization of Chinese enterprises. International expansion is no longer just about exporting industrial capacity or building overseas projects. It is also becoming a process through which Chinese companies gain global managerial experience and develop new organizational capabilities. This experience strengthens their expertise in institutional adaptation, intercultural coordination, operational flexibility, and long-term strategic integration. In this sense, globalization is becoming not only a process of international expansion, but also one of organizational learning.

Morocco offers a concrete example of these operational dynamics. Chinese companies operating in Morocco illustrate how operational dynamics can become complex even in a relatively stable and investment-friendly environment.

As Chinese firms deepen their global presence, their long-term success will depend not only on investment and technology, but also on their ability to adapt to diverse institutional and cultural environments.

A smartphone screen on a housewife's head records her actions through motion capture while she is slicing mangos at her home in Chennai, India, on May 15.

A housewife wears a smartphone on her head as she records her actions through motion capture while watering plants at her home in Chennai, India, on May 15.

Workers wear cameras on their heads while recording actions through motion capture inside a factory in Tamil Nadu, India, on May 13.

A worker wears a camera to record actions through motion capture while arranging colored blocks at an AI data company in Tamil Nadu, India, on May 13.

Robot mentoring

Indian housewives with phones on their heads train humanoids that will perform household jobs in future

With a smartphone strapped to her head, Indian housewife Nagireddy Sriramyachandra films herself slicing mangos to train AI-powered robots to take on household jobs in the future.

Earning just over $2 for an hour of video, her mundane recordings are invaluable for global tech companies teaching machines how to move like humans in the real world.

The 25-year-old is one of a growing army of thousands of AI system trainers in India.

"Who else will give you 250 rupees ($2.64) an hour just for doing housework?" said Sriramyachandra from her kitchen in Chennai in southern India's Tamil Nadu state.

"I may get a robot myself in the future," she said.

AI chatbots and image generators crunch reams of digital data, but building systems to navigate real-life environments is more challenging.

Developers think feeding first-person footage, called "egocentric data", into specialized AI models will help robots copy humans.

Some AI trainers work at home, others in factories or specialized studios — using video glasses, head-mounted cameras and motion sensors.

"It blares 'hands not detected' when I'm not recording properly," said Sriramyachandra, who sends recordings via a special app to the AI data company Objectways.

The humanoid robot market is booming, with investment bank Morgan Stanley predicting there could be over a billion in use by 2050, mostly for industrial and commercial purposes.

"Folding clothes, coffee-making ... cooking a very specific thing, sandwich-making," Objectways head Ravi Shankar said, listing videos requested by clients.

From top: A worker wears a camera to record her actions through motion capture at an AI data company in Tamil Nadu, India, on May 13. Data is acquired through motion capture at the AI data company in Tamil Nadu.

"Some jobs are supposed to be taken over, so humans can go and do better things."

In India, the emerging field of spatial AI is providing new employment.

"It's likely that these data collection services will increase," said digital labor expert Aditi Surie, from the Indian Institute for Human Settlements in Bengaluru.

At an Objectways studio, AI system trainers film themselves performing household tasks in fake, fully furnished apartment rooms.

After several thousand hours of filming, the wallpaper is changed to provide clients with variety.

"Today I sit here, tomorrow I stand there," said engineering graduate Rani N., 21, on a break from filming herself, once again, folding a towel.

Each video lasts about four minutes, and she records around 90 a day — on nearly every conceivable spot on the bed.

She says the job is "tolerable", but feels like she's always wearing a camera.

In other rooms, colleagues arranged pencil sharpeners, water bottles and crayons in patterns, recording with depth-sensor cameras.

Qanat Consulting Services in Andhra Pradesh, an Objectways subcontractor, supplies about a dozen larger data firms with recordings. Some of its 2,000 contributors perform tasks with motion-sensor bands on their "wrists, hands and legs", CEO Thaslim Pattan said.

Manish Agarwal of Bengaluru-based Humyn Labs records conversations as well as videos.

Contributors discuss assigned topics — ranging from politics to entertainment — for clients wanting to process speech patterns. Agarwal denies that robots will steal jobs, believing that networks of humans and robots "will work together" one day, he said.

"A welder in India could be managing a welder-robot in Prague," he said.

'China Shock' seen as cover of protectionism

Western framing undermines multilateral trading system, drives up costs: Experts

By **YANG RAN**
yangran1@chinadaily.com.cn

In response to growing rhetoric from the West over the so-called China Shock 2.0, experts say this narrative serves primarily as a political shield for protectionist policies rather than an objective economic assessment.

They warn that such framing could undermine the multilateral trading system and drive up global costs. Rather than viewing China's industrial advancement with hostility, those nations should instead adopt a more sophisticated collaborative mindset, leveraging China's robust supply capabilities to generate shared global benefits, experts urged.

During the three-day G7 summit concluded on Wednesday, European Commission President Ursula von der Leyen said, without naming China directly at first, that "some countries produce too much and do not consume enough", claiming it has been "increasingly dangerous for the stability of the global economy". She then explicitly singled out China, labeling its trade surplus with the European Union "unsustainable".

Her remarks mirror the "China Shock 2.0" narrative that has been gaining traction. Last month, the Centre for European Reform, a Europe-based think tank, published a report claiming that "a new China Shock is reverberating across global goods markets". During the G7 summit, many Western media outlets also leveraged this narrative to justify trade policies targeting China.

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, pointed out that the "China Shock" narrative largely focuses on the alleged trade imbalances, specifically concerning China's goods trade surplus with the West.

Sun Chenghao, head of the US-Europe Program at Tsinghua University's Center for International Security and Strategy, noted that the recent Western hype around the so-called China Shock 2.0 is in essence a political construct. "It layers together Western anxieties over lost industrial competitiveness, the rising costs of a green transition, and a broader strategic competition with China. They reframed these issues into a 'security threat' narrative, repackaging for public consumption."

The original "China Shock" thesis, coined by Western economists, argued that China's post-WTO export boom disrupted US labor markets.

Sun said that the underlying logic of the current version hasn't changed much. "Both versions externalize the internal challenges of Western economies — industrial restructuring, income inequality, and technological competitive pressures — and blame them on Chinese manufacturing."

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, agreed. He said the so-called China Shock is simply a natural outcome of market economics and competition.

"Developed countries have grown accustomed to holding the technological upper hand for decades," Tu said. "Now, when they face a real competitor, they seem reluctant to embrace the free market principles they've preached for decades."

Far from being a detriment, experts said that China's industrial upgrading, which offers high-tech products at lower costs, is a boon for the global economy, enhancing world productivity and welfare.

James Pethokoukis, a senior fellow at the American Enterprise Institute for Public Policy Research, a Washington-based think tank, highlighted this positive impact in a December article published on the organization's website.

He noted that while China's rapid growth reduced the US' share of the global GDP, it simultaneously helped US consumers by making a wide range of goods cheaper to buy and easier for US companies to produce. The US, he concluded, became "absolutely richer" even as it appeared "relatively smaller, economy-wise".

Benefiting the world

"China's massive, integrated production capacity, combined with intense domestic competition, allows it to produce high-tech goods at remarkably low cost," said Tu. "This, in fact, benefits the entire world, as it significantly lowers product prices, thereby enhancing their accessibility and affordability. This is particularly evident in renewable energy products, including solar power, wind energy, and electric vehicles."

Official data shows that Chinese wind turbines, solar panels, and new energy vehicle products are exported to over 200 countries and regions globally, driving down global wind and solar power generation costs by over 60 percent and 80 percent, respectively.

Sun warned that the West's pan-securitization of normal industrial competition would, in the long run, escalate global production costs, diminish consumer welfare, fragment supply chains, and further erode the WTO-centered multilateral trading system.

Against this backdrop, experts advocate a more rational and objective perspective on China's industrial and economic development, urging exploration of international cooperation for global prosperity.

Jian from Fudan University said, "What they call a shock is really just competitive pressure, which is inherently beneficial for the growth and prosperity of the global market." Blocking such normal competition, he argued, would be detrimental to overall economic development.

"In this context, it is crucial to view this competition rationally and objectively, embracing a market-oriented mindset and promoting self-growth through cooperation with the competitors," he said.

Instability reshapes global supply chains

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Business leaders and logistics executives said global supply chains are adapting to a more complex trade environment shaped by geopolitical tensions, evolving tariff policies and shifting trade patterns, while emphasizing the continued importance of long-term planning and international commerce.

Speaking at a news briefing hosted by the Port of Los Angeles, Gene Seroka, executive director of the port, and Dan Letter, chief executive officer of Prologis, the world's largest logistics real estate company, discussed how companies are navigating uncertainty while maintaining investments in logistics infrastructure, warehousing and trade-related operations.

The discussion came as businesses continue to assess the implications of recent developments in global trade and geopolitics, including ceasefire negotiations involving Iran and the United States, ongoing conflicts in the Middle East and Europe, and evolving China-US trade relations.

Seroka said a proposed reopening of the Strait of Hormuz could help ease pressure on energy markets and improve business confidence, although he cautioned that a memorandum of understanding involving the US and Iran remains only a framework for further negotiations.

"Twenty percent of the world's energy products flow through that strait," Seroka said. If the Iran situation further eases as expected, "we could see oil prices continue their decline, inflation possibly easing over the weeks and months ahead, and shipping confidence could begin to return".

He noted that the waterway normally accommodates more than 100 vessel crossings daily, but warned that shipping companies are unlikely to resume normal operations immediately.

"Crew safety remains the priority," Seroka said. "Even with a possible reopening, it will take months to normalize schedules, get supply chains back to some semblance of normalcy and clear backlogs."

Despite recent disruptions, Seroka said conversations with port operators and industry partners in Asia suggest that cargo flows remain resilient. He added that easing bunker fuel prices and improving confidence could provide additional support for trade volumes in the months ahead.

Turning to China-US trade relations, Seroka said recent discussions were a positive signal, but businesses want clearer direction.

Positive sign

"It's certainly positive when the leaders of the world's two largest economies sit down to negotiate," Seroka said, adding that while businesses are encouraged by the continued engagement, many companies are still seeking greater policy clarity as they make long-term decisions related to trade, investment and supply chains.

China remains one of the Port of Los Angeles' largest trading partners. According to port data, China-related cargo has historically accounted for a significant share of container volumes moving through the Southern California gateway, making developments in bilateral trade relations closely watched by logistics providers, retailers and manufacturers.

Seroka said uncertainty surrounding tariffs continues to influence business decisions. While discussions have included potential opportunities for increased US agricultural exports, including beef and soybeans, he noted that market conditions remain challenging.

He pointed out that Brazil and Argentina have expanded their presence in China's soybean market in recent years, making it more difficult for US exporters to quickly regain market share.

"Once overseas buyers establish new sourcing relationships, it can take a lot of time to win that business back," he said.

Companies are also monitoring upcoming tariff deadlines and potential new trade measures, prompting many businesses to shorten planning horizons and adjust inventory strategies.

"This is the new reality of doing business in today's trade environment," Seroka said.

Letter from Prologis said supply chains have become more resilient after navigating years of disruptions, including rising interest rates, geopolitical tensions and global conflicts.

"Our customers have been digesting all of these issues, and we're seeing them again make decisions," Letter said. "They're making these five-plus-year decisions with us."

Report: UK PM Starmer could resign

LONDON — United Kingdom's Prime Minister Keir Starmer was expected to resign on Monday and set out a timetable for his departure, according to The Observer, a local newspaper.

However, UK Business Secretary Peter Kyle said on Sunday that the news of Starmer's quitting is speculation. He added that Starmer is "making time to reflect on the political realities, challenges and opportunities that he finds himself in".

The threat to Starmer's position, which has been building for months, increased sharply on Friday when his rival Andy Burnham won a seat in Parliament that would allow him to launch a formal leadership challenge.

The Observer, which did not name its sources, said Starmer had reached the conclusion that his position was no longer tenable after speaking to cabinet ministers, advisers, donors and trade union leaders.

Starmer led the center-left Labour Party to a landslide election win in 2024 but has become deeply unpopular after a series of scandals and policy U-turns that have given many voters an impression that he cannot deliver on improving their standards of living that he promised.

If he were to quit or be ousted, it would mean the country installing its seventh prime minister in just over a decade — the highest turnover in nearly two centuries, reflective of anger at successive governments' failures to improve public services and tackle issues like illegal immigration.

More than 100 elected lawmakers in Starmer's party — roughly a quarter of all Labour representatives in the House of Commons — have publicly said they want him to quit or set out a timetable for his exit, according to a Reuters tally.

Burnham, until last week the mayor of Greater Manchester, decisively won the seat of Makerfield in northwestern England in a special election on Thursday. He took almost 55 percent of the 45,510 votes cast, over 9,000 more than the Reform UK runner-up.

Burnham did not immediately make a formal challenge to Starmer but used his victory address to promise a new path for the country.

Starmer congratulated Burnham on Friday but said he would fight any challenge to his leadership and urged Labour not to tear itself apart with infighting.

But Charlie Falconer, a senior Labour member of the House of Lords, said on Saturday that Starmer has "absolutely no authority" left.

"There should be an agreed transition process in which Andy and Keir cooperate as to when the handover should take place," he said.

Intra-Asian travel viewed as opportunity amid tensions

By **YANG HAN** in Hong Kong and **LEONARDUS JEGHO** in Jakarta

Turmoil in the Middle East has reshaped the global travel landscape. Long-haul travel is among the hardest hit, while intra-regional travel could become a bright spot for many tourism-dependent Asian economies, according to industry analysts.

Citing the situation in the Middle East, the Tourism Authority of Thailand slashed its forecast for long-haul arrivals this year from 11 million to 10 million, according to a report by The Nation on June 17.

However, arrivals from nearby markets such as China saw a strong recovery with Chinese tourists arrivals jumping 18.35 percent to 2.3 million. The number of Indian tourist arrivals also increased by 8 percent to about 1 million, the report said.

Paul Edmundus Talo, director of Floressa Bali Tours and Bali Flores Adventure, told China Daily that the conflict in the Middle East had affected international flight services, created a sense of uncertainty among travelers, and contributed to higher airfares.

Airfares for flights between Asia and Europe have hiked after the US-Israeli war on Iran began in late February.

According to an analysis by FlightsFinder.com in March, fares on direct routes between Asia and Europe surged by nearly 300 percent, meaning travelers would need to pay up to $2,330 more for the same flight.

Growth potential

Gary Bowerman, managing director of the weekly industry newsletter Asia Travel Re:Set, said that it is still unclear how consumers will respond to the challenges ahead, but Asian tourism still holds strong growth potential.

Bowerman said intra-regional demand has become a significant force for Asia's tourism recovery, and he expects regional travel in Southeast Asia and the broader Asia-Pacific to remain strong.

But currency volatility, rising interest rates, and higher living costs could weigh on travel at the margins, he said, noting the war in the Middle East will have strong residual effects for some regional economies in the second half of 2026.

"Destinations across the region must continue to diversify their visitor mixes to build more resilience in the future," said Bowerman.

Some Southeast Asian countries have pinned their hopes on the Chinese market with targeted campaigns.

A Chinese tourist wearing a Thai traditional costume poses for photos at Wat Pho Temple in Bangkok on May 5. RUNGROJ YONGRIT / EPA

Thai tourism authorities are planning to attract 7.5 million Chinese visitors in 2026. Apart from marketing through social media platforms, it also plans to build on the popularity of the Chinese film *Dear You* to increase interest in locations where the film was shot.

On June 15, Cambodia launched a four-month visa-free trial for Chinese tourists with multiple entries, its largest source of international visitors. The government said it aims to boost tourism recovery, according to the Khmer Times.

As tourist arrivals drop in Siem Reap Province, Khiev Thy, president of the Siem Reap Angkor Guides Association, said the visa exemption will play an important role in attracting Chinese tourists.

In Bali, the popular Indonesian tourism destination has quickly adjusted its strategy to prioritize the development of the Chinese market in response to the loss of Western tourists, said Ye Lu, head of the China market of the Bali Tourism Board, also founder of the Bali Mandarin Center.

Measures include simplified visas, increased direct flights, training for Chinese-speaking guides, and widespread acceptance of Alipay and WeChat Pay to fill the tourist gap, Ye said.

US-Japan military drills raise concern

Exercise destabilizing regional security and heightening tensions, experts say

By Liu Jianqiao
liujianqiao@chinadaily.com.cn

Japan and the United States have launched a large-scale joint military exercise, raising concerns of destabilizing regional security and further heightening tensions between Japan and its neighboring countries.

Japan's Ground Self-Defense Force and the United States Marine Corps launched the Resolute Dragon exercise on Saturday, taking place across the southwestern Kyushu region and Okinawa Prefecture and lasting over a week, according to Japan's Nikkei Asia.

The GSDF plans to deploy its US-made V-22 Osprey military transport aircraft from Camp Saga, Kyushu, to Miyako Island in Okinawa for the first time. The drill will include transporting simulated casualties from the island to the US Marine Corps Air Station Futenma on Okinawa.

The military drill, focused on island defense operations, has been held annually since 2021. About 9,600 personnel from both nations will participate in the exercise, which will include live-fire drills, combat exercises and logistics transport training at GSDF garrisons and training grounds, among other locations.

This is the first time a GSDF unit operating long-range missiles has participated in the joint exercise. The unit was deployed to Camp Kengun in Kumamoto in March. This also marks the first time SDF transport ships *Nihonbare* and *Yoko* have been used in military drills, according to Japan News. Last year, the London Maritime Academy reported that the vessels are part of a unit focused on enhancing maritime logistics.

Residents of Yamato Town in Kumamoto Prefecture recently submitted a protest letter to authorities, voicing concerns over the US military holding low-altitude training flights using Osprey transport aircraft during the exercises.

The protesters also warned that the joint military exercises could disturb regional peace and stability, and further heighten tensions between Japan and its neighbors.

Liu Shuliang, an associate researcher at the Tianjin Academy of Social Sciences, said Japan is strengthening its military cooperation with foreign partners and deepening coordination with the US, seeking to build a clique-based and confrontational military arrangement.

"Japan's continued strengthening of security cooperation with the US and other countries is widely seen as part of its broader push toward remilitarization," he said.

Undermining stability

By leveraging military cooperation with foreign countries, Japan is further expanding its military presence in the Asia-Pacific region, a move that could intensify regional tensions and undermine stability, Liu added.

"It may also trigger a chain reaction among neighboring countries, prompting higher military spending and faster defense modernization, thereby fueling an arms race and worsening the regional security dilemma," he said.

Liu said that since the end of World War II, Japan has long tried to portray itself as a peace-loving nation, adhering to an exclusively defense-oriented policy and cultivating a moderate image on the international stage.

"However, recent years have witnessed a fundamental transformation in Japan's defense and security policies, with the country accelerating a shift that many observers view as remilitarization," he said.

By steadily expanding the scope of its postwar security policies and loosening the constraints of its pacifist Constitution, Japan is accelerating a shift toward remilitarization. Under the banner of becoming a "normal nation", it risks undermining the peace-oriented image it has cultivated since World War II and moving toward "a new form of militarism", Liu said.

Chen Hong, director of East China Normal University's Asia-Pacific Studies Centre in Shanghai, said the US has been a key driver behind Japan's accelerated remilitarization, providing political and strategic support for the country's expanding military role.

In an effort to maintain its declining hegemony and strategic interests in the Asia-Pacific region, the US has been gradually easing postwar military constraints on Japan, he said.

First, it has deepened US-Japan military integration, encouraging Japan to expand its defense budget, develop advanced capabilities, and strengthen its military capacity, Chen said.

Second, it has sought to further incorporate Japan into the US-led security network, enabling it to play a more active role through joint military exercises and closer defense cooperation, he added.

Panda-monium

Syrian refugees embark on journey home

BEIRUT — As the first light of day filtered through the canvas walls of his tent in southern Lebanon, 48-year-old Abu Mohammad Jihad al-Omari carefully packed the last of his family's belongings. His wife folded clothes and blankets into large bags while their children loaded luggage onto an aging vehicle waiting outside.

Within hours, the family would begin a journey they had postponed for years — returning to Syria after seeking refuge in Lebanon.

"When we fled Syria, we were escaping war. I never imagined I would experience similar circumstances again," said al-Omari.

Al-Omari's family is among a growing number of Syrian refugees forced to embark on the journey home as the security situation in Lebanon increasingly deteriorates amid Israel's continued military campaign.

At Marj al-Khoukh camp near the southern city of Marjayoun, signs of departure were everywhere — worn blankets, abandoned cupboards, and household items left behind by departing families. At another camp, the Marjayoun Plain, rows of tents stood largely empty.

Once home to more than 1,400 Syrian refugees, around 85 percent of families have returned to Syria in recent months through voluntary return programs or their own initiative.

According to Lisa Abou Khaled, spokesperson for the United Nations High Commissioner for Refugees, around 630,000 registered Syrian refugees returned from Lebanon to Syria between January 2025 and April 2026. Between March 2 and June 11, 2026, 130 Syrian refugees were killed and 153 injured in Lebanon.

She said return decisions depend on several factors, including access to housing, education, basic services and livelihood opportunities in Syria. However, the increasing insecurity in Lebanon has accelerated many refugees' plans to leave.

Sixty-year-old Khawla Murad was also preparing to leave. "We endured difficult living conditions and economic hardships here, but we could no longer endure the fear," she said.

"When children started waking up at midnight to terrifying sounds of airstrikes, that's when we realized it was time to go back."

According to Lebanese authorities, approximately 1.5 million displaced Syrians are living in Lebanon, some of them in more than 1,400 informal camps across the country, placing significant social, economic and service-related pressures on the host nation.

Israel launches deadly strikes on Gaza

GAZA/JERUSALEM — Israeli forces carried out attacks in the Gaza Strip on Saturday, killing at least nine people, including a child and a journalist from Al Jazeera, in the latest violence to rock the Palestinian territory despite a ceasefire.

Israel and Hamas trade near-daily accusations of truce violations and the Gaza Strip remains gripped by bloodshed as progress on permanently ending the conflict remains stalled.

The airstrikes and gunfire killed at least nine people, Reuters reported, citing health officials. Agence France-Presse put the toll at 11.

An Israeli strike killed four Palestinians, including two women and a child, in an apartment building in Gaza City, health officials said. The attack on the building in the Sabra neighborhood destroyed the apartment and wounded several other people, medics added.

Residents inspect the rubble of an apartment following an overnight Israeli airstrike in Gaza City on Saturday. Abdel Kareem Hana / AP

The Israeli military said it struck a militant, without elaborating.

Farther north, Israeli forces shot and killed a woman in the town of Beit Lahiya, medics said. An Israeli airstrike killed at least one person and wounded eight others in Khan Younis, south of the enclave.

Later on Saturday, an Israeli airstrike killed three people, medics said, including Ahmed Wishah, a journalist working for Al Jazeera, in the Bureij refugee camp in the central Gaza Strip.

Al Jazeera said Wishah, a cameraman, was killed about two months after his brother, Mohammed Wishah, also an Al Jazeera journalist, was killed by the Israeli military.

The Palestinian Journalist Syndicate condemned Wishah's killing on Saturday and called for Israeli leaders to be held accountable for such attacks, which have killed nearly 300 Palestinian journalists since the conflict began in October 2023.

The Israeli military said in a statement that it killed a Hamas militant, who posed a threat and served as an Al Jazeera photojournalist.

An October ceasefire halted major fighting between Hamas and Israel, but a permanent Gaza peace plan remains elusive.

At least 1,012 Palestinians have been killed in Gaza since the ceasefire took effect on Oct 10 last year, according to the territory's health ministry.

The Israeli army has reported five deaths in its ranks during the same period.

The two sides remain deadlocked over some key issues. Israel says Hamas must cede power in Gaza, disarm, and play no role in the future governance of the enclave. Hamas links any full disarmament to launching a political track toward establishing a Palestinian state.

Hamas-led fighters killed 1,200 people during their cross-border attack into Israel on Oct 7, 2023, according to Israeli tallies.

The Gaza health ministry said more than 73,000 Palestinians have been killed in the territory since then.

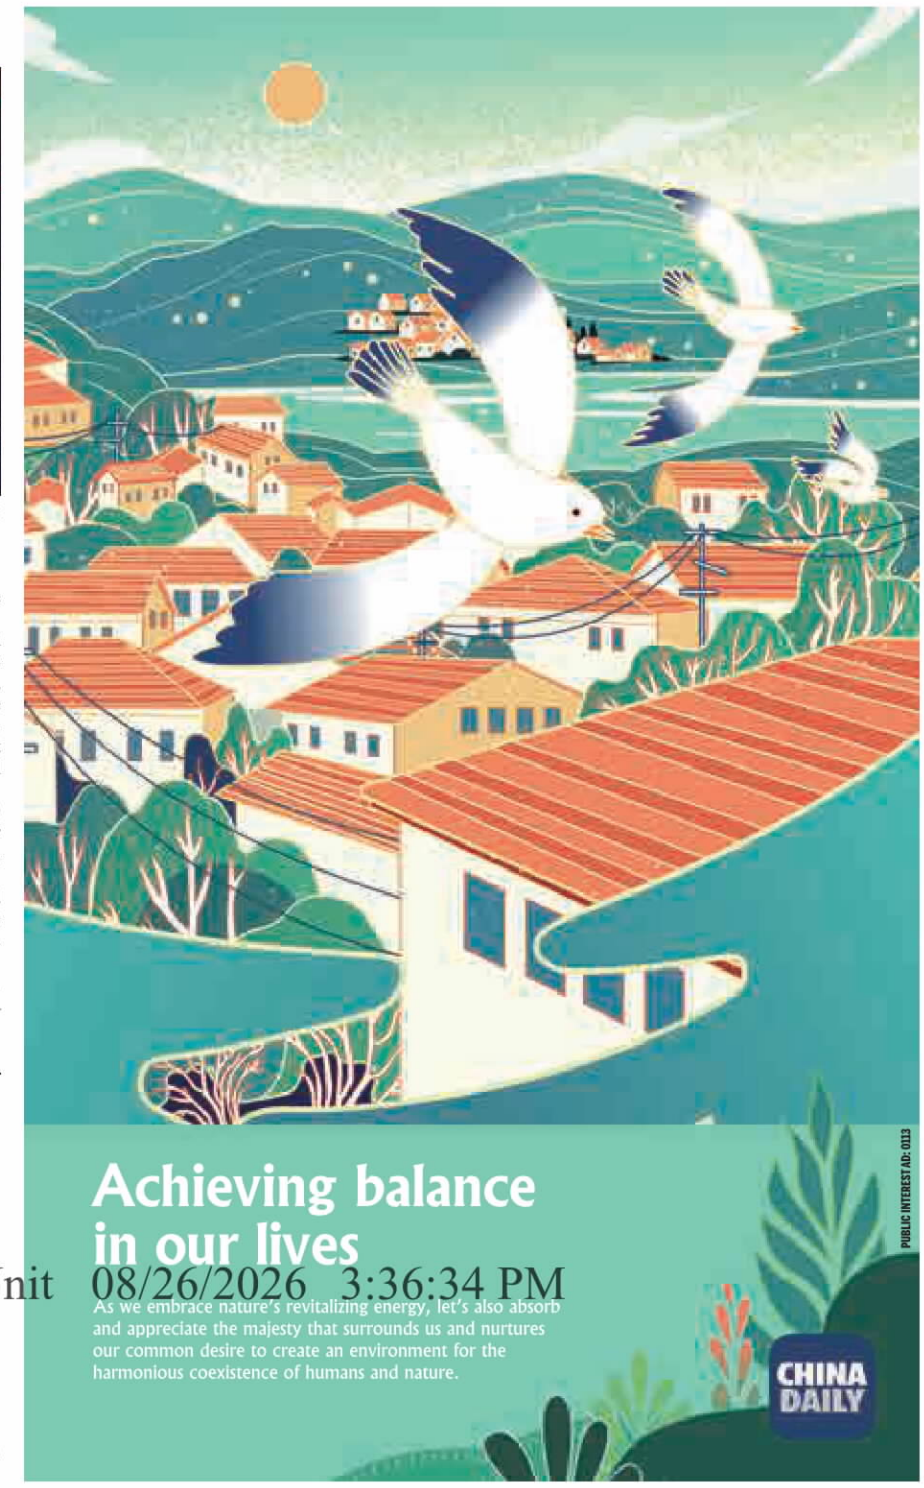
Briefly

United States

2 killed, 1 injured in Connecticut shooting

Two people were killed and another was injured in a shooting outside a bar in West Haven, the US state of Connecticut, early Saturday morning, according to authorities. Officers arrived at a bar on Campbell Avenue at around 1:27 am local time after receiving a report of gunshots, West Haven police said. Three people were found with gunshot wounds outside the bar, two of whom were pronounced dead after being transported to a hospital. The roads near the scene were blocked for more than nine hours after the shooting. Police said the shooting appears to be an isolated incident and there is no ongoing threat to the public. An investigation was underway.



DR Congo

Over 900 Ebola cases, 247 deaths reported

The number of confirmed Ebola cases in the Democratic Republic of Congo has risen to 956, including 247 deaths, according to the latest situation report released on Saturday by the country's health authorities. Twenty-three new confirmed cases, including two deaths, were reported on Friday in the provinces of Ituri and North Kivu. Ituri remains the epicenter of the outbreak, with 874 confirmed cases and 201 deaths, accounting for more than 91 percent of the country's confirmed cases. A total of 92 patients have recovered, while 361 patients were in isolation or hospitalized. The outbreak, caused by the Bundibugyo strain, was declared by the DR Congo authorities on May 15.

Home brands sharpen sport sponsorship

Firms pursuing dynamic, co-creative strategy with 2026 FIFA World Cup

By LI JING
lijing2009@chinadaily.com.cn

When the 2026 FIFA World Cup officially kicked off across the United States, Canada and Mexico this month, Chinese brands are less visible among top-tier sponsors than they were four years ago.

Only three Chinese companies — Lenovo, Hisense and Mengniu Dairy — remain among FIFA partners and FIFA World Cup sponsors, a sharp contrast to the wave of Chinese sponsorship that dominated stadium billboards during recent tournaments.

Yet the shift comes despite FIFA reporting its strongest commercial performance on record. The governing body said in March that all 16 global sponsorship positions for the 2023–26 cycle had been sold, making it the most successful commercial program in its history. Total revenue for the cycle is budgeted at nearly $13 billion.

But business leaders and researchers say the decline in sponsorship numbers does not signal waning interest from Chinese companies. Instead, it reflects a broader shift in how Chinese companies are using global sporting events to support going global strategies.

Rather than buying visibility alone, companies are increasingly treating the World Cup as a platform to demonstrate technology capabilities, strengthen brand positioning, deepen consumer engagement and expand their global footprint.

"It is a transition from a traffic-driven mindset to an effectiveness-driven mindset," said Hu Shan, principal at consultancy company Roland Berger. "Companies are paying much closer attention to return on investment and alignment with their global expansion strategies."

For Qiao Jian, senior vice-president of Lenovo, the shift can be summed up as a move from participants to co-builders.

"What Chinese companies export today is no longer a single product," said Qiao, who is also chief strategy officer and chief marketing officer of Lenovo.

"Increasingly, they are exporting integrated technology capabilities and becoming part of the infrastructure that powers global events."

The shift is becoming increasingly visible at the World Cup, where Chinese companies are moving beyond traditional sponsorship and embedding themselves into tournament operations.

For Lenovo, whose annual revenue reached a record $83.1 billion in fiscal year 2025/26, the World Cup serves as a showcase for its hybrid AI strategy as it seeks to expand higher-margin infrastructure and enterprise businesses globally. AI-related revenue accounted for roughly one-third of Lenovo's revenue during the past fiscal year.

Lenovo, FIFA's official technology partner, is supplying more than 17,000 devices and deploying more than 350 engineers across all 16 World Cup venues. The company is also introducing AI-powered digital twin technology capable of generating three-dimensional replicas of players and match situations.

"The World Cup is the world's largest AI testing ground," Qiao said.

Top: The billboard of Hisense catches the eye during the group A match between Mexico and South Africa during the 2026 FIFA World Cup at Mexico City Stadium in Mexico on June 12. yin gang / for china daily **Middle:** Merchants purchase plush toys related to the 2026 FIFA World Cup participating teams at Yiwu International Expo Center in Zhejiang province on May 12. gong xianming / for china daily **Above:** A visitor checks out 2026 FIFA World Cup authorized products at a FIFA themed official store in Hangzhou, Zhejiang province, in June. dong xuming / for china daily

She said the company views the tournament as an opportunity to demonstrate how its end-to-end AI infrastructure can support one of the most complex global events ever staged, far more than a conventional marketing campaign.

Hisense represents a similar evolution.

The company's overseas revenue now accounts for roughly half of total sales, according to company data, reflecting the importance of international markets in its strategy.

Having used the 2018 and 2022 World Cups to build brand visibility, the company is now moving deeper into tournament operations. As FIFA's official display technology partner for the video assistant referee system, Hisense provides RGB Mini LED display technology used in officiating operations during the tournament.

"Chinese companies are no longer simply buying advertising boards around stadiums," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

"They are becoming part of the technological infrastructure behind major international sporting events."

While China's established global brands are embedding themselves into FIFA's technology ecosystem, a broader group of Chinese consumer brands is pursuing a different path.

Rather than paying for official tournament sponsorship rights, many companies are partnering with national teams, soccer stars, influencers and local digital platforms to target specific consumer groups in overseas markets.

The home-robotics and smart-appliance maker Dreame Technology recently signed Portuguese soccer icon Cristiano Ronaldo as a global brand ambassador ahead of the tournament.

For Dreame, whose overseas business accounted for nearly 80 percent of total revenue in 2025, the World Cup is less about introducing the brand to consumers and more about strengthening brand recognition and emotional connection.

Chang Xinwei, global president of Dreame Technology, said the era of "buying exposure and hoping for results" was fading.

Consumers increasingly place greater trust in recommendations from content creators, communities and personalities they identify with than traditional advertising, he said.

"The goal used to be getting people to see us," Chang said. "Now it is getting people to want to engage with us."

Other Chinese brands have adopted similar approaches.

Luckin Coffee, Changan Automobile and Cotti Coffee are among companies that have partnered with national teams including Portugal and defending champion Argentina, targeting highly engaged fan communities rather than mass audiences.

The strategy allows companies to target specific markets at a fraction of the cost of official FIFA sponsorship while generating more measurable returns.

Analysts say the shift reflects a broader evolution among Chinese companies as they move from gaining awareness overseas to building long-term brand equity development.

"In the past, many Chinese brands used global sporting events to establish basic awareness," Wang said. "Today, they are increasingly using those events to strengthen positioning in mid- and high-end markets and deepen engagement with consumers."

Beyond the marketing, Chinese companies remain deeply embedded in the commercial and industrial ecosystem surrounding the World Cup.

From officially licensed merchandise and consumer products to display technologies and digital infrastructure, Chinese firms continue to play an important role in the tournament's supply chain.

In Yiwu, Zhejiang province, a global hub for small commodity manufacturing, local manufacturers have long produced World Cup-related goods ranging from flags to souvenirs.

According to estimates from the Yiwu sporting goods industry association, Chinese manufacturers accounted for roughly 70 percent of the global World Cup merchandise supply during the 2022 tournament in Qatar.

While no comparable estimate exists for 2026, customs data suggest continued strong demand. Yiwu exported 2.83 billion yuan ($418.5 million) worth of sports goods and equipment in the first quarter, up 12 percent year-on-year.

Some companies are also leveraging FIFA licensing programs to sell authorized products, while others are expanding into ticketing, hospitality and travel services for soccer fans travelling overseas.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the World Cup increasingly highlights China's role as a provider of industrial capabilities rather than simply low-cost manufacturing.

"The strength is not just producing a product," Zhou said. "It is coordinating an entire supply chain."

He said China's competitive edge lies in dense industrial clusters capable of delivering quality, scale and speed simultaneously.

The trend mirrors a broader shift among Chinese exporters, which are increasingly investing in product development, branding, intellectual property and global operations as they expand overseas.

Economy of sports more than merely on-field action

Reporter's log

By Li Jing

I am not what you would call an avid soccer fan.

I rarely follow league standings, transfer rumors or match schedules. Yet as the 2026 FIFA World Cup kicked off, I found myself paying attention anyway.

Not because of the soccer.

But because of Labubu.

Pop Mart's designer toy with its toothy grin made a surprise appearance during the World Cup opening ceremony. Within hours, Chinese social media exploded with chatter, and one of the most popular quips was that while Team China failed to reach the World Cup, Labubu had made it onto soccer's biggest stage.

As someone who does not regularly watch soccer, I was suddenly following World Cup-related stories. I was checking social media reactions, reading reports about limited-edition merchandise and monitoring travel data linked to host cities.

The experience reminded me that the world's biggest sporting events are no longer just sports competitions. They have become vast consumer platforms capable of reaching people far beyond traditional fan bases.

Labubu's World Cup collaboration products quickly sold out on Chinese e-commerce platforms, while some limited-edition items began trading at significant premiums on the secondary market.

At the same time, Chinese travel agencies reported growing interest in visiting World Cup host cities across the United States, Canada and Mexico. Online travel portal Tongcheng Travel said searches for World Cup-related travel packages jumped 166 percent week-on-week in the period leading up to June 2, while bookings and inquiries for customized viewing trips also surged.

A successful sports IP can create value far beyond ticket sales. It can drive tourism, hospitality, retail, advertising, merchandise, media rights and urban branding. The event itself may last a few weeks, but its commercial ecosystem can operate year-round.

China is increasingly trying to tap into that potential. The 2026 Government Work Report explicitly called for efforts to "actively develop the sports economy", placing it alongside tourism and wellness as areas with significant consumption potential.

Su Super League, an amateur soccer competition in Jiangsu province, has become a social-media sensation. What started as a regional competition has evolved into a celebration of local identity, generating traffic for restaurants, hotels and tourist attractions across participating cities.

In Guizhou province, the grassroots Village Super League, or "Cun Chao", has blended soccer with ethnic culture, music and tourism, drawing visitors from across the country. Local authorities say sports-related events generated billions of yuan in tourism and consumer spending last year.

"The overall commercialization of China's domestic sports IPs is still at a relatively early stage," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

While organizers have become increasingly successful at attracting sponsors, areas such as sponsorship activation, audience targeting, brand-event alignment and year-round content operations still have significant room for development, Wang said.

That distinction helps explain why events such as Su Super League and Cun Chao can generate enormous online attention but still differ from global properties such as the World Cup, the Olympics or the Australian Open tennis tournament.

FIFA's decision to embrace IPs like Labubu was not simply a cultural gesture. It reflected a broader effort to expand the tournament's appeal beyond traditional soccer audiences and connect with younger consumers through popular culture.

Perhaps that is the most important lesson for China's sports economy.

The country has already shown it can create sporting events that generate excitement and attract massive online audiences. The next challenge is transforming those moments into sustainable business models that continue creating value long after the final whistle.

Because the real measure of a successful sports economy is not whether an event goes viral.

It is whether the crowds, spending and attention remain after the teams have shaken hands.

Tanzanian merchants try wigs at Xuchang hair expo mall in Xuchang, Henan province, on June 2. wang yongtao / xinhua

Inland beauty clusters pursue more than factory margins

Luyi, Xuchang in Henan supply bulk of nation's hair makeup tool exports

ZHENGZHOU — A large share of the world's makeup brushes and wigs have origins located far from the fashion capitals where they are sold.

Local companies in Luyi, a county in Central China's Henan province, supply more than 85 percent of the world's artificial makeup brush fiber materials and account for over 90 percent of China's makeup brush exports. In the nearby city of Xuchang, at least six out of every 10 wigs sold globally are made by a cluster of more than 4,000 related companies.

Together, these two places in Henan show how inland manufacturing hubs in China are seeking a bigger share of the global beauty trade, moving from raw materials and contract manufacturing into brands, patents, overseas warehouses and direct online sales.

The roots of this success and expansion into new areas go back decades.

Luyi's makeup brush industry started in the late 1970s, when local villagers found export value in sheep tail hair. For years, companies there bought and processed hair, selling semifinished goods or making products for foreign labels.

Xuchang's hair trade, meanwhile, has even deeper roots. Local records trace it back to the Ming Dynasty (1368-1644), when residents traded needles and thread for human hair and made stage beards and headpieces. By the late Qing Dynasty (1644-1911), local merchants were exporting processed hair to Europe via partnerships with German traders.

In both places, scale came before brands. The industrial know-how was local, but much of the consumer-facing value was not. This gap is now what local companies are trying to close.

Luyi moved first through industrial policy. In 2016, the county launched a program to draw back entrepreneurs who had made their way to coastal trading hubs, pairing a new makeup brush industrial park with rent-free factory space, subsidized loans, a provincial quality inspection center and a cross-border e-commerce incubator.

One returnee was Huang Chunjie, chairman of Dias, a company specializing in makeup tools. After years of trading makeup-brush materials for Japanese and Korean clients in Yiwu in East China's Zhejiang province, which hosts the world's largest wholesale market for small commodities, Huang returned to Luyi in 2016 and moved up the chain: from raw-material sales and contract manufacturing to his own brand of mid- to high-end makeup brushes and beauty sponges for overseas markets.

This move gave Dias more than a label, it changed how the company sold. The firm has now built direct sales channels in Europe and set up an overseas warehouse in Germany. For urgent orders, China-Europe freight trains can get products from Luyi to European customers in as little as 20 days, about half the time required by traditional sea shipping. Dias' annual output value has topped 70 million yuan ($10.35 million), with foreign trade contributing more than 70 percent.

Luyi currently has over 1,000 related business entities, a local supply-chain matching rate of more than 95 percent and annual production of 150 million sets of high-end makeup brushes. Local companies sell through trade fairs, bulk sea shipments, China-Europe freight trains and platforms including Alibaba, Amazon and TikTok.

Xuchang has followed a different route up the value chain. Its advantage lies less in industrial-park policy than in materials technology, skilled labor and the ability to turn a centuries-old hair trade into a modern export cluster.

For years, Xuchang's hair-products industry had scale but limited leverage. High-end hair fibers were largely imported and many local producers worked for foreign labels. The breakthrough came as companies led by Rebecca, the first listed company in China's hair-products industry, developed multi-functional hair fibers and filled a domestic technology gap in high-grade human-hair-like fibers.

"From relying on imports to mastering core materials, companies have gained more pricing room," said Chen Yong, an administrative manager at Rebecca.

The advantage is not only in materials. Xuchang has more than 4,000 wig-related companies, directly supports nearly 300,000 jobs and produces almost 3,000 varieties of hair products. In Rebecca's workshops, a hand-woven wig can take more than a day to complete, with some requiring over 10,000 stitches.

Such craftsmanship is part of what makes the cluster hard to replicate, said Tian Liangjun, vice-president of Xuchang's hair products association. "Control over raw materials, accumulated craftsmanship and technological catch-up have together given Xuchang a unique position in the global wig supply chain," Tian explained.

XINHUA

Jiangxi fine-tunes talent to better meet rising market needs

By **HAN JINGYAN**
hanjingyan@chinadaily.com.cn

A Sino-foreign joint event is becoming a microcosm of a Chinese industry-education alliance being expanded globally amid the country's urge to boost high-quality Belt and Road cooperation.

Held for the first time outside of Malaysia, the 2025 iSpark International Entrepreneurship Competition attracted 70 entrepreneurial projects that competed over two days at Jiangxi Vocational College of Foreign Studies, which was founded in 1964.

The final of the event kicked off with 270 young entrepreneurs from eight countries and 16 universities vying for honors.

Liu Hongxia, a JXCFS student with her "Green Bamboo Technology" project team, and another JXCFS team promoting their "microporous and light porcelain" project, garnered two gold medals. In addition, JXCFS students won two bronze medals and two awards of excellence.

On June 27, 2025, the Tiangong College Alliance was established at JXCFS, grouping 101 universities and colleges, and 18 enterprises in Jiangxi province, and borrowing its name from *Tiangong Kaiwu (The Exploitation of the Works of Nature)* — a book by Ming Dynasty (1368-1644) scientist Song Yingxing from Jiangxi.

In its first six months, the alliance had established Tiangong Workshops in seven countries, including Southeast Asia's first at Tunku Abdul Rahman University of Management and Technology in Malaysia.

Zhu Longliang, JXCFS president, said vocational education must make innovations that truly serve industries.

In Jiangxi, which is undergoing a critical economic transformation and upgrading, over 2,000 e-commerce enterprises urgently need multi-skilled talent, and rural vitalization badly needs e-commerce talent to empower agricultural products.

Xu Zhenjing, head of a local cross-border e-commerce enterprise, said: "Our biggest headache is not being unable to recruit people, but in recruits offering real help."

"Many new recruits don't know ERP (enterprise resource planning) systems, overseas warehouse operations, and even can't understand basic cross-border logistics processes," he said.

"The traditional talent training model is struggling to accurately match industrial demand," Zhu said, adding that JXCFS has launched a systematic revolution in talent cultivation founded in three key areas — school-enterprise cooperation, competition-learning enhancement and integration of knowledge and practice.

Zhu said its school-enterprise cooperation has led to over 30 courses and 15 practical-training textbooks, while the practice of "using competition to promote learning and teaching" has helped 2,000 students obtain innovation credits through attending school, provincial and national-level contests.

The college has invested over 30 million yuan ($4.4 million) in building training bases covering all majors, including over 100 teaching bases outside of school, said Rao Jianhua, JXCFS vice-president.

Liu Cheng, an international business major, said he once attended a four-week "semester project" and a six-month "on-job internship".

"During the semester project, I was assigned to participate in enterprise projects — from market research to program execution," he said, noting that his internship at a cross-border e-commerce company helped him independently operate a store within six months.

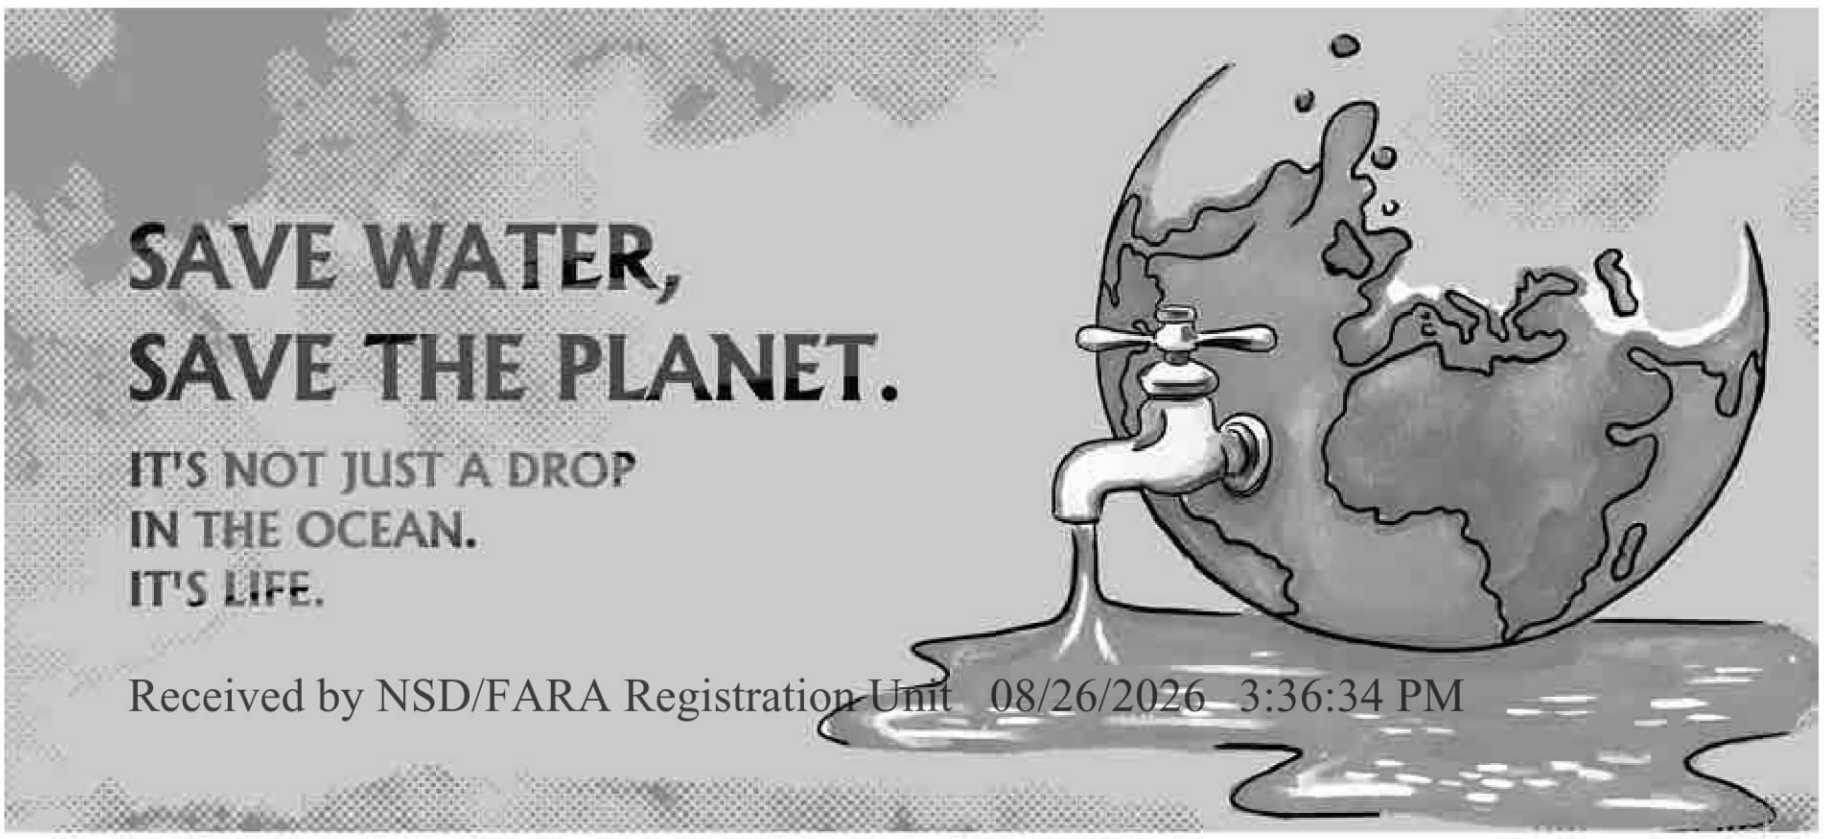
This three-way integration approach not only helped the students, but also the teachers.

"In the past, when we were in class, we just followed the textbook and didn't have any real experiences," Liu said.

Huang Jiajing, a teacher from the school of e-commerce, said that "it's different now, as we have to go to companies each year to practice and return with projects."

The proportion of "dual qualification" teachers in JXCFS has reached 65 percent.

Zhou Wei, dean of the school of innovation and entrepreneurship, said so far, JXCFS' new move has helped more than 200 Jiangxi enterprises explore overseas markets and gain significant benefits.



"The students have served the enterprises in a real market environment, honing their abilities and contributing to local economic development," Zhou said.

The overall employment rate for the 2023 JXCFS graduates reached 97.8 percent, and their starting salary jumped 32 percent compared with 2020.

The ultimate goal of the talent revolution is to help JXCFS transform from a talent supplier into a key node in boosting regional innovation systems, said Yan Bin, Party secretary of the college.

Zhu said: "By 2027, the Tiangong College Alliance aims to establish itself as a globally influential brand in vocational education going global, contributing more Jiangxi solutions to the Belt and Road Initiative."

Zhou Wei contributed to this story.

Stimulating domestic demand high on agenda

EAGLE EYE
By Xu Gao

The 2026 Government Work Report identifies the development of a strong domestic market as the top priority for China's economic agenda this year. At a time when the global economy is undergoing profound changes, rising unilateralism, increasing trade protectionism and persistent geopolitical uncertainties are creating greater instability for external demand.

Against this backdrop, expanding domestic demand has become a strategic anchor for China's economic resilience. The report stresses the need to expand domestic circulation and strengthen the internal drivers of growth in order to better withstand external shocks.

Within this framework, effective investment plays a central role in building a strong domestic market. The Government Work Report calls for coordinated efforts to boost consumption and expand investment, while emphasizing the need to fully unlock the potential of effective investment and leverage China's ultra-large market advantages.

As one of the two key components of domestic demand, alongside consumption, investment remains equally important for sustaining long-term growth.

In China's economic development model, consumption represents the ultimate goal, while investment serves as an essential means to achieve it. The people-centered nature of economic growth is reflected in the continuous expansion of consumption, which remains a top policy priority in efforts to expand domestic demand.

However, sustained consumption growth cannot be achieved without investment. Consumption heavily relies on investment-driven capital accumulation and income growth across society. At the same time, new forms of investment generate new supply, which in turn creates new demand. This dynamic interaction between supply and demand has become increasingly important in China's development strategy.

The outline of the 15th Five-Year Plan (2026-30) emphasizes the need to use new demand to guide new supply and new supply to create new demand, promoting a virtuous cycle between consumption and investment, as well as achieving a higher-level dynamic balance between supply and demand.

It also calls for integrating investment in physical assets with investment in people, and for greater emphasis on consumption-boosting and livelihood-related spending in fiscal policy.

When consumption is relatively weak, investment tends to account for a larger share of economic activity, helping to stabilize growth. As a developing economy with a large population, China still has significant room for investment-led development.

Although China's total economic output ranks among the highest in the world across multiple indicators, per capita levels remain relatively low in many areas. For example, while China's total electricity generation has long ranked first globally, per capita power generation remains less than 60 percent of that of the United States.

Against the backdrop of rising demand from artificial intelligence and digital technologies, investment in power supply capacity remains an important area of development.

At the same time, increasing global uncertainty and supply chain risks highlight the need for China to strengthen domestic industrial chains and reduce potential "bottleneck" constraints.

Even in the relatively weak property sector, there remains significant demand for improved housing conditions, requiring continued investment in better-quality residential development.

Taken together, these factors indicate that China still has broad upside potential for effective investment to address structural shortcomings in its development model.

A key issue in expanding effective investment lies in how investment returns are evaluated. Misunderstanding or incomplete assessment of investment returns can lead to a weakening of investment incentives.

In practice, investment returns can be understood through three layers: micro returns, regional social returns and national strategic returns.

Micro returns refer to direct financial returns of an investment project, typically measured by cash flow and internal rates of return. This is the most commonly used metric in market-based investment decisions. If expected returns exceed financing costs, the project is considered viable; otherwise, it is not.

However, focusing only on micro returns overlooks broader social benefits.

"Regional returns" refer to the broader economic and social value created within a local area. Infrastructure investment — such as roads, subways and public parks — often falls into this category. While such projects may not generate high direct financial returns, they significantly improve urban functionality and quality of life.

Beyond this, there are also "national returns", which reflect the strategic and long-term benefits of investment at the country level. These include contributions to employment, economic stability, regional coordination and national security.

Illustration generated by AI

For example, transportation infrastructure projects ranging from rural road networks to major railway lines in western China play an important role in promoting rural vitalization and balanced regional development.

Different types of investors naturally focus on different layers of returns. Market entities typically prioritize micro returns, as they operate under commercial principles. However, if all investment decisions are guided solely by micro profitability, socially beneficial projects with weak financial returns may be underfunded or neglected.

This is particularly relevant in infrastructure development. Many infrastructure projects are not financially profitable at the project level, yet they generate substantial social and economic benefits. Without government involvement, such projects often struggle to obtain financing.

China's infrastructure development experience demonstrates the importance of taking into account both regional and national returns. The practice of local governments engaging in urban development has played an important historical role in mobilizing investment.

In China, public ownership of land has also provided a unique institutional foundation. As urban infrastructure improves the quality of life in cities, it also increases the value of land held by local governments, allowing part of the social value created by infrastructure investment to be realized through fiscal channels.

This mechanism has enabled many local governments to balance costs and returns across both micro and regional dimensions, forming a sustainable model for infrastructure financing and urban development.

Another important dimension of investment concerns debt and financial sustainability.

China's investment-to-GDP ratio has remained significantly higher than the global average for a long period. Since investment necessarily involves financing, and China's financial system is predominantly debt-based, investment growth is closely linked to rising debt levels.

However, concerns about debt risks should not be assessed solely by looking at the absolute size of debt. A more important factor is the relationship between domestic savings and debt demand.

In a "savings-debt market", savings represent the supply of capital while debt represents demand for capital. If savings are in surplus relative to borrowing demand, then even a high level of debt does not necessarily point to high risks.

China is a high-savings economy. The International Monetary Fund estimates that China's savings rate in 2025 was around 42 percent, nearly double the global average of 23 percent. At the same time, China's net international investment position exceeded $4 trillion, indicating a large accumulation of overseas assets.

Against this backdrop of excess savings, China's relatively high debt level does not necessarily translate into high systemic risks.

Concerns about local government debt are also often linked to incomplete consideration of regional and national returns on investment. While infrastructure projects may appear unprofitable at the micro level, their broader economic and social benefits are significant when assessed from a wider perspective.

In recent years, China has strengthened efforts to manage local government debt risks, including the implementation of a comprehensive debt restructuring package and the replacement of hidden debt. The Government Work Report also proposes further optimization of local government bond issuances to support project financing.

The Government Work Report outlines a range of policy tools aimed at expanding effective investment.

On the government side, China plans to allocate 755 billion yuan ($112 billion) of central budgetary investment and 800 billion yuan from ultra-long special treasury bonds for major national strategic projects and security capacity-building initiatives. Standards for central investment subsidies will also be adjusted to better support priority areas.

At the local level, the issuance quota of special-purpose bonds will be increased and better aligned with regions that have well-prepared projects and demonstrate efficient use of funds.

In addition, China plans to issue 800 billion yuan in new policy-oriented financial instruments to mobilize more private capital for investment.

The writer is chief economist at BOC International.

First national-level special plan for urban regeneration issued

Main st Reet
By Fan Sibin

Recently, the State Council, China's Cabinet, issued an urban regeneration plan for the 15th Five-Year Plan period (2026-30). As China's first national-level special plan for urban regeneration, it marks the elevation of urban regeneration from an institutional and mechanism-building effort to a medium-to-long-term, overarching national strategy.

The release of the plan has drawn significant attention and sparked lively discussions across society. At a time when China's urban development is shifting from large-scale expansion to stock-based quality improvement and efficiency enhancement, the plan carries great significance.

It systematically sets out the goals, targets, key tasks and policy safeguards for urban regeneration over the next five years, outlining a vision and pathway for building modern people-centered cities.

Urban regeneration is closely linked to the daily lives of the people. Since the fifth plenary session of the 19th Central Committee of the Communist Party of China proposed the action of advancing urban regeneration, a series of livelihood, safety and development projects have been implemented to address pressing public concerns. As a result, urban regeneration has been widely welcomed and closely followed by the public.

Following last year's guidelines on advancing urban regeneration campaign issued by the general offices of the Communist Party of China Central Committee and the State Council, the plan represents the first key dedicated plan at the national level in the field of urban regeneration.

It not only reflects the continuous improvement of the top-level design for urban regeneration, but also underscores the fact that urban regeneration serves as both an important lever for building modern people-centered cities and a national strategic initiative crucial to the implementation of the new development philosophy and the long-term competitiveness of cities.

Looking back at the 14th Five-Year Plan period (2021-25), local pilot projects flourished across the country. With the launch of this plan, the national institutional framework has become more robust, overall coordination has strengthened and urban regeneration has entered a new phase characterized by institutionalization, long-term effectiveness and market-driven mechanisms.

The plan fully aligns with the goal of building modern people-centered cities. Centered on the objectives of "innovation, livability, beauty, resilience, civility and intelligence", it comprehensively lays out six key tasks, seven policy measures, and 14 major projects and initiatives, systematically establishing the goals, tasks and roadmap for urban regeneration.

First, for the first time, it uses quantitative targets to define the urban regeneration "scorecard". This is one of the most closely followed highlights of the plan. Ten key targets are set, including: by 2030, renovating 500,000 dilapidated urban residential units; starting the renovation of 115,000 aging residential communities; upgrading 1,500 old neighborhoods and factory compounds; reconstructing 365,000 kilometers of underground pipelines; and restoring 15,000 historic buildings.

These quantifiable and assessable indicators closely integrate urban regeneration with the construction of modern people-centered cities, providing clearer goals and assessment criteria for urban regeneration work.

Second, the plan fully embodies a people-centered approach while also addressing the strategic needs of expanding domestic demand, boosting investment, stimulating consumption and pursuing development.

It outlines six key tasks and 14 major projects and initiatives. This "task list" reflects a combination of investment in physical assets and investment in people.

The plan calls for the construction and renovation of quality housing, the renovation of aging residential communities and the development of complete communities — all major projects that improve people's livelihoods — across different spatial levels, creating high-quality urban living environments.

At the same time, the plan places particular emphasis on fostering new drivers of urban growth. It explicitly proposes revitalizing idle and inefficiently utilized resources such as old factories and underused commercial office spaces; promoting the transformation and upgrading of aging neighborhoods, factory compounds and inefficient industrial parks; cultivating emerging industries; and upgrading consumption infrastructure.

This means that urban regeneration also serves as a strategic lever for reshaping urban growth drivers and unlocking domestic demand potential.

Third, the plan introduces a policy system for sustainable urban regeneration through reform and innovation. The third plenary session of the 20th CPC Central Committee explicitly called for "establishing a sustainable model and policy-legal framework for urban regeneration".

The plan devotes a full chapter to specific arrangements for building a policy system for urban regeneration during the 15th Five-Year Plan period, outlining a roadmap for reform and innovation.

It directly addresses the difficulties and bottlenecks encountered in urban regeneration practice, focusing on seven key areas: implementation mechanisms, financial guarantees, land use, building safety, multi-stakeholder participation, laws and standards, and technology and talent.

The aim is to accelerate the development of a comprehensive, well-coordinated and efficient policy system for urban regeneration, providing solid support for orderly, routine and long-term urban regeneration.

Over the next five years, as the plan is implemented, urban regeneration will move rapidly from blueprint to reality in people's daily lives. It is likely to see continued improvements in cities: better housing, safer and more livable communities, more vibrant neighborhoods, lively blue-green spaces, more attractive consumer destinations and more innovative industrial parks.

According to estimates by multiple institutions, the total market size for urban regeneration during the 15th Five-Year Plan period will exceed 15 trillion yuan ($2.22 trillion). These figures will translate into tangible improvements for the people — better urban living environments, stronger economic dynamism and higher governance standards.

As time moves forward, with the high-quality and sustainable advancement of urban regeneration under the guidance of the plan, Chinese cities are poised for another qualitative leap in the new era. Modern people-centered cities that are innovative, livable, beautiful, resilient, civil and intelligent are steadily coming into view.

Quality and safety stressed as R&D cycle speeding up

By Wang Yuchen
wangyuchen@chinadaily.com.cn

Automakers in China are shortening development cycles and launching new models more quickly to better respond to changing consumer demand, but industry experts said faster iteration should be backed by more robust testing and quality management to ensure long-term safety and reliability.

The faster pace is reflected in both shorter development cycles and a growing number of new vehicle products. According to a McKinsey report, the development cycle for new vehicles in China has been shortened to about 24 months from around 60 months in the era dominated by traditional fuel vehicles.

A catalog released by the Ministry of Industry and Information Technology on June 10 included about 65 new passenger vehicle products, compared with 52 in May.

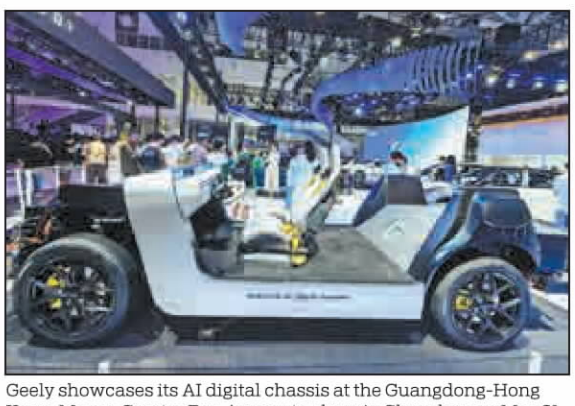
Annual product updates have become increasingly common among automakers, especially new energy vehicle brands. These may take the form of all-new models, upgraded versions or incremental functional improvements, including larger battery packs, driver-assistance systems and in-car software.

Part of the faster pace has been enabled by changes in vehicle architecture and engineering methods. Electric vehicles often use more centralized electronic and electrical architectures, allowing automakers to reuse software and key systems across models, while virtual simulation can improve the efficiency of design verification.

Guan Mingyu, a senior partner and leader of McKinsey's automotive practice in China, said the faster pace of product updates has given intelligent electric vehicles some characteristics similar to consumer electronics. But he said such similarities should not obscure the fact that cars remain durable goods closely linked to safety.

Guan said that no matter how automakers optimize development processes, they must complete necessary road tests and the required testing mileage. These steps are essential to protecting consumers and supporting automakers' long-term development, he said.

Li Shufu, chairman of Geely Holding Group, also cautioned against a shortcut-driven approach to vehicle development. Speaking at a recent industry forum in Chongqing, he said new models should follow standard vehicle development procedures instead of cutting test procedures or shortening verification time.



The emphasis on verification is also reflected in regulatory requirements. In January, the MIIT issued revised vehicle access standards, which will take effect on Jan 1, 2027. Under these requirements, conventional vehicles must complete at least 30,000 kilometers of reliability verification, while electric vehicles continue to follow a 15,000-kilometer requirement under type-approval testing procedures.

Quality management, however, is not limited to reliability testing. A study by J.D. Power showed that quality problems among China's new energy vehicles continued to increase in 2026, though at a slower pace.

Design-related problems now account for nearly 70 percent of all reported issues. It makes optimization of user interaction and intelligent system accuracy a core priority, said Sean Wang, managing director of automotive product solutions at J.D. Power China.

The 2026 China New Energy Vehicle Initial Quality Study released in April showed that the industry average reached 231 problems per 100 vehicles (PP100), an increase of 5 PP100 from a year earlier.

The findings also suggest there is still room for automakers to improve product design and user experience as they accelerate product updates.

Truck fleet targeted for electric makeover

Ministry of Transport plans low-carbon transformation of haulage sector

By Cao Yingying
caoyingying@chinadaily.com.cn

China has set its first nationwide targets to accelerate the green, low-carbon transformation of the heavy truck sector.

The country is expected to have 1.6 million new energy heavy trucks by 2030, with these vehicles accounting for 40 percent of new heavy truck sales, according to a recently released plan jointly issued by the Ministry of Transport and 10 other central government authorities.

Once fulfilled, new energy heavy trucks will account for 20 percent of the nation's entire heavy trucks fleet by the end of the decade.

Heavy trucks make up just 3 percent of China's total vehicle fleet yet generate half of all road transport carbon emissions, said Li Bin, an expert at the China Electric Power Research Institute, earlier in June. The statistic shows how electrifying heavy trucks is critical to hitting peak carbon goals within the transport sector.

The central government has rolled out supporting infrastructure targets to underpin the plan, building a 30,000-kilometer zero-carbon highway transport network covering key national expressways, accompanied by around 3,000 dedicated charging and battery swap stations that exclusively serve heavy trucks.

For regions, including the Beijing-Tianjin-Hebei cluster, which are prioritized under national air pollution control initiatives, over 80 percent of fixed-route short-distance shuttle transport will be electrified.

Liu Xin, head of the Transport Planning and Research Institute under the Ministry of Transport, said that beyond the 1.6-million-unit fleet target, the plan prioritizes building an integrated industrial ecosystem linking vehicles, road networks and energy supply systems. Coordinated planning of refueling and recharging hubs with transport infrastructure will eliminate bottlenecks in short- and long-haul routes, enabling large-scale commercial operations.

Market uptake has expanded in recent years. Between January 2025 and May 2026, cumulative sales of new energy heavy trucks hit 337,000 units, lifting segment penetration above 29.5 percent. In May alone, sales surged 104 percent to 30,800 units, accounting for 40.88 percent of total heavy truck sales.

XCMG topped the sector with 4,986 units sold in May, followed by China National Heavy Duty Truck Group and Sany Truck. Several major players posted explosive year-on-year growth in May: China National Heavy Duty Truck Group surged 213 percent, Dongfeng Motor rose 110 percent and Farizon New Energy Commercial Vehicle jumped 219 percent.

The growth was driven by a combination of subsidy incentives for phasing out China's National IV emission standard heavy trucks, trade-in policies and robust demand from mining, urban construction and other industrial segments.

Wider industry scale has narrowed the cost gap between electric and diesel heavy trucks while amplifying operational savings.

Dang Botao, new energy product manager at Shaanxi Automobile Group, noted the purchase cost of electric heavy-duty trucks is approaching that of internal combustion ones.

The economic edge stands out in bulk fixed logistics such as coal transit, steel mill yard transport and other bulk cargo, where per-kilometer energy costs run at one-third those of diesel trucks, Dang added.

Zhang Rongji, executive president of StarCharge China, said that electric heavy trucks deliver superior total cost of ownership, cutting annual operating expenses by 150,000 to 250,000 yuan ($22,190 to $36,980) per vehicle. Over a five-year service life, cumulative savings range from 500,000 to 1 million yuan per vehicle.

Liu Zhen, new energy product line manager at China National Heavy Duty Truck Group, projects sustained long-term growth. Advances in power battery technology, mass-scale green hydrogen production, intelligent connectivity and end-to-end zero-carbon systems could push new energy heavy truck market penetration to between 80 and 90 percent by 2035.

Huatai Securities has forecast a combined national fleet of 1.6 million new energy heavy trucks by 2030, split between 1.31 million battery-electric units and 290,000 hydrogen fuel cell ones.

Annual battery demand for electric heavy trucks will reach 85.5 gigawatt-hours from 2026 through 2030, representing 14 percent of China's annual power battery installation volume, with upward revisions to consumption estimates likely, according to Huatai Securities.

Major manufacturers and battery suppliers have ramped up strategic investments. Chinese battery giant CATL signed a strategic cooperation agreement with Shanxi province in May to build a flagship industrial hub centered on battery-swap heavy trucks.

Another battery provider, CALB, has launched field research in Tengzhou, Shandong province, in March, targeting diversified application scenarios covering electric heavy trucks and electric vessels.

Methanol gains ground in China's green transport transition

By Li Fusheng
lifusheng@chinadaily.com.cn

China's green transport transition is moving toward a more diversified energy mix, with battery electric vehicles being complemented by alternative fuels such as methanol, particularly in commercial and long-haul applications.

Future mobility systems should be understood as an integrated energy and transport network rather than a stand-alone automotive transformation, said Chan Ching-Chuen, an academician of the Chinese Academy of Engineering, at a recent industry forum.

China's rapid adoption of electric vehicles over the past decade has laid a strong foundation for transport decarbonization, but structural challenges remain in commercial transport, heavy-duty logistics and regions with complex operating conditions.

New energy vehicles accounted for over 50 percent of China's overall vehicle market in the first five months of this year, while penetration in the commercial vehicle segment stood at 28.2 percent, according to Zhang Yongwei, president of the China EV100 think tank.

He said the segment faces challenges in achieving rapid electrification and suggested that a diversified technology pathway — including battery electric, hybrid, fuel cell and methanol — is likely to prove more effective.

Fang Haifeng, chief expert at the China Automotive Technology and Research Center, said commercial vehicles account for a disproportionately large share of transport emissions despite their relatively smaller fleet size, making them a key focus for alternative fuel deployment.

He said China's policy framework is increasingly supportive of multi-path technologies, including battery-electric, hydrogen and methanol systems, particularly in heavy-duty and industrial transport segments.

Fang added that methanol offers advantages in energy storage, logistics and low-temperature performance, and can be integrated into existing fuel distribution infrastructure at a relatively low cost.

Methanol can be produced from coal, biomass, captured carbon dioxide and green hydrogen, positioning it as a flexible energy carrier within China's emerging low-carbon energy system, he said.

China's methanol vehicle sector has entered a steady growth phase, with clear industrial momentum, Fang said.

Last year, national methanol vehicle ownership exceeded 60,000 units, of which roughly two-thirds were commercial vehicles.

Supported by policy incentives and rising demand, the sector is expected to surpass 80,000 units this year.

Over the longer term, Fang said the industry is expected to build a more complete ecosystem and may move toward large-scale commercialization by 2030.

He said the sector is likely to become an important component of China's broader transport decarbonization strategy over the next five years.

Fang also called for a more structured policy framework, including national-level implementation plans for methanol vehicles, expansion of refueling infrastructure and coordinated systems for methanol production, storage and distribution.

He suggested expanding pilot applications across public transport, taxis, ride-hailing fleets, municipal services and heavy-duty logistics.

Farizon New Energy Commercial Vehicle, a subsidiary of China's Geely Holding Group, is one of the key players in methanol-electric technology.

CEO Fan Xianjun said methanol-electric systems can reduce particulate emissions by up to 98 percent compared with diesel engines and lower operating costs by about 32.52 percent, depending on application scenarios.

In heavy-duty logistics, certain models have achieved real-world driving ranges exceeding 1,500 kilometers per refueling cycle, addressing a key limitation of battery-only systems in long-haul operations.

Fan also cited a long-distance test involving a light commercial vehicle that traveled nearly 1,700 kilometers on a single methanol-electric refueling cycle, describing it as evidence of improving operational maturity.

Fan said Geely's methanol-electric vehicles have been deployed at scale, with more than 60,000 units in operation globally and cumulative mileage exceeding 25 billion kilometers.

Emerging markets including China's Hong Kong are showing interest in the technology.

Farizon's U12M methanol-electric bus, developed specifically for the Hong Kong market, has recently received emissions exemption approval from the city's environmental authorities and is expected to enter full commercial operation soon.

Chan, the academician of the Chinese Academy of Engineering, said methanol-powered commercial vehicles are a fitting choice for Southeast Asia as well, a region with a large population and massive logistics demand.

Short Torque

Lower pre-tax profits forecast by BMW

German carmaker BMW downgraded its 2026 targets on Tuesday due to turmoil in the Middle East and worsening business in key market China, and vowed to step up its cost-cutting efforts. It is the latest bad news from Germany's ailing auto sector, and a major blow for a manufacturer which had so far endured industry upheaval better than its peers Volkswagen and Mercedes-Benz. BMW said it now expects a "significant" decrease in pre-tax profit this year, against a previous expectation for only a moderate decrease. It forecast a slight fall in vehicle deliveries, compared to a previous prediction for them to remain stable. And profit margins in its auto division will come in between 1-3 percent, down from an earlier expectation of 4-6 percent.

Talks to decide new partner for Maserati

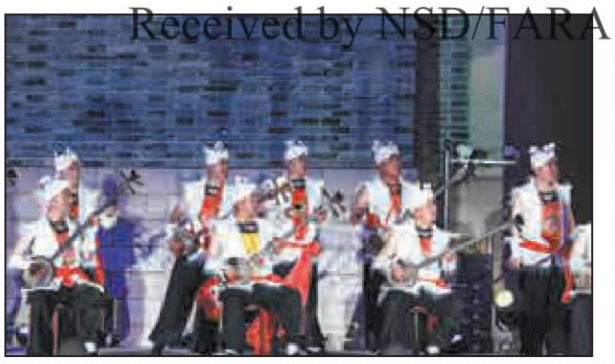
Stellantis is in talks with two potential partners for cooperation on its struggling luxury brand Maserati, the automaker's Chief Executive Antonio Filosa said on Wednesday during a hearing at the Italian parliament. Stellantis will soon decide which partner to choose, the CEO added. The automaker revealed its new long-term business plan in May, but said Maserati would present its own strategy at a separate capital markets day in December. Filosa said there's no plan to sell Maserati or the under-used Cassino plant near Rome. He said Cassino's future will be "closely tied" to that of Maserati and the brand will remain "an icon of Italian style".

Tata shares tumble after JLR prediction

Jaguar Land Rover will prioritize growth in the US as it seeks to counter weakness in its traditional stronghold of China, but will deliver only a 4 percent profit margin, it said on Wednesday, sending shares of its Indian parent Tata Motors tumbling. The British carmaker's plan to rebuild profitability and cut costs fell short of investors' expectations, triggering a sell-off with shares of Tata Motors falling by as much as 10 percent. JLR contributes about 80 percent of Tata's revenues. JLR's profit margin fell to 0.7 percent in fiscal year 2025 from near double-digits in earlier years. While the 4 percent forecast for the current year is an improvement, it is far from the 10 percent margin the company had targeted.

Auto exports fall again in South Korea

South Korea's auto exports fell for a second straight month in May due to fewer business days and production disruption of auto parts, government data showed on Wednesday. Outbound car shipments declined 5.9 percent from a year earlier to $5.83 billion in May, after reducing 5.5 percent in April, according to the ministry of trade, industry and resources. The downturn was attributed to fewer working days and a fire at a local parts supplier that disrupted auto output. Demand remained strong for eco-friendly vehicles, the export of which expanded 9.9 percent to $2.4 billion in May on a yearly basis. The number of vehicles manufactured in local factories decreased 8.2 percent to 329,559 in May.



Restructure sparks layoffs at Rivian

US EV maker Rivian said on Tuesday it is laying off less than 2 percent of its workforce as part of ongoing efforts to scale its operations profitably. The company, which employed 15,232 people as of December, has said it no longer expected to meet its 2027 adjusted core profit target. It comes as it ramps up spending on research and development to accelerate its autonomous driving road map. Rivian began production of its smaller R2 SUV in April, with deliveries underway, as the company bets on a lower-cost model to broaden demand and strengthen its path to profitability. "We recently restructured a handful of teams within Rivian as we work to profitably scale our business," a company spokesperson said.

LIFE

Received by NSD/FARA Registration Unit 08/26/2026 3:36:34 PM

Left: A folk performance marks the opening of the 2026 Intangible Cultural Heritage Summer Shopping Month, which kicked off on June 11 in Suzhou, Jiangsu province. **Right:** A tea-making demonstration draws visitors to one of the many heritage display booths during the event.

Preservation finds a way into modern hearts

Transformation and innovation help China's intangible cultural heritage find consumers hungry for fresh experiences, **Yang Feiyue** reports in Suzhou, Jiangsu.

Zhou Jing was holding a bowl of noodles at a booth on the historical Pingjiang Road in Suzhou, Jiangsu province, where crowds flowed along the ancient stone-paved street on a muggy June afternoon. At first glance, it did not look like a typical local dish. The bowl was made entirely of plush fabric and weighed almost nothing. Even the braised pork topping was soft and fuzzy.

And yet, around her, staff members engaged visitors in mock noodle-shop interactions.

"Hard noodles or soft? Extra broth or light?"

For many visitors, the questions were unfamiliar. That was by design.

Small cards and props at the booth explained the specialized vocabulary of Suzhou noodle culture: *kuan tang* (extra broth), *jin tang* (less broth), *zhong mian* (extra noodles), and *shao mian* (fewer noodles). In 2020, Suzhou-style noodle-making was added to the city's intangible cultural heritage (ICH) list, adding another layer to this seemingly simple interaction. For local regulars, these terms signal identity as much as taste. For outsiders, they offer a quick introduction to one of the city's best-loved traditions.

The experience was designed to be memorable — a playful encounter that transforms a local culinary custom into an interactive cultural lesson.

Zhou's booth was among the busiest attractions at the 2026 Intangible Cultural Heritage Summer Shopping Month, which opened on June 11 in Suzhou. Held along Pingjiang Road, a canal-side neighborhood lined with white-walled houses and black-tiled roofs, the event forms part of a nationwide campaign featuring more than 1,200 activities held through late July, aimed at bringing traditional culture closer to contemporary life.

For Zhou, a former travel entrepreneur who once specialized in European tours, the plush noodle bowl represents more than a novelty product. It is part of a growing movement across China that is reimagining how intangible cultural heritage is preserved, presented, and passed on to younger generations.

Across the country, cultural entrepreneurs and heritage inheritors are increasingly turning traditional crafts, foods and folklore into collectible toys, lifestyle products and social-media-friendly cultural IPs (intellectual property).

The transformation of Pingjiang Road into a sprawling heritage marketplace offers a glimpse of that shift.

Creative cultural products featuring Zibo soft pottery prove a hit with visitors at the shopping month event. Photos Provided to China Daily

> A friend once told me our works have a 'human touch'. That phrase exactly woke me up."
>
> **Wang Zhi,** a municipal-level inheritor of Zibo soft pottery

Creative inspiration

More than 100 heritage workshops and inheritors from across China gathered for the shopping month's main event, showcasing everything from embroidery and ceramics to weaving, sculpture and traditional foods.

Among them was Zhou's collection of plush noodle bowls, refrigerator magnets and blind boxes inspired by the local food culture.

Before the COVID-19 pandemic, Zhou operated a travel business serving Chinese tourists visiting Europe and international visitors coming to China. When global tourism ground to a halt in 2020, she began exploring opportunities closer to home.

"There weren't many cultural products that truly reflected Suzhou's local character and everyday life," she says. "I wanted to create something people could connect with."

Her workshop is located in the Dinghuisi alley in Suzhou's old town. Nearby, heritage masters regularly give public demonstrations and classes. Watching these activities, Zhou realized that many traditional cultural elements remained unfamiliar even to local residents.

"I discovered things I didn't know myself. If local people don't know about them, young people are even less likely to know," she says.

Although not an inheritor of a traditional craft, Zhou chose to serve as a translator between heritage and the marketplace. Food became her starting point.

"Visitors come to Suzhou for two things: the gardens and the food," she says, explaining why she chose food as her focus.

Inspired by the popularity of interactive cultural merchandise, she created products that transform familiar local dishes into collectibles. Customers not only receive a toy but also a cultural story.

Her first generation of plush noodle bowls attracted attention but struggled to sustain sales due to their relatively high price. Several rounds of redesign followed.

A second version added practical functions, such as card holders. The breakthrough came when Zhou combined several fast-growing categories in China's creative cultural market — blind boxes, plush toys and refrigerator magnets — into a single product that was smaller, more affordable and easier to collect.

Since the launch of the latest version in early 2025, sales have exceeded expectations.

She has since expanded collaborations with local brands, including Renchangshun, a traditional Suzhou pastry maker with a history stretching back more than two centuries. Together, they transformed products such as *dingsheng gao* and *zhuangyuan gao*, pastries associated with good fortune and academic success, into plush collectibles.

"My role is to help people take notice. Once they're interested, they can learn more," she says.

A broader movement

Zhou's story reflects a wider transformation taking place across China's heritage sector.

This year's ICH summer shopping month places particular emphasis on connecting traditional culture with contemporary consumption. Alongside exhibitions and craft demonstrations, the event features activities exploring themes such as "ICH plus designer toys", "ICH plus fashion", and "ICH plus technology" — an acknowledgment that preservation today increasingly depends on finding new ways to engage modern audiences.

The shift is being driven in part by changing consumer behavior, particularly among younger generations.

According to leading online food delivery and local services platform Meituan, searches related to nationally recognized intangible cultural heritage food traditions exceeded 18 million in 2025, up 34 percent year-on-year. Orders placed with related merchants rose by 140 percent, while nearly two-thirds of searches came from consumers aged 20 to 35.

Industry observers say the figures point to a growing appetite for heritage experiences that feel interactive, accessible and relevant to daily life, besides those from the museums or textbooks.

A report on China's cultural and creative industries, released by China Cultural Media Group, notes that heritage-based cultural products are increasingly moving beyond static preservation toward what it calls "living innovation" and market-oriented development, allowing traditional culture to become part of everyday consumer experiences.

For entrepreneurs and inheritors alike, the question has now been how to translate them into forms that resonate with younger consumers.

Pony with personality

About two hours north of Suzhou by high-speed rail, another experiment in heritage innovation has been unfolding in Zibo, Shandong province.

Wang Zhi, a municipal-level inheritor of Zibo soft pottery, has spent more than a decade exploring ways to engage contemporary audiences with traditional clay sculpture.

Her studio is known for miniature works inspired by Chinese history, everyday life and classical art. But national attention arrived in 2024 with the debut of Long Dada, a dragon whose round body and playful expression challenged conventional depictions of the mythical creature.

The character quickly gained popularity online and helped Wang rethink how traditional culture could be presented to younger audiences.

Her latest creation pushes that idea further.

Known as Ma Biaobiao, or "Scruffy Pony", the figure was developed in collaboration with the Beijing Fine Art Academy and inspired by a late painting by renowned Chinese artist Qi Baishi, depicting the spirit and vitality of a galloping horse.

The pony features oversized eyes and a dramatically fluffy mane made not from clay but from Tan sheep wool.

Achieving the dynamic pose proved technically demanding. The sculpture's front legs touch the ground while the hind legs lift into the air, requiring repeated experimentation and an internal support structure capable of withstanding the firing process.

To strengthen the connection with the original artwork, the team designed the display so the pony appears to leap from a traditional Chinese scroll painting.

The feature that most captured public attention, however, was the mane.

Owners are encouraged to braid, curl, decorate, or style it however they wish.

"We call it co-creation," Wang says.

The idea extends beyond the product itself. The pony's name originated from internet users, who described the character using the Shandong dialect word *biao*, a term suggesting something goofy, impulsive or endearingly eccentric. The team adopted the nickname and continued refining the character in response to customer feedback.

New mane colors, accessories and design details emerged through interactions with fans online.

"We listen carefully," Wang says. That approach has helped transform a single clay sculpture into a broader cultural IP encompassing keychains, refrigerator magnets, bags, and apparel.

For Wang, the appeal lies in creating an emotional connection.

"Heritage isn't something frozen in time. It continues to evolve," she says.

Wang has thought a lot about what makes heritage stick.

"A friend once told me our works have a 'human touch'," she says. "That phrase exactly woke me up. Intangible cultural heritage is about the warmth of the hand, the sedimentation of time, the power of healing, the possibility of co-creation."

Foreigners praise country's high sense of safety

What would happen if someone left a backpack full of personal belongings unattended in one of China's busiest commercial areas?

YouTuber "Because I'm Lizzy" decided to find out in Southwest China's Chongqing last year. After spending nearly two hours wandering through the city's winding streets, sampling local delicacies, and taking in its neon-lit nightlife, she returned to find everything exactly where she left it.

The 29-year-old South African content creator was not surprised by the outcome. "I've been proven so many times that nothing would ever get stolen," she says. "Safety is the number one reason why I stay in China."

Currently based in Kunming, the capital city of Yunnan province, the YouTuber, Jannelize Bessenger, has lived in China for seven years. She created a series of videos about the country after noticing that many people know little about the high safety level of the nation, with a population exceeding 1.4 billion.

But for Bessenger, "It is the people who live here and their value and respect for life that make China the safest place, where I will stay for many years."

Her first impression of China was shaped by an unexpected act of kindness from a stranger. She recalled that in 2019, just four months after arriving in China, she fell seriously ill while in Nanchang, Jiangxi province. Although she had the hospital's location saved on her phone, she still could not find it.

Speaking little Chinese at the time, she turned to a man nearby for help, using a translation app. To her surprise, he voluntarily accompanied her to the hospital by subway and then left.

Wondering whether the man would ask for her contact or something in return, Bessenger said nothing happened. "He was just being nice," she says. That moment made her realize she could live alone in China safely as a foreign woman.

Hailing from a small South African town renowned for its wildlife and safaris, solo traveler Bessenger says China's secure environment allows her to embrace a relaxed lifestyle.

"Whether I'm going for a walk with headphones on at 11 pm because I can't sleep or I want to get some fresh air without checking a map, I just go and explore," she says.

China ranks high among other countries on the safety and law and order index, according to Gallup's 2025 Global Safety Report.

When Bessenger shared her appreciation for feeling safe on the lifestyle-sharing platform RedNote, many Chinese users were puzzled as to why she kept bringing it up.

"They take it for granted. They don't really realize how lucky they are to live in such a safe country," she says. The feeling was shared by her mother, who visited China from South Africa two years ago and later decided to settle down.

China's safety and openness are also echoed by short-term travelers. In 2025, inbound tourist visits to China surpassed 150 million, up more than 17 percent year-on-year. Of these, over 30 million foreign travelers entered the country under China's visa-free policies.

With expensive camera gear in hand, Canadian YouTuber Dave Mani and his wife comfortably moved around Chinese cities and roamed rural areas.

"After visiting 56 countries, we can say that China is very high on the list in terms of general safety," says Mani.

As an independent content creator, Mani notices how deeply technology is integrated into everyday life in China. Whenever he and his wife needed help during the trip, locals were quick to use translation apps to communicate with them.

> I've been proven so many times that nothing would ever get stolen. Safety is the number one reason why I stay in China."
>
> **Jannelize Bessenger,** South African content creator known as "Because I'm Lizzy"

The couple quickly became fans of WeChat, saying the super app brought great convenience, especially WeChat Pay, which allowed them to make payments easily and safely.

"That level of everyday safety made filming and exploring very easy and enjoyable," says Mani.

Like Bessenger and Mani, Ana Rosa Neumann Devers, an exchange student from the Dominican Republic studying in Harbin, Heilongjiang province, finds it cozy and relaxing to stroll past the orderly market stalls day or night.

The girl from the tropical Caribbean nation has fallen in love with the icy northern city, captivated by its snowy nights and warmed by the kind sincerity of her schoolmates. At a school ball, she appeared in traditional Dominican attire and was met with warm applause and heartfelt eompliments.

"People here respect different cultures and customs. No one treats me differently because I'm from another country. I truly feel respected," she says.

In the past seven years, Bessenger has found that in China, every place offers something entirely different for travelers to discover. But for those who don't know where to go or who are eager to tap into the "becoming Chinese" trend, her advice is simple: just head downstairs when night falls.

"Walk around, get some street food, and see how people enjoy their meals and how the city settles into a peaceful but vibrant rhythm," she says. "That's when China feels most real."

Master's six strings strike global chords

An award-winning craftsman blends Spanish lutherie and local design to build world-beating classical guitars, **Wang Xin** reports in Shanghai.

Gao Yi, 56, is one of China's most accomplished classical guitarists. Today, however, he is winning even greater recognition worldwide as a luthier, crafting exquisitely handmade guitars that are earning international acclaim.

Two years ago, Gao's flamenco guitar won first prize at the 7th Antonio Marin Montero Guitar Building Competition held in Granada, Spain, where his classical guitar also remarkably made it to the final. He became the first Chinese luthier ever to win the competition's top prize.

Last month, his instruments impressed Japanese musicians and fellow luthiers at an exhibition in Tokyo. Standing out in this highly competitive market through exceptional craftsmanship, Gao signed cooperation agreements with Japan's major instrument distributors, including Gendai Guitar and Kurosawa Gakki, for both online and offline orders.

Born in Shandong province in 1970, Gao's connection with music and instruments began early. He primarily played the Chinese bamboo flute as a child and taught himself guitar at the age of 17. After graduating from Jining University with a music degree in 1992, he continued his studies in classical guitar performance at the Central Conservatory of Music in Beijing the following year. It was there that he first encountered guitars built in the traditional Spanish style.

In 2000, Gao won first place in the Chinese Guitar Competition while performing on an Antonio Marin Montero guitar borrowed from a friend.

Later that year, he joined Yamaha Corporation as China's guitar market manager and relocated to Shanghai. During his eight years with the company, Gao deepened his understanding of guitar history and construction techniques. At the same time, he continued performing solo concerts, often using his cherished Marin Montero guitars.

His first attempts at building guitars began in 2010, when he established his workshop, Gaoyi Guitars. Shortly afterward, a serious accident during a repair left his fingers badly injured. Rather than discouraging him, the experience strengthened his determination to pursue lutherie more seriously and eventually shift his professional focus toward guitar making.

In 2013, Gao seized an opportunity to study traditional Spanish guitar-making in Beijing under Juan Labella, a respected guitar maker from Granada.

The following year, with support from the Spanish Consulate General in Shanghai, he visited Spain, where he was introduced to Marin Montero himself. The legendary master offered valuable guidance and encouragement. Marin Montero, widely regarded as one of the most influential living masters of traditional Spanish guitar making, became both a mentor and a lasting source of inspiration for Gao.

In 2019, Gao was recommended by the European Guitar Foundation to study with another renowned Granada School luthier, Rene Baarslag. The experience further shaped and inspired his own approach to guitar making.

"While I was in Spain, I lived with local musicians and luthiers to learn and exchange ideas. Then I realized that guitar making is far more than simply creating a seemingly abstract sound. Behind it lie the culture, history, humanism, life experience and the thoughts of the luthiers," says Gao.

Regardless of national or cultural differences, Gao says he was warmly welcomed by Spanish masters. They generously shared their workshops, materials, tools, techniques, craftsmanship, experience and even their philosophy of life.

Gao says what many Chinese luthiers still lack in high-end guitar making is a deeper "understanding" and "perception" of the instrument itself. His experience as a performer has helped bridge that gap. Spain, widely regarded as the cradle of the classical guitar, has passed down its traditions and accumulated knowledge through generations of master builders.

It was during his time in Spain that Gao learned, for example, that the finest soundboards for premium Spanish-style guitars are often made from high-quality spruce sourced from the Fiemme Valley in the northern Alps at an altitude of around 1,500 meters. The same region supplied wood for the famed Stradivarius violins. Lightweight yet capable of producing remarkable clarity, the wood is highly prized among instrument makers. Gao also learned that every stage of guitar construction demands meticulous attention, from wood treatment and internal structure to component assembly and even the selection of the final finish.

"Guitar making is never like solving a math problem, and it doesn't have an exact formula. Every detail in the whole process comes from the accumulated experience of pioneers and also from luthiers' innovation. I see guitar making as a testament to collective creativity across generations," Gao says.

For Gao, guitar making is not merely craftsmanship but a form of "artistic creation". A guitar is far more than a box that produces sound; it is an artwork that reflects a maker's aesthetics, personality, life experiences and constant pursuit of innovation.

As technology advances and performance venues become increasingly diverse, guitarists are demanding more from their instruments, encouraging luthiers to continue pushing creative boundaries. Many modern classical guitars now incorporate aerospace technologies or carbon fiber materials into their soundboards to improve strength and project greater volume, particularly for larger venues and outdoor performances.

As a Chinese luthier proud of his country's rich cultural heritage, Gao has sought to incorporate elements of Chinese identity into his work. The rosettes on the two guitars that earned recognition at the Spanish competition draw inspiration from traditional Chinese geometric window-grille patterns combined with Japanese Hakone Yosegi Zaiku (marquetry wood mosaics), creating an elegant visual signature.

In other instruments, he frequently uses mother-of-pearl and shell carvings for decorative inlays. He is also exploring the use of locally sourced woods from different regions of China.

"We have already opened the door to the high-end guitar-making sector," Gao says. "As Chinese luthiers continue working toward the same goal and accumulating our own experience, I believe we will see more handmade guitars with a distinct Chinese identity shine on the global stage."

Building a high-quality guitar is a painstaking process. Working full-time as a luthier, Gao produces no more than 13 instruments a year. Benefiting from the keen tonal sensitivity developed during his years as a performer, he focuses on creating guitars with warm, delicate tones, rich dynamics, an authentic Spanish voice and a lasting Eastern character. His instruments are increasingly sought after by professional musicians and collectors from Germany, Spain, Japan, the United States and other countries.

As both a guitarist and a luthier, Gao has spent nearly four decades alongside the instrument he calls his "most loyal companion". The guitar has accompanied him through every stage of life, helping him express emotions, find friendship and resonance, and discover deeper meaning.

"The guitar is a record of my life," he says. "It contains my passion and what I hope to leave behind in the world. Even when my life comes to an end, my instruments will remain."

Asked about the secret to building a great guitar, Gao shares with China Daily an answer — and a life philosophy — that he first learned from Marin Montero: "Just slow down."

One man's mission creates China's zero-waste island

By Xing Wen
xingwen@chinadaily.com.cn

Far out in the East China Sea, Qingbang Island — part of the easternmost permanently inhabited archipelago off China's mainland in Zhoushan, Zhejiang province — is becoming a model for sustainable living.

Despite covering just 1.41 square kilometers, the island is experimenting with an innovative recycling system. Residents sort their household waste and exchange it for vouchers that can be used at local stores or redeemed for cash at the end of the year.

Food scraps will be fermented into organic fertilizer for growing vegetables and flowers, while recyclable plastics are collected by a Shanghai clothing company and transformed into garments, shoes, and hats sold on the island.

The voucher program has been running for three years, driven by the vision of Yan Shanyue, a former seaman who is determined to turn Qingbang into a zero-waste island.

Why vouchers? Yan explains. Selling recyclables directly typically earns only 20 or 30 yuan at a time — an amount that easily disappears among everyday expenses.

"But with a voucher, you can clearly see that it came from the waste you collected."

To keep motivation high, Yan also hosts an annual year-end meeting where active recyclers receive daily necessities like rice and cooking oil.

"That way," he adds, "people have one more thing to look forward to."

Yan grew up on Xiazhi Island, more than 60 kilometers from Qingbang, and many of his happiest childhood memories were shaped by the sea.

"Every morning around six or seven, after breakfast, my friends and I would head to the beach," recalls the 55-year-old.

"At high tide, we swam and challenged each other to jump higher or hold our breath longer. At low tide, we dug for clams and razor clams and carried home baskets full of them."

At the time, plastic waste was rarely seen on local shores. Occasionally, they would find a bottle with Japanese writing that had drifted across the sea.

In fact, Yan even had his first taste of instant noodles at age 7 after discovering a Japanese packet washed ashore following a typhoon, which he shared with three friends.

When he returned home in 2003 after leaving a career in deep-sea fishing, he was shocked to find beaches increasingly covered with rubbish, especially marine debris. Determined to help, he began cleaning the shoreline on his own.

Left: Yan Shanyue, a former seaman-turned-guesthouse owner, is helping transform Qingbang Island into the zero-waste island of his dreams. **Right:** A recent cleanup event was held to gather volunteers to collect trash together on the beach of Qingbang Island, Zhejiang province. photos provided to china daily

In 2013, Yan moved to Qingbang Island to open a guesthouse. He continued his beach-cleaning routine, and before long, other guesthouse owners joined him. Together, they discovered that just a few people could restore a small beach to its natural beauty within hours.

"Sometimes I think to myself that we really do have the power to make a difference," he says.

Encouraged by the results, Yan and his growing team began inviting volunteers from outside the island, offering affordable food and accommodation to support cleanup efforts. Through these activities, he connected with professionals from marine conservation organizations, inspiring him to establish his own environmental charity dedicated to creating a "zero-waste island".

He and his partners then mobilized local shop owners to sign a "zero waste island partnership" agreement.

Driving a small tricycle, he collected cardboard, aluminum cans, and plastic waste while visiting households to encourage recycling and proper waste sorting.

"What gives me the greatest sense of achievement is that the islanders trust in me is growing," Yan says.

The journey also pushed Yan to develop new skills. He learned how to write project proposals, create PowerPoint presentations, prepare budgets, and organize events ranging from waste surveys to community education programs and environmental improvement projects. He continues to seek partnerships with companies and environmental foundations to expand the initiative.

Yet, the challenge remains relentless. Every storm washes new debris onto the island's beaches. A shoreline cleaned by evening may be covered with trash again the following morning, creating what often feels like an endless cycle.

To cope with this frustration, Yan draws inspiration from a powerful memory from his years at sea. At age 16, he survived a fierce storm in which waves battered his fishing vessel for more than 50 hours. Crew members worked nonstop, bailing water while pumps ran continuously. The helmsman fought to keep the boat aligned with the waves, knowing that even a slight mistake could prove fatal.

Eventually, the storm passed.

"We couldn't control the environment back then," Yan says.

"We had no idea when the next wave would hit or when the boat might capsize. But we had no choice but to keep bailing the water out."

Decades at sea taught him a lesson he still follows today: while people cannot calm the wind and waves, persistence can keep a ship afloat — and help preserve the blue waters surrounding an island.

No Room for error

Curacao's goalkeeper Eloy Room makes a save during a 2026 World Cup Group E match between Ecuador and Curacao in Kansas City on Saturday. Room made 15 saves against a relentless Ecuador attack, helping The Blue Wave earn a 0-0 draw and a historic World Cup point. AFP

Fifteen saves from Curacao stopper earns nation its first World Cup point

KANSAS CITY, Missouri — Curacao better make some room for a new national hero.

Eloy Room delivered for his tiny Caribbean nation one of the finest performances in World Cup history on Saturday night, making 15 saves against a relentless Ecuador attack and helping The Blue Wave earn its first-ever point with a 0-0 draw against Ecuador.

The outcome also allowed Germany, which beat Cote d'Ivoire earlier in the day, to clinch Group E.

"It's going to be an insane memory," said Room, who plays for USL Championship club Miami FC. "You don't think about it when you do it, but, of course, it's going to be something you look back on. For me as a goalkeeper, this is almost a perfect game."

The 37-year-old Room, whose shutout of Jamaica in November sent Curacao to its first World Cup, bounced back in historic fashion from a 7-1 loss to Germany.

Since saves became a stat in 1966, Room's total was one shy of the record of 16 set by Tim Howard of the United States against Belgium on July 1, 2014, in a game that Room remembers watching.

Howard needed 120 minutes to reach that number, though. Nobody has made more saves than Room without extra time.

"I think I need a statue in Curacao now," he said with a smile.

The draw doesn't eliminate either team from the knockout stage, but it puts Ecuador in dire shape going into its group finale. Those matches take place Thursday with Curacao facing Cote d'Ivoire in Philadelphia and Ecuador playing Germany in New York.

"Well, there are things you cannot explain in football," Ecuador coach Sebastian Beccacece said. "We wanted to win. We didn't do it. I am the one who bears responsibility, and I told my team: 'If you're giving it all, competing, I have no complaints.'

"As long as we are alive (in the tournament), we will continue to give it our all. We are very united. We are like a family. No one said it would be easy."

Ecuador certainly had a home-field advantage Saturday night at the home of the Kansas City Chiefs. Its fan base, dressed like its players in bright yellow shirts, filled the stadium to the brim, making it look like a convention of Minions. There were only a couple of small pockets of blue-clad Curacao fans in a stadium with the capacity to house half of its island's citizenry.

Curacao goalkeeper Eloy Room waves to fans after a World Cup Group E match against Ecuador in Kansas City on Saturday. AP

Among those in the crowd were Bobby Witt Jr, Salvador Perez and Starling Marte of the Kansas City Royals. There were European royals, too, as King Willem-Alexander and Queen Maxima of the Netherlands, who began a memorable day in Houston cheering the Dutch past Sweden, flew to Kansas City to watch a constituent country within the Kingdom of the Netherlands make history.

"They were even dancing in the locker room to our music," Room said. "That's unreal that they witnessed this game."

The pressure mounted on Ecuador earlier Saturday, when Deniz Undav's goal in stoppage time lifted Germany to a 2-1 win over Cote d'Ivoire. The outcome of that match in Toronto meant that La Tri faced World Cup elimination with a loss to The Blue Wave.

Curacao made sure the pressure continued once play began.

Throughout the first half, 78-year-old coach Dick Advocaat's team kept finding seams through the middle of Ecuador's defense, and that created openings on goal. But each time, Curacao couldn't find the final ball.

Ecuador wasted its best scoring chance in the opening minutes, when World Cup veteran Enner Valencia found nothing between him and the goalkeeper. But Room guessed right, dived to his left and deflected the shot to keep the game scoreless.

"For us, it's no shock," Curacao midfielder Tahith Chong said. "We've become used to Eloy making these unbelievable saves."

The pressure of La Tri picked up in the second half — and each time, Room was standing in the way.

Moises Caicedo forced him into making a spectacular save early on, then Valencia did the same with a well-placed header that Room knocked wide. On the ensuing corner kick, Room made two more sensational saves before Curacao finally cleared it.

Ecuador wound up taking 27 shots to just 10 for Curacao. Ten of the 15 saves Room made were inside the box.

It was that kind of special night for him. And that kind of frustrating night for Ecuador.

"The team deserved more than they got," Beccacece said, "and I am the one who is responsible for that."

AP

Chinese refs take Cup stage

Chinese match officials marked a new World Cup milestone on Saturday as Ma Ning, Zhou Fei and Fu Ming took charge of the Group E encounter between Ecuador and Curacao.

Referee Ma Ning

Ma delivered a solid performance as the match referee in the 0-0 draw at Kansas City Stadium, issuing one yellow card to Ecuador and five to Curacao.

It represented the most significant World Cup involvement by Chinese match officials in more than two decades.

Ma became the first Chinese referee to take charge of a match in soccer's showpiece since 2002. Zhou served as an assistant referee, while Fu worked as a video assistant referee.

"The selected match officials are the very best in the world," FIFA's chief refereeing officer Pierluigi Collina said when the tournament officials were named.

FIFA's decision to appoint three Chinese officials to the same match underlined the progress made by the country's referees in recent years.

Soccer's global governing body appointed 52 referees, 88 assistant referees and 30 video match officials for the 2026 World Cup.

Those selected came from all six confederations and 50 member associations, making it the largest refereeing team in World Cup history.

FIFA said the selection process lasted more than three years and followed its "quality first" principle.

Candidates were assessed at FIFA tournaments, international matches and domestic competitions. Their consistency, fitness, health and match management were also rigorously monitored.

Collina said the officials had attended seminars and worked at FIFA events ahead of final selection.

"Their performances in domestic and international matches were regularly assessed," he said.

For China, Saturday's match continued a steady rise in high-level appointments.

Ma and Fu both worked at FIFA's expanded Club World Cup in 2025. Ma, Fu, Zhou and Zhang Cheng were also part of the Chinese team that officiated the 2024 AFC Asian Cup final in Qatar.

Ma's selection for a second straight World Cup underlined his standing among Asian referees.

At the 2022 World Cup, he served as a fourth official. In 2026, he made the move into the center of soccer's biggest stage.

Super-sub Undav sends Germany into knockouts

Substitute's brace overturns halftime deficit to snatch win over Cote d'Ivoire

Deniz Undav (26) scores his, and Germany's, first goal of its World Cup Group E match against Cote d'Ivoire in Toronto on Saturday. Undav scored twice after being subbed on in the second half to lead Germany to a 2-1 win and clinch a spot in the knockout phase. AP

Deniz Undav celebrates scoring Germany's second goal during a World Cup Group E match against Cote d'Ivoire on Saturday. AP

> "It's important that everyone sees that even the players from the bench can decide games. Now we have sent a really important signal to the team. I think that's very important in a game like this."
>
> **Deniz Undav,** after scoring twice to help Germany reach the knockout phase

TORONTO — An hour into the game, Germany was getting outplayed by Cote d'Ivoire and trailed by a goal.

Coach Julian Nagelsmann needed a spark and substituted three fresh players on, one of whom was Deniz Undav. That decision paid off big time.

Undav scored two goals off the bench as Germany pulled off a thrilling comeback to beat Cote d'Ivoire 2-1 in its World Cup Group E match on Saturday, securing its place in the knockout stage for the first time since it won the title in 2014.

After having two goals disallowed in the first half, Germany did not lose focus and used intricate passing to find its way, while the West Africans produced their dynamic brand of attacking soccer in a wild encounter at Toronto Stadium.

"It's important that everyone sees that even the players from the bench can decide games," said Undav, who also scored in Germany's 7-1 opening match rout of Curacao. "Now we have sent a really important signal to the team. I think that's very important in a game like this."

"We showed great character today," said the versatile striker, who now has nine goals in his last eight matches. "We want to achieve the most (we can)."

Undav leveled the score with a controlled, volleyed finish in the 68th minute and struck again in stoppage time when he received a pass on the turn, before swivelling and firing home a ball that Yahia Fofana had no chance at stopping.

Simon Adingra had a late chance for Cote d'Ivoire, but he failed to get a shot off in the area before Germany charged back down the field where Fofana blocked a low shot from Nathaniel Brown.

The loss denied, at least for now, Cote d'Ivoire the chance of securing its first trip to the knockout stages.

"We wanted to make history today," said Cote d'Ivoire winger Amad Diallo. "But I think everything was a little tight."

Unfamiliar territory

Cote d'Ivoire had opened the scoring in the first half when Franck Kessie slotted home a rebound off a shot from Diallo on a play created when Yan Diomande charged down the left side and sent in a cross.

With more than 100,000 people of German ancestry living in Toronto, Nagelsmann's men enjoyed plenty of support, but were a frustrated group at the interval with nothing to show for their eight attempts on goal.

It was definitely unfamiliar territory for Germany, as it marked only the fourth time it has faced a halftime deficit in its last 36 contests at the global showpiece.

But, after the break, a more active German side showed up, one that took more risks and was determined to dedicate everything to its effort to win.

"In the end, we deservedly won it," Nagelsmann told reporters. "The boys invested a lot. I'm very happy for the whole team."

"This is exactly what we hoped for, and I'm very happy for my team," Nagelsmann said.

He said that after his two-goal performance, Undav could make the starting 11 in Germany's third group stage match against Ecuador, but also stressed that the Stuttgart forward was thriving as a substitute.

"I could have him in the starting lineup," Nagelsmann said. "I think that every player would love to be in the starting lineup, but I think he's very happy as it is right now."

Two goals scratched off

Germany looked to have opened the scoring when midfielder Aleksandar Pavlovic rose to meet a short corner in the 25th minute, but was deemed to have fouled Fofana in the process.

The ruling left Pavlovic with his hands atop his head in disbelief, as Fofana received some attention after the collision and the partisan German crowd made their disdain for the referee's decision known.

Shortly afterward, it was Cote d'Ivoire that finally broke through with Kessie's goal.

The West Africans have scored in their last seven matches at the tournament, the longest such sequence on the global stage in their history.

Germany once again put the ball in the back of the net, but its celebrations were cut short as the referee determined that Jamal Musiala had fouled Odilon Kossounou in the build-up.

"We had exactly what it takes to succeed in a tournament, a winning mentality, team spirit," said German defender Jonathan Tah.

"We didn't give up; we just kept going.

"The guys coming off the bench brought new energy to the game. Deniz deserves special mention. He was outstanding."

After a court fight to get into Canada, Elye Wahi, the Cote d'Ivoire striker under investigation for alleged betting-related offenses while playing in France for Nice, did not play.

Germany tops Group E with six points and is through to the last 32, while Cote d'Ivoire remains on three after two matches. Ecuador and Curacao played to a goalless draw in Kansas City in a later match on Saturday.

Germany will close out the group stage against Ecuador on Thursday in New Jersey, while Cote d'Ivoire faces Curacao in Philadelphia.

Agencies via Xinhua

Les Elephants look to forget Toronto loss and charge toward Curacao clash

If Cote d'Ivoire wins its next match, Saturday's loss to the Germans won't matter.

After surrendering two second-half goals and missing the chance to clinch a knockout stage berth for the first time in its four World Cup appearances, Les Elephants turn their attention to their last group stage match against Curacao on Thursday.

Win, and the Elephants are in.

Forward Amad Diallo said he and his teammates will get over the Germany loss. They have to.

"We (have) respect for ourselves, but we want to make history for Cote d'Ivoire, and we (are) going to go there with a good mentality and try to rise again," he said.

Cote d'Ivoire seemed one step ahead of Germany throughout the first half on Saturday — and a chunk of the second — with mid-

Cote d'Ivoire's Franck Kessie celebrates his goal against Germany on Saturday. AP

fielder Franck Kessie's first-half goal silencing German fans for a long stretch.

But the German side of the sold-out crowd erupted when Deniz Undav scored the winning goal, his second of the match, leaving Cote d'Ivoire fans hanging their heads.

The team seemed a little shocked as well, and players spoke about the pain of losing a match they felt they should have won.

Cote d'Ivoire coach Emerse Fae felt his team could have been more decisive in its bid to get a second goal.

"It's more frustration that we're feeling after this defeat, because we were able to open the score against this strong German side," he told reporters.

"A difference in experience meant that the chances that we did have at the end of the game, where we needed to find the back of the net, we were hesitant," Fae said.

However, the Ivorian coach was quick to put the Germany game behind him and highlighted that, overall, he was happy with his team's performance.

"We're going to use this game as a lesson to try and fine-tune the mistakes, our shortcomings that we still have, and that will help us go as far as possible," he said.

He said he was looking forward to the challenge of facing Curacao next to see "what they are made of", and was expecting a strong fight.

"Our destiny is still in our hands, or at our feet," he said.

The good news for FIFA's No 31-ranked Les Elephants is that their next opponent, Curacao, is way below them at No 83.

The Caribbean nation also lost its first match to Germany, 7-1.

"It's going to be a big moment for everyone, for this new generation, because we know we have quality in the team," Diallo said. "But the priority now is that we are really focused on ourselves. It's going to be a very hard game."

Agencies via Xinhua

Double Dutch: Braces from Brobbey and Gakpo help sink Sweden

HOUSTON — Under intense pressure after its opening-game draw with Japan, the Netherlands delivered a dominant performance against Sweden in the World Cup on Saturday to move atop the Group F standings.

Brian Brobbey and Cody Gakpo scored two goals apiece to power the Dutch to the 5-1 win.

Brobbey's goals came in the first half, setting the Netherlands up for a big win after playing to a 2-2 draw the previous Sunday.

"It could be that the way we played builds confidence," Netherlands coach Ronald Koeman said. "Now we've got a slightly better peace of mind with the four points. You can build on what happened now, and that's really good."

Gakpo, who also had an assist, extended the lead to 3-0 just after halftime, scoring in the 47th minute off a cross from Denzel Dumfries. He matched Brobbey when he scored on a right-footed shot from the left side of the box in the 54th minute.

"Today, there was more variation in attacking play, more players in different positions, movement and all those things," Gakpo said. "So it was more difficult for the defenders to really mark us, and we became free in the box. I think that was the little thing maybe we missed in the last game."

Sweden couldn't build on its strong performance in a 5-1 walloping of Tunisia in its first match. The loss to the Dutch was its biggest World Cup defeat since losing 7-1 to Brazil in 1950.

Sweden coach Graham Potter said the defeat was less about what his team did and more about just how good the Netherlands played Saturday. "They're a top team, and they were better than us today. We have to congratulate them, but I think we'll learn a lot from the game."

The Dutch game plan to play out wide to open up Sweden and cross to Brobbey worked perfectly early on. He put the Netherlands on top in the 11th minute, one-timing a Gakpo cross with his right foot.

His second goal came when he took a cross from Dumfries while sliding and just got his right foot on the ball, scoring inside the far post in the 17th minute.

Koeman credited Brobbey's success to getting in better shape after he had struggled in the past with the rigors of playing a full game.

"He's fitter, he's sharper and he's developing really well," he said.

Anthony Elanga's left-footed goal cut the lead to 4-1 in the 59th minute and allowed Sweden to avoid the shutout loss.

Crysencio Summerville celebrates with NBA star Steph Curry's "night night" gesture after scoring the Netherlands' fifth goal of its 5-1 World Cup Group F win over Sweden in Texas on Saturday. REUTERS

Sweden had plenty of chances to score before that, but the Dutch goalkeeper Bart Verbruggen was brilliant in the first half with four saves.

Sweden appeared to have cut the lead to 2-1 on a header by Gustaf Lagerbielke in the 44th minute, but he was ruled offside. Lagerbielke is a baron from a noble family in Sweden. His father and grandfather are counts.

But he wasn't the only royalty in the stadium Saturday, as the Netherlands had two very special guests cheering them on with King Willem-Alexander and Queen Maxima watching from a luxury suite. "The King was very happy," Koeman said.

Crysencio Summerville, who assisted Gakpo's second goal, tacked on one of his own for the Netherlands in the 89th minute and celebrated with NBA star Steph Curry's "night night" gesture.

Summerville took a boot to the head late in the match and had received stitches, but Koeman said he should be ready for the next match.

Samurai blues for Tunisia

Meanwhile, Japan marked the 1,000th game in the history of the World Cup with a 4-0 thrashing of Tunisia in Saturday's final fixture.

Ayase Ueda scored twice while Daichi Kamada and Junya Ito were also on target, as the Asian giant joined the Netherlands on four points at the top of Group F.

Tunisia can no longer hope for a place in the knockout stages.

The Samurai Blue were always in control against Tunisia at the Monterrey Stadium in Mexico and Tunisia never looked like threatening a technically superior Japanese side that settled quickly into its trademark, smooth passing game.

Kamada opened the scoring after just four minutes following some deft interplay. Minutes later, Tunisia keeper Aymen Dahmen just managed to claw away the ball, which was barely centimeters from crossing his goal line. Japan eventually got its second in the 31st minute, with striker Ueda thundering in a low shot from the edge of the area.

The rout continued in the second half, with Ito latching onto a brilliant through ball to finish in the 69th, before Ueda nodded in a looping header in the 83rd.

Group F winds up on Thursday, with Japan playing Sweden at Dallas Stadium and the Netherlands facing Tunisia in Kansas City.

XI'S VISION | GOVERNANCE PERFORMANCE

Unremitting efforts seen as key to progress

Party's governance approach stresses tenacity, sustained work, lasting results

By **ZHAO JIA**
zhaojia@@chinadaily.com.cn

For years, Xingtang county in Hebei province was shadowed by a local saying that played on its name: "*Xingtang bu xing*" — Xingtang cannot do it.

The saying reflected more than a play on words. Along the eastern foothills of the Taihang Mountains, several counties had long struggled with constraints of terrain and resources. In Xingtang, a traditional agricultural county, quality farm products often failed to reach wider markets because they lacked strong brands and sales channels.

When Zou Guoyu arrived in Xingtang, he saw that changing the county's prospects would require more than short-term assistance. He was among the 13 officials assigned by the International Department of the Communist Party of China Central Committee to work in the county over the past decade. Their work focused on opening markets, building brands and strengthening the county's own capacity for development.

Those efforts gradually paid off. Xingtang red dates were selected as State gifts, honey produced in the county reached Southeast Asian markets, and the county's public brand for local specialties gained wider recognition.

What happened in Xingtang was not a single breakthrough, but a relay — one group of officials after another carrying the work forward and helping turn an old saying of resignation into a new confidence: Xingtang can.

That relay offers a window into the CPC's emphasis on establishing and practicing a correct view of governance performance, a theme repeatedly stressed by President Xi Jinping since the 18th CPC National Congress in 2012 and one that became this year's focus of a Party-wide education campaign. It is a view that values sustained work, long-term public benefit and results that can stand the test of time.

The logic behind such a relay can be traced to Xi's earlier poverty reduction work in Ningde, Fujian province, where he served as Party secretary from 1988 to 1990, when the region was among the poorest areas in Fujian.

In *Up and Out of Poverty*, which collects Xi's speeches and articles from his work in Ningde, he wrote that fundamentally changing poverty and backwardness required the people to carry forward the tenacity of "dripping water piercing stone" and make long-term, unremitting efforts.

In *Xi Jinping in Ningde*, a book published in 2020 that collects 19 interview accounts about Xi's work experiences in Ningde, an interview account recalled that Xi cautioned local officials against expecting poverty to be fundamentally solved simply by projects, or expecting to become rich overnight.

The emphasis on patience, local realities and sustained effort later became part of China's nationwide fight against absolute poverty.

Openness, resilience unleash regional growth potential

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Openness remains essential to unlocking the growth potential of the Asia-Pacific region and deepening regional economic cooperation, as rising unilateralism and protectionism continue to challenge global trade and investment, government officials said on Sunday.

Speaking at the APEC China CEO Forum 2026 in Beijing, they said that the economies of Asia-Pacific Economic Cooperation should stay committed to open cooperation and regional integration, while advancing connectivity projects and digital innovation to facilitate trade, improve supply chain resilience and create new growth opportunities for businesses across the region.

Eduardo Pedrosa, executive director of the APEC Secretariat in Singapore, said that APEC economies have identified a series of priority actions to restore growth momentum and strengthen regional economic cooperation.

These include accelerating progress toward the Free Trade Area of the Asia-Pacific, strengthening connectivity and supply chain resilience, investing in trade and logistics infrastructure, promoting market diversification, addressing nontariff barriers in food trade and advancing digital trade and transformation, he said.

Ren Hongbin, chairman of the China Council for the Promotion of International Trade, called for APEC economies to identify more areas of common interest and strengthen open cooperation in industrial and supply chains.

Citing the importance of strengthening regional connectivity, Ren said the APEC economies should make full use of regional free trade agreements such as the Regional Comprehensive Economic Partnership, while advancing an upgraded APEC connectivity blueprint to facilitate the safe and orderly flow of people, goods, capital and data, as well as foster closer industrial and supply chain cooperation across the region.

China remained the largest trading partner of 13 APEC economies in 2025, with the total value of trade with those economies reaching $3.7 trillion. It accounted for 57.8 percent of China's total foreign trade, data from the Ministry of Commerce showed.

The country has signed 24 free trade agreements or economic and trade deals with 31 countries and regions, including 15 APEC economies. In recent years, it has also completed upgrades to free trade agreements with APEC economies such as Singapore and Peru.

Addressing broader challenges facing the global trading system, Jiang Chenghua, deputy China international trade representative at the Ministry of Commerce, urged the APEC business community to exercise independent judgment, support the multilateral trading system and help safeguard the stability of global industrial and supply chains.

China will continue to expand opening-up in key areas including trade, investment and the cross-border flow of production factors, while the rapid advancement of digital, intelligent and green technologies will further reinforce its position as a long-term destination for global companies seeking investment and growth opportunities, said Jiang.

Ahead of the fourth China International Supply Chain Expo, which will run from Monday to Friday in Beijing, foreign business executives highlighted China's industrial ecosystem, market demand and supply chain advantages as key drivers of their long-term confidence in the country.

Jim Sutter, CEO of the US Soybean Export Council, said China is expected to import about 25 million metric tons of soybean from the United States during the marketing year Sept 1, 2025 to Aug 31, 2026, up from 22.6 million tons in the previous marketing year, marking a meaningful recovery.

"The recent announcement regarding tariff reductions is a positive signal, and the US soybean industry looks forward to seeing those commitments translated into concrete policy measures," said Sutter. "Stability in the China-US trade environment benefits both sides, and we are confident in the long-term direction."

A similar sentiment was expressed by Elodie Latour, vice-president for China at French multi-sports brand Decathlon. She said China's comprehensive industrial ecosystem and complete value chain enable companies to bring products to market faster, creating advantages that are difficult to replicate elsewhere.

Beijing-Seoul cooperation should look to the future

WORLD WATCH
By Woo Su-keun

As the global economy faces mounting uncertainty amid geopolitical tensions, supply chain restructuring and the resurgence of protectionism, the importance of stability, resilience and practical cooperation has become increasingly evident. At a time when strategic competition between major powers continues to intensify, countries around the world are recognizing that sustainable growth and regional prosperity cannot be achieved through confrontation alone.

Against this backdrop, China's steady economic development and South Korea's resilience in exports, advanced manufacturing and financial markets deserve close attention.

The recent meeting between South Korean President Lee Jae-myung and Chinese Vice-Premier He Lifeng sent a positive signal that both countries are prepared to expand cooperation in the fields of economy, industry and people-to-people exchanges. This should be regarded as a meaningful indication of a renewed commitment to pragmatic cooperation.

China and South Korea are not merely important trading partners. They are also key stakeholders in the peace, stability and future prosperity of Northeast Asia.

Over the past several decades, the two countries have achieved remarkable development through close economic cooperation. China has long been South Korea's largest trading partner, while South Korea has contributed significantly to China's industrial upgrading and technological advancement.

Although competition naturally exists between the industrial sectors of both countries, the overall relationship remains characterized by a high degree of complementarity.

CHINESE ROBOT VACUUMS CLEAN UP IN GLOBAL RANKINGS

Advanced AI systems, smart home integration help devices sweep past competition overseas

By **LI JIAYING**
lijiaying@chinadaily.com.cn

When Mikki Hayward was preparing her home in the United States for sale, she expected her robot vacuum to help with the cleaning. What she did not expect was for it to recognize clutter, navigate around obstacles and even flag small valuables.

"It doesn't get stuck on random boxes or obstacles, and it even tags small valuables it finds so they don't get lost in the shuffle," she said.

For Jessica Jones, another US user, the appeal lies elsewhere.

As her robot vacuum glides across the floor, she can use the device's camera to check on the foster kittens roaming around her home.

"Loving (the ability to) check in on my foster kittens while the machine does its cleaning thing!" she wrote in a social media post. "There are more and more features I'm discovering all the time, but pet mode is amazing!"

People watch as a cleaning robot navigates steps at the kiosk of Chinese technology company Dreame during the Consumer Electronics Show in Las Vegas, the United States, on Jan 7. CAROLINE BREHMAN / AFP

Technology reviewers have also been impressed by how much the latest generation of cleaning robots has evolved.

"What is also smart is that it adjusts how it cleans depending on the type of mess. So, wet messes and dry debris are not being treated the exact same way, and that makes the whole process feel much more hands-off," YouTube channel DailyTested said in a review.

All of these glowing testimonials refer to the latest product from Chinese manufacturer Narwal Robotics.

China Vibes GIFTS

Launched in the US market in April and equipped with a dual-camera vision recognition system and an artificial intelligence-powered cleaning platform capable of adapting to different household environments, the product quickly topped Amazon US' new releases ranking and entered the top 10 robot vacuum category within 24 hours of launch.

The success is far from an isolated case.

As Chinese manufacturers continue to integrate artificial intelligence, advanced sensors and autonomous navigation into household devices, a growing number of domestically developed cleaning robots are finding enthusiastic buyers around the world.

INDEPTH

Inbound tourism surges on curiosity about evolving China

Overseas visitors try Chinese kebabs while wandering through the historical alleys of Qianmen Street in Beijing on June 14. CHEN QIANG / FOR CHINA DAILY

Overseas visitors equally interested in country's rapid transformation as ancient marvels

By **YANG FEIYUE**
yangfeiyue@chinadaily.com.cn

Foreign tourists visit the Temple of Heaven in Beijing on June 9. CHEN QIANG / FOR CHINA DAILY

Wolfgang Georg Arlt, a tourism expert from Germany, made his first trip to Beijing in 1978.

"There was almost no light at night," recalled Arlt, who has over 50 years of expertise, both academically and in practice, in tourism and hospitality. In the years since, he has watched China's tourism infrastructure improve steadily year after year, with better facilities and services.

In early June, he returned to the Chinese capital for a summit hosted by the World Tourism Cities Federation. During his stay, he was struck again by what he saw. But this time, it was by the smart infrastructure, services powered by artificial intelligence, and the gleaming skyline.

"No one back then could have imagined such development," said Arlt, executive director of the Meaningful Tourism Centre, based in London and Kathmandu.

As China evolves into one of the world's leading travel destinations, Arlt has also noticed a shift in the preferences of foreign travelers. "Tourism used to be about sightseeing, taking photos and shopping. Now people want to learn something and experience something," he said.

Technology has removed many of the old travel barriers. Instant translation services on a smartphone, for instance, mean no one needs to fear getting lost anymore, he added.

Active immersion

The shift from passive sightseeing to active immersion has been quietly reshaping China's inbound tourism industry.

On a March morning in suburban Beijing, Yang Li stood between a dozen foreign diplomats and a fully automated assembly line.

His job was to explain the factory's operations, but he soon realized the diplomats wanted China's overall transformation explained. "They were eager to know how the country built this," he recalled.

For nearly three decades, Yang had made his living explaining China's past — its dynasties, emperors, temples and ancient walls. Now, standing above a humming production floor where robotic arms moved in synchronization and driverless carts glided between workstations, he found himself explaining not just how the machines worked, but how China learned to produce them at scale.

The March visit had been arranged by China's Ministry of Culture and Tourism for foreign diplomats stationed in Beijing. "They didn't go to see the Great Wall. They came here to see why China can do this," he recalled.

For generations, China's inbound tourism narrative rested on familiar pillars: the Forbidden City, the Great Wall, the Terracotta Warriors. Visitors came to witness the remnants of an ancient civilization.

"Today, many international visitors no longer come only to admire China's past. They also want to understand its present — how factories operate, how cities function, how innovation is reshaping daily life and how traditions continue to evolve alongside rapid modernization," Yang said.

Spanish clients have asked to visit smart factories in Shenzhen, Guangdong province, while in Changsha, Hunan province, Romanian travel groups requested tours of electric vehicle production lines, he said.

A 2026 Trip.com Group survey of more than 500 inbound tourism operators found that nearly two-thirds identified meeting diverse visitor demands as their biggest challenge. More than 80 percent reported overseas visitors' growing interest in experiences beyond traditional sightseeing.

Tour operator Li Jieming is based in Zhangjiajie, Hunan. The city's best-known attraction is the cluster of sandstone pillars that inspired the floating mountains in the film *Avatar*.

Three years ago, overseas visitors accounted for only a tiny share of his business. Today, they comprise around 60 percent.

The turning point came after China expanded visa-free entry policies for a growing number of countries in 2024.

"When I heard about the visa-free policy, I knew the number of inbound visitors would increase," Li said. "And Zhangjiajie already had something foreigners recognized — the *Avatar* mountains."

But his ability to seize the opportunity soon collided with new challenges: workers with foreign-language skills were scarce, and he had little overseas marketing experience.

Li began recruiting wherever he could find candidates — language schools, trading companies and returnees with international experience. His first international team consisted of just four people.

They posted videos of Zhangjiajie's landscapes on Facebook and handled inquiries one by one. Their first booking came from a Spanish couple who discovered the company online.

"We didn't make money on that booking," Li said with a laugh. "We just wanted to see if it could work."

By the spring of 2025, inquiries began arriving in waves. Today, Li's company employs more than 20 people serving international clients, and inbound tourism has become the core of the business.

Content upgrade

Many of the inquiries came from people who had never previously considered traveling to Zhangjiajie.

Some discovered Zhangjiajie through social media videos of the towering sandstone pillars. Others arrived after seeing short clips of local customs and village life.

The influx of visitors quickly taught Li another lesson: attracting international travelers was only the beginning.

"Many foreign visitors don't want to spend the entire day checking attractions off a list," he said. "They want to interact with people and understand local life."

At first, his team offered itineraries similar to those designed for domestic tourists. The results were mixed.

"That's when we realized we had to help those people understand a place beyond simply touting the landscape."

One European family initially planned a simple cable-car excursion. Instead, Li's team suggested a gentle rainforest hike. "The children could touch plants, look at insects and ask questions," Li said. "It turned out that the parents loved it."

They applied the same idea to cultural tourism.

Rather than limiting visitors to performances and demonstrations, Li's company incorporates hands-on experiences such as Tujia ethnic brocade weaving, the Baishou dance — a Tujia group dance often performed at festivals and celebrations — and traditional silverwork.

A visitor poses for a photo in Shanghai Disney Resort on April 28. CHEN AIPING / XINHUA

"All those ensure our foreign guests don't just watch, but participate," he said.

Li mentioned a family from Germany that spent an afternoon learning Tujia brocade weaving.

"None of them had ever touched a loom before, and their finished cloth was uneven with imperfect patterns," he said. "But when the workshop ended, the mother got a bit misty-eyed and said it was something they made together, rather than simply a purchase."

For Li, the moment captured why so many travelers now seek experiences rather than attractions. "The mountains gave them a view," he said. "The weaving gave them a memory."

Deeper dive

Yang, one of China's first nationally certified gold tour guides, has witnessed nearly every stage of the industry's modern development.

The change, he said, has been particularly noticeable in recent years. "Before, visitors listened to whatever you told them. Now they ask why," he said.

At the Great Wall, foreign tourists' curiosity isn't restricted to basic questions about its length, age or the construction techniques of the structure.

Instead, they want to know why the Great Wall occupies such an important place in the Chinese identity, Yang said. "One visitor even asked why it appears in China's national anthem," he said.

Yang's explanation begins with the ancient beacon towers that once signaled danger along China's northern frontier, and ends with the phrase from the national anthem — "using our flesh and blood to build a new Great Wall" — showing how a military defense system gradually evolved into a national symbol of endurance and unity.

He said an increasing number of overseas visitors make sense of modern China by comparing it with their own country's culture and history.

Spanish travelers draw parallels between the Great Wall and the Alhambra, a palace and fortress complex in Granada, while visitors from Latin America connect Chinese history with their own experiences of colonialism and nation-building, he shared.

For guides, this means understanding not only China but also the perspectives visitors bring with them. "If you don't understand their cultural background, you can't make the comparison meaningful," Yang said.

One Spanish architect, for example, asked him why Chinese walls were built with rammed earth while Spanish fortresses used stone. Yang didn't have a textbook answer but replied: "Different threats. Different materials. Different emperors."

The visitor nodded, and Yang said that was the moment he understood his real job.

At the end of May, nearly 2,000 tourism executives and industry professionals from 67 countries and regions gathered along the Lijiang River in Guilin, Guangxi Zhuang autonomous region, for one of China's largest inbound tourism events hosted by the local government and Trip.com Group.

Actor and filmmaker Jackie Chan, recently named an inbound tourism ambassador by Trip.com Group, greeted the crowd.

"My mission used to be bringing Chinese films to the world," he said. "Now my mission is bringing the world to China."

A giant illuminated passport appeared in the night sky during a drone show. Moments later, a golden dragon flew through it as the words "VISA FREE" lit up the sky above the crowd.

The image captured one of the biggest changes driving China's inbound tourism recovery — the steady expansion of visa-free policies and the gradual removal of barriers that once discouraged international visitors.

New storytellers

Visa-free entry can open the door, but content determines whether people choose to walk through it, many industry operators said.

Trip.com chairman James Liang announced that the company aims to attract 200 million inbound visitors over the next five years.

The tourism industry has already begun to adapt. Nearly 90 percent of inbound tourism employees have received some form of professional training. New job categories are emerging, ranging from inbound travel "customizers" to multilingual "experience designers" and cross-cultural content creators.

Yet, the industry's response remains uneven. While nearly two-thirds of practitioners feel service expectations have grown more demanding, fewer than 15 percent said lack of training is the main problem.

To become an outstanding guide for international visitors takes five to 10 years, Yang said. "Language ability, cultural fluency and the confidence to navigate complex conversations cannot be developed overnight," he said, adding that demand for Spanish-speaking guides, for example, has surged in recent years.

Yang speaks English and Spanish, has studied abroad, and traveled extensively. Years of experience have allowed him to understand both his visitors and the country he represents.

"Because what visitors are really doing is not just asking for explanations — they are interpreting China through their own cultural references. You need to understand those reference points as well as your own, so your answers are framed with meaning," he explained.

Many of Li's employees are from language schools, training centers and international trading firms and have never worked in the tourism industry before.

"Their language skills promise immediate and effective communication with potential clients," Li said.

"But they have to work hard to learn what the city has to offer and be capable of answering sophisticated questions based on that expertise. What visitors increasingly seek is not information alone. They want context, comparison and stories."

Experienced guides consistently earn more than newcomers, while regular training improves both service quality and income, industry figures showed. But income instability remains a concern. Tourism is highly seasonal, and many practitioners experience large swings in earnings between peak and off-peak periods.

For all the optimism surrounding inbound tourism's resurgence, the industry's growing pains are real, Li said.

Yang said being a tour guide is about creating understanding, a role he believes AI can never fully replace.

"AI can translate accurately. It can provide information," he said. "But it cannot read a visitor's eyes. It cannot create emotional connection."

In his 50s, he is still very optimistic about the industry's prospects, as more inbound visitors are requesting his services to understand a country still being built.

The Great Wall remains. So does the Forbidden City. But alongside them, a new set of destinations is emerging: factory floors, heritage workshops, innovation hubs and village studios.

"They all hold great sway over inbound travelers' curiosity and need guides like us to lead the way," he said.

TOP NEWS

Efforts: Policy continuity emphasized

From page 1

In the new era, poverty alleviation was pursued not as a short burst of assistance, but as a systematic effort carried out across regions, levels of government and successive stages of policy.

By 2021, China had secured a complete victory in the fight against absolute poverty. Under the current standard, all 98.99 million rural residents living in poverty had been lifted out of poverty, 832 impoverished counties, including Xingtang, had been removed from the poverty list, and 128,000 impoverished villages had shaken off poverty.

However, the achievement was not treated as the end of the task. Even before that milestone was reached, the central leadership had begun planning the next stage. At the Central Rural Work Conference in December 2020, Xi called for efforts to consolidate and expand poverty alleviation achievements and align them with rural vitalization, in order to ensure a smooth transition without gaps in work or policy support.

For long-term tasks, Xi has always stressed the need to maintain a strategic resolve and patience, and to follow through on sound blueprints with sustained effort. He once said that existing plans and arrangements should be carried forward from one term to the next if they are sound, suited to new practical requirements and in line with the people's aspirations.

Zheng Changzhong, a professor at Fudan University, said the experiences of Ningde, Xingtang and China's national poverty alleviation campaign all point to the same logic: Development cannot rely on a single push, and neither can governance performance be measured only by what is immediately visible.

What matters, Zheng said, is whether policies solve real problems, build lasting foundations and continue to benefit the people over time. He said this logic of sustained effort can be seen not only in poverty reduction, but also in broader development fields that require long-term planning, policy continuity and steady implementation.

Aisake Valu Eke, former prime minister of Tonga, said China's success in lifting nearly 100 million rural residents out of poverty was "a remarkable achievement for any country".

Eke said China's progress was supported by a system in which plans and strategies are developed by the CPC and carried out across different levels of government, from provinces and cities to villages.

Planning system hailed

Nur Rachmat Yuliantoro, professor of International Relations at Universitas Gadjah Mada in Indonesia, said China's five-year planning system, with its emphasis on long-term strategic planning and policy continuity, is one of the defining features of China's development.

He said that this approach enables China to pursue national goals while delivering immediate benefits to the people and advancing broader development objectives over time, a balance that can be seen in areas such as infrastructure, poverty alleviation, technological innovation, natural resource conservation and cultural heritage preservation.

"At the heart of this planning strategy and balance is sustainability," he said, adding that China has provided valuable experience for many countries, particularly those in the Global South.

Nichita Iris Liga, a member of the Executive Bureau of the Romanian Socialist Party, said that unlike some other countries, where systems and priorities may change every few years with electoral cycles, planning in China is not limited to a single five-year period, but is linked to longer-term goals, including the second centenary goal of building China into a great modern socialist country by the middle of the century.

Tradition wins big during holiday

By ZOU SHUO
zoushuo@chinadaily.com.cn

Cultural experiences took center stage during the just-concluded Dragon Boat Festival holiday as people from across the country embarked on journeys in search of traditional festivities involving boat races, rituals and seasonal foods, travel agencies said.

Searches for keywords such as "Dragon Boat Festival", "dragon boat" and "*zongzi*" more than tripled from a month earlier on online travel platform Qunar, reflecting the growing appeal of tradition-infused travel and transforming the three-day break into a vibrant celebration of Chinese cultural heritage.

Meanwhile, searches for folk-culture tourism jumped 55 percent year-on-year, according to People's Daily Overseas Edition, citing online travel agency Mafengwo.

Dragon boat racing, the festival's most iconic tradition, has evolved from a spectator event into a participatory cultural attraction. Travel platform Ctrip reported that searches for "dragon boat" rose 41.3 percent week-on-week, with races proving to be a major tourism magnet.

Guangdong province led the trend. Travel-related searches for Foshan increased by 134.9 percent week-on-week, driven by the famed Diejiao dragon boat race, often hailed as the "F1 on water", Ctrip said.

A tourist from Shanxi province, who went to Foshan to see the Diejiao race, said the chants of the boatmen and the roar of the drums made it a spectacularly moving experience.

"No matter how exciting the video is, nothing beats the real experience. I could feel the vitality all around," she said.

Not only in Guangdong, dragon boat events boosted tourism nationwide. Searches for Jingzhou in Hubei province rose 87.5 percent week-on-week, while Zigui in the same province — the hometown of poet Qu Yuan — became a holiday hot spot thanks to its cultural festival, according to Ctrip.

Qu was a legendary poet and minister in the State of Chu during the Warring States Period (475-221 BC). He drowned himself in the Miluo River when he learned that the State of Chu was being defeated by the State of Qin. Legend has it that upon learning of Qu's death, locals took out boats to search for his body, dropping rice dumplings into the river to prevent the body from being eaten by fish. It is to honor this legend that Chinese people hold dragon boat races and make *zongzi* to eat during the festival.

There was huge demand for seasonal Dragon Boat Festival delicacies as well. According to Qunar, food lovers hit the road in droves in search of festive cuisines. Instead of debating on whether to sample sweet or savory rice dumplings known as *zongzi*, hundreds headed to Quanzhou, Fujian province, to sample Minnan-style braised pork *zongzi*, or to Guiyang in Guizhou province to try the unique Buyi ash *zongzi* mixed with plant-ash lye, it said.

Beyond *zongzi*, crayfish from Qianjiang, Hubei province, mackerel dumplings from Qingdao, Shandong province, and cold fermented noodle soup from Lanzhou, Gansu province, were also big draws for food connoisseurs who traveled thousands of miles just to sample the fare. According to Qunar, hotel occupancy in these foodie-friendly destinations — including Qianjiang, Qingdao, Lanzhou, Quanzhou and Guiyang — increased by more than 20 percent during the holiday.

The folk-culture fervor fuels local industries. Miluo in Hunan province — known as the "hometown of dragon boats" — is home to 20 boat-building factories with an annual turnover of more than 200 million yuan ($29.6 million), according to data from the local government.

The finals of the 2026 Hunan Dragon Boat Super League kicked off in Miluo on Thursday. A total of 38 top dragon boat teams from 14 cities and prefectures across the province gathered to compete in the two-day race. Through dragon boat racing and folk traditions, they celebrated the spirit of Qu Yuan and participated in a grand Dragon Boat Festival event that deeply integrated culture, tourism and sports.

One workshop in Luojiang township continued working through the holiday to meet rising orders. Likewise, a *zongzi* producer in Quzici township said the number of orders defied all predictions of a market downturn.

Since late April, the Quzici plant has run at full capacity. Local villager Weng Zhenggui, who lives just 400 meters away and works eight hours a day, made over 1,000 *zongzi* and earned up to 6,000 yuan per month.

The cooking and packing processes in the plant are automated, boosting daily output to 100,000 *zongzi* while ensuring consistent quality. "The automated system precisely controls temperature and pressure, saving labor and improving efficiency and taste consistency," said company chairman Wu Liman.

Inbound tourism showed strong growth during the holiday, with Fliggy reporting that bookings were up more than sixfold year-on-year.

Tech: Cleaning robot market enters new phase

From page 1

According to data from the General Administration of Customs, cleaning robots — added as a stand-alone customs classification this year — accounted for 7.75 billion yuan ($1.14 billion) in exports during the first quarter of this year, representing 68.5 percent of China's total robot export value.

In addition, out of total global shipments of 32.72 million units in 2025, Chinese manufacturers accounted for more than half of the global market, according to global market consultancy IDC, with Roborock, Ecovacs, Dreame, Xiaomi and Narwal occupying the top five positions globally in household cleaning robot production.

"The market has entered a new phase, characterized by the dominance of Chinese brands, rapid technological iteration and increasing segmentation across product categories," said Zhao Siquan, a senior analyst at IDC China.

Under IDC's definition, the broader cleaning robot sector encompasses robot vacuums, window-cleaning robots, lawn-mowing robots and pool-cleaning robots.

"Leveraging a complete supply chain, rapid product iteration capabilities and strengths in algorithms, Chinese manufacturers have expanded their presence across virtually all of these segments," Zhao said.

From cordless designs and AI-powered navigation to all-in-one docking stations and multidevice collaboration, many technologies that were first deployed at scale by Chinese manufacturers are now becoming industry standards, she added.

As competition intensifies, leading players are also broadening their ambitions. "Top manufacturers are evolving from single-category providers into full-scenario home service companies," Zhao said. "This is because, for consumers, cleaning is not an isolated need, but part of everyday household life. Companies that can deliver services across a wider range of home scenarios will have a greater opportunity to build stronger user engagement and long-term brand loyalty."

Mediators seek pathway to ceasefire

Iran says 'good progress has been made', warns Trump to take care with statements

By SHI GUANG in New York
shiguang@chinadailyusa.com

High-level negotiations aimed at permanently ending the Iran war ended in Switzerland early Monday, mediators Pakistan and Qatar announced, while technical talks continued amid efforts to translate a fragile ceasefire into a lasting agreement.

Iran's Foreign Minister Abbas Araghchi wrote on X early Monday to hail the mediation efforts by Pakistan and Qatar, saying that they "delivered major progress to end the Lebanese War".

In his message, Araghchi said the first real test of the understandings reached would be a deconfliction method created over the fighting between Israel and Hezbollah in Lebanon.

Iran's Foreign Ministry spokesman Esmail Baghaei, speaking to the state-run IRNA news agency, also said "good progress was made" and a mechanism will be arranged on safe passage of ships through the Strait of Hormuz.

Pakistan, Qatar and Iran have all acknowledged the end of the first round of high-level talks. The US hasn't comment, The Associated Press reported.

On Sunday, US Vice-President JD Vance and US negotiators including Steve Witkoff and Jared Kushner, Trump's son-in-law, negotiated with Iranian officials to open talks under the terms of the memorandum of understanding signed between Washington and Tehran last week to extend the ceasefire from April for at least another 60 days.

The talks had a tense start, strained by President Donald Trump's renewal of threats, with Iran and US media reports providing different accounts of the discussions.

Iranian media said talks had entered a "difficult phase" and recessed after the "publication of an insulting message by the US President".

Just before talks officially began on Sunday, Fox News reported that Trump said he told Iranian officials "you won't have a country" if they tried to close the strait again. Trump also repeated an earlier threat that the US would take over the waterway and possibly charge a toll of its own, Fox News said.

The Iranian delegation left negotiations in protest of Trump's threat to launch further strikes against Iran, Iran's semi-official Tasnim news agency reported.

Trump also went to social media to continue threatening Tehran from afar.

"Iran must immediately stop their highly paid PROXIES in Lebanon from causing trouble," Trump said on Truth Social. "If they don't, we'll hit Iran very hard again, just like we did last week, only harder!!!"

"They would do better to be careful about their statements," Iran's lead negotiator, Mohammad Bagher Qalibaf, said on X after Trump's post. "Our armed forces are prepared to respond to them in a different manner. They may keep talking, it is we who act."

US officials, on the other hand, offered a separate account of the negotiations on Sunday.

Vance and the US delegation have been "engaged in constant meetings and negotiations," a US diplomat told reporters in Switzerland.

"The Iranians are still here and discussions are ongoing. We anticipate continuing to work through the night," the diplomat was quoted as saying.

"The Iranians never left and are still here meeting and negotiating deep into the night," the diplomat said.

"We've talked about the strait, Lebanon, nuclear issues and details of implementing the MOU, among other topics."

During the Sunday talks, the two sides discussed mechanisms to help ensure the Strait of Hormuz remains open, enforce the fragile ceasefire in southern Lebanon and address "all elements of the nuclear deal" in an effort to establish a starting point for technical negotiations, CNN reported on Sunday, citing a senior US diplomat involved in the negotiations.

Analysts have noted that Lebanon constitutes the "greatest test" for the talks.

Leslie Vinjamuri, president and chief executive officer of the Chicago Council on Global Affairs, noted that while the war has demonstrated what American power can still do, it has also revealed the United States has struggled to convert its coercive capacity into a durable regional order for the Middle East.

"The first and hardest test is Lebanon," followed by the nuclear program, Vinjamuri wrote in an analysis.

Cooperation: Innovation focus creates fresh opportunities

From page 1

Areas such as semiconductors, batteries, artificial intelligence, advanced manufacturing and the digital economy provide vast opportunities for mutually beneficial cooperation. As both countries pursue innovation-driven growth strategies, new possibilities for industrial and technological collaboration continue to emerge.

More important, the realities of today's global economy demonstrate that sustainable development cannot be achieved through zero-sum approaches. Global supply chains are deeply interconnected, and economic instability in one country inevitably affects neighboring economies and the wider international community. In this regard, China-South Korea economic cooperation is not simply a bilateral matter; it is closely linked to the stability and prosperity of Northeast Asia and the Asia-Pacific region as a whole.

Particularly noteworthy is the fact that China is actively pursuing high-quality development centered on technological innovation, while South Korea is strengthening its competitiveness in cutting-edge industries and future technologies. These parallel efforts create valuable opportunities for cooperation.

In practical terms, bilateral cooperation should increasingly focus on joint research and development, investment in future industries, green transformation, digital collaboration and talent exchanges.

The recovery and expansion of people-to-people exchanges is equally important. Economic cooperation cannot be sustained solely through agreements between governments. Long-term stability in bilateral relations depends on active engagement among business leaders, young people, academic communities and cultural sectors.

Naturally, China-South Korea relations still face various challenges. Changes in the international environment, security concerns and intensified competition in certain industries may continue to create pressure on bilateral ties. However, what matters most is how those differences are managed and how areas of common interest can continue to expand.

Today, the Asia-Pacific region stands at the center of global economic growth. The future prosperity of the region is closely linked to the quality of cooperation among its major economies.

From this perspective, China and South Korea should look beyond a bilateral framework and pursue cooperation from the broader standpoint of regional prosperity and global stability.

Now is the time for the two nations to elevate their relationship into a more resilient, forward-looking and mutually beneficial partnership.

The author is chairman of the Korea-China Global Association in Seoul. The views do not necessarily reflect those of China Daily.

GLOBAL LENS

A housewife wears a smartphone on her head as she records her actions through motion capture while slicing mangos at her home in Chennai, India, on May 15. PHOTOS BY R. SATISH BABU / AFP

A smartphone screen on a housewife's head records her actions through motion capture while she is slicing mangos at her home in Chennai, India, on May 15.

A housewife wears a smartphone on her head as she records her actions through motion capture while watering plants at her home in Chennai, India, on May 15.

Robot mentoring

Indian housewives with phones on their heads train humanoids that will perform household jobs in future

With a smartphone strapped to her head, Indian housewife Nagireddy Sriramyachandra films herself slicing mangos to train AI-powered robots to take on household jobs in the future.

Earning just over $2 for an hour of video, her mundane recordings are invaluable for global tech companies teaching machines how to move like humans in the real world.

The 25-year-old is one of a growing army of thousands of AI system trainers in India.

"Who else will give you 250 rupees ($2.64) an hour just for doing housework?" said Sriramyachandra from her kitchen in Chennai in southern India's Tamil Nadu state.

"I may get a robot myself in the future," she said.

AI chatbots and image generators crunch reams of digital data, but building systems to navigate real-life environments is more challenging.

Developers think feeding first-person footage, called "egocentric data", into specialized AI models will help robots copy humans.

Some AI trainers work at home, others in factories or specialized studios — using video glasses, head-mounted cameras and motion sensors.

"It blares 'hands not detected' when I'm not recording properly," said Sriramyachandra, who sends recordings via a special app to the AI data company Objectways.

The humanoid robot market is booming, with investment bank Morgan Stanley predicting there could be over a billion in use by 2050, mostly for industrial and commercial purposes.

"Folding clothes, coffee-making ... cooking a very specific thing, sandwich-making," Objectways head Ravi Shankar said, listing videos requested by clients.

From top: A worker wears a camera to record her actions through motion capture at an AI data company in Tamil Nadu, India, on May 13. Data is acquired through motion capture at the AI data company in Tamil Nadu.

"Some jobs are supposed to be taken over, so humans can go and do better things."

In India, the emerging field of spatial AI is providing new employment.

"It's likely that these data collection services will increase," said digital labor expert Aditi Surie, from the Indian Institute for Human Settlements in Bengaluru.

At an Objectways studio, AI system trainers film themselves performing household tasks in fake, fully furnished apartment rooms.

After several thousand hours of filming, the wallpaper is changed to provide clients with variety.

"Today I sit here, tomorrow I stand there," said engineering graduate Rani N., 21, on a break from filming herself, once again, folding a towel.

Each video lasts about four minutes, and she records around 90 a day — on nearly every conceivable spot on the bed.

She says the job is "tolerable", but feels like she's always wearing a camera.

In other rooms, colleagues arranged pencil sharpeners, water bottles and crayons in patterns, recording with depth-sensor cameras.

Qanat Consulting Services in Andhra Pradesh, an Objectways subcontractor, supplies about a dozen larger data firms with recordings. Some of its 2,000 contributors perform tasks with motion-sensor bands on their "wrists, hands and legs", CEO Thaslim Pattan said.

Manish Agarwal of Bengaluru-based Humyn Labs records conversations as well as videos.

Contributors discuss assigned topics — ranging from politics to entertainment — for clients wanting to process speech patterns. Agarwal denies that robots will steal jobs, believing that networks of humans and robots "will work together" one day, he said.

"A welder in India could be managing a welder-robot in Prague," he said.

'China Shock' seen as cover of protectionism

Western framing undermines multilateral trading system, drives up costs: Experts

By **YANG RAN**
yangran1@chinadaily.com.cn

In response to growing rhetoric from the West over the so-called China Shock 2.0, experts say this narrative serves primarily as a political shield for protectionist policies rather than an objective economic assessment.

They warn that such framing could undermine the multilateral trading system and drive up global costs. Rather than viewing China's industrial advancement with hostility, those nations should instead adopt a more sophisticated collaborative mindset, leveraging China's robust supply capabilities to generate shared global benefits, experts urged.

During the three-day G7 summit concluded on Wednesday, European Commission President Ursula von der Leyen said, without naming China directly at first, that "some countries produce too much and do not consume enough", claiming it has been "increasingly dangerous for the stability of the global economy". She then explicitly singled out China, labeling its trade surplus with the European Union "unsustainable".

Her remarks mirror the "China Shock 2.0" narrative that has been gaining traction. Last month, the Centre for European Reform, a Europe-based think tank, published a report claiming that "a new China Shock is reverberating across global goods markets". During the G7 summit, many Western media outlets also leveraged this narrative to justify trade policies targeting China.

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, pointed out that the "China Shock" narrative largely focuses on the alleged trade imbalances, specifically concerning China's goods trade surplus with the West.

Sun Chenghao, head of the US-Europe Program at Tsinghua University's Center for International Security and Strategy, noted that the recent Western hype around the so-called China Shock 2.0 is in essence a political construct. "It layers together Western anxieties over lost industrial competitiveness, the rising costs of a green transition, and a broader strategic competition with China. They reframed these issues into a 'security threat' narrative, repackaging for public consumption."

The original "China Shock" thesis, coined by Western economists, argued that China's post-WTO export boom disrupted US labor markets.

Sun said that the underlying logic of the current version hasn't changed much. "Both versions externalize the internal challenges of Western economies — industrial restructuring, income inequality, and technological competitive pressures — and blame them on Chinese manufacturing."

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, agreed. He said the so-called China Shock is simply a natural outcome of market economics and competition.

"Developed countries have grown accustomed to holding the technological upper hand for decades," Tu said. "Now, when they face a real competitor, they seem reluctant to embrace the free market principles they've preached for decades."

Far from being a detriment, experts said that China's industrial upgrading, which offers high-tech products at lower costs, is a boon for the global economy, enhancing world productivity and welfare.

James Pethokoukis, a senior fellow at the American Enterprise Institute for Public Policy Research, a Washington-based think tank, highlighted this positive impact in a December article published on the organization's website.

He noted that while China's rapid growth reduced the US' share of the global GDP, it simultaneously helped US consumers by making a wide range of goods cheaper to buy and easier for US companies to produce. The US, he concluded, became "absolutely richer" even as it appeared "relatively smaller, economy-wise".

Benefiting the world

"China's massive, integrated production capacity, combined with intense domestic competition, allows it to produce high-tech goods at remarkably low cost," said Tu. "This, in fact, benefits the entire world, as it significantly lowers product prices, thereby enhancing their accessibility and affordability. This is particularly evident in renewable energy products, including solar power, wind energy, and electric vehicles."

Official data shows that Chinese wind turbines, solar panels, and new energy vehicle products are exported to over 200 countries and regions globally, driving down global wind and solar power generation costs by over 60 percent and 80 percent, respectively.

Sun warned that the West's pan-securitization of normal industrial competition would, in the long run, escalate global production costs, diminish consumer welfare, fragment supply chains, and further erode the WTO-centered multilateral trading system.

Against this backdrop, experts advocate a more rational and objective perspective on China's industrial and economic development, urging exploration of international cooperation for global prosperity.

Jian from Fudan University said, "What they call a shock is really just competitive pressure, which is inherently beneficial for the growth and prosperity of the global market." Blocking such normal competition, he argued, would be detrimental to overall economic development.

"In this context, it is crucial to view this competition rationally and objectively, embracing a market-oriented mindset and promoting self-growth through cooperation with the competitors," he said.

Instability reshapes global supply chains

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Business leaders and logistics executives said global supply chains are adapting to a more complex trade environment shaped by geopolitical tensions, evolving tariff policies and shifting trade patterns, while emphasizing the continued importance of long-term planning and international commerce.

Speaking at a news briefing hosted by the Port of Los Angeles, Gene Seroka, executive director of the port, and Dan Letter, chief executive officer of Prologis, the world's largest logistics real estate company, discussed how companies are navigating uncertainty while maintaining investments in logistics infrastructure, warehousing and trade-related operations.

The discussion came as businesses continue to assess the implications of recent developments in global trade and geopolitics, including ceasefire negotiations involving Iran and the United States, ongoing conflicts in the Middle East and Europe, and evolving China-US trade relations.

Seroka said a proposed reopening of the Strait of Hormuz could help ease pressure on energy markets and improve business confidence, although he cautioned that a memorandum of understanding involving the US and Iran remains only a framework for further negotiations.

"Twenty percent of the world's energy products flow through that strait," Seroka said. If the Iran situation further eases as expected, "we could see oil prices continue their decline, inflation possibly easing over the weeks and months ahead, and shipping confidence could begin to return".

He noted that the waterway normally accommodates more than 100 vessel crossings daily, but warned that shipping companies are unlikely to resume normal operations immediately.

"Crew safety remains the priority," Seroka said. "Even with a possible reopening, it will take months to normalize schedules, get supply chains back to some semblance of normalcy and clear backlogs."

Despite recent disruptions, Seroka said conversations with port operators and industry partners in Asia suggest that cargo flows remain resilient. He added that easing bunker fuel prices and improving confidence could provide additional support for trade volumes in the months ahead.

Turning to China-US trade relations, Seroka said recent discussions were a positive signal, but businesses want clearer direction.

Positive sign

"It's certainly positive when the leaders of the world's two largest economies sit down to negotiate," Seroka said, adding that while businesses are encouraged by the continued engagement, many companies are still seeking greater policy clarity as they make long-term decisions related to trade, investment and supply chains.

China remains one of the Port of Los Angeles' largest trading partners. According to port data, China-related cargo has historically accounted for a significant share of container volumes moving through the Southern California gateway, making developments in bilateral trade relations closely watched by logistics providers, retailers and manufacturers.

Seroka said uncertainty surrounding tariffs continues to influence business decisions. While discussions have included potential opportunities for increased US agricultural exports, including beef and soybeans, he noted that market conditions remain challenging.

He pointed out that Brazil and Argentina have expanded their presence in China's soybean market in recent years, making it more difficult for US exporters to quickly regain market share.

"Once overseas buyers establish new sourcing relationships, it can take a lot of time to win that business back," he said.

Companies are also monitoring upcoming tariff deadlines and potential new trade measures, prompting many businesses to shorten planning horizons and adjust inventory strategies.

"This is the new reality of doing business in today's trade environment," Seroka said.

Letter from Prologis said supply chains have become more resilient after navigating years of disruptions, including rising interest rates, geopolitical tensions and global conflicts.

"Our customers have been digesting all of these issues, and we're seeing them again make decisions," Letter said. "They're making these five-plus-year decisions with us."

Report: UK PM Starmer could resign

LONDON — United Kingdom's Prime Minister Keir Starmer was expected to resign on Monday and set out a timetable for his departure, according to The Observer, a local newspaper.

However, UK Business Secretary Peter Kyle said on Sunday that the news of Starmer's quitting is speculation. He added that Starmer is "making time to reflect on the political realities, challenges and opportunities that he finds himself in".

The threat to Starmer's position, which has been building for months, increased sharply on Friday when his rival Andy Burnham won a seat in Parliament that would allow him to launch a formal leadership challenge.

The Observer, which did not name its sources, said Starmer had reached the conclusion that his position was no longer tenable after speaking to cabinet ministers, advisers, donors and trade union leaders.

Starmer led the center-left Labour Party to a landslide election win in 2024 but has become deeply unpopular after a series of scandals and policy U-turns that have given many voters an impression that he cannot deliver on improving their standards of living that he promised.

If he were to quit or be ousted, it would mean the country installing its seventh prime minister in just over a decade — the highest turnover in nearly two centuries, reflective of anger at successive governments' failures to improve public services and tackle issues like illegal immigration.

More than 100 elected lawmakers in Starmer's party — roughly a quarter of all Labour representatives in the House of Commons — have publicly said they want him to quit or set out a timetable for his exit, according to a Reuters tally.

Burnham, until last week the mayor of Greater Manchester, decisively won the seat of Makerfield in northwestern England in a special election on Thursday. He took almost 55 percent of the 45,510 votes cast, over 9,000 more than the Reform UK runner-up.

Burnham did not immediately make a formal challenge to Starmer but used his victory address to promise a new path for the country.

Starmer congratulated Burnham on Friday but said he would fight any challenge to his leadership and urged Labour not to tear itself apart with infighting.

But Charlie Falconer, a senior Labour member of the House of Lords, said on Saturday that Starmer has "absolutely no authority" left.

"There should be an agreed transition process in which Andy and Keir cooperate as to when the handover should take place," he said.

AGENCIES VIA XINHUA

Intra-Asian travel viewed as opportunity amid tensions

By **YANG HAN** in Hong Kong and **LEONARDUS JEGHO** in Jakarta

Turmoil in the Middle East has reshaped the global travel landscape. Long-haul travel is among the hardest hit, while intra-regional travel could become a bright spot for many tourism-dependent Asian economies, according to industry analysts.

Citing the situation in the Middle East, the Tourism Authority of Thailand slashed its forecast for long-haul arrivals this year from 11 million to 10 million, according to a report by The Nation on June 17.

However, arrivals from nearby markets such as China saw a strong recovery with Chinese tourists arrivals jumping 18.35 percent to 2.3 million. The number of Indian tourist arrivals also increased by 8 percent to about 1 million, the report said.

Paul Edmundus Talo, director of Floressa Bali Tours and Bali Flores Adventure, told China Daily that the conflict in the Middle East had affected international flight services, created a sense of uncertainty among travelers, and contributed to higher airfares.

Airfares for flights between Asia and Europe have hiked after the US-Israeli war on Iran began in late February.

According to an analysis by FlightsFinder.com in March, fares on direct routes between Asia and Europe surged by nearly 300 percent, meaning travelers would need to pay up to $2,330 more for the same flight.

Growth potential

Gary Bowerman, managing director of the weekly industry newsletter Asia Travel Re:Set, said that it is still unclear how consumers will respond to the challenges ahead, but Asian tourism still holds strong growth potential.

Bowerman said intra-regional demand has become a significant force for Asia's tourism recovery, and he expects regional travel in Southeast Asia and the broader Asia-Pacific to remain strong.

But currency volatility, rising interest rates, and higher living costs could weigh on travel at the margins, he said, noting the war in the Middle East will have strong residual effects for some regional economies in the second half of 2026.

"Destinations across the region must continue to diversify their visitor mixes to build more resilience in the future," said Bowerman.

Some Southeast Asian countries have pinned their hopes on the Chinese market with targeted campaigns.

A Chinese tourist wearing a Thai traditional costume poses for photos at Wat Pho Temple in Bangkok on May 5. RUNGROJ YONGRIT / EPA

Thai tourism authorities are planning to attract 7.5 million Chinese visitors in 2026. Apart from marketing through social media platforms, it also plans to build on the popularity of the Chinese film *Dear You* to increase interest in locations where the film was shot.

On June 15, Cambodia launched a four-month visa-free trial for Chinese tourists with multiple entries, its largest source of international visitors. The government said it aims to boost tourism recovery, according to the Khmer Times.

As tourist arrivals drop in Siem Reap Province, Khiev Thy, president of the Siem Reap Angkor Guides Association, said the visa exemption will play an important role in attracting Chinese tourists.

In Bali, the popular Indonesian tourism destination has quickly adjusted its strategy to prioritize the development of the Chinese market in response to the loss of Western tourists, said Ye Lu, head of the China market of the Bali Tourism Board, also founder of the Bali Mandarin Center.

Measures include simplified visas, increased direct flights, training for Chinese-speaking guides, and widespread acceptance of Alipay and WeChat Pay to fill the tourist gap, Ye said.

COMMENT

Editorials

Brussels' protectionist moves risk being costly backfiring gamble to EU

If a trade surplus is automatically interpreted as proof of unfairness, then many European Union exports — from automobiles to pharmaceuticals — could be subjected to the same logic elsewhere.

The EU justifies its trade surplus with the United States as a natural outcome of market forces, even as Washington accuses it of exploiting the US market. Yet, in a striking double standard, the EU now adopts the same logic in reverse. Framing its trade deficit with China as evidence of "victimhood", while overlooking the very market dynamics it so readily champions elsewhere.

The EU often lectures the world about the virtues of open markets, rules-based trade and economic integration. Yet Brussels' proposed Industrial Accelerator Act, along with other bills and policies, suggests that the bloc is increasingly tempted to abandon the very principles that helped build its prosperity.

Presented as a tool to "strengthen industrial competitiveness" and "accelerate the green transition", the IAA carries a less advertised objective: reducing China's role in Europe's strategic industries. Through public procurement restrictions, enhanced foreign investment screening and various "Made in Europe" preferences, the legislation marks a shift from openness toward industrial protectionism. It is nothing but an EU adaptation of "America First".

That is precisely why the concerns submitted by the China Chamber of Commerce to the EU on Thursday deserve serious consideration. The chamber, representing more than 1,000 Chinese enterprises operating in the EU, argues that several provisions of the IAA create legal uncertainty. More important, they threaten to make the EU's green transition slower and more expensive rather than faster and more competitive.

EU policymakers should realize that engaging with China brings opportunities to global enterprises. Multinational corporations are no longer peripheral players in China — they are integral to its industrial ecosystem. This is reflected in the numbers: foreign direct investment in the world's second-largest economy has topped $100 billion annually for 16 years running.

According to a report released at the seventh Qingdao Multinationals Summit on Tuesday, the surveyed multinational corporations in China allocated 14.3 percent of their global R&D spending to the country last year. At the same time, new foreign-invested enterprises in scientific research and technical services jumped 27.2 percent year-on-year to 14,000 — underscoring a deepening technological embrace of the Chinese market.

Divorced from the reality, however, the language of "de-risking", "reducing dependency" and correcting "trade imbalances" has become increasingly commonplace among some of the EU's political circles. Recent discussions among EU leaders have focused heavily on developing new restrictive trade instruments targeting China.

International trade is a matter of mutual choice. EU consumers purchase Chinese goods and EU companies source from Chinese supply chains because they are efficient and offer cost-performance advantages.

Trade balances are the outcome of market forces, industrial structures and consumer preferences. China has never deliberately sought a trade surplus with the EU. Treating a trade deficit as evidence of "economic victimhood" is a dangerous oversimplification.

The EU's competitiveness challenges stem from high energy costs, sluggish productivity growth, fragmented capital markets and regulatory burdens. Restricting Chinese investment will not solve these problems. Nor will excluding Chinese companies from procurement projects make European companies globally competitive.

Instead, it will lead to retaliatory measures, uncertainty and lost opportunities. China has made clear that it will take necessary measures to safeguard its legitimate rights and interests should discriminatory restrictions become EU policy.

But a more constructive path remains available. Despite growing tensions, China and the EU continue to maintain regular communication on economic and trade issues, as He Yadong, spokesman for China's Ministry of Commerce, said on Thursday. The talks in Brussels on June 9 between Ling Ji, vice-minister of commerce and deputy international trade representative of China, and Ditte Juul Jorgensen, director-general for trade and economic security at the European Commission, were "in-depth and comprehensive" and had helped lay the groundwork for ministerial consultations to be held soon, the Commerce Ministry spokesman added.

The ministerial consultations deserve strengthening to deepen mutual understanding.

A comprehensive and objective perspective is essential for the EU in managing its economic ties with China. Past efforts to resolve disputes, from electric vehicles to steel, have consistently shown that negotiation is the rational way forward in addressing bilateral trade frictions.

Should Brussels double down on a de facto "EU First" agenda, it may end up undermining the competitiveness it purports to protect. And when the dust settles, it will be EU businesses, consumers and future industrial strength that pay the price.

All relevant parties must uphold MoU terms

The signing of the first-phase Memorandum of Understanding between the United States and Iran offers not only hope for a ceasefire but also for further negotiations aimed at achieving lasting peace.

As the international community watches closely, it is imperative that all parties involved, including Israel, commit to upholding this agreement and work diligently toward regional stability.

The text of the MoU covers several key areas, including the cessation of hostilities, maritime security and navigation, reconstruction and economic assistance, sanctions relief, nuclear-related commitments and an executive mechanism. It states that the two sides commit to negotiating and achieving the final deal in a maximum of 60 days, extendable with mutual consent.

But the road to peace is rarely straight. Iran's announcement that it would close the Strait of Hormuz, citing Israel's continued attacks in Lebanon as a violation of the ceasefire deal, underscores the challenges in implementing the MoU.

The US-Iran negotiations that are scheduled to open in Burgenstock, Switzerland, are a testament to both parties' willingness to carry on the momentum of the MoU to continue dialogue. But much remains to be done to hold up the current fragile ceasefire and lay the groundwork for a final agreement.

The central question now is whether the US has both the genuine willingness and the practical capability to rein in Israel — especially given that Tel Aviv has made clear its determination to act of its own accord.

While Israel has agreed to a ceasefire in Lebanon, its refusal to withdraw from Lebanon poses a continued threat to peace. Reportedly, Israel is conducting negotiations with the US on maintaining its deployment of troops in southern Lebanon. For the MoU to succeed, Israel must cease its attacks and withdraw its forces, creating an environment conducive to negotiations.

Given the current challenges in implementing the 14-point memorandum and the fragile nature of the US-Iran ceasefire, the US-Iran negotiations, which were originally supposed to focus on the Iran nuclear issue, might now include discussions on the Lebanon ceasefire and the Strait of Hormuz.

The US-Iran talks may be in the spotlight, but their fate will be decided in the US-Israel negotiations. Tehran's revival of the Strait of Hormuz threat was to prompt the US to restrain Israel. The success of the talks in Switzerland hinges on the ability of all parties to adhere to their commitments and avoid actions that could derail the process.

China hopes that both the US and Iran will approach the second-phase negotiations with a rational and pragmatic attitude, working together toward positive outcomes.

Chinese Foreign Ministry spokesman Lin Jian said at a regular news briefing on Thursday that China welcomes the signing of the MoU and hopes that all relevant parties "will uphold the spirit of contract and implement it in good faith".

Beijing has been working for an end to the fighting since the outbreak of the conflict, demonstrating its commitment to peace through various diplomatic initiatives. The four-point proposal it put forward outlines a clear vision for safeguarding peace and stability, emphasizing good neighborliness, development, security and cooperation.

The path to lasting peace in the Middle East is fraught with challenges, but the MoU between the US and Iran offers a glimmer of hope as it provides the scaffolding for talks to end the conflict. For this hope to be translated into reality, all parties, including Israel, must prioritize peace and stability.

China stands ready to support these efforts, but the success of the forthcoming negotiations depends on the willingness of the parties directly involved to approach discussions with rationality and pragmatism.

New measures to enhance data security governance

China's digital economy has entered a stage in which data have become a key factor of production, an important strategic resource and a vital driver of innovation. Against this backdrop the release of measures to assess network data security risks marks a key step in strengthening the country's data security governance framework.

The measures, released on Thursday, will come into force on Aug 20. They aim to provide a systematic framework for identifying, analyzing and evaluating risks associated with network data and data-processing activities. The regulations require handlers of important data to conduct annual risk assessments while encouraging processors of general data to carry out assessments at least once every three years. They also establish clearer responsibilities for regulators, enterprises and third-party assessment institutions.

Since the enactment of the Data Security Law in 2021 and the issuance of regulations on network data security management, China has steadily built a comprehensive system for governing data resources. Yet a key question remained: how can enterprises effectively identify risks before incidents occur? The new measures answer that question by institutionalizing risk assessment as a routine and preventive mechanism. They transform data security governance from a reactive model focused on incident response into a proactive model centered on risk prevention and early warning.

The rapid expansion of artificial intelligence, cloud computing, industrial internet platforms and cross-border data flows has increased the complexity of data governance. As digital technologies penetrate every sector of the economy, data-related risks can quickly evolve into broader economic and social risks if left unchecked. The new measures therefore serve as an institutional safeguard for the high-quality development of the sectors concerned.

For industries and enterprises, the effect will be both immediate and long term.

For sectors that process large volumes of important data — including telecommunications, finance, energy, transportation, healthcare and industrial manufacturing — the measures will accelerate the establishment of more mature data governance systems. Enterprises will need to strengthen internal controls, improve data inventories, clarify data classification mechanisms and enhance monitoring of the entire data life cycle. While compliance costs may rise in the short term, the long-term benefits will include stronger resilience against cyberattacks, data leaks and operational disruptions.

The regulations are also expected to create new opportunities for China's cybersecurity and compliance service industries. By permitting enterprises to engage qualified third-party institutions to conduct assessments, the measures are likely to stimulate demand for professional services in risk evaluation, auditing, consulting, certification and security technology solutions. The development of a more standardized assessment ecosystem will further support the growth of specialized service providers and encourage technological innovation in data protection.

Importantly, the measures do not signal tighter restrictions on data utilization. Rather, they embody China's long-standing approach of balancing development and security. The objective is not to impede data circulation, but to create a more predictable and trustworthy environment in which data can be developed, shared and utilized safely. By clarifying assessment requirements and reducing uncertainty, the measures can help lower compliance burdens for many enterprises while enhancing confidence in data-driven innovation.

In an era when data security has become closely linked with economic security, social stability and national competitiveness, building robust risk management mechanisms is a must. The newly released measures represent important progress in China's effort to modernize data governance. By placing risk assessment at the forefront of security management, the country can lay a stronger foundation for the healthy growth of its digital economy.

What They Say

'Employment first' the key for social development

Editor's note: *China has issued an implementation plan for its employment-first strategy during the 15th Five-Year Plan (2026-30) period. China Media Group spoke to Zhang Chenggang, director of the research center for new forms of employment at Capital University of Economics and Business, on the goals, major tasks and policy measures for promoting high-quality and full employment. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

It is necessary to promote the quality and effectiveness of the service sector, which is the largest source of employment and offers a highly diverse range of jobs with varying entry requirements. Broadly speaking, it can be viewed from two perspectives — producer services and consumer services.

Producer services encompass the modern services that support manufacturing, such as finance, technology services and human resources services. Upgrading and expanding this sector hinges on whether it can generate a large number of high-value, well-paid jobs and continuously strengthen its competitiveness.

Consumer services account for a significant share of employment. In the past, many segments of the sector were characterized by small-scale and fragmented entities, uneven standards and relatively low entry barriers, resulting in wide variations in workforce quality.

The expansion of consumer services should be driven by organizations, enterprises and platforms that help raise service quality. Higher standards and better service quality will translate into an improved experience for consumers. In short, both producer and consumer services need to achieve growth in both quantity and quality.

A key message of the plan is that China must not only expand opportunities but also address existing shortcomings.

Expanding opportunities means continuing to support the development of new forms of employment and allowing the growth of the platform economy to play a greater role across both consumer and producer services. This, in turn, will create a wider variety of jobs, giving workers more choices and career paths.

At the same time, shortcomings in two key areas must be addressed. The first is social protection. Measures are needed to increase participation in social insurance among flexible workers and those in new forms of employment, while making enrollment more convenient. Occupational injury insurance should also be expanded to cover a broader range of workers in flexible employment.

The second area is public services. Service networks should become more extensive, ensuring that basic urban public services reach flexible workers and those engaged in new forms of employment. This will help them integrate more fully into urban life and share in the benefits of development.

It is also important to improve the alignment between educational provision and labor market demand. The establishment of a national big-data platform for talent demand will make workforce needs more visible and provide a stronger basis for educational institutions to adjust their academic programs.

A second priority is strengthening vocational education so that it becomes a respected pathway for career development rather than being viewed as a secondary option.

Also, academic disciplines must be adjusted in line with evolving industry needs. Educational institutions should closely follow the development of strategic emerging industries and future industries. Only by training people according to what the country and the market need can the education system better support economic and social development.

VIEWS

Sun Zhuangzhi

Remember past to safeguard future

A correct understanding of World War II history is necessary so that mistakes of the past are not repeated and both China and Russia are deeply committed to ensuring this. In a joint statement issued in May, both countries reaffirmed the commitment to safeguarding the outcomes of the victory embodied in the United Nations Charter and the charters and judgments of the Nuremberg Trials and the Tokyo Trials, and firmly opposing any attempt to deny or distort the history of WWII.

This stance is not just about preserving historical memory. Both China and Russia firmly uphold the UN-centered international system, reminding countries to avoid repeating historical mistakes and advocating for a fair and equitable global security governance system.

The postwar international order has institutionalized international relations and also established global organizations, including the UN, where major issues could be addressed with equal participation of member states. Under the postwar international order, international conduct has been regulated. The interconnected global economy necessitates shared behavioral standards. International law has gained prominence, providing a framework for dispute resolution, as exemplified by the World Trade Organization's role in shaping international trade rules.

At the same time, the international landscape gradually evolved from Cold War bipolarity to a multipolar structure, driven by the rise of developing countries and initiatives such as South-South cooperation and the Non-Aligned Movement. Nations increasingly engaged in multilateral cooperation to tackle global challenges, from climate change and environmental protection to counterterrorism.

Since the end of the Cold War, the postwar international order has faced significant challenges due to shifts in global power dynamics. Some Western countries are still clinging to outdated power politics because they don't want to relinquish their hegemonic positions and even distort historical facts. Besides, Japanese Prime Minister Sanae Takaichi has glorified militarism and refused to acknowledge Japan's history of aggression during WWII and the atrocities it inflicted on neighboring countries. These actions blatantly undermine fairness and justice and have drawn widespread condemnation from China, Russia and several Asian countries that suffered Japanese atrocities during the war.

The history of WWII offers crucial lessons for understanding today's international relations. An accurate view of that history is essential for preventing a relapse into large-scale conflict.

The war was a direct consequence of the lack of fairness and justice in the Versailles-Washington system established after the end of World War I. The Paris Peace Conference became a "looting assembly", with major powers redrawing their spheres of influence. The League of Nations was fundamentally flawed, and failed to maintain international peace and security.

Meanwhile, the global great economic turmoil in 1929-1933 created fertile conditions for the rise of fascism in Germany and Italy and militarism in Japan. They pursued aggressive military expansion and war preparations, ultimately leading to a global tragedy.

Today, the world once again stands at a critical juncture. Transformations unseen in a century are unfolding alongside intensified major-country rivalry and persistent regional conflicts. Deficits in peace, development, security and governance have become more pronounced, creating a vicious cycle.

Unilateralism and extremism have wantonly trampled on the sovereignty of other countries and blatantly violated the norms of international law centered on the UN Charter. The result has been sharp disagreements and confrontations between nations.

Calls from developing countries for peace and development have fallen on deaf ears. At the same time, globalization faces mounting challenges. Resources such as energy, food, and cyber capabilities are increasingly weaponized, while concerns over nuclear security have become more acute.

Addressing these challenges requires wisdom. The world is transitioning to a new landscape. While the US remains the sole superpower for the foreseeable future, emerging market economies and Global South countries are steadily expanding their influence across various fields — a trend that is set to strengthen further.

Developed countries maintain a clear edge in economic and technological competition, prolonging the transition period and resulting in asynchronous shifts in strengths across different areas. Economically, emerging markets have significantly expanded their share in international trade. However, shifts in security are slower, as the balance of military power, equipment and technology is unlikely to change anytime soon.

Culturally, the West continues to have a big advantage in this field due to modern means of communication and its control over mass media, but its influence is gradually diminishing. The trend toward civilizational diversity is strengthening, and resistance to Western cultural erosion is becoming more pronounced.

Against the backdrop of the prolonged Russia-Ukraine conflict, the spillover of the Middle East crisis, and certain Western countries attempting to maintain their grip on the steering wheel of international affairs, the advance of multipolarity must not devolve into factional confrontations.

In response to hegemonic headwinds, China and Russia have introduced a series of new security concepts within multilateral frameworks such as the UN, the Shanghai Cooperation Organization and BRICS. For instance, the Global Security Initiative proposed by China seeks to unite the international community in addressing global security challenges and maintaining world peace and stability. The SCO, advocating the "Shanghai Spirit", emphasizes common, comprehensive, cooperative, and sustainable security. It upholds equality among nations, favors partnerships over alliances, expands its cooperation network, and promotes dialogue to resolve disputes. This approach strives to turn the vision of "never again war" into reality.

Canada can drive down EV prices for buyers

For years, Canadians have been told that the electric vehicle revolution was just around the corner. The cars were getting better, charging infrastructure was expanding and the climate case was airtight. The only thing missing was a price that ordinary people could afford.

That barrier may soon come down.

Canada has slashed tariffs on Chinese EVs following Canadian Prime Minister Mark Carney's visit to Beijing, cutting them from the 100 percent surtax imposed in 2024 to 6.1 percent for an annual quota of 49,000 vehicles.

Chinese automakers wasted little time in responding. BYD, the world's largest EV manufacturer by sales volume, announced plans to open 20 dealerships across Canada within a year, starting in the Greater Toronto Area. Geely is assembling a Canadian leadership team, advertising senior roles in sales, marketing, legal and aftersales from a Toronto base. Other Chinese manufacturers, including Nio and Xpeng, may be coming too. At the same time, China has introduced an export licensing system this year for passenger EVs, creating a framework for expansion overseas.

For the first time, Canadian consumers will have real choices in the EV market, alongside healthy, market-driven price competition.

The timing is both significant and urgent. In late February, the military conflict in the Middle East effectively closed the Strait of Hormuz, the narrow waterway through which nearly 20 percent of the world's oil supply had been flowing. The impact on energy markets was immediate and severe. Brent crude, which began the year at roughly $61 a barrel, surged to above $120 a barrel in April, a level not seen since the Russia-Ukraine conflict broke out in 2022.

Canadians have felt that in every trip to the gas station. In Vancouver, which has the highest fuel prices in the country, it has now become common to see gasoline prices of C$2.20 ($1.58) per liter, the highest they have ever been and almost 40 percent higher than a few months ago.

Against this backdrop, the economics of driving an internal combustion engine have rarely looked worse while the case for switching to an EV has rarely looked better — provided you can actually afford one.

That has long been a barrier to owning an EV in Canada.

There are plenty of EVs on the streets across the country, but those vehicles are usually premium models in the high-priced segments. A market dominated by Tesla and a handful of established European and North American brands has faced limited pressure to compete on price. Consumers who wanted an electric vehicle but couldn't stretch to the average C$55,000 price of an EV were left with few options.

Chinese manufacturers bring a fundamentally different approach to the market. Take BYD's Seagull, which sells for the equivalent of roughly C$15,500 in China. It represents a category of affordable EVs that simply does not exist in Canada today. Even accounting for tariffs, shipping and local certification costs, Chinese EVs are expected to land in Canada at price points that will force established automakers to respond.

There are already indications that Canadians are responding to the changing market conditions.

Zero-emission vehicle (ZEV) sales jumped 74.7 percent in March compared with a year earlier as fuel prices started climbing. ZEVs accounted for 12.2 percent of all new vehicle sales that month, nearly double the 6.5 percent share recorded a year earlier.

That surge happened before a single Chinese showroom opened in Canada. When BYD's first Greater Toronto Area dealerships open later this year, the market will face its first real test of what genuine competition can do to an industry that has long been insulated from it.

The international context makes the Canadian opportunity even clearer. European Union EV sales rose 51 percent in March as competition and model diversity allowed buyers to easily shift away from traditional cars when oil prices spiked. In the United States, by contrast, EV sales fell yet again in March and have been falling for months as the federal government rolled back incentives and embraced an openly skeptical posture toward electrification.

Canada finds itself between those two trajectories, with an opportunity to choose which path to follow.

Some in Canada have voiced concerns over national security and the protection of domestic manufacturing. But the decision to grant an annual quota of 49,000 Chinese EVs at the most-favored-nation tariff rate — while China has adjusted countervailing measures — reflects bilateral efforts that will ultimately benefit Canadian consumers. In a year when the country lost more than 110,000 jobs in the first four months and consumer confidence has been sliding, the case for shielding a premium car market from competition has become untenable.

Fair and open competition can deliver tangible benefits to ordinary consumers. Chinese EVs will offer Canadian consumers more choices and lower prices, and may even play a role in shoring up the country's automotive industry.

This is not just about geopolitics or trade policy, though it involves both. It is about whether Canadians will be able to buy affordable, efficient vehicles at a time when the cost of the alternative continues to rise. The showrooms are not open yet, and the cars have not yet arrived on dealer lots. But the window that has been opened by this trade deal is real, and it should not be allowed to close.

Hibat-Allah Ezzahid

Adaptability of Chinese firms key to success abroad

Chinese companies are playing an increasingly important role in the global economy today. From advanced manufacturing and renewable energy to infrastructure, logistics, digital technologies, and industrial cooperation, they are transforming production systems and value chains across the world. As Chinese companies continue to expand internationally, the focus is shifting from merely entering foreign markets to operating effectively within diverse institutional, managerial, and cultural environments. While large-scale investments often attract attention, the day-to-day operational realities of globalization are becoming equally important for long-term success.

One major challenge that Chinese companies face is institutional complexity. Many international markets offer attractive macro-level conditions for investment, including political stability, industrial incentives, trade agreements, and strategic locations. However, once companies begin operations, they often face fragmented realities. Administrative procedures may involve multiple agencies with overlapping responsibilities, and regulatory implementation can vary across institutions or regions. Complexities in licensing systems, taxation procedures, labor regulations and documentation requirements may cause delays.

For instance, a Chinese automotive components company facing a three-month delay when importing machinery to Morocco due to complicated customs clearance processes involving several administrative entities suffered disrupted production planning and slowed local recruitment. In response, the company expanded its local legal and administrative team in the host country rather than relying solely on coordination from China.

Another challenge is cross-cultural and managerial coordination. Chinese companies have developed highly effective management systems characterized by organizational discipline, operational efficiency and strong operational commitment. These strengths have driven China's industrial transformation and global competitiveness. However, the workplace expectations, communication styles and professional cultures may differ significantly in global settings. Differences in approaches to hierarchy, communication, working rhythms, and work-life balance can create operational friction within multinational teams.

A Chinese manufacturing company introduced production schedules and overtime practices similar to those in China during a peak production period. But this led to tensions within local teams over overtime expectations and work-life balance. There were also misunderstandings because some local employees perceived the communication style of managers as too direct. In response, the company adjusted working schedules, localized certain HR practices and expanded the role of local middle managers.

Many companies are discovering that management systems cannot simply be transferred across borders. Therefore, Chinese companies are developing more adaptive and internationally integrated management approaches. They are not abandoning their organizational strengths, but combining them with greater local responsiveness and intercultural flexibility. This includes preparing managers for overseas environments, redesigning coordination mechanisms, adapting HR practices, and integrating local leadership into operations. This adaptability is becoming a strategic advantage for Chinese firms globally.

Human capital and localization present another challenge. During the early stages of international expansion, Chinese companies often rely heavily on expatriate teams for coordination and technology transfer. While this model facilitates early operations, long-term international integration requires stronger local participation. Local employees contribute essential knowledge of language, regulations, professional culture and market dynamics.

A Chinese manufacturing company initially depended heavily on expatriate teams for operational supervision, but later faced difficulties in communication with local workers and labor management practices. Misunderstandings often emerged regarding production instructions and workplace expectations because many local employees communicated in the local language rather than Chinese or English. In response, the company hired local supervisors and bilingual coordinators to improve communication and workforce management. Similarly, many Chinese companies are investing more deeply in local talent development, managerial training, and long-term integration.

In several international operations, Chinese companies are also introducing cross-border learning systems that help local employees understand corporate structures, operational standards and organizational culture. Moroccan employees receive technical or managerial training in China before they are given greater responsibilities locally.

This reflects a broader transformation in the globalization of Chinese enterprises. International expansion is no longer just about exporting industrial capacity or building overseas projects. It is also becoming a process through which Chinese companies gain global managerial experience and develop new organizational capabilities. This experience strengthens their expertise in institutional adaptation, intercultural coordination, operational flexibility, and long-term strategic integration. In this sense, globalization is becoming not only a process of international expansion, but also one of organizational learning.

Morocco offers a concrete example of these operational dynamics. Chinese companies operating in Morocco illustrate how operational dynamics can become complex even in a relatively stable and investment-friendly environment.

As Chinese firms deepen their global presence, their long-term success will depend not only on investment and technology, but also on their ability to adapt to diverse institutional and cultural environments.

GLOBAL VIEWS

TARIQ H. MALIK

Hitting back

China's anti-sanctions law provides a mature legal framework for countering the abuse of sanctions as instruments of coercion

Trade sanctions, designed as instruments of order, justice and responsibility, have increasingly become tools of coercion, commercial exclusion and geopolitical pressure in practice. They disrupt trade, undermine economic development, hinder education and research, damage cross-cultural harmony and instill anxiety in societies that have no direct role in political disputes. When sanctions become coercion, nations have both the right and the responsibility to defend their economic sovereignty, giving rise to the legitimacy of new laws to mitigate those negative effects on the global economy. Modern legal systems already recognize the need for anti-piracy laws to protect navigation, anti-trust laws to prevent market domination, anti-dumping laws to defend fair trade, anti-terrorism laws to protect public security, anti-corruption laws to safeguard institutions and anti-crime laws to preserve social order. Now there is also a need for anti-sanctions laws.

China has already taken action by introducing the Anti-Foreign Sanctions Law of the People's Republic of China, adopted in 2021. Its implementation is not a call for confrontation, but a legal defense against the weaponization of interdependence.

Sanctions are not a meaningful means of engaging in international trade, development or economic cooperation. Trade depends on rules, trust and mutual benefit, while sanctions rely on pressure and exclusion. Economic development requires stable expectations, investment, mobility and long-term confidence, all of which can be weakened when sanctions disrupt normal economic activity. When sanctions restrict finance, shipping, insurance, food, energy, technology or medical supply chains, they not only affect political leaders. They affect businesses, workers, students, patients, consumers and researchers. Small businesses lose suppliers. Banks over-comply out of fear. Scientific cooperation is delayed. Students and scholars face barriers. Cultural exchanges narrow. Suspicion replaces trust; anxiety replaces confidence; exclusion replaces dialogue. In this sense, sanctions harm more than trade and prosperity. They harm values, mental well-being, cross-cultural understanding and education. They weaken the human foundations of globalization itself.

Sanctions rarely achieve their stated political aims. They fail to change targeted nations' behavior, facilitate dialogue, advance peace or build mutual trust. Yet they are described as successful because they "send a message", create pressure, damage transactions or isolate targets — simply a rhetorical success.

The belief in the effectiveness of sanctions persists because they serve lobbying groups, media narratives and political performances. If they cause pain, they are said to be working. If they fail to change behavior in the desired way, more sanctions are demanded. This circular logic turns policy failure into symbolic success. It rewards disruption rather than solutions. It allows policymakers to claim moral seriousness while transferring the real costs of sanctions to ordinary people and developing economies. Sanctions are instruments of global shock that do not manage complexity but inject instability into it. They do not create efficient markets; they distort them. They do not prove moral superiority; they reveal the failure to compete fairly in an open system.

For decades, the language of the free market has been used to defend openness, competition and efficiency through the "invisible hand", a concept purported by many since Adam Smith's conceptualization. Yet crude sanctions reveal the "visible hand" behind the so-called invisible hand. If companies are free only when they obey

WANG XIAOYING / CHINA DAILY

the geopolitical preferences of powerful states, the market is no longer free. It becomes conditional because sanctions are signs of unwillingness to compete in an open system. When countries cannot win through innovation, productivity, quality, price or cooperation, they may turn to restrictions, bans, financial pressure and technological exclusion. This is not confidence in competition. It is the fear of competition.

The same logic applies to the petrodollar and wider financial structures. For decades, dollar-based systems gave many Western countries and their allies enormous influence over global finance and energy transactions. This was effective because many countries trusted the system as stable and useful since the end of World War II. Yet coercive sanctions are reducing that appeal. The more financial infrastructure is weaponized, the more countries seek alternatives. Excessive sanctions may accelerate the very multipolarity they seek to prevent.

Sanctions create an unequal distribution of costs and benefits. A few actors may gain strategically, commercially or politically. They may capture markets abandoned by competitors. They may redirect investment. They may use compliance systems to strengthen their own dominance. They may present themselves as defenders of morality while turning sanctions into instruments of economic advantage. By contrast, most countries lose. This is especially true for the Global South and South-South cooperation. Developing economies depend on affordable energy, infrastructure finance, technology transfer, food security and stable trade routes. When sanctions disrupt these flows, the damage spreads far beyond the sanctioned countries. It affects ports, logistics, payments, insurance, construction, education and industrial development.

Sanctions punish interdependence, neutrality and countries for maintaining ordinary economic relations. They convert global development into a hostage of geopolitical rivalry. This is why China's anti-sanctions law should be understood not only as a Chinese legal concern, but as part of a wider defence of development fairness. In earlier periods, sanctions could be framed through narrow diplomatic narratives. However, the digitized world today allows people to compare claims, observe double standards, and see the gap between humanitarian language and economic harm. People are less easily persuaded by unsolicited rhetoric. They can see when sanctions damage ordinary citizens while being hyped as a moral action. They can see when "rules" are applied selectively. They can see when pressure is called justice and economic pain is called effectiveness.

An anti-sanctions law gains legitimacy when sanctions themselves lose moral credibility. The greatest danger is not only economic damage. It is lawlessness. If powerful actors normalize coercion without legal restraint, the world risks moving toward a "Wild West" situation in which pressure replaces procedure and force replaces consent. Smaller countries become vulnerable. Leaders may be threatened, isolated, humiliated or targeted through extraterritorial mechanisms. International relations must not be governed by intimidation.

Countries are responding to this foul play by joining, supporting or developing legal frameworks that challenge the misuse of sanctions as instruments of coercion. China's anti-sanctions law is a mature legal framework grounded in clear standards, transparent procedures and credible safeguards against unlawful extraterritorial measures. It provides a clear definition of coercive sanctions, stronger protection for aggrieved entities, more effective remedies and proportionate countermeasures, including the announcement and adjustment of countermeasure lists, prohibitions on compliance with discriminatory foreign restrictions, and the right of affected Chinese citizens and organizations to seek legal remedies. This approach aims to deter escalation rather than encourage it, while reassuring legitimate foreign investors that normal business remains welcome. It also signals that China supports lawful trade, open cooperation and international engagement, but rejects coercion disguised as legal authority.

China is not alone, as many countries in the Global South hold an unfavorable view of unilateral coercive measures and illegal sanctions that affect international trade, development, sovereign equality and sustainable growth. In this sense, anti-sanctions law will become a more inclusive and fair legal response in favor of harmony, peace and prosperity. It tells the world that China and like-minded countries seek to trade, invest, innovate and cooperate, rather than living under intimidation. It tells domestic enterprises that the legal system is moving toward stronger protection. It tells the Global South that development should not be subject to external veto. And it tells the international community that globalization cannot survive if interdependence is turned into dependency. Ultimately, the anti-sanctions law is not merely a response to sanctions. It is a statement about the future of the international order.

YAN HUA

Shared cure

The SCO health cooperation model champions co-governance and capacity building to shape a stable, long-term global health solution

Over the past two decades, the Shanghai Cooperation Organization has forged a distinctive model of health cooperation that delivers a scalable, replicable regional blueprint for fair and effective global health governance.

Requiring no political preconditions and rooted in equal-footed consultation, this framework allows every member to contribute according to its strengths, share benefits equitably and turn fragmented health projects into sustainable, systemic and long-term collaboration.

Above all, the model prioritizes local ownership and long-term capacity building — a choice that empowers communities and medical professionals within SCO countries to master the skills and capabilities needed to independently sustain and develop their own health services for generations.

In an increasingly interconnected world, public health security has become a borderless challenge. In 2025, over 610,000 cholera cases were reported in 33 countries. Antimicrobial resistance is rising 5 to 15 percent annually, with one in six bacterial infections now resistant to standard antibiotics. No nation can stand alone against these transboundary challenges, making inclusive, effective multilateral health cooperation not just a choice, but an urgent global imperative.

Against this backdrop, the SCO has carried out pioneering, practice-proven exploration in health cooperation. Since the first SCO Health Ministers' Meeting in 2010, members have built mechanisms that grow steadily in breadth and depth. The ninth meeting in Bishkek, capital of Kyrgyzstan, in April proposed an SCO health management dialogue platform, a clear milestone signaling that cooperation has evolved into a mature, institutionalized system.

The SCO model operates on a simple but powerful principle: equality, multilateralism and no political preconditions. This is not symbolic partnership — it is real co-ownership. Partnerships are jointly initiated, shaped and led by multiple members.

Take ophthalmology as an example. The SCO National Ophthalmology Alliance was officially launched on Aug 21, 2025, in Tianjin, with 14 founding institutions from 10 countries. Its chair and vice-chairs are held collectively by experts from China, Russia, Kazakhstan, Uzbekistan, Kyrgyzstan and Tajikistan. The alliance's secretariat is based at the Tianjin Medical University General Hospital, which undertakes the core organizational work of daily coordination and academic exchanges for the alliance, but all critical decisions are made through equal consultation, with no single state dominating.

This co-governance structure is not a ceremonial formality, as it is successfully replicated and institutionalized across other key fields. In September 2025, the SCO Forum on Traditional Medicine in Nanchang, Jiangxi province, drew about 200 delegates from 13 countries and launched a trilingual information exchange platform. In October, a five-year training program for traditional medicine practitioners began in Tianjin, already supporting exchanges of over 100 specialists from various SCO countries. China and other SCO countries have also co-established nine traditional medicine centers in different countries.

Every initiative springs from genuine demand and voluntary contribution. This voluntary, demand-driven approach ensures that cooperation addresses real, on-the-ground needs rather than externally imposed priorities.

Flowing naturally from this co-governance principle, the SCO model prioritizes local ownership and capacity building in favor of sustainable self-sufficiency, rejecting short-term, one-way donations. The evidence of this focus is clear and compelling across multiple sectors.

WANG XIAOYING / CHINA DAILY

In emergency medicine, capacity building takes the form of training and equipment designed for local self-sufficiency. A bronchoscopy training base set up in Beijing last year has begun training SCO member clinicians on ventilator use and field rescue airway management, with plans to donate equipment — but crucially, the donation is paired with intensive hands-on instruction, so that local teams can fully operate and maintain the gear long after the external trainers leave.

Ophthalmology offers another direct measure of both local ownership and capacity building, through immersive hands-on training, direct surgical skill transfer to local professionals, and the establishment of health centers now fully operated and managed by local staff.

By the end of August last year, Chinese medical teams from various hospitals such as Tianjin Medical University General Hospital had traveled to SCO countries to conduct more than 2,300 free cataract surgeries, exceeding the three-year pledge of 2,000 surgeries for SCO citizens.

Crucially, these missions are paired with local training: Uzbek surgeons worked side by side with visiting teams, learning by doing and mastering techniques in real clinical settings.

Hands-on training has also taken the form of fellowships. As a first step, in December 2025, two Tajik ophthalmologists completed a fellowship at Tianjin Medical University General Hospital under the SCO National Ophthalmology Alliance arrangement, focusing on complicated cataracts and glaucoma. The hospital designed a systematic training program covering the entire process of preoperative assessment, surgical techniques and postoperative management, guaranteeing that the visiting doctors could independently perform complex surgeries upon returning to their home countries.

Other than skills transfer, local ownership also extends to facility management. Under the SCO collaboration, blindness prevention centers established in Kyrgyzstan and Uzbekistan are now managed by local staff members — not by expatriates. Similar collaborative efforts have also taken place in Tajikistan.

These tangible achievements prove that the SCO model delivers large-scale, life-changing outcomes while systematically transferring professional skills and management ownership to local personnel.

The SCO's broader health infrastructure reinforces this approach.

The SCO hospital cooperation alliance, founded in 2018, now includes 134 hospitals across SCO countries. The China-SCO emergency medicine cooperation center has been established as the first professional platform under the SCO framework dedicated to emergency rescue. In February, the China-SCO cooperation center for metabolic disease pledged to train 2,000 metabolic disease experts within three years.

In the field of ophthalmology, Tianjin Medical University General Hospital has also taken the lead in establishing an online academic exchange platform for the SCO, integrating surgical mentoring, fellowship training, and localized management of blindness prevention centers into a fully scalable capacity-building model.

This is the defining essence of the SCO model: training local professionals to independently sustain and expand health services, and building lasting self-sufficiency rather than permanent reliance on external teams.

Of course, challenges remain.

Divergent medical regulations and approval procedures hinder cross-border drug and device flows. Language and diagnostic standards limit telemedicine and academic exchanges. Long-term funding is not yet fully secured. These pressing issues are high on the agenda of health ministers' meetings, with members committed to pursuing systemic, cooperative solutions.

Looking ahead, SCO health cooperation will deepen further: A unified online platform for academic and technical cooperation, mutual recognition of medical qualifications, and a decisive shift from project-based cooperation to institution-driven cooperation could emerge. Institutionalizing these mechanisms is the strongest sign that SCO health cooperation has fully matured beyond its early experimental phase into a stable, long-term governance framework.

The SCO model is pragmatic and a work in progress. But judged by its concrete, life-improving outcomes — thousands of medical professionals in training pipelines, and multilateral platforms spanning ophthalmology to metabolic diseases — the evidence is unambiguous: This approach delivers real results while respecting every member and building lasting local capacity.

The SCO health cooperation is a truly inclusive multilateral endeavor where all parties participate, contribute and benefit equally. Rooted in the region yet open to the world, it can grow from a successful regional practice into a valuable, actionable reference for global health governance — and a solid contribution to building a global community of health for all.

Home brands sharpen sport sponsorship

Firms pursuing dynamic, co-creative strategy with 2026 FIFA World Cup

By LI JING
lijing2009@chinadaily.com.cn

When the 2026 FIFA World Cup officially kicked off across the United States, Canada and Mexico this month, Chinese brands are less visible among top-tier sponsors than they were four years ago.

Only three Chinese companies — Lenovo, Hisense and Mengniu Dairy — remain among FIFA partners and FIFA World Cup sponsors, a sharp contrast to the wave of Chinese sponsorship that dominated stadium billboards during recent tournaments.

Yet the shift comes despite FIFA reporting its strongest commercial performance on record. The governing body said in March that all 16 global sponsorship positions for the 2023–26 cycle had been sold, making it the most successful commercial program in its history. Total revenue for the cycle is budgeted at nearly $13 billion.

But business leaders and researchers say the decline in sponsorship numbers does not signal waning interest from Chinese companies. Instead, it reflects a broader shift in how Chinese companies are using global sporting events to support going global strategies.

Rather than buying visibility alone, companies are increasingly treating the World Cup as a platform to demonstrate technology capabilities, strengthen brand positioning, deepen consumer engagement and expand their global footprint.

"It is a transition from a traffic-driven mindset to an effectiveness-driven mindset," said Hu Shan, principal at consultancy company Roland Berger. "Companies are paying much closer attention to return on investment and alignment with their global expansion strategies."

For Qiao Jian, senior vice-president of Lenovo, the shift can be summed up as a move from participants to co-builders.

"What Chinese companies export today is no longer a single product," said Qiao, who is also chief strategy officer and chief marketing officer of Lenovo.

"Increasingly, they are exporting integrated technology capabilities and becoming part of the infrastructure that powers global events."

The shift is becoming increasingly visible at the World Cup, where Chinese companies are moving beyond traditional sponsorship and embedding themselves into tournament operations.

For Lenovo, whose annual revenue reached a record $83.1 billion in fiscal year 2025/26, the World Cup serves as a showcase for its hybrid AI strategy as it seeks to expand higher-margin infrastructure and enterprise businesses globally. AI-related revenue accounted for roughly one-third of Lenovo's revenue during the past fiscal year.

Lenovo, FIFA's official technology partner, is supplying more than 17,000 devices and deploying more than 350 engineers across all 16 World Cup venues. The company is also introducing AI-powered digital twin technology capable of generating three-dimensional replicas of players and match situations.

"The World Cup is the world's largest AI testing ground," Qiao said.

Top: The billboard of Hisense catches the eye during the group A match between Mexico and South Africa during the 2026 FIFA World Cup at Mexico City Stadium in Mexico on June 12. YIN GANG / FOR CHINA DAILY **Middle:** Merchants purchase plush toys related to the 2026 FIFA World Cup participating teams at Yiwu International Expo Center in Zhejiang province on May 12. GONG XIANMING / FOR CHINA DAILY **Above:** A visitor checks out 2026 FIFA World Cup authorized products at a FIFA themed official store in Hangzhou, Zhejiang province, in June. DONG XUMING / FOR CHINA DAILY

She said the company views the tournament as an opportunity to demonstrate how its end-to-end AI infrastructure can support one of the most complex global events ever staged, far more than a conventional marketing campaign.

Hisense represents a similar evolution.

The company's overseas revenue now accounts for roughly half of total sales, according to company data, reflecting the importance of international markets in its strategy.

Having used the 2018 and 2022 World Cups to build brand visibility, the company is now moving deeper into tournament operations. As FIFA's official display technology partner for the video assistant referee system, Hisense provides RGB Mini LED display technology used in officiating operations during the tournament.

"Chinese companies are no longer simply buying advertising boards around stadiums," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

"They are becoming part of the technological infrastructure behind major international sporting events."

While China's established global brands are embedding themselves into FIFA's technology ecosystem, a broader group of Chinese consumer brands is pursuing a different path.

Rather than paying for official tournament sponsorship rights, many companies are partnering with national teams, soccer stars, influencers and local digital platforms to target specific consumer groups in overseas markets.

The home-robotics and smart-appliance maker Dreame Technology recently signed Portuguese soccer icon Cristiano Ronaldo as a global brand ambassador ahead of the tournament.

For Dreame, whose overseas business accounted for nearly 80 percent of total revenue in 2025, the World Cup is less about introducing the brand to consumers and more about strengthening brand recognition and emotional connection.

Chang Xinwei, global president of Dreame Technology, said the era of "buying exposure and hoping for results" was fading.

Consumers increasingly place greater trust in recommendations from content creators, communities and personalities they identify with than traditional advertising, he said.

"The goal used to be getting people to see us," Chang said. "Now it is getting people to want to engage with us."

Other Chinese brands have adopted similar approaches.

Luckin Coffee, Changan Automobile and Cotti Coffee are among companies that have partnered with national teams including Portugal and defending champion Argentina, targeting highly engaged fan communities rather than mass audiences.

The strategy allows companies to target specific markets at a fraction of the cost of official FIFA sponsorship while generating more measurable returns.

Analysts say the shift reflects a broader evolution among Chinese companies as they move from gaining awareness overseas to building long-term brand equity development.

"In the past, many Chinese brands used global sporting events to establish basic awareness," Wang said. "Today, they are increasingly using those events to strengthen positioning in mid- and high-end markets and deepen engagement with consumers."

Beyond the marketing, Chinese companies remain deeply embedded in the commercial and industrial ecosystem surrounding the World Cup.

From officially licensed merchandise and consumer products to display technologies and digital infrastructure, Chinese firms continue to play an important role in the tournament's supply chain.

In Yiwu, Zhejiang province, a global hub for small commodity manufacturing, local manufacturers have long produced World Cup-related goods ranging from flags to souvenirs.

According to estimates from the Yiwu sporting goods industry association, Chinese manufacturers accounted for roughly 70 percent of the global World Cup merchandise supply during the 2022 tournament in Qatar.

While no comparable estimate exists for 2026, customs data suggest continued strong demand. Yiwu exported 2.83 billion yuan ($418.5 million) worth of sports goods and equipment in the first quarter, up 12 percent year-on-year.

Some companies are also leveraging FIFA licensing programs to sell authorized products, while others are expanding into ticketing, hospitality and travel services for soccer fans travelling overseas.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the World Cup increasingly highlights China's role as a provider of industrial capabilities rather than simply low-cost manufacturing.

"The strength is not just producing a product," Zhou said. "It is coordinating an entire supply chain."

He said China's competitive edge lies in dense industrial clusters capable of delivering quality, scale and speed simultaneously.

The trend mirrors a broader shift among Chinese exporters, which are increasingly investing in product development, branding, intellectual property and global operations as they expand overseas.

Economy of sports more than merely on-field action

REPORTER'S LOG

By Li Jing

I am not what you would call an avid soccer fan.

I rarely follow league standings, transfer rumors or match schedules. Yet as the 2026 FIFA World Cup kicked off, I found myself paying attention anyway.

Not because of the soccer.

But because of Labubu.

Pop Mart's designer toy with its toothy grin made a surprise appearance during the World Cup opening ceremony. Within hours, Chinese social media exploded with chatter, and one of the most popular quips was that while Team China failed to reach the World Cup, Labubu had made it onto soccer's biggest stage.

As someone who does not regularly watch soccer, I was suddenly following World Cup-related stories. I was checking social media reactions, reading reports about limited-edition merchandise and monitoring travel data linked to host cities.

The experience reminded me that the world's biggest sporting events are no longer just sports competitions. They have become vast consumer platforms capable of reaching people far beyond traditional fan bases.

Labubu's World Cup collaboration products quickly sold out on Chinese e-commerce platforms, while some limited-edition items began trading at significant premiums on the secondary market.

At the same time, Chinese travel agencies reported growing interest in visiting World Cup host cities across the United States, Canada and Mexico. Online travel portal Tongcheng Travel said searches for World Cup-related travel packages jumped 166 percent week-on-week in the period leading up to June 2, while bookings and inquiries for customized viewing trips also surged.

A successful sports IP can create value far beyond ticket sales. It can drive tourism, hospitality, retail, advertising, merchandise, media rights and urban branding. The event itself may last a few weeks, but its commercial ecosystem can operate year-round.

China is increasingly trying to tap into that potential. The 2026 Government Work Report explicitly called for efforts to "actively develop the sports economy", placing it alongside tourism and wellness as areas with significant consumption potential.

Su Super League, an amateur soccer competition in Jiangsu province, has become a social-media sensation. What started as a regional competition has evolved into a celebration of local identity, generating traffic for restaurants, hotels and tourist attractions across participating cities.

In Guizhou province, the grassroots Village Super League, or "Cun Chao", has blended soccer with ethnic culture, music and tourism, drawing visitors from across the country. Local authorities say sports-related events generated billions of yuan in tourism and consumer spending last year.

"The overall commercialization of China's domestic sports IPs is still at a relatively early stage," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

While organizers have become increasingly successful at attracting sponsors, areas such as sponsorship activation, audience targeting, brand-event alignment and year-round content operations still have significant room for development, Wang said.

That distinction helps explain why events such as Su Super League and Cun Chao can generate enormous online attention but still differ from global properties such as the World Cup, the Olympics or the Australian Open tennis tournament.

FIFA's decision to embrace IPs like Labubu was not simply a cultural gesture. It reflected a broader effort to expand the tournament's appeal beyond traditional soccer audiences and connect with younger consumers through popular culture.

Perhaps that is the most important lesson for China's sports economy.

The country has already shown it can create sporting events that generate excitement and attract massive online audiences. The next challenge is transforming those moments into sustainable business models that continue creating value long after the final whistle.

Because the real measure of a successful sports economy is not whether an event goes viral.

It is whether the crowds, spending and attention remain after the teams have shaken hands.

Stimulating domestic demand high on agenda

EAGLE EYE
By Xu Gao

The 2026 Government Work Report identifies the development of a strong domestic market as the top priority for China's economic agenda this year. At a time when the global economy is undergoing profound changes, rising unilateralism, increasing trade protectionism and persistent geopolitical uncertainties are creating greater instability for external demand.

Against this backdrop, expanding domestic demand has become a strategic anchor for China's economic resilience. The report stresses the need to expand domestic circulation and strengthen the internal drivers of growth in order to better withstand external shocks.

Within this framework, effective investment plays a central role in building a strong domestic market. The Government Work Report calls for coordinated efforts to boost consumption and expand investment, while emphasizing the need to fully unlock the potential of effective investment and leverage China's ultra-large market advantages.

As one of the two key components of domestic demand, alongside consumption, investment remains equally important for sustaining long-term growth.

In China's economic development model, consumption represents the ultimate goal, while investment serves as an essential means to achieve it. The people-centered nature of economic growth is reflected in the continuous expansion of consumption, which remains a top policy priority in efforts to expand domestic demand.

However, sustained consumption growth cannot be achieved without investment. Consumption heavily relies on investment-driven capital accumulation and income growth across society. At the same time, new forms of investment generate new supply, which in turn creates new demand. This dynamic interaction between supply and demand has become increasingly important in China's development strategy.

The outline of the 15th Five-Year Plan (2026-30) emphasizes the need to use new demand to guide new supply and new supply to create new demand, promoting a virtuous cycle between consumption and investment, as well as achieving a higher-level dynamic balance between supply and demand.

It also calls for integrating investment in physical assets with investment in people, and for greater emphasis on consumption-boosting and livelihood-related spending in fiscal policy.

When consumption is relatively weak, investment tends to account for a larger share of economic activity, helping to stabilize growth. As a developing economy with a large population, China still has significant room for investment-led development.

Although China's total economic output ranks among the highest in the world across multiple indicators, per capita levels remain relatively low in many areas. For example, while China's total electricity generation has long ranked first globally, per capita power generation remains less than 60 percent of that of the United States.

Against the backdrop of rising demand from artificial intelligence and digital technologies, investment in power supply capacity remains an important area of development.

At the same time, increasing global uncertainty and supply chain risks highlight the need for China to strengthen domestic industrial chains and reduce potential "bottleneck" constraints.

Even in the relatively weak property sector, there remains significant demand for improved housing conditions, requiring continued investment in better-quality residential development.

Taken together, these factors indicate that China still has broad upside potential for effective investment to address structural shortcomings in its development model.

A key issue in expanding effective investment lies in how investment returns are evaluated. Misunderstanding or incomplete assessment of investment returns can lead to a weakening of investment incentives.

In practice, investment returns can be understood through three layers: micro returns, regional social returns and national strategic returns.

Micro returns refer to direct financial returns of an investment project, typically measured by cash flow and internal rates of return. This is the most commonly used metric in market-based investment decisions. If expected returns exceed financing costs, the project is considered viable; otherwise, it is not.

However, focusing only on micro returns overlooks broader social benefits.

"Regional returns" refer to the broader economic and social value created within a local area. Infrastructure investment — such as roads, subways and public parks — often falls into this category. While such projects may not generate high direct financial returns, they significantly improve urban functionality and quality of life.

Beyond this, there are also "national returns", which reflect the strategic and long-term benefits of investment at the country level. These include contributions to employment, economic stability, regional coordination and national security.

ILLUSTRATION GENERATED BY AI

For example, transportation infrastructure projects ranging from rural road networks to major railway lines in western China play an important role in promoting rural vitalization and balanced regional development.

Different types of investors naturally focus on different layers of returns. Market entities typically prioritize micro returns, as they operate under commercial principles. However, if all investment decisions are guided solely by micro profitability, socially beneficial projects with weak financial returns may be underfunded or neglected.

This is particularly relevant in infrastructure development. Many infrastructure projects are not financially profitable at the project level, yet they generate substantial social and economic benefits. Without government involvement, such projects often struggle to obtain financing.

China's infrastructure development experience demonstrates the importance of taking into account both regional and national returns. The practice of local governments engaging in urban development has played an important historical role in mobilizing investment.

In China, public ownership of land has also provided a unique institutional foundation. As urban infrastructure improves the quality of life in cities, it also increases the value of land held by local governments, allowing part of the social value created by infrastructure investment to be realized through fiscal channels.

This mechanism has enabled many local governments to balance costs and returns across both micro and regional dimensions, forming a sustainable model for infrastructure financing and urban development.

Another important dimension of investment concerns debt and financial sustainability.

China's investment-to-GDP ratio has remained significantly higher than the global average for a long period. Since investment necessarily involves financing, and China's financial system is predominantly debt-based, investment growth is closely linked to rising debt levels.

However, concerns about debt risks should not be assessed solely by looking at the absolute size of debt. A more important factor is the relationship between domestic savings and debt demand.

In a "savings-debt market", savings represent the supply of capital while debt represents demand for capital. If savings are in surplus relative to borrowing demand, then even a high level of debt does not necessarily point to high risks.

China is a high-savings economy. The International Monetary Fund estimates that China's savings rate in 2025 was around 42 percent, nearly double the global average of 23 percent. At the same time, China's net international investment position exceeded $4 trillion, indicating a large accumulation of overseas assets.

Against this backdrop of excess savings, China's relatively high debt level does not necessarily translate into high systemic risks.

Concerns about local government debt are also often linked to incomplete consideration of regional and national returns on investment. While infrastructure projects may appear unprofitable at the micro level, their broader economic and social benefits are significant when assessed from a wider perspective.

In recent years, China has strengthened efforts to manage local government debt risks, including the implementation of a comprehensive debt restructuring package and the replacement of hidden debt. The Government Work Report also proposes further optimization of local government bond issuances to support project financing.

The Government Work Report outlines a range of policy tools aimed at expanding effective investment.

On the government side, China plans to allocate 755 billion yuan ($112 billion) of central budgetary investment and 800 billion yuan from ultra-long special treasury bonds for major national strategic projects and security capacity-building initiatives. Standards for central investment subsidies will also be adjusted to better support priority areas.

At the local level, the issuance quota of special-purpose bonds will be increased and better aligned with regions that have well-prepared projects and demonstrate efficient use of funds.

In addition, China plans to issue 800 billion yuan in new policy-oriented financial instruments to mobilize more private capital for investment.

First national-level special plan for urban regeneration issued

MAIN STREET
By Fan Sibin

Recently, the State Council, China's Cabinet, issued an urban regeneration plan for the 15th Five-Year Plan period (2026-30). As China's first national-level special plan for urban regeneration, it marks the elevation of urban regeneration from an institutional and mechanism-building effort to a medium-to-long-term, overarching national strategy.

The release of the plan has drawn significant attention and sparked lively discussions across society. At a time when China's urban development is shifting from large-scale expansion to stock-based quality improvement and efficiency enhancement, the plan carries great significance.

It systematically sets out the goals, targets, key tasks and policy safeguards for urban regeneration over the next five years, outlining a vision and pathway for building modern people-centered cities.

Urban regeneration is closely linked to the daily lives of the people. Since the fifth plenary session of the 19th Central Committee of the Communist Party of China proposed the action of advancing urban regeneration, a series of livelihood, safety and development projects have been implemented to address pressing public concerns. As a result, urban regeneration has been widely welcomed and closely followed by the public.

Following last year's guidelines on advancing urban regeneration campaign issued by the general offices of the Communist Party of China Central Committee and the State Council, the plan represents the first key dedicated plan at the national level in the field of urban regeneration.

It not only reflects the continuous improvement of the top-level design for urban regeneration, but also underscores the fact that urban regeneration serves as both an important lever for building modern people-centered cities and a national strategic initiative crucial to the implementation of the new development philosophy and the long-term competitiveness of cities.

Looking back at the 14th Five-Year Plan period (2021-25), local pilot projects flourished across the country. With the launch of this plan, the national institutional framework has become more robust, overall coordination has strengthened and urban regeneration has entered a new phase characterized by institutionalization, long-term effectiveness and market-driven mechanisms.

The plan fully aligns with the goal of building modern people-centered cities. Centered on the objectives of "innovation, livability, beauty, resilience, civility and intelligence", it comprehensively lays out six key tasks, seven policy measures, and 14 major projects and initiatives, systematically establishing the goals, tasks and roadmap for urban regeneration.

First, for the first time, it uses quantitative targets to define the urban regeneration "scorecard". This is one of the most closely followed highlights of the plan. Ten key targets are set, including: by 2030, renovating 500,000 dilapidated urban residential units; starting the renovation of 115,000 aging residential communities; upgrading 1,500 old neighborhoods and factory compounds; reconstructing 365,000 kilometers of underground pipelines; and restoring 15,000 historic buildings.

These quantifiable and assessable indicators closely integrate urban regeneration with the construction of modern people-centered cities, providing clearer goals and assessment criteria for urban regeneration work.

Second, the plan fully embodies a people-centered approach while also addressing the strategic needs of expanding domestic demand, boosting investment, stimulating consumption and pursuing development.

It outlines six key tasks and 14 major projects and initiatives. This "task list" reflects a combination of investment in physical assets and investment in people.

The plan calls for the construction and renovation of quality housing, the renovation of aging residential communities and the development of complete communities — all major projects that improve people's livelihoods — across different spatial levels, creating high-quality urban living environments.

At the same time, the plan places particular emphasis on fostering new drivers of urban growth. It explicitly proposes revitalizing idle and inefficiently utilized resources such as old factories and underused commercial office spaces; promoting the transformation and upgrading of aging neighborhoods, factory compounds and inefficient industrial parks; cultivating emerging industries; and upgrading consumption infrastructure.

This means that urban regeneration also serves as a strategic lever for reshaping urban growth drivers and unlocking domestic demand potential.

Third, the plan introduces a policy system for sustainable urban regeneration through reform and innovation. The third plenary session of the 20th CPC Central Committee explicitly called for "establishing a sustainable model and policy-legal framework for urban regeneration".

The plan devotes a full chapter to specific arrangements for building a policy system for urban regeneration during the 15th Five-Year Plan period, outlining a roadmap for reform and innovation.

It directly addresses the difficulties and bottlenecks encountered in urban regeneration practice, focusing on seven key areas: implementation mechanisms, financial guarantees, land use, building safety, multi-stakeholder participation, laws and standards, and technology and talent.

The aim is to accelerate the development of a comprehensive, well-coordinated and efficient policy system for urban regeneration, providing solid support for orderly, routine and long-term urban regeneration.

Over the next five years, as the plan is implemented, urban regeneration will move rapidly from blueprint to reality in people's daily lives. It is likely to see continued improvements in cities: better housing, safer and more livable communities, more vibrant neighborhoods, lively blue-green spaces, more attractive consumer destinations and more innovative industrial parks.

According to estimates by multiple institutions, the total market size for urban regeneration during the 15th Five-Year Plan period will exceed 15 trillion yuan ($2.22 trillion). These figures will translate into tangible improvements for the people — better urban living environments, stronger economic dynamism and higher governance standards.

As time moves forward, with the high-quality and sustainable advancement of urban regeneration under the guidance of the plan, Chinese cities are poised for another qualitative leap in the new era. Modern people-centered cities that are innovative, livable, beautiful, resilient, civil and intelligent are steadily coming into view.

The writer is director of the Research Institute of Urban Regeneration at the China Academy of Urban Planning and Design.

CHINA

Universities cater to AI study demand

Action plan fuels rapid expansion as the need for talent cultivation grows

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Artificial intelligence has become one of the most popular majors across China's institutions of higher education. More than 600 universities have launched AI undergraduate programs as of 2026, based on data from the Ministry of Education, marking explosive growth from just 35 institutions approved in 2018.

According to financial media outlet Yicai, among China's "Double First-Class" universities — the country's elite tier of institutions of higher education — at least 90 have launched AI-related schools or colleges.

The rapid expansion has been driven by a powerful convergence of national strategy and market demand.

In April, the Ministry of Education, together with four other central government departments, jointly issued an action plan outlining comprehensive measures for AI talent cultivation, application innovation, infrastructure development and ecosystem building.

The plan calls for making AI a public foundational course in higher education, creating new interdisciplinary programs and exploring new models for cultivating top-tier AI talent. The move followed the release of the 2026 undergraduate program catalog by the Ministry of Education in the same month. The catalog added 38 new undergraduate majors, including AI for business, embodied intelligence and brain-computer science and technology.

Universities are not merely adding new departments; they are fundamentally restructuring their academic ecosystems around AI. MyCOS, an education research institute, noted that when institutions establish AI schools, they often do not start from scratch. Instead, they consolidate existing computer science, big data and automation programs into new academic units.

Fudan University has rolled out a three-tiered AI curriculum system aimed at achieving 100 percent coverage across all undergraduate and graduate students, first-level disciplines and majors, according to a report from the university.

Ningbo University now requires every major to offer at least one "AI+" interdisciplinary course. Tsinghua University has emphasized an "AI+X" model that integrates AI across all disciplines, according to the official websites of both universities.

China's core AI industry was valued at more than 1.2 trillion yuan ($177 billion) in 2025, according to a Xinhua News Agency report quoting a senior Chinese official.

Yet demand for talent is far outstripping supply. Projections from McKinsey & Company suggest China could face a shortage of up to 4 million AI professionals by 2030. This "AI+" transformation extends beyond traditional technology fields.

Rao Yanting, an associate researcher at the China National Academy of Education Sciences, told China Central Television that AI is no longer just a major but is increasingly permeating every academic field, including not only science and engineering but also the humanities and social sciences.

However, as universities race to establish AI credentials, prominent voices in academia are raising concerns about sustainability and educational quality.

Fang Fuquan, president of Capital Normal University, told Beijing News that AI is a technology rather than a science.

Just as humanity's understanding of the universe relies on fundamental sciences such as the periodic table and Newton's laws, an excessive focus on technology at the expense of mathematics, physics, chemistry, biology and even humanities and the arts could have unintended consequences, he said.

He warned that people may lack the knowledge to distinguish truth from falsehood in AI-generated videos that defy physical laws.

Fang said that while there is widespread pursuit of quick results and greater emphasis on AI applications, universities must guide students to build a solid foundation in basic sciences alongside technological skills.

"Society should foster an ecosystem where not everyone needs to work on AI applications," he said. "Those who pursue basic sciences, humanities and the arts can also become outstanding talents."

"Science has its contingencies; a discipline that is obscure today may flourish in a few years," he said, calling for a more scientific and forward-looking evaluation system.

During the April action plan announcement, Jin Li, president of Fudan University, said AI models are iterating every few months, and what is popular today may become obsolete tomorrow.

"If universities are still training 'finished-product' talent, that's like clinging to a sword while crossing a river," he said.

Jin often uses a metaphor to describe the type of talent universities should cultivate.

"We should cultivate 'stem cell-style' talents — people who can quickly establish cognitive frameworks in unknown domains, integrate resources across disciplinary boundaries and continuously iterate in the face of failure," he said.

Rite of remembrance

Performers present a ceremonial music-and-dance tribute at a public memorial ceremony honoring Fuxi, the legendary ancestor of Chinese civilization, in Tianshui, Gansu province, on Sunday, which fell on the summer solstice. Known as the birthplace of Fuxi culture, the city hosts the annual rite, which was inscribed on China's national intangible cultural heritage list in 2006. FENG LEKAI / FOR CHINA DAILY

DPRK painters in Mudanjiang display artistic bonds

By **ZHOU HUIYING** in Harbin
zhouhuiying@chinadaily.com.cn

Over the past 15 years, more than 40 artists from the Democratic People's Republic of Korea have been invited to display their artistry on a canvas at "the creation base of the DPRK painters in China" in Mudanjiang, Heilongjiang province.

The base, which was established in August 2011, is the only one of its kind that the DPRK has set up overseas. It is used to create, exhibit and sell works of art from the DPRK, according to Cheng Wujun, the director of the base. The base serves as a bridge for cultural exchange between China and the DPRK, introducing authentic DPRK paintings to the Chinese market.

Since its establishment, DPRK artists have been stationed at the base for on-site creation and customized artworks tailored to the needs of collectors and businesses.

"The face-to-face creative exchange is unique in the DPRK foreign art cooperation, offering a unique cross-border artistic collaboration," said Cheng.

The DPRK paintings are known for their pure and simple creative philosophy, distinct artistic style and rigorous realism.

Their distinctness portrays realistic styles, unique emotional interpretation and strong feelings of national pride, all of which reflect the DPRK people's aspirations for peace, Cheng said.

The DPRK awards artists titles such as "People's Artist" and "Meritorious Artist", representing the highest standards in the country's art community.

"The base has always undertaken important functions such as the exhibition and sale of the DPRK works, authenticity identification, artist exchange and market regulation," Cheng added. "The base integrates high-quality works from major DPRK creation studios, providing collectors with authoritative certification, unified numbering certificates and authenticity identification services."

In 2012, Cheng was awarded the honorary title of "cultural ambassador for the DPRK-China art exchange" by the DPRK government — the only foreigner to receive the title to date.

Over the years, Cheng has brought contemporary DPRK paintings to exhibitions across various regions in China, including Harbin in Heilongjiang province, Xi'an in Shaanxi province, Guangzhou in Guangdong province, as well as Shanghai and Beijing.

"The DPRK paintings have distinct characteristics — bright and vivid colors, which give a positive and cheerful impression," he said. "The DPRK artists left me with the deepest impression of their professionalism and dedication."

"For instance, before returning to their accommodation after work every night, they ensure that the oil paints, paper and surrounding areas in front of the easel are clean," he said. "Their rigorous professionalism is evident. To paint a sunrise, they will ask the client what time he needs the sunrise to be depicted — 5, 6, or 7 am — as the sun's height, brightness, shadow effects and color differences are vastly different."

In April 2023, Cheng established a new creation base in Dalian, Liaoning province, and exhibited some DPRK paintings at the Dalian Wanzhongyuncang Technology Incubation Park.

"The works created by the DPRK artists displayed in our exhibition hall have attracted many visitors," said Jin Lin, director of the park's business development and operations department. "The natural scenery and folk customs depicted in the paintings are very detailed, with bright colors, making visitors feel calm and have a taste of life and history." According to Jin, nearly 100 works have been sold from the park so far.

Shang Shuke, an art collector in Dalian, started collecting the DPRK paintings around 10 years ago.

"In 2014, a friend introduced me to the base, so I traveled to Mudanjiang to visit the exhibition hall at the base and picked out some works by old DPRK artists from the 1950s and 1960s," he said. "The DPRK artists have deep artistic skills, with exquisite realism, delicate and lively brushwork and elegant and refined color tones."

"The creators are genuinely dedicated to art, not creating for profit, so the works are pure and simple in style, with strong artistic quality," he added.

Another collector, Peng Fengjiao, has expressed a fondness for the gentle and elegant artistic temperament of the DPRK paintings.

"They are not only exquisite art pieces for decorating life but also a stable collectible choice," she said. "Sometimes, I picked some of the DPRK works I collect as cultural gifts to my artistically-inclined friends, which were well received."

Yun Ju-hyok, the DPRK representative at the base, is now engaged in creative work in Dalian, leveraging his unique perspective to gradually introduce a series of outstanding modern and contemporary DPRK artworks to China.

"The DPRK art, based on subjective realism, uses concise, lively and realistic depictions, which are loved by both DPRK and Chinese people," he said. "After coming to China, the DPRK artists were also amazed by the profound influence of Chinese culture."

"In January 2019, I led five DPRK artists to hold an art exhibition in Taiyuan, Shanxi province," he said. "During the visit to the famous historical sites and museums in Taiyuan, they were full of praise for the breadth and depth of Chinese culture, which deeply touched them and gave them a new understanding and appreciation of China."

Visitors appreciate the DPRK paintings on display in the exhibition hall at the Dalian Wanzhong Yuncang Technology Incubation Park in Dalian, Liaoning province, in early June. PROVIDED TO CHINA DAILY

Chifeng model offers insight on land rehabilitation

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

China's experiences in grassland ecosystem restoration and desertification control, particularly in Chifeng, Inner Mongolia autonomous region, have provided valuable insights for global land rehabilitation and grassland conservation, international experts said at a conference recently held in the city.

Experts highlighted the country's achievements in desertification prevention, related scientific research and the use of technologies such as artificial intelligence and multi-source remote sensing.

The three-day event, held last week, brought together experts from China, South Africa, Japan and the Netherlands.

Participants engaged in interdisciplinary and cross-regional dialogue to explore innovative approaches to grassland protection and comprehensive desertification control, seeking to contribute scientific solutions for land degradation management, ecological civilization building and global sustainable development.

The event was jointly organized by Shanghai Jiao Tong University's School of Design, the university's Inner Mongolia Research Institute and the desert scientific exploration committee of the China Association for Scientific Expedition.

Johns Muleso Kharika, a representative of the secretariat of the United Nations Convention to Combat Desertification, emphasized the need for the international community to support policymaking backed by scientific evidence. He called for stronger cooperation between the Global North and Global South, as well as among international partners, to advance practical actions in land protection and grassland restoration.

"Effective management of desertification requires integrating ecological restoration with innovation in social mechanisms. The ecological restoration practices in Inner Mongolia and China as a whole can serve as important references for global desert management," said Michael Meadows, former president of the International Geographical Union and an emeritus professor at the University of Cape Town in South Africa.

During the event, experts conducted field studies in the Horqin Sandy Land, where they observed innovative sand-control models that combine road construction, sand stabilization and industrial development. They also visited a cold and arid apple and pear breeding base in Chifeng that preserves more than 90 varieties of economic forest resources.

At a newly established cherry experimental field, experts discussed the introduction and collection of superior local varieties with staff members.

The field visits showcased Chifeng's innovative practices in sand control and seed breeding, providing references for regional ecological management and the high-quality development of the forestry and grassland industries, participants said.

Piao Ying, an official in Chifeng, said that despite notable progress, ecological management remains a challenging task for a city located at the junction of the Horqin and Hunshandake sandy lands.

"The city must make better use of technology to safeguard the northern ecological barrier, move from experience-based management to precision-targeted interventions and strive to develop governance models that are replicable and scalable," he said.

Some experts also proposed new governance pathways. Li Xiaosong, a researcher at the Chinese Academy of Sciences' Aerospace Information Research Institute, said large vertical models for sand control could help address issues such as insufficient scientific zoning, weak process supervision and inadequate decision-making support.

"By integrating remote sensing, monitoring, knowledge databases and socioeconomic data, such models can support sand hazard diagnosis, governance plan generation, process supervision and effectiveness evaluation, paving the way for a shift from experience-driven management to precision and intelligent sand-control governance," he said.

Robo greeting

Former barren county transformed into beacon of sustainable economy

By **ZHU XINGXIN** in Youyu, Shanxi and **CHEN LIANG**

Seven decades ago, international environmental experts studying the wind-scoured plains of Youyu county in North China's Shanxi province reached a bleak conclusion: the area was entirely uninhabitable, and the total resettlement of its population was the only viable option. Whipped by brutal Siberian winds, blinding sandstorms routinely choked the air, burying entire villages under shifting desert dunes.

Today, that same desolate wasteland has been transformed into a lush, green oasis. This historic environmental reversal was globally spotlighted when, in 2024, Youyu county clinched the prestigious New Sustainable Cities and Human Settlements Award at the United Nations Headquarters in New York, recognized as a premier global blueprint for desertification control.

Youyu's transformation is a multigenerational epic of political discipline and human endurance. The story begins in 1949, with Zhang Ronghuai, Youyu's first Party secretary. He understood a simple truth: "If Youyu wants prosperity, we must stop the wind and sand. And to stop the wind and sand, we must plant more trees."

He initiated a series of patriotic tree-planting campaigns, rallying the people to action. The first sapling, a Chinese cottonwood (or Simon's poplar), was planted just outside the old county town gate, a defiant flag planted in the face of the encroaching desert.

However, the bitter winters and scorching summers made tree planting a constant battle. In the 1960s, the fourth and fifth county Party secretaries focused their efforts on the Huangshawa sand depression, a particularly challenging area.

Their initial attempts resulted in heartbreak, with over 90,000 saplings failing to survive because the non-native poplars planted drank too much water and died. But they learned from their mistakes, adapting their planting methods and persevering. By 1964, they had successfully planted more than 13,333 hectares, effectively stabilizing the shifting dunes.

Each subsequent leader built upon the work of their predecessors, innovating and adapting to the challenges.

In the 1970s, hardier tree species like pitch pine, larch and Mongolian scots pine were introduced as part of the Three-North Shelterbelt Forest Program, expanding the afforestation area to over 73,833 hectares.

According to the current Youyu Party secretary, Ma Zhanwen, 21 consecutive local leaders have maintained the same ecological priority, leading communities "one shovel and two hands at a time". To date, afforestation efforts have blanketed more than 113,000 hectares of Youyu with 130 million trees. The county's forest coverage rate has dramatically soared from a microscopic 0.3 percent in 1949 to an astonishing 57 percent, making it the first territory in Shanxi province to successfully reforest all its barren mountains.

Wang Zhanfeng, a 75-year-old villager, has planted 200 hectares of trees over the last 44 years. "My hands feel like tree bark," he said, gazing up at the towering trees he helped cultivate. "I've dedicated my life to this. I can't let all this effort go to waste. I have to keep planting, one tree after another, year after year."

The legacy continues with younger generations. Li Jie, a 31-year-old teacher at the Youyu Cadre Academy, has spent nearly a decade sharing the story of Youyu with thousands of visitors. "Shovels are heirlooms in every household in Youyu," she said. "They are a testament to the memory and legacy of generations of Youyu people."

She recounted that on her 10th birthday, her grandmother showed her the first small pine tree she had planted, introducing her to the legacy of Youyu's fight against the desert. That is what strengthened her decision to dedicate herself to this land and carry forward the Youyu spirit.

The transformation of Youyu has created new opportunities. The county is now using its lush environment, rich culture and cool climate to become a cultural tourism and health destination. Local businesses are developing innovative sea buckthorn products, boosting livestock farming and transforming ecological advantages into economic benefits.

"The development achievements of Youyu stem from the simple aspiration of allowing the people to survive and live a good life," said Liang Pengwei, assistant researcher at the Shanxi Provincial Academy of Social Sciences, who is also an editor of a book on the story of Youyu.

Tri-city alliance launched to protect Xiamen's dolphins

Coordinated efforts aim to improve public awareness of 'sea pandas'

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

Three neighboring coastal cities in East China's Fujian province — Xiamen, Quanzhou and Zhangzhou — have recently launched a landmark cross-regional collaboration to protect the Chinese white dolphins in their shared waters.

Xiamen is China's only major city where these marine mammals, under first-class State protection and affectionately nicknamed the "giant pandas of the sea", live right alongside bustling urban life and can be spotted occasionally by residents. It is estimated that around 80 Chinese white dolphins inhabit Xiamen's waters.

"Protecting white dolphins requires pulling the entire society together," said Xu Jing, an official at the Xiamen Chinese White Dolphin and Amphioxus Nature Reserve Affairs Center. "We focus on mobilizing volunteers to join our rescue and monitoring teams."

As the dolphins frequently migrate out of Xiamen's waters into neighboring areas, local enforcement teams officially upgraded this cross-regional mechanism last month to formally institutionalize real-time data sharing, joint maritime patrols and emergency rescues, according to Xu.

The upgraded mechanism also aims to further raise public awareness, including educating citizens on what to do and how to call for help if they encounter a stranded dolphin.

In August 2024, people from both Xiamen and Quanzhou jointly handled the emergency rescue of Le Bao, a 4-year-old female dolphin that swam out of Xiamen and became stranded on a beach in Quanzhou's waters.

A docent introduces the Chinese white dolphin preservation work in Xiamen at a museum in the city.

Local residents reported the stranding, triggering a rapid emergency chain that brought experts from the dolphin reserve in Xiamen and the Third Institute of Oceanography, Ministry of Natural Resources, based in Xiamen, to the scene for a joint medical response.

Following more than 40 days of intensive care at a nearby aquatic rescue station, Le Bao fully recovered and was successfully released back into her home environment in Xiamen's waters in September 2024. She was later named Le Bao after the facility, a name that also carried the rescuers' wishes for her to live a joyful life in the future.

"Le Bao's survival was a miracle made possible by an unbroken chain of rapid actions across two cities," Xu said. "If any single link had failed, this successful release would not have been possible."

The dolphin population's stable presence also stems from Xiamen's long-term ecological initiatives, including a complete clearance of marine aquaculture facilities to restore the coastal ecosystem to its primitive state, she said.

The city even re-engineered a tunnel project from an original above-water bridge design into an underground tunnel, heavily increasing capital investments solely to preserve the dolphins' habitats, she added.

"As a flagship barometer of our marine ecosystem, their presence represents Xiamen's outstanding achievements in biodiversity conservation," Xu said.

Local paddleboarders, open-water swimmers and wildlife photographers in Xiamen have voluntarily established a grassroots monitoring network, capturing footage during unplanned encounters to support scientific research.

Chen Yu, a local open-water swimmer and photographer who has been tracking the species via aerial drone in recent years, said that public engagement is deeply rooted in local tradition. The dolphins are traditionally called "Mazu fish" after the sea goddess, and are regarded by residents as guardians of the waters.

"Since childhood, we have been told by our elders that the waters are safe wherever the white dolphins appear," Chen said. "For local residents, these animals are seen as traditional protectors of the sea."

These photographic sightings provide critical data for marine biologists. Images documenting maternal behaviors, such as a mother lifting her calf to breathe or teaching it to hunt, assist researchers in managing a digital profiling system that tracks family dynamics and newborn calves.

Star Chinese white dolphin Da Bai is seen swimming with her calf in Xiamen in 2020.

In April, an aerial drone photographer captured footage of a newborn calf swimming closely alongside Da Bai, a well-documented wild female dolphin frequently seen nursing newborns in Xiamen's waters.

"When we photograph a dolphin year after year and see it is still there, we know it is growing up healthy and strong," Chen said. "Every encounter still makes me feel incredibly lucky."

Marine experts have introduced a science-based maritime code of conduct, instructing water sports enthusiasts and photographers to maintain a respectful distance instead of chasing the animals.

Lin Yuan, a local middle school teacher who is a paddleboarder, regularly records her encounters with the animals in the sea to use as educational materials in her classroom.

"I bring my own dolphin encounter videos to share with my students," Lin said. "We must cultivate an awareness of biodiversity conservation in children so they can continue to see these marine creatures in their local environment in the future."

Digital drive supports planting of millions of trees

By **HOU LIQIANG** in Beijing and **HU DONGMEI** in Yinchuan

China's private-sector, internet-based afforestation efforts have reached a massive scale milestone, demonstrating how gamified digital incentives have been successfully integrated into the country's broader national ecological strategies.

Since 2017, under a partnership between tree planting initiative Ant Forest and the China Green Foundation, 386 million trees have been planted across about 440 projects spanning seven provincial-level regions, including Gansu and Qinghai provinces and the Inner Mongolia autonomous region, said Zhang Quanzhou, the foundation's secretary general.

According to Zhang, the partnership saw more than 200,000 hectares of desertified land treated in that time, with about 90 percent of it located in key areas of the country's Three-North Shelterbelt Forest Program, which is the world's largest afforestation endeavor.

"This program has transformed the 'green energy' of hundreds of millions of netizens into tangible ecological outcomes," he said.

Ant Forest was launched in August 2016 by internet financial services firm Ant Financial, an affiliate of Alibaba Group.

The app rewards users with virtual energy — which they can use to have trees planted — when they take low-carbon actions such as walking or using public transport instead of driving, or buying things online, which avoids the need for paper receipts.

The amount of energy needed to plant different trees varies. After receiving an application from an app user who has saved enough energy, Ant Forest will plant a real tree.

To ensure that digital goodwill translates into lasting ecological impact, Zhang said the foundation has built a long-term mechanism for public participation.

In collaboration with the National Greening Committee, it launched a nationwide online platform that allows citizens to adopt, monitor and track tree growth via their mobile phones, making voluntary tree-planting a year-round, regular activity.

Zhang also said that the foundation has established a clear responsibility chain, supported by technologies such as satellite remote sensing, third-party inspections and digital oversight.

Moreover, a collaborative governance model has taken shape in the country, featuring government guidance, corporate donations, public participation, foundation execution, and oversight by forestry and grassland authorities, he added.

A recent commentary in the journal Nature said that Ant Forest is an example of how digital incentives can be used to inspire the public and generate funding.

Since its launch, the gamified initiative with more than 500 million users has funded more than 619 million drought-resistant trees and shrubs, the article said.

Li Meng, a 28-year-old map data collector and dedicated Ant Forest user, embodies the power of digital incentives to drive lasting behavioral change. To date, Li has planted 1,120 trees across Ant Forest's forested areas since October 20, 2016.

His motivation is deeply rooted in a sense of shared responsibility.

"Western China has a sparse population yet silently protects the ecological environment of the eastern region," he said. "Whether we live in the east or the west, everyone should consciously protect the environment."

When personally participating in a tree planting activity in Alxa League in the Inner Mongolia autonomous region, Li observed saplings at different growth stages — from newly planted seedlings to mature, thickening saxaul trees.

"It's like the development of public welfare: gradual, persistent and built on dedicated effort," he said. "It will slowly grow stronger, better and better."

A decoration marking Ant Forest's collectible "green energy" is displayed at a green lifestyle fair in Shanghai in September 2024. XING YUN / FOR CHINA DAILY

LIFE

Back to school for the 'silver' generation

After lifetimes spent working and caring for others, older Chinese people are now packing their sketchpads and notebooks and heading abroad, **Yang Feiyue** reports.

China's retirees are breaking free from long-held expectations centered on family duties and caregiving, challenging stereotypes that cast older people as preoccupied with their children's marriages, grandchildren and domestic routines.

A growing number of them are now doing some soul-searching and seizing learning opportunities abroad, determined to make fuller use of their retirement years, whether in search of fulfillment or simply for their own happiness.

While younger generations debate whether an overseas degree is worth its staggering price tag, a growing wave of gray-haired retirees is packing suitcases and walking into lecture halls around the world, not for diplomas, but for themselves.

For nearly two decades, Li Guolin could barely get out of bed.

A spinal fracture in 2000 forced her into early retirement from her job at a bank in the coastal city of Zhuhai, in South China's Guangdong province. Her world shrank to a mattress and the relentless companion of chronic pain.

"My whole attention was on the pain. My social circle was tiny, and I didn't want to do anything," she recalls.

She tried group tours after she finally got back on her feet in 2019, but the rushed itineraries exhausted her.

"Too tiring, not for me," she says, adding that the pain still returns from time to time.

Then, in April 2024, she stumbled upon a short art program in Italy, with some preparatory art lessons arranged.

Something clicked inside her.

"It was exactly the kind of tomorrow I had been hoping for," she says, adding that it satisfied her interest in art and living in a foreign country for a while.

During preparation in Beijing, she painted under instruction for the first time in decades. There were no rules, no grades. Just guidance.

"I was completely absorbed, and the pain disappeared," she says.

A few weeks later, she flew to Florence, Italy, for a two-week fashion design program at a local institute, which was her first time abroad as a learner rather than a tourist. She had never worked with fabric or dressed a mannequin. By the end of the course, she had completed seven or eight original pieces.

"The whole process swept my pain away," she says.

Li is among a growing number of older Chinese citizens redefining what retirement can look like. Once largely confined to domestic chores, square dancing or the occasional group tour, many of China's "new elderly" are now turning their gaze toward foreign lecture halls.

Clockwise from top: Students from the "silver generation" on a bridge over the River Cam, Cambridge, July 2025. Chinese older learners take a fashion design course at Arts University Bournemouth, UK, in June 2025. A faculty member leads a tour of the Ashmolean Museum, Oxford, for older Chinese learners, in July 2025. Liu Ping (left) takes a picture with two "silver" learners outside Polimoda's campus in Florence, Italy, in October 2025. PHOTOS PROVIDED TO CHINA DAILY

A booming market

According to EF (also known as Education First), a global education company that organizes language courses and overseas study tours worldwide, Chinese nationals over 50 accounted for just 3 percent of its overseas study tours in 2019. By 2023, that share had jumped to 20 percent.

Most of these Chinese nationals are between 56 and 65, and many come from Shanghai, Guangdong, and Beijing — the demographic that rode the wave of China's reform and opening-up.

Benefiting from China's economic boom, this group is open-minded and has a strong desire for self-improvement, observes Ma Jing, managing director of EF's overseas study tour operations in China.

The market potential is staggering. China's silver economy is currently worth about 7 trillion yuan (nearly $1 trillion), according to a 2024 report by the China Association of Social Welfare and Senior Service.

By 2035, that figure is expected to reach 30 trillion yuan. Senior education, once a niche, is projected to grow to 500 billion yuan by 2025, with an annual compound growth rate of 25.3 percent, far outpacing traditional education sectors, according to the market research consultancy Chinese Industry Research Network.

Traditional study-abroad agencies have taken notice. In late 2025, New Oriental, one of China's largest private education companies, launched the "Tulip Plan" short-term overseas program tailored for learners over 35.

The program targets three age segments, with the "55-plus" track tailored specifically for those seeking to enrich their retirement years through immersive cultural experiences.

The first offerings include an art program in the United Kingdom and a culinary course in France.

For Li Guolin, the Florence trip was only the beginning. She went on to study silk painting at Yokohama University of Art and Design in Japan in April, and learned lacquer carving from a master craftsman in his remote studio, producing a hand-carved ginkgo leaf, its veins traced in gold.

A new motivation

Not everyone in this new wave is fleeing a life of pain. For Liu Ping, a 60-year-old former financial auditor from the inland city of Liuzhou in South China's Guangxi Zhuang autonomous region, the motivation was more personal.

She had earned a CFO certificate years earlier that entitled her to attend a graduation ceremony at Cambridge, but then work got in the way.

"I always regretted it," she says.

When she saw an overseas study program that included a few weeks in Cambridge, she signed up immediately.

But first, she was required to attend a "growth camp" in Beijing.

At the camp, participants were asked to create a piece of art expressing their innermost feelings.

Liu, then still grieving her mother's recent death, poured herself into the task. She re-created a sunset scene by the river where she had once pushed her mother's wheelchair — stitching the bridge, the water, the separation.

When she finished, she felt an enormous release. That unexpected emotional breakthrough sparked her interest in art, so she decided to give it a real try at her dream school in Cambridge.

During her stay, the instructor asked the class to sketch something they had seen on campus. Liu chose the canopy of a corridor.

"It was the most complicated structure on campus," the instructor later told her.

She laughed. A career spent in auditing — precision, rules, getting things exactly right — had not prepared her for this.

"I saw the gap between myself and the students who had some foundation, but just finishing was already enough," she says.

Returning home, Liu felt several weeks studying in the UK were still too short. "I hadn't had my fill," she says.

She then bought a sketchbook and pencils.

Now, whenever she sees a beautiful scene, she photographs it and paints from the picture later.

"It's just for my own enjoyment," she says.

While Li and Liu stumbled upon their opportunities, Zi Wenli, a former CCTV director who retired in 2024, went looking for hers, and when she couldn't find it, she built it herself.

Like many new retirees, Zi felt adrift after retiring from China's State broadcaster where she had worked for about three decades.

"I lost all sense of rhythm and purpose, and my social circle collapsed almost overnight," she recalls.

She tried the local senior university, but found the offerings limited for her taste, with calligraphy, folk dancing, and painting "grand peonies". As she had helped design domestic university curricula and cofounded an overseas study agency that sent thousands of young Chinese to Western schools, she asked her own consultants to help her apply to universities like MIT and Stanford.

Yet, they turned her down.

"They told me there was no agency in China that served people over 35," she says.

So she traveled alone to the United States, the UK, and Japan, visiting universities and talking to professors.

In Japan, she met an 85-year-old professor still teaching and his 90-year-old student. In the UK, admissions officers told her that local retirees regularly enrolled in short courses.

She returned convinced. On a whim, on the night of Dec 23, 2024, she went live on WeChat's short-video platform from her living room with fewer than 800 followers. She talked about her idea of "studying abroad after retirement", a notion that older learners, free from the pressure of degrees and job prospects, might have an easier path than younger applicants competing for credentials.

Her phone soon exploded. By the end of the hourlong broadcast, she had received 544 private messages. The question was almost always the same: "How can I go?"

"I realized that night that this wasn't just my problem. I had stumbled upon a volcano of demand," she notes.

Within months, Zi founded the Retirement Study Club, later renamed the Mature Learning Club. In less than a year, it had attracted over 50,000 members nationwide and helped more than 500 retirees enroll in overseas programs, with over 1,000 more holding acceptance letters. Destinations include Japan, Italy, the UK, Spain, and the US, and the lengths of learning programs range from weeks to a year.

"In the beginning, I thought I would just help a few people, but the demand was overwhelming. These are people who have spent their whole lives taking care of others — their parents, their children, their grandchildren. For the first time, they want to do something just for themselves," she says.

Challenges and risks

Some critics question whether a two-week program, typically costing between 20,000 and 70,000 yuan, is worth it, while others raise health and safety concerns.

Da Zhigang, a researcher at the Heilongjiang Provincial Academy of Social Sciences, warns that Chinese seniors overseas may not receive timely medical care in an emergency due to language barriers, and could face unexpected risks.

There are deeper structural hurdles. China's higher education system remains designed for degree-seeking young people. Senior universities are widespread, but their curricula tend to focus on entertainment and hobbies, not skill renewal or social reintegration, experts say.

Professor Peng Xizhe, a demographer and senior professor at Fudan University, points to what he calls a "system ceiling".

The most fundamental challenge is a shift in mindset across society, he emphasizes.

Peng urges the education system, labor policies and other subsystems to be prepared for the new normal of an aging society.

Curiosity is the drive to live

To date, Zi's oldest participant has been an 83-year-old retired mathematics teacher from Shanghai who completed a fashion and crafts program in Italy.

"I was impressed when he told me curiosity is the drive to live," Zi says. The line has become something of a motto for her club.

"These people are running toward something, a version of themselves they had set aside decades ago," she says.

As for Li Guolin, she didn't take much of a break after finishing her studies in Japan in late April. Instead of flying directly home to Zhuhai, she detoured through Taipei to visit its Palace Museum, then flew to Hong Kong before returning to the mainland.

A few days later, right after the May Day holiday, she was at the airport again — this time for a holiday in Rome and Malta with a friend she met on one of her study trips.

"Our class averaged 60 years old and everyone agreed that before 50, we lived for our families and children. After 50, we decided to live for ourselves," she says.

Her family has noticed the change.

"They told me the biggest difference is that I have more energy now, and I don't fixate on my pain anymore," she shares.

When asked if she plans to keep going, she does not hesitate. "Spain will likely be my next learning destination for a dance program," she says.

"Even if I don't know how to dance, I want to try. I want to challenge myself. I don't want to live the way I used to — always holding back."

Preservation finds a way into modern hearts

Transformation and innovation help China's intangible cultural heritage find consumers hungry for fresh experiences, **Yang Feiyue** reports in Suzhou, Jiangsu.

Zhou Jing was holding a bowl of noodles at a booth on the historical Pingjiang Road in Suzhou, Jiangsu province, where crowds flowed along the ancient stone-paved street on a muggy June afternoon. At first glance, it did not look like a typical local dish. The bowl was made entirely of plush fabric and weighed almost nothing. Even the braised pork topping was soft and fuzzy.

And yet, around her, staff members engaged visitors in mock noodle-shop interactions.

"Hard noodles or soft? Extra broth or light?"

For many visitors, the questions were unfamiliar. That was by design.

Small cards and props at the booth explained the specialized vocabulary of Suzhou noodle culture: *kuan tang* (extra broth), *jin tang* (less broth), *zhong mian* (extra noodles), and *shao mian* (fewer noodles). In 2020, Suzhou-style noodle-making was added to the city's intangible cultural heritage (ICH) list, adding another layer to this seemingly simple interaction. For local regulars, these terms signal identity as much as taste. For outsiders, they offer a quick introduction to one of the city's best-loved traditions.

The experience was designed to be memorable — a playful encounter that transforms a local culinary custom into an interactive cultural lesson.

Zhou's booth was among the busiest attractions at the 2026 Intangible Cultural Heritage Summer Shopping Month, which opened on June 11 in Suzhou. Held along Pingjiang Road, a canal-side neighborhood lined with white-walled houses and black-tiled roofs, the event forms part of a nationwide campaign featuring more than 1,200 activities held through late July, aimed at bringing traditional culture closer to contemporary life.

For Zhou, a former travel entrepreneur who once specialized in European tours, the plush noodle bowl represents more than a novelty product. It is part of a growing movement across China that is reimagining how intangible cultural heritage is preserved, presented, and passed on to younger generations.

Across the country, cultural entrepreneurs and heritage inheritors are increasingly turning traditional crafts, foods and folklore into collectible toys, lifestyle products and social-media-friendly cultural IPs (intellectual property).

The transformation of Pingjiang Road into a sprawling heritage marketplace offers a glimpse of that shift.

Creative cultural products featuring Zibo soft pottery prove a hit with visitors at the shopping month event. PHOTOS PROVIDED TO CHINA DAILY

>
> **Wang Zhi,** a municipal-level inheritor of Zibo soft pottery

Creative inspiration

More than 100 heritage workshops and inheritors from across China gathered for the shopping month's main event, showcasing everything from embroidery and ceramics to weaving, sculpture and traditional foods.

Among them was Zhou's collection of plush noodle bowls, refrigerator magnets and blind boxes inspired by the local food culture.

Before the COVID-19 pandemic, Zhou operated a travel business serving Chinese tourists visiting Europe and international visitors coming to China. When global tourism ground to a halt in 2020, she began exploring opportunities closer to home.

"There weren't many cultural products that truly reflected Suzhou's local character and everyday life," she says. "I wanted to create something people could connect with."

Her workshop is located in the Dinghuisi alley in Suzhou's old town. Nearby, heritage masters regularly give public demonstrations and classes. Watching these activities, Zhou realized that many traditional cultural elements remained unfamiliar even to local residents.

"I discovered things I didn't know myself. If local people don't know about them, young people are even less likely to know," she says.

Although not an inheritor of a traditional craft, Zhou chose to serve as a translator between heritage and the marketplace. Food became her starting point.

"Visitors come to Suzhou for two things: the gardens and the food," she says, explaining why she chose food as her focus.

Inspired by the popularity of interactive cultural merchandise, she created products that transform familiar local dishes into collectibles. Customers not only receive a toy but also a cultural story.

Her first generation of plush noodle bowls attracted attention but struggled to sustain sales due to their relatively high price. Several rounds of redesign followed.

A second version added practical functions, such as card holders. The breakthrough came when Zhou combined several fast-growing categories in China's creative cultural market — blind boxes, plush toys and refrigerator magnets — into a single product that was smaller, more affordable and easier to collect.

Since the launch of the latest version in early 2025, sales have exceeded expectations.

She has since expanded collaborations with local brands, including Renchangshun, a traditional Suzhou pastry maker with a history stretching back more than two centuries. Together, they transformed products such as *dingsheng gao* and *zhuangyuan gao*, pastries associated with good fortune and academic success, into plush collectibles.

"My role is to help people take notice. Once they're interested, they can learn more," she says.

A broader movement

Zhou's story reflects a wider transformation taking place across China's heritage sector.

This year's ICH summer shopping month places particular emphasis on connecting traditional culture with contemporary consumption. Alongside exhibitions and craft demonstrations, the event features activities exploring themes such as "ICH plus designer toys", "ICH plus fashion", and "ICH plus technology" — an acknowledgment that preservation today increasingly depends on finding new ways to engage modern audiences.

The shift is being driven in part by changing consumer behavior, particularly among younger generations.

According to leading online food delivery and local services platform Meituan, searches related to nationally recognized intangible cultural heritage food traditions exceeded 18 million in 2025, up 34 percent year-on-year. Orders placed with related merchants rose by 140 percent, while nearly two-thirds of searches came from consumers aged 20 to 35.

Industry observers say the figures point to a growing appetite for heritage experiences that feel interactive, accessible and relevant to daily life, besides those from the museums or textbooks.

A report on China's cultural and creative industries, released by China Cultural Media Group, notes that heritage-based cultural products are increasingly moving beyond static preservation toward what it calls "living innovation" and market-oriented development, allowing traditional culture to become part of everyday consumer experiences.

For entrepreneurs and inheritors alike, the question has now been how to translate them into forms that resonate with younger consumers.

Pony with personality

About two hours north of Suzhou by high-speed rail, another experiment in heritage innovation has been unfolding in Zibo, Shandong province.

Wang Zhi, a municipal-level inheritor of Zibo soft pottery, has spent more than a decade exploring ways to engage contemporary audiences with traditional clay sculpture.

Her studio is known for miniature works inspired by Chinese history, everyday life and classical art. But national attention arrived in 2024 with the debut of Long Dada, a dragon whose round body and playful expression challenged conventional depictions of the mythical creature.

The character quickly gained popularity online and helped Wang rethink how traditional culture could be presented to younger audiences.

Her latest creation pushes that idea further.

Known as Ma Biaobiao, or "Scruffy Pony", the figure was developed in collaboration with the Beijing Fine Art Academy and inspired by a late painting by renowned Chinese artist Qi Baishi, depicting the spirit and vitality of a galloping horse.

The pony features oversized eyes and a dramatically fluffy mane made not from clay but from Tan sheep wool.

Achieving the dynamic pose proved technically demanding. The sculpture's front legs touch the ground while the hind legs lift into the air, requiring repeated experimentation and an internal support structure capable of withstanding the firing process.

To strengthen the connection with the original artwork, the team designed the display so the pony appears to leap from a traditional Chinese scroll painting.

The feature that most captured public attention, however, was the mane.

Owners are encouraged to braid, curl, decorate, or style it however they wish.

"We call it co-creation," Wang says.

The idea extends beyond the product itself. The pony's name originated from internet users, who described the character using the Shandong dialect word *biao*, a term suggesting something goofy, impulsive or endearingly eccentric. The team adopted the nickname and continued refining the character in response to customer feedback.

New mane colors, accessories and design details emerged through interactions with fans online.

"We listen carefully," Wang says. That approach has helped transform a single clay sculpture into a broader cultural IP encompassing keychains, refrigerator magnets, bags, and apparel.

For Wang, the appeal lies in creating an emotional connection.

"Heritage isn't something frozen in time. It continues to evolve," she says.

Wang has thought a lot about what makes heritage stick.

"A friend once told me our works have a 'human touch'," she says. "That phrase exactly woke me up. Intangible cultural heritage is about the warmth of the hand, the sedimentation of time, the power of healing, the possibility of co-creation."

Foreigners praise country's high sense of safety

What would happen if someone left a backpack full of personal belongings unattended in one of China's busiest commercial areas?

YouTuber "Because I'm Lizzy" decided to find out in Southwest China's Chongqing last year. After spending nearly two hours wandering through the city's winding streets, sampling local delicacies, and taking in its neon-lit nightlife, she returned to find everything exactly where she left it.

The 29-year-old South African content creator was not surprised by the outcome. "I've been proven so many times that nothing would ever get stolen," she says. "Safety is the number one reason why I stay in China."

Currently based in Kunming, the capital city of Yunnan province, the YouTuber, Jannelize Bessenger, has lived in China for seven years. She created a series of videos about the country after noticing that many people know little about the high safety level of the nation, with a population exceeding 1.4 billion.

But for Bessenger, "It is the people who live here and their value and respect for life that make China the safest place, where I will stay for many years."

Her first impression of China was shaped by an unexpected act of kindness from a stranger. She recalled that in 2019, just four months after arriving in China, she fell seriously ill while in Nanchang, Jiangxi province. Although she had the hospital's location saved on her phone, she still could not find it.

Speaking little Chinese at the time, she turned to a man nearby for help, using a translation app. To her surprise, he voluntarily accompanied her to the hospital by subway and then left.

Wondering whether the man would ask for her contact or something in return, Bessenger said nothing happened. "He was just being nice," she says. That moment made her realize she could live alone in China safely as a foreign woman.

Hailing from a small South African town renowned for its wildlife and safaris, solo traveler Bessenger says China's secure environment allows her to embrace a relaxed lifestyle.

"Whether I'm going for a walk with headphones on at 11 pm because I can't sleep or I want to get some fresh air without checking a map, I just go and explore," she says.

China ranks high among other countries on the safety and law and order index, according to Gallup's 2025 Global Safety Report.

When Bessenger shared her appreciation for feeling safe on the lifestyle-sharing platform RedNote, many Chinese users were puzzled as to why she kept bringing it up.

"They take it for granted. They don't really realize how lucky they are to live in such a safe country," she says. The feeling was shared by her mother, who visited China from South Africa two years ago and later decided to settle down.

China's safety and openness are also echoed by short-term travelers. In 2025, inbound tourist visits to China surpassed 150 million, up more than 17 percent year-on-year. Of these, over 30 million foreign travelers entered the country under China's visa-free policies.

With expensive camera gear in hand, Canadian YouTuber Dave Mani and his wife comfortably moved around Chinese cities and roamed rural areas.

"After visiting 56 countries, we can say that China is very high on the list in terms of general safety," says Mani.

As an independent content creator, Mani notices how deeply technology is integrated into everyday life in China. Whenever he and his wife needed help during the trip, locals were quick to use translation apps to communicate with them.

> I've been proven so many times that nothing would ever get stolen. Safety is the number one reason why I stay in China."
>
> **Jannelize Bessenger,** South African content creator known as "Because I'm Lizzy"

The couple quickly became fans of WeChat, saying the super app brought great convenience, especially WeChat Pay, which allowed them to make payments easily and safely.

"That level of everyday safety made filming and exploring very easy and enjoyable," says Mani.

Like Bessenger and Mani, Ana Rosa Neumann Devers, an exchange student from the Dominican Republic studying in Harbin, Heilongjiang province, finds it cozy and relaxing to stroll past the orderly market stalls day or night.

The girl from the tropical Caribbean nation has fallen in love with the icy northern city, captivated by its snowy nights and warmed by the kind sincerity of her schoolmates. At a school ball, she appeared in traditional Dominican attire and was met with warm applause and heartfelt compliments.

"People here respect different cultures and customs. No one treats me differently because I'm from another country. I truly feel respected," she says.

In the past seven years, Bessenger has found that in China, every place offers something entirely different for travelers to discover. But for those who don't know where to go or who are eager to tap into the "becoming Chinese" trend, her advice is simple: just head downstairs when night falls.

"Walk around, get some street food, and see how people enjoy their meals and how the city settles into a peaceful but vibrant rhythm," she says. "That's when China feels most real."

LIFE

Master's six strings strike global chords

An award-winning craftsman blends Spanish lutherie and local design to build world-beating classical guitars, **Wang Xin** reports in Shanghai.

Gao Yi, 56, is one of China's most accomplished classical guitarists. Today, however, he is winning even greater recognition worldwide as a luthier, crafting exquisitely handmade guitars that are earning international acclaim.

Two years ago, Gao's flamenco guitar won first prize at the 7th Antonio Marin Montero Guitar Building Competition held in Granada, Spain, where his classical guitar also remarkably made it to the final. He became the first Chinese luthier ever to win the competition's top prize.

Last month, his instruments impressed Japanese musicians and fellow luthiers at an exhibition in Tokyo. Standing out in this highly competitive market through exceptional craftsmanship, Gao signed cooperation agreements with Japan's major instrument distributors, including Gendai Guitar and Kurosawa Gakki, for both online and offline orders.

Born in Shandong province in 1970, Gao's connection with music and instruments began early. He primarily played the Chinese bamboo flute as a child and taught himself guitar at the age of 17. After graduating from Jining University with a music degree in 1992, he continued his studies in classical guitar performance at the Central Conservatory of Music in Beijing the following year. It was there that he first encountered guitars built in the traditional Spanish style.

In 2000, Gao won first place in the Chinese Guitar Competition while performing on an Antonio Marin Montero guitar borrowed from a friend.

Later that year, he joined Yamaha Corporation as China's guitar market manager and relocated to Shanghai. During his eight years with the company, Gao deepened his understanding of guitar history and construction techniques. At the same time, he continued performing solo concerts, often using his cherished Marin Montero guitars.

His first attempts at building guitars began in 2010, when he established his workshop, Gaoyi Guitars. Shortly afterward, a serious accident during a repair left his fingers badly injured. Rather than discouraging him, the experience strengthened his determination to pursue lutherie more seriously and eventually shift his professional focus toward guitar making.

In 2013, Gao seized an opportunity to study traditional Spanish guitar-making in Beijing under Juan Labella, a respected guitar maker from Granada.

The following year, with support from the Spanish Consulate General in Shanghai, he visited Spain, where he was introduced to Marin Montero himself. The legendary master offered valuable guidance and encouragement. Marin Montero, widely regarded as one of the most influential living masters of traditional Spanish guitar making, became both a mentor and a lasting source of inspiration for Gao.

In 2019, Gao was recommended by the European Guitar Foundation to study with another renowned Granada School luthier, Rene Baarslag. The experience further shaped and inspired his own approach to guitar making.

"While I was in Spain, I lived with local musicians and luthiers to learn and exchange ideas. Then I realized that guitar making is far more than simply creating a seemingly abstract sound. Behind it lie the culture, history, humanism, life experience and the thoughts of the luthiers," says Gao.

Regardless of national or cultural differences, Gao says he was warmly welcomed by Spanish masters. They generously shared their workshops, materials, tools, techniques, craftsmanship, experience and even their philosophy of life.

Gao says what many Chinese luthiers still lack in high-end guitar making is a deeper "understanding" and "perception" of the instrument itself. His experience as a performer has helped bridge that gap. Spain, widely regarded as the cradle of the classical guitar, has passed down its traditions and accumulated knowledge through generations of master builders.

It was during his time in Spain that Gao learned, for example, that the finest soundboards for premium Spanish-style guitars are often made from high-quality spruce sourced from the Fiemme Valley in the northern Alps at an altitude of around 1,500 meters. The same region supplied wood for the famed Stradivarius violins. Lightweight yet capable of producing remarkable clarity, the wood is highly prized among instrument makers. Gao also learned that every stage of guitar construction demands meticulous attention, from wood treatment and internal structure to component assembly and even the selection of the final finish.

"Guitar making is never like solving a math problem, and it doesn't have an exact formula. Every detail in the whole process comes from the accumulated experience of pioneers and also from luthiers' innovation. I see guitar making as a testament to collective creativity across generations," Gao says.

For Gao, guitar making is not merely craftsmanship but a form of "artistic creation". A guitar is far more than a box that produces sound; it is an artwork that reflects a maker's aesthetics, personality, life experiences and constant pursuit of innovation.

As technology advances and performance venues become increasingly diverse, guitarists are demanding more from their instruments, encouraging luthiers to continue pushing creative boundaries. Many modern classical guitars now incorporate aerospace technologies or carbon fiber materials into their soundboards to improve strength and project greater volume, particularly for larger venues and outdoor performances.

As a Chinese luthier proud of his country's rich cultural heritage, Gao has sought to incorporate elements of Chinese identity into his work. The rosettes on the two guitars that earned recognition at the Spanish competition draw inspiration from traditional Chinese geometric window-grille patterns combined with Japanese Hakone Yosegi Zaiku (marquetry wood mosaics), creating an elegant visual signature.

In other instruments, he frequently uses mother-of-pearl and shell carvings for decorative inlays. He is also exploring the use of locally sourced woods from different regions of China.

"We have already opened the door to the high-end guitar-making sector," Gao says. "As Chinese luthiers continue working toward the same goal and accumulating our own experience, I believe we will see more handmade guitars with a distinct Chinese identity shine on the global stage."

Building a high-quality guitar is a painstaking process. Working full-time as a luthier, Gao produces no more than 13 instruments a year. Benefiting from the keen tonal sensitivity developed during his years as a performer, he focuses on creating guitars with warm, delicate tones, rich dynamics, an authentic Spanish voice and a lasting Eastern character. His instruments are increasingly sought after by professional musicians and collectors from Germany, Spain, Japan, the United States and other countries.

As both a guitarist and a luthier, Gao has spent nearly four decades alongside the instrument he calls his "most loyal companion". The guitar has accompanied him through every stage of life, helping him express emotions, find friendship and resonance, and discover deeper meaning.

"The guitar is a record of my life," he says. "It contains my passion and what I hope to leave behind in the world. Even when my life comes to an end, my instruments will remain."

Asked about the secret to building a great guitar, Gao shares with China Daily an answer — and a life philosophy — that he first learned from Marin Montero: "Just slow down."

One man's mission creates China's zero-waste island

By **XING WEN**
xingwen@chinadaily.com.cn

Far out in the East China Sea, Qingbang Island — part of the easternmost permanently inhabited archipelago off China's mainland in Zhoushan, Zhejiang province — is becoming a model for sustainable living.

Despite covering just 1.41 square kilometers, the island is experimenting with an innovative recycling system. Residents sort their household waste and exchange it for vouchers that can be used at local stores or redeemed for cash at the end of the year.

Food scraps will be fermented into organic fertilizer for growing vegetables and flowers, while recyclable plastics are collected by a Shanghai clothing company and transformed into garments, shoes, and hats sold on the island.

The voucher program has been running for three years, driven by the vision of Yan Shanyue, a former seaman who is determined to turn Qingbang into a zero-waste island.

Why vouchers? Yan explains. Selling recyclables directly typically earns only 20 or 30 yuan at a time — an amount that easily disappears among everyday expenses.

"But with a voucher, you can clearly see that it came from the waste you collected."

To keep motivation high, Yan also hosts an annual year-end meeting where active recyclers receive daily necessities like rice and cooking oil.

"That way," he adds, "people have one more thing to look forward to."

Yan grew up on Xiazhi Island, more than 60 kilometers from Qingbang, and many of his happiest childhood memories were shaped by the sea.

"Every morning around six or seven, after breakfast, my friends and I would head to the beach," recalls the 55-year-old.

"At high tide, we swam and challenged each other to jump higher or hold our breath longer. At low tide, we dug for clams and razor clams and carried home baskets full of them."

At the time, plastic waste was rarely seen on local shores. Occasionally, they would find a bottle with Japanese writing that had drifted across the sea.

In fact, Yan even had his first taste of instant noodles at age 7 after discovering a Japanese packet washed ashore following a typhoon, which he shared with three friends.

When he returned home in 2003 after leaving a career in deep-sea fishing, he was shocked to find beaches increasingly covered with rubbish, especially marine debris. Determined to help, he began cleaning the shoreline on his own.

Left: Yan Shanyue, a former seaman-turned-guesthouse owner, is helping transform Qingbang Island into the zero-waste island of his dreams. **Right:** A recent cleanup event was held to gather volunteers to collect trash together on the beach of Qingbang Island, Zhejiang province. PHOTOS PROVIDED TO CHINA DAILY

In 2013, Yan moved to Qingbang Island to open a guesthouse. He continued his beach-cleaning routine, and before long, other guesthouse owners joined him. Together, they discovered that just a few people could restore a small beach to its natural beauty within hours.

"Sometimes I think to myself that we really do have the power to make a difference," he says.

Encouraged by the results, Yan and his growing team began inviting volunteers from outside the island, offering affordable food and accommodation to support cleanup efforts. Through these activities, he connected with professionals from marine conservation organizations, inspiring him to establish his own environmental charity dedicated to creating a "zero-waste island".

He and his partners then mobilized local shop owners to sign a "zero waste island partnership" agreement.

Driving a small tricycle, he collected cardboard, aluminum cans, and plastic waste while visiting households to encourage recycling and proper waste sorting.

"What gives me the greatest sense of achievement is that the islanders' trust in me is growing," Yan says.

The journey also pushed Yan to develop new skills. He learned how to write project proposals, create PowerPoint presentations, prepare budgets, and organize events ranging from waste surveys to community education programs and environmental improvement projects. He continues to seek partnerships with companies and environmental foundations to expand the initiative.

Yet, the challenge remains relentless. Every storm washes new debris onto the island's beaches. A shoreline cleaned by evening may be covered with trash again the following morning, creating what often feels like an endless cycle.

To cope with this frustration, Yan draws inspiration from a powerful memory from his years at sea. At age 16, he survived a fierce storm in which waves battered his fishing vessel for more than 50 hours. Crew members worked nonstop, bailing water while pumps ran continuously. The helmsman fought to keep the boat aligned with the waves, knowing that even a slight mistake could prove fatal.

Eventually, the storm passed.

"We couldn't control the environment back then," Yan says.

"We had no idea when the next wave would hit or when the boat might capsize. But we had no choice but to keep bailing the water out."

Decades at sea taught him a lesson he still follows today: while people cannot calm the wind and waves, persistence can keep a ship afloat — and help preserve the blue waters surrounding an island.

WORLD CUP 2026

Super-sub Undav sends Germany into knockouts

Substitute's brace overturns halftime deficit to snatch win over Cote d'Ivoire

Deniz Undav (26) scores his, and Germany's, first goal of its World Cup Group E match against Cote d'Ivoire in Toronto on Saturday. Undav scored twice after being subbed on in the second half to lead Germany to a 2-1 win and clinch a spot in the knockout phase. AP

Deniz Undav celebrates scoring Germany's second goal during a World Cup Group E match against Cote d'Ivoire on Saturday. AP

> "It's important that everyone sees that even the players from the bench can decide games. Now we have sent a really important signal to the team. I think that's very important in a game like this."
>
> **Deniz Undav,** after scoring twice to help Germany reach the knockout phase

TORONTO — An hour into the game, Germany was getting outplayed by Cote d'Ivoire and trailed by a goal.

Coach Julian Nagelsmann needed a spark and substituted three fresh players on, one of whom was Deniz Undav. That decision paid off big time.

Undav scored two goals off the bench as Germany pulled off a thrilling comeback to beat Cote d'Ivoire 2-1 in its World Cup Group E match on Saturday, securing its place in the knockout stage for the first time since it won the title in 2014.

After having two goals disallowed in the first half, Germany did not lose focus and used intricate passing to find its way, while the West Africans produced their dynamic brand of attacking soccer in a wild encounter at Toronto Stadium.

"It's important that everyone sees that even the players from the bench can decide games," said Undav, who also scored in Germany's 7-1 opening match rout of Curacao. "Now we have sent a really important signal to the team. I think that's very important in a game like this."

"We showed great character today," said the versatile striker, who now has nine goals in his last eight matches. "We want to achieve the most (we can)."

Undav leveled the score with a controlled, volleyed finish in the 68th minute and struck again in stoppage time when he received a pass on the turn, before swivelling and firing home a ball that Yahia Fofana had no chance at stopping.

Simon Adingra had a late chance for Cote d'Ivoire, but he failed to get a shot off in the area before Germany charged back down the field where Fofana blocked a low shot from Nathaniel Brown.

The loss denied, at least for now, Cote d'Ivoire the chance of securing its first trip to the knockout stages.

"We wanted to make history today," said Cote d'Ivoire winger Amad Diallo. "But I think everything was a little tight."

Unfamiliar territory

Cote d'Ivoire had opened the scoring in the first half when Franck Kessie slotted home a rebound off a shot from Diallo on a play created when Yan Diomande charged down the left side and sent in a cross.

With more than 100,000 people of German ancestry living in Toronto, Nagelsmann's men enjoyed plenty of support, but were a frustrated group at the interval with nothing to show for their eight attempts on goal.

It was definitely unfamiliar territory for Germany, as it marked only the fourth time it has faced a halftime deficit in its last 36 contests at the global showpiece.

But, after the break, a more active German side showed up, one that took more risks and was determined to dedicate everything to its effort to win.

"In the end, we deservedly won it," Nagelsmann told reporters. "The boys invested a lot. I'm very happy for the whole team."

"This is exactly what we hoped for, and I'm very happy for my team," Nagelsmann said.

He said that after his two-goal performance, Undav could make the starting 11 in Germany's third group stage match against Ecuador, but also stressed that the Stuttgart forward was thriving as a substitute.

"I could have him in the starting lineup," Nagelsmann said. "I think that every player would love to be in the starting lineup, but I think he's very happy as it is right now."

Two goals scratched off

Germany looked to have opened the scoring when midfielder Aleksandar Pavlovic rose to meet a short corner in the 25th minute, but was deemed to have fouled Fofana in the process.

The ruling left Pavlovic with his hands atop his head in disbelief, as Fofana received some attention after the collision and the partisan German crowd made their disdain for the referee's decision known.

Shortly afterward, it was Cote d'Ivoire that finally broke through with Kessie's goal.

The West Africans have scored in their last seven matches at the tournament, the longest such sequence on the global stage in their history.

Germany once again put the ball in the back of the net, but its celebrations were cut short as the referee determined that Jamal Musiala had fouled Odilon Kossounou in the build-up.

"We had exactly what it takes to succeed in a tournament, a winning mentality, team spirit," said German defender Jonathan Tah.

"We didn't give up; we just kept going.

"The guys coming off the bench brought new energy to the game. Deniz deserves special mention. He was outstanding."

After a court fight to get into Canada, Elye Wahi, the Cote d'Ivoire striker under investigation for alleged betting-related offenses while playing in France for Nice, did not play.

Germany tops Group E with six points and is through to the last 32, while Cote d'Ivoire remains on three after two matches. Ecuador and Curacao played to a goalless draw in Kansas City in a later match on Saturday.

Germany will close out the group stage against Ecuador on Thursday in New Jersey, while Cote d'Ivoire faces Curacao in Philadelphia.

AGENCIES VIA XINHUA

Les Elephants look to forget Toronto loss and charge toward Curacao clash

Cote d'Ivoire's Franck Kessie celebrates his goal against Germany on Saturday. AP

If Cote d'Ivoire wins its next match, Saturday's loss to the Germans won't matter.

After surrendering two second-half goals and missing the chance to clinch a knockout stage berth for the first time in its four World Cup appearances, Les Elephants turn their attention to their last group stage match against Curacao on Thursday.

Win, and the Elephants are in.

Forward Amad Diallo said he and his teammates will get over the Germany loss. They have to.

"We (have) respect for ourselves, but we want to make history for Cote d'Ivoire, and we (are) going to go there with a good mentality and try to rise again," he said.

Cote d'Ivoire seemed one step ahead of Germany throughout the first half on Saturday — and a chunk of the second — with midfielder Franck Kessie's first-half goal silencing German fans for a long stretch.

But the German side of the sold-out crowd erupted when Deniz Undav scored the winning goal, his second of the match, leaving Cote d'Ivoire fans hanging their heads.

The team seemed a little shocked as well, and players spoke about the pain of losing a match they felt they should have won.

Cote d'Ivoire coach Emerse Fae felt his team could have been more decisive in its bid to get a second goal.

"It's more frustration that we're feeling after this defeat, because we were able to open the score against this strong German side," he told reporters.

"A difference in experience meant that the chances that we did have at the end of the game, where we needed to find the back of the net, we were hesitant," Fae said.

However, the Ivorian coach was quick to put the Germany game behind him and highlighted that, overall, he was happy with his team's performance.

"We're going to use this game as a lesson to try and fine-tune the mistakes, our shortcomings that we still have, and that will help us go as far as possible," he said.

He said he was looking forward to the challenge of facing Curacao next to see "what they are made of", and was expecting a strong fight.

"Our destiny is still in our hands, or at our feet," he said.

The good news for FIFA's No 31-ranked Les Elephants is that their next opponent, Curacao, is way below them at No 83.

The Caribbean nation also lost its first match to Germany, 7-1.

"It's going to be a big moment for everyone, for this new generation, because we know we have quality in the team," Diallo said. "But the priority now is that we are really focused on ourselves. It's going to be a very hard game."

Double Dutch: Braces from Brobbey and Gakpo help sink Sweden

Crysencio Summerville celebrates with NBA star Steph Curry's "night night" gesture after scoring the Netherlands' fifth goal of its 5-1 World Cup Group F win over Sweden in Texas on Saturday. REUTERS

HOUSTON — Under intense pressure after its opening-game draw with Japan, the Netherlands delivered a dominant performance against Sweden in the World Cup on Saturday to move atop the Group F standings.

Brian Brobbey and Cody Gakpo scored two goals apiece to power the Dutch to the 5-1 win.

Brobbey's goals came in the first half, setting the Netherlands up for a big win after playing to a 2-2 draw the previous Sunday.

"It could be that the way we played builds confidence," Netherlands coach Ronald Koeman said. "Now we've got a slightly better peace of mind with the four points. You can build on what happened now, and that's really good."

Gakpo, who also had an assist, extended the lead to 3-0 just after halftime, scoring in the 47th minute off a cross from Denzel Dumfries. He matched Brobbey when he scored on a right-footed shot from the left side of the box in the 54th minute.

"Today, there was more variation in attacking play, more players in different positions, movement and all those things," Gakpo said. "So it was more difficult for the defenders to really mark us, and we became free in the box. I think that was the little thing maybe we missed in the last game."

Sweden couldn't build on its strong performance in a 5-1 walloping of Tunisia in its first match. The loss to the Dutch was its biggest World Cup defeat since losing 7-1 to Brazil in 1950.

Sweden coach Graham Potter said the defeat was less about what his team did and more about just how good the Netherlands played Saturday. "They're a top team, and they were better than us today. We have to congratulate them, but I think we'll learn a lot from the game."

The Dutch game plan to play out wide to open up Sweden and cross to Brobbey worked perfectly early on. He put the Netherlands on top in the fifth minute, one-timing a Gakpo cross with his right foot.

His second goal came when he took a cross from Dumfries while sliding and just got his right foot on the ball, scoring inside the far post in the 17th minute.

Koeman credited Brobbey's success to getting in better shape after he had struggled in the past with the rigors of playing a full game.

"He's fitter, he's sharper and he's developing really well," he said.

Anthony Elanga's left-footed goal cut the lead to 4-1 in the 59th minute and allowed Sweden to avoid the shutout loss.

Sweden had plenty of chances to score before that, but the Dutch goalkeeper Bart Verbruggen was brilliant in the first half with four saves.

Sweden appeared to have cut the lead to 2-1 on a header by Gustaf Lagerbielke in the 44th minute, but he was ruled offside. Lagerbielke is a baron from a noble family in Sweden. His father and grandfather are counts.

But he wasn't the only royalty in the stadium Saturday, as the Netherlands had two very special guests cheering them on with King Willem-Alexander and Queen Maxima watching from a luxury suite. "The King was very happy," Koeman said.

Crysencio Summerville, who assisted Gakpo's second goal, tacked on one of his own for the Netherlands in the 89th minute and celebrated with NBA star Steph Curry's "night night" gesture.

Summerville took a boot to the head late in the match and had received stitches, but Koeman said he should be ready for the next match.

Samurai blues for Tunisia

Meanwhile, Japan marked the 1,000th game in the history of the World Cup with a 4-0 thrashing of Tunisia in Saturday's final fixture.

Ayase Ueda scored twice while Daichi Kamada and Junya Ito were also on target, as the Asian giant joined the Netherlands on four points at the top of Group F.

Tunisia can no longer hope for a place in the knockout stages.

The Samurai Blue were always in control against Tunisia at the Monterrey Stadium in Mexico and Tunisia never looked like threatening a technically superior Japanese side that settled quickly into its trademark, smooth passing game.

Kamada opened the scoring after just four minutes following some deft interplay. Minutes later, Tunisia keeper Aymen Dahmen just managed to claw away the ball, which was barely centimeters from crossing his goal line. Japan eventually got its second in the 31st minute, with striker Ueda thundering in a low shot from the edge of the area.

The rout continued in the second half, with Ito latching onto a brilliant through ball to finish in the 69th, before Ueda nodded in a looping header in the 83rd.

Group F winds up on Thursday, with Japan playing Sweden at Dallas Stadium and the Netherlands facing Tunisia in Kansas City.

XI'S VISION | GOVERNANCE PERFORMANCE

Unremitting efforts seen as key to progress

Party's governance approach stresses tenacity, sustained work, lasting results

By **ZHAO JIA**
zhaojia@@chinadaily.com.cn

For years, Xingtang county in Hebei province was shadowed by a local saying that played on its name: "*Xingtang bu xing*" — Xingtang cannot do it.

The saying reflected more than a play on words. Along the eastern foothills of the Taihang Mountains, several counties had long struggled with constraints of terrain and resources. In Xingtang, a traditional agricultural county, quality farm products often failed to reach wider markets because they lacked strong brands and sales channels.

When Zou Guoyu arrived in Xingtang, he saw that changing the county's prospects would require more than short-term assistance. He was among the 13 officials assigned by the International Department of the Communist Party of China Central Committee to work in the county over the past decade. Their work focused on opening markets, building brands and strengthening the county's own capacity for development.

Those efforts gradually paid off. Xingtang red dates were selected as State gifts, honey produced in the county reached Southeast Asian markets, and the county's public brand for local specialties gained wider recognition.

What happened in Xingtang was not a single breakthrough, but a relay — one group of officials after another carrying the work forward and helping turn an old saying of resignation into a new confidence: Xingtang can.

That relay offers a window into the CPC's emphasis on establishing and practicing a correct view of governance performance, a theme repeatedly stressed by President Xi Jinping since the 18th CPC National Congress in 2012 and one that became this year's focus of a Party-wide education campaign. It is a view that values sustained work, long-term public benefit and results that can stand the test of time.

The logic behind such a relay can be traced to Xi's earlier poverty reduction work in Ningde, Fujian province, where he served as Party secretary from 1988 to 1990, when the region was among the poorest areas in Fujian.

In *Up and Out of Poverty*, which collects Xi's speeches and articles from his work in Ningde, he wrote that fundamentally changing poverty and backwardness required the people to carry forward the tenacity of "dripping water piercing stone" and make long-term, unremitting efforts.

In *Xi Jinping in Ningde*, a book published in 2020 that collects 19 interview accounts about Xi's work experiences in Ningde, an interview account recalled that Xi cautioned local officials against expecting poverty to be fundamentally solved simply by projects, or expecting to become rich overnight.

The emphasis on patience, local realities and sustained effort later became part of China's nationwide fight against absolute poverty.

Openness, resilience unleash regional growth potential

By **Zhong Nan**
zhongnan@chinadaily.com.cn

Openness remains essential to unlocking the growth potential of the Asia-Pacific region and deepening regional economic cooperation, as rising unilateralism and protectionism continue to challenge global trade and investment, government officials said on Sunday.

Speaking at the APEC China CEO Forum 2026 in Beijing, they said that the economies of Asia-Pacific Economic Cooperation should stay committed to open cooperation and regional integration, while advancing connectivity projects and digital innovation to facilitate trade, improve supply chain resilience and create new growth opportunities for businesses across the region.

Eduardo Pedrosa, executive director of the APEC Secretariat in Singapore, said that APEC economies have identified a series of priority actions to restore growth momentum and strengthen regional economic cooperation.

These include accelerating progress toward the Free Trade Area of the Asia-Pacific, strengthening connectivity and supply chain resilience, investing in trade and logistics infrastructure, promoting market diversification, addressing nontariff barriers in food trade and advancing digital trade and transformation, he said.

Ren Hongbin, chairman of the China Council for the Promotion of International Trade, called for APEC economies to identify more areas of common interest and strengthen open cooperation in industrial and supply chains.

Citing the importance of strengthening regional connectivity, Ren said the APEC economies should make full use of regional free trade agreements such as the Regional Comprehensive Economic Partnership, while advancing an upgraded APEC connectivity blueprint to facilitate the safe and orderly flow of people, goods, capital and data, as well as foster closer industrial and supply chain cooperation across the region.

China remained the largest trading partner of 13 APEC economies in 2025, with the total value of trade with those economies reaching $3.7 trillion. It accounted for 57.8 percent of China's total foreign trade, data from the Ministry of Commerce showed.

The country has signed 24 free trade agreements or economic and trade deals with 31 countries and regions, including 15 APEC economies. In recent years, it has also completed upgrades to free trade agreements with APEC economies such as Singapore and Peru.

Addressing broader challenges facing the global trading system, Jiang Chenghua, deputy China international trade representative at the Ministry of Commerce, urged the APEC business community to exercise independent judgment, support the multilateral trading system and help safeguard the stability of global industrial and supply chains.

China will continue to expand opening-up in key areas including trade, investment and the cross-border flow of production factors, while the rapid advancement of digital, intelligent and green technologies will further reinforce its position as a long-term destination for global companies seeking investment and growth opportunities, said Jiang.

Ahead of the fourth China International Supply Chain Expo, which will run from Monday to Friday in Beijing, foreign business executives highlighted China's industrial ecosystem, market demand and supply chain advantages as key drivers of their long-term confidence in the country.

Jim Sutter, CEO of the US Soybean Export Council, said China is expected to import about 25 million metric tons of soybean from the United States during the marketing year Sept 1, 2025 to Aug 31, 2026, up from 22.6 million tons in the previous marketing year, marking a meaningful recovery.

"The recent announcement regarding tariff reductions is a positive signal, and the US soybean industry looks forward to seeing those commitments translated into concrete policy measures," said Sutter. "Stability in the China-US trade environment benefits both sides, and we are confident in the long-term direction."

A similar sentiment was expressed by Elodie Latour, vice-president for China at French multi-sports brand Decathlon. She said China's comprehensive industrial ecosystem and complete value chain enable companies to bring products to market faster, creating advantages that are difficult to replicate elsewhere.

Beijing-Seoul cooperation should look to the future

WORLD WATCH
By Woo Su-keun

As the global economy faces mounting uncertainty amid geopolitical tensions, supply chain restructuring and the resurgence of protectionism, the importance of stability, resilience and practical cooperation has become increasingly evident. At a time when strategic competition between major powers continues to intensify, countries around the world are recognizing that sustainable growth and regional prosperity cannot be achieved through confrontation alone.

Against this backdrop, China's steady economic development and South Korea's resilience in exports, advanced manufacturing and financial markets deserve close attention.

The recent meeting between South Korean President Lee Jae-myung and Chinese Vice-Premier He Lifeng sent a positive signal that both countries are prepared to expand cooperation in the fields of economy, industry and people-to-people exchanges. This should be regarded as a meaningful indication of a renewed commitment to pragmatic cooperation.

China and South Korea are not merely important trading partners. They are also key stakeholders in the peace, stability and future prosperity of Northeast Asia.

Over the past several decades, the two countries have achieved remarkable development through close economic cooperation. China has long been South Korea's largest trading partner, while South Korea has contributed significantly to China's industrial upgrading and technological advancement.

Although competition naturally exists between the industrial sectors of both countries, the overall relationship remains characterized by a high degree of complementarity.

Chinese robot vacuums clean up in global rankings

Advanced AI systems, smart home integration help devices sweep past competition overseas

By **Li Jiaying**
lijiaying@chinadaily.com.cn

When Mikki Hayward was preparing her home in the United States for sale, she expected her robot vacuum to help with the cleaning. What she did not expect was for it to recognize clutter, navigate around obstacles and even flag small valuables.

"It doesn't get stuck on random boxes or obstacles, and it even tags small valuables it finds so they don't get lost in the shuffle," she said.

For Jessica Jones, another US user, the appeal lies elsewhere.

As her robot vacuum glides across the floor, she can use the device's camera to check on the foster kittens roaming around her home.

"Loving (the ability to) check in on my foster kittens while the machine does its cleaning thing!" she wrote in a social media post. "There are more and more features I'm discovering all the time, but pet mode is amazing!"

People watch as a cleaning robot navigates steps at the kiosk of Chinese technology company Dreame during the Consumer Electronics Show in Las Vegas, the United States, on Jan 7. Caroline Brehman / AFP

Technology reviewers have also been impressed by how much the latest generation of cleaning robots has evolved.

"What is also smart is that it adjusts how it cleans depending on the type of mess. So, wet messes and dry debris are not being treated the exact same way, and that makes the whole process feel much more hands-off," YouTube channel DailyTested said in a review.

All of these glowing testimonials refer to the latest product from Chinese manufacturer Narwal Robotics.

Launched in the US market in April and equipped with a dual-camera vision recognition system and an artificial intelligence-powered cleaning platform capable of adapting to different household environments, the product quickly topped Amazon US' new releases ranking and entered the top 10 robot vacuum category within 24 hours of launch.

The success is far from an isolated case.

As Chinese manufacturers continue to integrate artificial intelligence, advanced sensors and autonomous navigation into household devices, a growing number of domestically developed cleaning robots are finding enthusiastic buyers around the world.

Inbound tourism surges on curiosity about evolving China

Overseas visitors equally interested in country's rapid transformation as ancient marvels

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

Foreign tourists visit the Temple of Heaven in Beijing on June 9. chen qiang / for china daily

Overseas visitors try Chinese kebabs while wandering through the historical alleys of Qianmen Street in Beijing on June 14. chen qiang / for china daily

Wolfgang Georg Arlt, a tourism expert from Germany, made his first trip to Beijing in 1978.

"There was almost no light at night," recalled Arlt, who has over 50 years of expertise, both academically and in practice, in tourism and hospitality. In the years since, he has watched China's tourism infrastructure improve steadily year after year, with better facilities and services.

In early June, he returned to the Chinese capital for a summit hosted by the World Tourism Cities Federation. During his stay, he was struck again by what he saw. But this time, it was by the smart infrastructure, services powered by artificial intelligence, and the gleaming skyline.

"No one back then could have imagined such development," said Arlt, executive director of the Meaningful Tourism Centre, based in London and Kathmandu.

As China evolves into one of the world's leading travel destinations, Arlt has also noticed a shift in the preferences of foreign travelers. "Tourism used to be about sightseeing, taking photos and shopping. Now people want to learn something and experience something," he said.

Technology has removed many of the old travel barriers. Instant translation services on a smartphone, for instance, mean no one needs to fear getting lost anymore, he added.

Active immersion

The shift from passive sightseeing to active immersion has been quietly reshaping China's inbound tourism industry.

On a March morning in suburban Beijing, Yang Li stood between a dozen foreign diplomats and a fully automated assembly line.

His job was to explain the factory's operations, but he soon realized the diplomats wanted China's overall transformation explained. "They were eager to know how the country built this," he recalled.

For nearly three decades, Yang had made his living explaining China's past — its dynasties, emperors, temples and ancient walls. Now, standing above a humming production floor where robotic arms moved in synchronization and driverless carts glided between workstations, he found himself explaining not just how the machines worked, but how China learned to produce them at scale.

The March visit had been arranged by China's Ministry of Culture and Tourism for foreign diplomats stationed in Beijing. "They didn't go to see the Great Wall. They came here to see why China can do this," he recalled.

For generations, China's inbound tourism narrative rested on familiar pillars: the Forbidden City, the Great Wall, the Terracotta Warriors. Visitors came to witness the remnants of an ancient civilization.

"Today, many international visitors no longer come only to admire China's past. They also want to understand its present — how factories operate, how cities function, how innovation is reshaping daily life and how traditions continue to evolve alongside rapid modernization," Yang said.

Spanish clients have asked to visit smart factories in Shenzhen, Guangdong province, while in Changsha, Hunan province, Romanian travel groups requested tours of electric vehicle production lines, he said.

A 2026 Trip.com Group survey of more than 500 inbound tourism operators found that nearly two-thirds identified meeting diverse visitor demands as their biggest challenge. More than 80 percent reported overseas visitors growing interest in experiences beyond traditional sightseeing.

Tour operator Li Jieming is based in Zhangjiajie, Hunan. The city's best-known attraction is the cluster of sandstone pillars that inspired the floating mountains in the film *Avatar*.

Three years ago, overseas visitors accounted for only a tiny share of his business. Today, they comprise around 60 percent.

The turning point came after China expanded visa-free entry policies for a growing number of countries in 2024.

"When I heard about the visa-free policy, I knew the number of inbound visitors would increase," Li said. "And Zhangjiajie already had something foreigners recognized — the *Avatar* mountains."

But his ability to seize the opportunity soon collided with new challenges: workers with foreign-language skills were scarce, and he had little overseas marketing experience.

Li began recruiting wherever he could find candidates — language schools, trading companies and returnees with international experience. His first international team consisted of just four people.

They posted videos of Zhangjiajie's landscapes on Facebook and handled inquiries one by one. Their first booking came from a Spanish couple who discovered the company online.

"We didn't make money on that booking," Li said with a laugh. "We just wanted to see if it could work."

By the spring of 2025, inquiries began arriving in waves. Today, Li's company employs more than 20 people serving international clients, and inbound tourism has become the core of the business.

Content upgrade

Many of the inquiries came from people who had never previously considered traveling to Zhangjiajie.

Some discovered Zhangjiajie through social media videos of the towering sandstone pillars. Others arrived after seeing short clips of local customs and village life.

The influx of visitors quickly taught Li another lesson: attracting international travelers was only the beginning.

"Many foreign visitors don't want to spend the entire day checking attractions off a list," he said. "They want to interact with people and understand local life."

At first, his team offered itineraries similar to those designed for domestic tourists. The results were mixed.

"That's when we realized we had to help those people understand a place beyond simply touting the landscape."

One European family initially planned a simple cable-car excursion. Instead, Li's team suggested a gentle rainforest hike. "The children could touch plants, look at insects and ask questions," Li said. "It turned out that the parents loved it."

They applied the same idea to cultural tourism.

Rather than limiting visitors to performances and demonstrations, Li's company incorporates hands-on experiences such as Tujia ethnic brocade weaving, the Baishou dance — a Tujia group dance often performed at festivals and celebrations — and traditional silverwork.

A foreign tourist browses items at a trendy toy store in Shanghai in May. chen haoming / xinhua

Tourists interact with robots at Unitree Robotics' flagship store in Beijing on June 2. ju huanzong / xinhua

A visitor poses for a photo in Shanghai Disney Resort on April 28. chen aiping / xinhua

"All those ensure our foreign guests don't just watch, but participate," he said.

Li mentioned a family from Germany that spent an afternoon learning Tujia brocade weaving.

"None of them had ever touched a loom before, and their finished cloth was uneven with imperfect patterns," he said. "But when the workshop ended, the mother got a bit misty-eyed and said it was something they made together, rather than simply a purchase."

For Li, the moment captured why so many travelers now seek experiences rather than attractions. "The mountains gave them a view," he said. "The weaving gave them a memory."

Deeper dive

Yang, one of China's first nationally certified gold tour guides, has witnessed nearly every stage of the industry's modern development.

The change, he said, has been particularly noticeable in recent years. "Before, visitors listened to whatever you told them. Now they ask why," he said.

At the Great Wall, foreign tourists' curiosity isn't restricted to basic questions about its length, age or the construction techniques of the structure.

Instead, they want to know why the Great Wall occupies such an important place in the Chinese identity, Yang said. "One visitor even asked why it appears in China's national anthem," he said.

Yang's explanation begins with the ancient beacon towers that once signaled danger along China's northern frontier, and ends with the phrase from the national anthem — "using our flesh and blood to build a new Great Wall" — showing how a military defense system gradually evolved into a national symbol of endurance and unity.

He said an increasing number of overseas visitors make sense of modern China by comparing it with their own country's culture and history.

Spanish travelers draw parallels between the Great Wall and the Alhambra, a palace and fortress complex in Granada, while visitors from Latin America connect Chinese history with their own experiences of colonialism and nation-building, he shared.

For guides, this means understanding not only China but also the perspectives visitors bring with them. "If you don't understand their cultural background, you can't make the comparison meaningful," Yang said.

One Spanish architect, for example, asked him why Chinese walls were built with rammed earth while Spanish fortresses used stone. Yang didn't have a textbook answer but replied: "Different threats. Different materials. Different emperors."

The visitor nodded, and Yang said that was the moment he understood his real job.

At the end of May, nearly 2,000 tourism executives and industry professionals from 67 countries and regions gathered along the Lijiang River in Guilin, Guangxi Zhuang autonomous region, for one of China's largest inbound tourism events hosted by the local government and Trip.com Group.

Actor and filmmaker Jackie Chan, recently named an inbound tourism ambassador by Trip.com Group, greeted the crowd.

"My mission used to be bringing Chinese films to the world," he said. "Now my mission is bringing the world to China."

A giant illuminated passport appeared in the night sky during a drone show. Moments later, a golden dragon flew through it as the words "VISA FREE" lit up the sky above the crowd.

The image captured one of the biggest changes driving China's inbound tourism recovery — the steady expansion of visa-free policies and the gradual removal of barriers that once discouraged international visitors.

New storytellers

Visa-free entry can open the door, but content determines whether people choose to walk through it, many industry operators said.

Trip.com chairman James Liang announced that the company aims to attract 200 million inbound visitors over the next five years.

The tourism industry has already begun to adapt. Nearly 90 percent of inbound tourism employees have received some form of professional training. New job categories are emerging, ranging from inbound travel "customizers" to multilingual "experience designers" and cross-cultural content creators.

Yet, the industry's response remains uneven. While nearly two-thirds of practitioners feel service expectations have grown more demanding, fewer than 15 percent said lack of training is the main problem.

To become an outstanding guide for international visitors takes five to 10 years, Yang said. "Language ability, cultural fluency and the confidence to navigate complex conversations cannot be developed overnight," he said, adding that demand for Spanish-speaking guides, for example, has surged in recent years.

Yang speaks English and Spanish, has studied abroad, and traveled extensively. Years of experience have allowed him to understand both his visitors and the country he represents.

"Because what visitors are really doing is not just asking for explanations — they are interpreting China through their own cultural references. You need to understand those reference points as well as your own, so your answers are framed with meaning," he explained.

Many of Li's employees are from language schools, training centers and international trading firms and have never worked in the tourism industry before.

"Their language skills promise immediate and effective communication with potential clients," Li said.

"But they have to work hard to learn what the city has to offer and be capable of answering sophisticated questions based on that expertise. What visitors increasingly seek is not information alone. They want context, comparison and stories."

Experienced guides consistently earn more than newcomers, while regular training improves both service quality and income, industry figures showed. But income instability remains a concern. Tourism is highly seasonal, and many practitioners experience large swings in earnings between peak and off-peak periods.

For all the optimism surrounding inbound tourism's resurgence, the industry's growing pains are real, Li said.

Yang said being a tour guide is about creating understanding, a role he believes AI can never fully replace.

"AI can translate accurately. It can provide information," he said. "But it cannot read a visitor's eyes. It cannot create emotional connection."

In his 50s, he is still very optimistic about the industry's prospects, as more inbound visitors are requesting his services to understand a country still being built.

The Great Wall remains. So does the Forbidden City. But alongside them, a new set of destinations is emerging: factory floors, heritage workshops, innovation hubs and village studios.

"They all hold great sway over inbound travelers' curiosity and need guides like us to lead the way," he said.

Efforts: Policy continuity emphasized

From page 1

In the new era, poverty alleviation was pursued not as a short burst of assistance, but as a systematic effort carried out across regions, levels of government and successive stages of policy.

By 2021, China had secured a complete victory in the fight against absolute poverty. Under the current standard, all 98.99 million rural residents living in poverty had been lifted out of poverty, 832 impoverished counties, including Xingtang, had been removed from the poverty list, and 128,000 impoverished villages had shaken off poverty.

However, the achievement was not treated as the end of the task. Even before that milestone was reached, the central leadership had begun planning the next stage. At the Central Rural Work Conference in December 2020, Xi called for efforts to consolidate and expand poverty alleviation achievements and align them with rural vitalization, in order to ensure a smooth transition without gaps in work or policy support.

For long-term tasks, Xi has always stressed the need to maintain a strategic resolve and patience, and to follow through on sound blueprints with sustained effort. He once said that existing plans and arrangements should be carried forward from one term to the next if they are sound, suited to new practical requirements and in line with the people's aspirations.

Zheng Changzhong, a professor at Fudan University, said the experiences of Ningde, Xingtang and China's national poverty alleviation campaign all point to the same logic: Development cannot rely on a single push, and neither can governance performance be measured only by what is immediately visible.

What matters, Zheng said, is whether policies solve real problems, build lasting foundations and continue to benefit the people over time. He said this logic of sustained effort can be seen not only in poverty reduction, but also in broader development fields that require long-term planning, policy continuity and steady implementation.

Aisake Valu Eke, former prime minister of Tonga, said China's success in lifting nearly 100 million rural residents out of poverty was "a remarkable achievement for any country".

Eke said China's progress was supported by a system in which plans and strategies are developed by the CPC and carried out across different levels of government, from provinces and cities to villages.

Planning system hailed

Nur Rachmat Yulianto, professor of International Relations at Universitas Gadjah Mada in Indonesia, said China's five-year planning system, with its emphasis on long-term strategic planning and policy continuity, is one of the defining features of China's development.

He said that this approach enables China to pursue national goals while delivering immediate benefits to the people and advancing broader development objectives over time, a balance that can be seen in areas such as infrastructure, poverty alleviation, technological innovation, natural resource conservation and cultural heritage preservation.

"At the heart of this planning strategy and balance is sustainability," he said, adding that China has provided valuable experience for many countries, particularly those in the Global South.

Nichita Iris Liga, a member of the Executive Bureau of the Romanian Socialist Party, said that unlike some other countries, where systems and priorities may change every few years with electoral cycles, planning in China is not limited to a single five-year period, but is linked to longer-term goals, including the second centenary goal of building China into a great modern socialist country by the middle of the century.

Tradition wins big during holiday

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Cultural experiences took center stage during the just-concluded Dragon Boat Festival holiday as people from across the country embarked on journeys in search of traditional festivities involving boat races, rituals and seasonal foods, travel agencies said.

Searches for keywords such as "Dragon Boat Festival", "dragon boat" and "*zongzi*" more than tripled from a month earlier on online travel platform Qunar, reflecting the growing appeal of tradition-infused travel and transforming the three-day break into a vibrant celebration of Chinese cultural heritage.

Meanwhile, searches for folk-culture tourism jumped 55 percent year-on-year, according to People's Daily Overseas Edition, citing online travel agency Mafengwo.

Dragon boat racing, the festival's most iconic tradition, has evolved from a spectator event into a participatory cultural attraction. Travel platform Ctrip reported that searches for "dragon boat" rose 41.3 percent week-on-week, with races proving to be a major tourism magnet.

Guangdong province led the trend. Travel-related searches for Foshan increased by 134.9 percent week-on-week, driven by the famed Diejiao dragon boat race, often hailed as the "F1 on water", Ctrip said.

A tourist from Shanxi province, who went to Foshan to see the Diejiao race, said the chants of the boatmen and the roar of the drums made it a spectacularly moving experience.

"No matter how exciting the video is, nothing beats the real experience. I could feel the vitality all around," she said.

Not only in Guangdong, dragon boat events boosted tourism nationwide. Searches for Jingzhou in Hubei province rose 87.5 percent week-on-week, while Zigui in the same province — the hometown of poet Qu Yuan — became a holiday hot spot thanks to its cultural festival, according to Ctrip.

Qu was a legendary poet and minister in the State of Chu during the Warring States Period (475-221 BC). He drowned himself in the Miluo River when he learned that the State of Chu was being defeated by the State of Qin. Legend has it that upon learning of Qu's death, locals took out boats to search for his body, dropping rice dumplings into the river to prevent the body from being eaten by fish. It is to honor this legend that Chinese people hold dragon boat races and make *zongzi* to eat during the festival.

There was huge demand for seasonal Dragon Boat Festival delicacies as well. According to Qunar, food lovers hit the road in droves in search of festive cuisines. Instead of debating on whether to sample sweet or savory rice dumplings known as *zongzi*, hundreds headed to Quanzhou, Fujian province, to sample Minnan-style braised pork *zongzi*, or to Guiyang in Guizhou province to try the unique Buyi ash *zongzi* mixed with plant-ash lye, it said.

Beyond *zongzi*, crayfish from Qianjiang, Hubei province, mackerel dumplings from Qingdao, Shandong province, and cold fermented noodle soup from Lanzhou, Gansu province, were also big draws for food connoisseurs who traveled thousands of miles just to sample the fare. According to Qunar, hotel occupancy in these foodie-friendly destinations — including Qianjiang, Qingdao, Lanzhou, Quanzhou and Guiyang — increased by more than 20 percent during the holiday.

The folk-culture fervor fuels local industries. Miluo in Hunan province — known as the "hometown of dragon boats" — is home to 20 boat-building factories with an annual turnover of more than 200 million yuan ($29.6 million), according to data from the local government.

The finals of the 2026 Hunan Dragon Boat Super League kicked off in Miluo on Thursday. A total of 38 top dragon boat teams from 14 cities and prefectures across the province gathered to compete in the two-day race. Through dragon boat racing and folk traditions, they celebrated the spirit of Qu Yuan and participated in a grand Dragon Boat Festival event that deeply integrated culture, tourism and sports.

One workshop in Luojiang township continued working through the holiday to meet rising orders. Likewise, a *zongzi* producer in Quzici township said the number of orders defied all predictions of a market downturn.

Since late April, the Quzici plant has run at full capacity. Local villager Weng Zhenggui, who lives just 400 meters away and works eight hours a day, made over 1,000 *zongzi* and earned up to 6,000 yuan per month.

The cooking and packing processes in the plant are automated, boosting daily output to 100,000 *zongzi* while ensuring consistent quality. "The automated system precisely controls temperature and pressure, saving labor and improving efficiency and taste consistency," said company chairman Wu Liman.

Inbound tourism showed strong growth during the holiday, with Fliggy reporting that bookings were up more than sixfold year-on-year.

Tech: Cleaning robot market enters new phase

From page 1

According to data from the General Administration of Customs, cleaning robots — added as a stand-alone customs classification this year — accounted for 7.75 billion yuan ($1.14 billion) in exports during the first quarter of this year, representing 68.5 percent of China's total robot export value.

In addition, out of total global shipments of 32.72 million units in 2025, Chinese manufacturers accounted for more than half of the global market, according to global market consultancy IDC, with Roborock, Ecovacs, Dreame, Xiaomi and Narwal occupying the top five positions globally in household cleaning robot production.

"The market has entered a new phase, characterized by the dominance of Chinese brands, rapid technological iteration and increasing segmentation across product categories," said Zhao Siquan, a senior analyst at IDC China.

Under IDC's definition, the broader cleaning robot sector encompasses robot vacuums, window-cleaning robots, lawn-mowing robots and pool-cleaning robots.

"Leveraging a complete supply chain, rapid product iteration capabilities and strengths in algorithms, Chinese manufacturers have expanded their presence across virtually all of these segments," Zhao said.

From cordless designs and AI-powered navigation to all-in-one docking stations and multidevice collaboration, many technologies that were first deployed at scale by Chinese manufacturers are now becoming industry standards, she added.

As competition intensifies, leading players are also broadening their ambitions. "Top manufacturers are evolving from single-category providers into full-scenario home service companies," Zhao said. "This is because, for consumers, cleaning is not an isolated need, but part of everyday household life. Companies that can deliver services across a wider range of home scenarios will have a greater opportunity to build stronger user engagement and long-term brand loyalty."

Delegations from US, Iran start talks

Meeting taking place in Switzerland amid renewed tensions over Strait of Hormuz

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Inside
Editorial, **page 6**

Delegations from the United States, Iran and regional mediators have started talks in Burgenstock, Switzerland, with an aim to advance the Memorandum of Understanding signed between Washington and Tehran last week, with analysts saying that Lebanon constitutes the "greatest test" for the talks.

The high-level meeting is taking place amid renewed tensions over the Strait of Hormuz following conflicting accounts from Iran and the US, and with Tehran accusing Washington and Tel Aviv of truce violations amid continued violence in Lebanon. Israel and Hezbollah renewed their truce on Friday.

Qatari Foreign Ministry spokesman Majed Al-Ansari said on Sunday that the parties to the meeting in Switzerland had established technical groups to negotiate the terms of a final peace deal between Tehran and Washington, which is due within 60 days of negotiations.

Specialized technical groups have been formed to "negotiate the terms of a final agreement, which will cover all aspects of the memorandum of understanding", Al-Ansari told the Qatar News Agency.

Meanwhile, Iran's semi-official Tasnim news agency reported on Sunday that the country will not reopen the Strait of Hormuz if the war in Lebanon is not ended, citing a source close to the Iranian negotiating team.

The source warned that if Israel's "crimes" in Lebanon continue, and Lebanon's territorial integrity is not guaranteed, Iran will hold no negotiation on other issues.

The Iranian delegation, led by Parliament Speaker Mohammad Bagher Ghalibaf and Foreign Minister Abbas Araghchi, arrived in Switzerland on Saturday.

Speaking to the Islamic Republic News Agency, Iranian Foreign Ministry spokesman Esmaeil Baghaei said that the ongoing conflict in Lebanon between Israel and Hezbollah, frozen Iranian funds and the sale of the country's oil will top the agenda in talks with the US in Switzerland.

Trita Parsi, executive vice-president of the Quincy Institute for Responsible Statecraft, told Al Jazeera that "Lebanon has always been the greatest vulnerability to this deal because this is really crucial to the Iranians".

Ryan Costello, the policy director at the National Iranian American Council, also said Lebanon poses the "greatest test" for the ceasefire deal. "I would not be surprised at all if there is a breakdown in the broader negotiations," he was quoted as saying by Al Jazeera.

Prior to departing for Burgenstock, US Vice-President JD Vance said that success in Switzerland starts with establishing the structure of the negotiations, as US and Iranian officials begin the next phase of talks.

He said the focus will be on making progress on Iran's nuclear program and the Lebanon ceasefire, while technical teams remain on the ground to work through the details, Fox News reported.

Pakistani Prime Minister Shehbaz Sharif said in a post on social media platform X on Saturday that in his call with Saudi Crown Prince Mohammed bin Salman, they agreed that the next phase of negotiations "must remain anchored in a firm commitment to dialogue and diplomacy, along with vigilance against any attempts that could undermine the peace process".

Sharif is also in Switzerland for the high-level meeting, along with Pakistan's Chief of Army Staff Field Marshal Syed Asim Munir.

Israeli airstrikes killed at least seven people and wounded one in eastern and southern Lebanon, Lebanon's National News Agency reported on Sunday. On Saturday, Israeli attacks killed 16 people and wounded 12 in Nabatieh district in the south of the country, Al Jazeera reported, citing the Lebanese Civil Defense agency.

An Israel Defense Forces soldier was killed during an alleged attack by Hezbollah on Saturday morning, The Times of Israel reported.

Xinhua contributed to this story.

Cooperation: Innovation focus creates fresh opportunities

From page 1

Areas such as semiconductors, batteries, artificial intelligence, advanced manufacturing and the digital economy provide vast opportunities for mutually beneficial cooperation. As both countries pursue innovation-driven growth strategies, new possibilities for industrial and technological collaboration continue to emerge.

More important, the realities of today's global economy demonstrate that sustainable development cannot be achieved through zero-sum approaches. Global supply chains are deeply interconnected, and economic instability in one country inevitably affects neighboring economies and the wider international community. In this regard, China-South Korea economic cooperation is not simply a bilateral matter; it is closely linked to the stability and prosperity of Northeast Asia and the Asia-Pacific region as a whole.

Particularly noteworthy is the fact that China is actively pursuing high-quality development centered on technological innovation, while South Korea is strengthening its competitiveness in cutting-edge industries and future technologies. These parallel efforts create valuable opportunities for cooperation.

In practical terms, bilateral cooperation should increasingly focus on joint research and development, investment in future industries, green transformation, digital collaboration and talent exchanges.

The recovery and expansion of people-to-people exchanges is equally important. Economic cooperation cannot be sustained solely through agreements between governments. Long-term stability in bilateral relations depends on active engagement among business leaders, young people, academic communities and cultural sectors.

Naturally, China-South Korea relations still face various challenges. Changes in the international environment, security concerns and intensified competition in certain industries may continue to create pressure on bilateral ties. However, what matters most is how those differences are managed and how areas of common interest can continue to expand.

Today, the Asia-Pacific region stands at the center of global economic growth. The future prosperity of the region is closely linked to the quality of cooperation among its major economies.

From this perspective, China and South Korea should look beyond a bilateral framework and pursue cooperation from the broader standpoint of regional prosperity and global stability.

Now is the time for the two nations to elevate their relationship into a more resilient, forward-looking and mutually beneficial partnership.

The author is chairman of the Korea-China Global Association in Seoul. The views do not necessarily reflect those of China Daily.

A smartphone screen on a housewife's head records her actions through motion capture while she is slicing mangos at her home in Chennai, India, on May 15.

A housewife wears a smartphone on her head as she records her actions through motion capture while watering plants at her home in Chennai, India, on May 15.

Workers wear cameras on their heads while recording actions through motion capture inside a factory in Tamil Nadu, India, on May 13.

A worker wears a camera to record actions through motion capture while arranging colored blocks at an AI data company in Tamil Nadu, India, on May 13.

Robot mentoring

Indian housewives with phones on their heads train humanoids that will perform household jobs in future

With a smartphone strapped to her head, Indian housewife Nagireddy Sriramyachandra films herself slicing mangos to train AI-powered robots to take on household jobs in the future.

Earning just over $2 for an hour of video, her mundane recordings are invaluable for global tech companies teaching machines how to move like humans in the real world.

The 25-year-old is one of a growing army of thousands of AI system trainers in India.

"Who else will give you 250 rupees ($2.64) an hour just for doing housework?" said Sriramyachandra from her kitchen in Chennai in southern India's Tamil Nadu state.

"I may get a robot myself in the future," she said.

AI chatbots and image generators crunch reams of digital data, but building systems to navigate real-life environments is more challenging.

Developers think feeding first-person footage, called "egocentric data", into specialized AI models will help robots copy humans.

Some AI trainers work at home, others in factories or specialized studios — using video glasses, head-mounted cameras and motion sensors.

"It blares 'hands not detected' when I'm not recording properly," said Sriramyachandra, who sends recordings via a special app to the AI data company Objectways.

The humanoid robot market is booming, with investment bank Morgan Stanley predicting there could be over a billion in use by 2050, mostly for industrial and commercial purposes.

"Folding clothes, coffee-making ... cooking a very specific thing, sandwich-making," Objectways head Ravi Shankar said, listing videos requested by clients.

From top: A worker wears a camera to record her actions through motion capture at an AI data company in Tamil Nadu, India, on May 13. Data is acquired through motion capture at the AI data company in Tamil Nadu.

"Some jobs are supposed to be taken over, so humans can go and do better things."

In India, the emerging field of spatial AI is providing new employment.

"It's likely that these data collection services will increase," said digital labor expert Aditi Surie, from the Indian Institute for Human Settlements in Bengaluru.

At an Objectways studio, AI system trainers film themselves performing household tasks in fake, fully furnished apartment rooms.

After several thousand hours of filming, the wallpaper is changed to provide clients with variety.

"Today I sit here, tomorrow I stand there," said engineering graduate Rani N., 21, on a break from filming herself, once again, folding a towel.

Each video lasts about four minutes, and she records around 90 a day — on nearly every conceivable spot on the bed.

She says the job is "tolerable", but feels like she's always wearing a camera.

In other rooms, colleagues arranged pencil sharpeners, water bottles and crayons in patterns, recording with depth-sensor cameras.

Qanat Consulting Services in Andhra Pradesh, an Objectways subcontractor, supplies about a dozen larger data firms with recordings. Some of its 2,000 contributors perform tasks with motion-sensor bands on their "wrists, hands and legs", CEO Thaslim Pattan said.

Manish Agarwal of Bengaluru-based Humyn Labs records conversations as well as videos.

Contributors discuss assigned topics — ranging from politics to entertainment — for clients wanting to process speech patterns. Agarwal denies that robots will steal jobs, believing that networks of humans and robots "will work together" one day, he said.

"A welder in India could be managing a welder-robot in Prague," he said.

'China Shock' seen as cover of protectionism

Western framing undermines multilateral trading system, drives up costs: Experts

By **YANG RAN**
yangran1@chinadaily.com.cn

In response to growing rhetoric from the West over the so-called China Shock 2.0, experts say this narrative serves primarily as a political shield for protectionist policies rather than an objective economic assessment.

They warn that such framing could undermine the multilateral trading system and drive up global costs. Rather than viewing China's industrial advancement with hostility, those nations should instead adopt a more sophisticated collaborative mindset, leveraging China's robust supply capabilities to generate shared global benefits, experts urged.

During the three-day G7 summit concluded on Wednesday, European Commission President Ursula von der Leyen said, without naming China directly at first, that "some countries produce too much and do not consume enough", claiming it has been "increasingly dangerous for the stability of the global economy". She then explicitly singled out China, labeling its trade surplus with the European Union "unsustainable".

Her remarks mirror the "China Shock 2.0" narrative that has been gaining traction. Last month, the Centre for European Reform, a Europe-based think tank, published a report claiming that "a new China Shock is reverberating across global goods markets". During the G7 summit, many Western media outlets also leveraged this narrative to justify trade policies targeting China.

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, pointed out that the "China Shock" narrative largely focuses on the alleged trade imbalances, specifically concerning China's goods trade surplus with the West.

Sun Chenghao, head of the US-Europe Program at Tsinghua University's Center for International Security and Strategy, noted that the recent Western hype around the so-called China Shock 2.0 is in essence a political construct. "It layers together Western anxieties over lost industrial competitiveness, the rising costs of a green transition, and a broader strategic competition with China. They reframed these issues into a 'security threat' narrative, repackaging for public consumption."

The original "China Shock" thesis, coined by Western economists, argued that China's post-WTO export boom disrupted US labor markets.

Sun said that the underlying logic of the current version hasn't changed much. "Both versions externalize the internal challenges of Western economies — industrial restructuring, income inequality, and technological competitive pressures — and blame them on Chinese manufacturing."

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, agreed. He said the so-called China Shock is simply a natural outcome of market economics and competition.

"Developed countries have grown accustomed to holding the technological upper hand for decades," Tu said. "Now, when they face a real competitor, they seem reluctant to embrace the free market principles they've preached for decades."

Far from being a detriment, experts said that China's industrial upgrading, which offers high-tech products at lower costs, is a boon for the global economy, enhancing world productivity and welfare.

James Pethokoukis, a senior fellow at the American Enterprise Institute for Public Policy Research, a Washington-based think tank, highlighted this positive impact in a December article published on the organization's website.

He noted that while China's rapid growth reduced the US' share of the global GDP, it simultaneously helped US consumers by making a wide range of goods cheaper to buy and easier for US companies to produce. The US, he concluded, became "absolutely richer" even as it appeared "relatively smaller, economy-wise".

Benefiting the world

"China's massive, integrated production capacity, combined with intense domestic competition, allows it to produce high-tech goods at remarkably low cost," said Tu. "This, in fact, benefits the entire world, as it significantly lowers product prices, thereby enhancing their accessibility and affordability. This is particularly evident in renewable energy products, including solar power, wind energy, and electric vehicles."

Official data shows that Chinese wind turbines, solar panels, and new energy vehicle products are exported to over 200 countries and regions globally, driving down global wind and solar power generation costs by over 60 percent and 80 percent, respectively.

Sun warned that the West's pan-securitization of normal industrial competition would, in the long run, escalate global production costs, diminish consumer welfare, fragment supply chains, and further erode the WTO-centered multilateral trading system.

Against this backdrop, experts advocate a more rational and objective perspective on China's industrial and economic development, urging exploration of international cooperation for global prosperity.

Jian from Fudan University said, "What they call a shock is really just competitive pressure, which is inherently beneficial for the growth and prosperity of the global market." Blocking such normal competition, he argued, would be detrimental to overall economic development.

"In this context, it is crucial to view this competition rationally and objectively, embracing a market-oriented mindset and promoting self-growth through cooperation with the competitors," he said.

Instability reshapes global supply chains

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Business leaders and logistics executives said global supply chains are adapting to a more complex trade environment shaped by geopolitical tensions, evolving tariff policies and shifting trade patterns, while emphasizing the continued importance of long-term planning and international commerce.

Speaking at a news briefing hosted by the Port of Los Angeles, Gene Seroka, executive director of the port, and Dan Letter, chief executive officer of Prologis, the world's largest logistics real estate company, discussed how companies are navigating uncertainty while maintaining investments in logistics infrastructure, warehousing and trade-related operations.

The discussion came as businesses continue to assess the implications of recent developments in global trade and geopolitics, including ceasefire negotiations involving Iran and the United States, ongoing conflicts in the Middle East and Europe, and evolving China-US trade relations.

Seroka said a proposed reopening of the Strait of Hormuz could help ease pressure on energy markets and improve business confidence, although he cautioned that a memorandum of understanding involving the US and Iran remains only a framework for further negotiations.

"Twenty percent of the world's energy products flow through that strait," Seroka said. If the Iran situation further eases as expected, "we could see oil prices continue their decline, inflation possibly easing over the weeks and months ahead, and shipping confidence could begin to return".

He noted that the waterway normally accommodates more than 100 vessel crossings daily, but warned that shipping companies are unlikely to resume normal operations immediately.

"Crew safety remains the priority," Seroka said. "Even with a possible reopening, it will take months to normalize schedules, get supply chains back to some semblance of normalcy and clear backlogs."

Despite recent disruptions, Seroka said conversations with port operators and industry partners in Asia suggest that cargo flows remain resilient. He added that easing bunker fuel prices and improving confidence could provide additional support for trade volumes in the months ahead.

Turning to China-US trade relations, Seroka said recent discussions were a positive signal, but businesses want clearer direction.

Positive sign

"It's certainly positive when the leaders of the world's two largest economies sit down to negotiate," Seroka said, adding that while businesses are encouraged by the continued engagement, many companies are still seeking greater policy clarity as they make long-term decisions related to trade, investment and supply chains.

China remains one of the Port of Los Angeles' largest trading partners. According to port data, China-related cargo has historically accounted for a significant share of container volumes moving through the Southern California gateway, making developments in bilateral trade relations closely watched by logistics providers, retailers and manufacturers.

Seroka said uncertainty surrounding tariffs continues to influence business decisions. While discussions have included potential opportunities for increased US agricultural exports, including beef and soybeans, he noted that market conditions remain challenging.

He pointed out that Brazil and Argentina have expanded their presence in China's soybean market in recent years, making it more difficult for US exporters to quickly regain market share.

"Once overseas buyers establish new sourcing relationships, it can take a lot of time to win that business back," he said.

Companies are also monitoring upcoming tariff deadlines and potential new trade measures, prompting many businesses to shorten planning horizons and adjust inventory strategies.

"This is the new reality of doing business in today's trade environment," Seroka said.

Letter from Prologis said supply chains have become more resilient after navigating years of disruptions, including rising interest rates, geopolitical tensions and global conflicts.

"Our customers have been digesting all of these issues, and we're seeing them again make decisions," Letter said. "They're making these five-plus-year decisions with us."

Report: UK PM Starmer could resign

LONDON — United Kingdom's Prime Minister Keir Starmer was expected to resign on Monday and set out a timetable for his departure, according to The Observer, a local newspaper.

However, UK Business Secretary Peter Kyle said on Sunday that the news of Starmer's quitting is speculation. He added that Starmer is "making time to reflect on the political realities, challenges and opportunities that he finds himself in".

The threat to Starmer's position, which has been building for months, increased sharply on Friday when his rival Andy Burnham won a seat in Parliament that would allow him to launch a formal leadership challenge.

The Observer, which did not name its sources, said Starmer had reached the conclusion that his position was no longer tenable after speaking to cabinet ministers, advisers, donors and trade union leaders.

Starmer led the center-left Labour Party to a landslide election win in 2024 but has become deeply unpopular after a series of scandals and policy U-turns that have given many voters an impression that he cannot deliver on improving their standards of living that he promised.

If he were to quit or be ousted, it would mean the country installing its seventh prime minister in just over a decade — the highest turnover in nearly two centuries, reflective of anger at successive governments' failures to improve public services and tackle issues like illegal immigration.

More than 100 elected lawmakers in Starmer's party — roughly a quarter of all Labour representatives in the House of Commons — have publicly said they want him to quit or set out a timetable for his exit, according to a Reuters tally.

Burnham, until last week the mayor of Greater Manchester, decisively won the seat of Makerfield in northwestern England in a special election on Thursday. He took almost 55 percent of the 45,510 votes cast, over 9,000 more than the Reform UK runner-up.

Burnham did not immediately make a formal challenge to Starmer but used his victory address to promise a new path for the country.

Starmer congratulated Burnham on Friday but said he would fight any challenge to his leadership and urged Labour not to tear itself apart with infighting.

But Charlie Falconer, a senior Labour member of the House of Lords, said on Saturday that Starmer has "absolutely no authority" left.

"There should be an agreed transition process in which Andy and Keir cooperate as to when the handover should take place," he said.

Agencies via Xinhua

Intra-Asian travel viewed as opportunity amid tensions

By **YANG HAN** in Hong Kong and **LEONARDUS JEGHO** in Jakarta

Turmoil in the Middle East has reshaped the global travel landscape. Long-haul travel is among the hardest hit, while intra-regional travel could become a bright spot for many tourism-dependent Asian economies, according to industry analysts.

Citing the situation in the Middle East, the Tourism Authority of Thailand slashed its forecast for long-haul arrivals this year from 11 million to 10 million, according to a report by The Nation on June 17.

However, arrivals from nearby markets such as China saw a strong recovery with Chinese tourists arrivals jumping 18.35 percent to 2.3 million. The number of Indian tourist arrivals also increased by 8 percent to about 1 million, the report said.

Paul Edmundus Talo, director of Floressa Bali Tours and Bali Flores Adventure, told China Daily that the conflict in the Middle East had affected international flight services, created a sense of uncertainty among travelers, and contributed to higher airfares.

Airfares for flights between Asia and Europe have hiked after the US-Israeli war on Iran began in late February.

According to an analysis by FlightsFinder.com in March, fares on direct routes between Asia and Europe surged by nearly 300 percent, meaning travelers would need to pay up to $2,330 more for the same flight.

Growth potential

Gary Bowerman, managing director of the weekly industry newsletter Asia Travel Re:Set, said that it is still unclear how consumers will respond to the challenges ahead, but Asian tourism still holds strong growth potential.

Bowerman said intra-regional demand has become a significant force for Asia's tourism recovery, and he expects regional travel in Southeast Asia and the broader Asia-Pacific to remain strong.

But currency volatility, rising interest rates, and higher living costs could weigh on travel at the margins, he said, noting the war in the Middle East will have strong residual effects for some regional economies in the second half of 2026.

"Destinations across the region must continue to diversify their visitor mixes to build more resilience in the future," said Bowerman.

Some Southeast Asian countries have pinned their hopes on the Chinese market with targeted campaigns.

A Chinese tourist wearing a Thai traditional costume poses for photos at Wat Pho Temple in Bangkok on May 5. RUNGROJ YONGRIT / EPA

Thai tourism authorities are planning to attract 7.5 million Chinese visitors in 2026. Apart from marketing through social media platforms, it also plans to build on the popularity of the Chinese film *Dear You* to increase interest in locations where the film was shot.

On June 15, Cambodia launched a four-month visa-free trial for Chinese tourists with multiple entries, its largest source of international visitors. The government said it aims to boost tourism recovery, according to the Khmer Times.

As tourist arrivals drop in Siem Reap Province, Khiev Thy, president of the Siem Reap Angkor Guides Association, said the visa exemption will play an important role in attracting Chinese tourists.

In Bali, the popular Indonesian tourism destination has quickly adjusted its strategy to prioritize the development of the Chinese market in response to the loss of Western tourists, said Ye Lu, head of the China market of the Bali Tourism Board, also founder of the Bali Mandarin Center.

Measures include simplified visas, increased direct flights, training for Chinese-speaking guides, and widespread acceptance of Alipay and WeChat Pay to fill the tourist gap, Ye said.

Brussels' protectionist moves risk being costly backfiring gamble to EU

If a trade surplus is automatically interpreted as proof of unfairness, then many European Union exports — from automobiles to pharmaceuticals — could be subjected to the same logic elsewhere.

The EU justifies its trade surplus with the United States as a natural outcome of market forces, even as Washington accuses it of exploiting the US market. Yet, in a striking double standard, the EU now adopts the same logic in reverse. Framing its trade deficit with China as evidence of "victimhood", while overlooking the very market dynamics it so readily champions elsewhere.

The EU often lectures the world about the virtues of open markets, rules-based trade and economic integration. Yet Brussels' proposed Industrial Accelerator Act, along with other bills and policies, suggests that the bloc is increasingly tempted to abandon the very principles that helped build its prosperity.

Presented as a tool to "strengthen industrial competitiveness" and "accelerate the green transition", the IAA carries a less advertised objective: reducing China's role in Europe's strategic industries. Through public procurement restrictions, enhanced foreign investment screening and various "Made in Europe" preferences, the legislation marks a shift from openness toward industrial protectionism. It is nothing but an EU adaptation of "America First".

That is precisely why the concerns submitted by the China Chamber of Commerce to the EU on Thursday deserve serious consideration. The chamber, representing more than 1,000 Chinese enterprises operating in the EU, argues that several provisions of the IAA create legal uncertainty. More important, they threaten to make the EU's green transition slower and more expensive rather than faster and more competitive.

EU policymakers should realize that engaging with China brings opportunities to global enterprises. Multinational corporations are no longer peripheral players in China — they are integral to its industrial ecosystem. This is reflected in the numbers: foreign direct investment in the world's second-largest economy has topped $100 billion annually for 16 years running.

According to a report released at the seventh Qingdao Multinationals Summit on Tuesday, the surveyed multinational corporations in China allocated 14.3 percent of their global R&D spending to the country last year. At the same time, new foreign-invested enterprises in scientific research and technical services jumped 27.2 percent year-on-year to 14,000 — underscoring a deepening technological embrace of the Chinese market.

Divorced from the reality, however, the language of "de-risking", "reducing dependency" and correcting "trade imbalances" has become increasingly commonplace among some of the EU's political circles. Recent discussions among EU leaders have focused heavily on developing new restrictive trade instruments targeting China.

International trade is a matter of mutual choice. EU consumers purchase Chinese goods and EU companies source from Chinese supply chains because they are efficient and offer cost-performance advantages.

Trade balances are the outcome of market forces, industrial structures and consumer preferences. China has never deliberately sought a trade surplus with the EU. Treating a trade deficit as evidence of "economic victimhood" is a dangerous oversimplification.

The EU's competitiveness challenges stem from high energy costs, sluggish productivity growth, fragmented capital markets and regulatory burdens. Restricting Chinese investment will not solve these problems. Nor will excluding Chinese companies from procurement projects make European companies globally competitive.

Instead, it will lead to retaliatory measures, uncertainty and lost opportunities. China has made clear that it will take necessary measures to safeguard its legitimate rights and interests should discriminatory restrictions become EU policy.

But a more constructive path remains available. Despite growing tensions, China and the EU continue to maintain regular communication on economic and trade issues, as He Yadong, spokesman for China's Ministry of Commerce, said on Thursday. The talks in Brussels on June 9 between Ling Ji, vice-minister of commerce and deputy international trade representative of China, and Ditte Juul Jorgensen, director-general for trade and economic security at the European Commission, were "in-depth and comprehensive" and had helped lay the groundwork for ministerial consultations to be held soon, the Commerce Ministry spokesman added.

The ministerial consultations deserve strengthening to deepen mutual understanding.

A comprehensive and objective perspective is essential for the EU in managing its economic ties with China. Past efforts to resolve disputes, from electric vehicles to steel, have consistently shown that negotiation is the rational way forward in addressing bilateral trade frictions.

Should Brussels double down on a de facto "EU First" agenda, it may end up undermining the competitiveness it purports to protect. And when the dust settles, it will be EU businesses, consumers and future industrial strength that pay the price.

All relevant parties must uphold MoU terms

The signing of the first-phase Memorandum of Understanding between the United States and Iran offers not only hope for a ceasefire but also for further negotiations aimed at achieving lasting peace.

As the international community watches closely, it is imperative that all parties involved, including Israel, commit to upholding this agreement and work diligently toward regional stability.

The text of the MoU covers several key areas, including the cessation of hostilities, maritime security and navigation, reconstruction and economic assistance, sanctions relief, nuclear-related commitments and an executive mechanism. It states that the two sides commit to negotiating and achieving the final deal in a maximum of 60 days, extendable with mutual consent.

But the road to peace is rarely straight. Iran's announcement that it would close the Strait of Hormuz, citing Israel's continued attacks in Lebanon as a violation of the ceasefire deal, underscores the challenges in implementing the MoU.

The US-Iran negotiations that are scheduled to open in Burgenstock, Switzerland, are a testament to both parties' willingness to carry on the momentum of the MoU to continue dialogue. But much remains to be done to hold up the current fragile ceasefire and lay the groundwork for a final agreement.

The central question now is whether the US has both the genuine willingness and the practical capability to rein in Israel — especially given that Tel Aviv has made clear its determination to act of its own accord.

While Israel has agreed to a ceasefire in Lebanon, its refusal to withdraw from Lebanon poses a continued threat to peace. Reportedly, Israel is conducting negotiations with the US on maintaining its deployment of troops in southern Lebanon. For the MoU to succeed, Israel must cease its attacks and withdraw its forces, creating an environment conducive to negotiations.

Given the current challenges in implementing the 14-point memorandum and the fragile nature of the US-Iran ceasefire, the US-Iran negotiations, which were originally supposed to focus on the Iran nuclear issue, might now include discussions on the Lebanon ceasefire and the Strait of Hormuz.

The US-Iran talks may be in the spotlight, but their fate will be decided in the US-Israel negotiations. Tehran's revival of the Strait of Hormuz threat was to prompt the US to restrain Israel. The success of the talks in Switzerland hinges on the ability of all parties to adhere to their commitments and avoid actions that could derail the process.

China hopes that both the US and Iran will approach the second-phase negotiations with a rational and pragmatic attitude, working together toward positive outcomes.

Chinese Foreign Ministry spokesman Lin Jian said at a regular news briefing on Thursday that China welcomes the signing of the MoU and hopes that all relevant parties "will uphold the spirit of contract and implement it in good faith".

Beijing has been working for an end to the fighting since the outbreak of the conflict, demonstrating its commitment to peace through various diplomatic initiatives. The four-point proposal it put forward outlines a clear vision for safeguarding peace and stability, emphasizing good neighborliness, development, security and cooperation.

The path to lasting peace in the Middle East is fraught with challenges, but the MoU between the US and Iran offers a glimmer of hope as it provides the scaffolding for talks to end the conflict. For this hope to be translated into reality, all parties, including Israel, must prioritize peace and stability.

China stands ready to support these efforts, but the success of the forthcoming negotiations depends on the willingness of the parties directly involved to approach discussions with rationality and pragmatism.

New measures to enhance data security governance

China's digital economy has entered a stage in which data have become a key factor of production, an important strategic resource and a vital driver of innovation. Against this backdrop the release of measures to assess network data security risks marks a key step in strengthening the country's data security governance framework.

The measures, released on Thursday, will come into force on Aug 20. They aim to provide a systematic framework for identifying, analyzing and evaluating risks associated with network data and data-processing activities. The regulations require handlers of important data to conduct annual risk assessments while encouraging processors of general data to carry out assessments at least once every three years. They also establish clearer responsibilities for regulators, enterprises and third-party assessment institutions.

Since the enactment of the Data Security Law in 2021 and the issuance of regulations on network data security management, China has steadily built a comprehensive system for governing data resources. Yet a key question remained: how can enterprises effectively identify risks before incidents occur? The new measures answer that question by institutionalizing risk assessment as a routine and preventive mechanism. They transform data security governance from a reactive model focused on incident response into a proactive model centered on risk prevention and early warning.

The rapid expansion of artificial intelligence, cloud computing, industrial internet platforms and cross-border data flows has increased the complexity of data governance. As digital technologies penetrate every sector of the economy, data-related risks can quickly evolve into broader economic and social risks if left unchecked. The new measures therefore serve as an institutional safeguard for the high-quality development of the sectors concerned.

For industries and enterprises, the effect will be both immediate and long term.

For sectors that process large volumes of important data — including telecommunications, finance, energy, transportation, healthcare and industrial manufacturing — the measures will accelerate the establishment of more mature data governance systems. Enterprises will need to strengthen internal controls, improve data inventories, clarify data classification mechanisms and enhance monitoring of the entire data life cycle. While compliance costs may rise in the short term, the long-term benefits will include stronger resilience against cyberattacks, data leaks and operational disruptions.

The regulations are also expected to create new opportunities for China's cybersecurity and compliance service industries. By permitting enterprises to engage qualified third-party institutions to conduct assessments, the measures are likely to stimulate demand for professional services in risk evaluation, auditing, consulting, certification and security technology solutions. The development of a more standardized assessment ecosystem will further support the growth of specialized service providers and encourage technological innovation in data protection.

Importantly, the measures do not signal tighter restrictions on data utilization. Rather, they embody China's long-standing approach of balancing development and security. The objective is not to impede data circulation, but to create a more predictable and trustworthy environment in which data can be developed, shared and utilized safely. By clarifying assessment requirements and reducing uncertainty, the measures can help lower compliance burdens for many enterprises while enhancing confidence in data-driven innovation.

In an era when data security has become closely linked with economic security, social stability and national competitiveness, building robust risk management mechanisms is a must. The newly released measures represent important progress in China's effort to modernize data governance. By placing risk assessment at the forefront of security management, the country can lay a stronger foundation for the healthy growth of its digital economy.

— LI YANG, CHINA DAILY

What They Say

'Employment first' the key for social development

Editor's note: *China has issued an implementation plan for its employment-first strategy during the 15th Five-Year Plan (2026-30) period. China Media Group spoke to Zhang Chenggang, director of the research center for new forms of employment at Capital University of Economics and Business, on the goals, major tasks and policy measures for promoting high-quality and full employment. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

It is necessary to promote the quality and effectiveness of the service sector, which is the largest source of employment and offers a highly diverse range of jobs with varying entry requirements. Broadly speaking, it can be viewed from two perspectives — producer services and consumer services.

Producer services encompass the modern services that support manufacturing, such as finance, technology services and human resources services. Upgrading and expanding this sector hinges on whether it can generate a large number of high-value, well-paid jobs and continuously strengthen its competitiveness.

Consumer services account for a significant share of employment. In the past, many segments of the sector were characterized by small-scale and fragmented entities, uneven standards and relatively low entry barriers, resulting in wide variations in workforce quality.

The expansion of consumer services should be driven by organizations, enterprises and platforms that help raise service quality. Higher standards and better service quality will translate into an improved experience for consumers. In short, both producer and consumer services need to achieve growth in both quantity and quality.

A key message of the plan is that China must not only expand opportunities but also address existing shortcomings.

Expanding opportunities means continuing to support the development of new forms of employment and allowing the growth of the platform economy to play a greater role across both consumer and producer services. This, in turn, will create a wider variety of jobs, giving workers more choices and career paths.

At the same time, shortcomings in two key areas must be addressed. The first is social protection. Measures are needed to increase participation in social insurance among flexible workers and those in new forms of employment, while making enrollment more convenient. Occupational injury insurance should also be expanded to cover a broader range of workers in flexible employment.

The second area is public services. Service networks should become more extensive, ensuring that basic urban public services reach flexible workers and those engaged in new forms of employment. This will help them integrate more fully into urban life and share in the benefits of development.

It is also important to improve the alignment between educational provision and labor market demand. The establishment of a national big-data platform for talent demand will make workforce needs more visible and provide a stronger basis for educational institutions to adjust their academic programs.

A second priority is strengthening vocational education so that it becomes a respected pathway for career development rather than being viewed as a secondary option.

Also, academic disciplines must be adjusted in line with evolving industry needs. Educational institutions should closely follow the development of strategic emerging industries and future industries. Only by training people according to what the country and the market need can the education system better support economic and social development.

Remember past to safeguard future

A correct understanding of World War II history is necessary so that mistakes of the past are not repeated and both China and Russia are deeply committed to ensuring this. In a joint statement issued in May, both countries reaffirmed the commitment to safeguarding the outcomes of the victory embodied in the United Nations Charter and the charters and judgments of the Nuremberg Trials and the Tokyo Trials, and firmly opposing any attempt to deny or distort the history of WWII.

This stance is not just about preserving historical memory. Both China and Russia firmly uphold the UN-centered international system, reminding countries to avoid repeating historical mistakes and advocating for a fair and equitable global security governance system.

The postwar international order has institutionalized international relations and also established global organizations, including the UN, where major issues could be addressed with equal participation of member states. Under the postwar international order, international conduct has been regulated. The interconnected global economy necessitates shared behavioral standards. International law has gained prominence, providing a framework for dispute resolution, as exemplified by the World Trade Organization's role in shaping international trade rules.

At the same time, the international landscape gradually evolved from Cold War bipolarity to a multipolar structure, driven by the rise of developing countries and initiatives such as South-South cooperation and the Non-Aligned Movement. Nations increasingly engaged in multilateral cooperation to tackle global challenges, from climate change and environmental protection to counterterrorism.

Since the end of the Cold War, the postwar international order has faced significant challenges due to shifts in global power dynamics. Some Western countries are still clinging to outdated power politics because they don't want to relinquish their hegemonic positions and even distort historical facts. Besides, Japanese Prime Minister Sanae Takaichi has glorified militarism and refused to acknowledge Japan's history of aggression during WWII and the atrocities it inflicted on neighboring countries. These actions blatantly undermine fairness and justice and have drawn widespread condemnation from China, Russia and several Asian countries that suffered Japanese atrocities during the war.

The history of WWII offers crucial lessons for understanding today's international relations. An accurate view of that history is essential for preventing a relapse into large-scale conflict.

The war was a direct consequence of the lack of fairness and justice in the Versailles-Washington system established after the end of World War I. The Paris Peace Conference became a "looting assembly", with major powers redrawing their spheres of influence. The League of Nations was fundamentally flawed, and failed to maintain international peace and security.

Meanwhile, the global great economic turmoil in 1929-1933 created fertile conditions for the rise of fascism in Germany and Italy and militarism in Japan. They pursued aggressive military expansion and war preparations, ultimately leading to a global tragedy.

Today, the world once again stands at a critical juncture. Transformations unseen in a century are unfolding alongside intensified major-country rivalry and persistent regional conflicts. Deficits in peace, development, security and governance have become more pronounced, creating a vicious cycle.

Unilateralism and extremism have wantonly trampled on the sovereignty of other countries and blatantly violated the norms of international law centered on the UN Charter. The result has been sharp disagreements and confrontations between nations.

Calls from developing countries for peace and development have fallen on deaf ears. At the same time, globalization faces mounting challenges. Resources such as energy, food, and cyber capabilities are increasingly weaponized, while concerns over nuclear security have become more acute.

Addressing these challenges requires wisdom. The world is transitioning to a new landscape. While the US remains the sole superpower for the foreseeable future, emerging market economies and Global South countries are steadily expanding their influence across various fields — a trend that is set to strengthen further.

Developed countries maintain a clear edge in economic and technological competition, prolonging the transition period and resulting in asynchronous shifts in strengths across different areas. Economically, emerging markets have significantly expanded their share in international trade. However, shifts in security are slower, as the balance of military power, equipment and technology is unlikely to change anytime soon.

Culturally, the West continues to have a big advantage in this field due to modern means of communication and its control over mass media, but its influence is gradually diminishing. The trend toward civilizational diversity is strengthening, and resistance to Western cultural erosion is becoming more pronounced.

Against the backdrop of the prolonged Russia-Ukraine conflict, the spillover of the Middle East crisis, and certain Western countries attempting to maintain their grip on the steering wheel of international affairs, the advance of multipolarity must not devolve into factional confrontations.

In response to hegemonic headwinds, China and Russia have introduced a series of new security concepts within multilateral frameworks such as the UN, the Shanghai Cooperation Organization and BRICS. For instance, the Global Security Initiative proposed by China seeks to unite the international community in addressing global security challenges and maintaining world peace and stability. The SCO, advocating the "Shanghai Spirit", emphasizes common, comprehensive, cooperative, and sustainable security. It upholds equality among nations, favors partnerships over alliances, expands its cooperation network, and promotes dialogue to resolve disputes. This approach strives to turn the vision of "never again war" into reality.

Canada can drive down EV prices for buyers

For years, Canadians have been told that the electric vehicle revolution was just around the corner. The cars were getting better, charging infrastructure was expanding and the climate case was airtight. The only thing missing was a price that ordinary people could afford.

That barrier may soon come down.

Canada has slashed tariffs on Chinese EVs following Canadian Prime Minister Mark Carney's visit to Beijing, cutting them from the 100 percent surtax imposed in 2024 to 6.1 percent for an annual quota of 49,000 vehicles.

Chinese automakers wasted little time in responding. BYD, the world's largest EV manufacturer by sales volume, announced plans to open 20 dealerships across Canada within a year, starting in the Greater Toronto Area. Geely is assembling a Canadian leadership team, advertising senior roles in sales, marketing, legal and aftersales from a Toronto base. Other Chinese manufacturers, including Nio and Xpeng, may be coming too. At the same time, China has introduced an export licensing system this year for passenger EVs, creating a framework for expansion overseas.

For the first time, Canadian consumers will have real choices in the EV market, alongside healthy, market-driven price competition.

The timing is both significant and urgent. In late February, the military conflict in the Middle East effectively closed the Strait of Hormuz, the narrow waterway through which nearly 20 percent of the world's oil supply had been flowing. The impact on energy markets was immediate and severe. Brent crude, which began the year at roughly $61 a barrel, surged to above $120 a barrel in April, a level not seen since the Russia-Ukraine conflict broke out in 2022.

Canadians have felt that in every trip to the gas station. In Vancouver, which has the highest fuel prices in the country, it has now become common to see gasoline prices of C$2.20 ($1.58) per liter, the highest they have ever been and almost 40 percent higher than a few months ago.

Against this backdrop, the economics of driving an internal combustion engine have rarely looked worse while the case for switching to an EV has rarely looked better — provided you can actually afford one.

That has long been a barrier to owning an EV in Canada.

There are plenty of EVs on the streets across the country, but those vehicles are usually premium models in the high-priced segments. A market dominated by Tesla and a handful of established European and North American brands has faced limited pressure to compete on price. Consumers who wanted an electric vehicle but couldn't stretch to the average C$55,000 price of an EV were left with few options.

Chinese manufacturers bring a fundamentally different approach to the market. Take BYD's Seagull, which sells for the equivalent of roughly C$15,500 in China. It represents a category of affordable EVs that simply does not exist in Canada today. Even accounting for tariffs, shipping and local certification costs, Chinese EVs are expected to land in Canada at price points that will force established automakers to respond.

There are already indications that Canadians are responding to the changing market conditions.

Zero-emission vehicle (ZEV) sales jumped 74.7 percent in March compared with a year earlier as fuel prices started climbing. ZEVs accounted for 12.2 percent of all new vehicle sales that month, nearly double the 6.5 percent share recorded a year earlier.

That surge happened before a single Chinese showroom opened in Canada. When BYD's first Greater Toronto Area dealerships open later this year, the market will face its first real test of what genuine competition can do to an industry that has long been insulated from it.

The international context makes the Canadian opportunity even clearer. European Union EV sales rose 51 percent in March as competition and model diversity allowed buyers to easily shift away from traditional cars when oil prices spiked. In the United States, by contrast, EV sales fell yet again in March and have been falling for months as the federal government rolled back incentives and embraced an openly skeptical posture toward electrification.

Canada finds itself between those two trajectories, with an opportunity to choose which path to follow.

Some in Canada have voiced concerns over national security and the protection of domestic manufacturing. But the decision to grant an annual quota of 49,000 Chinese EVs at the most-favored-nation tariff rate — while China has adjusted countervailing measures — reflects bilateral efforts that will ultimately benefit Canadian consumers. In a year when the country lost more than 110,000 jobs in the first four months and consumer confidence has been sliding, the case for shielding a premium car market from competition has become untenable.

Fair and open competition can deliver tangible benefits to ordinary consumers. Chinese EVs will offer Canadian consumers more choices and lower prices, and may even play a role in shoring up the country's automotive industry.

This is not just about geopolitics or trade policy, though it involves both. It is about whether Canadians will be able to buy affordable, efficient vehicles at a time when the cost of the alternative continues to rise. The showrooms are not open yet, and the cars have not yet arrived on dealer lots, but the window that has been opened by this trade deal is real, and it should not be allowed to close.

Hibat-Allah Ezzahid

Adaptability of Chinese firms key to success abroad

Chinese companies are playing an increasingly important role in the global economy today. From advanced manufacturing and renewable energy to infrastructure, logistics, digital technologies, and industrial cooperation, they are transforming production systems and value chains across the world. As Chinese companies continue to expand internationally, the focus is shifting from merely entering foreign markets to operating effectively within diverse institutional, managerial, and cultural environments. While large-scale investments often attract attention, the day-to-day operational realities of globalization are becoming equally important for long-term success.

One major challenge that Chinese companies face is institutional complexity. Many international markets offer attractive macro-level conditions for investment, including political stability, industrial incentives, trade agreements, and strategic locations. However, once companies begin operations, they often face fragmented realities. Administrative procedures may involve multiple agencies with overlapping responsibilities, and regulatory implementation can vary across institutions or regions. Complexities in licensing systems, taxation procedures, labor regulations and documentation requirements may cause delays.

For instance, a Chinese automotive components company facing a three-month delay when importing machinery to Morocco due to complicated customs clearance processes involving several administrative entities suffered disrupted production planning and slowed local recruitment. In response, the company expanded its local legal and administrative team in the host country rather than relying solely on coordination from China.

Another challenge is cross-cultural and managerial coordination. Chinese companies have developed highly effective management systems characterized by organizational discipline, operational efficiency and strong operational commitment. These strengths have driven China's industrial transformation and global competitiveness. However, the workplace expectations, communication styles and professional cultures may differ significantly in global settings. Differences in approaches to hierarchy, communication, working rhythms, and work-life balance can create operational friction within multinational teams.

A Chinese manufacturing company introduced production schedules and overtime practices similar to those in China during a peak production period. But this led to tensions within local teams over overtime expectations and work-life balance. There were also misunderstandings because some local employees perceived the communication style of managers as too direct. In response, the company adjusted working schedules, localized certain HR practices and expanded the role of local middle managers.

Many companies are discovering that management systems cannot simply be transferred across borders. Therefore, Chinese companies are developing more adaptive and internationally integrated management approaches. They are not abandoning their organizational strengths, but combining them with greater local responsiveness and intercultural flexibility. This includes preparing managers for overseas environments, redesigning coordination mechanisms, adapting HR practices, and integrating local leadership into operations. This adaptability is becoming a strategic advantage for Chinese firms globally.

Human capital and localization present another challenge. During the early stages of international expansion, Chinese companies often rely heavily on expatriate teams for coordination and technology transfer. While this model facilitates early operations, long-term international integration requires stronger local participation. Local employees contribute essential knowledge of language, regulations, professional culture and market dynamics.

A Chinese manufacturing company initially depended heavily on expatriate teams for operational supervision, but later faced difficulties in communication with local workers and labor management practices. Misunderstandings often emerged regarding production instructions and workplace expectations because many local employees communicated in the local language rather than Chinese or English. In response, the company hired local supervisors and bilingual coordinators to improve communication and workforce management. Similarly, many Chinese companies are investing more deeply in local talent development, managerial training, and long-term integration.

In several international operations, Chinese companies are also introducing cross-border learning systems that help local employees understand corporate structures, operational standards and organizational culture. Moroccan employees receive technical or managerial training in China before they are given greater responsibilities locally.

This reflects a broader transformation in the globalization of Chinese enterprises. International expansion is no longer just about exporting industrial capacity or building overseas projects. It is also becoming a process through which Chinese companies gain global managerial experience and develop new organizational capabilities. This experience strengthens their expertise in institutional adaptation, intercultural coordination, operational flexibility, and long-term strategic integration. In this sense, globalization is becoming not only a process of international expansion, but also one of organizational learning.

Morocco offers a concrete example of these operational dynamics. Chinese companies operating in Morocco illustrate how operational dynamics can become complex even in a relatively stable and investment-friendly environment.

As Chinese firms deepen their global presence, their long-term success will depend not only on investment and technology, but also on their ability to adapt to diverse institutional and cultural environments.

Hitting back

Tariq M. Malik

China's anti-sanctions law provides a mature legal framework for countering the abuse of sanctions as instruments of coercion

Trade sanctions, designed as instruments of order, justice and responsibility, have increasingly become tools of coercion, commercial exclusion and geopolitical pressure in practice. They disrupt trade, undermine economic development, hinder education and research, damage cross-cultural harmony and instill anxiety in societies that have no direct role in political disputes. When sanctions become coercion, nations have both the right and the responsibility to defend their economic sovereignty, giving rise to the legitimacy of new laws to mitigate those negative effects on the global economy. Modern legal systems already recognize the need for anti-piracy laws to protect navigation, anti-trust laws to prevent market domination, anti-dumping laws to defend fair trade, anti-terrorism laws to protect public security, anti-corruption laws to safeguard institutions and anti-crime laws to preserve social order. Now there is also a need for anti-sanctions laws.

China has already taken action by introducing the Anti-Foreign Sanctions Law of the People's Republic of China, adopted in 2021. Its implementation is not a call for confrontation, but a legal defense against the weaponization of interdependence.

Sanctions are not a meaningful means of engaging in international trade, development or economic cooperation. Trade depends on rules, trust and mutual benefit, while sanctions rely on pressure and exclusion. Economic development requires stable expectations, investment, mobility and long-term confidence, all of which can be weakened when sanctions disrupt normal economic activity. When sanctions restrict finance, shipping, insurance, food, energy, technology or medical supply chains, they not only affect political leaders. They affect businesses, workers, students, patients, consumers and researchers. Small businesses lose suppliers. Banks over-comply out of fear. Scientific cooperation is delayed. Students and scholars face barriers. Cultural exchanges narrow. Suspicion replaces trust; anxiety replaces confidence; exclusion replaces dialogue. In this sense, sanctions harm more than trade and prosperity. They harm values, mental well-being, cross-cultural understanding and education. They weaken the human foundations of globalization itself.

Sanctions rarely achieve their stated political aims. They fail to change targeted nations' behavior, facilitate dialogue, advance peace or build mutual trust. Yet they are described as successful because they "send a message", create pressure, damage transactions or isolate targets — simply a rhetorical success.

The belief in the effectiveness of sanctions persists because they serve lobbying groups, media narratives and political performances. If they cause pain, they are said to be working. If they fail to change behavior in the desired way, more sanctions are demanded. This circular logic turns policy failure into symbolic success. It rewards disruption rather than solutions. It allows policymakers to claim moral seriousness while transferring the real costs of sanctions to ordinary people and developing economies. Sanctions are instruments of global shock that do not manage complexity but inject instability into it. They do not create efficient markets; they distort them. They do not prove moral superiority; they reveal the failure to compete fairly in an open system.

For decades, the language of the free market has been used to defend openness, competition and efficiency through the "invisible hand", a concept purported by many since Adam Smith's conceptualization. Yet crude sanctions reveal the "visible hand" behind the so-called invisible hand. If companies are free only when they obey the geopolitical preferences of powerful states, the market is no longer free. It becomes conditional because sanctions are signs of unwillingness to compete in an open system. When countries cannot win through innovation, productivity, quality, price or cooperation, they may turn to restrictions, bans, financial pressure and technological exclusion. This is not confidence in competition. It is the fear of competition.

wang xiaoying / china daily

The same logic applies to the petrodollar and wider financial structures. For decades, dollar-based systems gave many Western countries and their allies enormous influence over global finance and energy transactions. This was effective because many countries trusted the system as stable and useful since the end of World War II. Yet coercive sanctions are reducing that appeal. The more financial infrastructure is weaponized, the more countries seek alternatives. Excessive sanctions may accelerate the very multipolarity they seek to prevent.

Sanctions create an unequal distribution of costs and benefits. A few actors may gain strategically, commercially or politically. They may capture markets abandoned by competitors. They may redirect investment. They may use compliance systems to strengthen their own dominance. They may present themselves as defenders of morality while turning sanctions into instruments of economic advantage. By contrast, most countries lose. This is especially true for the Global South and South-South cooperation. Developing economies depend on affordable energy, infrastructure finance, technology transfer, food security and stable trade routes. When sanctions disrupt these flows, the damage spreads far beyond the sanctioned countries. It affects ports, logistics, payments, insurance, construction, education and industrial development.

Sanctions punish interdependence, neutrality and countries for maintaining ordinary economic relations. They convert global development into a hostage of geopolitical rivalry. This is why China's anti-sanctions law should be understood not only as a Chinese legal concern, but as part of a wider defence of development fairness. In earlier periods, sanctions could be framed through narrow diplomatic narratives. However, the digitized world today allows people to compare claims, observe double standards, and see the gap between humanitarian language and economic harm. People are less easily persuaded by unsolicited rhetoric. They can see when sanctions damage ordinary citizens while being hyped as a moral action. They can see when "rules" are applied selectively. They can see when pressure is called justice and economic pain is called effectiveness.

An anti-sanctions law gains legitimacy when sanctions themselves lose moral credibility. The greatest danger is not only economic damage. It is lawlessness. If powerful actors normalize coercion without legal restraint, the world risks moving toward a "Wild West" situation in which pressure replaces procedure and force replaces consent. Smaller countries become vulnerable. Leaders may be threatened, isolated, humiliated or targeted through extraterritorial mechanisms. International relations must not be governed by intimidation.

Countries are responding to this foul play by joining, supporting or developing legal frameworks that challenge the misuse of sanctions as instruments of coercion. China's anti-sanctions law is a mature legal framework grounded in clear standards, transparent procedures and credible safeguards against unlawful extraterritorial measures. It provides a clear definition of coercive sanctions, stronger protection for aggrieved entities, more effective remedies and proportionate countermeasures, including the announcement and adjustment of countermeasure lists, prohibitions on compliance with discriminatory foreign restrictions, and the right of affected Chinese citizens and organizations to seek legal remedies. This approach aims to deter escalation rather than encourage it, while reassuring legitimate foreign investors that normal business remains welcome. It also signals that China supports lawful trade, open cooperation and international engagement, but rejects coercion disguised as legal authority.

China is not alone, as many countries in the Global South hold an unfavorable view of unilateral coercive measures and illegal sanctions that affect international trade, development, sovereign equality and sustainable growth. In this sense, anti-sanctions law will become a more inclusive and fair legal response in favor of harmony, peace and prosperity. It tells the world that China and like-minded countries seek to trade, invest, innovate and cooperate, rather than living under intimidation. It tells domestic enterprises that the legal system is moving toward stronger protection. It tells the Global South that development should not be subject to external veto. And it tells the international community that globalization cannot survive if interdependence is turned into dependency. Ultimately, the anti-sanctions law is not merely a response to sanctions. It is a statement about the future of the international order.

Shared cure

Yan Hua

The SCO health cooperation model champions co-governance and capacity building to shape a stable, long-term global health solution

Over the past two decades, the Shanghai Cooperation Organization has forged a distinctive model of health cooperation that delivers a scalable, replicable regional blueprint for fair and effective global health governance.

Requiring no political preconditions and rooted in equal-footed consultation, this framework allows every member to contribute according to its strengths, share benefits equitably and turn fragmented health projects into sustainable, systemic and long-term collaboration.

Above all, the model prioritizes local ownership and long-term capacity building — a choice that empowers communities and medical professionals within SCO countries to master the skills and capabilities needed to independently sustain and develop their own health services for generations.

In an increasingly interconnected world, public health security has become a borderless challenge. In 2025, over 610,000 cholera cases were reported in 33 countries. Antimicrobial resistance is rising 5 to 15 percent annually, with one in six bacterial infections now resistant to standard antibiotics. No nation can stand alone against these transboundary challenges, making inclusive, effective multilateral health cooperation not just a choice, but an urgent global imperative.

Against this backdrop, the SCO has carried out pioneering, practice-proven exploration in health cooperation. Since the first SCO Health Ministers' Meeting in 2010, members have built mechanisms that grow steadily in breadth and depth. The ninth meeting in Bishkek, capital of Kyrgyzstan, in April proposed an SCO health management dialogue platform, a clear milestone signaling that cooperation has evolved into a mature, institutionalized system.

The SCO model operates on a simple but powerful principle: equality, multilateralism and no political preconditions. This is not symbolic partnership — it is real co-ownership. Partnerships are jointly initiated, shaped and led by multiple members.

Take ophthalmology as an example. The SCO National Ophthalmology Alliance was officially launched on Aug 21, 2025, in Tianjin, with 14 founding institutions from 10 countries. Its chair and vice-chairs are held collectively by experts from China, Russia, Kazakhstan, Uzbekistan, Kyrgyzstan and Tajikistan. The alliance's secretariat is based at the Tianjin Medical University General Hospital, which undertakes the core organizational work of daily coordination and academic exchanges for the alliance, but all critical decisions are made through equal consultation, with no single state dominating.

This co-governance structure is not a ceremonial formality, as it is successfully replicated and institutionalized across other key fields. In September 2025, the SCO Forum on Traditional Medicine in Nanchang, Jiangxi province, drew about 200 delegates from 13 countries and launched a trilingual information exchange platform. In October, a five-year training program for traditional medicine practitioners began in Tianjin, already supporting exchanges of over 100 specialists from various SCO countries. China and other SCO countries have also co-established nine traditional medicine centers in different countries.

Every initiative springs from genuine demand and voluntary contribution. This voluntary, demand-driven approach ensures that cooperation addresses real, on-the-ground needs rather than externally imposed priorities.

Flowing naturally from this co-governance principle, the SCO model prioritizes local ownership and capacity building in favor of sustainable self-sufficiency, rejecting short-term, one-way donations. The evidence of this focus is clear and compelling across multiple sectors.

wang xiaoying / china daily

In emergency medicine, capacity building takes the form of training and equipment designed for local self-sufficiency. A bronchoscopy training base set up in Beijing last year has begun training SCO member clinicians on ventilator use and field rescue airway management, with plans to donate equipment — but crucially, the donation is paired with intensive hands-on instruction, so that local teams can fully operate and maintain the gear long after the external trainers leave.

Ophthalmology offers another direct measure of both local ownership and capacity building, through immersive hands-on training, direct surgical skill transfer to local professionals, and the establishment of health centers now fully operated and managed by local staff.

By the end of August last year, Chinese medical teams from various hospitals such as Tianjin Medical University General Hospital had traveled to SCO countries to conduct more than 2,300 free cataract surgeries, exceeding the three-year pledge of 2,000 surgeries for SCO citizens.

Crucially, these missions are paired with local training: Uzbek surgeons worked side by side with visiting teams, learning by doing and mastering techniques in real clinical settings.

Hands-on training has also taken the form of fellowships. As a first step, in December 2025, two Tajik ophthalmologists completed a fellowship at Tianjin Medical University General Hospital under the SCO National Ophthalmology Alliance arrangement, focusing on complicated cataracts and glaucoma. The hospital designed a systematic training program covering the entire process of preoperative assessment, surgical techniques and postoperative management, guaranteeing that the visiting doctors could independently perform complex surgeries upon returning to their home countries.

Other than skills transfer, local ownership also extends to facility management. Under the SCO collaboration, blindness prevention centers established in Kyrgyzstan and Uzbekistan are now managed by local staff members — not by expatriates. Similar collaborative efforts have also taken place in Tajikistan.

These tangible achievements prove that the SCO model delivers large-scale, life-changing outcomes while systematically transferring professional skills and management ownership to local personnel.

The SCO's broader health infrastructure reinforces this approach.

The SCO hospital cooperation alliance, founded in 2018, now includes 134 hospitals across SCO countries. The China-SCO emergency medicine cooperation center has been established as the first professional platform under the SCO framework dedicated to emergency rescue. In February, the China-SCO cooperation center for metabolic disease pledged to train 2,000 metabolic disease experts within three years.

In the field of ophthalmology, Tianjin Medical University General Hospital has also taken the lead in establishing an online academic exchange platform for the SCO, integrating surgical mentoring, fellowship training, and localized management of blindness prevention centers into a fully scalable capacity-building model.

This is the defining essence of the SCO model: training local professionals to independently sustain and expand health services, and building lasting self-sufficiency rather than permanent reliance on external teams.

Of course, challenges remain.

Divergent medical regulations and approval procedures hinder cross-border drug and device flows. Language and diagnostic standards limit telemedicine and academic exchanges. Long-term funding is not yet fully secured. These pressing issues are high on the agenda of health ministers' meetings, with members committed to pursuing systemic, cooperative solutions.

Looking ahead, SCO health cooperation will deepen further: A unified online platform for academic and technical cooperation, mutual recognition of medical qualifications, and a decisive shift from project-based cooperation to institution-driven cooperation could emerge. Institutionalizing these mechanisms is the strongest sign that SCO health cooperation has fully matured beyond its early experimental phase into a stable, long-term governance framework.

The SCO model is pragmatic and a work in progress. But judged by its concrete, life-improving outcomes — thousands of medical professionals in training pipelines, and multilateral platforms spanning ophthalmology to metabolic diseases — the evidence is unambiguous: This approach delivers real results while respecting every member and building lasting local capacity.

The SCO health cooperation is a truly inclusive multilateral endeavor where all parties participate, contribute and benefit equally. Rooted in the region yet open to the world, it can grow from a successful regional practice into a valuable, actionable reference for global health governance — and a solid contribution to building a global community of health for all.

Home brands sharpen sport sponsorship

Firms pursuing dynamic, co-creative strategy with 2026 FIFA World Cup

By LI JING
lijing2009@chinadaily.com.cn

When the 2026 FIFA World Cup officially kicked off across the United States, Canada and Mexico this month, Chinese brands are less visible among top-tier sponsors than they were four years ago.

Only three Chinese companies — Lenovo, Hisense and Mengniu Dairy — remain among FIFA partners and FIFA World Cup sponsors, a sharp contrast to the wave of Chinese sponsorship that dominated stadium billboards during recent tournaments.

Yet the shift comes despite FIFA reporting its strongest commercial performance on record. The governing body said in March that all 16 global sponsorship positions for the 2023–26 cycle had been sold, making it the most successful commercial program in its history. Total revenue for the cycle is budgeted at nearly $13 billion.

But business leaders and researchers say the decline in sponsorship numbers does not signal waning interest from Chinese companies. Instead, it reflects a broader shift in how Chinese companies are using global sporting events to support going global strategies.

Rather than buying visibility alone, companies are increasingly treating the World Cup as a platform to demonstrate technology capabilities, strengthen brand positioning, deepen consumer engagement and expand their global footprint.

"It is a transition from a traffic-driven mindset to an effectiveness-driven mindset," said Hu Shan, principal at consultancy company Roland Berger. "Companies are paying much closer attention to return on investment and alignment with their global expansion strategies."

For Qiao Jian, senior vice-president of Lenovo, the shift can be summed up as a move from participants to co-builders.

"What Chinese companies export today is no longer a single product," said Qiao, who is also chief strategy officer and chief marketing officer of Lenovo.

"Increasingly, they are exporting integrated technology capabilities and becoming part of the infrastructure that powers global events."

The shift is becoming increasingly visible at the World Cup, where Chinese companies are moving beyond traditional sponsorship and embedding themselves into tournament operations.

For Lenovo, whose annual revenue reached a record $83.1 billion in fiscal year 2025/26, the World Cup serves as a showcase for its hybrid AI strategy as it seeks to expand higher-margin infrastructure and enterprise businesses globally. AI-related revenue accounted for roughly one-third of Lenovo's revenue during the past fiscal year.

Lenovo, FIFA's official technology partner, is supplying more than 17,000 devices and deploying more than 350 engineers across all 16 World Cup venues. The company is also introducing AI-powered digital twin technology capable of generating three-dimensional replicas of players and match situations.

"The World Cup is the world's largest AI testing ground," Qiao said.

Top: The billboard of Hisense catches the eye during the group A match between Mexico and South Africa during the 2026 FIFA World Cup at Mexico City Stadium in Mexico on June 12. yin gang / for china daily **Middle:** Merchants purchase plush toys related to the 2026 FIFA World Cup participating teams at Yiwu International Expo Center in Zhejiang province on May 12. gong xianming / for china daily **Above:** A visitor checks out 2026 FIFA World Cup authorized products at a FIFA themed official store in Hangzhou, Zhejiang province, in June. dong xuming / for china daily

She said the company views the tournament as an opportunity to demonstrate how its end-to-end AI infrastructure can support one of the most complex global events ever staged, far more than a conventional marketing campaign.

Hisense represents a similar evolution.

The company's overseas revenue now accounts for roughly half of total sales, according to company data, reflecting the importance of international markets in its strategy.

Having used the 2018 and 2022 World Cups to build brand visibility, the company is now moving deeper into tournament operations. As FIFA's official display technology partner for the video assistant referee system, Hisense provides RGB Mini LED display technology used in officiating operations during the tournament.

"Chinese companies are no longer simply buying advertising boards around stadiums," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

"They are becoming part of the technological infrastructure behind major international sporting events."

While China's established global brands are embedding themselves into FIFA's technology ecosystem, a broader group of Chinese consumer brands is pursuing a different path.

Rather than paying for official tournament sponsorship rights, many companies are partnering with national teams, soccer stars, influencers and local digital platforms to target specific consumer groups in overseas markets.

The home-robotics and smart-appliance maker Dreame Technology recently signed Portuguese soccer icon Cristiano Ronaldo as a global brand ambassador ahead of the tournament.

For Dreame, whose overseas business accounted for nearly 80 percent of total revenue in 2025, the World Cup is less about introducing the brand to consumers and more about strengthening brand recognition and emotional connection.

Chang Xinwei, global president of Dreame Technology, said the era of "buying exposure and hoping for results" was fading.

Consumers increasingly place greater trust in recommendations from content creators, communities and personalities they identify with than traditional advertising, he said.

"The goal used to be getting people to see us," Chang said. "Now it is getting people to want to engage with us."

Other Chinese brands have adopted similar approaches.

Luckin Coffee, Changan Automobile and Cotti Coffee are among companies that have partnered with national teams including Portugal and defending champion Argentina, targeting highly engaged fan communities rather than mass audiences.

The strategy allows companies to target specific markets at a fraction of the cost of official FIFA sponsorship while generating more measurable returns.

Analysts say the shift reflects a broader evolution among Chinese companies as they move from gaining awareness overseas to building long-term brand equity development.

"In the past, many Chinese brands used global sporting events to establish basic awareness," Wang said. "Today, they are increasingly using those events to strengthen positioning in mid- and high-end markets and deepen engagement with consumers."

Beyond the marketing, Chinese companies remain deeply embedded in the commercial and industrial ecosystem surrounding the World Cup.

From officially licensed merchandise and consumer products to display technologies and digital infrastructure, Chinese firms continue to play an important role in the tournament's supply chain.

In Yiwu, Zhejiang province, a global hub for small commodity manufacturing, local manufacturers have long produced World Cup-related goods ranging from flags to souvenirs.

According to estimates from the Yiwu sporting goods industry association, Chinese manufacturers accounted for roughly 70 percent of the global World Cup merchandise supply during the 2022 tournament in Qatar.

While no comparable estimate exists for 2026, customs data suggest continued strong demand. Yiwu exported 2.83 billion yuan ($418.5 million) worth of sports goods and equipment in the first quarter, up 12 percent year-on-year.

Some companies are also leveraging FIFA licensing programs to sell authorized products, while others are expanding into ticketing, hospitality and travel services for soccer fans travelling overseas.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said the World Cup increasingly highlights China's role as a provider of industrial capabilities rather than simply low-cost manufacturing.

"The strength is not just producing a product," Zhou said. "It is coordinating an entire supply chain."

He said China's competitive edge lies in dense industrial clusters capable of delivering quality, scale and speed simultaneously.

The trend mirrors a broader shift among Chinese exporters, which are increasingly investing in product development, branding, intellectual property and global operations as they expand overseas.

Economy of sports more than merely on-field action

Reporter's log

By Li Jing

I am not what you would call an avid soccer fan.

I rarely follow league standings, transfer rumors or match schedules. Yet as the 2026 FIFA World Cup kicked off, I found myself paying attention anyway.

Not because of the soccer.

But because of Labubu.

Pop Mart's designer toy with its toothy grin made a surprise appearance during the World Cup opening ceremony. Within hours, Chinese social media exploded with chatter, and one of the most popular quips was that while Team China failed to reach the World Cup, Labubu had made it onto soccer's biggest stage.

As someone who does not regularly watch soccer, I was suddenly following World Cup-related stories. I was checking social media reactions, reading reports about limited-edition merchandise and monitoring travel data linked to host cities.

The experience reminded me that the world's biggest sporting events are no longer just sports competitions. They have become vast consumer platforms capable of reaching people far beyond traditional fan bases.

Labubu's World Cup collaboration products quickly sold out on Chinese e-commerce platforms, while some limited-edition items began trading at significant premiums on the secondary market.

At the same time, Chinese travel agencies reported growing interest in visiting World Cup host cities across the United States, Canada and Mexico. Online travel portal Tongcheng Travel said searches for World Cup-related travel packages jumped 166 percent week-on-week in the period leading up to June 2, while bookings and inquiries for customized viewing trips also surged.

A successful sports IP can create value far beyond ticket sales. It can drive tourism, hospitality, retail, advertising, merchandise, media rights and urban branding. The event itself may last a few weeks, but its commercial ecosystem can operate year-round.

China is increasingly trying to tap into that potential. The 2026 Government Work Report explicitly called for efforts to "actively develop the sports economy", placing it alongside tourism and wellness as areas with significant consumption potential.

Su Super League, an amateur soccer competition in Jiangsu province, has become a social-media sensation. What started as a regional competition has evolved into a celebration of local identity, generating traffic for restaurants, hotels and tourist attractions across participating cities.

In Guizhou province, the grassroots Village Super League, or "Cun Chao", has blended soccer with ethnic culture, music and tourism, drawing visitors from across the country. Local authorities say sports-related events generated billions of yuan in tourism and consumer spending last year.

"The overall commercialization of China's domestic sports IPs is still at a relatively early stage," said Wang Xueli, director of the center for development of sports industry at Tsinghua University's School of Economics and Management.

While organizers have become increasingly successful at attracting sponsors, areas such as sponsorship activation, audience targeting, brand-event alignment and year-round content operations still have significant room for development, Wang said.

That distinction helps explain why events such as Su Super League and Cun Chao can generate enormous online attention but still differ from global properties such as the World Cup, the Olympics or the Australian Open tennis tournament.

FIFA's decision to embrace IPs like Labubu was not simply a cultural gesture. It reflected a broader effort to expand the tournament's appeal beyond traditional soccer audiences and connect with younger consumers through popular culture.

Perhaps that is the most important lesson for China's sports economy.

The country has already shown it can create sporting events that generate excitement and attract massive online audiences. The next challenge is transforming those moments into sustainable business models that continue creating value long after the final whistle.

Because the real measure of a successful sports economy is not whether an event goes viral.

It is whether the crowds, spending and attention remain after the teams have shaken hands.

Stimulating domestic demand high on agenda

EAGLE EYE
By Xu Gao

The 2026 Government Work Report identifies the development of a strong domestic market as the top priority for China's economic agenda this year. At a time when the global economy is undergoing profound changes, rising unilateralism, increasing trade protectionism and persistent geopolitical uncertainties are creating greater instability for external demand.

Against this backdrop, expanding domestic demand has become a strategic anchor for China's economic resilience. The report stresses the need to expand domestic circulation and strengthen the internal drivers of growth in order to better withstand external shocks.

Within this framework, effective investment plays a central role in building a strong domestic market. The Government Work Report calls for coordinated efforts to boost consumption and expand investment, while emphasizing the need to fully unlock the potential of effective investment and leverage China's ultra-large market advantages.

As one of the two key components of domestic demand, alongside consumption, investment remains equally important for sustaining long-term growth.

In China's economic development model, consumption represents the ultimate goal, while investment serves as an essential means to achieve it. The people-centered nature of economic growth is reflected in the continuous expansion of consumption, which remains a top policy priority in efforts to expand domestic demand.

However, sustained consumption growth cannot be achieved without investment. Consumption heavily relies on investment-driven capital accumulation and income growth across society. At the same time, new forms of investment generate new supply, which in turn creates new demand. This dynamic interaction between supply and demand has become increasingly important in China's development strategy.

The outline of the 15th Five-Year Plan (2026-30) emphasizes the need to use new demand to guide new supply and new supply to create new demand, promoting a virtuous cycle between consumption and investment, as well as achieving a higher-level dynamic balance between supply and demand.

It also calls for integrating investment in physical assets with investment in people, and for greater emphasis on consumption-boosting and livelihood-related spending in fiscal policy.

When consumption is relatively weak, investment tends to account for a larger share of economic activity, helping to stabilize growth. As a developing economy with a large population, China still has significant room for investment-led development.

Although China's total economic output ranks among the highest in the world across multiple indicators, per capita levels remain relatively low in many areas. For example, while China's total electricity generation has long ranked first globally, per capita power generation remains less than 60 percent of that of the United States.

Against the backdrop of rising demand from artificial intelligence and digital technologies, investment in power supply capacity remains an important area of development.

At the same time, increasing global uncertainty and supply chain risks highlight the need for China to strengthen domestic industrial chains and reduce potential "bottleneck" constraints.

Even in the relatively weak property sector, there remains significant demand for improved housing conditions, requiring continued investment in better-quality residential development.

Taken together, these factors indicate that China still has broad upside potential for effective investment to address structural shortcomings in its development model.

A key issue in expanding effective investment lies in how investment returns are evaluated. Misunderstanding or incomplete assessment of investment returns can lead to a weakening of investment incentives.

In practice, investment returns can be understood through three layers: micro returns, regional social returns and national strategic returns.

Micro returns refer to direct financial returns of an investment project, typically measured by cash flow and internal rates of return. This is the most commonly used metric in market-based investment decisions. If expected returns exceed financing costs, the project is considered viable; otherwise, it is not.

However, focusing only on micro returns overlooks broader social benefits.

"Regional returns" refer to the broader economic and social value created within a local area. Infrastructure investment — such as roads, subways and public parks — often falls into this category. While such projects may not generate high direct financial returns, they significantly improve urban functionality and quality of life.

Beyond this, there are also "national returns", which reflect the strategic and long-term benefits of investment at the country level. These include contributions to employment, economic stability, regional coordination and national security.

Illustration generated by AI

For example, transportation infrastructure projects ranging from rural road networks to major railway lines in western China play an important role in promoting rural vitalization and balanced regional development.

Different types of investors naturally focus on different layers of returns. Market entities typically prioritize micro returns, as they operate under commercial principles. However, if all investment decisions are guided solely by micro profitability, socially beneficial projects with weak financial returns may be underfunded or neglected.

This is particularly relevant in infrastructure development. Many infrastructure projects are not financially profitable at the project level, yet they generate substantial social and economic benefits. Without government involvement, such projects often struggle to obtain financing.

China's infrastructure development experience demonstrates the importance of taking into account both regional and national returns. The practice of local governments engaging in urban development has played an important historical role in mobilizing investment.

In China, public ownership of land has also provided a unique institutional foundation. As urban infrastructure improves the quality of life in cities, it also increases the value of land held by local governments, allowing part of the social value created by infrastructure investment to be realized through fiscal channels.

This mechanism has enabled many local governments to balance costs and returns across both micro and regional dimensions, forming a sustainable model for infrastructure financing and urban development.

Another important dimension of investment concerns debt and financial sustainability.

China's investment-to-GDP ratio has remained significantly higher than the global average for a long period. Since investment necessarily involves financing, and China's financial system is predominantly debt-based, investment growth is closely linked to rising debt levels.

However, concerns about debt risks should not be assessed solely by looking at the absolute size of debt. A more important factor is the relationship between domestic savings and debt demand.

In a "savings-debt market", savings represent the supply of capital while debt represents demand for capital. If savings are in surplus relative to borrowing demand, then even a high level of debt does not necessarily point to high risks.

China is a high-savings economy. The International Monetary Fund estimates that China's savings rate in 2025 was around 42 percent, nearly double the global average of 23 percent. At the same time, China's net international investment position exceeded $4 trillion, indicating a large accumulation of overseas assets.

Against this backdrop of excess savings, China's relatively high debt level does not necessarily translate into high systemic risks.

Concerns about local government debt are also often linked to incomplete consideration of regional and national returns on investment. While infrastructure projects may appear unprofitable at the micro level, their broader economic and social benefits are significant when assessed from a wider perspective.

In recent years, China has strengthened efforts to manage local government debt risks, including the implementation of a comprehensive debt restructuring package and the replacement of hidden debt. The Government Work Report also proposes further optimization of local government bond issuances to support project financing.

The Government Work Report outlines a range of policy tools aimed at expanding effective investment.

On the government side, China plans to allocate 755 billion yuan ($112 billion) of central budgetary investment and 800 billion yuan from ultra-long special treasury bonds for major national strategic projects and security capacity-building initiatives. Standards for central investment subsidies will also be adjusted to better support priority areas.

At the local level, the issuance quota of special-purpose bonds will be increased and better aligned with regions that have well-prepared projects and demonstrate efficient use of funds.

In addition, China plans to issue 800 billion yuan in new policy-oriented financial instruments to mobilize more private capital for investment.

First national-level special plan for urban regeneration issued

Main st Reet
By Fan Sibin

Recently, the State Council, China's Cabinet, issued an urban regeneration plan for the 15th Five-Year Plan period (2026-30). As China's first national-level special plan for urban regeneration, it marks the elevation of urban regeneration from an institutional and mechanism-building effort to a medium-to-long-term, overarching national strategy.

The release of the plan has drawn significant attention and sparked lively discussions across society. At a time when China's urban development is shifting from large-scale expansion to stock-based quality improvement and efficiency enhancement, the plan carries great significance.

It systematically sets out the goals, targets, key tasks and policy safeguards for urban regeneration over the next five years, outlining a vision and pathway for building modern people-centered cities.

Urban regeneration is closely linked to the daily lives of the people. Since the fifth plenary session of the 19th Central Committee of the Communist Party of China proposed the action of advancing urban regeneration, a series of livelihood, safety and development projects have been implemented to address pressing public concerns. As a result, urban regeneration has been widely welcomed and closely followed by the public.

Following last year's guidelines on advancing urban regeneration campaign issued by the general offices of the Communist Party of China Central Committee and the State Council, the plan represents the first key dedicated plan at the national level in the field of urban regeneration.

It not only reflects the continuous improvement of the top-level design for urban regeneration, but also underscores the fact that urban regeneration serves as both an important lever for building modern people-centered cities and a national strategic initiative crucial to the implementation of the new development philosophy and the long-term competitiveness of cities.

Looking back at the 14th Five-Year Plan period (2021-25), local pilot projects flourished across the country. With the launch of this plan, the national institutional framework has become more robust, overall coordination has strengthened, and urban regeneration has entered a new phase characterized by institutionalization, long-term effectiveness and market-driven mechanisms.

The plan fully aligns with the goal of building modern people-centered cities. Centered on the objectives of "innovation, livability, beauty, resilience, civility and intelligence", it comprehensively lays out six key tasks, seven policy measures, and 14 major projects and initiatives, systematically establishing the goals, tasks and roadmap for urban regeneration.

First, for the first time, it uses quantitative targets to define the urban regeneration "scorecard". This is one of the most closely followed highlights of the plan. Ten key targets are set, including: by 2030, renovating 500,000 dilapidated urban residential units; starting the renovation of 115,000 aging residential communities; upgrading 1,500 old neighborhoods and factory compounds; reconstructing 365,000 kilometers of underground pipelines; and restoring 15,000 historic buildings.

These quantifiable and assessable indicators closely integrate urban regeneration with the construction of modern people-centered cities, providing clearer goals and assessment criteria for urban regeneration work.

Second, the plan fully embodies a people-centered approach while also addressing the strategic needs of expanding domestic demand, boosting investment, stimulating consumption and pursuing development.

It outlines six key tasks and 14 major projects and initiatives. This "task list" reflects a combination of investment in physical assets and investment in people.

The plan calls for the construction and renovation of quality housing, the renovation of aging residential communities and the development of complete communities — all major projects that improve people's livelihoods — across different spatial levels, creating high-quality urban living environments.

At the same time, the plan places particular emphasis on fostering new drivers of urban growth. It explicitly proposes revitalizing idle and inefficiently utilized resources such as old factories and underused commercial office spaces; promoting the transformation and upgrading of aging neighborhoods, factory compounds and inefficient industrial parks; cultivating emerging industries; and upgrading consumption infrastructure.

This means that urban regeneration also serves as a strategic lever for reshaping urban growth drivers and unlocking domestic demand potential.

Third, the plan introduces a policy system for sustainable urban regeneration through reform and innovation. The third plenary session of the 20th CPC Central Committee explicitly called for "establishing a sustainable model and policy-legal framework for urban regeneration".

The plan devotes a full chapter to specific arrangements for building a policy system for urban regeneration during the 15th Five-Year Plan period, outlining a roadmap for reform and innovation.

It directly addresses the difficulties and bottlenecks encountered in urban regeneration practice, focusing on seven key areas: implementation mechanisms, financial guarantees, land use, building safety, multi-stakeholder participation, laws and standards, and technology and talent.

The aim is to accelerate the development of a comprehensive, well-coordinated and efficient policy system for urban regeneration, providing solid support for orderly, routine and long-term urban regeneration.

Over the next five years, as the plan is implemented, urban regeneration will move rapidly from blueprint to reality in people's daily lives. It is likely to see continued improvements in cities: better housing, safer and more livable communities, more vibrant neighborhoods, lively blue-green spaces, more attractive consumer destinations and more innovative industrial parks.

According to estimates by multiple institutions, the total market size for urban regeneration during the 15th Five-Year Plan period will exceed 15 trillion yuan ($2.22 trillion). These figures will translate into tangible improvements for the people — better urban living environments, stronger economic dynamism and higher governance standards.

As time moves forward, with the high-quality and sustainable advancement of urban regeneration under the guidance of the plan, Chinese cities are poised for another qualitative leap in the new era. Modern people-centered cities that are innovative, livable, beautiful, resilient, civil and intelligent are steadily coming into view.

The writer is director of the Research Institute of Urban Regeneration at the China Academy of Urban Planning and Design.

Universities cater to AI study demand

Action plan fuels rapid expansion as the need for talent cultivation grows

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Artificial intelligence has become one of the most popular majors across China's institutions of higher education. More than 600 universities have launched AI undergraduate programs as of 2026, based on data from the Ministry of Education, marking explosive growth from just 35 institutions approved in 2018.

According to financial media outlet Yicai, among China's "Double First-Class" universities — the country's elite tier of institutions of higher education — at least 90 have launched AI-related schools or colleges.

The rapid expansion has been driven by a powerful convergence of national strategy and market demand.

In April, the Ministry of Education, together with four other central government departments, jointly issued an action plan outlining comprehensive measures for AI talent cultivation, application innovation, infrastructure development and ecosystem building.

The plan calls for making AI a public foundational course in higher education, creating new interdisciplinary programs and exploring new models for cultivating top-tier AI talent. The move followed the release of the 2026 undergraduate program catalog by the Ministry of Education in the same month. The catalog added 38 new undergraduate majors, including AI for business, embodied intelligence and brain-computer science and technology.

Universities are not merely adding new departments; they are fundamentally restructuring their academic ecosystems around AI. MyCOS, an education research institute, noted that when institutions establish AI schools, they often do not start from scratch. Instead, they consolidate existing computer science, big data and automation programs into new academic units.

Fudan University has rolled out a three-tiered AI curriculum system aimed at achieving 100 percent coverage across all undergraduate and graduate students, first-level disciplines and majors, according to a report from the university.

Ningbo University now requires every major to offer at least one "AI+" interdisciplinary course. Tsinghua University has emphasized an "AI+X" model that integrates AI across all disciplines, according to the official websites of both universities.

China's core AI industry was valued at more than 1.2 trillion yuan ($177 billion) in 2025, according to a Xinhua News Agency report quoting a senior Chinese official.

Yet demand for talent is far outstripping supply. Projections from McKinsey & Company suggest China could face a shortage of up to 4 million AI professionals by 2030. This "AI+" transformation extends beyond traditional technology fields.

Rao Yanting, an associate researcher at the China National Academy of Education Sciences, told China Central Television that AI is no longer just a major but is increasingly permeating every academic field, including not only science and engineering but also the humanities and social sciences.

However, as universities race to establish AI credentials, prominent voices in academia are raising concerns about sustainability and educational quality.

Fang Fuquan, president of Capital Normal University, told Beijing News that AI is a technology rather than a science.

Just as humanity's understanding of the universe relies on fundamental sciences such as the periodic table and Newton's laws, an excessive focus on technology at the expense of mathematics, physics, chemistry, biology and even humanities and the arts could have unintended consequences, he said.

He warned that people may lack the knowledge to distinguish truth from falsehood in AI-generated videos that defy physical laws.

Fang said that while there is widespread pursuit of quick results and greater emphasis on AI applications, universities must guide students to build a solid foundation in basic sciences alongside technological skills.

"Society should foster an ecosystem where not everyone needs to work on AI applications," he said. "Those who pursue basic sciences, humanities and the arts can also become outstanding talents."

"Science has its contingencies; a discipline that is obscure today may flourish in a few years," he said, calling for a more scientific and forward-looking evaluation system.

During the April action plan announcement, Jin Li, president of Fudan University, said AI models are iterating every few months, and what is popular today may become obsolete tomorrow.

"If universities are still training 'finished-product' talent, that's like clinging to a sword while crossing a river," he said.

Jin often uses a metaphor to describe the type of talent universities should cultivate.

"We should cultivate 'stem cell-style' talents — people who can quickly establish cognitive frameworks in unknown domains, integrate resources across disciplinary boundaries and continuously iterate in the face of failure," he said.

Robo greeting

A humanoid robot shakes hands with a student at Hangzhou Anjilu Experimental School in Zhejiang province on Saturday as candidates arrive for Hangzhou's senior high school entrance examination. Rite of remembrance

Performers present a ceremonial music-and-dance tribute at a public memorial ceremony honoring Fuxi, the legendary ancestor of Chinese civilization, in Tianshui, Gansu province, on Sunday, which fell on the summer solstice. Known as the birthplace of Fuxi culture, the city hosts the annual rite, which was inscribed on China's national intangible cultural heritage list in 2006. feng lekai / for china daily

DPRK painters in Mudanjiang display artistic bonds

By **ZHOU HUIYING** in Harbin
zhouhuiying@chinadaily.com.cn

Over the past 15 years, more than 40 artists from the Democratic People's Republic of Korea have been invited to display their artistry on a canvas at "the creation base of the DPRK painters in China" in Mudanjiang, Heilongjiang province.

The base, which was established in August 2011, is the only one of its kind that the DPRK has set up overseas. It is used to create, exhibit and sell works of art from the DPRK, according to Cheng Wujun, the director of the base. The base serves as a bridge for cultural exchange between China and the DPRK, introducing authentic DPRK paintings to the Chinese market.

Since its establishment, DPRK artists have been stationed at the base for on-site creation and customized artworks tailored to the needs of collectors and businesses.

"The face-to-face creative exchange is unique in the DPRK foreign art cooperation, offering a unique cross-border artistic collaboration," said Cheng.

The DPRK paintings are known for their pure and simple creative philosophy, distinct artistic style and rigorous realism.

Their distinctness portrays realistic styles, unique emotional interpretation and strong feelings of national pride, all of which reflect the DPRK people's aspirations for peace, Cheng said.

The DPRK awards artists titles such as "People's Artist" and "Meritorious Artist", representing the highest standards in the country's art community.

"The base has always undertaken important functions such as the exhibition and sale of the DPRK works, authenticity identification, artist exchange and market regulation," Cheng added. "The base integrates high-quality works from major DPRK creation studios, providing collectors with authoritative certification, unified numbering certificates and authenticity identification services."

In 2012, Cheng was awarded the honorary title of "cultural ambassador for the DPRK-China art exchange" by the DPRK government — the only foreigner to receive the title to date.

Over the years, Cheng has brought contemporary DPRK paintings to exhibitions across various regions in China, including Harbin in Heilongjiang province, Xi'an in Shaanxi province, Guangzhou in Guangdong province, as well as Shanghai and Beijing.

"The DPRK paintings have distinct characteristics — bright and vivid colors, which give a positive and cheerful impression," he said. "The DPRK artists left me with the deepest impression of their professionalism and dedication."

"For instance, before returning to their accommodation after work every night, they ensure that the oil paints, paper and surrounding areas in front of the easel are clean," he said. "Their rigorous professionalism is evident. To paint a sunrise, they will ask the client what time he needs the sunrise to be depicted — 5, 6, or 7 am — as the sun's height, brightness, shadow effects and color differences are vastly different."

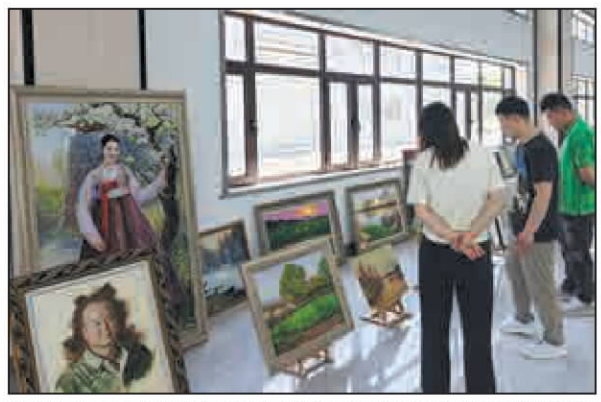
In April 2023, Cheng established a new creation base in Dalian, Liaoning province, and exhibited some DPRK paintings at the Dalian Wanzhongyuncang Technology Incubation Park.

"The works created by the DPRK artists displayed in our exhibition hall have attracted many visitors," said Jin Lin, director of the park's business development and operations department. "The natural scenery and folk customs depicted in the paintings are very detailed, with bright colors, making visitors feel calm and have a taste of life and history." According to Jin, nearly 100 works have been sold from the park so far.

Shang Shuke, an art collector in Dalian, started collecting the DPRK paintings around 10 years ago.

"In 2014, a friend introduced me to the base, so I traveled to Mudanjiang to visit the exhibition hall at the base and picked out some works by old DPRK artists from the 1950s and 1960s," he said. "The DPRK artists have deep artistic skills, with exquisite realism, delicate and lively brushwork and elegant and refined color tones."

"The creators are genuinely dedicated to art, not creating for profit, so the works are pure and simple in style, with strong artistic quality," he added.



Another collector, Peng Fengjiao, has expressed a fondness for the gentle and elegant artistic temperament of the DPRK paintings.

"They are not only exquisite art pieces for decorating life but also a stable collectible choice," she said. "Sometimes, I picked some of the DPRK works I collect as cultural gifts to my artistically-inclined friends, which were well received."

Yun Ju-hyok, the DPRK representative at the base, is now engaged in creative work in Dalian, leveraging his unique perspective to gradually introduce a series of outstanding modern and contemporary DPRK artworks to China.

"The DPRK art, based on subjective realism, uses concise, lively and realistic depictions, which are loved by both DPRK and Chinese people," he said. "After coming to China, the DPRK artists were also amazed by the profound influence of Chinese culture."

"In January 2019, I led five DPRK artists to hold an art exhibition in Taiyuan, Shanxi province," he said. "During the visit to the famous historical sites and museums in Taiyuan, they were full of praise for the breadth and depth of Chinese culture, which deeply touched them and gave them a new understanding and appreciation of China."

Visitors appreciate the DPRK paintings on display in the exhibition hall at the Dalian Wanzhong Yuncang Technology Incubation Park in Dalian, Liaoning province, in early June. Provided to China daily

Chifeng model offers insight on land rehabilitation

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

China's experiences in grassland ecosystem restoration and desertification control, particularly in Chifeng, Inner Mongolia autonomous region, have provided valuable insights for global land rehabilitation and grassland conservation, international experts said at a conference recently held in the city.

Experts highlighted the country's achievements in desertification prevention, related scientific research and the use of technologies such as artificial intelligence and multi-source remote sensing.

The three-day event, held last week, brought together experts from China, South Africa, Japan and the Netherlands.

Participants engaged in interdisciplinary and cross-regional dialogue to explore innovative approaches to grassland protection and comprehensive desertification control, seeking to contribute scientific solutions for land degradation management, ecological civilization building and global sustainable development.

The event was jointly organized by Shanghai Jiao Tong University's School of Design, the university's Inner Mongolia Research Institute and the desert scientific exploration committee of the China Association for Scientific Expedition.

Johns Muleso Kharika, a representative of the secretariat of the United Nations Convention to Combat Desertification, emphasized the need for the international community to support policymaking backed by scientific evidence. He called for stronger cooperation between the Global North and Global South, as well as among international partners, to advance practical actions in land protection and grassland restoration.

"Effective management of desertification requires integrating ecological restoration with innovation in social mechanisms. The ecological restoration practices in Inner Mongolia and China as a whole can serve as important references for global desert management," said Michael Meadows, former president of the International Geographical Union and an emeritus professor at the University of Cape Town in South Africa.

During the event, experts conducted field studies in the Horqin Sandy Land, where they observed innovative sand-control models that combine road construction, sand stabilization and industrial development. They also visited a cold and arid apple and pear breeding base in Chifeng that preserves more than 90 varieties of economic forest resources.

At a newly established cherry experimental field, experts discussed the introduction and collection of superior local varieties with staff members.

The field visits showcased Chifeng's innovative practices in sand control and seed breeding, providing references for regional ecological management and the high-quality development of the forestry and grassland industries, participants said.

Piao Ying, an official in Chifeng, said that despite notable progress, ecological management remains a challenging task for a city located at the junction of the Horqin and Hunshandake sandy lands.

"The city must make better use of technology to safeguard the northern ecological barrier, move from experience-based management to precision-targeted interventions and strive to develop governance models that are replicable and scalable," he said.

Some experts also proposed new governance pathways. Li Xiaosong, a researcher at the Chinese Academy of Sciences' Aerospace Information Research Institute, said large vertical models for sand control could help address issues such as insufficient scientific zoning, weak process supervision and inadequate decision-making support.

"By integrating remote sensing, monitoring, knowledge databases and socioeconomic data, such models can support sand hazard diagnosis, governance plan generation, process supervision and effectiveness evaluation, paving the way for a shift from experience-driven management to precision and intelligent sand-control governance," he said.

Editor's note: *As protection of the planet's flora, fauna and resources becomes a global priority, China Daily is publishing a series of stories to illustrate the country's commitment to safeguarding the natural world.*

Former barren county transformed into beacon of sustainable economy

By ZHU XINGXIN in Youyu, Shanxi and **CHEN LIANG**

Seven decades ago, international environmental experts studying the wind-scoured plains of Youyu county in North China's Shanxi province reached a bleak conclusion: the area was entirely uninhabitable, and the total resettlement of its population was the only viable option. Whipped by brutal Siberian winds, blinding sandstorms routinely choked the air, burying entire villages under shifting desert dunes.

Today, that same desolate wasteland has been transformed into a lush, green oasis. This historic environmental reversal was globally spotlighted when, in 2024, Youyu county clinched the prestigious New Sustainable Cities and Human Settlements Award at the United Nations Headquarters in New York, recognized as a premier global blueprint for desertification control.

Youyu's transformation is a multigenerational epic of political discipline and human endurance. The story begins in 1949, with Zhang Ronghuai, Youyu's first Party secretary. He understood a simple truth: "If Youyu wants prosperity, we must stop the wind and sand. And to stop the wind and sand, we must plant more trees."

He initiated a series of patriotic tree-planting campaigns, rallying the people to action. The first sapling, a Chinese cottonwood (or Simon's poplar), was planted just outside the old county town gate, a defiant flag planted in the face of the encroaching desert.

However, the bitter winters and scorching summers made tree planting a constant battle. In the 1960s, the fourth and fifth county Party secretaries focused their efforts on the Huangshawa sand depression, a particularly challenging area.

Their initial attempts resulted in heartbreak, with over 90,000 saplings failing to survive because the non-native poplars planted drank too much water and died. But they learned from their mistakes, adapting their planting methods and persevering. By 1964, they had successfully planted more than 13,333 hectares, effectively stabilizing the shifting dunes.

Each subsequent leader built upon the work of their predecessors, innovating and adapting to the challenges.

In the 1970s, hardier tree species like pitch pine, larch and Mongolian scots pine were introduced as part of the Three-North Shelterbelt Forest Program, expanding the afforestation area to over 73,833 hectares.

According to the current Youyu Party secretary, Ma Zhanwen, 21 consecutive local leaders have maintained the same ecological priority, leading communities "one shovel and two hands at a time". To date, afforestation efforts have blanketed more than 113,000 hectares of Youyu with 130 million trees. The county's forest coverage rate has dramatically soared from a microscopic 0.3 percent in 1949 to an astonishing 57 percent, making it the first territory in Shanxi province to successfully reforest all its barren mountains.

Wang Zhanfeng, a 75-year-old villager, has planted 200 hectares of trees over the last 44 years. "My hands feel like tree bark," he said, gazing up at the towering trees he helped cultivate. "I've dedicated my life to this. I can't let all this effort go to waste. I have to keep planting, one tree after another, year after year."

The legacy continues with younger generations. Li Jie, a 31-year-old teacher at the Youyu Cadre Academy, has spent nearly a decade sharing the story of Youyu with thousands of visitors. "Shovels are heirlooms in every household in Youyu," she said. "They are a testament to the memory and legacy of generations of Youyu people."

She recounted that on her 10th birthday, her grandmother showed her the first small pine tree she had planted, introducing her to the legacy of Youyu's fight against the desert. That is what strengthened her decision to dedicate herself to this land and carry forward the Youyu spirit.

The transformation of Youyu has created new opportunities. The county is now using its lush environment, rich culture and cool climate to become a cultural tourism and health destination. Local businesses are developing innovative sea buckthorn products, boosting livestock farming and transforming ecological advantages into economic benefits.

"The development achievements of Youyu stem from the simple aspiration of allowing the people to survive and live a good life," said Liang Pengwei, assistant researcher at the Shanxi Provincial Academy of Social Sciences, who is also an editor of a book on the story of Youyu.

The school is the city's first to introduce marine ecology preservation into its curriculum. PHOTOS PROVIDED TO CHINA DAILY

Tri-city alliance launched to protect Xiamen's dolphins

Coordinated efforts aim to improve public awareness of 'sea pandas'

By ZHANG YI in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

Three neighboring coastal cities in East China's Fujian province — Xiamen, Quanzhou and Zhangzhou — have recently launched a landmark cross-regional collaboration to protect the Chinese white dolphins in their shared waters.

Xiamen is China's only major city where these marine mammals, under first-class State protection and affectionately nicknamed the "giant pandas of the sea", live right alongside bustling urban life and can be spotted occasionally by residents. It is estimated that around 80 Chinese white dolphins inhabit Xiamen's waters.

"Protecting white dolphins requires pulling the entire society together," said Xu Jing, an official at the Xiamen Chinese White Dolphin and Amphioxus Nature Reserve Affairs Center. "We focus on mobilizing volunteers to join our rescue and monitoring teams."

As the dolphins frequently migrate out of Xiamen's waters into neighboring areas, local enforcement teams officially upgraded this cross-regional mechanism last month to formally institutionalize real-time data sharing, joint maritime patrols and emergency rescues, according to Xu.

The upgraded mechanism also aims to further raise public awareness, including educating citizens on what to do and how to call for help if they encounter a stranded dolphin.

In August 2024, people from both Xiamen and Quanzhou jointly handled the emergency rescue of Le Bao, a 4-year-old female dolphin that swam out of Xiamen and became stranded on a beach in Quanzhou's waters.

A docent introduces the Chinese white dolphin preservation work in Xiamen at a museum in the city.

Local residents reported the stranding, triggering a rapid emergency chain that brought experts from the dolphin reserve in Xiamen and the Third Institute of Oceanography, Ministry of Natural Resources, based in Xiamen, to the scene for a joint medical response.

Following more than 40 days of intensive care at a nearby aquatic rescue station, Le Bao fully recovered and was successfully released back into her home environment in Xiamen's waters in September 2024. She was later named Le Bao after the facility, a name that also carried the rescuers' wishes for her to live a joyful life in the future.

"Le Bao's survival was a miracle made possible by an unbroken chain of rapid actions across two cities," Xu said. "If any single link had failed, this successful release would not have been possible."

The dolphin population's stable presence also stems from Xiamen's long-term ecological initiatives, including a complete clearance of marine aquaculture facilities to restore the coastal ecosystem to its primitive state, she said.

The city even re-engineered a tunnel project from an original above-water bridge design into an underground tunnel, heavily increasing capital investments solely to preserve the dolphins' habitats, she added.

"As a flagship barometer of our marine ecosystem, their presence represents Xiamen's outstanding achievements in biodiversity conservation," Xu said.

Local paddleboarders, open-water swimmers and wildlife photographers in Xiamen have voluntarily established a grassroots monitoring network, capturing footage during unplanned encounters to support scientific research.

Chen Yu, a local open-water swimmer and photographer who has been tracking the species via aerial drone in recent years, said that public engagement is deeply rooted in local tradition. The dolphins are traditionally called "Mazu fish" after the sea goddess, and are regarded by residents as guardians of the waters.

"Since childhood, we have been told by our elders that the waters are safe wherever the white dolphins appear," Chen said. "For local residents, these animals are seen as traditional protectors of the sea."

These photographic sightings provide critical data for marine biologists. Images documenting maternal behaviors, such as a mother lifting her calf to breathe or teaching it to hunt, assist researchers in managing a digital profiling system that tracks family dynamics and newborn calves.

Star Chinese white dolphin Da Bai is seen swimming with her calf in Xiamen in 2020.

In April, an aerial drone photographer captured footage of a newborn calf swimming closely alongside Da Bai, a well-documented wild female dolphin frequently seen nursing newborns in Xiamen's waters.

"When we photograph a dolphin year after year and see it is still there, we know it is growing up healthy and strong," Chen said. "Every encounter still makes me feel incredibly lucky."

Marine experts have introduced a science-based maritime code of conduct, instructing water sports enthusiasts and photographers to maintain a respectful distance instead of chasing the animals.

Lin Yuan, a local middle school teacher who is a paddleboarder, regularly records her encounters with the animals in the sea to use as educational materials in her classroom.

"I bring my own dolphin encounter videos to share with my students," Lin said. "We must cultivate an awareness of biodiversity conservation in children so they can continue to see these marine creatures in their local environment in the future."

Digital drive supports planting of millions of trees

By HOU LIQIANG in Beijing and **HU DONGMEI** in Yinchuan

China's private-sector, internet-based afforestation efforts have reached a massive scale milestone, demonstrating how gamified digital incentives have been successfully integrated into the country's broader national ecological strategies.

Since 2017, under a partnership between tree planting initiative Ant Forest and the China Green Foundation, 386 million trees have been planted across about 4.4 million hectares spanning seven provincial-level regions, including Gansu and Qinghai provinces and the Inner Mongolia autonomous region, said Zhang Quanzhou, the foundation's secretary general.

According to Zhang, the partnership saw more than 200,000 hectares of desertified land treated in that time, with about 90 percent of it located in key areas of the country's Three-North Shelterbelt Forest Program, which is the world's largest afforestation endeavor.

"This program has transformed the 'green energy' of hundreds of millions of netizens into tangible ecological outcomes," he said.

Ant Forest was launched in August 2016 by internet financial services firm Ant Financial, an affiliate of Alibaba Group.

The app rewards users with virtual energy — which they can use to have trees planted — when they take low-carbon actions such as walking or using public transport instead of driving, or buying things online, which avoids the need for paper receipts.

The amount of energy needed to plant different trees varies. After receiving an application from an app user who has saved enough energy, Ant Forest will plant a real tree.

To ensure that digital goodwill translates into lasting ecological impact, Zhang said the foundation has built a long-term mechanism for public participation.

In collaboration with the National Greening Committee, it launched a nationwide online platform that allows citizens to adopt, monitor and track tree growth via their mobile phones, making voluntary tree-planting a year-round, regular activity.

Zhang also said that the foundation has established a clear responsibility chain, supported by technologies such as satellite remote sensing, third-party inspections and digital oversight.

Moreover, a collaborative governance model has taken shape in the country, featuring government guidance, corporate donations, public participation, foundation execution, and oversight by forestry and grassland authorities, he added.

A recent commentary in the journal Nature said that Ant Forest is an example of how digital incentives can be used to inspire the public and generate funding.

Since its launch, the gamified initiative with more than 500 million users has funded more than 619 million drought-resistant trees and shrubs, the article said.

Li Meng, a 28-year-old map data collector and dedicated Ant Forest user, embodies the power of digital incentives to drive lasting behavioral change. To date, Li has planted 1,120 trees across Ant Forest's forested areas since October 20, 2016.

His motivation is deeply rooted in a sense of shared responsibility.

"Western China has a sparse population yet silently protects the ecological environment of the eastern region," he said. "Whether we live in the east or the west, everyone should consciously protect the environment."

When personally participating in a tree planting activity in Alxa League in the Inner Mongolia autonomous region, Li observed saplings at different growth stages — from newly planted seedlings to mature, thickening saxaul trees.

"It's like the development of public welfare: gradual, persistent and built on dedicated effort," he said. "It will slowly grow stronger, better and better."

A decoration marking Ant Forest's collectible "green energy" is displayed at a green lifestyle fair in Shanghai in September 2024. XING YUN / FOR CHINA DAILY

Back to school for the 'silver' generation

After lifetimes spent working and caring for others, older Chinese people are now packing their sketchpads and notebooks and heading abroad, **Yang Feiyue** reports.

China's retirees are breaking free from long-held expectations centered on family duties and caregiving, challenging stereotypes that cast older people as preoccupied with their children's marriages, grandchildren and domestic routines.

A growing number of them are now doing some soul-searching and seizing learning opportunities abroad, determined to make fuller use of their retirement years, whether in search of fulfillment or simply for their own happiness.

While younger generations debate whether an overseas degree is worth its staggering price tag, a growing wave of gray-haired retirees is packing suitcases and walking into lecture halls around the world, not for diplomas, but for themselves.

For nearly two decades, Li Guolin could barely get out of bed.

A spinal fracture in 2000 forced her into early retirement from her job at a bank in the coastal city of Zhuhai, in South China's Guangdong province. Her world shrank to a mattress and the relentless companion of chronic pain.

"My whole attention was on the pain. My social circle was tiny, and I didn't want to do anything," she recalls.

She tried group tours after she finally got back on her feet in 2019, but the rushed itineraries exhausted her.

"Too tiring, not for me," she says, adding that the pain still returns from time to time.

Then, in April 2024, she stumbled upon a short art program in Italy, with some preparatory art lessons arranged.

Something clicked inside her.

"It was exactly the kind of tomorrow I had been hoping for," she says, adding that it satisfied her interest in art and living in a foreign country for a while.

During preparation in Beijing, she painted under instruction for the first time in decades. There were no rules, no grades. Just guidance.

"I was completely absorbed, and the pain disappeared," she says.

A few weeks later, she flew to Florence, Italy, for a two-week fashion design program at a local institute, which was her first time abroad as a learner rather than a tourist. She had never worked with fabric or dressed a mannequin. By the end of the course, she had completed seven or eight original pieces.

"The whole process swept my pain away," she says.

Li is among a growing number of older Chinese citizens redefining what retirement can look like. Once largely confined to domestic chores, square dancing or the occasional group tour, many of China's "new elderly" are now turning their gaze toward foreign lecture halls.

Clockwise from top: Students from the "silver generation" on a bridge over the River Cam, Cambridge, July 2025. Chinese older learners take a fashion design course at Arts University Bournemouth, UK, in June 2025. A faculty member leads a tour of the Ashmolean Museum, Oxford, for older Chinese learners, in July 2025. Liu Ping (left) takes a picture with two "silver" learners outside Polimoda's campus in Florence, Italy, in October 2025. photos provided to china daily

A booming market

According to EF (also known as Education First), a global education company that organizes language courses and overseas study tours worldwide, Chinese nationals over 50 accounted for just 3 percent of its overseas study tours in 2019. By 2023, that share had jumped to 20 percent.

Most of these Chinese nationals are between 56 and 65, and many come from Shanghai, Guangdong, and Beijing — the demographic that rode the wave of China's reform and opening-up.

Benefiting from China's economic boom, this group is open-minded and has a strong desire for self-improvement, observes Ma Jing, managing director of EF's overseas study tour operations in China.

The market potential is staggering. China's silver economy is currently worth about 7 trillion yuan (nearly $1 trillion), according to a 2024 report by the China Association of Social Welfare and Senior Service.

By 2035, that figure is expected to reach 30 trillion yuan. Senior education, once a niche, is projected to grow to 500 billion yuan by 2025, with an annual compound growth rate of 25.3 percent, far outpacing traditional education sectors, according to the market research consultancy Chinese Industry Research Network.

Traditional study-abroad agencies have taken notice. In late 2025, New Oriental, one of China's largest private education companies, launched the "Tulip Plan" short-term overseas program tailored for learners over 35.

The program targets three age segments, with the "55-plus" track tailored specifically for those seeking to enrich their retirement years through immersive cultural experiences.

The first offerings include an art program in the United Kingdom and a culinary course in France.

For Li Guolin, the Florence trip was only the beginning. She went on to study silk painting at Yokohama University of Art and Design in Japan in April, and learned lacquer carving from a master craftsman in his remote studio, producing a hand-carved ginkgo leaf, its veins traced in gold.

A new motivation

Not everyone in this new wave is fleeing a life of pain. For Liu Ping, a 60-year-old former financial auditor from the inland city of Liuzhou in South China's Guangxi Zhuang autonomous region, the motivation was more personal.

She had earned a CFO certificate years earlier that entitled her to attend a graduation ceremony at Cambridge, but then work got in the way.

"I always regretted it," she says.

When she saw an overseas study program that included a few weeks in Cambridge, she signed up immediately.

But first, she was required to attend a "growth camp" in Beijing.

At the camp, participants were asked to create a piece of art expressing their innermost feelings.

Liu, then still grieving her mother's recent death, poured herself into the task. She re-created a sunset scene by the river where she had once pushed her mother's wheelchair — stitching the bridge, the water, the separation.

When she finished, she felt an enormous release. That unexpected emotional breakthrough sparked her interest in art, so she decided to give it a real try at her dream school in Cambridge.

During her stay, the instructor asked the class to sketch something they had seen on campus. Liu chose the canopy of a corridor.

"It was the most complicated structure on campus," the instructor later told her.

She laughed. A career spent in auditing — precision, rules, getting things exactly right — had not prepared her for this.

"I saw the gap between myself and the students who had some foundation, but just finishing was already enough," she says.

Returning home, Liu felt several weeks studying in the UK were still too short. "I hadn't had my fill," she says.

She then bought a sketchbook and pencils.

Now, whenever she sees a beautiful scene, she photographs it and paints from the picture later.

"It's just for my own enjoyment," she says.

While Li and Liu stumbled upon their opportunities, Zi Wenli, a former CCTV director who retired in 2024, went looking for hers, and when she couldn't find it, she built it herself.

Like many new retirees, Zi felt adrift after retiring from China's State broadcaster where she had worked for about three decades.

"I lost all sense of rhythm and purpose, and my social circle collapsed almost overnight," she recalls.

She tried the local senior university, but found the offerings limited for her taste, with calligraphy, folk dancing, and painting "grand peonies". As she had helped design domestic university curricula and cofounded an overseas study agency that sent thousands of young Chinese to Western schools, she asked her own consultants to help her apply to universities like MIT and Stanford.

Yet, they turned her down.

"They told me there was no agency in China that served people over 35," she says.

So she traveled alone to the United States, the UK, and Japan, visiting universities and talking to professors.

In Japan, she met an 85-year-old professor still teaching and his 90-year-old student. In the UK, admissions officers told her that local retirees regularly enrolled in short courses.

She returned convinced. On a whim, on the night of Dec 23, 2024, she went live on WeChat's short-video platform from her living room with fewer than 800 followers. She talked about her idea of "studying abroad after retirement", a notion that older learners, free from the pressure of degrees and job prospects, might have an easier path than younger applicants competing for credentials.

Her phone soon exploded. By the end of the hourlong broadcast, she had received 544 private messages. The question was almost always the same: "How can I go?"

"I realized that night that this wasn't just my problem. I had stumbled upon a volcano of demand," she notes.

Within months, Zi founded the Retirement Study Club, later renamed the Mature Learning Club. In less than a year, it had attracted over 50,000 members nationwide and helped more than 500 retirees enroll in overseas programs, with over 1,000 more holding acceptance letters. Destinations include Japan, Italy, the UK, Spain, and the US, and the lengths of learning programs range from weeks to a year.

"In the beginning, I thought I would just help a few people, but the demand was overwhelming. These are people who have spent their whole lives taking care of others — their parents, their children, their grandchildren. For the first time, they want to do something just for themselves," she says.

Challenges and risks

Some critics question whether a two-week program, typically costing between 20,000 and 70,000 yuan, is worth it, while others raise health and safety concerns.

Da Zhigang, a researcher at the Heilongjiang Provincial Academy of Social Sciences, warns that Chinese seniors overseas may not receive timely medical care in an emergency due to language barriers, and could face unexpected risks.

There are deeper structural hurdles. China's higher education system remains designed for degree-seeking young people. Senior universities are widespread, but their curricula tend to focus on entertainment and hobbies, not skill renewal or social reintegration, experts say.

Professor Peng Xizhe, a demographer and senior professor at Fudan University, points to what he calls a "system ceiling".

The most fundamental challenge is a shift in mindset across society, he emphasizes.

Peng urges the education system, labor policies and other subsystems to be prepared for the new normal of an aging society.

Curiosity is the drive to live

To date, Zi's oldest participant has been an 83-year-old retired mathematics teacher from Shanghai who completed a fashion and crafts program in Italy.

"I was impressed when he told me curiosity is the drive to live," Zi says. The line has become something of a motto for her club.

"These people are running toward something, a version of themselves they had set aside decades ago," she says.

As for Li Guolin, she didn't take much of a break after finishing her studies in Japan in late April. Instead of flying directly home to Zhuhai, she detoured through Taipei to visit its Palace Museum, then flew to Hong Kong before returning to the mainland.

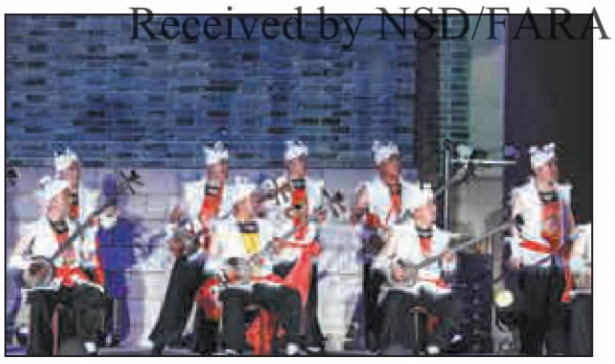
A few days later, right after the May Day holiday, she was at the airport again — this time for a holiday in Rome and Malta with a friend she met on one of her study trips.

"Our class averaged 60 years old and everyone agreed that before 50, we lived for our families and children. After 50, we decided to live for ourselves," she says.

Her family has noticed the change.

"They told me the biggest difference is that I have more energy now, and I don't fixate on my pain anymore," she shares.

When asked if she plans to keep going, she does not hesitate. "Spain will likely be my next learning destination for a dance program," she says.



"Even if I don't know how to dance, I want to try. I want to challenge myself. I don't want to live the way I used to — always holding back."

Left: A folk performance marks the opening of the 2026 Intangible Cultural Heritage Summer Shopping Month, which kicked off on June 11 in Suzhou, Jiangsu province. **Right:** A tea-making demonstration draws visitors to one of the many heritage display booths during the event.

Preservation finds a way into modern hearts

Transformation and innovation help China's intangible cultural heritage find consumers hungry for fresh experiences, **Yang Feiyue** reports in Suzhou, Jiangsu.

Zhou Jing was holding a bowl of noodles at a booth on the historical Pingjiang Road in Suzhou, Jiangsu province, where crowds flowed along the ancient stone-paved street on a muggy June afternoon. At first glance, it did not look like a typical local dish. The bowl was made entirely of plush fabric and weighed almost nothing. Even the braised pork topping was soft and fuzzy.

And yet, around her, staff members engaged visitors in mock noodle-shop interactions.

"Hard noodles or soft? Extra broth or light?"

For many visitors, the questions were unfamiliar. That was by design.

Small cards and props at the booth explained the specialized vocabulary of Suzhou noodle culture: *kuan tang* (extra broth), *jin tang* (less broth), *zhong mian* (extra noodles), and *shao mian* (fewer noodles). In 2020, Suzhou-style noodle-making was added to the city's intangible cultural heritage (ICH) list, adding another layer to this seemingly simple interaction. For local regulars, these terms signal identity as much as taste. For outsiders, they offer a quick introduction to one of the city's best-loved traditions.

The experience was designed to be memorable — a playful encounter that transforms a local culinary custom into an interactive cultural lesson.

Zhou's booth was among the busiest attractions at the 2026 Intangible Cultural Heritage Summer Shopping Month, which opened on June 11 in Suzhou. Held along Pingjiang Road, a canal-side neighborhood lined with white-walled houses and black-tiled roofs, the event forms part of a nationwide campaign featuring more than 1,200 activities held through late July, aimed at bringing traditional culture closer to contemporary life.

For Zhou, a former travel entrepreneur who once specialized in European tours, the plush noodle bowl represents more than a novelty product. It is part of a growing movement across China that is reimagining how intangible cultural heritage is preserved, presented, and passed on to younger generations.

Across the country, cultural entrepreneurs and heritage inheritors are increasingly turning traditional crafts, foods and folklore into collectible toys, lifestyle products and social-media-friendly cultural IPs (intellectual property).

The transformation of Pingjiang Road into a sprawling heritage marketplace offers a glimpse of that shift.

Creative cultural products featuring Zibo soft pottery prove a hit with visitors at the shopping month event. Photos Provided to China Daily

> A friend once told me our works have a 'human touch'. That phrase exactly woke me up."
>
> **Wang Zhi,** a municipal-level inheritor of Zibo soft pottery

Creative inspiration

More than 100 heritage workshops and inheritors from across China gathered for the shopping month's main event, showcasing everything from embroidery and ceramics to weaving, sculpture and traditional foods.

Among them was Zhou's collection of plush noodle bowls, refrigerator magnets and blind boxes inspired by the local food culture.

Before the COVID-19 pandemic, Zhou operated a travel business serving Chinese tourists visiting Europe and international visitors coming to China. When global tourism ground to a halt in 2020, she began exploring opportunities closer to home.

"There weren't many cultural products that truly reflected Suzhou's local character and everyday life," she says. "I wanted to create something people could connect with."

Her workshop is located in the Dinghuisi alley in Suzhou's old town. Nearby, heritage masters regularly give public demonstrations and classes. Watching these activities, Zhou realized that many traditional cultural elements remained unfamiliar even to local residents.

"I discovered things I didn't know myself. If local people don't know about them, young people are even less likely to know," she says.

Although not an inheritor of a traditional craft, Zhou chose to serve as a translator between heritage and the marketplace. Food became her starting point.

"Visitors come to Suzhou for two things: the gardens and the food," she says, explaining why she chose food as her focus.

Inspired by the popularity of interactive cultural merchandise, she created products that transform familiar local dishes into collectibles. Customers not only receive a toy but also a cultural story.

Her first generation of plush noodle bowls attracted attention but struggled to sustain sales due to their relatively high price. Several rounds of redesign followed.

A second version added practical functions, such as card holders. The breakthrough came when Zhou combined several fast-growing categories in China's creative cultural market — blind boxes, plush toys and refrigerator magnets — into a single product that was smaller, more affordable and easier to collect.

Since the launch of the latest version in early 2025, sales have exceeded expectations.

She has since expanded collaborations with local brands, including Renchangshun, a traditional Suzhou pastry maker with a history stretching back more than two centuries. Together, they transformed products such as *dingsheng gao* and *zhuangyuan gao*, pastries associated with good fortune and academic success, into plush collectibles.

"My role is to help people take notice. Once they're interested, they can learn more," she says.

A broader movement

Zhou's story reflects a wider transformation taking place across China's heritage sector.

This year's ICH summer shopping month places particular emphasis on connecting traditional culture with contemporary consumption. Alongside exhibitions and craft demonstrations, the event features activities exploring themes such as "ICH plus designer toys", "ICH plus fashion", and "ICH plus technology" — an acknowledgment that preservation today increasingly depends on finding new ways to engage modern audiences.

The shift is being driven in part by changing consumer behavior, particularly among younger generations.

According to leading online food delivery and local services platform Meituan, searches related to nationally recognized intangible cultural heritage food traditions exceeded 18 million in 2025, up 34 percent year-on-year. Orders placed with related merchants rose by 140 percent, while nearly two-thirds of searches came from consumers aged 20 to 35.

Industry observers say the figures point to a growing appetite for heritage experiences that feel interactive, accessible and relevant to daily life, besides those from the museums or textbooks.

A report on China's cultural and creative industries, released by China Cultural Media Group, notes that heritage-based cultural products are increasingly moving beyond static preservation toward what it calls "living innovation" and market-oriented development, allowing traditional culture to become part of everyday consumer experiences.

For entrepreneurs and inheritors alike, the question has now been how to translate them into forms that resonate with younger consumers.

Pony with personality

About two hours north of Suzhou by high-speed rail, another experiment in heritage innovation has been unfolding in Zibo, Shandong province.

Wang Zhi, a municipal-level inheritor of Zibo soft pottery, has spent more than a decade exploring ways to engage contemporary audiences with traditional clay sculpture.

Her studio is known for miniature works inspired by Chinese history, everyday life and classical art. But national attention arrived in 2024 with the debut of Long Dada, a dragon whose round body and playful expression challenged conventional depictions of the mythical creature.

The character quickly gained popularity online and helped Wang rethink how traditional culture could be presented to younger audiences.

Her latest creation pushes that idea further.

Known as Ma Biaobiao, or "Scruffy Pony", the figure was developed in collaboration with the Beijing Fine Art Academy and inspired by a late painting by renowned Chinese artist Qi Baishi, depicting the spirit and vitality of a galloping horse.

The pony features oversized eyes and a dramatically fluffy mane made not from clay but from Tan sheep wool.

Achieving the dynamic pose proved technically demanding. The sculpture's front legs touch the ground while the hind legs lift into the air, requiring repeated experimentation and an internal support structure capable of withstanding the firing process.

To strengthen the connection with the original artwork, the team designed the display so the pony appears to leap from a traditional Chinese scroll painting.

The feature that most captured public attention, however, was the mane.

Owners are encouraged to braid, curl, decorate, or style it however they wish.

"We call it co-creation," Wang says.

The idea extends beyond the product itself. The pony's name originated from internet users, who described the character using the Shandong dialect word *biao*, a term suggesting something goofy, impulsive or endearingly eccentric. The team adopted the nickname and continued refining the character in response to customer feedback.

New mane colors, accessories and design details emerged through interactions with fans online.

"We listen carefully," Wang says. That approach has helped transform a single clay sculpture into a broader cultural IP encompassing keychains, refrigerator magnets, bags, and apparel.

For Wang, the appeal lies in creating an emotional connection.

"Heritage isn't something frozen in time. It continues to evolve," she says.

Wang has thought a lot about what makes heritage stick.

"A friend once told me our works have a 'human touch'," she says. "That phrase exactly woke me up. Intangible cultural heritage is about the warmth of the hand, the sedimentation of time, the power of healing, the possibility of co-creation."

Foreigners praise country's high sense of safety

What would happen if someone left a backpack full of personal belongings unattended in one of China's busiest commercial areas?

YouTuber "Because I'm Lizzy" decided to find out in Southwest China's Chongqing last year. After spending nearly two hours wandering through the city's winding streets, sampling local delicacies, and taking in its neon-lit nightlife, she returned to find everything exactly where she left it.

The 29-year-old South African content creator was not surprised by the outcome. "I've been proven so many times that nothing would ever get stolen," she says. "Safety is the number one reason why I stay in China."

Currently based in Kunming, the capital city of Yunnan province, the YouTuber, Jannelize Bessenger, has lived in China for seven years. She created a series of videos about the country after noticing that many people know little about the high safety level of the nation, with a population exceeding 1.4 billion.

But for Bessenger, "It is the people who live here and their value and respect for life that make China the safest place, where I will stay for many years."

Her first impression of China was shaped by an unexpected act of kindness from a stranger. She recalled that in 2019, just four months after arriving in China, she fell seriously ill while in Nanchang, Jiangxi province. Although she had the hospital's location saved on her phone, she still could not find it.

Speaking little Chinese at the time, she turned to a man nearby for help, using a translation app. To her surprise, he voluntarily accompanied her to the hospital by subway and then left.

Wondering whether the man would ask for her contact or something in return, Bessenger said nothing happened. "He was just being nice," she says. That moment made her realize she could live alone in China safely as a foreign woman.

Hailing from a small South African town renowned for its wildlife and safaris, solo traveler Bessenger says China's secure environment allows her to embrace a relaxed lifestyle.

"Whether I'm going for a walk with headphones on at 11 pm because I can't sleep or I want to get some fresh air without checking a map, I just go and explore," she says.

China ranks high among other countries on the safety and law and order index, according to Gallup's 2025 Global Safety Report.

When Bessenger shared her appreciation for feeling safe on the lifestyle-sharing platform RedNote, many Chinese users were puzzled as to why she kept bringing it up.

"They take it for granted. They don't really realize how lucky they are to live in such a safe country," she says. The feeling was shared by her mother, who visited China from South Africa two years ago and later decided to settle down.

China's safety and openness are also echoed by short-term travelers. In 2025, inbound tourist visits to China surpassed 150 million, up more than 17 percent year-on-year. Of these, over 30 million foreign travelers entered the country under China's visa-free policies.

With expensive camera gear in hand, Canadian YouTuber Dave Mani and his wife comfortably moved around Chinese cities and roamed rural areas.

"After visiting 56 countries, we can say that China is very high on the list in terms of general safety," says Mani.

As an independent content creator, Mani notices how deeply technology is integrated into everyday life in China. Whenever he and his wife needed help during the trip, locals were quick to use translation apps to communicate with them.

> I've been proven so many times that nothing would ever get stolen. Safety is the number one reason why I stay in China."
>
> **Jannelize Bessenger,** South African content creator known as "Because I'm Lizzy"

The couple quickly became fans of WeChat, saying the super app brought great convenience, especially WeChat Pay, which allowed them to make payments easily and safely.

"That level of everyday safety made filming and exploring very easy and enjoyable," says Mani.

Like Bessenger and Mani, Ana Rosa Neumann Devers, an exchange student from the Dominican Republic studying in Harbin, Heilongjiang province, finds it cozy and relaxing to stroll past the orderly market stalls day or night.

The girl from the tropical Caribbean nation has fallen in love with the icy northern city, captivated by its snowy nights and warmed by the kind sincerity of her schoolmates. At a school ball, she appeared in traditional Dominican attire and was met with warm applause and heartfelt eompliments.

"People here respect different cultures and customs. No one treats me differently because I'm from another country. I truly feel respected," she says.

In the past seven years, Bessenger has found that in China, every place offers something entirely different for travelers to discover. But for those who don't know where to go or who are eager to tap into the "becoming Chinese" trend, her advice is simple: just head downstairs when night falls.

"Walk around, get some street food, and see how people enjoy their meals and how the city settles into a peaceful but vibrant rhythm," she says. "That's when China feels most real."

Master's six strings strike global chords

An award-winning craftsman blends Spanish lutherie and local design to build world-beating classical guitars, **Wang Xin** reports in Shanghai.

Gao Yi, 56, is one of China's most accomplished classical guitarists. Today, however, he is winning even greater recognition worldwide as a luthier, crafting exquisitely handmade guitars that are earning international acclaim.

Two years ago, Gao's flamenco guitar won first prize at the 7th Antonio Marin Montero Guitar Building Competition held in Granada, Spain, where his classical guitar also remarkably made it to the final. He became the first Chinese luthier ever to win the competition's top prize.

Last month, his instruments impressed Japanese musicians and fellow luthiers at an exhibition in Tokyo. Standing out in this highly competitive market through exceptional craftsmanship, Gao signed cooperation agreements with Japan's major instrument distributors, including Gendai Guitar and Kurosawa Gakki, for both online and offline orders.

Born in Shandong province in 1970, Gao's connection with music and instruments began early. He primarily played the Chinese bamboo flute as a child and taught himself guitar at the age of 17. After graduating from Jining University with a music degree in 1992, he continued his studies in classical guitar performance at the Central Conservatory of Music in Beijing the following year. It was there that he first encountered guitars built in the traditional Spanish style.

In 2000, Gao won first place in the Chinese Guitar Competition while performing on an Antonio Marin Montero guitar borrowed from a friend.

Later that year, he joined Yamaha Corporation as China's guitar market manager and relocated to Shanghai. During his eight years with the company, Gao deepened his understanding of guitar history and construction techniques. At the same time, he continued performing solo concerts, often using his cherished Marin Montero guitars.

His first attempts at building guitars began in 2010, when he established his workshop, Gaoyi Guitars. Shortly afterward, a serious accident during a repair left his fingers badly injured. Rather than discouraging him, the experience strengthened his determination to pursue lutherie more seriously and eventually shift his professional focus toward guitar making.

In 2013, Gao seized an opportunity to study traditional Spanish guitar-making in Beijing under Juan Labella, a respected guitar maker from Granada.

The following year, with support from the Spanish Consulate General in Shanghai, he visited Spain, where he was introduced to Marin Montero himself. The legendary master offered valuable guidance and encouragement. Marin Montero, widely regarded as one of the most influential living masters of traditional Spanish guitar making, became both a mentor and a lasting source of inspiration for Gao.

In 2019, Gao was recommended by the European Guitar Foundation to study with another renowned Granada School luthier, Rene Baarslag. The experience further shaped and inspired his own approach to guitar making.

"While I was in Spain, I lived with local musicians and luthiers to learn and exchange ideas. Then I realized that guitar making is far more than simply creating a seemingly abstract sound. Behind it lie the culture, history, humanism, life experience and the thoughts of the luthiers," says Gao.

Regardless of national or cultural differences, Gao says he was warmly welcomed by Spanish masters. They generously shared their workshops, materials, tools, techniques, craftsmanship, experience and even their philosophy of life.

Gao says what many Chinese luthiers still lack in high-end guitar making is a deeper "understanding" and "perception" of the instrument itself. His experience as a performer has helped bridge that gap. Spain, widely regarded as the cradle of the classical guitar, has passed down its traditions and accumulated knowledge through generations of master builders.

It was during his time in Spain that Gao learned, for example, that the finest soundboards for premium Spanish-style guitars are often made from high-quality spruce sourced from the Fiemme Valley in the northern Alps at an altitude of around 1,500 meters. The same region supplied wood for the famed Stradivarius violins. Lightweight yet capable of producing remarkable clarity, the wood is highly prized among instrument makers. Gao also learned that every stage of guitar construction demands meticulous attention, from wood treatment and internal structure to component assembly and even the selection of the final finish.

"Guitar making is never like solving a math problem, and it doesn't have an exact formula. Every detail in the whole process comes from the accumulated experience of pioneers and also from luthiers' innovation. I see guitar making as a testament to collective creativity across generations," Gao says.

For Gao, guitar making is not merely craftsmanship but a form of "artistic creation". A guitar is far more than a box that produces sound; it is an artwork that reflects a maker's aesthetics, personality, life experiences and constant pursuit of innovation.

As technology advances and performance venues become increasingly diverse, guitarists are demanding more from their instruments, encouraging luthiers to continue pushing creative boundaries. Many modern classical guitars now incorporate aerospace technologies or carbon fiber materials into their soundboards to improve strength and project greater volume, particularly for larger venues and outdoor performances.

As a Chinese luthier proud of his country's rich cultural heritage, Gao has sought to incorporate elements of Chinese identity into his work. The rosettes on the two guitars that earned recognition at the Spanish competition draw inspiration from traditional Chinese geometric window-grille patterns combined with Japanese Hakone Yosegi Zaiku (marquetry wood mosaics), creating an elegant visual signature.

In other instruments, he frequently uses mother-of-pearl and shell carvings for decorative inlays. He is also exploring the use of locally sourced woods from different regions of China.

"We have already opened the door to the high-end guitar-making sector," Gao says. "As Chinese luthiers continue working toward the same goal and accumulating our own experience, I believe we will see more handmade guitars with a distinct Chinese identity shine on the global stage."

Building a high-quality guitar is a painstaking process. Working full-time as a luthier, Gao produces no more than 13 instruments a year. Benefiting from the keen tonal sensitivity developed during his years as a performer, he focuses on creating guitars with warm, delicate tones, rich dynamics, an authentic Spanish voice and a lasting Eastern character. His instruments are increasingly sought after by professional musicians and collectors from Germany, Spain, Japan, the United States and other countries.

As both a guitarist and a luthier, Gao has spent nearly four decades alongside the instrument he calls his "most loyal companion". The guitar has accompanied him through every stage of life, helping him express emotions, find friendship and resonance, and discover deeper meaning.

"The guitar is a record of my life," he says. "It contains my passion and what I hope to leave behind in the world. Even when my life comes to an end, my instruments will remain."

Asked about the secret to building a great guitar, Gao shares with China Daily an answer — and a life philosophy — that he first learned from Marin Montero: "Just slow down."

One man's mission creates China's zero-waste island

By Xing Wen
xingwen@chinadaily.com.cn

Far out in the East China Sea, Qingbang Island — part of the easternmost permanently inhabited archipelago off China's mainland in Zhoushan, Zhejiang province — is becoming a model for sustainable living.

Despite covering just 1.41 square kilometers, the island is experimenting with an innovative recycling system. Residents sort their household waste and exchange it for vouchers that can be used at local stores or redeemed for cash at the end of the year.

Food scraps will be fermented into organic fertilizer for growing vegetables and flowers, while recyclable plastics are collected by a Shanghai clothing company and transformed into garments, shoes, and hats sold on the island.

The voucher program has been running for three years, driven by the vision of Yan Shanyue, a former seaman who is determined to turn Qingbang into a zero-waste island.

Why vouchers? Yan explains. Selling recyclables directly typically earns only 20 or 30 yuan at a time — an amount that easily disappears among everyday expenses.

"But with a voucher, you can clearly see that it came from the waste you collected."

To keep motivation high, Yan also hosts an annual year-end meeting where active recyclers receive daily necessities like rice and cooking oil.

"That way," he adds, "people have one more thing to look forward to."

Yan grew up on Xiazhi Island, more than 60 kilometers from Qingbang, and many of his happiest childhood memories were shaped by the sea.

"Every morning around six or seven, after breakfast, my friends and I would head to the beach," recalls the 55-year-old.

"At high tide, we swam and challenged each other to jump higher or hold our breath longer. At low tide, we dug for clams and razor clams and carried home baskets full of them."

At the time, plastic waste was rarely seen on local shores. Occasionally, they would find a bottle with Japanese writing that had drifted across the sea.

In fact, Yan even had his first taste of instant noodles at age 7 after discovering a Japanese packet washed ashore following a typhoon, which he shared with three friends.

When he returned home in 2003 after leaving a career in deep-sea fishing, he was shocked to find beaches increasingly covered with rubbish, especially marine debris. Determined to help, he began cleaning the shoreline on his own.

Left: Yan Shanyue, a former seaman-turned-guesthouse owner, is helping transform Qingbang Island into the zero-waste island of his dreams. **Right:** A recent cleanup event was held to gather volunteers to collect trash together on the beach of Qingbang Island, Zhejiang province. photos provided to china daily

In 2013, Yan moved to Qingbang Island to open a guesthouse. He continued his beach-cleaning routine, and before long, other guesthouse owners joined him. Together, they discovered that just a few people could restore a small beach to its natural beauty within hours.

"Sometimes I think to myself that we really do have the power to make a difference," he says.

Encouraged by the results, Yan and his growing team began inviting volunteers from outside the island, offering affordable food and accommodation to support cleanup efforts. Through these activities, he connected with professionals from marine conservation organizations, inspiring him to establish his own environmental charity dedicated to creating a "zero-waste island".

He and his partners then mobilized local shop owners to sign a "zero waste island partnership" agreement.

Driving a small tricycle, he collected cardboard, aluminum cans, and plastic waste while visiting households to encourage recycling and proper waste sorting.

"What gives me the greatest sense of achievement is that the islanders trust in me is growing," Yan says.

The journey also pushed Yan to develop new skills. He learned how to write project proposals, create PowerPoint presentations, prepare budgets, and organize events ranging from waste surveys to community education programs and environmental improvement projects. He continues to seek partnerships with companies and environmental foundations to expand the initiative.

Yet, the challenge remains relentless. Every storm washes new debris onto the island's beaches. A shoreline cleaned by evening may be covered with trash again the following morning, creating what often feels like an endless cycle.

To cope with this frustration, Yan draws inspiration from a powerful memory from his years at sea. At age 16, he survived a fierce storm in which waves battered his fishing vessel for more than 50 hours. Crew members worked nonstop, bailing water while pumps ran continuously. The helmsman fought to keep the boat aligned with the waves, knowing that even a slight mistake could prove fatal.

Eventually, the storm passed.

"We couldn't control the environment back then," Yan says.

"We had no idea when the next wave would hit or when the boat might capsize. But we had no choice but to keep bailing the water out."

Decades at sea taught him a lesson he still follows today: while people cannot calm the wind and waves, persistence can keep a ship afloat — and help preserve the blue waters surrounding an island.

World Cup 2026

Super-sub Undav sends Germany into knockouts

Substitute's brace overturns halftime deficit to snatch win over Cote d'Ivoire

Deniz Undav (26) scores his, and Germany's, first goal of its World Cup Group E match against Cote d'Ivoire in Toronto on Saturday. Undav scored twice after being subbed on in the second half to lead Germany to a 2-1 win and clinch a spot in the knockout phase. AP

Deniz Undav celebrates scoring Germany's second goal during a World Cup Group E match against Cote d'Ivoire on Saturday. AP

> "It's important that everyone sees that even the players from the bench can decide games. Now we have sent a really important signal to the team. I think that's very important in a game like this."
>
> **Deniz Undav,** after scoring twice to help Germany reach the knockout phase

TORONTO — An hour into the game, Germany was getting outplayed by Cote d'Ivoire and trailed by a goal.

Coach Julian Nagelsmann needed a spark and substituted three fresh players on, one of whom was Deniz Undav. That decision paid off big time.

Undav scored two goals off the bench as Germany pulled off a thrilling comeback to beat Cote d'Ivoire 2-1 in its World Cup Group E match on Saturday, securing its place in the knockout stage for the first time since it won the title in 2014.

After having two goals disallowed in the first half, Germany did not lose focus and used intricate passing to find its way, while the West Africans produced their dynamic brand of attacking soccer in a wild encounter at Toronto Stadium.

"It's important that everyone sees that even the players from the bench can decide games," said Undav, who also scored in Germany's 7-1 opening match rout of Curacao. "Now we have sent a really important signal to the team. I think that's very important in a game like this."

"We showed great character today," said the versatile striker, who now has nine goals in his last eight matches. "We want to achieve the most (we can)."

Undav leveled the score with a controlled, volleyed finish in the 68th minute and struck again in stoppage time when he received a pass on the turn, before swivelling and firing home a ball that Yahia Fofana had no chance at stopping.

Simon Adingra had a late chance for Cote d'Ivoire, but he failed to get a shot off in the area before Germany charged back down the field where Fofana blocked a low shot from Nathaniel Brown.

The loss denied, at least for now, Cote d'Ivoire the chance of securing its first trip to the knockout stages.

"We wanted to make history today," said Cote d'Ivoire winger Amad Diallo. "But I think everything was a little tight."

Unfamiliar territory

Cote d'Ivoire had opened the scoring in the first half when Franck Kessie slotted home a rebound off a shot from Diallo on a play created when Yan Diomande charged down the left side and sent in a cross.

With more than 100,000 people of German ancestry living in Toronto, Nagelsmann's men enjoyed plenty of support, but were a frustrated group at the interval with nothing to show for their eight attempts on goal.

It was definitely unfamiliar territory for Germany, as it marked only the fourth time it has faced a halftime deficit in its last 36 contests at the global showpiece.

But, after the break, a more active German side showed up, one that took more risks and was determined to dedicate everything to its effort to win.

"In the end, we deservedly won it," Nagelsmann told reporters. "The boys invested a lot. I'm very happy for the whole team."

"This is exactly what we hoped for, and I'm very happy for my team," Nagelsmann said.

He said that after his two-goal performance, Undav could make the starting 11 in Germany's third group stage match against Ecuador, but also stressed that the Stuttgart forward was thriving as a substitute.

"I could have him in the starting lineup," Nagelsmann said. "I think that every player would love to be in the starting lineup, but I think he's very happy as it is right now."

Two goals scratched off

Germany looked to have opened the scoring when midfielder Aleksandar Pavlovic rose to meet a short corner in the 25th minute, but was deemed to have fouled Fofana in the process.

The ruling left Pavlovic with his hands atop his head in disbelief, as Fofana received some attention after the collision and the partisan German crowd made their disdain for the referee's decision known.

Shortly afterward, it was Cote d'Ivoire that finally broke through with Kessie's goal.

The West Africans have scored in their last seven matches at the tournament, the longest such sequence on the global stage in their history.

Germany once again put the ball in the back of the net, but its celebrations were cut short as the referee determined that Jamal Musiala had fouled Odilon Kossounou in the build-up.

"We had exactly what it takes to succeed in a tournament, a winning mentality, team spirit," said German defender Jonathan Tah.

"We didn't give up; we just kept going.

"The guys coming off the bench brought new energy to the game. Deniz deserves special mention. He was outstanding."

After a court fight to get into Canada, Elye Wahi, the Cote d'Ivoire striker under investigation for alleged betting-related offenses while playing in France for Nice, did not play.

Germany tops Group E with six points and is through to the last 32, while Cote d'Ivoire remains on three after two matches. Ecuador and Curacao played to a goalless draw in Kansas City in a later match on Saturday.

Germany will close out the group stage against Ecuador on Thursday in New Jersey, while Cote d'Ivoire faces Curacao in Philadelphia.

Agencies via Xinhua

Les Elephants look to forget Toronto loss and charge toward Curacao clash

If Cote d'Ivoire wins its next match, Saturday's loss to the Germans won't matter.

After surrendering two second-half goals and missing the chance to clinch a knockout stage berth for the first time in its four World Cup appearances, Les Elephants turn their attention to their last group stage match against Curacao on Thursday.

Win, and the Elephants are in.

Forward Amad Diallo said he and his teammates will get over the Germany loss. They have to.

"We (have) respect for ourselves, but we want to make history for Cote d'Ivoire, and we (are) going to go there with a good mentality and try to rise again," he said.

Cote d'Ivoire seemed one step ahead of Germany throughout the first half on Saturday — and a chunk of the second — with mid-

Cote d'Ivoire's Franck Kessie celebrates his goal against Germany on Saturday. AP

fielder Franck Kessie's first-half goal silencing German fans for a long stretch.

But the German side of the sold-out crowd erupted when Deniz Undav scored the winning goal, his second of the match, leaving Cote d'Ivoire fans hanging their heads.

The team seemed a little shocked as well, and players spoke about the pain of losing a match they felt they should have won.

Cote d'Ivoire coach Emerse Fae felt his team could have been more decisive in its bid to get a second goal.

"It's more frustration that we're feeling after this defeat, because we were able to open the score against this strong German side," he told reporters.

"A difference in experience meant that the chances that we did have at the end of the game, where we needed to find the back of the net, we were hesitant," Fae said.

However, the Ivorian coach was quick to put the Germany game behind him and highlighted that, overall, he was happy with his team's performance.

"We're going to use this game as a lesson to try and fine-tune the mistakes, our shortcomings that we still have, and that will help us go as far as possible," he said.

He said he was looking forward to the challenge of facing Curacao next to see "what they are made of", and was expecting a strong fight.

"Our destiny is still in our hands, or at our feet," he said.

The good news for FIFA's No 31-ranked Les Elephants is that their next opponent, Curacao, is way below them at No 83.

The Caribbean nation also lost its first match to Germany, 7-1.

"It's going to be a big moment for everyone, for this new generation, because we know we have quality in the team," Diallo said. "But the priority now is that we are really focused on ourselves. It's going to be a very hard game."

Agencies via Xinhua

Double Dutch: Braces from Brobbey and Gakpo help sink Sweden

HOUSTON — Under intense pressure after its opening-game draw with Japan, the Netherlands delivered a dominant performance against Sweden in the World Cup on Saturday to move atop the Group F standings.

Brian Brobbey and Cody Gakpo scored two goals apiece to power the Dutch to the 5-1 win.

Brobbey's goals came in the first half, setting the Netherlands up for a big win after playing to a 2-2 draw the previous Sunday.

"It could be that the way we played builds confidence," Netherlands coach Ronald Koeman said. "Now we've got a slightly better peace of mind with the four points. You can build on what happened now, and that's really good."

Gakpo, who also had an assist, extended the lead to 3-0 just after halftime, scoring in the 47th minute off a cross from Denzel Dumfries. He matched Brobbey when he scored on a right-footed shot from the left side of the box in the 54th minute.

"Today, there was more variation in attacking play, more players in different positions, movement and all those things," Gakpo said. "So it was more difficult for the defenders to really mark us, and we became free in the box. I think that was the little thing maybe we missed in the last game."

Sweden couldn't build on its strong performance in a 5-1 walloping of Tunisia in its first match. The loss to the Dutch was its biggest World Cup defeat since losing 7-1 to Brazil in 1950.

Sweden coach Graham Potter said the defeat was less about what his team did and more about just how good the Netherlands played Saturday. "They're a top team, and they were better than us today. We have to congratulate them, but I think we'll learn a lot from the game."

The Dutch game plan to play out wide to open up Sweden and cross to Brobbey worked perfectly early on. He put the Netherlands on top in the 11th minute, one-timing a Gakpo cross with his right foot.

His second goal came when he took a cross from Dumfries while sliding and just got his right foot on the ball, scoring inside the far post in the 17th minute.

Koeman credited Brobbey's success to getting in better shape after he had struggled in the past with the rigors of playing a full game.

"He's fitter, he's sharper and he's developing really well," he said.

Anthony Elanga's left-footed goal cut the lead to 4-1 in the 59th minute and allowed Sweden to avoid the shutout loss.

Crysencio Summerville celebrates with NBA star Steph Curry's "night night" gesture after scoring the Netherlands' fifth goal of its 5-1 World Cup Group F win over Sweden in Texas on Saturday. REUTERS

Sweden had plenty of chances to score before that, but the Dutch goalkeeper Bart Verbruggen was brilliant in the first half with four saves.

Sweden appeared to have cut the lead to 2-1 on a header by Gustaf Lagerbielke in the 44th minute, but he was ruled offside. Lagerbielke is a baron from a noble family in Sweden. His father and grandfather are counts.

But he wasn't the only royalty in the stadium Saturday, as the Netherlands had two very special guests cheering them on with King Willem-Alexander and Queen Maxima watching from a luxury suite. "The King was very happy," Koeman said.

Crysencio Summerville, who assisted Gakpo's second goal, tacked on one of his own for the Netherlands in the 89th minute and celebrated with NBA star Steph Curry's "night night" gesture.

Summerville took a boot to the head late in the match and had received stitches, but Koeman said he should be ready for the next match.

Samurai blues for Tunisia

Meanwhile, Japan marked the 1,000th game in the history of the World Cup with a 4-0 thrashing of Tunisia in Saturday's final fixture.

Ayase Ueda scored twice while Daichi Kamada and Junya Ito were also on target, as the Asian giant joined the Netherlands on four points at the top of Group F.

Tunisia can no longer hope for a place in the knockout stages.

The Samurai Blue were always in control against Tunisia at the Monterrey Stadium in Mexico and Tunisia never looked like threatening a technically superior Japanese side that settled quickly into its trademark, smooth passing game.

Kamada opened the scoring after just four minutes following some deft interplay. Minutes later, Tunisia keeper Aymen Dahmen just managed to claw away the ball, which was barely centimeters from crossing his goal line. Japan eventually got its second in the 31st minute, with striker Ueda thundering in a low shot from the edge of the area.

The rout continued in the second half, with Ito latching onto a brilliant through ball to finish in the 69th, before Ueda nodded in a looping header in the 83rd.

Group F winds up on Thursday, with Japan playing Sweden at Dallas Stadium and the Netherlands facing Tunisia in Kansas City.

Supply chains' intl integration hailed as key

Amid geopolitical headwinds, cooperation of every country needed, Beijing expo told

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Against mounting cost pressures and evolving geopolitical headwinds, deeper supply chain integration and closer industrial collaboration have become ever more pivotal for global businesses to sustain innovation momentum and bolster trade growth, senior government officials and business leaders said on Monday.

Addressing the opening ceremony of the fourth China International Supply Chain Expo in Beijing, Vice-Premier Ding Xuexiang said that global supply chains, industrial chains and value chains are closely interconnected, with every country serving as a link in the chain of cooperation.

Ding emphasized that safeguarding the stability and smooth operation of global industrial and supply chains calls for concerted efforts from all stakeholders.

Running from Monday to Friday, the expo has attracted more than 676 companies and institutions from 85 countries, regions and international organizations this year, according to the Beijing-based China Council for the Promotion of International Trade, the expo's organizer.

Echoing the vision of enhanced international cooperation, South African Deputy President Paul Mashatile said the world stands at a critical juncture. Geopolitical shifts, technological breakthroughs, climate challenges and shifting production paradigms are collectively reshaping the global trade landscape, he said.

Governments and businesses worldwide are now prioritizing greater resilience, diversification, decarbonization and sustainability throughout supply chain systems, Mashatile said, adding that in this context, restoring confidence in the multilateral trading system and advancing inclusive, sustainable economic growth have emerged as pressing global imperatives.

John Denton, secretary-general of the Paris-based International Chamber of Commerce, warned that prevailing uncertainties may curb global business and investment activities by up to $400 billion this year alone.

However, he said, "Bolstering supply chains through digital transformation, refined operational approaches and modern trade practices could unlock over $3 trillion in additional global economic output over the next five years."

China has also sought to reinforce these efforts through a series of policy measures, with the government rolling out a new action plan to stabilize foreign investment. The package pledges broader market access, streamlined investment procedures and more robust support for foreign businesses operating in the Chinese market, according to information released on Monday by the Ministry of Commerce.

Zhao Ping, head of the China Council for the Promotion of International Trade's academy, said China's commitment to wider opening-up, advanced manufacturing development and industrial ecosystem improvement has underpinned the resilience and stability of global industrial and supply chains.

China's foreign trade grew 15.3 percent year-on-year to 20.68 trillion yuan ($3.05 trillion) in the first five months of 2026, while foreign-invested businesses in the country recorded 6.02 trillion yuan in imports and exports, up 15.7 percent year-on-year, according to data from the General Administration of Customs.

Business leaders said that against the backdrop of profound shifts in the global economy, building secure, stable and efficient supply chains has become a shared priority for businesses worldwide.

Landon Loomis, president for China at Boeing, said the United States-based aircraft manufacturer works with around 40 suppliers in China, with components produced by these suppliers incorporated into Boeing aircraft delivered worldwide.

Silvia Ding, managing director for China at Danish shipping company Maersk, said that Chinese companies have increasingly expanded their overseas supply chains across multiple regions and nodes, bringing greater complexity.

"With the continued development of China's advanced manufacturing sector, industries such as electronics, automotive and new energy equipment are accelerating the expansion of their global manufacturing footprint," she said.

WORLD WATCH
By Gim Huay Neo

Scaling innovation to turn ideas into impact

We are at the cusp of a new industrial age, powered by rapid technological changes and confronted with increasing complexities. The World Economic Forum's Global Risks Report 2026 highlights geo-economic confrontation as the foremost risk for 2026, while environmental threats loom large over the next decade.

Anxiety over the adverse outcomes of artificial intelligence and societal polarization has also risen in the past two years. These challenges are making economies and societies rethink how we produce, consume, work and live together. The key question is whether humanity will seize this opportunity to build not just strong and vibrant economies, but also cohesive communities and a healthy planet.

Innovating at scale requires transformational shifts at the systems level. This involves fundamental changes in structures, incentives, relationships and operations across entire sectors so that innovation can deliver a broader and sustained impact.

China slaps export controls on 10 US firms

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China imposed a sweeping set of countermeasures against the United States on Monday, placing 10 US companies on an export control list and barring government agencies from purchasing products from 46 others, in a direct response to Washington's recent expansion of its list of so-called Chinese military-linked companies.

The actions, taken less than two weeks after the Pentagon added Chinese companies to its list in sectors such as electric vehicles, artificial intelligence, biotech and robotics, are aimed to pressure the US to revoke its wrongful classifications and return to the track of dialogue and cooperation, experts said.

The Ministry of Commerce announced the addition of 10 US entities to its export control list on Monday, banning the sale of dual-use items — goods and technologies with both civilian and military applications — to companies spanning the aerospace, defense, robotics, maritime services and rare earth sectors.

Organizations and individuals from any country or region are prohibited from transferring or providing dual-use items originating in China to the listed entities, and any ongoing export activities must be ceased immediately, according to the announcement.

Inside
Editorial, **page 6**

A ministry spokesperson said in a separate statement that the move is necessary to "respond to the US government's malicious addition to the so-called 'Chinese military company list'".

The updated list now includes over 180 Chinese entities, with the scope extending far beyond traditional defense industries into sectors such as cloud computing, AI, biotechnology and robotics.

Washington's blacklisting drive to curb China's technological ascent through supply chain restrictions has added new volatility to a relationship that has shown tentative signs of a thaw after the two heads of state reached a series of consensuses in Beijing last month, experts said.

"China does not initiate friction, nor does it allow unilateral bullying to spread unchecked," said Liao Fan, director of the Chinese Academy of Social Sciences' Institute of World Economics and Politics. "When others cross the line, we respond in accordance with regulations to defend national security red lines, protect our industrial interests and safeguard the order of global trade."

Liao also noted that this will form a "deterrence mechanism", forcing Washington to think twice before imposing further sanctions.

A survey released by the US-China Business Council earlier this month found that the mounting pressure on US businesses in China stems increasingly from the uncertainty surrounding US export controls, and the Chinese countermeasures that the US actions inevitably provoke are compounding the challenges for US companies on the ground.

Any further expansion of Beijing's export controls will likely force US companies into a costly and yearslong scramble to rebuild their supply chains, according to survey respondents.

In a separate measure on Monday, the Ministry of Finance announced a ban on government procurement from 46 US companies, including major defense contractors Lockheed Martin and Raytheon. The ban also excludes the affected companies' subsidiaries from operating in China.

The calibrated nature of the response, which targets specific entities rather than broad sectors and exempts US-invested companies operating in China, suggests that Beijing is seeking to pressure Washington to reverse course, not to escalate tensions, said Cui Fan, a professor at the University of International Business and Economics in Beijing.

LIVING HISTORY DRAWS VISITORS TO ANCIENT MIAO VILLAGE

Idyllic locale, traditional attire and intricate crafts attract global travelers to ethnic Guizhou

By **GUO JIATONG**
guojiatong@i21st.cn

After living in China for a year, Italian designer Lucrezia Gestri has discovered a detailed and artistic side of the country she currently calls home.

While visiting Xijiang Qianhu Miao Village of Kaili, the capital of the Qiandongnan Miao and Dong autonomous prefecture in Southwest China's Guizhou province, Gestri noted: "I often experience the country through innovation, design and modern urban life. But Xijiang feels deeply connected to tradition, craftsmanship and heritage."

With the wooden houses spread across the mountainside and the village illuminated by lights in the evening, Gestri said that the scene felt "almost surreal" and "very cinematic".

Traveling with a Chinese friend, she also gained a deeper understanding of local customs by talking to residents, which helped her see the meanings behind the village's clothing, craftsmanship and everyday traditions.

"The traditional clothing, embroidery and silver ornaments are incredibly detailed and artistic," she said. "You can immediately feel that every decoration carries history, symbolism and craftsmanship passed down through generations. It felt like stepping back into the past."

For Etienne, a tourist from France, the traditions of Xijiang were not only something to observe, but also something to take part in. During his recent trip to China, he joined local residents in a *lanmenju* welcoming ritual.

A tourist visits the Xijiang Qianhu Miao Village in Kaili, Guizhou province, in April. PROVIDED TO CHINA DAILY

During the ritual, guests are greeted with rice wine as a symbol of hospitality. "The custom revealed the important role that food and drink continue to play in expressing warmth and community in Chinese culture," said Etienne, the French tourist.

Xijiang Qianhu Miao Village, often described as an open-air museum of Miao culture, is home to more than 6,000 residents in over 1,000 households. Nestled among the mountains in southeast Guizhou, the village attracts visitors with its layered wooden stilt houses, vibrant song-and-dance traditions, sparkling silver ornaments and distinctive sour soup cuisine.

The growing popularity of ethnic tourism has also created economic opportunities. According to Ouyang Guanglong, chairman of the Xijiang Tourism Group, the scenic area received more than 5.3 million visitors last year, generating a total tourism revenue of 591 million yuan ($87.3 million), a year-on-year increase of 10.82 percent.

Hong Kong fire survivors rebuild lives from ashes

Apartment buyback scheme, psychological support, independent inquiry help in healing process

Above: Residents of seven fire-affected Wang Fuk Court blocks in Hong Kong's Tai Po district return to their fire-hit apartments to collect remaining belongings on April 23. EDMOND TANG / CHINA DAILY
Top: A hand-drawn picture of the word "Family" is found after Gabby and her husband Antonio sifted through their fire-damaged apartment. PROVIDED TO CHINA DAILY

By LU WANQING in Hong Kong
wanqing@chinadailyhk.com

Lau is counting the days to June 30, a deadline that offers survivors of Hong Kong's Wang Fuk Court fire tragedy a potential new start in life after about seven months in the wilderness.

It's the first designated date for affected apartment owners to take up the Hong Kong Special Administrative Region government's buyout offer for their burned-out apartments.

An acceptance letter will entitle an owner to take part in the "first-round selection" for a new home under a special sales program.

A ballot will determine who chooses first.

"The draw could lead us anywhere," Lau said. "Still, a place to call my own is, in the end, better than any rented room."

Lau had just completed renovations of her home on the 16th floor of Wang Sun House, one of eight towers on the estate, when the blaze engulfed Wang Fuk Court on Nov 26.

Within hours, seven buildings were ablaze. The inferno raged for 43 hours, and 168 people lost their lives in the city's deadliest fire in nearly eight decades.

The apartment complex in Tai Po district, near Hong Kong's boundary with the Chinese mainland, was home to more than 4,600 residents. Lau and her family are among almost 2,000 displaced households piecing their lives back together after the disaster.

Lau, her husband, and two sons moved three times in the month following the fire.

Despite being provided a temporary shelter by the HKSAR government, they accepted a friend's offer to live in a beauty salon, she said. However, Lau's husband was too embarrassed to linger in the salon during the day as customers streamed in.

He went to a nearby park and sat there from "sunrise to sunset", she said. "I felt so sorry for him and found us somewhere else to live as fast as I could," Lau said.

A resident leaves after collecting his belongings in Wang Fuk Court on April 20. EDMOND TANG / CHINA DAILY

Resettlement top concern

Some of the surviving Wang Fuk Court residents believe the path ahead is clear in outline, if not in details.

The HKSAR government has offered Wang Fuk Court apartment owners acquisition prices of HK$8,000 ($1,020) or HK$10,500 per square foot, either as cash or a "flat-for-flat" exchange voucher.

Wang Chi House, the sole tower spared from the blaze, will be included only if at least 75 percent of owners agree to the buyout plan by June 30.

The total cost of acquiring all eight blocks is estimated at HK$7.8 billion, involving HK$5 billion in public funds and HK$2.8 billion from a support fund established by the government.

A number of residents China Daily spoke to described resettlement as "labyrinthine" and "disorienting". Their questions mainly related to the size of the new residences to be offered and their locations.

Joe Wong, whose family of five lived in Wang Tai House in the estate, said he is now a "dislocated man". Part of his daily routine used to be walking his daughter to her primary school in Tai Po.

Now, he lies awake at night wondering whether the flats on offer will match what they once had, with a comparable living space, and transport and medical care within reach. Wong, who said his concerns are shared by many other former residents, also hopes for a sense of community and an established school network at his new home.

Under the official special sale program, 10 developments are in the pipeline. The earliest project could welcome residents by the end of 2026. The last developments will not be ready until 2030 or 2031.

Among the projects is a two-phase new development in Tai Po featuring 1,500 units. The earliest move-in date is expected to be in 2029 under the most optimistic forecast.

The government has ruled out rebuilding on the Wang Fuk Court site citing technical constraints and a drawn-out timeline. But some residents remain hopeful that the authorities might reconsider rebuilding the estate on the old site or nearby.

Generous donors, inquiry

On Nov 27, the day after the fire, a dedicated assistance fund — the Support Fund for Wang Fuk Court in Tai Po — was launched with HK$300 million in start-up capital from the HKSAR government.

Within a day, public donations from across the country added another HK$500 million. By the third day, the total had reached HK$1.2 billion.

The donations kept rolling in and by late February the fund had hit HK$4.7 billion.

About 98 percent of the public donations were in amounts of HK$10,000 or less, authorities disclosed earlier this year, adding they were likely from "ordinary people". Large contributions of over HK$1 million from institutions and companies numbered more than 700.

Some of the money has already been used for 13 support programs, including condolence and funeral payments for the families of the deceased, according to the fund's official website.

Funds have also been allocated for living allowances, rent and relocation subsidies for displaced residents, along with grants and subsidies for affected students, workers, and foreign domestic helpers. A Chinese New Year goodwill token was also offered.

Multiple private charities have also been distributing funds raised in the fire's aftermath. In March, the Hong Kong Red Cross reported over HK$530 million in donations.

The Red Cross said the donations would provide urgent relief funds as well as financial and psychological support for Wang Fuk Court fire victims. They will also help fund a five-year community program, providing training in disaster preparedness and first aid.

Meanwhile, an independent commission was formed in December, tasked with uncovering the root structural flaws leading to the blaze and its exceptionally rapid spread.

The committee held 24 public hearings from March to early May. Three more are scheduled for Monday, Wednesday and Thursday.

Evidence at the hearings has indicated a litany of suspected human factors in the blaze. The list includes: the estate's main fire alarm being deactivated during the fire; flammable scaffolding mesh and foam panels being used for renovation work; and the maintenance project's consultant and contractors likely rigging the tendering process. Oversight of the actual on-site maintenance work barely existed, the inquiry also heard.

The committee has nine months to determine the fire's cause and recommend systemic reforms. Local authorities have already floated a raft of legislative amendments and additional fire safety-related rules to overhaul building maintenance and fire-service regulation.

Government employees accompany residents to collect their belongings in Wang Fuk Court on April 20. EDMOND TANG / CHINA DAILY

Seven individuals and two companies — the contractor and engineering consultant involved in the estate's renovation work — appeared in court on June 10 to face 25 offenses including conspiracy to defraud, money laundering, attempting to pervert the course of justice, and tax evasion.

Charred memories

Displaced families from the estate's seven fire-ravaged blocks were allowed to return to the site for the first time on April 20 to retrieve what remained of their possessions.

For many, it was also an opportunity to say goodbye to the place they once called home.

Among them were Gabby and Antonio, a married couple from Wang Sun House in their 40s. Inside their apartment, the plaster on the smoke-stained walls hung like ragged sheets. The door was burned through, and building debris littered the floor.

"We braced ourselves beforehand," they said. "The stair climb, and our flat's condition, were about what we imagined."

However, there was some joy amid the ruins. Antonio retrieved one of their wedding rings from their bedroom using a metal detector.

Gabby also pulled some of her old drawings from the debris. On a yellowed sheet of paper with charred edges was written the word "Family". She plans to have the page framed and displayed once they settle into a new home.

> "We had one good cry together. Now we silently agree not to pick the wounds anymore."
>
> **Lau,** a resident of one of the blocks of fire-hit Wang Fuk Court

At Wang Sun House, Lau was among the first former residents to go upstairs. Unfortunately, she said gold ingots she had in her apartment were missing. She reported the suspected theft to the police.

By May 30, a total of 142 such reports had been made by Wang Fuk Court residents, with 16 cases remaining open, Hong Kong authorities said.

A local official reported that 1,674 of the 1,736 affected households in the seven fire-hit buildings — 6,265 people, including former residents, friends and helpers — had gone upstairs during the visiting period from April 20 to May 4. Around 50 opted out after viewing photos of their flats. Fewer than 10 required separate arrangements, the official reported.

Residents of Wang Chi House — the sole block untouched by the blaze — had made two return trips by May 17.

A second round of visits to the seven fire-hit buildings ran from May 21 to 29.

'Not alone'

Months on from the inferno, Lau still gets goose bumps just talking about it.

One of her neighbors lost a child in the fire, and a playmate of Lau's child lost her mother.

George Cheung Chi-lim, aged in his 70s, and his wife suffered physical injuries and have been diagnosed with post-traumatic stress disorder.

Joe Wong said his seven-year-old is "a different person" now — "touchier and easily angered".

Despite the negative psychological impacts of the tragedy, the survivors China Daily spoke to all agreed they were not facing their problems alone.

Lau said she still sees her old neighbors.

"We had one good cry together," she said. "Now we silently agree not to pick the wounds anymore."

Instead, they share memories of leaning on one another amid the calamity: water poured from upstairs windows down onto the flames, and Styrofoam window seals carried inside to stop the possibility of any molten drops falling on the floors below.

Cheung, a resident of Wang Fuk Court for over four decades, testified before the independent commission in March. He spoke of climbing onto a windowsill and throwing water on the flames. He said he and his wife took in an elderly neighbor who could not flee. They were all finally rescued five hours later.

The Cheungs said they now "treasure each other even more".

Gabby and Antonio returned to Wang Fuk Court again on May 23, this time with their two children, aged 7 and 11.

"They need to say bye-bye as well," Gabby said, "to the house, and to their stuffed animal toys that they'll never have back."

Wong said he spends more time with his daughter nowadays and maintains a steady line of communication with her school's social worker to ensure emotional support for the seven-year-old. "Being there, that's what matters," he said.

The HKSAR government has introduced a "one social worker per household" service. Around 2,000 social workers from the Social Welfare Department are available to help the fire victims handle queries on financial aid and supplies, and arrange counseling sessions.

Wong said the social worker assigned to him checks in regularly, and has visited the family at their temporary home.

Still, he said he feels melancholy about how the old community — his daughter's childhood playmates, his own circle of friends — has disappeared. "We can hardly meet up now," he said.

Stacy Shi contributed to this story.

Iran to let in inspectors, can sell its oil

Final deal to be reached within 60 days, Iran says it will administer Strait of Hormuz

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

Iran's chief negotiator, Mohammad Bagher Ghalibaf, told Iranian media on Monday that the Strait of Hormuz would be administered by Iran.

"Everyone should know that the administration of the Strait of Hormuz will never go back to the way it was before the war," Ghalibaf said on his way back to Tehran after negotiations with the US in Switzerland.

"Of course, international regulations will be observed, but Iran will administer the Strait of Hormuz," he said.

Ghalibaf's statement came following talks with the US that all parties acknowledged had shown "encouraging progress".

In Switzerland, the United States agreed it would allow Iran to sell crude oil and petroleum products for two months, and said Iran would allow nuclear inspectors into the country.

"In line with the ongoing productive talks in Switzerland, Iran has committed to free and open transit in the Strait of Hormuz and to permit International Atomic Energy Agency (IAEA) inspectors into their country," US Treasury Secretary Scott Bessent posted on X on Monday.

"As part of the framework, Treasury has issued a temporary 60-day general license authorizing the production, delivery, and sale of Iranian oil," Bessent said.

US President Donald Trump has said for a long time that Iran should not be allowed to possess nuclear weapons, while Iran has maintained that its nuclear enrichment program is for civilian purposes.

The license to sell oil runs until Aug 21, and while it allows the import of Iranian oil into the US, transactions with countries that the US has sanctioned, such as North Korea or Cuba, were still not authorized.

US Vice-President JD Vance was positive about the talks.

"We laid a very good foundation for a successful final deal," Vance said on Monday. "We made great progress."

However, Iran pushed back against Bessent's assertion about nuclear inspectors, saying that cooperation with the IAEA would continue "under the current procedures".

Iranian Foreign Ministry spokesperson Esmaeil Baghaei told the country's official news agency, IRNA, that the IAEA would proceed "in accordance with Iran's obligations under safeguard agreements" and "in line with resolutions passed by Parliament and decisions of the Supreme National Security Council".

US and Iranian negotiators have been in Switzerland, along with mediators from Pakistan and Qatar, for a first round of talks.

Pakistan and Qatar released a joint statement on Monday that affirmed an agreed-upon road map toward reaching a final deal within 60 days, laying the foundation for the commencement of technical talks.

A communication line has been formed between the parties "to avoid incidents and miscommunication" in securing safe passage for commercial vessels through the Strait of Hormuz.

"The parties agreed on the creation of a deconfliction cell between the parties and the Lebanese Republic," the statement said.

Iran's Foreign Minister Abbas Araghchi also posted on X that some frozen Iranian assets had been released and a major reconstruction and development plan for Iran had been launched, though the US had yet to confirm this.

Chinese Foreign Minister Wang Yi said on Monday that maintaining and implementing the memorandum of understanding between Iran and the US will help consolidate the hard-won ceasefire, open new prospects for Iran-US relations and bring peace back to the Middle East.

When meeting in New Delhi, India, with Qadir Nizamipour, deputy secretary of Iran's Supreme National Security Council, Wang said that maintaining and implementing the MoU serve not only Iran's fundamental interests, but also the shared expectations of the international community.

As Iran's comprehensive strategic partner, China has always upheld a just position and supported all efforts conducive to peace, he said.

He added that China supports Iran in safeguarding its sovereignty, security and national dignity, as well as in improving relations with Gulf countries and other countries in the region.

Oil prices fell on Monday, with benchmark Brent trading around $78 a barrel.

Starmer quits, Burnham strong contender for post

By **JULIAN SHEA** and **XING YI** in London

British Prime Minister Keir Starmer ended all speculation about his future on Monday by announcing his resignation, less than two years after guiding the Labour Party to a landslide victory in the 2024 general election.

His resignation means the United Kingdom will have its seventh prime minister in just over a decade. Amid the imminent change, the British pound slid as much as 0.4 percent to touch $1.3181 early on Monday, approaching its 2026 low of $1.3159 set in March, before paring losses. The yield of the UK 10-year gilt bonds, a benchmark for what the Treasury pays to borrow money, edged up from 4.84 percent to 4.85 percent, while the yield on 30-year gilts rose from 5.54 percent to 5.55 percent.

Doubts over Starmer's leadership had been growing for some time, particularly after the recent damaging local election results, for which Starmer took personal responsibility.

In an address outside his Downing Street office, Starmer said that he had "heard the answer of my Parliamentary party" as to whether he was "best placed" to lead it into the next general election. "I accept that answer with good grace," he added, saying that he would continue until his successor was chosen.

Starmer became Labour Party leader in April 2020, replacing Jeremy Corbyn, who had led the party to a heavy defeat in the 2019 general election. He faced three Conservative prime ministers before Labour won 411 of the 650 seats in the 2024 general election. However, although this gave Labour a clear Parliamentary majority, it secured just 34 percent of the popular vote, the smallest share received by any majority government since World War II.

With the main right-wing party, the Conservatives, having lost support to Reform UK, another British right-wing party, Starmer's critics accused him of focusing too much on trying to win votes from Reform, particularly over immigration, rather than appealing to more traditional Labour or progressive voters.

He was criticized for his handling of the appointment of former British ambassador to the United States Peter Mandelson, who resigned over his ties to sex offender Jeffrey Epstein. May's local elections further weakened his position.

One person cited as a potential leadership contender, Wes Streeting, quit as health secretary earlier, saying: "Where we need vision, we have a vacuum. Where we need direction, we have drift … It is now clear that you will not lead the Labour Party into the next general election."

On the day Starmer resigned, the man widely tipped to replace him, Andy Burnham, returned to Parliament after nine years away as mayor of Greater Manchester.

Burnham tried to return to Parliament in January by running as a Labour candidate in a by-election, only to be blocked by party bosses, whose preferred candidate lost.

As Starmer's position weakened, a sitting Labour member resigned his seat, allowing Burnham to run in another by-election last week, which he won comfortably.

Nominations for any leadership election will begin on July 9 and stay open for a week, allowing a new leader to be chosen before Parliament returns from summer recess in September.

London-based political analyst Keith Bennett told China Daily that Burnham's win made Starmer's exit inevitable.

"The gradual erosion of his authority in the Parliamentary Labour Party and then the Cabinet was turning into a flood that would have swept him from office in any case," he said.

Bennett said that Burnham's win showed that he was a more popular option with party members and the wider electorate. Should he become leader, he could offer a genuine change of approach, although quite what that would be remains unclear, Bennett added.

"Much will depend on the makeup of a new Cabinet, but above all the serious nature of the challenges facing the country remains unchanged.

"A change at the top gives Labour a chance to prevail at the next general election, but only a chance — much will depend on how events unfold, many of which will be outside the government's control," he said.

"The local election results showed people are impatient for the change that was promised," London Mayor Sadiq Khan said.

Innovation: Culture, societal readiness also essential

From page 1

Scale is not only about deploying more technology or expanding companies; it's also about translating new ideas into lasting and large-scale change. Achieving this demands a conducive environment of policies, regulations, standards, infrastructure, capital and capabilities, alongside culture, trust and cooperation. Without these, innovation risks being confined to pilots and early adopters.

Entrepreneurship is central to this transformation. Often seen as risk-takers or disruptors, entrepreneurs are essentially pathfinders who chart new ways of thinking, interacting and operating, bridging the gap between possibility and practice. They identify market bottlenecks, service gaps and institutional frictions. They rally talent, capital and partnerships to address these challenges, testing new approaches, adapting them to real-world problems and applying solutions that can be scaled and sustained, helping to define and shape standards and regulations.

In Asia, entrepreneurship has fueled innovation by building purpose-driven ecosystems that integrate infrastructure, skills, capital, markets and public-private partnerships to achieve resilient, sustainable and inclusive growth. Manufacturing networks have helped smaller suppliers thrive alongside larger companies, digital platforms and logistics networks have opened new markets for micro and small enterprises, and investments in connectivity have created new models in payments, commerce, mobility and services.

China's 15th Five-Year Plan (2026-30) exemplifies how industrial upgrading, technological innovation and green development can be pursued in tandem to support structural transformation and more sustainable growth. The development of clean energy value chains that link solar power, batteries, smart grids and electric vehicles illustrates this integration. These interconnected industries have spurred job creation, exports and local incomes while lowering energy costs, reducing emissions, improving air quality and accelerating a wider shift toward greener industry and mobility.

Around half of the AI pioneers in the World Economic Forum's MINDS (Meaningful, Intelligent, Novel, Deployable Solutions) program are based in China. These companies have shown how AI solutions can be applied meaningfully and at scale to generate value for businesses and society. One MINDS company in the healthcare sector, for example, has reduced patient screening time by 83 percent, shortened clinical site investigation cycles by 67 percent, and improved operational efficiency in core medical scenarios by 30 percent through a governed enterprise AI operating model.

Such examples show that the future of manufacturing prowess and economic resilience will be defined not only by the speed of technology adoption, but also by the ability to build ecosystems and redesign systems that benefit people and the planet, alongside productivity and resource allocation gains.

For innovation to scale, three interconnected and interdependent systems need to evolve: governance, business responsibility and societal readiness. The public sector can reimagine policy levers to stimulate capital flow for innovations, try out solutions before they are scaled and harness partnerships for more co-creation between the public sector, research institutions and private enterprises.

For businesses, innovation can move from isolated success to sector-wide transformation by prioritizing ethical business practices, stakeholder value and employees' well-being.

Culture and societal readiness are also essential. For entrepreneurship to flourish, we must create environments where people have the confidence to experiment, the networks to collaborate, and the support to learn and try again. More can be done to widen access to capital and networks, especially for women, young people and community-based enterprises. Society should support and recognize not only high-growth technology companies, but also small manufacturers, agribusinesses, care providers, logistics platforms and social enterprises that create jobs and solve local problems.

In a world marked by increasing complexities and declining multilateral cooperation, smaller and more agile coalitions of countries and companies will play a bigger role in ensuring that overall cooperation endures. Systemic transformation is already underway, characterized by collaborations that are flexible and agile enough to acknowledge geo-economic realities, and yet ambitious and pragmatic enough to address shared global challenges.

Ultimately, to innovate at scale is to build systems that enable more people to contribute to and benefit from transformation. In a more complex and fragmented world, collaboration must become more purposeful — connecting technology with the human touch, enterprise with social responsibility, and growth with sustainability. That momentum is already building, and if we dare to dream big, we can build a future characterized by stronger economies, cohesive communities and a healthy planet.

Ritual: Tradition integrated into a wider cultural platform

From page 1

The village is currently working toward becoming a national 5A-level tourist attraction, China's highest tourism rating. To enhance the visitor experience, the scenic area now has 225 registered photography studios offering traditional Miao costume styling and photography services.

Among them is photographer Miao Xiaoliang, who established his studio in 2023 with the vision of presenting the most authentic traditional Miao attire to visitors. To date, his studio has reproduced around 100 sets of traditional Miao clothing, enabling tourists to experience authentic ethnic attire and obtain professionally photographed portrait sets for 399 yuan.

"We hope visitors can truly appreciate the authentic ethnic clothing and understand the culture behind it," said Miao. Rather than simply reproducing popular tourist images, he and his team carefully design photography settings that reflect the everyday living environments of local residents, to immerse guests more deeply in daily village life.

According to the photographer, traditional attire is often described as "history books worn on the body", with some motifs tracing back to some of the earliest cultural symbols in Chinese civilization. Over centuries, different branches of the Miao community have developed distinct clothing styles, with nearly 170 documented costume systems in Guizhou alone. Through intricate patterns and embroidery techniques, the garments preserve traces of migration, mythology, aesthetics and ancient beliefs.

In some regions, the patterns are inspired by nature and focus on birds, butterflies, fish and flowers, he said. Some patterns also embody ancient cosmological concepts and philosophical ideas, including the traditional understanding of the universe and the harmony between yin and yang.

Due to the diversity and regional specificity of the garments and accessories, collecting and reproducing traditional costumes has been far from easy. However, with increasing numbers of tourists visiting Xijiang each year, Miao hopes that the village will evolve into a broader cultural platform, introducing its unique traditions to the world.

"The Miao are a global ethnic group," he said. "There are Miao communities across Southeast Asia and even in the United States."

"We hope Xijiang can become a top tourism destination and an important cultural center connecting Miao people around the world," he said.

Editor's note:

In this weekly feature China Daily gives voice to Asia and its people. The stories presented come mainly from the Asia News Network (ANN), of which China Daily is among its 20 leading titles.

A woman sells bags at Dong Xuan market in Hanoi, Vietnam, on June 3. Vietnam's annual inflation rate increased to 5.6 percent in May from 5.46 percent in the previous month, according to data from the National Statistics Office of Vietnam. LUONG THAI LINH / EPA

Domino effect

ASEAN factories face closures, layoffs amid cost shocks driven by war, tariffs

Even with a recent ceasefire in the Middle East, the surge in raw material, energy, and shipping costs — compounded by US tariff measures — continues to squeeze manufacturers, driving factories across Southeast Asia to close and shed jobs.

While strong production in electronics has helped keep headline economic indicators looking relatively resilient, economists and industry leaders warn that deeper stress is spreading through small and medium-sized enterprises across the region.

The manufacturing confidence across Association of Southeast Asian Nations, or ASEAN, remained in positive territory in April, according to S&P Global's Purchasing Managers' Index, but the figure fell to its lowest level in nine months and marked a sharp slowdown from the period before the Iran war.

Firdaos Rosli, chief economist at AmBank in Kuala Lumpur, said Malaysia's April trade figures appeared stronger than expected, with exports growing at a double-digit rate. However, he warned that the headline numbers concealed major differences between sectors.

Rosli said the strength of overall data was masking severe pressure in some businesses, particularly as different parts of the economy were moving at very different speeds.

"For example, logistics, secondary manufacturing and local construction are the groups we expect to be hit hard. Although other thriving businesses may temporarily offset the figures in the national accounts, the distress at the micro level is real," he said.

Malaysia and the Philippines are among the countries hardest hit, with small and medium-sized enterprises facing the greatest risk as higher costs and weaker demand erode already thin margins.

Malaysia

In Malaysia, more than 100 small furniture factories in Muar, the country's largest furniture manufacturing hub, have closed in recent months. Industry players said the impact of the war had worsened pressure already created by tariff measures affecting exports to the United States.

Jeffrey Ng, owner of TKL Furniture, which exports all of its products to the US, said smaller factories were shutting down one after another as operators struggled to absorb rising costs.

"Small factories are beginning to close one after another. Around us, long-established factories are shutting down because they can no longer endure the pressure," he said.

A delivery boy carrying LPG gas cylinders on a motorcycle waits at the traffic signal in Bangkok, Thailand, on April 1. MATT HUNT VIA GETTY IMAGES

"Smaller operators can no longer withstand the squeeze, so they have to close. Older companies that made money in previous years are choosing to shut down and turn their assets into cash rather than allow their money to keep draining away."

Steve Ong, president of the Johor Furniture Association in southern Malaysia, said the impact of the war extended beyond the countries directly involved in the conflict.

He said global freight transport had been severely disrupted, pushing up shipping costs and prompting foreign customers to delay taking delivery of goods.

A May survey by the Federation of Malaysian Manufacturing found that 28 percent of 225 respondents had either reduced staff or planned to do so as a direct result of the crisis, while 72 percent said their business conditions had worsened.

The Philippines

In the Philippines, government data showed that factories cut about 217,000 jobs in March, equivalent to 5.8 percent of the country's manufacturing workforce.

The country's manufacturing PMI also fell into contraction territory, making it the weakest among ASEAN's six largest economies.

Miguel Chanco, chief emerging Asia economist at UK-based Pantheon Macroeconomics, said Philippine manufacturers were under pressure from both the demand and supply sides, as higher energy costs affected production costs and consumer purchasing power.

He said the Philippines was also more exposed than some neighbors because its export sector had benefited less from the AI hardware boom, which has supported electronics and component shipments in other parts of the region.

Chanco said the Philippine government had a thinner policy cushion than some regional peers, including fewer fuel-related support measures.

Vietnam

Vietnam is also seeing signs of strain despite electronics exports remaining a key driver of growth.

Andrew Harker, economics director at S&P Global Market Intelligence, said the latest survey showed output was still rising, but the pace of expansion had slowed close to stagnation. With new orders beginning to fall, he warned that production could contract in the coming months unless price and supply conditions improve soon.

One of the sectors facing heavy pressure is Vietnam's footwear industry.

Phan Thi Thanh Xuan, vice-president of the Vietnam Leather, Footwear and Handbag Association, said export markets in the Middle East had been effectively frozen by the conflict.

She said a 15 percent rise in transport costs and a 30 percent increase in raw-material prices linked to higher crude oil prices had left local factories in a difficult situation, as many export contracts had already been agreed in advance at fixed prices.

As a result, manufacturers have little room to pass higher costs on to buyers and are being forced to absorb the increase themselves.

Thailand & Indonesia

The surge in crude oil-linked raw-material prices is spreading through supply chains across Southeast Asia.

In Thailand, John Higham, chief commercial officer of Element 6 Evolution, a sailing yacht shipyard near Laem Chabang Port, said the company could no longer ship key composite materials from Dubai by sea.

"The big problem is resin, which is our heaviest main raw material," he said. "We now have to fly in thousands of kilograms of this hazardous cargo instead, because if we do not, the entire factory will have to stop production."

The emergency switch to air-freight has pushed the company's resin costs up by as much as 40 percent.

The cost shock is also spreading in Indonesia, where the Indonesian Employers Association said 10 out of 16 manufacturing sectors were growing far more slowly than the country's overall economic expansion of 5.61 percent in the first quarter.

Higher naphtha prices have directly affected the domestic plastics industry, while the Association of Indonesian Automotive Industries is surveying the impact on supply chains as rising costs and transport delays intensify pressure on manufacturers.

Singapore

As long-distance supply chains become more risky, companies in the region are starting to shift toward nearby sourcing partners.

Singapore-based firms, which remain among the most confident in the region, are seeking new raw-material sources to diversify risk.

Melvin Tan, vice-president of the Singapore Manufacturing Federation, said many manufacturers were turning to the newly established Johor-Singapore Special Economic Zone and nearby Indonesian factories as alternative bases for sourcing materials and supporting production.

The shift reflects a broader reassessment of supply chains, as companies try to reduce exposure to distant suppliers and volatile freight routes.

Analysts warn that conditions could worsen unless raw-material supplies improve quickly.

Malaysia's CIMB Investment Bank Berhad said a central bank survey showed that factories had, on average, only three to four months of raw-material inventory remaining. This suggests shortages could become more severe from the end of the second quarter of 2026 onward.

Rosli from the AmBank said the current situation had become a crisis that headline GDP figures may not capture immediately because the damage is unfolding gradually.

"The transmission of impact will spread quietly from one domino to another. It works like a fire that burns slowly," he said.

THE NATION, THAILAND

Drones are saving lives on world's highest mountain

For 22-year-old guide Lakpa Ringi Sherpa, this spring climbing season on Qomolangma, known as Mount Everest in the West, felt different.

The fear was still there. The dangerous Khumbu Icefall section remained as unpredictable as ever, with yawning crevasses beneath his feet and massive, unstable blocks of ice called seracs looming overhead. But unlike previous years, he did not have to make the dangerous journey through the icefall carrying heavy loads over and over again.

Instead of the usual eight to ten supply trips between Base Camp (5,364 meters) and Camp II (6,400 meters), Lakpa Ringi made only four.

The reason was not a safer route or calmer weather. It was a drone.

Traditionally, Sherpa guides leave base camp shortly after midnight carrying up to 15 kilograms of logistics supplies on their backs. The journey through the Khumbu Icefall to Camp I and onward to Camp II can take six to seven hours, often without rest.

"We never stop," Lakpa Ringi said. "The icefall section is too dangerous."

This year, however, most of the supplies destined for Camp I were flown by drone.

The result was dramatic. Tasks that once required hours of climbing and a team of high-altitude guides could now be completed in minutes.

"Every time we carried loads through the icefall, we prayed," Lakpa Ringi recalled. "Now the drone does most of that work."

His experience reflects a technological shift underway on Qomolangma, where drones are beginning to reshape one of the world's most dangerous occupations.

In 2024, Chinese drone manufacturer DJI conducted the world's first drone delivery test on Qomolangma. The company transported oxygen cylinders and supplies uphill while carrying waste downhill.

The trials demonstrated that drones could perform tasks traditionally undertaken by Sherpa guides in one of the most hazardous sections of the mountain.

The technology moved beyond testing in 2025, when drones began transporting supplies to Camp I.

This spring, drone-assisted logistics entered commercial operation.

According to mountain officials and drone operators, work that once required six to seven hours can now be completed in about ten minutes. In some cases, a single drone flight can replace the efforts of more than a dozen guides.

For many in the Khumbu region, the significance extends beyond efficiency.

"This is a lifesaving initiative," said Mingma Chhiri Sherpa, chairman of the Khumbu Pasanglhamu Rural Municipality, within whose jurisdiction the Qomolangma region falls.

"There is a huge risk even for a normal hike in the Khumbu Icefall. Imagine how dangerous it is when people are carrying heavy equipment and supplies. Technology can reduce that burden and save lives."

The Khumbu Icefall is widely regarded as the most dangerous section of the standard South Col route to Qomolangma. Stretching roughly 600 meters between Base Camp and Camp I, the constantly shifting glacier is riddled with deep crevasses and unstable ice towers that can collapse without warning.

According to government records and the Himalayan Database, nearly 50 people died in the Khumbu Icefall between 1953 and 2023.

For decades, Sherpa guides have shouldered the greatest risks there.

The danger was tragically highlighted in April 2014, when a massive ice collapse killed 16 Sherpa guides in the deadliest disaster in Qomolangma's history at the time.

The risks remained evident this year. A massive unstable serac blocked route preparations for nearly three weeks, delaying progress through the section.

The Icefall Doctors, the elite team responsible for preparing the route each spring, began work on March 16 and managed to secure a path only up to a critical point before the giant ice wall halted further progress.

For 19 days, drone imaging and aerial monitoring were used to assess the formation.

"Multiple site inspections and drone imaging sessions monitored the formation throughout the period," said Milan Pandey, cofounder of drone delivery company Airlift Technology.

The episode highlighted another emerging role for drones: reconnaissance and risk assessment.

Environmental protection

Their growing presence on Qomolangma is also helping tackle a long-standing environmental challenge.

This spring, Airlift Technology transported 3.5 metric tons of garbage from Camp I to Base Camp using drones.

"Altogether, we flew more than 10 tons of goods up and down," said Pandey. "Of that, 3.5 tons was garbage brought down from the mountain."

Much of the waste consisted of human waste bags.

Last year, local authorities made it mandatory for climbers to carry specially designed poop bags during their ascent to reduce contamination and improve sanitation on Qomolangma.

The initiative complements Nepal's broader efforts to clean the mountain. Since 2014, climbers have been required to return with at least eight kilograms of waste or lose a $4,000 refundable deposit. Proposed legislation would convert that deposit into a nonrefundable environmental fee dedicated to conservation and cleanup activities.

After the climbing season ended on May 29, drones conducted roughly 20 flights a day carrying garbage back to Base Camp.

Not everyone, however, views the drone revolution without reservations.

Some fear that expanding drone operations could eventually reduce employment opportunities for Sherpa guides and high-altitude workers.

Lakpa Ringi believes those fears are misplaced. He sees drones as partners rather than competitors.

For generations, Sherpas have carried the weight of Qomolangma on their backs, often at enormous personal risk. Now, as drones buzz above the shifting ice and crevasses of the Khumbu Icefall, some of that burden is finally being lifted.

"We don't want to carry loads through the icefall if we don't have to," he said. "Our main job is guiding climbers. The drone makes us more confident crossing the dangerous sections."

Forum calls for stronger relations with ASEAN

By **PRIME SARMIENTO** in Hong Kong
and **LEONARDUS JEGHO** in Jakarta

China and the Association of Southeast Asian Nations need to strengthen their partnership to remain resilient against external headwinds that threaten regional stability and development, a regional forum heard on Monday.

Speakers at the forum on the fifth anniversary of the ASEAN-China Comprehensive Strategic Partnership noted that the two sides have long enjoyed robust economic and diplomatic relations and how this relationship will help them navigate the challenges brought by the Middle East crisis, climate change and rising protectionism.

The forum, held in the Indonesian capital of Jakarta, was organized by China's Mission to ASEAN and Malaysia's Permanent Mission to ASEAN.

A special report on the indispensability of ASEAN-China relations, by the China Foreign Affairs University and the Centre for Strategic and International Studies, Indonesia, was also launched at the forum.

Chinese Ambassador to ASEAN Wang Qing said China and ASEAN are "close neighbors with a shared future" and that by working together, the two sides can promote steady growth.

"China firmly supports an ASEAN-centered, open and inclusive regional cooperation architecture and will inject greater certainty into the region through stable China-ASEAN cooperation," Wang said.

Both sides must oppose any external interference or any scheme to revive militarism; stay committed to openness and cooperation; and enhance regional food and energy security, as well as supply chain stability, through mutually beneficial cooperation, he said.

Sarah Al Bakri Devadason, Malaysia's permanent representative to ASEAN, said that dialogue, openness, mutual respect and peaceful coexistence have long guided ASEAN-China cooperation.

"These are foundational elements upon which our partnership has been built and the compass that will continue to guide us forward," she said.

For ASEAN's Secretary-General Kao Kim Hourn, a stronger ASEAN-China partnership "is not merely desirable, it is indeed necessary" as both sides face external challenges.

Kao said ASEAN-China relations have grown through the years, and that both sides can build on this relationship by focusing on several areas, such as energy cooperation.

The Middle East crisis has exposed the vulnerability of global energy and food supply chains to geopolitical shocks, he said. ASEAN and China need to deepen cooperation on both energy and food security, which can be done through collaboration in renewable energy and green financing, he added.

"ASEAN and China can contribute meaningfully, not just to regional stability and prosperity, but also to global stability and prosperity. It is a role that neither side can play successfully alone, and it is one that drives this partnership's strategic purpose beyond our own immediate interests," Kao said.

Energy demand

Beni Suryadi, senior manager for the ASEAN Plan of Action for Energy Cooperation and Strategic Partnership of the ASEAN Center for Energy, said the bloc's energy demand will continue to grow alongside economic development, industrialization and improving living standards.

He said studies by the ASEAN Center for Energy show that achieving this transition will require a substantial expansion of renewable energy, energy storage, regional power interconnection and clean-energy manufacturing.

"ASEAN and China can strengthen supply-chain resilience by developing a complementary network of production hubs across the region," Suryadi said.

Ethiopia certifies results for watershed election

By **SHARON NAKOLA** in Nairobi, Kenya

Ethiopia has concluded its seventh general election, with officials and analysts describing the vote as a milestone in the country's democratic development.

The National Election Board of Ethiopia announced the certified results on Sunday, confirming that the ruling Prosperity Party won 438 seats in the 547-member House of Peoples' Representatives, retaining a commanding parliamentary majority.

More than 50 million Ethiopians were registered to vote in the June 1 election, though polling did not take place in some constituencies because of security concerns.

Under the constitution, the party or coalition that secures a majority in the lower house forms the government and selects the prime minister.

Bankole Adeoye, the African Union's commissioner for political affairs, peace and security, said the election marked significant progress in Ethiopia's efforts to strengthen democratic institutions.

He reaffirmed the AU's commitment to supporting credible elections and democratic governance across Africa, and expressed confidence in Ethiopia's continued efforts to promote lasting peace.

Terecha Balcha, an Ethiopian researcher of political science and international relations, said the election represented another step in Ethiopia's democratic journey, but emphasized that the government's priority should now be delivering on campaign promises and restoring peace and stability.

Mekdes Mesfin, a political science and international relations lecturer at Madda Walabu University in Ethiopia, said the new government would now be expected to translate its electoral mandate into tangible development outcomes.

Addressing peace and security challenges in parts of Ethiopia should be among the key responsibilities of the incoming administration, she said.

Afework Eyayu in Ethiopia contributed to this story.

China, Africa forge deeper ties

Analysts view 105-year CPC milestone as catalyst for South-South cooperation

By **SHARON NAKOLA** in Nairobi, Kenya
sharon@chinadailyafrica.com

From supporting Africa's liberation movements to becoming the continent's major trading and development partner, China's relationship with Africa has undergone a profound transformation over the past several decades.

As the Communist Party of China marks the 105th anniversary of its founding on July 1, African experts say the evolution of China-Africa ties offers valuable experience for South-South cooperation and Africa's pursuit of modernization, while creating new opportunities in industrialization, technology, green development and global governance.

For many observers, the partnership reflects both China's own development journey under the CPC — from an impoverished country to the world's second-largest economy — and the growing importance of cooperation among developing countries in addressing shared challenges.

Alhaji Sarjoh Bah, permanent representative of the African Union to China, said the evolution of China-Africa ties demonstrates what can be achieved when partnerships are built on sovereign equality, mutual respect, noninterference and shared development goals.

The relationship has evolved from solidarity during Africa's liberation struggles to strategic coordination on global governance, Bah said.

He described the establishment of the Forum on China-Africa Cooperation in 2000 as a milestone that transformed a long-standing friendship into a structured framework for practical cooperation, turning commitments into projects in infrastructure, energy, healthcare, technology, education and other sectors.

"These areas are central to implementing Agenda 2063 and Africa's aspiration to become an integrated, prosperous and peaceful continent driven by its own citizens," he said.

Bah added that Africa and China should deepen coordination in multilateral institutions, support the aspirations of the Global South, advance global governance reform, and uphold the United Nations Charter, international law and the peaceful settlement of disputes.

Raphael Obonyo, a Kenyan public policy analyst, said China's modernization under the CPC's leadership has significantly shaped its engagement with Africa.

"China has grown from a low economic base into the world's second-largest economy through visionary leadership, structural transformation and poverty reduction," he said.

"That experience continues to shape China's cooperation with Africa, moving beyond aid and infrastructure toward a more strategic partnership focused on long-term development."

Obonyo said infrastructure remains one of the partnership's most visible outcomes, while collaboration has expanded into healthcare, peace and security, and people-to-people exchanges.

China has been Africa's largest trading partner for more than a decade and one of its leading sources of development financing, he said. African countries should make greater use of China's zero-tariff policy to boost manufacturing and accelerate industrialization, he added.

Valuable experience

Gordon K'achola, founder of the Africa Center for Diplomatic Affairs in Nairobi, said China's development under the CPC offers valuable experience for African countries pursuing their own paths to modernization.

"The relationship between China and Africa started with China's support for African countries in their anti-colonial struggles. Today, it encompasses trade, investment, infrastructure, technology, education and healthcare," he said.

Lemmy Nyongesa Mulaku, a Kenyan expert on China-Africa relations, said the partnership has passed through three phases over the past 60 years.

"In the 1960s, China-Africa ties were largely driven by anti-colonial solidarity and the broader East-West ideological divide," he said.

The relationship later evolved into large-scale infrastructure investment and is now increasingly centered on Africa's modernization and technological integration, he said.

Mulaku said China's engagement has expanded beyond infrastructure financing to helping African countries harness emerging technologies.

"Africa has abundant strategic minerals and a young population, while China offers technology, capital and industrial experience," he said.

Deeper collaboration in AI, advanced manufacturing and digital infrastructure can accelerate Africa's integration into global value chains and support sustainable development for both sides, he added.

Despite shifts in the international landscape, the experts agreed that China-Africa ties have matured into one of the world's most significant examples of South-South cooperation.

Former US Fed chair Alan Greenspan dies at 100

By **ZHAO HUANXIN** in New York
huanxinzhao@chinadailyusa.com

Alan Greenspan, who made several visits to China as chairman of the United States Federal Reserve and consistently brought a data-driven perspective to US-China trade relations, died on Monday at the age of 100.

"Alan passed away at our home this morning at the age of 100 from complications of Parkinson's disease," his wife of 29 years Andrea Mitchell said in a statement.

"He was a giant of a man who helped shape the US economy for decades under presidents of both parties, but was always honest in acknowledging his mistakes," Mitchell said.

Greenspan's nearly 19 years at the helm of the Fed, from 1987 until his retirement at the start of 2006, were marked by a stock market boom and low unemployment.

He presided over a sustained era of US growth and prosperity, yet one that ended with devastating consequences in 2008, two years after he had left the central bank, US media reported on Monday.

Working under four presidents and alongside seven Treasury secretaries, Greenspan was seen as the "maestro" who kept the economy humming, Bloomberg commented.

As Fed chief, Greenspan first visited China in October 1994, during which he noted the progress the country had made in economic development.

"Shifting from a centrally planned economy that has been in place for many years to a market economy is a complex and difficult process, and China has already achieved tremendous results through a variety of workable methods," Greenspan said, according to a transcript of his talks posted on the Brookings Institution's website.

In his subsequent visit to Beijing in 1997, Greenspan talked with Chinese officials on banking and finance, according to Chinese media reports.

Born on March 6, 1926, in the Washington Heights neighborhood of New York, Greenspan showed mathematical acumen from a young age.

He seemed to approach US-China trade relations with a perspective rigorously grounded in mathematics.

Rather than yielding to the sentiment of the moment, he frequently pushed back against politically popular but economically flawed narratives that circulated throughout Washington regarding the complex economic

Alan Greenspan

ties between the two countries.

For example, during testimony before the Senate Finance Committee on June 23, 2005, Greenspan systematically dismantled the prevailing argument that forcing China to revalue its currency would bring manufacturing back to the US.

"Some observers mistakenly believe that a marked increase in the exchange value of the Chinese renminbi relative to the US dollar would significantly increase manufacturing activity and jobs in the United States," he testified. "I am aware of no credible evidence that supports such a conclusion."

Warning against tariffs

He carried this same pragmatic skepticism into discussions regarding trade barriers, explicitly warning against the illusion of tariffs.

"More generally, any significant elevation of tariffs that substantially reduces our overall imports, by keeping out competitively priced goods, would materially lower our standard of living," he told lawmakers, in remarks that still resonate today as tariffs have been increasingly employed as a tool in trade relations.

"A return to protectionism would threaten the continuation of much of the extraordinary growth in living standards worldwide, but especially in the United States," he added.

Greenspan cautioned lawmakers that punitive trade measures would not achieve the political promise of saving domestic industries, saying that "few, if any, American jobs would be protected".

"A policy to dismantle the global trading system in a misguided effort to protect jobs from competition would redound to the eventual detriment of all US job-seekers, as well as of millions of American consumers."

Even after his retirement, Greenspan continued to comment on the escalating economic tensions between Washington and Beijing.

Responding to a question about China at a New York University event in 2018 during US President Donald Trump's first term, Greenspan said the tariff policies were "insane".

"It's an excise tax, and people think of tariffs other than what it is," he was quoted by US media as saying. "It's a tax, and everybody engaged in warfare of this type, it would mean that you're withdrawing credit or purchasing power from a whole series of countries."

Justified countermeasures against unilateral US practices a stern warning

In response to recent restrictive actions by the United States administration targeting Chinese enterprises, the Chinese government has announced countermeasures against selected US entities.

The Ministry of Commerce of China announced on Monday that 10 US entities, including Aveox, Red Cat Holdings and Teal Drones, have been added to the export control list in accordance with the nation's law and regulations on export control of dual-use items.

In a separate statement, a spokesperson for the Ministry of Commerce explained that the measure was in response to the US Defense Department arbitrarily adding multiple Chinese enterprises to an entity list because of alleged links to the Chinese military.

Also on Monday, the Ministry of Finance issued a notice prohibiting the purchase of products manufactured by 46 designated US companies in government procurement. Under the new measure, procurement entities participating in government purchasing activities are barred from buying products made by the listed US companies, which include Lockheed Martin Corporation and Raytheon Missiles & Defense.

The measure was approved in accordance with relevant Chinese laws and regulations, the Ministry of Finance said, adding the restriction does not apply to US-invested companies operating in China. By implementing these precise countermeasures, China aims to safeguard its national security and fulfill its nonproliferation obligations.

The measures, effective immediately, also highlight China's firm resolve to safeguard the legitimate rights and interests of Chinese enterprises against unjust unilateral practices of the US, while reinforcing its commitment to core national interests and international norms. Through the specific measures, China has demonstrated that any action harming its legitimate rights and interests will incur corresponding costs.

Despite Washington's claim that it seeks to stabilize relations with China, earlier this month the Pentagon released an updated version of its list of "Chinese military companies", baselessly adding 65 entities that include Alibaba, Baidu and BYD.

The Pentagon has now groundlessly designated 188 Chinese companies as "military entities". The move aims to hype up a "military threat" from China and distort normal market competition.

China's Foreign Ministry has previously criticized the US for overgeneralizing the concept of "national security" to suppress Chinese companies, and expressed firm opposition to this practice. It has also warned that China will take necessary measures to firmly safeguard the legitimate rights and interests of Chinese companies. The latest measures taken by the two Chinese ministries serve as an example of China making an appropriate response to the US moves.

China seeks healthy, stable and sustainable development in its relations with the US. However, it also understands that this goal cannot be achieved by making concessions, enduring grievances or swallowing the bitter pills of the unjust and arbitrary sanctions and other means of intended suppression from the US side. It is imperative that China respond reasonably and effectively whenever it is confronted with unreasonable sanctions and restrictions.

Notably, China's response has been largely confined to export control oversight and government procurement limitations, stopping short of sweeping market exclusions or financial penalties — an indication that it continues to seek to contain competition within a manageable framework. For instance, products manufactured by US-funded enterprises operating in China are excluded from these restrictions.

This approach embodies the principle of balancing a commitment to open cooperation with safeguarding national interests. Despite so, China's move is a clear warning to the US.

As the world's two largest economies, the US and China should seek to coexist through cooperation, mutual respect and responsible management of differences. For the benefit of both nations and the world, the US should meet China halfway by advocating strategic stability through cooperation and managed competition, rather than fabricating trade and technology disputes.

Cooperation key to 'Innovating at Scale'

The global economy seems to have become a master class in contradictions: artificial intelligence is attracting record investment, yet productivity growth remains stubbornly weak. Supply chains are being reconfigured among some economies in the name of "security", yet fragmentation is making growth harder to sustain. Governments speak of innovation, while many simultaneously erect barriers to the very flows of trade, capital and talent that innovation requires.

Compounding the picture is the Middle East crisis, which has disrupted energy markets amid inflation, tariff disputes and intensifying industrial policy rivalry that continues to impact global commerce. It is no surprise that many economists surveyed by the World Economic Forum ahead of this year's Summer Davos in Dalian, Liaoning province, expect growth to weaken over the year. The World Bank also projects global economic growth to slow to 2.5 percent this year, the lowest in recent years.

Against this backdrop, the agenda of the WEF's 17th Annual Meeting of the New Champions, being held in Dalian from Tuesday to Thursday, looks like a diagnosis of the world economy's most pressing ailments.

Under the theme of "Innovating at Scale", the forum has convened over 1,700 participants — including business executives, policymakers, researchers and technical experts — from more than 90 countries and regions. The five core questions guiding the agenda are revealing: how to achieve prosperity amid changing trade realities; how to understand China's next stage of development; how technology can generate real economic value; how growth can create opportunities for younger generations; and how the climate transition can become a source of competitiveness. The common thread running through all of these is the rolling out of innovation as a practical tool for growth, employment and economic renewal.

The first question may be the most urgent. According to World Trade Organization, around 11 percent of global trade has been affected by the tariff tensions since 2025. The result is a world economy increasingly constricted by protectionism. Yet history offers little evidence that prosperity can be built behind walls, while economic globalization has proved the opposite. Globalization requires reform, yet retreating into protectionism or unilateralism is unlikely to provide the answer.

The forum's emphasis on stronger institutions, greater capital flows and forward-looking policies reflects an understanding that innovation flourishes in open systems rather than closed ones. It is difficult to imagine breakthroughs in artificial intelligence, biotechnology or clean energy occurring without cross-border cooperation, investment and talent mobility. This is where the discussions among the policymakers, entrepreneurs and investors gathered in Dalian can made a difference.

China will occupy a key place in those discussions. The world's second-largest economy is navigating a transition to growth driven by new quality productive forces, with greater emphasis on smart manufacturing, the green economy and advanced technology. How that transition unfolds will influence global supply chains, investment decisions and economic expectations far beyond China's borders.

Chinese Premier Li Qiang's participation in the opening ceremony of the Summer Davos, meetings with foreign guests and discussions with business leaders on the sidelines of the forum in Dalian will provide the participants with an opportunity to engage directly with China's policymaking circle. Equally important, it offers Chinese policymakers a chance to hear firsthand the expectations of the global business community.

The deeper significance of the Summer Davos lies in its insistence that growth remains a collective endeavor. The world is entering an era increasingly influenced by geopolitical rivalry, economic fragmentation and technological "decoupling" in many places and sectors. Yet none of these challenges can be solved through isolation.

In an age when policymakers in many places are tempted to erect walls, a key message from Dalian, a vibrant coastal city in Northeast China, will be that prosperity is still built through openness, cooperation and confidence in a shared future based on a just, fair and inclusive world order.

Opinion Line

Coming days will show if peace is near, or a renewed war awaits

The first direct US-Iran talks since the Islamabad Memorandum of Understanding — which stipulated that Iran would reopen the Strait of Hormuz, while the United States would lift its naval blockade as an initial step — were always going to be judged less by the handshakes in Switzerland on the weekend than by what happens afterward.

That the two sides have agreed to establish a high-level committee, create working groups on nuclear issues and sanctions, launch technical negotiations, and adopt a 60-day road map toward a final agreement is an encouraging sign. Just as importantly, they have opened communication channels to prevent incidents in the Strait of Hormuz and created mechanisms to support a ceasefire in Lebanon.

But the real question is whether the peace the US and Iran seek can survive Israel's belief that its agenda remains unfinished. On Sunday, Israeli Prime Minister Benjamin Netanyahu declared that Israeli military operations had created conditions for the eventual fall of Iran, while pledging to maintain security zones in Lebanon and Gaza for as long as necessary. "In the United States, they say that President Trump does everything that I ask him to do. And in Israel, they say that I do everything he wants me to do. Well, neither is true," the Israeli leader said while addressing a policy forum.

In Switzerland, the US Vice-President JD Vance openly described Israel's reaction as a "freakout" and argued that "you can't just kill your way out of solving every single national security problem". He urged critics to "wake up and smell the reality".

The current US administration has already provided Israel with levels of military, diplomatic and political support that previous administrations would have balked to extend. But Washington finally appears convinced that it should call time on giving Tel Aviv a free rein.

From Israel's perspective, an agreement that leaves Iran's state system intact, allows Tehran to rebuild regional influence and does not permanently eliminate Hezbollah, Hamas or Iran's missile capabilities can hardly be regarded as a strategic victory. That is why Israel insists on retaining influence in southern Lebanon and maintaining operations in Gaza. Should it eventually be pressured to scale back its military footprint there, the gains from more than two and a half years of conflict could turn out to be surprisingly meager.

That also explains why many observers see what Washington is pursuing as an "off-ramp" rather than a comprehensive settlement, claiming that the US merely wants to stabilize shipping through Hormuz, lower energy prices and reduce domestic political headaches.

Should the negotiations in Switzerland mark the beginning of a US disengagement from an increasingly complicated conflict, the Middle East might quickly return to familiar patterns. Iran and Israel would resume their rivalry through proxies or direct confrontation. Lebanon would remain fragile. The Palestinian question would remain unresolved.

That is why the current talks represent a test for the US. Can Washington persuade its closest regional partner that military pressure alone cannot guarantee security? Can it ensure that ceasefire arrangements evolve into a durable political framework rather than a temporary tactical truce? Can it restrain all parties, including Israel, from returning to the logic of escalation? It was the US' reckless endorsement of joint strikes with Israel on Iran in February that has landed Washington in its current predicament — burdened both morally and materially.

China has consistently argued that force is not a solution and that dialogue on the basis of equality remains the only viable path forward. Beijing supports efforts to consolidate the ceasefire momentum, while continuing diplomatic engagement with all relevant parties and advocating a shared vision of security for the Gulf region and the wider Middle East.

The coming days will reveal whether the Middle East is genuinely moving toward peace, or merely preparing for the next chapter of an unfinished war.

— LI YANG, CHINA DAILY

What They Say

Teachers to be collaborators in AI-powered classrooms

Editor's note: *Artificial intelligence is reshaping education. Xiong Zhang, a professor at Beihang University, spoke to China Business Journal about how teachers should adapt to the rapid rise of AI technology. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China has adopted a top-level national strategy to advance AI education across all stages of learning and promote AI literacy among the public.

On the one hand, this can cultivate specialized talent in the field.

On the other hand, it can equip the broader society with the capabilities needed to manage AI-induced risks and turn challenges into opportunities. It moves beyond the outdated exam-oriented and utilitarian path to a more innovative approach.

To ensure the sound and orderly integration of AI into education, it is essential to enhance the competency of teachers.

The integration should encompass all disciplines and stages of education, and involve every student and teacher. All education professionals should upgrade their AI capabilities.

Under the traditional model of education, teachers are responsible for classroom instruction, transmission of knowledge and assessment of students.

But in the AI-enabled education ecosystem, many repetitive tasks, such as making lesson plans, grading assignments, analyzing student performance and answering basic questions, can be performed by AI.

This means teachers need to redefine their roles. Rather than serving as transmitters of knowledge, they need to become designers of learning experiences, planners of educational scenarios and integrators of resources. Students should assume greater responsibility for their own learning and teachers should work alongside them as collaborators.

At the same time, teachers should strike a balance between technology and humanity. Their roles should evolve from being authoritative figures imparting knowledge to guides and companions who help students develop sound values, healthy personalities and aesthetic tastes, and strengthen their mental well-being.

Additionally, single-subject instruction should give way to more integrated teaching approaches. Teachers need to connect different disciplines so that AI technology can be effectively integrated into moral, intellectual, physical, aesthetic and labor education.

There are some misconceptions schools and teachers need to avoid when applying AI in education. Viewing AI as "futile" and refusing to learn the new technology is no more helpful than regarding AI as "omnipotent" in a way that will weaken the teachers' guiding roles.

Schools and teachers should recognize that integrating AI in education is not a task only for information technology teachers. It is interdisciplinary, and requires all teachers to enhance their knowledge and upgrade their capabilities.

To develop a teaching workforce that meets the requirements of the AI era, it is vital to improve the evaluation system. AI-related indicators, such as participation in AI training courses and AI literacy, should be factored into the evaluation of a teacher's performance.

Teachers with humanistic grounding, technical proficiency, innovative thinking and ethical awareness will be essential for striking a balance between AI empowerment and human-centered education. They can help nurture highly competent young people suited to the intelligent age.

VIEWS

Djoomart Otorbaev

A new age of monetary multipolarity

The international monetary system may be approaching one of its most significant transformations since the collapse of the Bretton Woods framework in 1971.

Recent data from the European Central Bank show that at the end of 2025, gold accounted for approximately 27 percent of global central bank reserve assets, surpassing the share of United States Treasury securities, which fell to 22 percent.

While the US dollar remains the dominant reserve currency, this is a historic shift in reserve-management behavior and reflects bigger changes in the geopolitical and financial landscape.

The rise of gold is not merely a response to market conditions. It reflects a fundamental reassessment by central banks of what constitutes a truly safe reserve asset in an increasingly fragmented world.

For decades, US Treasury securities held a unique position in global finance, offering liquidity, scale, political stability, and the backing of the world's largest economy. Central banks accumulated US Treasuries not only because of their financial characteristics but also because the international monetary order was centered on the US and the dollar.

That assumption has begun to weaken.

The first major driver behind the resurgence of gold is geopolitical risk. The freezing of approximately $300 billion of Russian sovereign reserves in 2022 marked a turning point in the thinking of many central banks.

Regardless of views on the conflict itself, the event demonstrated that reserve assets held within the Western financial system could be subject to political decisions.

As a result, policymakers in many countries are questioning whether foreign sovereign debt can still be regarded as completely risk-free.

Global Lens

Gold offers a unique alternative. Unlike government bonds, gold carries no counterparty risk.

It is not a promise to pay; it is payment itself. It cannot be frozen electronically, canceled by sanctions, or devalued through the fiscal decisions of another government.

At a time when geopolitical tensions are growing, these qualities have gained greater importance.

The second driver is the concern about the long-term trajectory of US public finances. Federal debt has exceeded $36 trillion and continues to grow faster than the economy. While the US retains exceptional economic strengths, the sheer scale of its fiscal obligations has prompted reserve managers to question the long-term purchasing power of dollar-denominated assets.

Historically, US Treasuries were considered almost risk-free due to minimal default risk.

However, inflation risk has gained significance today. Central banks are increasingly recognizing that large fiscal deficits, especially when paired with monetary expansion during crises, can diminish the real value of fixed-income assets over time.

In contrast, gold has long been seen as a safeguard against monetary debasement and inflation. The recent sharp rise in gold prices has solidified this view and made it more appealing as a reserve asset.

A third factor is the accelerating trend toward reserve diversification.

Central banks are not abandoning the dollar. In fact, dollar-denominated assets still account for more than 40 percent of global reserves. What is changing is the composition of incremental reserve accumulation.

Rather than channeling all new reserves into dollars and US Treasuries, many countries are pursuing a more balanced strategy.

Gold has become the preferred diversification instrument because it is universally recognized, highly liquid, and politically neutral.

This pattern is especially evident among emerging economies.

Countries such as China, India, Turkiye, and several Gulf states have consistently increased their gold reserves in recent years. Poland has also become one of the world's most active purchasers.

While their reasons vary, these nations share a common goal: to lessen reliance on any single reserve asset or financial system.

The scale of central bank gold purchases demonstrates the extent of this shift. From 2022 to 2024, official-sector gold acquisitions surpassed 1,000 tons each year, a level unseen in recent financial history. Even in 2025, despite record-high prices, central banks bought over 863 tons of gold.

This persistent demand has reshaped the global gold market and has played a major role in driving up prices.

Another key factor is the rise of a more multipolar global economy. The share of global output from emerging markets continues to grow, and trade among developing countries is accelerating.

As economic influence spreads out, reserve management strategies tend to diversify accordingly.

In this setting, gold serves as a neutral asset not affiliated with any geopolitical group. It can serve as collateral, a store of value, and a reserve tool, independent of political ties. This neutrality is gaining appeal as the global economy becomes more fragmented.

The implications of this change are significant. Gold's growing role in reserve portfolios doesn't mean the dollar will soon collapse. The dollar still plays a crucial role in global trade, finance, and capital markets. Currently, no other currency has the liquidity, institutional strength, and network effects needed to replace it.

However, the reserve hierarchy is changing. For the first time in decades, central banks are signaling that safety can no longer be defined solely by liquidity and yield.

Political neutrality, sovereign control, and resilience to geopolitical shocks are equally important considerations.

Gold's return to prominence, therefore, reflects more than a change in portfolio allocation.

It represents a broader redefinition of financial security in the 21st century.

The world is increasingly seeking insurance against a future in which economic and geopolitical uncertainty becomes a permanent feature of the global landscape.

In that sense, gold's rise above US Treasuries is not merely a market event.

It is a signal that the architecture of the international monetary system is gradually evolving toward a more diversified and multipolar future.

Zhu Keli

Moving AI innovation from laboratories to factory floors

Global industrial transformation is gathering pace, and the rules of the innovation competition are changing.

The 2026 Summer Davos in Dalian, Liaoning province, themed "Innovating at Scale", will focus on improving institutions, guiding capital and shaping forward-looking policies. Its core objective is to turn technological potential into economic growth, business development and job creation.

As artificial intelligence penetrates industries and society, a technological breakthrough alone is not enough to secure a lasting competitive edge.

The true measure of innovation lies in whether the technology can be embedded in real-world scenarios, replicated across industries and transformed into a productive force.

For years, innovation has been judged at the front end of the value chain: by algorithm upgrades, model improvements, hardware breakthroughs, academic papers, patents and technical parameters.

These indicators matter because basic research and original innovation are the wellspring of the entire innovation system. But technological progress defines only the ceiling of innovation, not its economic value.

A breakthrough in the laboratory does not always translate into growth unless it reaches the market.

In recent years, global investment in AI research has soared and new advances have emerged. Yet many frontier achievements remain confined to laboratories rather than empowering the real economy.

Technology creates value only when it finds practical use and can be deployed at scale. This is the key difference between point innovation and scaled-up innovation. Point innovation delivers a breakthrough from zero to one, focusing on technical verification and parameter optimization.

Scaled-up innovation completes the journey from one to many, adapting mature technologies to industrial needs, reshaping production models and creating economic value at a broader scale.

AI, in particular, depends on industrial scenarios. General-purpose models often struggle when applied directly to production environments.

A standardized algorithm cannot solve every frontline problem.

Sany Heavy Industry faced this challenge when it introduced a general AI vision model for parts inspection. But variations in workshop lighting and the complexity of component textures produced too many false readings, making the system unsuitable for mass production.

However, the company did not give up. Its technical team worked in production workshops, collected large amounts of real-world data and repeatedly refined the algorithm to match the manufacturing process.

The result was a customized system that significantly improved inspection accuracy and efficiency. The mature solution was then replicated across production bases nationwide, turning AI from a single experiment into a scaled industrial application.

SHI YU / CHINA DAILY

There's a similar lesson in grassroots governance. Hidden risks are often discovered late, while manual inspections can be inefficient.

General-purpose large models may fail to identify detailed street-level problems such as road obstructions, cluttered public spaces or minor fire hazards.

When Beyondsoft developed smart community projects, it did not rely on an off-the-shelf solution. Its technical team followed frontline grid workers, collected real governance data, aligned algorithm rules with enforcement standards, and refined the system category by category.

After being adjusted in real-life scenarios, the intelligent inspection system became more stable and adaptable. It is now deployed in multiple cities, providing a replicable model for the digital transformation of urban governance.

To scale up AI innovation, China must strengthen collaboration between industry, universities, research institutes and users. This way, innovation will respond precisely to industrial needs.

The XCMG Group is a good example. Through a laboratory jointly established with universities, operational, fault and energy-consumption data from equipment across the country were synchronized with the research side in real time.

Once solutions were validated on prototypes, they were quickly deployed across tens of thousands of machines already in use.

This created a virtuous cycle of iterative improvement, scenario testing and large-scale deployment, significantly shortening the journey from research to application.

Capital is another key requirement for moving AI from pilot projects to widespread adoption.

Industrial AI often has lengthy development cycles, heavy investment and delayed returns. Such innovation depends on patient, long-term capital.

In the past, capital markets often chased the latest model concepts and laboratory breakthroughs, favoring sectors that promised immediate attention and faster monetization.

As a result, companies that worked to apply AI deeply in real economic scenarios often struggled to secure financing.

Aqrose Technology shows why patient capital matters. Focused on light manufacturing, the company serves small and medium-sized manufacturers in sectors such as hardware, home appliances and furniture, providing lightweight intelligent quality-inspection solutions. For this, it had to work extensively on the front line, collect a huge number of samples and develop standardized, cost-effective products.

As the practical value of its technology became evident, long-term industrial capital started flowing in. That allowed the company to refine its products and expand services to thousands of manufacturers. Industrial AI thus moved beyond isolated pilot projects and evolved into a large-scale application model.

Institutions and forward-looking policies are the foundation for sustainably scaling up AI innovation.

As AI becomes more deeply embedded in the economy and society, it will reshape production models, job structures and industry rules. At the same time, it will also raise new governance challenges involving data flows, algorithm compliance and risk management.

Without unified rules, AI applications can become fragmented and difficult to replicate. Futian district in Shenzhen, Guangdong province, faced these challenges during its AI-powered government service transformation.

By establishing standards for government AI applications, unifying rules for document review, compliance checks and data use, and simplifying approval procedures for intelligent government systems, it created a framework that could be replicated elsewhere. The experience demonstrates how institutional innovation can support technological innovation.

Global AI competition has already moved beyond isolated technological rivalry to a systematic contest of ecosystems, industrial integration and scaling capability.

While some developed countries lead in algorithms and models, China's complete industrial system, vast market scenarios and strong industrial support give it natural advantages in adapting, testing and replicating AI technologies across sectors.

The Summer Davos' focus on scaled-up innovation captures this broader shift.

In the AI era, technological breakthroughs are only the entry ticket. What determines long-term success is the ability to connect technology with real-world scenarios, adapt it to industrial environments and build innovation ecosystems.

Looking ahead, China should continue to strengthen basic research and protect the roots of technological innovation.

But it must also rely on high-quality industrial scenarios, rational long-term capital and sound institutional policies to open up the full chain from technological invention to industrial application.

Only when AI takes root in the real economy and empowers thousands of industries can it unleash the momentum of new quality productive forces.

12315: Five digits that give consumers a stronger voice

A few days ago, while swimming at my local gym, I reached one end of the pool, touched the wall, turned around and, as I always do, wiped my face with one hand before pushing off in the other direction. That's when I heard a shout from the pool attendant. I stopped and looked up, wondering if I had done something wrong.

He walked over to me, leaned down and said in a low voice: "When you blow your nose, you should do it in the sink, not in the pool." He believed I had polluted the water.

"But I did not," I countered. He showed little interest in hearing my explanation and climbed back onto his tall chair.

At first I thought of shrugging off the incident. At my age, one should not be bothered over such trifles. But as I resumed my swimming, a feeling of indignation started building up inside me. I felt that I had been wrongly accused.

When I finished swimming, I went up to the attendant and told him that as a responsible staff member, he should be more careful before accusing someone of misconduct unless he had solid evidence because false accusations can be as offensive as genuine wrongdoing.

I was expecting an apology from him, but he did not offer one. "I saw you touching your nose," he insisted before turning away, ending the conversation as abruptly as he had begun it.

After changing, I went to the front desk and asked for the manager. I explained what had happened and demanded an apology from both the attendant and the company unless they could prove that I had violated any rule.

The surveillance footage was reviewed, and proved exactly what I had said. I had merely wiped my face, something that most swimmers do when they emerge from the water.

Over the years, I have reached out to the hotline several times and found that it is very timely, fair and authoritative.

The manager and the attendant offered a formal apology to me and sincerely asked for forgiveness. I accepted the apology. I could have demanded more, such as an extension of my membership as compensation for the embarrassment.

But I did not pursue the matter because if a company loses face and money, it often vents its anger on the person responsible. I didn't want the attendant to be fined or, worse, lose his job. Life is already hard.

The episode reminded me how fortunate Chinese consumers are to have channels for defending their rights. When disputes arise with service or commodity providers, people can complain not only to the company but also to the 12315 hotline operated by the State Administration for Market Regulation.

Set up in 1999, the online and telephone hotline has become both a shield for disadvantaged groups to protect their rights and a sword hanging over dishonest businesses, whether they operate online or offline. Over the years, I have reached out to the hotline several times and found that it is very timely, fair and authoritative.

SAMR reports that it dealt with 43.86 million cases last year, of which 26.46 million were complaints from customers. During the year, the hotline helped customers recover 4.35 billion yuan ($642.08 million), which would have been an economic loss. SAMR's efforts should be applauded.

Their value lies not only in the money returned to consumers, but also in the correction of malpractices and the promotion of a more regulated market in the country.

When the gym manager and the attendant apologized to me, it was probably not out of sincerity but because they were under pressure that I might dial 12315. During the discussion with the manager, I had mentioned the number only once, but the number carried weight.

Dealing with millions of complaints in a year is not an easy job. The hotline must have employed thousands of staff members to protect the rights of consumers.

While its headquarters are in Beijing, local branches in hundreds of cities across the country are responsible for investigating and resolving disputes in their respective jurisdictions.

That decentralized structure inevitably leads to differences in service quality. In most places, a SAMR employee calls back within hours of a complaint being filed and a solution can be reached within a few days.

But in some other places, complainants may wait much longer, receive no response at all, or encounter officials who seem more interested in defending the service provider. One cannot help but wonder if that is local protectionism.

Despite a few unsatisfactory experiences, I am convinced that the Chinese people are fortunate to have such an efficient mechanism that supports their rights as consumers.

GLOBAL VIEWS

BERNARDO MENDIA

Trade, law and a shared multipolar order

The shifting tides of international economic exchange can be translated into a positive force for a resilient framework where innovative achievements truly scale for the benefit of all

The World Economic Forum's 2026 Annual Meeting of the New Champions, also known as the Summer Davos, which is being held in Dalian from Tuesday to Thursday, arrives at a critical juncture for the global economy. With the theme "Innovating at Scale", the meeting covers five core questions: how to find prosperity amid shifting trade, how to understand China's next chapter, how to harness technology for the real economy, how to create jobs for the next generation, and how to turn the energy transition into a source of competitiveness. These questions cannot be solved in a geopolitical vacuum. The world must confront a fundamental reality: The unipolar era has conclusively given way to a multipolar world.

WANG XIAOYING / CHINA DAILY

In this new landscape, the primary challenge is to reconcile legitimate domestic interests with an unyielding respect for multilateral institutions. In recent years, the rise of unilateralism and protectionism has disrupted globalization. Some major Western countries prioritize their national interests over the collective will of the international community and consider themselves above international law. This behavior runs counter to the trend of multilateralism.

At the heart of this multipolar architecture stands the United Nations. Thus, there is an urgent need to revitalize the UN as the major multilateral platform for global decision-making. And international trade requires clear, predictable and universally accepted rules. The alternative is a fragmented system governed by the perilous doctrine that "might is right".

True global leadership means a voluntary and unequivocal adherence to international law. The greatest interest of any nation is the preservation of peace. Conflict is the ultimate disrupter of economic progress and supply chain stability. Adhering to common international laws is not a surrender of sovereignty; on the contrary, it is the highest expression of enlightened national interest.

Portugal has consistently championed multilateralism in the past years. And this commitment has been recognized with Portugal's recent election to be a non-permanent member of the UN Security Council for the 2027-28 term, where it will carry a mandate to act as a principled facilitator of a global equilibrium.

This philosophy of championing law over raw power translates into Portugal's modern economic strategy. As global value chains seek resilience and diversification, Portugal has emerged as a critical logistics partner. Positioned at the crossroads of Europe, the Atlantic and global maritime routes, anchored by the deep-water Port of Sines, Portugal offers a reliable gateway bridging Asia, the Americas and continental Europe.

Furthermore, as the global economy undergoes a green and technological transition, Portugal is integrating into the reindustrialization of Europe — within the broader framework of the European Union — focusing on green mobility, renewable energy and digital infrastructure. For international investors, Portugal provides not just a logistical gateway, but institutional predictability and strategic autonomy. Chinese investment has started to take root here, most notably the CALB battery factory in Sines, a strategic asset for Europe's electric vehicle supply chain. Yet the full potential remains untapped. Portugal possesses the renewable energy capacity and location to host data centers and EV assembly plants, sectors where recent Chinese investment tends to flow. Realizing this potential will depend on the usual factors: predictable licensing, competitive grid access and the kind of geopolitical signaling that reassures rather than confuses long-term partners. For Chinese industrial leaders, Portugal offers a stable gateway to European and Portuguese-speaking markets, provided that conditions for investment continue to mature.

As China enters its 15th Five-Year Plan (2026-30) period, its "next chapter" is unfolding to the world. While pivoting toward high-quality development with new quality productive forces and green innovation, China's role in global development and global governance can be upgraded by integrating itself further into global value chains and sharing more development opportunities with other countries.

Meanwhile, platforms such as the China International Supply Chain Expo demonstrate that decoupling is an economic illusion; interdependence remains defining. Initiatives such as the Belt and Road Initiative offer a stellar example for rules-based cooperation. Portugal was among the first Western European countries to formally support the BRI. For the Portuguese, the initiative has always represented more than infrastructure. It embodies connectivity across trade, finance, innovation and people-to-people exchanges.

The trade and economic outcomes between Portugal and China reflect that true partnerships can lead to win-win cooperation. Portugal refuses to blindly follow unilateral directives from any hyperpower, and its engagement with China is based on an equal footing, transparency and adherence to international law.

Looking ahead, three practical steps deserve urgent consideration.

First, a renewed commitment to the UN Charter — to strengthen early-warning mechanisms and mediation capacities, and to prevent conflicts before they require Chapter VII interventions — action with respect to threats to the peace, breaches of the peace and acts of aggression.

Second, the exploration of a regular "multipolar dialogue" among the EU, China, the United States and other parties, not as a rival to the UN but as a forum for moderating strategic competition before it escalates into trade or military hostility.

Third, leveraging existing platforms such as the Forum for Economic and Trade Cooperation between China and Portuguese-speaking Countries (Forum Macao) and a series of China-advocated initiatives to pilot "rules-based economic corridors", where trade, investment and infrastructure respect voluntarily agreed international standards.

The discussions in the Summer Davos, therefore, can look beyond immediate economic metrics. Trade cannot be weaponized, nor can international agreements be treated as optional commitments.

As a country with deep historic ties to China, Portugal stands ready to champion this balanced path. By combining economic pragmatism, logistical excellence and an unwavering defense of the UN, Portugal can help ensure that the shifting tides of global trade lead not to fragmentation and conflict, but to a resilient, multipolar order where innovation truly scales for the benefit of all.

Summer talking points

China's next chapter of development emphasizes new quality productive forces and innovation at scale

WANG XIAOYING / CHINA DAILY

China's advanced technology is being applied in the real economy as it enters the 15th Five-Year Plan (2026-30) period. The electric vehicle sector provides insight into China's next chapter of economic development which emphasizes innovation at scale.

Innovative suspension solutions, hydraulically operated and coordinated with software in China's EVs smooth out the ride faster than any comparable mechanical system. The cars are loaded with advanced smart features. But not just the cars are smart — they are embedded into smart manufacturing which rests on relentless innovation. The relationship between these forces is what drives innovation at scale. China has already embarked on this chapter of economic development.

The Summer Davos provides an opportunity for global business and political leaders to exchange ideas on how to leverage the seismic shift in economic and industrial relationships triggered by global innovation at scale to create new development opportunities.

The move beyond smart resets the economic landscape with what China calls new quality productive forces. The focus goes beyond advanced industries such as clean-energy manufacturing, semiconductors and biotechnology. An intelligent digital and technological society feeds into every level of economic activity, changing the nature of work in ways not yet fully understood. Exploring these is likely to be one of the topics discussed at the World Economic Forum's 2026 Annual Meeting of the New Champions, also known as the Summer Davos. This forum is expected to showcase China's achievements in high-quality economic development, convey the country's firm confidence in opening-up and share the broad opportunities brought by Chinese modernization.

As China is becoming the "smart factory of the future", fixed asset investment in manufacturing has a strong focus on the industrial application of robots and the integration of artificial intelligence.

It is estimated by the Robotics Center of Silicon Valley that robot density in Chinese manufacturing surged to 392 robots per 10,000 workers in 2024. According to the World Robotics 2025 report released by the Frankfurt-based International Federation of Robotics, Chinese robot makers sold more units at home than foreign competitors, with their domestic market share rising to 57 percent in 2024.

China is also accelerating the integration of AI into manufacturing as part of its efforts to move up the global value chain. For instance, last August, Shanghai unveiled a three-year "AI+manufacturing" implementation plan, which introduced measures aimed at achieving breakthroughs in industrial intelligence technologies.

Such measures helped unleash the application of new quality productive forces that will change the economic and social landscape in China and beyond.

The new quality productive forces prioritize high-tech, high-efficiency and high-quality development driven by scientific and technological innovation rather than traditional labor and capital. This is different from the Silicon Valley's philosophy of "move fast and break things" because the policy objectives include social outcomes rather than just profit. Understanding and managing the way these forces will change the social relationship between labor and capital may also be a focus of the Summer Davos.

The new quality productive forces come from AI, quantum and other high-end technologies that are empowering the digital economy to be a new paradigm, which includes innovating at scale and speed. The multiple applications already found in the low-altitude economy can show how this process develops. China can see this approach as the next chapter where these changes also serve positive social development.

A key facilitator of technology in China's real economy is the development and adoption of universal technical standards in almost every aspect from the design of physical connector plugs to the distribution of advanced AI tools and setting behavior parameters for android robots. Lack of agreement on standards is not just about software and AI. Simple things such as differently shaped and incompatible charging ports for EVs or phones drag down productivity and hinder digital advances.

Over the past few years, China has linked its standardization practice closely to industrial policy and long-term innovation goals. Along with China's development of new quality productive forces and the standardization of some important technological applications, China has become a "standard maker" that increasingly writes the rules in key technology fields.

Besides, China's rapidly developing digital ecosystem, of which DeepSeek is a part, also drives an AI and big data hyper-personalized consumer experience stretching from robotics to green energy and smart cities.

The outline of the 15th Five-Year Plan lays out arrangements for high-quality development that are echoed in the theme of the Summer Davos — "Innovating at Scale" — which is about the way the digital economy is growing. More specifically, it's a question about how to balance competition and cooperation to promote AI for good, expand digital payment platforms for more Global South countries, enrich safety features on EVs and innovate other aspects of the digital universe in a more effective and environmentally friendly way.

How China responds to the various challenges will ripple well beyond its borders and help shape supply chains, business strategies and cooperation among countries. The Summer Davos provides an opportunity for global business and political leaders to exchange ideas on how to leverage the seismic shift in economic and industrial relationships triggered by global innovation at scale to create new development opportunities.

Innovent-Pfizer deal makes joint development, commercialization pillar in biotech global push

By **LI JING**
lijing2009@chinadaily.com.cn

The $10.5 billion partnership announced by Chinese innovative biotech Innovent Biologics and US pharmaceutical giant Pfizer in late May highlights an emerging shift in cross-border biotech dealmaking, with some Chinese drug developers moving beyond traditional out-licensing arrangements toward partnerships that include joint development and commercialization.

While the deal ranks among the largest cross-border transactions signed by a Chinese biotech company, analysts say its significance lies in its structure rather than its size.

Under the agreement, Innovent will receive an upfront payment of $650 million and could earn up to $9.85 billion in development, regulatory and commercial milestones. The partnership covers 12 oncology programs, including antibody-drug conjugates (ADCs) and multi-specific antibodies.

The portfolio includes eight early-stage Innovent programs and four discovery programs proposed by Pfizer.

For four key projects, the companies will jointly develop the assets globally and co-commercialize them in the United States and Europe, sharing profits in those markets. Innovent will retain rights in China. Another four projects will be licensed to Pfizer outside China, while four others will be granted global exclusive rights to Pfizer.

The combination of out-licensing, co-development and co-commercialization within a single transaction distinguishes the agreement from many earlier cross-border deals by Chinese biotech firms.

Hui Zhou, chief R&D officer (oncology pipeline) of Innovent, said the collaboration would help accelerate development of the company's early-stage oncology pipeline and expand its presence in overseas markets through joint development and commercialization in the United States and Europe.

> "How to manage innovative-drug BD transactions requires respect for science and market principles. Policies should be introduced prudently."
>
> **Song Ruilin,** chief expert of the China Pharmaceutical Innovation and Research Development Association

Jeff Legos, chief oncology officer at Pfizer, said the collaboration brings together both companies' "highly complementary engines of innovation", combining Innovent's capabilities in drug discovery and early clinical development with Pfizer's global research and development and commercialization expertise.

The transaction comes amid a surge in cross-border out-licensing activity by Chinese drug developers.

Data from the National Medical Products Administration showed that the cross-border out-licensing deals of Chinese biotech firms hit a record transaction value of more than $60 billion in the first quarter, approaching half of the total $135.7 billion recorded for all of 2025.

Several large transactions have been announced this year. In January, Yantai in Shandong province-based RemeGen reached a collaboration agreement with AbbVie valued at up to $4.95 billion. Later that month, Shijiazhuang in Hebei province-based CSPC Pharmaceutical Group announced a deal with AstraZeneca worth up to $18.5 billion. More recently, Jiangsu Hengrui Pharmaceuticals signed a global strategic collaboration and licensing agreement with Bristol Myers Squibb with potential milestone payments of more than $15 billion.

Against the backdrop, the Innovent-Pfizer deal stands out for its use of co-development and co-commercialization, or Co-Co, arrangements, a model that is gaining traction among China's leading drugmakers.

Innovent previously adopted a similar structure in its collaboration with Takeda, while Hengrui's recent deal with Bristol Myers Squibb included options for joint development and commercialization.

Unlike conventional out-licensing deals, Co-Co arrangements allow companies to share development costs as well as future commercialization returns.

Analysts at China Securities said the Pfizer transaction represented another milestone in Innovent's globalization strategy, noting that the company would gain access to overseas markets through a combination of licensing and Co-Co arrangements.

Another notable feature of the deal is the expansion of profit-sharing rights beyond the United States.

You Fei, chief financial officer of Innovent, told investors during a conference call on June 1 that previous profit-sharing arrangements had primarily focused on the US market, while the Pfizer agreement extends that model to Europe.

"This time, both the US and Europe are included in profit sharing," You said, adding that the two regions together account for more than 80 percent of the global pharmaceutical market.

The company now has more than 20 drug candidates partnered with four multinational pharmaceutical companies, including five projects using Co-Co structures, according to You.

The inclusion of Europe broadens the geographic scope of Innovent's profit-sharing arrangements, reflecting that leading Chinese drugmakers are seeking to retain a larger role in global commercialization rather than relying solely on royalties.

The boom in cross-border business development has also drawn attention to the policy and geopolitical environment surrounding China's biotechnology sector.

Song Ruilin, chief expert of the China Pharmaceutical Innovation and Research Development Association, said that while some US lawmakers have proposed restrictions on Chinese biotechnology companies and questioned the use of Chinese clinical-trial data, multinational pharmaceutical companies continue to pursue partnerships with Chinese firms because of their growing role in global drug development.

Morgan Stanley forecast in 2025 that drugs originating from China could account for 35 percent of new medicines approved by the US Food and Drug Administration by 2040, underscoring expectations that Chinese companies will play a larger role in global drug innovation.

Speaking at a healthcare policy forum in May, Song emphasized that cross-border business development deals have become an increasingly important source of financing for China's innovative drug sector and a necessary phase for its globalization.

At the same time, he urged policymakers to take a cautious approach toward any potential measures affecting cross-border transactions.

"How to manage innovative-drug BD transactions requires respect for science and market principles. Policies should be introduced prudently," Song said.

Pakistan, China strengthen capital ties

Tire manufacturing joint venture listing on PSX paves way for broader relations

By **ZHOU LANXU**
zhoulanxu@chinadaily.com.cn

The successful listing of a Sino-Pakistani tire manufacturer on Pakistan's stock market may have paved the way for broader capital market cooperation between China and Pakistan, including more fundraising by Chinese-invested enterprises and potential cross-border investment products, a senior Chinese exchange executive said.

You Hang, executive vice-president of the China Financial Futures Exchange and Chinese shareholder director of the Pakistan Stock Exchange, or PSX, said in an exclusive interview with China Daily that the China Financial Futures Exchange, or CFFEX, will continue expanding its pipeline of qualified Chinese-invested companies in Pakistan seeking equity and debt financing through local capital markets.

Beyond corporate listings, You said CFFEX and PSX will explore broader product cooperation. Subject to regulatory approval, the two sides may study the feasibility of cross-border exchange-traded funds or ETF products and examine potential operational, regulatory and technical arrangements for future market connectivity.

The remarks came days after Service Long March Tyres Ltd — a joint venture between Pakistan's Servis Group and China's Chaoyang Long March Tyre Co Ltd — became what market participants describe as the first Chinese-invested company to list on the PSX.

The company raised 7.77 billion Pakistani rupees ($28 million), making it the largest private-sector IPO in Pakistan's history. Proceeds will be used mainly to build a new passenger-car radial tire plant in Pakistan.

The project, expected to begin operations in 2028, will expand local manufacturing capacity, reduce import dependence and support exports, thus helping Pakistan address the challenges of tight foreign exchange reserves and an imbalance in international payments, You said.

As of midday on Monday, shares of SLM traded at 25.2 rupees, more than a quarter above the IPO price of 19.95 rupees, reflecting strong investor demand, according to the PSX website. Experts said such market recognition suggests that capital market cooperation between the two countries is gradually evolving from individual projects toward a more institutionalized framework.

"By raising funds through Pakistan's domestic capital market, it has created a market-oriented and sustainable development model that combines Chinese technology, bilateral industrial capacity cooperation and local capital," he said.

Building on the listing of SLM, the CFFEX will proactively promote more high-quality corridor projects to list on the PSX, You said, planning to conduct regular research visits to Chinese enterprises operating in Pakistan and identify financing needs in sectors such as energy, manufacturing and infrastructure.

The listing also highlights a decade-long partnership between the two exchanges. In 2017, a Chinese-led consortium — including the CFFEX, the Shanghai Stock Exchange and the Shenzhen Stock Exchange — acquired a strategic stake in the PSX, becoming its largest single shareholder.

CFFEX has worked with the Pakistani bourse on initiatives ranging from technology upgrades and governance reforms to ETF development and corporate listings, with SLM the first flagship industrial IPO completed under the cooperation framework.

You said further cooperation would also cover market infrastructure and product development. Building on the launch of ETF products in Pakistan, CFFEX will continue supporting efforts to broaden the range of investment products available to local investors, including assisting PSX in preparing for the potential introduction of equity-index and single-stock futures, and exploring Islamic finance products.

Skills focus

The Shuozhou Track Maintenance Division in Shanxi province launches the 2026 Track Worker Professional Skills Competition at a training yard, drawing technical backbone staffers to display their skills. The contest covered theoretical tests, track inspection car diagram interpretation and switch inspection operations, aiming to hone staffers' skills through practice and help ensure safe rail transport. LI HAIFENG / FOR CHINA DAILY

Qinghai home to world largest single-unit CSP facility

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

China's 350-megawatt concentrated solar power demonstration project is set to deliver a replicable, large-scale model for the nation's CSP commercialization, backed by world-leading thermal storage, proprietary technology and full industrial chain independence, said industry experts and company executives.

China General Nuclear Power Corp came up with the world's largest single-unit CSP facility by thermal storage capacity and mirror field aperture last week in Northwest China's Qinghai province.

The project, integrating molten salt tower and parabolic trough systems, also marks the large-scale deployment of the company's self-developed 8.6-meter molten salt parabolic trough collector, it said.

Ding Yeliang, deputy general manager of CGN New Energy Holdings Co Ltd, said core components including collector brackets, flexible connection modules, local controllers and precision detection devices are jointly developed by CGN and top domestic enterprises, achieving 100 percent independent control of core technologies across the industrial chain.

CSP technology uses mirrors to concentrate solar energy to heat a fluid that drives a turbine. It has the unique advantage of built-in thermal energy storage, allowing it to generate dispatchable power, providing grid stability by supplying electricity even when the sun is not shining, a feature essential for national energy security.

The project's 15-hour molten salt thermal storage system, with a capacity of 11,747 megawatt-hours, enables stable round-the-clock generation and strong peak-shaving capabilities to boost new energy integration and power supply reliability in Qinghai.

Once fully operational, it is expected to produce 1 billion kilowatt-hours of electricity annually, saving 320,000 metric tons of standard coal and reducing carbon dioxide emissions by 860,000 tons each year.

China aims to bring its total concentrated solar power installed capacity to approximately 15 million kilowatts by 2030, according to a guideline released by the National Development and Reform Commission and the National Energy Administration.

Yang Kun, executive vice-chairman of the China Electricity Council, said earlier that technological advancements and economies of scale have steadily driven down construction expenses, while over 95 percent of China's CSP equipment is now manufactured domestically.

This was echoed by Ding from CGN, who said that building on its technological edge, China's concentrated solar power sector is well-positioned to capitalize on this moment and lead the next phase of clean energy advancement.

Future projections point to strong international growth for the industry, with global CSP capacity expected to reach 22.4 million kW by 2030.

Leading enterprises like CGN have been playing a central role in achieving technological self-reliance, accelerating key integrated solar thermal and storage projects, demonstrating the industry's rapid pace of development, according to the council.

According to CGN, the plant's mirror field covers a staggering total aperture area of 3.7 million square meters, comprising three 1.1-million-square-meter tower fields and one 400,000-square-meter trough field.

The entire trough field utilizes the cutting-edge 8.6-meter large-aperture collectors.

As a pioneer in China's CSP sector since 2011, CGN has consistently driven industry development through technological innovation. It operates the National Energy Solar Thermal Power Technology R&D Center, the only national-level research platform in this field.

To date, CGN has completed 19 scientific and technological capability appraisals, secured 68 patents, and participated in drafting 30 national and industry standards in the solar thermal sector.

Reshaping Tongxiang's digital landscape

City in eastern China moving away from traditional manufacturing by embracing latest smart technologies

By REN QI in Jiaxing, Zhejiang
renqi@chinadaily.com.cn

Located in the heart of the Yangtze River Delta, Tongxiang in Zhejiang province is rapidly transforming from a traditional manufacturing hub into a highland for the digital economy. Focusing on smart vehicles, smart computing, smart sensing and the industrial internet, the city is partnering with China Unicom to build a robust foundation for future industries.

As a key driver of this regional transformation, China Unicom is accelerating the development of new quality productive forces across the province. By leveraging advanced computing centers, vehicle-road-cloud integration and the low-altitude economy, the telecom giant is comprehensively reshaping the local digital landscape.

At the core of this transformation is the Wuzhen supercomputing center. Situated near the permanent site of the World Internet Conference, this landmark project represents a total investment of approximately 1 billion yuan ($147.6 million).

Designed with 880 racks and a planned computing power of 2,000 petaflops, the center has already built a 500-petaflop multi-computing platform. Utilizing integrated power solutions from Chint, a smart energy solutions provider based in Zhejiang, the center sets a green benchmark for energy efficiency. By collaborating with industry leaders like Alibaba and Moore Threads, China Unicom is building a domestic computing ecosystem that empowers cutting-edge fields.

This massive localized computing power is the strongest brain behind Tongxiang's vehicle-road-cloud integrated city-level management service platform. Initiated by five ministries, this pilot project utilizes 5G and C-V2X hybrid networks to enable high-reliability and low-latency data exchange between smart roads and vehicles.

Qian Jianhua, general manager of China Unicom's Jiaxing branch in Zhejiang, detailed the strategic layout. "Because the data path is short and the data do not need to leave the city, the system achieves an ultra-low response time of just one to four milliseconds," Qian said. This rapid processing has optimized overall traffic flow.

The Tongxiang pilot project has yielded remarkable results. Nearly 40 autonomous vehicles, including unmanned delivery equipment and smart buses, are operating across 39 open test roads spanning 300 kilometers. They have accumulated over 39,000 hours and 303,500 km of operation. Furthermore, the platform monitors over 2,100 key vehicles in real time and is integrating with major mobility platforms like T3 and Didi Chuxing. To ensure data security, China Unicom is building a trusted data circulation platform complying with TC609 standards.

Visitors observe a humanoid robot at the Light of Internet Expo, a signature event of the 2025 World Internet Conference Wuzhen Summit, in Wuzhen, Zhejiang province, on Nov 6. YANG MEIQING / FOR CHINA DAILY

Workers produce automotive radar, camera modules and domain controllers in a smart production workshop at Freetech Intelligent Systems Co in Wuzhen on Nov 10, 2024. DONG XUMING / FOR CHINA DAILY

Beyond the roads, China Unicom is aggressively tapping into the low-altitude economy, a strategic emerging industry. The company is building smart low-altitude test networks in 10 cities. In Nanjing, Jiangsu province, China Unicom built the country's first large-scale 5G low-altitude smart network over a 98-km stretch of the Yangtze River in Nanjing for maritime patrols. In Shenzhen, Guangdong province, it is partnering with logistics giants like SF Express and Meituan to create a multi-scenario "3-km, 15-minute delivery" low-altitude logistics network. In Qingdao, Shandong province, China Unicom has developed a unified smart platform for the local data bureau, managing drone operations across eight urban governance scenarios.

These infrastructure advancements are deeply intertwined with China Unicom's artificial intelligence ambitions, spearheaded by the newly established China Unicom Digital Technology Co. Operating under a "one company, one research institute" structure that gathers top global scientists, the company is pioneering the circulation of data elements. During a nationwide wave of trusted data space construction last year, China Unicom was tasked with building 12 of 63 trusted data spaces initiated by the National Data Administration.

In July 2024, the company released its in-house large language model, Yuanjing, which has already been implemented in over 100 benchmark cases. In Zhejiang's traditional clothing industry, China Unicom has partnered with leading enterprises like BXN Holdings and Jihua Group to build 5G future factories. Powered by a massive clothing data model, these factories feature rapid design, one-click pattern making and virtual fitting, reducing design cycles by 80 percent and production cycles by 30 percent.

Chen Haifeng, chairman and general manager of China Unicom Digital Technology Co, emphasized the company's commitment to technological self-reliance. "We are dedicated to solving the challenges of domestic computing cards and domestic AI models," Chen said.

This commitment has yielded remarkable results across various vertical applications. In the government sector, China Unicom's Yuanjing secretary AI agent is revolutionizing administrative workflows. By combining foundational large models like DeepSeek-V4 with fine-tuned small models, it covers 15 types of official documents and performs intelligent policy comparisons. Deployed in highly secure, localized environments where data do not leave the domain, it can process a 12,000-word report in just one minute with an accuracy rate exceeding 90 percent.

In the heavy industry sector, China Unicom's Yuanjing industrial time-series analysis platform is transforming traditional thermal power plants. By utilizing a dual-model architecture for prediction and optimization, the platform directly adjusts industrial control systems with a latency of under one second. In a major regional power plant, this AI-driven approach has stabilized steam temperatures, reduced nitrogen oxide emission fluctuations by 50 percent, and significantly improved the plant's ability to adapt to power grid peak-shaving demands.

In the medical sector, China Unicom has partnered with Beijing Tongren Hospital to develop an AI fundus screening tool. "Previously, patients spent half a day at the hospital. Now, with a simple scan at a community hospital, they receive a diagnosis in seconds, reducing the cost to less than 100 yuan," Chen said.

Similarly, in the cultural tourism sector, China Unicom has co-developed the Palace Museum digital twin platform. Utilizing internationally advanced cross-engine 3D real-time rendering technology, the platform integrates over 20 million multi-source data entries. It creates a highly accurate digital avatar of the museum, allowing global visitors to experience centimeter-level, first-person digital roaming of the Central Axis of Beijing and the Hall of Mental Cultivation via mobile apps.

As AI applications proliferate, the business model is evolving. Ding Ding, deputy general manager of China Unicom Digital Technology Co, highlighted the company's innovative "token" operations. Instead of merely selling raw computing power, the company integrates tokens with specific business scenarios. "The logic of token billing is highly similar to telecom data plans. Our ability to provide transparent, real-time and fair billing eliminates industry issues like fake billing, serving as a significant security and trust highlight for our customers," Ding said.

To support this digital ecosystem, China Unicom Zhejiang Branch has built nearly 100,000 5G base stations, extending coverage to 99 percent of rural areas. Looking ahead, Tong Haibo, Party secretary and general manager of China Unicom Zhejiang Branch, summarized the strategic vision.

"The development of AI and computing applications is not an isolated technological evolution, but an organic whole deeply intertwined with communication networks. By building a high-speed, stable and intelligent network architecture, we have laid a solid 'information highway' for massive data transmission and computing, contributing more to the construction of new quality productive forces," Tong said.

5G tech transforms factory in Zhejiang province

By REN QI

The first commercial 5G local area network in Zhejiang province has successfully transformed the China Jushi fiberglass factory into a highly efficient, unmanned smart manufacturing hub.

On the intelligent production lines of China Jushi Co, a seamless dance of human-machine collaboration is unfolding. As the building materials industry accelerates its transition from traditional manufacturing to smart manufacturing, fiberglass — a critical material for wind power, new energy vehicles and 5G communications — has become a focal point for technological breakthroughs.

China Jushi, a core enterprise of China National Building Material Co Ltd, stands as a global leader in the fiberglass industry. The company boasts the world's largest production capacity, holding a commanding 40 percent market share in China and 24 percent globally. Over the years, China Jushi has maintained its industry-leading position in scale, technology and quality, earning prestigious accolades such as the China Grand Awards for Industry, the National Science and Technology Progress Award, and recognition as a national intelligent manufacturing demonstration factory.

To further accelerate its digital transformation, China Unicom Zhejiang Branch recently achieved the deep commercial integration of a 5G LAN at China Jushi's No 5 factory in Jiaxing, Zhejiang. This milestone project marks the very first commercial use case of 5G LAN in Zhejiang, helping Jushi build a comprehensive 5G-powered factory.

The advanced 5G LAN technology supports 5G-native Layer 2 networking, allowing terminals to be highly flexible and plug-and-play. Crucially, it maintains the enterprise's original network architecture, significantly lowering the difficulty of upgrading production lines to 5G. The technology can create specialized "groups" for enterprise terminals at Layer 2 or Layer 3, providing flexible communication services such as terminal interconnection and isolation.

At the Jiaxing No 5 factory, 5G terminals are installed directly into control cabinets, deeply integrating with the factory's programmable logic controllers — the "brains" of the machinery. By utilizing advanced 5G LAN technology, the factory has constructed a seamless end-to-end network. This enables real-time collaboration between different programmable logic controllers and ensures instant data sharing with the supervisory control and data acquisition system. This signifies a major step forward for China Unicom's 5G Private Network Plus 3.0, proving that 5G has deeply penetrated the core production links of industrial manufacturing.

Robotic arms perform material-handling operations on a smart production line at China Jushi's smart manufacturing base in Tongxiang, Zhejiang province, on April 14. SUN YANGYANG / CHINA NEWS SERVICE

Stepping into the No 5 factory, the results are visually striking. Industrial robots navigate the workshop in perfect order, executing material transport and loading with flawless precision. Rows of mechanical arms complete complex procedures with every bend and stretch, while rolls of fiberglass packaging materials are automatically elevated within the smart warehouse. Only a handful of technicians are needed to debug products or machinery. In the factory's intelligent control center, massive display screens continuously update dense data charts, providing a digitized, visualized and full-process monitoring system for multiple production lines.

Song Guangmin, director of the industrial internet support center at China Unicom Zhejiang Branch, highlighted the philosophy behind this transformation. "From the very beginning of the factory's construction, we established a foundational requirement for the full connection of data elements," Song said. "What we see now is a 'mega-factory' in Zhejiang — a fully connected operation based on the deep integration of 5G, IT and operational technologies."

Song noted that the factory leverages AI large models for extensive data collection, analysis and scenario applications. "The massive unmanned technologies operating here are the result of fusing new-generation information technologies, represented by 5G, with AI large models. This has dramatically boosted China Jushi's competitiveness, increasing its production efficiency by over 20 percent since the project was implemented," he said. The customized computing power required for these AI applications is seamlessly provided by China Unicom's supercomputing center in Wuzhen, Zhejiang.

During a recent visit, Fan Ji'an, chief big data scientist at China Unicom, highly praised the deep integration of the 5G factory. China Unicom and Jushi have agreed to expand their cooperation in industrial manufacturing, including reliability verification of cross-SMF 5G LAN networking, extending 5G LAN to multi-campus wide-area networks and building 5G private networks for China Jushi's new factories.

Yu Yadong, director of the information technology center at China Jushi, outlined the ambitious road ahead: "The 5G factory will not only focus on internal digital and intelligent transformation, but also expand externally. Based on China Unicom's unified multi-campus 5G private network solution, we aim to connect upstream and downstream industries, establish a wide-area 5G LAN, and promote our advanced fiberglass production technologies from the Tongxiang headquarters to global branches in Chengdu, Sichuan province, Jiujiang, Jiangxi province, and Suez in Egypt, leading the high-quality development of the global fiberglass industry."

Navy's carrier battle group back after drill

Liaoning and its escort vessels complete over-40-day, long-range deployment in South China Sea and western Pacific Ocean

Clockwise from left: During an over-40-day far-sea combat training of the PLA Navy's strike group, a J-15 fighter jet monitors a US anti-submarine patrol aircraft after taking off from the aircraft carrier *Liaoning*. PROVIDED TO CHINA DAILY

By ZHAO LEI
zhaolei@chinadaily.com.cn

A carrier battle group of the People's Liberation Army Navy, led by the aircraft carrier CNS *Liaoning*, concluded a long-range training deployment and returned to its homeport of Qingdao, Shandong province, on Monday, according to the PLA Navy.

In a statement, the PLA Navy said the carrier battle group spent more than 40 days conducting realistic combat-oriented exercises in the South China Sea and the western Pacific Ocean.

During the training period, Japanese vessels and aircraft repeatedly conducted close-range surveillance near the Chinese naval formation. The *Liaoning* group maintained a high state of alert when encountering these vessels and aircraft, and deployed carrier-based fighter jets to respond to what it described as unsafe actions by the Japanese side in a professional and prudent manner, according to the statement.

Video clips released by the PLA Navy showed several Japanese military aircraft and JS *Asahi*, a destroyer of the Japan Maritime Self-Defense Force, operating in close proximity to Chinese vessels, posing potential safety risks for both sides.

The PLA Navy said that since departure, the *Liaoning* and its escort vessels had conducted continuous training throughout the voyage, sailing across multiple sea areas.

During the deployment, the group created realistic training scenarios, built a robust early-warning and detection system, simulated complex battlefield environments, and followed practical exercise plans.

Sailors and pilots participated in a series of drills covering air combat and air defense, anti-ship strikes, battlefield support, joint search and rescue, and live-fire exercises.

The group also carried out multiple rounds of day-and-night carrier-air wing and ship-aircraft integrated exercises to verify its strike and defense capabilities, and conducted targeted training for core combat elements, the PLA Navy said, noting that these activities effectively tested the battle group's joint operational capability in long-range deployments.

In a designated area in the western Pacific, the *Liaoning* carrier battle group held joint exercises with an amphibious assault group led by CNS *Anhui*, a Type 075 amphibious assault ship. According to the PLA Navy, both formations conducted integrated training to enhance coordinated far-sea combat operations.

Song Zhongping, a retired PLA Rocket Force officer and military affairs commentator, said in light of the PLA Navy having commissioned new carrier-based aircraft and warships, it was necessary to explore and optimize new tactics.

"The carrier group needs to build operational synergy with new types of warships, such as amphibious assault ships, through joint training. A combined strike group made up of aircraft carriers and amphibious assault ships can carry out a range of complex missions. Carriers are responsible for securing air and maritime superiority, while amphibious assault ships take charge of landing, occupying and defending islands," he said.

Commenting on the Japanese side's close-range activities, Song said, "No matter whether the actions came from Japanese or United States vessels and aircraft, they effectively served as a simulated adversary. Such forces have, in effect, acted as 'Blue Force' elements and de facto training partners, helping improve the quality of combat-oriented training. We take these activities as a realistic operational backdrop, making the training more authentic and challenging. This is, in fact, a positive outcome."

The *Liaoning* was commissioned into the PLA Navy in September 2012, becoming China's first aircraft carrier and, at the time, the largest warship in the fleet. To date, the *Liaoning* has participated in more than 10 long-range training and exercise deployments, mostly in the western Pacific Ocean.

China probes claim of formamide in diapers

By WANG XIAOYU
wangxiaoyu@chinadaily.com.cn

The State Administration for Market Regulation announced on Monday the launch of a joint investigation with other government agencies into the alleged presence of formamide in baby diapers.

The probe is being conducted jointly by the Ministry of Industry and Information Technology, the National Health Commission, and the National Disease Control and Prevention Administration.

This follows the release of a media report on Thursday which claimed some consumers had reported their babies developing recurrent diaper rash and skin ulceration after using certain brands of infant diapers.

Third-party tests on several mainstream infant diaper products detected traces of formamide, and the substance was even found in the blood and urine of some infants, according to the media report.

In the wake of the report, a number of diaper brands, including Babycare, Huggies, and BIBAbebe, have stated that internal and external tests conducted on their products have shown no traces of the chemical.

In one of the latest responses, BIBAbebe said on its official social media account on Monday morning that it had commissioned third-party institutions to test all its mainstream products and found no presence of formamide. The company is continuing to test other batches of products and raw materials.

Formamide is classified as a substance of very high concern and a reproductive toxicant under European Union regulations.

"This means the substance won't cause immediate poisoning, but it's not safe for long-term, close, airtight contact — especially for babies," said China-Test Group, an independent testing institution on Friday.

The institution said for babies, even tiny residues of the substance after wearing diapers can cause symptoms such as rash, redness, and allergies, and that long-term accumulation could affect their growth and development.

It added that legitimate diaper brands do not add formamide to their products, and any detections should be residual traces from the manufacturing process.

Products with complicated prints and thicker elastic bands are at higher risk of containing residual formamide.

The hygiene products committee of the China Technical Association of Paper Industry said in a statement released on Thursday that it is important to disclose the actual levels of the alleged formamide presence, who conducted the tests, and what standards, equipment, and testing methods were used, so as to determine the risk associated with these baby diapers.

Fuyao university reaffirms nonprofit role

By ZOU SHUO
zoushuo@chinadaily.com.cn

Fuyao University of Science and Technology remains committed to its nonprofit, public welfare mission, and its push for schools and departments to gradually achieve financial self-sufficiency does not mean they are required to pursue profits or engage in market-driven revenue generation, according to the institution's leadership.

Wang Shuguo, president of the university, made the clarification following public discussion over remarks by Cao Dewang, founder of the university and chairman of the Fuyao Glass Industry Group.

In a 2025 interview with Phoenix TV, Cao said each school and department should gradually become self-sustaining through independent accounting, generating income by helping enterprises solve practical problems and commercializing research outcomes.

In a post published on the university's WeChat account on Wednesday, Wang said, "If you cannot even sustain yourself, it shows you lack real capability."

The post quickly sparked online debate on whether an emphasis on self-sufficiency could turn universities into profit-driven enterprises.

In an interview with The Paper published on Sunday, Wang further explained that the university encourages schools and departments to conduct research on real industrial problems and enhance their self-sustainability through the commercialization of research results, rather than by pursuing profits.

> "If you cannot even sustain yourself, it shows you lack real capability."
>
> **Wang Shuguo,** president of Fuyao University of Science and Technology

"We expect our faculty to ground their research in the country's real needs and address practical industrial challenges," he said.

"Schools and departments are encouraged to strengthen their self-sustainability and internal drive through the commercialization of research results, but this never means they are required to seek profits or operate as market-oriented businesses," Wang added.

Located in Fuzhou, Fujian province, Fuyao University of Science and Technology is a private, nonprofit institution established by entrepreneur and philanthropist Cao Dewang with a 10-billion-yuan ($1.48 billion) donation from the Heren Charitable Foundation.

The university is positioned as a new-type research institution focused on science and engineering, interdisciplinary integration and industrial applications.

Wang said the university was founded to advance scientific research that addresses genuine industrial challenges and translates research achievements into industrial development and social progress.

Cao has repeatedly emphasized that his goal was not to add another institution to China's higher education landscape, but to explore a model rooted in his years of industrial experience — one in which universities face industry, serve practical applications and look to the future.

To bridge the gap between theory and practice, the university is promoting two-way integration between academia and industry. Top industry professionals are invited to serve as enterprise mentors for students, while faculty members are encouraged to participate in real-world industrial projects, Wang said.

He stressed that the university remains firmly committed to its nonprofit, public welfare mission. Cao has repeatedly said that "education is a cause, not an industry" and opposes the entry of capital into education.

Undergraduate tuition is set at 5,460 yuan per year, while accommodation costs 1,200 yuan annually for a double room. The university has also pledged that no student will be denied access to education for financial reasons, Wang said.

He added that the university has sufficient and diversified funding sources, including donations from the Heren Charitable Foundation, annual special allocations from the Fuzhou municipal government, social donations and income from research commercialization.

All revenue is reinvested in faculty development, laboratory construction, talent cultivation and the development of foundational disciplines, he said.

Briefly

Chinese fleet to visit Vladivostok this month

A Chinese naval fleet will visit Vladivostok, Russia, in late June at the invitation of the Russian Navy, the Chinese Defense Ministry said on Monday. The fleet comprises the training ship CNS *Qi Jiguang* and the amphibious dock landing ship CNS *Kunlunshan*, it said in a news release. The Chinese and Russian militaries will earnestly implement the consensus reached by the two heads of state, and continue to expand practical cooperation in various fields, the release said.

Medical rescue training held on Tiangong

Shenzhou XXIII spaceflight mission's three astronauts have conducted their first in-orbit medical rescue training since arriving at the Tiangong space station, a video released by the China Manned Space Agency has shown. The training aims to help astronauts Zhu Yangzhu, Zhang Zhiyuan and Lai Ka-ying familiarize themselves with rescue operation techniques and force application characteristics under microgravity conditions, the CMSA said in the video on Sunday. In addition to the medical training, the crew has been engaged in a wide range of scientific experiments. China launched the Shenzhou XXIII crewed spaceship on May 24. The mission is notable for including a one-year in-orbit stay experiment, which will provide crucial data for future long-duration space exploration.

China's AI weather agent being deployed globally

Shanghai Meteorological Service rolls out MAZU urban hazard warning system worldwide, sending out alerts, mitigating disasters

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

The MAZU system is displayed at China Meteorological Administration's booth during the World Artificial Intelligence Conference in Shanghai on July 27, 2025. PROVIDED TO CHINA DAILY

A specialized artificial intelligence system developed by the Shanghai Meteorological Service is being deployed across dozens of developing nations to combat increasingly severe urban climate risks, marking a major expansion of China's role in global humanitarian tech.

The MAZU AI Agent for Urban Multi-Hazard Early Warning operates as a critical component of China's national response to the United Nations' Early Warnings for All initiative, which aims to protect every person on Earth from hazardous climate events by the end of 2027.

According to the China Meteorological Administration, the overarching cloud-based MAZU solution — named after the ancient Chinese sea goddess who protects travelers — is already being utilized by more than 40 national meteorological agencies, with seven countries deploying deeply customized versions of the system.

"As climate change increases the frequency and intensity of extreme weather events, strengthening early warning systems has become more important than ever," said Yu Jun from the World Meteorological Organization's Regional Office for Asia and the Southwest Pacific.

Yu made the remarks on June 1 in Shanghai at the opening ceremony of the second international training course on artificial intelligence-empowered early warning systems.

"The UN's Early Warnings for All initiative calls for every person on Earth to be protected by life-saving early warning systems. Achieving this goal requires innovation, partnership, and capacity development," he added. "It offers tremendous opportunities to strengthen every component of the early warning value chain, from observations and forecasting to risk assessment, communication and early action."

The MAZU system leverages advanced satellites, radar and localized AI models to execute hyper-local functions, including minute-level disaster data collection and analysis, customized meteorological risk assessments, real-time automated weather alert broadcasting and emergency shelter navigation mapping for citizens.

The solution has seen continuously expanding international application in developing countries to help cope with extreme weather and climate risks. Since 2024, nearly 1,000 participants from over 100 developing countries and regions have received training in China on early warning technologies.

The global rollout of the AI agent for urban hazard warning is managed by the Zhang Qian Mission, an international cooperation unit formed in 2024 by the Shanghai Meteorological Service. Composed of roughly 50 young scientists and engineers, the group coordinates system delivery, installation and technical training.

The mission has established distinct, localized pipelines to handle unique geographic challenges across Asia and Africa, customizing the AI's predictive models to the specific climate threats faced by partner nations.

In Mongolia, where authorities face severe desertification, flash floods and "dzuds" — extreme winter freezes that cause catastrophic livestock mortality — the system was officially transferred in July 2025. The tool is currently being calibrated to track regional forage availability and broadcast high-priority alerts to nomadic herders, a measure aimed directly at stabilizing the country's livestock-dependent economy.

Meanwhile, the framework is being adapted in Nigeria to address severe riverine flooding and coastal high-tide inundation. Local teams are currently piloting the cloud-based infrastructure, with an operational focus on incorporating predictive flood modeling to protect vulnerable river ecosystems and facilitate early evacuations.

A similar deployment was finalized in Djibouti in late 2025. Because the East African nation faces a volatile mix of extreme arid cycles and sudden flash flooding, engineers are focusing updates on maximizing the geographic accuracy of the system to ensure rapid, neighborhood-level alerts for urban centers.

The Zhang Qian Mission takes its name from Han Dynasty (206 BC-AD 220) explorer and envoy Zhang Qian (c.164-114 BC), whose expeditions and diplomatic missions paved the way for the Silk Road.

"A big highlight of our AI agent is that it is placed locally with interfaces prepared for users. They can upload their local data to the system, which we are not able to see on the backend," said Xu Chen, a member of the Shanghai Meteorological Service's specialized international outreach team. "They can also use the tools in the system to analyze the data, and the whole process is totally safe on its own."

Joining the mission in 2024, Xu has worked closely with the meteorological team in Nigeria.

"It is very fulfilling when we see that our technology and experience can actually help the people in other countries. Our overseas counterparts may not summarize their philosophy (of meteorological service) as 'people-centered' as we do, but we do share the same goal," said Xu.

Francis Bassey Etim, technical adviser to the chairman at Nigeria's House Committee on Emergency and Disaster Preparedness, has been working with the Chinese team since last year.

"China's meteorological agencies have really advanced technologies, which we are here to learn. We hope to incorporate them into our own system to predict when floods are coming, see how we can control it, and most importantly, how we can come together to save lives and our ecosystems," said Etim during the training course in Shanghai.

"It (the AI agent) is not only a technology for today, but for the future. Hopefully when this agent comes to my country, we can have a team able to manage it. It's going to be beneficial to citizens and for a more sustainable future for us all," he added.

Last July, Shanghai donated the AI agent to meteorological authorities in Mongolia and Djibouti as part of its initial technology-sharing efforts. In October, the Zhang Qian Mission team flew to Ulan Bator, capital of Mongolia, to install the system and conduct training. Entering this year, the training program has been expanding and the two sides are continuously exploring deeper into local conditions and system upgrading.

"We already started testing the system in our country and service, and it has helped us a lot to face the increasingly intense climate hazards such as floods, lightning, drought and desertification. It gave us many useful hints, and we hope to train the system to be more accurate and helpful," said Oyunjargal Lamjav, director of the weather forecasting department at Mongolia's National Agency for Meteorology and Environmental Monitoring.

Liu Haobo, 39, team leader of the Zhang Qian Mission, has worked with the Mongolian team from the very start.

"Livestock populations support the economy and the lives of a very large number of Mongolian people. Early warnings are never only about sending alerts, but more about informing the priority groups promptly, so they can get prepared and take early actions to confront the disaster," said Liu, who hopes to leverage AI to help them come up with a customized solution to tackle the challenge of "dzuds".

According to Liu, the mission has received extensive feedback from international partners looking to tailor the platform to local infrastructure. Key engineering priorities now include leveraging AI to eliminate local language barriers, developing more efficient SMS text-alert distribution systems, and sharpening the geographic accuracy of early warning maps.

"They believe in us," Liu said. "Every time I see the confidence and trust in their eyes, I get powered up and filled with hope for the future."

Training course on intelligent platform draws 30-nation delegation

By **WANG XIN**

Meteorological representatives from more than 30 nations gathered in Shanghai for the second international training course on artificial intelligence-empowered early warning systems on June 1, marking a significant expansion of China's technical role in global humanitarian disaster defense.

The intensive five-day program, spearheaded by the Shanghai Meteorological Service, centered on deploying advanced AI to meet the United Nations' Early Warnings for All initiative, a global mandate to shield every community from severe climate events by the end of 2027.

Rather than relying on generic weather models, the gathering highlighted cutting-edge, localized tech pipelines — spanning precise typhoon forecasting, low-Earth orbit satellite applications, smart agricultural meteorology and multi-hazard alerts.

"The weather and climate are boundless. We need to enhance international exchanges and cooperation to learn from other countries, overcome extreme cases together for a better future," said Oyunjargal Lamjav, director of the weather forecasting department at Mongolia's National Agency for Meteorology and Environmental Monitoring.

Mariam Tidiga, director general of Burkina Faso's National Meteorological Agency, said at the opening ceremony that the agency highly appreciates the opportunity to come together, share experiences, strengthen capacities and explore innovative solutions to address the growing challenges.

Tidiga said that international cooperation, knowledge sharing and technological advancement are essential to ensure that no community is left behind in the global effort to build resilience and achieve sustainable development.

"We would also like to express our strong interest in strengthening cooperation in agro-meteorological services. The combination of climate information, weather forecasts, agricultural advisory services and innovative crop solutions offers significant opportunities to enhance food security, improve water management and strengthen resilience to climate variability," she added.

The participants reaffirmed their commitment to actively engage in the MAZU Global Intelligence Innovation Application Challenge. They view this initiative as an excellent platform to promote innovation, develop practical solutions adapted to local realities, and strengthen collaboration among meteorological services, research institutions, universities and operational partners.

The MAZU AI Agent for Urban Multi-Hazard Early Warning is already making practical differences in Djibouti and Mongolia.

In Djibouti, a Chinese team from the Zhang Qian Mission has developed a tailored early warning dashboard to work with the agent's on-site service mechanism. The dashboard integrates multi-source meteorological observations, forecasts and disaster risk data to enable rapid risk detection and alerts. In Mongolia, coordinated efforts on both sides have been accelerating.

Liu Haobo, team leader of the Zhang Qian Mission, shared a letter from the Mongolian meteorological authority in May, which read: "Thank you for providing the MAZU AI Agent system and related training to us. Overall, the agent has a clear interface and smooth operation. It is promising as a platform for viewing different meteorological information in one place and supporting city-level weather risk analysis."

Xu Xianghua, deputy director general of the department of international cooperation at the China Meteorological Administration, said, "We always believe that early warning is not merely a matter of meteorological science and technology, but also a fundamental global public good that safeguards the lives of people worldwide and ensures global development."

PHOTOS PROVIDED TO CHINA DAILY

Unearthing long-lost fiefs

A massive Shaanxi discovery reveals the hidden noble network that protected a 3,000-year-old capital city, **Wang Ru** reports.

In the Western Zhou Dynasty (c.11th century-771 BC), the dynasty's strength relied not only on its grand capitals — Fenghao, in present-day Xi'an, Shaanxi province, and Luoyi in today's Luoyang, Henan province — but also on an invisible network of fiefdoms, known as *caiyi,* scattered across the royal domain.

These were fiefs granted by Zhou kings to members of the royal family and trusted officials. Largely self-sufficient, tightly administered and generally loyal to the throne, they collected taxes and helped maintain the vital corridor linking the two capitals.

Now, archaeologists have uncovered another complete *caiyi* from the middle-to-late Western Zhou period, offering a rare opportunity to test historical records against physical evidence.

After four years of work, archaeologists have identified a Western Zhou fiefdom at the Changchun site in Fuping county, Shaanxi. The discovery was listed as one of China's top 10 archaeological discoveries of 2025, a selection organized by the National Cultural Heritage Administration.

Excavations began in 2022 as a rescue effort targeting looted tombs. Unexpectedly, archaeologists uncovered an entire Western Zhou fief in the eastern part of the Guanzhong region — one of the most prosperous areas of present-day central Shaanxi and the northern frontier of the royal domain. The site covers an impressive 2.2 million square meters and includes both a vast cemetery and a large settlement.

Li Yanfeng, the lead archaeologist, says the Guanzhong region lies at the heart of the royal domain and has long been a focus of Western Zhou research. Yet, most previous work concentrated on western Guanzhong, leaving major gaps in understanding the east. The Changchun site helps fill that void.

Research first focused on the cemetery, which spans 200,000 sq m and contains more than 3,150 tombs and chariot pits. Among them are 12 large tombs, each featuring a tomb passage — a characteristic often associated with high social status.

"Such a large cemetery, together with so many large tombs with passages, has never before been found in eastern Guanzhong and remains rare in Western Zhou archaeology," says Li.

The cemetery was used exclusively for burials, with no residential remains within its boundaries. It features a clearly organized layout and distinct boundaries, although no surrounding ditches have been found. All tombs face northeast. Large, medium and small tombs are distributed in an orderly pattern. A vacant strip divides the cemetery into two sections: the elevated northern area contains large and medium-sized tombs, while the southern section is occupied by smaller graves.

"These features closely resemble those of other cemeteries at the sites identified as Western Zhou fiefdoms, such as the Kongtougou site in Baoji, Shaanxi, as well as the dynasty's vassal states like the Liulihe site in Beijing," says Li.

Excavations of selected tombs have provided further clues. High-ranking burials feature three layers of coffins — one outer coffin and two inner coffins. Many also contain dismantled chariots among the grave goods, practices widely recognized as characteristic of Zhou burial traditions.

Many tombs were looted long ago, resulting in the loss of numerous valuable artifacts. Although no inscriptions have been discovered that directly identify the tomb occupants, surviving objects still point to their elevated status.

Among the finds are a gold ornament shaped like a beast mask, a jade plaque decorated with dragon motifs, and artifacts made from fossilized coral, all exceptionally refined compared with similar objects previously unearthed from the same period, Li says.

"Taken together, the evidence indicates that the cemetery was used from the middle to late Western Zhou period," Li says. "It served as a public cemetery primarily for Zhou people and is one of the largest Western Zhou cemeteries ever discovered within the vast royal domain between Fenghao and Luoyi."

After uncovering the cemetery, archaeologists began asking where so many people had lived. Extensive surveys of the surrounding area eventually led them to a settlement south of the cemetery that was occupied during the same period.

From top: Professionals clean chariot remains at the Changchun site. The Baijia cemetery excavation area at the same site where archaeologists worked in 2024 and 2025.

"We found that the settlement was an enclosed area covering 2 million sq m, bounded by the Shichuan River, one of its tributaries and two man-made ditches. One of the ditches even separated the settlement from the cemetery," says Li.

To better understand the settlement's layout, archaeologists searched for traces of roads, waterways and defensive structures. They identified a series of artificial horizontal and vertical ditches that divided the site into a grid-like pattern.

"This resembles the layouts of capitals from the Xia (c.21st century-16th century BC) and Shang (c.16th century-11th century BC) dynasties, particularly the crisscrossing road network at the Erlitou site in Luoyang. But there is a difference: the multi-grid system at Changchun was built around a water network," says Li.

Wang Wei, a veteran archaeologist at the Chinese Academy of Social Sciences, notes that such a layout is the first of its kind discovered at a Western Zhou site.

After establishing the site's overall layout, archaeologists excavated part of the settlement and uncovered extensive remains of handicraft production, including bronze casting, pottery making and antler-tool manufacturing, suggesting the area functioned as a state-run specialized workshop district.

Within an area of 50,000 sq m, archaeologists discovered 30 pottery kilns, a concentration and scale comparable to ceramic workshops in the ancient capital of Fenghao.

In a pit near a workshop that produced antler arrowheads, archaeologists found the remains of four individuals. DNA analysis identified a mother-son relationship between two of them, suggesting they may have belonged to the same family.

"Studies on the skeletal remains indicate they were involved with repetitive upper body labor over long periods and suffered from poor health. These findings match the physical profile of professional craftspeople," says Li.

"Taken together, the evidence suggests a household-based production model operating within a state-run handicraft system," he adds.

Comparisons with other Western Zhou sites show that the scale and layout of the settlement, together with the size, organization and population composition of the cemetery, closely follow the pattern seen at other aristocratic fiefdoms within the royal domain, Li says.

"Therefore, we believe the Changchun site was another large aristocratic fiefdom, although somewhat smaller than sites such as Zhougongmiao in Baoji and Kongtougou in the Guanzhong region," he says.

The *caiyi* system emerged in the early Western Zhou period as an important tool for governing the royal domain and rewarding members of the royal family and meritorious officials. Unlike vassal states, which were often located on the dynasty's frontiers, *caiyi* fiefdoms were concentrated within the royal domain. Their rulers could collect revenues and administer local affairs, but they lacked the political, military and diplomatic powers enjoyed by the rulers of vassal states, Li explains.

As the dynasty declined, the *caiyi* system gradually disappeared. Why, then, did such a large fiefdom emerge during the middle and late Western Zhou period?

"By tracing the evolution of settlements in this region, we can see that the influence of the Zhou rulers appears to have weakened over time," Li says. "In response, a buffer zone was needed on the periphery of the royal domain to protect the capital, Fenghao. We believe this was the context in which the Changchun site emerged."

"Such a well-planned and fully functional aristocratic fiefdom, as the social center of the Shichuan River Basin, provides a valuable case study for understanding the political structure and state organization of the Western Zhou Dynasty," says Wang.

Listening to stones on Xinjiang's ancient grasslands

By **SUN MENG** in Bortala, Xinjiang
sunmeng@chinadaily.com.cn

On the vast Husta grasslands in Wenquan county, Bortala Mongolian autonomous prefecture, Xinjiang Uygur autonomous region, a solitary container house stands against the horizon. It serves as the base camp for the Husta archaeological team.

The name Husta means "a place with birch trees" in Mongolian. Although the birch trees have long disappeared, endless grasslands remain, along with a group of dedicated archaeologists who have chosen a profession that is both quiet and, at times, lonely.

"That is the Alatau Mountains," says Yu Xiaoxiao, a team member, pointing toward the distant peaks.

Thousands of kilometers from her hometown in Guangdong province, this site near the China-Kazakhstan border feels both dreamlike and real. It is a place where physical traces of the past connect ancient history to the modern world.

Each year, from June to September, the team's five permanent members conduct field excavations at the site. During the rest of the year, they work at their base near the mountains, restoring and studying the artifacts they have uncovered.

At Yu's feet lies Dun Dun, a small dog she affectionately describes as "another member of the team".

More than a decade of patient excavation has produced one of Xinjiang's most significant archaeological discoveries in recent years.

While the main Husta settlement dates to the late Bronze Age, around 1600 BC, tombs found in the eastern section are even older, dating to approximately 2800 BC. These burials rank among the earliest Bronze Age remains ever discovered in Xinjiang.

A bronze knife unearthed from one of the tombs is now considered one of the oldest known bronze artifacts found in China.

The discovery of multi-person burial tombs is also remarkable, the first of its kind in Xinjiang, according to Yu. The largest burial pit found so far contains at least 120 individual skeletons, representing a multi-generational family that lived together in this area for many years.

Yu says the site has also yielded other remarkable artifacts, including human-head sculptures decorated with bronze beads and a stone scepter. Each discovery is helping scholars reshape their understanding of ancient communities and settlement patterns along the Tianshan Mountains.

Physical anthropologists sort and study human skeletal remains at the team's base camp in Wenquan county, Xinjiang Uygur autonomous region. PROVIDED TO CHINA DAILY

Inside the team's field workshop, excavation tools are carefully arranged — scrapers, pickaxes, hand trowels and more. Yet, one of their most effective tools is surprisingly simple: a cut-up plastic water bottle.

"Sometimes, inside the tombs, there are very narrow spaces between human bones," explains Mengker of the Mongolian ethnic group, who is the youngest member of the team at 24.

"This tool can bend around corners, making it easier to remove soil without damaging the nearby artifacts."

Beneath the grasslands lies a civilization waiting to be revealed, and many of the archaeologists' tools are improvised.

Even so, Mengker and her colleagues continue to uncover relic after relic from the distant past. During excavation season, they spend long days digging and long nights beneath star-filled skies.

Life at the site is far from convenient. There are no supermarkets or food-delivery services, and the nearest town is more than an hour away by car.

Yet, material hardship is not their greatest challenge. The surrounding wilderness can be dangerous.

"In 2023, a bear entered our camp," recalls team member Chen Siyu, showing an old photograph.

The same year, the team also experienced sudden flash floods, Chen adds.

Despite these difficulties, the archaeologists speak warmly about their work.

Wenquan county is often called "a museum without walls". Almost any stone scattered across the grasslands may hold traces of people who lived there 3,000 years ago.

"Sometimes when I look at a stone, I feel it can speak," says Yu. "It seems to tell you what life was like, who those people were, how they came here, and what they were doing."

On this grassland, more stones may speak.

Wenquan county is home to countless rock carvings depicting animals, hunting scenes, and other aspects of ancient nomadic life. Together with the Husta site, these carvings help reconstruct thousands of years of human history on the grasslands.

Day after day, these young archaeologists carry out work that is demanding, meaningful, and often solitary.

Throughout it all, Dun Dun remains their loyal companion. The puppy was a gift from local border defense personnel, while its mother and brother continue serving at a nearby border checkpoint.

When visitors leave, Dun Dun rarely comes to say goodbye. Perhaps the dog has grown accustomed to seeing people arrive, marvel at the wonders of the site, and then depart.

Or perhaps it simply knows that when summer returns, the archaeologists will come back once again to listen to the voices hidden within the stones.

"We are honored to help pass those voices on to future generations," Yu says.

LIFE

Far left: Qi Lin poses with a basket-weaving woman in a village in Kitui county, Kenya. The woven basket balanced on his head is known locally as a kiondo. PROVIDED TO CHINA DAILY **Left:** Taken by Qi in 2016, the photo shows that near the Kakuma Refugee Camp in Turkana county, Kenya, a Turkana woman fetches water to wash a child's hair. QI LIN / FOR CHINA DAILY **Above:** the cover of Qi's newly released book *The Camel Diaries*. PROVIDED TO CHINA DAILY

Diary of a man, a camera and a camel

Fascinated by deserts and having a fondness for taking the tougher path, photographer releases a book about his adventures, including finding an unconventional protein source, **Yang Yang** reports.

Driving from Lake Turkana in northwestern Kenya on the afternoon of Sept 14, 2021, 37-year-old Qi Lin and his assistant, 25-year-old Martin, reached their destination: Lake Kisima, a seasonal soda lake that often experiences periods of dryness. After nibbling on some corn, they decided to check the meat they had brought, only to find an army of white maggots wriggling on the surface of the mutton they bought two hours earlier.

Failing to get rid of the maggots by knocking the meat on a stone, they cooked the mutton with some cabbage and ate it.

In his newly released book *The Camel Diaries*, Qi recorded this impressive excerpt from his 701-kilometer journey on foot north along the eastern side of the East African Rift.

"Maggot is protein, good stuff," he says very seriously.

"Some people might wonder how I can eat it, but my perspective might be completely different. When you're on a journey with nothing good to eat, and suddenly you find some animal protein, having a bit of meat or fat, even if it's not the freshest, is a joy," he says.

"You have to be grateful. Today, you have something to eat, even if it's maggots."

The Camel Diaries records the journey that began in September 2021 and ended in November of the same year. Qi, Martin, and their 3-year-old camel, Kipesh, crossed the equator and highlands, navigating diverse landscapes such as elephant forests and savannas until they reached Lake Turkana, known as the "Cradle of Humankind". From the lake, they circled Mount Kulal and ventured into the harsh desert wilderness.

It's a hard journey not only for humans but also for camels. Usually, to travel such a long distance, one person needs four camels to take turns carrying 50 kilograms of water, food, cooking equipment, tents, and more.

"My budget was very limited, so I only got one camel. For such a long-distance travel in the desert, a camel's carrying limit is 70 kg," he explains.

When they reached Lake Turkana, Qi had lost 10 kg. The camel weighed 100 kg and was in a dangerous condition.

Qi learned that when a camel dies, it often shows no warning signs. It might just tilt its head and collapse, or it might not get up after sitting down to rest. Therefore, he let the camel rest for over 20 days because the upcoming journey into the Chalbi Desert would be even more challenging, with less food and water.

As expected, the Chalbi Desert became the hardest part of the whole journey, more dangerous than the place where they were surrounded by armed local people in tribal conflicts, or later, when the camel was robbed. It is a desert where Qi gained a direct understanding of the impacts of climate change. In the remote nomadic desert town of Maikona on the northern edge of the Chalbi Desert, a 4-year-old girl had never seen rain.

Traveling on foot, with a camel carrying all the necessities, the desert was still very challenging to traverse. Though Qi only mentioned it briefly in the book, he says, "I was probably on the verge of heatstroke (several times). My mouth felt numb, there was a metallic taste, and I started hallucinating."

At the end of each day, after walking 30 to 40 km and overcoming many difficulties, Qi finally set up his tent, often with low blood sugar, and wrote in his diary on his cell phone, which had a broken screen, then posted it on WeChat.

"My diaries are kept in a simple manner, without many thoughts running through my mind," Qi says, explaining his writing style.

"What mattered to me at that moment was survival. It might sound a bit exaggerated, but when I say I survived, I don't mean I was on the brink of death every day. It's more about having worked so hard and traveled such a long path, I finally have a place where I can catch my breath," he says.

Through this ascetic journey, Qi emerged not only from the dangerous deserts of northern Kenya but also from the lowest point of his life.

Qi's family has a tradition of working abroad. His grandfather was a doctor on the first Chinese medical team sent to Somalia. His mother, also a doctor, was sent to Nepal to work for three years. In 2011, inspired by his grandfather, he went to Africa and worked there until 2015, when he decided to quit a Chinese company and become a full-time husband.

In 2015, he and his wife, a UN employee, relocated to New York. Having spent four years in Africa, the full-time househusband felt lost in this cosmopolis known for its financial industry and high-rises. To pass the days and sleep well at night, he sometimes joined two other househusbands for long, aimless walks, covering about 20 km per day.

Since 2008, photography has been one of Qi's biggest passions. To pursue photography and map his future in New York, he attended master classes.

Since 2016, Qi has spent one to two months each year away from home on his documentary photographic series, exploring themes such as the experiences of overseas Chinese people and children's lives in Nairobi's slums.

He chooses destinations that are often the toughest, photographing Chinese workers installing power lines in Sudan, Chinese fishermen in Angola, and Chinese factory workers in Ethiopia, among others.

"Throughout this process, my understanding of photography, especially documentary photography, has evolved. Each year, this work supports me and makes my year worthwhile," he says.

However, in 2020, the retina in his right eye began to detach from the underlying supportive tissue. If not treated promptly, this condition would lead to vision loss. Unfortunately, due to the COVID-19 pandemic, proper treatment was delayed until 2023, by which time his eyesight had deteriorated to an irrevocable 0.3.

Top: In September 2021, Qi, his guide Martin, and their camel Kipesh pose for a photo while crossing the equator en route to Lake Turkana. The equator marker in Nyahururu stands behind them. **Above:** Qi and Martin take turns leading Kipesh across the vast Chalbi Desert. PHOTOS PROVIDED TO CHINA DAILY

In 2021, he unexpectedly spent several months in Haiti, where he witnessed extreme street violence that was largely unreported outside the country. "From there, I lost all confidence in humanity," he recalls, explaining the motivation behind the journey chronicled in *The Camel Diaries*.

His depression worsened by the news of a good friend killed in an air crash. When he returned to Kenya in 2021, his perspective on the world had changed significantly.

"After Haiti, everything I saw felt like it was through a filter. I didn't experience things directly anymore. It was a protective mechanism. If I opened myself up, I would get hurt, and my emotions were overwhelming. Because of this, I developed an aversion to photography. I felt physically nauseous, like I wanted to vomit, which is something I never experienced before," he says.

"Photography used to be my remedy, but then it had turned into my poison," he says.

Having a special fondness for deserts, he had long aspired to lead a camel to retrace the ancient "Camel Rock Trail", the Timbuktu-Taoudenni caravan route in Mali, a key western route for the trans-Saharan gold and salt trade. However, Mali was too dangerous to travel in.

Then a friend, half-jokingly, suggested going to the deserts in northern Kenya on a camel if he really wanted such travel.

In the deserts of northern Kenya is Lake Turkana, a particularly fascinating place for him.

Situated in the Great Rift Valley in northwestern Kenya and extending into Ethiopia, Lake Turkana is the world's largest permanent desert lake and the largest alkaline lake. In 1984, a well-preserved skeleton of a Homo erectus youth who lived approximately 1.6 million years ago was discovered here. The fossil provides critical insights into the physical development and anatomy of early humans.

When these three elements — deserts, Turkana and a camel — came together, the journey became irresistible.

Previously, he had visited the lake twice: once by car and once by flying partway and then driving. This time, he traveled on foot, accompanied by a resilient camel and Martin, a member of the Samburu nomadic group from northern Kenya, who depend on camels for their livelihood.

"I didn't have a concrete plan. I just wanted to head out, without a clear idea of how far I'd go or which direction to take. Simply setting foot on the road is enough for me. I prefer to know as little as possible about what comes next," he says. "There are some things you mustn't tell me; no spoilers."

Despite challenges along the way, there were two or three moments when Qi suddenly felt connected to the whole of nature, becoming one with it.

"Each time was only for a short while, but I genuinely felt connected. You can hear the wind, feel the sunlight on your skin, and even smell the distant rain. Your senses not only open up but also feel interconnected in that moment," he says, talking about the best part of the journey.

It's not the beautiful scenery, but the feeling that is similar to meditation, he adds.

He remembers that during the journey, the scenery was the same as others', but suddenly the colors seemed more vibrant and full of infinite details. The whole world came alive.

"It comes unexpectedly; you might be bored, and then suddenly, you enter that state for a short while before coming out of it, realizing that the world is truly real. It's quite an important experience to me," he notes.

"With my background in science and engineering, I understand that many concepts, like truth, freedom, language, and reality, have limitations. But when I truly experience being a whole person in that environment, it transcends language," he says.

Qi resumed photography during the journey; after completing it, continued his previous lifestyle. Later, he was featured in Liu Na's *Narrating the World: 12 Chinese Men and Women Tell Their Stories*, published by the Commercial Press in 2024 and about the overseas Chinese. His diaries sparked editors' interest in publishing a book. This year, *The Camel Diaries* came out.

Cheng Ying, a tenured associate professor at Peking University's Department of Asian-African Languages and Literatures, highlights the book's groundbreaking nature in the context of African historical narratives. Qi's journey takes him through areas seldom visited by either Chinese or local Africans, plunging him into untouched wilderness.

Traditionally, Africa and its people have been observed and defined by outsiders, but the author's writing presents a more reciprocal relationship with the locals and environment, she says.

For instance, the camel Kipesh is portrayed as gazing at and even mocking his owner. Additionally, Qi meticulously captures details such as tire tracks, footprints and iron pots from Chinese construction sites in the wilderness, giving the work a timeless quality.

Cao Yin, a tenured associate professor of history at Peking University, observes that in today's travel trend of taking photos for social media, this book takes a different approach. The author embarks on a challenging journey, enduring hardships such as stomach troubles, blisters and sunburn. By sharing meals and living with locals, he integrates into African tribes and gains trust through empathy and mutual respect, capturing the authentic and vibrant essence of Africa.

Qi's grounded journal offers the public a look into the complex realities of African societies and provides valuable grassroots insights for academic understanding of Africa, he notes.

CULTURE

From 'digital pickles' to an entertainment giant

China's micro-short drama industry has grown into a 100-billion-yuan phenomenon, and is reshaping perceptions of the genre, **Xu Fan** reports.

As one of the easiest forms of entertainment to consume on a smartphone, micro-short dramas — vertically shot, packed with cliffhangers and delivered at a breakneck pace — have evolved into a cultural and economic phenomenon in China.

Four months after the National Radio and Television Administration, the sector's top regulator, announced that the industry's market size had surpassed 100 billion yuan ($14.7 billion) — almost double its 2024 figure — the State Council Information Office organized a group interview that, for the first time, invited a micro-short drama director to share key rules for producing hits.

Latest figures from the administration also showed that a total of 33,000 such dramas were streamed online last year, an increase of around 50 percent year-on-year and reaching nearly 700 million viewers. In addition, more than 800 Chinese micro-short drama applications have been available in overseas markets, generating a total revenue of $3.24 billion in 2025 and $1 billion in the first quarter of 2026, according to the administration's development research center.

For an industry once dismissed as inferior — largely because most of its tales relied on exaggerated and melodramatic plots — the SCIO's event has been interpreted by some insiders as a positive signal encouraging the creation of higher-quality content. The mainstream genres of the past, for instance, often revolved around a protagonist waking up to find herself resurrected and time-traveling to a different era, or an ordinary woman discovering that her loyal lover is a secret billionaire.

Above: Poster for the micro-short drama *Bussiere Garden*, inspired by the true story of French doctor Jean Augustin Bussiere. **Top middle:** (From top) Posters for *Meng Ying* (Dreaming Cinema), a series marking the 120th anniversary of Chinese cinema, and *The Red Cradle*, a work set during the War of Liberation (1946-49). Yang Kenan, a micro-short drama director. **Top right:** A poster for Yang's popular micro-short drama *My Sweet Home*.photos PROVIDED TO CHINA DAILY

Formula behind a hit

"It was around 2020 that the short-video industry started to boom," Yang Kenan, a 35-year-old director from the influential micro-drama production company Shanghai Tinghuadao Cultural Media, told China Daily after attending a State Council Information Office event on June 5.

Having started working in the entertainment industry over a decade ago, Yang — previously a scriptwriter and advertisement producer — has witnessed the unprecedented expansion of micro-short dramas.

Recalling that he was one of the earliest figures to have been part of this landmark shift in online content — from its early wild, rapid development to its current more regulated and quality-driven trend — Yang says the industry, despite being labeled as "fast-food culture" in the public's eyes, could also tell stories with emotional power, heartfelt warmth and positive connection.

Yang's *My Sweet Home*, one of the country's most popular micro-short dramas, is such an example. The first season, consisting of 79 episodes and released in March last year, is set in southern Sichuan province and quickly soared as a sleeper hit, amassing 3 billion views online.

Unlike the typical soap-opera-style narrative of micro-short dramas, *My Sweet Home* employs a plain, down-to-earth, neighborhood tone. It follows an ordinary couple — two divorced people — as they work to establish a new family with the children each had from their previous marriages.

The series — which unfolds from the early 1980s and is spoken in the local dialect — naturally exerts the unique sense of humor that is a trademark of Sichuan natives. The husbands, for instance, are known for being "henpecked", a teasingly regional pride referring to men's respect for and gentle treatment of their wives, as well as their family-oriented nature.

As showcased in the franchise — whose second season, containing 111 episodes, helped propel the franchise's overall views past 6 billion — the well-crafted script includes sequences like the following: the female protagonist, a single mother cold-shouldered by her elder brother's family after the divorce, receives unexpected warmth from her second husband, a technology veteran and factory executive who resists his own mother's objections and gives his salary to his wife to handle every month.

Yang, a native of Southwest China's Guizhou province, notes that his local dialect and culture share similarities with those of Sichuan province, which made it easier for him to create the work with the help of fellow creators — some of whom are also from Sichuan.

Interestingly, big data played a role in deciding what dialect the characters should speak. "We conducted a lot of research online and discovered that the Sichuan dialect is quite popular on major social platforms like Douyin, with many dialect-based jokes created in it," Yang explains, shedding light on why the team made this choice.

> "No matter how the format changes, audiences ultimately stay for stories that can move them. That is what gives micro-short dramas lasting vitality."
>
> **Yang Kenan,** director of micro-short drama series *My Sweet Home*

He adds that the dialect primarily relies on differences in tone, but as long as it is spoken slowly, people from all over the country can generally understand it. "Therefore, the barrier to comprehension is relatively low," he adds.

Currently working on the franchise's third season, Yang believes the industry's long-term success still depends on one essential factor: storytelling. "No matter how the format changes, audiences ultimately stay for stories that can move them. That is what gives micro-short dramas lasting vitality," he says.

A bigger landscape

The industry's transformation has also gained recognition among insiders. Dong Tao, an industry researcher and council member of the China Literature and Art Critics Association, says that the sector's market value grew from just 940 million yuan in 2020 to 50.5 billion yuan in 2024, the first year it surpassed China's annual box-office revenue, before doubling again last year.

"For a long time, some industry insiders underestimated micro-short dramas," Dong says. "Now the focus should be on improving quality and production standards so that more compelling Chinese stories can reach international audiences."

Signs of that shift are already emerging. One recent example is *Meng Ying* (Dreaming Cinema), a tribute produced for the 120th anniversary of Chinese cinema. The story follows a film archivist who travels back to 1905 in search of the original reel of *Dingjun Mountain*, performed by Peking Opera artist Tan Xinpei and believed to be China's first film.

Leng Song, director of the audiovisual research office at the Chinese Academy of Social Sciences, believes the genre has gradually shed some of the stereotypes attached to it.

"Micro-short dramas were once criticized as 'digital pickles' and accused of promoting 'aesthetic decline'. However, as more creators explore history, culture and reality-based themes, the genre can also offer audiences a rich cultural feast," says Leng.

Popular examples include productions commemorating the 80th anniversary of the Chinese People's War of Resistance Against Japanese Aggression (1931-45). Among them are *Bussiere Garden*, inspired by the true story of French doctor Jean Augustin Bussiere, who transported medicine for the Eighth Route Army during the war, and *The Red Cradle*, about a nursery in Yan'an that escorted 136 children of martyrs to a safe zone in 1946, when the Kuomintang launched an all-out offensive against the liberated areas of the Communist Party of China.

Meanwhile, the genre is increasingly moving beyond smartphones. Last year, 124 high-quality micro-short dramas were broadcast on the country's satellite television channels. Of those, 42 were produced in Beijing, the highest number among Chinese cities.

"Micro-short dramas are evolving from an emerging form of mass entertainment into a globally oriented content product that balances cultural expression with commercial potential. Their growing influence at home and abroad is helping Chinese stories cross linguistic and cultural boundaries to find shared emotional resonance," adds Leng.

Sudanese acrobats celebrate a legacy born 55 years ago

PORT SUDAN, Sudan — Nahid Sharhabil Ahmed could no longer hold back her tears.

Sitting quietly at the front of a soft-lit celebration hall in Port Sudan, Ahmed watched as black-and-white images flickered across the screen: young Sudanese children training in the distant Chinese city of Wuhan, Hubei province. It had been more than half a century. And she was one of them.

Inside the hall, decorated with Sudanese and Chinese flags and faded photographs, traditional Chinese music played quietly in the background, blending with the murmurs of the audience and occasional bursts of applause at each historic scene on screen.

For Ahmed, time seemed to slip backward.

She appeared in the documentary herself — a young girl performing acrobatic routines alongside the first group of Sudanese trainees sent to China in 1971 under a bilateral cultural exchange program.

As the old training scenes unfolded, Ahmed wiped away tears several times. The memories had brought her back to "the most beautiful years" of her life.

Now head of the Sudanese Acrobatic Troupe, she spoke with deep emotion and nostalgia.

"I was 9 years old when we arrived in Wuhan," Ahmed says. "We were little children, afraid of being far from home and unable to speak a single word of Chinese. But we found warm hearts there that embraced us with kindness.

"The Chinese teachers treated us not just as students, but truly as their own children," she adds. "They woke us before dawn for training, helped us with our studies and meals, and cared for us when we were sick.

"That is why China has always remained, for me, associated with family and warmth," she says.

In 1971, Sudan sent 50 carefully selected children to China to form the core of its first acrobatic troupe. They underwent three years of specialized training in Wuhan.

"Every movement we learned there carried a lesson in patience and discipline. When we returned to Sudan, we felt we were carrying a great dream that we had to share with our people," Ahmed recalls.

In 1974, the children returned to stage performances as the first acrobatic troupe in both Africa and the Arab world.

Nahid Sharhabil Ahmed, head of the Sudanese Acrobatic Troupe, watches a video on the troupe's history in Port Sudan, eastern Sudan, late last month. FAYEZ ELZAKI / XINHUA

Since then, the troupe has become one of Sudan's leading artistic institutions, blending Chinese acrobatic techniques with Sudanese and African rhythms and dances.

Looking at the photographs of the old days, Ahmed says she feels "both pride and sadness".

"Pride because we created something that has endured for more than half a century, and sadness because many of our companions are gone or have been scattered by life and war," she says.

Her reflections came during a reception hosted late last month by the Chinese embassy in Sudan in Port Sudan, marking the troupe's 55th anniversary. Sudanese officials, diplomats, veteran performers, and Chinese community members gathered to celebrate.

The celebration unfolded against the backdrop of Sudan's prolonged conflict.

According to Ahmed, the troupe's management has drawn up a plan to rehabilitate its headquarters, provide equipment, and train new performers.

For veteran member Magdi Babikir, the troupe was more than an artistic project.

"It was a complete human journey that shaped our personalities and changed our lives," Babikir says. "We were children from different parts of Sudan, and there we learned commitment and teamwork. We learned how art can bring people together despite differences in language and culture.

"Even in this difficult war, I still believe this troupe will return," Babikir says, "because it is not just stage performances, but a shared memory between two peoples."

At the ceremony, Xu Jian, charge d'affaires of the Chinese embassy in Sudan, said the anniversary represented "golden years in which legends were written".

Xu noted that more than half a century ago, young Sudanese children "traveled from the banks of the White and Blue Nile to the banks of China's Yangtze and Hanjiang rivers, where teachers from the Wuhan Acrobatic Troupe instructed them hand in hand and cared for them as their own children".

These human bonds, he said, helped create "a flower of Sudanese-Chinese friendship".

Sudanese Foreign Ministry official Omer Oshik said the troupe has become part of Sudan's cultural memory and a "symbol of civilizational exchange".

Despite the hardships of war, the anniversary carried a clear message: the flower of friendship can bloom again. The art born 55 years ago on the Nile still holds the power to connect people, bridge nations, and remind us that some bonds, like the memory of a warm hand in a foreign land, never fade.

WORLD CUP 2026

Blue Sharks bite back to tie Uruguay

Cape Verde does it again, scoring twice to draw 2-2 with two-time champion

Cape Verde's magical start to its first World Cup isn't over. In fact, it might just be getting started.

The tiny island nation that stunned tournament favorite Spain last week did it again against Uruguay — a two-time World Cup champion — on Sunday, coming from behind for a 2-2 draw at the Miami Stadium in Miami Gardens, Florida.

Kevin Pina scored on a freekick for Cape Verde's first-ever goal in the World Cup, and Helio Varela scored the equalizer for what has become one of the most surprising sides of the expanded 48-team tournament — a side now with a legitimate chance of getting into the knockout stage.

"This is something we owe to other smaller national teams — teams that struggled to qualify for a world tournament," Cape Verde coach Pedro Leitao Brito said, adding that his entire squad believes it can continue its historic run and reach the knockout stage.

Cape Verde, which has two points in Group H along with Uruguay, faces Saudi Arabia in its final group match.

"We're also here to show that a country may be small, may struggle financially," he added, "but if they are resilient, if they can endure struggle, they can also stand shoulder to shoulder with other major teams and with players who are on another level."

The group of islands off Africa's west coast have about 4,000 square meters (about 2.5 miles) of landmass and approximately a half million inhabitants, making Cape Verde the third-smallest nation by population to qualify for the World Cup.

Even as a large number of fans at Miami Stadium chanted for Uruguay throughout Sunday's match, Cape Verde's players seemed undaunted. "Once you're on the pitch, a lot of things become equal," Leitao Brito said.

Cape Verde's fans who watched their squad pull off one of the stunning results of the tournament last week by holding Spain to a scoreless draw, continued their celebrations when Pina split Uruguay's wall and blasted a strike past a diving Fernando Muslera to take a 1-0 lead in the 21st minute.

Late first-half goals from Maximiliano Araujo and Agustin Canobbio put Uruguay ahead going into halftime, but Varela, minutes after coming into the game in the second half, took advantage of a bad pass by Mathias Olivera and caught Muslera way off his line to fire the tying goal, and his first international score, into an empty net.

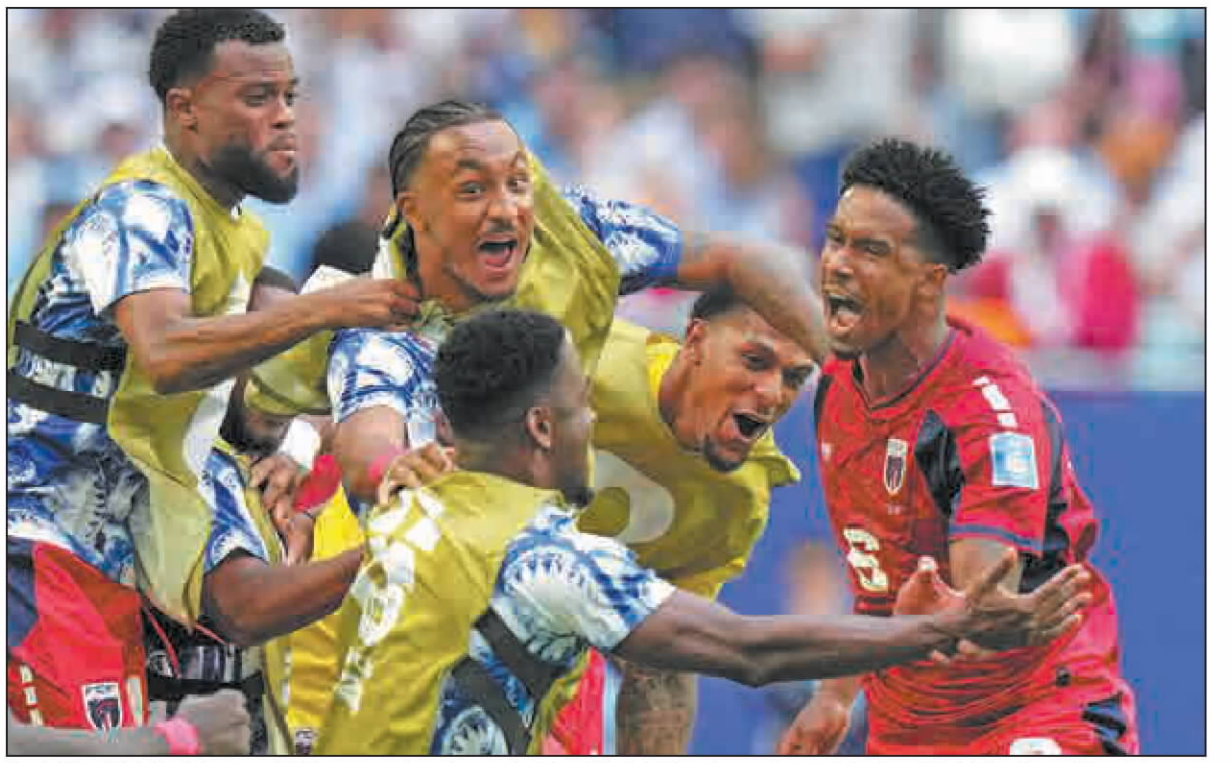
"I had dreamed of this," Varela said in a quote distributed by FIFA, "but I never imagined it would happen this way. Scoring my first goal for the national team on my World Cup debut is incredible. I have no words."

Varela celebrated by hopping into his teammates' arms and flexing atop their shoulders as Muslera and other Uruguay players dropped their heads in disappointment.

"The result, I think, was quite deserved," Uruguay coach Marcelo Bielsa said afterward.

La Celeste failed to capitalize on numerous late chances to take the lead, and settled for its second draw after a 1-1 finish against Saudi Arabia in its opener. Bielsa's men next face Spain in their group stage finale, needing a positive result to have a chance at advancing.

"The organizational mistakes that were made — that a squad makes — they always fall upon the (head coach)," Bielsa added. "There is no magical recipe to fix them. It goes without saying we paid a very high price for those mistakes."



It was another special moment for Cape Verde's Vozinha, who became one of the tournament's breakout stars after shutting out Spain. The 40-year-old goalie had his mother in the stands for Sunday's match; she was unable to attend Cape Verde's opener against Spain because she couldn't obtain a United States visa.

It was also the first World Cup match where both starting keepers were over the age of 40, after Muslera, making his 18th World Cup appearance, hit the milestone on June 16.

Vozinha waved to the stands after the final whistle, as his teammates ran to a section of Cape Verde fans, who cheered and danced as if they were celebrating a victory.

"You show up, you believe, and we work very hard as a team," said aptly named Blue Sharks defender Stopira. "I think all the world can see we play very well, and we also have quality in the team. So, now, it's on to the next game, and to try to reach the next stage."

Vozinha's mom roots for her son from the stands

On Father's Day, it was about a mother watching her son make more history.

There were 64,003 people in the stadium for the 2-2 draw between Cape Verde and Uruguay on Sunday night, none of them with a better how-they-got-there story than Ana Candida Evora — the mother of Vozinha, Cape Verde's goalkeeper.

Evora arrived in Miami on Friday, reunited with her son over the weekend and watched Sunday's game from a suite at Miami Stadium.

Cape Verde's fairytale run now has a chance of reaching the knockout stage, depending largely on how its group stage finale against Saudi Arabia goes.

Cape Verde is one of the absolute feel-good stories of the World Cup, a tiny island nation with two draws in its two matches to this point. Vozinha — whose name is Josimar Jose Evora Dias — had his mother in the stands Sunday; she was unable to attend Cape Verde's opening draw against Spain because she couldn't obtain a United States visa.

And even without a win — in fact, her 40-year-old son didn't even make a save Sunday — her presence makes Cape Verde's story even better.

Goalkeepers don't always have to make a save to be effective. Vozinha's best two plays of the match might not even show up on a stat sheet — he was perfectly positioned on a pair of Uruguay's scoring chances in the closing minutes, cutting down angles and forcing shooters to aim at tight spaces. Both shots sailed high, and Vozinha exhaled deeply both times.

"I want to thank all the fans, everyone who helped in the process, for the support you gave to the team, especially to Cape Verde," Evora said Sunday in remarks distributed by FIFA in a video message before the match. "We're all rooting for Cape Verde to play well, to shine on the pitch. The players need to have faith and everything will go well.

"Keep your heads held high, go onto that pitch, push for a goal and you'll perform beautifully, my boys. A kiss for you, be strong and brave. Blue Sharks!"

Evora carried a Cape Verde flag into the stadium Sunday, her son's name and jersey number on the back of her shirt, and she was ushered into a suite to watch the contest.

Vozinha heard roars from the fans — even with a mostly pro-Uruguay crowd — whenever he was shown on the video screens during warm-ups, and got perhaps the loudest ovation of any player when starters were introduced.

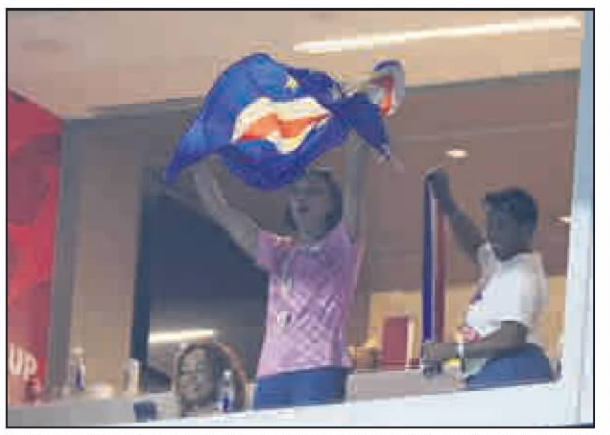
Evora's visa issues — primarily raising the money needed for one — were worked out after the US State Department and Cape Verde's soccer federation combined efforts to help Evora to fly to Miami. There was also assistance from an unlikely source: Lin Jie, a Cape Verde-based Chinese entrepreneur, who reportedly helped Evora with her visa paperwork, and provided travel necessities and transportation to the airport. "Vozinha's cousin happened to work in my wife's clothes shop," Lin told reporters.

"I offered to help."

She arrived Friday afternoon after more than 24 hours of travel from Cape Verde and was greeted by FIFA officials and volunteers.

Vozinha had about 50,000 followers on Instagram as the World Cup was starting.

He was up to 15 million followers by game time Sunday, after he grabbed the world's attention by leading the defense against Spain — one of the tournament favorites.



That equates to around 30 followers every second since the end of the Spain match up to kickoff on Sunday.

He went viral after the Spain match for tearful comments, wishing that his late grandparents could have seen him play in the World Cup and that his mother's visa issues had been resolved in time to be there. That sparked an immediate effort to find ways for Evora to get to the US.

The historic draw, combined with the story of a goalie and his mom, has thrust Cape Verde's soccer team into the global spotlight both on and off the pitch.

"It's been intense," Cape Verde forward Garry Rodrigues said.

Shared growth highlighted at Summer Davos

Li stresses cooperation, global execs voice confidence in Chinese market

By **JI HAISHENG** in Dalian, Liaoning
jihaisheng@chinadaily.com.cn

As political and business leaders gather in Dalian, Liaoning province, for the 17th Annual Meeting of the New Champions of the World Economic Forum, global attention is turning to how China will use the event to reinforce its role in championing stable growth and practical cooperation at a time of mounting global economic uncertainty.

Premier Li Qiang underscored China's commitment to strengthening cooperation with various countries in emerging sectors and enhancing development synergy, as he held a series of bilateral meetings with heads of government on Tuesday on the sidelines of the event, also known as the Summer Davos forum. The prime ministers Li met with were Guinea's Amadou Oury Bah, Kazakhstan's Olzhas Bektenov, the Republic of Korea's Kim Min-seok, Mongolia's Nyam-Osor Uchral and Montenegro's Milojko Spajic.

During the meeting with Bektenov, Li voiced China's readiness to work with Kazakhstan to expand bilateral trade, deepen cooperation in energy and mineral resources, enhance connectivity, and broaden collaboration in emerging fields such as artificial intelligence, smart cities, big data and the digital economy — injecting fresh momentum into the modernization drive of both nations.

While meeting with Kim, Li called on both sides to seize new opportunities for innovation-driven development, and stressed efforts to advance an open Asia-Pacific economy, uphold free trade and multilateralism, and keep global industrial and supply chains secure and stable.

The foreign government heads pledged efforts to deepen collaboration with China across various sectors. Uchral Nyam-Osor, the Mongolian prime minister, said that Mongolia is ready to enhance synergy between its national development strategy and China's 15th Five-Year Plan (2026-30), and to bolster cooperation in trade, cross-border connectivity, infrastructure, energy and mining, agriculture and the green economy.

The three-day event, which began on Tuesday, brings together more than 1,700 leaders from the business, government, academic and media communities from over 90 countries and regions to discuss ways to boost world economic growth and cooperation.

Long regarded as a key platform for promoting exchanges between China and the world and enhancing practical cooperation, the annual gathering also speaks volumes about global stakeholders' broad recognition of China and their unwavering confidence in its prospects amid worldwide volatility.

Some participants stressed that the world's second-largest economy is a reliable partner for joint innovation, practical cooperation and shared growth.

Pontus Erntell, who oversees Ikea's operations in China, described the country as a strategic market where the Swedish home furnishing giant has been deeply rooted for a long time.

"China is one of very few countries outside of Sweden where we have all parts of the value chain. It is a market where we truly want to develop, learn and collaborate with local partners," he said.

Jiang Ying, chair of Deloitte China, said that China's complete industrial system, resilient economic fundamentals and continued high-level opening-up remain key pillars supporting the country's long-term growth.

Jiang said emerging sectors such as AI and the low-altitude economy are set to make further breakthroughs, while the coordinated development of traditional and new growth drivers will help sustain China's economic momentum.

"The long-term value of the Chinese market lies in its vast and dynamic consumer base, vibrant technological and industrial innovation, and continued high-level opening-up," Jiang said.

Chafic Nassif, senior vice-president at communications tech giant Ericsson and head of Ericsson Northeast Asia, said that China's combination of "scale, speed of execution and innovative industrial ecosystem" makes it a uniquely critical market in the global technology landscape.

Cheng Yu and Zhang Chenxu in Dalian contributed to this story.

Greater BRICS role urged in upholding intl order

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Inside

Comment, **page 6**

The more than 100-day conflict involving the United States, Israel and Iran underscored the importance of upholding international rules, respecting state sovereignty, embracing a new vision of security and understanding the changing nature of warfare, China's top diplomat Wang Yi said on Tuesday.

The Chinese foreign minister made the remarks in New Delhi, the capital of India, at the 16th Meeting of BRICS National Security Advisors and High Representatives on National Security, following the recent first-phase memorandum of understanding reached by the US and Iran.

The BRICS cooperation mechanism was formally launched in 2009, and now has 11 formal members after its latest expansion.

Addressing the meeting, Wang said that any settlement of international or regional hotspot issues must comply with international rules, adding that the law of the jungle may prevail for a time, but cannot be sustained.

Territorial integrity must not be violated, and no country's internal affairs should be subject to interference, he said, calling this the most basic moral baseline in international relations.

The conflict also highlighted the importance of adopting a new vision of security, Wang noted. As countries become increasingly interconnected, seeking absolute security for oneself at the expense of others' security will only backfire, he warned.

Wang also pointed to the need to recognize new forms of warfare. In a number of recent conflicts, non-traditional forms of warfare, including information warfare and cyber warfare, have become more open and visible.

With traditional and nontraditional security threats increasingly intertwined, it is timely and necessary for BRICS countries to strengthen dialogue and cooperation on security affairs, he added.

Against this backdrop, Wang called on BRICS countries to shoulder their responsibilities in safeguarding the international order by upholding multilateralism, firmly defending the purposes and principles of the United Nations Charter, and opposing unilateralism and protectionism.

He urged BRICS countries to build greater consensus when addressing security dilemmas, push for the political settlement of hotspot issues, and explore effective ways to resolve disputes through dialogue and consultation.

Wang also stressed the need to combat terrorism in all forms, oppose the militarization of outer space, respond effectively to global energy and food security challenges, strengthen cooperation on strategic mineral resources, and work together in response to the Ebola outbreak in Africa.

PECULIAR TASTE IS THE TOAST OF SUZHOU IN SUMMER

With mint, candied fruits and steamed mung beans, the city's distinctive seasonal drink is winning over curious visitors

By **YANG FEIYUE**
yangfeiyue@chinadaily.com.cn

The shady corners of Suzhou's UNESCO-listed classical gardens, epitomizing the beauty of Chinese landscaping, are not the only attraction drawing overheating visitors to the historical city in East China's Jiangsu province.

There is another local tradition just as essential to surviving the sultriness of the summer season: a tall glass of something cold, clear and utterly peculiar.

Unlike the thick, creamy mung bean soup enjoyed by most of China's population, this Su-style concoction is crystal clear, with distinctive green mung beans and pearly white glutinous rice resting at the bottom like a miniature still life.

Floating on top are colorful strips of red and green made from vegetables, candied winter melon, dried sweet dates, raisins and the occasional preserved kumquat. All of this is topped off with a faint whiff of mint.

To the uninitiated, it looks like a dessert, a drink and a puzzle all at once.

Its origins are as layered as its ingredients. Mung bean soup has been a Chinese summer staple since the Tang (618-907) and Song (960-1279) dynasties, when street vendors sold chilled versions to cool down passersby.

Mung bean soup is seen in this photo taken on Nov 18, 2025, in Suzhou, Jiangsu province. ZUO DONGCHEN / FOR CHINA DAILY

But Suzhou's distinctive interpretation emerged much later, shaped by the region's prosperity and its taste for refinement.

According to Zhao Guoming, curator of the Suzhou Diet Museum, the soup's evolution mirrors the city's own history. As Suzhou grew wealthy through trade and commerce, locals began embellishing the humble mung bean soup with preserved fruits and candied ingredients — luxuries once reserved for well-off families.

For Suzhou people, a glass of iced mung bean soup has been summer's "happy water" and an essential part of local food culture, Zhao said.

The preparation method also sets it apart. Unlike the boiled-to-a-pulp version found elsewhere, Suzhou's version requires the mung beans and glutinous rice to be steamed separately, which keeps each bean distinct and ensures a firm, chewy texture.

And then there's the mint: A few drops of mint extract or a soak of mint leaves gives the drink its signature sharp, cooling kick — a sensation so intense that some outsiders find it startling.

China Vibes — FOOD —

"It's very natural," said Guo Hui, 50, who has been making the soup since her teens and runs a shop selling it near Guanqian Street, the city's bustling historical shopping district.

"Just purified water, rock sugar and mint leaves. You don't mess with it."

Guo insists on using premium-grade mung beans, which have a matte texture, and steaming them only after soaking them thoroughly. "You can't rush it," she said.

In recent years, the drink has become a social media sensation, with tourists flocking to Suzhou specifically to try it. Dedicated shops have sprouted across the city, offering creative twists, such as black rice and dried mango, alongside the classic version.

Food delivery platforms report booming sales each summer, and social media feeds are filled with videos of curious tourists taking their first sips.

For Mi Jiahao, 40, this newfound fame is both amusing and affirming.

WORLD WATCH
By Kin Phea

Partnership on energy now crucial for ASEAN

As strategic rivalries, economic fragmentation and climate pressures fracture global politics, energy security has become one of the most pressing strategic concerns in Southeast Asia. For the region's developing and middle-income nations, energy security is no longer just an economic box to check. It has become a matter of political stability, industrial competitiveness and long-term sovereignty.

This urgency was front and center at the recent meetings of the Association of Southeast Asian Nations in Cebu in the Philippines.

Beyond the diplomatic language, the reality is clear: No country in the Southeast Asia region can handle the current energy chaos alone. Energy markets have become increasingly volatile, while supply chains are heavily affected by geopolitical factors, and the global transition to green energy is increasingly shaped by evolving international dynamics.

Ethnic groups use 'express line' to national lawmakers

Outreach offices empower, improve understanding of people from all walks of life

By **CAO YIN** in Xinjiang
caoyin@chinadaily.com.cn

Officials and villagers gather to discuss local matters and legislative items in Hudiyayuz, a town in the Ili Kazak autonomous prefecture in Xinjiang Uygur autonomous region, on April 28. PROVIDED TO CHINA DAILY

Under the lush canopy of a mulberry tree in a village in the Xinjiang Uygur autonomous region, over 20 villagers from various ethnic backgrounds — including Uygur, Kazak, and Han — gathered this month to chat about local matters over milk tea and *nang* bread.

Leading the discussion was Zhao Jianquan, the village head, who was introducing the newly adopted Ethnic Unity and Progress Promotion Law, which will take effect on July 1.

Zhao recalled how, during a review of the draft law the previous year, villagers had proposed expanding volunteer teams to look after left-behind children, take the elderly to see doctors, and maintain public sanitation. They believed these activities could enhance interaction and mutual support among different ethnic groups in their village.

To their surprise, this simple suggestion from Hudiyayuz, a remote area in the Ili Kazak autonomous prefecture, swiftly reached China's top legislative body through an "express line" and was finally incorporated into the law.

In March, the National People's Congress passed the law, which encourages and supports volunteers and volunteer service organizations in fostering exchanges, cooperation, and mutual assistance among all ethnic groups.

"Our suggestion was adopted nationally and became part of the law. We're proud of this achievement," Zhao said.

The "express line" that carried their suggestion is a legislative outreach office established by the NPC Standing Committee's Legislative Affairs Commission in Hudiyayuz township in July 2022. It is Xinjiang's first national-level outreach office.

Grassroots voices

The legislative outreach office is an initiative launched by the commission in July 2015. It acts as a bridge between the public and lawmakers to effectively solicit a wide range of opinions and suggestions on legislation from all walks of life, putting whole-process people's democracy into practice.

To date, the commission has established 60 such offices across the country, with 16 located in border ethnic regions. Between July 2015 and April 2026, over 77,000 opinions were collected on 224 legislative documents, with nearly 11,000 of those coming from border areas.

Following the establishment of the office in Hudiyayuz, the standing committee of the people's congress in Kuqa, Aksu prefecture, became the second location in Xinjiang to open such an office. Both have played a big role in seeking legislative ideas from the public.

In 2024, Fan Linsong, a 30-year veteran of the energy industry from Xinjiang Kuqa Green Hydrogen Co, saw his suggestion regarding hydrogen energy incorporated into the Energy Law.

After the project began operating in Kuqa in 2023, he realized the significant role hydrogen could play in energy security and low-carbon development. Noticing its absence in the draft law, he suggested that legislators boost the hydrogen industry and increase support for hydrogen technology research.

When the Energy Law took effect in January 2025, he found his advice had been included in provisions encouraging the development, utilization, research and storage of hydrogen-related technology and equipment.

"This was a huge encouragement for me and my team," he said, adding that he plans to continue sharing new ideas through the office to ensure that policies and laws better support industrial development.

The national-level outreach office model is being replicated in local legislation as well. The standing committee of the Xinjiang people's congress has expanded the initiative by establishing similar offices in subdistricts, industrial zones, and communities. This expansion has helped gather input from a broader range of people during the formulation and revision of local regulations.

Left: Officials listen to suggestions at a hospital in Kuqa, Aksu prefecture, on April 30. **Right:** Legislative information collectors consult with residents at a villager's home in Isihara town in Kuqa on Feb 6. PHOTOS PROVIDED TO CHINA DAILY

Kuqa resident Zulpikar Amar submitted a suggestion through the local outreach office while attending a community seminar in late 2025. He called for streamlining the approval process for housing maintenance funds needed for emergency repairs for burst pipes, elevator breakdowns, and fire equipment damage. He said such procedures were often delayed due to unclear timelines, which frustrated property managers.

"I was just highlighting work problems during the meeting never expecting it would lead to change," he said. "I was pleasantly surprised when the revised regulation in May incorporated my suggestion, clearly listing emergency situations and setting defined review timelines."

Under the amended local regulation, maintenance fund officials are required to review applications within two working days and release funds promptly if conditions are met.

"I never imagined that someone like me could have my voice heard by lawmakers, let alone see my first suggestion included in a regulation," he added. "It's reassuring to see democracy in action where I live."

> "I never imagined that someone like me could have my voice heard by lawmakers, let alone see my first suggestion included in a regulation."
>

Unifying legislation

Ye Jianxun, deputy head of the legislative affairs commission of the standing committee of Xinjiang people's congress, said outreach offices in border ethnic regions are instrumental in fostering a strong sense of community.

Adil Rehmet, an official from Qiman township in Kuqa, said information collection stations have been established in many villages to teach residents how to provide suggestions through the Kuqa outreach office, and improve officials' understanding of grassroots concerns.

In Baiyang village, for example, efforts to make legislative participation more accessible include posting draft laws in plain language and organizing discussions on legal issues relevant to villagers, such as land transfers, and marriage and family matters. In addition, QR codes and phone numbers of officials are made public to enable villagers to report urgent problems at any time.

"These measures break down barriers, making it easier for people — especially those from minority ethnic groups who are not proficient in *Putonghua*, or standard spoken and written Chinese, to provide suggestions, thereby protecting their right to be informed about the law and to express their views," Adil said.

This process unites all ethnic groups and strengthens the "community spirit of the Chinese nation", he added. "As an ethnic minority official who was raised here, I believe ethnic unity is key to ensuring long-term stability and prosperity," Adil said.

Zamira Hopurjan, an outreach officer from a multi-ethnic tourism village in Ili, led left-behind women in establishing a tea factory after discovering their eagerness to start businesses. Now, 44 women work at the factory, learning new skills and earning an income.

"Outreach offices provide a platform for me to better understand local people's needs and fulfill their aspirations for a better life," Zamira said. The Ethnic Unity and Progress Promotion Law will encourage local governments to take employment and entrepreneurship measures to promote ethnic integration, she said.

"Our experience has been workable. I believe more people will contribute to strengthening ethnic unity, and their lawful rights will be better protected," she added.

Mirigul Memet, a judge from Shuimogou District People's Court in Urumqi, the capital of Xinjiang, has integrated legislative consultation with legal education in her work.

To help implement the Law on Standard Spoken and Written Chinese Language, she conducted community and school lectures using real-life cases to explain how standard Chinese enhances exchanges, job opportunities, and shared development. She also patiently listened to people's expectations regarding language, culture, public services, and rights protection that were relayed through an outreach office.

In her courtroom, she upholds the principle of equal protection for all ethnic groups, and focuses on strengthening ethnic unity while handling disputes.

Last year, when reviewing the draft law on ethnic unity and progress promotion, she suggested schools integrate fostering "a sense of community for the Chinese nation" into classroom teaching and social practices, which was ultimately incorporated into the final version of the law.

"Teenage years are critical for shaping values and national identity. It's essential that fostering a sense of community starts from childhood," she stressed. "Schools should introduce the ethnic unity law in ways that children can easily understand, thereby helping to enhance their legal awareness."

She highlighted the significant role of the rule of law, adding, "I will continue to be a guardian of the rule of law for ethnic unity."

Spreading awareness

While encouraging people to participate in legislation through outreach offices across the autonomous region, Xinjiang has also stepped up efforts to use these sites to provide legal education.

At a night school for farmers and herders in a Kuqa village, training sessions are held every Monday, Tuesday and Thursday. Village head Gulpiya Turdi said the classes are determined on standard Chinese proficiency. Each two-hour class includes one hour of *Putonghua* learning, and one hour of legal education.

She said most villagers are from ethnic minorities, with some participants older and others less educated.

"Combining language learning with legal cultivation fits their needs and makes laws more relatable," Gulpiya said. "Only when they understand what the law means can they offer targeted suggestions, leading to better law-based governance."

Ma Ziyang, head of Guangming community in Kuqa, agrees with this approach.

"Law is not just text — it is a pillar that solves problems. Only when legislation directly addresses people's real needs can it be effectively implemented," he said.

Ma, a former police officer, uses real-life scenarios — such as flight delays, school bullying, and self-defense — to explain legislation such as the Civil Aviation Law and the Public Security Administration Punishment Law to residents.

He also conveys the public's concerns through the Kuqa outreach office, contributing to legislative changes. This establishes a positive cycle of effective legal education and responsive lawmaking.

In Horgos, a city at the forefront of China's westward opening-up, collecting input on legislation is also progressing in an orderly manner, supporting both grassroots governance and opening-up.

The standing committee of the city's people's congress brought together 84 people — including law enforcement officials, legal professionals, residents and business representatives — to form a legislative input collection team. The team also integrated legislative consultation with foreign-related legal services.

Zhu Xuejie, a lawyer from Horgos, said she and other collectors concentrated on common legal issues related to contracts, labor and foreign trade. This helped introduce laws to people, with legal services also provided for enterprises aiming to go global.

"Our efforts are focused on promoting Xinjiang's high-level opening-up and improving grassroots governance of foreign-related disputes by strengthening the prevention and resolution of conflicts at their source," Zhu said.

Ye, the deputy head of the legislative affairs commission, said that outreach offices and information collection stations in Xinjiang serve not only to widely gather public opinions, but also to enhance legal awareness among the populace. "Only when legislators and ordinary people move toward each other can we better protect people's rights and ensure that law-based governance takes root at the grassroots level," he said.

Milestone reached in quantum computing

By **ZHU LIXIN** in Hefei
and **LIU BOQIAN** in Guiyang

A new photonic quantum computer has begun formal operation in China and has been connected to China Telecom's Tianyan quantum cloud platform, making it accessible online to researchers and developers worldwide, China Telecom Quantum Group said on Monday.

The Tianyan-P2000 photonic quantum computer was jointly built by the group and Jiuzhang (Jinan) Quantum Technology Co, under the guidance of the Chinese Academy of Sciences' Center for Excellence in Quantum Information and Quantum Physics.

"With Tianyan-P2000 online, our platform has become the world's first cloud platform capable of providing quantum advantage services through both photonic and superconducting technologies," said Huang Wenya, a senior product manager of the Tianyan quantum cloud platform.

With the new system, China now offers the country's first online quantum advantage service through a photonic quantum computer, she added.

According to Liu Chunwang, a quantum control engineer at China Telecom Quantum Group, photonic quantum computing can operate at room temperature, a key advantage over superconducting systems, which require extreme cold.

It also offers longer coherence times, has lower noise and operating costs, and can directly interface with existing fiber-optic and quantum communication networks, Liu said.

Coherence time is the duration over which a qubit, the fundamental unit of information in quantum computing, retains its quantum properties, and noise refers to various factors that can affect the accuracy of calculations.

China Telecom Quantum Group said that the system can control 2,682 photons, a key metric of its computational capability. In a benchmark test of quantum computing performance, the device completed a high-complexity computation in just 29 microseconds — a task far beyond the reach of classical supercomputers, which would take an estimated 16 billion years to complete.

According to a simplified explanation by China Science Communication, a national science literacy platform of the China Association for Science and Technology, classical computers process one possibility at a time, while quantum computers can explore many possibilities simultaneously, enabling them to solve certain problems much faster.

The launch of Tianyan-P2000 follows a recent breakthrough by Chinese researchers. In May, a team led by the University of Science and Technology of China published results in Nature magazine on Jiuzhang 4.0, a photonic quantum computing prototype demonstrating a milestone in quantum computing by outperforming classical computers in a specific task. Tianyan-P2000 is based on the same core architecture as Jiuzhang 4.0, developers said.

Tianyan-P2000 now provides computing resources to research institutes, universities and businesses. The platform has launched applications in graph data analysis, drug discovery, spectral computation and machine vision.

The group said the platform has recorded over 50 million visits, processed more than 4 million experimental tasks and served users in more than 60 countries and regions.

Zheng Jinran in Beijing contributed to this story.

Running from Tuesday to Thursday, the event has drawn more than 1,700 participants from over 90 countries and regions. HAN HE / XINHUA

China's growth outlook draws global confidence

Country's vast, dynamic market creates fresh opportunities for businesses, experts say

By **ZHANG CHENXU** in Dalian and **ZHOU LANXU** and **ZHONG NAN** in Beijing

Global executives and leading economists voiced confidence in China's economic resilience and long-term prospects on Tuesday, citing strong momentum in high-tech sectors, continuing economic rebalancing and strong policy support, as the country's stable growth outlook drew renewed attention amid rising external uncertainties.

They made the remarks at the ongoing 17th Annual Meeting of the New Champions of the World Economic Forum, also known as the Summer Davos forum, held under the theme "Innovating at Scale" in Dalian, Liaoning province.

Despite external headwinds, they said China's vast and dynamic market, along with vibrant technological and industrial innovation, is creating fresh opportunities for global businesses and injecting new momentum into global growth.

Yin Zheng, executive vice-president of China and East Asia operations at French industrial conglomerate Schneider Electric, said that advanced technologies, including artificial intelligence, are accelerating the world's transition toward a more digitalized and intelligent era.

"China, as a major engine of global growth and an important technology hub, is becoming a fertile ground for global innovations," Yin said, adding that the country is further strengthening its advantages across industrial and innovation systems.

Jiang Ying, chair of Deloitte China, said China's complete industrial system, resilient economic fundamentals and continued high-level opening-up remain key pillars underpinning the country's long-term growth.

She said that emerging sectors such as AI and the low-altitude economy are poised for further breakthroughs, while the coordinated development of traditional and new growth drivers will help sustain China's economic momentum.

Echoing that view, Ruan Fang, managing director and senior partner at Boston Consulting Group, said that China's most notable growth opportunities lie in advanced manufacturing and AI.

The world's second-largest economy has become a major innovation hub, supported by its huge market, intense competition and fast pace of iteration, she said.

"Many multinational companies choose to stay in China not only for revenue or profits, but also to tap into such innovation — whether in business models, products or AI applications," Ruan added.

Offering a macroeconomic perspective, Huang Yiping, dean of Peking University's National School of Development, struck a similarly optimistic note, saying that despite the challenges facing the Chinese economy, the country has been steadily advancing economic rebalancing, with positive progress already taking shape.

"If you look at the trajectory of the Chinese economy over the past 20 years or more, the macroeconomic structure is much better now," Huang said at a forum during the event.

However, he warned that the rebalancing process remains far from sufficient. "China needs to boost consumption, and it needs to do so in a more proactive way," Huang said.

The broader confidence in China's outlook came as global financial markets faced renewed uncertainty, with expectations of possible interest rate hikes by the United States Federal Reserve adding to concerns over market volatility and cross-border capital flows.

According to Reuters, BofA Global Research, the research arm of Bank of America, and Deutsche Bank now expect the US Federal Reserve to raise interest rates in 2026, marking a departure from prior forecasts of steady rates.

BofA said on Monday that it expects the US central bank to raise rates by 25 basis points each in September, October and December, while Deutsche Bank, in a note dated June 19, forecast two 25-basis-point hikes this year — one in September and another in December.

Shi Kang, chair professor at Tsinghua University's PBC School of Finance, said at an earlier forum in Beijing that if expectations of further US rate hikes become increasingly entrenched, US capital markets may face a significant adjustment, which could send shocks across the global economy.

"At such a time, a stable renminbi could provide valuable support for global liquidity," Shi said.

He said that amid inflationary pressure, the US has limited policy room to absorb such shocks, given its high debt levels and already elevated interest rates, adding that global markets need more sources of financial stability.

Yang Chang, an analyst at Zhongtai Securities, said that China's monetary policy has long adhered to the principle of being mainly guided by domestic conditions, and the People's Bank of China, the country's central bank, still has room to maintain reasonably ample liquidity through targeted and flexible policy operations.

Dish: Soup's taste 'peculiar' but 'refreshing'

From page 1

Mi has been drinking Su-style mung bean soup since he was 4.

"Every summer, as soon as it got hot, my parents would make it," he recalled. "It's just what we do in Suzhou."

When out-of-town friends visit, Mi always takes them to try it.

Their first reaction is often bewilderment.

"They say it tastes like toothpaste water, but for us, this is what summer tastes like," he said, laughing.

Most come around, he added. "Even with all the jokes online, they actually end up liking it. It's more of a friendly jibe than a real complaint."

For Mi, the drink's popularity is a welcome development. "The shops are still making it the traditional way," he noted.

"And for visitors, it's a way to connect with Suzhou's food culture — to feel like they've arrived."

On a hot day, the ritual is simple.

You stir the glass, mixing the minty water with the ingredients resting at the bottom, Mi said. Then you sip — the mint hits first, sharp and cooling — then you crunch on a piece of candied winter melon, followed by the soft chewiness of steamed glutinous rice. "It is refreshing, complex and undeniably peculiar," he said.

Energy: Regional policy has to be flexible, pragmatic

From page 1

The challenge for ASEAN lies in the fact that it is far from a monolith. This divide has created very different energy realities across the region. On the one side are the resource-rich exporters, with large natural energy reserves and the economic flexibility to move more quickly toward a green transition. On the other side sit the fuel-dependent importers, nations that are heavily tied to fossil fuels just to sustain basic economic growth and are highly vulnerable to fluctuations in global energy prices. Because of these massive internal disparities, any regional energy policy has to be flexible and highly pragmatic, not bound by rigid Western or global ideologies.

To be fair, ASEAN has built solid foundations. Initiatives like the ASEAN Power Grid, the Trans-ASEAN Gas Pipeline and the ASEAN Plan of Action for Energy Cooperation are vital, as are high-level platforms like the ASEAN Ministers on Energy Meeting and the East Asia Summit. But these shouldn't be viewed merely as technical achievements; they are important safeguards against external economic shocks.

Yet external pressures are mounting. Developing countries are under growing pressure from international demands to decarbonize overnight, without fully considering local developmental constraints and economic realities. For a country like Cambodia, this creates a difficult policy dilemma. The green transition is necessary, but moving too quickly carries serious economic risks. If the transition is rushed, production costs will soar, industries will lose their competitive edge, and poverty reduction efforts — the very core of national development — will stall.

This is exactly why the Global South is raising concerns over one-size-fits-all climate requirements. True sustainability is impossible without recognizing that different nations have entirely different capacities. For developing states, energy security and national development are fundamentally inseparable — a successful green transition is difficult to achieve without a stable economic foundation.

This is where the partnership between China and ASEAN becomes vital. Over the past decade, Beijing has expanded its role significantly in the region's energy sector, anchoring everything from Mekong hydropower and solar farms to electric vehicle supply chains and smart grids.

At its core, this partnership focuses on genuine multilateralism, consultation and respect for different national conditions — principles that are particularly urgent in a sector where long-term stability is paramount. In practical terms, it means turning political commitments into practical initiatives to strengthen emergency response coordination, improve technology-sharing transparency, expand green financing, and standardize cross-border connectivity. If ASEAN hopes to navigate this transition without breaking its supply chains or choking economic growth, this level of regional coordination will become increasingly important.

But this level of coordination cannot just exist on paper; it must be proved on the ground. Infrastructure projects should be judged by their actual utility and practical outcomes, not their political symbolism.

This is precisely why long-term cooperation will only survive if it is approached with genuine pragmatism and mutual sensitivity rather than geopolitical grandstanding. Energy security should never become a mere extension of major-power competition.

However, building physical infrastructure is only half the battle. Infrastructure alone will not be enough without skilled human resources and institutional capacity. Southeast Asia is facing a serious deficit in the technical expertise, regulatory capacity and institutional resilience required to manage these increasingly complex energy systems over the long term. This operational challenge is made even more difficult because energy security can no longer be viewed in isolation. It is now closely linked to maritime security, digital infrastructure, critical supply chains and technological governance.

Ultimately, energy cooperation between China and ASEAN is about far more than electricity generation, trade flows or infrastructure financing. It is a defining test of whether the region can preserve stability and sustain economic progress during a period of intense global uncertainties.

For developing nations, reliable and affordable energy remains the bedrock of social stability and economic opportunity. In an increasingly polarized world, Southeast Asia's resilience will not be built on exclusionary blocs or ideological confrontations. It will depend largely on deep regional connectivity, practical regional cooperation and the ability of regional actors to navigate major-power dynamics with caution, balance and careful strategic judgment.

Heightened vigilance

A security guard uses a metal detector to inspect students' bags as they enter a school in Quezon City, the Philippines, on Tuesday, a day after at least three students were killed and seven others were injured in a school shooting in Tacloban City in the central Philippines. Authorities said two suspects, aged 15 and 14, were arrested, and investigations are underway. NOEL CELIS / REUTERS

Security: Improving governance in emerging areas highlighted

From page 1

He urged BRICS countries to contribute their wisdom to improving governance in emerging areas by guarding against artificial intelligence risks, guiding the sound development of AI, and supporting the UN as the main channel for advancing global governance of cyberspace and digital affairs.

The meeting reviewed the outcomes of BRICS working group meetings on counterterrorism and cybersecurity.

Wang said that BRICS countries are all victims of terrorism and should strengthen counterterrorism cooperation, make full use of the working group mechanism, deepen intelligence sharing, operational coordination and exchanges of experience, and promote the full implementation of the UN Global Counter-Terrorism Strategy.

On cybersecurity, Wang called on BRICS countries to jointly uphold international rules in cyberspace, oppose the creation of artificial divisions and confrontation, encourage countries to sign and ratify the UN Convention against Cybercrime as soon as possible, and actively participate in the international alliance against telecom and online fraud.

The vitality of BRICS lies in equality and mutual benefit, and its strength lies in solidarity and mutual support, Wang said, adding that China, which will assume the BRICS rotating presidency next year, is ready to work with BRICS partners to implement the four China-proposed global initiatives and jointly open up a future of peace and prosperity.

Participants said that amid the impact of unilateralism and rising global uncertainty, BRICS countries should uphold mutual respect, work together to address traditional and nontraditional security challenges, and firmly safeguard the common interests of the Global South.

Iran, US peace talks advance with progress

Technical negotiations see establishment of groups for nuclear issues and sanctions

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Progress appears to be holding in the technical talks between the United States and Iran in Switzerland, with the establishment of four working groups to oversee the implementation of the mechanisms of their interim peace agreement, according to Iranian Deputy Foreign Minister Kazem Gharibabadi.

Gharibabadi, head of Iran's technical negotiating team, said an agreement was reached on several key measures by the high-level follow-up committee on the Islamabad Memorandum of Understanding, which met from Sunday into the early hours of Monday.

The Iranian official is among those remaining in Switzerland after four-party talks between Iran, the US, Pakistan, and Qatar to continue negotiations, which are expected to last a week.

According to a report by Iran's Mehr News, four working groups will be formed for sanctions termination, nuclear issues, reconstruction and economic development, and monitoring and implementation.

Future negotiations will then be conducted by a high-level committee.

Oman and Iran will form a team to reach an agreement on "administration of navigation in the Strait of Hormuz" and associated costs and services, they said in a joint statement on Tuesday. The two states will hold talks with coastal countries and other concerned parties, the statement said.

Apart from the communication line to be established among the MoU's member states for the safe passage of commercial ships through the Strait of Hormuz, a conflict prevention unit for Lebanon is also to be created, with Pakistani and Qatari participation.

Meanwhile, Gharibabadi confirmed the US would issue a general license for the sale of Iranian oil, petrochemicals, petroleum products, and related services. This will be published by the Office of Foreign Assets Control, which administers and enforces US economic sanctions programs.

In Pakistan, Iran's President Masoud Pezeshkian arrived in Islamabad on Tuesday for talks with officials who have been mediating the negotiations.

In the US, President Donald Trump said on Tuesday that Iran has "fully and completely agreed" to allow nuclear inspectors to return to the country.

"Iran has fully and completely agreed to highest level Nuclear inspections long into the future," Trump posted on his Truth Social platform, adding that bilateral negotiations are "going well".

However, at a news conference in Tehran on Tuesday, Iranian Foreign Ministry spokesman Esmaeil Baghaei said Iran's delegation in Switzerland did not meet with IAEA chief Rafael Grossi.

Baghaei said there was no clear schedule for the IAEA to examine the Iranian nuclear facilities.

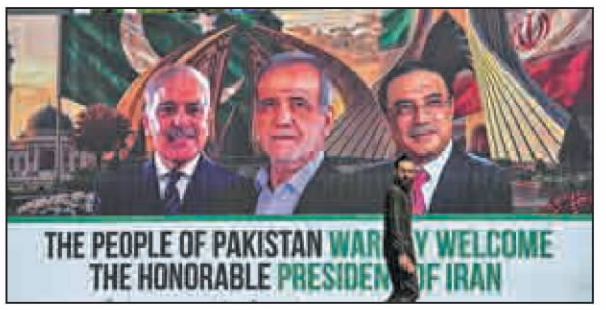
Trump also said on Tuesday that any Iranian funds unfrozen through sanctions relief or released by the US Treasury would go into a Washington-controlled escrow account, which Tehran could tap to purchase US food and medical supplies.

Frozen assets

Baghaei earlier said Iran would spend its released frozen assets as it sees fit following the US government's remarks.

Abdul Wahed Jalal Nori, a lecturer in the Department of Fundamental and Inter-Disciplinary Studies at the International Islamic University Malaysia, told China Daily that the "institutionalization of dialogue suggests both sides are testing a pathway from confrontation to managed coexistence".

Abdul Wahed said the latest agreement addresses symptoms rather than root causes.



"While sanctions relief and safeguards around the Strait of Hormuz reduce immediate tensions, the fundamental disputes over Iran's regional influence, proxy networks, and the regional security architecture remain unresolved," he said.

Abdul Wahed noted that the real test is whether this evolves into a sustainable political framework or becomes another temporary pause before the next cycle of escalation.

"Neither Washington nor Iran wanted a full-scale war; each wanted leverage. What emerged is not trust, but a pragmatic arrangement driven by mutual exhaustion and the recognition that escalation was becoming too costly," he said.

Agencies contributed to this story.

Security Council to protect peacekeepers

By **MINLU ZHANG** at the United Nations
minluzhang@chinadailyusa.com

The UN Security Council on Tuesday unanimously adopted a resolution calling for strengthened accountability for crimes committed against United Nations peacekeepers.

The resolution was jointly drafted by Pakistan and Denmark and gained 153 co-sponsors.

Speaking after the vote, Sun Lei, China's deputy permanent representative to the United Nations, welcomed the adoption of the resolution, saying UN peacekeeping operations are an important instrument for maintaining international peace and security.

Sun said peacekeepers are facing serious traditional and non-traditional security threats amid a complex international security environment. Recent attacks causing casualties among peacekeepers have shown the need for further Security Council action, especially as progress in investigations and accountability has been inadequate, he said.

One Serbian UN peacekeeper was killed in an attack in southern Lebanon earlier this month, while two peacekeepers from the UN Interim Force in Lebanon (UNIFIL), from El Salvador and Spain, were injured.

According to the UN, the latest death raised the number of UN peacekeepers killed in the region to seven since Israel resumed "targeted" ground operations against Hezbollah in southern Lebanon in early March.

"Deliberate attacks against peacekeepers violate international humanitarian law and relevant Security Council resolutions," Sun said, adding that China supports the implementation of the resolution and hopes it will help strengthen the safety of peacekeepers and accountability for perpetrators.

China pays tribute to all UN personnel serving in peacekeeping operations and to those who lost their lives in the cause of peace, Sun said.

China is the second-largest contributor to the UN peacekeeping budget and the largest troop-contributing country among the permanent members of the Security Council, Sun said.

China has dispatched more than 50,000 peacekeepers to 29 UN peacekeeping operations authorized by the Security Council, established an 8,000-member peacekeeping standby force and formed a standing peacekeeping police squad.

More than 20 Chinese peacekeepers have died while serving in UN peacekeeping missions, including one female peacekeeping police officer, he said.

According to the United Nations, more than 4,500 UN peacekeepers have lost their lives in the line of duty since UN peacekeeping operations began in 1948.

Pakistan's permanent representative to the United Nations, Asim Iftikhar Ahmad, said attacks against UN peacekeepers across several missions have increased in number and sophistication.

"Peacekeepers are being targeted, often with little accountability," he said, adding that the draft resolution seeks to move the Council beyond statements condemning such attacks.

Resolution 2823 requests the UN secretary-general to report annually to the Security Council on the status of investigations and prosecutions in cases involving the killing of, and acts of violence against, UN personnel serving in peacekeeping operations.

It also requests the secretary-general to provide, within 120 days, options on ways to strengthen the accountability framework for crimes against peacekeepers.

Ahmad said the measures would "help the Council assess what is working, where gaps remain and what further action may be required".

The vote came as the inaugural UN Peacebuilding Week is being held at UN Headquarters in New York from Monday to Friday.

Chinese ambassador refutes Panama accusations

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

Xie Feng, Chinese ambassador and permanent observer to the OAS, refuted Panamanian accusations about inspections on incoming vessels at Chinese ports.

While attending the Dialogue with Permanent Observers of the Organization of American States in Panama on Tuesday, Xie said that since the start of 2026, Panama-flagged ships have been involved in several collisions between merchant or fishing vessels in Chinese waters, resulting in a number of people killed and missing.

Out of a sense of responsibility for maritime safety, Xie said, China has conducted port state control inspections on incoming vessels in accordance with Chinese laws and international conventions, according to a statement released by the Chinese Embassy.

Panama had complained recently about an increase in inspections of Panamanian-flagged vessels that it alleged were being detained in Chinese ports, which it suggested was linked to a dispute over operations at the Panama Canal.

Over the past three decades, cooperation between the two sides regarding the canal had been smooth, with no major disagreements, and no complaints raised about the Chinese enterprise, CK Hutchison, that had operated the ports at both ends of the Panama Canal. Unfortunately, the Supreme Court of Panama issued a ruling in January stating that Chinese control of the ports was unconstitutional, and voided CK Hutchison's license to operate the ports.

The court transferred interim operations of the ports to A.P. Moller-Maersk and Mediterranean Shipping Co.

CK Hutchison said that it "strongly disagrees with the determination" and had taken case to international arbitration.

"Anyone clear-eyed can see this is politically driven. If contracts could be disregarded, market principles ignored, assets taken over and operators forced out at any time, who would have the confidence to invest and seek cooperation?" Xie asked, according to the statement.

About 5 percent of world maritime trade and 40 percent of US container traffic pass through the Panama Canal.

Last year, CK Hutchison negotiated a $2.3 billion sale of its non-port assets to a consortium led by BlackRock. That decision followed threats from the US government that the United States would seize control of the canal if the Chinese company continued to operate it.

Scott Kennedy, a senior advisor at the Center for Strategic and International Studies, told CNBC that it appeared to be "a simple contest for dominance in Latin America", with the US trying to push against Chinese trade interests.

"The most likely scenario is a drawn-out legal fight in multiple jurisdictions, along with substantial political and economic pressure imposed by both Beijing and Washington," Kennedy told CNBC.

Xie urged the Panamanian side to correct its mistakes and protect the legitimate and lawful rights and interests of Chinese businesses, the Embassy statement said.

Extreme heat, storms cause chaos in Europe

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

Two children aged two and four are among 18 people who have died so far in a heat wave across France, as large parts of Europe struggle to deal with record-breaking summer temperatures.

Helene Mourges, the prosecutor of the southeastern French town of Carpentras, where the children were reportedly found in a family car, told reporters, "the causes of death are yet to be determined, but the heat is the leading line of inquiry".

Three elderly people in the Bordeaux region died over the weekend from health issues related to the extreme heat. In addition, the BBC reported that 20 people had died by drowning from the start of the weekend to Tuesday morning, as they became increasingly desperate for ways to escape the extreme conditions, as the heat wave known as an Omega block, because of its similarity in shape to the Greek letter, continues to draw up warm air from the Sahara desert with no wind to provide any respite.

The World Meteorological Organization's European State of the Climate 2025 report, published in April this year, showed that at least 95 percent of Europe experienced above-average annual temperatures in 2025, with the annual sea surface temperature for Europe being the highest ever recorded, and that as a whole, Europe is warming at more than double the global rate, a stark message that is being reinforced by current weather conditions.

In the northern Spanish city of San Sebastian, traditionally one of the country's cooler regions, Reuters reported that on Tuesday the temperature was set to reach 40 degrees Celsius, more than twice the city's historical average for the date.

"We are seeing temperatures between five and 10 degrees above normal for this time of year, and in some northern areas even more than 10 degrees above average," said Ruben del Campo, spokesman for Spain's State Meteorological Agency.

Heat wave red alerts were issued in 12 cities across Italy, with reports of faltering power supplies in the northern city of Turin, because of strain on the grid, and similar warnings were issued in Germany, Switzerland and Luxembourg.

In the United Kingdom, temperatures are on course to exceed those recorded in the summer of 1976, the benchmark against which all extreme temperatures are popularly measured. Tuesday was predicted to be the hottest day on record in London, and storms and torrential rain overnight saw firefighters in the capital take 400 calls after midnight.

Xizang acts to clean up environment

Autonomous region of Southwest China presents achievements that have won it national recognition in recent years

By **YUAN SHENGGAO**

With an emphasis on environmental protection, the Xizang autonomous region in Southwest China is well on track to become a highland for ecological civilization.

Xizang's office for the construction of a national ecological civilization highland released a report in February on the autonomous region's achievements in environmental protection. The report, consisting of 38 indexes, showed that Xizang has 21 indexes ranking among the leading levels and nine indexes ranking first in the nation.

The report said that the nine top-ranking indexes included air quality, water quality, wetland protection and the ratio of clean energy in power generation.

In the process of building a national highland for ecological civilization, Xizang has presented a number of cases that have won nationwide recognition.

Greening project

Drolma is a resident in Lhasa's Chengguan district. When seeing lush vegetation on the hillsides of Nanbeishan — or the South and North Mountains, she always thinks of her late father.

"My father was a forestry worker who took part in the early phase of the Nanbeishan Greening Project," Drolma said. "He planted the seedlings of trees on the barren hills several years ago. He would be very proud if he had survived to see this surprising transformation."

Xizang kicked off the large-scale Nanbeishan Greening Project in 2021. It is a large-scale ecological restoration effort and a key livelihood project aimed at improving the well-being of residents.

The project aims to expand the green coverage in Lhasa and its surroundings by afforesting more than 137,333 hectares of barren mountains by 2030, mainly covering 35 townships in nine counties and districts in the cities of Lhasa and Lhokha.

Over the past five years, trees have been planted on an area of 73,900 hectares, with a survival rate surpassing 85 percent.

The Nanbeishan Greening Project is only one of the examples of Xizang's efforts in green development. Latest statistics show that the autonomous region's grassland coverage has reached 50 percent of its total land area. Its soil and water conservation rate has been kept at 92.27 percent, basically solving the problem of soil erosion.

It is worth mentioning that Xizang has put more than 50 percent of its land in the ecological protection red line. As a result, the autonomous region has seen a steady recovery of its plateau ecological system, featuring 246 rare animal species and 169 rare plant species on the national list of key protection.

The construction of a highland for ecological civilization has also brought benefits to local economic development, as Xizang is trying to balance growth and ecological protection and turning its environmental advantages into a driver for high-quality development.

Sustainable growth

During the 14th Five-Year Plan (2021-25), Xizang had been one of the national leaders in terms of economic growth, with its GDP growth rates ranking first for several years.

It is noteworthy that the growth was achieved in a sustainable manner, instead of at the cost of the environment.

In Xizang, the energy consumption per unit of GDP has been lower than the national average over recent years.

Its per capita carbon emissions have been only half the national average. Nonfossil fuels account for more than 50 percent of total energy consumption, nearly 30 percentage points higher than the national average.

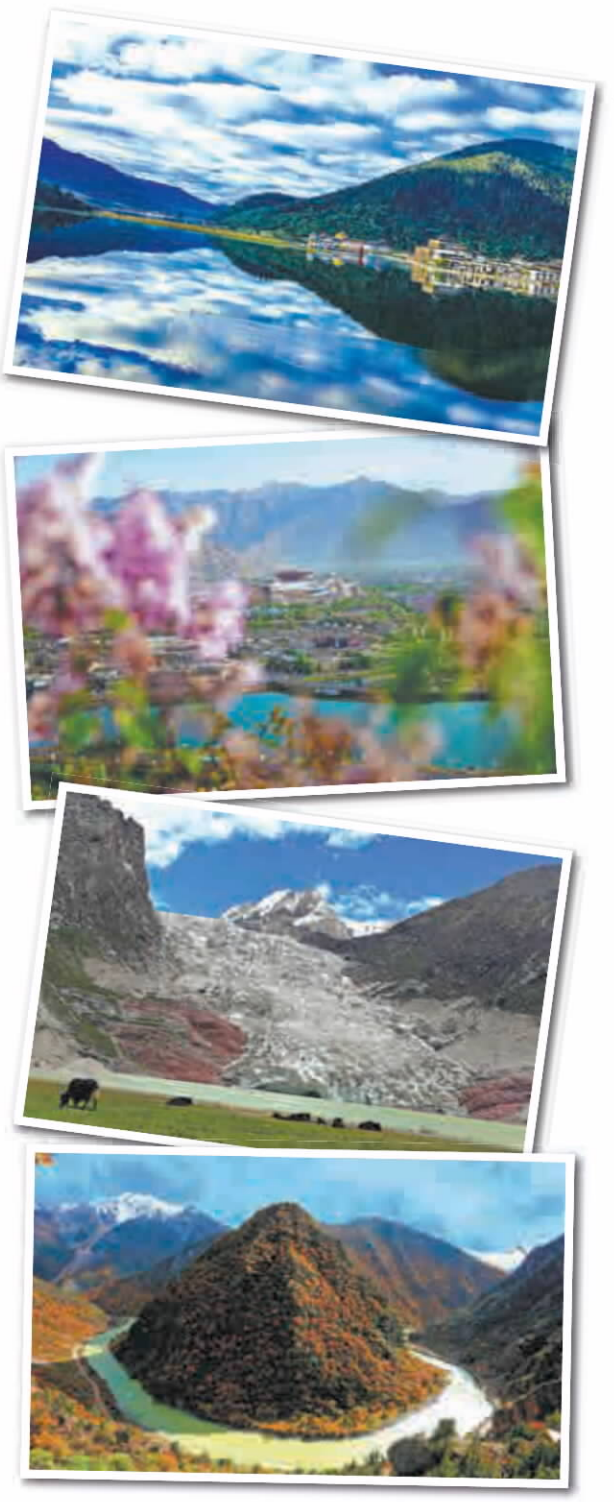
The CRRC Lhokha Clean Energy Equipment Industrial Park in Dranang county, Lhokha, for instance, is the first clean energy equipment manufacturing base in Xizang.

"Our core operations are to develop equipment for plateau clean energy development, supporting the green and low-carbon growth of Xizang," said Zou Wenchao, a production manager at the facility.

By June 2025, the industrial park secured orders worth 600 million yuan ($88.8 million), with equipment delivered to key energy projects on the Qinghai-Tibet Plateau.

Xizang has seen strong momentum in the development of the clean energy industry. By the end of 2025, the installed capacity of clean energy projects in Xizang, either completed or under construction, reached 33 million kilowatts. In 2024, more than 99 percent of the electricity in Xizang was produced by clean-energy power facilities.

Benefiting residents



In Xizang, ecological protection initiatives are generating substantial benefits for local residents.

The Nanbeishan Greening Project, for instance, has brought revenue worth 2.55 billion yuan to residents via the purchase of tree seedlings from farmers and the creation of forestry-related jobs.

In Metog county in Nyingchi city, the good environment has led to the booming development of ecotourism and farming of tea and other cash crops, bringing new revenue streams to residents.

Gede township, for instance, is an emerging tea production base in the county, producing leaves under the geographical indication of "Metog Tea".

Local farmer Pema Dechen operates a nearly 2-hectare tea farm in the township. "Last year, my family earned more than 70,000 yuan from tea farming," he said. "That was a big addition to our income."

From top: Known for its clean environment, Lunang town in Nyingchi is an emerging tourist destination. PROVIDED TO CHINA DAILY The city of Lhasa viewed from the lushly vegetated Nanshan Mountain. TENZIN NYIDA / XINHUA Cattle graze on a grassland near a glacier in Sog county. PROVIDED TO CHINA DAILY The dense forest lining the Yi'ong Zangbo River in Lhari county makes it one of the most beautiful valleys in China. PROVIDED TO CHINA DAILY

Ecotourism is benefiting more than 300,000 rural residents in Xizang as a whole, according to the region's tourism authorities.

In the autonomous region, more rural residents are benefiting from environmental protection because of an ecological compensation mechanism and the creation of environmental protection-related jobs.

Lhundrup, a farmer in Gar county, Ngari prefecture, is a protection worker for a willow forest near the county seat.

With an altitude of more than 4,200 meters, the area was once regarded as "a forbidden land for trees", according to Lhundrup.

"After more than a decade of efforts, we now boast a forest of several hundred hectares," he said. "We are proud that it offers an ecological barrier for our county and a source of revenue for locals."

According to the Xizang Department of Ecology and Environment, the autonomous region has provided more than 440,000 environmental protection-related jobs to local farmers and herders each year during the 14th Five-Year Plan. In addition, it has offered about 17.1 billion yuan as ecological compensation to rural residents.

The improved ecological environment has also created better living conditions for residents.

The department's statistics show that, in recent years, good or excellent air quality has been reported for more than 99 percent of the days in a year in Xizang. Also, the water quality of major rivers such as Yarlung Zangbo and Nujiang has reached the nation's second-class level or better.

Joint efforts

Various regions in Xizang and government bodies at different levels are contributing their efforts to the construction of a national highland for ecological civilization.

During a recent meeting hosted by the Xizang Department of Ecology and Environment, Zhao Shidong, vice-mayor of Lhasa, talked about the city's practices in environmental protection.

"Centering on the general goals of building a national highland for ecological civilization, Lhasa city has more than 10 regulations and policy measures in place to guide our environmental protection efforts," Zhao said.

The official added that the city had invested more than 16.7 billion yuan for green development during the 14th Five-Year Plan, mainly in the areas of emission and pollution reduction, greening, and balancing development between the economy and environment.

"We are aiming for an ecology-prioritized, green development path with plateau characteristics and in accordance with Lhasa's conditions," Zhao said.

For ecological recovery, Lhasa has implemented a program for the protection of mountains, rivers, forests, farmlands, lakes, grasslands and glaciers.

The program is part of China's Shan-Shui Initiative, which was recognized by the United Nations in 2022 as one of the world's 10 groundbreaking projects known as the World Restoration Flagships. The initiative combines 75 large-scale projects to restore ecosystems, from mountains to coastal estuaries, across the country.

Lhasa's efforts in environmental protection also include the classified treatment of domestic waste, construction of sewage disposal plants and domestic waste incineration power plants, according to Zhao.

The second phase of Lhasa Waste Incineration Power Plant, for instance, became operational in November 2024. "The operation of this power plant means that more than 85 percent of Lhasa's domestic waste can be treated via incineration," Zhao said. "And the facility can also generate 234 million kilowatt-hours of electricity annually."

In the same meeting, Dundrup, deputy chief of the Xizang Department of Culture and Tourism, said the cultural tourism sector is implementing practices to balance ecological protection and industrial development.

The official said the cultural tourism industry is a direct beneficiary of Xizang's practice of ecological civilization and a showcase of the region's achievements in environmental protection.

"We are trying to promote a development pattern that prioritizes protection and highlights sustained, high-quality growth," Dundrup said.

"Based on the principle of strict regulations, we are designing tour options featuring 'low impact on the environment and immersive experience for tourists'. We recommend such tours as hiking, photography and sightseeing for travelers and are restricting the development of large-scale tourism projects."

Meanwhile, officials from other administrative institutions in Xizang introduced their practices to boost ecological civilization during the meeting.

An official from the Xizang Department of Housing and Urban-Rural Development said that the department's emphasis had been placed on waste treatment in both rural and urban areas over recent years.

"A total of 4.6 billion yuan has been invested in domestic sewage and garbage treatment projects during the 14th Five-Year Plan, allowing the full coverage of such facilities in all the cities, counties and districts in Xizang," said the official.

An official from Lhasa Customs said that it has focused on preventing the invasion of alien species to better safeguard local biodiversity and ecological safety.

An official from the Xizang Department of Agriculture and Rural Affairs said that minimizing the use of farming chemicals and fertilizers, protecting the grassland ecology, recovering polluted farmlands and controlling agricultural pollution have topped the department's environmental agenda.

He said more than 26.3 billion yuan was invested in rural environmental protection during the 14th Five-Year Plan.

Editorials

New plan to attract foreign investment reinforces market reality on the ground

This month, China is hosting a succession of international business gatherings that collectively reflect the importance the world's corporate sector attaches to the Chinese market.

The China International Supply Chain Expo, which opened in Beijing on Monday, has attracted some 700 major companies and industry groups from 85 countries, regions and international organizations. In Dalian, Liaoning province, the ongoing Summer Davos has drawn over 1,700 global executives, researchers and policymakers from more than 90 countries and regions. And in Qingdao, Shandong province, the Qingdao Multinationals Summit recently wrapped up with 357 multinational corporations — 105 of them Fortune Global 500 companies — from 44 countries and regions.

These are not the numbers to expect if global businesses were genuinely preparing to leave China as some allege. Last year, a total of 70,392 new foreign-invested enterprises were established across China, marking a 19.1 percent increase compared with 2024.

The Western claims that China is an "economic threat" — whether "overcapacity", "subsidies", "currency manipulation" or "trade imbalances" — are not new. They are simply recycled in search of listeners. But they have never gained real traction, because China's economic rise has delivered tangible benefits to the world, including developed economies, in the form of stable supply chains, more consumer options and a superlarge market that have created healthy profits for multinationals.

To deflect attention from their own shortcomings in addressing domestic economic challenges in these turbulent times, some Western politicians have resorted to hyping up a "China Shock 2.0" narrative targeting China's "new three" — new energy vehicles, lithium-ion batteries and photovoltaic products.

Yet reality tells a different story — multinationals are still doubling down on their operations in China. The trade data of recent months reinforce this reality. China's foreign trade has continued to demonstrate resilience. Its foreign trade in yuan-denominated terms grew 16.9 percent year-on-year in May. In the process, foreign-invested enterprises remain important contributors to exports, technological innovation and industrial upgrading.

And China's new action plan on foreign investment, rolled out on Monday with fresh incentives for global capital and talent, will only drive a deeper wedge between the China-bashers' rhetoric and the market reality on the ground.

The plan expands market access, addresses practical concerns of international investors and signals that China intends to attract foreign investment through a combination of market size, complete industrial system, good business environment and institutional openness. The plan also calls for faster revisions to regulations governing foreign mergers and acquisitions, smoother cross-border data transfers, stronger support for foreign-funded research and development centers, tax incentives for reinvested profits and enhanced services for major investment projects.

The contradiction between the Western political rhetoric and business reality is getting harder to ignore — especially in the European Union, which is mulling restrictive trade measures against China in the name of boosting its own competitiveness.

EU companies remain deeply embedded in China's industrial ecosystem and European businesses acknowledge the immense cost of "de-risking" from Chinese manufacturing networks. Supply chains built over decades cannot simply be replicated elsewhere by political decree.

The EU says it backs globalization, yet when it comes to China, the bloc acts as if it's a zero-sum game — where China's gain would be Europe's loss. In fact, China-EU economic ties are mutually beneficial. If the China-bashing politicians in Brussels truly want to fix the bloc's competitiveness problem, they should look at home — not cast blame elsewhere.

China's competitive strengths did not emerge from what the China naysayers claim. They stem from innovation, competition and the long-term hard work of the Chinese people. Against this backdrop, reports that Chinese Commerce Minister Wang Wentao is to visit Brussels assume added significance. Both sides have practical incentives to engage in dialogue and continue cooperation.

China's new action plan on foreign investment clearly indicates that the world's second-largest economy welcomes multinational companies by creating new opportunities in finance, health care, education, biotechnology and advanced manufacturing. For global businesses, the choice remains straightforward. Markets, efficiency and growth opportunities matter more than political slogans in some Western capitals. And for all the political noise surrounding "de-risking", the world's boardrooms appear to have already made their decision.

Japan's neo-militarist march continues

In recent weeks, a series of actions by Japan — ranging from provocative military maneuvers and missile deployments to political grandstanding and public displays of militaristic symbols — has proved that the Sanae Takaichi government is resolved to adhere to its dangerous neo-militarist course.

The hyped-up need to respond to the much bandied-about "China threat" was again the pretext for the Japan Self-Defense Forces' participation in the annual "Resolute Dragon 26" joint military exercise with the United States, which began on Saturday in Kyushu and Okinawa. The exercise coincided with reports that the US military plans to deploy the Typhon midrange missile systems in Japan.

When the People's Liberation Army Navy's CNS *Liaoning* aircraft carrier strike group was conducting far-sea training, which concluded on Monday, the strike group had to respond professionally to repeated close-range Japanese harassment.

Showing the lengths that the Takaichi government is going to in pursuing its agenda, at last week's G7 summit in France, Takaichi tried to push for a "joint stockpile" of critical minerals to alleviate the so-called "rare earth shortages" Japan's business and military sectors face. Her aim is to mitigate Japan's self-created predicament by forming a united front against China. However, the initiative met a cold reception and merely served to show her readiness to call white black.

Takaichi's flustered reaction at the G7 summit when the US leader brought up Pearl Harbor for the second time, after first mentioning it during her visit to Washington in March, illustrates that she is not forgetful — she simply wants Japan's unsavory wartime past to evade global scrutiny.

Her government is also attempting to stoke narrow nationalist sentiment at home to rally public support for the resurgence of militarism.

During Japan's match with Tunisia at the 2026 FIFA World Cup at Monterrey Stadium in Guadalupe, Mexico, on Saturday, some Japanese fans repeatedly displayed a "rising sun flag", a symbol of Japanese militarism during World War II.

No wonder, it immediately sparked criticism from China, the Republic of Korea and other victim nations of Japan's aggression in history. Displaying the flag is a flagrant violation of FIFA regulations that explicitly prohibit political, offensive, or discriminatory flags, banners and materials inside World Cup stadiums. The presence of such symbols at an international event points to an alarming degree of "normalization" regarding Japan's historical aggression among some segments of the Japanese public.

Taken together, these actions paint a clear and troubling picture: Japan is pushing forward a multipronged neo-militarist agenda. This is reinforced by its recent drive to expand arms exports, collaborate with Western allies on weapons manufacturing and hike military spending to record levels. Meanwhile, right-wing politicians are intensifying their revisionist campaigns — distorting school textbooks to downplay wartime atrocities and making pilgrimages to the Yasukuni Shrine, a site that shamelessly "glorifies" Japan's war criminals as "national heroes".

These actions are part of a systematic push to undermine Japan's postwar constitutional restraints — driven by right-wing forces' ambitions to transform Japan into a "normal country", if not a fully-fledged war machine.

To that end, they readily paint neighbors, including China, as "security threats", and have even claimed that the Taiwan Strait situation constitutes a "survival-threatening situation" for Japan, one they argue demands an armed response.

The international community cannot afford to overlook the seriousness of this moment. Japan is effectively dusting off the same playbook it used in the lead up to and throughout WWII. The country is fast emerging as a significant danger to regional stability. The historical record of unbridled Japanese militarism is one of devastation. To ensure that history does not repeat itself, the world must stay alert and resolutely push back against these reckless moves.

Song Chen

Opinion Line

BRICS should aim at common, cooperative, sustainable security

As senior officials gathered in New Delhi this week for the 16th Meeting of BRICS National Security Advisors and High Representatives on National Security, an undercurrent was the mounting resolve among developing countries to reject their long-assigned place "on the menu".

Representing nearly half the global population and about 40 percent of the world's GDP, the grouping has evolved from a coordination mechanism for its founding members into one of the most important platforms for the Global South to amplify its voice and influence. Its growing focus on security cooperation indicates that countries long relegated to the margins of global security governance are no longer content to be at someone's mercy.

That broader transformation formed the backdrop to Chinese Foreign Minister Wang Yi's visit to New Delhi for the security meeting.

A series of bilateral meetings Wang had with officials from different countries on the sidelines of the BRICS gathering, including India's National Security Advisor Ajit Doval, Deputy Secretary of Iran's Supreme National Security Council Qadir Nizamipour and South Africa's Minister in the Presidency Khumbudzo Ntshavheni, shows China's commitment to enhancing communication and coordination with the BRICS members.

A common thread ran through those discussions. In a world facing mounting security challenges, closer cooperation and coordination are essential.

BRICS members increasingly see themselves as stakeholders in a multipolar international order. Security should encompass economic resilience, social stability and human well-being.

BRICS therefore serves as a builder of multilateralism at a moment when the practice is under strain. The grouping's appeal lies in its rejection of the old either-or logic that has long dominated geopolitics and its upholding of dialogue instead of confrontation, partnership instead of bloc politics, and cooperation instead of containment. In an age seemingly defined by polarization, such common-sense ideas should prevail.

Just as importantly, BRICS should champion political solutions to international disputes.

Too many crises today are framed through the lens of military options before diplomatic ones have been exhausted. Lasting peace cannot be imposed; it must be negotiated. That requires respecting legitimate security concerns, seeking common ground and refusing to allow disagreements to become permanent barriers.

The larger question hanging over global politics is who gets to write the rules. BRICS is a defender of fairness and justice in a system that was designed without the full participation of developing countries. The grouping advocates a more representative multipolar order and a more inclusive form of globalization — one that reflects today's realities rather than yesterday's hierarchies.

Underlying much of this vision is China's Global Security Initiative, which calls for common, comprehensive, cooperative and sustainable security. Its central premise is difficult to dismiss: in an interconnected world, security cannot be hoarded by a few and denied to the many.

The conversations in New Delhi suggest that, despite the grouping's differences on some issues, its members are increasingly inclined toward a common understanding that BRICS should evolve into a force promoting a more balanced international order through cooperation.

BRICS members should strengthen security cooperation by managing internal security matters effectively and delivering visible results in both traditional security and nontraditional areas such as technology governance and counterterrorism.

The overextension of "security" by some countries, however, is becoming an excuse to weaponize economic and trade policies — a dangerous trend that warrants collective attention.

Security challenges today are inextricably linked — no country can be secure at the expense of another. The only viable path forward is common, comprehensive, cooperative and sustainable security, grounded in respect for sovereignty and a commitment to dialogue over confrontation.

— LI YANG, CHINA DAILY

What They Say

Industrial foundation needs further strengthening

Editor's note: *China is committed to strengthening its industrial foundation in the coming years. Outlook Weekly news magazine spoke to Chen Xuedong, an academician at the Chinese Academy of Engineering, about improving this vital sector. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

While China has made notable progress in strengthening its industrial foundation, several challenges persist. For instance, there is a high dependence on foreign suppliers for core foundational products.

There remains a gap in the quality and reliability of domestically produced foundational products.

Weaknesses in the industrial foundation have restricted enterprises' access to high-end markets, while the technological content and value added of export products remain relatively low, limiting the manufacturing sector's transition toward higher-value activities.

To address these challenges, China should accelerate the upgrading of its industrial foundation, coordinate efforts to advance industrial foundation reengineering and promote major technological equipment development programs.

National science and technology projects should strategically focus on fields such as instrumentation and industrial software. Establishing a competitiveness evaluation system for the country's industrial foundations is crucial, along with forward-looking planning for the foundational products and technologies required by emerging and future industries. In major national plans, breakthroughs in industrial foundation technologies should be recognized as landmark achievements alongside advances in major equipment and systems.

The enhancement of the industrial foundation should be integrated with the development of high-quality and effective technological equipment. There should be differentiated industry clusters for major technological equipment and specialized industry clusters for small and medium-sized enterprises. World-class industry clusters supported by stable supply chains should be developed to better respond to the restructuring of the global industry chains.

Efforts should focus on key industry chains, organizing coordinated research on critical foundational technologies through enterprise-led collaboration among industry, academia and research institutions.

Research on failure modes and failure mechanisms, as well as long-life and high-reliability design and manufacturing, should be strengthened, alongside pilot-scale testing and validation.

Enterprises producing foundational products should be encouraged to accelerate digitalization, networking and intelligent transformation to improve manufacturing processes. Product lifespan and reliability should be enhanced through the establishment of quality grading systems and premium pricing mechanisms for high-quality products.

Standardization systems should be strengthened, testing and certification capabilities improved, and a deeper understanding of the needs of users developed through effective demand-response mechanisms.

The integration of technological innovation and industrial innovation should be further strengthened. Enterprises should be encouraged to increase investment in new growth drivers, emerging technologies and innovative products, generating original and disruptive technological breakthroughs.

Enterprises should also be encouraged to expand international cooperation. Chinese companies should be guided to establish diversified and multilevel partnerships in key segments and optimize the global layout of research, production and services.

VIEWS

Prakoso Bhairawa Putera

A bridge linking innovation to adoption

As leaders from business, government, academia, and the innovation sector gather in Dalian, in Northeast China's Liaoning province, for the Annual Meeting of the New Champions 2026, also known as the Summer Davos, one question deserves particular attention: Why do some innovations become part of everyday life while others remain prototypes, pilot projects or just promising laboratory results?

The question of how innovation can scale up is especially relevant as the world searches for new engines of growth. Artificial intelligence, clean energy, biotechnology, smart transportation, digital payments and space technology offer new possibilities.

Yet possibility alone does not translate into public value. A bridge must be built between invention and widespread adoption.

That bridge is institutions.

Innovation scales up when society builds the institutions that transform bright ideas into trusted, funded and widely adopted realities.

Technology opens the door, but institutions make people, markets and governments willing to walk through it. A prototype proves that something can work. Scale shows that society is ready to use it widely.

China offers several examples of scaling. BeiDou, for instance, is not only a story of launching a satellite navigation system. Its real breakthrough lies in how that system has transformed into an ecosystem of applications. BeiDou is now integrated into smartphones, transportation, agriculture, logistics, location-based services, and various civilian applications.

The satellites operate in space, but their economic value grows when they are linked to standards, devices, industries, and everyday services.

BeiDou has scaled not only because of its technological sophistication, but because institutional support has turned strategic infrastructure into a public platform and application market.

A similar lesson comes from new energy vehicles. Electric cars don't become mainstream simply because of better batteries or attractive designs.

Consumers need assurance: availability of charging infrastructure, reasonable operating costs, after-sales services, and a supportive energy ecosystem. This is why new energy vehicles require more than products.

They require policy packages, incentives, standards, charging networks, battery-swapping systems, industrial investment, and coordination among government, automakers, battery producers, and energy providers.

Hence, the innovation being scaled is not just the car, but an entire low-carbon mobility system.

China's high-speed rail and the Fuxing train show how standardization can become an engine of scale. High-speed rail is a transportation project, but at the national scale it becomes an industrial system, a public service system, and a system of trust.

Global Lens

For high-speed trains to operate safely, punctually, and across many regions, they require technical standards, efficient operators, rail networks, signaling systems, manufacturing capacity, maintenance systems, financing, and a culture of safety.

Fuxing shows that innovation is not just about speed, but also about organizing technology into a replicable, expandable, and trustworthy system.

Indonesia's Quick Response Code Indonesian Standard is another example. Before QRIS, digital payments were fragmented, with multiple applications and service providers, each having its own code and system.

For small merchants, especially micro, small, and medium-sized enterprises, this diversity was a barrier.

QRIS changed this by introducing a national standard, enabling one code to accept payments from different applications. Here, innovation becomes a public utility. The regulator doesn't merely supervise the market; it builds a shared standard so that innovation is used more easily by millions of people.

QRIS shows that scalable innovation does not always require complex technology. Sometimes, the most crucial innovation is a standard that makes technology simple, affordable and inclusive. When small shops, street vendors, tourism actors, public transport users, and everyday consumers use the same payment standard, innovation ceases to be a novelty and becomes a new habit.

From BeiDou and new energy vehicles to high-speed rail, Fuxing and QRIS, a similar pattern can be seen. Innovation scales up when there is public trust, standardization, long-term financing, supporting infrastructure and collaborative governance.

No single entity can scale innovation on its own. Researchers discover, startups test, industries produce, governments set standards, financial institutions provide capital, and society legitimizes through everyday use.

This message is vital for the Summer Davos 2026. The world isn't short of great ideas. What is often lacking is the mechanism to scale those ideas to work socially.

Therefore, global forums such as the Annual Meeting of the New Champions should not only celebrate new technologies, but also discuss how those technologies can become trusted, funded, adopted, and sustained.

Today's "new champions" are not the first inventors of technology but the societies, companies, cities, and countries that can build bridges between discovery and broad adoption.

They understand that innovation doesn't just come from laboratories, but also thrives in institutions, standards, financing, infrastructure, and public trust.

Recognizing this challenge, the National Research and Innovation Agency of the Republic of Indonesia has launched an initiative to strengthen the bridge between research and real-world impact.

The concept is simple but strategic: Indonesia needs a shared home for innovation where ready-to-use technologies can be displayed, connected, licensed, incubated, and matched with industries, state-owned enterprises, local governments, universities, investors, startups, and communities.

As a national innovation showcase, hub, and one-stop service, the initiative embodies the principle that innovation can scale only when good ideas are supported by institutions that connect knowledge, intellectual property, financing, co-creation, co-development, and public use.

Ultimately, innovation is not only invented but also organized. Breakthroughs open possibilities, but institutions turn those possibilities into realities.

The future will not be shaped only by those with the best ideas, but by those who can enable good ideas to grow into real, broad, and sustainable public value.

The author is a senior researcher and director of Policy Formulation for Research, Technology, and Innovation, at the National Research and Innovation Agency, the Republic of Indonesia.

MA XUEJING / CHINA DAILY

Anthony Moretti

China affirms vision of a better global future

The first quarter of the 21st century has offered several reminders of how volatile the world is. Multiple wars dotted the news. Poverty, food insecurity and economic displacement threatened millions of people. A global pandemic crippled humanity. And most recently, public officials and private citizens have warned about the dangerous potential of artificial intelligence.

Amid these and other worries, China released a timely white paper titled "More Just and Equitable Global Governance: China's Principles, Proposals and Actions" on June 17.

The document outlines the country's vision of a brighter future, not just for developed nations, but crucially for the developing world.

At its core is a call for "building a just and equitable global governance system". Multilateralism, described as the "only viable path forward", alongside major countries acting in a responsible manner, is seen as essential in enabling such an environment.

Nations must engage in consultation, cooperation and communication. Additionally, if nations prioritize "we" before "me" and affirm that each of the world's 8 billion people deserves domestic stability and international peace, then China's often-stated goal of a shared future for humanity can be realized.

China's Global Governance Initiative is frequently referenced in the white paper. Unveiled in September 2025, the initiative advocates for the international rule of law, supports multilateralism, places people at the center of all efforts and demands tangible solutions for real-world challenges.

Global Lens

World peace and global development are vital to the success of the GGI, which has already been endorsed by more than 160 nations. Releasing the white paper, Chinese Foreign Minister Wang Yi said the GGI "has evolved from a Chinese proposal into an international practice, and it is showing ever growing vitality".

The white paper underscores a crucial point: no country, no matter how powerful, should place itself above the United Nations, which is described as the "most comprehensive, representative and authoritative international organization" that "plays an irreplaceable and vital role in global governance".

China's unwavering support for the UN has been regularly demonstrated. The white paper affirms that the UN should occupy its rightful position atop the global hierarchy of organizations tackling the world's most vexing challenges.

China's endorsement of the UN is especially critical now, as certain nations appear determined to undermine it financially and structurally.

The divisive rhetoric emanating from certain capitals contrasts sharply with the positive assessment by Beijing.

The white paper also outlines the proactive steps that China has taken on the global stage during this century. It brought together Iran and Saudi Arabia, restoring ties between these longtime adversaries. China has steadfastly supported statehood for Palestine, and pushed for the African Union to gain membership in the G20.

It also remains resolute in not interfering in the domestic affairs of other nations and advocates for the economic wishes of the Global South. China recognizes the value of people-to-people exchanges. It provided vaccines and masks to vulnerable nations during the COVID pandemic.

Collectively, these actions clearly demonstrate, as the white paper states, that China continues to respond "to the common aspiration of the international community" while "addressing the most pressing issues in global governance".

China rightfully deserves recognition for its commitment to global governance, yet it doesn't regard itself as superior to the UN or any other globally respected organization. It has repeatedly reaffirmed the paramount role of the UN in addressing global challenges.

Why do China's recent achievements matter? Because, frankly, few other nations are stepping up to do the same. The US has intentionally reduced its global presence. Europe is grappling with a corrosive nationalism and sluggish growth. Japan continues to show a reckless disregard for history as it commits itself to a militaristic future. Meanwhile, no other nation, or bloc of nations, can move the needle.

On the other hand, China is acting responsibly. Through the four global initiatives — the Global Development Initiative, Global Security Initiative, Global Civilization Initiative and Global Governance Initiative — announced in recent years, President Xi Jinping has articulated a vision for a much better future for the world.

The current generation will benefit, and perhaps the next generation could embrace a world in which reliability replaces recklessness.

The white paper should be studied by those interested in learning more about how China envisions the future and its role in it. Readers will find that the document was not created to temporarily boost global opinion about China.

Rather, "More Just and Equitable Global Governance: China's Principles, Proposals and Actions" reminds us that "the baton of history is in our hands, and the question of where global governance is headed demands an answer".

Opening a new chapter in parenting

Two recent headlines have reignited a familiar debate about parenting and family education. On June 15, the United Kingdom announced a ban on a range of social media apps for children under 16, saying the move aims to "give childhood back to children".

Earlier in the month, Nvidia CEO Jensen Huang joked that "once you've been raised by Asian parents, you need therapy for life".

Juxtaposed, these otherwise unrelated remarks raise a critical question: What challenges does family education face in the age of artificial intelligence, particularly in Asia?

The UK's observation that today's children are growing up in a world where "technology has invaded every area of life" aptly captures the environment shaping the youngest generation.

Huang's self-deprecatory quip, made days ahead of the college entrance exam, or *gaokao*, triggered a heated debate over Asian — especially Chinese — parenting. As usual, opinions were sharply divided.

But Huang's reflection was itself two-sided. It was not merely a criticism of Asian parenting, as some have framed it.

While joking that he was criticized all his life — alluding to the East Asian tendency to tell children they are never quite good enough — he also credited that upbringing for making him tougher. In his view, Asian children often grow into adults who are exceptionally resilient.

The UK's observation that today's children are growing up in a world where "technology has invaded every area of life" aptly captures the environment shaping the youngest generation.

Any discussion on Asian-style parenting or family education must move beyond simplistic praise or blame. Take China as an example. It is undeniable that many families impose high standards while falling short on emotional communication, leaving some children with psychological scars.

Yet Chinese families almost universally regard education as central to a child's growth, emphasizing foundational skills such as math and language as a means of securing a competitive advantage.

This rigor and measured pressure can foster resilience and drive, which is a likely factor behind the consistently superior academic performance of East Asian students globally.

This parenting style has historical and cultural contexts. Rooted in Confucian traditions and embedded in the national psyche, it is a value system based on the belief that "jade must be polished to shine". It is also a mirror of a parental mindset shaped by hardship.

Generations who lived through social upheaval and scarcity made it their life's mission to ensure the security of their children. They rarely verbalize their affection and express their love through sacrifice, investing everything in the education of their children. This has been the defining trait of Chinese parents for decades.

Clearly, Asian-style parenting should not be dismissed outright. But we also cannot ignore the fact that the emerging AI era may pose sharper challenges here than elsewhere.

As AI reshapes how children learn and grow, the limitations of traditional models are becoming increasingly apparent.

Problems linked to AI — from over-reliance on technology to emotional detachment — may get amplified in East Asian societies, compelling a fundamental rethink.

For instance, if traditional East Asian family education leans too heavily toward knowledge over capability, there's an urgent need to correct this.

As AI takes over repetitive and memory-based tasks, human strengths — creativity, imagination, interpersonal skills — become paramount.

Grades may determine short-term outcomes, but mindset shapes lifelong trajectories. Parents must get over their obsession with scores and prioritize holistic development, moral grounding, innovative thinking and critical inquiry to encourage exploration.

Similarly, the rise of AI risks fostering children's dependence on digital companionship, including chatbots — a likely reason behind the UK's social media ban. In cultures already criticized for limited parent-child interaction, this risk intensifies. The temptation to outsource parenting to AI warrants still more serious caution.

The home is the first school of life, and parents are a child's first teachers. In China, family education has evolved from a private matter into a national priority.

From the first Five-Year Plan for Family Education in 1996 and the National Family Education Guidelines in 2010 to the Family Education Promotion Law enacted in 2021, China's approach has steadily become more systematic and institutionalized.

Encouragingly, as Gen Z and millennials become parents and social norms evolve, the traditional archetype is also shifting.

Many see this as a conscious effort to break cycles of intergenerational trauma and build healthier family relationships. Clashes between old and new mindsets might persist for some time to come, but a new era of family education has undoubtedly begun.

GLOBAL VIEWS

SLAVICA STAMENIC

Pioneering partnership

Serbian-Chinese strategic partnership is an example of promising South-South cooperation

Contemporary international politics is undergoing a period of deep structural transformations, in which bilateral relations are increasingly becoming precise indicators of broader global processes. The state visit of the president of Serbia to China in May opened up significant space for observing how bilateral partnerships shape the position of states in an increasingly fluid world order. During this visit, the two sides focused on deepening cooperation and implementing the concept of "a community with a shared future", and signed 23 bilateral agreements, reflecting the multidimensional nature of the two countries' relationship.

Both sides frequently use the term "ironclad friendship" to describe and emphasize the strength and continuity of their relationship, which goes far beyond mere economic exchanges to encompass strategic alignment.

Europe has developed a complex policy toward China, treating it simultaneously as an economic partner and a strategic rival. However, China is an important trade partner not only for Europe, but also for many individual European countries. It is clear that their trade relations remain sound even though some deny the fact that the Europe-China and Serbia-China trade ties are mutually beneficial.

Serbia's relations with China are multilayered. For instance, according to China's General Administration of Customs, total bilateral trade grew from $596 million in 2016 to $6.48 billion in 2025, representing more than a tenfold increase in less than a decade. In addition, Serbia was among the first European countries to abolish the visa requirements for Chinese citizens, and the free trade agreement, which entered into force in 2024, further deepened economic ties between the two countries.

A particularly impressive dimension of the Serbian president's state visit to China was the signing of a joint statement on promoting the four global initiatives that China has proposed, namely the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative. China actively promotes these frameworks as a model of cooperation among Global South countries, and as a reference and support for a United Nations-centered global governance system, as they uphold the principles of non-intervention, multipolarity and the right of every sovereign state to independently define its own development path. By aligning with this conceptual framework, Serbia explicitly sides with those countries that would work together to build a fairer and more inclusive international order.

Serbian-Chinese cooperation is mutually beneficial and will contribute to a more stable and inclusive model of global governance with concrete institutional results on the ground.

Serbia has become a pioneer in advancing China's four initiatives in Central and Eastern Europe. Having signed a memorandum of understanding with the China International Development Cooperation Agency in October 2023, Serbia now leverages the Global Development Initiative as an important instrument to advance its modernization, and above all, to serve its core national interests.

Cooperation between Serbia and China can also be viewed as a major case study of the South-South cooperation model. Its success depends on the ability to achieve real transfer of technology, knowledge and sustainable development practices alongside traditional economic exchanges. According to HBIS Group, one of China's largest State-owned steelmakers, China-Serbia cooperation in green steelmaking has achieved a major breakthrough, with researchers confirming that Serbian iron ore can meet green steel standards through hydrogen metallurgy. This shows that Chinese investment can also help modernize Serbia's existing industrial capacities and empower Serbia's green development.

Thus, the next phase of this partnership can focus more on measurable and concrete development outcomes. In practice, this implies significantly greater involvement of universities, domestic research centers and local business entities, as well as stricter alignment of infrastructure projects with international environmental protection and public finance transparency standards.

The areas where the announced cooperation appears most promising include green energy, the digital economy and artificial intelligence, all of which could expand economic ties through knowledge transfer. China is a global leader in green development, and Serbia could become a bridge for the transfer of this expertise to European markets and consumers if it implements facilitating policies and pools resources to help the whole country gradually build institutional capacities for absorbing that knowledge from China and developing local solutions based on Serbia's national conditions.

As Serbia aspires to European Union membership, every project must be "EU-ready". Serbia can play the role of a "translator" between Chinese development models and European regulatory frameworks.

To summarize, Serbian-Chinese relations in 2026 can represent one of the most illustrative examples of South-South cooperation. They can inspire other Global South countries to explore their own ways of sustainable development. Serbia, as a small country in the heart of Europe, possesses limited room for geopolitical balancing. The historical experience of countries in similar positions shows that short-term gains from diversification can easily be neutralized by long-term uncertainty if the strategic orientation remains vague. Therefore, in an era of global turmoil and increasingly pronounced multipolarity, the ability to balance smartly, manage risks and conduct foreign policy pragmatically will become a key survival test for all states striving to preserve their room to maneuver. Serbian-Chinese cooperation is mutually beneficial and will contribute to a more stable and inclusive model of global governance with concrete institutional results on the ground.

SUN CHUANWANG

Creating new edge

Building on the Maritime Silk Road and the 15th Five-Year Plan, China can strengthen its marine industries for a more solid foundation

The ocean serves as a key strategic frontier for high-quality development, as well as a core platform for China to expand its opening-up. The outline of the 15th Five-Year Plan (2026-30) provides a clear pathway for pursuing maritime strength in the new era, prioritizing the high-quality joint construction of the Belt and Road Initiative and the high-quality growth of the marine economy.

The outline sets objectives: promoting coordinated land-sea development planning; strengthening, optimizing and expanding marine industry; and promoting the building of a maritime community with a shared future. On the basis of the 14th Five-Year Plan (2021-25), which focused on consolidating foundations and achieving scale expansion, China's marine economy has now entered a new stage marked by structural optimization and accelerated opening-up.

In 2025, according to data released by the Ministry of Natural Resources, China's marine economy recorded steady growth, with its gross ocean product surpassing 11 trillion yuan ($1.63 trillion), a year-on-year increase of 5.5 percent. Its share of GDP rose to 7.9 percent, making it a key pillar supporting the stable growth of the national economy.

On the one hand, China's marine industries became more competitive. According to the Ministry of Industry and Information Technology, China's shipbuilding sector maintained its global lead for the 16th consecutive year in 2025, accounting for over 50 percent of the global market, and offshore wind power and other emerging sectors are picking up speed.

On the other hand, opening-up and cooperation in the marine sector expanded further. It is estimated that the Maritime Silk Road handled more than 5.4 million twenty-foot equivalent units in 2025 alone, up 9.11 percent year-on-year and connecting 150 ports across 48 countries and regions.

To date, China has engaged in targeted collaboration with Southeast Asia, the Middle East, Europe and beyond. Win-win outcomes have been achieved in projects such as the China-Malaysia cold chain shipping route and the Red Sea project in Saudi Arabia. These initiatives have not only solidified the foundation for China's domestic economic growth but also provided replicable and scalable experience for international maritime cooperation.

Nevertheless, the sector's transformation still faces challenges such as industrial homogenization, blocked flows of institutions and factors and intensifying global competition. Accordingly, China needs to pursue industrial synergy, institutional innovation and opening-up cooperation to transform itself from a large maritime country into a maritime powerhouse, shifting its marine economy from scale to quality, and from domestic circulation to deeper integration between domestic and international markets.

First, China can strengthen the synergy among marine industries and consolidate the foundation for high-quality development.

Coordination mechanisms can be gradually established for the three major marine economic circles in northern, eastern and southern China with clearly defined and differentiated roles. China should also leverage marine economy demonstration zones to promote integration such as "wind power +ranching" and "port+data". For example, Guangdong's "Fuxi No 1" wind power-fishery integrated project can produce around 900 metric tons of high-quality fish annually, delivering integrated industrial growth and optimal resource utilization.

International cooperation can also be deepened. The BRI and BRICS cooperation mechanisms can be used to advance cooperation in port operations, marine equipment and fishery farming. That would help Chinese enterprises participate in the construction of key ports in Southeast Asia, the Middle East and Africa to build a global Maritime Silk Road network, facilitate the export of ships and offshore wind power equipment as well as technical standards, advance China's deep-sea aquaculture technologies, and build marine ranches jointly with some Southeast Asian countries.

Furthermore, emerging industries can be expanded. Aligning with the priorities of the outline of the 15th Five-Year Plan, China can accelerate marine biomedicine, seawater desalination and other industries, support Qingdao, Xiamen and other cities in building marine science and innovation centers to achieve breakthroughs in core technologies in deep-sea exploration and desalination, promote the integration of offshore wind power and deep-sea aquaculture by building demonstration projects that combine "blue granary and green energy" and cultivate the marine digital economy by developing shipping big data and crossborder e-commerce overseas warehouses to open up new growth avenues.

Second, China can advance marine-related institutional innovation to facilitate the cross-border flow of production factors. On the one hand, it should innovate opening-up mechanisms and optimize the business environment. For instance, promoting the "single window" customs clearance model among ports along the Maritime Silk Road could help reduce cross-border trade costs.

Moreover, authorities should explore reforms to facilitate the cross-border flow of marine resources, such as piloting a negative list for the outbound transfer of marine data in areas including the Hainan Free Trade Port and the Lin-gang Special Area in Shanghai, thereby simplifying approval processes for cross-border marine shipping data. On the other hand, the marine economic accounting system can be improved by incorporating blue carbon, the marine digital economy and other emerging sectors into the calculation framework, thereby more accurately reflecting development outcomes.

Third, China can deepen international cooperation in the marine sector. In the energy realm, greater connectivity can be pursued by promoting the integration of deep-sea oil and gas exploration with offshore wind, wave energy and other renewables, as well as by jointly building maritime energy corridors with partners in the Middle East, Southeast Asia and Russia. Moreover, supporting Chinese enterprises in global marine energy development would help enhance China's voice in international markets and safeguard national energy security.

On the environmental front, strengthening cooperation on ecological protection is equally important. This calls for joint efforts with partner countries on marine pollution control, coral reef protection and coastal restoration.

A thriving marine economy strengthens a nation; a strong marine economy empowers a nation. The 15th Five-Year Plan period is critical for China to build itself into a maritime power and develop new strengths in the marine economy.

Building on the momentum of the 21st Century Maritime Silk Road and closely following the strategic priorities of the 15th Five-Year Plan, China can strengthen its marine industries for a more solid foundation, advance institutional innovation for higher efficiency, and expand global cooperation for broader opportunities.

By better integrating domestic and international markets, China will achieve higher-quality development of its marine economy, injecting ocean-driven momentum into the nation's drive to build a modern socialist country, while contributing Chinese wisdom and strength to the building of a maritime community with a shared future.

Key role in global supply chains stressed

Greater integration, coordination and development core of transformation

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Technological innovation and green development are becoming key drivers of China's supply-chain transformation, prompting foreign companies to expand local investment and partnerships in advanced manufacturing, industrial technology and sustainable agriculture, senior executives said on Tuesday.

Speaking at the fourth China International Supply Chain Expo, or CISCE, running from Monday to Friday in Beijing, they noted that China's supply chain is shifting from basic connectivity toward greater integration, coordination and innovation.

Yin Zheng, executive vice-president of China and East Asia operations at Schneider Electric, said that amid the combined uncertainties of climate change, geopolitical tensions and trade frictions, supply chain resilience — the ability to withstand disruptions, recover quickly and continuously adapt — has become a critical capability for companies seeking to navigate economic cycles.

"China, the world's only country with a complete industrial system, will continue to play a vital role as both a stabilizer and innovation driver for global supply chains," said Yin, adding that the country has become one of the group's most important global supply chain hubs and one of its four global research and development centers, with local procurement exceeding 90 percent.

The French industrial conglomerate is nearing completion of its new industrial park in Wuxi, Jiangsu province, while its industrial park in Xiamen, Fujian province, is set to begin operations by the end of this year and will become Schneider Electric's largest global medium-voltage production base, strengthening support for China's industrial transformation and supplying customers around the world.

The broader appeal of China's market and innovation ecosystem is also evident in official data. The number of foreign-invested enterprises in China has risen for three consecutive years to surpass 530,000, with total accumulated foreign direct investment exceeding $3.6 trillion, data from the Ministry of Commerce show.

In 2025, more than 8,000 overseas businesses increased their investment in China, a jump of over 10 percent year-on-year.

Zhai Jingli, deputy CEO of APP China-Sinar Mas Group, Indonesia's integrated plantation-pulp-paper group, said industrial development is moving beyond strengthening individual value chains toward fostering broader industrial ecosystems, where companies from different sectors can jointly address sustainability challenges and unlock new growth opportunities.

To support this transition, the Indonesian company, also a third-time CISCE participant, unveiled a new industry initiative to promote value co-creation through decarbonization, digital innovation and ecosystem partnerships at this year's expo.

"Over the next three to five years, China's paper sector is expected to move toward greener, smarter and more interconnected development, with ecosystem-building becoming a key source of competitiveness," Zhai said.

Agriculture is another sector where technological innovation is strengthening supply chains and creating new opportunities for sustainable growth. Syngenta Group, the Basel, Switzerland–headquartered agricultural technology company, showcased a comprehensive portfolio of solutions spanning seed innovation, sustainable crop protection, digital agriculture and integrated technical services at this year's expo.

Su Fu, president of Syngenta Group China, said the country is rapidly emerging as a key testing ground for artificial intelligence-enabled agricultural innovation, with advances in breeding technologies and digital services expected to improve productivity, sustainability and supply chain efficiency.

During the expo, the company announced new partnerships and initiatives with industry and food-sector players, including value-chain cooperation with McDonald's China and McCain Foods China, as well as the release of a regenerative agriculture practice evaluation guide with partners, as part of broader efforts to advance regenerative agriculture and enhance resilience across China's agricultural supply chains.

Ericsson bets on nation's innovation to power its AI evolution

By **CHENG YU** and **ZHANG XIAOMIN**
in Dalian, Liaoning

China will remain one of Ericsson's important markets as the Swedish telecoms equipment maker doubles down on next-generation mobile networks as a key enabler of artificial intelligence and physical AI in the country, a senior executive said at the ongoing 2026 Summer Davos.

Chafic Nassif, head of Ericsson Northeast Asia and senior vice-president at Ericsson, said: "China's combination of scale, speed of execution and innovative industrial ecosystem make it a uniquely critical market in the global technology landscape."

Speaking in an interview with China Daily at the 2026 Summer Davos, also known as the 17th Annual Meeting of the New Champions, in Dalian, Liaoning province, Nassif said that there are only a few countries globally that are as forward-leaning as China — probably none at the same scale.

He said: "Scale is one thing. The second is the ability to be at the forefront of technology. The third is the R&D capability, from universities through to applied research."

"China is important to us and the world. And moving forward, it will continue to be even more important," he added.

Ericsson, which has long positioned itself as an infrastructure provider across global markets, sees China not just as a commercial opportunity but as a key arena for technological evolution in AI-driven connectivity.

"We see ourselves playing a very big role in driving AI and physical AI moving forward," Nassif said. "To be a credible player in that evolution, we have to be where it is happening."

His comments come as global technology supply chains fragment under geopolitical pressure, with increasing scrutiny on cross-border cooperation in semiconductors, telecommunications and AI.

"There is a lot of geopolitics happening, and different countries are closing in on themselves," he said. "I hope that is not going to be the strategy in China. We believe strongly in openness and diversity."

Ericsson, he added, views collaboration as central to long-term innovation in connectivity technologies.

"We believe very heavily in diversity, and it is very important that we continue to foster deep collaboration for the betterment of industries and ultimately humanity," Nassif said.

China's telecom and digital ecosystem, he said, stands out for its ability to rapidly industrialise new technologies.

"It is a phenomenal and unique market. It is always mind-boggling how scale works in China, and even more impressive how fast the speed of execution is," he said.

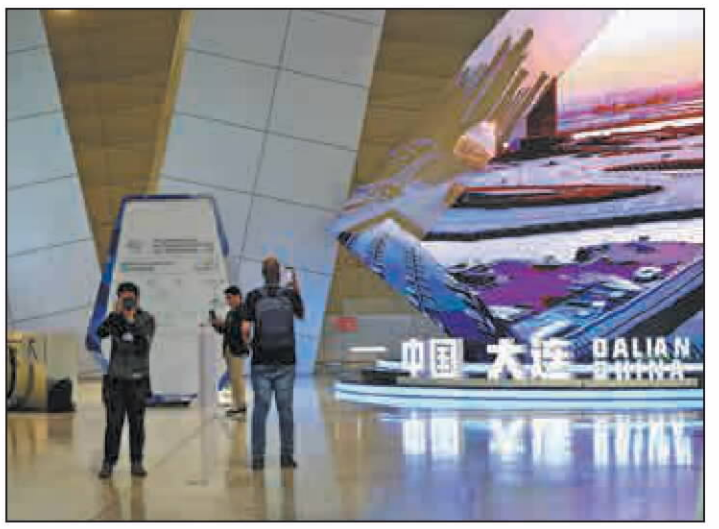
He pointed to China's early nationwide deployment of 5G Standalone networks as an example of its infrastructure-first approach. "China was the first to roll out 5G Standalone across the whole country from the beginning," he said.

That momentum, Nassif said, is now extending into next-generation networks and AI-native communications systems.

"The formula is the same. We are now looking ahead to 6G, which will be AI-native," he said. "We are starting to collaborate with Chinese companies in this space."

He added that so-called physical AI — artificial intelligence embedded in robotics and autonomous systems — will play a growing role in industrial transformation.

"We already see companies like Unitree and others driving that economy forward," he said, referring to Chinese robotics firms. "We also see companies coming very close to autonomous driving, including BYD and Xiaomi."



For Ericsson, China's innovation ecosystem — spanning universities, research institutes and manufacturing supply chains — remains central to its global strategy.

"That is China's unique capability: the ability to industrialize at massive scale," Nassif said.

Despite geopolitical uncertainty, he expressed optimism that collaboration would continue to deepen.

"We have very positive hope this will continue and even grow," he said. "We hope China continues to foster openness, because we want to continue working together for the evolution of our industries."

Expert says Chinese consumption will grow

By **OSWALD CHAN** in Hong Kong
oswald@chinadailyhk.com

With advantages in traditional global exports and manufacturing, China is transitioning to innovation-driven advanced manufacturing, and domestic consumption will gradually become the driving force for the country's economic growth, said Joe Ngai, senior partner and chairman of McKinsey & Co Greater China office.

With geopolitical tensions and trade disputes, coupled with rising labor and production costs in China, as well as supply chain disruptions arising from the COVID-19 pandemic and the conflict in Ukraine, global enterprises in the last few years have been maintaining operations in China while expanding production to at least one other country to reduce risks and costs, as well as to diversify their markets.

"In the last couple of years, although there are more trade barriers, China has exported more than ever before. The trade linkages between China and the rest of the world have grown even faster," Ngai told China Daily in an interview.

Ngai is confident that while China moves up the value chain ladder toward high-tech manufacturing, the country can still maintain competitiveness on the low-tech side.

"The scale of the Chinese market makes domestic manufacturing still competitive. That scale has enabled it to drive the prices and supply chain costs with more economies of scale even on the low-tech side," Ngai told China Daily.

China is in some ways an innovation-driven economy, and innovation has been applied to the actual manufacturing process, driving the way toward advanced manufacturing.

"China is progressing from labor-intensive manufacturing into high-tech manufacturing. There are many parts of the economy that need capital investment and capacity and therefore have pretty good opportunities," Ngai said.

"We are exporting not only hard goods, but also our methodologies and processes. The next phase of China growth is not exporting finished goods, but exporting ideas, intellectual property, and engineering capacity," he added.

Ngai said that multinationals in the past introduced many of their technologies and much of their know-how to China. "Now we may be seeing China bring its many technologies and know-how to other countries. As the next phase begins in the industrialization of other countries, I think China can play a very big role in helping that industrialization."

The traditional export sector remains resilient and the country is transitioning toward advanced manufacturing. Ngai therefore does not believe China has to change completely from a manufacturing economy into a pure consumption economy, even though consumption will be a force in Chinese economic growth.

"Chinese consumers will spend as they have plenty of savings and personal debt in China is actually quite low," Ngai said. "In the last couple of years, there has been a slight confidence issue because of plunging real estate prices, but as the market stabilizes, Chinese consumption will continue to grow."

He added that the contribution of the consumption segment to the country's gross domestic product will grow, but it will take time to gauge how fast the segment will expand.

Ngai said that Chinese consumer sentiment is recovering, but consumers are now more selective, sophisticated, experimental, and willing to try new things and look for value.

In recent years, the Chinese economy has been embroiled in an involution characterized by excessive and race-to-the-bottom competition with aggressive price cuts and thin profit margins, which has occurred across a wide range of sectors. Cut-throat competition is also associated with overcapacity, excessive supply, and low capacity utilization.

At the microeconomic level, excessive price competition can be very frustrating for a company, as prices keep dropping and there may also be oversupply issues. But from a macroeconomic perspective, competition induces a lot of innovation and new thinking.

"If I have to lower my cost by 30 percent, I need to think of my product in a very different way. Involution drives a lot of innovation and competitiveness for Chinese companies today. It has created companies that have become very competitive world-class players," Ngai said.

Dense ecosystem sees Beijing emerge as China's AI capital

In 2025, city generated more than 450 billion yuan in core industry output

Technicians showcase a collaborative robot operated via motion capture systems in Beijing on March 26. XIE HAN / XINHUA

A view of the Beijing AI Genesis Community in Haidian district, Beijing, on June 10. WANG HAIXIN / FOR CHINA DAILY

By CHENG YU
chengyu@chinadaily.com.cn

On the top floor of a converted office building in Wudaokou, a popular neighborhood in Beijing's Haidian district that is famous for its close distances to leading universities, a crowd gathered around a robot trying to pick up tennis balls.

The contestants were not seasoned engineers from China's biggest technology companies. Many were university students. Nearby, founders discussed open-source robotics projects. Investors drifted between tables. Entrepreneurs exchanged business cards over coffee.

Han Yaqi, branding head of the company that operates Beijing AI Genesis Community, one of Beijing's growing networks of artificial intelligence startup hubs, said, "Sometimes you come here for a cup of coffee and end up meeting your next investor."

The scene offers a glimpse into why Beijing has emerged as China's AI capital. The city last year generated more than 450 billion yuan ($66.4 billion) in core AI industry output, hosted more than 2,500 AI companies and nearly 40 AI unicorns, accounting for more than half of China's total. Beijing is also home to 241 registered large language models, more than any other city in the country.

Behind those numbers lies something more difficult to quantify: a dense ecosystem where universities, startups, investors, manufacturers and policymakers increasingly operate within walking distance of one another.

"Beijing AI Genesis Community is not just an incubator," Han said. "It connects the entire chain, from university research to commercial innovation."

That ecosystem is becoming increasingly important as China seeks to transform AI breakthroughs from laboratory achievements into commercially viable products.

While Silicon Valley remains synonymous with software innovation, Beijing is betting that the next phase of AI will be built around deep integration between research, hardware, manufacturing and real-world deployment.

Beijing has also spent years laying the groundwork. Research and development spending accounts for more than 6 percent of Beijing's economic output, a level comparable with leading global innovation centers. Basic research represents roughly 16 percent of total R&D spending, among the highest shares internationally.

The authorities have launched more than 800 major research projects across fields including AI, semiconductors and biotechnology. The results range from the open-source RISC-V processor core to quantum computing cloud platforms and advanced scientific instruments.

Increasingly, however, policymakers want those breakthroughs to leave the laboratory.

Under Beijing's embodied intelligence development plan, the capital city aims to achieve more than 100 key technological breakthroughs in humanoid robotics and embodied AI by 2027, while producing at least 10 globally leading hardware and software products.

That ambition is already visible inside Beijing's emerging robot industry. Engineers at the Beijing Innovation Center of Humanoid Robotics are building what resembles a miniature automotive factory.

The facility serves as a pilot manufacturing and testing platform where companies can validate designs before committing to mass production. From actuator assembly and joint manufacturing to full robot integration and testing, the center covers the entire production process.

Huang Zhe, head of production at the center, said: "We can build a complete robot here in one to two days."

The pilot platform of the center became operational this year and currently has an annual pilot production capacity for about 5,000 embodied robots, Huang said.

"The goal is not simply manufacturing efficiency. It is shortening the distance between invention and commercialization," he said.

China's robotics industry increasingly faces a challenge familiar to many AI startups worldwide: moving beyond impressive demonstrations.

In another part of the city, robots are practicing tasks that appear deceptively simple. One repeatedly folds clothes. Another assembles cardboard boxes. A third attempts to tie shoelaces.

For humans, these are routine actions. For robots, they represent some of the hardest challenges in embodied intelligence.

"Clothes are deformable objects. They don't have fixed shapes. A robot can't handle them the same way it handles a solid block," said Li Yao, vice-president of Noitom Robotics.

Such exercises are not designed for household chores alone. The same capabilities are needed for future deployment in factories, warehouses and logistics centers, where robots must manipulate objects of varying shapes, textures and physical properties.

Nearby, another robot trains on a replica automotive production line. The machine picks up piston tubes, inserts them with precision, moves empty trays aside and returns for the next task.

The production line mirrors one at an international automotive supplier where the robot is expected to begin commercial operations later this year.

For Beijing's AI industry, the challenge is increasingly practical: not whether robots can perform impressive tricks, but whether they can generate economic value.

That shift is also reshaping how startups are built. At Zhongguancun AI North Latitude Hub, more than 100 AI startups, including one-person companies, are developing products ranging from laboratory automation systems to embodied intelligence applications.

Inside one startup, a robot learns how to grasp test tubes and dispense liquids with precision. The founder, Chen Kai, also teaches at a nearby institution. Half of his employees are his students.

The arrangement reflects another unusual feature of Beijing's AI ecosystem: the increasingly blurred boundary between universities and startups.

A three-minute walk connects the startup incubator to Zhongguancun Academy, a new education and research institution designed specifically to commercialize advanced technologies.

Students come from 31 partner universities and are selected through an unconventional process. Rather than traditional entrance exams, candidates must build AI projects within 12 hours.

The objective is not simply academic excellence.

"We want people who can solve real-world problems," Chen said.

Students work directly with startup founders, chief scientists and entrepreneurs. Many launch companies are still conducting research. The institute currently supports around 120 research and industrial projects.

"Our goal is to help students transform immature ideas into commercial products," said Dong Bin, the academy's executive vice-president.

The model reflects a broader effort by Beijing to bridge what policymakers often describe as the "last mile" between scientific discovery and industrial deployment. The strategy is also increasingly aligned with China's broader industrial priorities.

As competition intensifies globally in AI, semiconductors and robotics, Beijing's advantage may not come from any single breakthrough technology.

Instead, it may stem from concentration. Together they form a miniature supply chain covering hardware, data services, open-source frameworks, AI models and downstream applications.

For startups, proximity matters.

Sun Changku, vice-president of Quantaeye, recalled discovering a potential business partner simply by walking upstairs.

"We were working on water utility applications," he said. "Then we found another company in the building focused on the same industry. Collaboration happened naturally."

Huairou Science City shaping up as provider of top-end research hubs

By CHENG YU

Emails from overseas scientists keep arriving in Li Gang's inbox, often carrying the same message: when will the experiment station reopen?

The associate researcher at the Institute of Physics under the Chinese Academy of Sciences is currently overseeing the platform for quantum control at one of China's most advanced research facilities — Synergetic Extreme Condition User Facility in Beijing's Huairou Science City.

Among those waiting are research teams from some of the world's leading institutions, including the Cavendish Laboratory at the University of Cambridge in England.

"We hosted our first international users in 2023, and the Cambridge team was among them," Li said. "Based on experiments conducted here, they have already published two high-level papers. Their fourth visit to Huairou is already scheduled for September."

The growing queue reflects the rising international profile of China's expanding network of large-scale scientific facilities, which are increasingly attracting foreign researchers seeking access to experimental conditions unavailable elsewhere.

One of the facility's most sought-after platforms is the low-temperature superconducting quantum device control station, which can generate extremely low temperatures.

Operating under such conditions is the Quafu Quantum Cloud Platform, a cloud-based quantum computing system.

Since its debut, the platform has attracted around 3,000 researchers from around the world, who have executed more than 1 million computing tasks and contributed to over 10 major scientific achievements, according to Liu Guangtong, a researcher at the institute of physics under the Chinese Academy of Sciences.

"The platform is open year-round for measurement services," he said. "Demand for experimental time consistently exceeds supply."

The system allows scientists to remotely access superconducting quantum devices and conduct experiments without traveling to China, extending the facility's global reach.

A photo shows the city lounge of Huairou Science City in Beijing on Oct 22, 2024. PROVIDED TO CHINA DAILY

The popularity of the platform highlights China's growing ambition to become a major provider of scientific infrastructure, not only for domestic researchers, but also for the international scientific community.

That ambition is particularly visible in Huairou Science City, a sprawling research hub on the northeastern outskirts of Beijing.

Often described as China's answer to large-scale science campuses such as CERN in Europe or national laboratory clusters in the United States, Huairou Science City has become one of the country's most concentrated collections of advanced research infrastructure.

The city has built six national major science facilities alongside 17 scientific and educational infrastructure platforms and 14 interdisciplinary research platforms. Together they form the highest-density cluster of scientific research facilities in China.

By the end of 2025, 29 facilities and platforms had entered operational status, providing more than 1.77 million hours of research access to over 1,000 universities, research institutes and companies from China and abroad.

The facilities cover a broad range of disciplines, from quantum physics and materials science to energy research, life sciences and advanced instrumentation.

For international researchers, access to such facilities is increasingly valuable as scientific experiments become more complex and expensive.

Large-scale scientific infrastructures often require years of construction and billions of dollars in investment, making global collaboration essential.

China's strategy is to position Huairou Science City as an open platform within that ecosystem.

As scientific competition intensifies globally, Beijing is simultaneously trying to strengthen its own innovation capabilities while attracting international talent and research partnerships. The steady stream of returning foreign users suggests that the approach is gaining traction.

For Li, the emails arriving during maintenance periods are a sign that the facilities have become more than national assets.

"They're becoming part of the global research infrastructure," he said.

And as China's scientific ambitions continue to expand, researchers from around the world appear increasingly willing to make Huairou Science City a regular stop on their research calendars.

CHINA

CAR-T cell therapy for tumors approved

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

The world's first CAR-T cell therapy targeting solid tumors, developed by a Shanghai-based biopharmaceutical company, has been approved in China, marking a major step forward for the country in the field of cell and gene therapy.

The approval was announced by the National Medical Products Administration on Monday.

The new treatment, designed for advanced gastric cancer and adenocarcinoma of the esophagogastric junction, offers a breakthrough option for patients with these gastrointestinal tumors and provides a new Chinese solution to a long-standing clinical challenge, medical experts said.

Doctors noted that patients with these cancers who have not experienced positive outcomes from standard treatments face poor prognoses and extremely limited therapeutic options. The newly approved drug helps fill a critical gap in meeting this urgent clinical need.

Tumors are generally classified into hematologic and solid tumors. Solid tumors, which grow in organ tissues and have fixed shapes, are particularly difficult to treat because of their complex microenvironments, making them more challenging to manage than hematologic malignancies, or blood cancers.

The indications for CAR-T therapy, or chimeric antigen receptor T-cell therapy, have expanded in recent years, driven by advances in the treatment of hematologic cancers, such as leukemia, lymphoma and myeloma. CAR-T therapy involves collecting T cells from a patient's blood and genetically modifying them before reinfusing them into the body to attack cancer cells. The treatment enhances the ability of T cells — described as the body's "health guardians" — to precisely identify and destroy tumor cells, according to medical experts.

"About 90 percent of human tumors are solid tumors, while previously approved CAR-T products were used only for hematologic malignancies. Therefore, the approval of this injection marks a new milestone and suggests that more CAR-T products could be developed for other solid tumors in the future," said Li Zonghai, founder and chief executive officer of CARsgen Therapeutics Holdings. The therapy was developed by a subsidiary of the company.

Li said the company has benefited from strong support from both the central government and the Shanghai municipal government across the entire biopharmaceutical industrial chain. Over the past three years, Shanghai has rolled out a series of action plans to promote technological innovation and industrial development in cell and gene therapy, yielding notable results.

As one of the earliest regions in China to develop the cell and gene therapy industry, Shanghai's Pudong New Area has achieved significant milestones. It is home to the country's first gene therapy product. With the approval of the new drug, Pudong now has five domestically developed CAR-T products on the market, accounting for about a quarter of the global total.

Also on Monday, the world's first approved bispecific antibody-drug conjugate, developed by domestic company Biokin Pharmaceutical, received approval in China for the treatment of nasopharyngeal carcinoma — a rare type of throat cancer.

The company announced plans to establish its global innovation, research and development center in Shanghai's Pudong district, focusing on cutting-edge oncology drugs.

The new therapy offers precise treatment with low toxicity. Its innovative mechanism overcomes the limitations of traditional chemotherapy and single-target drugs, opening a new path for precision cancer treatment.

Academician's accolade

China boasts a robust juvenile justice system

SPP report highlights progress in refining punishment, rehab and crime prevention

By **YANG ZEKUN**
yangzekun@chinadaily.com.cn

China has developed a comprehensive juvenile procuratorial system over the past 40 years, integrating punishment, rehabilitation, victim support and crime prevention, a senior prosecutor said on Tuesday.

Addressing a news conference to mark the 40th anniversary of juvenile procuratorial work, Shi Weizhong, deputy prosecutor-general of the Supreme People's Procuratorate, said many protection mechanisms pioneered by procuratorates have been incorporated into law.

They include social investigations, family meetings, the presence of appropriate adults during proceedings, the sealing of juvenile criminal records, mandatory reporting of suspected abuse and background checks for jobs involving close contact with minors.

The SPP also released a report reviewing the development of juvenile procuratorial work over the past four decades.

Since 2018, procuratorates have arranged 96,000 meetings between juvenile suspects and their families, ensured the presence of appropriate adults on 95,000 occasions to support minors and oversee proceedings, and helped 347,000 minors obtain legal aid.

A mandatory reporting system introduced in May 2020, requiring professionals working with children to promptly report suspected abuse, has helped uncover 17,000 cases. More than 1,900 people have been held accountable for failing to report cases that resulted in serious consequences.

Shi said prosecutors adopt differentiated approaches based on the nature and severity of offenses. Minors who commit grave crimes with strong malicious intent, brutal methods or serious consequences are punished in accordance with the law. Those involved in less serious offenses, particularly first-time or occasional offenders, may receive lenient treatment focused on education and rehabilitation.

Since 2018, procuratorates have approved the arrests of 234,000 juvenile suspects and prosecuted 349,000. Meanwhile, 144,000 minors received conditional non-prosecution decisions along with supervision and tailored assistance; more than 95 percent did not reoffend. Over the past five years, more than 7,100 juvenile offenders entered universities after receiving procuratorial assistance.

Authorities have also maintained a zero-tolerance stance toward crimes against minors, including sexual assault and violent abuse. Since 2018, procuratorates have approved the arrests of 429,000 suspects and prosecuted 531,000 in such cases.

Judicial and law enforcement authorities have jointly issued judicial interpretations and regulatory documents to standardize the handling of sexual offenses against minors.

Through guiding cases, the SPP has established that online sexual abuse of children without physical contact can constitute a crime. Such offenses include coercing children through online chats to produce and transmit nude images. Since 2019, prosecutors have charged 18,000 people with sexually abusing minors remotely via the internet.

Measures have also been introduced to protect victims from secondary harm. More than 2,600 one-stop case-handling facilities now combine interviews, evidence collection, physical examinations and psychological counseling.

When both offender and victim are minors, procuratorates adopt a dual-protection approach that combines mediation, judicial assistance and psychological support, according to the report.

In addition, tiered intervention and correction mechanisms have been developed for minors involved in misconduct or crime, while oversight of specialized education and correctional programs has been strengthened.

Measures have also been introduced to help minors involved in cases return to school, prevent sexual abuse on campuses, and strengthen oversight of schools, entertainment venues, hotels, tattoo businesses and other areas that may pose risks to minors.

Shi said China's juvenile procuratorial system has developed within the country's legal and institutional framework rather than by simply adopting overseas models.

The SPP has established regular cooperation with UNICEF and Save the Children and maintained exchanges with more than 20 countries, including the United Kingdom, Russia and South Africa.

Song Yinghui, a member of the SPP's expert advisory committee and a professor at Beijing Normal University, called for further development of public interest litigation in areas affecting minors, including online gaming, campus safety, food and medicine.

Song also suggested closer coordination among criminal, civil, administrative and public interest litigation departments. Improved mechanisms for transferring leads and jointly handling cases could expand case sources and enable faster responses to complex cases and emerging risks, he said.

CAS' new English data journal to aid research

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China launched its first English-language data journal in Beijing on Tuesday, underscoring the growing strategic importance of scientific data in artificial intelligence-driven research worldwide.

Titled Data Express, the open-access journal is sponsored by the Chinese Academy of Sciences and edited by Yu Guirui, an ecologist and member of the CAS. It serves as the flagship of a cluster of 20 titles — one comprehensive journal and 19 discipline-specific publications — covering strategic fields including AI corpus research, ecosystem science, ocean science, lightning data, biomedicine, materials science and agriculture.

Sun Degang, Party secretary of the CAS Computer Network Information Center, said scientific data has become a strategic national resource in the era of big data and AI.

"Data journals serve as a crucial lever to encourage open data sharing, improve data governance, and empower new research paradigms," Sun said.

Yu noted that making high-value scientific data findable, accessible, interoperable and reusable — known as the FAIR principles — is a shared global challenge.

"Data Express is our response to that challenge. It not only fills a gap in China's high-end data publishing sector, but also offers a Chinese hub for global scientific data exchange, enabling barrier-free circulation and collaboration," Yu said.

Zhang Yun, deputy director of the CAS Bureau of Basic Capacity for Science and Technology, said data journals enable long-confined, high-quality scientific data — much of it generated by engineers and technicians at large-scale facilities and field stations — to be made accessible, giving due credit to contributors. Such data provides critical fuel for "AI for Science" and supports global research progress.

"Data papers are recognized as formal academic outputs," Zhang said, adding that the CAS is drafting guiding measures to encourage institutes to include such contributions in professional promotion and degree-awarding evaluations.

The cluster's design is anchored in China's national science data center system. The 19 discipline-specific journals correspond to established sub-centers across various fields, ensuring a steady pipeline of high-quality data submissions from the outset, Zhang added.

Zhang expressed confidence in the cluster's international competitiveness, noting that Chinese scholars already account for nearly 40 percent of the world's high-quality scientific papers.

Zhang Fan, deputy general manager of China Science Publishing & Media, whose SciEngine platform supports the cluster, said the initiative also addresses a long-standing vulnerability in China's academic publishing ecosystem — the "both ends outside" dilemma, where Chinese scientists publish their papers and store data on foreign platforms.

"Scientific data is a strategic resource, especially in the AI era. The data we feed into AI models may be even more valuable than individual papers. Keeping that data on a platform easily accessible for scientists is essential," Zhang Fan said.

The SciEngine platform is fully self-developed and domestically produced, and currently serves more than 1,000 journals. It connects directly with nearly 20 international databases, including Web of Science and Scopus, ensuring global visibility while retaining data sovereignty, he added.

"Unlike conventional articles that typically publish only positive findings, data journals also welcome well-documented negative or null results," Zhang Fan said, noting that these are particularly valuable in fields such as materials science for helping researchers avoid duplicating effort and for providing high-quality training corpora for AI models.

"Globally, data journals are a relatively recent development, with leading titles such as Elsevier's Data in Brief and Springer's Scientific Data emerging only around 2014," he said. "China's first Chinese-language data journal, China Scientific Data, was launched in 2016 — almost in step with global progress."

"Data journals are an integral part of the national strategy to build world-class scientific journals. This clustered launch places China in a strong position to run neck and neck with, or even surpass, international leaders in this emerging field," Zhang Fan said.

Cultural strokes

Experts urge caution in using AI tools for university applications

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Amid widespread anxiety related to complex admission rules, many parents and candidates preparing college applications after the national college entrance exam, or *gaokao*, are turning to artificial intelligence tools in the hope that algorithms can instantly generate the "optimal plan".

However, education experts and teachers are warning that blind reliance on such AI services may backfire.

Li, whose son took this year's *gaokao*, told China National Radio that she purchased a digital card for an AI-powered consulting service from an online platform for 300 yuan ($44), far cheaper than traditional consulting services.

Another parent, surnamed Pan, purchased cards from several providers and found that each online platform generated vastly distinct recommendations.

"The efficiency of AI screening is indeed high, but the divergent results make me uneasy about actually submitting the applications," she said.

The Ministry of Education has repeatedly warned families to stay vigilant against various fraud schemes during the application and admission season. In an alert issued during the 2025 college admission period, the ministry cautioned that some individuals and organizations spread false information, heighten anxiety and lure parents into purchasing expensive consulting services.

The ministry stressed that many so-called "experts" are temporary hires with no real credentials, noting that no professional certification of this kind has ever been issued by relevant authorities.

Xu Qicheng, a senior teacher at a high school in Tongling, Anhui province, who has guided college applications for years, said the data used by AI systems often lags behind current developments.

For instance, some universities have expanded or reduced enrollment for certain majors this year, and the popularity of majors continues to shift rapidly. Xu added that newly established programs introduce further variables that AI systems cannot fully account for.

"Many people are using the same AI software. Students with identical scores receive basically the same recommendations," Xu said.

Li Qing, director of the admissions office at Beijing University of Chemical Technology, stressed the importance of verifying data sources.

"You must add a reminder to obtain relevant scores from official websites. If you don't, the AI might scrape random data," he said.

Chen Hao, an associate professor at the School of Artificial Intelligence at Xidian University, said AI is not meant to replace human decision-making.

Its strength lies in information retrieval, organization and comparison, he told Xi'an-based Sanqin Daily.

"In a sense, the rationality of AI-generated plans depends on the breadth, accuracy and authority of the data it collects," Chen said.

He suggested that candidates adopt a "human-machine collaborative" approach, using AI as a reference while retaining final control over decisions.

Chen advised students and parents to carefully verify every recommendation by cross-checking official sources, including universities' historical admission scores, rankings and program information. Doing so can help reduce the impact of AI "hallucinations" and data inaccuracies.

Yang Weian, deputy dean of the faculty of education at Northeast Normal University, called on families to apply caution when considering AI marketing claims.

AI should be used to narrow the pool of potential institutions by inputting objective criteria such as scores, provincial rankings and subject requirements, allowing algorithms to quickly eliminate clearly ineligible options, he said in an interview with Guangming Daily.

At the same time, students should further refine the AI-generated list by incorporating personal preferences, including preferred cities, academic interests and career aspirations, Yang said.

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

Straits Forum delivers for Taiwan's grassroots

Despite obstacles imposed by DPP, event still enables further exchanges

By **ZHANG YI** in Xiamen, Fujian and **HU MEIDONG** in Fuzhou

The deep-seated momentum of cross-Strait economic and cultural integration remains resilient — actively driven by the Chinese mainland's fusion efforts — despite political barriers imposed by Taiwan authorities, according to attendees of the 18th Straits Forum held in June in Xiamen, Fujian province.

As the largest mainland-hosted platform for grassroots exchanges between the two sides of the Strait, the annual event gathered compatriots across industries to advance diverse cooperative achievements.

The event with over 30 activities attracted over 6,000 compatriots from Taiwan, including a large number of young people and first-time visitors, despite the strictest restrictions and obstructions imposed by Taiwan's ruling Democratic Progressive Party authorities.

In a milestone development, mainland enterprises signed purchasing agreements with businesses and trade associations from Taiwan's agricultural counties, including Taitung, Yunlin and Nantou, to import specialties such as pomelos, tea and aquatic products.

This cross-Strait procurement initiative delivers tangible dividends directly to grassroots farmers and fishermen on the island.

Around 120 industry professionals witnessed the signing. Yang Chi-chun, vice-chairman of the Taiwan Agricultural United Marketing Cooperative, celebrated an atemoya fruit contract with Hunan province, saying that it is a joy to bring the hardworking farmers' fruits into the vast mainland market.

In April, a 10-point policy package was released by the Chinese mainland's Taiwan Affairs Office of the State Council, which focused on increasing cross-Strait flights, tourism, agricultural trade and other aspects vital to the welfare of the ordinary people of Taiwan.

The DPP authorities, however, have attempted to suppress exchanges, with their mainland affairs authority labeling the forum a tool for "penetration and division".

Due to blocks imposed by the DPP, Yao Ching-ling, the magistrate of Taitung county, was barred from attending in person and had to deliver her speech via a pre-recorded video during the signing ceremony.

Chang Jung-kung, vice-chairman of the Chinese Kuomintang, called the ban on local magistrates attending the forum a great regret, noting that agricultural cooperation is the most pragmatic way to enhance the livelihoods of Taiwan residents.

"Taiwan farmers and fishermen market their products to the mainland simply to make a living. To smear and suppress them for this is absolutely against justice," Chang said.

Recent reports from Taiwan media revealed that peanut harvest prices in Yunlin county — the island's largest peanut-producing region — have plummeted, possibly due to widespread panic among local growers over potential zero-tariff peanut imports from the United States under recent trade frameworks.

Chen Binhua, spokesman for the State Council Taiwan Affairs Office, said: "The DPP authorities disregarded the farmers' anxieties, made nothing more than a perfunctory effort, showing that the DPP is completely helpless. This fully exposes their governance incompetence and proves that blindly kneeling to the US will only harm the interests of Taiwan's various sectors."

Chen added that the new agreements with the mainland would allow agricultural products from relevant Taiwan counties to enter the mainland market more conveniently, boosting incomes for farmers in central and southern Taiwan.

"The DPP authorities act out of political self-interest, jumping out to smear and attack the forum every year, and this year they went even further to restrict and obstruct participants," Chen said. "But the more they disrupt, the more they fail."

Song Tao, director of the Taiwan Affairs Office, reiterated at the forum that peace, stability and the welfare of Taiwan compatriots can only be guaranteed by adhering to the 1992 Consensus and opposing "Taiwan independence" separatism.

Business and industrial leaders attending the forum urged Taiwan enterprises to actively leverage existing preferential policies and look toward more cooperation.

Lee Cheng-hung, president of the Association of Taiwan Investment Enterprises on the Mainland, said: "The DPP authorities are highly contradictory; they claim to value public livelihood but impose highly irrational and self-contradictory restrictions."

Lee said that growing cross-Strait trade shows the two sides are "stronger together", urging entrepreneurs to expand into emerging industries on the mainland, including semiconductors, the low-altitude economy and artificial intelligence.

Chou Hsi-wei, vice-chairman of the Want Want Group from Taiwan, also said that the desire of compatriots on both sides for peace and integration cannot be stopped.

"Obstructing freedom of assembly and trade violates basic rights and is completely wrong, and 'Taiwan independence' is a dead end," Chou said.

Fostering integration

Beyond economic pacts, physical and institutional links topped the agenda as participants explored new integration pathways. Cross-Strait infrastructure projects were highlighted at the forum this year, as a rising number of Taiwan visitors called for closer economic integration despite political barriers.

Taiwan attendees toured major developments in Xiamen, including the ongoing Xiamen Xiang'an International Airport and Xiamen-Jinmen Bridge projects.

Wang Chao, head of the Xiamen section project of the bridge, said: "Once completed, the bridge will end the history of Jinmen residents waiting for ferries and favorable weather. It will drastically boost traffic efficiency and transport capacity for people and goods."

Wang added that the bridge structure will also carry pipelines to supply water, electricity and gas to ease energy shortages on Jinmen.

The new Xiamen airport, scheduled to open by the end of this year, sits just across the water from Taiwan-administered Jinmen.

Li Sheng-feng, vice-chairman of Taiwan's pro-reunification New Party, said: "Tens of millions of passengers will land right on the opposite shore every year. If artificial barriers block us from linking up, Jinmen will miss an immense development opportunity."

Li blamed Taiwan's ruling DPP for restricting opportunities for young people by distorting the mainland's image. "The DPP has no right to make choices for young people. Enabling them to see the real mainland is being responsible for their future," Li said.

Chai Hsuan, a Taiwan vlogger who has documented the Xiamen-Jinmen bridge construction site multiple times, said younger generations in Taiwan increasingly view "Taiwan independence" as a false proposition.

"They prefer to join the mainland's progress," Chai said, noting recent milestones such as Hong Kong astronauts joining the mainland's space program. "Taiwan talents need platforms to seize these opportunities."

Young bonds

Political barriers have failed to dampen the enthusiasm for travel, as official data points to an accelerating recovery in personnel exchanges. Fujian entry ports recorded 518,000 arrivals from Taiwan from January to May, marking a 29.7 percent surge year-on-year.

To facilitate closer integration, 19 pairs of cross-Strait youth organizations signed partnership agreements alongside the release of 23 cooperative projects during the forum in Xiamen.

In the financial sector, the event saw the release of the mainland's first-ever group standard for banking services tailored for Taiwan enterprises to help them more easily enter the mainland market.

For maritime and cultural cooperation, authorities announced five new measures to boost cross-Strait shipping, while Fujian province introduced Taiwan television dramas into prime-time satellite broadcasting slots.

Young Taiwan visitors at the forum welcomed these policies and noted the stark contrast between their experiences on the mainland and the political rhetoric in Taiwan.

An Chen-chu, a Taiwan youth, recalled her surprise at discovering mainland digital payment systems and said: "The DPP authorities are blocking our channels to see the world. I told people back home how convenient it is to go out with just a phone instead of a heavy wallet."

Chen Yi-xuan, another young attendee from Taiwan, expressed her excitement at seeing mainland actor Zhang Linghe, whose recent historical drama has become a major hit on the island.

Mentioning several mainland period dramas also popular in Taiwan, she said, "Traditional aesthetics and Chinese cultural heritage share a profound resonance across the Strait because our culture stems from the same roots.

"Culture serves as an excellent bridge. Since Taiwan's roots are in the mainland, I hope more young people will return to explore their heritage, allowing both sides to interact and integrate like family," Chen said.

Su Heng, a Taiwan political commentator, said the DPP tried to obstruct the Straits Forum out of fear that island residents will witness the mainland's rapid development and see through the falsehoods fabricated by the party.

Su cited two recent Taiwan polls showing that public support for "independence" has dropped to a record low of 21 percent, while nearly 60 percent back proactive peace consultation with the mainland.

The public narrative in Taiwan is changing as people witness the mainland's growing global strength, Su said, adding that shifting US policies have triggered widespread skepticism toward the US.

25-year family legacy built on vital ferry route between Xiamen and Jinmen

By **ZHANG YI** and **HU MEIDONG**

For entrepreneur Yang Chia-chi, the 30-minute ferry route between his hometown Jinmen and Xiamen, Fujian province, is far more than a transit line — it's a living family legacy across the Taiwan Strait.

As general manager of a shipping company founded by his father, Yang steers a business closely tied to the maritime crossing, which celebrates its 25th anniversary this year.

Over the past quarter-century, the pioneering route has transported more than 24 million passengers, evolving from a basic link for separated families into a bustling, daily economic and cultural circle.

"I grew up listening to the rumble of ship engines and smelling the salty sea breeze," Yang said. His family's ties to the channel run deep, rooted in an earlier era of separation.

In the early days, many Jinmen residents who moved away for work could not have their remains returned home. Driven by a desire to help fellow residents, Yang's father purchased the company's first vessel.

He later established the maritime shipping company, dedicating his life to the ferry service between Jinmen and Xiamen, carrying the profound longing of countless cross-Strait compatriots separated for decades.

Yang's grandmother, born in Xiamen in 1915, married into a Jinmen family but was unable to visit her hometown for decades due to frozen cross-Strait relations. She passed away in 1998, just three years before the ferry line opened, leaving behind a lifelong regret of never being able to set foot in her ancestral home again.

When the route opened in 2001, Yang's father boarded the vessel holding his late mother's photograph. Stepping over the threshold of the old family home, he wept and said in the southern Fujian dialect: "Mother, we are home".

"The journey my grandmother could not finish in her lifetime is now a path traveled by thousands every day," Yang said, adding that the route remains a natural bond of cross-Strait kinship rather than a mere transport service.

Yang has witnessed how lifestyles on both sides have become increasingly integrated. Many of his friends in Jinmen travel to Xiamen for weekend trips, while residents of Xiamen visit Jinmen for shopping excursions.

The tourism sector in Jinmen has experienced a robust recovery following the resumption of travel for mainland residents from Fujian and Shanghai in April. Yang often sees heartwarming scenes of mainland families exploring historic streets in Jinmen on electric scooters.

Beyond tourism, trade is increasing, too. Yang estimates that Xiamen cargo exports to Taiwan via Jinmen will exceed 50,000 twenty-foot equivalent units this year.

Previously, shipping e-commerce goods to Taiwan took two to three days. Now, under a new express system, goods collected in Xiamen transit through Jinmen, depart for Taiwan the same night, and reach consumers within 24 hours, he said.

The maritime route has even brought Yang his own cross-Strait marriage. His wife is from the Guangxi Zhuang autonomous region, and her mother once ran a river snail rice noodle restaurant in Xiamen.

Yang said he ate at the restaurant 20 days in a row, after falling in love with the cuisine and the owner's daughter.

Looking ahead, Yang said the construction of the Xiamen-Jinmen Bridge, designed to connect Jinmen Island to the upcoming Xiamen Xiang'an International Airport, will further facilitate travel between the two places and place Jinmen on a larger development stage through closer cross-Strait links.

Right: Huang Jiani (right) shows a finished memoir to an elderly participant. PROVIDED TO CHINA DAILY

Old stories, new bonds

From scattered memories to structured narratives, a student-led project turns elders' lives into written and visual stories, preserving them as lasting legacies.

By **CHEN XUE** and **XIONG XINYI**

When Huang Jiani's father finished reading the story she had written about his mother, the usually quiet man told her, "I feel like I've come to know my mother again. Her life was so interesting. We should treat her better."

At the time, Huang was a freshman studying sociology at Fudan University (FDU). For a class assignment, she and her classmates were asked to interview an older person about an event that took place before they were born. Huang chose to interview her grandmother, who had left her hometown of Quanzhou at 18 and traveled to Ninghua county in Fujian province to build a kindergarten from scratch.

The assignment was designed to cultivate what the course called a "sense of history". But for Huang, her father's reaction revealed something more personal.

"I realized that recording a person's life story could change the way a family understands one of its own," said Huang, now 21 and a junior at FDU.

That realization soon grew into a larger project. Huang began assembling a team dedicated to helping older people tell their life stories.

The project, Yishu Guanghua — or Lumemoir — officially launched in early 2025.

According to Huang, the team now has more than 10 members spanning all four undergraduate years, most of them from the humanities and social sciences. One recent recruit studies microelectronics and is exploring how AI can support the project's work.

So far, the team has completed eight memoirs totaling more than 200,000 Chinese characters, along with around 100 minutes of video footage.

The work involves far more than simply asking questions and taking notes.

"People's memories are scattered, leaping from one moment to the next," Huang said. "We can't force elders into a strict timeline or box their lives into neat categories — that only makes them hold back. We want to step into their memories as they actually are: rich, messy and full of surprises."

Before each interview, team members research the elder's era, hometown and related historical records. During conversations, they begin with gentle, open-ended questions before gradually moving toward more specific topics.

Old photographs or film clips often help spark memories. Sometimes an elder might start by correcting what appears on screen: "Oh, things weren't like that back then."

Then the stories begin to flow.

Drawing on her sociology training, Huang uses what she calls a "transcribe first, then code" method. The team first transcribes each interview, then organizes fragmented memories into a structured narrative web that can stretch across dozens of pages, tracing family ties and the values passed between generations.

Alongside written memories, the team also produces short videos, a format some elders prefer. A few have even asked the students to use AI to restore images of their younger selves at work.

> "In a society that is always moving forward, we also need to look back. Preserving the stories of yesterday and passing them on to tomorrow — that is the mission of our generation."
>
> **Li Yiyan,** 20, a student at Fudan University

One elder, who had spent his youth working the fertile black-soil farmland of Northeast China, had no footage from those years. When he watched the AI-generated video, he said it had finally fulfilled a lifelong dream.

"For children, seeing their parents on video is also a direct way of getting to know them again," Huang said.

Fu Xiaoqing, a 22-year-old senior majoring in journalism at FDU, handles much of the team's video production. She joined the project in her junior year after seeing a recruitment post on a classmate's WeChat Moments.

Her decision was personal. A political science assignment had once led her to interview her grandfather, who she had only known in his 60s as gentle and easy-going. Through those conversations, she discovered someone different: a driven young man who had risen from a rural village to a managerial position in the city.

"I saw a side of him that was ambitious, proactive and full of energy," Fu said.

Since joining the project, Fu has edited about 20 memoir videos for elderly participants. One moment left a deep impression on her: during an interview, a veteran of the War to Resist US Aggression and Aid Korea (1950-53) picked up an accordion and began to play and sing.

"It felt as though I had been transported back 70 years," she said.

The project also changed something in her life outside work. During the winter break in February, Fu went home and sat with her grandfather again — this time with patience and full attention.

"Before, whenever he started reminiscing, I would get impatient or let my mind wander to other things I could be doing," she said. "Now I sit quietly and listen, with genuine curiosity and respect for everything he has lived through."

Learning through lives

Li Yiyan, a 20-year-old sophomore majoring in Chinese language and literature, joined Lumemoir two months ago, hoping to connect what she had learned in books with real lives.

"As a Chinese literature major, I often wonder what words really mean to the world," Li said. "I've spent so much time absorbing stories and ideas, but not enough time giving something back. When I saw the recruitment post mentioning 'life narratives', I thought this might be a way to put words to use for others."

After joining Lumemoir, Li and her teammates visited a nursing home. Conversations with the elderly residents helped turn that abstract question into something concrete.

"While talking with the elderly residents, something inside me settled," she said. "I came to understand that the value of practice lies in the act of practicing itself."

One of Li's assignments was to help a senior write about her late father, a prominent local figure whose life was closely tied to the region's educational history.

The team chose to trace his contributions to education through the perspective of his daughter. What stayed with Li was one small detail: despite moving homes many times, the father had carefully kept every school award his daughter had ever received.

The story reminded Li of her own grandmother, who still keeps her childhood drawings in an old tin box.

"In that moment, I realized we had both been touched by the same kind of sincere love from our elders," she said. "It connected two different generations in such a quiet but powerful way."

"In a society that is always moving forward, we also need to look back. Preserving the stories of yesterday and passing them on to tomorrow — that is the mission of our generation," she added.

Deep Dive

Fake news can kill.

In a crisis, misleading posts can make people panic, hesitate, or ignore life-saving advice. Young social media users often encounter information first through short posts, rather than directly from experts. When those posts use fear, vague evidence or confusing language, readers may not know what to trust.

Linguistics can help. By reading carefully and spotting warning signs in how a message is written, young citizens can protect themselves and others.

The challenge is urgent: can they recognize fake news before it shapes their actions?

Linguistics gives youth tools against fake news

Here are two messages that might appear in your social media feed.

One says: A person who is vomiting, bleeding and very sick might have Ebola. Ebola does not spread through the air like the flu, but contact with blood, vomit or other body fluids can infect you, especially through your eyes, nose, mouth or broken skin. Do not touch the person or the fluids. Get help from health workers.

Another says: Remember in 2021 when the FDA asked to make the public wait until 2096 to disclose Pfizer's vaccine data? Well, when the data were finally released, one document was included. Guess what it listed as an adverse reaction to the vaccine — Ebola.

Which message helps you act? Which one makes you afraid, confused or doubtful?

Facing infectious diseases, most people do not immediately know what to do. That is why reliable health guidance often uses simple, direct language. It explains the danger, names the action people should take and accepts responsibility for guiding them clearly.

The first post shows these features. It is clear, concrete and useful. Its words are simple: "blood", "vomit", "eyes" and "do not touch". Even a child can understand it. This language helps readers grasp the risk quickly and act safely.

The second post works differently. It turns a technical situation into a frightening implication, and its language reveals how.

It begins with "remember when", shifting responsibility onto the reader. Instead of proving the claim, the writer invites readers to supply their own suspicion. It also widens the gap between the public and medical experts, making official guidance feel distant and less trustworthy.

Ming Ming Chiu

The post also relies on official-sounding words such as "disclose", "document" and "adverse reaction". They create an impression of authority, but hide the key issue: whether Ebola was caused by the vaccine. The post never proves that. It only suggests it.

Its structure adds to the problem. Instead of saying directly, "The vaccine causes Ebola," it leads readers through a memory cue, a document reference and a dramatic reveal. That complexity makes the accusation feel more credible than it is.

The vague phrase "one document" is another warning sign. Which document? Where can readers check it? The reference plants suspicion without giving readers enough information to verify the source.

This is how misleading posts often work. They do not need readers to believe every word; they only need readers to hesitate. Fear, confusion, doubt and misplaced responsibility can all delay action.

That is where Professor Ming Ming Chiu's Deceptive Writing Theory becomes useful. It draws on linguistics and social psychology to examine how patterns in language — such as uncertainty, emotional framing, complexity and shifts in responsibility — can signal misleading communication. Chiu and collaborators have applied these ideas to social media posts in English, Chinese, Korean and French.

Language analysis cannot replace scientific facts. But it can help readers notice warning signs before they share a post, believe a rumor, or freeze in a crisis. When facts are still emerging, the way a message is written can offer clues about whether it deserves trust.

Reliable emergency guidance helps people act. Misleading news clouds the danger, undermines trust, raises suspicion and leaves people uncertain.

The choice is yours. Will you follow the online crowd? Or will you slow down, examine the language, check the evidence and act wisely?

Written by Ming Ming Chiu, chair professor of Analytics and Diversity and director of the Analytics/Assessment Research Center, and Sze Ming Lam, assistant center manager of the Analytics/Assessment Research Center, The Education University of Hong Kong.

Tianjin grows into high-tech innovation hub

From laboratory breakthroughs to industrial production lines, Tianjin is building a system that helps scientific ideas move further and faster.

By **GUO JIAFONG** and **YAN DONGJIE**

Inside a laboratory at the State Key Laboratory of Medicinal Chemical Biology at Nankai University (NKU), Professor Zhang Zhenjie held up a small vial of pale-yellow powder as he explained its possible applications to visiting journalists during a recent research tour.

Though visually unremarkable, the powder belongs to a class of porous crystalline materials known as covalent organic frameworks, or COFs, which can be used in gas separation, pharmaceutical purification and energy-related applications.

The small vial offered an early glimpse of the tour's broader theme: how Tianjin is working to move scientific ideas from laboratory benches into real-world production.

"When we first started, production was only at the milligram level," Zhang said. "At that scale, practical application was impossible."

The scene was part of the four-day "Vibrant China Research Tour" in Tianjin from June 15 to 18, which brought together more than 100 journalists from across China to explore the city's innovation ecosystem.

In recent years, COFs have drawn global attention for their tunable structures and potential in high-end industrial uses. Yet commercialization has long been limited by low synthesis efficiency and difficulties in scaling up production.

Zhang's team has helped achieve ton-scale production of COF materials for the first time. Holding multiple patents on COF synthesis, they have been invited to leading international conferences this year to share their progress in the field.

The breakthrough, however, was the result of years of sustained research rather than a single leap.

After completing his studies at NKU and conducting postdoctoral research in the United States, Zhang returned to Tianjin in 2016. At the time, he was part of a growing wave of overseas-trained researchers contributing to China's push for innovation-driven development.

Back at NKU, he focused on improving structural stability, optimizing synthesis pathways and reducing production costs, gradually moving COFs from laboratory samples toward scalable production.

"In the early stage, everything was done at the gram or even milligram scale," he said. "The real challenge was whether the material could be reproduced consistently, not just once."

Today, COF-based materials are already being explored in analytical instruments and high-end equipment supply chains, supporting efforts to replace imported core materials in key industrial sectors.

If Zhang's lab shows how new materials are born, another team just a few buildings away keeps the instruments running that make such research possible.

Li Ang works at the university's cryo-transmission electron microscopy platform, where he is responsible for the operation and maintenance of large-scale instruments used in materials science, chemistry and life sciences.

His work represents a less visible but essential layer of innovation: the people who keep advanced research infrastructure stable, precise and accessible.

Zhang Zhenjie demonstrates equipment at the State Key Laboratory of Medicinal Chemical Biology at Nankai University. PROVIDED TO CHINA DAILY

> "The final step from research to industrial application is always the hardest. It takes time to stabilize processes and solve problems that do not exist in theoretical models."
>
> **Ren Chengzu,** founder and chief scientist of Tianjin Chuangjin Jinggong Technology Co Ltd

> "Tianjin has built a relatively complete industrial chain. That makes it easier for technologies to move from laboratories into real-world use."
>
> **Zhang Lei,** general manager of Sugon's solutions and innovation business

One of the most urgent parts of his job often arrives without warning. Cryogenic biological samples are highly sensitive. If the system fails, they can thaw quickly, forcing researchers to restart experiments that may have taken weeks or months to prepare.

"That usually means all previous work is lost," he explained. "For example, if a microscope suddenly stops working, we have to respond immediately."

Because of this, stability and rapid troubleshooting have become part of Li's daily routine.

Over time, he said, the job has shaped not only his technical skills but also his understanding of precision.

"Sometimes a very small adjustment can make a noticeable difference in data quality," Li said. "That's where much of the value lies."

Beyond maintenance work, Li also helps run training courses that allow students from different disciplines — including chemistry, biology and even non-science majors — to operate advanced instruments.

For many students, it is their first direct exposure to how modern scientific research is conducted.

"It helps them understand what high-level research actually looks like," he said.

Scaling the breakthrough

Beyond the campus, Tianjin's innovation chain extends into office buildings, industrial parks and factories, where research outcomes face the test of mass production.

The Tiankai Higher Education Innovation Park, established in 2023 and developed with strong links to NKU and Tianjin University, has become a key platform connecting research institutions with industry.

It provides rent subsidies, shared facilities, financing support and technology transfer services, reducing the friction between laboratory research and commercialization.

Ren Chengzu, founder and chief scientist of Tianjin Chuangjin Jinggong Technology Co Ltd, credited Tianjin's broader innovation environment for his company's long-term progress.

"In the early stage, we received rent reductions and access to shared facilities, which significantly lowered operational pressure," Ren said. "More importantly, it allowed us to focus on technical challenges."

Ren's company is engaged in the development of ultra-precision bearing rollers, key components in high-end manufacturing systems.

In this field, the challenge is not only achieving precision in controlled laboratory conditions but maintaining it consistently in mass production.

Through years of process optimization, Ren's team has reduced dimensional deviations to below 0.5 micrometers, surpassing widely used international benchmarks.

He said such precision is critical in advanced equipment such as robotic systems, where component stability directly affects performance and reliability.

"The final step from research to industrial application is always the hardest. It takes time to stabilize processes and solve problems that do not exist in theoretical models," Ren said.

"As application scenarios expand, precision requirements will become even more demanding," he continued.

Precision manufacturing is only one part of the picture. In computing and digital services, companies such as Sugon are also helping connect academic research with industrial demand.

Zhang Lei, general manager of Sugon's solutions and innovation business, said Tianjin has developed a diversified industrial base covering computing, life sciences, advanced manufacturing and digital technologies.

He noted that closer collaboration among universities, research institutes and enterprises is helping accelerate the transformation of research outcomes into practical applications.

In recent years, such collaboration has become increasingly central to Tianjin's innovation strategy.

"Tianjin has built a relatively complete industrial chain. That makes it easier for technologies to move from laboratories into real-world use," Zhang Lei said.

Sugon maintains close ties with universities and continues to recruit talent from academia, while expanding joint training programs to better align education with industrial demand.

During the four-day research tour, journalists moved between laboratories, research centers and manufacturing sites.

What they observed varied widely in form but shared a common thread: a city steadily building the capacity to turn scientific ideas into industrial reality.

In Tianjin, innovation is no longer an abstract idea or a laboratory pursuit. It is taking shape across a connected ecosystem — from research institutes to production lines — as the city works to turn scientific discovery into everyday reality.

Ancient arts find new life

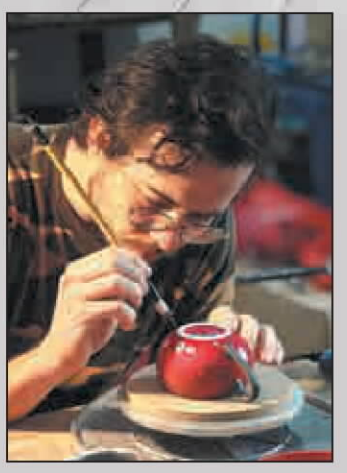
From Dunhuang murals to Wudang martial arts, young people are giving ancient traditions new meaning across borders at the World Youth Development Forum.

Young delegates from around the world pose for a photo at the 2026 World Youth Development Forum in Wuhan, Hubei province. PROVIDED TO CHINA DAILY

By LIU KUN, XU YIDAN, WANG JINGYAO in Wuhan and **MENG WENJIE**

"Civilizations become richer through exchange, and cultures are renewed when they cross boundaries," said Wu Qiongfang, deputy director of the Cultural and Creative Research Center of Dunhuang Academy.

Speaking at the 2026 World Youth Development Forum in Wuhan, Hubei province, Wu was not describing cultural heritage as something distant or static. She was describing how a site more than 1,000 years old can enter the lives of young people through technology, design and participation.



The forum, themed "Youth Drive Development for a Better World", opened on June 15, bringing together more than 500 youth representatives, experts and officials from UN agencies, international organizations and more than 120 countries and regions.

At a thematic forum on creative economy and trendy culture on June 16, Wu introduced her team's long-running efforts to bring the Mogao Grottoes in Dunhuang, Gansu province, closer to contemporary audiences.

Behind her, a screen displayed an extended reality (XR) immersive project developed by the team. Wearing a headset, visitors can view murals and painted sculptures up close and enter a recreated Lantern Festival night from the Tang Dynasty (618-907).

The team has also worked with Chinese tech company Tencent on a mini-program that allows users to design Dunhuang-inspired silk scarves. According to Wu, more than 1 million user-generated designs were submitted on the first day of its launch.

"Dunhuang culture should not remain confined to academic texts; it should be brought closer to young people through creative products and immersive experiences," she said.

> "Even though we all compete in the same market, there is more inspiration than competition. We learn from each other and grow together."

Wu's work reflects a broader shift: young creators are increasingly moving from cultural observers to communicators, participants and collaborators.

For Jake Pinnick from the United States, that process began with kung fu films.

Fascinated as a child by Bruce Lee and Jackie Chan, Pinnick traveled alone to Wudang Mountain, a renowned Taoist sanctuary in Hubei, in 2010. He was 20, had never been abroad and did not speak Chinese. He carried a small dictionary and a handwritten note that read: "I want to go to Wudang Mountain."

Smartphones and translation apps were far less common then, and Pinnick relied on the help of strangers to reach the mountain. Sixteen years later, he has become an inheritor of the Wudang Sanfeng school and received China's Foreign Permanent Resident ID Card in 2025.

"Practicing martial arts has not only improved my health but also helped me find myself and become more confident," he said.

Today, Pinnick shares Wudang martial arts and Taoist culture with a large online audience. He has also published an English-language beginner's guide to the *dongxiao*, a traditional Chinese vertical flute, and hopes to establish a cultural exchange center in China.

"Many young people overseas tell me they first discovered Wudang and tai chi through my videos," he said. "That makes me very happy."

For French porcelain artist Yann Colleu, heritage became most vivid not in a museum, but in a workshop.

Colleu, now a PhD candidate at Jingdezhen Ceramic University in Jiangxi province, first arrived in Jingdezhen in 2017. Two years ago, he co-founded Borsomin, a porcelain design studio in the city aimed at promoting cultural exchange through design and art.

To Colleu, Jingdezhen is a place where "heritage is alive", with traditional craftsmanship integrating with new technology and innovation.

What impressed him most, however, was how naturally collaboration unfolded there. After meeting local artisans, he was often invited to their studios the next day to create work together. Some even shared their suppliers' contacts with him.

"Even though we all compete in the same market, there is more inspiration than competition. We learn from each other and grow together," Colleu said.

His recent collection blends French Renaissance aesthetics with Chinese porcelain art, applying color transitions and textures inspired by European painting techniques to Chinese tea ware.

"For international young creators, Jingdezhen offers a unique opportunity to access world-class craftsmanship while working in a dynamic environment that encourages experimentation, innovation and global collaboration," he said.

While Dunhuang, Wudang and Jingdezhen show how traditional culture can be renewed, Wuhan-based graffiti artist Jiang Heng is exploring how contemporary Chinese culture can travel outward.

Jiang has worked in public art for 17 years and serves as general manager of Wuhan 27 Kilometers Culture Communication.

With support from local authorities, his original character EMO — with tired eyes, anxious eyebrows and a constant smile — has appeared across Wuhan, from alleyways and bus stops to the area around the Yellow Crane Tower.

"EMO is inspired by Wuhan's cherry blossoms, representing the tired yet hopeful spirit of young people in today's urban life," he said.

Jiang plans to bring EMO to Burning Man in Nevada, the United States, from Aug 30 to Sept 7, where he will create a large-scale installation and invite participants from different countries to add graffiti in multiple languages and forms of expression.

For Jiang, the project is less about presenting a Chinese original character overseas than creating a space where people can respond to it in their own ways.

"I hope EMO can open cross-cultural dialogue and help more people understand the uniqueness of Eastern culture," he said.

Young changemakers give tradition a modern voice

By XU YIDAN, LIU KUN in Wuhan and **MENG WENJIE**

For 22-year-old Ping Chen, farming is not only about the land. It is also about branding, social media, public participation and the connections young people can build across cultures.

As the new media operator of Tomato Farm, an organic agricultural venture in Shanghai, Ping joined the 2026 Acceleration Week for Global Youth Development Programs, where he introduced "Future from the Field", an initiative that aims to draw more young people toward agriculture through education, branding and public engagement.

"China is a major agricultural country," he said. "We believe the future for young people can be rooted in the land."

Held in Shanghai and Wuhan, Hubei province, from June 11 to 17, the event brought together more than 170 youth-led initiatives from over 70 countries and regions. Covering fields from technological innovation to green development, the program provided a platform for young changemakers to present their work, strengthen their skills and build international partnerships.

With an average team age of just 25, Tomato Farm focuses on agricultural branding and rural revitalization through innovation. It cultivates more than 300 tomato varieties from over 30 countries and has developed a digital ecological farming system.

"Growing such a wide range of varieties makes our products more international and reflects our commitment to agricultural diversity," Ping said. "It also helps us reduce risks, as a single natural disaster or pest outbreak is less likely to affect all crops."

Still an undergraduate majoring in exhibition economy and management as well as media design, Ping applies classroom knowledge to farming practice. He organizes open-farm events, allows visitors to experience agricultural work firsthand and shares daily operations through social media.

"By showing our day-to-day work, we build trust with consumers," he said. "They are no longer just buyers — they become part of the farm's story."

Another young participant using innovation to renew tradition is 23-year-old Bui Thi Hong Van from Vietnam.

Bui serves as business development manager of Maypaperflower, a project dedicated to revitalizing the 300-year-old Thanh Tien paper flower craft. The initiative combines traditional craftsmanship with contemporary design, sustainable approaches and digital tools.

Bui said Thanh Tien paper flowers, originally used mainly in spiritual and cultural ceremonies in central Vietnam, were nearing extinction about a decade ago. Only a few artisan families remained, as younger generations left for work elsewhere and the market continued to shrink.

"We realized that preserving this heritage meant not only safeguarding techniques, but also creating new opportunities and a sustainable future for the people who keep the craft alive," she said.

The team has since reimagined Thanh Tien paper flowers for modern lifestyles, blending traditional techniques with contemporary aesthetics and Vietnamese cultural storytelling. For example, the lotus flower — long seen in Vietnamese culture as a symbol of purity and resilience — has been reinterpreted as a minimalist decorative item while preserving its cultural essence.

Today, more than 100 artisans and community members are involved in preserving the craft through Maypaperflower, whose products reach customers in over 20 countries.

The project also creates job opportunities for women and people with disabilities. Bui recalled a local woman who once believed her disability would limit her future but has since become a skilled artisan earning a stable income from home.

Ping Chen takes photos at Tomato Farm's cafe in Zhejiang province. PROVIDED TO CHINA DAILY

"Cultural preservation is not only about saving traditions. It is also about empowering people and restoring their sense of self-worth," she said.

The idea resonated strongly with Ping. Although Tomato Farm and Maypaperflower work in different fields, both projects show how young people can use creativity, communication and practical action to connect traditional communities with new audiences.

"Young people can be that bridge," Ping said. "We can bring rural communities closer to urban areas, and farms closer to dining tables."

WORLD CUP 2026

MASTERFUL MESSI STANDS ALONE

Argentine's brace against Austria makes him the all-time leading goalscorer at FIFA's global showpiece

MESSI'S RECORD IN WORLD CUPS

- **2006:** ONE GOAL IN THREE MATCHES
- **2010:** NO GOALS IN FIVE MATCHES
- **2014:** FOUR GOALS IN SEVEN MATCHES
- **2018:** ONE GOAL IN FOUR MATCHES
- **2022:** SEVEN GOALS IN SEVEN MATCHES
- **2026:** FIVE GOALS IN TWO MATCHES (SO FAR)

ALL-TIME WORLD CUP LEADING SCORERS

- **18** - LIONEL MESSI (ARG)
- **16** - KYLIAN MBAPPE (FRA), MIROSLAV KLOSE (GER)
- **15** - RONALDO (BRA)
- **14** - GERD MULLER (GER)
- **13** - JUST FONTAINE (FRA)
- **12** - PELE (BRA)
- **11** - JURGEN KLINSMANN (GER), SANDOR KOCSIS (HUN)

Scoring goals and breaking records is what Lionel Messi does, and he is already doing it again at his sixth World Cup.

The Argentina captain now has the World Cup scoring record all to himself after another standout performance, one that began with frustration after missing a penalty kick, but ended in pure elation with another victory.

Messi, who many consider the greatest player of all time, scored both goals in his team's 2-0 victory over Austria on Monday.

That brace took his tally to 18 World Cup goals, six days after his first-ever World Cup hat-trick put him level with German forward Miroslav Klose on 16 tournament strikes.

"Beyond anything, I'm so happy for the win," Messi said. "It was huge, tough and difficult. It allows us to be relaxed for what's ahead. All matches in this World Cup are very even, very intense. I'm enjoying this moment and crave to enjoy it with my teammates."

In the 38th minute, as the ball went into the net for his record 17th goal, Messi ran toward a corner and thrust his right arm into the air to celebrate the mark with the Argentina fans, who made up the majority of the 70,649 fans inside the sold-out Dallas Stadium in Arlington, Texas, home of the NFL's Dallas Cowboys.

It was the sixth consecutive World Cup game in which Messi has scored — joining France striker Just Fontaine and Brazil great Jairzinho, the only other players to achieve that feat.

The goal came about half an hour after he missed the spot kick for a chance to match the record.

There had been an audible gasp from those same fans when Messi missed the penalty attempt in the ninth minute.

"There were moments when I was really angry about missing the penalty, but I was able to make up for it," said Messi, who has won a record eight Ballon d'Or awards as the best player in Europe.

The penalty was awarded after Lautaro Martinez was running free in the box and was tackled from behind by Xaver Schlager and Stefan Posch, the defender playing with a broken jaw.

Play continued for more than a minute with Martinez still on the ground near the goal. When the game was stopped for him, officials reviewed the play and called for the penalty to be awarded.

Messi's left-footed attempt went just wide of the right post. He is now four from seven spot kick attempts in regulation time at the World Cup, with misses in three consecutive tournaments.

The goal record became Messi's alone when he caught goalkeeper Alexander Schlager leaning the wrong way after Thiago Almada let Facundo Medina's pass go by him and directly onto Messi's left foot from about 20 yards.

Messi added his 18th World Cup goal in the waning seconds of stoppage time, when he took a shot through several defenders after his first attempt was turned away by the keeper.

"I knew it wasn't going to be easy," Messi said. "The way things are going in the World Cup, the way it's being played. No one is giving away anything."

Argentina advanced to the knockout round by winning its first two group games.

Messi also scored all of his team's goals in Argentina's 3-0 opening win over Algeria in Kansas City.

"I have no more words to talk about Leo," Argentina coach Lionel Scaloni said.

Austria coach Ralf Rangnick did. "Someone who is 39 years old and can score two goals, and five goals overall at the beginning of the World Cup, well, that makes a difference.

"We knew that he is on a level of his own, and Lionel Messi showed us today that he's the best."

The win against Austria came two days before Messi's 39th birthday and amid concern for his ailing father.

His father has been undergoing medical treatment for an undisclosed illness, the family said in a statement last week, while not providing any specific details.

The 68-year-old Jorge Messi has played a key role in his third son's soccer career, acting as his agent and managing his business affairs off the field.

Lionel Messi was overcome with emotion after scoring his first goal against Algeria on June 17, and said it was due to some tough days not related to soccer. Four more goals later, he's all-time top scorer.

The ousted Klose played in 24 World Cup matches, wrapping up his fourth tournament in 2014 by winning the title as Germany beat Argentina — and Messi — 1-0 in extra time.

In an interview published on June 12, Klose said he expected Messi to break his scoring record.

"With the larger field of competing teams, there are more games and, so, more chances to score goals, and I assume Argentina and France will go far," Klose told German newspaper Suddeutsche Zeitung. "That's perfectly OK, the record will be broken eventually anyhow, and Messi is welcome to be the one who does it. I'm a big fan, always have been. Messi is a genius."

Messi's hat-trick in the previous game, in his 200th international appearance, came 20 years to the date of his World Cup debut in Germany, when he also scored. Monday was his FIFA-record 28th match in the tournament.

AP

Scaloni admits fatigue over constant chatter about star player

Argentina coach Lionel Scaloni admitted to being fatigued by the endless questions around the regular record-breaking feats of Lionel Messi after seeing his captain become the World Cup's all-time leading scorer on Monday.

The Inter Miami player's double in the 2-0 win over Austria took him to 18 World Cup goals, surpassing both Miroslav Klose's men's record of 16 and Marta's overall tournament mark of 17 to claim sole possession of the all-time record.

"When the team was having a rough time without the ball, he worked and managed to steal the ball," Scaloni said of his former teammate. "You could see his level of commitment.

"There's a reason for that, he has commitment and this is what he generates. I have no more words to talk about Leo. It makes us a little bit tired talking about him all the time."

After Messi opened the scoring, Argentina was rarely troubled, with goalkeeper Emiliano Martinez making one save of note before Messi's determination secured his second goal five minutes into stoppage time.

"It had been complex," Scaloni said of the challenge presented by Ralf Rangnick's side. "We had the peace of mind we needed toward the end. I'm so happy with Leo's performance, he scored again when we were struggling.

"The team did suffer today, at times they were creating difficulties and we didn't have possession. We know how to suffer and that's something praiseworthy as a team.

"This was an opponent that had very tall players, that posed a challenge. No one thought this would be easy."

Back-to-back wins have already confirmed Argentina's progress into the knockout rounds and Scaloni remains confident the defending champion will be a contender at the business end of the tournament.

"This World Cup has nothing to do with playing favorites, or the players in the national teams," he said. "There are other elements at play, the levels of fitness and the emotional element.

"There are so many teams that can win, one of the big ones will win. We will be there, we will be one of the contenders, but it will be hard facing one of these big teams.

"But," he added, "it will be hard for them facing us."

REUTERS

Mbappe storms to another double against Iraq, despite two-hour rain delay

PHILADELPHIA — Kylian Mbappe said he was not paying too much attention to World Cup scoring records after getting two more goals on what he described as a draining night in Philadelphia, as France beat Iraq 3-0 in a game interrupted by a two-hour storm delay.

Mbappe's strikes came either side of halftime on his 100th appearance for France, and Ousmane Dembele got the other goal in a game which was held up at halftime as torrential rain lashed the city.

"It was a very long evening. In terms of staying switched on, emotionally it was very difficult, because we had to remain focused in the dressing room for almost two hours. That is very difficult and very demanding," said Mbappe.

"We stayed calm, I was joking with the players," France coach Didier Deschamps said.

"I was joking with the players. This is a safety matter, so I don't blame anyone for it.

"As soon as there is a risk, we adapt to local laws. These are unusual circumstances, and I hope it won't happen again."

A match which began at 5 pm local time didn't finish until close to 9 pm, but Mbappe's performance made it memorable for other reasons for the capacity crowd of over 68,000.

His brace came after scoring a double in France's opening 3-1 win over Senegal, and he has seven goals in his last three World Cup matches, including his hat-trick in the 2022 final against Argentina.

Kylian Mbappe celebrates his second goal. REUTERS

Mbappe now has 16 World Cup goals, equaling the pre-tournament overall scoring record held by Germany's Miroslav Klose.

Lionel Messi, Mbappe's old teammate at Paris Saint-Germain, shot past that mark earlier Monday with two goals in Argentina's 2-0 win over Austria, establishing a new record of 18.

"Leo always scores goals and always will. So I am not looking at what he is doing, I'm just focusing on helping my team," said Mbappe.

He now has 60 goals for his country, having overtaken Olivier Giroud's previous French record of 57 against Senegal.

Through to last 32

It was put to him that he could chase down the record for most goals scored in one World Cup — that is held by France's Just Fontaine, who scored 13 in the 1958 edition of the tournament in Sweden.

"I'm not thinking about that just now," said the Real Madrid star.

"I think it is important to focus on the collective at the moment.

"I have always scored goals at the World Cup, but the priority is to be at our best as a team.

"You need to beat the best teams to win a World Cup, so it's going to be very difficult."

Les Bleus are already through to the last 32 with two wins from two in Group I, and next return to their Boston base, where they play Norway on Friday.

Norway beat Senegal 3-2 in New Jersey later on Monday, meaning it is also now through. France and Norway are level on six points each, but France's superior goal difference means it will finish top of Group I with a draw in that last match.

"The players and staff had to make a big effort. But we did the job and we are very pleased with how we played," said Mbappe.

Iraq, which has played five World Cup matches across two tournaments, but has lost them all, now has to beat Senegal in Toronto on Friday to stand any chance of advancing as a best third-placed team.

"We stuck to our game plan and executed it pretty well, but France are good," said Iraq defender Rebin Sulaka.

"We still have a chance, we are still in the competition, so we have to go back and correct our mistakes and then go out and give everything against Senegal."

Xi calls for modernizing rural areas

Stable supply of grain, building of beautiful, livable villages stressed

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

President Xi Jinping has called for solid measures to advance the modernization of agriculture and rural areas, emphasizing the need to guide farmers to create a better life with hard work and wisdom.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made the remarks during an inspection tour on Wednesday to the city of Dezhou, East China's Shandong province.

He said that the modernization of agriculture and rural areas is crucial to the overall development and quality of Chinese modernization.

It is important to enhance the capacity, quality and efficiency of agricultural production, ensure the stable supply of grain and other important agricultural products, and promote the construction of livable, business-friendly, harmonious and beautiful villages according to local conditions, Xi said.

The inspection trip came at the time of the summer grain harvest in rural areas.

Attaching great importance to the work related to agriculture, rural areas and farmers, Xi has said on various occasions that efforts must be made to ensure food security, drive rural vitalization on all fronts and promote common prosperity.

At Dongyujia, a village in Dezhou's Lingcheng district, Xi heard reports about local agricultural production, learning about wheat harvests, corn planting and farming supplies in local areas.

Xi inspected water and fertilizer integration facilities and chatted with grain growers, machinery operators and agricultural technicians.

He said that ensuring the stable supply of grain and other important agricultural products is the top priority of agricultural production.

President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, chats about daily life with the family of farmer Yu Xinhui on Wednesday during an inspection trip to Dezhou, Shandong province.
XIE HUANCHI / XINHUA

Xi underlined the need to implement policies that support grain production, saying that efforts must be made to stabilize farming supplies and their prices, and actively apply varieties of grain that suit local conditions, as well as advanced technologies and equipment, in order to steadily increase yields and efficiency, striving for a bountiful grain harvest for the year.

He also called for improving agricultural infrastructure, enhancing the efficiency of water use, and strengthening efforts in monitoring and providing early warnings for disastrous weather to strengthen the capability in agricultural disaster prevention, mitigation and relief.

While visiting Xiyujia village, Xi inquired in detail about how the village strengthens the Party organization and provides services to the villagers.

Xi expressed the hope that village Party organizations would further leverage the guiding role of Party building and make new achievements in building a beautiful and harmonious countryside for people to live and work in.

He urged sustained efforts to reduce the burden for grassroots officials so that they have more time and energy to serve the people and promote development.

Xi also visited the home of Yu Xinhui, a farmer in the village, looking around at the home furnishings and sitting down with the family to chat about everyday matters.

Xi asked about their work and incomes, the health of the elderly and children's education, and inquired in detail about whether the Party's policies on agriculture, rural areas and farmers had been fully implemented.

He pointed out that establishing and practicing a correct understanding of governance performance is ultimately aimed at improving the well-being of the people.

Party members and officials must enhance their sense of serving the people, strengthen the bond with the people, and do more good things, be down-to-earth and address difficulties for the people, thereby genuinely enhancing the people's sense of fulfillment, happiness and security, he said.

As Xi left the village, villagers warmly saw him off.

He noted that July 1 marks the 105th anniversary of the founding of the CPC, highlighting the remarkable achievements the country has made under the leadership of the CPC over the past 105 years.

As the nation is embarking on a new journey of comprehensively building a modern socialist country, Xi called on all the people throughout the country to work in solidarity to create a brighter future and continuously meet the people's aspirations for a better life.

He wished that the villagers would build beautiful homes and have better lives under the Party's leadership.

Premier Li says China offers world converging dividends

By **JI HAISHENG**
in Dalian, Liaoning
jihaisheng@chinadaily.com.cn

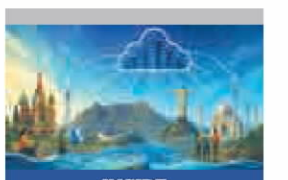
Premier Li Qiang highlighted "China Opportunity 2.0" at the opening plenary of the 17th Annual Meeting of the New Champions of the World Economic Forum in Dalian, Liaoning province, on Wednesday, underscoring that China's development has brought the world vast opportunities and considerable room for growth.

He emphasized that China now offers the world converging dividends — anchored in its massive market scale and low-cost production factors, and reinforced by technological advancement and industrial upgrading. Li made the remarks while addressing a full house of political and business leaders at the annual gathering, also known as the Summer Davos forum.

Elaborating on "China Opportunity 2.0", the premier said that it represents across-the-board innovation empowerment and high-return investment prospects for enterprises worldwide, while for global development, he added, it means more accessible advanced technologies and more widely shared development benefits.

"China is committed to an open approach to innovation. Much of its innovation is open-source," Li said. "This enables more countries, particularly developing countries, to access affordable new technologies and new products, which enhances their development capacity and can help address many difficulties holding back global development."

He cited broad international recognition and acclaim for China's rapid progress in innovation, and rebutted the narrative of a so-called "China Shock 2.0" — a term that implies anxiety over China's technological and industrial advances, and frames its development as a "shock" to the global economy.



On the Chinese economy, he said that despite increased volatility in the international landscape and greater strain on the fragile global economic recovery since the start of this year, China has withstood the challenges, forged ahead and demonstrated strong resilience and a promising outlook.

The nation's economy has demonstrated stability, innovation, vitality, and integration with the rest of the world at the beginning of the 15th Five-Year Plan (2026-30) period, he added.

EYES OF THE WORLD TURN TO DONGGUAN

Glasses from China's southern manufacturing hub don't just make you look smart — they are smart

By **ZHENG CAIXIONG**
in Dongguan, Guangdong
zhengcaixiong@chinadaily.com.cn

The voice was calm, yet the effect was instant. "Xiaohuan, Xiaohuan, capture the scene in front of me," said Yang Wen'an, and the moment was frozen — snapped and saved by the pair of artificial intelligence glasses he was wearing. The onlookers who were gathered around him in a demonstration space in Fenggang town burst into applause, marveling at this technological scene.

China Vibes — GIFTS —

Yang, general manager of Dongguan Qianhuan Shiheng Industrial Co, was wearing a pair of smart glasses developed by the company, which entered the AI eyewear arena in 2022.

They are part of a fully self-developed smart glasses system launched last year that features a 13-megapixel camera powered by proprietary optics, hardware and algorithms, all designed and manufactured entirely in-house.

A visitor inquires about smart glasses at the 139th session of the China Import and Export Fair, or Canton Fair, in Guangzhou, Guangdong province, on April 15. ZHANG XIANGLIANG / FOR CHINA DAILY

According to data from the research firm Omdia, global shipments of AI glasses reached 8.7 million units last year, a year-on-year increase of 322 percent. Even more striking is the fact that more than 4 million of these — nearly half of all AI glasses globally — were shipped by enterprises based in Dongguan, Guangdong province.

The southern manufacturing hub not only ranks first in the world for shipment volume, but also marks a profound shift. Once known as the "world's factory", Dongguan has quietly evolved into a global hub for smart products, and the AI glasses perched on millions of noses are its new calling card.

Step inside the facilities of Snoko Electronics Technology Co, and that newly forged reputation becomes even more matter-of-fact.

Blacklists raise costs for all, narrow scope of dialogue

WORLD WATCH
By Jack Midgley

Earlier this month, the Pentagon added 65 more names to its blacklist of so-called "Chinese military companies", bringing the total to 188. This time, Alibaba, Baidu, BYD and Tencent were grouped with missile makers and shipyards on a roster that, starting June 30, bars the United States Department of Defense from signing new contracts with any of the listed companies.

A separate restriction next year would limit Pentagon purchases of goods incorporating inputs from any listed company. This means that US companies and consumers are strongly discouraged from doing business with the blacklisted companies.

In response, on Monday, China imposed a set of countermeasures against the US, placing 10 US companies on an export control list and barring government agencies from purchasing products from 46 others.

Washington calls the designations routine security vetting aimed at companies that it says are tied to China's military-industrial base. But blacklists can be counterproductive. They rarely make any nation "more secure". Rather, they raise costs, narrow the channels available for international dialogue, and feed mistrust that makes future disagreements harder to resolve.

There is also a US candor problem. Section 1260H, or the so-called "Chinese military companies" list, targets companies for contributing to what Washington calls China's military-civil fusion strategy, blurring the line between civilian commerce and military modernization. But "military-civil fusion" has long been practiced by the US, openly and by design. For example, the Pentagon's Defense Innovation Unit has a legal mandate to "accelerate the adoption of commercial technology throughout the military". Its Replicator Initiative repurposes commercial drones and software for the battlefield.

The Defense Advanced Research Projects Agency, an independent research and development agency within the US Department of Defense, has spent decades funding research that blurs the line between defense laboratories and civilian life, producing the internet and GPS along the way. None of this is secret; it is published policy.

Overcoming the 'paralyzed family' trap

New insurance program aims to solve problem of care for elderly disabled people

By LI LEI
lilei@chinadaily.com.cn

For 36-year-old Zhao Zhiqiang, life stopped last November. That's when his 56-year-old father suffered a massive brain hemorrhage, leaving him nearly paralyzed, unable to speak, and dependent on Zhao's assistance for almost every bodily function.

With no savings for a professional caregiver and no other relatives to help, Zhao quit his job to provide round-the-clock care at their home in rural Kangxian county, Gansu province.

"I have no work and no income," Zhao told China Daily. "All I do every day is cook blended food, clean up feces, turn him over in bed, and guess why he is groaning. He can't tell me where it hurts."

The family survives on a monthly welfare payment of about 2,000 yuan ($276). Zhao's wife lives apart with their two young daughters, aged 4 and 7, while his 83-year-old grandmother — still self-sufficient — also needs occasional assistance. His father's monthly medicine and supplies — including diapers and incontinence pads — run to almost 1,000 yuan, leaving the family with just enough to cover the bare minimum of food, and nothing more. "I desperately need a professional caregiver so I can go back to work," Zhao said.

His situation is indicative of China's growing predicament. With an aging population and shrinking family sizes, many disabled and incapacitated elderly are falling through the cracks. The result is what some families call the "one disabled, whole family paralyzed" trap that robs breadwinners of their livelihoods and leaves the most vulnerable without proper care.

In late March, China launched a national long-term care insurance program. Dubbed the "sixth insurance" the program is intended to fill the gap not covered by the social pillars of the pension, and medical, unemployment, work-related injury and maternity support. The scheme follows nearly a decade of pilot programs that covered more than 3.3 million people and cut caregiving costs by over 100 billion yuan ($14.5 billion). It aims to provide professional services and financial aid for people with long-term disabilities, and will be available in home-based, community and institutional settings.

The new system will be rolled out in stages and implemented nationwide by the end of 2028, covering all residents regardless of employment status. Funding comes from employers, individuals and government subsidies, with premiums capped at roughly 0.3 percent of wages. Beneficiaries will pay no deductible amounts, though annual reimbursements are limited to no more than 50 percent of the previous year's local per capita disposable income, according to guidelines issued by the general offices of the Communist Party of China Central Committee and the State Council.

Zhao said he had never heard of long-term care insurance until contacted by China Daily for this interview. But once he learned about it, his hopes were lifted.

"My final wish," he said, "is for the policy to be rolled out faster and cover us as early as possible, so we can get back to work and earn a living. But the policy must reach villages — not just county seats. And the carers must be properly trained — not just anyone off the street."

'Too weak to care'

In Jiangsu province's Suzhou, a pilot city since 2017, the program has already transformed daily life for thousands of families. The city has gone further than the national standard by including moderately disabled people — not just those with severe disabilities — a model that authorities hope to replicate nationwide.

Zhang Jian, 70, cares for his 96-year-old father, who has advanced Alzheimer's disease and can barely walk. Before long-term care insurance, Zhang and his sister juggled supervision 24-7, often canceling social engagements and sometimes losing patience.

"Bathing him required two people — me and my brother-in-law," Zhang said. "Friends kept inviting me out, but I had to say 'no' every time. I felt stuck at home, sometimes irritable. But you think: everyone gets old. It's our duty."

Since July 2025, a certified carer from Shanghai-headquartered provider Fortune Care has been at Zhang's home every morning from 8:30 to 10:30 — a time chosen because his father is most alert after waking. The carer measures the father's blood pressure, sends the readings by text message, massages the elderly man, helps him walk or sit outside in a wheelchair, and even manually removes feces when necessary.

"The carer does things even we children are reluctant to do," Zhang said. "I saw her put on gloves and help my father with his bowel movement without any hesitation. I was deeply grateful."

Zhang pays only 2.5 yuan per hour, or 5 yuan for each two-hour session — a fraction of the market rate. For moderately disabled care recipients like his father, the plan covers 13 home visits per month (18 for severe disability). Suzhou goes even further for people with dementia or intellectual disabilities, extending visits to 2.5 hours each because such cases require more time and patience.

Dong Hui is head of Puyuan Care Group, a nationwide long-term care provider operating in 46 cities with nearly 200 service stations and more than 6,000 carers serving 30,000 families.

She said the insurance solves three core problems of families: those who don't know how to care, have no time to care, or are physically too weak to care.

Professional carers, she said, use proper techniques for bed-to-chair transfers, bathing, and pressure-sore prevention — while also training family members while on the job.

"Before long-term care insurance, families had to choose between filial piety and earning a living," Dong said. "Now they have backup — a real safety net."

Human toll

Chen Lixiu, 52, a single mother from Dong'an county in Hunan province, knows that trade-off intimately. Her 76-year-old mother suffered a severe stroke in March and is now unable to speak, swallow, or move. Doctors said only conservative treatment is possible.

For two months, Chen has slept next to her mother, providing 24-hour care with no relief. Her father, nearly 80, is too frail to help. Her siblings have their own problems to deal with: one brother supports six people on a single salary, including his disabled son; one sister cares for her disabled husband; while another sister works away from home.

"I haven't gone back to my job," Chen said. "I was supposed to return after the May Day holiday. Now I have no income."

The physical toll is high. Chen must turn her mother every two hours to prevent bedsores — "a laborious job, and I'm not strong".

She prepares liquid food that is administered through a tube, worries about nutrition and choking, and cleans up urine and fecal matter multiple times a day. Her mother cannot tell her when she is hungry, thirsty, or in pain. "You just guess. You watch closely. It breaks your heart," Chen said.

Her brother pays for the medicine and supplies, which exceed 1,000 yuan per month. He has suggested stopping treatment, as the family can no longer afford it. However, Chen and her father refuse to give up although she sees no way out of the predicament.

"If I don't work, I have no income. With no income, I cannot sustain this long-term care," she said. "And I cannot keep burdening my son, who just started working and still has debts from our government-assisted housing."

Chen said she would welcome a professional carer at an affordable price, ideally providing home-based services so her father can see his wife every day.

"Long-term care insurance would solve two things: the caregiver problem — because most rural children of the elderly are working far away — and the financial pressure. With professional help and some reimbursement, we could work and the elderly would get proper care," she said.

Stopping fraud

To prevent the fraud that plagued some pilot schemes — including inflated disability ratings, fabricated service records, and identity theft — the new national program mandates surveillance technology.

Millimeter-wave radar sensors, as small as a computer mouse, use thermal sensing to detect a carer's presence and the service duration without capturing identifiable images, and preserving patient privacy. Bluetooth-enabled badges worn by carers transmit signals every 10 to 20 seconds; any departure from the patient's home triggers a back end alert.

Random "flight checks" by supervisors and quarterly satisfaction surveys further enforce the quality of care, said He Yue, Puyuan's national operations director.

Zhang, who cares for his father in Suzhou, said he welcomes the monitoring. "I am completely at ease," he said. "It doesn't feel like an invasion of privacy. It makes the service more standardized and gives me peace of mind."

Behind the technology are human carers like Xu Xinglan, 55, who has worked in long-term care for six years. She holds an elderly care certificate, a medical care certificate, and — as of May 2026 — a new "long-term carer" certification that requires passing both written and practical exams.

Xu recalled one of her most difficult patients: an elderly man with severe Alzheimer's who did not recognize his own family, screamed at them, and would hit anyone who tried to clean him. On her first visit, he was hostile and tried to strike her.

"I didn't get impatient," Xu said. "I crouched down, spoke softly, soothed him like a child. Even when he kicked or yelled, I understood — he was sick and couldn't control himself."

After months of daily visits, the man began to recognize Xu. He now greets her and sometimes says "thank you". His family, she said, marvels that he is closer to her than to his own children.

Workforce crunch

By the end of 2025, China's population aged 60 and above reached 323.38 million — about 23 percent of the total. Roughly 35 million of them need long-term care, according to official statistics.

The new insurance is expected to channel private capital and create new business models. Wang Wenjun, deputy head of the National Healthcare Security Administration, said pilot senior care programs have already attracted more than 60 billion yuan in private investment.

But a shortage of trained carers looms. Dong, head of Puyuan Care Group, said the industry suffers from "three lows and one high" — low pay, low social recognition, low professional skill, and high physical strain. Sixty percent of her carers are over 50, with an average age of 55. To maintain quality, the company caps hiring at age 60.

"Young people are not willing to join," Dong said. "We need government-led vocational grading, better salaries, and university programs to cultivate a new generation of carers." She noted that the Suzhou government is already promoting a professional ranking system for long-term carers to raise the job's social status and attract younger workers.

For Zhao, who cares for his paralyzed father in Gansu, such long-term reforms cannot come soon enough.

He said he would happily pay 0.3 percent of his future wages for long-term care insurance — just like cooperative medical insurance. "You put in a little when times are good, and when disaster strikes, the system has your back," he said.

China's growth fuels global development

Country is not a so-called "shock", but a shared opportunity for world economy

By **ZHANG CHENXU** in Dalian, Liaoning and **ZHONG NAN** in Beijing

China's strong innovation momentum and resilient growth prospects are giving global businesses greater confidence and fueling world economic growth, as the country continues to share the benefits of its vast market and high-standard opening-up with the world, business leaders and experts said on Wednesday.

Speaking at the ongoing 17th Annual Meeting of the New Champions of the World Economic Forum, also known as the Summer Davos forum, in Dalian, Liaoning province, they added that the world's second-largest economy is not a so-called "shock", but a powerful engine of innovation-driven growth, long-term investment opportunities and shared growth for the global economy.

Ben Dawson, president for Asia Pacific, Japan and China at United States-based tech company Cisco, said in an exclusive interview with China Daily that China's vast and dynamic market has continued to create opportunities for global companies.

Having invested in and deeply engaged with China for 32 years, Cisco has seen the country's artificial intelligence development gain momentum on the back of a strong industrial base, sustained investment in manufacturing and faster adoption of advanced technologies across traditional sectors, Dawson said.

The upbeat sentiment comes as China is moving faster to create new forms of smart economy, with this year's Government Work Report calling for advancing and expanding the "AI Plus" initiative, promoting faster application of new-generation intelligent terminals and AI agents, and encouraging large-scale commercial application of AI in key sectors and fields.

Yin Zheng, executive vice-president of China and East Asia operations at French industrial conglomerate Schneider Electric, said that China has become both an important engine of global economic growth and a major hub for technological innovation, with its solid energy foundation and strong industrial system reinforcing each other.

The trend extends beyond Schneider Electric. Jiang Ying, chair of Deloitte China, said more multinational companies are adopting a new growth model in China — rooting themselves in the local market while serving global demand — by using the country's vast market as a testing ground for technology deployment, industrial collaboration and global expansion.

"The long-term value of the Chinese market lies in its vast and dynamic consumer base, vibrant technological and industrial innovation, and continued high-level opening-up," she added.

Global companies' growing confidence in China stands in contrast to some overseas anxiety about the country's advances in technology and industrial innovation, including the narrative of a so-called "China Shock 2.0" that frames China's development as a disruption to the global economy.

Yet executives and experts at the forum said the country's industrial rise is creating new sources of innovation, efficiency and shared growth.

Joe Ngai, chairman of McKinsey Greater China, said that Chinese industry is already "indisputably at the leading edge of global development" in many areas, especially high-tech manufacturing, clean energy, AI applications and robotics.

"Chinese companies are exporting a lot of their intellectual property, their methodologies and their processes. China is becoming the factory for factories," Ngai said.

China's industrial strengths are also underpinned by its complete value chain, said Elodie Latour, Decathlon's vice-president for China.

"I don't think there is any other place in the world where you have the full value chain available like you do in China. And when you have the full value chain available, your time to market becomes almost irreplaceable," Latour said.

Product personalization and fast response to market needs are other areas where China can really stand out and offer a unique customer experience, she added.

Noah Xie, chairman and CEO of Kmind Strategy Consulting, said China's vast market represents a major opportunity for foreign companies that are willing to invest, operate and grow in the country.

Premier Li Qiang (center, right) attends a symposium and exchanges ideas with business representatives on Wednesday at the 17th Annual Meeting of the New Champions of the World Economic Forum, also known as the Summer Davos forum, in Dalian, Liaoning province. ZOU HONG / CHINA DAILY

Forum: Stable, predictable market lauded

From page 1

China remains committed to openness and cooperation regardless of external changes, Li told around 150 corporate leaders from more than 30 countries and regions in a separate meeting attended by representatives of the business community.

He said that the country will continue to deepen its participation in international trade and investment cooperation, and promote the connectivity and integration of the Chinese market with the world market.

Li noted that over the years, China's economy has been advancing toward innovation and higher quality, which will bring more opportunities for global companies. He highlighted three areas of upgrading — the market, manufacturing and infrastructure — that he said would create richer incremental space, a more efficient industrial ecosystem, and more favorable conditions for global businesses operating in China.

The premier pledged that the Chinese government will provide better service for businesses from all countries and foster a more open, fair and friendly environment for their operations in China.

Matts Johansen, CEO of Norwegian company Aker BioMarine, expressed growing confidence in China, calling it a stable and predictable market in an unstable world. He noted that the Chinese market contributes to 20 percent of the company's global sales and is its fastest-growing region.

"If you want to invest in the future, you have to invest in China. If you want to connect to the world, you have to connect to the Chinese innovation and supply chain," he said, adding that the company is establishing its own innovation and manufacturing hubs in the country.

Johansen endorsed the concept of "China Opportunity 2.0". He said, "Innovation here in China is a great opportunity for global businesses," citing the country's innovation strength, efficient supply chain and innovative consumers that adopt new products.

Luca Forte, corporate supply chain director at Italian multinational automotive electronics giant Eldor, said he is impressed by China's focus on developing new technologies and praised its efforts in pioneering a wide range of technologies.

He said the Chinese approach has demonstrated to the world that technologies can be developed in a very short time, with a simple method and avoiding unnecessary complexities while remaining highly active and efficient.

Nation rejects false claims about ethnic law

By **CUI JIA**
cuijia@chinadaily.com.cn

Inside
Editorial, **page 11**

A senior official strongly rebutted on Wednesday claims made by certain foreign organizations and forces that the Ethnic Unity and Progress Promotion Law "assimilates ethnic minorities". He said that there is no point in attacking China's ethnic affairs with prejudice and turning a blind eye to facts.

Bayanqolu, a member of the Standing Committee of the National People's Congress, China's top legislature, and chairman of the Ethnic Affairs Committee of the NPC, said at a news conference that some foreign forces are spreading falsehoods about China's human rights situation, especially in the context of ethnic issues.

He said that they disregard the fact that the law was formulated in line with China's national conditions and modern governance concepts and reflects the common aspiration of the people of all ethnic groups in the country.

"Seeing is believing, and facts should be the basis. What is the point of fabricating and sensationalizing with prejudice?" Bayanqolu said during the news conference held by the State Council Information Office on the law.

"The so-called statements issued by these organizations ignore the tremendous achievements made in China's ethnic regions, unjustly criticize China's ethnic policies and legal construction, and constitute a blatant interference in China's internal affairs. We strongly resent and firmly oppose it," he added.

As a matter of fact, the economic and social development of ethnic regions has seen unprecedented progress, and living standards are at an all-time high, he said.

The development of all five ethnic autonomous regions — Inner Mongolia, Ningxia Hui, Xizang, Xinjiang Uygur and Guangxi Zhuang — has accelerated. Between 2012 and 2025, the GDP of these regions increased from 3.25 trillion yuan ($478 billion) to 8.66 trillion yuan, Duan Yijun, deputy head of the United Front Work Department of the Communist Party of China Central Committee, said.

On the road to poverty alleviation and building a moderately prosperous society, no ethnic group or individual has been left behind, and as Chinese-style modernization advances, no ethnic group or individual can be left behind either, said Bayanqolu, the chairman of the Ethnic Affairs Committee.

The law, which was passed on March 12 and will take effect on July 1, defines the protection of the legal rights of citizens seeking employment and entrepreneurship to further safeguard the development rights of people from all ethnic groups. There is absolutely no so-called "forced migration" or "forced labor" in the Xinjiang Uygur autonomous region as claimed by some Western organizations and media, said Chen Ruifeng, director of the National Ethnic Affairs Commission, at the news conference.

"All Xinjiang residents who seek employment outside the region do so of their own free will," Chen said, adding that claims of "forced migration" or "forced labor" are "extremely absurd and ridiculous".

Chen added that China's Constitution and a series of other laws and regulations fundamentally prohibit all forms of forced labor. The Ethnic Unity and Progress Promotion Law further clarifies measures such as rights protection and legal assistance for cross-regional workers.

When the draft law was submitted to the NPC Standing Committee for a second reading in December, a provision was added that educational institutions should use standard Chinese for teaching, as the promotion of standard Chinese is mandated by the Constitution and is also an important measure to foster a strong sense of community for the Chinese nation. Since then, some Western media outlets have used the legal provision to attack China's ethnic policies.

Lei Jianbin, vice-chairman of the Legislative Affairs Commission of the Standing Committee of the NPC, said it is important to note that the promotion and popularization of the national standard language should not be seen as opposing the learning and use of the languages of different ethnic groups.

In fact, the protection of the right of people from all ethnic groups to use their own languages is explicitly stipulated in the Constitution and other laws. The new law encourages different ethnic groups to learn each other's languages, Lei said.

Bayanqolu said that after the Ethnic Unity and Progress Promotion Law was passed, it received high recognition and firm support from people across all ethnic groups. Many individuals, media and institutions from various countries said they believe the law has provided a reference path for multiethnic countries.

Blacklist: Costs reach well beyond companies named

From page 1

Washington's complaint might carry more weight if the US acknowledged that a version of the same fusion is also US policy.

The costs of blacklisting reach well beyond the 188 companies named. Multinational companies in both markets must now screen suppliers, customers and partners against a growing patchwork of US and Chinese rules, a compliance burden that has little to do with security while increasing the cost of doing business. Many companies respond by duplicating supply chains rather than risk falling afoul of either government, and that redundancy raises prices. Global trade, still adjusting to years of tariff and export-control friction, absorbs another layer of it. None of this serves workers, consumers or businesses in either country, or the global economy that depends on steady commerce between its two largest players.

China has built its own legal tools to safeguard economic security since 2020, including an unreliable entity list and an Anti-Foreign Sanctions Law. The real question is not whether China can respond if pressed; it plainly can. The question is whether Washington will give good reason to rely on dialogue instead of retaliation.

Both countries hold real strengths. China's position in critical minerals and rare-earth processing underpins much of global manufacturing; the US' position in advanced semiconductors, capital markets and dollar-denominated finance underpins much of global commerce. These facts are reminders that the two economies are already deeply interdependent, and that interdependence is best managed through negotiation, not lists that try to isolate the other country.

The way ahead is well understood. Chinese leaders have long framed the bilateral relationship around mutual respect, peaceful coexistence and win-win cooperation, language that leaves ample room for positive outcomes. The recent China-US summit showed that high-level dialogue can still produce real momentum. The question is whether Washington builds on the positive momentum or lets a blacklist undercut it.

A more productive US approach would look different from this month's list: narrowing designations to companies, boosting direct military ties rather than letting blacklists grow; building in review and sunset provisions instead of a one-way ratchet; and pairing any future step with a genuine offer to negotiate the underlying concerns through structured economic dialogue.

China and the US are not short on shared interests — in technology, trade and the stability the rest of the world quietly depends on. The opportunity for a steadier relationship is real, and it has not closed. What happens next is largely Washington's choice.

Tech: Half the world's AI glasses trace back to Dongguan

From page 1

Xu Zuowei, the company's general manager, reels off the functions of Snoko's smart glasses: music playback, phone calls, AI voice interaction, photography, video recording, real-time translation and navigation.

The glasses free your hands, he said, adding that you can answer a call without reaching for your phone, chat with a voice assistant that offers emotional comfort as readily as it handles daily queries, and capture fleeting moments that would otherwise slip away in the time it takes to get your phone out of your pocket.

Snoko entered the AI glasses market five years ago, and has since shipped more than 1 million units, with an annual production value exceeding 100 million yuan ($14.7 million). Between 70 and 80 percent of its smart glasses are sold overseas, reaching retailers in Southeast Asia, Japan and South Korea, as well as Europe and the Americas. Prices for the glasses range from around 100 yuan to several thousand, depending on the model and configuration.

The company has recently launched ultralight AI glasses weighing 25 grams. They are designed to be comfortable to wear for hours on end. Supporting real-time translation of 160 languages, they boast a battery life of more than 20 hours.

Xu said he believes that the future trajectory is clear: "AI glasses will become smarter, more intuitive, user-friendly and convenient. Just like smartphones, they will evolve into an indispensable part of our lives."

Zhang Jiawei, chief executive officer of Guangdong-based Kreta Yunke Technology Co, is driven by something more altruistic. His company's AI glasses can help the visually impaired navigate the world, correct their wearers' sitting posture, identify parasites and offer traditional Chinese medicine diagnoses.

The approach is deliberate: Find an overlooked aspect of life and use a pair of glasses to see it better than human eyes ever could.

In one very specific application, Zhang's company developed smart glasses that help herdsmen locate caterpillar fungus, a prized ingredient in traditional medicine that is notoriously difficult to spot. Powered by specialized algorithms and large models, the glasses can detect the fungus over a one-meter range and send out an instant alert. A task that once demanded backbreaking patience and trained intuition has been reduced to a quiet beep.

"It greatly lowers the difficulty for herdsmen to locate the fungus," said Zhang.

There is a quiet poetry to the fact that all of this — half the world's AI glasses, bound for mountains, boardrooms and megacities alike — traces back to the workshops and research and development labs of Dongguan.

A city that once stitched and assembled for the world now thinks for it in a whisper: "Xiaohuan, capture the scene." A scene, it seems, that has already been set — one pair of glasses at a time.

Experts wary of 'optimistic' climate projections on China

Energy security, growing power demand seen as impediments to transition goals

By HOU LIQIANG
houliqiang@chinadaily.com.cn

Energy experts have dismissed a recent report from a foreign research institute on China's carbon emissions, noting that its optimistic climate projections for the nation may not fully align with current realities.

Although China has made remarkable progress in addressing climate change and advancing its "dual carbon" initiatives, experts noted that the report might not adequately consider challenges such as China's existing grid limitations, rising power demand, and the government's emphasis on energy security.

The report, unveiled by BloombergNEF in May, projects that China's emissions will fall 17 percent from their 2023 peak by 2030, outpacing China's commitment under the landmark 2015 Paris Agreement.

Yet, China has never officially announced that its emissions have peaked. The country pledged in 2020 that it would strive to reach peak carbon dioxide emissions before 2030 and carbon neutrality before 2060.

The report said China is rapidly electrifying, with electricity already the dominant final energy carrier by 2023 and coal's share of power generation falling from about 54 percent in 2025 to an estimated 19 percent in 2035 and 7 percent by 2050.

Wang Weiquan, deputy secretary-general of the renewable energy committee at the China Energy Research Society, described the report as "overly optimistic" and "even radical".

Coal-fired power plants still contribute over 50 percent of China's electricity generation, he noted. If the share is to decrease to 19 percent by 2035, as mentioned in the report, the country has to bring it down by three percentage points a year.

"That's too optimistic," Wang said.

He argued that the report underestimated the weight that the Chinese government places on energy security, which underpins economic stability and people's livelihoods.

"The government has to take a holistic approach," he said.

Wang also pointed to several hurdles that stand in the way of China's energy transition.

China's electricity demand is rising by 500-600 billion kilowatt hours annually, reaching over 10 trillion kWh in 2025 and an estimated 13 trillion kWh by 2030, he said. Wind and solar together currently generate 2.2 trillion kWh.

Including hydro and nuclear, non-fossil sources account for roughly 40 percent, he added.

In addition, the growth of wind and solar power generation may slow down as both have to compete in the power market, where volatile prices create uncertain returns, he said.

"That uncertainty has made even the big State-owned power companies scale back their investment pace," Wang said.

In February 2025, Chinese authorities reformed the approach to pricing wind and solar power, transitioning from fixed tariffs to a market-based system.

For new renewable energy projects with an operation commencement date of June 1, 2025 or later, electricity prices will be established via market-based competitive bidding, according to the new policy.

Prior to this, the country's feed-in tariff mechanism required grid operators to purchase renewable electricity at government-set prices, a guaranteed above-market rate funded through a small surcharge on electricity bills.

Wang said challenges in integrating renewable energy into the grid, along with a shortage of suitable land for new projects, are also hindering the country from rapidly expanding renewable energy development.

"To sustain rapid increase in renewable energy generation is far from easy, given all these real-world constraints," he continued.

Lin Boqiang, dean of Xiamen University's China Institute for Studies in Energy Policy, said the biggest challenge for China to peak carbon emissions and go carbon neutral lies in the construction of a new electricity system dominated by solar and wind power.

"The country's current energy infrastructure remains inadequate, as its power grid lacks the capacity to fully accommodate new energy sources," he said, highlighting that China has yet to develop sufficient capability to address the intermittency of solar and wind power.

Currently, the growth in contribution from wind and solar sources to the grid simply cannot keep up with the rise in power demand, Lin added. As a result, coal-fired power remains the only option to bridge the gap, which explains its continued expansion — albeit at a very slow pace.

"Nuclear power is constrained by safety concerns, preventing large-scale development. As for hydropower, the issue is resource availability — there simply aren't enough suitable sites," he said.

Lin urged enhanced efforts to boost power storage capacity, emphasizing its dual role: addressing the intermittency of renewable sources and, equally important, halting the continued expansion of coal-fired power.

He Kebin, dean of the Institute for Carbon Neutrality at Tsinghua University, said the process of peaking carbon emissions and achieving carbon neutrality will also bring new challenges to air pollution control in China.

He, also an academician of the Chinese Academy of Engineering, stressed that building a new electricity system cannot be done all at once, especially in the face of the explosive growth in power demand driven by climate-induced extreme weather events and the robust growth of artificial intelligence.

Building a new electricity system could take decades, he said. To ensure grid balance throughout this transition, new coal-fired power capacity will still be required, while some existing coal-fired plants will be repurposed to provide reliability support for the grid.

Under these circumstances, many coal-fired power plants will no longer operate according to their designed operating hours, he said. Instead, they will have to start and stop frequently and run at low loads, which will compromise the performance of ultra-low emission technologies and consequently affect the emission of air pollutants.

Yao Xuan, vice-general manager of CHN Energy Longyuan Environmental Protection Co, shared He's views.

Addressing the 24th China International Environmental Protection Exhibition and Conference on June 2, Yao said, to achieve deep peak shaving, many coal-fired power units in developed regions like Zhejiang and Jiangsu provinces are now running at 20 percent load over long durations during the daytime.

"This was something unimaginable," he said.

As one of the country's major electricity generators, China Energy Investment Corporation (CHN Energy) saw its power units average 16 start-stop cycles per unit in 2025, compared with only five half a decade ago, he said.

The frequent start-stop cycles and low-load operating conditions make it challenging to effectively control nitrogen oxide emissions, prevent ammonia slip, and avoid excessive particulate emissions, Yao said.

AI sorting machine seeks to bolster TCM industry

By YAN DONGJIE in Tianjin
yandongjie@chinadaily.com.cn

A Tianjin-based research center has rolled out the latest generation of an artificial intelligence-powered sorting machine for traditional Chinese medicinal herbs, replacing subjective manual inspection with digital quality assessment in a move aimed at modernizing the centuries-old industry.

The new system, developed by the National Modern TCM Innovation Center, combines X-ray imaging, hyperspectral analysis and machine vision to detect hidden defects, measure chemical composition and automatically grade raw herbal materials.

The fourth-generation machine is already being used at pharmaceutical facilities in Tianjin and provinces of Jilin, Jiangsu and Guangdong, where it helps manufacturers identify counterfeit or damaged herbs, remove impurities and sort raw materials according to quality standards.

"Herbs supplied by different farmers can vary significantly in quality," said Liu Changqing, senior manager of the center's green intelligent manufacturing department.

"The machine grades every batch before production begins, helping manufacturers ensure the consistency of finished medicines. That has been the central goal of our research."

Traditionally, medicinal herbs were sorted through a combination of manual picking, air separation and visual inspection. The labor-intensive process depended heavily on workers' experience, making it difficult to detect internal defects or maintain consistent standards.

The new system addresses those limitations by combining three types of data.

X-rays examine the internal structure of herbs without damaging them, revealing hidden problems such as rot or hollow cavities. Hyperspectral sensors analyze chemical composition and estimate the levels of active medicinal compounds, while high-resolution cameras inspect surfaces for mold, dirt and other contaminants.

"Each technology captures different information," Liu said. "When the data is cross-checked, the error rate can be greatly reduced."

The research team spent five years developing four generations of the machine. The first prototype was unveiled in 2020, while the latest version entered mass production earlier this year.

So far, researchers have developed digital identification models for more than 50 commonly used medicinal herbs. But the challenge remains substantial.

China uses around 1,000 major medicinal materials, many of which exist in multiple processed forms. Ginger alone, for example, can be processed into six products, including fresh ginger, dried ginger and ginger peel, each requiring large amounts of training data to build accurate algorithms.

The team has collected around 400,000 samples and is currently digitizing about a dozen new herb varieties each year.

"We hope to gradually build digital databases covering all mainstream medicinal herbs," Liu said. "We also develop customized algorithms tailored to individual manufacturers and their production processes."

Researchers said the technology could also strengthen the international competitiveness of Chinese herbal products by providing standardized and traceable quality-control records.

According to customs data, China exported 255,000 metric tons of raw herbal materials to 196 countries and regions in 2025. Industry experts said overseas buyers increasingly prefer objective testing data and traceable records over assessments that rely solely on human experience.

During this year's National People's Congress, Zhang Boli, an academician of the Chinese Academy of Engineering and chief technical adviser to the center, said AI could help modernize the TCM industry, but should complement rather than replace professional expertise.

"If Chinese medicine is to advance internationally, standardized digital quality control must become the foundation, rather than relying solely on the experience of veteran pharmacists," Zhang said.

Beyond intelligent sorting hardware, the National Modern TCM Innovation Center has built a full R&D pipeline covering lab trials, pilot manufacturing and large-scale commercial rollout.

Wang Ping, general manager of the innovation center, said the facility connects every stage from lab experiments to mass manufacturing via continuous pilot production lines.

"The quality of authentic medicinal herbs directly shapes how well finished treatments work," Wang said. "Our integrated pilot platform combines extraction, formulation and full-process quality testing under one roof. This significantly lowers costs and technical barriers for small and medium drug firms to upgrade their factories and develop new herbal medicines."

Meng Jiarui, Zhong Aiyamei and Wei Lan contributed to this story.

DPP authorities slammed for ongoing military drill

By LI SHANGYI
lishangyi@chinadaily.com.cn

A Chinese mainland spokeswoman, on Wednesday, dismissed remarks and actions by Taiwan's Democratic Progressive Party authorities aimed at resisting reunification, reiterating that "Taiwan independence" separatism is doomed to fail.

Zhang Han, a spokeswoman for the State Council Taiwan Affairs Office, said at a regular news conference that Taiwan's ongoing military drill concealed the DPP authorities' intention to pursue "Taiwan independence" through military means.

"It further demonstrates that they are the root cause of cross-Strait confrontation and tension, and a destabilizing factor for peace and stability in the Taiwan Strait," Zhang said.

According to media reports, Taiwan's military launched a five-day "immediate combat readiness drill" on Monday to test the responsiveness of various combat zones and their joint operational capabilities in the event of any mainland actions.

Zhang described the DPP authorities' posturing as futile in the face of the powerful People's Liberation Army, noting it would only harm Taiwan and ultimately lead to their own downfall.

Refuting recent remarks by Taiwan leader Lai Ching-te on cross-Strait relations, Zhang said his words and actions cannot change the historical and legal fact that Taiwan is part of China's territory, nor can they stop the inevitable trend toward national reunification.

During a meeting with foreign correspondents in Taipei on June 18, Lai claimed that the two sides of the Taiwan Strait are not subordinate to each other.

In response, Zhang said there is only one China in the world and Taiwan is part of China.

"Taiwan's future can only be decided jointly by the 1.4 billion Chinese people, including compatriots in Taiwan," she said.

She criticized the DPP authorities for adhering to a separatist "Taiwan independence" position and attempting to alter the status quo in the Taiwan Strait, where both sides belong to one China. She added that such actions amount to a denial of the outcomes of victory in World War II and a challenge to the post-war international order.

Zhang said the international community's adherence to the one-China principle and opposition to "Taiwan independence" separatism, together with mainstream public opinion on the island favoring peace, development, exchanges and cooperation, demonstrate that "Taiwan independence" has no future and that "anti-China" efforts are bound to fail.

"Lai's repeated public rhetoric exposes his anxiety and unease, and further confirms that 'Taiwan independence' is increasingly reaching a dead end," she said.

At the June 18 event, Lai also urged the mainland to abandon military expansion in the South China Sea, East China Sea and Taiwan Strait, and renounce the use of force against Taiwan, while stating that Taiwan is willing to engage in dialogue with the mainland on the basis of "equal dignity".

Zhang said the situations in the South China Sea and East China Sea remain generally stable, adding that the DPP authorities' separatist stance and attempts to pursue "Taiwan independence" by relying on external forces and military means remain the root cause of tensions and instability in the Taiwan Strait.

She reaffirmed the mainland's position that it is willing to make the utmost sincere efforts to pursue the prospect of peaceful reunification, but will never commit to renouncing the use of force or leave any room for any form of "Taiwan independence" separatist activity.

Only by recognizing the 1992 Consensus, which embodies the one-China principle, and ending separatist activities can the DPP authorities restore cross-Strait dialogue and return relations to the correct path of peaceful development, Zhang added.

Factories encouraged to build up, not out

Ministry of Natural Resources' program pushes more efficient industrial land use

By LI MENGHAN
limenghan@chinadaily.com.cn

Left: People browse souvenirs at Hongqi Fang, a redeveloped commercial complex on the site of a former porcelain factory, in Quanzhou, Fujian province, during the May Day holiday. **Right:** An expansion project increases the land use efficiency at Maanshan Shangdian Electrical Co. PHOTOS PROVIDED TO CHINA DAILY

In Maanshan city's Bowang district, Anhui province, a newly expanded electrical plant has bypassed local land shortages by reinforcing its second floor to hold one metric ton per square meter — allowing heavy industrial spoolers to run high above the ground.

This vertical setup is a textbook example of "industry going upstairs", a national policy shift that encourages manufacturers to increase output from their existing footprints. By forcing factories to grow vertically rather than horizontally, the strategy keeps traditional manufacturing hubs viable, powers high-tech upgrades and protects the country's vital farmland.

"It is not new land," said Jiang Donghang, general manager of Maanshan Shangdian Electrical Co, watching the copper strands feed into a spooler. "We consolidated several underused plots, demolished unsafe structures and built upward. On roughly the same area, we now have more than twice the usable floor space."

Jiang's factory is a microcosm of a national shift dating back to 2013, when the former ministry of land and resources introduced guidelines to address the inefficient use of land.

The Ministry of Natural Resources has since required that new construction land quotas be linked to local performance in revitalizing inefficient stock land. Supporting measures include greater flexibility in plot density, the issuance of special bonds to repurchase idle parcels, and the publication of model redevelopment cases to guide nationwide practice.

Progress under the pilot program remains robust. Data from the ministry shows that, as of the end of March, 100 pilot cities had launched redevelopment projects covering 79,800 cases, spanning 129,900 hectares.

During the 14th Five-Year Plan (2021-25) period, total approved construction land nationwide was 8.6 percent lower than planned ceilings. Land consumption per unit of GDP fell by 19.36 percent, while more than 400,000 hectares of idle land were returned to productive use.

Wang Zhengyi, an official with the Ministry of Natural Resources' department of natural resource development and utilization, said these figures mark a decisive shift away from decades of low-density peripheral expansion toward more intensive use of land within existing urban boundaries.

He said that the policy reorientation is driven by both constraint and calculation. China treats arable land as a strategic red line, with around 12 percent of its territory suitable for intensive cultivation to feed 1.4 billion people. As the economy pivots toward advanced manufacturing, green energy and digital infrastructure, the marginal returns from continued suburban expansion are diminishing.

The objective, he added, is to reshape urban growth by increasing output efficiency, aligning land supply with industrial upgrading needs, and easing pressure on farmland.

This national strategy finds concrete expression in the city of Maanshan's Bowang district. Since the 1980s, small workshops and micro enterprises producing blades, dies and machine-tool accessories have clustered there. By the late 2000s, however, the developed area had become saturated. Scattered plots — many occupied by aging single-story plants with a plot ratio of barely 0.4, compared with more than 1.0 in modern industrial parks — left little room for expansion.

Lion dancers perform during a carnival at Hongqi Fang on May 1.

"We have little space for enlarging the development zone," said Chen Puwen, head of the Bowang division of the Maanshan Natural Resources and Planning Bureau. "If we wanted to keep traditional industry viable and bring in emerging industries, we had to look inward — consolidate fragmented lots, raise density and reallocate resources."

Bowang introduced a performance-based enterprise evaluation system for land allocation in 2018. Firms are assessed annually on land-output value, tax contribution, energy intensity, environmental compliance and workplace safety. Top performers receive priority when consolidated land becomes available. Lower-ranked firms are not forcibly removed; instead, they are relocated to standardized multi-story plants, each occupying around five hectares, freeing original plots for higher-intensity use.

"The biggest hurdle in such consolidation efforts remains funding," Chen said.

To address this, Bowang secured 650 million yuan ($95.56 million) in 2021 through Anhui's bank loan program linked to land-intensification performance, with total credit extended reaching 3.22 billion yuan.

Chen added that the funds supported compensation, demolition of unsafe buildings, and construction of standardized plants with plot ratios rising to 1.5. To date, around 200 hectares of inefficient land have been cleared and repackaged across the district.

Jiang, the general manager at Maanshan Shangdian Electrical, grew up amid the clatter of grinding wheels and stamping presses that once earned Bowang its reputation as the hometown of cutting tools and molds. That strength, however, gradually became a constraint, as decades of scattered, low-rise workshops left little room for expansion.

In the 1990s, Jiang joined the ranks of local salesmen traveling across the country to sell Bowang's blades and molds. He later established a base in Nanjing in neighboring Jiangsu province, founding a business producing copper wire for power transformers.

"When I saw the district was serious about land consolidation (around 2019) and actively supporting emerging industries, I knew it was time to come back," Jiang said.

He acquired a 4,500-sq-m site in a Bowang industrial park in 2019, then successfully applied for one of the newly consolidated plots last year, securing space for expansion.

That original site is now being rebuilt into a 30,000-sq-m facility, with production lines upgraded to serve the national power grid and renewable energy projects. Rooftop photovoltaic panels have been installed to meet 70 to 80 percent of daytime electricity demand. Annual revenue now runs into the billions of yuan.

Jiang attributed the expansion in part to the district's land consolidation measures, which prioritize firms aligned with strategic emerging industries, including high-end electrical equipment.

"Electrification, EVs, energy storage, AI computing, all require transformers," Jiang said. "We're simply riding that current."

Reimagined returns

Further south in Quanzhou, Fujian province, a former porcelain factory in Dehua county illustrates a different pathway for low-efficiency land redevelopment — one centered on conservation, cultural revitalization and sustainable economic returns.

Founded in 1951, the Red Flag Porcelain Factory was once a pillar of Dehua's renowned translucent white porcelain industry, prized since the Ming Dynasty (1368-1644) for its purity and widely used in religious sculpture and fine tableware. After ceasing operations in the 1990s, its red-brick workshops, chimneys and wood-fired kilns sat idle as stranded assets in the center of a growing ceramics town.

Under the national low-efficiency land pilot program, the 97,000-sq-m site — now branded Hongqi Fang — was consolidated by a State-owned enterprise in 2021 and renovated into a commercial complex with a light-touch approach.

More than 40 percent of the built fabric has been retained as historical structures dating back over 50 years, including brick terraces, a centuries-old dragon kiln partially opened for public viewing, four signature chimneys and original timber roof trusses. Salvaged sagger bricks and kiln fragments have been reused in landscape design.

Functionally, the site has shifted from single industrial production to a composite model integrating manufacturing, exhibition, sales and tourism. The redevelopment introduced hotels, museums, a shared kiln, a ceramic authentication and auction center, and retail streets showcasing local crafts.

In addition, retired kiln workers and veteran artisans have returned as demonstrators and interpreters. On open days, they demonstrate wheel-throwing and glazing techniques, while also curating exhibitions of old payroll records, kiln logs and archival photographs, reconnecting visitors with the factory's industrial past.

Entering trial operation in 2025, Hongqi Fang spans 173,800 sq m and is projected to generate 300 million yuan in annual tourism revenue and attract 500,000 additional visitors per year.

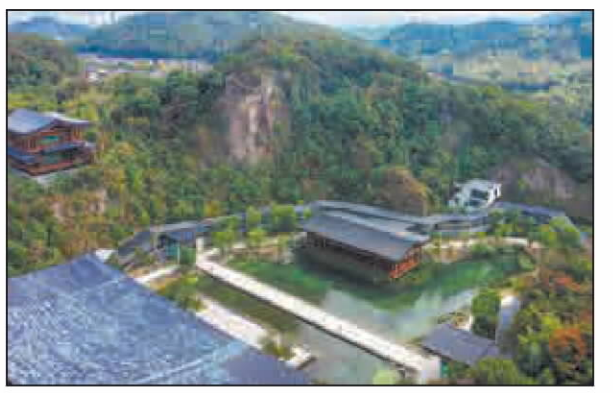
The four chimneys, once symbols of industrial output, now frame a cultural-commercial precinct drawing large visitor flows. What was once idle industrial space has been revived — not by erasing the past, but by integrating it into a new economic and cultural future.

Polluted shores turned into ecological assets

By LI MENGHAN
limenghan@chinadaily.com.cn

Once choked off by chemical plants, rusting pipelines and gantry cranes that blocked the view of the Yangtze River, the Wushan area of Nantong, Jiangsu province, has been transformed into a breezy stretch of greenways where parents push strollers and children chase one another along the river.

"Rapid industrialization after 2000 came at the direct cost of the environment," said Wu Haitao, an official with the Nantong Natural Resources and Planning Bureau. Locals told him that even on the hottest July days, riverside residents dared not open their windows, as the air was filled with the smell of chemicals and stagnant water.



To address the damage, the city began phasing out riverside industries in 2015, and accelerated the effort after the launch of the national Yangtze River protection initiative, relocating or shutting down polluting plants and clearing the shoreline.

Authorities dismantled 203 substandard plants and 162 unauthorized small vessels, removed 65,000 square meters of illegal structures, and reclaimed 5.5 kilometers of shoreline. Six sq km of new forest has taken root on the reclaimed land, anchoring a total of 12 km of restored riverside habitat.

Today, 80 percent of the area is shaded by woodland, while 20 km of greenways thread through what was once a heavily polluted industrial belt. The river meets a living edge of trees and pathways, where families linger instead of fleeing the smell.

Nantong's riverfront renewal is part of a national push to revitalize inefficient land, anchored in ecological priorities. While the city healed its scars by returning land to nature, another transformation with a cultural focus unfolded to the southwest in Hangzhou, Zhejiang province.

In Yuhang district, adjacent to the Liangzhu Ancient City — a UNESCO World Heritage Site recognized as evidence of the dawn of Chinese civilization — two massive craters once scarred the landscape. Decades of mining had left cliffs up to 61 meters high, with unstable rock formations posing constant risks of collapse.

A former mine site is redeveloped to house the Hangzhou Branch of the National Archives of Publications and Culture as part of ecological restoration efforts. PROVIDED TO CHINA DAILY

Rather than opting for the conventional solution of flattening the site and backfilling the voids, planners saw an opportunity. They realized the deep, stabilized craters were naturally suited for an archive. In 2020, the site was selected to house the Hangzhou Branch of the National Archives of Publications and Culture, transforming a geological liability into a vault for Chinese civilization.

The design team, led by Pritzker Architecture Prize laureate Wang Shu, conducted comprehensive geological surveys for planning. Leveraging the natural topography, they constructed a massive concrete retaining wall against the cliff face. This dual-purpose structure serves as a permanent anchor stabilizing the rock mass while also forming the exterior wall of the main archive repository embedded within the hillside, saving land while addressing slope stability concerns.

To restore the degraded slopes, the team drilled deep into the rock to install steel supports and laid mesh over exposed surfaces, encouraging vegetation to take root in the barren stone. Excavated soil from the original mining operations was also returned to the site — a low-impact approach that reduced costs and provided suitable substrate for native tree species.

Since its inauguration in July 2022, the archive has safeguarded 2.18 million physical artifacts and received nearly 1.4 million visitors from 67 countries and regions, with out-of-town visitors accounting for more than 60 percent as of the end of 2025.

Data from Yuhang district show that vegetation coverage at the site has increased from less than 10 percent to more than 80 percent, soil erosion has dropped by 90 percent, and more than 21,000 sq m of exposed rock faces have been restored to greenery. In addition, air quality has improved significantly, with PM2.5 concentrations falling by more than 30 percent.

The project also demonstrates how high-level cultural investment can drive regional vitality. While admission remains free to ensure public welfare, revenue from cultural and creative products has exceeded 8.5 million yuan ($1.25 million). More importantly, it has acted as a gravitational anchor for the Liangzhu Cultural Corridor, boosting local catering, hospitality and transportation industries, and providing a steady increase in income for surrounding farmers.

Nation's energy mix gains edge amid global woes

By **REN QI**
renqi@chinadaily.com.cn

China's systematic approach to energy development and massive infrastructure investment has provided a compelling example of strategic foresight for the international community amid growing global uncertainties, a senior Russian executive said.

Over the past few decades, the world primarily viewed energy as a matter of resources, technology and markets. However, recent events have demonstrated that geopolitical conflicts, disrupted trade routes, surging power demand, and accelerating technological competition have made energy security a critical pillar of national resilience, said Igor Sechin, CEO of Rosneft.

The vulnerability of global energy markets has been starkly exposed by recent tensions in the Strait of Hormuz. Serving as a veritable "artery" in the global shipping system, the strait plays a crucial role in global oil and liquefied natural gas supplies.

According to the US Energy Information Administration, the daily transport volume of crude oil and petroleum products through the strait is estimated to have been around 20 million barrels in 2025, with an annual energy trade value approaching $600 billion.

However, following recent military strikes by the United States and Israel on Iran, the security of this strategic chokepoint has dropped to freezing point. Surging fuel prices have directly driven up operating costs worldwide. Vincent Clerc, CEO of Danish shipping giant Maersk, warned that these price hikes "will be passed on to our customers and to consumers".

Against this turbulent backdrop, China's experience has become highly relevant. "In recent decades, China has demonstrated not only economic success but also remarkable science and technology advances, enabling it to become a global energy power," Sechin noted.

He emphasized that thanks to its balanced approach to ensuring energy security, China turned out to be the most prepared for the Hormuz crisis and the rise in fuel prices.

Sechin pointed out that China has created cheap urban and intercity transport infrastructure for domestic consumers. After the blockade of the Strait of Hormuz, this foresight allowed motor fuel consumers to painlessly use available alternatives, such as electric cars, electric buses, gas trucks, the subway, electric trains and electric taxis.

According to a report by Sechin, this resilience stems from China's view of energy development as a unified, long-term task inherently linked to economic security. Over a 10-year period, solar and wind energy generation in China has grown tenfold to 2,300 terawatt-hours, accounting for 22 percent of the country's energy balance.

At the same time, the country continues to construct thermal power plants to ensure supply stability, the report noted. Last year alone, 78 gigawatts of coal generation were put into operation. China is also implementing the largest program for the development of nuclear generation, with 39 reactors currently being built, representing more than half of all nuclear power plants under construction in the world.

To ensure the flexibility of this massive energy system, energy storage plays an important role, a sector where China also leads globally, Sechin highlighted. In parallel, China leads in investments in power grids, investing about $100 billion in this sector.

This diversified and systemic layout has yielded tangible competitive advantages, particularly in electricity prices, he observed. Power costs in China stand at about 9 cents per kilowatt-hour for industry — 72 percent lower than in Germany and 59 percent lower than in France — and about 7 cents per kilowatt-hour for the population, which is 58 percent lower than in the US.

"Only Russia stands at a similar level," Sechin added.

Ultimately, strengthening energy security is part of China's broader strategy of internal resource mobilization, Sechin concluded. By translating strategic vision into real economic advantages through massive energy investments and systemic infrastructure development, China's model is increasingly capturing the attention and study of the international community.

Summer chill

Workers from the Datong Railway Logistics Center under China Railway Taiyuan Group, alongside staff from other units supporting the Datong-Qinhuangdao Railway — a key national energy artery — conduct cooling operations on oil tank cars during a drill to gear up for the summer transport peak. Mind the gap

An aerial photo taken on Wednesday shows the box girder erection site of a railway bridge along the Shanghai-Nanjing section of the Shanghai-Chongqing-Chengdu High-speed Railway in Taicang, Jiangsu province. According to China Railway 24th Bureau Group, a State-owned contractor involved in the project construction, the route aims to shorten travel times between Yangtze River Delta cities and drive high-quality integrated regional development. PROVIDED TO CHINA DAILY

China's healthcare shift woos more global biz

UCB: Fast-track drug approvals, AI surge, booming R&D turn country into innovation hub

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China has evolved from a massive market into an indispensable source of global healthcare innovation, driven by fast-track review pathways, expanded global collaborations and an artificial intelligence-integrated healthcare model, a senior executive told China Daily.

"China has moved from manufacturing to clinical trial expertise, and is now becoming a source of discovery and innovation for the rest of the world," said Jean-Christophe Tellier, CEO of multinational bio-pharmaceutical firm UCB.

Tellier made the assessment during a visit to Beijing earlier this month that brought nearly the entire global leadership team to mark the company's 30th anniversary in China.

"Bringing the executive committee with me — and almost everyone came — was a symbol of China's importance," Tellier said. "When people saw all of us here, they realized that when we said China is important for us, it's a reality."

On June 4, UCB signed an agreement to establish the China Integrated Operation Center in the Suzhou Industrial Park in Jiangsu province, to strengthen end-to-end commercialization, distribution and supply capabilities in China.

"There is an element of investing to strengthen our supply chain — something that in our industry is becoming more local and less global. The era of supplying the entire world from a single location is over," Tellier said.

UCB recently introduced several differentiated innovative medicines in China and is committed to improving their accessibility and affordability for Chinese patients, including through active engagement in the national reimbursement drug list process, he noted.

"The speed by which China is now doing approvals is ahead of everybody else," Tellier said. "There is really this willingness, engagement and commitment across the healthcare ecosystem to deliver innovative solutions as quickly as possible, which is really remarkable."

To accelerate the market entry of innovative drugs, the National Medical Products Administration launched fast-track review pathways in the Provisions for Drug Registration issued in 2020. They were later incorporated into the new regulations of China's Drug Administration Law, which took effect in May, further strengthening the legal basis for expedited drug approval.

Beyond speed, Tellier highlighted a deeper structural shift in where medicines originate. He noted that roughly one in four new drugs discovered globally now comes from China, and expected that ratio might rise to two in four in the near future.

UCB itself has embedded China into its global research and development system. "We decided six or seven years ago that systematically, each of our global clinical trials for strategic products will include Chinese, Japanese and other Asian patients, to make sure we could file at the same time. Today, 14 global multicenter clinical trials are being conducted simultaneously in China," Tellier said.

The NMPA has approved the marketing of 19 innovative drugs so far this year, including 15 from Chinese manufacturers. In 2025, it approved 76 innovative drugs, a record number and a significant hike from the 48 approved in 2024.

This changing geography of innovation, he argued, has rendered the old "China for China" mindset obsolete.

"We have reached a point where, particularly because of its innovations, China has now reached a level of development that is global by nature. When you discover new medicines, they cannot be just for China — patients are everywhere. Science is global. Progress is global," Tellier said.

Tellier also pointed to China's expanding innovation ecosystem during a visit to Beijing's biomedical park, where regulators, clinical researchers, data scientists and commercial teams operate in close physical proximity.

"Collaboration, AI, plus the culture and mindset of testing, experimenting, changing and pivoting, make me feel that if change comes in the future, it is likely to come from China," he said.

Envision ramps up AI-energy integration to further tap global market

By **ZHENG XIN**
zhengxin@chinadaily.com.cn

Believing that the new energy system is the ultimate solution to the expansion of artificial intelligence, green technology company Envision Group plans to step up investments in integrating AI into its energy sector to ensure the technology's evolution ultimately secures a winning edge.

China's expansion of its power generation capacity serves as vital support for its pursuit of global AI leadership, as the low-cost electricity is a strategic asset to fuel its data centers and compute-intensive research and development, said Sun Jie, chief sustainability officer and vice-president of Envision Group.

"While surging electricity demand presents a formidable grid challenge worldwide, China's robust energy infrastructure and rapid expansion of renewable capacity uniquely position the country to convert this power challenge into a global competitive advantage in the AI race," he said.

As computing and power infrastructure share deeply intertwined underlying technologies, Sun noted that the entity mastering these innovations and deploying them cost-effectively will ultimately lead the global market.

To leverage this, Envision plans to step up investment utilizing cutting-edge technology to build new energy systems and drive green new industries.

The company has recently announced an ambitious plan to construct 5 gigawatts of green AI computing centers across global desert regions, including the Gobi Desert, by 2030, eyeing to build stable, eco-friendly, and cost-effective infrastructure for the AI era.

Industry experts believe China has established the most comprehensive production system globally, with production capacity now accounting for approximately 60 percent of the global total.

In 2025, China's total transformer exports reached 60 billion yuan ($8.82 billion), representing a year-on-year increase of over 20 percent, said Cai Yiqing, secretary-general of the power equipment branch of the China Electricity Council.

The interplay of AI and the energy sector has moved from simple one-way support to deep integration, Sun said, adding that this synergy has become the core pathway for cultivating new quality productive forces and building a global energy powerhouse.

This corporate push aligns closely with China's national policy direction.

According to an action plan recently issued by the National Energy Administration, China aims to significantly increase the clean energy supply capacity for AI computing infrastructure by 2030, while deeply embedding AI applications across the energy sector.

The guideline seeks to open high-value application scenarios for AI, unlock the value of energy data, and strengthen AI model innovation within the energy field.

According to the NEA, China established 42 massive-scale intelligent computing clusters last year, pushing the total electricity consumption of national computing centers to 170 billion kilowatt-hours.

To capture these burgeoning global opportunities, Envision is delivering scene-specific solutions tailored to diverse regional grid needs.

Envision Group's booth is seen during an energy expo in Shanghai on June 4. PROVIDED TO CHINA DAILY

Overseas markets, either grid-connected or off-grid scenarios, the opportunities are massive, said Sun.

In remote parts of Southeast Asia, such as off-grid islands in Indonesia and the Philippines, deploying small-scale renewable microgrids combining wind, solar, and storage will provide local communities with stable power and replace costly diesel generators, while in isolated mining districts across Africa and Australia, integrated energy solutions can substantially slash energy costs, offering a far greener profile, he said.

"China maintains a competitive edge in this regard. Both computing and power infrastructures are backed by a multitude of deeply linked technologies. The ultimate winner will be whoever can master these innovations and apply them cost-effectively," Sun said.

BGI plans foray into consumer products

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

BGI Group, one of the country's leading gene sequencing firms, is stepping up efforts to turn its life-science research and industrial capabilities into consumer products, signaling a strategic push to capitalize on everyday health, nutrition, skincare, and pet care markets.

Yang Shuang, senior vice-president at the company, said BGI's long-term goal is to extend life-science technologies beyond laboratories and professional settings into "daily life scenarios", building what he described as a multi-tier consumer health ecosystem anchored in genomics.

In the past, genetic technology was mostly understood by the public as scientific research, clinical use, or high-end testing technology, Yang said. "But with declining sequencing costs, the miniaturization of equipment, advances in artificial intelligence capabilities, and growing consumer health awareness, life science technology is moving out of professional institutions and heading into households, communities and everyday consumption scenarios."

High-end technology becoming more accessible to the public, health management becoming more proactive, and consumer products becoming more technology empowered will constitute key industry trends going forward, Yang added.

BGI's strategy reflects a broader shift among biotechnology firms attempting to commercialize advances in sequencing and AI as costs fall and consumer demand for personalized health services rises.

At the core of BGI's approach is its vertically integrated platform spanning sequencing hardware, algorithms and multi-omics datasets. The company said this stack allows it to convert research outputs into scalable consumer applications.

A central infrastructure asset is its high-throughput sequencing facility, GigaLab, marketed as a "lights-out" automated lab capable of 24/7 sample processing. The system integrates proprietary sequencing platforms, mass spectrometry devices and automated sample preparation workflows designed to standardize large-scale biological testing.

BGI is also expanding its AI capabilities in health interpretation. Its AI-driven assistant "i99" is positioned as a consumer-facing tool that translates multi-omics data into understandable health recommendations and daily routine guidance.

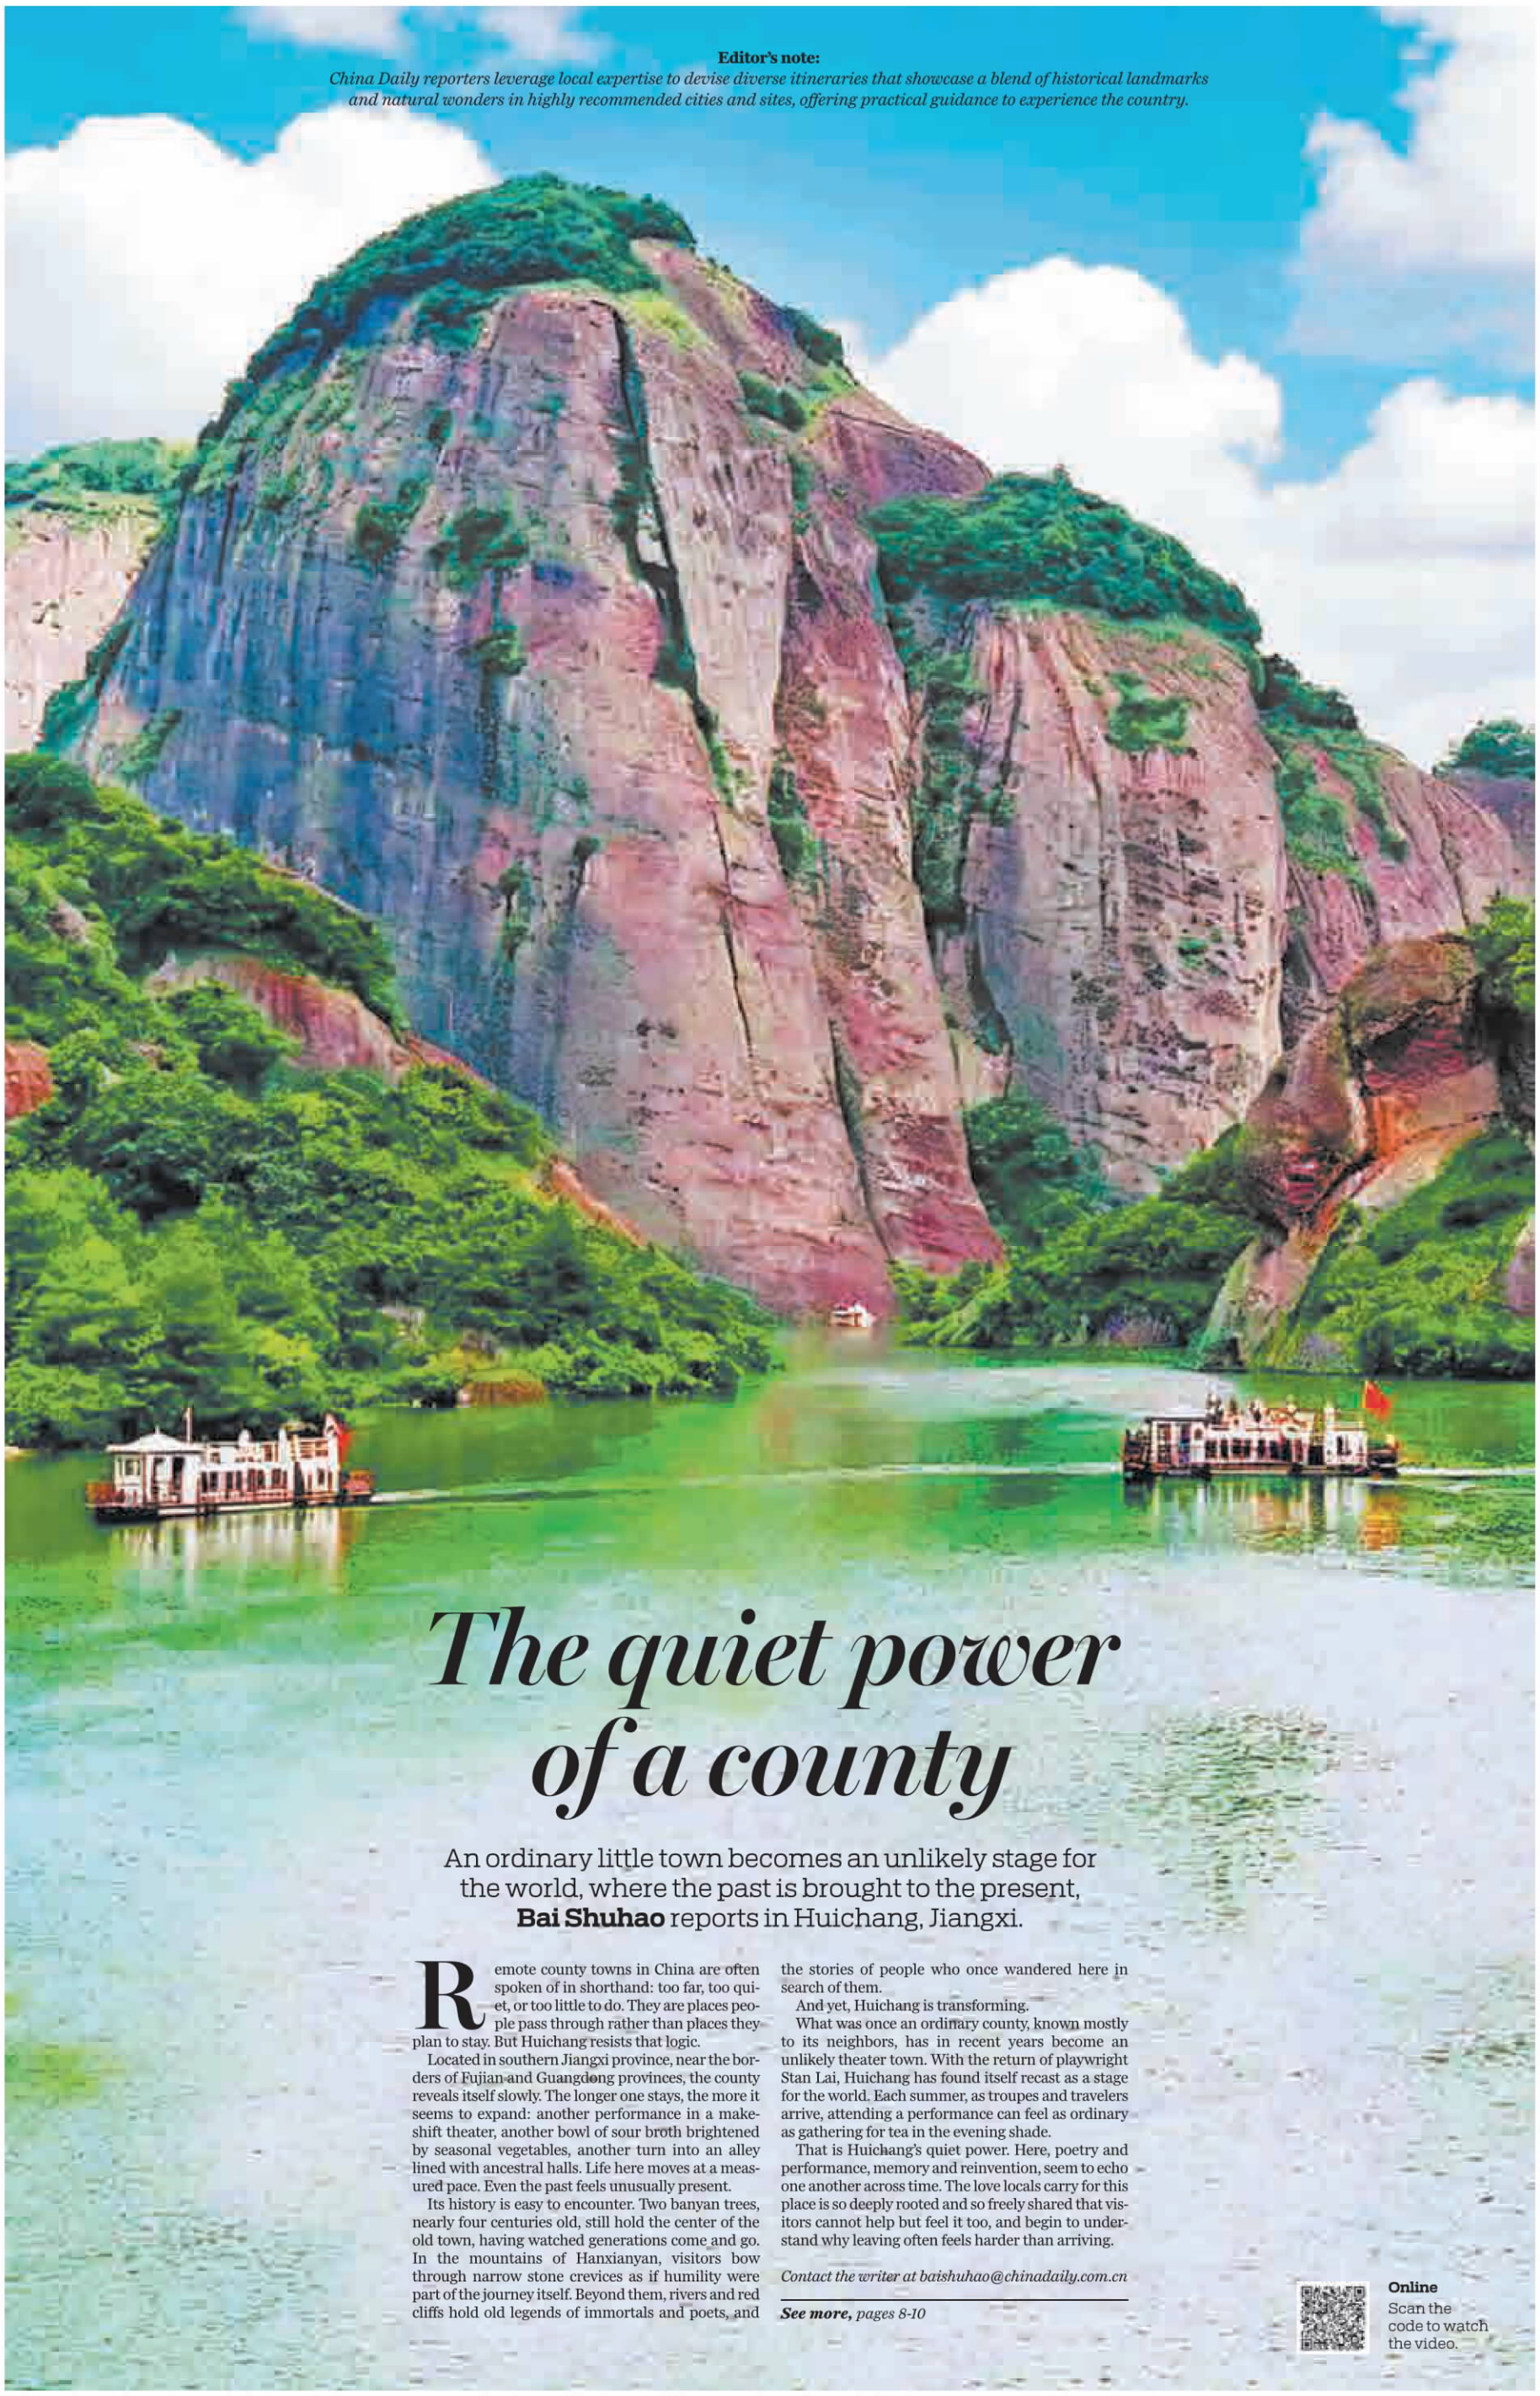
The company is accelerating its efforts in sectors including consumer genetic testing, food safety, consumer health and skin care, and microbiome products, said the top executive.

In consumer genetic testing, BGI is developing handheld and rapid testing devices aimed at bringing genetic testing closer to point-of-care use. For example, BGI developed an alcohol testing kit, which is a palm-sized handheld rapid detection device based on BGI's proprietary sequencing technology. Through a simple operation, a congenital alcohol metabolism capacity assessment report can be obtained in 20 minutes.

In consumer health and skincare, BGI is leveraging biological research — ranging from regenerative biology to cellular studies — to develop cosmetic and wellness products marketed as science-backed formulations.

In pet health, the company is applying sequencing technologies to pet genetics, covering disease risk profiling, lineage tracing and behavioral analysis.

BGI said it is also expanding into personalized microbiome products.



In the proactive health field, the company will continue to promote the application of multi-omics data-driven health improvement solutions.

TALES & TRAILS

Editor's note:
China Daily reporters leverage local expertise to devise diverse itineraries that showcase a blend of historical landmarks and natural wonders in highly recommended cities and sites, offering practical guidance to experience the country.

The quiet power of a county

An ordinary little town becomes an unlikely stage for the world, where the past is brought to the present, **Bai Shuhao** reports in Huichang, Jiangxi.

Remote county towns in China are often spoken of in shorthand: too far, too quiet, or too little to do. They are places people pass through rather than places they plan to stay. But Huichang resists that logic.

Located in southern Jiangxi province, near the borders of Fujian and Guangdong provinces, the county reveals itself slowly. The longer one stays, the more it seems to expand: another performance in a makeshift theater, another bowl of sour broth brightened by seasonal vegetables, another turn into an alley lined with ancestral halls. Life here moves at a measured pace. Even the past feels unusually present.

Its history is easy to encounter. Two banyan trees, nearly four centuries old, still hold the center of the old town, having watched generations come and go. In the mountains of Hanxianyan, visitors bow through narrow stone crevices as if humility were part of the journey itself. Beyond them, rivers and red cliffs hold old legends of immortals and poets, and the stories of people who once wandered here in search of them.

And yet, Huichang is transforming.

What was once an ordinary county, known mostly to its neighbors, has in recent years become an unlikely theater town. With the return of playwright Stan Lai, Huichang has found itself recast as a stage for the world. Each summer, as troupes and travelers arrive, attending a performance can feel as ordinary as gathering for tea in the evening shade.

That is Huichang's quiet power. Here, poetry and performance, memory and reinvention, seem to echo one another across time. The love locals carry for this place is so deeply rooted and so freely shared that visitors cannot help but feel it too, and begin to understand why leaving often feels harder than arriving.

Life, performed live

A playwright's family roots inspire a theater village where art blurs the line between audience and performer, **Bai Shuhao** reports in Huichang, Jiangxi.

The theater begins before you even realize you have entered it. At the heart of Huichang's theater village this summer stands a miniature cinema unlike any other — a black box capable of rotating 360 degrees.

Audience members step inside, take their seats, and wait for the curtain to rise. But there is no film. Instead, the stage is the world outside: the town square itself, its weathered facades, passing pedestrians and clusters of curious onlookers.

During the just-concluded Huichang Theater Season 004, this performance, titled *Panorama*, unfolded almost daily.

Crowds packed around the small structure as actors drew passersby into the action, inviting them to dance, improvise and slip into unexpected roles.

Even those with little interest in theater found themselves lingering. One afternoon, Brigitte Lin Ching-hsia, the revered star of Chinese cinema, sat quietly inside the black box, watching.

For a moment, it was impossible to tell who was performing and who was simply living.

The script

That ambiguity feels fitting here, because Huichang's theater village is itself a story — one written long before any curtain rose.

In the 1980s, while studying in the United States, playwright and director Stan Lai received a letter from relatives in Huichang county, Jiangxi province, introducing him to the hometown he had never known.

His father was born there but rarely spoke about it. In 1949, the family left for Taiwan and later settled in the US. When Lai was 14, his father died. It was only through letters from relatives in Huichang that he began to piece together the place his father had left behind.

By 1986, Lai had become one of the most influential figures in Chinese-language theater with *Secret Love in Peach Blossom Land*. In Chinese lore, the Peach Blossom Land is an unreachable utopia. In Lai's work, both his father and Huichang seemed to linger in the background.

When he first visited Huichang in 1997, the journey took nearly 20 hours along mountain roads. Northwest Street, where his father once lived, was lined with crumbling houses.

"I never thought Huichang was my Peach Blossom Land," Lai says.

In 2015, Lai staged one of his plays in Huichang for the first time and vowed to return every year. Two years later, when the county began renovating the old town, he proposed turning his father's old neighborhood into a theater community.

The first Huichang Theater Season opened in 2024. This year, in its fourth edition, the festival brought nearly 30 productions from China and abroad, with close to 400 performances across the town.

Despite not being born here, Lai has become unmistakably local. Residents speak of him less as a celebrity than as a neighbor.

"I went to school with his nephew," one resident says.

"I live right next to his old house," says another.

If you happen to see him strolling through the town, you can simply call him Teacher Lai.

The stage

The origin story of Huichang's theater village is compelling enough on its own. The town itself provides the props.

Situated at the confluence of three rivers and embraced by nearly a kilometer of Southern Song Dynasty (1127-1279) walls, Huichang was once a thriving inland port.

Today, people gather here again — not for trade, but for performances. At the entrance stands a 400-year-old banyan tree. Beside it, a stone arch bears four characters: *ci chu you xi* ("theater is here").

Farther in rises another ancient banyan. At its roots lies an old well. Each year, at the opening of the festival, Lai and his guests draw water from it to pour onto the tree, a ritual that feels like a blessing for both the festival and the town.

The two banyans are more than landmarks; they are witnesses. Looking at their sprawling branches, it is easy to imagine the countless meetings and farewells they have seen. They seem almost like audience members themselves, quietly observing the human drama unfolding below.

Nearby sits Huichang's local museum, its walls crowded with wooden plaques. In Hakka tradition, these intricately carved pieces are gifts of praise, symbols of honor passed between families and generations.

The same Hakka architecture shapes much of the town. Its signature venue, the Courtyard Theater, was once an ancestral hall built in 1772. For Hakka families, such halls served as the spiritual center of communal life, places to worship ancestors, settle disputes, and mark births, marriages and funerals.

The theater still carries that history. Its walls are weathered, its timber darkened by time. An open courtyard frames the sky above. Even without a performance, it is worth sitting there during the rainy season, watching water trickle down chains and fall in a slow, measured rhythm.

Elsewhere, another ancestral hall has become the Xiuchun Theater. This year, Lai's immersive production *Dream Walk* guided audiences through its rooms after dark. Under moonlight spilling into the courtyard, the building seemed suspended between dream and reality.

Outside Lai's family home, now transformed into another open-air stage, choreographer Zhu Fengwei staged his dance work *Cosmic Tree*.

With the old gate behind him, Zhu says he felt strangely connected to his surroundings, a fitting sentiment for a work centered on mortality and reflection.

Even the old print factory and abandoned houses along Northwest Street have become venues. Ancient and modern, local and foreign converge here, just like the three rivers converging just beyond the town walls.

The actors

In Huichang, everyone seems to become part of the cast.

As dusk falls, the square fills with people. This is when the theater village feels most alive. Huichang is small enough that familiar faces quickly find one another, and conversations begin almost immediately.

Sometimes, the "celebrities" you run into are not the ones you expect.

There is, for instance, a 90-year-old local photographer who still walks the streets with a camera in hand. Spot a visitor, and he is quick to pull out his photos, proudly showing the images he has taken of the theater village over the years.

That is one kind of fame.

But during the festival, there is another kind, too. For a few days each year, the town fills with actors, directors and theater troupes from across China and around the world.

In Huichang, celebrity feels strangely unremarkable. You might share dinner with a famous actor or find yourself seated beside one during a performance.

Each year, Lai follows a local custom: setting out long Hakka banquet tables laden with local dishes for performers and guests. People raise glasses, exchange stories, and, when the mood strikes, break into a dance.

But the true protagonists of Huichang are its residents.

Last year, when Lai invited 60 actors from Greece to perform here, many were visiting China for the first time. Residents helped them find hotels and guided them through the town if they got lost.

"It's here that they really get to know what Chinese people are like," Lai says.

In Lai's view, it is that Hakka sincerity — straightforward and unpretentious — that has allowed the theater village to thrive.

Here, theater has no threshold. There is little distance between performers and audiences. Perhaps that is why performance feels so immediate, so real and so deeply shared.

Outdoor performances attract large crowds to the town square, the vibrant hub of Huichang's theater festival.

Since its launch in 2024, the Huichang Theater Season has transformed the picturesque town in southeastern Jiangxi province into a global stage for performance, blending East and West, and tradition with innovation. The festival, as one of the country's major art events, brings together actors, directors and theater troupes from across China and around the world. PHOTOS PROVIDED TO CHINA DAILY

A place to practice the freedom of the Eight Immortals

By **BAI SHUHAO** in Huichang

It helps to be humble when walking through Hanxianyan (Rock of the Han Immortal).

Not metaphorically, but physically. The mountain demands it.

At several points along the trail, the stone narrows into slits so tight that the only way through is to bend at the waist, forehead nearly brushing the rock, and shoulders turned sideways like a key entering a lock.

That feels fitting for a place where immortals are said to have once passed through.

About an hour's drive from downtown Huichang in southeastern Jiangxi province, Hanxianyan rises in red folds of Danxia stone, its cliffs wrapped by the clear waters of the Xiangjiang River. According to legend, this was where Han Zhongli, one of the Eight Immortals of Taoist mythology, attained enlightenment.

At the entrance, the Eight Immortals stand in a line, cast in stone, each shown with a symbolic attribute or mount: a lotus blossom, a fan, a bamboo tube, or even a donkey.

Their legend, *Eight Immortals Crossing the Sea*, is one of China's best-known folktales, giving rise to the idiom "each displaying their own powers" — a phrase still used to describe people relying on their individual talents.

Unlike the lofty, distant gods of other traditions, the Eight Immortals were deeply human before they became divine. They drank, flirted, dressed poorly, and defied authority. They came from different classes, ages and genders. Their appeal was never perfection, but personality.

At Hanxianyan, personality is geography.

A story is attached to every part of the land: a spring where Han Zhongli drank, a cliff where he meditated, and a cave where he resisted temptation.

My guide, Zhong Weili, told me that Han Zhongli had once been a Han Dynasty (206 BC-AD 220) general, exiled after angering powerful men of the court. Wandering the world with Li Tieguai — also known as Iron Crutch Li, the leader of the Eight Immortals — he came upon Hanxianyan and found it suitable for cultivation.

I had heard stories of the Eight Immortals since childhood, but this was the first time they felt less like stories and more like coordinates.

Before we climbed, a blue butterfly appeared, fluttering briefly before us, then vanishing into the trees.

The forest was dense and wet with summer. Invisible insects whirred. Shrubs and vines tangled over one another. Zhong pointed out signs of squirrels and mentioned the silver pheasant — a protected bird with a scarlet face and feet, a black-feathered crest, and a tail so long it seemed designed for ceremony. It looked, she said, like the sort of creature that might accompany immortals.

The first gate into the mountain is Hezhang Men ("the Praying Hands Gate"), named for its shape, resembling two hands pressed together, leaving only a narrow seam between them. Only one person can pass through at a time.

Stepping through it felt like crossing a threshold in temperature as much as in space. The heat fell away, the air turned cool, vegetation thinned, and the red body of the mountain emerged, slick with pale moss.

On those rock faces were inscriptions carved by centuries of travelers.

Top: Danxia cliffs, shrouded in a thin veil of clouds at Hanxianyan, Huichang county, Jiangxi province. **Center:** An aerial view of Yangjiao Water Castle in Huichang. **Above:** Hanxian Lake is a must-see in Huichang. PHOTOS PROVIDED TO CHINA DAILY

The most striking line read: "Towering cliffs that rise straight up to the sky."

It was left by a Ming Dynasty (1368-1644) official. Nearby was a short poem for a friend who had retired from office, envying him for returning home to live "among rocks and ancient trees".

Elsewhere, another carving — "May the Emperor Live Ten Thousand Years" — is said to have been written by the Song Dynasty (960-1279) patriot Wen Tianxiang, the man behind the famous line: "Since ancient times, who has escaped death? Let my loyalty illuminate history."

He wrote it while camped nearby, hoping to prolong a collapsing dynasty. The dynasty fell anyway, and he became a prisoner.

Later, an emperor visiting the site saw the words and briefly suspected rebellion, a sign of someone proclaiming himself ruler. Only after hearing the story did he decide not to destroy these stone carvings.

Time has nearly erased it now. Rain has been working longer than the empires.

Beside the faded words, a patch of crimson flowers known locally as *zhuangyuanhong* ("Top Scholar Red") bloomed. They belong to the genus *Clerodendrum*, but from a distance, they resemble the robes of imperial scholars who had passed the highest examinations.

It was hard not to imagine those frustrated officials climbing here, reading these poems, seeing the flowers, and wondering if retreat into the mountains might be wiser than ambition.

The higher we climbed, the stranger the path became.

Just when the trail seemed to end, it reopened through cracks in the rock.

Passing through required crouching, twisting, and sometimes nearly crawling. My back scraped against stone. There were no carved steps, only steep, polished inclines.

One slip would mean blood, or worse. I was grateful for my sturdy shoes.

At one point, the passage became so narrow that the only way through was to rotate the whole body sideways, a movement locals call *yaozi fanshen*, or "the hawk's turning".

Beyond it, the mountain suddenly opened. Han Zhongli's cave was a narrow, hidden chamber, roofed by stone, yet wide with air and silence.

"Cool in summer, warm in winter," Zhong told me.

"No mosquitoes."

It is the kind of place where time slows enough for a man to become immortal, or at least catch his breath.

From there, the trail descends. Some visitors take the cliffside plank paths. Others continue down the steeper back mountain, where the landscape narrows into Yixiantian ("Thin Strip of Sky"), a slit between two rock walls where sunlight pours down like falling water.

To fully understand Hanxianyan, though, you have to leave it.

From a boat on Hanxian Lake, the Danxia cliffs come into view all at once, their formations taking on strange, shifting shapes — a camel here, a snail there, one improbably a hamburger.

Not far away is Yangjiao Water Castle, a military settlement dating to the Ming (1368-1644) and Qing (1644-1911) dynasties, where remnants of old walls, watchtowers and Hakka ancestral halls still stand.

It was also home to the Ming scholar Zhou Yixin, whose family was among the most prominent in the village. Liu Shaoyang, a local historian, describes him as "Hanxianyan's five-star recommender".

Many visitors Zhou hosted, moved by both his hospitality and the landscape, left poems and inscriptions carved into the mountain's rocks.

Hanxianyan drew people caught between two ideals that have long shaped Chinese life: Confucianism and Taoism — to serve the world, and to leave it.

For generations of scholars, entering office was the Confucian dream: to govern and shape society. But when politics soured, mountains offered another path of withdrawal, reflection, and self-cultivation.

Han Zhongli had chosen that path long before the rest of them. Perhaps that is why they kept coming. And perhaps why people still do.

For travelers now, Hanxianyan remains what it was for those who came before: a place to step briefly outside the machinery of ordinary life, to follow old footsteps into cool stone, and, if only for an afternoon, practice the freedom of the immortals.

Scan for a Wow! China experience.

If you go

Getting there: Huichang's theater village is easily accessible via Ganzhou Ruijin Airport, Ruijin Railway Station and Huichang North Railway Station, all about an hour's drive away.

Visitors can arrange a shuttle through the WeChat mini-program "Huichang Travel", with fares starting at around 70 yuan ($10) per person.

Where to stay: For the most convenient experience, stay at the Hotel Des Artistes, located within the theater village.

The hotel is especially popular with festivalgoers attending evening performances. Room rates typically range from 200 to 800 yuan per night.

Planning your visit: The theater festival is usually held in May or June, though dates vary each year. For the latest program and ticket information, visit the website (www.hctheatrevillage.com).

Tickets are also available at the visitor center on-site.

Beyond the stage: If you have time to explore the surrounding area, several attractions make rewarding day trips, including Hanxianyan Scenic Area, Hanxian Lake, Yangjiao Water Castle, and Dongtou She Ethnic Village.

TALES & TRAILS

Where happiness tastes sour

At a family-run snack shop tucked away in an alley, locals return for *suanshui*, a distinctive soup that has become a symbol of home, **Bai Shuhao** reports in Huichang, Jiangxi.

In Huichang, Jiangxi province, summer rain arrives without warning — sudden, heavy and absolute. By the time I stepped into Old Tree Cold Bar, one of the county's most beloved snack shops, the storm had just passed. The pavement was still slick, and rainwater pooled on the empty plastic tables outside.

Business is always slow when it rains, the owner, Zhong Lanping, told me with a shrug. She seemed used to it.

The shop sits deep inside a residential alley, tucked between aging apartment blocks, the kind of place you would almost never find without a local guide. Its name suggests shade and roots, yet there isn't a tree in sight. Huichang's famous twin banyans in the theater district are a five-minute walk away.

Ordering here doesn't begin with a menu. Instead, it starts with a gesture: pointing at trays of prepared dishes lined across the counter.

The snacks are divided into cold and hot dishes. The cold offerings include deep-fried eggplant and sweet potato, chilled taro and dried tofu. The hot dishes range from beef and chicken soups to steamed meatballs wrapped in sweet potato starch, and dumpling-like cakes made from mugwort leaves and glutinous rice. Only locals can name them all correctly.

Zhong has run the shop for nearly 20 years. Counting both local specialties and recipes she picked up elsewhere, she estimates she makes nearly 100 kinds of snacks — far more than what's listed on the wall.

But I had come for one thing: *suanshui*, literally, "sour water".

I had heard of *tangshui*, the cooling sweet soups of southern China. But sour water?

In the long, damp, plum-rain season of southern China, when the air is thick enough to kill your appetite, the mere thought of something sour feels enough to wake the taste buds.

Near the entrance, a metal pot simmered, clouded with pale broth and steam. Inside floated baby taro, bamboo shoots and radish — humble vegetables that are easy to find in the surrounding hills and fields.

Enduring appeal

When I told Zhong I wanted to try it, she muttered something in the local dialect and assembled a cautious sampler: a little of everything in a small bowl, topped with chopped scallions and dried chili.

"Out-of-towners don't always like it," she said. "Better to see if you can handle the taste first."

I braced myself for vinegar-level aggression. But the sourness, when it came, was unexpectedly gentle and round.

The acid gives taro, a type of food that usually has little personality of its own, an unexpected spark. Chewing it feels almost like biting into a thundercloud: soft and sticky, yet alive with tiny bursts of energy striking against the roof of your mouth. The bamboo shoots and radish are just as layered, though in different ways. Locals, Zhong said, often drink the broth down to the last drop.

The secret, she explained, lies in the liquid.

In rural Huichang, nearly every household once kept a clay jar of pickles by the door. The broth for *suanshui* comes from that fermenting water. But unlike pickles, where vegetables are left to sour in the liquid, *suanshui* uses the fermented brine to cook fresh vegetables directly.

Like many enduring dishes, it comes with a legend. During the Tang Dynasty (618-907), a starving young monk collapsed while begging for food. An elderly woman rescued him, but had nothing at home except taro and radish — and fetching fresh water meant walking too far. So she improvised, boiling the vegetables in the sour brine from her pickle jar. The monk survived, and later sold the dish on the street, earning the nickname "the Sour Water Monk".

Whether the story is true hardly matters. In Huichang, *suanshui* feels indispensable.

"If you open a snack shop here, you have to sell it," Zhong said. "Eighty or 90 percent of people in Huichang love sour water."

She learned the craft from her mother. As a child, Zhong watched her mother sell the snacks outside schools, earning enough to keep the family afloat.

Later, Zhong left Huichang with her husband to work in Zhejiang province. But homesickness, she said, always tasted like sour water.

"The first thing I'd do after getting off the train was come straight here," she told me. "If I didn't eat it, I couldn't sleep properly."

In 2007, after the birth of her first daughter, Zhong and her husband returned home and took over a snack shop near the banyan trees. They kept the original name — Old Tree Cold Bar — even after relocating.

From top: Old Tree Cold Bar in Huichang, Jiangxi province, offers a variety of snacks and is always bustling with diners. Pomelos are popular products in Huichang. Local farmers sun-dry *tangpi*, a type of Hakka snack made from rice. PHOTOS BY ZHU HAIPENG AND PROVIDED TO CHINA DAILY

Afternoon treats

Around 4 pm, the rain had completely cleared, and Huichang was slipping into its second daily rhythm: afternoon snacks.

This is something like afternoon tea, except there is little sweetness involved. Families and friends gather over bowls of sour, spicy and salty dishes. A few dollars buy enough for everyone to share.

According to locals, the custom of afternoon snacking may have grown out of Huichang's relaxed, slow-paced way of life.

The county abounds with good eateries, but their opening hours are anything but fixed. They might open in the afternoon or sometimes in the morning, and you never know when you'll arrive to find them closed.

The outdoor tables filled quickly. Zhong's conversation with me was interrupted every few minutes by new orders. She employs six middle-aged women, along with nieces and nephews, but on busy afternoons even that isn't enough.

Two young men in their 20s walked in, greeting her like family. They had grown up eating at the shop, Zhong said.

The friends ordered dumplings drenched in chili oil and cilantro, which were already dressed and needed no dipping sauce, along with hand-peeled sour bamboo shoots, their fibrous outer skin stripped away to reveal the crisp heart inside.

"This place represents Huichang," one of them told me. When he was studying out of town, he once asked his friend to vacuum-seal snacks from the shop and mail them to him.

For many locals, Zhong said, this shop is both the first stop when they return home and the last before they leave.

"This is our local pride. You can't find this kind of happiness outside Huichang," she said.

Huichang's food is built from simple things: soybeans, taro, bamboo shoots and sweet potatoes, the ordinary crops of mountain fields. Yet from them come dishes layered with texture and color: dried tofu, taro balls, sour water and herbal jelly.

It is a cuisine shaped by necessity, by heat, humidity and rugged land.

Even plants that are inedible on their own are ingeniously combined with other ingredients and brought to the table.

Before leaving, I ordered more: herbal jelly, taro balls, steamed meatballs wrapped in sweet potato starch. The rain had cooled the air into something clear and breathable.

Somewhere in the rush, I forgot my umbrella at the restaurant.

I have a private superstition: whenever you leave something somewhere, it means you are meant to return. In a place with 100 dishes still left to taste, it felt less like an accident than a promise.

Contact the writer at baishuhao@chinadaily.com.cn

If you go

Street food: Huichang is known for a variety of local snacks and street foods, including dried tofu and *xianren ban*, a refreshing herbal jelly popular in southern China.

Dishes: Must-try local favorites include fried rice noodles, Hakka stuffed tofu, and the famous Jiangxi stir-fries, known for their intense smoky flavor from high-heat cooking. Recommended dishes include stir-fried pork belly and tofu with crispy pork crackling.

Restaurants:

- Beimen Restaurant is a long-established favorite in the theater village, serving refined Hakka and southern Jiangxi cuisine.
- Lai Mama Private Kitchen is inspired by the home cooking of renowned playwright Stan Lai's mother. Alongside local Hakka dishes, it offers creative fusion cuisine such as Bhutanese beef and the signature Stan Lai Invisible Pizza.

Souvenirs: Popular local products to take home include pumpkins, pomelos, and navel oranges, all well-known specialties of the region.

Signature dishes at Old Tree Cold Bar include shredded dried tofu (top left), salt and pepper shrimp (top right), *suanshui*, or sour water (above left), shredded taro salad (above center) and pan-fried tofu (above right).

COMMENT

Editorials

'China Opportunity 2.0' means more widely shared development benefits from innovation

As Chinese high-tech products gain global market share, some Western armchair strategists have slapped a new label on their "bogeyman": "China Shock 2.0".

Catchy perhaps, but with a hollow ring.

Speaking at the opening of the Summer Davos in Dalian, Liaoning province, on Wednesday, Chinese Premier Li Qiang offered a precise description of the moment. Rather than a shock, he pointed out, the world is experiencing "China Opportunity 2.0" — a new phase of development driven by the country's innovation, technological upgrading and deeper integration with the global economy.

The difference between the two narratives is revealing. One views China's technological rise as a "threat". The other sees it as a boon. One incites fear. The other invites engagement.

The "China Shock 2.0" alarm is being sounded on the fabricated assumptions that China's economic success is somehow "artificial" and designed to be "pernicious". Yet the evidence is nothing but a house of cards. China's competitiveness is the fruit of its long-term input in innovation. The country now spends nearly 4 trillion yuan ($586 billion) annually on research and development. Its R&D intensity has surpassed 2.8 percent of GDP, exceeding the OECD average. Chinese entities filed more than 73,000 international patent applications in various fields last year, more than any other country in the world. These are not the statistics of a country relying on "subsidies", "overcapacity" or "currency manipulation", the cards that allegedly support "China Shock 2.0".

Instead, China's progress stems from its super-large competitive domestic market in which enterprises constantly innovate to survive. Companies face relentless pressure from rivals at home and abroad. Competition has acted as a catalyst for innovation. This reality is inconvenient for some Western policymakers because it shifts the focus away from China and back to themselves.

For decades, some advanced economies have prioritized finance over manufacturing, short-term returns over long-term investment and political theater over industrial strategy. The result: infrastructure aged, vocational training weakened, and industrial capacity hollowed out. When the consequences arrived, blaming China proved easier than meaningfully addressing the real causes.

The irony is difficult to miss. Many of the policies now criticized when practiced by China — industrial planning, infrastructure investment, support for emerging industries and strategic technological development — were once central features of the development strategies pursued by today's advanced economies themselves.

Even more striking is the policy response. Rather than rebuilding competitiveness through investment in education, infrastructure and innovation, some Western countries have increasingly turned to tariffs, sanctions and technology restrictions to "subsidize" the competitiveness of their enterprises. Such measures do little to address underlying structural weaknesses. In many cases, they raise costs for domestic consumers and businesses while fragmenting global supply chains.

Shutting China out while insisting that China stays open is not reciprocity; it is hypocrisy. Policymakers intoxicated by unilateralism should remember that no one has ever stopped spring by cutting the flowers. China's development is not a seasonal anomaly but the result of decades of investment, innovation and hard work. Efforts to isolate China will not isolate the country from the world; they risk isolating their own economies from growth and opportunity.

The broader point Li made in Dalian deserves attention: Innovation-driven cooperation, not technological containment, offers the most promising path out of the current global growth slowdown. In a world grappling with mounting geopolitical uncertainty, the challenge is not how to contain the world's second-largest economy, but how to engage more effectively with it and harness the opportunities its continued development creates.

In May alone, China's foreign trade in yuan-denominated terms grew 16.9 percent year-on-year, exports rose 13.8 percent from the same period last year and imports increased 21.5 percent, underscoring China's role not only as a producer but also as a major source of demand.

The real lesson of the "China Opportunity 2.0" is that longtermism in the development of technology, human capital and productive capacity still matters. China's innovation gains, as Li noted, were earned through years of strengthening domestic capabilities and relentless endeavor.

Smears against ethnic unity law groundless

In a major step to strengthen national cohesion and social harmony, China's top legislature adopted the Ethnic Unity and Progress Promotion Law in March, which is set to take effect on Wednesday next week.

The law embeds the vision of fostering a strong sense of community for the Chinese nation into the legal framework, advancing the law-based governance of ethnic affairs. Its core value lies in its ensuring the effective implementation of the regional ethnic autonomy system and its guarantee of efforts to promote high-quality development in ethnic regions. It is structured to promote interaction, exchanges and integration among the various ethnic groups, ensuring common prosperity and development. It directs governments to strengthen infrastructure, foster industrial growth, enhance public services and protect the environment, laying a comprehensive foundation for ethnic regions to thrive.

From 2012 to 2025, the gross domestic product of the five autonomous regions — Guangxi Zhuang, Inner Mongolia, Ningxia Hui, Xizang and Xinjiang Uygur — increased from 3.25 trillion yuan ($477.75 billion) to 8.66 trillion yuan, and public services in these regions have seen remarkable improvements. Xizang led the nation in providing 15 years of publicly funded education from kindergarten to high school since 2012, with similar programs in Xinjiang.

Yet some external forces are maliciously misinterpreting the law. For instance, the European Parliament has passed a resolution criticizing the law, groundlessly claiming it will intensify what it considers to be the "suppression" of ethnic peoples in the country. This absurd allegation doesn't have a leg to stand on as the law stipulates that upholding national unity and ethnic solidarity is the responsibility of all Chinese nationals, and it prohibits discrimination and suppression. While promoting the use of standard Chinese, the law strictly safeguards the right to study and use ethnic minority languages. This approach ensures cultural diversity is preserved while promoting national unity.

The baseless allegations of certain forces exist largely to sustain the illusion that they are "champions of human rights". Yet if they genuinely cared about the development and well-being of China's ethnic regions, they would not willingly serve as political brokers for anti-China forces. What makes their performance particularly absurd is that their rhetoric on China's ethnic affairs has barely changed in decades, while the regions they claim to care so much about have undergone profound economic and social transformation. The gap between their talking points and reality has grown wider with each passing year.

Notably, the law stipulates that organizations and individuals outside China who engage in actions undermining ethnic unity and progress or inciting ethnic division will be held legally accountable. This clause can be applied to terrorist groups such as the East Turkestan Islamic Movement, which are based overseas and pose a serious threat to the security of China's ethnic regions.

But some China naysayers pick fault with that clause, hyping it up as evidence proving their allegations. For them, opposition to China appears to be the only qualification needed to confer "moral legitimacy". When separatist, extremist and terrorist forces fomented unrest in Xinjiang and Xizang years ago, they went so far as to portray them as "freedom fighters". But when confronted with separatism, extremism or terrorism within their own borders, these politicians suddenly discover the language of "law and order". They demand that such actors be held accountable at once. This selective "morality" reveals a troubling double standard. To condemn the three forces at home while romanticizing them in the context of China is a distortion of "human rights".

China's ethnic regions will continue to preserve their cultural heritage and ethnic traditions that will be better safeguarded by the law. The regions are also embracing sustainable development, digital transformation and the artificial intelligence era. Against this backdrop, the recycled anti-China cliches resemble political caricatures divorced from realities on the ground.

The implementation of this law is purely China's internal affair. The legislative process was conducted in accordance with established legal procedures and was open, transparent and fully compliant with China's constitutional and legal framework. No external force has the right to use this legislation as a pretext for interfering in China's domestic affairs.

Opinion Line

Better governance simply by going where people are

In Urumqi, Ili and Kuqa in the Xinjiang Uygur autonomous region, legislative outreach offices are now physically embedded within comprehensive service centers, mediation hubs and even public plazas. At the lower administrative level, these liaison points share space with township government halls, neighborhood committee offices and routine administrative service counters.

As a result, in an office building in Urumqi, the capital of Xinjiang, judges, lawyers, community officials and local legislators can be seen collecting feedback on a draft neighborhood management regulation — not in a separate hearing room, but in a common area where residents come for totally unrelated matters, such as property registration or passport applications. The idea is simple: crowded places will have people with a broader and more diverse range of opinions, while allowing citizens to participate in legislative consultation without making an additional trip.

In Baiyang village, Kuqa, local farmers and herders attend a village night school three times weekly, devoting one hour to learning Putonghua and another hour to legal education. The legal segment serves to explain upcoming laws — such as the Ethnic Unity and Progress Promotion Law set to take effect on July 1 — and to gather opinion on bills that are under review.

By taking legislative outreach to an existing educational program, the village reduces duplication of staffing, facilities and funding, while also ensuring a smooth consultation process. As the village head put it, when people understand what a law says and how it affects their lives, they become more attentive, more capable of identifying problems and more likely to offer constructive suggestions — thus improving both participation and legislative quality.

Such outreach is an innovative initiative launched by the Legislative Affairs Commission of the National People's Congress Standing Committee in 2015, with the aim of bridging the gap between the public and lawmakers, as well as seeking opinions on legislative items from people in various walks of life. To date, China has established 60 such offices, soliciting over 77,000 public opinions on 224 pieces of legislation.

The model contrasts with an earlier practice in which government agencies operated in relative isolation, each maintaining separate offices, staff members and budgets. For many residents, this often meant confusion over which office handled which matter, and unnecessary travel between multiple locations. The newer integrated approach reduces red tape.

Underlying this change is a reorientation in how government performance is understood. In late February, the Communist Party of China launched a Party-wide campaign to guide its members, especially officials, in establishing and practicing a correct understanding of governance performance. The campaign will run until July.

Under the campaign, Party members and government officials are urged to proceed from reality, act in accordance with the laws, and deliver results that can stand the test of practice and history, truly benefit the people, and earn public recognition through sound decision-making and solid work. It highlights a principle that essentially measures policy outcomes not through visible or large-scale projects, but by whether they serve public needs sustainably and practically.

Placing legislative outreach in busy service halls, or embedding legal education into village night schools, may lack spectacle, but these choices reflect a deliberate calculation: that saving people's time, lowering administrative costs and making government services more approachable are themselves valid measures of effective governance.

This may not appear to be dramatic institutional reform. Yet the change is less about slogans or infrastructure than about reorganizing existing resources to reduce unnecessary movement, lower overheads and open more accessible channels for public input. Whether viewed from within or beyond, there is a practical logic to a system that meets people where they already are — both physically and in their daily routines — and that treats efficiency and responsiveness not as secondary concerns, but as integral to public service itself.

— CAO YIN, CHINA DAILY

What They Say

Emissions reduction challenging balancing act

Editor's note: *Shanghai-based Wenhui Daily hosted a seminar earlier this month, inviting experts, including Li Jin, deputy general manager of the Shanghai Environment and Energy Exchange, and He Kebin, dean of the Institute for Carbon Neutrality at Tsinghua University, to share their insights on China's green transition. Below are excerpts of their presentations at the seminar's round table session, as reported by Wenhui Daily. The views don't necessarily represent those of China Daily.*

As China has established the world's largest domestic carbon market, many emerging and developing countries that seek to develop their own carbon markets, such as in Southeast Asia and BRICS member states, are communicating with China to learn from its experience.

China is ready to share its expertise in designing carbon market mechanisms with other emerging economies. At last year's 30th Conference of the Parties to the United Nations Framework Convention on Climate Change in Brazil, China, together with the European Union and Brazil, launched the Open Coalition on Compliance Carbon Markets to share its experience.

Regarding the connectivity in the international carbon market, Articles 6.2 and 6.4 of the Paris Agreement make it clear that countries may transfer emissions reduction credits to assist each other in fulfilling their nationally determined contributions. Standards and infrastructure for the international trading of emissions reduction credits are gradually being developed.

Carbon mitigation presents both challenges and opportunities for countries. It is not only an obligation under global climate agreements but also an opportunity for transforming economies. A key topic in the discussion over the green transition is how countries can strike a balance between emissions cuts and economic growth.

Local governments in China face several pressures regarding emissions reduction requirements. First, China has a carbon-intensive energy mix, in which fossil fuels, particularly coal, account for a relatively large share.

Second, industry is a major contributor to China's GDP. China produces a large quantity of construction materials, petrochemicals and metallurgical products for the global market. Researchers are exploring consumption-based accounting for greenhouse gas emissions for these products, but the current international standard is production-based. This drives up China's emissions figures while it is still undergoing industrial transformation.

Third, China has maintained high economic growth rates. Aligning economic growth with emissions cuts is therefore a challenge.

Fourth, unlike Europe and the United States, which have traveled on "a gentle slope" to reduce carbon emissions, China faces a "steep slope" because it has a tight timeline for achieving carbon peaking before 2030 and carbon neutrality before 2060.

Technological advancement and breakthroughs are crucial to addressing these challenges.

Shanghai plans to roll out measures for evaluating the "green performance" of companies, including energy consumption, carbon emissions and pollutant discharge. Enterprises will make self-declarations for evaluation and the results will influence the granting of green credit and financial guarantees. The city is also working to allow enterprises that use carbon as collateral to enjoy interest subsidies on loans. This will encourage enterprises to utilize carbon financial tools and engage more effectively in green financing.

VIEWS

Bernard Momanyi

Zero-tariff lifts Kenya up the value chain

China's decision to grant zero-tariff access to exports from 53 African countries from May 1 is a turning point in Africa's economic relationship with the world's second-largest economy. Announced by President Xi Jinping, the measure has been widely welcomed across the continent as a bold step toward deepening trade and economic cooperation.

Global Lens

For Kenya, however, this development is more than just an open door to a vast market. It is a rare opportunity for businesses to rethink their export strategies, move up the value chain and position themselves more competitively in global markets.

Historically, many African economies have remained heavily dependent on exports of raw commodities.

Coffee, tea, minerals, horticultural products and other agricultural goods leave African shores with little processing, only to return as finished products that command significantly higher prices.

While this model has generated export earnings, it has done little to create sufficient jobs, develop industries or build economic resilience.

No country has achieved lasting prosperity by only exporting raw materials. The world's most successful economies industrialized by processing their resources, developing manufacturing capabilities and creating value-added products for domestic and international markets.

Kenya's path to long-term growth should be no different.

China's zero-tariff offer provides a powerful incentive for Kenyan enterprises to accelerate this transition. With tariffs removed, Kenyan products can now enter one of the world's largest consumer markets on more competitive terms.

But the greatest beneficiaries will not be exporters of raw commodities. The real winners will be businesses capable of producing processed foods, manufactured goods, textiles, pharmaceuticals, consumer products and other higher-value exports.

Consider coffee, one of Kenya's most celebrated exports. While Kenyan coffee beans enjoy a strong global reputation, much of the value is captured elsewhere through roasting, packaging, branding and retailing. The same is true for tea. Kenya is one of the world's largest producers but exports much of its tea in bulk form. The zero-tariff arrangement is an opportunity for Kenyan firms to export branded, packaged and finished products to Chinese consumers rather than simply supplying raw materials.

The agricultural sector presents similar opportunities. Instead of exporting only fresh produce, Kenya can expand into processed foods, fruit concentrates, juices, canned products and specialty consumer goods tailored to the growing demand from China.

Manufacturing firms can explore opportunities in leather products, textiles, apparel and household goods, where Kenya has the potential to develop competitive advantages.

This opportunity aligns with China's shift toward a consumption-driven economy. A growing middle class with rising purchasing power is fueling demand for high-quality imported products, including premium food items and consumer goods. Kenyan businesses that understand these trends and invest in quality standards, branding and innovation stand to benefit significantly.

Yet, market access alone is not enough. To fully leverage the zero-tariff initiative, Kenya must address the long-standing constraints that have hindered its industrial growth.

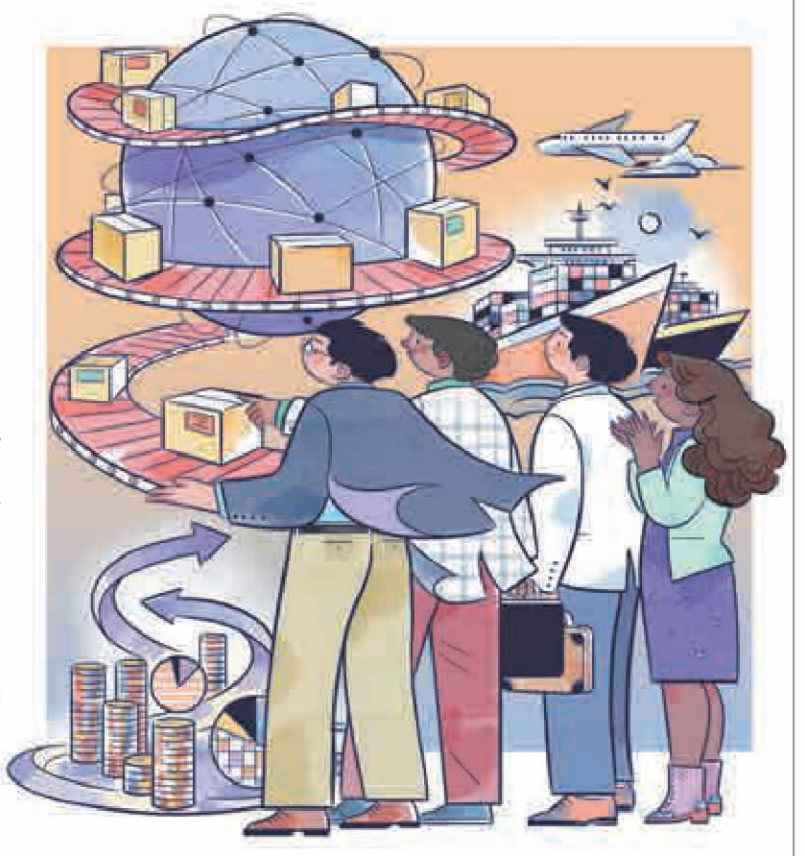
These include high production costs, expensive energy, logistical bottlenecks, limited access to affordable financing and weak value-chain development. Government and the private sector must work together to improve competitiveness and create an environment that supports export-oriented manufacturing.

Special economic zones, industrial parks and targeted incentives for value-added production can help accelerate industrialization. Investments in infrastructure, skills development and technology transfer will also be critical. Equally important is ensuring that Kenyan products meet the quality, safety and certification standards demanded by Chinese consumers and regulators.

The opportunity also aligns with the objectives of the African Continental Free Trade Area. As African countries deepen regional integration, businesses can build larger production networks, source inputs across borders and achieve economies of scale.

Kenyan enterprises should see the Chinese market as part of a broader strategy to develop globally competitive industries capable of serving both regional and international markets.

The responsibility now lies with governments and businesses to ensure that increased market access translates into industrial development rather than simply higher volumes of raw commodity exports.



China has opened a significant door for Africa. What happens next depends largely on Africa itself. The zero-tariff policy should not be viewed merely as a trade concession but as a catalyst for industrial transformation, value addition and export diversification.

For Kenyan enterprises, this is a moment that demands ambition, innovation and long-term thinking. If Kenya's businesses seize this opportunity by investing in processing, manufacturing and branding, the benefits could extend far beyond increased exports.

More jobs could be created, local industries strengthened and greater value retained within the economy.

In doing so, Kenya would not only expand its presence in the Chinese market but also take a meaningful step toward achieving the industrialization and economic transformation that have long remained central to its development aspirations.

LI MIN / CHINA DAILY

Zhang Monan

Innovation needs open doors, not high walls

The global innovation system is undergoing its most profound transformation since the end of the Cold War. Once driven by openness, cross-border collaboration and optimal efficiency, global innovation chains are now being reshaped by "national security" strategies and "de-risking" policies, raising unprecedented concerns about fragmentation and division.

Yet, amid growing security anxieties, one fundamental reality remains unchanged: no country can sustain technological leadership behind closed doors.

Pitting security against openness and innovation is conceptually flawed. Innovation flourishes through openness, not isolation. Progress in frontier fields such as artificial intelligence, biomedicine and clean energy relies heavily on the flow of talent, sharing of knowledge and collaboration across industrial chains.

Recent data from the World Intellectual Property Organization show that global international patent applications filed through the Patent Cooperation Treaty system reached 275,900 in 2025, marking the second consecutive year of growth.

The increase is a clear indicator that modern technological development transcends national borders.

The trend is driven not only by the dynamism of sectors such as digital communications and semiconductors but also by the deep integration of global innovation networks.

Generative AI offers a vivid example. Foundational open-source communities such as Hugging Face bring together hundreds of thousands of developers from around the globe. Without cross-border code sharing, open datasets, and distributed collaboration, the pace of AI technological iteration would slow down considerably.

The lesson is clear: innovation advances fastest when knowledge circulates rather than when it is confined.

The same logic applies to supply chains. Excessive localization and efforts at "decoupling" do not eliminate risks but create new vulnerabilities.

A diversified supply system and an integrated global division of labor are, by themselves, the best ways to mitigate risk.

If nations erect barriers and engage in redundant development, global supply chains will shift from a state of "efficient interconnection" to one of "fragmented islands". This would not only push up inflation and drag down global growth but also expose every economy to the systemic risks associated with reliance on single markets or single technological pathways.

The challenge is compounded by what economists Henry Farrell and Abraham L. Newman have described as "weaponized interdependence". In their view, the global economy is not a flat landscape but a network of nodes and hubs.

Nations that control key nodes and set the rules can leverage financial systems, technical standards, data flows, energy transport and supply chain hubs to restrict or even sanction other countries.

This has turned global interdependence from a source of mutual benefit into a potential instrument of strategic competition. Weaponized interdependence has created a global collective security dilemma.

The first challenge is collective action. While a "security-first" approach can enhance a nation's resilience, it undermines the foundation of international cooperation.

Countries seek the benefits of openness yet fear being subjected to "chokepoints" where access can be cut off. At the same time, major countries find it increasingly difficult to mobilize coordinated responses to transnational challenges such as climate change, financial stability, digital governance and the provision of global public goods.

The second challenge is coordination. Divergent national approaches to technical standards, data governance, digital currencies and supply-chain security make it harder to harmonize international rules.

In emerging fields such as AI governance, cross-border data flows and critical infrastructure security, countries often prefer to establish their own regulatory frameworks rather than seek unified international mechanisms.

Such regulatory fragmentation reduces efficiency and complicates global governance.

Finally, there is the issue of assigning responsibility. Too often, countries tend to shift the blame and responsibility for conflicts onto other nations. This tendency reinforces a system in which power is concentrated but responsibility is diffused.

Such imbalances in the international system undermine the institutional foundations of shared global security.

The rise of economic security should not be seen as the end of open innovation. Rather, it is a stress test for the international community's ability to preserve openness while addressing legitimate security concerns.

Amid geopolitical realities, preserving the necessary space for global innovation requires more than just unilateral actions; it demands the collaborative participation of national governments, multilateral mechanisms, market entities, and the scientific community.

The world urgently needs to reach a consensus. Unnecessary barriers must be dismantled to ensure the flame of global innovation continues to burn.

Efforts should be made within multilateral frameworks — such as the World Trade Organization and the Organization for Economic Cooperation and Development — to establish common standards that clearly define the scope of national security reviews, export controls and investment restrictions.

Such measures should remain narrowly focused on genuinely sensitive areas related to national defense and critical infrastructure.

Equally important are institutional safeguards that prevent security concerns from becoming a broad justification for economic and technological restrictions. Major countries must provide policy leadership and demonstrate a sense of responsibility.

As key economies, they should provide global public goods and act as stabilizing forces in innovation governance. By shunning unilateralism, they can prevent policy confrontations among major countries from causing a systemic fragmentation of the global innovation system.

In emerging fields such as AI and cyberspace governance, dialogue and consultation are especially important.

If major countries take the lead in establishing channels for dialogue on innovation policy, and reach a basic consensus on security boundaries and fundamental rules, they can preserve the strategic space necessary for global innovation cooperation.

Chen Guiqing

DPP must abandon separatist agenda for a better future

Recent changes to cross-Strait policies because of the separatist stance of the Democratic Progressive Party authorities on Taiwan island have invited criticism both within the island and among international observers. More voices have urged the DPP authorities to face reality, move away from the outdated "Taiwan independence" platform, and return to the political foundation that can safeguard peace and stability across the Strait.

A recent article published by Foreign Policy also warned that the DPP needs to distance itself from radical "pro-independence" positions and avoid moves that can deepen cross-Strait tensions. The message from the different voices is increasingly clear: Persisting with the "Taiwan independence" platform does not serve the interests of Taiwan residents, nor does it conform to the broader trend of regional peace and international relations.

Only by abandoning separatist positions and stopping provocative activities can the DPP remove obstacles to cross-Strait exchanges and create conditions for Taiwan's long-term growth.

Since taking office, the DPP authorities have promoted the approach of "seeking independence through military means" and relying on external forces, increasing military purchases from the United States and expanding military preparations.

These actions have increased risks, and a region that should have seen peace, stability, communication and cooperation has, instead, been pushed closer to what has been described as "one of the most dangerous places on Earth".

The DPP's pursuit of separatist policies has also affected Taiwan's economic prospects and people's livelihoods. Obstacles to cross-Strait economic cooperation, restrictions on people-to-people exchanges, uncertainties facing investors, challenges to industrial development, rising living pressures and fewer opportunities for young people have become increasingly visible. It is becoming increasingly clear that the "Taiwan independence" platform is not a commitment to values, but a burden that undermines Taiwan's future.

Every political attempt to advance separatism places the interests of ordinary Taiwan residents at greater risk.

As the dangers from "Taiwan independence" become increasingly clear, its social foundation on the island is eroding rapidly.

Several recent polls show that more than half of Taiwan residents are dissatisfied with the Lai Ching-te authorities' cross-Strait policies; more than 60 percent support restoring regular cross-Strait consultations; and nearly 70 percent favor stronger people-to-people, economic, trade and cultural exchanges.

Peace, cross-Strait exchanges and stability have become the mainstream expectations among people on the island, who are also recognizing the need to face the issue of reunification.

A more notable shift is in the attitude of the so-called "Formosa Alliance", a political force on the island that once strongly advocated radical "Taiwan independence" but has now accepted the broader trend toward cross-Strait reunification. Their adjustment reflects the declining appeal of extreme separatist positions.

At the same time, more young people in Taiwan are seeing through the false narrative of "Taiwan independence", rejecting separatist rhetoric and choosing to study, work and start businesses across the Strait.

The direction of public opinion demonstrates a simple reality: confrontation cannot represent the future of Taiwan. The interests of the people should not become tools for political manipulation by a small number of politicians.

Meanwhile, the international environment, particularly the clear signals from the US, has further weakened the DPP's separatist illusions. Shortly after the China-US summit in Beijing in May, US President Donald Trump told Fox News in an interview that "I'm not looking to have somebody go independent", adding that Taiwan should not expect a "blank check" from the US military, directly exposing the DPP's long-promoted fantasy of "seeking independence by relying on the US".

It also shattered the illusion that external forces would stand behind "Taiwan independence".

In fact, US policy on the Taiwan question has always been shaped by its own interests. Peace and stability across the Taiwan Strait serve Washington's broader Asia-Pacific strategy, while turbulence caused by radical "Taiwan independence" moves would run counter to US interests.

That is why the US has repeatedly sent signals to cool tensions and restrain separatist provocations.

From a global perspective, opposing "Taiwan independence" and recognizing the one-China principle remain the prevailing consensus of the international community.

Today, 183 countries have established diplomatic relations with Beijing on the basis of the one-China principle. Attempts to promote separatism run against this international reality and have no future.

Fundamentally, "Taiwan independence" and peace across the Strait are incompatible.

The separatist agenda represents the greatest threat to Taiwan's stability and development, while the DPP's "Taiwan independence" platform remains a major obstacle to the restoration of normal cross-Strait interaction.

If the DPP authorities and Lai continue to cling to an outdated separatist position and act against public expectations and historical trends, they will only deepen confrontation, increase risks across the Strait and damage the fundamental interests of Taiwan residents.

The path forward requires political courage and a clear understanding of reality. The trend toward national reunification and rejuvenation is irreversible, while people across the Strait increasingly hope for peace, exchanges and cooperation.

The DPP should remove its separatist illusions, listen to people's expectations, abandon the "Taiwan independence" platform, return to the common understanding that both sides of the Strait belong to one China, and take concrete steps to safeguard peace, stability and Taiwan's future.

GLOBAL VIEWS

WANG XIAOYING / CHINA DAILY

HUSSEIN ASKARY

Diversified data pathways

Digital Silk Road offers the Global South an alternative to the ecosystem dominated by the big Western tech firms

Global South countries are confronted with the dual challenges of securing their digital transition and integration on the one hand, and defending digital sovereignty, cybersecurity and technological independence on the other.

As the most digitally developed Global South country, China is offering a major platform for its partners in the BRICS and beyond through the Digital Silk Road. As other Global South countries take major steps toward digital sovereignty, the combined capabilities of these nations will help build a fairer and more inclusive global digital governance framework in the next decade.

The digital infrastructure of the BRICS is a large but uneven ecosystem shaped by rapid expansion and structural disparities. Collectively, these countries host a substantial share of global internet users and are investing heavily in digital systems as foundations for economic growth and technological autonomy. However, quantitative indicators reveal wide differences in the maturity of their digital ecosystems: Internet penetration ranges from roughly 70 percent in India to over 80 percent in China and some 90 percent in Russia. Data center capacity is even more uneven. While China is hosting hundreds of large-scale data centers (with more edge facilities) and is approaching 40 gigawatts of capacity, the markets of India and Brazil remain in the 1 to 2 GW range — an order-of-magnitude gap that underscores China's lead in artificial intelligence-era infrastructure build-out.

These disparities are not merely developmental gaps; they reflect strategic vulnerabilities. The vast differences in infrastructure maturity create an internal dependency chain, where the less-equipped members inevitably rely on external, often Western-controlled, digital corridors and cloud services for global data transit. This digital capacity reliance of the BRICS member states effectively undermines the collective goal of digital sovereignty.

The huge growth potential of the BRICS digital landscape hinges not on isolated national upgrades, but on coordinated integration — building direct fiber links and shared cloud facilities among member states to bypass external choke points and turn internal diversity into complementarity advantages.

The domestic fiber-optic backbone and international connectivity layer represent a strategic shift in the BRICS digital infrastructure. Rather than reducing dependence on global internet routes — a practical impossibility given the nature of cross-border data flows — these investments enhance digital sovereignty by diversifying pathways and reducing reliance on third-party-controlled infrastructure. By building and controlling their own submarine cables and terrestrial links, BRICS countries gain greater routing autonomy, improved resilience against geopolitical disruptions, and the capacity to handle their vast internal data flows without being subject to the latency and surveillance risks of traditional transit hubs.

The Digital Silk Road represents an alternative model of international cooperation on global digital infrastructure development. Under this framework of cooperation, nations are equipped to negotiate the terms of technical training, capacity building and joint innovation that reflect a balanced, long-term commitment.

In this context, the Digital Silk Road, officially launched by China in 2017, can play a crucial role in bridging the gaps. Compared to the rent-seeking Western models, which are many times more expensive and thus not affordable to the majority of the population and companies in the Global South, the Digital Silk Road is contributing to the liberalization of digital services so that the whole population can get access to digital services at an affordable price. It can create a seamless, cross-border digital ecosystem linking China with Southeast Asia, Central Asia, West Asia, Africa and Europe. This can reduce trade costs, expand e-commerce and spread advanced tech.

Equally important, for many nations, the Digital Silk Road is a chance to bypass a digital landscape dominated by the big Western tech companies and their leverage in global tech governance, breaking monopolies by providing alternatives to the United States' cloud giants, which control nearly two-thirds of the market. The Digital Silk Road focuses on building key digital infrastructure, including submarine and land-based fiber-optic cables such as the Pakistan and East Africa Connecting Europe, 5G networks where Chinese companies such as Huawei and ZTE are world leaders, data centers and cloud services led by Alibaba Cloud and Tencent, e-commerce and digital payment systems such as Alipay, smart city technologies, and AI and satellite navigation as in a Beidou-supported alternative to GPS.

The Digital Silk Road is more than a concept; it is already shaping global tech, trade and internet governance. Members of the BRICS have already benefited from it, and many nations in Africa are leapfrogging in terms of telecom and internet coverage and digital services, such as digital payment systems in the continent where access to banking services is very limited. At the governance level, the Digital Silk Road promotes a state-centric, shared model of internet governance and cyber sovereignty, which contrasts sharply with Western private and proprietary approaches.

The Digital Silk Road represents an alternative model of international cooperation on global digital infrastructure development. Under this framework of cooperation, nations are equipped to negotiate the terms of technical training, capacity building and joint innovation that reflect a balanced, long-term commitment. Ultimately, the vision of the Digital Silk Road aligns closely with the broader aspirations of the Global South and multilateral forums such as the BRICS to cultivate a more equitable and inclusive digital order. By facilitating the co-development of secure, interconnected and sovereign digital infrastructure, the initiative supports a future where technological progress and governance are equally shared, contributing to a more balanced and resilient global digital ecosystem.

RONNIE LINS

Perceived value

The next task for the BRICS is transforming international cooperation into visible societal gains

The BRICS has transitioned into a new phase of institutional consolidation and strategic relevance following its latest expansion. Over the past two decades, member states have strengthened economic coordination mechanisms, expanded trade relations and deepened cooperation in finance and infrastructure. The New Development Bank has increased its role in financing projects across emerging economies, while new connectivity initiatives continue to reshape trade and investment flows throughout the Global South.

China has played a particularly important role in this transformation through infrastructure investment, technology partnerships and economic integration initiatives directed toward developing markets. These efforts have helped turn the BRICS into a more structured platform for international cooperation.

Today, the bloc represents more than 48 percent of the world's population and roughly 39 percent of global GDP measured in purchasing power parity. Yet the current international environment presents a different kind of challenge. Building institutions is no longer enough by itself. The BRICS cooperation must increasingly translate into pragmatic benefits that ordinary citizens can actually perceive.

Institutional architecture remains essential, but the long-term legitimacy of any multilateral arrangement also depends on its ability to improve daily economic life. Small businesses, students, tourists, farmers and workers need to see concrete advantages associated with cross-border cooperation.

This discussion becomes even more relevant as the BRICS grows larger and more heterogeneous. The group now includes economies with different production structures, regional priorities and geopolitical interests that do not always align perfectly. Under these conditions, achieving full diplomatic convergence on every international issue naturally becomes more difficult.

That does not necessarily indicate institutional weakness. Instead, it may point to the emergence of a different integration model. Rather than relying on complete political alignment, BRICS countries can strengthen cohesion through pragmatic initiatives capable of generating visible economic and technological gains for their societies. For many citizens, discussions about multilateralism still feel distant from everyday concerns. That is precisely why practical cooperation matters.

Two areas illustrate this potential particularly well: digital payment interoperability and AI cooperation applied to the real economy.

In recent years, several BRICS member states have built sophisticated digital payment infrastructures. Brazil consolidated PIX, a central bank-operated instant payment system connecting more than 170 million users. India has scaled the Unified Payments Interface into one of the world's largest digital payment ecosystems. China developed an advanced digital payments environment through platforms such as Alipay and WeChat Pay while continuing to expand the digital yuan and cross-border settlement experiments.

Although these systems emerged under different institutional architectures, they share important characteristics: large-scale digital adoption, rapid settlement capacity, strong mobile integration and deep incorporation into daily economic activity. This creates a concrete foundation for interoperability initiatives linking existing national systems.

The most realistic path for the BRICS may not involve creating a common currency in the near term. A more pragmatic approach would be the gradual construction of interoperable payment corridors connecting existing national infrastructures while preserving monetary sovereignty and regulatory autonomy.

Initially, these mechanisms could focus on lower-risk, high-impact activities such as tourism payments, remittances, student transfers and transactions involving small and medium-sized businesses. A Brazilian tourist, for example, could pay in reais through PIX while a merchant in another BRICS country automatically receives settlement in its local currency.

The importance of this goes beyond technical efficiency.

Faster transactions, lower operational costs and simpler cross-border payments are changes that businesses and consumers immediately recognize. When international cooperation produces visible improvements in daily economic routines, public support for multilateral initiatives tends to deepen.

The second major area involves AI and emerging technologies.

Too often, discussions about AI are framed exclusively through geopolitical rivalry among major powers. For developing economies, however, AI also represents a practical instrument for productive modernization, competitiveness and technological upgrading. Shanghai's Xuhui district alone hosts more than 1,500 AI companies alongside specialized universities and research centers. This kind of ecosystem demonstrates how technological cooperation can move beyond diplomatic rhetoric and generate direct connections between companies, academic institutions and productive sectors.

For emerging economies, the potential effects are significant. AI tools applied to agriculture, logistics, manufacturing and energy management can increase productivity, reduce operational costs and improve competitiveness. Small and medium-sized enterprises, in particular, may gain access to technologies that today remain concentrated in a limited number of global innovation hubs.

At the same time, the pace of technological transformation means BRICS countries will need to continuously adapt. AI, quantum computing, advanced cybersecurity and next-generation data infrastructure are likely to reshape economic competitiveness over the coming decades. More important than following isolated technological trends will be the ability to create lasting mechanisms for joint research, talent development and technological absorption.

Once again, the central issue returns to social perception.

International cooperation acquires more practical results when farmers improve productivity using digital forecasting tools, when small businesses reduce logistics costs, and when universities expand collaborative research and innovation programs.

This may become the defining challenge of the next BRICS phase.

The bloc has already demonstrated diplomatic relevance and institutional resilience. The next step is transforming international cooperation into visible societal gains. A realistic road map could include pilot interoperable payment corridors, joint technology training programs and open cooperation networks focused on AI applications for productive sectors. Visible public results can make the bloc more attractive to future partners.

In the long run, the relevance of the BRICS will likely depend more on their ability to generate tangible economic opportunities across the Global South. By bringing international cooperation closer to daily life, the bloc may help redefine what multilateralism means in the 21st century.

Collaboration seen as key to shaping the future of AI

By ZHANG ZHOUXIANG
in Brussels
zhangzhouxiang@chinadaily.com.cn

China and Europe have different approaches to artificial intelligence, but they share a common objective, which includes building technological capacity, strengthening competitiveness, and securing a place in the economy of the future, said Charles Michel, former president of the European Council and now distinguished professor at the China Europe International Business School, or CEIBS.

Michel made the remarks at the 12th Europe Forum 2026 in Brussels on Wednesday, themed around strategic opportunities in EU-China AI development.

"China is in a strong position, with access to critical raw materials. You innovate a lot, you innovate fast, and with the ambition to deploy AI at a large scale," he said, pointing out that Europe, meanwhile, has focused on finding a balance between innovation, privacy protection, and data governance, among others.

"We need multilateral and bilateral frameworks where we can exchange views, improve mutual understanding, reduce risks and manage competition. This is what we should continue to do between the European Union and China," Michel said.

The forum, hosted by the CEIBS, brought together policymakers, business leaders and academics to discuss how China and Europe can navigate the rapid rise of AI while maintaining economic cooperation and technological competitiveness.

Wang Hong, president and professor of management at the CEIBS, said cooperation between China and Europe has become increasingly important as both sides seek to balance innovation and governance.

Although China and Europe follow different development models, they share the view that AI development should not be defined by a single technological hegemon, Wang said.

China's scale advantages and vast market potential can complement Europe's experience in governance and institutional innovation, creating an important balancing force in global AI governance.

Frank Bournois, co-president (European) and a professor of governance and leadership at the CEIBS, said AI cooperation should not be viewed simply as expanding the size of the global AI market. Instead, it also involves addressing differences in governance philosophies and regulatory approaches.

According to Bournois, the European Union places greater emphasis on privacy protection, legal accountability and public trust, while China has earned widespread recognition for its speed of innovation and ability to rapidly scale technologies.

"It's not just about making the cake bigger, but also about putting different ingredients and recipes into the cake of AI," Bournois said while talking about how the two sides could cooperate.

While China and Europe may not follow the same model, sustained dialogue can help bridge differences and bring the two sides closer together, he added.

Forum hails progress in Sino-Indonesia cooperation

By LEONARDUS JEGHO in Jakarta
For China Daily

China and Indonesia's deepening strategic partnership is delivering gains for Southeast Asia's largest economy as the two nations enter the final year of the Action Plan for the Implementation of the Comprehensive Strategic Partnership (2022-26), according to a forum in Jakarta on Wednesday.

Wang Lutong, Chinese ambassador to Indonesia, said that China and Indonesia had made great and tangible progress in their bilateral relations over the years.

Wang said bilateral trade has reached $167.5 billion by the end of 2025 and that China has been Indonesia's largest trading partner for 13 consecutive years.

He cited projects implemented under the China-Indonesia strategic partnership, such as the Jakarta-Bandung High-Speed Railway.

He added that the strategic partnership has accelerated cooperation in various sectors, including artificial intelligence, green transformation and people-to-people exchanges.

He said that the positive results achieved so far through China-Indonesia cooperation have been due to their mutually beneficial partnership and Chinese-style modernization.

According to Wang, China and Indonesia are moving toward the goal of building a community with a shared future.

Stella Christie, Indonesia's vice-minister of higher education, science, and technology, said China-Indonesia cooperation in education has spurred more Indonesians to study in China. There are some 15,000 Indonesians studying in China.

Christie said the two sides had also discussed ways of developing curriculum and infrastructure that match the labor needs of various industries.

Such an "industry-matched" curriculum will benefit Indonesian students once they start looking for jobs, according to Christie. For example, Chinese businesses that are keen to invest in Indonesia will look for skilled local workers.

"Because collaboration with China always means concrete action — and we have done that," Christie said.

Tong Xiaoling, vice-president of the China Public Diplomacy Association, said think tanks and media of both countries should have the responsibility to advocate for dialogue and cooperation.

She also encouraged representatives from Indonesian media and think tanks to visit China and experience Chinese modernization firsthand, and "introduce a true, three-dimensional and comprehensive China to the Indonesian public".

Santo Darmosumarto, director-general of Asia-Pacific and African Affairs at Indonesia's Ministry of Foreign Affairs, said the Indonesia-China partnership should remain deep and resilient.

He said a balanced trade structure gives Indonesia greater value-added opportunities for its exporters and small and medium enterprises, as well as greater access to the Chinese market.

Darmosumarto said technology transfer from China can support Indonesia's development of its electric vehicle and battery ecosystems, battery recycling, solar manufacturing, and renewable energy.

Bryant Gozali, CEO of Bolong Media Indonesia and Principal Cellist of the Jakarta Simfonia Orchestra, said Indonesia-China relations have moved beyond economics alone.

He said he had personally seen concrete examples of people-to-people exchanges through education, youth programs, tourism, arts and cultural events, and academic cooperation.

"For me, the inclusion of culture and people-to-people exchanges in the Indonesia-China plan of action is very meaningful. Economic cooperation is important, but relationships between countries become truly sustainable when there is mutual understanding and trust between their people," Gozali said.

Public opinion in Australia of China ticks up

Poll: Over half regard relations with Beijing more vital than Washington

By LIU JIANQIAO
liujianqiao@chinadaily.com.cn

A new poll shows that more than half of Australians regard relations with China as more important than ties with the United States. Experts said the findings reflect a growing recognition among Australians that China is not only an important trading partner for Australia, but also a key partner in addressing shared challenges, with considerable potential for cooperation across a wide range of areas.

The annual poll released on Monday by the Sydney-based Lowy Institute revealed significant shifts in public perceptions of Australia's two most important bilateral relationships — those with the US and China.

According to the poll, 61 percent of Australians view China primarily as an economic partner rather than a "security threat", up 11 percentage points from 2025. Meanwhile, Australians' trust in the US to act responsibly in the world has fallen to 31 percent, the lowest level since the Lowy Institute began conducting its surveys.

The poll marked a notable shift in Australian public opinion. A majority of respondents said Australia's relationship with China is more important than its relationship with the US, while 45 percent ranked ties with the US as more important.

According to a report by the Australian Broadcasting Corporation, Australians broadly oppose many of the US policies, including those regarding Greenland.

Despite declining confidence in the US, Australians have not turned away from the US alliance. The poll found that 73 percent of respondents still regard the alliance as either "very important" or "fairly important" to Australia's security.

Chen Hong, director of the East China Normal University's Australian Studies Center, said that the findings do not suggest a sudden change in Australian society's perception of China.

Instead, they point to a growing tendency among Australians to assess the country's external relations through the lens of national interests and economic realities.

"The current US administration's 'America First' policy has underscored the limits of alliance commitments ... Australians are increasingly reluctant to sacrifice economic prosperity, employment opportunities and regional stability for the sake of geopolitical competition driven by the US."

He mentioned that China is currently Australia's second-largest source of inbound tourists, providing tangible benefits to sectors such as tourism, hospitality, and urban services.

In addition, China remains the largest source of international students in Australia, making a significant contribution to the country's education sector and broader economy.

Multilateralism underlined

Li Jianjun, director of the Australian Studies Center at Beijing Foreign Studies University, said that China and Australia are both major economies in the Asia-Pacific region and important stakeholders in safeguarding multilateralism, free trade and the postwar international order.

"China and Australia can strengthen coordination in advancing the Free Trade Area of the Asia-Pacific, safeguarding the stability of regional industrial and supply chains, and tackling climate change. They can also work together to uphold world peace and foster a regional environment that supports peace, development and shared prosperity," he said.

"By strengthening cooperation under multilateral frameworks such as the Regional Comprehensive Economic Partnership, China and Australia can jointly uphold free trade and boost an open global economy," said Liu Le, an associate researcher at the National Institute of International Strategy of the Chinese Academy of Social Sciences.

Expanded cooperation in trade, green energy and people-to-people exchanges would not only benefit both countries, but also contribute to shared growth and prosperity across the Asia-Pacific region, Liu said.

District judge nullifies US immigration arrest policies

NEW YORK — A federal judge in California vacated the US President Donald Trump administration's nationwide policies expanding arrests at immigration courthouses and the duration for detaining non-citizens in short-term facilities. The judge found the actions of US Immigration and Customs Enforcement and another government arm "arbitrary and capricious".

US District Judge P. Casey Pitts of the Northern District of California on Tuesday vacated ICE's policies that had rescinded previous strictures on arrests at immigration courthouses and allowed detainees to be held in short-term cells for up to 72 hours. He did the same for a similar policy undertaken by the US Department of Justice's Executive Office for Immigration Review that removed limits on courthouse arrests.

The 71-page ruling, issued in a case brought by an asylum seeker arrested upon departing a routine hearing at a San Francisco immigration court, struck down key parts of the Trump administration's immigration enforcement policies.

Judge Pitts, appointed by former US president Joe Biden, effectively reinstated Biden-era policies that limited arrests at immigration courthouses to narrow circumstances and capped detentions in short-term facilities to 12 hours.

Since Trump retook office in January of last year, his administration has ramped up arrests of immigrants suspected of being in the US illegally as part of an aggressive deportation push.

US Department of Homeland Security General Counsel James Percival criticized the ruling on X, calling it "naked judicial activism in service of an anti-American, open borders agenda".

Previous guidance limited arrests at courthouses to circumstances such as national security threats, imminent danger and "hot pursuit" of someone posing a public safety risk, the ruling said.

The judge found that the Trump administration failed to provide "reasoned explanations" for rescinding previous policies as required under the Administrative Procedure Act.

"For 80 years, Congress has commanded federal agencies to think before they act," the judge wrote in his ruling, adding that the law requires "an agency at least provide sound reasons for following its chosen course".

Shipping rules emerge as next flashpoint in US-Iran friction

Rubio rejects tolls in Strait of Hormuz as Senate votes to curb Trump's war powers

By JAN YUMUL in Hong Kong
and **CUI HAIPEI** in Dubai, UAE

US Secretary of State Marco Rubio reiterates that Iran would not be allowed to charge tolls in the Strait of Hormuz, following talks between Tehran and Oman on navigation arrangements in the waterway.

Rubio made the remark as he landed in Abu Dhabi, United Arab Emirates, on Tuesday, kicking off his Gulf visit, which also includes Kuwait and Bahrain.

"No country is allowed to charge tolls or fees on an international waterway," Rubio told reporters when asked if the United States could guarantee freedom of navigation in the strait, which remains a point of contention.

Oman and Iran said in a joint statement on Tuesday that the two "coastal states sharing the Strait of Hormuz" reaffirm their commitment to ensuring safe passage through the strait in accordance with the relevant provisions of international law and the provisions set in the Islamabad Memorandum of Understanding.

They also emphasized their sovereignty and sovereign rights over their territorial waters in the strait.

In addition, the two sides agreed to continue dialogue on the matter through a joint working team between their foreign ministries, "with the aim of reaching an agreement on the future management of navigation in the Strait of Hormuz, the services to be provided in this regard, and the associated costs, in accordance with international standards", the statement said.

US President Donald Trump said on Wednesday that Iran has told the United States that no tolls were being sought from ships traveling through the Strait of Hormuz.

There are "no tolls, no insurance costs, and no other charges of any kind being sought or received by Iran" on ships traveling the strait, Trump said on social media.

In a post on X, Oman's Foreign Minister Sayyid Badr Albusaidi acknowledged the "constructive discussions" on the Iran-US memorandum of understanding, "especially the Strait of Hormuz paragraph", saying "we affirmed commitment to international law and toll-free safe passage".

Meanwhile, the US Senate for the first time approved a war powers resolution on Tuesday seeking to block US military action against Iran, as lawmakers warily watch Trump's efforts to resolve a conflict that the administration launched on its own and now needs Congress to fund.

It was the 10th time the Senate had tried to stop the war, and the outcome, on a vote of 50-48, was a stunning turnaround from past efforts.

While the resolution is largely symbolic and does not carry the full force of law, it reflects the growing concerns from a number of Republican lawmakers in both the House and Senate over both the war and the deal Trump struck with Iran to end it. The House approved the resolution earlier this month.

Trump responded angrily on Tuesday night, calling the vote "poorly timed and meaningless" and saying it "provided aid and comfort" to Iran.

Evacuating seafarers

As countries attempted to reach a consensus on the Strait of Hormuz, the International Maritime Organization said on Tuesday that it would begin implementing an evacuation plan for more than 11,000 seafarers stranded in the waterway.

The agency's secretary-general, Arsenio Dominguez, said they have secured safety guarantees and have thoroughly verified the conditions for safe navigation to support the operations.

An IMO spokesperson said on Wednesday that "ships have already begun to pass under the plan", declining to provide any details of the vessels that had crossed.

Dominguez welcomed "with deep satisfaction" the US-Iran peace agreement, saying it marked "a decisive step toward restoring maritime security and bringing to an end the unacceptable attacks against civilian shipping".

He also paid a tribute to 14 "innocent seafarers who tragically lost their lives during this conflict".

The Maritime Security Centre of Oman said on Wednesday that, in coordination with the IMO, it would provide a shipping transit corridor in the Strait of Hormuz on the basis of Oman's responsibilities toward the strait and its importance to the global economy.

Meanwhile, Pakistan's Foreign Ministry spokesman Tahir Andrabi told journalists in Islamabad that technical talks between the US and Iran could resume early next week, Al Jazeera reported, adding that June 29 or July 1 were also possible start dates, without providing details on the location of discussions.

S. Korea sets visitor record as Chinese tourism surges

By YANG HAN in Hong Kong
kelly@chinadailyapac.com

South Korea's annual foreign arrivals surpassed 10 million by the third week of June, reaching the milestone at a record pace, with China retaining its position as the country's largest source of inbound tourists.

The figure was achieved about a month earlier than last year, when foreign arrivals exceeded 10 million in mid-July, according to preliminary data released by South Korea's Ministry of Culture, Sports and Tourism on Wednesday.

The country's inbound tourism sector continued to show strong momentum, with 1.95 million foreign visitors recorded in May, up 19.4 percent from a year earlier. During the first five months of the year, total foreign arrivals reached 8.72 million, an increase of 21 percent year-on-year.

China remained the largest source market, with 560,000 visitors from the Chinese mainland in May. Arrivals from Taiwan and Hong Kong totaled 190,000 and 60,000, respectively.

Japan ranked second with 360,000 visitors, while long-haul travelers from Europe and the Americas also numbered about 360,000.

"Despite the increase in fuel surcharges stemming from the Middle East situation, the total number of foreign tourists visiting South Korea through May rose 21 percent year-on-year and surpassed 10 million by mid-June, showing a solid growth momentum in inbound tourism," said Kang Jung-won, head of the ministry's tourism policy office.

Visitors dressed in traditional Korean attire walk in front of the Gyeongbokgung Palace in Seoul on Sunday. JADE GAO / AFP

According to ministry data, foreign tourists' domestic card spending in May was estimated at 2.1 trillion won ($1.35 billion), up 67.1 percent year-on-year and exceeding the 2 trillion won mark for the first month since records began in January 2018.

The Korea Tourism Organization noted on June 17 that the surge was largely driven by Chinese tourists, whose card spending more than tripled in May compared with the same month last year.

The organization attributed the increase to high-end luxury shopping by Chinese visitors, especially watches, jewelry and accessories.

South Korea has stepped up efforts to attract more Chinese tourists. Recently, Seoul and Beijing agreed to increase bilateral air traffic rights by an additional 70 flights per week within the second half of the year, including 56 passenger services, according to a June 8 statement from South Korea's Ministry of Land, Infrastructure and Transport.

The agreement marked the first expansion of bilateral traffic rights since 2019 and reflects growing people-to-people exchanges and trade between the two countries.

Passenger traffic between China and South Korea reached around 4.39 million in the first quarter, surpassing the pre-pandemic level of 4.14 million recorded during the same period of 2019 before COVID-19, ministry data showed.

Looking ahead, the Yanolja Research institute in Seoul predicted in January that South Korea would welcome a record of more than 20 million foreign visitors this year.

China is expected to solidify its position as the largest inbound tourism market, with 6.15 million arrivals, the travel and tourism research institute said.

It added that the figure could exceed 7 million as some travelers choose destinations other than Japan amid bilateral tensions.

Food exporters eye health-conscious consumers in China

By RENA LI in Los Angeles
renali@chinadailyusa.com

Almonds, dairy products and other premium foods are finding growing audiences among China's increasingly health-conscious consumers, offering new opportunities for some California agricultural exporters despite ongoing trade challenges.

For California's almond industry, China remains a strategically important destination.

"We have been investing in market promotion and collaborating with Chinese industry partners for more than 30 years," Lindsay Tello, senior adviser for trade policy at the Almond Board of California, told China Daily. "It continues to be an important export destination for California almonds."

According to Tello, Chinese consumers have long associated almonds with health and nutrition.

"Chinese consumers are very aware of health and historically associate certain foods with nutritional benefits," she said. "Almonds, with their high Vitamin E and heart-healthy properties, are well recognized in China and viewed as an important part of the daily diet."

According to Tello, the growing focus on health and wellness is creating new opportunities for almond-based products in China. Almonds, almond flour and almond paste are increasingly being used in products such as baked goods and daily nut snack packs, while the versatility of almonds in different forms allows food manufacturers to incorporate them into a wide range of products that offer both nutritional benefits and consumer appeal.

To support market development, the Almond Board continues to work with Chinese manufacturers and industry organizations.

"We work closely with Chinese manufacturers and associations in providing information on the benefits of a healthy diet which includes almonds," Tello said. "We have also engaged over the years with key Chinese organizations, such as the Chinese Nutrition Society."

At the same time, California exporters continue to face challenges stemming from tariffs and increased competition.

"In China, California is currently at a duty disadvantage to Australia," Tello noted. "However, Chinese manufacturers value the quality of California almonds as well as the commitments we have made over the years to growing the market."

Recent trade tensions have had a measurable impact on California agriculture. According to a study by the University of California Giannini Foundation of Agricultural Economics, the value of California's top agricultural exports to China fell from an average of $1.55 billion in 2024 to $554 million in 2025, a decline of 64 percent. Almond exports declined by an estimated $228 million, while pistachio exports dropped by approximately $478 million as buyers shifted purchases to alternative suppliers.

"Long-term trade relationships are fragile," Sandro Steinbach, a professor of agribusiness and applied economics at North Dakota State University and one of the study's authors, said in the report. "Trade policy shifts can easily destroy more than they protect."

The researchers noted that rebuilding market share can take years once overseas buyers establish new sourcing relationships.

Despite these challenges, Tello said the industry remains optimistic about China's long-term potential.

"We continue to be optimistic about the long-term growth opportunities for California almonds," she said. "We hope the current trade situation will improve, allowing California almonds to be enjoyed by current and future consumers in China."

California's dairy industry is seeing similar opportunities as Chinese consumers seek products that combine nutrition, quality and convenience.

"We have seen growing interest in value-added dairy products as Chinese consumers become more focused on nutrition, quality and food safety," Matt Henderson, director of international sales at California Dairies Inc, told China Daily. "Demand is increasing for products with enhanced nutritional benefits, including high-protein milk and lactose-free milk, which address evolving dietary preferences and wellness goals."

Henderson said China's expanding coffee culture and premium foodservice sector are creating additional demand for dairy ingredients.

"We are also seeing strong growth in cream products driven by China's expanding coffee culture and premium foodservice sector," he said. "Cream is increasingly used in specialty beverages, pastries, desserts and cooking applications, reflecting consumers' willingness to seek higher-quality and more indulgent experiences."

According to Henderson, California producers are well positioned to meet these needs because of their scale, food-safety standards and production capabilities.

"California is well positioned to meet these needs," he said. "As the largest dairy-producing state in the US, California offers a reliable year-round supply backed by stringent food safety standards, advanced production systems and strong traceability."

Looking ahead, Henderson sees strong potential in products that offer additional nutritional benefits.

"We see strong potential in functional dairy products that offer additional benefits, such as higher protein content, lactose-free options and products fortified with vitamins and other nutrients," he said. "Consumers are becoming more sophisticated and are looking for foods that support healthier lifestyles without compromising on taste or convenience."

He added that stable and predictable trade relations will remain important to future growth.

"Long-term success will depend on predictability, stability and continued cooperation between our two markets," Henderson said. "Strong trade relationships thrive when there is a transparent and mutually beneficial framework that allows businesses to plan and invest with confidence."

WORLD CUP 2026

CR7 brace sets new milestone

Ronaldo becomes first player to score in six World Cups with two goals against Uzbekistan

Cristiano Ronaldo celebrates scoring Portugal's first goal during a World Cup Group K match against Uzbekistan in Houston on Tuesday. REUTERS

Cristiano Ronaldo had a simple, but strong message as the final whistle sounded after Portugal's big win at the World Cup on Tuesday.

"I'm back," he said directly into the television camera. "I'm back."

Ronaldo became the first player to score in six different World Cup tournaments by getting two goals in Portugal's 5-0 win over Uzbekistan, quieting critics after his forgettable performance in the team's 1-1 draw with DR Congo in the opener.

Even though criticism isn't anything new to the 41-year-old superstar, he admitted that the intense negativity directed toward him this week was difficult.

"But it's always like that," he said in Portuguese. "It doesn't matter, because it's been 23 years on the job and when things go well, 'Cristiano is good,' when things go bad, 'Cristiano should retire, he's old.' It will always be like that. But we responded well today, me and my teammates, which is what we wanted."

Ronaldo made history in the sixth minute when Joao Cancelo crossed the ball to him and he shot with his right foot to make it 1-0. He ran toward the bench and celebrated with his teammates.

He added another in the 39th minute when he got a pass from Bruno Fernandes and scored with his right foot just inside the near post to make it 3-0.

"As a defender you need to be ready and you need to be close to him in the box," said Uzbekistan coach Fabio Cannavaro, a standout defender in his playing days who led Italy to the 2006 World Cup title. "If you give him one centimeter in the box you are dead."

Cristiano Ronaldo (center) is embraced by his teammates after scoring Portugal's opening goal during a World Cup Group K match against Uzbekistan in Houston on Tuesday. AP

Ronaldo was named man of the match for his performance, the latest of many in his incredible career.

Portugal coach Roberto Martinez raved about the professionalism and poise Ronaldo showed this week amid calls from outsiders to bench him.

"He's a human being," Martinez said. "He's allowed to have emotions. He's allowed to have feelings. What is impressive with him is the answer. Whatever he feels, the answer is to get back on the training ground and practice and work, and demand more from himself. That professionalism is what's (led) to his longevity."

The goals on Tuesday make him the second-oldest player to score at a World Cup behind Cameroon forward Roger Milla, who was 42 when he scored at the 1994 tournament in the United States.

Ronaldo and Argentina captain Lionel Messi became the only men in history to play in six World Cup tournaments this year. Ronaldo's scoring streak started on his debut in 2006 and he also netted goals in 2010, 2014, 2018 and 2022.

While he shares the record for most tournaments with Messi, he stands alone in scoring a goal in each edition after Messi failed to score at the 2010 World Cup in South Africa.

Portugal coach Martinez says Ronaldo's rivalry with Messi is important for both players, and is what drives them to stay at their best.

"I believe both players have improved football over the years, and their rivalry is important for them both to grow," he said.

"(Ronaldo) is an icon and a role model in the national team. He has a great attitude on the pitch and in the dressing room.

"(It's) not just the scoring, (it's) the passes, the chances created, he is a role model when it comes to the World Cup."

Ronaldo's two strikes against Uzbekistan gave him 10 career goals in the tournament. Messi has 18 after a hat-trick in Argentina's opener against Algeria and two more goals Monday against Austria that made him the all-time leading scorer in the tournament's history.

Ronaldo's latest performance extended his record by giving him 145 international goals, and his 10 career goals in the World Cup moved him past Eusebio's nine to make him Portugal's all-time leading scorer at the tournament.

Tuesday's game was the 230th of Ronaldo's international career, which is the most in history.

This is likely to be the final World Cup for Ronaldo, who won the European Championship with Portugal in 2016 and five Champions League titles with Manchester United and Real Madrid.

AGENCIES

Lionel Messi (left), Erling Haaland (center) and Cristiano Ronaldo are among the top contenders in the race for this year's World Cup Golden Boot. AP / REUTERS

Golden Boot battle is fast becoming the main event

KANSAS CITY — Usually a subplot, the race for the World Cup Golden Boot is one of the main talking points at the 2026 tournament, as the top marksmen have got off to a blistering start.

The overall record has already been broken by Argentine superstar Lionel Messi, who now has 18 goals over six World Cups after adding five in two games in the United States.

But, he is being chased closely by Kylian Mbappe and Erling Haaland — who have four goals apiece — with Cristiano Ronaldo and Harry Kane also in the mix.

The long-standing single-tournament record of 13 goals set at the 1958 tournament by France's Just Fontaine appears vulnerable.

German great Gerd Muller was the last man to hit double figures when he scored 10 goals at the 1970 tournament in Mexico.

Since then, at all but three tournaments, the Golden Boot winner has scored six goals or fewer.

Messi, who turns 39 on Wednesday, has been the standout performer so far at the tournament, being held across Canada, Mexico and the US.

He struck a memorable hat-trick against Algeria before scoring twice in a 2-0 victory over Austria, accounting for all five of the defending champion's goals so far.

Argentina coach Lionel Scaloni said it was "hard to explain" the genius of the veteran forward after their opening match in Kansas City.

"We are amazed with him still, although we get to see him on a daily basis and he's been the best for 20 years," he said. "He still pulls it off every single match."

Messi's most likely challenger, based on the prospect of a deep run in the tournament, is Mbappe, who scored eight goals four years ago in Qatar to win the Golden Boot.

The 27-year-old, now France's record goalscorer, is just two goals behind Messi's career World Cup total.

The Real Madrid star said, perhaps unconvincingly, that chasing Messi was not top of his agenda after his team's 3-0 stroll against Iraq.

"Leo always scores goals and always will," he said. "So, I am not looking at what he is doing, I'm just focusing on helping my team."

Haaland streak

Level with Mbappe on four goals is Manchester City forward Haaland, who has scored in his past 12 competitive appearances for Norway.

The giant forward, 25, played down his extraordinary talent after taking his international tally to a remarkable 59 goals in 52 games.

"It's like many other things, I'm just really good at scoring goals and I'm quite lucky," he said. "I don't know what I'm doing. It's just how it is."

Germany's Deniz Undav and Canada's Jonathan David have three goals each and Kane and Ronaldo are among a clutch of players with two.

Portugal's Ronaldo briefly stole the spotlight from long-time rival Messi on Tuesday when he became the first man to score in six different World Cup tournaments after his two strikes in a 5-0 romp against Uzbekistan, which followed his insipid performance in Portugal's opening 1-1 draw against DR Congo.

Ronaldo, the leading scorer in men's international history, with 145 goals, said: "I always arrive, even if it's late, but I'm there."

Kane, whose six goals won him the Golden Boot at the 2018 World Cup in Russia, is stuck on two after missing a golden chance during England's goalless draw against Ghana on Tuesday.

US striker Folarin Balogun, who has netted twice, has set his sights on matching the world's elite, but realizes he has tough acts to follow.

"Seeing players like Messi, Mbappe, Haaland — they're so inevitable. I think they're scoring a goal a game, sometimes more," he said.

"For me, it's just about trying to get to that level — to be inevitable as well, to be consistent."

AFP

Tuchel insists England remains on course, despite goalless Ghana draw

FOXBOROUGH, Massachusetts — England coach Thomas Tuchel admitted his team lacked a cutting edge in its frustrating 0-0 draw with Ghana on Tuesday, but insisted there were plenty of positive signs going forward in England's quest to end it's 60-year World Cup drought.

"It's a long tournament and I think the boys tried everything. They played with the right energy," said Tuchel after the stalemate at Boston Stadium.

"We always try to entertain our fans. It was difficult today, but I hope the fans don't lose belief. There is a long way to go. I just feel I was right that we were in a very difficult group."

England had 79 percent of the possession, but could not break down a determined Ghanaian defense in the Group L contest.

It also lacked the clinical finishing that made the difference in its opening 4-2 win against Croatia in Dallas, having 19 attempts on goal, but managing only three on target.

Manchester City's Nico O'Reilly hit the bar late on, after coming off the bench, and Harry Kane blazed the rebound over the bar, summing up the day's frustration for England.

"It fell to him, and 99 times out of 100 he takes that chance. If he converts his chance, maybe we would be talking now about the patience, discipline and performance," added Tuchel.

"But, now, it is 0-0, and maybe the headlines are a little different. We had enough set-pieces to decide the match, but we were not clinical enough."

The German said that it was "just natural" to rely on Kane, who was unable to add to his two goals against Croatia and move ahead of Gary Lineker as his country's all-time top scorer at World Cups.

Tuchel also admitted that the match could serve as a "reality check", even if the outcome is hardly problematic for England — it has four points from two games, and a win against Panama in New Jersey on Saturday will clinch the group.

'VAR went for a coffee'

"This is a difficult, difficult team to play against. None of us thought there was an easy match ahead of us, but there were a lot of things that were much better than against Croatia.

"It is just not the same result or excitement, but it takes two to tango," Tuchel added in a nod to Ghana's defensive approach.

England remains unbeaten against African opponents at World Cups, but the Black Stars were clearly delighted with the point which keeps them on course to make the knockout phase for the first time since they got to the quarterfinals in 2010.

"Football is not only about possession. It is also about having the right attitude," Ghana coach Carlos Queiroz said, as his team built on its opening 1-0 victory against Panama.

"We celebrated because we got a draw against a team who are one of the favorites to win the World Cup."

His team also has four points before heading to Philadelphia next to take on Croatia.

"You have to pay a high price to get points. Probably because we are in the US, where everything is expensive," he joked.

However, the former Real Madrid and Portugal boss also felt his team should have had a penalty for a late challenge on Prince Adu by Ezri Konsa.

Nothing was given by the Honduran referee, and he was not summoned to check the VAR monitor.

"The VAR went for a coffee, which is natural, but it is a clear penalty and a red card," insisted Queiroz.

Two deadly earthquakes rock Venezuela

More than 200 killed, thousands injured; rescue efforts underway

By **LIU JIANQIAO** and **MO JINGXI**

Two powerful earthquakes struck Venezuela on Wednesday, killing at least 235 people and injuring more than 4,000 as dozens of buildings collapsed in and around Caracas, the nation's capital.

China expressed its condolences to Venezuela on Thursday, saying that it stands ready to provide assistance based on the South American country's needs.

A magnitude 7.2 earthquake hit about 160 kilometers west of Caracas, followed less than a minute later by a magnitude 7.5 tremor, according to the United States Geological Survey. The twin quakes, the country's strongest in more than a century, hit when many Venezuelans were at home during a public holiday.

The US Pacific Tsunami Warning Center issued several tsunami alerts that were later lifted.

Delcy Rodriguez, the acting president of Venezuela, said the coastal state of La Guaira in northern Venezuela was hit the hardest, describing it as a "disaster zone" where dozens of buildings had collapsed entirely. "La Guaira state is a true tragedy," Rodriguez said.

Rescue operations were underway as the country declared a state of emergency following the strong earthquakes, with the number of casualties and extent of damage expected to rise.

Chinese Foreign Ministry spokesman Guo Jiakun said at a regular news briefing that China "has noted reports of the earthquakes in Venezuela and extends its sincere sympathies to the Venezuelan government and the people affected by the disaster". No Chinese casualties had been reported so far, he said.

"We believe that, under the leadership of the Venezuelan government, the Venezuelan people will overcome the disaster and rebuild their homes as soon as possible," Guo said. "China stands ready to provide assistance within its capacity and in an appropriate manner based on Venezuela's needs."

While Venezuela sits near multiple fault lines, its position straddling the South American and Caribbean plates makes strong earthquakes much less common than in other parts of Latin America.

Rodriguez appealed to businesses to make heavy construction equipment available for rescue operations, adding that search and rescue teams certified by the United Nations were on their way to Venezuela to assist.

She said authorities were shifting rescue teams from other parts of the country to La Guaira, adding that officials were trying to make the most of daylight hours to speed up efforts to rescue people believed to be still trapped under the rubble.

Rodriguez said the government was creating a $200 million reconstruction fund for damaged hospitals and homes, and the nation's economy and finance minister was instructed to oversee the effort.

Television broadcasts on Thursday showed rescue workers using power tools to work their way into piles of rubble. Many people searching for the missing appeared to be regular citizens rather than professionals. Collapsed buildings, toppled electrical poles and debris blocked streets.

During the quakes, people ran from swaying buildings in Caracas, and many were visibly shocked when they turned back to see destroyed walls that left furniture visible from the street.

Parts of the capital lost power and cellphone coverage, and the earthquakes damaged and closed Simon Bolivar International Airport, the country's main airport, Rodriguez said. Subway service was suspended and natural gas shut off. Schools canceled classes for several days, and the Ministry of Education said some school buildings would be used as shelters and donation centers.

Emergency workers scrambled over the debris of collapsed buildings in Caracas as night fell, while distraught relatives sought help for loved ones feared trapped. Dazed survivors were seen being led away, some on stretchers.

The lack of cellphone coverage in parts of Venezuela deepened the distress of many families, particularly those among the more than 7.7 million people who have left the country during its protracted crisis and who struggled to reach relatives still living in the country.

Agencies contributed to this story via Xinhua.

History gives China, Latin America a rare new opportunity

History is shaped not only by the decisions nations make but also by the opportunities they miss. Over six centuries ago, Admiral Zheng He (1371-1433) of the Ming Dynasty (1368-1644) led one of the most advanced maritime expeditions, demonstrating the dynasty's technological prowess across the Indian Ocean.

At its naval peak, however, China chose introspection over expansion. Whether these voyages could have crossed the Pacific remains a matter of speculation, but their cessation significantly influenced global history.

Five centuries later, history offers a renewed opportunity. The current objective is partnership rather than discovery. The China-Latin America relationship is now defined by strategic complementarity rather than geographic distance. The Pacific Ocean, once a barrier between distant regions, now serves as a bridge linking economies in an increasingly interconnected world.

There have been concerns in China about the rise of conservative governments in Latin America that appear to favor Washington, particularly as the United States renews its engagement with the region. While these concerns are understandable, they risk conflating temporary electoral cycles with enduring structural realities. Governments and political coalitions change, but geographic and economic fundamentals persist.

For decades, Latin America has alternated between left- and right-leaning governments, liberalization and protectionism, and varying degrees of openness and nationalism. Despite these shifts, a notable continuity remains. Regardless of ideology, administrations consistently aim to attract investment, modernize infrastructure, enhance productivity, create quality employment, and secure positions in emerging industries.

Brazil to raise up to 5b yuan in issuance of panda bonds

By **ZHOU LANXU**
zhoulanxv@chinadaily.com.cn

Brazil formally kicked off plans to issue its first sovereign panda bonds on Thursday, a landmark move that officials said would create new opportunities for bilateral cooperation in financial markets.

The move, which makes Brazil the first Latin American country to issue sovereign panda bonds, shows the growing interest of international issuers in such bonds for diversified and lower-cost funding channels, and this could pave the way for broader participation by international issuers in China's bond market, analysts said.

A panda bond is a renminbi-denominated debt instrument issued by overseas governments or institutions in China's onshore capital market.

On Thursday, Brazil's Ministry of Finance delivered its letter of intent for issuing panda bonds to China's National Association of Financial Market Institutional Investors, with officials from China and Brazil attending a ceremony in Beijing marking the occasion.

Brazil plans to raise up to 5 billion yuan ($735 million) with its inaugural issuance of panda bonds.

Pan Gongsheng, governor of the People's Bank of China, the country's central bank, said at the ceremony that bank has worked closely with Brazil's Finance Ministry and central bank, delivering tangible outcomes in areas such as local currency cooperation, financial infrastructure connectivity and financial market collaboration.

"We stand ready to offer facilitation to the Ministry of Finance of Brazil in issuing panda bonds in China," Pan said, noting that he believes the successful issuance of the bonds would create more opportunities for bilateral financial cooperation.

He added that there has been a growing appetite for panda bonds from the private sector and sovereign issuers around the world, and the PBOC welcomes more qualified Brazilian institutions to participate in China's financial markets.

Speaking to China Daily on the sidelines of the event, Brazil's Minister of Finance Dario Durigan confirmed that the delivery of the letter of intent on Thursday made Brazil the first Latin American sovereign issuer formally seeking the issuance of panda bonds.

"We are ready to come to China and offer our sovereign bonds from Brazil in the Chinese market as a sign of confidence, and as a sign that we should work together if we want to improve the lives of our people," Durigan said at the event.

Aiming to issue the panda bonds within the next few months, the Finance Ministry of Brazil is also advancing wider capital market cooperation with China, including a bilateral exchange-traded fund connectivity program and information services for Chinese investors in the Brazilian capital market, he added.

Brazil's planned offering would follow inaugural sovereign panda bond issuances by Kazakhstan and Pakistan earlier this year, adding further momentum to the internationalization of the RMB bond market.

According to data from China's central bank, panda bond issuances reached 132.98 billion yuan in the first five months of 2026.

Liu Chunsheng, an associate professor of international economics at the Central University of Finance and Economics, said that issuing panda bonds would help Brazil diversify its external financing, lower funding costs and reduce foreign exchange risks by better matching RMB financing with its growing trade and investment links with China.

Visitors flock to Kumtag Desert to experience Uygur sand therapy

By **FANG AIQING**
in Shanshan county, Xinjiang
fangaiqing@chinadaily.com.cn

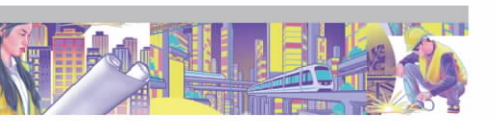
China Vibes

Remember when, as a child, you'd visit the beach with your family, and your older siblings, or maybe your parents, would bury you up to your neck in the sand? At the time, you probably thought it was just seaside shenanigans, but believe it or not, people travel thousands of miles to do just that, citing a variety of health benefits.

That's because, at the edge of the Kumtag Desert in Shanshan county of Turpan in Northwest China's Xinjiang Uygur autonomous region, the summer heat heralds the season for sand therapy. From June to August, visitors flock to the dunes to participate in a traditional Uygur medical practice — being buried up to their chests in hot sand.

Imagine a sauna, but instead of a little wooden shack next to a frozen Nordic lake, it's the open desert and you're under a sun umbrella, breathing in crisp, hot, dry air. That, in essence, is sand therapy, as described by Tswelopele Makoe from South Africa, who experienced it on June 19.

"Ethereal" was the word she chose for the roughly 20-minute session. "It's almost like I'm on cloud nine — super relaxed, (like I'm) floating, very calm," she said, while lying in the sand.



Turpan, sitting in China's lowest basin, is one of the country's hottest and driest places.

Summer temperatures during the day regularly touch 40 C, and annual rainfall averages only 14.7 millimeters, according to the city's website.

Bored at work? Let AI do the heavy lifting

Smart tech takes over dull tasks, frees new employees' creative instincts and 'human skills'

By **ZHOU WENTING** in Shanghai
zhouwenting@chinadaily.com.cn

Ji Hang, 25, began working at a robotics company in Hangzhou city, Zhejiang province, a year ago. Instead of doing a stereotyped, repetitive, meticulous programming job, Ji has delegated much of the tedious coding work to artificial intelligence.

"The monotonous details of programming have been handed over to AI. It handles the syntax of various programming languages more proficiently than we do," said Ji, a graduate of an elite university in Zhejiang.

"We just need to provide the AI tool with a direction and teach it how to help us solve problems," he said, adding that he had witnessed significant advances in AI's programming capabilities, with today's version far better than what it was just six months ago.

Ji's experience reflects a broader trend across industries, where AI is taking over basic tasks.

As a result, entry-level job requirements have rapidly evolved. Newcomers are no longer just responsible for executing tasks. Instead, they are expected to undertake greater responsibilities, such as doing creative work and making judgments and decisions at an earlier stage of their careers, tasks which are considered more valuable, said industry experts.

The number of entry-level job positions has not decreased, they said, but the requirements are higher — AI literacy combined with creativity.

"The most valued skill in today's job market is the ability to integrate AI into real work processes to solve specific problems. In the future, the ability to effectively use AI as a work partner will significantly differentiate individuals in terms of work quality and efficiency," said Wang Xiangdao, founder and CEO of MoSeeker, a Shanghai-based enterprise providing digital recruiting solutions.

For Ji and his colleagues, it's not just the technical aspects of programming that are being rapidly overtaken by AI. Tasks like data annotation, which previously required dedicated personnel or even outsourcing, can now be handled automatically by large models. This approach is faster, highly accurate, and requires little proofreading.

"This shift has just occurred over the past year, and the change is quite evident," said Ji, who works at a company that develops autonomous exploration and mapping robots for places like underground mines that are hard for humans to reach.

Similarly, in the human resources industry, entry-level job tasks, such as searching for resumes online, will soon be completely replaced by AI. Leading companies now complete 80 percent of their initial recruitment processes through AI and automation, which offers significant advantages in terms of efficiency and fairness, Wang said.

Before, HR specialists had to search for talent online, review each resume, make comparative evaluations, arrange interviews, and follow up with candidates. However, AI is much faster, able to review tens of thousands of resumes received during a campus recruitment campaign and manage subsequent communications.

"Moreover, AI interviews are more impartial. Every human interviewer has personal preferences. They might give higher scores to candidates who are attractive or have backgrounds in big companies, but this doesn't necessarily reflect true ability," said Wang.

Over 2,000 libraries nationwide have deployed AI librarians, said Zhang Longqi, president of Chaoxing Group, a provider of digital and intelligent solutions for libraries, at a conference in Shanghai in May attended by hundreds of library managers from across the country.

"The accelerated implementation of intelligent technology and large model applications requires human librarians to collaborate with AI librarians to transform the vast resources of libraries into interactive, intelligent academic resources," he said.

"Human-machine collaboration should become the norm in library services for university faculty members and students."

A global report by the World Economic Forum on entry-level employees pointed out that most changes happening in the workplace today are due to task compression and role reshaping brought about by the advent of AI. This new technology is not simply taking away the first job, but redefining the content and value of entry-level positions, according to the report released in January.

Wang Wei, general manager of Talent Solutions Overseas Recruitment at LinkedIn China, said that AI is an inevitable trend in productivity upgrades, and young people have no choice but to adapt.

"Resisting or being annoyed by AI, essentially means falling behind the pace of the times and gradually being eliminated from the workplace," she said.

Balanced approach

On the Chinese mainland, 38 percent of enterprises are in the AI deployment phase, while another 38 percent are in the pilot phase, a report released in May by the global human resources service provider Aon Human Capital showed.

In addition, most Chinese enterprises said their employees were receiving AI-related training or skills enhancement, demonstrating that Chinese firms are more proactive than the global average in preparing talent for the future.

Ji said his employer values whether new recruits can work effectively with AI and use it in their work. The company hopes employees understand the core logic of using AI — to enhance efficiency and achieve a better work state — rather than relying on it completely without being aware of potential hidden risks.

Some HR experts said if newcomers are smart enough, they can use AI to make their work easier.

Ni Ke, an advertising professional in Shanghai, said tasks like summarizing the effectiveness of an ad campaign by watching hundreds of videos can be a challenge.

"However, AI can assist by analyzing the performance of each video ad, traffic conditions, and viewing duration. AI can even identify the top videos with the best performance and purchasing conversion effects, analyze what makes them successful and quantify these elements," said Ni, 34.

However, the same AI tools can yield vastly different outcomes depending on who uses them, experts said.

MoSeeker's Wang said the difference in applying AI tools correctly is the ability to instruct them how to deconstruct a problem.

"Knowing how to break down a complex problem into sub-problems, understanding the logical relationships between them, and the criteria for each sub-problem are crucial. AI can execute efficiently within a framework set by a user, but it cannot create the framework," Wang said.

More valuable roles

Jiang Jianghao, a new media video director, started her first full-time job this spring. With AI as a work assistant, newcomers in this field no longer start with information collection, but instead jump directly into the creative process, she said.

Behind each video project, extensive research is required, explained Jiang. Only after understanding all the content can ideas be extracted and creativity expressed.

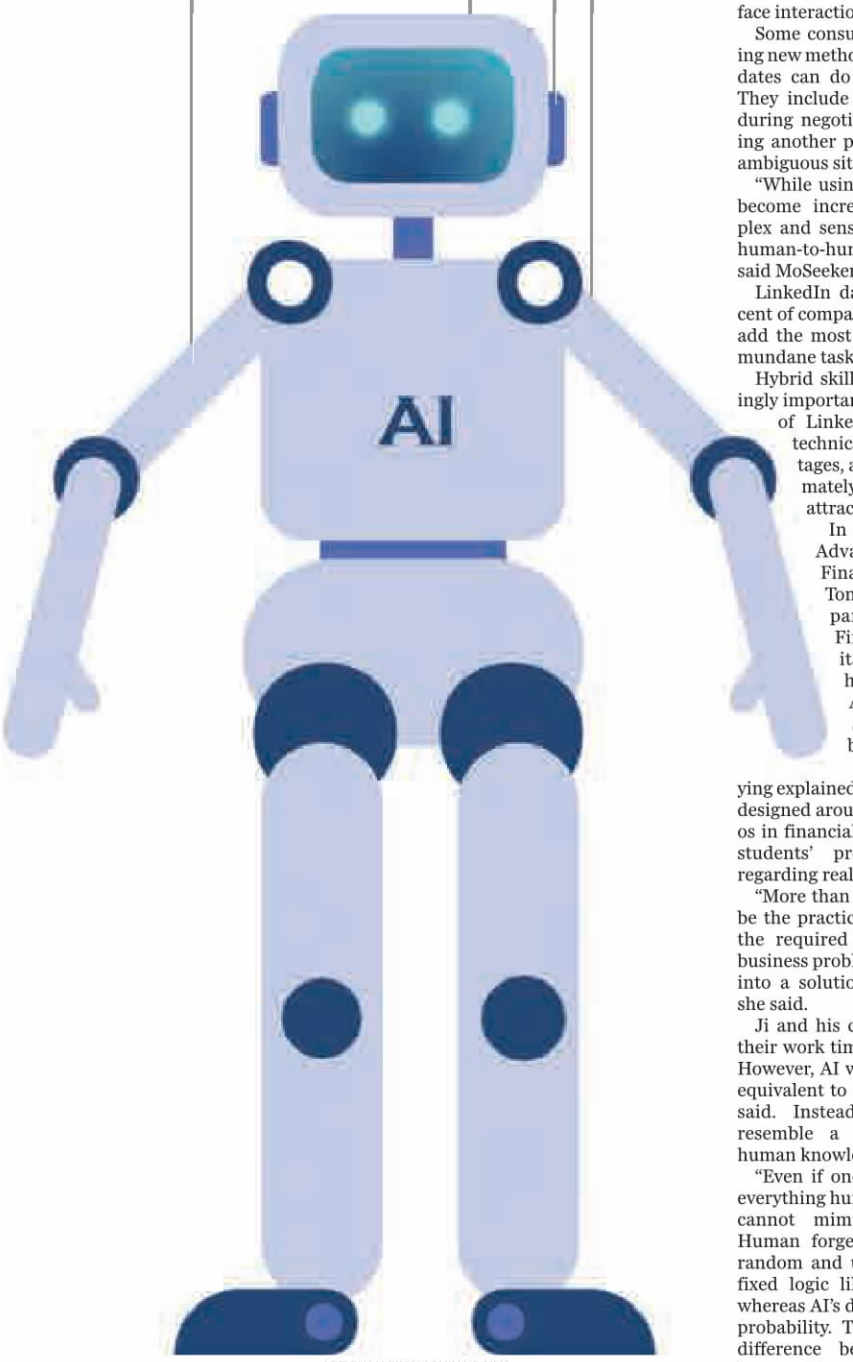
AI has now replaced much of the painstaking work of information gathering. If a video is meant to promote a tourist destination, she can use AI to identify unique aspects and fun facts about the place. Jiang said she then needs to creatively integrate these elements with the desired content to showcase it in an engaging way.

"While AI can produce content, it cannot generate feelings. Truly touching works require human experiences, warmth, and judgment, which machines cannot imitate," said Jiang.

Many new employees shared this sentiment. With the arrival of AI, they are more often placed in roles where they must make judgments and decisions in complex real-world scenarios.

Ji said part of his work involves building a bridge between the "virtual and the real".

While large models can derive results through reasoning, whether these results can be implemented and meet expectations depends on humans using their practical experience and life knowledge, he said.



"In robotics, AI cannot make immersive judgments in real environments, and lacks lateral thinking and associative ability — unique human traits," said Ji.

Wang from LinkedIn said that the changes brought by AI have reshaped what constitutes valuable skills. This includes human judgment, making connections, and the ability to quickly adapt in complex environments, she said.

"For example, journalists today need to think about how to adapt to the AI era to excel in content creation," she said.

"Similarly, the legal profession is being reshaped by AI, as basic tasks like legal research and document drafting can now be handled by AI. Across various industries, the young talents moving fastest are those who quickly adapt to changes within their fields."

> "The most valued skill in today's job market is the ability to integrate AI into real work processes to solve specific problems. In the future, the ability to effectively use AI as a work partner will significantly differentiate individuals in terms of work quality and efficiency."
>
> **Wang Xiangdao,** founder and CEO of MoSeeker

ART BY LU PING / CHINA DAILY

Human nature, go figure

Although AI is already beginning to replace some aspects of labor, many experts agree AI cannot replace the "soft skills" of humans, such as communication, collaboration, and face-to-face interaction.

Some consulting firms are now trying new methods to test whether candidates can do things that AI cannot. They include sensing subtle nuances during negotiations, and understanding another person's true concerns in ambiguous situations.

"While using AI to send emails will become increasingly common, complex and sensitive issues still require human-to-human communication," said MoSeeker's Wang.

LinkedIn data also showed 75 percent of companies agree that soft skills add the most value when AI handles mundane tasks.

Hybrid skills are becoming increasingly important as well, said Wang Wei of LinkedIn. A combination of technical fluency, human advantages, and adaptability will ultimately make job seekers more attractive to employers.

In May, the Shanghai Advanced Institute of Finance at Shanghai Jiao Tong University launched a part-time Master of Finance program. One of its aims is to cultivate hybrid talents with both AI technology understanding and financial business capabilities.

The institute's Ni Haiying explained that the program will be designed around real business scenarios in financial institutions to enhance students' problem-solving abilities regarding real financial issues.

"More than half of the program will be the practical part. We break down the required skill modules for real business problems, and integrate them into a solution-oriented curriculum," she said.

Ji and his colleagues spend part of their work time training large models. However, AI will by no means become equivalent to an individual person, he said. Instead, it will increasingly resemble a super-collective of all human knowledge.

"Even if one day robots can mimic everything humans see and touch, they cannot mimic human 'forgetting'. Human forgetting and thinking are random and uncertain, not based on fixed logic like equation derivation, whereas AI's decision-making relies on probability. This is the fundamental difference between machines and humans," Ji said.

Chinese Premier Li Qiang (right) meets with Bangladeshi Prime Minister Tarique Rahman on Thursday at the Great Hall of the People in Beijing. Rahman's official visit to China began on Wednesday and concludes on Friday. WANG ZHUANGFEI / CHINA DAILY

Li highlights ties with Bangladesh

Beijing is willing to work with Dhaka to consolidate strategic mutual trust

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

China and Bangladesh signed an array of cooperation agreements on Thursday as the two countries vowed to enhance bilateral ties.

Premier Li Qiang and visiting Bangladeshi Prime Minister Tarique Rahman witnessed the signing of the documents after their talks at the Great Hall of the People in Beijing.

On Wednesday, Rahman began a three-day official visit to China, his first to the country after assuming office in February. He also attended the opening plenary of the 17th Annual Meeting of the New Champions of the World Economic Forum, or the Summer Davos forum, in Dalian, Liaoning province.

During their talks, Li expressed China's willingness to work with Bangladesh to maintain good-neighborly relations, consolidate strategic mutual trust, expand practical cooperation and continuously achieve greater development in bilateral ties to deliver more benefits to the people of both countries.

China is willing to work with Bangladesh to promote high-quality Belt and Road cooperation, steadily advance major landmark projects in port and water conservancy, and strengthen cooperation in trade, industrial and supply chains, and finance to promote the common development and prosperity of both countries, he said.

The premier expressed the nation's readiness to import more high-quality products from Bangladesh, support Chinese enterprises in investing in the South Asian country and expand cooperation in emerging industries such as new energy, digital economy and artificial intelligence.

China hopes that Bangladesh will continue to provide a favorable environment for Chinese enterprises, he said.

Noting that both China and Bangladesh are developing countries, Li said that China is willing to enhance multilateral coordination with Bangladesh to defend common interests, promote solidarity and self-reliance among developing countries, and make greater contributions to the development of the Global South.

Inside
Editorial, **page 6**

Rahman said the Bangladeshi government firmly adheres to the one-China principle, and looks forward to maintaining close high-level exchanges with China and promoting economic, trade and cultural cooperation under the framework of the Belt and Road Initiative.

Bangladesh firmly defends the postwar international order based on the Cairo Declaration, the Potsdam Proclamation and the United Nations Charter, supports the vision of a community with a shared future for humanity and the four major global initiatives proposed by China, he said.

Bangladesh is willing to strengthen multilateral communication and coordination with China to promote regional and global peace, stability, and development, he added.

Among multiple cooperation items, the flagship Padma Bridge, built by Chinese companies, has become a model of partnership between the two countries. Chinese enterprises have also participated in solar and wind power projects in Bangladesh, supporting efforts to diversify the energy mix and wean the country off fossil fuels.

Imtiaz Ahmed, executive director of the Centre for Alternatives, a policy research forum based in Dhaka, the capital of Bangladesh, said that Rahman's visit to China is expected to help bring Bangladesh back onto its development trajectory through deeper bilateral cooperation.

Investment should be high on the agenda for the new Bangladeshi government, as investment had declined over the past two years amid political uncertainty and instability, Ahmed said in a recent interview with Xinhua News Agency.

He said that apart from infrastructure, Bangladesh also expects more investment in the health, education and energy sectors. "There is strong public support for China and for Chinese investment," he said.

More talks planned on reciprocal tariff cuts

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China and the United States will hold further consultations on reciprocal tariff reductions under the mechanism of the trade council, the Ministry of Commerce said on Thursday.

He Yadong, a spokesman for the ministry, said at a news conference that the two sides agreed to set up the council and to discuss tariff cooperation, including reciprocal reductions.

"The trade teams from both countries will hold further consultations on the arrangements," he added.

Under the proposed arrangement, the two sides have agreed in principle to discuss a framework for reciprocal tariff reductions on products of equivalent scale, with each side covering $30 billion or more in goods.

Meanwhile, products of mutual concern, as agreed by both sides, are expected to enjoy most-favored-nation tariff rates or even lower rates.

He also noted that trade cooperation between China and the US in aircraft and agricultural products is mutually beneficial.

Rare blue hole formed by coral reefs found in waters off Huangyan Island

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

An aerial photo shows the blue hole in a lagoon off Huangyan Island in the South China Sea. PROVIDED TO CHINA DAILY

China's first coral reef blue hole — a large natural depression on the ocean floor — has been identified in the waters off Huangyan Island in the South China Sea, and it has emerged as a biodiversity hot spot, according to a report released on Thursday.

Environmental DNA technology has helped scientists detect more than 2,700 marine species in and around the blue hole, which was first spotted by a scientific observation team in August last year in the central area of a lagoon, said the 2025 Survey Report on Huangyan Dao Blue Hole released by the Ministry of Ecology and Environment.

Based on their genesis, these underwater sinkholes can be categorized into two types — one formed through limestone dissolution and the other formed by coral reefs, with the latter considered a rare phenomenon worldwide.

Preliminary geochronological studies suggest that the Huangyan blue hole formed at least 3,200 years ago and developed in a high-density patch reef area within the lagoon, the report said. The sinkhole is shaped like a funnel, with a surface diameter of 56.3 meters and a depth of 16.6 meters. The surface area of the blue hole is 1,491.7 square meters.

Typical coral reef biological communities are thriving inside the blue hole, including different species of fish, giant clams, sponges and sea anemones. The green sea turtle, which is a Class I protected wildlife species in China, has been observed inhabiting the blue hole and its surrounding waters.

Field surveys in the surrounding waters over the past two years have recorded 165 species of hard corals, belonging to 14 families and 44 genera, and 184 species of fish, belonging to 27 families and 85 genera.

The report said this coral reef blue hole serves as a vivid testament to the natural ecosystem diversity of Huangyan Island and a key geological archive for reconstructing paleoenvironmental changes in the South China Sea, including sea-level fluctuations and the impacts of global and regional climate change.

The blue hole can provide critical insights into the geological evolution of the Huangyan region, as well as biodiversity and environmental changes in the South China Sea since the Holocene epoch, it said.

The sinkhole offers essential scientific support for understanding the formation, evolutionary mechanisms and ecological effects of this unique marine ecosystem, the report added.

Pei Xiaofei, a spokesman for the Ministry of Ecology and Environment, said the results of the survey highlight the progress China has made in its ecological protection efforts in the waters surrounding the island, which is firmly underpinned by the establishment of the Huangyan Island national nature reserve in September 2025.

The ministry will conduct "more in-depth, systematic and comprehensive research" on the blue hole to provide scientific support for further enhancing ecosystem and biodiversity conservation in the South China Sea, Pei added.

Turpan: Warmth of sand offers natural remedy

From page 1

Yet this harsh environment has provided a natural remedy, as locals harness its conditions to combat ailments like rheumatic and rheumatoid arthritis.

Guljannat Emar, a staff member at the county's Uygur medicine hospital, which has run the therapy base since July 2024, said that the sand can reach nearly 50 C. This warmth induces heavy sweating, stimulates the metabolism and aids blood circulation, as well as detoxifying the body through the pores.

Trace minerals penetrate the skin, and the combination of the dunes' natural magnetic properties and the massaging effects of the sand itself offers holistic physiotherapy, she said. The therapy also benefits those with chronic eczema, vitiligo, dysmenorrhea and menstrual irregularities, and relieves fatigue and muscle soreness, she added.

However, the effect that has generated the most buzz on social media — where short videos of sand therapy have gone viral for the past two summers, a trend that is continuing this year, too — is its potential to draw out *shiqi* (internal dampness) and *hanqi* (cold energy).

In traditional Chinese medical theory, *shiqi* is considered the root cause of most ailments, clouding the body from within and eventually leading to disease.

The benefits of sand therapy may not be immediately obvious, but will become apparent in winter.

And this is not some social media fad.

Sand therapy in western China has been documented in multiple medical texts as early as the Tang Dynasty (618-907), including *Qianjin Yaofang* (Essential Emergency Prescriptions Worth a Thousand Pieces of Gold) by renowned physician Sun Simiao. It was listed as a national-level intangible cultural heritage in 2014.

According to Guljannat Emar, the base received 31,000 visits last year for sightseeing or sand therapy, with more than 19,000 during peak season.

Sand, wherever it lies, seems to invite a kind of intimacy. Khaled Elshamy from Egypt noted similar practices in the Siwa Oasis in Matrouh governorate of his home country, where the therapy is often combined with tourist itineraries.

While sand temperatures may be lower in Siwa, showering after the session is strictly forbidden. Instead, olive oil is applied as a moisturizer, which differs from the Uygur method of using a medicated or salt bath.

Elshamy suggested that exchanges and cooperation between Matrouh and Xinjiang could benefit sand therapy professionals and patients alike.

"Both Egypt and China, with their rich histories and cultures, are nations of wisdom and abundant resources. This knowledge of sand therapy deserves further development and utilization," he said.

Mao Weihua in Urumqi contributed to this story.

Relations: Links shaped by two sides' shared interests

From page 1

The China-Latin America relationship is not built on ideological affinity but on economic necessity. China needs food security, diversified supply chains, renewable energy, biodiversity, and strategic minerals — resources that underpin artificial intelligence, electric mobility, quantum technologies and advanced manufacturing. Latin America holds these resources in abundance. The region, in turn, seeks investment, logistics, technology, industrial upgrading and access to innovation ecosystems. These can transform natural wealth into sustainable prosperity.

The Chinese saying *juli chansheng mei* — "distance creates beauty" — highlights a key aspect of this relationship. Unlike in many regions, China and Latin America carry little historical baggage. There are no legacies of territorial disputes, colonial domination, military confrontation or inherited security dilemmas. Their relationship begins with neutrality, allowing cooperation to be shaped by shared interests rather than by unresolved grievances.

Recent efforts in Washington to revive a more assertive hemispheric posture have prompted comparisons to the Monroe Doctrine. However, the international environment has changed profoundly. Latin America today is not what it was in previous generations. Governments in the region recognize that reliance on a single external partner creates vulnerability, not resilience. Diversification has become a strategy for sovereignty.

Latin America's greatest challenge is economic transformation, not military security. The region does not primarily need aircraft carriers or ideological prescriptions; it needs ports that integrate supply chains and railways that reduce logistics costs. It also needs digital infrastructure to support artificial intelligence, financing for renewable energy, and technology transfer.

China demonstrates that sustained investment in infrastructure, technology, institutional continuity and long-term planning can reshape economic trajectories. This lesson transcends political systems. For Beijing, the priority is building relationships grounded in shared development interests — partnerships that reflect the continuity of structural complementarity rather than the fluctuations of any single electoral cycle. Strategic partnerships are resilient when rooted in genuine mutual benefit.

Five centuries ago, the seas were left uncrossed. The opportunity was lost, and history changed course. Now, history offers a second chance — not to repeat Zheng He's voyages, but to complete them in a different form. The aim is shared development. The goal is co-creation, not discovery.

Political winds will continue to shift. Ideologies will evolve. Alliances will be renegotiated. However, the structural complementarity between China and Latin America is likely to endure. In an era defined by artificial intelligence, the energy transition and technological change, their partnership is becoming indispensable.

History rarely gives nations a second chance. When it does, wisdom lies not in looking back. Instead, it lies in recognizing the future this chance makes possible.

US sister cities, states keep China ties strong

Through sports, schools, medicine and trade, local partnerships are keeping Sino-US ties rooted in personal relationships

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

Top: Students from Qinghai and Utah participate in a fun activity on May 29 in Xining, Qinghai. The year 2026 marks the 15th anniversary of the sister-city relationship between Qinghai and Utah. MA MINGYAN / CHINA NEWS SERVICE **Left:** A replica of the John A. Roebling Suspension Bridge over the Ohio River, a joint project of Liuzhou and Cincinnati, Ohio, stands in the Cincinnati-Liuzhou Friendship Garden in Liuzhou, south China's Guangxi Zhuang autonomous region. PROVIDED TO CHINA DAILY
Above: Joe Hamrick (fourth from left), chair of the Cincinnati-Liuzhou Sister City Committee, poses with other committee members and their counterparts from Liuzhou, South China's Guangxi Zhuang autonomous region, for a group photo in Cincinnati, Ohio, in 2019. PROVIDED TO CHINA DAILY

Jeffrey Sullivan, director of system-wide athletics for Montgomery County Public Schools in Maryland, has not taken a bracelet off his wrist since February. A Chinese student from a visiting delegation knotted it there and told him that it would bring luck for the entire year. Sullivan has no intention of removing it.

Across the country in Utah, a young woman named Ellie Phelps once sat in a Chinese-language class and was ready to quit for lack of personal connection with the language. One summer camp in China changed everything. Today, Phelps is on a Fulbright Scholarship at Tianjin University. This year, she will return to the summer camp as a mentor.

Inside Cincinnati-Liuzhou Friendship Garden in China, a replica of a Cincinnati suspension bridge has become a romantic landmark, so beloved that couples take their wedding photographs on it.

In Tacoma, Washington, more than 200 Lincoln High School students have visited their Chinese sister city Fuzhou, Fujian province since 2008. Among them was a young woman whose single trip sparked a lifelong love of immersing herself in other cultures. In Oregon, a state senator came home from a trade mission to 13 Chinese cities to find that more than 80,000 additional tons of Oregon hay will head to China.

At a moment when US-China tensions dominate the headlines, an expanding network of subnational partnerships, spanning states including Oregon, Maryland, Ohio, Utah, California and Washington, is quietly deepening.

In the 47 years since Nanjing and St Louis forged the first US-China sister city bond in 1979, the two countries have built 238 such pairings and 50 sister province-state relationships.

Built to Last

In Tacoma's Chinese Reconciliation Park, an ornate pavilion, the Fuzhou Ting, was gifted entirely by the city of Fuzhou.

"We're so proud and grateful for the relationship with our beautiful sister city of Fuzhou," said Tacoma Council Member Jamika Scott. "It's been a privilege to nurture this relationship for more than 30 years, and we continue to learn and grow from our ties."

The *ting*, a traditional Chinese structure built to provide shelter, rest and viewing points, has since hosted dragon boat races, welcomed musicians from Fuzhou for the sister-cities international music festival, and served as a stage for film and cultural celebrations, said Scott.

In Liuzhou, south China's Guangxi Zhuang autonomous region, a different kind of monument has taken on an unexpected romance. A replica of the Roebling suspension bridge that spans the Ohio River was built collaboratively by the cities of Liuzhou and Cincinnati, Ohio.

Couples in Liuzhou now stand on the bridge and get their wedding pictures taken.

Despite the city's profound German heritage, Cincinnati formed its first sister city relationship with China. Established nearly four decades ago, the sister city partnership with Liuzhou has touched thousands of lives through teacher and professional exchanges, said Janet Huston, Ohio state representative for Sister Cities International.

More recently, pickleball enthusiast and sister city committee chair Joe Hamrick recruited seven couples to travel to Liuzhou and introduce the sport. They visited high schools, universities and recreation centers. But, as Huston observed, the games were never really the point.

"The real purpose of any sister city exchange is to foster peace and understanding between two cultures, and what both sides came away with was just this overwhelming sense of kindness and love, changing attitudes, literally one person at a time," she said.

Pickleball Diplomacy

Echoing the Ping-Pong Diplomacy that helped reopen US-China ties in the 1970s, Sullivan is betting on pickleball as a universal language connecting young people across cultural divides.

His philosophy of the initiative is that international relations are built "one relationship, one rally at a time".

The initiative began in April 2025, when more than 30 Montgomery County student-athletes flew to Beijing, Shenzhen and Shanghai for 12 days of shared play, school visits and cultural exchange. Shenzhen returned the visit that August.

In February, a Shanghai delegation arrived in Maryland, followed by a group of students from Montgomery County Public Schools traveling back to China, visiting Shenzhen, Shangyou, Hebi and Beijing.

These cities have either established sister-city ties with US cities or actively participated in people-to-people exchange initiatives, particularly youth and sports diplomacy.

"What was so amazing about this trip was it occurred during the Spring Festival," said Sullivan, and the students watched robots dance in Shenzhen and were "fascinated" by the trip. He had also told the students what that city represents: a place that used to be a small fishing village is now a global technology metropolis.

"I believe in the power of sport and the power of pickleball to bring people together," Sullivan said. "I hope to continue to return to China to see different cities, both the big ones and the small villages as well. It really all speaks to the culture of China, and I think it gives us a different perspective."

The program is already drawing interest from Chinese cities. At a recent US-China Sister Cities Summit in San Francisco, representatives from Guilin and Xi'an extended invitations to explore pickleball exchanges of their own.

"I would like to spread the feeling and the purpose of pickleball diplomacy to as many cities and provinces as possible around China," he said.

Beyond pickleball, Chinese-language learning is also turning cultural exchange into personal connection.

See from Another Lens

Phelps had studied Chinese since she was six years old. The language felt abstract and disconnected, with no real friendships, no personal stakes, no compelling reason to continue. Her mother persuaded her to join a summer program run by the Helen Foster Snow Foundation. Today she is at Tianjin University on a Fulbright Scholarship and has a Chinese boyfriend.

"She talks about how transformative this experience has been for her life," said Eric Chipman, executive director at the Helen Foster Snow Foundation in Utah.

The foundation supports 12,000 Utah public school students who learn Chinese for half the school day. This year, approximately 300 US students from kindergarten through university level will travel to the cities of Shenzhen and Beijing as well as provinces of Hainan, Shaanxi and Qinghai.

The foundation's mission is not only language acquisition, but also people-to-people exchange, said Chipman. "What I believe are the heart and core of exchange trips are real relationships, real meaningful connections," he said. He is actively seeking provincial and municipal partners to scale the programs into school curricula.

In Tacoma, Lincoln High School's exchange with the Affiliated High School of Fuzhou Institute of Education has produced more than 200 student visits and sustained faculty exchanges in both directions since the two sides signed a memorandum of understanding in 2008.

"We have been very proud to host students from Fuzhou at Lincoln High School every summer and introduce them to Tacoma," said Tacoma Council Member Jamika Scott. She said her younger cousin was one of those students and the experience helped her discover a lifelong passion for the world.

"I have no doubt these invaluable firsthand experiences are life changing. I think it's going to be particularly important to expand our exchange programs in the coming years."

A former teacher and artist, Scott envisions deepening the relationship through the creative fields. "Students in Tacoma are especially engaged in the arts, including glass blowing, painting, photography, filmmaking, dance and so much more. Sharing these creative passions with their Chinese counterparts and learning more about the creative work in China will enrich the lives of our young people," she said.

"When youth share their perspectives through art I believe they can deepen their understanding of each other and find ways to imagine a bright future working together in collaboration," she added.

The same spirit of exchange extends beyond sport and language. In medicine, one of the oldest US-China educational partnerships continues to bring students, doctors and researchers together more than a century after it began.

The partnership that produced one of China's earliest Sino-foreign cooperative medical schools began in 1905, when an American Yale-trained physician named Edward Hume arrived in Changsha, capital of Hunan province, and established a clinic that would grow into Xiangya Hospital.

The name Xiangya means Hunan and Yale. More than 120 years later, this heritage has turned Hunan into a long-running hub for US-China medical education cooperation, and that relationship is still active today through student exchanges, joint training and research partnerships, said Mai Miao, vice-president of Hunan people's association for friendship with foreign countries.

Xiangya School of Medicine, now part of Central South University, continues to collaborate with US institutions on training and research. The school's American origin makes Xiangya a natural bridge between Hunan and US medical institutions. Building on that bridge, Mai said, the province aims to become a base where Chinese and US medical professionals exchange ideas and collaborate.

In April, the Changsha leg of the 2026 China-US Youth Health Dialogue convened young medical professionals from both countries at Xiangya School of Medicine. Vladimir Ljubimov, a neurosurgery faculty member at Cedars-Sinai Medical Center in Los Angeles, shared his research at the conference and later documented the experience on social media.

The photos show him posing for group photos with Chinese colleagues, visiting the thousand-year-old Yuelu Academy, a traditional pharmacy and the neurosurgery department of Xiangya School of Medicine. He called it "an unbelievable experience" and wrote in the post: "I got to see and learn so much about China's healthcare and met world class young professionals from China and US, making great friends along the way!"

University of Michigan Medical School student Max Wagner, one of seven students from the university who attended the China-US Youth Health Dialogue last year, encouraged his fellow students to apply for it.

"These experiences broaden our understanding of medicine and the diverse ways it can be delivered and perceived by patients," he said in a news release on the school's website. "We embraced so many opportunities to step outside our US-based clinical lens to see patient care from a new cultural perspective."

You Have to Be There

Whether through a pickleball court, a classroom or a medical exchange, the deeper purpose is the same: to move people beyond abstraction. For those working on US-China subnational ties, that begins with showing up.

Ker Gibbs, former president of the American Chamber of Commerce in Shanghai, has a story about Max Baucus, the US ambassador to China under president Barack Obama.

Early in his posting, Baucus was the guest of honor at a Chinese banquet. Everything was going smoothly until, midway through the meal, he looked sideways and found the seat beside him empty. His host had gone. Baucus's first instinct was anger. Then he looked up. The host was moving from table to table, glass raised, toasting guests, filling the room with warmth and noise. Then came understanding. He picked up his own glass, walked to the nearest table, and did exactly the same. The room was delighted.

Gibbs shared the story with the attendees at the recent US-China Sister Cities Summit in San Francisco to make the point: you have to be there.

"If you talk to Max Baucus today, he can't wait to get up out of his chair. You invite him to dinner, he barely sits down, and he just grabs his glass and goes off and toasts people," Gibbs said.

"There is no substitute for actually being there in China, talking to people and experiencing their culture and traditions," said Gibbs.

This year marks the 42nd anniversary of Oregon's sister-state bond with Fujian province and the 12th year of its sister relationship with Tianjin municipality.

Oregon became the first state in the United States to codify a sister-state committee in law: a bipartisan, bicameral committee designed explicitly to outlast any administration or electoral cycle. When political winds shift, the relationship holds its course.

"This design is highly intentional," said Oregon State Senate President Rob Wagner, who co-chairs the Joint Committee on Oregon-China Sister State. "It ensures that our relationship with China transcends elections and party politics."

The legal framework, he said, sends a clear message that Oregon is open for business, committed to educational and cultural exchange, and legally bound to building enduring subnational bridges.

Last October and November, the committee sanctioned two trade missions to China. Wagner led a delegation that visited 13 cities in nearly three weeks.

Those missions bore what Wagner called "magnificent fruit": Oregon successfully signed an agreement last month to export more than 80,000 additional tons of hay to China.

To economists, he acknowledged, that amounts to a line on a balance sheet. "But to the farmers, to local communities keeping their generational lands profitable, and to the workers at our ports staying employed, it means so much more," he said. "It is these subnational relations that turn abstract diplomacy into real-world mutual prosperity."

Angkor treasures bring Khmer legacy to Shanxi

Series of artifacts trace Cambodia's historical civilization and cultural exchange with China

Bottom: Statues created during the Chenla period are displayed at the Cambodian exhibition that was opened on June 5 and is scheduled to conclude on Oct 7.

By **YUAN SHENGGAO**

When Cambodia's national flag, featuring a white silhouette of Angkor Wat Temple in its center, was projected on a wall of the main venue of Shanxi Museum in Taiyuan on June 5, local residents and tourists alike were pleased to see the opening of a major exhibition in Shanxi province, which is set to present a dialogue between two of the great civilizations in Asia.

According to officials at Shanxi Museum, the exhibition showcasing the cultural assets of Angkor Wat and ancient Cambodian, or Khmer, civilization, will last until Oct 7.

More than 130 exhibits are now on display, which are mainly new arrivals in China, including many making their overseas debut.

The exhibition has aroused great interest among Chinese and Cambodian people since its opening.

On June 8, Wang Wenbin, China's ambassador to Cambodia, made a passionate introduction regarding the event to the world on his social media accounts, using the Cambodian and English languages.

He announced that it is time for "ancient Khmer civilization takes center stage in China's Shanxi".

Wang noted that this is the first time that the ancient Khmer civilization has been exhibited in North China's Shanxi province, which is also one of the cradles of Chinese civilization. He added that the exhibits span various periods in Cambodia's history, with items covering such categories as Buddhist statues, structural components, ceramics and stone carvings.

At Shanxi Museum, a visitor said this event takes people on "a journey back in time to a land nurtured by the Mekong River and Tonle Sap Lake for millennia".

The exhibition is composed of three sections, about "the rise of kingdoms", "the forming of a city", and "lives of ancient Khmer people".

History on display

The first section of the exhibition aims to familiarize visitors with the history of Cambodia using exhibits, maps and pictures.

According to the exhibition's introduction, the history of Cambodia is closely related to the Mekong River and the Tonle Sap Lake.

The Mekong, originating in China, arrives in Cambodia after a journey of more than 4,000 kilometers. In the country, it is connected to the Tonle Sap Lake via the Tonle Sap River.

Tonle Sap Lake is a natural flood plain reservoir in central Cambodia. It is drained during the dry season by the Tonle Sap River, across a vast plain southeastward to the Mekong.

During the monsoon season from June to November, the swollen Mekong reverses the flow of the Tonle Sap River back to the lake, which increases the lake's area by nearly four times.

The regular rise and retreat of water in Tonle Sap Lake brings fertile mud to the plain, making it one of the most productive rice-growing regions in Southeast Asia. That's how the river and lake nurtured the people and led to the forming of a nation.

Based on the flourishing agriculture, a kingdom, which was named "Funan" by Chinese historians, emerged on the land in the 1st century AD. Funan went into decline in the 6th century and was supplanted by a group of kingdoms that Chinese historians refer to as "Chenla". The two periods served as the foundation of the Khmer civilization.

In the early 9th century, Prince Jayavarman II founded a new kingdom called the Khmer Empire, the first to unite Cambodia into a political entity. It lasted until 1431.

The capital of the Khmer Empire was the city of Angkor, centering around the great number of temples including Angkor Wat.

A number of exhibits belonging to the periods are now on display at Shanxi Museum.

For instance, there is a copper statue of Buddha, which is identified as an item of the Funan period. The work features a Phnom Da style, which is named after the Phnom Da Temple built during the period. The statue-making art originated in the Gandhara region in South Asia — a key hub for the eastward spread of Buddhism more than 2,000 years ago, and local modifications put a greater emphasis on details of statues.

Another exhibit of the period is a statue of the Hindu deity of Vishnu, showing a combination of the Gupta art of India and local aesthetics during the Funan period.

There are also exhibits from the Chenla period, including statues of the Hindu deities of Vishnu, Shiva and Brahma. Statues from the period continued to show the influence of the Hindu religious art but local aesthetics began to prevail — mainly manifested in facial expressions. A prominent feature is the faintly discernible smile of the deity statues.

Forming of a city

The second section, "the forming of a city", tells the stories about the city of Angkor — in a region known as today's Siem Reap — and its valuable cultural assets created during the Khmer Empire.

During the period, the country was governed by a system featuring the integration of "kings and deities", where kings claimed they governed the country according to the will of deities. In this context, a great number of temples — either Hindu or Buddhist — were built along with the construction of "the Great City of Angkor" — or Angkor Thom.

Large construction projects for the city and temples lasted for about 600 years beginning in the early 9th century. Home to a population of nearly 1 million, the Angkor urban complex was among the largest cities in the world in the 12th century.

Large-scale temple construction projects began in the 9th century, with Preah Ko Temple and Bakong Temple among the first Hindu temples in the Angkor region.

Several Shiva statues with distinctive Preah Ko style are on display in Shanxi Museum, including a sitting Shiva with three eyes, who reaches toward his son with a benevolent look.

An eye-catching exhibit is a Shiva statue with both male and female features — with a mustache on one side of the face and softer facial lines on the other side. This characteristic, according to researchers, is a manifestation of inclusive divinity.

Construction of the Angkor Wat Temple began in the 12th century, as a gift dedicated to Vishnu.

On display are a number of relics from the temple, including a statue of a four-armed Vishnu. This statue is engraved with exquisite details, including a crown and a pleated dress with complicated patterns.

Lives of ancient people

The third section of the exhibition highlights the lives of the ancient Khmer people by displaying daily utensils discovered at various sites in Cambodia.

The exhibits show an integration of aesthetics and functionality. For instance, on display at Shanxi Museum are a number of pottery utensils in the shapes of local animals and birds, such as elephants, pangolins and owls.

A number of porcelain utensils, showing both Chinese and Cambodian elements, attracted the attention of many visitors.

"I guessed they were items from China at first glance," said a visitor. "Later, I recognized they were local products after finding they had patterns with Cambodian elements."

A tour guide explained to visitors that following the large-scale export of Chinese porcelain to Southeast Asia during the Song Dynasty (960-1279), craftsmen in Cambodia began to make their own porcelain items incorporating Chinese techniques, aesthetics and local elements.

"The exhibits are evidence of the cultural exchanges and mutual learning happening on the Maritime Silk Road," said the tour guide.

According to the organizers of the exhibition, in the modern era, the cultural exchanges between China and Cambodia have been deepened over the past three decades, especially in the area of cultural heritage protection.

Since the 1990s, China's heritage protection workers have taken part in a number of international initiatives for the protection of the Angkor relics. They have shared their specific experiences and knowledge — especially in the areas of stone carving protection, architectural restoration and archaeological studies — to aid in the repairs of such sites as Chau Say Tevoda, Ta Keo and the Angkor Royal Palace relics site.

Liu Yan contributed to this story.

Visit provides opportunity to advance development of China-Bangladesh ties

The official visit of Bangladeshi Prime Minister Tarique Rahman to China from Wednesday to Friday comes at an important moment for the development of China-Bangladesh relations.

As Rahman's first visit to China since taking office in February, the trip provides an opportunity for the two sides to deepen strategic communication, expand mutually beneficial cooperation and jointly chart the future course of bilateral ties.

During Chinese Premier Li Qiang's meeting with Rahman in Beijing on Thursday, the two sides had in-depth exchanges on bilateral relations and regional and international issues of common concern, outlining the key fields of future pragmatic cooperation ranging across trade, investment, infrastructure, connectivity, water conservancy, healthcare and people-to-people exchanges. That will be conducive to expanding their high-quality Belt and Road cooperation and extending their collaboration to high technology, the green economy and the digital sector.

Li said China is willing to expand imports from Bangladesh and increase investment in the South Asian country. He also expressed the hope that Bangladesh will provide Chinese enterprises and investments with a good business environment.

It is good to hear Rahman say that Bangladesh is ready to deepen Belt and Road cooperation with China. He also voiced the country's support for the four global initiatives and the building of a community with a shared future for humanity proposed by China.

Notably, the two sides signed a series of cooperation agreements in various fields on Thursday that will help transform the common understandings between them on promoting development and exchanges into concrete actions and results in the foreseeable future.

All these will serve to inject fresh vitality into the two neighbors' traditional friendship and their comprehensive strategic cooperative partnership that has delivered tangible benefits to both peoples since the establishment of diplomatic relations between the two countries over 50 years ago.

The deepening of practical cooperation between the two sides will help further broaden their shared interests, enhance mutual understanding and strengthen the foundation for closer strategic coordination on international affairs.

This, in turn, will enable them to effectively uphold multilateralism and promote a fairer, more just and inclusive international order that better reflects the aspirations and interests of the Global South. In doing so, they can work together to safeguard regional peace, stability and common development.

China is the largest trading partner of Bangladesh, while Bangladesh is China's second-largest trading partner in South Asia. Bilateral trade reached about $25 billion last year, demonstrating the high degree of complementarity between the two economies.

China's strengths in manufacturing, infrastructure, technology and industrial development align closely with Bangladesh's aspirations for industrialization, modernization and economic transformation.

Rahman's participation in the Summer Davos 2026 in Dalian, Liaoning province, on Wednesday presented him with an opportunity to engage with China's business community, learn more about the world's second-largest economy's innovation-driven growth and explore new avenues for cooperation in emerging sectors.

During Rahman's visit, President Xi Jinping and Chairman of the National People's Congress Standing Committee Zhao Leji are also scheduled to meet and hold talks with him respectively, according to the Ministry of Foreign Affairs.

Xi will draw up a new strategic plan to further deepen China-Bangladesh relations in his meeting with the Bangladeshi prime minister, Li said.

Against the backdrop of rising uncertainties in the region and beyond, Rahman's visit undoubtedly presents a valuable opportunity for both countries to elevate the China-Bangladesh comprehensive strategic cooperative partnership to a new level.

Supercomputing crown amid adversity

For much of the past decade, Washington has operated on the assumption: restrict China's access to advanced technology and its climb up the value chain will slow down. Few sectors better illustrate this strategy than supercomputing, where export controls, entity lists and semiconductor restrictions have become standard instruments of US policy.

Yet the unveiling of China's LineShine supercomputer at the International Supercomputing Conference High Performance 2026 in Hamburg this week suggests the outcome is not unfolding as intended.

Reclaiming a technological crown that China last held nearly a decade ago, LineShine has become the world's fastest supercomputer, surpassing systems from the United States and Germany.

What makes this moment noteworthy is that it arrives after years of increasingly stringent Western attempts to deny China access to the technologies needed to build such a machine.

In 2015, Washington imposed restrictions linked to China's Tianhe-2 supercomputer project. In 2019, it placed two Chinese supercomputing giants — Sugon and Sunway TaihuLight — on its blacklist. Two years later, in 2021, it expanded the restrictions to include seven additional Chinese supercomputing entities with controls extending to advanced semiconductors, high-end GPUs and chipmaking equipment.

China, however, did not cave in.

LineShine reportedly became the first exascale-class supercomputer to achieve its performance using only CPUs rather than relying on the GPUs that power most leading systems today. Reports suggest it is roughly 20 percent faster than El Capitan, the US machine that previously occupied the top position.

More important than LineShine's speed is what it represents. Supercomputers are not standalone products; they are ecosystems. Their success depends on advances across semiconductors, memory architecture, interconnect technologies, software optimization, cooling systems and large-scale integration.

LineShine demonstrates that China has developed an increasingly complete domestic technology stack. It is reportedly the first supercomputer to reach the pinnacle of global supercomputing without relying on products from Nvidia, Intel or AMD. In that sense, it represents not merely a computing breakthrough but a broader technological and industrial achievement.

This is where the story becomes less about high technology and more about geopolitics.

The US has resorted to blacklisting Chinese entities it perceives as "strategic competitors", restricting their access to advanced technologies, equipment and components and pressuring its allies to adopt similar measures. Yet these restrictions have failed to negate the inherent advantages of China's sizable research ecosystem, superlarge domestic market, comprehensive manufacturing base, deep pool of engineering talent, strong policy coordination and extensive integration into global supply chains and innovation networks.

Rather than slowing China's innovation drive, external pressure has strengthened the incentive for indigenous research and technological self-reliance. The behavior of multinational corporations reinforces this reality. Many global companies continue to deepen their engagement with China's innovation and industrial ecosystem. The country has attracted more than $100 billion in actual foreign investment annually for 16 consecutive years, while multinational corporations are steadily expanding their research activities in the country.

The implications extend well beyond China. For decades, advanced computing capabilities were concentrated in a small group of developed economies. Many developing countries have depended on technologies controlled elsewhere and subject to political restrictions. China's experience suggests a different possibility: technological advancement should not be the exclusive preserve of any single country, alliance or geopolitical bloc.

China's rise from 34th place in the Global Innovation Index in 2012 to 10th last year reflects sustained investment in education, research and industrial capacity and the hard work of the Chinese people. These gains were not condescending gifts from the West. Nor were they outcomes of "subsidies".

The broader takeaway from Hamburg, a storied cradle of Western European innovation, is that technological preeminence is not something that can be ring-fenced through restrictions or sanctions alone.

Innovation is not a fortress to be defended. Like capital, talent and knowledge, it tends to find alternative routes when existing ones are blocked, so long as the pro-innovation environment is favorable.

Lai's support of Tokyo-Manila scheme shows his true colors

The current leader of China's Taiwan region, Lai Ching-te, has once again revealed his die-hard secessionist agenda, this time by criticizing the Chinese mainland's legitimate maritime law enforcement activities in the waters east of Taiwan island. His rhetoric not only disregards international norms but also endorses the provocations of foreign countries interfering in China's internal affairs.

Lai supported the "maritime delimitation" attempt by Japan and the Philippines, saying the Chinese mainland had no right to "intervene". He also accused the China Coast Guard of "fueling regional anxiety" with its legal operations.

The "maritime delimitation" attempts by Japan and the Philippines are themselves illegal. China's law enforcement patrols in these waters, which are entirely justified and in accordance with the law, are aimed at safeguarding the country's sovereignty and maritime rights and interests.

In fact, immediately after Japan and the Philippines announced they would hold the so-called "maritime delimitation" talks in waters where China has its exclusive economic zone and continental shelf, Lai offered his support, once again exposing his willingness to betray the Chinese nation and flatter external forces for his narrow ends.

The move by Japan and the Philippines seriously violates international law, including the United Nations Convention on the Law of the Sea, as well as the basic norms of international relations, gravely infringing upon China's maritime rights and interests.

Their "maritime delimitation" scheme is nothing but a political farce laden with absurdity and ignorance. A quick glance at the map reveals the strategic significance of Taiwan's location. For Tokyo and Manila to lay false claim to the waters east of the Chinese island is like two neighbors trespassing into another's front yard and carving up the garden.

But instead of denouncing their shenanigans, Lai has seized the opportunity to vigorously spread "Taiwan independence" secessionist fallacies and incite anti-Beijing sentiments — an act that is "vile, shameless and destined to be held accountable", as a spokesperson for the State Council Taiwan Affairs Office said.

In another example of external interference in the Taiwan question, on Wednesday, the United States, the United Kingdom, France and Germany pointed an accusing finger at Beijing's law enforcement patrols off the east coast of Taiwan, alleging that the patrols "threaten regional stability and freedom of navigation".

This only serves to expose their hypocrisy and double standards. These Western nations, while quick to criticize China's rightful defense measures, conveniently ignore Japan and the Philippines' unwarranted and unlawful "maritime delimitation" attempts and turn a blind eye to their own provocative and destabilizing naval activities in the region. Their statements form part of a broader strategy to exert pressure on China by interfering in its internal affairs.

"Taiwan independence" leads nowhere. China's national reunification is the trend of history and any attempt to split Chinese territory, whether by secessionist forces on the island, external forces or their collusion, will be resolutely opposed and inevitably crushed by the wheels of history.

— WANG HUI, CHINA DAILY

What They Say

Adapting to climate change vital for agriculture

Editor's note: *As traditional methods of increasing agricultural yields through labor and input expansion reach their limits, leveraging climate resources has emerged as a promising avenue for boosting grain production. The Economic Observer spoke to Pan Zhihua, a professor at the College of Resources and Environmental Sciences at China Agricultural University, on how fluctuating climate resources can be efficiently converted into agricultural products. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The more severe climate change becomes, the greater the risks it poses to agricultural production. Sharp fluctuations in weather patterns can disrupt crop growth cycles, affecting yields and quality. These effects vary across different stages of crop development, necessitating adaptive measures such as adjusting cropping systems and adopting more resilient crop varieties.

For years, advances in agricultural technology have partially offset the extent to which climate influences agricultural production. Despite China's vast territory and diverse climate conditions, national grain production has consistently increased, albeit with periodic fluctuations.

At the regional level, however, weather often exerts a significant influence on crop yields. Losses in one area may be offset by bumper harvests elsewhere, making the overall effect less visible on a national scale.

Ultimately, agricultural production is the process of converting climate resources into agricultural products. This transformation depends on a wide range of technologies that enable farmers to make effective use of meteorological resources. In this sense, climate conditions play a central role in determining agricultural productivity.

But climate resources are inherently variable. When these fluctuations exceed certain thresholds, they can trigger natural disasters that threaten agricultural production. One of the central challenges for future agriculture is to transform highly variable climate resources into agricultural products and biomass in a stable and efficient manner.

Rising temperatures have expanded the geographic scope of agricultural production. Areas that previously lacked sufficient heat for crop growth are increasingly becoming suitable for cultivation. As a result, China's agricultural frontier is generally shifting northward and upward — from southern regions to northern latitudes, and from lowland plains toward higher elevations.

The arid and semi-arid regions of northwestern China and the fringes of the Qinghai-Tibet Plateau have become important zones for agricultural expansion, particularly in the northern dryland areas.

In theory, climate warming has opened new areas for potential cultivation. However, heat is only one of the conditions required for crop growth; adequate water resources are equally essential. Generally, higher crop yields need more water.

However, in reality, while the potential agricultural frontier is shifting northward, precipitation in these regions has not increased. As a result, if these newly suitable farming areas face water shortages, their agricultural potential may not be fully realized.

Creating favorable environmental conditions is fundamental to enhancing the utilization and value of climate resources. Efforts to maximize the benefits of climate resources generally focus on the efficient use of solar radiation, heat and water. Improvements in these areas ultimately lead to higher crop yields and better product quality.

Experience shows that adopting improved crop varieties, optimizing irrigation practices, refining cultivation techniques and applying fertilizers more efficiently can significantly enhance the utilization of climate resources.

Agricultural development, in many ways, is about adapting to and overcoming weather-related challenges. Establishing a comprehensive national-level climate adaptation framework for agriculture would therefore be both a major achievement and a long-term systemic undertaking.

Policy support will be crucial in this process. Over a decade ago, governments introduced subsidies for agricultural machinery and fertilizers to encourage farmers to invest in productivity-enhancing inputs. In the future, subsidies should place greater emphasis on climate-related technologies, adaptation measures and the efficient use of climate resources.

Governments can also promote the development of meteorology-oriented economic parks, integrating climate services into industrial park planning and making them a key component of local economic development strategies.

Muhammad Haris

Why legacy automakers are losing the race

Industries do not decline gradually — they polarize. One segment ascends, propelled by new technology and fresher economics; another descends, weighed down by the very capabilities that once made it great.

The world is watching as this dynamic unfolds inside the global automobile industry today, and the script is disturbingly familiar to anyone who has read *Clayton Christensen's The Innovator's Dilemma* (1997). The question is no longer whether Chinese electric vehicles are winning. It is why the legacy automakers — with their century of accumulated engineering, brand equity, and distribution reach — are so structurally incapable of matching the speed of their Chinese competitors.

Global Lens

Christensen's central insight is simple yet brutal. It explains why well-managed, profitable incumbents fail — precisely because they are well-managed. They primarily focus on higher returns by investing excessively in the products their customers want.

As such, they operate within a locked "value network" shaped by their supplier relationships, cost structures and investor expectations.

This very discipline makes them lower their guard against the "disruptive innovations" that initially seem unprofitable but eventually overtake the market. Over time, as disrupters improve, the chasm widens, revealing gaps that are structural rather than merely technical.

The automobile industry has lived this story before. In the 1970s, General Motors, Ford, and Chrysler — the American "Big Three" — were locked into a high-cost, high-margin manufacturing philosophy anchored around large, fuel-hungry vehicles. The oil shocks of 1973 and 1979 exposed their vulnerability. Into that gap stepped Toyota and Honda, offering the Corolla and the Civic: compact, fuel-efficient, and engineered with a reliability that American producers had never prioritized.

The Japanese did not compete on the Big Three's terms. They rewrote the terms.

Toyota's production system — lean manufacturing, just-in-time inventory, and kaizen culture (a Japanese business philosophy focused on continuous, incremental improvements) — gave Japan a structural cost and quality advantage that Detroit could not replicate simply by building smaller cars. By 1980, Japan had surpassed the United States as the world's largest automobile producer.

Another example that illustrates Christensen's pattern is the Republic of Korea's Hyundai Motor Group.

When they entered the Western markets in the mid-1980s with inexpensive, rudimentary vehicles, Japanese and American manufacturers openly mocked them. They were dismissed — until they were not. Investing heavily in quality improvement and design through the 1990s and 2000s, Hyundai closed 2025 on a high note, achieving the fifth straight year of record retail sales, what they called their "5 for 5 in 2025" mission.

MA XUEJING / CHINA DAILY

The recent entry of Chinese manufacturers through EVs is a classic case of the innovator's dilemma. They compete with legacy automakers on two fronts simultaneously — one regulatory, the other technological.

On the compliance front, Chinese manufacturers developed a vertically integrated supply chain and modular production architecture that slashed development cycles from five years to under three. This allowed them to meet — and in some cases exceed — global emissions and safety standards faster than incumbents could react. On the technological front, the Chinese challengers fundamentally rewrote the value proposition of the car. Instead of competing on horsepower or heritage, they shifted the center of gravity toward software-defined features — advanced driver-assistance systems (ADAS), over-the-air updates, and immersive digital cockpits.

For legacy automakers, long organized around mechanical engineering and combustion platforms, this shift created a painful asymmetry.

The existing capabilities of legacy manufacturers have become liabilities whereas their EV road maps, often compromised by the need to protect internal combustion profits, fell chronically behind.

Honda reported losses worth $2.6 billion in the fiscal year ending in March 2026, mainly attributed to enhanced competition from Chinese automakers as well as the allocation of resources to EV development at the cost of a decline in value for customers in the hybrid and gasoline car segments.

The innovator's dilemma does not spare the high end of the market. For decades, European luxury marques relied on barriers of brand prestige, V8 dynamics, and hand-finished interiors to fend off newcomers. Today, those defenses are being bypassed.

Brands like BYD, Nio and XPeng — and now Huawei with its expanding automotive ecosystem — are making inroads into the high-end market long dominated by Ferrari, Porsche, and Mercedes-AMG.

They are offering instant torque, lidar-based autonomous driving across all product lines, and smartphone-grade user experiences at more competitive prices.

The legacy supercar manufacturers remain ambivalent about their EV strategies because of two major challenges. First, because they have lost ground in major markets such as China.

Second, they are under pressure to produce cars that comply with global emissions standards. Both Lamborghini and Porsche have signaled curtailment of EV plans due to lower demand.

Even Ferrari, which unveiled its first fully electric model, the Ferrari Luce, did not get an overwhelmingly positive response. Rather than rallying, Ferrari's shares fell — a telling reaction from investors who recognized that a once-unassailable icon is now playing catch-up in a game whose rules have been rewritten in Shenzhen and Shanghai, not Maranello.

There is at least one consolation in this disruption: it is unambiguously good for the planet. The accelerated adoption of EVs, whatever its competitive origins, is an essential response to the climate emergency.

Yet history rarely grants permanent advantage. Japan disrupted the US; ROK disrupted Japan; China is now disrupting both. The innovator's dilemma is not a one-time event — it is a recurring structural condition of capitalism to which the Chinese EV manufacturers must remain vigilant.

Wang Dong and Zhang Xueyu

Governance walls shouldn't hold back the future of AI

In a recent move echoing Cold War-era tactics, the United States government has demanded that artificial intelligence company Anthropic suspend access to its advanced models, Fable 5 and Mythos 5, for all foreign nationals, citing national security concerns.

Faced with the impracticality of verifying users' nationality, identity and purposes, Anthropic took the drastic step of taking these models offline globally.

This incident highlights Washington's tightening grip on frontier AI technologies. It also underscores that attempting to restrict AI technology with outdated export-control measures is both naive and futile.

Unlike traditional military goods, chip-making equipment or industrial components, AI is not a "physical item" that can be boxed, sealed, labeled or intercepted.

It is a complex technological system consisting of algorithms, data, computing power, engineering expertise, open-source communities and global talent networks.

While the US may be able to restrict a company or a model, it cannot block the global spread of technological ideas and innovation paradigms.

The more walls Washington erects through administrative orders, the more it will push other countries and developers to create alternatives, including localized deployment, independent model training and open-source ecosystems.

The current China-US tech rivalry has three key features.

First, both sides recognize each other's genuine technological strengths in certain fields and understand that unchecked competition could harm their own development interests. The rivalry is not just about "decoupling" or "supply-chain rupture" but a complex state of competition without full disengagement.

What we need is not a technological iron curtain, but a transparent, verifiable and accountable global governance framework.

Second, the US continues to apply its traditional export control logic, extending it from chips and equipment to models, platforms, data and talent flows, aiming to maintain its technological edge through a combination of hard and soft policy measures.

Third, after years of external pressure, China has forged a more mature approach to building technological resilience.

It has advanced localization, security-oriented capacity building and systematic technological upgrading in key areas, rendering US physical export-control logic less effective.

Applying these controls to AI technologies could have severe negative consequences. Restricting the cross-border flow of intangible technologies will fragment the global AI ecosystem.

AI development thrives on open collaboration and cross-border exchange, and the "closure-for-security" mindset is at odds with the "openness-for-cooperation" logic needed for tech governance.

Treating frontier models as strategic assets exclusive to one country and its citizens, firms and institutions, will lead to isolated systems marked by mutual mistrust, poor interoperability and conflicting rules.

This will not only drive up AI adoption costs, but also weaken the collective ability to manage AI risks.

What's more, US AI restrictions targeting China could destabilize bilateral relations.

Past proposals by US lawmakers have attempted to securitize and politicize technical learning, model optimization and industrial competition, conflating commercial disputes with national security risks and narrowing the scope for China-US scientific and technological cooperation.

While frontier AI does carry risks of loss of control, misuse and operational failures, blanket technology restrictions are not the solution.

Anthropic's own governance documents acknowledge that as model capabilities advance, stricter safety evaluations, deployment thresholds and accountability mechanisms are indispensable.

So, the US Commerce Department's latest move reflects not just strategic anxiety over technology leakage, but also worries about models' self-learning capacity and rapid iterative progress.

However, reducing such governance risks to a simple matter of "preventing foreigners from accessing the technology" grossly oversimplifies an intricate challenge.

The focus should be on constraining high-risk model capabilities, not users from specific nations.

What we need is not a technological iron curtain, but a transparent, verifiable and accountable global governance framework.

The future of AI cannot be safeguarded by inventing imaginary adversaries.

Framing technological diffusion as hostile infiltration and labeling normal competition as a security threat will only create more barriers and misunderstandings.

For major AI powers, including China and the US, the priority is balancing security and development. Both countries have agreed to launch an intergovernmental dialogue on AI.

This mechanism should center on risk governance, capability evaluation, model safety, misuse prevention and the provision of global public goods. It must not be hijacked by export controls or technological containment.

The AI era needs more communication, unified rules and joint cooperation. Walls cannot hold back the future of AI.

Only responsible openness and coordinated global governance can ensure this technology delivers tangible benefits to all of humanity.

Xizang is beautiful, modern and traditional

I am only halfway through my first trip to the Xizang autonomous region, having spent the past 12 days traversing it. Yet what I have seen so far has already been a revelation.

The Potala Palace in Lhasa, the world's highest palace and a UNESCO World Heritage site, is as magnificent and majestic as the photographs and videos suggest. So is the nearby Jokhang Monastery. In Lhoka, the colorful Samye Monastery and Yumbulagang — the earliest palace in Xizang — are equally impressive.

I also ventured to the Rituo Temple, perched at an altitude of about 4,450 meters above sea level in the middle of the beautiful Yamzhog Yumco Lake.

Known as the Roof of the World, Xizang's landscape is unrivaled as I experienced during my driving tour.

The shimmering lakes and massive glacial mountain ranges, such as the 7,782-meter Namcha Barwa, a mountain peak that sits before the 270-degree view from my hotel room in Suosong village in Nyingchi, are simply breathtaking.

Equally impressive is the region's commitment to protecting its natural landscape. Almost all of Xizang's energy comes from renewable sources, including hydropower, solar and wind.

The region has become a net exporter of clean energy to the national power grid.

A visit to a solar farm in Lhasa offered a glimpse of this transformation. The project is one of the many in the region and has helped improve the livelihoods and well-being of the local community.

Almost all of Xizang's energy comes from renewable sources, including hydropower, solar and wind.

Driving in Xizang is quite comfortable because the highway system has improved dramatically. The 13-kilometer-long Guigala Tunnel that links Lhasa and Lhoka is a modern engineering marvel.

Xizang and Hainan are the only two provincial-level regions in China that operate highway systems without physical toll stations.

A four-wheel drive is highly recommended in Xizang if you want to explore steep mountain paths and some rough terrain. As I have painfully discovered during the trip, even cars can suffer altitude sickness.

The booming tourism industry has brought many job opportunities for local residents, who now run family inns, restaurants, tour agencies and handicraft shops.

A Tibetan incense factory I visited in Dagze district of Lhasa offers a vivid example of how tradition and modernization can reinforce each other. The traditional technique has been well preserved while creating jobs for the locals, including people with disabilities.

Norbu, a young Tibetan man, offered me valuable advice for my road trip. An avid traveler himself, he studied at a university in Jilin province and speaks fluent Putonghua and English in addition to Tibetan.

During my 16 years as a foreign correspondent in the United States and Europe, I frequently came across accusations that "the Chinese government was trying to erode the Tibetan language".

The truth, as I heard from the locals, is very different. Almost everyone speaks Tibetan in Xizang.

The problem is actually the opposite, as I was told. Those who speak only Tibetan but not Putonghua, or Mandarin, face more challenges in the job market, both in Xizang and elsewhere in China. It's similar to Spanish speakers in the US who do not speak English and therefore have fewer employment opportunities.

Like the rest of China, Xizang has made phenomenal progress over the past decades. Living standards have risen significantly, infrastructure has expanded and education and medical services have improved dramatically.

Pensions in Xizang are now among the highest in the country and local employees at government institutions enjoy considerably longer holidays than their counterparts elsewhere.

I also met many foreign tourists in Lhasa, another reminder of the region's growing appeal. I have little doubt that Xizang will become even more prosperous in the years and decades ahead while continuing to preserve its spectacular natural beauty and rich traditions.

Before embarking on the trip, I worried about possible altitude sickness. But a few days of adjustment in Lhasa proved quite effective.

As I continue my travels over the coming days, I am already contemplating a more ambitious and challenging road trip to the Ngari prefecture in western Xizang, perhaps later this fall or next year.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

SOURABH GUPTA

Constructing candid, peaceful coexistence

With data showing that cooperation has directly benefited US workers, farmers and families, the steady, sound and sustainable development of China-US relations is beneficial to all

LI MIN / CHINA DAILY

The China-US summit in Beijing last month has established a new vision for relations between China and the United States. It falls upon the two nations' shoulders to maintain the period of relative strategic calm in bilateral ties. As the two most consequential actors in the global system, it also behooves them, working with the other major countries, to establish an international system based on a broad consensus that is just and fair to all.

China and the US have previously succeeded in utilizing the "steering wheel" of head-of-state diplomacy to hold their bilateral relationship in good stead for the past five decades, instilling greater predictability and stability in ties. Over the past year, both sides have artfully deployed points of selective leverage vis-a-vis the other and created a rough-and-ready equilibrium in their trade and technology policy dealings. The next year will be crucial for whether this equilibrium can be broadened to the larger political and security relations. With multiple presidential meetings fulfilled or slated during this year, the Beijing meeting served as a new starting point in framing a relationship of candid, clear-eyed and peaceful coexistence.

The empirical record of the past decade reveals a more nuanced truth: cooperation with Beijing has, in specific and critical sectors, directly advanced the economic security of US workers, farmers and families. A clear-eyed assessment of this track record shows that it is a strategic necessity to build a "win-win" framework for the future — one built on proven mutual interest rather than naive optimism.

As the US and China are the two foremost countries in the international system today, a stable and forward-looking bilateral relationship is a necessary ingredient for the reform of the United Nations-centered multilateral system.

The US agricultural sector has been the most consistent beneficiary of stable ties. Despite geopolitical turbulence, China remains the largest export market for US agriculture, accounting for nearly one-fifth of the US' total agricultural overseas sales, according to the US Department of Agriculture. In 2023 alone, US farm exports to China topped $29 billion. This demand has been a critical price floor for rural communities, directly supporting farm incomes and local agribusinesses. For US farmers, access to the Chinese market is far from an abstract concept, but a core component of their balance sheets.

Chinese enterprises have become significant contributors to US industrial job creation and supply chain resilience. This is most visible in the clean energy sector, where Chinese manufacturers are responding to Inflation Reduction Act incentives by building US-side factories. For example, Longi & Invenergy's joint venture in Ohio has invested $600 million in a 5GW solar panel plant, creating at least 850 local jobs. Trina Solar has established a major module facility in Texas, generating employment for 1,500 local people. Beyond solar, Chinese investment underpins core US industries. GE Appliances (Haier) is executing a $3 billion, five-year US expansion plan, directly adding over 1,000 manufacturing jobs in Kentucky and the Southeast. In biopharma, BeiGene's $800 million biologics campus in New Jersey has established a new hub for cancer therapy production, employing hundreds of US scientists and technicians. These investments demonstrate that Chinese companies can be partners in rebuilding the US' industrial base when the regulatory framework aligns.

Perhaps the starkest example of mutual interest is in counternarcotics. Data shows that when US-China law enforcement cooperation is functional, it yields tangible results. Following the resumption of the bilateral working group and China's tightening of precursor chemical controls, the US saw a 27 percent year-on-year decline in drug overdose deaths in 2024 — the lowest level since 2019. The two sides' counternarcotics collaboration, which includes intelligence sharing and chemical scheduling, is a direct contributor to saving US lives and strengthening homeland security.

History provides the substantive basis for the practical way forward. The goal is not to ignore competition but to compartmentalize it. A durable framework would leverage these proven areas of mutual gain — agriculture, selective industrial investment, and public health — as stabilizing ballast. It would institutionalize safeguards to protect critical US technologies while allowing the economic and public health benefits that have demonstrably accrued to US households to continue.

This realism can continue and evolve from the recent meeting in Beijing. As the US and China are the two foremost countries in the international system today, a stable and forward-looking bilateral relationship is a necessary ingredient for the reform of the United Nations-centered multilateral system. The greater the flux in the system, the greater must be the sense of responsibility on both sides to place restraints on the use of force. Major power diplomacy can play a pathfinder role in managing global hot spots and devising bridging solutions to these challenges, including to the fraught Persian Gulf situation. For this to be the case though, they must maintain justice in international affairs and craft a framework of ties that keeps tensions within a manageable range and prioritizes a constructive working relationship in areas of common interest without trampling on the other side's system, values and regional commitments.

The author is a senior fellow at the Institute for China-America Studies based in Washington DC. The author contributed this article to China Watch, a think tank powered by China Daily. The views do not necessarily reflect those of China Daily.

LIU YUANLING

Critical convergence

China and the US share significant common ground in advancing green, low-carbon development and tackling global climate challenges

A stable relationship between China and the United States is an important global public good, which not only affects the pattern and development of global governance, but also influences all aspects of the international community's energy transition and climate action. After their meeting in May, the heads of state of the two countries agreed to build a constructive relationship of strategic stability as a new framework for China-US ties. This provides a more mature and resilient model for major-country coexistence that has been developed from the intense and turbulent bilateral relations of the past few years. In this process, the difficulties in China-US cooperation on climate and energy issues are expected to be further alleviated.

In fact, what China and the US are currently experiencing is not a simple "warming relationship", but a deep reconstruction of institutionalization. As the two countries demonstrate the responsibility of striving to put their previously highly uncertain major-country relations into normalized communication channels, it is necessary to review the systems that endure in bilateral relations.

The China-US Working Group on Enhancing Climate Action in the 2020s is one of the few China-US climate cooperation platforms to maintain regular intergovernmental dialogue. Thanks to the Chinese government's consistently responsible climate policies and stance, as well as the active participation of knowledgeable people in the US (local governments such as California have shown high enthusiasm for cooperation in this field), bilateral cooperation in the fields of energy and climate has endured.

Taking climate cooperation as an opportunity, China and the US can make achievements in the field of methane emissions reduction. As an important greenhouse gas, methane needs to be taken seriously as it has a global warming potential that is tens of times more than that of carbon dioxide. Over the past year, China has issued a series of major documents aimed at supporting methane management. For the first time, China's new round of nationally determined contribution targets has included non-carbon dioxide greenhouse gases such as methane, and the 15th Five-Year Plan (2026-30) lists the reduction of non-carbon dioxide greenhouse gases as a major project, demonstrating the country's firm determination to advance methane control at the national level. According to the "Sunnylands Statement on Enhancing Cooperation to Address the Climate Crisis" issued at the 2023 San Francisco Summit between the heads of state of China and the US, the reduction of non-carbon dioxide GHGs such as methane has been identified as a key area of cooperation, and a dedicated working group has been established accordingly. The group is directly led by high-level officials from both sides. Since 2024, the two sides have held multiple dialogues, providing a stable and professional communication platform for methane emissions reduction cooperation between China and the US. Among them, not only top universities such as Tsinghua University and Harvard University are still cooperating on projects such as "China-US Deep Decarbonization Technology Innovation and Policy", but also regions in the US such as California have signed local climate action memorandums with provinces in China such as Guangdong and Hainan, listing methane reduction as the direction of cooperation. This has become a substantive and institutionalized highlight of current climate cooperation between the two countries.

SONG CHEN / CHINA DAILY

The prospects for cooperation between China and the US in the field of nuclear energy are also broad. China is the world's largest market for nuclear power plants, with plans to build dozens of new nuclear power plants by 2035 and increase the proportion of nuclear power in China's total electricity generation from the current 5 percent to around 10 percent. In 2023, at the 28th United Nations Climate Change Conference, the US joined the other 21 countries to jointly launch the Declaration to Triple Nuclear Energy, with the aim of tripling global nuclear power capacity by 2050. In 2025, the US further upgraded the original target with a plan to construct 10 large-scale nuclear power plants by 2030 and quadruple the US nuclear power capacity by 2050. In March, at the second Nuclear Energy Summit held in Paris, China announced its accession to the declaration. This move injects strong momentum into promoting the sustainable development of global nuclear energy and the green and low-carbon transformation of energy. In this context, China and the US can cooperate in areas such as the development of security standards and supply chain resilience that do not involve sensitive technologies. Building on the 2016 China-US Joint Statement on Nuclear Security Cooperation, the continuous interaction from the two sides will provide a valuable stabilizer for the two countries to maintain communication and avoid misjudgment on a wide range of issues.

The cooperation between China and the US in building energy efficiency and clean coal, including carbon capture, utilization and storage will continue to deepen. The 2022 protocol for institutionalized cooperation between China and the US in the field of clean energy between the US Department of Energy and China's Ministry of Science and Technology and the National Energy Administration still plays a role in ensuring the long-term stability of the mechanism. Currently, the two countries are jointly promoting the industrialization process of carbon capture, utilization and storage technologies through joint research under the protocol on the China-US Joint Research Center for Clean Energy. The high-level meeting between the National Energy Administration and ExxonMobil in December 2025, for example, helped facilitate progress on carbon capture and storage. At the same time, Chinese and US universities are jointly tackling the issue of ecosystem service degradation caused by coal mining. Through building bridges via cooperation, the two countries promote technological innovation and the transformation of achievements in this field, and provide Chinese solutions and US experience for global ecological and environmental governance.

Although federal-level climate policy in the US has exhibited significant volatility due to partisan competition, subnational actors — including state governments, local governments and business coalitions — have continued to advance climate action. According to data from the US Climate Alliance, as of 2024, its member states accounted for approximately 55 percent of the US population and 60 percent of its economic output. When local governments and business coalitions are further included, the regions and organizations that continue to implement various climate actions in the US will cover approximately 65 percent of the population and 70 percent of its GDP.

China is expected to work with all these positive forces to contribute to the steady development of global climate governance, which concerns the fate of all humanity. Strengthening cooperation in this field is not only a pragmatic need, but also holds the potential to become a stabilizing force and a new growth point in China-US bilateral relations.

Chinese automakers gain ground in S. Korea

By LI JIAYING
lijiaying@chinadaily.com.cn

Chinese automotive brands are making fresh inroads into South Korea's highly competitive auto market, as their advances in intelligent technologies and improving brand perception are increasingly acknowledged by local consumers.

According to data released this month by the Korea Automobile Importers and Distributors Association, or KAIDA, China ranked among the top three countries by imported vehicle registrations in April, marking the first time that Chinese automakers have surpassed their Japanese counterparts in monthly registrations in South Korea.

Notably, the milestone was achieved largely on the strength of a single brand. Chinese automaker BYD registered 2,023 vehicles during the month, exceeding the combined registrations of Japan's three major brands — Lexus, Toyota and Honda — which together recorded 1,974 units, according to KAIDA.

"The key driver behind this growth is the leading position Chinese brands have established in electrification, intelligent technologies and product innovation, which aligns closely with the strong demand among young South Korean consumers for smart mobility solutions," said Zhang Hong, a senior new energy vehicle industry expert at the China Automobile Dealers Association. "South Korean consumers no longer choose Chinese brands simply because they are affordable. What they value is overall value for money."

Chinese brands are able to offer highly competitive pricing while maintaining strong quality and reliability, meeting consumers' dual expectations for both practicality and cost-effectiveness, he added.

Beyond product competitiveness, Zhang noted that the South Korean market's higher expectations for after-sales services, dealership coverage and customer experience make it a valuable test of automakers' overseas operational capabilities.

In this regard, the performance of Chinese brands in South Korea also demonstrates the growing maturity of their overseas sales and service networks, he added.

The momentum also aligns with a broader shift in South Korean consumer preferences as vehicle electrification accelerates across the country.

According to KAIDA data, NEV sales in South Korea increased from 68,800 units in 2016 to 788,900 units in 2025. Over the same period, the share of NEVs in total vehicle sales rose from 4.4 percent to 51.9 percent.

The growing acceptance of electric vehicles has created new opportunities for Chinese manufacturers, with Chinese-made models accounting for 33.9 percent of newly registered EVs in South Korea last year, up sharply from 7.5 percent in 2023.

Against this backdrop, Chinese automakers have been accelerating their investments and market expansion efforts in the country.

BYD, for example, has rapidly built its presence since launching its first passenger vehicle deliveries in South Korea in April 2025. By March 2026, the company had sold more than 10,000 vehicles in the market, achieving the milestone in just 11 months and setting a new record among imported car brands in South Korea.

Meanwhile, Zeekr officially entered the South Korean market in May by opening its first flagship store in Seoul's Gangnam district. The company introduced its electric 7X SUV as its first model in the country, with orders exceeding 500 units since pre-sales began on June 5.

Looking ahead, Zhang said Chinese automakers are expected to continue gaining market share in South Korea as consumers become increasingly receptive to high-quality EVs and smart mobility technologies.

"Chinese brands are likely to further expand their presence in South Korea over the next year," Zhang said. "At the same time, they will need to closely monitor changes in local policies and market dynamics to sustain long-term growth."

Airbus banks on China supplier base

Firm sees nation's market require 9,500 new planes in next 20 years

By LI JING
lijing2009@chinadaily.com.cn

European planemaker Airbus is deepening the integration of Chinese suppliers into its global manufacturing network, highlighting the country's strategic role as the company works to increase aircraft production worldwide.

Attending as a "chain leader" at the ongoing fourth China International Supply Chain Expo in Beijing, Airbus showcased a collaborative ecosystem, bringing together 11 of its key Chinese and international suppliers spanning materials, aerostructures, manufacturing and logistics.

The company's commitment comes as global aircraft makers race to scale up output to meet strong airline demand while navigating persistent constraints in the aerospace supply chain.

"Airbus will continue to diversify its supplier base in China and neighboring countries and build a competitive industrial ecosystem," John Harrison, Airbus' general counsel and head of public affairs, said at an aerospace supply-chain forum on the sidelines of the expo.

China remains Airbus' largest single-country market for commercial aircraft, accounting for around 20 percent of the company's annual deliveries in recent years. Airbus aircraft also make up roughly 55 percent of the country's in-service civil aviation fleet.

In an interview with China Daily, Harrison emphasized that Airbus viewed China as both a key market and production base and would continue expanding industrial cooperation across manufacturing, research and aircraft lifecycle services.

"China has always been a comprehensive strategic partner of Airbus," Harrison said.

For more than four decades, the partnership has evolved from simple aircraft sales to a comprehensive industrial footprint, including engineering, manufacturing, final assembly, maintenance, and aircraft recycling. Today, Airbus works with about 200 suppliers in China, covering the entire value chain. Components made in China can be found across Airbus commercial aircraft programs.

Airbus China CEO George Xu said the company's industrial cooperation value in China exceeded $1.4 billion in 2025, and is expected to continue growing as production rates increase.

Xu said more than half of Airbus' direct procurement spending in China now comes from the Aviation Industry Corp of China, also known as AVIC, which serves as its largest global aerostructures supplier, excluding engine manufacturers.

The company's two A320-family final assembly lines in the northern city of Tianjin are central to its global strategy, and underpin the company's target of producing 75 single-aisle aircraft per month by 2027.

Among suppliers exhibiting alongside Airbus is Zhejiang Xizi Aviation Manufacture Co, a private aerospace manufacturer that supplies components for Airbus A220, A320 and A350 aircraft.

Mo Chi, the company's general manager, said Airbus-related business accounts for about 80 percent of its total operations, making Airbus its largest customer.

Working with Airbus has required the company to meet stringent global standards for manufacturing, quality control and delivery, helping improve its production capabilities and management systems, Mo said.

The company also supplies components for Boeing aircraft and China's domestically developed passenger jet.

Wu Rongxin, executive vice-president of AVIC, said cooperation between Airbus and AVIC now spans aircraft structures, cabin systems, advanced materials and joint industrial projects covering Airbus' major aircraft program.

Wu said the global aviation industry continued to face challenges including insufficient production capacity and geopolitical restrictions, making supply-chain resilience and cross-industry coordination increasingly important.

Industrywide supply chain constraints remain one of the biggest challenges facing aircraft manufacturers. Airbus CEO Guillaume Faury said earlier this year that the company continues to ramp up production while managing shortages of Pratt & Whitney engines and other supply-chain disruptions.

To support the aviation industry's low-carbon transition, Airbus is also expanding its footprint in sustainable aviation fuel and aircraft recycling. The company's aircraft lifecycle services center in Chengdu, Sichuan province, focuses on aircraft dismantling, recycling and reuse as part of broader efforts.

The European manufacturer estimates China will require more than 9,500 new passenger and freighter aircraft over the next 20 years, highlighting the country's importance to the future growth of the global aviation industry.

Driven by a robust recovery in passenger traffic, which rose 6.5 percent year-on-year to 200 million trips in the first quarter, according to the Civil Aviation Administration of China, the domestic aviation market is widely expected to become the world's largest over the next two decades.

Power capacity hits 4b kW on green push

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's total installed power generation capacity recently reached a historic milestone of 4.01 billion kilowatts, exceeding the combined total capacity of the United States, the European Union, India, Japan and Russia, according to data from the National Energy Administration on Thursday.

The data reveal a remarkably accelerating pace of expansion. While it took the country eight years to grow its capacity from 1 billion kW in 2011 to 2 billion kW in 2019, and five years to hit the 3-billion-kW mark by April 2024, adding the latest 1 billion kW took merely about two years.

Overall, from 2010 to 2025, China's power generation capacity maintained an average annual growth rate of 9.7 percent, outpacing the growth rates of the US, the EU, India, Japan and Russia during the same period.

Industry experts believe that shortening the timeframe to add 1 billion kilowatts of capacity from eight years down to roughly two years is a testament to China's formidable infrastructure construction and equipment manufacturing capabilities.

The fundamental driver behind this acceleration is the explosive growth of new energy, primarily solar and wind power, said Jiang Debin, deputy director of the statistics and data center at the China Electricity Council.

"This not only illustrates the continuous improvement in the efficiency and scale of China's power grid expansion, but also reflects the comprehensive advantages of the country's manufacturing system, engineering prowess and institutional mechanisms," he said.

According to the council, while frequent geopolitical conflicts have triggered energy shortages and price spikes in some countries in recent years, China has maintained a stable power supply.

As electricity demand from emerging sectors such as artificial intelligence and high-end manufacturing continues to surge, this massive 4-billion-kilowatt capacity base provides solid energy security for the country's broader economic and social development, said Jiang.

According to the NEA, this rapid expansion has been overwhelmingly driven by a structural shift toward clean energy, with nonfossil fuels emerging as the main contributor to incremental growth.

Since 2010, nonfossil energy sources have accounted for 74 percent of all newly added capacity nationwide.

Consequently, the country's energy mix has transformed significantly. The proportion of coal-fired power capacity plunged from 61 percent in 2010 to just 32 percent by the end of May. Over the same period, the share of nonfossil fuel capacity soared from 25 percent to 62 percent.

Renewable energy, in particular, has seen massive adoption. Its share of total installed capacity jumped from 24 percent in 2010 to 61 percent by May 2026.

Since 2010, renewables have constituted 73 percent of all new power capacity additions across the country, with solar and wind power alone accounting for 43 percent and 21 percent of the newly added capacity, respectively.

The capacity boom is underpinned by a fundamental shift in unit economics. Over the past 10 years, solar module prices have dropped by over 90 percent, and onshore wind costs are now on par with or cheaper than coal. Driven by technological progress and economies of scale, renewables have transitioned from relying on State subsidies to generating stable profits, igniting broad investor enthusiasm.

This financial viability is backed by the world's most complete renewable supply chain, with China producing roughly 80 percent of global solar modules and 60 percent of wind equipment. Alongside the rapid buildout of ultra-high-voltage transmission and advanced energy storage, this industrial and engineering heft ensures that the country's 4-billion-kilowatt grid can seamlessly integrate and consume the surging clean power supply.

Beyond securing its domestic needs, China's massive power generation capacity is increasingly spilling over its borders through cross-border electricity trade. Leveraging its robust grid infrastructure, the country has steadily expanded power interconnectivity with neighboring countries, particularly in Southeast Asia, according to the council.

This cross-border transmission not only helps alleviate regional power shortages, but also allows neighboring nations to share in China's rapidly growing green energy dividend, it said.

Growth seen in nutrition, health food, supplements market

By ZHENG YIRAN in Shanghai
zhengyiran@chinadaily.com.cn

China's healthcare supplement market is in a stage of rapid transformation and development, with demand shifting from basic healthcare to quality upgrades and precise maintenance, industry experts said.

Their comments coincided with Healthplex Expo 2026 and Natural and Nutraceutical Products China 2026, which were recently held in Shanghai by the China Chamber of Commerce for Import and Export of Medicines and Health Products, or CCCMHPIE, and Shanghai Sinoexpo Informa Markets International Exhibition Co.

The expos, covering an area of over 200,000 square meters, have become a platform for domestic and international enterprises to connect with new partners, expand business channels and learn about the latest trends in the field of health and nutrition.

Fabio De Cillis, chief representative of the Italian Trade Agency Shanghai Office, said: "The health supplement market in China is mature, and consumers of all ages have a demand for health products. Therefore, ITA will require Italian health product brands to adopt a localization strategy to better serve Chinese consumers."

John O'Doherty, CEO of Complementary Medicines Australia, said: "Chinese consumers have a leading understanding of health products globally, so many consumers choose Australian health products because of their higher quality. Most countries regulate health products as food, but in Australia, health products are regulated as drugs. The health product market in Australia is $4 billion annually, with a significant portion coming from China."

Against the backdrop of a complex and ever-changing global trade environment, marked by geopolitical and supply chain fluctuations, China's nutrition and health food industry still demonstrated strong development resilience. Data from the CCCMHPIE showed that in 2025, the import and export volume of the industry reached nearly $12.9 billion, up 7.1 percent year-on-year.

The import volume rose 6.9 percent year-on-year to nearly $8.3 billion, while the export volume increased by 7.8 percent year-on-year to $4.6 billion. The trade deficit was around $3.68 billion, increasing for three consecutive years, said the CCCMHPIE.

Chen Xi, deputy general manager of Shanghai Ai Huitong Biotechnology Co, said, "Currently, in the healthcare industry, where there is a mix of good and bad products, it is necessary to strengthen publicity and help consumers identify products."

Li Baoheng, president of Baoheng Group, called for the introduction of more relevant laws and regulations to promote the healthy and sustainable development of the industry.

Zhang Xinyuan, a researcher at Co-Found Think Tank, said the future development opportunities of the healthcare supplement market mainly lie in the personalized and precise nutritional needs brought by "full-cycle health management", especially customized products for the elderly, children and sub-healthy populations.

In addition, the integration and innovation of traditional culture, such as medicine and food sharing the same origin, is important. Meanwhile, enterprises should pay attention to the scenario-based development of functional supplements — such as sleep aids, sports nutrition and emotional management — and new trends in the healing economy.

Solar policy shift set to shake up industry

Removal of VAT rebate for exports will move focus of competition from price to value

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's solar power industry is entering a mature phase of stable pricing and high-quality manufacturing, following the recent removal of a key export tax rebate, which ends a prolonged era of volume-driven price wars and forces weaker, subsidy-reliant manufacturers out of the market.

Following the removal of a key value-added tax rebate for solar exports starting April, industry insiders and market analysts observe that a profound structural shake-up is actively underway.

The policy shift is acting as a powerful catalyst, forcing weaker, subsidy-reliant manufacturers out of the market while accelerating a much-needed return to long-term value, they say.

"This policy marks a critical turning point for the entire industry," noted Chen Jiahui, a senior solar market analyst from Shanghai Metals Market, a metal information provider in China.

"Top-tier Chinese manufacturers are pivoting from simply exporting basic components to delivering localized, high-efficiency power systems. This will fundamentally shift the core logic of the market from pure supply-and-demand volume to long-term cost efficiency, technological upgrades, and comprehensive service," he said.

Designed to rein in irrational price competition and eliminate outdated production capacity, the policy completely eliminated the 9 percent VAT export tax rebate for photovoltaic products — including silicon wafers, solar cells, and modules — effective April 1.

In addition, to encourage domestic enterprises to focus on core technological breakthroughs rather than rely on export subsidies, the export tax rebate rate for battery products was reduced from 9 to 6 percent starting April 1 and will be entirely phased out from Jan 1, 2027.

This definitive cancellation of the export rebate marks the second major recalibration of China's solar fiscal policy in over a year, following an initial reduction of the rebate rate from 13 to 9 percent in December 2024, said Lin Boqiang, head of the China Institute for Studies in Energy Policy at Xiamen University.

Lin described this environment as a "survival of the fittest" landscape.

"For top-tier manufacturers equipped with vertically integrated supply chains, advanced technology, and strong brand pricing power, the policy shift is a golden opportunity to consolidate their dominance," he said.

"These firms can absorb cost fluctuations through internal optimization and expand their overseas asset-light production bases."

Conversely, for smaller manufacturers lacking technical advantages and heavily reliant on low-price dumping to survive, the removal of the tax rebate poses an existential threat, Lin added.

Workers produce high-efficiency PV modules for overseas orders at a solar factory in Haian, Jiangsu province, on April 29.
GU HUAXIA / FOR CHINA DAILY

Visitors view energy tech displays at a global solar industry expo in Shanghai on June 3. YIN LIQIN / CHINA NEWS SERVICE

The era of "involution" — relentless, margin-crushing internal competition — is yielding to a healthy environment where price competition gives way to value competition, Lin said.

According to Chen, anticipating potential cost variations, overseas buyers have proactively secured extensive orders to ensure steady supply chains.

Data from Chinese customs reveal that solar panel exports reached a record high this March, rising 125 percent month-on-month and 67 percent year-on-year in value terms to $3.61 billion.

According to research firm TrendForce, total first quarter module exports reached between 80 and 100 gigawatts, effectively covering more than a third of the anticipated global demand for the entire year.

Consequently, the second quarter is projected to be a period of rational recalibration. Export volumes are expected to stabilize as international channels digest their massive first quarter inventories, paving the way for a steady, healthy market recovery in the third and fourth quarters.

Amy Fang, a senior analyst at PV consultancy InfoLink Consulting, noted that the robust performance across both module and cell segments in March was a direct result of manufacturers rushing to ship products before the April policy adjustment took effect. She highlighted that while Europe and the Asia-Pacific region remained the primary drivers of this export wave, Africa stood out as a significant emerging growth engine.

Echoing this sentiment, S&P Global analyst Jessica Jin attributed the export boom to both the impending rebate elimination and enhanced profit margins driven by cheaper silver.

However, she cautioned that these massive export figures do not strictly mirror actual downstream consumption. Instead of reaching end-users immediately, a portion of these shipments was likely stockpiled at overseas production facilities or intermediate transit hubs, Jin explained.

Nations across Southeast Asia and Africa, for example, aggressively stockpiled components to beat the April 1 rebate cancellation. Simultaneously, the rippling effects of geopolitical tensions in the Middle East, which raised the specter of fossil fuel supply disruptions, deeply amplified the global urgency to secure independent, renewable energy infrastructure.

"Countries are importing solar panels at record levels and building up their own domestic assembly and manufacturing capabilities to address surging global demand," said Euan Graham, a senior analyst at energy think tank Ember.

Beyond the sheer volume of shipments, China is also moving up the global value chain by exporting more advanced, high-tech solar components.

Chen from SMM points out that while fully assembled modules remain the primary export, accounting for 67 percent of the total, shipments of higher-value solar cells have become the fastest-growing segment, and now comprise 18 percent. Wafers and polysilicon account for 9 percent and 4 percent, respectively.

The geographic footprint of China's exports is also transforming. While traditional markets like the United States and Europe see varying degrees of stabilization, emerging markets have become the primary engines of mid-to-long-term growth, he said.

Exports to the Association of Southeast Asian Nations have grown by 29.4 percent, while shipments to Africa have surged by nearly 50 percent, illustrating a rapidly expanding global market share in the Global South.

According to Chen, for overseas end-users, the policy shift presents a scenario of short-term cost fluctuations, but profound long-term benefits.

While procurement costs may see a slight, temporary rise, the market's return to rationality guarantees that international buyers will receive vastly improved product stability, technological quality, and comprehensive after-sales service, hence avoiding the hidden operational risks inherent in ultra-cheap, low-tier equipment, he said.

This drive to eliminate low-end overcapacity and prioritize high-quality exports mirrors a broader, systemic pivot within China's domestic green energy strategy.

Having already established the world's most extensive renewable energy supply chain, Beijing is systematically transitioning from a phase of explosive capacity expansion to one focused on efficient integration and actual energy utilization.

In tandem with upgrading the quality of its global offerings, the authorities are taking decisive steps at home to address rising curtailment rates — where clean power is wasted because local grids cannot absorb the rapid influx of wind and solar generation. To break this domestic bottleneck and ensure the green energy produced is actually used, policymakers are turning their attention to the demand side.

China has laid out broad new rules that mandate increased use of renewables as it continues to shift the focus of its energy transition from building new generation to ensuring it gets consumed.

Starting Aug 1, the government will implement binding targets for renewable energy consumption. This marks a strategic shift in China's energy transition — moving away from the massive capacity expansion seen in recent years toward combating power curtailment and ensuring clean electricity is actually utilized.

Under the new rules, regions and companies will face strict quarterly monitoring and annual evaluations. Those failing to meet their clean energy quotas will be required to purchase green electricity certificates, a move expected to boost revenue for solar and wind farms.

The mandate also covers non-electric energy uses, such as heating and green fuels, which are poised to spur demand for critical emerging sectors like green hydrogen.

This domestic push for system integration and higher energy utilization aligns perfectly with what Chinese enterprises are now offering their global customers: comprehensive, high-value solutions rather than just raw components.

"Today, solar energy has become an affordable and clean power source for many parts of Africa, allowing local people to access electricity and live better lives," said Zhong Baoshen, chairman of Longi Green Energy Technology, a leading Chinese PV manufacturer.

Showcasing this shift toward advanced applications, Longi recently dispatched a massive 30-megawatt-hour energy storage system to the African continent. This shipment marks a substantial breakthrough for the company's "solar-plus-storage microgrid" solution, a highly specialized system meticulously designed for the demanding environments of remote African mining operations.

These advanced overseas deployments build upon a remarkable track record. Over the past decade, by commanding more than 80 percent of global PV manufacturing capacity and leveraging unparalleled full-chain technological advantages, China's solar sector has miraculously driven the levelized cost of global solar electricity down by over 80 percent.

Today, as the export tax rebate policy officially concludes, it forces the entire domestic sector to permanently abandon low-end price wars, said Lin.

By redirecting its immense capabilities toward relentless technological innovation, advanced product iteration, and localized service optimization, China is nurturing a new generation of globally competitive, premium clean energy brands, he said.

Photovoltaic giants unveil AI-driven storage systems

By ZHENG XIN

Chinese photovoltaic giants are shifting their business models from selling single solar components to providing integrated "solar-plus-storage" system solutions heavily powered by artificial intelligence, as a massive influx of renewable energy challenges grid stability and drives a pressing need for intelligent, long-duration energy storage.

During the recently held 19th International Photovoltaic Power Generation and Smart Energy Conference and Exhibition, or SNEC, in Shanghai, solar giants including Longi Green Energy Technology, Envision Group and Trina Solar showcased their latest technologies, signaling a definitive industry-wide trend toward seamless solar, storage, and AI integration.

Envision Energy launched its next-generation AI-driven solar-plus-storage system during the exhibition. Powered by advanced weather and energy large language models, the system embeds AI capability into real-time forecasting, trading and grid-forming controls to coordinate wind, solar, storage and hydrogen assets.

Rather than acting as a passive hardware supplier, Envision is delivering an integrated smart middle office that dynamically coordinates solar string inverters, wind turbines, and its massive 12.5 megawatt-hours AI energy storage systems in real time, it said.

This AI-centric approach follows Envision's landmark deployment of a 12.8 gigawatt-hour battery storage cluster in the Inner Mongolia autonomous region, where localized AI agents have achieved top-tier trading forecast accuracy and boosted project lifecycle returns by over 20 percent.

By merging physical infrastructure with digital intelligence, the company is targeting multi-scenario applications ranging from zero-carbon industrial parks to advanced data centers.

Following a similar philosophy of native consolidation, Longi unveiled its "Longi ONE" full-stack strategy that integrates high-efficiency back contact solar technology with a comprehensive storage framework. The unified architecture enhances system round-trip efficiency to 93 percent and extends thermal runaway prediction windows to over three months, it said.

"Over the past two decades, the PV industry has succeeded in making solar power cheap," said Li Zhenguo, founder and chief technical officer of Longi. "But as solar takes up a higher share of the generation mix, grid stability, dispatchability and energy storage synergy have become the new structural bottlenecks. Cheap electricity loses its value if it cannot be stably fed into the grid."

According to data from the National Energy Administration, China's total installed solar power capacity reached 1.24 billion kilowatts by the end of March, representing a robust 31.3 percent year-on-year expansion.

This unprecedented volume of intermittent green power has triggered a bottleneck in grid flexibility, forcing manufacturers to transition from simple hardware providers to holistic system architects.

Concurrently, the broader market is undergoing a profound transformation. The China Energy Storage Alliance forecasts a massive surge in global cumulative battery energy storage capacity, which is expected to grow by between 8 and 17 times from 2024 to 2035.

The industry, currently dominated by China, the United States and Europe, is transitioning from a period of explosive expansion into a "gear-shifting" phase, said Chen Haisheng, chairman of the CNESA and director of the Institute of Engineering Thermophysics at the Chinese Academy of Sciences.

Longi Green Energy Technology showcases its latest photovoltaic and smart energy solutions at its booth during an exhibition in Shanghai on June 5. PROVIDED TO CHINA DAILY

Between 2026 and 2030, the compound annual growth rate is expected to reach approximately 20.7 percent under conservative estimates and 25.5 percent in ideal scenarios, Chen added.

Chinese scientist wins top IMO prize

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Chinese meteorological scientist and engineer Xu Jianmin, an academician of the Chinese Academy of Engineering, received the 70th International Meteorological Organization Prize on Wednesday, becoming the fourth Chinese expert to receive the World Meteorological Organization's highest honor.

Xu accepted the prize in Geneva during a session of the WMO Executive Council, where he also delivered a special presentation.

Established in 1955, the IMO Prize is regarded as the most prestigious award in global meteorology. It recognizes outstanding contributions to meteorology, climatology, hydrology and related sciences.

Xu Jianmin

The award honors Xu's decades-long contributions to China's meteorological satellite program and highlights the country's growing strength in meteorological and space technologies.

A founder and pioneer of China's Fengyun meteorological satellite program, Xu played a leading role in charting the development roadmap for the country's satellite-based weather observation system. He spearheaded the development and launch of the Fengyun 1 polar-orbiting satellites and Fengyun 2 geostationary satellites, laying the foundation for China's modern meteorological satellite network.

Xu and his team also achieved breakthroughs in a range of core technologies, including high-precision satellite cloud-image positioning and image-stabilization techniques, helping transform Fengyun satellites into essential tools for weather forecasting, climate monitoring and disaster prevention.

Xu has also promoted the international application of Fengyun satellites. He helped optimize the orbit of the Fengyun 2H satellite, expanding geostationary weather observations over the Indian Ocean, and supported the launch of Fengyun 3E, the world's first civil meteorological satellite operating in an early-morning orbit, filling a key gap in global observation coverage.

According to the China Meteorological Administration, China's Fengyun satellite program has undergone rapid development in recent decades.

To date, the country has launched 23 Fengyun satellites, with 10 currently in operational service. China is now the only nation operating civilian meteorological satellites across all four major near-Earth orbital observation periods.

The 10,000 Swiss francs ($12,300) awarded to Xu with the IMO Prize will be donated to establish the MAZU Scholarship, providing seed funding for its initial grants and operations, the CMA said.

MAZU — short for Multi-hazard, Alert, Zero-gap and Universal — is a China-initiated program aimed at promoting international cooperation in meteorological services and disaster risk reduction.

Named after the MAZU initiative, the MAZU Scholarship will recognize individuals who have made outstanding contributions to Fengyun satellite applications and early-warning capacity building.

The scholarship is intended to promote international cooperation in disaster risk reduction efforts and support the global implementation of the United Nations' Early Warnings for All initiative.

The MAZU program has already been implemented in seven countries, while more than 40 nations have gained access to its services through cloud-based platforms, according to the CMA.

Drug crimes involving minors to feel the heat

Authorities pledge harsher penalties for traffickers

By **YANG ZEKUN** and **CAO YIN**

China's top court and procuratorate vowed on Thursday, ahead of the International Day Against Drug Abuse and Illicit Trafficking, to intensify punishment for drug crimes involving minors, including cases whereby offenders instigate, lure or deceive minors into drug use or trafficking, as well as crimes that target minors.

The Supreme People's Court and the Supreme People's Procuratorate also pledged tougher action against the illegal production and sale of unregulated addictive substances. Both bodies said harsh penalties will be imposed on upstream crimes such as smuggling, manufacturing and the large-scale trafficking of new drugs, warning that teenagers have become a major group affected by such substances.

The SPC said the number of minors involved in the aforementioned and related cases both fell by 32 percent year-on-year in 2025, with the decline continuing between January and May this year, signaling initial progress.

However, compared with 2023, both figures increased by about 1.8 times in 2025, while the abuse of unregulated addictive substances as substitutes has become more prominent.

Liu Weibo, chief judge of the SPC's Fifth Criminal Division, said substances involved in such cases are becoming more diverse. They include narcotic and psychotropic drugs diverted from medical institutions and pharmacies, as well as substances smuggled from overseas.

Some are disguised as milk tea, chocolate or e-cigarettes, while others are promoted as products for weight loss, energy-boosting or aphrodisiac effects, or are used in sexual assault-related crimes, Liu said.

E-cigarettes containing psychoactive substances are particularly common among minors and have become a major vehicle for drug abuse among young people. Some teenagers obtain such substances out of curiosity, excitement or peer influence, while others are lured, coerced or deceived into using them, he said.

Courts have stepped up punishment for core drug-related crimes involving minors, especially smuggling, manufacturing and the large-scale trafficking of new drugs. Severe penalties will also be imposed on offenders who use narcotics or addictive substances to rape or threaten young people, Liu said.

For juveniles involved in drug crimes, courts will impose tougher penalties on those with strong malicious intent or repeat offenses, while leniency may be considered for first-time offenders, those misled into drug use or those coerced into crime. The SPC is also drafting a judicial document on handling new drug crimes, with specific provisions for cases involving minors.

Zhang Jianzhong, head of the SPP's prosecutorial department for major crimes, said traditional drug crimes have continued to decline under sustained crackdowns, but some offenders have shifted to addictive substances not yet under official control to evade punishment.

Cases involving the production, sale and abuse of substances such as nitrous oxide, commonly known as "laughing gas", and butane have rapidly increased, Zhang said. Such substances are deceptive and concealed; they can easily appeal to teenagers' curiosity, leading to abuse and faster spread among minors.

Procuratorates will continue to crack down on the illegal production and sale of such substances, with a focus on crimes involving the instigation, inducement or deception of minors into abusing them, Zhang said.

In a typical case released by the SPP, a minor bought e-cigarette cartridges containing etomidate and related controlled psychotropic substances in Suqian, Jiangsu province, between July and October 2024, then transported them to Changzhou, Jiangsu, for use and sale.

The minor and others sold 415.5 e-cigarette cartridges, collecting more than 212,800 yuan ($31,300) from sales. Several defendants were later convicted of drug trafficking or both drug trafficking and transportation, with sentences ranging from five months' detention to four years in prison, along with fines.

In response to the involvement of both minors and adults in drug trafficking and use, local authorities developed a tiered supervision and governance model covering family and school discipline, supervised care, public security penalties and criminal punishment. To date, it has covered 1,068 drug-related individuals, with 985 corrected at an early stage and returning to normal social activities. The regional drug-related reoffending rate fell by 35 percent during the same period.

Japan warned to shun path of remilitarization

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

The Chinese Defense Ministry urged Japan on Thursday to abandon its dangerous path toward remilitarization, warning that the revival of Tokyo's military-industrial complex posed a significant threat to regional stability.

Zhang Xiaogang, a spokesman for the ministry, said at a regular media conference that Japan continues to portray itself internationally as a victim of nuclear bombings to mislead the international community, while in reality it seeks to replicate nuclear-sharing arrangements and introduce allied nuclear weapons into Japan.

He made the remarks in response to a recent draft proposal by Japan's ruling Liberal Democratic Party to revise its three key national security documents, as well as the recent United States-Japan extended deterrence dialogue. The draft emphasizes strengthening the credibility of US "extended deterrence", with nuclear weapons at its core, and advocates for the development of next-generation submarines capable of launching long-range missiles.

Zhang said that such "extended deterrence" cooperation, a legacy of the Cold War, heightened the risks of nuclear proliferation and conflict.

He warned that Japan's nuclear ambitions are long-standing, with right-wing forces attempting to undermine the country's Three Non-Nuclear Principles.

"The Japanese nuclear issue has shifted from a potential concern to a real one," Zhang said, urging Tokyo to comply with the Treaty on the Non-Proliferation of Nuclear Weapons and calling on the US to stop provocative policies and to avoid undermining regional and global stability.

The spokesman also refuted recent remarks by Japanese Defense Minister Shinjiro Koizumi questioning the transparency of China's defense budget while claiming that Japan will invest in new operational capabilities, including drones and artificial intelligence, transparently.

In response, Zhang said China's defense spending is fully transparent, with detailed budget reports submitted annually to the United Nations since 2008. He said China's military expenditure remains low and restrained, consistently accounting for less than 1.5 percent of the GDP.

Japan's defense budget, in contrast, has increased for 14 consecutive years to 2 percent of its GDP, with per capita defense spending three times that of China, Zhang said.

He described Japanese accusations as a smokescreen designed to mislead public opinion and conceal its own military expansion.

"Japan owes the world a transparent explanation regarding where it is headed, as its expanding neo-militarism becomes an escalating threat," Zhang said.

Japanese official data shows that the country's domestic orders for weapons and equipment, such as surface-to-air missiles and aircraft, have grown significantly in recent years.

Zhang noted that Japan's military-industrial complex once served as the economic foundation of its wartime expansion during World War II. Postwar international documents, including the Cairo Declaration and the Potsdam Proclamation, explicitly restricted Japan from maintaining industries that could enable rearmament.

"The rapid expansion of Japan's reactivated military-industrial complex will push the country further down the path of reckless remilitarization, ultimately endangering the Japanese people," Zhang said, calling on peace-loving people across the world to remain vigilant against the expansion of Japanese military capital and safeguard regional peace.

Having a ball

Former England soccer star Michael Owen interacts with young players at a primary school in Rongjiang county, Guizhou province, on Wednesday. New findings offer clues on ancient salt production

By **WANG KAIHAO** and **WANG RU**

Salt, a crucial cooking ingredient, is often a feature on the dinner table that continues to quietly influence culinary culture. For archaeologists, however, it may help draw a grand picture of civilization.

Off the coast of East China, an ongoing research project which began in 2022 on the Zhoushan Islands in Zhejiang province unveils a massive, prehistoric salt production complex that would fill many gaps in academic studies, as revealed during a Thursday media conference held by the National Cultural Heritage Administration in Beijing.

"Dating back to between 4,800 and 4,500 years ago, they compose the oldest and the largest known remains of sea-salt production in China," said Zhu Xuefei, a leading archaeologist of the project from the Zhejiang Provincial Institute of Cultural Relics and Archaeology.

She added that the 60,000-square-meter Yaojiawan site in Daishan county, Zhoushan, yields the most important findings, though only 1,430 sq m have been excavated.

Archaeologists discovered workshops featuring salt production remains, including salt stoves, piles of discarded salt-making debris, areas for stacking and firing salt, zones for piling deposits, and suspected brine processing facilities. As the deposits continued to pile up over centuries, terraces rose from the ground for human settlements.

A large number of pans related to salt boiling have also been unearthed, along with small red clay pots that were possibly used to store brine.

The Yaojiawan site is only 4 kilometers from the sea, and "wan" in its name means bay in Chinese. Zhu believed it was part of a bay in ancient times, thanks to support from various high-tech analytic approaches in the lab.

Research on environmental changes in history, based on local soil samples, showed that the last time the sea inundated this area was no more than 1,000 years ago, which offered an ideal condition for salt production.

Excavations also proved that salt production activities on the site lasted until about 2,500 years ago.

Technical analysis also helps experts put the jigsaw puzzle back together. Facing numerous broken pieces of production facilities, it seemed a challenging task to tell what they were used for.

"Salt can dissolve in water," Zhu explained. "So their distribution on the facilities is random. It's difficult to figure out the original position of the pieces if we only look for salt."

Instead, researchers used X-ray fluorescence analysis to look for calcium and other elements that were precipitated in the salt production process. The presence of calcium in various components can help to identify their nature on the production line. As a result, the team gradually began to reconstruct a picture of these salt production facilities.

Chen Xingcan, a veteran archaeologist with the Chinese Academy of Social Sciences, said, "We have many ancient Chinese documents on salt production.

"But how did these facilities work in every phase? We need more physical evidence, and the new findings offer much key information."

And tracing the origins of the findings on Zhoushan Islands to 4,800 years ago offered an even bigger horizon: it was the peak time of Liangzhu culture.

The culture, known for its jade worship, rice cultivation, and water conservancy, dates back 5,300 to 4,300 years ago and was centered around the Archaeological Ruins of Liangzhu City, located in present-day Hangzhou, Zhejiang's provincial capital. The ruins are inscribed on the UNESCO World Heritage List.

"Salt production may provide a key economic pillar and offers a fresh angle to understand Liangzhu in the future," Lin Liugen, a professor of archaeology at Zhejiang University, said. "It also inspires us to wonder whether Liangzhu culture expanded to the sea as well."

Using recent findings as a benchmark, the research team has already nurtured new knowledge on previous findings, according to Zhu.

For example, a satellite photo from 1972 once showed many artificial mounds around Yaojiawan.

"They indicate salt production remains for us, and excavations prove that," Zhu said.

Archaeologists also experienced a eureka moment when they realized that many unidentified pottery pieces in local museums were actually part of salt production facilities.

"I believe Zhoushan Islands would not be the only place to have such breakthrough findings," Chen said. "Similar potteries will be found on more islands off the coast."

Matching Chen's assumption, some other key findings on salt production were also made over the past few years in coastal areas in Jiangsu and Shandong provinces. Though their vessels varied from those on Zhoushan Islands, experts pointed to the possible existence of a north-south route for technical exchanges.

"New findings rewrite the cultural history of Zhoushan Islands," Zhu said. "We're ushered to explore more topics surrounding human migration, sea island development, and social change. They prove that the southeast coast of the country has a pivotal role in forming Chinese civilization."

POLICY REVIEW

Urban renewal targets residents' needs

Massive five-year project set to revamp city infrastructure, public spaces

By JI HAISHENG
jihaisheng@chinadaily.com.cn

JIN DING / CHINA DAILY

China has launched its first-ever five-year plan dedicated entirely to urban renewal, triggering a capital blitz estimated to be in the trillions of yuan to overhaul cities and to improve livability, safety and daily convenience.

The landmark blueprint, issued by the State Council on May 28 for the 15th Five-Year Plan (2026–30), shifts the national focus away from soaring skyscrapers and sprawling new suburban districts. Instead, with China's urbanization rate exceeding 67 percent and the traditional real estate market facing a cyclical slowdown, the government is pivoting toward a top-down, systematic regeneration of existing urban spaces.

The refocus will see projects such as the installation of elevators in old residential compounds, parks fitted with digital displays tracking residents' evening jogs, and old industrial sites converted into indoor-outdoor shopping complexes.

The plan is structured around six pillars: cultivating new growth drivers, creating high-quality living spaces, advancing green and low-carbon development, strengthening urban resilience, enriching cultural life and improving urban governance.

By 2030, the plan mandates that China will have made solid progress in urban renewal, delivering tangible outcomes in the transition to a new model for urban development and construction, and fostering a higher quality of life for city residents. This will include the upgrading of 365,000 kilometers of aging underground pipelines — a subterranean overhaul requiring an estimated 5 trillion yuan ($738 billion) — alongside the renewal of 115,000 old residential communities, 4,000 urban villages, and 500,000 dilapidated houses.

By 2035, the plan envisions that the institutional framework for urban renewal will be more robust and refined, with urban development achieving remarkable outcomes. The overarching aim is to have basically built, across the nation, modern, people-centered cities that are innovative, livable, beautiful, resilient, culturally vibrant and smart, the plan says.

"The core breakthrough of this plan is the shift toward a holistic, top-down approach," said Zhang Xueliang, executive dean of Shanghai University of Finance and Economics' Institute for Yangtze River Delta and Yangtze River Economic Belt Development. "In the past, urban projects were often operated in isolation — a road built here, pipes replaced there. This initiative, however, is structured as an integrated framework with multiple specialized sections, forming a practical and measurable system for implementation."

A distinct shift is also occurring in the development paradigm itself, Zhang said.

"We are transitioning from the era of large-scale greenfield construction to a new stage focused on the revitalization and refined management of existing urban spaces," he said. "Urban development is no longer indefinite outward expansion, but rather targeted renovation and revitalization within the current urban fabric."

He stressed that the five-year plan "represents a key move to redefine the foundational logic of how our cities develop and renew".

The new plan builds on substantial achievements made during the 14th Five-Year Plan (2021-25) period. For example, during that time, more than 240,000 old residential communities were renovated, benefiting over 110 million residents.

To drive forward urban renewal initiatives, the central government has kept rolling out fiscal subsidies to eligible cities since 2024. In late May this year, the Ministry of Finance and the Ministry of Housing and Urban-Rural Development selected 15 cities, including Jincheng in Shanxi province, Changchun in Jilin province, Wuxi in Jiangsu province and Quanzhou in Fujian province.

Subsidies are tiered by region in terms of maximum amounts: up to 800 million yuan for eligible cities in eastern China, 1 billion yuan for those in central areas, and 1.2 billion yuan for western regions. This year, the funding will be earmarked for two priority tasks: establishing flagship demonstration zones and refining the institutional frameworks that support urban renewal practices.

According to a report by Xinhua News Agency subsidiary China Economic Information Service, industry projections estimate that the total investment scale related to urban renewal over the next five years is likely to reach 15 to 20 trillion yuan. This substantial capital will be drawn from a diversified mix of sources, including government funding, special bonds, social capital and, in smaller projects, contributions from residents.

Yan Yuejin, deputy head of the Shanghai-based E-House China R&D Institute, told China Economic Information Service that urban renewal has entered a full-speed development phase, which will not only fuel high-quality urban growth, but also unlock enormous opportunities for the real economy and capital markets.

Yan said he expects that urban renewal will directly drive the growth of upstream and downstream industries, such as construction, building materials, engineering machinery, and planning and design.

A China Securities research report indicated that high-quality urban renewal demands advanced standards for developing premium residential properties, livable urban spaces, and convenient surrounding amenities, and that real estate developers with strong product capabilities and presence in major cities are well-positioned to play a pivotal role in high-standard urban renewal initiatives.

However, industry insiders have cautioned that the plan should not be misinterpreted as a stimulus for the conventional real estate sector.

Shi Jing, an analyst at Shanghai-based real estate information provider CRIC, said that estimates linking the plan to a new round of housing price hikes are groundless, because the bulk of investment will be channeled into infrastructure upgrading and public service improvement, rather than large-scale resettlement projects or new commercial housing development.

Such investment initiatives aim to tackle deep-seated, long-term urban challenges — such as chronic urban problems, deficits in public welfare and the need for greater safety and resilience, rather than serving as a countermeasure to the property market's cyclical downturn, Shi wrote in a research report.

Zhang, from Shanghai University of Finance and Economics, said he believes that the greatest business opportunities over the next five years will no longer lie in traditional real estate development, but in emerging fields. These include comprehensive building upkeep, the integrated management of aging neighborhoods and industrial blocks, intelligent upgrading of critical infrastructure, and community-based services that prioritize support for the elderly, children and other vulnerable groups, he said.

He emphasized that the plan's core principle is unequivocal — urban renewal must be people-centered, not merely a physical overhaul of space. "All the quantitative targets for housing, community and pipeline renovation ultimately serve to safeguard the safety and well-being of millions of households," he added.

For instance, renovating old residential compounds should go far beyond cosmetic work such as repainting exterior walls and replacing windows. Supporting amenities and services — including property management, elderly care centers, childcare facilities and community canteens — must be added simultaneously.

Furthermore, he noted that merely leasing out a repurposed industrial building does not equate to truly bringing it back to life; that only happens when public services — such as healthcare, cultural spaces and sports facilities — are integrated, creating mutual gains that enhance both asset value and social welfare.

Policy Digest

Measures issued to boost automotive aftermarket

China on Tuesday rolled out a package of measures to stimulate and expand automotive consumption across the entire industrial chain, with a particular focus on secondhand and aftermarket sales.

According to a document released by eight departments, including the Ministry of Commerce, 40 cities nationwide have been designated as pilot areas for auto circulation reforms, each with priorities tailored to their local conditions.

Another document puts forward 17 targeted measures stimulating consumption in vehicle modification, recreational vehicle camping, classic vintage cars, auto maintenance and insurance services, motor sports and car rental.

Vice-Commerce Minister Sheng Qiuping said at a recent policy briefing that more than 50 percent of passenger vehicles in China are over 7 years old, and the aftermarket is entering a period of rapid growth.

Online consultation underway for *gaokao* participants

The Ministry of Education is running an online consultation week for this year's participants in the college entrance exam, or *gaokao*, from Monday to Sunday via the ministry's official exam information portal — gaokao.chsi.com.cn, known as the "Sunshine Gaokao" platform — as part of the 2026 *gaokao* support campaign. Officials put the number of registered candidates for the 2026 *gaokao* at about 12.9 million.

During the event, Q&A services are available from 9 am to 5 pm, and colleges and universities are hosting live video sessions to explain admissions policies and guide students on how to weigh options for preferred institutions.

In addition, a free public advisory system — backed by large-scale official data on enrollment, student records and graduate employment — has also been put in place to help applicants explore academic programs and career prospects.

Plan unveiled for coordinated platform economy growth

China has rolled out an action plan (2026-28) to advance the coordinated development of large, medium-sized and small platform enterprises, to boost the integration of digital and real economies.

The plan, unveiled by seven authorities, including the Ministry of Industry and Information Technology, sets out targets for 2028, such as establishing replicable models for collaborative innovation and cultivating leading manufacturing enterprises in the platform economy sector.

The plan also calls for greater openness and sharing of technologies and data, and lays out key tasks and special actions, including guiding platform enterprises to strengthen innovation in artificial intelligence, deepening governance of algorithms and traffic, and promoting algorithm transparency.

Ministries release guideline to foster 'AI plus consumption'

China's Ministry of Commerce and seven other government departments on Thursday released an implementation guideline document to accelerate the development of "artificial intelligence plus consumption".

It includes 17 measures in five areas to promote the deeper integration of AI with consumer markets by expanding smart product consumption, empowering services consumption and creating new consumption scenarios.

Regarding goods consumption, the document calls for increasing the supply of new AI products, upgrading consumer electronics, household appliances and home products, cultivating the smart wearable market, and promoting AI-powered robots for elderly care, companionship and daily assistance.

Addressing services consumption, it encourages wider AI application in home services, elderly care, tourism, accommodation and catering, and education, including smart elderly-care facilities, AI-enabled tourism services and smart canteens in offices, schools and hospitals.

CHINA DAILY—XINHUA

Seniors, children front and center for upgrades

By JI HAISHENG

Most afternoons, 83-year-old Qian Weimin meets her neighbors at a community service center in a residential compound in Shenyang, Liaoning province, to sing and play the *hulusi*, also known as the cucurbit flute.

Before extensive renovation, this bustling hub was once a 2,980-square-meter disused boiler room.

"This place has been turned into the thriving heart of the neighborhood," Qian said. "We seniors have a lovely place to gather, and kids get a fun spot to stay after school. We can dine and enjoy leisure activities just steps from home."

Built in the 1980s, the Chang'an community was long plagued by aging infrastructure and insufficient public services. Its renovation began in 2023, when Shenyang rolled out a citywide campaign to revamp old residential compounds. The neighborhood now features the community service center, a reading room, a calligraphy studio, a senior service station, a children's play zone and an elderly dining hall.

"All our work is guided by one principle: delivering convenience, tangible benefits and safety for residents," said Cao Xue, Party chief of the residential community. "Catering to the needs of seniors and children is always a top priority in all our projects. For example, we have not only installed age-friendly facilities but also built a dedicated children's area spanning more than 1,000 square meters."

The community has rolled out a range of activities for people of all ages, such as traditional festival gatherings and movie nights, to forge closer intergenerational bonds.

Chang'an's success offers a glimpse into China's drive to renovate old residential communities. Qin Haixiang, vice-minister of housing and urban-rural development, said in a recent policy briefing that over the past five years, more than 200,000 such communities nationwide have been revamped. He added that around 64,000 new facilities for elderly care, childcare and other services have been put in place, improving the quality of life for hundreds of millions of residents.

Under China's recently released five-year plan for urban renewal (2026-30), the country's first national-level specialized plan for urban renewal, clear targets have been laid out to expand, upgrade and refine the building of complete residential communities. These are neighborhoods that, within a walkable range of residents, offer comprehensive basic public services, convenient commercial facilities, complete civil infrastructure, public activity spaces, property management and sound governance mechanisms.

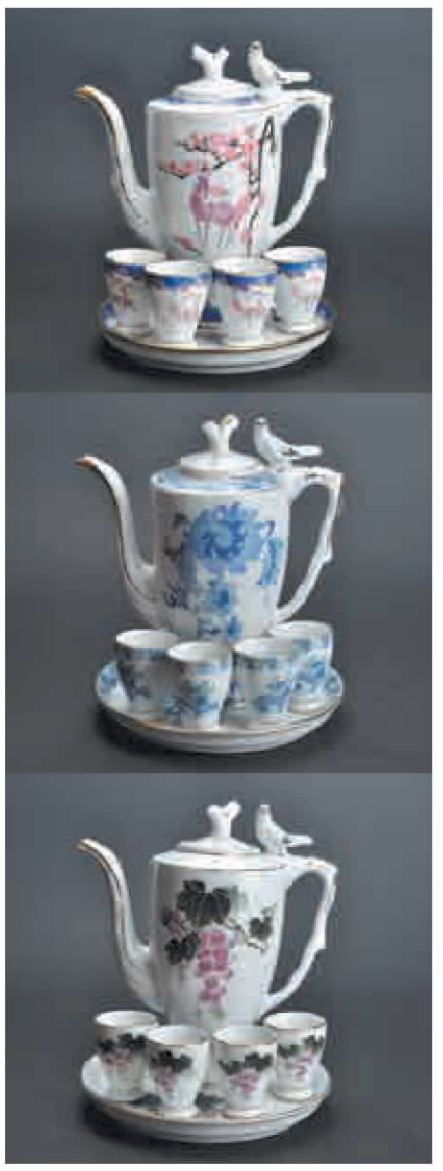
The plan calls for upgrading 5,000 residential communities by enhancing public amenities such as elderly care and childcare facilities.

According to the Ministry of Housing and Urban-Rural Development, urban residents in China spend around 75 percent of their daily lives in residential communities, and by 2035, roughly 70 percent of the country's population will live in such urban neighborhoods.

Experts said that seniors and children stay in residential communities far longer than other groups, and are in greater need of public services and support. They urged more efforts to take care of the practical needs of the elderly and children during community renovation.

Wang Fang, an associate researcher at the Institute of Sociology of the Shanghai Academy of Social Sciences, said that children's participation is vital to building child-friendly cities and residential communities.

She said that many child-friendly facilities are designed from an adult perspective, instead of being fully tailored to children's actual thoughts and needs.



Wang took a child-friendly community park in Shanghai as a good case in point. With children engaged in every phase of its planning and design, the park has become a favorite among local young visitors, she said.

Liu Shicheng in Shenyang contributed to this story.

LIFE

Birdsong porcelain sounds a revival call

An unusual diplomatic gift highlights how one ceramic city balances history with contemporary appeal, **Li Muyun** and **He Chun** report in Liling, Hunan.

A specially crafted porcelain vessel presented to Russian President Vladimir Putin has cast a spotlight on Liling, a city in Central China's Hunan province. Renowned for its centuries-old ceramics industry, the city is experiencing a renaissance through modern design and growing global engagement.

During Putin's recent visit to Beijing, he reunited with Peng Pai, a civil engineer from Hunan, in a heartwarming encounter. Twenty-six years ago, during Putin's first official visit to China as Russian president, he met the then 12-year-old Peng and his family at Beijing's Beihai Park, a moment captured in a memorable photograph.

At their reunion at the Diaoyutai State Guesthouse in Beijing on May 21, Peng presented Putin with a porcelain wine set from Liling. Its centerpiece was a wine pot with an unusual feature: it chirps like a bird when poured.

The pot is elegantly decorated with red plum blossoms and bamboo on a pale blue-white glaze. A small ceramic magpie perches atop the handle. In Chinese culture, the magpie and plum blossoms symbolize the arrival of good news. When the pot is tilted, it emits a gentle yet distinct chirping sound, bringing the tiny bird to life.

Remarkably, the sound is not produced by any mechanical device, but only by air pressure, explains Xiao Diqiang, head of the public research and development department at the Liling Ceramic Research and Development Center. The secret lies within the pot: hidden beneath the magpie is a small ceramic whistle. As liquid pours from the vessel, shifting water levels compress air inside the pot, forcing it through the whistle and creating the birdlike call.

"The principle is simple," Xiao says. "It works much like human whistling." Whether filled with wine, tea, hot or cold water, the sound remains unchanged. Instead, its tone and duration depend on the speed of the pour and the craftsmanship behind each piece.

"In theory, every pot has its own voice — though the differences may be too subtle for most people to notice," Xiao adds.

The pot was originally produced in the early 1970s, a period of transformation for Liling's ceramics industry. It was part of a limited batch of hand-painted works made primarily for state guesthouses and diplomatic gifts.

Because so few were produced, these pots have become rare over the past five decades. The set presented to Putin was donated by a local collector who had preserved it for years, Xiao says.

The renewed attention has sparked interest among collectors and ceramic enthusiasts eager to re-create the design. Yet, reproducing it remains difficult. The whistle mechanism is a single, integrated structure made of high-temperature porcelain, Xiao explains.

"The margin for error is extremely small," Xiao explains. "Any slight deformation or crack during firing would cause the piece to fail."

To better understand the pot's construction, researchers at the Liling Ceramic Research and Development Center have been studying surviving examples, including flawed pieces that reveal details of their internal structure. The team also plans to interview retired craftsmen who worked on the original production to document and preserve the techniques behind the pot.

At the Liling Ceramics Museum, four similar bird-chirping pots from the 1970s have been brought out of storage and placed in a prominent display case. They are among more than 2,000 exhibits, each narrating a different chapter of Liling's rich ceramic history — from its ancient roots to its modern-day revival.

Top: Three wine sets featuring bird-chirping pots made in the 1970s are displayed in the Liling Ceramics Museum in Liling, Hunan province. PROVIDED TO CHINA DAILY **Above:** Blue-and-white porcelain produced in Liling during the Ming (1368-1644) and Qing (1644-1911) dynasties exhibited at the museum. LI MUYUN / CHINA DAILY

Earlier this year, Hunan TR Gallery, a ceramics company in Liling, launched a blind box collection of ceramic pony figurines inspired by the Year of the Horse. LI MUYUN / CHINA DAILY

In 2018, an ancient porcelain kiln was discovered in Liling's Maojialing area. Archaeologists dated it to the Five Dynasties and Ten Kingdoms (907-960), marking the earliest known evidence of porcelain production in the region.

By the Ming (1368-1644) and Qing (1644-1911) dynasties, Liling had become a major center for blue-and-white porcelain production, with more than 100 workshops clustered around Weishan Mountain.

In 1905, Xiong Xiling, a reform-minded Qing official, founded a vocational ceramics school in the city to cultivate talent for a modern ceramics industry. Around the same period, a new technique emerged: underglaze polychrome porcelain, which produced richer colors under a vibrant, glassy finish. Liling ceramics went on to win international acclaim, including awards at the Panama-Pacific International Exposition in San Francisco in 1915.

The technique was lost during years of conflict but revived after the founding of the People's Republic of China in 1949. Since 1958, porcelain factories in Liling have produced large quantities of wares for State leaders and diplomatic gifts.

Today, Liling's ceramics industry is both rooted in tradition and geared for the future. Local manufacturers have been continuously innovating, developing products that appeal to contemporary tastes and younger consumers.

Earlier this year, Hunan TR Gallery launched a blind-box collection featuring ceramic pony figurines created for the Year of the Horse. Combining zodiac-inspired designs with functional teacups, the collection offered a playful interpretation of traditional porcelain and quickly gained popularity among younger consumers. More than 60,000 units were sold within three months of launch.

Liling manufacturers have also become suppliers to global brands such as Starbucks and Ikea. Their products, including cups, plates and bowls, are exported to more than 140 countries and regions.

The industry has developed a comprehensive supply chain — from raw materials and equipment to manufacturing, marketing, and logistics. By the end of last year, Liling was home to more than 1,500 ceramics-related enterprises, employing nearly 200,000 people. The total output value of the industry cluster exceeded 80 billion yuan ($11.8 billion), according to government figures.

New film to look at NY immigrants' lives 'in the cracks'

By SHI GUANG in New York
shiguang@chinadailyusa.com

Production officially began on June 18 on *Lily in the Cracks*, the second installment of the New York Stories film series, a project that focuses on the lives of overseas Chinese people and their quest for identity, belonging and hope while living abroad.

The launch ceremony and news conference were held in New York, bringing together filmmakers, actors and representatives from Chinese and Asian American communities.

The film is written and directed by New York-based filmmaker Wang Ziqi and stars Hong Kong actress Irene Wan and veteran actress Wang Ji.

According to organizers, the New York Stories series follows several generations of Chinese immigrants whose lives are shaped by uncertainty, struggle and perseverance.

Lily in the Cracks centers on people living on the margins of a major city and explores their struggles and growth amid social, economic and emotional pressures.

The film's Chinese title roughly translates as "a lily growing in the cracks", a metaphor for people who continue to persevere and grow despite difficult circumstances.

The imagery reflects the experiences of immigrants navigating life between cultures, women confronting social and personal challenges, and overseas Chinese communities building lives between different worlds.

Wang said the project grew out of real people and experiences she encountered while living in New York. She described the city as a place where everyone has a story, and said she began developing scripts related to New York in 2022, eventually creating multiple storylines centered on the city.

"For Chinese people trying to make films in the United States or overseas, it is actually very difficult," Wang said. "But making a good film is something I have been working extremely hard to do."

She said the film focuses on the process of finding balance between dreams and reality, a challenge she has also faced since moving to New York.

Through the New York Stories series, Wang said she hopes audiences will be moved not only by the captivating stories set in New York but also by the inspiring individuals who are determined to build fulfilling lives in the metropolis.

The launch ceremony for *Lily in the Cracks*, the second installment of the New York Stories film series, is held in New York. The film focuses on the lives of overseas Chinese and their search for identity, belonging and hope while living abroad. IRIS YE / FOR CHINA DAILY

Hong Kong actress and singer Irene Wan, who stars in the film, said she felt a strong personal connection to the role and was drawn to the project both because she has known the director for many years and because she was moved by the script.

Wan said the character explores multiple themes, including family relationships, generational differences between mothers and daughters, emotional responsibility and women's personal growth.

Known for a career spanning film, television and music, the actress said the character reflects her own belief in perseverance and her hopes for younger generations.

Wan said she hopes the role will convey a message of female empowerment and encourage women to pursue their own dreams while continuing to grow in both their personal and professional lives.

Actress Chang Guiruisi, who plays a mother in the film, said her character was once a talented designer who gave up her ambitions after immigrating to the US and taking on family responsibilities.

> "For Chinese people trying to make films in the United States or overseas, it is actually very difficult. But making a good film is something I have been working extremely hard to do."
>
> **Wang Ziqi,** New York-based filmmaker

Chang said the role reflects the tension many immigrant women face between dreams and reality, as well as the emotional and generational challenges common in immigrant families.

Producer Max Ren said the film's focus on women, family relationships and the experiences of Chinese immigrants gives it contemporary relevance. He said films about overseas Chinese can help audiences better understand their experiences, values and aspirations.

Ryan Su, a senior inspector in New York City law enforcement and an actor in *River Cards*, the first film in the New York Stories series, said he hopes the film will encourage greater unity, mutual support and resource-sharing within Chinese communities abroad.

He also expressed hope that more international audiences will gain a broader understanding of Chinese communities beyond their economic pursuits.

Song Miao, head of the Canada-China International Film Festival, said that there have not been many Chinese-language feature films centered on immigrant experiences in recent years. She said stories of this kind have contemporary relevance and could resonate with a wider audience.

As filming gets underway in New York, the creators say the film will continue to use the city as a backdrop to tell stories of Chinese women and immigrant families searching for identity, pursuing their dreams and navigating life between cultures.

The extraordinary vitality of Chinese civilization

Exhibition sheds light on how China's first unified dynasty was formed, with artifacts that highlight the Qin people's pivotal role in laying the foundation for long-standing traditions, **Zhang Kun** reports.

With more than 320 pieces and sets of recently unearthed Qin-related artifacts from Gansu and Shaanxi provinces in Northwest China, alongside select items from the museum's permanent collection, *Dawn of the First Empire: The Qin's Unification in Archaeological Treasures* is taking place at Shanghai Museum East through Sept 7.

As the fifth installment in the museum's The Essence of China exhibition series, the new exhibition sheds light on the Qin Dynasty (221-206 BC), which forged China's first unified dynasty.

According to Chu Xiaobo, director of the Shanghai Museum, the transition from the Eastern Zhou Dynasty (770-256 BC) to the Qin represents a pivotal turning point, marking China's shift from a network of regional states to a centralized empire. The Qin pioneered enduring political institutions, integrated diverse cultures, and refined systems of governance, laying the foundation for China's long-standing tradition of unification.

Speaking at the exhibition's opening ceremony on June 9, Chu noted that the showcase traces the Qin's rise from a vassal state under the Western Zhou Dynasty (c. 11th century-771 BC) to the founder of a unified nation, revealing its pivotal role in shaping the pluralistic yet integrated trajectory of Chinese civilization.

"In recent years, Qin culture has become a major focus of both museum exhibitions and academic research," says Wang Yue, curator of the exhibition. "For this project, we moved away from the conventional chronological narrative and instead focused on uncovering the intrinsic qualities of Qin culture."

The exhibition is structured in four thematic sections: the Qin people, the Qin state, cultural integration, and the unification of the Seven Warring States.

The first section draws heavily on artifacts from Gansu to illustrate the centuries-long development of the Qin people prior to the empire's founding. According to Ban Rui, director of the Gansu Provincial Museum, 66.7 percent of the Qin artifacts on loan from Gansu are classified as precious cultural relics, marking the first large-scale presentation of Qin-era treasures from the province at the Shanghai Museum.

"Recent archaeological discoveries in Gansu have shed new light on previously untold chapters of Qin history, about how the Qin emerged in their formative stage and evolved step by step into a formidable empire," Ban says.

Pottery pieces excavated at the Liya site in Gansu confirm that the Qin people originated in eastern China and migrated westward during the Western Zhou Dynasty. These pots, jars and basins reflect the stylistic traditions of the Shang Dynasty (c. 16th century-11th century BC), whose heartland lay along the Central Plains of the Yellow River in present-day Henan province.

Dawn of the First Empire: The Qin's Unification in Archaeological Treasures is on show at Shanghai Museum East, bringing together more than 320 pieces and sets of recently unearthed Qin-related artifacts from Gansu and Shaanxi provinces, alongside select items from the museum's permanent collection. PHOTOS BY GAO ERQIANG / CHINA DAILY

In the gallery, bronze vessels inscribed with "Lord of Qin" unearthed from the Qin ancestors' mausoleum at Dabuzi Mountain in Li county, Gansu, demonstrate how they inherited the ritual and musical culture of the Central Plains from the Shang and Zhou dynasties. They also offer a vivid glimpse into the grandeur of Qin sacrificial ceremonies.

Golden ornaments in the shape of birds of prey also unearthed from the same site combine Central Plains motifs with steppe metalworking techniques. These objects reveal the early Qin state's aesthetic diversity and technical sophistication.

"These artifacts tell us that the rise of the Qin was largely driven by their inclusiveness," says Li Wenyuan, a researcher in the Bronze Department of the Shanghai Museum and a member of the curatorial team. "Rather than clinging rigidly to tradition or clan identity, the Qin embraced whatever strengthened the state."

The final section focuses on the institutional legacy of unification — standardized laws, measurements, currency, and military regulations — demonstrating that Qin unification was not merely territorial, but systemic.

Emperor Qinshihuang's Mausoleum Site Museum in Shaanxi contributed 12 groups of artifacts from the mausoleum complex, including a large terracotta warrior, a painted warrior head and a pair of bronze wild geese. According to Li Gang, the museum's director, these works exemplify the high level of Qin craftsmanship.

Among the most significant artifacts on loan is a painted terracotta head, displayed outside of Shaanxi for the first time.

"Painted terracotta artifacts are rarely on exhibition elsewhere because the pigments are extremely vulnerable to flaking during transportation," Li Wenyuan explains.

"Even during their excavation, preventing pigment loss was a major challenge. Therefore, this is a rare opportunity for Shanghai's audiences to observe the detailed facial features of a Qin warrior. The application of color was the final touch that brought these figures to life, offering a glimpse of the Terracotta Warriors' original appearance, which is quite different from the unadorned pottery we see today."

The success of the Qin was neither accidental nor achieved overnight, Chu says. Underpinning it was a spirit of pragmatism, inclusiveness, resilience, and innovation — values that lie at the heart of the Essence of China exhibition series.

Through a systematic presentation of archaeological discoveries, the museum seeks to answer a fundamental question: "Where do we come from?"

"We hope visitors will feel the pulse of history and gain a deeper appreciation for the deep roots and extraordinary vitality of Chinese civilization," Chu says.

Film festival concludes with boost to industry's economy

By **ZHANG KUN**

Winners of the Golden Goblet Awards meet with the media on June 20. Zhong Kaifeng (left), director of *Atlantic Rhapsody*, receives the Best Feature Film Award from Tony Leung Chiu-wai, jury president of the Main Competition at the 28th SIFF on June 20. PHOTOS PROVIDED TO CHINA DAILY

The 28th Shanghai International Film Festival generated significant economic benefits across the city, contributing over 5.3 billion yuan ($782 million) to related industries — a nearly 6 percent year-on-year increase. As China's only FIAPF-accredited A-list film festival, the SIFF continues to solidify its global standing.

Held from June 12 to last Sunday, this year's festival welcomed 4,714 registered guests from 81 countries and regions, with more than 420 films screened across Shanghai.

Total box office revenue reached nearly 38 million yuan, attracting over 450,000 attendees. Notably, 27 percent were first-time festival goers, and over 70 percent of domestic and international visitors traveled specifically for the film festival, staying an average of six days.

Competition was fierce, with a record-breaking 4,100 submissions from 125 countries and regions. Of the 49 films selected for the main lineup, 41 held their world premieres at the festival, underscoring the festival's role as a premier global launch platform.

At the Golden Goblet Awards ceremony last Saturday, *Atlantic Rhapsody*, the debut feature by 31-year-old Chinese director Zhong Kaifeng, won the Best Feature Film award. Zhong credited his success to "persistence, passion, hard work, and faith". The Jury Grand Prix went to the Belgian production, *Iluminada*.

Chinese American actress Lisa Lu received the Lifetime Achievement Award. The 99-year-old quipped that the honor "is not my retirement certificate", expressing her desire to continue acting. Her 1968 film *The Arch*, restored in 4K, was screened during the festival and previously selected for the Cannes Classics category at the 78th Cannes Film Festival.

The Belt and Road Film Week, themed "Shared Screens", showcased 16 recent films from 26 countries. On June 17, the Royal Film Commission — Jordan became the 58th member of the Silk Road Film Alliance, which was established in 2018. To date, the alliance has facilitated overseas screenings of 67 Chinese films and introduced over 1,000 titles from countries involved in the Belt and Road Initiative to Chinese audiences.

Addressing rapid industry transformation, the film festival hosted forums and workshops on AI, XR and virtual production. A new AI Backlot initiative invited four interdisciplinary teams to conduct a month-long production experiment. Observed by academics from the Communication University of China, the project culminated in the release of the AI Video Integrated Creation Industry Observation Report, which offers insights into emerging creative workflows.

The SIFF has always been committed to energizing the industry and nurturing the future. The festival's flagship SIFFORUM, a perennial industry highlight, centered its 2026 edition on talent discovery and cultivation.

Chen Guo, director of the Shanghai International Film & TV Festival Center, emphasizes the strategic depth of these efforts: "We have established a three-pronged incubation system anchored by industry events, professional awards, and overseas showcases. This framework ensures a seamless pipeline, from project hatching and production completion to international distribution."

Among a series of key initiatives, the SIFF Project is a well-regarded platform in the Chinese film industry.

This year, the SIFF Project saw a record 560 valid submissions, with 31 high-quality feature film projects ultimately selected. Among them, *Only the Moon Knows* received the "Annual Focus" honor, while projects like *Pelican Year* and *Starfruit* were spotlighted at the Belt and Road Film Week for targeted matchmaking with potential co-production and distribution partners.

CULTURE

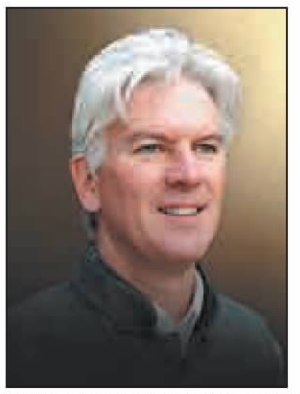
The 19th Special Book Awards of China gave away prizes to 15 writers, translators, and publishers from 12 different countries on June 16 in Beijing. The awards are the highest honor in the Chinese publishing industry for international recipients. PHOTOS PROVIDED TO CHINA DAILY

Global scholars celebrated in Beijing

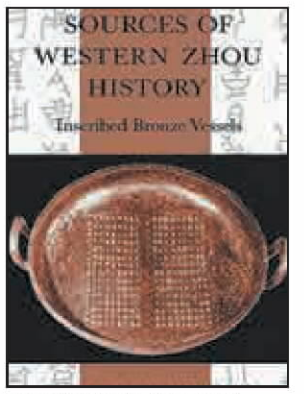
Recipients of this year's Special Book Awards include leading Sinologists whose work spans Chinese classics, archaeology and publishing, **Yang Yang** reports.

Fifteen writers, translators and publishers from 12 countries received honors at the 19th Special Book Awards of China in Beijing on June 16, the highest award in the Chinese publishing industry for foreign recipients.

This year's recipients represented multiple countries and professional backgrounds, including veteran Sinologists, international publishers, promoters of China-Arab cultural exchange and young practitioners of international communication.



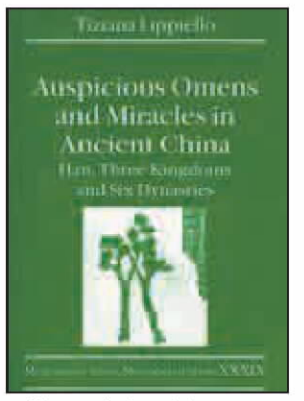
Among the recipients is US Sinologist Edward L Shaughnessy, who has been dedicated to the study of pre-Qin history, paleography, excavated texts and the Confucian classics. His publications include *Sources of Western Zhou History: Inscribed Bronze Vessels*; *The Origin and Early Development of the Zhou Changes*; *Before Confucius: Studies in the Creation of the Chinese Classics*; and *Rewriting Early Chinese Texts*. He also coedited *The Tsinghua University Warring States Bamboo Manuscripts: Studies and English Translations*, and *The Cambridge History of Ancient China: From the Origins of Civilization to 221 BC*.



In his acceptance speech, Shaughnessy recollected his early experience of studying ancient Chinese classics under the supervision of distinguished Chinese scholars more than 50 years ago in China. It was at the start of "the Golden Age of Chinese Archaeology". Since then, Chinese archaeologists have unearthed hundreds more sites with ancient texts of all types, from oracle-bone inscriptions and inscribed bronze vessels of the Shang (c. 16th century-11th century BC) and Zhou (c. 11th century-256 BC) dynasties to thousands and even tens of thousands more manuscripts from the Han Dynasty (206 BC-AD 220), but increasingly also from the still earlier Warring States Period (475-221 BC).

"It has been the blessing of my lifetime not only to have seen these newly unearthed materials, but also to have been privileged to become friends with Chinese scholars such as Zhang Zhenglang, Zhu Dexi, Li Xueqin, Qiu Xigui, and too many others to be mentioned here, who have welcomed me to join them in their work to make them intelligible to others, both in China and abroad," he said in his acceptance speech.

"And it is a very great honor for me today to receive this special book award, and to be able to represent the other awardees in thanking the organizing committee for making this special day possible," he said.



Another recipient, Mohamed Mousa Mohamed Bin Huwaidin from the United Arab Emirates, said the recognition would further encourage cultural and educational exchanges between China and the UAE.

US Sinologist Edward L Shaughnessy and his book, *Sources of Western Zhou History: Inscribed Bronze Vessels*.

Italian Sinologist Tiziana Lippiello and her work, *Auspicious Omens and Miracles in Ancient China: Han, Three Kingdoms and Six Dynasties*.

Mohamed Mousa Mohamed Bin Huwaidin from the United Arab Emirates and his book, *The Falcon and the Dragon: Sino-Gulf Relations — From Strangers to Strategic Partners*.

As the dean of the College of Humanities and Social Sciences at the United Arab Emirates University, his research focuses on China's relations with the Middle East and the Gulf region. His works include *China's Relations with Arabia and the Gulf 1949-1999*, and *The Falcon and the Dragon: Sino-Gulf Relations — From Strangers to Strategic Partners*.

Bin Huwaidin noted that both countries share important similarities as developmental states committed to improving people's lives through advancement and have created distinctive cooperation models through public-private partnership.

He also emphasized the importance of helping international audiences better understand China.

"People need to understand that China is a responsible state," he said, adding that China has made positive contributions to regional and international affairs.

Looking ahead, he highlighted educational exchange as an important direction for future China-Arab cooperation, saying that education promotes mutual understanding and creates broader opportunities for collaboration.

Italian Sinologist Tiziana Lippiello is also among the recipients of this honor. As the former rector of Ca' Foscari University in Venice, professor of Chinese language and literature, vice-president of the International Society for Chinese Language Teaching, and council member of the International Confucian Association, she has long been dedicated to the dissemination and study of traditional Chinese culture and literary classics. As such, she was among the first Sinologists to translate *The Analects* and *The Doctrine of the Mean* in their entirety into Italian. Her major works include *Confucianism*; *Auspicious Omens and Miracles in Ancient China: Han, Three Kingdoms and Six Dynasties*; and *Shen Yue's Treatise on Auspicious Omens*.

She said she was honored to receive the recognition and valued the opportunity to exchange ideas with fellow recipients while gaining a deeper understanding of the significance of the award.

Reflecting on her observations of contemporary China, Lippiello noted that many people in Europe are still unfamiliar with China's development achievements and stressed the importance of visiting China in person to gain a deeper understanding.

Drawing on her years of translating Confucian classics, she said misunderstandings about China often stem from limited access to authentic knowledge and the difficulty of fully conveying the richness of Chinese language and culture through translation alone.

While translation serves as an important bridge for cultural communication, she emphasized that firsthand experience remains essential to understanding China.

Asked to summarize the essence of Chinese culture, Lippiello chose one word: "simplicity". She explained that many ideas found in Confucian teachings are simple, universal and continue to resonate across cultures.

Since its establishment in 2005, the Special Book Awards of China has honored 234 writers, translators, and publishers from 67 countries.

Fan Tingxiao contributed to this story.

Readers, pacts and tech share spotlight at BIBF

By YANG YANG

Books may have been the main attraction, but the 32nd Beijing International Book Fair was equally a showcase of ideas, technology and cultural exchange.

Over five days, the fair transformed the China National Convention Center into a global meeting place for publishers, authors, literary agents and readers. By the time the event concluded last Sunday, it had attracted nearly 300,000 visitors and facilitated 2,835 copyright trade agreements and intentions between Chinese and international partners, underscoring its growing influence in the global publishing landscape.

Among the agreements reached during the fair were 1,959 copyright export deals, 754 import agreements and 122 cooperative publishing projects. Social sciences, children's literature, and science and technology were the most active categories in terms of trade volume.

The United Arab Emirates, this year's guest of honor, embraced the theme "Society and People" and introduced a cultural pavilion known as the United Arab Emirates House, alongside a dedicated copyright trading booth.

Through a series of cultural seminars, professional discussions, visits, exchanges, and cooperation signings, the UAE highlighted its rich cultural heritage and demonstrated a commitment to enhancing Sino-Arab cultural ties and expanding collaborative opportunities.

"The book fair is no longer merely a platform for displaying publications; it is a global arena for cultural exchanges, cutting-edge knowledge dissemination, and transformative developments within the publishing industry," said Salem bin Khalid Al Qassimi, the UAE Minister of Culture.

Gvantsa Jobava, president of the International Publishers Association, attended the fair for the second time and said she was impressed by the diversity of Chinese publications, the quality of their content, the high standards of printing, and the meticulous organization of the event.

William Achauer, editorial director for business, economics, politics and law at Springer Nature, described the BIBF as the company's premier copyright matchmaking platform in Asia. He noted that this year's technology and business management matchmaking sessions featured prearranged meetings with Chinese publishers specializing in science, engineering and management, resulting in highly efficient exchanges.

The fair also placed a spotlight on emerging industry trends, demonstrating how new technologies, innovative business models and evolving publishing practices are helping drive the sector's high-quality development.

Leading online literature companies like China Literature Group, alongside China National Publications Import and Export (Group) Co and various publishing institutions, presented a range of representative products and services centered on the innovative applications of big data, cloud computing, and artificial intelligence in publishing.

Professional forums throughout the event focused heavily on themes like new productivity and AI technology. The Beijing International Publishing Forum, the 2nd STM APAC Conference, and the 4th PubTech Conference delved into cutting-edge topics such as AI empowerment in publishing and AI-driven industry transformation.

For instance, the 2026 Beijing International Publishing Forum, themed Redefining Publishing in the AI Era, explored topics like "opening a new chapter in nationwide reading", "Chinese expression and global dialogue in philosophy and social sciences", and "AI-driven systemic transformation in the publishing industry", addressing the opportunities and challenges faced by the global publishing industry and underscoring the book fair's role as a trendsetter.

Beyond the professional program, organizers introduced a variety of attractions designed to engage the general public. Five themed exhibition areas — the BIBF Picture Book Fair, BIBF Art Book Fair, BIBF Illustration Exhibition, BIBF Gourmet Book Fair and Gifts from the World — offered visitors new ways to experience books and visual culture.

Together with a Harry Potter-themed pop-up store, these spaces became some of the fair's most popular attractions, turning exhibition halls into vibrant destinations for reading, discovery and social interaction.

The BIBF Picture Book Fair welcomed more than 40,000 visitors, while the Harry Potter pop-up store attracted over 25,000 fans.

In total, the fair hosted more than 1,000 cultural events. Renowned writers and thinkers, including Liu Zhenyun, Yu Hua, Tsai Chih-chung, Chen Hui and Canadian poet and essayist Tim Lilburn, met audiences through programs such as the BIBF Ambassador Salon, Author Focus and the First Beijing International Literature Week.

Top: Liu Zhenyun (second from left), Chinese author and BIBF ambassador, joins a group of European Sinologists for a discussion on reading, writing, and cultural exchange last Saturday. **Above:** The BIBF Gifts from the World market features a diverse selection of cultural and creative products.

WORLD CUP 2026

Brazil's Vinicius Junior celebrates scoring his side's first goal during a World Cup Group C match against Scotland at the Miami Stadium, Florida, on Wednesday, which set the five-time champion on its way to a 3-0 group-clinching win. REUTERS

Ancelotti hails Vinicius after firing Brazil into round of 32

Madrid star's Scotland brace also sees him pull level with Mbappe and Haaland

Vinicius celebrates scoring his, and Brazil's, second goal during the World Cup Group C match against Scotland in Miami, Florida, on Wednesday. AP

Brazil coach Carlo Ancelotti hailed Vinicius Junior as "one of the best players in the world", after the Real Madrid forward continued his excellent World Cup form with a brace in Wednesday's 3-0 win over Scotland.

Vinicius scored twice in the first half in Miami, including a header, to set Brazil on its way to a victory which allowed it to progress to the last 32 as winner of Group C.

"I had no doubts about how he would be coming into this World Cup," said Ancelotti of the 25-year-old, who has four goals in three games at this year's tournament.

"For him, it is an honor to play for the national team. He is playing well, and he even scored a header, which is very rare for him.

"I knew all about what Vini could do. He is one of the best players in the world," added Ancelotti, who managed the forward for four years at Real Madrid.

Vinicius scored in Brazil's opening 1-1 draw with Morocco and also netted in the 3-0 victory over Haiti.

His latest brace puts him level with France's Kylian Mbappe and Norway's Erling Haaland in the Golden Boot race, with that trio all on four goals, one behind Lionel Messi.

He is the first Brazilian to score in all three group matches at a World Cup since Ronaldo and Rivaldo both achieved the feat in 2002.

The only other Brazilian players to find the net in all three group games are Jairzinho, in 1970, and Romario in 1994 — that is illustrious company to keep, and Brazil went on to lift the trophy every time one of its players did that in the past.

> "I had no doubts about how he would be coming into this World Cup. I knew all about what Vini could do. He is one of the best players in the world."
>
> **Carlo Ancelotti,** Brazil coach

"I always say I am not that bothered about numbers. I am not used to scoring so many goals, but the coach has moved me into a position to which I have adapted well, and now I am scoring and helping the team," Vinicius told Brazilian broadcaster CazéTV.

"Hopefully, I can keep going to the final. I am very happy with the work being done by the team. If everyone is playing well, the ball will arrive in attacking areas and we will have chances to score goals," he added.

'The passion of a kid'

Matheus Cunha got Brazil's other goal against Scotland, before the Manchester United player was replaced by Neymar, who made his first appearance for his country since October 2023.

"He deserved to come on. He has worked hard and trained hard to recover fitness. He has done it very professionally," Ancelotti said of Brazil's all-time top scorer.

"He needs no motivation to play for Brazil, none of the players do. He is 34, but he has the same passion for playing football as a kid."

With Neymar the final piece to slot in, do Ancelotti's men have the tools to mount a challenge for the title?

"Compared to the first game, we are making fewer errors, playing with more rhythm, and we are more clinical up front," added Ancelotti.

"Now we are really playing as a team, and that was one of the aims. We are not perfect, we have things to improve on.

"But, I am very happy, because we have gotten better and we are solid now. It's really important to be solid in the knockout rounds."

Self-inflicted defeat

Scotland coach Steve Clarke believes his team will soon be heading home from its first World Cup in 28 years after what he viewed as a largely self-inflicted defeat.

The Scots, with three points, still technically have a chance of progressing to the knockout stages at a World Cup for the first time as one of eight third-placed teams with the best records across the 12 groups.

As things stand, Scotland has the seventh-best record, but Clarke clearly believes that, with 18 group matches remaining, it will be overtaken.

"Fair result," he said. "You give a team like Brazil the chances that we gave them, you expect to get punished, and that's what happened. I think we're probably going home.

"We know they're deadly in the attacking third of the pitch, and we gave them, for sure, the first two goals, probably the third goal as well.

"So, we gave them the goals, but on the counter of that, they also missed a few chances and Angus (Gunn) had to make a few good saves. We created one or two chances, but nothing really clean."

Clarke's frustration with his team's performance on Wednesday was clear, but he said he was not angry with the players who got Scotland to its first World Cup since France in 1998.

"I'm disappointed for them, because they didn't reach the levels that they can reach," he said.

"I think we all know that. Anybody that's watched this team over the last few years knows that we didn't reach the levels that we can reach."

The former Chelsea fullback said the campaign had also exposed structural issues in Scottish soccer that needed addressing.

"I think when you see the physicality, the power and the technique of both Morocco and Brazil, you can see that we have to do something about it," he said.

"We have to try and be better at producing young players that can grace the world stage."

Atlas Lions roar on

While Brazil now heads to Houston to play the runner-up in Group F — either the Netherlands, Japan or Sweden — Morocco will head to Monterrey, Mexico, to face the Group F winner. Both games will be played Monday.

The Atlas Lions twice fought back against plucky Haiti for a 4-2 win in Atlanta to finish level in Group C with Brazil on seven points, but finished runners-up on goal difference.

AFP

'Our idol is back': Neymar makes return as a sub

Neymar has finally played in this World Cup, and the superstar is back just in time for the knockout rounds.

Neymar came off the bench in the 76th minute against Scotland on Wednesday, with the team leading 3-0 and well on its way to clinching a spot in the knockout stage that starts Monday.

His appearance wasn't a surprise: Brazil said earlier this week that he would be available, clearing the way for the forward to make his return after missing the first two matches because of a right calf injury.

He did not start, and it seemed like that was the plan Brazil coach Carlo Ancelotti had all along when he raised the possibility earlier this week that Neymar could play as a substitute.

And when Neymar got off the bench and started doing some warm-up sprints and stretches along the touchline during the second half, fans in that section of the stadium roared. The cheers got louder when his number was called by the fourth official, as well as when he took his first touch.

"A very important moment for all of us," Vinicius Junior, who scored two goals for Brazil, said in Portuguese. "Our idol is back, a guy who always fought hard and did everything to be here, returning after a spell out with injury. I hope he can keep evolving and keep improving, helping us throughout the competition. That's what matters most."

Neymar was one of the final players to get off Brazil's bus Wednesday, flashing a thumbs-up, giving a wave and slapping hands with a few well-wishers as he made his way into the stadium and toward the locker room.

"He is available. He trained very well this week," Ancelotti said Tuesday, without confirming that Neymar would take the field against Scotland. "He is fit and able, ready to play. We are very happy that he is back. He is a high-quality player."

The calf injury had sidelined Neymar for more than a month. He came through a full training session on Sunday unscathed, clearing the final hurdle needed to play.

Neymar is Brazil's top scorer with 79 goals in 130 international appearances. The 34-year-old has appeared in each of the past three World Cups for Brazil, scoring eight goals.

His role — and whether he deserves to be on this team at all — has been a major talking point among Brazil fans. Neymar has struggled since his return from a left knee ACL tear in October 2023 in a World Cup qualifier, and has four goals in eight matches for Brazilian club Santos this season.

"Every player here will be a huge help to us in this competition," Vinicius said.

AP

Czech out time: 3-0 win puts gloss on Mexico's perfect Group A campaign

MEXICO CITY — Mexico continued its perfect start to the World Cup with a 3-0 romp against a hapless Czech Republic on Wednesday, finishing its group-stage campaign with a flourish and killing off its tame opponent's hopes of making the knockouts.

The co-host had already booked its spot in the last 32 as Group A winner, but showed no mercy at the Azteca Stadium to complete a third straight victory that left the sorry Czechs bottom of the standings and out of the tournament.

The game looked to be drifting toward a drab draw before Mexico exploded in the second half, with Mateo Chavez opening the scoring, before Julian Quinones grabbed his second of the tournament and substitute Alvaro Fidalgo dealt the final blow in the dying seconds.

Mexico's reward for a faultless opening stage will be a knockout clash on Tuesday with a third-placed side from Group C, E, F, H or I, with the match again in front of its fans at the Azteca, where it is unbeaten in nine World Cup games.

"I think the team played a good game, honestly," Mexico's hard-to-please coach Javier Aguirre said.

"Ultimately, we always have a few things to work on, but tonight is a good night for everyone."

Mexico's superb start to the tournament has kindled the fires of hope in its fervent supporters that this team could be the one to end the supposed curse that has seen it fail to reach the quarterfinals since it last hosted the tournament in 1986.

The omens suddenly look auspicious — unbeaten in 11 games having sauntered through the group stage at a World Cup back on home soil, the hope is that this Mexico side could put years of turmoil and under-performance behind it.

The numbers are also starting to stack up. This was its biggest World Cup win since a 4-0 victory over El Salvador in 1970, while at the other end a rock-solid defense ensured it became the first team with three clean sheets in the group stage since Uruguay in 2018.

This apparent new dawn is perfectly symbolized by 17-year-old midfield prodigy Gilberto Mora, who is the youngest player to start in the tournament since 2002, and produced a superb display with his every touch loudly appreciated by the crowd.

"To be honest, I believed I could achieve it, but not this soon," he said when asked if he imagined reaching this stage so quickly. "Now that I'm here, I'm just trying to enjoy it, take it day by day and give my best whenever I'm on the pitch."

Sparking into life

With their fate riding on the outcome, the Czechs were predictably more eager in the opening exchanges, with Denis Visinsky snatching at an early effort when space opened up in front of him.

Mexico's players hoist substitute keeper Guillermo Ochoa into the air to mark his first appearance at his sixth World Cup following the team's 3-0 win over the Czech Republic on Wednesday. AP

It took 35 minutes for Mexico to conjure a shot, and, when it did, centerback Israel Reyes drifted the ball harmlessly wide.

The game had all the hallmarks of a stalemate until the 55th minute, when Mexico sparked into life and found the breakthrough that brought the Azteca to its feet.

Luis Romo emerged with the ball in midfield and slipped a pass through to fullback Chavez who skipped past one challenge before calmly opening his body up to sidefoot his finish past goalkeeper Matej Kovar. The second goal six minutes later had Mora's fingerprints all over it, as the youngster dribbled deep into Czech territory before playing a delightful ball through to Jorge Sanchez.

He bundled his attempted finish over the keeper and after a brief scramble Quinones followed up to poke the ball home.

Probably the loudest cheer of the night arrived when 40-year-old substitute keeper Guillermo Ochoa came on. This is his sixth World Cup, although he didn't play a minute at the 2006 and 2010 editions, and is set to hang up his gloves after this one finishes.

Then came the final flourish, deep in stoppage time, when Fidalgo blasted the ball into the top corner from 18 meters to complete a resounding win for the co-host.

Nearly a decade of booming cross-boundary collaboration in science and technology between the Hong Kong Special Administrative Region and the Chinese mainland began with a single letter to President Xi Jinping from a renowned Hong Kong scientist and fellow academicians, who advocated that national sci-tech funding be cleared for cross-boundary use.

The momentum, which continues to gain pace today, began in 2017 when Hong Kong scientist Nancy Ip Yuk-yu and 23 fellow academicians from the Chinese Academy of Sciences and the Chinese Academy of Engineering sent the letter to Xi.

Before mid-2017, the research community in Hong Kong was facing hurdles to participating in the nation's rapid sci-tech development, Ip recalled. Access to national research funding was proving to be a major stumbling block for Hong Kong researchers, preventing potential collaborations with the mainland, and Hong Kong-made scientific equipment faced tariffs when entering the mainland.

The academicians' aspirations brought a swift response from Xi, unlocking a highly fruitful, decade-long golden era of cross-boundary technological cooperation between Hong Kong and the Chinese mainland.

Today, a grander vision is taking shape. The Hong Kong SAR is poised to play a pivotal role in propelling the nation to becoming a technological powerhouse under the 15th Five-Year Plan (2026-30), Ip said in an exclusive interview with China Daily ahead of the 29th anniversary of Hong Kong's return to the motherland on July 1.

Ip, a renowned neuroscientist and president of The Hong Kong University of Science and Technology, reflected upon the decade-long improvement in Hong Kong's research environment and national support. She pledged further contributions toward the nation's strategic goal of technological self-reliance.

In an unprecedented move in June 2017, hoping to better integrate the Hong Kong SAR into the nation's scientific development, Ip and 23 other Hong Kong-based academicians wrote the letter to Xi, outlining the challenges they faced.

Xi responded quickly and instructed the relevant authorities to follow up.

The Ministry of Science and Technology and the Ministry of Finance then promulgated provisions on opening up science and technology funding of the central government for use by higher education institutions and research institutions in Hong Kong.

This included arrangements for cross-boundary utilization of approved project funding to Hong Kong.

By September that year, a pilot program was in place, allowing cross-boundary use of research funding at two laboratories — one at HKUST and one at University of Hong Kong. By April 2018, 22 State-level labs in Hong Kong had been approved to receive a total of 22 million yuan ($3.24 million).

Chan Ching-chuen, Hong Kong's first academician elected to the Chinese Academy of Engineering, was a co-signatory of the letter to Xi.

The swift response from Xi to the letter, which conveyed the aspirations of Hong Kong scientists to contribute to the nation's needs, injected confidence in Hong Kong's sci-tech sector, said Chan, who is widely lauded for being the "father of Asian electric vehicles".

Chan added that, catalyzed by Xi's response, the mainland and Hong Kong have deepened sci-tech collaboration in a growing number of areas, with Lai Ka-ying, a Hong Kong payload expert, currently at the nation's space mission aboard the Tiangong space station. Lai is the first female Chinese civilian from Hong Kong to reach outer space.

Following Xi's instructions, Hong Kong's sci-tech sector has ushered in a new era of development by integrating into the nation's development, Chan said, noting extended cooperation over the past decade in areas such as aerospace, new energy, artificial intelligence and transportation.

This is the living embodiment of Hong Kong leveraging its distinctive advantages to serve the nation's needs, he said.

WORLD WATCH
By Li Meng

AI should not become next asset bubble

Whether the artificial intelligence sector in the United States has become a bubble is stirring intense debate, with sharply divided opinions. Pessimists warn that AI is inflating into an unprecedented mega-bubble, potentially 17 times larger than the dot-com bubble of 2000 and four times bigger than the 2008 subprime mortgage crisis. But optimists argue that AI technology is redefining economic paradigms and could, over the next decade, drive advances that eclipse those of the past century.

What truly warrants attention is not whether an AI bubble exists, but whether AI has become excessively financialized. An objective assessment of this financialization is more important.

History shows that nearly every cutting-edge technology goes through a phase of capital frenzy — the "bubble" stage — in its early development. This is known as the Perez industrial cycle. A certain degree of exuberance in the initial phase of breakthrough technologies fits the pattern of technological industrialization and is not necessarily harmful.

Truce strained as US, Iran trade strikes

By CUI HAIPEI in Dubai, UAE
and **JAN YUMUL** in Hong Kong

Disputes over shipping access in the Strait of Hormuz have sparked fresh tensions between Iran and the United States, with each side accusing the other of breaching a fragile interim accord signed less than two weeks ago to end their four-month conflict, a war that disrupted global maritime trade and sent shockwaves through international energy markets.

Iran launched missiles and drones at US military sites in Kuwait and Bahrain early on Sunday, responding to US airstrikes on 10 Iranian military targets. Tehran warned that all war-ending negotiations could come to a complete halt if Washington conducts further strikes.

Iran's Revolutionary Guard said in a statement that the US strikes had violated the ceasefire and "will result in the complete halt of all diplomatic processes", according to state-run Press TV. The IRGC navy command said US bases in the region "will experience hell in the coming days".

In an earlier social media post, US President Donald Trump confirmed that the US had "struck Iranian missile and drone storage locations, and coastal radar sites", warning of a point where the US may no longer be able to be reasonable "and will be forced to militarily complete the job". "If that happens, the Islamic Republic of Iran will no longer exist!" he wrote.

Inside
Views, **page 7**

About an hour after Trump's post, the Kuwaiti army said its air defenses were responding to "hostile" missile and drone attacks, while sirens sounded in Bahrain, according to Bahrain's Interior Ministry. Both nations condemned the attacks, calling them a blatant violation of national sovereignty.

The US military hit Iran's Sirik, Bandar-e Lengeh and Qeshm Island on Saturday. The US Central Command said the attacks were in response to an Iranian drone attack on the Panama-flagged oil tanker *Kiku* near the strait on Saturday.

The vessel was reportedly attempting to navigate an alternative shipping lane along Oman's coastline, a bypass route separate from the Iran-regulated waterway, Reuters reported.

This latest flare-up follows a tit-for-tat exchange just days earlier, after the Singapore-registered container ship *Ever Lovely* was hit by a drone on Thursday. The US retaliated with strikes near Sirik, and Iran responded by targeting US military outposts across the Gulf.

The Strait of Hormuz once handled one-fifth of global oil and natural gas shipments. Washington has pushed for a southern shipping corridor off Oman's coast, while Tehran maintains that all transiting vessels must use its designated channel and warns any alternative routes violate the ceasefire terms.

Amid the exchanges on Sunday morning, CMA CGM's *Galapagos* container ship sailed out of the strait in what the shipping giant called "an important milestone in a regional context that remains complex".

Iranian Foreign Minister Abbas Araghchi said on Sunday that "the Strait of Hormuz remains under the total oversight and management of Iran throughout the 30 coming days, and after all obstacles are removed, the total capacity of the waterway will be restored".

"Any fresh military escalation will worsen the situation, delay the full reopening of the strait and push tensions even higher," he added, warning outside powers not to interfere.

Wolfgang Pusztai, a Vienna-based defense analyst, said that while US-Iran hostilities have reignited, the conflict remains containable, though accidental full-scale escalation cannot be ruled out.

"The scale of retaliatory strikes from both Iran and the US does not signal either side intends all-out war. To my mind, there remains room for a negotiated diplomatic settlement," he told the Al Jazeera news outlet.

YAK YOGURT GAINS INCREASING POPULARITY

A traditional — and unique — taste of Xizang is evolving to suit the modern palate

By PALDEN NYIMA in Lhasa
and **ZHENG JINRAN**

China Vibes
— FOOD —

The first spoonful came as a shock.

"It was so sour that I couldn't help but shiver a little," recalled Liu Wanqing, a tourist from Henan province visiting the Xizang autonomous region for the first time.

Her first taste of Tibetan yak yogurt came on Barkhor Street in Lhasa, where pilgrims, tourists and shopkeepers mingle. Unlike the smooth, sweet yogurt she was used to, this one was thick, with a texture she compared to tofu pudding.

"You simply can't find another taste like it," she said.

For generations, yak yogurt has been an indispensable part of Tibetan daily life. Made from yak milk through natural fermentation, it is valued not only as a nutritious food, but also as a symbol of hospitality and blessing.

In Tibetan culture, yogurt is one of the "three white foods", alongside milk and cheese curds, representing purity, prosperity and good fortune.

Pema Tashi, a Tibetan studies scholar at the Xizang Academy of Social Sciences, said yogurt also lies at the heart of *shoton*, one of the region's most important traditional festivals.

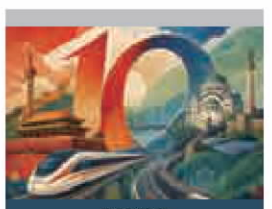
"The word *shoton* literally means 'yogurt banquet' in Tibetan," he said. "Originally, local farmers and herders offered yogurt to monks descending from monasteries after a period of summer retreat. Over time, the celebration evolved into a grand festival featuring yogurt feasts, Tibetan opera performances, Buddha unveiling ceremonies and other cultural activities."

A customer prepares to have a bowl of yak yogurt on Wednesday at a restaurant in Lhasa, the capital of the Xizang autonomous region.
PALDEN NYIMA / CHINA DAILY

Beyond tradition, yak yogurt is also prized for its nutritional value.

Drolma, a doctor at the Tibetan Medicine Hospital of Xizang, said yak yogurt contains indigenous probiotics unique to the plateau, and it can help stimulate appetite, improve digestion and promote better sleep.

She added that yak milk itself is exceptionally rich in nutrients, with almost double the calcium content of cow's milk, and significantly higher protein and fat levels.



The unique yogurt is also evolving to cater to modern tastes.

On a recent Sunday afternoon on Barkhor Street, customers streamed in and out of Patahey Yak Yogurt Ice Cream Shop.

The tiny store offers a handful of seats, and most customers place an order and leave within minutes. A cartoon yak flashes across a digital screen behind the counter, while tourists line up outside, many opting for the shop's signature Oreo yogurt ice cream.

By YU YILEI and **WANG YING** in Shanghai

It might be one of the world's toughest engineering feats — keeping China's first ultra-large blast furnace operating consistently at a temperature of around 1,510 degrees Celsius.

But this seemingly impossible task is now being streamlined and improved with the help of artificial intelligence.

Commissioned on Sept 15, 1985, Baoshan Iron and Steel Co's No 1 Blast Furnace — with a capacity exceeding 4,000 cubic meters — has been operating for over 40 years. The towering furnace is located in Shanghai's Baoshan district at a base of Baosteel, a subsidiary of China Baowu Steel Group.

Now, the 115-meter-tall structure is undergoing a technological revival and refinement of its operations thanks to the applications of AI.

Once the upgrading of the No 1 Blast Furnace is finished in the next few days, all four blast furnaces at the Baoshan base will be fully AI-powered. The technology will help reduce each furnace's operating costs by over 10 million yuan ($1.48 million) annually and cut carbon emissions by 5 kilograms per metric ton of hot metal, setting a benchmark for intelligent manufacturing in the steel industry.

Blast furnace ironmaking — a core process in steel production — has long faced challenges such as highly complex operating conditions, multi-variable coupling, and heavy reliance on human experience.

The "black box" nature of the process has been a major barrier to intelligent upgrading of the sector and is described as "dirty, difficult and dangerous", according to Wang Shibin, chief engineer of big data application at Baosteel's ironmaking plant.

"Within the sealed furnace, where temperatures can exceed 2,300 C and even rock is fully molten, no instrument can be inserted for direct measurement. Yet, the furnace temperature is crucial to blast furnace production, directly determining product quality stability," he said.

Poor control of furnace temperature and sulfur content can disrupt downstream steelmaking processes and increase production costs, Wang said.

Previously, furnace temperature was managed mainly through the experience of the company's senior operators.

"With large AI models the blast furnace, which was once a 'black box', has become far more transparent. By analyzing complex internal interactions, the system can now generate highly accurate forecasts, with predictions made two hours ahead and exceeding 90 percent accuracy," Wang said, adding that work efficiency has also improved by 20 percent.

"Taking the blast furnaces at the Baoshan base for example, the target is to maintain an ideal range of 1,510, plus or minus 10 degrees Celsius, with longer stability providing stronger operational assurance," he added.

The company officially launched the world's first AI-powered smart blast furnace model on April 3.

This marked that Baosteel has leveraged AI large models to improve furnace temperature predictions, providing a practical model for the steel industry's digital transformation by converting experience into data and uncertainty into precision.

Blast furnace ironmaking accounts for around 70 percent of total steel production costs. In this process, temperature fluctuations are not only cost-related, but also closely linked to carbon emissions.

According to Wang, the AI large model has played a significant role in ensuring stable blast furnace operations. Prediction accuracy has improved from just over 70 percent at the beginning of 2024 to over 90 percent, and continues to be optimized. Other external production bases have invited the team to help deploy the system.

Before embracing AI large models, Baosteel had already built a strong basis for using cutting-edge technologies.

Since the 1990s, the steelmaker has focused on information system development and experience accumulation, and further advanced digitalization to form a sizable database.

Smart factories

Baosteel designated 2024 its "Year of AI" and set a goal of developing 1,000 models to embed AI across production processes. To date, the technology has been applied in more than 600 scenarios.

"From the perspective of a single process, the AI smart blast furnace — what we call the 'AI furnace manager' — is actually a strong example of best practice in our operations," said Wu Wenbin, director of Baosteel's data and AI department.

According to the company's paper on AI application scenarios published earlier this year, AI now covers six major business segments and 23 scenario categories. A total of 162 AI achievements have been recorded, generating economic benefits of over 270 million yuan. The company is also actively contributing to industry standards and co-building an AI-driven industrial ecosystem.

A global first "intelligent driving" grading framework for production lines has been introduced by the steelmaker, drawing on autonomous driving logic to establish a Level 1–5 smart manufacturing maturity system.

The applications of AI in core processes have also achieved breakthroughs. Six major new applications now span the entire production chain, from ironmaking and steelmaking to rolling and quality inspection, with all performance outcomes quantified and verifiable.

Over the past 30 years, Baosteel has progressed through three stages of development — informationization, digitalization and intelligentization, Wu said.

The company's entry into smart manufacturing can be divided into two key phases.

During the first smart manufacturing stage from 2015 to 2023, Baosteel was listed as a World Economic Forum lighthouse factory, the first enterprise in the Chinese steel industry to receive the classification. During the same period, the steelmaker began smart manufacturing demonstration projects, laying the foundation for its intelligent manufacturing framework.

Since 2024, the company has entered the second smart manufacturing stage, with AI being the core driver. It has launched industry-first large models for the steel sector, including blast furnace models, setting benchmark applications, and leading the industry toward a new AI-driven paradigm of digital intelligence, Wu said.

Chen Fangruo, dean of Antai College of Economics and Management at Shanghai Jiao Tong University, said, "We are now in the fourth industrial revolution, where big data, artificial intelligence and computing applications are key features."

"Being selected as a lighthouse factory represents a global leading level of advanced manufacturing," Chen said.

As of March, there are 224 lighthouse factories worldwide, including 101 in China, which accounted for nearly half of the global total.

"Baosteel was also listed as one of the 15 in the first batch of leading-level smart factories by the Ministry of Industry and Information Technology last year, a further recognition of its advancement in AI applications," Chen said.

"In my view, these two honors reflect the highly advanced level of Baosteel's manufacturing sector, and also represent one of the most advanced levels globally," he added.

Powering production

Hu Wangming, chairman of China Baowu Steel Group Corp, said that as the world's largest steel enterprise, China Baowu has elevated redefining steelmaking with artificial intelligence to become a corporate strategy.

Baosteel's "smart blast furnace", a global first, is the result of collaboration between Baosteel, Shanghai Baosight Software and partners including Huawei Technologies Co, he said, and represents a major breakthrough in addressing long-standing industry challenges.

It serves as a model for integrating AI with ironmaking operations, offering a valuable reference for the global steel industry's transformation, Hu added.

Baosteel operates multiple production bases with a combined annual steelmaking capacity of 80 million metric tons. By the end of 2025, the company had deployed a total of 994 industrial robots across its operations, equivalent to a robot density of 216 robots per 10,000 employees.

Robot density — a key measure of the adoption of automation in manufacturing — is the number of robots per 10,000 people in the industry.

China has a robot density of 166 per 10,000 workers, ranking sixth in Asia and 22nd globally, according to the latest report from the International Federation of Robotics.

In terms of the total number of industrial robots, China leads the world. China accounted for about 2 million units, nearly 4.5-fold more than Japan in second place, the report said. The country's annual installation numbers were also impressive as 54 percent, or 295,000 units, of all robots installed worldwide in 2024 were deployed in China.

"By 2030, we plan to build the 'Baosteel Brain' to enable centralized decision-making across all production processes and maximize operational value," Wu, director of Baosteel's data and AI department, said.

Since implementing its AI strategy, Baosteel has undergone a profound shift from experience-driven operations to a data-driven mode, and from "passive response" to "proactive prediction".

Looking ahead, Baosteel said it will continue to advance China's strategy for high-end, intelligent and green manufacturing, while deepening the implementation of an AI+ initiative as a central State-owned enterprise, and under China Baowu's "AI 2.0 strategy".

With AI as its core engine, Baosteel aims to build a future steelmaking model that is greener, smarter and more efficient, contributing a new solution to the digital and intelligent transformation of China's steel industry.

Core strategy

From a business perspective, the vast majority of steelmakers have already made digital transformation a core corporate strategy.

According to a survey by the China Iron and Steel Association, more than 95 percent of steelmakers have incorporated digital transformation into their overall development plans, reflecting a broad industry consensus on embracing digital technologies represented by AI.

"The steel sector has also stood out in national smart factory evaluations," said Wang Guoqing, director of the Beijing Lange Steel Information Research Center.

"So far, 36 steel plants have been recognized as the nation's excellent level smart factories by the Ministry of Industry and Information Technology, representing the high level of intelligent manufacturing in China."

In addition, among the 151 typical application cases for AI-enabled new industrialization released by the MIIT, 12 came from the steel industry, covering key areas including intelligent analysis, quality inspection and production optimization, Wang said.

"The industry shift toward intelligent manufacturing has also been driven by structural changes in China's steel market. While overall steel output has gradually declined in recent years, demand for high-quality and high value-added steel products has continued to rise, accelerating the transformation of companies such as Baosteel," she said.

China's crude steel output fell from 1.06 billion metric tons in 2020 to 960.81 million tons in 2025, according to official data.

Chen said when Baosteel was established in 1978, it carried the nation's hopes for industrial development. In the new era, the company's transformation has continued to closely align with the pulse of the times.

"Baosteel has made breakthroughs in a number of core steel products, serving both export markets and domestic industrial demand while continuously adapting to changing industrial needs.

"There is a huge sign at the entrance of Baosteel that roughly reads 'History will prove that the establishment of Baosteel was the right decision'," Chen said.

AI: Ultimate value lies in generating productivity

From page 1

The challenge is to determine whether the bubble is appropriately sized. AI is not immune to the Perez cycle, and some bubble is inevitable.

Globally, there is consensus that AI is advancing from large language models to agents and embodied intelligence. But opinions are divided on the pace of this development, especially in its transformation into real-world industrial applications, where both depth and speed vary widely. Widespread adoption can absorb investment and mitigate the bubble, but a shortfall in real-world applications may depress returns on investment and lead to overheated capital influx.

In both China and the US, it is difficult to determine whether the computing power market is overheating. It is a seller's market driven by genuine demand. High-end training computing power is in short supply, and infrastructure-level resources such as graphics processing units and data centers are its hard currency. The significant supply-demand gap suggests that investment in computing power is addressing genuine demand rather than creating the overcapacity that results in a "bubble burst".

This boom is fueled not only by current shortages, but also by expectations of future applications. For instance, Huawei estimates that nearly 900 billion intelligent agents could exist worldwide by 2035, implying an enormous demand for computing power as foundational infrastructure.

But the absence of a bubble in computing power does not mean there is no irrational exuberance in other areas of AI. Some AI application companies — such as those offering apps or wrapper models — are massively overvalued. The term "price-to-dream ratio" has been coined to describe these loss-making companies with exorbitant market capitalizations. The rapid rise of AI-related stocks in the US, Japan and the Republic of Korea calls for close scrutiny.

The deeper concern is whether AI has become over-financialized. This occurs when resources such as computing power, models, data and equity in AI projects begin to function like financial assets. They acquire financial attributes such as price signals, tradability, speculative potential and leverage.

A moderate financialization of AI helps in raising capital and fostering technological progress. But excessive and rapid financialization inflates virtual value and diverts capital toward speculation instead of research and development. In such a scenario, participants focus less on the practical value of AI and more on the price the next buyer is willing to pay.

This creates a self-reinforcing cycle where rising prices attract more capital, leading to even higher prices, ultimately resulting in a market with no effective brakes.

AI's ultimate value lies in generating real productivity. Finance should return to its core role of serving the real economy, while AI should stay true to its essence of technological innovation.

The author is chairman of the Chinese Society for Sustainable Development. The views do not necessarily reflect those of China Daily.

Bull run

A jockey balances on a wooden plough as he steers and spurs on two bulls through a flooded paddy field during Pacu Jawi, a traditional bull-racing event, in Simabur village, Indonesia, on Saturday. YASUYOSHI CHIBA / AFP

A shares stay resilient despite global jitters

By SHI JING in Shanghai
shijing@chinadaily.com.cn

The A-share market, despite facing temporary downward pressure due to last week's sharp sell-offs in the global tech sector, still holds promise for a gradual bull run, experts said, citing broad-based earnings improvements and robust growth of China's artificial intelligence industry.

A shares are shares in Chinese mainland-based companies that trade on Chinese stock exchanges and are renminbi-denominated.

Due to pullbacks in sectors including energy metals, batteries and communications equipment, the benchmark Shanghai Composite Index shed 2.26 percent to close at 4027.26 points on Friday. The Shenzhen Component Index slid 3.44 percent and the technology-focused ChiNext in Shenzhen lost 4.07 percent.

This was part of an overall market slide in the Asia-Pacific region on Friday. The Hang Seng Index in Hong Kong shed 1.76 percent while the Hang Seng Tech Index fell 3.41 percent. Japan's Nikkei 225 dropped 4.15 percent and the South Korean stock market, which saw its Kospi Index close 5.81 percent lower, halted trading for 20 minutes during the morning session as the index plunged over 8 percent for the fifth time this year.

Despite short-term market volatility, analysts said China's macroeconomic fundamentals remain supportive for equities. They noted that major international financial institutions including Goldman Sachs and Morgan Stanley expect the Chinese economy to remain resilient this year, supported by policy measures, improving exports, stronger corporate earnings and the rapid development of AI, which is building a solid foundation for the stock market over the medium to long term.

The latest bout of market volatility was partly fueled by global concerns over the tech sector, following Apple's announcement on Thursday of a price hike amid surging memory chip costs, and reports that OpenAI is postponing its IPO until next year. In the trading week ending Friday, the United States' stock market witnessed its first net outflow in 13 weeks, with the tech sector logging a record $9.3 billion in weekly net outflow.

Yang Delong, chief economist at First Seafront Fund in Shenzhen, Guangdong province, said the pullback was mainly a correction for sectors that had drawn excessive capital and risen too fast, and the scale of the correction should be relatively small. He added that the slow-bull logic for A shares remains unchanged.

Wang Yongjian, an analyst at Zhongtai Securities, said that systemic risks are low in the A-share market. He added that structural opportunities exist in upstream resources and selected themes, even though he warned of near-term volatility in the tech sector.

Xia Fanjie, a strategist at China Securities, said that he remained optimistic about a slow A-share bull run, fueled by AI and computing. The supportive policies introduced at the Lujiazui Forum held in mid-June in Shanghai will translate into strong performance in the technology-focused STAR Market in Shanghai and ChiNext in Shenzhen, he said.

Yang Weiyong, an associate professor of economics at the University of International Business and Economics, stressed that AI is no castle in the air. He said that it is underpinned by solid technological and industrial foundations, and unlike the dot-com bubble back in 2000, when viable profit models were largely absent, AI today has been deeply integrated into numerous industries and delivered tangible value.

According to Meng Lei, a China equity strategist at UBS Securities, recovery in A-share profitability has been accelerating, which can be seen from the first quarter fiscal results and the improving industrial profits. The average profitability growth rate is likely to reach 11 percent in 2026, up from 3.9 percent last year. Overseas investors are likely to further return to the Chinese stock market. Given a slow bull outlook, Meng said that growth enterprises are likely to outperform.

From the global perspective, there is rising probability that major adjustments are underway, said Hong Hao, chief investment officer at Lotus Asset Management. Investors are thus advised to take profits and divert their focus to companies which have not seen significant gains in the previous rounds of rally.

Sci-tech: More opportunities open for HK

From page 1

Since receiving the letter, support from the central government has been "never-ending", with policy barriers falling and more opportunities opening for Hong Kong scientists to join national projects, Ip said.

Not only the central government, but also Guangdong's provincial and municipal authorities have opened research funding to Hong Kong scientists.

In 2022, Xi visited the InnoHK Hong Kong Center for Neurodegenerative Diseases, and encouraged researchers to constantly pursue excellence and contribute to the nation's scientific endeavors.

During Xi's visit, Ip, who leads the center, explained its self-developed blood test technology for Alzheimer's disease. The technology analyzes specific proteins and predicts the risk of developing Alzheimer's up to 15 years before symptoms appear, enabling early intervention.

The neuroscientist said she appreciated Xi's care and high expectations for Hong Kong scientists, as he was always encouraging them to produce greater results and, more important, translate the results into tangible applications.

"I clearly remember him asking what he could do to help our research results 'land' and make them widely available to benefit humanity," Ip said.

Xi's expectations also have become key goals of the center.

By refining the technology, the HKUST team reduced the Alzheimer's blood protein panel from 21 to three, cutting costs by 80 percent while maintaining over 90 percent accuracy.

"As one of the inventors, I'm excited to see our (Alzheimer's) blood test technology moving from the lab into clinical settings and communities," said Jason Jiang Yuanbing, a research assistant professor in HKUST's Division of Life Science, who demonstrated the blood test technology during Xi's visit. "Through collaboration across the mainland and overseas, we're getting closer to making this innovation more accessible to help meet the needs of an aging society," Jiang said.

Mok Kin-ying, chief medical officer of the center and head of clinical partnerships at HKUST's School of Medicine, said: "Over the past decade, Hong Kong and the mainland have seen much closer exchange and collaboration in science and technology. Looking ahead, we hope this momentum will further strengthen research and healthcare services and deliver tangible benefits to people on both sides."

In recent years, and especially now, since the 15th Five-Year Plan has set technological self-reliance as a national goal, Ip said that she has felt the nation's unprecedented commitment to sci-tech development. As president of HKUST, the educator holds high hopes for the city's young generation of researchers.

During the interview, Ip encouraged students and young researchers to prepare for challenges, uphold academic integrity, and approach every experiment and paper with rigor. They should also maintain a global vision and an open mind by collaborating across fields and borders, and above all remember that the ultimate goal is to solve societal problems and serve the public, Ip said.

Shadow Li contributed to this story.

Industrial sector sustains strong momentum

Nation remains on steady recovery track and ready to meet its growth target, analysts say

By ZHANG CHENXU and **ZHONG NAN**

China's industrial sector sustained strong growth momentum in the first five months of 2026, as major industrial companies recorded faster profit growth, buoyed by the robust demand for artificial intelligence-related electronics products, official data released on Saturday showed.

Analysts said the upbeat figures underscore the increasingly stronger role played by new growth drivers in supporting the world's second-largest economy, adding to signs that China remains on a recovery track and is well positioned to meet growth targets.

In the first five months of the year, industrial enterprises with annual main business revenue of at least 20 million yuan ($2.93 million) reported total profits of 3.14 trillion yuan, up 18.8 percent year-on-year, with the growth rate accelerating by 0.6 percentage point from the January-April period, data from the National Bureau of Statistics showed.

In May, profits at major industrial enterprises rose 21.1 percent year-on-year, continuing to expand at a double-digit pace after a 24.7 percent increase in April. "Profits at major industrial firms have continued to post solid gains since the beginning of the year," said Yu Weining, a statistician at the bureau.

Yu attributed the improvement in profits mainly to strong gains in the electronics, high-tech manufacturing and raw materials manufacturing sectors, as well as the continued implementation of proactive macro policies.

The electronics manufacturing sector remained a major growth engine, with profits surging 103.9 percent year-on-year in the first five months and contributing 43.1 percent to the overall profit growth of major industrial enterprises.

"The rapid advance of AI worldwide has spurred a surge in demand for advanced computing and memory chips, providing a strong boost to profit growth in the electronics sector," Yu added.

High-tech manufacturing also maintained solid growth, with profits rising 44.7 percent year-on-year in the first five months.

On Sunday, the China Federation of Logistics and Purchasing released the country's logistics performance data for the January-May period. The total value of social logistics reached 146.6 trillion yuan in the first five months, up 5.2 percent year-on-year.

In May, logistics demand associated with high-tech manufacturing grew 15.1 percent year-on-year, while that for equipment manufacturing rose 9.5 percent.

The strong performance of advanced manufacturing, logistics and AI-related sectors reinforced optimism among global financial institutions about China's growth outlook.

Morgan Stanley last month raised its forecast for China's GDP growth this year to 4.8 percent from 4.7 percent. Robin Xing, chief China economist at Morgan Stanley, said the revision was supported by resilient exports and robust AI- and green-related investment, which are expected to generate positive spillovers leading to industrial upgrade and modernization.

Goldman Sachs also raised China's GDP growth this year to 4.8 percent from 4.3 percent, citing stronger export growth expectations and China's expanding global market share in manufacturing.

Wen Bin, chief economist at China Minsheng Bank, said industrial profits are likely to remain on a recovery track in coming months.

"Improving price conditions, better profit margins, stronger policy support, as well as sustained momentum in emerging industries, will continue to underpin industrial profitability," Wen said.

Despite the strong gains, experts said the recovery remains uneven, as some downstream and traditional industries continue to face profit pressures, pointing to the need for more targeted support.

Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities, said the uneven recovery reflects the broader structural transition underway in China's economy, with new growth drivers becoming increasingly important as property-related sectors remain under pressure.

According to experts, policy support would remain a key pillar. Zhang Di, chief macroeconomic analyst at China Galaxy Securities, said that further support for equipment renewal, infrastructure investment and consumption stimulus would help improve demand recovery in midstream and downstream sectors.

Yogurt: Larger-scale production possible

From page 1

Over the past decade, as tourism has flourished, yogurt stores catering to visitors have sprung up, offering yogurt ice cream, fruit jam yogurt and yogurt topped with chocolate powder or roasted highland barley flour.

Zhang Xinyue, another tourist from Henan, said she would also like to see more variations inspired by local ingredients.

"Adding honey, roasted highland barley or wild berries makes it more approachable while keeping its plateau character," Zhang said.

At the Patahey yogurt shop, the traditional flavor remains the best-seller.

"Most visitors say the yogurt tastes rich and natural," said Drukmokhar, a staff member at the store. "Many say (its sourness) is exactly what makes it special."

And it's a taste of Xizang that can only be properly experienced by going there.

The yogurt only remains fresh for about three days and requires cold-chain transportation, making long-distance shipping difficult, she said.

Science, though, is on the case. Over the past seven years, researchers at the Xizang Academy of Agricultural and Animal Husbandry Sciences have traveled the region collecting samples of traditional fermented foods, including yogurt and cheese curds.

Led by Zhang Yuhong from the academy's Institute of Agricultural Products Development and Food Science, the team isolated more than 2,000 microbial strains and eventually identified six stable indigenous lactic acid bacteria strains capable of re-creating Tibetan yogurt's signature "plateau flavor".

The breakthrough means that traditional fermentation methods, once passed down orally among herding families, can now be preserved, studied and standardized, allowing authentic Tibetan yak yogurt to be produced on a larger scale without losing its original character.

Back on Barkhor Street, tourists continue to pucker at its unexpected sourness. Others ask for honey or sugar to tone it down. But almost everyone leaves with the same realization: Your first taste of Tibetan yak yogurt is impossible to forget.

WORLD IN FOCUS

FRAMING HOPE

In Turkiye's 'house of photo', the world is seen through the lens of children fleeing wars

In a dimly lit room illuminated by a pair of red lamps, eight-year-old Zeynep waits to see photographs she has taken, now trapped as shadows and silhouettes on a roll of film.

"How big is your curiosity?" asks her mentor, 40-year-old photographer Amar Kilic, as he develops the negatives in a sink.

"As big as the world," she replies.

Originally from the southeastern province of Mardin, Zeynep is among eight children taking part in a two-month analog photography workshop for local and migrant youth near Turkiye's borders with Iraq and Syria.

The project, called Fotohane Darkroom, started in Mardin in 2024, by Kilic and Syrian photographer and educator Serbest Salih. In Turkish, Arabic, Kurdish and Persian, Fotohane means "house of photo", a name chosen by the children.

In fact, insists Kilic, the children are in charge throughout the process.

"From loading film, to developing it and printing their own photographs, they do everything by themselves. They get to set and write their own rules also."

Once part of Mesopotamia, the walls of Mardin's old city, traversed by narrow streets, hold thousands of years of history and attract tourists from all over the world.

But the city is also home to low-income families and refugees who fled Syria's civil war.

Among them are the families of 13-year-old Yahya, 12-year-old Yusuf, 11-year-old Nihal and 13-year-old Sam. They came from Damascus in 2014 and 2015 when a war broke out inside Syria.

"I'm very excited when I take pictures, it's all very interesting for us," says Nihal, swinging a small, black camera from her wrist as she searches for a frame to capture.

Their teacher, 32-year-old Salih, a smiling photographer with curiosity-filled eyes, fled the Kurdish town of Kobane, in northern Syria, when it was torn by the war in 2014.

Thousands of Syrian refugees have settled across the Turkish border in Mardin region during the war that ended with the fall of then Syrian president Bashar al-Assad.

Top and above: Children look at camera films in a darkroom during a workshop held as part of Fotohane Darkroom project in Mardin, Turkiye, on June 14.

His own struggle is a topic Salih wants to avoid and instead insists all the attention should go on the children he's patiently educating.

Since his arrival in Turkiye, he has been trying to establish himself as a bridge of tolerance and integration.

He started his first analog photography workshop in 2015 in a secondhand caravan, driving to villages along the border and focusing on vulnerable local and refugee children.

"Analog photography is about self-confidence. When taking a digital photograph you might think about deleting it on the spot. But with film, they spend the whole workshop thinking and feeling every one of those 36 frames, and only see them at the end. And their photos are beautiful," Salih says.

'The magic room'

Ask any of the children what part of the process is their favorite and the answer will be: the darkroom where the images they first see through the viewfinder and captured by pressing the shutter come to life.

"They call it the magic room," says Kilic, who teaches development and printing, always with a smile on his face while giving feedback.

"Seeing an image on a completely white sheet of paper, bringing to life with their own hands an image they themselves took, creates a very special feeling for the children. They say: 'I was able to produce this'," says Kilic.

This summer, the children's photos are on display in Italy, Belgium, Britain and Indonesia.

Salih and Kilic are hosting the workshop in the center of Mardin, but they think about returning to Salih's initial approach with the darkroom in a caravan.

"The most logical way is to become mobile. To go to different regions, offer training and have them carry it forward," says Kilic.

Venezuela quake toll tops 1,400

Tens of thousands still missing as foreign rescue teams pour into devastated nation

LA GUAIRA, Venezuela — Rescue crews raced on Sunday to find survivors in the rubble of Venezuela's powerful earthquakes as the death toll reached 1,430 and hopes dwindled more than three days after the earth roared and rumbled.

Tens of thousands of people were reported missing as collapsed buildings dotted cities in a country already enduring an economic crisis and political upheaval after United States special forces forcibly seized President Nicolas Maduro in January.

Millions of people were also feared to lack sanitation and other basic needs.

The Chinese embassy in Venezuela said eight Chinese nationals had been confirmed dead in Wednesday's earthquakes as of Saturday afternoon (Sunday morning, Beijing time).

Experts say the first 72 hours after natural disasters are the key, narrow window for finding the living. After that, the search becomes one of recovering bodies.

A Salvadoran rescue worker who declined to give his name put it this way: "At this point, they are probably dead bodies. Thanks to God, maybe we can find people still alive."

An 11-year-old boy was rescued from the rubble in Caraballeda, in the north of the country, late on Saturday, interim leader Delcy Rodriguez said.

"Every life is a source of hope for Venezuela," she said in a post on X, accompanied by a video of the rescue.

The search for survivors saw desperate attempts by local residents to claw away rubble from collapsed buildings.

"It's just very chaotic, hot and unorganized," said Australian firefighter Craig De Meillon, 43, who traveled alone to La Guaira from Miami, Florida, to help. "Hopefully, there are more people to find."

Venezuela's government said on Saturday that 1,600 members of foreign rescue teams had arrived to help search for survivors as it tightened access to the worst-affected state.

Rodriguez said in an overnight address on state television that 10 more countries were still to join rescue efforts and 14,000 military and police members were in La Guaira to patrol and take sanitary measures.

Foreign Ministry official Oliver Blanco said on Saturday that in recent hours Venezuela had received 17 flights carrying more than 1,600 members of rescue teams, and that over the next 24 hours, 25 additional flights were expected.

"We thank the international community for its support and solidarity during these moments of uncertainty for Venezuelans," Blanco said.

Donating supplies

The Chinese embassy said overseas Chinese in Venezuela have donated about 500 metric tons of relief supplies, including bottled water, biscuits, diapers, milk, rice, sugar and fish.

The supplies were donated by the Federation of Chinese Associations in Venezuela and other Chinese community groups as of Saturday afternoon, benefiting nearly 10,000 families affected by the disaster.

Tom Fletcher, UN under-secretary-general for humanitarian affairs and emergency relief coordinator, told Agence France-Presse on Friday that the death toll could continue to soar, adding that more than 50,000 people were missing.

The International Organization for Migration said it had examined available population and damage data and had determined that "up to 6.76 million people could be affected", and would "require emergency shelter, safe water, sanitation and hygiene services, healthcare, protection support and essential relief items".

Venezuelan National Assembly President Jorge Rodriguez reported 1,430 dead and 3,238 people injured on Saturday, while the United Nations estimated $6.7 billion in physical damage, equivalent to 6 percent of the country's GDP.

Serbian President Vucic says he will resign within weeks

BELGRADE — Serbian President Aleksandar Vucic said on Saturday that he will remain in office for a few more weeks before submitting his resignation.

Speaking at a large pro-government rally themed "Serbia, One Family" in Belgrade, Vucic said he would continue to serve as president for a short period before stepping down.

He called for national unity and said he would propose an electoral list named "United Serbia" in the upcoming elections. However, he did not specify when he would dissolve parliament before the snap elections.

Vucic said Serbia is at a critical stage of development and must maintain political stability and social cohesion, pledging continuous efforts to boost economic growth and improve living standards.

He said the government aims to raise average monthly salaries to 1,400 euros ($1,595) and pensions to 650 euros in the coming years, while increasing support for low-income groups.

The rally was attended by about 207,000 supporters from across the country, along with government officials and representatives of the ruling coalition, according to the Serbian Interior Ministry.

Vucic's second five-year term was set to end in the spring of 2027, which, under the Serbian constitution, is also his final term.

Briefly

FRANCE

Measures sought after Burkina Faso cuts ties

France said on Saturday that it was considering reciprocal measures after Burkina Faso broke off diplomatic relations. Burkina Faso severed ties with France on Friday, saying "the conditions essential for promoting relations based on mutual respect, reciprocal trust, respect for the principle of noninterference in internal affairs and national sovereignty are no longer in place". The French Foreign Ministry said France "regrets this hostile and unfounded decision, which illustrates the worrying drift of the Burkinabe authorities". The ministry urged French nationals in Burkina Faso "to exercise heightened vigilance".

Plane crash kills all 11 people on board

A civilian aircraft carrying skydivers crashed near the eastern French town of Tomblaine on Sunday, killing all 11 people on board, local authorities said. The crash killed five instructors, five students, and the pilot, said Yves Seguy, the prefect of the eastern department of Meurthe-et-Moselle. "There were no bystanders among the victims," he added. The aircraft, registered in Germany, crashed in a grassy area near the runway of the Nancy-Essey airfield, close to a residential area and two roads, an Agence France-Presse journalist reported. The cause of the incident was not immediately clear.

DR CONGO

Confirmed Ebola cases exceed 1,200

The Democratic Republic of Congo has reported 1,203 confirmed cases of Ebola, including 321 deaths, since the outbreak was declared in mid-May, according to a report released on Friday by public health authorities. The report said 148 patients had recovered, while 419 patients were in isolation or receiving hospital care. Tedros Adhanom Ghebreyesus, director-general of the World Health Organization, said on Friday that contact tracing in the DR Congo was reaching more people and that more Ebola patients were recovering and returning home. However, he warned that the fight was "far from over".

China's governance initiative draws praise

By **SARA EL ASHRAFY** in Cairo
For China Daily

The Global Governance Initiative proposed by China has been widely hailed by intellectuals and diplomats as instrumental in promoting multilateralism and international cooperation amid profound transformations in the international system and escalating global crises.

The Global Governance Initiative, or GGI, represents a strategic shift in the structure of the international system, offering an alternative vision that goes beyond the monopoly of a single model, according to Ali Youssef, former Sudanese foreign minister and secretary-general of the Association of Arab-Chinese Friendship Societies.

He said the initiative is grounded in the concept of "developmental governance", which emphasizes the role of the state and political stability as a gateway to development. He added that the Chinese experience provides practical experience for developing countries, contributing to the consolidation of pluralism in governance systems.

"The initiative ... seeks promoting multipolarity and enhancing the representation of Global South countries in international decision-making institutions, while adhering to the principles of sovereignty and noninterference as fundamental pillars of international cooperation," he said at a seminar in Cairo recently.

Zhu Xiaozhong, minister counselor at the Chinese embassy in Egypt, stated that the international system is witnessing a growing rise in unilateralism, hegemony, and protectionism, alongside deepening deficits in peace, development, security, and trust. He noted that the GGI is based on key principles, including sovereign equality, mutual respect, and the centrality of people in development and international policymaking.

He said that "achieving sustainable peace in the Middle East requires sustained collective efforts from all parties", noting that China has intensified its engagement with various stakeholders since the escalation of conflict between the United States, Israel and Iran, aiming to de-escalate tensions and promote dialogue.

Qualitative shift

Ali El-Hefny, former Egyptian assistant foreign minister and vice-president of the Egypt-China Friendship Association, said that the initiative represents a qualitative shift in the approach to global governance, restoring the principles of multilateralism and balance in international relations. He noted "its growing importance as it seeks to mobilize broad international support, particularly from Global South countries".

El-Hefny stated that the initiative "reflects a transformation in global governance as a strategic priority in reshaping the international order", adding that it extends across multiple regions, from Africa to the Arab world, as well as groupings such as BRICS.

Ahmed Kandil, head of the International Relations Unit at Egypt's leading think tank Al-Ahram Center for Political and Strategic Studies, said the world is experiencing an extremely complex international phase marked by overlapping political, security, economic, climate and technological crises. Such troubles span conflicts in Gaza and Ukraine, tensions in the Red Sea, issues involving Iran, as well as pressing energy and food security challenges.

"This accumulation of crises reveals a deeper structural crisis in global governance, reflected in the widening gap between the scale of accelerating challenges and the capacity of existing global governance institutions to respond effectively," he said, stressing that the Chinese initiative represents a reform-oriented approach aimed at strengthening multilateralism and cooperation instead of hegemony and polarization.

Rania Aboelkheir, secretary-general of the Global Forum for Future Studies, based in Cairo, said that GGI is based on building a "community with a shared future for humanity" through a comprehensive approach linking development, security, and civilization.

She explained that "the initiative serves as an overarching framework integrating major Chinese initiatives, strengthening shared security, supporting multipolarity, and reinforcing respect for international law", noting that it functions as a coordinating mechanism among the Belt and Road Initiative, the Global Development Initiative, the Global Security Initiative, and the Global Civilization Initiative.

COMMENT

Editorials

EU's use of maximum pressure belies its faith in talks to resolve disputes

Despite mounting challenges facing China-EU economic and trade relations, the European Union, rather than responding to China's concerns and taking concrete actions to address them, has indicated that it will adopt even more aggressive protectionist and restrictive measures targeting China.

European Central Bank chief Christine Lagarde last week pointed an accusing finger at China for allegedly "manipulating" its currency, which she said is about 15 or 16 percent "undervalued" and causes "imbalances" that "endanger" the global economy.

Her remarks reflect some EU politicians' dissatisfaction with the current state of China-EU trade, which they describe as "unsustainable". The EU's goods deficit against China increased to nearly 360 billion euros ($409 billion) last year, up from 305 billion euros the year before. Brussels has signaled repeatedly it is prepared to impose new tariffs and restrictions on Chinese goods and companies.

The EU's proposed revisions to its Cybersecurity Act and the Industrial Accelerator Act are expected to introduce additional barriers for Chinese companies and products. The EU is also reportedly considering imposing additional tariffs on Chinese-made plug-in hybrid vehicles. European Commission President Ursula von der Leyen has said that the bloc has a broad toolbox which it would use more proactively to safeguard its interests, while also developing new instruments.

These intimidating remarks come just before a major meeting under the China-EU trade and investment consultation mechanism scheduled for this week. They do not bode well for the prospect of achieving any substantial outcomes at the event. Instead, the EU's lack of sincerity in resolving economic and trade disputes risks escalating China-EU trade frictions.

Europe's justifications hinge on alleged "trade imbalances" with China and concerns over issues such as "subsidies" and "overcapacity". Yet these arguments are rooted in inaccurate and hostile interpretations and overlook the fact that Europe's economic woes stem mainly from declining manufacturing competitiveness, insufficient innovation capacity and surging energy costs.

China has always seen the EU as an important economic and trade partner. It wants to manage disputes with the bloc through dialogue and consultation, and promote pragmatic cooperation to advance the sound and steady development of bilateral economic and trade ties.

With the EU putting up barriers and engaging in protectionist acts, China has rightly pointed out that such moves will only prove counterproductive, undermine market rules, and disrupt global industry and supply chains.

Despite the danger of trade frictions escalating into a trade war, the EU seems ready to let the differences between the two sides hinder their consultations. It has so far failed to respond to China's concerns over the unreasonable suppression of Chinese enterprises and the continued abuse of investigation tools under its so-called "Foreign Subsidies Regulation".

Confronted with the EU's punitive measures, China has no choice but to pledge to take forceful and effective countermeasures. As some experts said, the countermeasures could include launching anti-discrimination investigations, conducting reviews into supply chain security, and imposing restrictions on some EU products.

China's rationality and restraint should not be mistaken for weakness and used as a pretext to escalate pressure. That would only take the EU further down the wrong path of confrontation.

The economic cooperation between China and the EU is pivotal to economic globalization. Preserving its stability is instrumental to upholding the world's economic and trade order and global economic system. The ongoing trade frictions, if mismanaged by the EU, might pose a challenge to the soundness of the global economy at large.

To break the deadlock, the EU should view the competitive dynamics and perceived security concerns in a more rational and objective manner and address these issues through openness rather than protectionism.

Economic and trade disputes should be resolved via bilateral coordination instead of unilateral protectionist policies and arbitrary regulatory moves. Trying to force China into submission through maximum pressure will only lead to a dead end.

'China Opportunity 2.0' knocks for the world

China's latest industrial profit figures show the growing gap between the dubious narratives of some Western political circles and the economic reality of China. Official data released on the weekend show that the profits of China's industrial enterprises above a designated size reached 3.14 trillion yuan ($464 billion) in the first five months of the year, up 18.8 percent year-on-year.

Profits in the electronics industry more than doubled, surging 103.9 percent and contributing more than 43 percent of overall industrial profit growth. Demand from artificial intelligence, new energy and advanced manufacturing industries pushed profits in the nonferrous metals sector up 117.1 percent.

This is more than a cyclical rebound. It is the latest evidence that China's growth story is moving into a new phase — one that is being described as "China Opportunity 2.0". Increasingly, multinational companies are coming to innovate with China. The country's expanding technological ecosystem, stable industrial supply chains and accelerating commercialization of new technologies have become competitive advantages in their own right.

That was the unmistakable message emerging from this year's Summer Davos in Dalian, Liaoning province. While some economies remain preoccupied with tariffs, "decoupling" and geopolitical rivalry, many business leaders focused instead on China's growing role as an innovation platform.

In his speech at the event, Chinese Premier Li Qiang said that amid increased volatility in the international landscape, four keywords — stability, innovation, dynamism and integration — present a comprehensive outlook of the Chinese economy.

China's next phase of development will generate opportunities not simply through market size but through technological progress, industrial upgrading and deeper global cooperation. Innovation-driven development is the key to China's long-term, steady and sustained economic success. The country's innovation has been forged through relentless research and development efforts, tempered through extensive application across industries and cultivated through a robust ecosystem.

This helps explain why the "de-risking" rhetoric has produced far less economic separation in practice than its peddlers might suggest. Companies may diversify supply chains at the margins, but few are willing to detach themselves from one of the world's largest innovation ecosystems.

The "Shopping in China: Sharing New Opportunities of Open Development" report released by Xinhua Institute on Friday points to another dimension of "China Opportunity 2.0". Openness is no longer defined solely by exports or foreign direct investment. It is increasingly reflected in expanding consumer demand, digital commerce, improved business services and policies designed to make China a more attractive destination for global companies and international consumers alike. Consumption is becoming another gateway through which foreign businesses can participate in China's next stage of development.

None of this suggests that China's economy is without challenges. The property adjustment continues, external demand remains uncertain and geopolitical tensions are unlikely to disappear. But too much international commentary still evaluates China through the lens of yesterday's economy rather than tomorrow's.

"China Opportunity 2.0" is more about innovation and cooperation that are the answers to tackling the challenges to global growth. There should be joint efforts to deepen connectivity and collaboration, foster an open world economy, keep global industry and supply chains stable and unimpeded, and seek greater synergy for innovation.

On its part, the world's second-largest economy is increasingly exporting technologies and research capabilities alongside manufactured products while opening its door wider for multinational companies, investments, products and talents.

The crux of "China Opportunity 2.0" lies in participating in one of the world's fastest-moving innovation ecosystems, where research, manufacturing and commercialization reinforce one another on an unparalleled scale.

The question is whether global businesses can afford to miss the opportunities emerging from China's next phase of innovation-driven growth. That, more than any quarterly statistic, is what "China Opportunity 2.0" is really about.

Japanese businesses should help to rein in Tokyo's adventurism

Several Japanese commercial delegations visited Beijing recently for the fourth China International Supply Chain Expo, which was held from June 22 to 26. Among them was a delegation of Japan's Association for the Promotion of International Trade, which also visited China's Foreign Ministry and met with a vice-foreign minister.

The Japanese visitors were seeking to ease Japan's strained access to crucial industrial minerals supplied by China against the backdrop of a deteriorating political climate — one created and exacerbated by Japanese Prime Minister Sanae Takaichi and her government.

Japan's economy is deeply intertwined with China's, featuring remarkable structural complementarity. Bilateral trade reached $146.7 billion in the first five months of 2026, up 17.2 percent year-on-year, according to the General Administration of Customs of China.

Japanese companies supply precision machinery, advanced manufacturing equipment and high-end materials to China. China, meanwhile, provides Japan with a super-large consumer market, efficient manufacturing capacity and supply chains that are difficult to replicate elsewhere. It should be an economic relationship built on mutual benefits.

That explains why Japanese companies continue to flock to Chinese trade fairs. Supply chains constructed over decades cannot simply be restructured because the Japanese right-wing forces decide to redraw geopolitical maps.

But the Takaichi government's political choices, particularly those that touch issues related to China's sovereignty, territorial integrity and core interests, are having grave economic consequences.

Since Takaichi assumed office last October, her irresponsible and erroneous remarks and actions have deeply damaged China-Japan relations. Japanese businesses have paid a heavy price.

Their frustration is understandable. Their efforts to try and mend economic ties with China reflect a recognition shared by much of Corporate Japan that the Takaichi government's China policy threatens the very foundation of bilateral economic relations.

The goodwill of some Japanese businesses, however, cannot substitute for political trust. Economic dialogue cannot be insulated indefinitely from broader diplomatic tensions. If the Takaichi government continues to inflame historical grievances and persists in its misguided neo-militarist trajectory, the economic relationship between China and Japan will inevitably bear the brunt of further consequences.

That is the stark reality confronting Japanese companies operating in China, as well as those relying on China's market and manufacturing ecosystem. Instead of urging Beijing to restore normal economic ties, Japanese businesses might achieve more by directing their efforts at home. The current diplomatic impasse is the product of the political choices of Tokyo.

Even more troubling is the possibility that the present impasse could be institutionalized by Tokyo. If the Takaichi government continues using the strained relations to justify the "restructuring" of supply chains and reducing economic engagement with China, Japanese companies should brace for a vastly different commercial environment.

Beneath this economic calculus lies a far graver concern. Should Japan's right-wing forces succeed in resurrecting their militaristic ambitions and steering the country back toward confrontation with its neighbors, the Takaichi government's current moves would be seen as a calculated step down that road. Left unchecked, this path leads to a re-militarized Japan, and a new source of regional conflict. In this dangerous context, the fate of Sino-Japanese economic relations is not merely a consequential footnote — it is a critical indicator of the direction in which the broader relationship is headed.

Geography and history, however, are stubbornly immune to ideology. China and Japan are destined to remain neighbors. Nor can history be rewritten by Japanese right-wing forces.

Japan's business community still has an indispensable role to play. Japanese commercial leaders have long served as an important bridge between China and Japan. They are uniquely placed to pressure the Japanese government to recognize a simple truth: the rise of neo-militarism will only lead the country to repeat its historical mistakes.

— LI YANG, CHINA DAILY

What They Say

Action plan to facilitate foreign investment

Editor's note: *Three government departments, including the Ministry of Commerce, have formulated an action plan to stabilize and enhance foreign investment. The plan includes deepening the opening-up of the education sector, particularly vocational training institutions, vocational colleges and high-level universities specializing in science, engineering, agriculture and medicine. Sang Baichuan, a professor at the University of International Business and Economics, explained the measures to DaHe Fortune Cube, a financial news outlet under Henan Daily. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The education sector is an important part of China's service industry, which is now opening up at a faster pace. Initiatives to open up the education sector have already been implemented within its pilot free trade zones and free trade ports. Drawing on this experience, China is now scaling up its opening-up efforts.

High-tech manufacturing and high-end service industries have an enormous demand for talent. High-quality talent pools deliver better human resources for high-quality foreign investment. Opening up vocational education and fields such as science, engineering, agriculture and medicine to foreign investment will help China cultivate a large workforce tailored to the needs of high-end manufacturing and service industries.

China's abundant talent resources are a major draw for foreign investment, yet there is room for improvement in vocational and higher education through increased opening-up. A greater inflow of high-quality international educational resources will help elevate the quality of domestic education. This will help foster more outstanding talents to meet the demand of high-quality foreign investment.

The action plan addresses the concerns of foreign-invested enterprises, and strives to remove the obstacles constraining their development. This demonstrates that China welcomes foreign investment, and that the country will offer expanded market opportunities for foreign-invested companies to benefit from its economic growth.

China is currently upgrading its economic structure and pursuing high-quality development. It places special emphasis on leveraging the opportunities brought by the digital economy and intelligent transformation to attract high-quality foreign investment. The plan serves as a solid institutional guarantee for such foreign investment.

Foreign-invested enterprises are less concerned about strict policies than about frequent policy shifts. Through institutional opening-up and improved regulation and services, the action plan safeguards the rights and interests of foreign investments, fosters fair competition between domestic and foreign-funded enterprises, and enhances transparency in the government's decision-making.

The role of the government is to rectify market failures, create equitable opportunities for foreign-invested enterprises, and address concerns about the business environment. China encourages foreign investment in high-end manufacturing, high-tech services, and industries aligned with the digital and intelligent industrial revolution.

Moreover, the action plan calls for ensuring that foreign-invested companies participate in government procurement on an equal footing. China has always emphasized fair treatment of both domestic and foreign-invested companies during the government procurement process.

Andrey Kortunov

GDI crucial for a stable world

Five years ago, in September 2021, at the general debate of the 76th session of the UN General Assembly, President Xi Jinping announced the Global Development Initiative.

It was the first of the four strategic initiatives China has put forward, the others being the Global Security Initiative, Global Civilization Initiative and Global Governance Initiative.

Together they present China's vision of a community with a shared future.

Global Lens

Back in 2021, the world was still recovering from the COVID-19 pandemic and from the subsequent economic and social hardships, distortions and uncertainties.

Under those difficult circumstances, many nations around the world hoped that the worst times were already behind them and that a realistic task for the coming years was to return to stable economic growth based on globalization.

With its focus on accelerating the implementation of the United Nations 2030 Agenda for Sustainable Development Goals and shifting global attention from fighting COVID-19 back to core development issues, the Global Development Initiative reflected these hopes.

Regretfully, the international situation since the pandemic has been characterized by regional conflicts, an arms race and intensifying confrontation between major powers. The future of globalization has been challenged by unilateral tariffs, economic sanctions and the steady erosion of multilateralism.

With only four and a half years left till the end of 2030, significant progress has been tracked in implementing only one-third of the SDGs.

The progress is much slower than planned in almost half of the goals, while there has been regression rather than progress in the remaining goals.

Many former enthusiasts of SDGs have come to the conclusion that the idea of sustainable development should be put on a back-burner until better times emerge; that national security should have a higher priority over economic growth and that the name of the game in global politics for the time being is not prosperity, but survival.

This shift in priorities has been reflected in national budgets that favor defense spending over social and economic programs. The world is feverishly preparing, if not for a third world war, then at least for a long and extremely costly military-political standoff between major powers.

In 2021, global military spending amounted to slightly more than $2 trillion; in 2026 it might close or even exceed $3 trillion. If that trend were to continue, the total global defense budget could nearly double within the next 10 years, reaching $5-6 trillion a year by 2036.

Societies are growing accustomed to the idea that humanity will face a long period of low economic growth. After the pandemic, the average annual growth of the global economy constituted about 3.2 percent compared to 4.4 percent in the early 2000s.

The 2020s are likely to be the weakest decade for growth since the mid-20th century, and the preliminary forecasts for the 2030s are not bright either.

In many countries, living standards of generations to come will be lower, not higher than those of their parents and grandparents.

It is also considered self-evident today that the era of globalization is a thing of the past and that the world will be divided into several opposing regional blocs for the foreseeable future.

Each of the blocs will strive for development, but the fragmentation of the world economy, tariff wars, the collapse of global production chains and fierce competition in the field of new technologies will inevitably cause a further slowdown in economic growth and social progress.

These are widely regarded as the sobering realities of our times. However, do they really mean that the tenets and practical suggestions of the Global Development Initiative should be put on hold?

Not at all. There can be no security without development. When you start to think about how stable and reliable settlements of the conflicts in places such as Gaza, Ukraine, the Persian Gulf or the Sahel region in Africa can be attained, you invariably run into one and the same problem — how to convert the destructive energy of conflict into the creative energy of development. There can be no long-term development without security, but there can be no sustainable security without development.

MA XUEJING / CHINA DAILY

It is also clear that one cannot reduce wars, the arms race and geopolitical confrontation without simultaneously reducing protectionism, unilateral trade restrictions, disruptive financial sanctions and many other manifestations of national economic egotism and shortsightedness.

That means the Global Development Initiative is even more relevant today than it was five years ago.

Since 2021, the West has proved unable to offer any intelligible alternative to the ideas contained in the Global Development Initiative.

The US administration's attempts to address the development agenda through creating ad hoc private-public mechanisms — such as the Board of Peace for the Gaza Strip — have demonstrated very limited effect and are unlikely to constitute a solid foundation for dealing with development needs even in a small place such as Gaza, let alone set a model for the rest of the world.

It should also be noted that since 2021 China has been one of the world's leading practitioners in pursuit of the SDGs, including poverty elimination, improved public health and the transition to green energy, where it is either on track or ahead of schedule. Of course, the nation has its own bottlenecks and outstanding issues, but there is no doubt that China will meet most of its SDG targets by 2030.

Its contribution to SDGs on a global level should not be underestimated either: for instance, it now accounts for 70 percent of the world's wind power equipment supplies and for 80 percent of the global solar photovoltaic module shipments.

China's exports of these help to reduce the global CO2 emissions by no less than a billion tons a year.

The implementation of the Global Development Initiative is indispensable for global sustainability. Recent years have only confirmed its importance.

If the global development agenda is not properly addressed, everything else — including international security — will remain on shaky ground.

Rana Mazid

Flexibility marks strategic reshuffle in Middle East

For decades, the Middle East's strategic map was deceptively simple. Washington was the indispensable architect, and most Arab states built their security, economy, and foreign policies around that pillar.

But the US-Israeli war against Iran shattered that old order. As Iranian missiles struck Saudi energy facilities and US bases in Bahrain and Qatar, Gulf states realized the harsh truth that the US security umbrella was no longer absolute. The era of unchallenged US primacy was giving way to a fluid, multipolar order.

Rather than fearing this transition, Arab states are actively engineering it. They see diplomatic flexibility not as a hedge against collapse, but as a tool for survival.

The war has only confirmed what Arab leaders suspected since the Houthi attacks on Saudi Arabia's oil facilities at Abqaiq and the restrained response by the US. While the US retains a formidable military footprint in the region, its focus has shifted toward great-power strategic competition.

For Saudi Arabia and the United Arab Emirates, the lesson was clear: US guarantees were not enough to deter Iranian missiles or drones.

The question in Arab capitals is no longer "What does Washington want?" but "How can we build a network of alliances to survive in a highly volatile environment?"

The new Arab diplomatic playbook favors flexible issue-based alignments that defy Cold War-style blocs. These are not anti-US moves, but post-US calculations.

Two emerging alliances are particularly significant. The first is the quadrilateral of Egypt, Turkiye, Saudi Arabia and Pakistan. Their foreign ministers have met repeatedly in Riyadh, Islamabad and Antalya, driven by shared concerns over regional instability.

Global Lens

At the same time, another partnership has emerged between the UAE and Israel. During the war, Israeli air-defense systems were deployed in UAE territory to intercept Iranian missiles targeting Abu Dhabi.

More significant is the multi-billion-dollar joint defense fund to develop advanced air defense and counter-drone systems. The UAE is not just buying Israeli technology, but also investing in and co-developing it, creating deep, long-term interdependence.

These two alliances are not necessarily on a collision course. But their coexistence raises profound questions about the future of Gulf and Arab solidarity.

The region is witnessing not just a rearrangement of alliances but a redefinition of security itself.

First, permanent blocs are giving way to "coalitions of the willing" that vary by issue. Egypt and Turkiye cooperate in Libya but compete in the Eastern Mediterranean; Saudi Arabia and the UAE coordinate in Yemen but diverge in Sudan and Somalia.

Second, security is no longer just military deterrence but also includes energy security, supply chains, water, and digital connectivity. The India-Middle East-Europe Corridor illustrates this shift.

By linking Indian ports to the Gulf, Israel and Europe, it creates economic interdependence that may prove more durable than formal treaties.

Third, non-state actors have become permanent features of the security landscape. Groups such as the Houthis, Hezbollah and Iraqi militias are no longer mere proxies. As the Houthis demonstrated in the Red Sea, they can open entire fronts, forcing Arab states to combine diplomacy, military action, and economic pressure in new forms of hybrid deterrence.

This means regional stability depends less on one coalition defeating another than on the ability of this hybrid network to manage escalation before it spirals out of control.

This new multipolarity carries both promise and risk. On the positive side, flexible coalitions reduce the likelihood of an all-out war.

When Riyadh speaks directly to Tehran, when Ankara coordinates with Cairo on Libya, and when Islamabad mediates between Washington and Tehran, the region's zero-sum logic begins to erode.

Economic interdependence — via China's Belt and Road investments, Gulf sovereign wealth funds in Turkiye and Egypt, and the UAE-Israel defense partnership — creates incentives for restraint.

However, the risks are equally significant. These fluid coalitions can fragment as quickly as they form.

A sudden escalation between the quadrilateral and the UAE-Israel axis could trigger a cascade of counter-alignments. The proliferation of actors armed with drones and precision missiles increases the chance of miscalculation.

Three broad scenarios could shape the next phase of Middle Eastern geopolitics. The most likely is contained multipolarity, where competing coalitions coexist, cooperating on some issues and competing on others.

The US remains the dominant military power, but its influence is negotiated, not assumed.

China and Russia expand their economic and diplomatic roles, while non-state actors are contained through hybrid deterrence.

Regional stability is messy, fragile, but an all-out war is avoided.

A second possibility is renewed polarization. A major crisis or strategic miscalculation could divide the region into rival camps, reviving a Cold War-style division, with devastating economic and human costs. This scenario is less likely.

A third but least likely scenario is the emergence of a regional security framework.

This framework would institutionalize crisis management mechanisms, improve communication and gradually build trust between rivals. This scenario requires a level of political will and external support that is currently absent, but remains the long-term aspiration of many regional strategists.

The Middle East is not a vacuum waiting to be filled. It has become a crowded marketplace of interests. The US is indispensable but no longer dominant. China offers development and diplomatic engagement.

Russia provides energy coordination and a UN veto but little else. Turkiye is an influential but mercurial neighbor. Iran is a rival, but now a talking partner for many.

For Arab countries, the art of statecraft in this new era is learning to dance with all these partners without stepping on any single toe too hard.

Flexible coalitions are not a destination but a way to manage risk in an uncertain and volatile world.

The most significant change may be that Arab states are no longer an arena for great-power competition. They can finally shape their own fate. Whether that leads to stability or chaos will depend not on the absence of conflict, but on the ability to manage it without letting it descend into the abyss.

Corruption rarely a sudden leap, more often a gradual psychological journey

Whenever news breaks that a senior official has been investigated or imprisoned for corruption, the public's reaction is often predictable: anger, criticism, and sometimes even satisfaction.

My own reaction is different. After more than two decades of interviewing over 200 convicted officials in Chinese prisons, I rarely get a feeling of triumph when a corrupt official falls. What I feel most often is regret.

Many of these individuals were once respected public servants. They had promising careers, enjoyed the trust of their communities, and benefited from years of organizational training and support. Yet somewhere along the way, they lost sight of their original mission.

The question that haunted me throughout these interviews was surprisingly simple: If they knew what they were doing was illegal, why did they do it?

The answer is never greed alone. Contrary to popular belief, corruption seldom begins with a suitcase full of cash. It starts with small compromises that seem harmless at the time.

Time and again, former officials shared similar stories. At first, they did not see themselves as corrupt. A dinner with an old classmate. A favor for a friend. An introduction to a businessman. A gift accepted out of courtesy. None of these actions appeared to constitute wrongdoing.

Only later did they realize they had become like a frog in slowly boiling water — unable to notice the risk as it gradually intensified until it was too late.

Corruption is rarely a sudden leap. More often, it is a gradual psychological journey. Effective anti-corruption efforts require addressing three different dimensions of human behavior.

The first is making corruption impossible. Strong institutions, transparent procedures, and effective oversight reduce opportunities for abuse.

The second is making corruption dangerous. When violations are consistently punished, the cost of misconduct rises.

The fight against corruption is ultimately not just about catching those who go astray.

But the third dimension is the most important and the most difficult: making people unwilling to be corrupt.

The first two dimensions depend largely on external constraints. The third depends on internal restraint.

A society achieves its greatest protection against corruption not when people fear punishment, but when abusing power becomes morally unacceptable.

This distinction matters. Fear can prevent misconduct when someone is watching. Conscience prevents misconduct even when nobody is.

Unfortunately, power itself sometimes weakens conscience. Many psychological studies have shown that individuals who possess authority tend to overestimate their own judgment, become less sensitive to criticism and increasingly believe that normal rules should not apply to them.

Power creates distance. Distance reduces accountability. And reduced accountability increases temptation.

This pattern appears across political systems, cultures and historical periods. Corruption is not uniquely Eastern or Western. It is fundamentally human.

One of the strongest drivers of corruption is social comparison. One imprisoned official complained bitterly that a small contractor he had once helped secure a project eventually became far wealthier than he was.

A former judge asked me why a lawyer who had attended the same university could earn more from a single case than he would earn in a lifetime.

Behind such thoughts lies a powerful psychological force: resentment.

When individuals feel that their sacrifices are not adequately rewarded, corruption can begin to appear not as theft but as compensation.

The most dangerous stage often emerges through relationships rather than transactions. Businesspeople who seek influence rarely begin by offering bribes. Instead, they offer friendship.

They organize dinners, introduce useful contacts, provide emotional support, and create an atmosphere of mutual trust. The immediate goal is rarely money. The long-term goal is access.

Many imprisoned officials later described these encounters with deep regret.

One told me he believed he was simply having dinner with old friends. "If I had known I was being drawn into a network designed to cultivate influence, I would have refused."

But human beings are social creatures and rejecting an invitation from an old friend is difficult. Accepting it feels natural.

But what begins as friendship can eventually become dependency. What begins as reciprocity can evolve into corruption.

Over the years, I have observed three particularly vulnerable stages in an official's career.

The first occurs around age 29, when young professionals face mounting pressures: marriage, housing costs, children's education, career advancement, and financial insecurity.

The second emerges around age 39, when many officials have accumulated substantial authority but begin to worry that their political advancement has stalled.

The third is the well-known "age 59 phenomenon", when retirement approaches and officials fear losing status, influence, and the social attention that power provides.

One imprisoned official put it bluntly: "When you're in office, people line up outside your door. After retirement, nobody calls. If you were me, wouldn't you be anxious?"

His words reveal a painful truth. For some officials, corruption is not simply about wealth. It is about insecurity, status, recognition, and fear of irrelevance.

This is why corruption should never be viewed solely as a legal problem.

It is also a psychological problem.

Laws can punish misconduct. Institutions can restrict opportunities. But lasting integrity requires something deeper: a public culture in which power is understood not as a privilege to be enjoyed, but as a responsibility to be exercised.

The fight against corruption is ultimately not just about catching those who go astray.

It is about ensuring that fewer people begin that journey in the first place.

Powering the ironclad friendship

Sustained China-Serbia partnership hinges on energy and finance, not industrial equipment

WANG XIAOYING / CHINA DAILY

When Serbian President Aleksandar Vucic visited a "future factory" in Jiaxing, Zhejiang province, on May 27, the images that went viral were of the machines — a humanoid robot writing Chinese calligraphy, another mixing drinks, four-legged units clambering over obstacles, while production lines ran on their own. Vucic, by his own account, felt as if he had stepped into the 22nd century, and the footage earned the attention it deserved. But the consequential part of his state visit was harder to photograph. It lay in the investment agreements, the energy projects and the quieter financial arrangements signed around the spectacle.

Lu Jiajun

Ding Yuzhou

This year marks the 10th anniversary of the China-Serbia comprehensive strategic partnership, and the relationship has clearly outgrown its first phase. For most of the past decade, cooperation was built on heavy infrastructure and traditional industry projects such as the Budapest-Belgrade railway, the Smederevo steel mill and the Bor copper complex, which mattered, and, in many ways, still matter.

China is, by now, Serbia's largest source of foreign direct investment, with cumulative Chinese investment reported at more than 7.2 billion euros ($8.33 billion) and the total value of Chinese-backed projects, loans included, above 14 billion euros. Yet the questions now facing both sides are different ones. Serbia wants to move up the value chain, decarbonize its economy and stay on its long path toward European Union membership. China, in turn, is looking for durable, high-quality outlets for its capital, its technology and its clean-energy industries. In their talks in Beijing, both sides agreed to widen cooperation in emerging sectors, with green energy and advanced manufacturing high on the list. Sustainable energy, and the financing that is needed to support it, falls almost exactly at the intersection of those two agendas.

That, more than the robots, is why it deserves attention.

Energy is where the structural shift is easiest to notice. Serbia still leans heavily on coal, which supplies more than half of its installed power capacity, and it is committed to ending coal-fired electricity generation by 2050 while pushing renewables toward roughly half of its mix by 2030. That is a very large gap to close, and it will not be closed cheaply. Chinese capital has already begun to fill part of it. Zijin Mining and Shanghai Fengling Renewables, for example, have committed around 2 billion euros to developing 1.5 gigawatts of wind, 500 megawatts of solar and a green-hydrogen facility, much of it meant to power the Bor copper operations rather than simply feed the national grid. Other Chinese companies have signed up for solar-module manufacturing, energy storage and additional wind farms. Put together, these projects mark a change in the character of the partnership: from China helping Serbia build power plants and steel mills to China helping Serbia build the renewable base it will need next.

Energy hardware, though, is only half the story, and arguably the easier half. The harder question is financial. The model under which Chinese investment flowed into Serbia over the past 10 years relied largely on state lending and engineering-procurement-construction contracts tied to individual projects. That model suited roads and bridges well enough. However, it suits a clean-energy transition far less, because such a transition depends on long horizons, predictable returns and patient capital rather than one-off construction deals. What Serbia needs now, and what would make the cooperation more durable, is a financial architecture designed for sustainability in the financial sense too: green bonds, long-term project finance, blended public and private vehicles, and clearer environmental and disclosure conditions attached to the money itself. Some of the groundwork is being laid. The free trade agreement that took effect in 2024 has helped lift bilateral trade to $6.48 billion in 2025, up 13 percent year-on-year, and the two governments have moved to set up a renminbi-clearing bank in Serbia and to widen local-currency settlement. These can sound like technical plumbing. In practice, they are part of what allows energy and industrial projects to be financed, hedged and scaled without relying entirely on a single channel of state credit.

This is also where a whole-industry view helps, rather than treating energy as a sector on its own. The investment agreements signed around Vucic's visit, worth about 953 million euros on Serbia's own part, ran across auto parts, robotics, artificial intelligence and energy, and were expected to create around 1,650 jobs. Chinese clean-tech sectors, from solar modules to batteries and electric vehicles, are placing more of their production units inside Serbia, and that production will increasingly run on locally generated renewable power. If it works, it forms something of a loop: clean energy supports green manufacturing, and green manufacturing creates demand for still more clean energy. For Serbia, which sends most of its exports to the EU and now faces the bloc's carbon border levy, producing more cleanly is not only an environmental preference, but increasingly, a competitive necessity.

None of this happens on its own, and the work ahead should not be underestimated. Serbia's EU accession path means its energy and industrial choices will be measured against European environment, competition and disclosure rules, and the carbon border adjustment mechanisms will increasingly reward genuinely low-carbon production, regardless of where the capital comes from.

In many ways that plays to the strengths of the China-Serbia partnership. Chinese clean-energy technology is among the most cost-competitive in the world, and pairing it with high environmental and disclosure standards would let Serbia treat compliance as an advantage rather than a burden. The cooperation will be most durable, in both meanings of the word sustainable, where the green content keeps deepening: financing tied to clear environmental benefits, projects built to the standards Serbia needs to meet in Brussels, and gains that reach local communities. These are demanding goals. They are also, arguably, where the real value lies.

The robots in Jiaxing were a fitting symbol of where the relationship wants to go. But symbols work best when they rest on solid structures. The less glamorous work, aligning energy projects with a financial system built for the long term and making sure the green content runs all the way through, is what will let sustainable energy anchor the next decade of cooperation, much as steel and highways anchored the last. If this visit is any guide, both sides look ready to do exactly that.

YU HONGYUAN AND HUANG XIA

Global green alignment

A more just and effective environmental governance system requires shared responsibility, patient institution-building and the creation of real capacity

ZHANG YUJUN / FOR CHINA DAILY

Global environmental governance is entering a period of institutional stress. Climate change, biodiversity loss, pollution and ecological degradation are no longer separate technical issues. They are linked to development, finance, trade, technology, energy security and the basic capacity of states to protect people's livelihoods. Therefore, the question facing the international community is no longer whether environmental governance matters, but whether the existing system can still generate sufficient authority, resources and trust to deal with problems that are growing more complex.

Yu Hongyuan

Huang Xia

The current system has important achievements to its credit. The United Nations has provided the central platform for international environmental cooperation. The 1972 Stockholm Conference, the Rio Earth Summit, the UN Framework Convention on Climate Change, the Convention on Biological Diversity and the 2015 Paris Agreement have gradually built a broad institutional architecture. International organizations, governments, scientific communities, civil society groups and businesses have all become part of this governance process.

Yet, this system has its limitations, which are becoming increasingly visible. Environmental governance remains fragmented across institutions, agreements and issue areas. The gap between developed and developing countries persists over responsibility, finance, technology and the pace of transition. In some cases, environmental rules are being reshaped by unilateral pressure, trade protection and bloc politics. Measures introduced in the name of the green transition have become new barriers for developing countries. As a result, global environmental governance faces not only a capacity deficit, but also a trust deficit.

This is the broader context, in which China's Global Governance Initiative should be understood. The initiative is not simply another diplomatic statement. It addresses a structural problem: the global governance system needs reform, but reform cannot be achieved by abandoning multilateralism, weakening the UN or allowing a small number of states to monopolize rulemaking. Environmental governance is where this reform is needed most urgently, because ecological risks cross borders while the costs of adjustment are distributed unevenly.

The following principles are important when the reform of the global environmental governance system is undertaken.

The first principle is sovereign equality. In environmental governance, sovereign equality means that all countries, regardless of size, wealth or power, should have the right to participate in agenda-setting, rulemaking and implementation. This is especially important for the Global South. Many developing countries face the sharpest climate and ecological pressures, but they often have limited influence over the rules that shape finance, technology access, industrial upgrading and transition pathways. A fairer system must give these countries stronger representation and a more meaningful voice.

The second principle is the rule of law in international relations. Environmental commitments lose force when rules are applied selectively or when powerful states treat international agreements as instruments of convenience. A more effective environmental governance system requires rules that are negotiated broadly, applied equally and respected consistently. This is also a condition for protecting developing countries from arbitrary barriers and double standards in the name of environmental protection.

The third principle is multilateralism. Environmental problems cannot be solved through exclusive circles or selective rulemaking. The UN remains the most legitimate platform for coordinating global action, and the authority of the UN Framework Convention on Climate Change, the Paris Agreement and other multilateral environmental agreements should be maintained. Multilateralism does not mean a slow or empty process. Properly designed, it allows different interests to be coordinated, responsibilities to be clarified and common expectations to be stabilized.

The fourth principle is a people-centered approach. Environmental governance should ultimately return to the basic needs of human survival and development. Climate adaptation, clean air, safe water, food security and protection from extreme weather are not abstract diplomatic concerns. They are directly connected with people's well-being, welfare and dignity. This approach prevents environmental governance from getting detached from development. A transition that ignores employment, affordability and social resilience will not be sustainable.

The fifth principle is practical effectiveness. The credibility of global environmental governance depends on implementation. The international community does not lack declarations. It lacks adequate finance, accessible technology, capacity-building mechanisms and platforms that can turn commitments into results. Developed countries should honor their responsibilities on funding and technology transfer, while developing countries should strengthen cooperation, improve domestic capacity and contribute within their means. Effectiveness requires both responsibility and partnership.

Institutional alignment can proceed at several levels. At the global level, the Global Governance Initiative can be connected with reform efforts around the UN and the Pact for the Future. Environmental governance should be linked more closely with international financial reform, so that climate risks, green investment and sustainable development are treated as core issues rather than peripheral concerns. Multilateral development banks should provide more green credit and more predictable support for developing countries.

At the regional level, China's cooperation with the Association of Southeast Asian Nations, Central Asia, Arab countries and Africa can help link global environmental principles with concrete regional practices. These mechanisms already provide channels for policy dialogue, technical cooperation and capacity building. Their future value lies in moving beyond project-based exchanges toward deeper coordination on green standards, environmental regulation, climate adaptation and clean energy development.

The Green Belt and Road Initiative has a particular role to play. Through climate cooperation agreements, low-carbon assistance projects, training programs and the Belt and Road Initiative International Green Development Coalition, China has helped expand practical green cooperation with partner countries. As this cooperation deepens, it can promote soft connectivity in environmental rules, green finance and technical standards. This gives developing countries more options for transition and creates a testing ground for more inclusive environmental governance.

China's contribution, therefore, lies in combining ideas, institutions and capacity. It supports a more representative governance order, defends the central role of multilateral frameworks and provides practical cooperation through green development.

This does not mean that difficulties will disappear. Differences over responsibility, finance, technology and standards will remain. External pressure and discursive competition will also continue. The task is to turn broad principles into stable mechanisms and visible outcomes.

A more just and effective environmental governance system cannot be built through exclusion or pressure. It requires shared responsibility, patient institution-building and the creation of real capacity. By promoting sovereign equality, multilateralism, international rule of law, a people-centered approach and practical results, China can help provide new momentum for global environmental governance and contribute to the building of a community with a shared future for humanity.

Deeper Sino-EU cooperation urged

Experts call for Brussels to quit its 'de-risking' plan, increase dialogue

By WANG KEJU
wangkeju@chinadaily.com.cn

As trade tensions between China and the European Union show signs of escalating, economists and executives are calling on Brussels to abandon its "de-risking" strategy, strengthen dialogue with Beijing and enhance its competitiveness and supply chain resilience through deeper cooperation — a move they say would provide much-needed certainty for the global economy.

The call comes after Brussels, since the start of the year, has been expanding its trade defense arsenal, unveiling a series of restrictive measures targeting Chinese enterprises and products.

Most recently, its push to force EU companies to diversify suppliers under the bloc's proposed revision of the Cybersecurity Act is piling on yet more investment barriers and institutional discrimination, with China bearing the brunt.

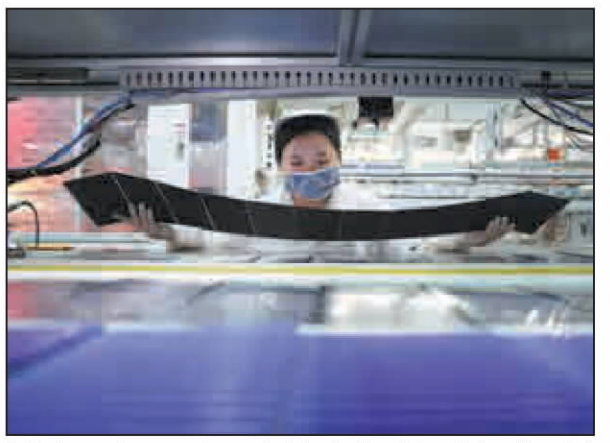
"China-EU economic and trade cooperation stems from shared interests, and its essence is the result of comparative advantages and market competition," said Wang Xuekun, head of the Chinese Academy of International Trade and Economic Cooperation.

"Complementarity is not a risk, and the integration of interests is not a threat," Wang added, stressing that the EU's push to force companies to diversify supply chains in the name of reducing "excessive dependency" on China is nothing more than protectionism dressed in new language.

A joint report by the China Chamber of Commerce to the EU and KPMG in May estimated that the forced replacement of Chinese suppliers could cost the EU nearly 367.8 billion euros ($417.9 billion) over five years, with Germany bearing the heaviest burden at 170.8 billion euros.

The report noted the mandatory replacement of Chinese suppliers as "unlikely to achieve meaningful security gains". Instead, it warned of systemic negative effects: innovation budgets could be crowded out, fiscal burdens on member states increased, and household incomes eroded.

"Protectionism is unlikely to address the competitiveness challenges facing the EU," said Sun Yawen, an assistant research fellow at the Institute of European Studies, Chinese Academy of Social Sciences.



Sun noted the core issues of its declining competitiveness lie in deep-seated structural challenges, including its fragile energy system, high labor costs, rigid and cumbersome regulatory frameworks, and difficulties in coordination among member states.

"The EU's increasingly closed internal market is hindering its ability to learn from and absorb cutting-edge technologies, thereby constraining potential pathways for industrial catch-up," Sun said.

Meanwhile, the continuous escalation of protectionist measures is unlikely to stimulate innovation among EU companies, trapping the EU in a vicious cycle where more protection leads to falling further behind, Sun added.

Despite Brussels' persistent "de-risking" rhetoric, many EU companies across different sectors are choosing to deepen their presence in China, expanding their businesses, as shown by industry data.

A recent survey by the EU Chamber of Commerce in China showed that EU companies are doubling down on manufacturing in China, with 75 percent of respondents describing their China-based production as more efficient than operations elsewhere.

Meanwhile, China, according to the report, has a dynamic research and development ecosystem and is highly competitive, and 48 percent of respondents say Chinese firms in their industry are more innovative than their EU counterparts, compared with just 24 percent who favor EU firms.

"What is now shaping China's development is the shift toward new quality productive forces," said Raquel Ramirez Alexander, vice-president of the European Union Chamber of Commerce in China.

The transition, she said, marks a departure from growth driven primarily by scale and investment, and a move toward a model increasingly defined by technology, productivity, digitalization, sustainability and advanced manufacturing.

In response to the growing friction, Beijing and Brussels have taken steps to keep channels open. On June 9, Chinese Vice-Minister of Commerce Ling Ji met with Ditte Juul Jorgensen, director-general of the European Commission for trade and economic security, at the EU headquarters.

During the meeting in Brussels, the EU side stated that "a trade war is not the EU's policy objective toward China" and that it maintains a positive attitude toward constructive dialogue, commerce ministry spokesperson He Yadong told a regular press conference in mid-June.

The two sides held an "in-depth and comprehensive" discussion on preparations for the China-EU trade and investment consultation mechanism, laying the groundwork for upcoming ministerial-level consultations, He said.

China is willing to work with the EU to manage differences through dialogue and consultation, properly handle frictions, promote practical cooperation and advance the sound and steady development of bilateral economic and trade relations, He added.

Senior Chinese and EU officials are reportedly to hold the first meeting of the China-EU trade and investment consultation mechanism in Brussels later this month, a session that analysts say offers a critical opportunity to manage differences through dialogue and stabilize a bilateral economic relationship under mounting strain.

China and the EU are each other's second-largest trading partners, with two-way goods trade exceeding $800 billion last year.

China recorded a $48.3 billion deficit in services trade with the EU in 2025, with the bloc emerging as the largest source of China's services trade deficit, accounting for 41.6 percent of the total.

On June 7, the Ministry of Commerce launched its first overseas event under the "Big Market for All: Export to China" initiative in Belarus, followed by the EU's inaugural event in Germany on June 11. The events were designed to build bridges for global businesses to expand exports to China and share in the world's second-largest consumer market.

By bringing the campaign to Europe at a moment when Brussels is rolling out a series of protectionist measures, Beijing is making it clear to businesses across the continent and beyond that "regardless of how the global landscape shifts, China's door will only open wider," said Wang, head of the Chinese Academy of International Trade and Economic Cooperation.

"With 100-plus events this year, we are turning 'China opportunities' into actual contracts," Wang said. "This is not just a policy statement. It's a practical mechanism with actionable steps, especially for smaller businesses that have struggled to enter the Chinese market on their own."

The EU's "de-risking" approach, if pushed too far, risks unraveling decades of economic integration that has benefited both sides, experts said.

"We need to seek truth from facts," said Ondrej Dostal, a member of the European Parliament. "I see the relationship between the EU and China not as strategic rivalry, but as practical cooperation."

He has advocated for synergizing the Belt and Road Initiative with the EU's Global Gateway project to promote shared prosperity, as well as fostering cooperation in areas such as artificial intelligence, healthcare and green energy.

Experts argue that forced decoupling would be costly and ineffective. Chinese suppliers offer not just lower costs, but scale, technical capability, logistics networks and processing infrastructure that alternatives cannot quickly match.

Cui Fan, a professor of international trade at the University of International Business and Economics in Beijing, said that interdependence is not a one-way dependency, but a web of mutual benefit where both sides have genuine stakes in each other's prosperity.

When Chinese companies invest in Europe, they create jobs, bring technical expertise and support the bloc's green transition, Cui said, adding that when EU firms operate in China, they tap into scale, supply chain depth and a fast-moving innovation ecosystem.

"The relationship is not about who needs whom more, but about where the points of convergence lie and how to expand them," Cui said. "Both sides can upgrade from a simple 'buy-sell' relationship to deep integration in joint R&D, standard setting and market sharing."

As global economic uncertainty intensifies, China's combination of continuous openness, massive market scale, and innovation capacity is offering multinational companies a predictable and rewarding business climate that increasingly shapes their long-term commitment in the world's second-largest economy, said business leaders.

Ola Kallenius, chairman of the Board of Management of Mercedes-Benz Group AG, noted that "China is a crucial innovation hub, especially in fields of electrification and intelligence. We are accelerating the next level of localization in China, tapping even more into the potential of its unique local ecosystem."

Illusory China 'threat' claim a classic own goal

REPORTER'S LOG
By Wang Keju

European politicians, think tanks and media have been ramping up the narrative of so-called "trade imbalance", claiming that Chinese industrial subsidies, weak domestic demand and fierce domestic competition have created "overcapacity" and led to a widening surplus with Europe.

Chinese exports, according to them, are a "threat". The remedy from Brussels is "rebalancing" and "de-risking".

But when I sat down with European business leaders over the past months, I have heard the other side of the story, one of deepened commitment and, in particular, continued confidence.

For much of the past two decades, Europe exported high-end machinery, precision instruments, luxury goods and automotive technology. China exported consumer electronics, textiles and assembled manufactured goods. Each side occupied a distinct tier in the global value chain.

That era is over. China's manufacturing capability has made a huge leap into sectors that have long been Europe's industrial heartland — electric vehicles, batteries, renewable energy equipment, advanced machinery, and increasingly, semiconductors and pharmaceuticals.

Chinese companies are no longer just suppliers to European firms; they are now direct competitors in the same global markets. For many politicians in Brussels, this shift spells danger. But the European executives I spoke with see it differently. To them, competing in China is not a liability, but a proving ground.

"China is like a fitness club," Denis Depoux, global managing director at Roland Berger, told me. "Foreign companies have to be competitive, have to move quickly, and have to bring the most cutting-edge innovations to China," he said. "But if you can make it here, you can make it anywhere."

The very competition and cooperation that Brussels frames as a threat is, for European businesses, a source of global advantage. The pressure to innovate, the speed of iteration, the scale of the market don't weaken European firms; they sharpen them.

Rogier Janssens, president of Merck China, put it more directly. "We look at China not just as a market," he said. "We see China as a production base and, in particular, a base for innovation."

He pointed to China's "2.0 version" of opening-up as "not just about enabling multinational companies to access the Chinese market, but empowering them to collaborate in innovation."

Business leaders I met are fully aware that in the industries that will define the next decade, China is not just a market to be accessed. It is a competitor to be matched, and a partner to be engaged.

Jean-Christophe Tellier, CEO of multinational bio-pharmaceutical firm UCB, told me: "Collaboration, AI, plus the culture and mindset of testing, experimenting, changing and pivoting, make me feel that if change comes in the future, it is likely to come from China."

As the world's significant economies, China and the EU are deeply intertwined. The real question is not whether to engage, but how to engage. European companies are already voting with their feet.

Joseph Cherian, president and dean of the Asia School of Business, noted that "Businesses can't afford not to be in China. Not because it's huge, but because it's very likely where the future is being shaped."

The question is whether Brussels will listen or continue to pursue a strategy that serves neither its industrial competitiveness nor its geopolitical interests.

H2 macro outlook: New drivers of China's growth

EAGLE EYE
By Yang Fan

ILLUSTRATION GENERATED BY AI

Looking ahead to China's economy in the second half, robust exports are expected to remain an important driver of economic growth, while domestic demand will generally remain stable. PPI inflation is expected to remain elevated, while CPI inflation is likely to stay moderate. As prices continue to recover, the full-year GDP deflator is expected to reach 1.1 percent.

GDP growth is expected to dip before recovering in the second to fourth quarters, with expansion forecast at 4.5 percent, 4.6 percent and 4.8 percent, respectively. We forecast China's full-year real GDP growth at 4.7 percent, with nominal GDP growth at 5.8 percent. USD/CNY could hover around 6.7-6.8 this year, supported by China's current account surplus and stronger corporate willingness to convert foreign-exchange receipts.

On the domestic macro front, imports and exports remain key drivers of growth. We expect China's foreign trade to stay resilient in the second half of 2026, supported by multiple factors including the global AI investment cycle. First, the continued capital spending cycle among overseas cloud providers is turning computing-power-related goods into an increasingly important driver of China's trade growth. According to China customs statistics, China's integrated circuit exports rose 83.7 percent year-on-year in the first four months, making a notable contribution to overall trade growth. We expect this support to persist in the second half. Second, elevated crude oil and natural gas prices caused by the Middle East conflict are likely to further boost global demand for new energy products. As a major producer of photovoltaic products, electric vehicles and lithium batteries, China continues to benefit from this trend. Third, China's relative cost advantages in manufacturing are set to widen. With oil and gas accounting for a lower share of its energy mix than in the European Union, Japan, South Korea and ASEAN economies, China is relatively less vulnerable to energy-price shocks, which could further strengthen the cost competitiveness of its manufacturers. Fourth, import growth is also expected to remain elevated in the second half, supported by stronger semiconductor supply-chain imports driven by rising AI computing demand, as well as higher import values for upstream commodities such as nonferrous metals, oil and gas amid price gains. Overall, we forecast China's full-year export and import growth in 2026 at around 13.2 percent and 15.5 percent, respectively.

On the consumption front, retail sales growth, particularly goods consumption, is likely to remain subdued this year as subsidies are phased out, front-loaded demand fades, household income growth remains tepid and household balance-sheet repair falls short of expectations, weighing on consumers' willingness to spend. Services consumption, however, is expected to emerge as a structural bright spot in household spending this year, underpinned by policy support. Special treasury bond funding for this year's consumer goods trade-in program is slightly lower than the amount allocated last year. We estimate that subsidy funding in the first and second halves will amount to 77 percent and 91 percent of year-earlier levels, respectively, creating a modest drag on retail sales growth. At the same time, property-sector weakness could continue to weigh on household balance-sheet repair and consumer confidence, while persistent pressure on income growth is likely to curb households' willingness to spend. Taken together, we expect retail sales — particularly goods consumption — to remain on a weak recovery path in the second half, with full-year growth likely at around 2.5 percent. Compared with goods consumption, services consumption is more experience-driven and tends to benefit from continued upgrading and repeat demand. With household consumption patterns shifting and policy support increasing, services consumption is likely to become an increasingly important driver of overall consumption growth.

On the investment front, fixed-asset investment growth is expected to stay slightly positive in 2026, as tighter "anti-involution" policies limit inefficient capacity additions and property investment continues to drag. Structurally, investment is likely to feature a steady growth in infrastructure investment, weak manufacturing investment and a continued but narrowing drag from real estate development investment. For infrastructure investment, the combination of limited fiscal resources for the remainder of the year and a shrinking pool of project reserves suggests that the second quarter could be a near-term trough in growth. Infrastructure investment growth is expected to recover sequentially in the second half. For manufacturing investment, it is expected that the strong momentum in AI-related sectors and the overall improvement in corporate profits will support a moderate increase in manufacturing investment growth. However, as anti-involution policies continue to be rolled out, manufacturing investment is likely to post only modest positive growth for the full year. For property investment, the decline in real estate development investment is expected to narrow further.

On the price front, "imported inflation" is expected to keep China's PPI elevated, while CPI inflation is likely to remain moderate. The year-on-year growth gap between PPI and CPI may therefore persist. Judging from the performance of key commodities, higher crude oil prices driven by Gulf tensions have been the main driver of China's rapid PPI increase since March. Regardless of how the conflict evolves, crude prices are unlikely to return to pre-conflict levels in 2026, and should continue to provide upward support to China's industrial goods prices. Under our base-case scenario, PPI inflation is expected to rise by around 2.3 percent in 2026. CPI inflation is expected to remain moderate this year, with the annual rate likely to come in at around 0.8 percent in 2026 under our base-case scenario.

In terms of fiscal and monetary policy, China's fiscal spending and government bond issuances have been front-loaded in 2026. In the second half, efforts to clear overdue payments, advance the "Six Networks" initiative (including water networks, new-type power grids, computing power networks, next-generation communication networks, urban underground pipeline networks and logistics networks), and increase livelihood-related spending are expected to become key channels for optimizing the allocation of fiscal funds. Regarding monetary policy, we believe that under the base-case scenario, China is unlikely to cut interest rates or the reserve requirement ratio this year.

Transitioning from large consumer market to strong consumer economy

MAIN STREET
By Huang Yanfen

In December, the annual Central Economic Work Conference identified boosting consumption and expanding domestic demand across the board as a key priority for economic policy.

The task is not merely a short-term response to economic challenges. It also reflects a broader strategic goal: transforming China from one of the world's largest consumer markets into a truly strong consumer economy.

Achieving that goal will require not only policy support, but also a gradual shift in consumer behavior — from cautious spending toward more confident and self-assured consumption.

China is already one of the world's largest consumer markets. With a population of more than 1.4 billion, the country has maintained its position as the world's second-largest consumer market for years. Yet scale alone does not necessarily translate into strength.

Compared with many developed economies, China's final consumption expenditure still accounts for a relatively smaller share of GDP.

In economies such as the United States and the United Kingdom, final consumption has long remained above 80 percent of GDP, while China's ratio remains below 60 percent.

More fundamentally, the difference lies in consumer psychology. Influenced by long-standing cultural traditions that emphasize living within one's means and preparing for future uncertainties, Chinese households have historically maintained high savings rates and relatively cautious spending habits.

Such prudence was understandable, and even beneficial, during earlier stages of development. However, as China enters a new phase in which domestic demand is expected to play a greater role in driving growth, excessive caution can become a constraint on economic vitality.

The transition from a large consumer market to a strong consumer economy is not simply about how much people spend. It is also about how and why they spend.

Consumption driven by confidence, aspirations and quality-of-life improvements is fundamentally different from spending limited to essential needs or shaped by concerns about future uncertainty.

It is important to clarify that more confident consumption does not mean encouraging extravagance or wasteful spending.

Rather, it reflects a consumption mindset supported by stable income growth, stronger social protection and positive expectations about the future.

Confidence is the first pillar. When consumers believe their incomes will continue to grow steadily, when they feel adequately protected against major life risks, and when concerns about healthcare and retirement are reduced, they are more likely to allocate resources between consumption and savings in a balanced and rational manner rather than saving excessively for unforeseen contingencies.

Choice is another important dimension. Consumption upgrading is, at its core, a transition from focusing on whether products are available, to focusing on whether they are desirable and valuable.

As incomes rise and markets become more diversified, consumers gain greater freedom to choose among premium domestic brands, international products, physical goods and service-based experiences. Such freedom of choice is itself a reflection of stronger consumption capacity.

Equally important is rationality. A mature consumer culture is not about purchasing the most expensive products, but about making informed decisions based on actual needs and personal preferences.

In today's highly transparent information environment, consumers are increasingly capable of distinguishing genuine value from marketing hype and making purchasing decisions that balance quality, individuality and sustainability. Such consumption is both higher in quality and more sustainable over the long term.

The shift toward more confident consumption will not happen overnight. Nor can it be achieved through slogans alone. It requires coordinated efforts from the government, businesses and society.

Income growth remains the foundation. Without stable and sustainable income growth, stronger consumption cannot be maintained.

Expanding employment opportunities, improving income distribution and increasing household earnings are essential.

Measures such as improving wage growth mechanisms, refining policies related to factor-based income distribution and broadening channels for property income all help strengthen consumer spending power.

Social security serves as an equally important pillar. One reason Chinese households traditionally save a large portion of their income is uncertainty surrounding major expenditures such as healthcare, education and retirement.

Further improving the multi-tiered social security system and strengthening the social safety net can help reduce such concerns.

As confidence in long-term security increases, the need for precautionary savings is likely to decline, creating greater room for consumption.

Supply-side improvements are also critical. Consumers can only spend with confidence when high-quality products and services are available.

Continued industrial upgrading, increased supply of mid to high-end consumer goods and the development of emerging consumption sectors — including service consumption, digital consumption and green consumption — will provide consumers with more attractive options and better experiences.

Meanwhile, a safe and trustworthy consumption environment remains indispensable. Stronger protection of consumer rights, more effective regulation against counterfeit and substandard products, and more accessible channels for resolving disputes can all help strengthen confidence in the marketplace.

A consumption environment where consumers feel protected is itself a powerful driver of spending.

Ultimately, the transition from a large consumer market to a strong consumer economy represents more than a change in economic indicators. It reflects a broader transformation in China's development model.

A stronger consumer economy would mean a more balanced growth structure, higher living standards for the country's 1.4 billion people and a fuller release of the potential embedded in China's vast domestic market.

The gradual shift from cautious spending to confident consumption is one of the most visible manifestations of that transformation.

When consumers feel comfortable paying for better quality, embracing new experiences and pursuing lifestyles that reflect their aspirations, the vision of a stronger consumer economy moves closer to reality.

As the Central Economic Work Conference emphasized, efforts should focus on enhancing consumer spending power and strengthening their willingness to consume.

That objective is not only an important economic task, but also a shared aspiration of millions of households. Enabling people to consume with greater confidence and enjoy a better quality of life lies at the heart of building a stronger consumer economy in the years ahead.

Harvard dean pushes to strengthen Sino-US ties

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

Graham Allison, a renowned political scholar from the United States and founding dean of the Harvard Kennedy School, called for sustained efforts to stabilize and improve China-US relations, saying a stable and improving bilateral relationship is "good news for all of us".

Accompanied by Wang Linggui, chairman of the All-China Federation of Returned Overseas Chinese, Allison toured the special exhibition *Tales of People-to-People Bonds Between China and the US* at the Overseas Chinese History Museum of China in Beijing on Saturday.

Allison, known for coining the concept of the "Thucydides Trap", said the entire bilateral agenda, from top-level leadership to grassroots exchanges, would benefit from more direct interaction.

During his visit, Allison carefully examined historical photographs, documents and artifacts tracing centuries of exchanges between the Chinese and American peoples.

He said the collection serves as a reminder that the two peoples have long engaged with each other in constructive ways.

"As the museum suggests, we are people-to-people — Americans and Chinese have engaged with each other. There's a long history of successful contributions to a better world," he said.

However, Allison expressed concern over the recent decline in people-to-people exchanges, particularly after the COVID-19 pandemic. He noted that the number of American students studying in China and Chinese students studying in the US has dropped significantly.

"I think that's bad, and I think the aspiration to get back to where we were before — and even beyond that — is a good lesson for all of us," he said. He stressed that direct engagement — whether among students, academics, businesspeople or ordinary visitors — is far more effective than speculation.

"Almost all those disagreements are better handled by people talking to each other and understanding each other, rather than imagining what the other might be doing, or might be thinking or might be saying," he added.

Asked about the historical memory of China and the US fighting side by side during World War II, Allison pointed to the shared sacrifice in the fight against fascism.

"Remember the Flying Tigers," he said. "Remember how much of the burden of the war China bore before the Americans entered the war." He said neither country might have defeated Japan alone and described that history as "a good reminder" of the value of cooperation.

Before leaving the museum, Allison wrote in the guestbook: "An amazing and inspiring collection that reminds us of the many ways Chinese and American working together can make both nations greater and contribute to a more peaceful and prosperous world."

The exhibition systematically traces the history of friendly exchanges between the peoples of China and the US since the founding of the nation in 1776.

The 100 artifacts on display include gold-mining tools, railroad spikes, agricultural implements, documents, newspapers, dining utensils, medals commemorating the Chinese People's War of Resistance Against Japanese Aggression and personal belongings of notable figures, offering a window into the centuries-old bonds between the two nations.

Graham Allison, founding dean of the Harvard Kennedy School, visits the special exhibition *Tales of People-to-People Bonds Between China and the US* at the Overseas Chinese History Museum of China in Beijing on Saturday. ZHANG WEI / CHINA DAILY

APEC tourism heads congregate in Macao

Officials call for regional cooperation through digital innovation, exchanges

By **YANG HAN** and **LI XIAOYUN** in Macao

Over the weekend, officials gathered at the 13th Asia-Pacific Economic Cooperation Tourism Ministerial Meeting in the Macao Special Administrative Region, where they emphasized China's major contributions to regional and global tourism development, which is seen as a key economic driver for the Asia-Pacific region.

China looks forward to working with all APEC members to advance cooperation and jointly promote the growth and prosperity of the Asia-Pacific region, said Chen Xu, chair of the APEC 2026 Senior Officials' Meeting and president of China Public Diplomacy Association.

"Travel facilitation is a key priority within APEC's tourism agenda," said Chen.

Tourism contributed 10.4 percent of the region's GDP before the COVID-19 pandemic, data from the APEC website showed. In 2024, APEC economies received 439 million international visitors, of whom 359 million were intra-regional travelers.

Under the theme "Digital Innovation, Collaborative Empowerment: Leveraging Tourism for an Asia-Pacific Community", the meeting brought together over 200 participants from APEC economies to discuss sustainable tourism development and the joint exploration of new pathways for tourism cooperation across the region.

"This meeting is an important opportunity to seek cooperation measures for the sustainable growth of the tourism industry in the APEC region amid the era of digital transformation," said Chae Hwi-young, South Korea's minister of culture, sports and tourism.

Chae also proposed jointly designating 2027-28 as the "China-South Korea Year of Tourism".

"Chinese tourist arrivals to Vietnam reached 2.3 million in the first half of this year," said Ha Van Sieu, vice-chairman of the Viet Nam National Authority of Tourism.

He said he was optimistic about the prospects for bilateral tourism cooperation and looked forward to new breakthroughs under the China-Vietnam tourism cooperation year in 2026-2027.

At a welcome dinner co-hosted by the Ministry of Culture and Tourism and the Macao SAR government on June 26, Macao Chief Executive Sam Hou-fai noted that it had been 12 years since Macao last hosted the APEC Tourism Ministerial Meeting.

"Leveraging our deep heritage of over four centuries of Chinese-Western cultural integration and our unique advantage of close ties with Portuguese-speaking countries, we will actively align with national strategic deployments, fully serve the mutual learning between Chinese-Western civilizations," Sam said, noting the SAR aims to be an important bridgehead for the nation's high-level opening up.

This sentiment was echoed by tourism and cultural officials from APEC member economies when they wrapped up the 13th APEC Tourism Ministerial Meeting on June 28 with a tour showcasing Macao's distinctive blend of Eastern and Western heritage.

They said the Macao SAR's commitment to developing its tourism sector and promoting exchanges between China and the West makes it an ideal platform for advancing Asia-Pacific tourism cooperation.

Anna Clark, deputy secretary of New Zealand's Ministry of Business, Innovation and Employment, said she was glad to visit museums and heritage sites in Macao as they formed an important part of the region's tourism offering.

Maria Helena de Senna Fernandes, director of the Macao Government Tourism Office, said all vehicles used by delegates were electric to showcase the nation's advanced technology, and that the event also featured traditional Chinese dances and Portuguese folk dance performances.

The Tourism Ministerial Meeting was an important component of the APEC China 2026 series of events. As the host of APEC 2026, China will hold the 33rd APEC Economic Leaders' Meeting in Shenzhen, Guangdong province, in November. About 300 APEC-related meetings and events are taking place in multiple Chinese cities throughout the year.

Yang Xiaoyu and Li Xiang in Macao contributed to this story.

Manta ray submersible capable of reaching 2,000-meter depths

By **CHEN MEILING**
chenmeiling@chinadaily.com.cn

Northwestern Polytechnical University in Xi'an, Shaanxi province, has developed a manta ray-inspired submersible capable of operating at depths of up to two kilometers beneath the water surface.

The remotely operated electric-powered craft is designed to generate minimal disturbance to marine life, offering a quieter alternative to traditional propeller-driven vehicles for ecological monitoring and deep-sea exploration.

Traditional propeller-driven submersibles generate high levels of noise and strong water flow, often stirring up seabed sediment, producing blurry images and disturbing marine organisms, making them unsuitable for high-precision near-seabed detection and environmentally friendly monitoring missions.

"We have translated the swimming mechanics of manta rays into engineering technologies to make deep-sea exploration more efficient, quieter and better adapted to the marine environment," said Cao Yong, a researcher at the university's School of Marine Science and Technology.

Cao said the submersible utilizes a manta ray-inspired undulating flapping fin propulsion system.

The research team overcame a long-standing limitation in conventional marine equipment by applying the same variable buoyancy technology that is used in underwater gliders, Cao said.

Traditional systems typically achieve either long-range cruising at the expense of maneuverability or high maneuverability at the cost of endurance.

In glide mode, the submersible uses its variable buoyancy system to perform periodic diving and ascending motions with ultralow power consumption, enabling wide-area ocean surveys spanning thousands of kilometers.

In flapping mode, its pectoral fins move at low frequencies to execute highly agile maneuvers, including in-place turning, rapid pitching and precise hovering.

Seamless switching between the two modes enables both long endurance and operational flexibility.

Without high-speed rotating components, it generates low operational noise and minimal water disturbance. It also avoids stirring up sediment during near-seabed operations and offers excellent biocompatibility, Cao said.

Its flat fuselage provides superior stability when landing on the seabed. Designed for long-term deployment, the vehicle can remain in dormant mode before being reactivated, and carry payloads for integrated detection and operational tasks.

"To improve target recognition in complex seabed environments, the submersible adopts hierarchical recognition technology to accurately distinguish between interference from reefs, sunken vessels and other underwater objects," Cao said. "It can withstand pressure of up to 200 atmospheres, enabling operations at depths of up to 2,000 meters."

To achieve this, the university team studied manta ray movement by analyzing tens of thousands of video clips and raising cownose rays — which have similar biological characteristics to manta rays — in laboratory facilities.

The V-shaped bionic manta ray soft-bodied submersible developed by Northwestern Polytechnical University. PROVIDED TO CHINA DAILY

The team also collaborated with Ningbo University in Zhejiang province on 3D scanning and CT imaging to analyze the rays' muscle and skeletal structures.

"During ecological monitoring missions, this submersible can conduct long-term silent observation of ecosystems such as coral reefs and submarine hydrothermal vents, providing important data support for biodiversity conservation," Cao said.

"For the operation and maintenance of marine ranches, it can enable early warning of fish diseases, precision feeding and escape monitoring, supporting the development of the 'blue granary'," he added.

The submersible can also serve as a safe and efficient platform for underwater archaeology and marine science education.

Cao highlighted that the team plans to integrate artificial intelligence and swarm algorithms for autonomous underwater navigation under low-bandwidth communication conditions.

"The research fills China's technological gap in bionic underwater submersibles capable of integrating wide-area detection with high precision operations," said Pan Guang, president of the School of Marine Science and Technology. "It advances autonomous unmanned underwater technologies from single-function systems to multifunctional integrated platforms."

Magnets pull China closer to fusion power

By **ZHU LIXIN** in Hefei
zhulixin@chinadaily.com.cn

Scientists and engineers announced major progress in the development of two key superconducting magnets for future fusion reactors on Saturday, marking another step toward making fusion energy a practical source of electricity.

One of the breakthroughs involves a toroidal field superconducting magnet weighing 582 metric tons, developed by the Institute of Plasma Physics of the Chinese Academy of Sciences in Hefei, Anhui province.

Wu Yu, a researcher at the institute, said the magnet is currently the world's largest toroidal field magnet designed for a fusion reactor.

It passed a comprehensive review by an expert panel on Saturday.

"The volume of this magnet is 1.3 times that of the toroidal field magnet used in the International Thermonuclear Experimental Reactor, and its energy storage capacity is three times higher," Wu said.

The toroidal field magnet is one of the most important components of a fusion reactor.

It generates an extremely powerful magnetic field that keeps superheated plasma — a state of matter hotter than hundreds of millions of degrees Celsius — from touching the reactor walls.

This allows the fusion reaction to continue safely while reducing energy loss and damage to the reactor.

Because the magnet is expected to operate continuously for about 60 years, it must remain stable under extreme conditions, including ultralow temperatures, high electric currents, intense radiation and enormous mechanical stress.

The second breakthrough is a high-temperature superconducting central solenoid coil, which completed full-condition parameter testing on Saturday.

Scientists said its key performance indicators have reached world-leading levels.

"The central solenoid coil operates under the most demanding conditions in a fusion reactor," said Qin Jinggang, deputy director of the Hefei institute.

"It plays a critical role in starting and sustaining the fusion reaction," he added.

Qin said the coil is a key technology for moving fusion energy from laboratory experiments to practical electricity generation.

Researchers said the successive breakthroughs in the two core superconducting magnets have further strengthened the technological foundation for China's development of fusion reactors.

Song Yuntao, director of the Hefei institute, said the Burning Plasma Experimental Superconducting Tokamak, a major fusion research facility, is under construction in Hefei.

He said the facility aims to achieve net fusion power gain — producing more energy from fusion than is used to sustain the reaction — and demonstrate electricity generation by around 2030.

Fusion occurs when two atomic nuclei combine to form a heavier nucleus, releasing enormous amounts of energy. Scientists hope to reproduce the same process that powers the sun to generate carbon-free electricity on Earth.

If successful, fusion could provide a virtually limitless source of clean energy without carbon emissions while offering lower safety risks than conventional nuclear power.

The latest breakthroughs will significantly enhance China's capabilities in the independent research, development and engineering of fusion reactors, according to the Hefei scientists.

Xizang children head home after life-changing heart surgeries

All costs covered by Chinese Red Cross Foundation and Shandong hospital

Gangjong Lhamo undergoes an ultrasonic checkup in Ngari on June 6.

Twenty-two children from remote areas in the Xizang autonomous region are heading home with healthy hearts recently after undergoing free, life-changing cardiac surgeries in Zibo, Shandong province.

The medical pipeline began earlier this month during the "Tour of Angels" campaign, a joint humanitarian initiative by Shibo High-tech Hospital in Zibo and the Chinese Red Cross Foundation.

From June 2 to 10, medical teams traveled across Xizang to screen 226 children using specialized auscultation and color Doppler ultrasound imaging, identifying those in urgent need of congenital heart disease intervention.

The selected patients were flown to Shandong province on June 15 for treatment. To ease the financial burden on the families, the foundation and the hospital completely covered all surgery fees, alongside the travel and lodging costs for both the children and an accompanying parent.

"I'm so happy that I have recovered and can go home," said Gangjong Lhamo from Xizang's Ge'gyai county.

Following their operations, the children received a send-off from senior foundation officials as they began their return journey in good condition.

LIFE

Xu Fengying's oil paintings mark a new chapter for her as a self-taught painter, while also offering a realistic portrayal of daily life in rural Shanghai. PHOTOS PROVIDED TO CHINA DAILY

Brushstrokes of courage

An elderly woman who picked up painting after cancer surgery has become an unlikely artistic inspiration, **Wang Xin** reports in Shanghai.

Xu Fengying, a 79-year-old from rural Shanghai, never imagined she would become an oil painter. Yet, a decade ago, she picked up a brush for the first time and began an extraordinary new chapter in her life.

In late May, more than 150 of her oil paintings were exhibited at a gallery in Beijing, drawing praise from artists, academics and visitors alike.

Born in Zhujiajiao, an ancient water town in Shanghai's Qingpu district, Xu has spent most of her life as a farmer in a nearby village. Her paintings portray the surrounding landscapes, the rhythms of rural life and the people she has known over the years.

Using the artistic language of Western oil painting, she gently narrates nostalgic life stories in the context of Chinese modernization.

Her canvases capture the seasons of village life — spring planting, summer blossoms, autumn harvests, and winter stillness — while also documenting close-knit communities, the happiness of older residents and the transformation of China's countryside.

The warmth and bright colors of her paintings offer little hint of the hardships she endured for much of her life.

Born in 1947 into a poor family, Xu lost her father at the age of 4. She spent much of her childhood moving from place to place before returning to her hometown at 13. By the age of 7, she was already rowing boats to help earn a living, beginning a lifelong struggle to improve her circumstances.

Life gradually improved in the early 1990s, when her two children completed their studies and began supporting the family. As China's rural development accelerated, her old house in Linjia village was renovated, becoming a comfortable home for Xu, her daughter and son-in-law in 2009.

The event that ultimately led her to painting, however, came unexpectedly. In 2016, Xu was diagnosed with colorectal cancer and underwent surgery. Accustomed to constant work, she returned to farm labor shortly after the operation, causing complications that required a second procedure.

Determined to keep her from overexerting herself again, her family encouraged her to find a hobby.

Xu Fengying (center), 79, displays more than 150 of her oil paintings at a gallery in Beijing in late May.

They suggested painting. In December that year, Xu began her first oil painting, depicting a group of large trees outside her home.

"Those trees were about to be cut down. I wanted to record them and the scene on canvas," recalls Xu.

The work took nearly a month to complete.

Largely self-taught, Xu learned through trial and error, seeking advice whenever she encountered professional painters. She found oil painting forgiving and practical. If a stroke doesn't work, the painter can scrape it away, correct it, and continue, she says.

"The challenge was mastering color. Mixing the right colors is the hardest part. Paint is expensive, and it used to take me at least two hours to create the shades I wanted," says Xu.

Though she has never received formal training, her work has won widespread admiration. At the recent Beijing exhibition, visitors and professional artists praised her paintings. Some even asked for her advice on color mixing, while a university professor purchased several of her works.

The experience left Xu both delighted and energized. Although she did not particularly enjoy painting at first, she gradually discovered a sense of fulfillment in the process. Seeing villagers, tourists and visitors from around the world respond to her work with appreciation has deepened her commitment.

For Xu, painting is a way of preserving life as she remembers it and as she experiences it today. Alongside her favorite subjects — flowers, waterways and village scenes — she has set an ambitious goal: completing 100 paintings of old bridges. So far, she has finished 12.

"The bridges don't have to be in Shanghai," she says with a smile.

"I hope to travel to more places and paint the bridges — and maybe the trees and other things — that I love."

As Xu embraces this unexpected second act, her story continues to inspire people far beyond her village. Her daughter, Chen Junfang, recalls a visit several years ago from an elderly mathematician from Sichuan province who had been diagnosed with pancreatic cancer.

"He was under enormous stress," Chen says.

"My mother simply told him, 'It's no big deal.' Those simple words eased his anxiety. He relaxed and smiled again."

Living with Xu in the village, Chen and her husband are delighted to see her mother flourishing in later life. They hope to support her creative work, help her travel more widely, and organize additional exhibitions to share her uplifting paintings with a broader audience.

"My mother proves that it is never too late to learn," Chen says.

"In many ways, she is living out a dream I once had myself."

Toys fight back in the age of screens

By XU FAN
xufan@chinadaily.com.cn

It is a familiar scene in homes across the world: a child sits alone, illuminated by the blue glow of a screen, fingers tapping across a tablet or smartphone. Toys lie abandoned nearby, mute and motionless, their stories shelved — perhaps permanently — in favor of digital worlds and endless streams of content.

But thanks to Pixar, the animation behemoth, toys can still reclaim children's hearts — at least within the fable-like world of *Toy Story 5*.

The newest chapter in the beloved franchise arrives more than three decades after the original *Toy Story* transformed cinema as the world's first feature-length computer-animated film.

In China, the latest installment has struck a chord with audiences, topping the Dragon Boat Festival holiday box office with earnings exceeding 120 million yuan ($17.6 million).

With a score of 8.1 out of 10 on the review platform Douban, the film has stirred nostalgia among longtime fans while raising a distinctly contemporary question: What role do traditional toys still play in a childhood increasingly shaped by screens?

That question sits at the heart of the story. For the first time in the franchise's more than 30-year history, Jessie, the spirited cowgirl toy, steps out of Woody's shadow to become the undisputed leader of the toy crew.

Assisted by Buzz Lightyear, Jessie must confront an unexpected new adversary — Lilypad, a frog-shaped smart tablet that threatens to render traditional toys obsolete in the life of 8-year-old Bonnie.

While the premise reflects contemporary concerns and the animation showcases Pixar's technical brilliance, the franchise's enduring strength lies in something far simpler. Beneath the adventures of talking toys is a story about friendship, loyalty, love, and resilience — themes that continue to resonate with audiences of all ages.

That emotional connection was evident at the film's premiere in Shanghai earlier this month.

Singer Huang Zihongfan, who joined veteran host He Jiong to perform the Chinese-language version of the theme song *You've Got a Friend in Me*, spoke about growing up with the franchise.

For Huang, *Toy Story* is inseparable from childhood memories.

"The first movie means so much to me. When I was in elementary school, I would secretly watch *Toy Story* films even when I still had homework to finish. Those moments became some of my most unforgettable childhood memories," he recalls.

The films also added a touch of fairy-tale magic to his imagination.

"When I first watched *Toy Story*, I fell in love with Buzz Lightyear. I genuinely believed he could fly. He had wings and came from another planet. His gear was so cool, and as a child, I often imagined myself soaring through the sky just like him," Huang says.

Now 27, Huang believes the franchise carries a message that extends well beyond entertainment.

"No matter what challenges we face or where life takes us, if we have good friends beside us, we never have to feel alone. Their support makes us stronger and braver," he says.

That idea of enduring friendship and the passage of time is also central to the filmmakers' vision.

In promotional materials, director-screenwriter Andrew Stanton explains why the series continues to inspire new stories.

"I always figured they'd keep going with *Toy Story*. The world is just so rich. The toys don't really age, but the world does. It's not every movie idea you come up with where time is part of the interesting aspect of a story about childhood, parenthood, growing up, and moving on. The toys are the observers of everything," says Stanton.

Finding cultural resonance with printmaking

SE Asian artists showcase their works in new exhibition, highlighting their link with Chinese traditions, **Lin Qi** reports.

Left: *Faint Light*, a lithograph of Chinese artist Cao Dan on show at *Imprints of Civilization: China-ASEAN Printmaking Exhibition* at Beijing's Today Art Museum. **Right top:** Indonesian artist Lutse Lambert Daniel Morin in front of his work, *That Papua Person*, along with his wife Murin Astuti, at the exhibition's opening. **Right middle:** Wen Zhongyan's work on show, *Beihai 2011.7.8*, celebrates his dedication of nearly 20 years to depicting the changing atmospheres of the imperial garden Beihai Park in the heart of Beijing. **Right above:** The exhibition builds a cross-cultural arena that is inclusive, diverse, and open to all. PHOTOS PROVIDED TO CHINA DAILY

The pre-Qin Dynasty (221-206 BC) foundational text of Chinese mythology, *Shanhaijing* (The Classic of Mountains and Seas), catalogs several mythological creatures that combine the bodies of birds and fish — some considered positive symbols and others bad omens. For example, the *wenyao* fish is a celestial beast with a carp's body and avian wings, and the text records that it flies at night and its appearance heralds a bumper harvest.

In his Beijing exhibition debut, Filipino artist Salvador Buds Convocar shows his own rendition of the *wenyao* fish — a work titled *Fish-bird* — but in a different cultural context. An integration of printmaking and collage, the piece depicts a colorful fish with a bird's wings, beak and feet.

Convocar says he was inspired by and has borrowed the term chimera, from Greek mythology, which refers to an imaginary creature that combines parts of different animals. In his work, the creature's big, round eyes, together with its high spread wings and claws that grip the ground tightly, convey a vibrancy that connects one with the varied beauty of the Philippines' natural topography, its chill beaches, and the archipelago's culture and biodiversity.

The distinct chemistry between Convocar's chimera and the land where the *wenyao* fish was imagined millennia ago ushers visitors into an interplay of past and present, at the crossroads of different civilizations, when viewing *Imprints of Civilization: China-ASEAN Printmaking Exhibition*, where *Fish-bird* is on display.

The exhibition, running at Beijing's Today Art Museum until July 8, brings together more than 150 prints by more than 140 artists from China and the member states of the Association of Southeast Asian Nations, or ASEAN. The project is sponsored by the Beijing Culture and Arts Fund, a public fund established by the Beijing Municipal Bureau of Culture and Tourism to mobilize public participation in cultural development.

One of five Filipino artists on show, Convocar has a connection to Chinese art that he hopes to share with his Chinese counterparts. Among his other works, he explains that one, *Man Bathed in Moon*, uses a unique printmaking technique called *chine colle*, a French term meaning "using thin Chinese paper to create multiple colors on a plate".

For centuries, printmaking has played a crucial role in the development of artists, regardless of the medium they primarily work with. Celebrated artists such as Pablo Picasso, Henri Matisse and Andy Warhol were deeply engaged with printmaking, renewing people's interest in the form as artistic expression.

With Wen Zhongyan and Fu Bin, both from the Academy of Arts and Design, Tsinghua University, as the exhibition's chief curators, the exhibition showcases how artists use printmaking as a vessel for distinctive experiences and shared feelings, as they gaze at the mountains and waters that surround them and the history and traditions that have shaped their everyday lives. Meanwhile, they reflect on urban evolution amid the era's shifting tides and its influence on individuals.

Beihai 2011.7.8, one of the works on display at the exhibition, was created by Wen, who heads the painting department at the Academy of Arts and Design. The painting delivers a nighttime solemnity at Beihai Park, one of Beijing's imperial gardens. Wen used acrylic to depict the landmark White Pagoda on the Jade Islet bathed in nocturnal serenity, as well as the bridge's dim lighting. He also employed silkscreen printing to create dense, nuanced patterns of geometric shapes and numerals throughout the painting.

Wen says he was inspired by a television's repair diagram — "the components' densely packed arrangement reminds me of the maze-like yet orderly structure of Beijing's old, beautiful alleyways", he explains, adding that the distinctively textured surface of the work hints at the marks of time that have been imprinted on the capital.

"I've worked on the Beihai series for nearly two decades. The park's varied hues correspond with the changing climates of the days I visit, and the changing atmosphere of the historical architecture," he adds.

Yan Yan, the executive director of Today Art Museum, says the artists capture the myriad textures of life and the spirit of the times, building a cross-cultural arena that is inclusive, diverse and open to all.

Wen notes the exhibition introduces home audiences to the printmaking art of Southeast Asia, which they are less familiar with.

The exchanges have also expanded beyond museum spaces. Convocar showed how he worked with the *chine colle* approach during a workshop at the Academy of Arts and Design after the exhibition opening on June 18. He says he once taught at a university for years before becoming a full-time artist.

In November 2025, a printmaking exhibition of Chinese and Thai artists, including some from the Academy of Arts and Design at Tsinghua University and the Central Academy of Fine Arts, was held in Bangkok to celebrate the 50th anniversary of the diplomatic relations between Thailand and China.

A mesmerizing peek into the transformation of identity

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

From left: Portraits of Peking Opera performers by French artist Esther Imard are displayed at Yishu 8, an art platform housed in the former Sino-French University. During the opening of her exhibition in Beijing this month, Peking Opera performers present selected vocal excerpts. PHOTOS PROVIDED TO CHINA DAILY

A Peking Opera performer sits before a mirror. Makeup is applied with precision, costumes are adjusted, and an ordinary identity begins to dissolve. Moments later, the actor steps onto the stage and enters a story that first took shape more than four centuries ago.

It is this brief interval — between the everyday self and a stage character — that French artist Esther Imard seeks to capture in her paintings.

Imard, recipient of the 2025 Yishu 8 French Young Artist Award supported by Boucheron, arrived in Beijing in April for a residency at Yishu 8, an art platform housed in the former Sino-French University. Living in a *hutong* (alleyway), studying Chinese, and attending performances, she gradually immersed herself in the city's theatrical and social rhythms.

Her connection to theater, however, predates Beijing. Imard describes a childhood spent around a suburban Paris theater where her father served as co-director.

"I was wandering around the empty theater, on stage, playing hide-and-seek under the bleachers with my brother, and bothering the lighting manager," the 26-year-old artist recalls. "It was like being home, with a huge family made up of different people."

She describes the theater as a "safe space" rather than a distant cultural institution. "If a play needed a child on stage, I was happy to play a small role," she says.

That continuity was disrupted during her studies at the Ecole Nationale Superieure des Beaux-Arts de Paris, when her father lost his position following a managerial transition at the theater. "I felt like part of my childhood was left there," she says.

To remain close to that world, she worked as an usher in a Paris theater while studying fine arts, dividing her days between painting and evening shifts. Later, she interned in stage painting at the Paris Opera, an experience that reshaped her understanding of artistic production.

"The purpose of stage painting is to make your individuality disappear," she says. "All the hands involved in a project must harmonize. It's a wonderful feeling to paint with other people."

Imard's first encounter with Peking Opera came through Chen Kaige's film *Farewell, My Concubine*. She later attended a live performance of *The Orphan of Zhao* in Paris, an experience she describes as formative.

"I was mesmerized by the singing, the costumes, the makeup — everything," she says.

When she arrived in Beijing for her residency, she had already prepared by reading extensively on Peking Opera. With support from Yishu 8, she also met performers and entered rehearsal and backstage spaces — access that became central to her work.

At a production of *Dabaoguo, Tan Huangling and Er Jingong* at the Mei Lanfang Theatre, she observed not only the stage performance but the backstage environment.

"I think there are not many differences between the backstage of the Paris Opera and the Mei Lanfang Theatre," she says. "Singers warming up, practicing tongue twisters, eating a quick snack before going on stage — the atmosphere is quite similar."

However, she was struck by one element unique to Peking Opera culture: the altar dedicated to Erlang Shen.

"I had read about it, but had never seen it," she says. "Seeing the respect performers show was very moving. There is no such thing in France."

These backstage observations now define the core of her painting practice.

At her Beijing studio, Imard presented portraits of performers from *Dabaoguo, Tan Huangling and Er Jingong*, depicted during the makeup application process.

"I hope people can see the actors behind their makeup — their humanity," she says. "At that moment, they are not their everyday selves, but not yet fully their characters either."

She is drawn to what she calls a "tension in identity". "There is vulnerability in this state," she says. "It is a very delicate moment. It moves me deeply."

In addition to the portraits, she is developing a large-scale painting of four performers waiting in the wings — fully costumed, poised before going on stage.

For Yishu 8 founder Christine Cayol, Imard's work echoes a European pictorial tradition while remaining grounded in lived observation. The dark, staged compositions suggest anticipation — "something about to happen", as she describes it.

Among the performers Imard has painted is Zhang Yandong, who portrays Yang Shixiang in the show. During an open day at the studio, he and fellow actor Song Ruoxuan performed selected vocal excerpts, offering visitors an encounter with the vocal traditions of Peking Opera without the costumes.

The residency has also deepened into personal exchanges. "There is great generosity in how people here share their culture," Imard says. "I have fallen in love with Beijing and its people."

As her time in the city draws to a close, she returns to a single question: "When will I be able to come back?"

LIFE

Thanks to technology, music is becoming easier to compose, but far harder to make memorable in an increasingly crowded marketplace, **Chen Nan** reports.

AI changes the score

Across China's music industry, artificial intelligence is no longer on the sidelines. It is shaping how songs are created, filtered, distributed, and valued.

That shift set the tone for the 11th Music Industry Forum in Beijing earlier this month, where researchers and industry leaders examined an industry expanding rapidly, but also reinventing itself at the same time.

The numbers remain strong. China's music industry generated 519 billion yuan ($76.64 billion) in gross revenue last year, up 5.3 percent year-on-year. But beneath those figures, a different story is unfolding: AI is not just speeding up production, it is changing the structure of music itself.

A separate industry report, White Paper on China's Digital Music Industry (2025), coproduced by Tencent Music Entertainment Group, TME Research Institute and the Digital Music Committee of the China Audio-Video and Digital Publishing Association, describes 2025 as a "year of acceleration". Not just in consumption, but in creation.

The data is striking. Tencent Music Entertainment Group's platforms now receive 107,000 new song uploads every day, up from 76,000 in 2024. By December 2025, AI-generated songs accounted for 36.2 percent of all new releases. On AI music platform Suno, users generate more than 7 million songs per day. Music creation is no longer scarce — it is abundant, continuous and increasingly automated.

Professional musicians, for the most part, have adapted. The report notes a shift from caution to adoption, with AI now widely used to generate lyric ideas, arrange drafts and assist production. Music is no longer created solely by humans or machines, but through collaboration between the two.

Yet, this explosion of content has not simply diluted music, it has reorganized attention.

Algorithms and short-video platforms now account for more than 80 percent of new music discovery. Increasingly, listeners are not searching for songs; songs are finding them.

As production becomes easier, value is shifting from making "more music" toward making "more meaningful music".

One of the report's most significant findings is the rise of "superfans". Listening has evolved beyond streaming into an expression of identity, participation and emotional connection. In China's digital music economy, these highly engaged users generate outsized value, spending far more than average listeners and driving demand for experience-based services rather than simple playback.

That reflects a broader global trend. Growth in traditional streaming is slowing as the industry shifts its focus from expansion to engagement. New users increasingly come from emerging markets, while future growth will depend less on scale than on the depth of audience relationships.

In China, that engagement is becoming both more intense and more global. The country became the world's fourth-largest recorded music market in 2025, according to the International Federation of the Phonographic Industry, the organization that represents the recording industry worldwide, with revenue rising 20.1 percent. Yet, per-user revenue remains well below that of mature markets, leaving considerable room for growth. At the same time, Chinese music is increasingly reaching overseas audiences through its distinct cultural identity rather than translation.

Soundtracks from games such as *Genshin Impact* and *Black Myth: Wukong*, along with viral rap tracks, are finding global audiences through platforms where rhythm, tone, and visual identity often matter as much as language.

Creativity meets machine

"Artificial intelligence is rapidly reshaping the music industry, but its impact goes far beyond faster production or lower costs. It is challenging a basic assumption: that music and art must be created by humans alone," says Li Xiaobing, professor and head of the department of music artificial intelligence and music information technology at the Central Conservatory of Music.

"For years, many believed machines could not create art because they lack emotion. But that view is now being questioned. We understand only a small part of the human brain," says Li. Advances in AI composition and voice synthesis have already produced music and singing that many listeners struggle to distinguish from human performances — and in some cases even find emotionally moving, he adds.

The impact is evident across the industry. AI can generate compositions in seconds that once took hours and reconstruct how musicians performed historical works through data analysis. Music education, performance and production are all being compressed into faster, more automated workflows.

Top: A view of the immersive cave experience hall at the digital entertainment zone during the 4th Global Digital Trade Expo in Hangzhou in September last year. The installation was part of a special interactive music exhibition jointly presented by Zhejiang Conservatory of Music and Dunhuang Cultural and Tourism Group. XU YU / XINHUA **Above:** Kaka in his Cashmere Studios. PROVIDED TO CHINA DAILY

But key questions remain unresolved — especially around copyright, originality, and ownership in a world where AI can generate vast amounts of music instantly, Li says.

AI is now embedded throughout the production process — from recording and arranging to demo creation — and is already replacing parts of traditional workflows, according to Guo Kun, deputy secretary-general of the China Audio-Video Copyright Association.

One of the biggest challenges, she says, is scale and transparency. Not all AI-generated music is identified as such, and some tracks are even presented as human-made. As a result, no precise figures exist, though industry estimates suggest platforms receive anywhere from 50,000 to 150,000 new AI-generated tracks every day, she points out.

Streaming services have developed their own settlement systems. While copyright issues remain unresolved, AI-generated music is already generating revenue. Some payments are treated as royalties, others as platform incentives. In many cases, the same rules apply whether AI is involved or not.

Industry observers note a clear divide between China and some overseas markets. "In many foreign markets, the attitude is more negative, and most AI music does not receive income or formal settlement," she says.

China's platform ecosystem, by contrast, is taking a more pragmatic approach. The key question is not whether AI was used, but whether the music attracts listeners and succeeds commercially. "If a piece of music sounds good and attracts listeners, it can generate income," she says.

Even so, industry data point to an important distinction. Fully AI-generated music rarely performs strongly on its own. Most commercially successful projects still involve human creators, shifting the debate from whether AI will replace musicians to how deeply it will become part of the creative process.

Regulation remains unsettled. "There is still no final legal judgment in this area," Guo says, pointing to the absence of binding case law on AI-generated music and copyright.

The human difference

But while AI is transforming the front end of music creation, its impact is not evenly distributed across the production chain.

In fact, one of the most striking effects of the AI boom is that not every role is disappearing. Some are proving remarkably resilient.

Mixing is one of them.

Mixing is the stage where vocals, instruments, and effects are balanced into a finished track. It is technical, but also deeply subjective. And that subjectivity is precisely what has made it resistant to automation.

The reason is partly economic. As AI reduces the cost of composing and arranging music, more production budgets are being redirected toward the final stages — where human judgment still carries the greatest value.

Cashmere Studios in Shanghai offers a glimpse into why.

For its founder, Kaka, mixing is less about engineering and more about taste.

"Clients don't come to a mixing engineer just for technical output," he says. "It's like asking a friend for fashion advice. You want aesthetic judgment, not a correct answer."

He argues that mixing resists automation because it depends on choices that are difficult to quantify: how warm a vocal should sound, how far an instrument should sit in the mix, or how emotionally a chorus should land.

There is also a structural reason AI struggles here. Much of professional mixing relies on proprietary tools, hardware-specific workflows, and tacit knowledge that is rarely documented. In industry terms, it is a "black box" process — difficult to capture, and even harder to train at scale.

While AI can now generate complete songs, it is still far less capable of finishing them.

This imbalance is shaping a broader reality across the industry: AI is not replacing music creation outright. It is removing the repetitive, standardized layers while increasing the value of judgment-heavy work.

That shift is already showing up in earnings.

Independent musicians report declining income from certain types of commercial work, especially functional music for advertisements, corporate events, and short-form video content. These are exactly the areas where AI performs best: fast, cheap, and "good enough".

One industry description captures this new aesthetic bluntly: AI-generated music often sounds like a "standard face" — technically correct, polished, but lacking identity.

At Cashmere Studios, Kaka has witnessed the shift firsthand. Corporate commissions have declined as companies increasingly generate music in-house using AI tools. Film and game studios, once reliable clients for licensed tracks and live recordings, are also experimenting with AI-generated demos before approaching human musicians.

"Before, they would buy music or hire musicians to test ideas," he says. "Now they often start with AI."

Still, the industry is not simply shrinking. It is splitting.

On one side, AI is rapidly absorbing functional, low-emotion content. On the other, demand is growing for work rooted in human interpretation, cultural understanding and emotional nuance.

The broader picture is not replacement, but rebalancing.

Even as production becomes more automated, the industry is becoming more dependent on human judgment.

That may be the AI era's greatest paradox: the easier it becomes to generate music, the harder it becomes to create something truly worth listening to.

Beloved dumplings reveal links across the Silk Road

ANKARA — On a busy afternoon in central Ankara, capital of Turkiye, steaming plates of *manti*, the beloved Turkish dumpling, arrive one after another at Maharet Manti, a restaurant dedicated to a dish generations of Turks have grown up eating.

At one table, diners savor tiny Kayseri-style *manti* drenched in garlic yogurt and butter sauce. For restaurant owner Nurcan Sertakan, *manti* tells a story that extends far beyond the dining table.

"When we researched its history, we found different accounts, but the most widely accepted one points to China and its spread through the Silk Road," says Sertakan.

She gestures toward plates featuring dumplings from various countries, part of the restaurant's effort to introduce customers to the global family of dishes linked by a shared culinary heritage.

"What fascinates us is that the essence never really changes," she says. "You take dough and fill it with meat, vegetables, or other ingredients. The form changes, the size changes, but the idea remains the same."

Food historians say Turkish *manti* belongs to a vast network of dumpling traditions stretching from East Asia to Anatolia. Along the ancient Silk Road, merchants, travelers and nomadic peoples carried not only goods but also recipes and cooking techniques across thousands of kilometers, they say.

Left: A customer enjoys Turkish dumplings, known locally as *manti*, at a restaurant in Ankara, Turkiye, on June 12. **Right:** Chefs prepare *manti*, the traditional Turkish dumpling dish, in Ankara. PHOTOS BY XINHUA

"The connection between Turkish *manti* and Chinese dumplings is striking," says Turkish gastronomy expert Aylin Oney Tan.

"One of the most significant foods shared across the Silk Road is the dumpling. These dishes reveal a common culinary past and demonstrate remarkable similarities despite the great distances between them," she says.

Tan says many etymological studies trace the word *manti* to the Chinese term *mantou*, often referred to as a Chinese steamed bun, while others point to Mongolian influences that helped spread dumpling traditions westward.

At Maharet Manti, Sertakan sees those connections come to life every day. The restaurant regularly welcomes visitors from China and other East Asian countries, many of whom are intrigued by Turkiye's version of a familiar dish.

"Our Chinese guests are very curious about Turkish *manti*," she says.

"As dumplings traveled west along the Silk Road, their form evolved," Sertakan says. "The larger dumplings common in parts of East Asia gradually became smaller in Anatolia. The appearance changed according to local tastes, but the essence remained the same."

For Sertakan, the story of *manti* also illustrates the broader cultural significance of the Silk Road. "It didn't just transport goods. It carried cultures. Food is culture, and it travels together with people," she says.

Among those enjoying that heritage is 25-year-old Irem Aydin, who sampled Uzbek-style *manti* during a recent visit.

Like many Turks, Aydin associates *manti* with childhood memories and family traditions.

"It has always been one of our favorite foods," she says. "It's a dish our grandmothers used to make, so it has a special place in our culture."

Trying different varieties has made her appreciate how a single concept can take many forms across countries.

"When you look closely, it's often the same ingredients presented differently. There is craftsmanship involved," she says.

For Tan, the enduring popularity of dumplings across Asia highlights a deeper historical connection between cultures often perceived as far apart.

"I see Chinese and Turkish food cultures as two sisters that have lost touch," she says. "One developed on the eastern edge of Asia and the other on the western edge. Yet, when you compare their foods, you can still see traces of a shared past."

DR Congo writes itself a new World Cup chapter

ATLANTA — For 52 years, the Democratic Republic of the Congo's standout World Cup memory was a humiliating 9-0 rout at the hands of the former Yugoslavia during its only previous appearance at soccer's global showpiece.

Not anymore.

Not after a new generation of players made history by advancing DR Congo to the knockout stage of the World Cup for the first time, and setting up a round-of-32 clash with one of the pre-tournament favorites and 1966 champion England.

"The weight on our shoulders was hard to bear," said striker Yoane Wissa, whose two goals helped DR Congo rally to a 3-1 win over Uzbekistan on Saturday night.

Wissa said he would dedicate his brace to those suffering back home from years of wars.

"We are a proud country. We are proud people. We love our country. We love our national team. We love what we represent!" Wissa told reporters.

"I think, tonight, we just showed what it means for us, and just to fight, no matter what.

"It's not easy in our country. There's a war in east Congo. Every day, every time we wear this shirt, we think about them.

"That's why tonight, what we showed says that 'guys, no matter what, we need to keep going'.

"Because we want peace, and to (the supporters), I just say 'thank you'. Thank you because we came from far. We came from nothing to be here. Now, we write our story with a black pen, and we need to be proud."

Fiston Mayele was also on target in a dramatic second-half comeback. "We told ourselves we can't give up," Mayele said.

Alongside Cape Verde, DR Congo has been one of the surprise stories of this World Cup, with few expecting it to emerge from a group that included Cristiano Ronaldo's Portugal and Colombia. And history was hardly on its side.

Congo's previous appearance, when it competed as Zaire, was in 1974, when it lost all three games, including the rout by Yugoslavia.

It's a completely different story now.

After holding Ronaldo and Portugal to a surprise 1-1 draw earlier in the tournament, DR Congo needed a win in its final Group K game to advance as one of the best third-placed teams.

And it did just that, with a breathless fightback after trailing to Eldor Shomurodov's lobbed goal in the 10th minute.

"We're a team that knows how to respond when we concede a goal; we keep fighting with determination," coach Sebastien Desabre said.

If the weight of the occasion was evident in DR Congo's first-half performance, the resilience of its players proved irresistible after the break.

The game was level in the 68th when Wissa was brought down in the box by Abdukodir Khusanov for a penalty.

Wissa picked himself up and sent Uzbekistan goalkeeper Abduvohid Nematov the wrong way, rolling the ball into the bottom corner for the first of a late flurry of goals.

Mayele put Congo ahead 10 minutes later when flicking past Nematov at the near post and was mobbed by his teammates, including the substitutes, who raced off the bench and across the field to join in the wild celebrations.

There were even more joyous scenes when Wissa put the result beyond any doubt in added time with a curling shot into the bottom corner.

Fans continued celebrating long after the final whistle, singing and dancing in the stadium concourses, the memories of 1974's humiliation long forgotten.

"We're going to savor this moment because it's been tough," said Wissa. "All the guys — the substitutes, those who've worn the jersey before, and those who'll wear it tomorrow — we should be proud. Thank you to all the Congolese people; it's for moments like these that we do what we do. We did it!"

DR Congo became the eighth African nation to advance from the group stage at this tournament.

"It's quite an achievement. We showed a good image of Congo," said Desabre.

Uzbekistan's debut at the World Cup ended in three straight defeats.

"This tournament will give us a lot of experience. I hope that experience will give us more motivation for the future," said the team's Italian coach Fabio Cannavaro.

Algerian fans celebrate their progression to the knockout stages of the World Cup following Saturday's dramatic 3-3 draw with Austria in Kansas City. **Inset:** Egypt's Mohamed Salah (10) consoles Iran's Ramin Rezaeian (23) after their 1-1 draw on Friday in Seattle. REUTERS

Late goal rush sees Austria, Algeria advance

Stoppage time thriller finishes 3-3, but result means heartbreak for Iran

Algeria and Austria knew that a pedestrian draw on Saturday night would have sent both to the knockout round of the World Cup.

They delivered a six-goal thriller instead.

In the wildest finish of the group stage, Algeria took the lead in stoppage time only for Austria to answer in the final seconds of the match, making it 3-3 at the final whistle.

It was a win-win result for both teams, but a heartbreaking one for Iran, which was eliminated from the tournament.

"I've been a coach for about 40 years. I don't remember a game that had such a dramatic course, and such an unexpected trajectory," Austria coach Ralf Rangnick said, shaking his head.

"Even at the beginning of the match, if someone would have said it would be 3-3, nobody would have believed it. Somebody would have won an incredible bet, I guess."

Austria struck first when Marko Arnautovic perfectly timed a run between two Algerian defenders, found himself one-on-one with goalkeeper Oussama Benbot, and overcame a stumble to score his record-extending 49th career goal for his nation.

Algeria answered just before halftime, when Rafik Belghali's left-footed shot easily beat Austrian goalkeeper Alexander Schlager.

The frenetic pace continued early in the second half on a hot night in Kansas City, where many of the locals appeared to be rooting for Algeria, which made its training base in the nearby town of Lawrence and has struck up a unique friendship with the residents.

Not content with a 1-1 draw, Austria's Konrad Laimer sent a sharp pass across the field that Marcel Sabitzer finished to regain the lead — and give Iran some hope — only for Algeria to answer minutes later, when Riyad Mahrez scored off a perfect cross from Houssem Aouar.

The game was tied at two goals apiece in the closing minutes, and Algeria looked as if it was content to run out the clock and allow both teams to advance, when Mahrez, who obviously hadn't read the script, scored his second goal of the game.

That put Austria on the verge of elimination, only for Sasa Kalajdzic to head in the equalizer just a minute later, rescuing his team's World Cup hopes and devastating Iran's hopes of advancing.

"The locker room is madness," Rangnick said with a smile.

"If Alfred Hitchcock — who had nothing to do with soccer, didn't really like soccer — if he had written such a drama, I would have said he was completely mad."

"I think the match was a little crazy. It sort of went beyond the limits of everyone's endurance," said Algeria coach Vladimir Petkovic.

"Let's celebrate our promotion, so to speak, let's rest and then we will begin again for the next round."

Iran would've advanced as one of the eight best third-placed teams had Austria or Algeria won, but when Kalajdzic scored in stoppage time to tie the game one last time, it signaled the end of a grueling tournament for the Iranians.

"When you have 3-3, nobody can assume that it was an agreement (to tie) or anything like that," Rangnick said, perhaps referencing the infamous "Disgrace of Gijon" that occurred during the 1982 tournament in Spain, when Austria and then West Germany were widely accused of fixing the result of their final group game so both sides would advance, ironically, at the expense of Algeria.

Germany scored early on in that game, and both teams then proceeded to play keep-ball in their respective backfields until the final whistle.

While it was never officially proven that there was any nefarious agreement, it prompted FIFA to introduce simultaneous kickoffs for the final group matches at every World Cup.

The newly expanded 48-team format, however, has raised concerns of a possible repeat of that ignominious day, with some teams in the final round of group games, such as Austria and Algeria, once again knowing what results would secure a knockout place.

There is no doubt, though, that there were plenty of longtime Algeria supporters who had been waiting 44 years for some World Cup revenge against Austria, and Mahrez came agonizingly close to delivering it for them.

Their disappointment would have been one last painful moment for Iran in a World Cup that's been tumultuous, on and off the pitch.

The team has been playing at the same time as Tehran negotiates with Washington on terms of a deal meant to permanently end the ongoing conflict instigated by United States and Israeli air strikes on Iran earlier this year.

During the World Cup, Iran coach Amir Ghalenoei and players complained about numerous complications, including travel restrictions, visa denials for support staff and forced immediate departures from the US after matches.

US officials have said all such restrictions were known before the tournament.

After Iran was eliminated Saturday night, the team sent a statement expressing "heartfelt appreciation to the wonderful people of Mexico, especially the beautiful city of Tijuana," where its base camp was located after being forced to change its original plans to stay in the US.

"Leaving Tijuana is truly difficult for all of us," the statement said.

For the first two matches, near Los Angeles, the team was not permitted to travel until the day before and had to return to Mexico immediately after each game.

"We were treated very, very badly," Ghalenoei said after Friday's draw with Egypt left the Iranians clinging to hope they would get to the next round.

"I hope the world becomes aware of these issues.

"What these young Iranian national team players have done should be recorded in history," Ghalenoei said.

"Why? Because the host treated us in the worst possible way."

Austria, which finished second behind Argentina in Group J to advance for the first time since that fateful game in 1982, is rewarded with a match against European champion and one of the tournament favorites Spain in Los Angeles.

Meanwhile, Algeria will face Switzerland in Vancouver, Canada.

Both games are set to be played on Thursday.

More records tumble, as Messi posts longest tournament scoring streak

ARLINGTON, Texas — As a second-half substitute, Lionel Messi didn't have much time to try to become the first to score in seven consecutive World Cup games.

But, to nobody's surprise, Argentina's superstar did it anyway.

Messi made it seven straight while extending the all-time men's World Cup scoring record with his 19th goal in Argentina's 3-1 victory over Jordan in their group stage finale on Saturday night.

In his first match since turning 39 three days earlier, Messi scored from a freekick after being taken down just outside the penalty box in the 80th minute. The low drive, barely above the grass, split two Jordan defenders and powered into the left corner of the net.

It was his 72nd career goal from a freekick, including his 12th for Argentina. Messi now has 123 international goals — second only to Cristiano Ronaldo's all-time leading 145 — in 202 appearances.

Messi had been one of only three players to score in six consecutive World Cup games along with France striker Just Fontaine and Brazil great Jairzinho.

Messi also joined Brazilian greats Pele and Rivellino, Peru's Teofilo Cubillas, France's Bernard Genghini and England's David Beckham to have scored two World Cup goals directly from freekicks, at least, since such records started being kept in 1966.

"I am very happy for him, for the moment he is having," Giovani Lo Celso said after becoming the first Argentine other than Messi to score in this tournament so far, also from a freekick in the 19th minute.

"The truth is that seeing him every day excites, and is infectious. So, obviously, seeing him like that, for us, is very important."

Messi didn't start because Argentina had already clinched first place in Group J, and the game had become somewhat of dead rubber, with Jordan already eliminated.

Nevertheless, the decidedly pro-Argentina crowd of 70,649 at the home of the NFL's Dallas Cowboys was eager to see Messi.

Fans started chanting his name as soon as the second half started, and cheered loudly when he came off the bench to go through his warm-up.

The roar was louder when he stepped onto the field in the 60th minute, replacing Lautaro Martinez, who scored from the penalty spot in the first half.

For all the accomplishments of the eight-time Ballon d'Or winner, Messi has never won the World Cup's Golden Boot. Maybe he'll manage on his sixth attempt. He now has six goals in this tournament, two clear of France's Kylian Mbappe, Brazil's Vinicius Junior and Norway's Erling Haaland.

Argentina will now look toward its round-of-32 fixture on Friday in Miami, where it will help to write the next chapter in World Cup debutant Cape Verde's fairytale run.

Xi highlights strong ties with Belarus

President says the two countries are true friends, good partners

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

President Xi Jinping said on Monday that China and Belarus should maintain strategic communication and promote the continuous advancement of bilateral relations at a high level to better benefit the two peoples.

Xi made the remarks during a meeting with Belarusian President Alexander Lukashenko at the Diaoyutai State Guesthouse in Beijing.

Xi described China and Belarus as true friends who trust and support each other, good partners in shared development and prosperity, and all-weather comprehensive strategic partners, saying that the relationship between the two countries has withstood the test of changes in the international landscape and has achieved leapfrog development in recent years, entering its best period in history.

He noted that political mutual trust between the two countries is rock solid, high-quality Belt and Road cooperation has yielded fruitful results, the two sides have made tangible progress in key cooperation projects, and their multilateral collaboration is effective.

Facts have proven that deepening all-weather, all-around cooperation between China and Belarus aligns with the trend of the times and serves the fundamental interests of the two peoples, he said.

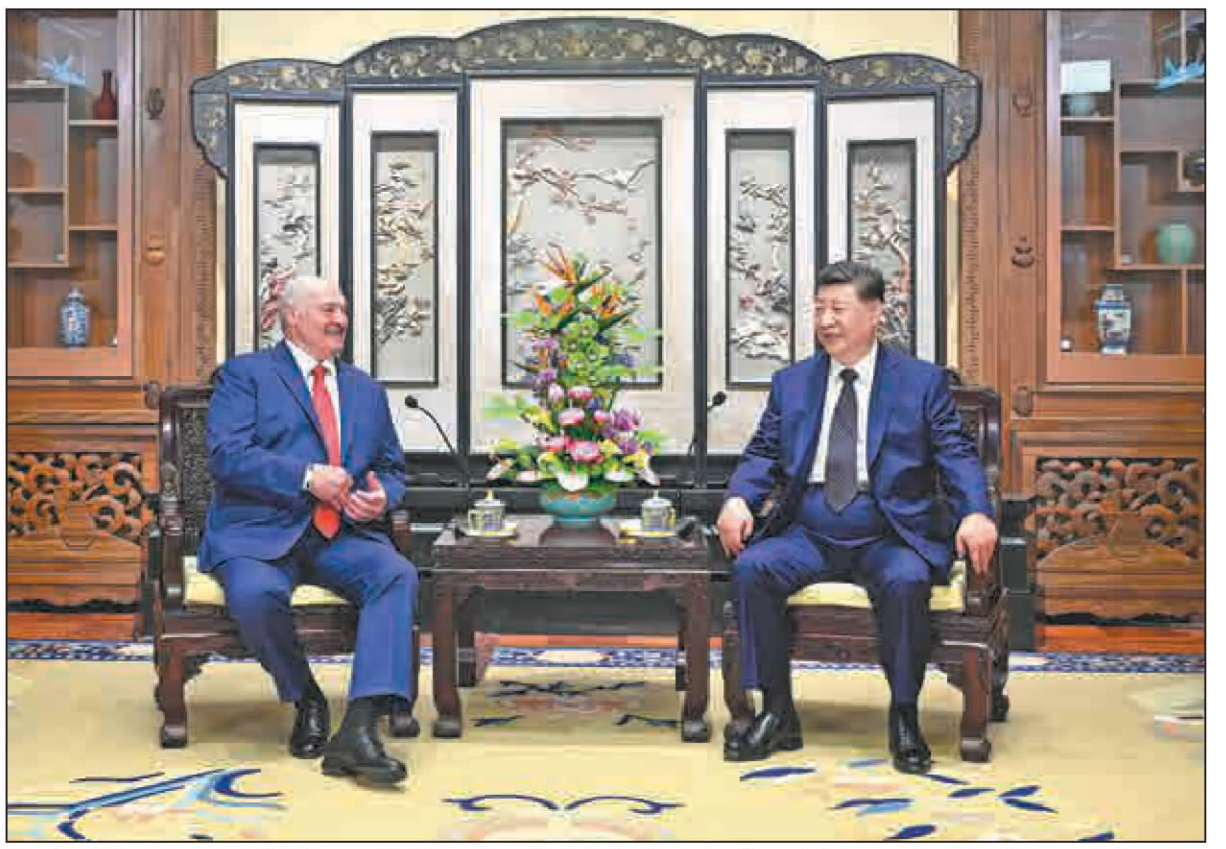
Xi emphasized that China supports Belarus in safeguarding its national sovereignty, independence and territorial integrity, and in pursuing a development path suited to its own national conditions. The nation is willing to continue offering assistance within its capacity for the development of Belarus, he added.

He called on both countries to mobilize resources in all sectors to advance Belt and Road cooperation and enrich the content of their pragmatic cooperation.

China is willing to work with Belarus to jointly build a community with a shared future for humanity, implement the four major global initiatives, and strengthen coordination and cooperation within multilateral mechanisms, such as the United Nations and the Shanghai Cooperation Organization, to serve as a stabilizing force in a turbulent world, Xi said.

Lukashenko, who is making his 17th visit to China since he became the president of Belarus, said that he totally agrees with Xi on the latter's remarks about bilateral ties. China is an all-weather comprehensive strategic partner for Belarus, and the comprehensive and deep cooperation between the two countries provides significant support for the economic and social development of Belarus, he said.

Lukashenko said that Belarus attaches great importance to its relationship with China, and looks forward to strengthening strategic communication, expanding areas of cooperation and achieving greater development in bilateral relations.



He hailed the four major global initiatives proposed by Xi, saying that these help to promote the political resolution of hot spot issues and make significant contributions to world peace, stability and prosperity.

Belarus is willing to continue maintaining close coordination with China on international and regional affairs, and jointly promote regional and global peace, development and stability, he said.

The China-Belarus Industrial Park, located 25 kilometers from Minsk, the Belarusian capital, has become a landmark project for mutually beneficial cooperation.

China has become the second-largest trading partner of Belarus and its largest trading partner in Asia.

Data from the General Administration of Customs shows that the trade value between China and Belarus in 2025 was $8.86 billion, up 5.5 percent year-on-year.

Nation adds 20 Japanese entities to its export control list

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China placed 20 Japanese entities on a control list with absolute export prohibition on Monday, while adding 20 others to a watch list with enhanced scrutiny, a move that experts said would ratchet up pressure on Tokyo to abandon its remilitarization and nuclear ambitions, and would help safeguard regional peace.

Inside
Editorial, **page 6**

According to the Chinese Ministry of Commerce, the 20 entities on the control list, including Japan's National Institute for Defense Studies and several Mitsubishi-affiliated defense contractors, now face a blanket ban on the export of all dual-use items — goods and technologies that have both civilian and military applications. The ban also applies to foreign organizations and individuals seeking to transfer or supply Chinese-origin dual-use items to these entities.

The 20 other Japanese entities on a separate watch list, including Mitsui E&S Co, face stricter licensing requirements and enhanced end-user reviews on any dual-use item exports. The review period is not bound by the standard statutory deadline of 45 working days as stipulated in related regulations on export control of dual-use items.

Monday's announcement follows an initial round of export controls imposed in February on 40 Japanese entities.

A spokesperson for the Ministry of Commerce said the measures are "completely justified, reasonable and lawful", and are aimed at "curbing Japan's attempts at remilitarization and possession of nuclear weapons".

"Regrettably, over time, Japan has shown no signs of repentance, but has instead gone further down the wrong path, accelerating its new militarism and remilitarization," the spokesperson added.

Public broadcaster NHK reported on Monday that the Japan Ground Self-Defense Force has deployed a surface-to-ship missile launcher on Minamitorishima, the country's easternmost Pacific outpost. The report said this is the first time such weaponry has been stationed on the remote island.

Ties between Beijing and Tokyo have been tense since late last year when Japanese Prime Minister Sanae Takaichi implied that Japan might have to intervene militarily in the Taiwan Strait, and she refused to retract her erroneous remarks.

MUSEUM OFFERS VISITORS A BROLLY GOOD TIME

Traditional art of West Lake silk umbrella making gains a new generation of fans

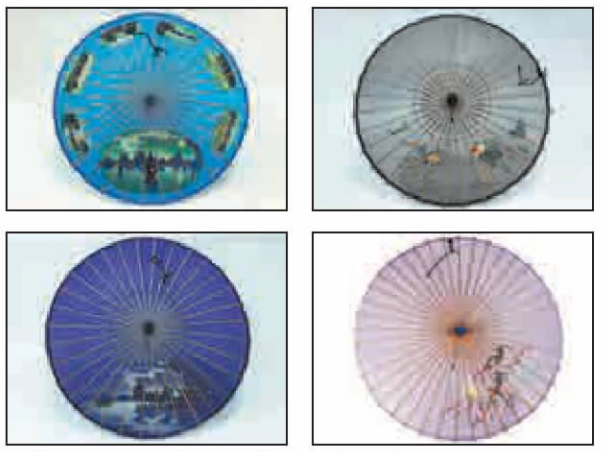
By **MENG WENJIE**
mengwenjie@i21st.cn

In mid-May, 31-year-old Russian student Daria Dykusar stood in the experience area of the China Umbrella Museum in Hangzhou, Zhejiang province, holding a toothbrush.

Before her were stencil plates, fine mesh screens, pigments and a paper postcard. Using the brush, she gently applied pigment to the postcard. It filtered through the mesh like a fine mist, gradually creating the soft, rain-washed effect that is characteristic of many scenes depicted on West Lake silk umbrellas.

"At first, it looked easy," she said. "But once I started, I realized it wasn't. You need exactly the right amount of pigment — otherwise, you can ruin the whole picture."

The technique is a signature decorative method used in West Lake silk umbrella making, a craft that has been on China's national intangible cultural heritage list since 2008.



Dykusar, who holds a master's degree in mechanics and mathematics from Lomonosov Moscow State University, is now studying Chinese at Zhejiang Business College. She joined 12 fellow international students on a visit to the museum to experience the artistry behind the iconic Hangzhou parasols.

After nearly two hours of careful work, she completed a design featuring *Duanqiao canxue*, or lingering snow on Broken Bridge, one of West Lake's best-known scenic spots.

"I got paint everywhere — on my clothes, my hands and even in my hair," she said with a laugh. "It requires tremendous patience and attention to detail."

Before visiting the China Umbrella Museum in Hangzhou, Dykusar had seen many examples of silk umbrellas online, often carried by women wearing traditional Chinese attire. Yet, it was only after trying the design process herself that she fully appreciated the skill involved.

"The first time I saw a silk umbrella, I thought it was beautiful," she said. "But when I tried creating one, I realized how much work goes into it. Looking at the finished product alone, you would never imagine the effort behind it."

Making West Lake-themed silk umbrellas in Hangzhou, Zhejiang province, is a craft that was added to China's national intangible cultural heritage list in 2008. PHOTOS PROVIDED TO CHINA DAILY

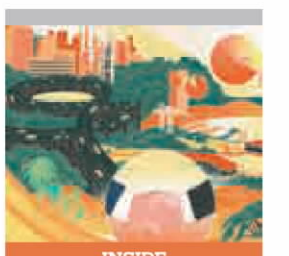
105 years of commitment to China's development

WORLD WATCH
By Alessandro Golombiewski Teixeira

As the Communist Party of China marks its 105th anniversary, it should be seen not merely as the governing party of the People's Republic of China, but also as the principal architect of the country's extraordinary development and modernization.

Few political organizations in modern history have had such a profound and sustained influence over such a massive population. Fewer still can claim responsibility for a transformation of such a vast scale and intricate complexity. A country once plagued by warlordism, foreign invasions and endemic poverty, China has risen to become the world's second-largest economy, a manufacturing powerhouse, a technological titan and a global heavyweight.

China's current stature is attributed to the CPC's ability to set ambitious national goals, define long-term strategic priorities and coordinate State agencies to execute them with discipline and efficiency.



The Party's initial triumph was political. In the turbulent decades following the collapse of the Qing Dynasty (1644-1911), China was internally divided, institutionally fragile and vulnerable to external domination. The CPC emerged as a revolutionary force that not only promised national revival and restoration of sovereignty, but also a deep social transformation. Its victory in the War of Liberation and the establishment of the People's Republic of China in 1949 laid the foundation for a unified nation.

The CPC's enduring strength lies not only in its revolutionary origins, but also in its remarkable capacity for ideological and organizational adaptation. The Mao Zedong era established a sound institutional framework for the Party and laid critical foundations in areas such as public health and basic literacy.

The launch of reform and opening-up in 1978 was pivotal for China. While retaining its central political role, the Party anchored its legitimacy in tangible outcomes: rapid economic growth, social stability and steady improvements in people's living standards.

This pragmatic approach distinguished the CPC from many other communist parties. Rather than resorting to abrupt liberalization or "shock therapy" that led to institutional collapse elsewhere, China pursued reform slowly and carefully. The Party experimented with policy innovations in pilot special economic zones before scaling up successful initiatives. Measures such as agricultural de-collectivization and dual-track pricing expanded the scope for market mechanisms while preserving the government's guiding role.

CPC 105TH ANNIVERSARY

Left: Fan Tianqian, secretary of a Party branch in the Jiangsu Road neighborhood, gives a piano lesson at a local community senior college in Shanghai on June 5.

Vibrant Shanghai hums with Party innovators' energy

Birthplace of CPC flourishes with fresh ideas for growth, promoting new economy

A young docent tells the history of the Communist Party of China to younger children during their visit to the Memorial Hall of the First National Congress of the CPC on June 7.
PHOTOS BY GAO ERQIANG / CHINA DAILY

Editor's note: *To mark the 105th anniversary of the founding of the Communist Party of China on July 1, China Daily talked to four individuals and groups active in Party building in Shanghai, the birthplace of the CPC. The four are revitalizing grassroots Party building, and coming up with innovative ways to add fresh vibrancy to the city.*

By XU XIAOMIN and **ZHOU WENTING** in Shanghai

Coffee bean queen

Li Binbin's job is probably the envy of many people.

Every day, she walks over 10,000 steps around Shanghai's picturesque downtown plane tree area, centered around the iconic Wukang Building, visiting coffee shops that emit enticing aromas.

The 44-year-old is the Party secretary of the coffee industry branch in Xuhui district's Tianping subdistrict, home to one of the highest densities of coffee shops in the city.

In April 2024, the subdistrict launched an initiative to support the entrepreneurial dreams of returning overseas students and boost commercial coffee ventures. Li is responsible for liaising with 150 coffee shops spread across the 2.68-square-kilometer area, addressing their needs, and helping foster a vibrant coffee culture.

"I was originally a tea drinker, but I pushed myself to become a coffee expert to better connect with shop owners," said Li.

Before, the coffee shop owners had to navigate issues like power outages, water leaks, and equipment approvals on their own, dealing with various administrative departments. Now, the Party branch serves as a one-stop service center, efficiently resolving issues.

Yan Yafen, who runs BPC Coffee on Yongjia Road, said Li had helped her numerous times. During a typhoon last summer, for instance, her shop's sign was waterlogged. Li promptly arranged for repairs to keep the sign illuminated.

The Party branch's efforts have increased trust, encouraging more coffee shops to open in the area. Existing stores are expanding, and new ones are moving in. Li said the number of coffee shops before the Party branch's inception was 135. Now it has stayed at 150 for more than half a year.

While prioritizing political leadership and service cohesion, Li said she is also thinking of ideas to help the coffee shops attract more customers, turning "city walks" into "city shopping".

Ahead of the recent May Day holiday, the Party branch collaborated with the district's cultural and tourism bureau to partner with the influential restaurant review platform Dazhong Dianping. They launched a "spring coffee culture map" promoting three routes, which attracted over 100,000 page views.

This positive impact has led to thriving businesses giving back to the community. "For instance, they took the initiative to fulfill small wishes of disadvantaged groups, buying new backpacks for children, and installing water heaters for the elderly in winter," Li said.

Inspired by Li's positive energy and reminded of her grandmother, a veteran Party member in her hometown in rural Hefei city, Anhui province, Chen Xiaohong, head chef at a cafe, decided to join the Party.

Chen, 42, said she used to independently organize charitable activities, like delivering mung bean soup to elderly neighbors in summer.

"With Li working here, we find more meaning in such activities. As members of society, we should actively participate in these small, heartwarming deeds, and I genuinely love this community," she said.

Piano teacher creates harmony

Fan Tianqian, a piano teacher whose students range in age from 3 to over 70, has been making waves not only in music education but also in community management.

Fan, 30, opened her piano studio on vibrant and historic Yuyuan Road in downtown Changning district in 2021, bringing music tutoring to a street known for its youthful energy.

In 2024, Fan took on a new role as the secretary of a Party branch in the Jiangsu Road neighborhood. Such branches were established to extend the Party's influence into new economy sectors, connecting community resources to invigorate the neighborhood and strengthen grassroots Party organizations.

Fan's area of responsibility includes over 80 small businesses along the street, ranging from restaurants and trendy fashion boutiques to creative crafts and pet-related enterprises. She visits each shop to meet the owners and understand their needs, offering genuine assistance and suggesting improvements.

For instance, a bookstore located on the second floor of a building asked for more street-level displays to attract foot traffic. Another business wanted better integration into the neighborhood's promotional activities to increase brand visibility.

"Proactive connections and exploration of needs are crucial for startups and individual entrepreneurs. They can determine whether they survive the tough early stages and enter a positive growth cycle," said Fan.

That same year, she attended a city-level meeting where she realized the potential for having an even bigger impact. The discussion emphasized that Party-building efforts in new economy fields required both outreach and attraction. Fan knew she needed to use her expertise to draw people in.

Yuyuan Road and its lanes are home to a high concentration of young, dynamic individuals, much like Fan herself. With her background in music, Fan organized art activities that resonated with the character of the neighborhood.

She has helped organize several community events, including piano flash mobs, which have strengthened the bonds between shop owners and drawn more visitors to the area.

Last fall, Fan launched a music course at a local community senior college, teaching retirees to play the piano and perform well-known revolutionary songs. "I love seeing seniors leading fulfilling lives post-retirement. It's truly inspiring," she said.

Reflecting on her experience as a Party branch secretary, Fan believes she herself has been the greatest beneficiary.

"I no longer feel the loneliness I once did. I've transformed from a small business owner into someone with a strong sense of belonging to this community. Being involved in its governance has changed my perspective entirely. Walking down this street every day now feels completely different," she said.

Delivering for colleagues

After 12 years in Shanghai's food delivery industry, Song Zengguang has advanced from being a delivery rider to a prominent team leader and mentor.

He is now a trainer, overseeing thousands of food delivery riders working with Alibaba's online marketplace Taobao. Song attributes his success to a positive mindset and the ability to balance work and life pressures.

"Being a delivery rider is tough work, dealing with all kinds of weather, from scorching heat to freezing cold. But from another perspective, we interact with so many people every day, and through simple actions like wishing someone an enjoyable meal, we can pass on positive energy to others, and we, in turn, receive encouraging feedback," said Song, 42, who is based in Shanghai's Putuo district and is originally from Lianyungang, Jiangsu province.

As an instructor, Song emphasizes safety and service while also sharing insights on remaining positive and overcoming challenges.

"Everyone has dreams of a better life when they first enter society. There will inevitably be pressures and anxieties at work. Remembering our original intentions helps keep us on track," he said, adding that his original goal was to create a stable and pleasant life with his wife.

Song's influence extends beyond training. He has inspired many apprentices, some of whom have become key figures at their workstations, while others have applied to join the Communist Party of China. "I believe that as more delivery riders join the Party, this community will continue to improve," he said.

Song Zengguang, a Party member and a trainer overseeing food delivery riders, walks out of a Taobao Flash Sale workstation in Putuo district on June 6.

> "I no longer feel the loneliness I once did. I've transformed from a small business owner into someone with a strong sense of belonging to this community. Being involved in its governance has changed my perspective entirely. Walking down this street every day now feels completely different."
>
> **Fan Tianqian,** piano teacher and secretary of a Party branch

In addition to his work duties, Song sometimes represents the delivery industry at government-led meetings, advocating for employee rights. He has highlighted issues like the lack of continuous non-motor vehicle lanes, which complicates delivery routes, and the problem of malicious order cancellations, which can leave riders covering meal costs that sometimes exceed a day's earnings.

As a Party member, Song is committed to giving back to society. Motivated by him, dozens of delivery riders have formed a volunteer team, assisting elderly residents by purchasing groceries, delivering meals, and taking out trash during work breaks.

"Through such actions, I want my peers to realize that we delivery riders aren't just delivering meals. We have many meaningful things that we can do," said Song.

"Some people compare delivery riders and couriers to the faint lights of the city. When these lights come together, they can illuminate society," he said.

Little 'red megaphones'

For the past two decades, a unique tradition has thrived at the Memorial Hall of the First National Congress of the Communist Party of China in Shanghai. Over 1,000 children have taken turns serving as young docents, proudly known as the "red megaphones".

These children, who once listened to stories, have become storytellers themselves, sharing the CPC's history with visitors from across China and even around the world. Using their youthful voices and creative methods such as rhythmic storytelling and skits, they bring the founding stories of the Party to life in Mandarin, the Shanghai dialect, and English.

On the eve of International Children's Day, Xi Jinping, general secretary of the CPC Central Committee, replied in a letter to student docents at the memorial hall and the Nanhu Revolutionary Memorial Museum in Jiaxing, Zhejiang province. He encouraged them to carry forward revolutionary traditions, broaden their knowledge, develop their abilities, and strengthen their willpower and moral character.

The children participating in the Shanghai program come from Luwan No 1 Central Primary School in Huangpu district, where learning the docent script is a compulsory part of the curriculum that starts in first grade.

The idea to involve children as docents began simply.

Yang Yu, director of the memorial hall's publicity and education department, recalled discussing with the school's principal over 20 years ago the possibility of having children narrate the Party's history to their peers. The children crafted their own version of the script, filled with youthful narratives that visitors loved.

Xie Yiling has been telling the Party's story for four years and has conducted over 30 sessions. "When I was a first-grader, I listened to my seniors and felt their voices were so powerful. I thought, if they are the sparks, then I want to be a little flame," she said, adding that she has also guided foreign visitors, including some from the United States and Brazil.

Last year, the memorial hall received around 100,000 foreign visitors, setting a record.

Yang expressed hope that all visitors, whether domestic or international, leave inspired by the children's guide work. "The CPC's journey has not been without challenges, but the Party has always maintained a forward-looking spirit," she said.

Yang also noted that over two decades, successive generations of young people have not only told stories, but also carried forward a legacy of belief.

He Linjia, now 20 and a student at Shanghai Jiao Tong University School of Medicine, became a member of the "red megaphones" in the third grade. She credited the experience with planting a seed of responsibility and love in her heart.

Today, she is actively involved in volunteer activities, including participating in medical support for the Shanghai Marathon and engaging in environmental cleanup hikes.

China, EU see importance of dialogue

By ZHANG ZHOUXIANG
in Brussels
zhangzhouxiang@chinadaily.com.cn

The first meeting of the China-European Union trade and investment consultation mechanism was held in Brussels on Monday, with China's Minister of Commerce Wang Wentao and European Commissioner for Trade and Economic Security and Interinstitutional Relations and Transparency Maros Sefcovic leading the meeting. They agreed to establish a joint monitoring mechanism to exchange relevant data, monitor trade flows and support technical work with a view to improving transparency, enhancing mutual trust and managing trade frictions.

The meeting, held after months of intensive preparatory consultations, saw the two sides having noted the importance of addressing the challenges affecting the bilateral trade relationship and agreeing to seek practical solutions, with four initial workstreams under the consultation identified: trade and investment balancing, export controls, intellectual property rights and reform of the World Trade Organization, or WTO.

The two sides took note of positive results achieved to date by the EU-China Export Control Dialogue regarding rare earth elements and other critical materials and minerals, and they intend to strengthen dialogue in this field. They also underlined the necessity of strengthening bilateral cooperation in the WTO, advancing substantive progress on WTO reform, and improving the authority and effectiveness of the WTO.

Bernard Dewit, chairman of the Belgian-Chinese Chamber of Commerce, said that continued engagement between China and the EU creates opportunities to address concerns through dialogue, identify new areas of cooperation such as green transition, digitalization and advanced manufacturing, and strengthen mutual understanding.

"The global business community benefits when major economies choose cooperation over confrontation and work together to address common challenges in a pragmatic and predictable manner," he said.

Jian Junbo, director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, hopes that in their negotiations, the two sides can focus more on one another's concerns, arguing that such a dialogue can make meaningful progress only if both Brussels and Beijing show ample readiness to address each other's legitimate concerns, instead of echoing just one side's.

For European businesses, preserving communications has become more important than ever because both economies remain deeply intertwined, especially in the manufacturing, investment and technology sectors. Michael Schumann, chairman of the German Federal Association for Economic Development and Foreign Trade, said: "Europe cannot be (economically) independent from the United States, and it cannot be independent from China. Our economies, technologies, supply chains and security structures are far too deeply interconnected."

Schumann said enterprises can help to turn political consensus into broader cooperation practices via active business activities.

"Business cannot solve every political question, but business can keep doors open, create practical trust and show where interests overlap," he said. "Looking ahead, cooperation will remain essential in green energy, electric mobility, batteries, hydrogen, artificial intelligence, industrial automation, health technology, biotechnology, critical raw materials and modern infrastructure."

Wang and Sefcovic also agreed to meet again at the ministerial level in the fall. Schumann added: "I remain confident that, in the upcoming talks and negotiations, Europe and China can find constructive, balanced and mutually beneficial solutions – if both sides keep dialogue open, respect each other's legitimate interests and focus on what we can build together."

A moment of silence

People attend a vigil on Sunday outside a church for those who lost their lives in last week's earthquake, in Valencia, Venezuela. The death toll from the earthquakes stands at 1,450, Venezuelan authorities said. JUAN CARLOS HERNANDEZ / REUTERS

Revival: Museum develops creative products

From page 1

Located along the Beijing-Hangzhou Grand Canal, the museum is part of the Hangzhou Arts and Crafts Museum complex, which preserves and showcases the city's rich folk traditions and handicrafts.

Among its most prized exhibits are West Lake silk umbrellas. First created in 1932, they are made from locally sourced bamboo and Hangzhou silk, while scenes of West Lake and the surrounding landscape are delicately rendered through painting, embroidery and brush-dyeing.

"What makes these umbrellas unique is that when opened, they reveal an elegant silk canopy, but when folded, they resemble natural bamboo," said Song Zhiming, a national-level inheritor of the technique.

To achieve this effect, artisans carefully remove a thin outer layer of bamboo and label each strip before constructing the frame. Once the silk covering is installed on the bamboo ribs, each sliver is meticulously reattached, piece by piece, to its corresponding rib.

These handcrafted creations were once highly sought after both in China and overseas.

According to Chen Na, an associate research librarian at the museum, annual output exceeded 600,000 umbrellas in the late 1950s and early '60s, with about 400,000 exported overseas.

However, as lifestyles changed and demand declined, the number of artisans making the umbrellas gradually dwindled.

In recent years, renewed interest in intangible cultural heritage across China has helped revive the tradition, attracting growing attention from visitors at home and abroad.

"We want these cultural treasures to truly come alive," Chen said. "Preservation is important, but so is helping people connect with them in today's world."

To engage younger audiences, the museum has introduced mixed-reality experiences that allow visitors to create silk umbrellas in a virtual environment. It has also developed a range of cultural and creative products, including miniature umbrella phone stands and magnets.

The museum's efforts also resonated with 20-year-old Mohammed Salah Mosleh Al-Sayadi, a Yemeni student studying Chinese at Zhejiang Business College. Having lived in Egypt for eight years, he learned through visits to local museums that umbrellas also played a role in ancient Egyptian society.

"In ancient Egypt, umbrellas symbolized power and privilege, and were reserved for royalty," he said. "In China, however, I found that umbrellas carry many layers of cultural meaning."

Song is also embracing innovation. Today, both his son and daughter-in-law have joined the profession, bringing fresh ideas and new vitality to the age-old tradition.

His team is experimenting with new materials and production methods, while collaborating with gaming companies to incorporate popular animation and game characters into designs, making the umbrellas more appealing to younger consumers.

"Traditional craftsmanship needs new generations to carry it forward," Song said.

"But the soul of West Lake silk umbrellas — the dedication, patience and skill behind them — will never change."

List: Measures will not affect normal trade

From page 1

Cui Fan, a professor at the University of International Business and Economics in Beijing, noted that the listed entities are active in Japan's defense industry, manufacturing ships, fighter jets, missiles and other military equipment.

"By tightening controls, China aims to weaken Japan's military capabilities and create a deterrent," Cui said. "More important, it sends a clear warning to Japan that any action that damages China's core interests will come at a corresponding price."

The Commerce Ministry emphasized that the measures target only a small number of Japanese entities, apply solely to dual-use items, and will not affect normal economic and trade activities between China and Japan.

"Japanese entities that act in good faith and comply with the law have absolutely no cause for concern," the spokesperson said, urging Japan to sincerely reflect on the past, change its erroneous ways and return to the right track.

Political tensions between the two countries notwithstanding, the Japanese business community is seeking out alternative ways to stay connected.

Last week, the Japan Business Federation and other major economic groups from the country led delegations to Beijing to attend the fourth China International Supply Chain Expo.

Osamu Onodera, chief representative for China and Northeast Asia of the Japan External Trade Organization, said that Japanese companies want to maintain a healthy relationship with the Chinese business community during this "difficult period in bilateral relations".

Joint patrol with Russia highlights PLA's systematic combat deployment

By ZHAO LEI
zhaolei@chinadaily.com.cn

The recent joint patrol by the Chinese and Russian air forces demonstrated the improved capabilities of the People's Liberation Army Air Force in organizing sophisticated long-range operations that incorporate full combat elements, experts said.

Zhang Xuefeng, a military hardware observer and retired PLA Air Force officer, said that in recent years, the range of Chinese aircraft taking part in China-Russia joint strategic patrols has been steadily expanding, bolstered by improved performance and growing systemic operational capabilities.

Zhang said that the joint patrol on Saturday featured two major characteristics. First, it adopted systematic deployment of combat assets. Besides H-6K bombers and various escort fighter jets, the PLA Air Force deployed new large electronic warfare aircraft to deliver intelligence support, he added.

"The KJ-500A early-warning and control aircraft also took part in the operation, serving as an aerial command hub, while the YY-20A aerial refueling aircraft extended the flight radius of fighter jets and boosted their capacity to protect bombers," he said.

Second, the observer noted, the operation showed a high level of combat-oriented training.

"For example, escort fighters such as the J-16s carried live ammunition during the patrol. Electronic reconnaissance and jamming gear taken by the escort jets can effectively intercept foreign military radar signals for analysis and positioning, and can launch jamming operations in case of emergencies," Zhang added.

As part of the 11th joint strategic air patrol, aircraft from the two air forces flew over the Sea of Japan, the East China Sea and the western part of the Pacific Ocean.

The operation demonstrated the two sides' determination and capability to jointly safeguard regional peace and stability, the PLA Air Force said in a brief statement.

The PLA Air Force sent several types of aircraft, including the J-10C fighter jet, YY-20A refueling tanker, KJ-500A early-warning and control aircraft, and H-6K bomber, while Russia deployed its Tu-95 strategic bombers, Su-35 fighters and other planes.

Wu Peixin, an aviation industry observer, said the advanced tactical and strategic electronic warfare jets participating in the operation are capable of conducting electronic suppression against enemy ground targets, most notably radar systems and air-defense missile installations.

"When required, they can launch anti-radiation missiles to strike high-threat air defense positions, creating a relatively secure environment for strategic bombers to conduct precision strikes against deep enemy targets," he said, noting that the deployment of the KJ-500A also marks a key highlight of the joint patrol.

Aircraft take part in a China-Russia joint strategic air patrol on Saturday. The two countries carried out their 11th joint air patrol over the Sea of Japan, the East China Sea and the western Pacific Ocean. XINHUA

"Currently the world's best medium-sized early-warning and control aircraft, the KJ-500A is fitted with a state-of-the-art digital array radar whose scanning is fully computer-controlled. Lighter in weight, equipped with more transmit/receive modules and boasting a longer detection range, the radar can effectively counter stealth targets and small low-altitude targets," Wu said.

Institution: History is a story of continual reinvention

From page 1

The result is a "socialist market economy with Chinese characteristics" where State-owned enterprises play key roles in strategic sectors and the financial system, while private enterprises and foreign capital operate within a State-guided macroeconomic framework.

Consistent with the Confucian emphasis on *fu min* ("enriching the people") and good governance, these companies are permitted to pursue profit and enjoy considerable operational autonomy while also being expected to align their activities with broader developmental objectives such as employment generation, technological self-reliance and social stability. They represent a pragmatic synthesis of market dynamism and State guidance.

The scale of this hybrid model is noteworthy. China's private sector now accounts for more than half of national tax revenues, approximately 60 percent of GDP, roughly 70 percent of technological innovation outputs, and about 80 percent of urban employment.

The developmental outcomes are equally remarkable. Over several decades, China recorded the fastest sustained growth among major economies, averaging nearly 10 percent annual GDP growth. More than 800 million people were lifted out of extreme poverty. Urbanization accelerated and infrastructure investment reached unprecedented levels, including the world's largest high-speed rail network. Social indicators also improved markedly: Life expectancy rose into the high 70s, literacy became nearly universal and basic insurance and pension programs extended to most of the population.

These changes were not incidental by-products of unfettered markets, but rather the outcome of deliberate State policies, long-term planning and a governing party capable of aligning political legitimacy with developmental objectives.

The same logic of adaptation now informs the CPC's current strategic turn.

Under the leadership of General Secretary Xi Jinping, the Party has acknowledged the limits of the previous model of high-speed, investment- and debt-driven growth. The emphasis has now shifted from property-led expansion and low-cost, labor-intensive manufacturing toward advanced manufacturing, green energy, digital infrastructure and technological self-reliance. Xi's notion of "new quality productive forces" signals an effort to steer policy support toward strategic high-tech sectors that are expected to underpin China's future competitiveness and development strategy.

At the same time, the CPC's 105-year history is a story not only of extraordinary achievements but also of continual reinvention. China faces a complex set of challenges. The Party confronts the task of transitioning from catch-up growth to innovation at the global technological frontier, while simultaneously maintaining political stability.

The CPC should be seen not as a residual artifact of 20th-century ideology, but as the core leadership force behind China's rise and the primary coordinator of its "long-term objectives" and "national rejuvenation". How effectively it navigates the formidable "risks and challenges" ahead will shape not only China's next stage of "high-quality development", but also the evolving configuration of the broader international order.

The author is a former tourism minister of Brazil, a distinguished professor at Tsinghua University and a professor at The Chinese University of Hong Kong in Shenzhen. The views do not necessarily reflect those of China Daily.

A metropolis stuck in gridlock

As Indonesian capital approaches 500th anniversary, Jakartans long for seamless transit

Traffic congestion occurs on Jalan Jenderal Gatot Subroto Road in Jakarta, Indonesia, on Jan 9, 2025. ASLAM IQBAL VIA GETTY IMAGES

Zakaria, 24, waited for a less crowded commuter line train so he could sit on his trip home to Daru, Banten, from Tanah Abang Station in Central Jakarta. He had just transferred from Bekasi, West Java, where he had undergone a hemodialysis session in a hospital, and was feeling too weak to stand through the journey.

He braces himself for the overcrowded commuter train journey twice a week for his treatment, as crossing three provinces would be highly inconvenient if public transit did not connect cities beyond Jakarta.

"Going by ambulance is the only alternative, but that's for emergencies. I can only rely on the commuter line, while other transport modes don't reach Daru," he told The Jakarta Post.

Zakaria said integrated transport around the capital is essential for patients like him who rely on long-distance mobility for treatment. Even reaching Tangerang, the nearest city in Banten, is more difficult for him than traveling to Jakarta or Bekasi.

"It's easier to go to Jakarta because it's faster and more accessible. It already feels like Daru is connected to Jakarta," he said. But still he wished that trains bound from Jakarta to Daru were more frequent and more punctual.

Jakarta remains marred by long-standing mobility problems, as the capital turns 499 years old on June 22.

Isra Livera, also 24, has grown frustrated with the traffic and overcrowded public transport defining her daily commute from Depok, West Java, to her office in South Jakarta on commuter trains, Transjakarta buses and motorcycle taxis.

"I complain about it a lot. But then again, everyone else is enduring the same problem like me," she said, having long accepted her life as a commuter for over 16 years, even grown fond of Jakarta's lively and fast-paced environment.

As she applauded Jakarta's development progress as a capital, Isra wished it "could find its way to improve itself and be more welcoming for everyone", including by creating a better-integrated multimodal public transport system that workers across Greater Jakarta can rely on.

"Jakarta really needs to add more capacity so we don't end up packed inside every time," she said, hoping for improvement as the city marks another anniversary. "With better integration, I wouldn't have to walk so far just to transfer."

As Jakarta celebrates its 499th anniversary, the city has long outgrown its boundaries and became the world's most populous megacity with 42 million inhabitants across the sprawled metropolitan area.

Yet Greater Jakartans continue to grapple with urban challenges as a plan for an agglomeration, which would further integrate the region's mobility, economy, infrastructure and services, remains in limbo.

The agglomeration plan was incorporated in the 2024 Special Region of Jakarta Act, which was enacted as part of Jakarta's transition away from being Indonesia's capital. The law mandates the establishment of an agglomeration council, but it has yet to be operational, pending a presidential decree on the capital relocation to the new city of Nusantara in East Kalimantan.

Urban expert Yayat Supriatna said that while the plan remains unclear, it becomes important as Jakarta's highly mobile population has not been matched by infrastructure and services improvements in satellite cities.

"Jakarta has played its role in agglomeration, particularly in transportation," he said.

"But it is also struggling because there is no subsidy or financial support from neighboring regions."

Earlier this month, Jakarta Governor Pramono Anung revealed a plan to raise fares on Transjabodetabek, the extended city-owned Transjakarta bus network, as subsidizing it became difficult to sustain.

Yayat argued the agglomeration council could help ensure continuity. But its effectiveness would depend on "how strong its budget is and how much authority is granted to it".

Shared priorities

The Jakarta Development Planning Agency, known as Bappeda, said preparations for the agglomeration are underway through the planning and identification of shared priorities among administrations, including transportation and transit-oriented development projects.

However, it acknowledged that aligning Jakarta's interest with surrounding cities remains a challenge, and it is waiting for the agglomeration council to improve coordination.

"Problems such as traffic congestion, flooding, air pollution and housing cannot be addressed by a single administration alone, as their root causes are spread across the metropolitan region," Bappeda said in a statement.

In celebration of the anniversary, the city has stepped up efforts to improve urban mobility, with the governor launching a pedestrian deck linking transport modes at the Dukuh Atas transit hub in Central Jakarta and a new commuter line station at the Jakarta International Stadium in North Jakarta.

Singapore travelers cheer expanded payment options in China

SINGAPORE — As an account manager traveling to China at least 10 times a year for work and leisure, Victoria Goh effortlessly uses popular e-wallet WeChat Pay for rides, shopping and dining.

But like many travelers, the 29-year-old often pays more for her purchases than necessary. Each time her transaction exceeds 200 yuan (about $30), a 3 percent fee is levied on her Singapore-issued debit card that is linked to WeChat Pay to top up the e-wallet.

These additional charges, levied by WeChat Pay, are now behind her.

She is among millions of DBS Bank users who are now able to remit funds directly from their bank account to their WeChat Pay e-wallet, and make payment via merchant QR codes in China without incurring additional platform fees.

The update comes as Chinese payment giant TenPay Global, which operates WeChat Pay, opened up its remittance service to foreign passport holders residing in or visiting China.

It is the latest in a series of moves that have made payment in China increasingly seamless for foreigners. Since February, OCBC Bank has allowed its Singapore customers to scan WeChat Pay merchant QR codes for payment directly through the OCBC app, without having to download third-party apps.

Direct transfers from foreign banks were previously not allowed, and the only way for foreign passport holders to top up their WeChat Pay wallets was a linked credit or debit card.

To avoid paying additional fees through the linked credit or debit cards, some travelers had asked friends with Chinese bank accounts to transfer money directly into their WeChat Pay wallets.

Financial adviser Ryan Lok had done this when he went to China for two work trips in 2026.

The 27-year-old added that he would be tapping DBS' and OCBC's new features to make payments during his upcoming trip at the end of June if the exchange rates the banks charge are "favorable".

"If the bill is $200, paying an extra 3 percent is not so bad. But if the bill is $1,000, paying an extra $30 is a lot," said Lok, who often foots the bill for meals and drinks with friends and clients using WeChat Pay.

In China, small shops do not accept foreign bank-issued credit cards. The most common mode of payment is via QR code scanning with e-wallets WeChat Pay or Alipay.

Media professional Carol Ang, 48, said that being able to remit from DBS to WeChat Pay is a handy backup plan in case her preferred payment method, Alipay, does not work.

"Every trip, I would encounter at least one instance where my payment does not go through, mostly at smaller food stalls by the road," said Ang, who added that she has had to keep cash on hand to deal with such contingencies.

DBS is among 60 major banks and institutions globally that TenPay Global works with to allow cross-border remittance for non-Chinese citizens.

'Ubiquitous connectivity'

"We are continuously exploring opportunities to expand our network of banking and financial institution partners in Singapore," said a TenPay Global spokesperson, adding that the goal is to achieve "ubiquitous connectivity across the global financial ecosystem".

OCBC Bank has allowed its Singapore customers to scan UnionPay and Alipay QR codes to make payments directly to Chinese merchants through the OCBC app since 2023 and 2024, respectively.

The expansion to include WeChat Pay QR codes since February has led to an increase in the use of OCBC's scan and pay feature in China, said OCBC's head of card payments and personal loans, Regina Lim.

"Last year, one in five overseas Scan & Pay transactions on the OCBC app was made in China," said Lim, who added that China has emerged as a top destination for OCBC customers using this feature overseas.

By the end of June, OCBC plans to allow its customers to transfer money directly from the OCBC app to non-Chinese passport holders using WeChat Pay.

Among those who prefer to use OCBC's scan and pay feature is final-year undergraduate Teng Xin Yi. "I don't want to use so many apps. I can just stick to the OCBC app to make payment," said the 24-year-old who travels at least once a year to visit her family in China.

"The exchange rate is also not a huge difference and quite competitive."

THE STRAITS TIMES, SINGAPORE

Thailand uses AI to crack down on soccer gambling

BANGKOK — Thailand's government has blocked 13,888 illegal online gambling pages and websites linked to the 2026 World Cup in an 18-day AI-backed crackdown, while warning businesses against showing live match broadcasts for commercial purposes without permission.

Thailand's Prime Minister's Office has outlined tougher measures to prevent legal violations during the World Cup, targeting transnational online football gambling networks alongside efforts to protect intellectual property rights.

The government stressed that businesses must strictly follow the rules to help create a responsible and lawful atmosphere for watching the global sporting event.

Thailand's Deputy Government Spokeswoman Ploytalay Laksameesangchan explained that the government had integrated the work of security and technology agencies to strengthen cyber-blocking measures against URLs linked to online gambling.

The operation has been carried out with support from the Ministry of Digital Economy and Society, which is using artificial intelligence to detect, analyze and screen suspicious data across social media platforms more accurately.

The proactive campaign follows direct instructions from Prime Minister Anutin Charnvirakul, who has ordered agencies to eradicate online gambling websites, which the government described as a social time bomb.

From June 1 to 18, officials filed petitions with the court and obtained court orders to block illegal websites.

They also coordinated with online platform providers to remove illegal pages and websites, bringing the total number of blocked or removed items to 13,888.

Warning about copyright

Beyond gambling, the deputy government spokeswoman also warned shop owners, restaurants and entertainment venues nationwide to comply with copyright rules for the 2026 World Cup.

The government supports Thai football fans watching and cheering the tournament, but underlined that all viewing must comply with the law and respect the intellectual property rights of official rights holders, Ploytalay said.

"The government wishes to stress that anyone who uses, rebroadcasts or redistributes the World Cup 2026 live broadcast signal without written permission from the official rights holder in Thailand — whether by recording matches and re-uploading them, re-streaming them online, livestreaming them on social media, or showing the signal inside shops to attract customers for commercial benefit — will be deemed to have committed commercial copyright infringement," she said.

"The law sets severe penalties, with imprisonment of six months to four years, a fine of 100,000 to 800,000 baht, or both," she added.

The government called on the public and business operators across all sectors to help set a new standard for responsible World Cup viewing, avoid all forms of gambling and strictly follow copyright procedures.

It added that compliance would help support the sustainable growth of Thailand's sports, media and related business sectors.

Commuter commotion

A train derails in Kyoto City, Japan, on Monday. At 5:13 am, the four-car local train came off the tracks at the Kintetsu Kyoto Station. None of the 13 passengers on the train were injured, but services going in both directions were suspended. YOMIURI SHIMBUN VIA AP

US says talks with Iran to resume

Tehran yet to confirm Doha meeting as it says $6 billion of assets to be unfrozen

By JAN YUMUL in Hong Kong and **CUI HAIPEI** in Dubai, UAE

The United States said technical talks with Iran will resume in Doha on Tuesday, while Iranian officials said nothing has been scheduled and some $6 billion of Iranian assets would be released through Qatar.

US President Donald Trump said on Monday on social media that Iran had requested a meeting with US counterparts, though Iranian officials said no such meeting was scheduled.

"Iran has requested a meeting. It will take place tomorrow in Doha," Trump wrote in all capital letters in a social media post on Monday.

Moments later, Trump's press secretary, Karoline Leavitt, told Fox News that top envoys Steve Witkoff and Jared Kushner would attend the talks. "On the sidelines of those high-level talks, will be the technical talks," she said.

The US news site Axios had reported that the planned meeting is said to focus on the Strait of Hormuz.

But Kazem Gharibabadi, a senior negotiator for Iran, denied any talks had been scheduled, in comments published by IRNA.

"Although consultations with Qatar, including on following up on the implementation of the other side's commitments, are continuing as usual, reports by some media about technical talks by the working groups being held in Doha are not confirmed," he said.

"No technical meetings of the working groups are planned for this week," Gharibabadi said, quoted by state TV, referring to the Iranian week ending on Friday.

Iranian President Masoud Pezeshkian announced on Monday that $6 billion of Iran's frozen assets will be released and returned through Qatar, Iran's Mehr News reported.

He also confirmed that oil and petrochemical sanctions have been lifted under the peace deal, which he called a "great victory" for the Iranian people.

The Iranian president said the $6 billion is part of a total of $12 billion in Iranian funds held in Qatar, with a follow-up underway to return the remaining portion.

The release of the funds and the sanctions relief were part of the framework agreed at the talks in Switzerland and the Islamabad Memorandum of Understanding.

Renewed fighting over the weekend stemmed from conflicting interpretations of the MoU to end the war, as well as the provisions regarding the status of Hormuz, according to Axios.

Gharibabadi separately met with Sheikh Abdulaziz bin Abdullah bin Zahir Al Hinai, ambassador-at-large at Oman's Ministry of Foreign Affairs in Muscat.

Hormuz a flashpoint

During the trip to Muscat, the first meeting of the Hormuz Joint Committee was held with the Omani official, according to Gharibabadi in a post on X on Monday.

"While reviewing current issues related to the strait, we exchanged views on the future management of the strait within the framework of paragraph five of the Islamabad Memorandum of Understanding and the sovereign rights of the coastal states," Gharibabadi added.

The Omani-Iranian meeting is part of the fifth point of the MoU's framework, which states that Iran will make its best efforts to secure the safe passage of commercial vessels from the Persian Gulf to the Sea of Oman and vice versa for 60 days without charge.

The MoU also states that Iran and Oman will define the future administration and maritime services in the Strait of Hormuz, in discussion with other littoral states, in line with applicable international law and the sovereign rights of the strait's coastal states.

Earlier, Trump once again threatened Iran, a day after the maritime skirmishes.

Trump said a US aircraft had struck Iranian missile and drone storage locations, as well as coastal radar sites, "for violating the cease-fire agreement", he wrote on social media on Sunday.

Elsewhere, at a joint news conference in Baghdad with Iranian Foreign Minister Seyed Abbas Araghchi on Sunday, Iraqi Foreign Minister Fuad Hussein called for a summit bringing together Gulf countries, Iraq, and Iran to discuss regional security.

Hussein stressed that the security of the region should be the responsibility of its peoples, according to a report by the Iran News Agency.

Russia faces unprecedented Western pressure: Putin

MOSCOW/KYIV — The country is under severe and unparalleled pressure from Western nations, Russian President Vladimir Putin stated on Sunday.

"Russia is facing harsh, unprecedented pressure from Western elites. Unable to deliver a strategic defeat or battlefield victory against Russia, these forces have sought to destabilize its political landscape and stoke internal unrest, yet all such attempts have ended in failure," Putin stated at the plenary session of the 23rd Congress of the United Russia party.

He stressed that Ukraine has been weaponized as a "battering ram" in the West's confrontation with Russia, with blatant disregard for the Ukrainian people.

Putin pointed out that the West deliberately turns a blind eye to Kyiv's strikes on civilian populations and infrastructure. Despite these blatant provocations, the West continues to impose new, illegitimate sanctions exclusively targeting Russia, he said.

He added that Russia is firmly resisting all attempts to stifle its development, emphasizing that the country possesses ample capability to withstand such pressure, leaving no room for doubt.

In a television interview on the same day, Putin said Russia needed to boost its air defense capacity to counter intensified Ukrainian drone attacks aimed mainly at its oil industry. He described the attacks on oil refineries as an attempt to "cause a split in Russian society and force Russia to halt, even if only briefly, the advance of our troops along the line of contact, and create conditions for launching a negotiation process on terms advantageous to our adversary".

A fuel truck delivers fuel at a gas station in Moscow on June 24. MIKHAIL VOSKRESENSKIY / SPUTNIK

Putin also said that Ukraine had proposed a mutual halt to long-range strikes as a step toward peace. But Moscow saw it as a means to relieve pressure on Kyiv's forces along the front line and would not be distracted by it.

The office of Ukrainian President Volodymyr Zelensky did not immediately respond to a request, submitted during late-night hours in Ukraine, for comment on Putin's remarks.

Zelensky wrote an open letter to Putin this month proposing a face-to-face meeting, which the Russian leader has rejected.

The Kremlin said on Monday that Russia has not changed its stance on the conditions needed for a peace deal in Ukraine.

Meanwhile, Zelensky said on Sunday that Ukrainian forces had carried out overnight strikes on two oil refineries in Russia.

In a post on X, Zelensky said one of the targets was the Slavyansk oil refinery in Russia's Krasnodar region, about 300 kilometers from the front line.

Local media reported that the refinery has an annual processing capacity of about 4 million metric tons of oil.

He said another refinery in Russia's Yaroslavl region, about 700 km from the Ukrainian-Russian border, was also targeted, but did not give further details.

Zelensky said the strikes were aimed at weakening Russia's ability to sustain its campaign effort.

There were no immediate reports from Russian authorities about the strike on the Yaroslavl refinery. Its local governor reported on Sunday that some roads between Moscow and the region's capital, Yaroslavl, were temporarily closed due to "an enemy attack by Ukrainian drones."

Meanwhile, Russia's Defense Ministry said on Sunday its forces have taken the villages of Pysantsi in Dnipropetrovsk region and Novoselivka in the neighboring Zaporizhzhia region, state news agency TASS reported.

Cultural exchanges bring Shanghai and New York closer

By MINGMEI Li in New York
mingmeili@chinadailyusa.com

Both surrounded by water, New York and Shanghai tell a shared story of China-US cultural exchange.

From the Huangpu River to the Hudson River, the two global cities continue to connect through culture, education and dialogue.

"From Shanghai to New York: A Century-Long Cultural Journey Inspiring New China-US Dialogue," a core session of the third season of Bund: A Global Urban Humanities Dialogue between Shanghai and New York, was held on June 29 at the China Institute of America in New York.

Bringing together young scholars and artists from China and the US, the event explored the intersection of technology, art and philosophy, creating a platform for intellectual exchange among younger generations and encouraging mutual learning across cultures.

"This is not only an academic dialogue across geographical boundaries, but also a cultural exchange that connects history with the future," said Yu Yougen, education counselor of the Chinese Consulate General in New York.

"Shanghai and New York, two internationally renowned cities shaped by water, have maintained close and fruitful exchanges for decades. From the Huangpu River to the Hudson River, what crosses the Pacific is not only exhibitions and conversations, but also the shared aspiration of people from both countries to learn from each other," Yu added.

Zhang Huihong, deputy chair of the University Council of East China Normal University, said Shanghai and New York share more than their identities as global cities.

"Shanghai and New York are both cities shaped by water and recognized as international metropolises. Although they are thousands of miles apart, they share similar city spirits of openness and inclusiveness," she said.

"Through collaborative cultural creation and cross-ocean dialogue, we hope to explore more possibilities for people-to-people exchanges between China and the US," she added.

Founded in New York in 1926 by figures including Chinese scholar Hu Shih and American educators John Dewey and Paul Monroe, the China Institute is one of the oldest nonprofit organizations in the US dedicated to promoting understanding between China and the US through culture and education.

From July 9 to July 30, the gallery will feature more than 100 works created by students and faculty members from East China Normal University. The exhibition traces its inspiration to the 1930 US tour of renowned Peking Opera artist Mei Lanfang, whose performances introduced Chinese opera to American audiences and became a milestone in China-US cultural exchange.

Through prints, paintings, illustrations, animations and AI-generated artworks, the exhibition explores how traditional Chinese art and intangible cultural heritage can be reinterpreted through contemporary design and emerging technologies.

"Our students are trained in contemporary art, but we have always felt that it was important for them to reconnect with their own cultural heritage," Wei Shaonong, a professor at the School of Design of East China Normal University, told China Daily.

"Traditional Chinese culture contains rich artistic elements, and we hope students can reinterpret them through today's artistic language and creative approaches. In this process, they learn from tradition while exploring how traditional art can remain connected to contemporary life."

Speaking about Mei Lanfang's influence, Wei said the legendary artist offered an important lesson in cultural communication.

"Peking Opera was far from American audiences' cultural background at the time, yet Mei Lanfang achieved tremendous success in the US because he understood one important principle: when bringing art and culture to a new audience, you need to find ways to communicate through a language and context that people can understand."

"The great inspiration we gained from Mei Lanfang's visit is that cultural communication requires translating not only language, but also the way stories are told and the cultural context behind them," he added.

The event also featured the opening of Collaborative Learning, an intercultural exchange in-person roundtable discussion in New York. The forum was initiated by Paul J. D'Ambrosio, professor of Chinese philosophy at East China Normal University.

"As scholars, we should remember that cultural exchange happens through many different forms," D'Ambrosio told China Daily. "It can happen through films, music, entertainment and many other creative expressions."

"While academic research and focused discussions remain important, we also need to stay open to broader forms of communication," he added.

"From Shanghai to New York: A Century-Long Cultural Journey Inspiring New China-US Dialogue", a core session of the third season of "Bund: A Global Urban Humanities Dialogue between Shanghai and New York", is held on Monday at the China Institute of America in New York. MINGMEI LI / CHINA DAILY

Editorials

Justified, calibrated countermeasures aim to prompt Tokyo to rethink its path

The latest export controls on Japanese entities China unveiled on Monday indicate that Beijing is opposing Japanese neo-militarist policy while protecting normal economic and trade exchanges between China and Japan.

The move added 20 Japanese entities, including the National Institute for Defense Studies, to China's export control list, while placing another 20, including Mitsui E&S, on a watch list because their end users and the end uses of certain dual-use items could not be verified.

Announcing the move, the Ministry of Commerce said that the measures were intended to safeguard national security, fulfill the country's nonproliferation obligations and curb Japan's remilitarization. The controls remain a calibrated signal, as they target only selected Japanese entities and apply solely to dual-use items, leaving normal trade untouched.

China's February sanctions of Japan targeted 20 organizations associated with Japan's military establishment. The June list, however, broadens the scope to shipbuilding, advanced machinery, electronics, information technology, aerospace and research institutions.

The message is that modern military power no longer resides solely in weapons factories. It runs through industrial software, robotics, precision engineering and maritime technology. This is why the measures are an institutionalized economic security policy.

Entities on the watch list may apply to be removed if they cooperate with end-user verification requirements. In other words, Beijing is not simply imposing penalties; it is establishing a compliance framework that can be tightened or relaxed over time. Export controls are becoming a standing policy instrument rather than an occasional response to the rise of neo-militarism in Japan.

The precision of the targeting is equally notable. China remains one of Japan's largest trading partners, and Japanese investment is deeply embedded in China's manufacturing ecosystem.

Instead, Beijing has chosen a narrower route: raising the cost of operating in strategic sectors while preserving broader commercial ties. Strict licensing procedures, compulsory approval timelines and sweeping end-use reviews increase compliance costs even when exports are ultimately approved.

None of this guarantees immediate changes among the Japanese military-industrial complexes. It does suggest gradually rising transaction costs for Japan's remilitarization.

Since taking office last October, Japanese Prime Minister Sanae Takaichi has pursued an irresponsible, provocative and aggressive posture toward China by expanding military capabilities, deepening military cooperation with allies and promoting closer technology-military coordination with like-minded partners. Tokyo brazenly claims these steps are necessary responses to the "external threat" posed by China. The result is a familiar action-reaction cycle in the region that exposes Japan as the real threat to regional peace and stability.

In less than a year, the Takaichi government has systematically undermined the postwar order, interfered in China's internal affairs, rewritten security policy, liberalized arms exports, ballooned military budgets, whitewashed militarist history, and fueled regional military rivalry — all in flagrant violation of the pacifist Constitution of the country, the postwar restrictions on Japan and the spirit of the Tokyo Trials.

The Takaichi government's drive to remilitarize Japan is being pursued through a multifaceted strategy that mobilizes legislative, political, economic, cultural, technological, industrial and commercial tools alike. Far from being ad hoc or reactive, this approach represents a dangerous amalgam of historical revisionism, political adventurism, diplomatic expediency and resurgent militarism.

By posing as a "peacekeeper" while convening allies and distorting the facts, the Takaichi government is pushing Japan further down a path of error and peril.

As a spokesperson for the Ministry of Commerce said on Monday, it is hoped that the Takaichi government will come to a timely recognition of its erroneous actions, desist from its current destabilizing policies, and, through thorough and honest reflection, restore itself to a course consistent with international law, historical justice and the shared interests of the region.

Testament to 'China Opportunity 2.0' appeal

In an era marked by rapid global economic shifts and rising uncertainties, the concept of "China Opportunity 2.0" has emerged as a symbol of new possibilities for international trade and innovation.

While some China doomsters have expressed "anxiety" over China's advances in technology and industrial innovation, even promoting the narrative of a so-called "China Shock 2.0" that groundlessly frames China's development as a "threat" to the global economy, the reality is that "China Opportunity 2.0", as Chinese Premier Li Qiang said last week, represents comprehensive innovation-driven empowerment and high-return investment prospects. Speaking at the 17th Annual Meeting of the New Champions of the World Economic Forum in Northeast China's coastal city of Dalian, Li underscored China's potential to offer high-return investment prospects and its fostering of mutually beneficial technological collaboration worldwide.

The ongoing visit to China of David Eby, premier of Canada's British Columbia province, serves as a testament to the substantive appeal of "China Opportunity 2.0". Eby has stressed that the purpose of his trip is to strengthen British Columbia's ties with China as a strategic move to diversify the province's trade relationships.

"We're seeking to reduce our reliance on the United States and obviously, Asian markets have been a major focus for us," Eby told the media last week before embarking on his first China trip on Saturday. This includes the goal of doubling trade to non-US markets within the next 10 years. "China will be part of that," he added.

By targeting key sectors such as forestry products, energy — specifically liquefied natural gas development — and tourism, he is seeking to unlock new avenues for growth and job creation in British Columbia. This aligns with the principles of "China Opportunity 2.0", which emphasizes mutual benefits and shared development.

The visit follows Canadian Prime Minister Mark Carney's trip to China earlier this year, the first by a Canadian prime minister in eight years. Carney's visit laid the groundwork for the healthy development of China-Canada relations, with multiple cooperation agreements signed across trade, customs, energy, construction, culture and public security. Eby's trip builds on this momentum, signaling a proactive approach to deepening collaboration and exploring innovative opportunities. According to Canadian media, his itinerary includes Beijing, Shanghai and Guangzhou.

The strategic sectors targeted for collaboration are indicative of a balanced approach that prioritizes mutual benefits and sustainable growth.

China-Canada relations have experienced ups and downs in recent years, but there are no territorial disputes or clash of fundamental interests between the two countries, and they can become partners for achieving mutual success.

This year marks the 56th anniversary of the establishment of diplomatic relations between China and Canada, as well as the 21st anniversary of the establishment of their strategic partnership. It is an important chance to reflect on the past and think about the future. Eby's visit shows that an objective and rational attitude toward China is conducive to strengthening cooperation with a positive and open spirit. Reinforcing this, Canada's Minister of International Trade Maninder Sidhu recently revealed in a media interview that he plans to meet with his Chinese counterpart this fall.

Although certain Western policymakers have been drawn into the rhetorical vortex of a purported "China Shock 2.0", the evolving arc of China-Canada ties points to the emergence of a countervailing cohort of countries that chooses to assess the situation objectively and remains open to the considerable potential of "China Opportunity 2.0".

As Li put it in his speech at last week's Summer Davos, to overcome the global growth challenge, innovation-driven cooperation is imperative. To this end, countries should forge closer connectivity and collaboration by joining forces and pooling resources to innovate. China possesses a complete industrial system and well-integrated industry clusters, which underpin efficient, reliable production and supply chains for businesses worldwide. By rejecting the notion of a "China Shock 2.0", countries stand to capture the vast opportunities presented by China's dynamic economy and superlarge market.

Europe requires cool heads, but Brussels prefers hot air

Europe is discovering an uncomfortable truth: ideology is a poor substitute for air conditioning.

For years, Brussels has treated climate policy almost like a "religion", where virtue was measured by how much discomfort one could endure in the name of the planet. Then June arrived with temperatures soaring past 40 degrees Celsius. Schools closed, roads buckled, hospitals overflowed with patients and, tragically, lives were lost. Across the continent, Europe's infrastructure wilted almost as quickly as its gardens.

Suddenly, Europeans who had spent years debating whether air conditioners represented environmental excess found themselves desperately looking for one. Store shelves emptied. Installation waiting lists stretched for weeks. Portable units became prized possessions. Asian manufacturers, especially Chinese brands, found themselves answering Europe's unexpected SOS. Reuters reports that demand has surged across France, Germany, Spain and the United Kingdom, with Chinese manufacturer Midea's portable systems selling out as Europeans searched for solutions compatible with the continent's aging buildings.

So, it turns out, that after all the talk about "strategic autonomy", when the thermometer climbs high enough, nobody checks whether the air conditioner they are buying carries the correct "passport".

That is not surprising given that quality Chinese products have increasingly become practical solutions. For industries, Chinese equipment and components facilitate industrial upgrading, green transitions and deeper integration into global value chains. According to the United Nations Conference on Trade and Development, intermediate-goods trade with China helped increase the number of developing economies serving as key global trading hubs from six in 2007 to 11 in 2024. For households struggling with persistent inflation in developed economies, affordable Chinese products ease financial pressure. The European Central Bank estimates that a 10 percent increase in Chinese imports into the European Union in 2026 would reduce overall import prices by 1.6 percent. That sounds less like an economic "shock" than an economic cushion. There is something almost theatrical about policymakers discussing new trade barriers inside air-conditioned conference rooms while people scramble to buy the very products those same officials portray as "strategic threats".

The bureaucracy seems fascinated by drafting ever more elaborate restrictions on Chinese green products, even as Europe's own consumers demonstrate that they value affordability, reliability and availability over political slogans.

Trade wars are wonderfully "exciting" to some — until someone else has to pay the electricity bill. The irony extends beyond air conditioners. Europe's heat wave has exposed something basic — aging houses poorly suited for rising temperatures, insufficient cooling infrastructure, energy shortages, cumbersome installation rules, fragmented local governance and slow bureaucratic responses cannot be solved by raising tariffs. Instead, restricting access to competitively priced Chinese green products simply increases the cost of Europe's own green transition. Inflationary pressures are intensifying precisely at a time European economies can least afford additional burdens.

Nor is China likely to absorb such measures passively. China has repeatedly demonstrated that it will defend its legitimate trade interests. Escalating restrictions inevitably invite countermeasures that benefit nobody. Fortunately, Beijing has consistently left the door open for candid dialogue to manage disagreements and expand areas of cooperation.

During the first five months of this year, China's imports grew by 20.5 percent, exceeding export growth by 8.7 percentage points. Among China's 50 largest trading partners, 32 recorded faster export growth to China than import growth from the country. This counters the narrative that China seeks permanent trade surpluses at others' expense.

Perhaps EU politicians should spend less time inventing new trade barriers and more time listening to the people's heated complaints. The continent's latest heat wave has delivered a lesson far more persuasive than any policy paper: when reality arrives, practical cooperation matters far more than political posturing. Hot air belongs to the atmosphere, not to trade policy.

— LI YANG, CHINA DAILY

What They Say

Power plan to spark green energy transition

Editor's note: *China aims to establish a clean, low-carbon, secure and efficient new energy system by 2030, according to a plan released recently. China Central Television spoke to Tian Lei, a researcher at the Academy of Macroeconomic Research of the National Development and Reform Commission, and Wang Peng, a professor at the North China Electric Power University, on the future of new energy development. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The shift to clean energy has two major implications. First, renewable energy will move from a supporting role and become the primary driver of the energy system.

Second, this transformation will drive technological upgrades in the power system, reshaping its operational models and overall structure. The expansion of renewable energy will also spur the growth of electric vehicles and emerging technologies.

Achieving these goals and sustaining the rapid growth of renewable energy will require strengthening the energy storage capacity through coordinated efforts on both the supply and demand sides.

On the supply side, developing new energy storage technologies and pumped-storage hydropower is essential to provide rapid balancing capacity during peak demand periods. At the same time, greater emphasis will be placed on hydrogen storage by converting surplus renewable electricity into green hydrogen, enabling long-duration energy storage.

On the demand side, the focus will be on enhancing the flexibility of electricity users by aggregating adjustable loads from households, businesses and factories so they can help in peak-load regulation.

Future energy investment will focus on three broad areas: ensuring energy security, advancing the green transition and fostering new growth drivers. The plan calls for coordinated national deployment, discourages homogeneous local investment, strengthens market regulation and addresses disorderly competition, including below-cost pricing and mandatory project bundling.

At the same time, the development of a unified national electricity market will align power generation projects more closely with electricity demand and grid absorption capacity.

The plan also aims to enhance energy self-sufficiency in eastern China, while recognizing that the overall pattern of transmitting electricity, natural gas and coal from the western to eastern regions will remain unchanged.

Long-distance energy transmission inevitably involves electricity losses and requires extensive infrastructure for transporting coal. From the perspective of resource allocation, using more energy where it is produced in western China would significantly improve efficiency. However, this would also require the gradual relocation of industries to western regions.

There is a strong demand for computing resources in the more developed eastern regions of China, while abundant energy resources are concentrated in the west, making western China a natural location for large-scale computing centers. This requires close coordination between computing resources in the eastern and western regions, as well as a more efficient nationwide energy allocation.

VIEWS

Sun Jingying and Zhang Yuyan

Inspirations from China's journey

For many developing nations, a persistent question is: How can a populous country with limited resources achieve widespread and lasting improvements in the quality of life for its people?

Over the past century, China has provided the answer. Under the leadership of the Communist Party of China, the country has moved from widespread poverty and food shortages to building a moderately prosperous society and is now pursuing common prosperity.

China's path may not be a blueprint for others to copy, but the principles behind it offer valuable lessons for countries facing similar development challenges.

A consistent focus on improving people's livelihoods has been a defining feature of China's development journey. In the early years of New China, the priorities were straightforward: restore production, stabilize prices and secure basic livelihoods.

With the reform and opening-up, poverty reduction became a central mission. Over several decades, large-scale poverty alleviation programs transformed living conditions across rural China.

From 2012 to 2020, all 98.99 million rural residents living below China's current poverty line had been lifted out of poverty, and all 832 designated impoverished counties had shed that label. Absolute poverty, a problem that had plagued China for centuries, was eliminated.

The scale of the transformation is reflected in everyday indicators. Life expectancy has risen from about 35 years in 1949 to more than 79 years today.

The Engel coefficient — a measure of the share of household spending devoted to food — has fallen below 30 percent, placing China in a category generally associated with relatively affluent societies according to standards used by the Food and Agriculture Organization of the United Nations.

China's poverty reduction efforts, notable for both their speed and scale, have received widespread recognition from international organizations, including the UN and the World Bank.

Yet China's ambitions extend beyond eradicating extreme poverty. In recent years, the focus has shifted toward common prosperity — a concept often misunderstood abroad.

It does not imply absolute egalitarianism, nor does it imply that everyone becomes wealthy. Rather, it seeks to ensure that the benefits of growth are more broadly shared while maintaining incentives for innovation, entrepreneurship and productivity.

LI MIN / CHINA DAILY

The significance of common prosperity lies in the institutional arrangements supporting it. China's approach combines three layers of distribution.

Primary distribution relies on markets and economic activity to create wealth. Redistribution, through taxation, social security and transfer payments, helps narrow excessive disparities. A third layer consists of voluntary contributions from businesses and high-income groups to support broader social development.

Equally important is the effort to expand access to basic public services. A nationwide compulsory education funding system, medical insurance coverage exceeding 95 percent of the population and a pension system reaching virtually all citizens have helped translate economic growth into tangible improvements in daily life.

At the same time, regional development strategies and rural revitalization programs seek to reduce geographic inequalities.

The experience of Zhejiang province, China's pilot demonstration zone for common prosperity, offers a notable example.

Through measures ranging from stronger village-level collective economies to coordinated regional development, Zhejiang has reduced the urban-rural income gap ahead of schedule.

The broader relevance of China's experience lies more in the principles underlying its policies than in specific measures.

First, lasting improvements in living standards require strong political commitment and effective state capacity. In many developing countries, social progress is constrained not only by scarce resources but also by limited ability to mobilize those resources or implement long-term policies.

Second, gradual reform often works better than abrupt transformation. China's social security system was not built overnight. From rural subsistence assistance to basic medical insurance, catastrophic illness coverage and long-term care insurance, reforms were introduced incrementally, tested locally and refined over time.

Third, development and distribution should advance together. Some countries have struggled with unsustainable welfare commitments introduced before sufficient economic foundations were established.

Others have experienced deep social divisions after prioritizing growth while neglecting equity. China's approach has sought a middle path: promoting growth while steadily expanding social protection and preventing excessive inequality.

Fourth, improving people's livelihoods is not solely the responsibility of the government. Public institutions provide the foundation, markets deliver diverse services, social organizations contribute additional support, and families and individuals remain active participants.

This balance helps avoid both welfare dependency and the fiscal burdens associated with excessive state intervention.

This does not mean China's experience can be transplanted elsewhere. Every country faces unique political, economic and social conditions.

Nations with different political systems will need different coordination mechanisms.

Countries still struggling with extreme poverty may need to prioritize clean water, basic healthcare and food security before pursuing broader goals of equal access to public services.

For this reason, China has consistently emphasized sharing experience rather than exporting models.

Today, the world faces overlapping challenges: the lingering effects of the pandemic, mounting debt pressures, climate change and geopolitical tensions.

Across many countries, livelihoods are under strain. Against this backdrop, China's century-long journey — from securing basic subsistence to pursuing common prosperity — offers a simple but powerful insight: improving people's lives is not merely the outcome of development; it is also its purpose and driving force.

Large-scale improvements in human welfare are neither automatic nor easy. But with political commitment, pragmatic reforms and strategic patience, they are achievable.

The challenge for other countries is not to replicate China's path, but to draw experiences from it while forging development strategies suited to local realities.

In that shared search for more equitable, sustainable and dignified development, there is much that nations can learn from one another.

Sun Jingying is deputy chief of staff at the National Institute for Global Strategy at the Chinese Academy of Social Sciences; and Zhang Yuyan is a professor at the Chinese Academy of Social Sciences. The views don't necessarily reflect those of China Daily.

Abdulwahed Jalal Nori

Water a strategic asset that ensures economic resilience

Global Lens

For more than a century, oil has been the lifeblood of modern civilization, fueling industrial revolutions, shaping geopolitical alliances and influencing the rise and fall of nations. Control over energy resources often translated into economic strength and strategic influence.

Yet as the world enters an era increasingly defined by climate uncertainty, technological transformation, and environmental stress, another resource has quietly emerged as the foundation of future prosperity and stability: water.

The strategic significance of water has long been underestimated. Unlike oil, there is no substitute for freshwater. While economies can diversify their energy mix, replacing coal with solar power or oil with hydrogen, there is no substitute for water.

Every aspect of human life — from food production and public health to industrial development and energy generation — depends on reliable access to freshwater.

This reality is particularly relevant for Asia. Home to nearly 60 percent of the world's population and some of the fastest-growing economies, Asia faces a convergence of pressures that could make water one of the defining strategic challenges of the 21st century.

Rapid urbanization, industrial expansion, agricultural demand, population growth, and climate change have placed unprecedented strain on rivers, lakes, reservoirs and groundwater systems across the continent.

The challenge is not just environmental, but also has geopolitical and developmental dimensions. Manufacturing hubs require reliable water supplies. Agriculture depends on predictable irrigation systems. Expanding cities need resilient infrastructure capable of withstanding both floods and droughts. Water is no longer simply a resource to be managed, but a strategic asset that underpins economic resilience and social stability.

Climate change is intensifying these pressures. Rising temperatures are altering rainfall patterns across Asia.

Prolonged droughts are becoming more frequent in some regions, while others face increasingly severe floods. The Himalayan glaciers, often described as Asia's water towers, feed many of the continent's major rivers, including those that sustain hundreds of millions of people.

The implications of these changes extend beyond national borders. Many of Asia's most important rivers are transboundary waterways. The Mekong River alone supports the livelihoods of millions across China and Southeast Asia. What happens to the river system upstream inevitably affects communities downstream. As demand for water increases, effective management of shared resources will become one of the most important tests of regional cooperation.

Contrary to alarmist predictions, the future need not be defined by water conflicts. History demonstrates that shared resources can encourage cooperation as much as competition. The challenge for Asia is to move beyond reactive management and embrace a proactive framework for water governance. In this regard, China and the Association of Southeast Asian Nations have a unique opportunity to provide global leadership.

China's development experience offers valuable lessons. Over the past decades, the country has invested heavily in water infrastructure, flood control systems, advanced irrigation technologies and large-scale water transfer projects.

These initiatives reflect an understanding that water security is inseparable from long-term development planning. As China advances its vision of high-quality development, water efficiency, ecological sustainability, and climate resilience have become important pillars of national strategy.

ASEAN countries confront similar challenges. Rapid urbanization, food security concerns, and climate-related risks have placed pressure on water systems across Southeast Asia. Rather than address these challenges separately, a stronger China-ASEAN partnership on water security could be substantially more beneficial for the entire region.

Several practical policy initiatives deserve serious consideration.

First, China and ASEAN should establish a permanent China-ASEAN water security cooperation mechanism to facilitate regular dialogue, information sharing, joint research, and coordinated responses to droughts, floods, and other water-related emergencies. Water diplomacy should become a central pillar of regional cooperation, alongside trade, connectivity, and technological innovation.

Second, both sides should increase investment in smart water technologies. Artificial intelligence, satellite monitoring, big data analytics and digital water management systems can significantly improve efficiency and reduce waste.

A China-ASEAN water innovation fund could support collaborative research to design affordable solutions for developing economies.

Third, greater emphasis should be placed on water-efficient agriculture. Agriculture is the largest consumer of freshwater in most ASEAN countries. Joint initiatives focused on precision irrigation, drought-resistant crops, and sustainable farming practices could improve food security while reducing pressure on water resources.

Fourth, regional cooperation on climate adaptation should be strengthened. Shared early warning systems for floods and droughts, coordinated disaster preparedness mechanisms, and joint environmental monitoring programs would help build collective resilience against climate-related shocks.

Fifth, water security should be incorporated into broader regional development frameworks, including the Belt and Road Initiative and ASEAN's long-term community-building agenda.

Infrastructure projects should not only support economic growth but also enhance environmental sustainability and water resilience.

Most importantly, policymakers must broaden their understanding of security itself. Traditional notions of security often focus on military capabilities and geopolitical competition. While these are important, the most significant threats in the coming decades may arise from resource scarcity, environmental degradation, and climate disruption. A nation might have sophisticated military capabilities, but it remains vulnerable if it doesn't have adequate water resources.

For Asia, the lesson is clear. The era in which oil dominated strategic thinking is gradually giving way to a new reality. Water is emerging as the resource that will shape economic resilience, food security, environmental sustainability, and regional stability. The question is no longer whether water security will define Asia's future.

The question is whether governments will act with sufficient foresight to ensure that it is defined by cooperation and shared prosperity rather than crisis and scarcity.

Property management sector could do with an overhaul

In recent years, property management disputes have been on the rise in China.

According to the Supreme People's Court, in the first quarter of 2026, courts in China handled 294,700 such cases, up 37.28 percent from the same period last year.

But the actual number of complaints might be even higher. Whenever a property management dispute arises, people tend to first complain to the community committees, dial the consumer hotline number 12345, or visit relevant departments under the local government. Approaching courts is often the last resort.

More than 67 percent of the over 1.4 billion Chinese population now lives in cities and towns and about half of them dwell in apartments built in the past three decades or so.

When hundreds or thousands of people live in the same complex, property management becomes a necessity. Unlike in many other countries where house owners have to pay a huge sum in real estate taxes, those in China are not required to do so as they don't own the land on which their apartment buildings are built.

However they usually have to pay a significant management fee to the service-providing companies.

Depending on the locality and service quality, the fee could range from 2,000 to 7,000 yuan ($295-$1,033) a year for a two-bedroom apartment.

Efforts have been made by both the central and local governments to standardize property management operations.

In the early years after house owners move into an apartment complex, the property management service is usually satisfactory, thanks to the good condition of public facilities and the fact that the fees are paid in a timely manner. With the passage of time, however, quality dwindles.

Some house owners first complain to the property management companies about the dirty corridors, stinking garbage bins, dripping water from the ceilings, poor maintenance and high repair charges.

They also complain about the shortage of parking space and the lack of transparency regarding what the management companies earn by renting out the basements and/or parking spaces or allowing other companies to paste ads inside the elevators.

Failing to get satisfactory answers from the management companies and seeing no improvement in service quality, some homeowners stop paying property management fees. In some extreme cases, almost half the residents of an apartment complex have followed suit.

With the flow of money curtailed, the related property management companies cannot afford to take care of the apartment complexes anymore, even doing away with the support staff members who were doing some work, however unsatisfactory.

Thereafter, those house owners and management companies start suing each other, leading to prolonged litigation as both sides make a strong case against the other.

Reports suggest that in some apartment complexes, house owners set up their own committees and removed the existing property management companies, replacing them with new operators, who worked efficiently for a few years before a rerun of the same story.

Efforts have been made by both the central and local governments to standardize property management operations.

Relevant national regulations have been revised at least three times in the past two decades, with further adjustments expected to be made.

Each revision made clear the duties and obligations of both the house owners and the property management companies. However, the rising number of complaints and court cases shows that there is still a long way to go before many property management companies work efficiently, making the house owners happy.

In the interest of the masses, the arms of the owners' committees should be strengthened under the supervision of local community committees — a grassroots governmental organization.

At present, many apartment complexes have yet to establish owners' committees.

However, where they exist, there have been reports of some owners' committee members being bribed by property management companies to keep their mouths shut regarding certain irregularities.

The good news is that the discipline inspection bodies at different levels have started probing into malpractices related to people's livelihood, including in the property management sector.

The sector should be regulated in a way that property management companies make their income, expenses, and the services they provide more transparent to the fee payers.

This will help avoid many misunderstandings and disputes, bringing relief to judges and those at the consumer hotline receiving complaint calls.

GLOBAL VIEWS

MAO KEJI

Anatomy of economic unraveling

The strategic quagmire Japan finds itself in is characterized by four interwoven vulnerabilities

In an era defined by accelerating global transformation, Japan finds itself confronting a convergence of crises that would have seemed unimaginable to the generation that once spoke of its "economic miracle". What was once the world's second-largest economy, a technological trailblazer and the anchor of the United States' strategy in the Asia-Pacific now exhibits an unmistakable structural unraveling — one that spans technological marginalization, industrial degeneration, macroeconomic anemia and geopolitical entrapment. Understanding these four interlocking vulnerabilities is essential for understanding how the regional balance in East Asia is shifting and why Japan's room for maneuver has narrowed so dramatically.

The most striking feature of Japan's relative decline is its accelerating detachment from the global technological mainstream. The world once expected Japan to leverage its strengths in precision manufacturing, advanced materials and industrial robotics to upgrade into the defining frontier domains of the 21st century — green energy, artificial intelligence, digital transformation, unmanned aerial systems and humanoid robotics. However, Japan has fallen behind and largely failed to establish any meaningful presence in these domains, dashing such expectations.

What makes this particularly damaging is the compounding nature of technological divergence. Japan might have been able to afford to be a fast follower before, refining and perfecting innovations pioneered elsewhere. But in an age where AI and digital economies reward first-movers with insurmountable network effects, late entry likely leads to permanent exclusion. Japan's inability to translate basic research into scalable commercial applications means it is risking structural marginalization from the entire next wave of global wealth creation.

If technological drift points to Japan's forward-looking failure, the hollowing-out of its manufacturing base reveals the implosion of Japan's historical foundation. For decades, Japan's economic identity was inseparable from its industrial prowess — steel, ships, automobiles and electronics that conquered global markets and symbolized its national resurgence. That once formidable base is now crumbling on multiple fronts.

In consumer electronics and telecommunications, the fall has been rather precipitous. Yet even this pales beside the existential threat now facing Japan's automobile industry, which has been an engine of Japanese prosperity for generations. Today, that engine is sputtering. Its long-standing bet on hydrogen fuel-cell technology, while scientifically elegant, has diverged ever further from the global mainstream, leaving Japanese automakers with stranded assets and obsolete expertise while Chinese, US and European competitors scale up battery-electric production.

Beyond these technological pressures, decades of loose monetary policy and an increasingly burdensome public debt structure have made it even harder for Japan to avoid macroeconomic anemia. For years after the asset bubble collapsed, the economy relied on low interest rates and large-scale fiscal spending to stimulate demand, stabilize the financial system and support key industries. Yet these policies failed to rebuild Japan's growth engine. Instead, Japan was left with a massive public debt burden and far less room to maneuver. According to Japan's Ministry of Finance, by the end of fiscal year 2025, outstanding long-term debt owed by the central and local governments was expected to reach roughly 1,330 trillion yen ($8.31 trillion), equivalent to 211 percent of GDP.

Persistently low interest rates have widened the yield gap between Japan and the US, encouraging capital to flow into dollar-denominated assets and placing sustained depreciation pressure on the yen. In the past, Japan could still rely on its powerful export machine, trade surpluses and repatriated overseas profits to offset this pressure. But as its industrial competitiveness has weakened, and as more production and profits remain overseas, Japan's external balance no longer provides the same support for the currency. At the same time, rising imports of energy, food, digital services and industrial inputs have further increased demand for dollar payments. This pressure has been further amplified by renewed volatility in energy supplies. With the yen at one point falling toward 160 per dollar, import costs have surged, intensifying imported inflation.

The consequences are corrosive. Household purchasing power has been compressed, while corporate production costs have risen sharply. In theory, Japan could raise interest rates to ease pressure on the exchange rate and inflation. In practice, however, Japan's high public debt makes tightening difficult. Tokyo has been trying to stabilize the yen, contain inflation, protect the bond market, and avoid choking off growth all at once, but achieved only limited success on any front, resulting in a weakening capacity to resist economic deceleration.

SONG CHEN / CHINA DAILY

The International Monetary Fund now projects Japan's real GDP growth to slow from 1.1 percent in 2025 to 0.7 percent in 2026. Meanwhile, yen depreciation has further reduced Japan's dollar-denominated economic size.

Japan's external vulnerabilities are no less severe than its internal problems. The US administration's approach to alliance management has revealed the transactional reality beneath the rhetoric of shared values. Tariffs, investment demands measured in hundreds of billions of dollars and the systematic extraction of Japanese resources show that the US views Japan as a tributary to be harvested rather than as a partner to be cultivated. The ally Japan depended upon the most has become the power applying the most crushing pressure on it.

Compounding this US extraction has been Japan's own strategic rigidity. By blindly aligning with Washington's containment strategies, Tokyo has poisoned relations with its most significant neighbors, burning any possible geostrategic bridge behind it. As a consequence, its capacity to absorb and deflect external shocks has fallen to dangerously low levels.

These four vulnerabilities do not exist in isolation. They reinforce one another in devastating synergy: technological drift accelerates industrial erosion; industrial erosion deepens macroeconomic anemia; macroeconomic anemia increases dependence on external assistance; and that dependence intensifies geopolitical entrapment. Breaking this cycle would require political will, strategic imagination and institutional flexibility that Japan's current leadership has shown no capacity to muster. The result is a nation that remains wealthy by historical standards but strategically diminished — a former giant whose shadow grows shorter with each passing season. A less economically resilient Japan may cling more tightly to the US as its strategic lifeline, while becoming more anxious and risk-prone in regional affairs, adding further instability to the Asia-Pacific order.

WANG XIAOYU

An AI cooperation blueprint for the Global South

China and Arab countries have moved from R&D toward its practical use, pioneering a people-centered path

China's engagement with Arab states started 70 years ago with the establishment of diplomatic relations with Egypt. Since then, China-Arab cooperation has steadily expanded beyond trade in energy to infrastructure development, industrial investment and technological innovation. Today, as the digital economy expands and technological transformation accelerates, artificial intelligence is emerging as a new engine for China-Arab cooperation, creating fresh opportunities for collaboration in advanced technologies.

Many Arab states have incorporated digital transformation and artificial intelligence into their national development strategies. Policy frameworks such as Egypt's National AI Strategy, Saudi Arabia's National Strategy for Data and AI, the United Arab Emirates' National Strategy for AI 2031, and Qatar's Digital Agenda 2030 all identify AI as a key catalyst for economic diversification, more effective public services, and growth in future-oriented industries.

Meanwhile, China is fostering new quality productive forces and accelerating the integration of AI into the real economy. It has also accumulated substantial experience in AI research and development, industrial applications and digital infrastructure.

As important actors of the Global South, China and Arab countries share common objectives: advancing economic transformation, cultivating emerging industries and accelerating digitalization. Against this backdrop, AI has become a promising new pillar of cooperation to drive digital transformation and innovation for both sides.

SHI YU / CHINA DAILY

More importantly, China-Arab cooperation in AI is guided by a people-centered vision that seeks to ensure AI serves economic and social development while improving people's well-being.

This vision is reflected in three closely connected areas: promoting localized innovation, expanding AI applications in public services, and strengthening local talent development. Together, these efforts demonstrate how China and Arab countries are translating AI cooperation into practical development outcomes.

Localized innovation is essential for making AI more inclusive. This goal extends beyond technological advancement and calls for equitable participation of diverse linguistic and cultural groups in the digital age.

Much of the current global AI landscape has been built on English-language data. The relative scarcity of Arabic-language digital resources has limited the development and deployment of AI technologies across the Arab world.

In 2023, Chinese and Saudi researchers jointly released AceGPT, an open-source large language model specifically optimized for Arabic-language applications. Compared with more general-purpose models, AceGPT has demonstrated strong performance in Arabic-language understanding and generation tasks.

This collaboration has enriched the Arabic AI ecosystem, expanded access to AI technologies for Arabic-speaking communities and provided valuable insights into the development of AI in diverse linguistic environments. By prioritizing language adaptation and locally grounded innovation, China-Arab cooperation is helping ensure that AI technologies are better adapted to local needs and development priorities.

China-Arab cooperation in AI offers one practical response to this challenge. Rather than pursuing AI as an abstract technological race, the two sides have focused on areas closely related to economic transformation and social needs.

In recent years, China-Arab cooperation in AI has moved beyond research and development to practical applications in areas closely related to public services and daily life, including healthcare, tourism and urban governance.

In healthcare, the Chinese company Synyi AI has partnered with Saudi Arabia's Almoosa Health Group to launch "Dr Hua", an AI-powered clinical assistant. The system currently focuses on around 30 common respiratory conditions and supports patient consultations in English and Arabic, generating preliminary diagnostic reports and treatment suggestions for human doctors to review. In tourism, China's Baidu AI Cloud has collaborated with the Saudi Tourism Authority to enhance visitor experiences through large language models, intelligent translation services and digital human technologies. The cooperation aims to improve multilingual tourism services and visitor experiences. In urban governance, Chinese companies have participated in smart city initiatives across the Arab world, contributing to projects in intelligent transportation systems, smart buildings and digital urban management. In Saudi Arabia's Yanbu Industrial City, for example, Huawei helped deploy an AI-enabled traffic management system using 256 HD cameras across 16 major intersections, which reportedly reduced monthly traffic violations from about 5,000 to 2,000.

The growth of the AI sector depends on a continuous supply of skilled talent. For many Arab countries, developing local digital expertise and strengthening innovation capacity are critical to achieving successful digital transformation. Expanded cooperation between China and Arab states in this area reflects a shared recognition that technological progress requires sustained investment in people as much as in technology.

In 2024, SenseTime Middle East and Africa signed a memorandum of understanding with the King Abdulaziz and His Companions Foundation for Giftedness and Creativity (Mawhiba) to provide AI training programs for young Saudi students. In 2025, Huawei launched an AI education initiative in partnership with several Egyptian universities, offering online courses and certification programs for more than 25,000 students. Huawei has also launched a skills development center in Saudi Arabia, in partnership with the Ministry of Communications and Information Technology, aiming to train 25,000 local talents by 2030.

As AI becomes increasingly integrated into economic and social development, developing countries face a common challenge: how to harness AI in ways that advance their own development priorities rather than simply following technological pathways shaped elsewhere.

China-Arab cooperation in AI offers one practical response to this challenge. Rather than pursuing AI as an abstract technological race, the two sides have focused on areas closely related to economic transformation and social needs. From developing Arabic large language models and expanding AI applications in healthcare, tourism and urban governance to fostering local digital talent, the cooperation between the two sides has centered on localized innovation, practical applications and capacity building tailored to local needs.

This experience shows that AI can generate tangible development outcomes when it is rooted in local realities. Looking ahead, China and Arab countries are well-positioned to deepen their innovation partnerships and expand knowledge exchanges. By doing so, they can not only generate new momentum for their own digital development but also provide practical experience for other developing countries seeking AI strategies suited to their own linguistic, social and development conditions.

US curbs have limited impact on tech firms

Move shows again 'Washington is abusing scope of national security'

By MA SI
masi@chinadaily.com.cn

The US government's latest attempt to curb Chinese telecom and tech companies will have limited impact on their business, but the move once again shows that Washington is abusing the scope of national security, experts said on Monday.

The comments came after the US Federal Communications Commission on Friday said it would ban the import of more equipment from a group of Chinese manufacturers.

The move expands an FCC ban imposed in 2022 on new models of telecommunications and video surveillance equipment made by Huawei, ZTE, Hytera, Hikvision, and Dahua, citing alleged US national security risks.

Bai Ming, a researcher at the Chinese Academy of International Trade and Economic Cooperation, said the US government has been abusing the national security concept to contain the rise of Chinese tech companies.

It is mixing politics with normal business cooperation, and such practices will ultimately harm the rights and interests of US consumers, Bai said.

Xiang Ligang, director-general of the Information Consumption Alliance, a telecom industry association, said this is the latest move by Washington to crack down on Chinese-made electronic gear.

The above Chinese companies now have very limited business presence in the US, and the latest ban barely harms their actual operations.

"Rather, it speaks more loudly about the US government's political motives," Xiang added.

According to a report by Reuters, the latest ban now includes old models, not just those designed starting in late 2022, of equipment used for "public safety, security of government facilities, physical security surveillance of critical infrastructure, and other national security purposes," the FCC said.

The expanded ban is set to take effect in early July.

The FCC has rolled out a series of restrictive measures targeting Chinese technology. In December, it imposed a ban on imports of all new models of Chinese-made drones.

In March, it extended the restrictions to cover new models of Chinese-manufactured consumer routers — the networking devices that connect computers, smartphones, and other smart gadgets to the internet.

China's Ministry of Commerce expressed firm opposition in May to the US FCC's proposed restrictive measures against Chinese entities, urging Washington to stop its wrongful practices and respect market rules.

The FCC voted to advance measures last month that would revoke the qualifications of testing and certification bodies from countries without a mutual recognition agreement with the United States, and prohibit entities on its "Covered List" from conducting telecommunications business in the US.

In response, a spokesperson for the ministry stated that the FCC has abandoned the principle of technological neutrality and overstretched the concept of national security.

Without factual basis, the US has frequently introduced restrictive measures that discriminatorily treat enterprises and products from other countries, including China, severely damaging the interests of China and other relevant trading partners, the ministry said.

These measures undermine the hard-won stability of Sino-US economic and trade relations, and run counter to the consensus reached by the two heads of state, the spokesperson added.

The ministry urged the US to heed the voices of the industry and revoke the relevant measures.

A view of the Zhejiang Tiantai Pumped-storage Power Station. SUN JINBIAO / FOR CHINA DAILY

All units online for record-breaking hydroelectricity station in East China

By ZHENG XIN
zhengxin@chinadaily.com.cn

The full operation of a record-breaking pumped-storage hydroelectricity station in East China is poised to further accelerate the nation's green energy transition and fortify long-term grid security, said industry experts.

Marking a monumental technological leap in ultra-high head and large-capacity energy storage, the Zhejiang Tiantai Pumped-storage Power Station, which brought all its units online last week, serves as a crucial "regulator" for the country's modern power system.

As the first facility of its kind to become fully operational during the 15th Five-Year Plan (2026-30) period, the 1.7-gigawatt project, located in Taizhou, Zhejiang province, boasts the world's highest rated water head at 724 meters, according to its operator China Three Gorges Corp (CTG).

In hydroelectric engineering, water head refers to the vertical drop between the upper reservoir and the turbine units. A higher water head means greater water pressure and potential energy, allowing the station to generate more power using less water.

However, a massive 724-meter drop creates immense pressure, demanding state-of-the-art materials and cutting-edge engineering to ensure safe operation.

The megaproject features four 425-megawatt reversible pump-turbine units, representing the largest single-unit capacity domestically, and utilizes a domestic record 483-meter single-stage inclined penstock, it said.

Primarily tasked with peak-shaving, valley-filling, frequency regulation and emergency backup for the Zhejiang power grid, the station is expected to generate 1.7 billion kilowatt-hours of clean electricity annually.

Overcoming the immense challenges of a world-record water head, the project team systematically mastered the core manufacturing and application technologies for units exceeding 700 meters in head and 400 MW in capacity.

Furthermore, the project pioneered the large-scale domestic application of 1,000-megapascal high-strength steel and implemented innovative low-heat cement techniques to prevent rockfill dam face cracking. It also introduced unmanned, smart construction equipment — such as autonomous bulldozers — ensuring high-quality, collaborative operational efficiency.

The Tiantai station's completion aligns with a broader national strategy to utilize pumped-storage facilities as vital engines for sustainable development.

According to a recent report by the China Renewable Energy Engineering Institute, the sector will see a rapid leap over the next five years, with China expected to add roughly 100 million kilowatts of new capacity.

China has been steadily advancing the construction of approved projects, striving to meet the power system's demand for 400 million kW of flexible capacity by 2035.

Zhao Zenghai, deputy head of the institute, emphasized that these facilities are increasingly irreplaceable for ensuring safe grid operations amid expanding renewable energy integration.

He pointed out that while earlier projects primarily addressed peak-shaving in eastern load centers, future layouts will heavily support cross-provincial power transmission from new energy mega-bases in central and western regions, significantly enhancing transmission corridor efficiency.

Zhao believes that compared with the 14th Five-Year Plan (2021-25) period, the sector's development scale is expected to experience a rapid leap in the next five years.

Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute, observed that modern pumped-storage stations have shifted from prioritizing sheer scale to balancing scale with economic viability and ecological safety.

They will play a dual role: balancing rapid grid responses in the east while smoothing out wind and solar volatility in resource-rich western and northern areas to boost outbound transmission, he said.

Canadian boost for Chinese NEVs

By LI JIAYING
lijiaying@chinadaily.com.cn

China's new energy vehicle makers are accelerating their move into Canada as the two countries' new trade arrangement opens the door to greater market access, with leading automakers already moving to establish local sales networks and prepare product launches.

The latest sign of that momentum came as China's Ambassador to Canada Wang Di announced that Lotus, the premium electric vehicle brand under Geely Auto Group, will begin sales in Canada next month. The launch will mark the first Chinese-owned and manufactured EVs to enter the Canadian market under a new bilateral arrangement that allows up to 49,000 Chinese EVs to be imported each year at a preferential tariff rate of around 6 percent.

The agreement, which took effect on March 1, replaced the previous 100 percent tariff imposed in 2024. The annual quota will expand by 6.5 percent each year, reaching about 67,000 vehicles by 2031, providing Chinese automakers with gradually increasing access to the Canadian market.

Besides Lotus, more Chinese automakers are lining up to enter Canada. During her visit to China this month, Canadian Industry Minister Melanie Joly said she met with executives from four Chinese automakers — BYD, Chery, Geely and Shanghai Launch Automotive Technology — all of which expressed interest in exploring joint ventures in Canada as a pathway to local production.

The interest has already translated into concrete preparations, with several leading Chinese automakers having accelerated their market entry plans.

According to domestic media reports, BYD plans to open six retail outlets while completing import compliance procedures for two passenger vehicle models. Geely's premium Lotus is also preparing six dealerships, while ChangAn Automobile has established a dedicated local team to advance vehicle certification and build its local sales network.

Although Chinese-made EVs have been entering Canada under the new framework since May, import quotas have been dominated by Tesla vehicles manufactured at its Shanghai Gigafactory in this early window, with an estimated share of 10 percent to date, according to foreign media reports.

However, He Weiwen, a senior fellow at the Chinese Association of International Trade, said the tariff quota arrangement is still "a pragmatic breakthrough".

"An annual quota of 49,000 vehicles accounts for only about 2.5 percent of Canada's new vehicle sales last year, but it provides Chinese automakers with an important foothold in the market. In addition, Canada's renewed interest in automotive cooperation with China reflects its broader strategy to diversify trade partnerships," He said.

"Canada has long relied heavily on the United States market, and the risks of excessive dependence on a single trading partner have become increasingly apparent," he said, adding that the Canadian government has already proposed doubling exports to markets outside the US over the next decade. "Cooperation with China's auto industry is thus one important piece of that broader diversification strategy."

Still, He cautioned against overstating the broader implications of Canada's policy shift.

"For Chinese automakers, the key question is not how many countries are opening their doors. The real challenge is to become an indispensable long-term partner in those markets through technology, products and localized operations," He said.

CSITF seen as a catalyst for growth, development

By WANG YING in Shanghai
wang_ying@chinadaily.com.cn

With a record 600 deals reached, the China (Shanghai) International Technology Fair (CSITF), which concluded recently, has become an ideal platform for introducing the latest innovations and technologies, creating vast business opportunities and promoting industry cooperation spanning domestic and global markets.

As a regular participant at the fair, Shanghai-based iSage took part in this year's event with its exhibition area expanding to a record 126 square meters.

"The fair has helped us connect with a wide range of customers, investors and end-users, contributing to our growth as an industrial humanoid robot company. Our products are now available in more than 200 countries and regions," said Lu Xuedong, a marketing staffer with iSage. According to Lu, the company exhibited its full product lineup and debuted its latest industrial humanoid robot model at this year's fair.

"We aim to further strengthen our brand presence and ensure our equipment better reaches target customers," added Lu.

MengW, a company based in Suzhou, Jiangsu province, unveiled its first humanoid robot designed for the security sector during the fair.

"We need a platform to let more people know about our product, and the CSITF is exactly the one we are looking for," said Huang Jiangcheng, a senior account manager at MengW.

The robot product, officially known as Leo, traces its development back to 2017, when its research and development started.

"In addition to providing round-the-clock security services, the robot can also express basic emotions through actions such as greeting, saluting and giving a thumbs-up," Huang said.

According to him, the company anticipates that the debut will assist the goal of becoming a service provider for smart-city public spaces.

For N-Jump, a skincare technology company based in Beijing, the CSITF is not only a platform that opens the domestic market, but also a nexus linking global opportunities.

"Founded in 2023, we now operate a physical store in Beijing, and our Shanghai flagship store is scheduled to open in August," said Zhou Bingliang, head of the China market at N-Jump.

A robot seen at the recent China (Shanghai) International Technology Fair. BAO GANSHENG / FOR CHINA DAILY

According to Zhou, as a first-time participant of the fair, N-Jump joined the event as part of the group exhibitor organized by Beauty Nova Tech Hub, where N-Jump set up its physical booth last December.

Beauty Nova Tech Hub is an innovative beauty and health ecosystem community situated in Shanghai's Jing'an district.

Launched in May 2025 with only a few companies, Beauty Nova Tech Hub has grown to 102 enterprises. This year, it set up a 120-square-meter exhibition area to help 24 participating companies better connect with resources at the event, said Zhu Zihui, head of marketing at Beauty Nova Tech Hub.

At its 135-square-meter exhibition booth, Suzhou-based Magiclab showcased a total of 16 robots across six models, and also unveiled the first public demonstration of its robotic arm application in smart homes, powered by its large model.

"We attend the CSITF to let more people know about our products. Through exhibiting the large model, which is the brain of our humanoid robots, we hope to reach possible partners and build an ecosystem together," said Lin Fan, a manager on communications with Magiclab.

According to Lin, Magiclab's products are sold in more than 50 countries and regions, with around 60 percent of its revenue coming from overseas markets.

Briefly

Yuan weakens against greenback

The central parity rate of the yuan weakened 9 pips to 6.8175 against the US dollar on Monday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day. The central parity rate of the yuan against the US dollar is based on a weighted average of prices offered by market makers before the opening of the interbank market each business day.

Work safety enhanced to bolster rail transport

Chinese railway operators have bolstered work safety to solidify safe rail transport. With the 25th national safe production month taking place in June, Houma Train Operation Section under China Railway Taiyuan Group optimized safety control measures at station areas within its jurisdiction, stepping up safety education and practical drills. Partnering with police stations and the local fire and rescue brigade, it organized a joint drill at Linfen Station, letting employees from multiple workshops, including track maintenance, communication, signaling and power supply, to improve their emergency handling capabilities and safeguard travel safety.

MWC26 sets direction for future mobile

Industry at threshold where 5G giving way to 6G, IoT ascending to next stage

By MA SI
masi@chinadaily.com.cn

As the world's gaze focused on the FIFA World Cup 2026, an electrifying spectacle of skill unfolded at an exhibition hall in Shanghai: humanoid robots stepping up to the penalty spot, striking balls with precision and celebrating goals in front of roaring crowds.

The humanoid robot football penalties challenge, a centerpiece of the newly launched mobile artificial intelligence innovation pioneer zone at the 2026 Mobile World Congress Shanghai, also known as MWC26 Shanghai, a three-day event which ran through Friday, featured eight teams including Unitree Robotics, Linkerbot and China Mobile (Hangzhou). No remote controls, no preset scripts — each robot independently completed the entire process, from ball recognition and positioning to angle calculation, force control and shooting, all within milliseconds. It was, in every sense, a hardcore validation of embodied intelligence's perception-decision-motion control loop.

This was just one part of the exhibition that has firmly established itself as the global stage where AI meets the physical world. Vivek Badrinath, director-general of GSMA, an industry group representing the world's largest mobile phone operators, identified humanoid robotics, the low-altitude economy and autonomous driving as the three most exciting frontier tracks in Asia's mobile ecosystem.

Badrinath said not long ago, the core mission revolved around connecting people and devices. That remains important, but it is no longer the whole story. Telecom operators are now strategic digital partners working across industries to drive robotics, drones, connected vehicles and AI solutions deep into every sector of the economy.

Zhong Zhihong, chief engineer of the Ministry of Industry and Information Technology, laid out China's strategic direction for information and communication development: building robust next-generation infrastructure, strengthening technological innovation, deepening digital-industry integration, and pursuing open, win-win global cooperation.

On the technology front, Zhong called for accelerating 6G core research and development and standardization while cultivating application ecosystems across AI, quantum technology and embodied intelligence.

Crucially, she urged the global community to uphold unified 6G standards and build broad consensus on AI governance.

China Mobile Chairman Chen Zhongyue opened his keynote speech with a poignant story: Zhang Xujia, a hearing-impaired individual, received an AI device using China Mobile's "one person, one model" accessibility technology — and for the first time, was able to hear his own voice making phone calls and ordering food like anyone else. "AI should not serve only a select few, nor stop at the general public — it must equally illuminate every life," Chen said.

He argued that the very meaning of "mobile" is evolving — from Mobile Communication (voice and messages) to Mobile Computing (bytes) to Mobile AI (tokens). The core task now is processing "intelligence flows" — knowledge-bearing, problem-solving streams — not just data flows. Telecom operators must break free from the pipeline role and upgrade to AI service platforms capable of millisecond-level semantic parsing, cloud inference and intelligent generation.

China Mobile is building an open intelligent service ecosystem and integrated intelligent infrastructure as twin growth flywheels. "We do not build walled gardens," Chen said. "We aim to be a cooperative, win-win service platform."

On the network side, the company is advancing 5G-A, terabit optical networks and space-air-ground integrated deployment, with 6G R&D anchored to industrial manufacturing and telemedicine scenarios. Self-evolving "autonomous networks" — self-configuring, self-optimizing and self-healing — are also taking shape.

Meanwhile, China Unicom said on the sidelines of MWC26 Shanghai that it has identified international expansion as a new growth engine and is working with global partners to enhance submarine cable systems, cross-border terrestrial fiber routes, and accelerate the buildout of a global data-intelligent network and satellite-based internet of things infrastructure.

The State-owned telecom giant laid out its vision at the UniCom Global Partners Meeting 2026.

Miao Shouye, deputy general manager of China Unicom, underscored the company's strategic shift from a "basic pipeline provider" to a "comprehensive digital service provider", focusing on the core areas of connectivity, computing power, services and security.

He called for four collaborative actions: co-building intelligent networks via shared submarine and cross-border cables, as well as edge nodes, to create an integrated space-air-ground-ocean network; co-developing a cross-border cloud-computing ecosystem with token-based product suites to tap new business opportunities; co-delivering smart services by embedding AI into industry scenarios to meet diverse client needs; and co-establishing a security framework that ensures safe cross-border data flows and joint anti-fraud efforts.

Huawei Deputy Chairman and Rotating Chairman Wang Tao also declared 2026 a critical inflection point for mobile communications. He outlined key propositions for the next decade.

First, mobile networks must expand from connecting people and things to connecting intelligence. In hotspot areas, the density of intelligent agents is expected to exceed 10 million per square kilometer — far surpassing population density in the future. Second, on AI-network integration, Huawei proposed a three-layer intelligent architecture with a two-phase rollout.

On spectrum, Wang stressed that operators need 200 to 400 megahertz of continuous wideband spectrum as the capacity layer to deliver 6G's promised fivefold downlink and tenfold uplink improvements with ultra-low latency and high reliability. For space-terrestrial integration, he outlined two models: telecom operators introducing satellites as supplements, or ground-led collaborative network construction.

As the GSMA's latest report underscores, China now accounts for over 40 percent of global 5G connections. But the story at MWC26 Shanghai was about what comes next. From humanoid robots playing football to AI models giving voice to the hearing-impaired, from drone fleets operating under unified regulatory platforms to connected vehicles evolving into software-defined intelligent platforms, the message was unmistakable: the industry is standing at the threshold where 5G gives way to 6G, and where the internet of things ascends to the internet of intelligence.

MWC26 Shanghai made one thing clear: the future of mobile is not just about faster networks — it is about intelligence that is ubiquitous, inclusive and deeply embedded in the physical world. And China, for better or worse, is leading the charge.

Book-type foldables fast turning into hot AI interface

By MA SI

The book-type foldable smartphone is undergoing a profound transformation from a hardware novelty into a genuine AI-powered productivity tool, experts and corporate executives said.

A new report from market research company Counterpoint Research said that as smartphone AI evolves from single-feature gimmicks into system-level interactive gateways, book-type foldables with their expansive screens and multitasking capabilities are emerging as the optimal terminal for complex AI workflows.

This shift is reshaping market dynamics. Counterpoint projects global foldable smartphone shipments will grow 20 percent year-on-year in 2026, with book-type devices surging from 52 percent of total foldable shipments in 2025 to 65 percent in 2026. China alone accounts for more than half of global shipments, with shipments in the country surpassing 10 million units in 2025.

"The value of large screens is shifting from entertainment to productivity," Counterpoint said. As consumer AI demands move from simple Q&A to cross-app, multi-step complex tasks, users need sufficient screen real estate to review source materials, verify AI-generated content, and manage parallel operations. Traditional bar-type phones, with their constant app-switching friction, simply cannot keep up. Book-type foldables, by contrast, visualize entire workflows on a single expansive canvas, enabling parallel information processing that fully unlocks AI's productive potential.

Crucially, the report emphasizes that AI is not creating demand for foldables — it is multiplying their practical value exponentially.

The trend is in line with China's broader efforts to boost the consumption of AI-powered devices. Minister of Industry and Information Technology Li Lecheng said China will spare no effort in promoting the research, development and iterative upgrading of next-generation AI products this year.

The minister outlined a comprehensive roadmap for AI integration across multiple facets of the economy and daily life. A key priority is the consumer sector, where the MIIT aims to accelerate the development of AI-powered personal computers, AI mobile phones and smart home appliances to meet people's needs for a better life.

Against this background, Chinese tech company Vivo has launched its latest foldable flagship, the X Fold6, positioning it squarely at the intersection of "big screen plus AI productivity". The device represents what the company called the "second evolution" of foldables — "not just unfolding a big screen, but unfolding an AI workstation to complete complex tasks".

Huang Tao, vice-president of Vivo, said: "We want to build a software and hardware platform truly born for mobile AI, so users can enjoy AI to the fullest."

The X Fold6 runs OriginOS 6 Fold, the industry's first operating system custom-built for foldable large screens and AI task flows. Its signature feature — the Atomic Workbench — introduces both "serial" and "parallel" modes. In serial mode, users can run up to five windows simultaneously in a one-primary-four-secondary layout with no overlap. A simple screen fold or three-finger swipe transitions to parallel mode, which supports four apps tiled across the screen, each freely resizable. Frequently used layouts can be saved as one-tap desktop shortcuts.

The Atomic Workbench also features "AI cross-window drag-and-drop", enabling smooth information flow between apps — drag to convert to spreadsheets, translate text or save business cards with a single gesture. The system-level AI proactively identifies user intent, suggesting app combinations and even allowing multiple AI assistants to run side by side for comparative output analysis, Vivo said.

The move comes as industry analysts see 2026 as a pivotal year. Market research company International Data Corp has forecast that worldwide foldable smartphone shipments will grow 30 percent year-on-year in 2026, driven by Apple's anticipated entry into the segment later this year.

"The year 2026 will prove exciting for the foldable category with multiple launches pushing the market to 30 percent year-on-year growth," said Nabila Popal, senior research director at IDC. "Apple's entry will be a real game-changer."

Facing Apple's possible competition, Chinese vendors are accelerating their large-screen strategies to defend premium-tier positions. As IDC said in a report, foldables now represent a critical value driver — while still a niche by volume, their average selling prices are three times higher than standard smartphones.

However, challenges remain. "Compared to traditional bar-type smartphones, foldable R&D and bill-of-materials costs are significantly higher, directly limiting user base expansion," said Li Zegang, an analyst at UK market research company Omdia.

"Software adaptation is still incomplete, and there is room for product experience optimization. How to fully leverage the differentiated advantages of the large-screen foldable form factor through system design remains a critical challenge for the industry," Li added.

As the foldable market enters this new phase — defined by AI-powered productivity and intensifying competition — devices like the Vivo X Fold6 are staking a clear claim: the future of foldables is not just about how big the screen is, but how intelligently it works, experts said.

Visitors try out foldable smartphones at an exhibition in Shanghai on June 25. PROVIDED TO CHINA DAILY

Macao's tourism sector flourishes on diversity

By ZHAO YIMENG
zhaoyimeng@chinadaily.com.cn

On a rainy morning in mid-June, the familiar melody of *Jasmine Flower*, one of China's most beloved folk songs, drifted through the ornate interior of the Dom Pedro V Theatre in Macao, the first Western-style theater built in China.

The performers were members of the Macao Chinese Orchestra. Their instruments — the *erhu* and *guzheng* — embodied the essence of traditional Chinese music, while the resonant tones of the cello, a hallmark of Western classical tradition, were woven seamlessly into the arrangement. As the final notes faded, applause filled the 160-year-old theater.

The scene could hardly have unfolded anywhere but Macao.

As tourism ministers from across the Asia-Pacific gathered last week for the 13th APEC Tourism Ministerial Meeting, Macao presented itself as a living embodiment of cultural coexistence — a place where East and West have shared streets, flavors, architecture and traditions for more than four centuries.

In a city covering just 33 square kilometers, visitors can walk from the ruins of a European church facade to the Na Tcha Temple in a matter of minutes, while Macao cuisine blends Portuguese culinary traditions with Chinese ingredients and Southeast Asian spices.

"Macao is firmly rooted in Chinese culture while serving as an important window for exchanges and mutual learning between Eastern and Western civilizations," said O Lam, secretary for social affairs and culture of the Macao Special Administrative Region government.

The APEC gathering, she said, provided an opportunity to showcase Macao's role as a place where Chinese culture remains the mainstream while diverse cultures coexist and flourish.

Pansy Ho Chiu-king, chairperson of the Global Tourism Economy Research Center, believes the city's dual identity has become one of its greatest assets.

"The cultural and tourism sector is Macao's pillar industry," Ho said. "Our openness and inclusiveness make it easier for us to connect with different regions of the world and give us a unique appeal."

Macao is a gateway through which international visitors can better understand contemporary China, she said.

With about 600,000 residents, the city has the world's highest concentration of internationally recognized five-star hotel brands.

"Our service capacity, multilingual capabilities and international standards are among our greatest strengths," Ho said.

What Ho finds most remarkable is how seamlessly Macao has integrated its past with its future.

At the Historic Centre of Macao, a UNESCO World Heritage site, colonial buildings stand alongside centuries-old Chinese temples. Across the Cotai Strip, futuristic resorts rise from reclaimed land that did not exist a generation ago.

Since Macao's return to the motherland, the skyline has changed dramatically, but the historic neighborhoods that define the city's character remain intact.

Tourism authorities have expanded efforts to integrate heritage preservation, neighborhood revitalization and cultural experiences into tourism offerings.

New campaigns are targeting visitors from a broader range of international markets, according to Maria Helena de Senna Fernandes, director of the Macao Government Tourism Office.

In 2025, Macao received more than 40 million visitors. Arrivals have already exceeded 14.6 million in the first four months of this year, including more than 1 million international travelers, she said.

Meanwhile, neighboring Hengqin in Guangdong province has become a platform for economic diversification and deeper integration.

Wu Chuangwei, director of the Economic Development Bureau of the Guangdong-Macao In-Depth Cooperation Zone in Hengqin, said new travel facilitation measures are making multi-destination tourism more seamless.

A policy introduced in May 2024 allows organized tour groups to travel multiple times between Hengqin and Macao within a seven-day period. By April, more than 36,000 tour groups involving over 168,000 travelers had taken advantage of the arrangement, according to the bureau.

Leong Wai Man, director of Macao's Cultural Affairs Bureau, said the SAR is ramping up efforts to build a new international tourism and cultural district — a platform where Chinese culture serves as the mainstream while diverse cultures coexist.

In addition, new performance venues and talent development programs are intended to strengthen cultural ties across the Guangdong-Hong Kong-Macao Greater Bay Area while attracting global audiences, Leong said.

The write approach

Children dressed in *hanfu* — Chinese traditional clothing — and Li, Miao and Hui ethnic minority costumes demonstrate the Chinese character "*ren*", or "people", they wrote in a writing ceremony at a Confucian temple in Sanya, Hainan province, on Sunday. Nearly 100 students completed the ancient ritual, marking a new stage of life in pursuing knowledge and etiquette. PROVIDED TO CHINA DAILY

Qingzhou tests spur space tech

Robotic craft prototype finishes in-orbit cultivation, next-gen medicine tasks

By ZHAO LEI
zhaolei@chinadaily.com.cn

A prototype of China's Qingzhou, or "Light Ship", robotic cargo spacecraft has completed a series of experimental and testing tasks, its developer announced on Monday.

According to the Shanghai-based Innovation Academy for Microsatellites of the Chinese Academy of Sciences, the completed tasks covered space precision detection, next-generation space medicine and in-orbit biological cultivation.

In a news release, the academy said the results will provide technical support for the application of China's new space technologies, the transfer of space technologies to everyday life, the safe and efficient operation and maintenance of the Tiangong space station, and the utilization of space resources.

A micron-level deformation laser measuring instrument developed by the Harbin Institute of Technology achieved micron-level monitoring of the Qingzhou spacecraft's structural deformation in orbit, according to the release.

By extracting faint signals from a strong noise background through multiple core technologies, the instrument can accurately detect deformation of the spacecraft's cabin.

The technology is expected to provide critical measurement support for the long-term safe operation of the space station and cargo spacecraft, as well as for in-orbit precision manufacturing. It is also expected to enable ground controllers to monitor the health of spacecraft in real time.

Another advanced instrument, a chip-scale gyroscope developed by Shanghai Jiao Tong University, successfully completed angular velocity measurements aboard the Qingzhou.

The technology is expected to play an important role in precision navigation for deep-space exploration and bio-inspired aircraft, while enhancing the performance and intelligence of bio-inspired equipment.

An electromyography sensor, jointly developed by Shenzhen University of Advanced Technology and the Shenzhen Institutes of Advanced Technology under the Chinese Academy of Sciences, has, for the first time, verified the feasibility of continuously collecting and transmitting faint human muscle signals in real time.

Researchers from multiple organizations under the Chinese Academy of Sciences also used the Qingzhou to conduct a space resuscitation experiment on *Syntrichia caninervis*, or desert moss, an extremely stress-tolerant plant species.

The experiment verified the feasibility of the plant's resuscitation and survival under extreme space conditions, including microgravity, radiation and drought.

The findings are expected to support low-energy ecological improvement and in-situ resource utilization at future extraterrestrial bases, offer new approaches to building extraterrestrial bioregenerative life support systems, and provide references for the use of stress-resistant biological resources in desertification control and ecological restoration on Earth.

The Qingzhou prototype, a single-section cargo spacecraft, was launched on March 30 aboard a Kinetica 2 rocket from the Jiuquan Satellite Launch Center in northwestern China.

The first mass-produced Qingzhou spacecraft is scheduled to launch in early 2027 and dock with the Tiangong space station, according to the Innovation Academy for Microsatellites.

Submariners keep nation's flag flying under the sea

By LI SHANGYI
lishangyi@chinadaily.com.cn

Like a giant steel shark gliding silently through the depths, a naval submarine under the command of the People's Liberation Army Eastern Theater Command has carried out numerous missions in recent years. Hidden beneath the waves and out of public view, its crew members have endured dizziness, isolation and demanding conditions, remaining steadfast in their duties throughout each deployment.

Xu Guangze, a 23-year-old who joined its crew two years ago, completed his first sailing mission in 2025. For him, the experience was unforgettable.

As a new crew member, Xu followed a veteran sergeant responsible for the submarine's propulsion system. Although the deployment was relatively short, Xu admitted that there was much to adapt to.

Life underwater

Deprived of sunlight beneath the surface, crew members depended on a 24-hour clock to distinguish day from night. Their biological clocks were synchronized with the submarine's watch rotation, leaving them with fragmented sleep between shifts.

Xu knew that every section of the submarine was vital to its operation. "When I was alone at my post, I was very nervous," he said.

Fortunately, Xu did not suffer from seasickness, and he took every opportunity to learn from his fellow crew members.

After returning to shore, Xu still felt as though the ground was swaying beneath his feet. Fresh air filled his lungs, a stark contrast to the atmosphere inside the sealed submarine, where the air carried a mixture of smells from cooking, paint, electrical equipment and microbial fermentation.

There was little time to recover, however, as he and his fellow crew members quickly shifted their focus to reviewing the mission, drawing lessons from their experience and preparing for the next deployment.

This has become routine for Tang Jin over the past decade. A veteran submariner, Tang progressed from a novice sailor to a highly experienced sergeant during nearly 20 years of service in the PLA Navy.

In charge of the submarine's logistics support system, Tang said the sense of responsibility has long outweighed the discomfort of seasickness. He is known as the submarine's "troubleshooter" because he can solve a wide range of mechanical problems, from repairing valves to fixing onboard equipment.

Years of experience have enabled Tang to quickly identify problems. Once the submarine is underwater, he said, it is difficult to sleep soundly because he is constantly thinking about his responsibilities and remains on high alert.

In the submarine's cramped living quarters, three sailors shared two narrow bunks equipped with safety straps. As crew members rotated through shifts around the clock, the bunks were rarely empty and were often still warm when the next sailor climbed in.

For the crew, their priority is always the successful completion of the mission. During one deployment, Tang had just lain down when a fellow sailor woke him up to help drain contaminated water from the submarine.

"If the submarine has problems, about 70 percent fall under my area of responsibility, such as issues related to water and electricity," Tang said.

Before every mission, he repeatedly checked the equipment, knowing that any malfunction should be addressed as early as possible.

Recalling his first deployment 10 years ago, when he was still an apprentice, Tang said he became severely seasick, vomiting five times in just four hours in one instance. Although he still experiences occasional seasickness, he is now able to perform his duties without being affected.

The transition from a new sailor to a senior crew member takes three to five years of intensive training, according to Tang.

"Responsibility matters throughout the process," he said.

Tang said he is honored to serve in the PLA Navy. Since his days as a conscript, he has carried with him a saying: "For two years, roughly one thirty-fifth of a lifetime, you protect others. For the rest of your life, others protect you."

More to learn

Over the years, the crew has cultivated many technical experts like Tang.

Zhou Xiaohui, a veteran sailor with 30 years of experience, also lectures and mentors younger sailors.

"When I was a young sailor, I got nervous too," he said. "Now, whenever a problem occurs, I can usually determine the cause immediately, even pinpointing it to a specific screw."

In one year, Zhou spent more than 100 days aboard the submarine.

When the team was established, its members had an average age of 28. A long-standing tradition of mentoring and passing on experience has helped make it a well-known talent incubator in the PLA Navy. So far, the team has produced four submarine captains.

Zhang Shouwei, who has served in the PLA Navy for 16 years, said many sailors have devoted their youth to submarine service. While the vessel has been key to their personal growth, they have also witnessed the evolution of several generations of submarines.

Because a submarine is a highly complex system, Zhang said sailors must master a broad range of knowledge, from theory to operational skills. Even while ashore, their daily routine centers on training and navigation simulations.

The rapid evolution of equipment also requires sailors to continually update their knowledge and skill sets. Even Tang, now a sergeant in his 40s, is still learning to operate new equipment.

"There's always more to learn, like rust can never be fully scraped away," he said.

Describing a deployment as "a hundred men working in unison on a single gun", Zhang said every crew member must obey orders and perform their duties professionally to ensure the submarine operates smoothly and safely.

Young sailors like Xu are not intimidated by the long hours of study and training. Instead, they find them motivating.

"No matter how old we are, we stand together on the submarine, supporting one another," Xu said.

Sailors carry out preparations on the deck as a submarine returns to port and docks. PROVIDED TO CHINA DAILY

Homesickness

"Through the long night, the bells and drums seemed endlessly delayed, and the gleaming river of stars lingered as the sky approached dawn," said Zhang as he referenced an ancient Chinese poem to describe life aboard a submarine.

Sometimes deployments coincided with traditional festivals such as Mid-Autumn Festival. On those occasions, sailors lined up for a chance to look through the periscope and catch a glimpse of the full moon, Zhang said.

Beyond the physical and psychological demands of their work, submarine sailors must also cope with homesickness.

"We can't tell our families exactly when a mission begins or ends, and we don't want them to worry," Tang said.

During one deployment, his child fell seriously ill at home. His wife called him repeatedly, but he was unable to answer.

After Xu completed his first deployment, he discovered numerous missed calls from his parents.

"I called them back immediately," Xu said. "As soon as my mother saw me on the video call, she burst into tears."

Over time, their families came to understand the unique demands and sacrifices of submarine service.

However, submarine sailors do not dwell on these hardships. Instead, they remain focused on their duties and continue honing their technical skills.

"Being a soldier means dedication," Tang said.

Sun Chao and Ding Feiyu contributed to this story.

Yunnan village makes succulent profit

Area's dry desertified soil put to good use to create cactus industry that's growing residents' incomes

By **YAN YUJIE** in Wenshan, Yunnan and **LI YINGQING** in Kunming

Zhuangzitian, a village once severely impacted by rocky desertification in Southwest China's Yunnan province, has reversed a decades-long trend of environmental degradation and economic migration by developing a 15-million-yuan ($2.2 million) cactus cultivation and processing industry.

According to local village data, the initiative has successfully restored 80 hectares of previously barren land in the Wenshan Zhuang and Miao autonomous prefecture. The ecological shift has increased regional vegetation coverage from 32 percent to 75 percent and reduced annual soil erosion by an estimated 12,000 metric tons.

The environmental rehabilitation has triggered an economic turnaround for the village, which previously saw 70 percent of its young and middle-aged population leave for urban centers due to a shortage of arable land. By 2025, per capita income in Zhuangzitian reached 32,000 yuan, representing a 2.2-fold increase from 2022 levels and prompting a full return of the village's migrant workforce.

Above: Villagers reap cactus pads in Zhuangzitian. YAN YUJIE / CHINA DAILY
Right: Residents collect harvested cactus fruit in the village. PROVIDED TO CHINA DAILY

Opening a path

The restructuring program began in 2021 under the direction of Lu Chunhong, the village Party branch secretary, who returned to Zhuangzitian after two decades in the private sector. Lu targeted the region's native cactus population — a drought-resistant plant that had been grown on a small scale for over 200 years but lacked commercial scale or supply chain integration.

Traditionally, a household growing cacti on 0.67 hectares could earn up to 15,000 yuan annually from selling fresh fruit. However, by creating a cooperative that processes the fruit into dried products, their annual income could potentially increase more than threefold.

To incentivize participation, Lu established an agricultural cooperative and introduced a formalized collective profit-sharing model: 50 percent of returns are allocated to villagers who pool their land assets, 30 percent is distributed evenly among all residents, and 20 percent is directed into public welfare funds.

The villagers were soon convinced and eagerly pooled their land into the cooperative, initiating large-scale cactus cultivation.

With years of business experience, Lu realized that to propel the cactus industry forward, it was essential to extend the value chain.

He spearheaded the development of a comprehensive system that includes seedling cultivation, technical guidance and product procurement. A 4,000-square-meter processing facility was established to seamlessly integrate harvesting, processing and storage, effectively tackling challenges like cactus preservation and initial processing limitations.

Lu actively collaborated with institutions like China Agricultural University in Beijing and Southwest Forestry University in Kunming to form a 20-member research and development team, creating over 10 high-value-added products such as cactus beer and enzymes. This shift from selling raw materials to marketing finished products and brands enhanced the value-added potential by more than threefold.

To diversify sales channels, Lu partnered with a local agricultural investment company to establish a specialized operations team that covers offline supply, online sales and exports. As a result, the products are now available across several provinces and in neighboring countries.

In August 2025, 20 tons of edible cactus pads were exported to Vietnam, representing China's first cross-border shipment of these products, according to Kunming Customs.

Truong Cong Le Hoang, an executive member of the Vietnam Young Entrepreneurs Association, sampled cactus-based products like cactus beverages, describing their main advantages as having a "health concept" and "cultural appeal".

As the cactus market grows, the village has expanded its cultivation, reaching approximately 333 hectares last year, with a total annual output value of 15 million yuan.

Industrial diversification

The village has simultaneously diversified into secondary and tertiary industries, establishing an annual Cactus Cultural Tourism Festival since 2022 to drive agritourism.

Local residents have converted the increased foot traffic into direct retail revenue. Zhang Dengyun, a 51-year-old villager, said that during the peak festival period, direct on-site farm sales reached 40,000 yuan in a single day.

"This year, we plan to extend the festival from one day to three days," Lu said.

These festivals have put the village on the map. In 2025, the village attracted 100,000 tourists, providing a significant boost to the local dining scene.

The increased liquidity has altered local farming infrastructure. The Zhang family, whose household income rose from 100,000 yuan in 2022 to over 200,000 yuan in 2025 alongside a 30,000-yuan collective dividend, recently integrated commercial drones into their harvesting operations to bypass difficult mountain terrain.

"Previously, it took half an hour to carry a basket of cactus pads from the field to the transport truck by the roadside," Zhang said. "Now, with the drone, they can move two baskets in just two minutes, greatly enhancing efficiency and reducing physical strain. Nowadays, farming isn't as tough as it used to be."

Other residents have transitioned into the hospitality sector. Wang Yunxi, a 44-year-old villager, has operated a themed cactus restaurant since December 2021, drawing food enthusiasts from Beijing, Shanghai, the Guangxi Zhuang autonomous region and Zhejiang province.

"My restaurant is doing great, as many visitors are eager to try our cactus-themed feast. Last year, our revenue surpassed 400,000 yuan," Wang said.

He added that the most popular dish is chicken soup with cactus fruit, and he plans to develop more dishes to cater to the tastes of tourists from different regions.

Li Jiawen, a 43-year-old villager, opened a casual eatery serving drinks and snacks, providing tourists visiting the village with a place to relax. It opened in January and can seat up to 70 guests.

"My eatery usually gets busier on weekends, and we're seeing more and more visitors from other provinces," Li said.

It's not just the local villagers who have seized the opportunity to start businesses; outside investors are also attracted to the village's potential and are investing in educational tourism.

In 2024, Gao Bo from Chongqing started investing in educational tourism projects in the village and quickly reaped the benefits. By 2025, Gao's team had attracted nearly 40,000 visitors, generating revenues exceeding 300,000 yuan.

Among the visitors were kindergarten children who engaged in learning about cacti, pine trees and insects while getting physical exercise on specially designed hiking trails. Elementary school students have also visited the village, mainly for spring and autumn outings, as well as hands-on experiences like farming activities.

"I am optimistic about the village's growth prospects and view it as a compelling investment opportunity," Gao said.

The development of the cactus industry in Zhuangzitian has not only been an advancement in agriculture but has also been a comprehensive development of ecological management, rural vitalization, cultural-tourism integration and cross-border cooperation, according to Hoang from the Vietnamese entrepreneurs association.

Happy returns

The development of Zhuangzitian village has brought tangible benefits to its residents.

In 2025, Wang's family earned an additional 40,000 yuan in dividends from the village cooperative.

"My family's income is now significantly higher than when my wife and I were working out of the village. Back then, after covering our living expenses, we could save at most 60,000 yuan," he said.

What brings Wang even more comfort is that being back home allows him to better care for his elderly parents and two children.

Fellow eatery operator Li can really relate to this feeling. After spending nearly 20 years away from home, he's now back with a business and can finally enjoy quality time with his family.

Zhuangzitian village's green development path has attracted the attention of Vietnam, which shares a border with Wenshan Zhuang and Miao autonomous prefecture.

Starting in 2023, Vietnamese delegations have frequently visited Zhuangzitian village to explore collaboration opportunities.

Hoang said that the village's experience holds significant value for Vietnam. Some areas in his country face similar challenges, such as inefficient land use. However, cacti, known for their drought resistance, adaptability and high economic value, are ideally suited for cultivation in these regions.

By integrating the industry with local tourism, youth entrepreneurship and green agriculture in Vietnam, there is potential to develop a unique and innovative industrial chain in the future, he added.

Returned Party chief spearheads local development

By **YAN YUJIE** and **LI YINGQING**

In a makeshift livestream studio set up inside a cactus warehouse in Zhuangzitian village of Wenshan Zhuang and Miao autonomous prefecture, Yunnan province, a middle-aged man in a suit is seen adeptly presenting a wide range of cactus products.

He isn't a full-time host but the village's Party branch secretary, Lu Chunhong. Livestreaming is just one of the many roles he juggles as he strives to lead the village toward prosperity.

Zhuangzitian village was once notorious for its poverty. Over 80 percent of its land suffered from rocky desertification, leaving each villager with less than 0.13 hectares of arable land.

Lu Chunhong

As a result, many young people left to seek better opportunities elsewhere, and Lu was once among them.

For nearly 20 years, Lu has engaged in various business ventures outside the village, spanning industries such as mining, agriculture, aquaculture and trade. Despite his growing success, Lu remained deeply concerned about the persistent poverty in his hometown.

In 2021, when the local government launched a talent return program aimed at boosting rural development through the leadership of prominent individuals, Lu decided to return to his hometown, bringing with him the wealth and experience he had accumulated over the years.

Rather than following the trend of planting the most popular crops, he evaluated the soil conditions and engaged with the villagers to identify the most suitable crops for the village.

"Cacti are well-suited to the region's arid climate and poor soil, making them an economical choice for cultivation. They are highly valuable, with their fruits, flowers and pads being used in the production of food, medicine and cosmetics," Lu said.

After selecting cacti as the primary crop and intercropping with corn and beans, Lu's next challenge was to persuade the villagers to pool their land as shares, paving the way for large-scale cultivation and unified sales.

To ease the villagers' worries, Lu contributed all 2 hectares of his own land to the village's collective economy. He assured them that he would cover any loss, while profits would be shared among everyone.

Inspired by Lu's leadership, the villagers gradually set aside their doubts and contributed their land as equity shares.

In 2022, the first harvest from 93 hectares of cacti was plentiful, generating more than 5 million yuan ($740,000) in sales revenue that year.

However, Lu didn't rest on his laurels; instead, he focused on the next challenge.

"I understand that industries with low entry barriers usually don't stay lucrative for more than three years, as they quickly become saturated with imitators. Therefore, we need to extend the supply chain and increase the added value of our products," Lu said.

He simultaneously targeted production, research and development, and sales to build a comprehensive industry chain, setting the cactus industry in Zhuangzitian village apart from the rest.

After five years of development, all the village's migrant workers had returned, and by 2025, the average income per resident had reached 32,000 yuan. This transformation has turned the village into a model of industrial prosperity in the region.

The villagers have cherished what Lu has done for the community. Villager Wang Yunxi said: "Lu is the heart and soul of the village. He has played a crucial role in developing our cactus industry, and we couldn't have achieved this without him."

Gao Bo, an investor from Chongqing, has seen firsthand how Lu spearheaded the development of the cactus industry in the village.

"Lu has a very dynamic mindset and thinks differently from many others. He has what it takes to unite the entire village, leading everyone toward prosperity and benefiting the local community," said Gao.

Lu said that he always keeps in mind that working for the people's well-being is the greatest achievement.

CULTURAL HERITAGE

Journey through the birth of dynastic China

Rare relics reveal how distant communities were united with ritual and belief, report **Bai Shuhao** and **Zhou Lihua** in Wuhan.

On an ordinary day more than 3,000 years ago, a diviner posed a question to the gods: Would it not rain? The answer came in the cracks of a turtle shell. At the time, the land that is now China was warmer and wetter than it is today, rich with rainfall and fertile soil. But the question inscribed on that oracle bone — No rain? — betrayed a deeper anxiety.

For the rulers of the Shang Dynasty (c. 16th century-11th century BC), agriculture was the ground on which the kingdom stood. Drought and flood alike could bring famine, unrest and even the collapse of the state.

That fragment of divination, excavated millennia later, now sits inside a glass case at the Panlongcheng site in Wuhan, Hubei province, anchoring one of China's most compelling archaeological exhibitions this year.

Opened for the country's annual Cultural and Natural Heritage Day, *Tracing Xia and Shang*, an exhibition at the Panlongcheng Site Museum, gathers 163 artifacts from 35 museums and archaeological institutions across the country.

Together, they tell the story of how China's earliest dynasties, the Xia (c. 21st century-16th century BC) and the Shang, exchanged, negotiated and absorbed influences across distant regions, laying the foundations of an enduring civilization. The exhibition runs through Oct 18.

Its setting itself is part of that story. Rule of both Xia and Shang centered present-day Henan province in the heart of the Yellow River Basin. Once a thriving city during the Xia-Shang period, Panlongcheng stood not in that core area, but along the Yangtze River, hundreds of kilometers to the south.

Yet the bronzes unearthed here bear unmistakable ties to the royal centers of the north. "The bronze vessels found at Panlongcheng share forms and decorative patterns with those of the Central Plains," says Song Ruohong, the exhibition's curator. "That tells us it was under direct influence, perhaps even direct administration, from the Shang capitals."

In her view, Panlongcheng represented an early model of Chinese governance: a political center extending its authority outward through regional strongholds. The exhibition follows that logic through three sections — Foundations of the Dynasty, Origins of Ritual and Music, and Pivot of the Four Quarters — tracing how power was built.

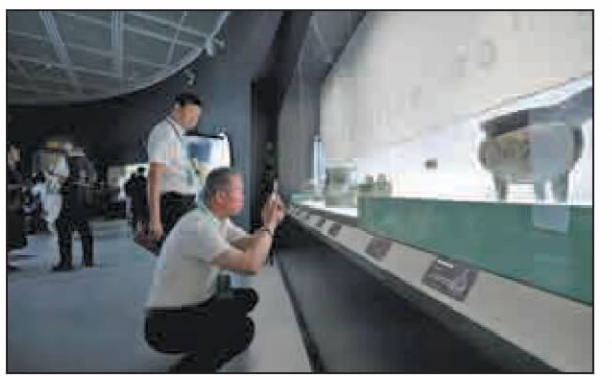
The first gallery begins with roofs and pipes. A single clay roof tile and a segment of ceramic drainage pipe sit near the entrance, humble objects suggesting something profound: by the Xia and Shang periods, China had already developed advanced construction techniques and water-management systems.

Agriculture, too, was becoming increasingly sophisticated. The exhibition displays charred seeds, bronze adzes used for cutting wood and bronze spades for turning soil.

These were tools of survival. But survival was becoming organized. By this period, craft production had begun shifting from household workshops to centralized industries overseen by royal or aristocratic authorities. Labor was becoming specialized. Regions were beginning to depend on one another.

Bronze casting makes that shift visible. One vessel on display, a *ding* from Anyang in Henan province, was made using whole casting in which molten bronze was poured into a complete mold. The seams of that mold remain visible along its sides.

Beside it stands a bronze *gui* from Panlongcheng, made using sectional casting, a more complex process in which separate parts were cast and later assembled.



"Sectional casting made the flourishing of later bronze culture possible," Song explains. "Without it, you would never see those massive, highly intricate ritual bronzes."

Some scholars, she adds, have suggested that something resembling an assembly line for bronze production may already have existed during the Shang.

The second gallery charts what those technical breakthroughs made possible. At its center stands what archaeologists call China's earliest bronze *ding*: a grid-patterned vessel from Erlitou, a site often associated with the Xia capital, and the oldest bronze *ding* yet discovered.

Top: A Sanxingdui mask on display. **Above:** Oracle bones inscribed with weather divinations on display. **Left:** A bronze *gui* vessel with *taotie* motifs, reflecting the sophisticated bronze-casting techniques of the Shang Dynasty (c. 16th century-11th century BC), and a scallop shell found atop the head of an aristocratic tomb occupant from the late Xia Dynasty (c. 21st century-16th century BC). **Below:** Bronze ritual vessels on display at *Tracing Xia and Shang*, an exhibition at the Panlongcheng Site Museum in Wuhan, Hubei province. Nearby is its opposite: the smallest known bronze *ding* ever excavated, just 5.1 centimeters tall and weighing only 50 grams. Found in a child's tomb, it is exquisitely made, complete with a tiny lid. Archaeologists say it may have been a toy, or a mourning object left by grieving parents.

Elsewhere in the room is a ritual wine vessel belonging to Yazhang, a Shang general who died in battle during the reign of Wuding, a king of the late Shang. Its body bears a bronze relief of a large elephant sheltering a smaller one beneath its legs, a scene of tenderness rarely seen in Shang bronzes.

But not everything in this section is bronze. A massive pottery *zun* from the Dawenkou site bears a striking resemblance to the bronze ritual vessels displayed beside it.

"If people couldn't access bronze, they found other materials to imitate it," Song says. "They were still trying to move closer to the aesthetics and authority of the capital."

By then, ritual had become a language of power. And that raises the exhibition's most pressing question: How did dynasties like Xia and Shang extend themselves across such a vast landscape?

The final gallery offers one answer. Song holds that if local elites used the same ritual vessels as the center, it suggested they accepted the same hierarchy. That was how power traveled. Among the objects here, one has become a favorite among visitors: a Shang-era bronze *gui* unearthed in Shanxi province.

Shaped like a fierce beast, its ears, eyes and nose are sharply defined. At its base crouches a smaller creature, part horse, part deer. Archaeologists believe the animal may represent the totem of the Bing clan, a tribal group active in Shanxi during the Shang.

"Shanxi was a frontier," Song says. "Part of it was under Shang control, but it was also close to hostile steppe groups. The Bing clan seems to have maintained friendly ties with the Shang king, perhaps ruling here on the dynasty's behalf."

But by the late Shang, as royal authority receded, that order began to fragment. Bronzes in the south developed regional styles of their own.

The exhibition closes with artifacts from the Yangtze basin, including the haunting bronze masks of Sanxingdui. Though they still relied on Shang casting techniques, their forms had become radically different.

"By then, the Shang court had turned eastward and loosened its control over the Yangtze. That was when Panlongcheng gradually declined. It was no longer a political outpost, but a place of trade," Song reflects.

To Zhang Jian, deputy director of the Zhengzhou Municipal Institute of Cultural Relics and Archaeology, the bronzes themselves reveal the deeper logic of rule. "The dynasty maintained authority through rituals embodied in bronze vessels," he says. "That was the foundation of political legitimacy."

Yang Haiyan, deputy director of the Shandong University Museum, says the exhibition offers a rare map of how the Xia and Shang civilizations took shape. Her museum lent two top-tier national relics to the show.

In her view, the advanced pottery and jade craftsmanship of the eastern regions influenced distant cultures in ways only now becoming clear. It was this constant movement of ideas, materials and beliefs, she says, that produced the brilliance of early Chinese civilization.

For Song, that legacy endured far beyond the fall of the Shang. The ritual order and political hierarchy forged during the Xia and Shang would shape Chinese dynasties for the next several thousand years. Again and again, power would grow by drawing in the margins and extending outward, carried by shared symbols, bronze vessels and systems of belief.

County preserves revolutionary history beyond museum walls

By DENG ZHANGYU
in Hong'an, Hubei
dengzhangyu@chinadaily.com.cn

In the heart of Hubei province, Hong'an county in the city of Huanggang stands as a living testament to China's revolutionary past.

Home to 224 preserved revolutionary sites, it has earned the nickname "a city of revolutionary history without walls".

Carefully protected wartime relics dating to the 1920s offer visitors a vivid glimpse into a defining chapter of modern Chinese history.

Hong'an was the birthplace and nurturing ground of three major Red Army forces. It also served as the heart of the Eyuwan revolutionary base, a key stronghold established during the Agrarian Revolutionary War period (1927–37), where the Communist Party of China built rural Soviet governments and mobilized farmers against warlords and landlords.
