According to Wu Guohong, curator of the Hong'an County Museum, this small county lost 140,000 of its sons and daughters during the years of national defense, and produced 223 founding generals of the People's Republic of China.

The spirit of those years lives on in a local folk song: "Little Hong'an, every person a hero; when the bronze gong sounds, 480,000 rise; men go to battle, women bring food."

Almost every resident can still sing it.

One of the most striking areas is Changsheng Street, a 600-meter-long stone-paved lane, lined with black-tiled roofs and wooden buildings that have changed little since the 1920s. Here, visitors can find former Red Army canteens, a Red Army pharmacy, post office, labor union, and bank.

Traditional craft shops, including fabric stores, tailors' shops, and blacksmith workshops continue to operate alongside these historic landmarks, blending everyday life with revolutionary heritage.

About a 20-minute drive from the county seat is Bayi village, where the revolutionary song *The Osmanthus Blossoms in August* was first sung.

The village preserves several former Red Army living and working sites while offering immersive study tours. Visitors can learn revolutionary songs from local residents and hear the story of General Fang Heming, who returned after the war to help rebuild his hometown.

Left: A meeting room once used by the Red Army, located in Bayi village, Hong'an county, Hubei province, has been restored on its original site. **Right:** Changsheng Street in Hong'an, a 600-meter-long stone-paved lane, has many key revolutionary relics. PHOTOS BY DENG ZHANGYU / CHINA DAILY

In May, the village welcomed an average of over 600 visitors each day.

Despite decades of exposure to the elements, these revolutionary sites remain remarkably well preserved. In 2024, Hong'an was designated as one of the second batch of National Demonstration Zones for the Protection and Utilization of Revolutionary Cultural Relics.

Liu Wei, director of Hong'an's Cultural Relics Development Center, says the central government's support for protecting and making use of revolutionary heritage has increased significantly over the past decade through both funding and policy.

"These measures have brought major improvements to the preservation of our revolutionary heritage," Liu says.

In 2021, the National Cultural Heritage Administration formulated a detailed special plan for protecting and utilizing revolutionary cultural relics. The revised Cultural Relics Protection Law, which took effect in March 2025, includes a dedicated chapter on revolutionary cultural relics and sets out rules for their restoration and ownership.

Local authorities have also introduced a range of conservation measures. Every site now has a designated guardian and a comprehensive protection plan, Liu says.

The ultimate goal, Liu explains, is to help younger generations remember and understand their history.

The county has trained student guides to lead tours and share local stories.

"We want, above all, to engage young people," Liu says. "We hope the children and young people of Hong'an understand their own history and pass it on to their peers."

In addition to conventional tours, the county has also launched an immersive live-action production, *Hong'an, Hong'an*.

Against a backdrop of explosions, gunfire and battle cries, audiences are transported back to 1927, offering another powerful way to experience this pivotal period of revolutionary history.

LIFE

From left: Two quiet presences of egrets; a flock of swans floating on the blue lake framed through willow branches; and a heron standing atop a large rock. PHOTOS BY ZHANG LIANJUN / FOR CHINA DAILY

Photography puts biodiversity in flight

Through his lens, Zhang Lianjun captures not only birds, but the harmony between humans and nature, as well as philosophy and metaphors, **Xing Wen** reports.

In the stillness of Antarctica, a lone penguin stands dead-center on the ice, with a jagged peak rising in the background. Its reflection shimmers faintly on the dark water below.

With wings slightly outstretched, its white belly faces the camera while its head tilts subtly, as if locking eyes with the viewers through one dark orb.

This quiet, meaningful moment is captured by nature and wildlife photographer Zhang Lianjun, better known by his pseudonym Bianyuan ("Edge"), and featured in his latest solo exhibition at the Guardian Art Center in Beijing from June 6 to 9, during which a series of events were also held, including photographer sharing sessions and thematic science lectures.

The show brought together 72 avian photographs, selected from more than 1.3 million that Zhang has taken over 36 years in the field.

Through his lens, birds are never merely subjects — they become metaphors for solitude, migration, kinship, and the interconnected natural world we all share.

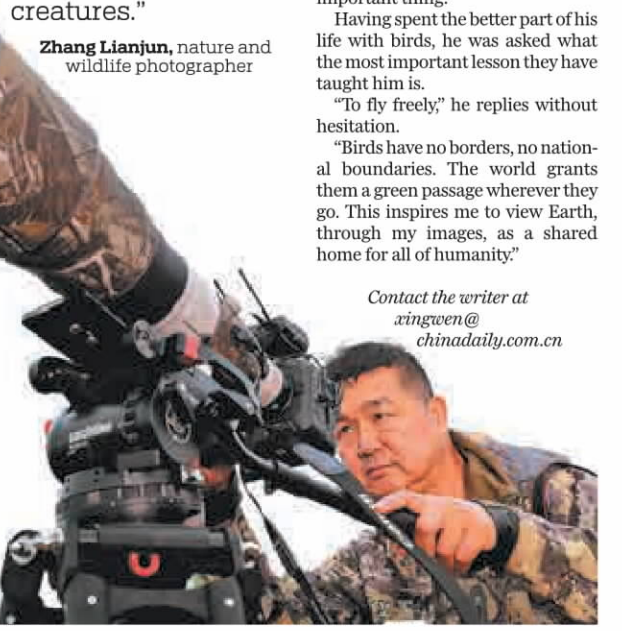
Upon entering the exhibition, one can see a crested ibis hidden among the branches of deep-red autumn leaves, its white feathers contrasting with the warm reds in an interplay of cool and warm tones; a close-up of a swan's neck partially submerged as it ducks its head into the water, forming a shape resembling the Chinese calligraphic stroke "一" (one); and a black-and-white photograph in which a flock of birds in flight is rendered as ethereal blurs scattered across the dark, intertwining lines of withered branches, as quiet as a traditional Chinese ink painting.

"There are no Photoshop-manipulated images in the entire exhibition," Zhang explains. Instead, he makes extensive use of techniques such as slow shutter speeds, panning, and multiple exposures to capture the dynamic moments of birds in flight or gliding through water.

Zhang, born in 1963, became fascinated with avian photography in 1989.

His travels have taken him to the North Pole and Antarctica, as well as to over 100 nature reserves across Africa, the Americas, Europe, Australia, and Asia.

Within China, he has visited more than 300 bird breeding, habitat and migration sites.



Looking back, he divides his photography career into three stages.

"The first 12 years, I focused on capturing the interplay of light and shadow on birds' feathers and their flight postures," Zhang says.

Left: In late autumn in the Qinling Mountains of Shaanxi province, a crested ibis perches alone on a branch. **Below:** Zhang Lianjun travels across the country to photograph birds. PHOTOS PROVIDED TO CHINA DAILY

> "What matters most is how you approach ecology with your heart and enter into a dialogue with living creatures."
>
> **Zhang Lianjun,** nature and wildlife photographer

"In the second stage, I aimed to express the relationship between humans and birds through my photographs. In the third stage, I began using my images to convey my own state of mind and philosophical reflections."

In his latest exhibition, every lone bird serves as a metaphor for his solo journey in pursuit of birds' traces, he adds.

"And those flocks of birds," he says, "express that I am not traveling alone — that there are also social bonds and kinship".

During his travels over the passing decades, he has also witnessed China's progress in ecological protection firsthand.

In the early 1990s, he recalls, the country had only a small number of nature reserves, with insufficient government investment and incomplete relevant laws and regulations.

"In remote areas, transportation was difficult," he says, "and sometimes I had to borrow a donkey to carry my equipment, as there was also a lack of strict zoning controls."

Today, however, he notes that nature reserves have implemented a tiered management system consisting of core zones, buffer zones and ecological experiment zones. "Government investment has grown tremendously," he says, "and responsibilities have been assigned down to the township, village and even every household, with strict prohibitions against destructive behaviors."

He adds that protecting birds and the ecosystem has now become a consensus among people of various age groups, "forming a positive situation where humans and nature coexist in harmony".

The exhibition was held as part of the fifth anniversary celebration of the launch of the Canon Biodiversity Photography Initiative, a charity program that encourages photography enthusiasts to document China's biodiversity through photographs, raise public awareness of ecological protection, and support the development of ecological photography culture.

Over the past five years, the project has attracted more than 7,000 photography enthusiasts. Participants have traveled to 47 cities and visited over 10 nature reserves, producing more than 60,000 ecological images capturing nearly 1,000 species of nationally protected animals.

"The project has amassed a large volume of high-quality, traceable wild bird images, providing significant supplementary data for avian ecology research and opening an intuitive window for the public to understand the relationship between urbanization and biodiversity," said Zhang Zhengwang, chair of the China Ornithological Society.

Zhang Lianjun joined the project in 2021.

"I don't think bird photography is bound by the length of the lens," Zhang Lianjun says.

"What matters most is how you approach ecology with your heart and enter into a dialogue with living creatures. That, to me, is the most important thing."

Having spent the better part of his life with birds, he was asked what the most important lesson they have taught him is.

"To fly freely," he replies without hesitation.

"Birds have no borders, no national boundaries. The world grants them a green passage wherever they go. This inspires me to view Earth, through my images, as a shared home for all of humanity."

Millennia-old charm in 'city of porcelain' transcends time

NANCHANG — The 2026 Congress of the International Academy of Ceramics opened in the eastern Chinese city of Jingdezhen, Jiangxi province, on Sunday, attracting international ceramic artists and experts to explore the theme of "Inheritance and Innovation".

The Geneva-based International Academy of Ceramics is holding the event in Jingdezhen, China's ancient porcelain capital, with a porcelain-making history spanning over 1,700 years.

The event features a series of activities, including keynote speeches, academic seminars and international exhibitions. During the event, participants will discuss preserving tradition while opening new paths for creation, sustainability and technology.

Speaking at the opening ceremony, Oriol Calvo Verges, president of the IAC, highlights the significance of the event's theme.

"In recent decades, China has shown that ceramics can be much more than a heritage to preserve. Ceramics can also be a powerful force for urban regeneration, education, tourism, innovation, industry, artistic creation and international dialogue," he says.

Left: People attend the opening ceremony of the 2026 Congress of the International Academy of Ceramics in Jingdezhen, East China's Jiangxi province, on Sunday. **Right:** Oriol Calvo Verges, president of the International Academy of Ceramics, speaks at the opening ceremony on the same day. PHOTOS BY XINHUA

He adds that Jingdezhen is an exceptional place where heritage is visible everywhere, including in the kilns and workshops, while innovation thrives everywhere — in exhibitions and new creative districts, for example.

Chen Kelong, secretary of the Jingdezhen Municipal Committee of the Communist Party of China, says the city is building itself into a national demonstration zone for the inheritance and innovation of ceramic culture.

Attendees agree that Jingdezhen is captivating young enthusiasts from around the world with its openness and inclusivity.

Chen also notes that Jingdezhen has established partnerships with over 180 cities in more than 70 countries, and that artists and ceramists from over 50 countries and regions have settled in the city to create and work.

Australian artist Fleur Schell says that Jingdezhen's scale and comprehensive ceramic industrial chain have drawn many of her friends and colleagues from Australia to work in the city. "It feels like anything is possible," she says. "You can make anything in ceramics."

Donald Wayne Higby, an emeritus professor of ceramic art at Jingdezhen Ceramic University who first visited Jingdezhen in 1992, shared his deep affection for the city. "People used to call this 'the city of porcelain'. I say it's also 'the city of possibility'," Higby says.

"I have returned to Jingdezhen every year, sometimes even three or four times a year, since 1992," he adds. "I meet young artists here who inspire me tremendously."

Beyond inspiration, the artist emphasizes the role ceramics play in fostering international exchange, serving as a "common language" that transcends cultural boundaries.

Pu Shouzhi, Party secretary of Jingdezhen Ceramic University, echoed this sentiment, noting that the event aims to connect the wisdom of the East and the West. "We look forward to using ceramic culture as a bridge to let the millennia-old porcelain charm transcend mountains and seas," Pu says.

Since the Song Dynasty (960-1279), ceramics crafted in Jingdezhen have been exported to Central Asia, West Asia, Europe, and Africa. Today, the city still retains its global appeal, drawing more than 5,000 ceramic enthusiasts from around the world at peak times.

"Let us remember the past, but let us also imagine the future," says Verges, adding that Jingdezhen reminds people that ceramics can carry memory, beauty, identity, and hope across centuries.

LIFE

Destiny unfolds in long-awaited spy tale

Director Feng Xiaogang has brought his long-cherished espionage story to the screen, using one man's hidden identity to explore fate, **Xu Fan** reports.

Three months after celebrating his 68th birthday, director Feng Xiaogang — long known for his sharp tongue and fiery temperament — appeared unusually gentle and composed before the media.

Earlier this month, at the premiere of his latest film, *I Know Who You Are*, held at Beijing Exhibition Theater, Feng kept a low profile. Wearing a pair of reading glasses, he stood quietly to one side, leaving the spotlight to the film's two leading actors, Hu Ge and Lei Jiayin.

The subdued appearance seemed a departure from the outspoken filmmaker audiences have known for decades. Yet beneath that calm exterior lies a story of persistence — one that stretches back more than three decades.

The roots of *I Know Who You Are* can be traced to 1993, when Feng and his longtime collaborator, writer Wang Shuo, jointly acquired the adaptation rights to Zhang Ce's 1992 novella *Wu Hui Zhui Zong* (No Regrets). The espionage story follows a police officer's four-decade pursuit of a Kuomintang spy who went undercover on the eve of the founding of the People's Republic of China.

The novella was first adapted into a 20-episode television series of the same title, becoming a hit when it aired in 1995. Written by journalist-turned-screenwriter Shi Jianquan, who has also served as scriptwriter of the new film, the TV drama evolved into a classic, securing a rating of 9.4 out of 10 on the major review aggregator Douban.

This is not a typical cat-and-mouse thriller. There are no car chases, no gunfights, no trench-coated spies trading coded messages in the rain. Instead, the film offers something rarer: an emotionally layered portrait of two men bound together by suspicion and circumstance, their lives unfolding against the backdrop of China's sweeping social transformation from 1949 to the late 1980s.

At its core, it is a meditation on fate — on how history, chance, and the quiet weight of personal choices can shape, and sometimes shatter, an ordinary life. That philosophical depth, and its exploration of the absurdity of destiny, is precisely what continued to resonate with Feng decades after he first encountered the story.

With the June 19 release of *I Know Who You Are*, Feng, whose career spans acclaimed works from *The Dream Factory* (1997) to *Youth* (2017), has finally realized his long-cherished dream. The film will also be released in the United States, Canada, Australia and New Zealand in early July, according to American magazine The Hollywood Reporter.

Top: Director Feng Xiaogang's latest film, *I Know Who You Are*, had its premiere at Beijing Exhibition Theater on June 17. **Above:** The movie features actor Hu Ge as a Kuomintang spy who is assigned to operate undercover in the capital on the eve of the founding of New China. PHOTOS PROVIDED TO CHINA DAILY

Top: A poster of the film. **Above:** Actor Lei Jiayin plays a police officer who dedicates decades to the spy investigation.

"It is a film I've always wanted to make. The lives we've lived — I hope to capture them on screen. This is a commitment, a responsibility ... For directors of my generation, it is our duty to bring to life the eras and events that younger audiences have never experienced firsthand, so that through cinema they can truly understand the past," says Feng, a native of Beijing.

This film, as Feng puts it, is steeped in the everyday life of Beijing's *hutong* alleys. Unfolding on the eve of the founding ceremony of New China, the story follows Feng Jingbo — a Kuomintang colonel and secret agent played by actor Hu — who is entrusted by his superior, played by Yu Hewei, with an espionage mission, along with four gold bars and a radio transmitter.

However, during a casual chat in a barbershop, Feng Jingbo reveals his knowledge of military salutes, arousing the suspicion of Xiao Dali, the local police chief played by Lei. To aid his investigation, Xiao moves into the same courtyard where Feng Jingbo lives, becoming his neighbor. To maintain his cover, Feng Jingbo, who works as a geography teacher at a primary school, spares no effort — including sacrificing love to marry a woman from the "working class", and contributing to economic development, ultimately rising to become the school's principal. Meanwhile, Xiao endures a series of devastating blows — losing his wife, his youngest son, and having one leg crippled.

But Xiao's unwavering loyalty to the country, his persistence in pursuing the spy investigation, and his personal misfortunes all weigh heavily on Feng Jingbo's conscience. In the 1980s, Feng Jingbo's former superior — now a Hong Kong businessman — returns to Beijing for his son's wedding. It is then that Feng Jingbo discovers that his painstaking undercover work of 35 years has been meaningless, as he has long been forgotten by the intelligence agency in Taiwan.

Added to this is his growing admiration for the Communist Party of China, and Feng turns himself in willingly, finally finding himself able to share a drink with Xiao — the man he has respected and rivaled for half a lifetime.

For actor Hu, a Shanghai native, inspiration came from conversations with his father, who was born in 1949. "My father lived through the eras that Feng Jingbo experienced. Through him, I came to feel that individuals, within the sweep of history, are often carried forward by forces beyond their control," Hu says.

"As an intellectual who came of age in the old era, Feng Jingbo possesses an idealistic streak. He accepts the undercover mission out of a genuine hope that his country and its people would improve — he simply chooses the wrong side," adds Hu.

Lei, who plays the dedicated police chief, recalls reading the script at 6 am the following day, having received it from Feng Xiaogang the previous night. "The story is brilliantly written. What truly moves me is watching how people's fates shift and intertwine against the backdrop of a changing era," he says.

Interestingly, Lei reveals that he, Hu, and the two actresses who play their wives created a WeChat group, using their character names to chat every day. They discussed trivial details of daily life — such as whether they could raise hens in the courtyard — to cultivate the special bond between their characters, who are at once enemies and friends, and to let those nuanced emotions grow organically off-screen.

With its resonant lines and vivid, nostalgic depiction of Beijing decades ago, the film has gained wide acclaim, receiving 7.5 points on Douban and grossing 100 million yuan ($14.72 million) at the box office by Monday.

Chinese doctor's legacy of service lives on in Tanzania

DAR ES SALAAM — In a pediatric operating room at Muhimbili National Hospital in Dar es Salaam, Tanzania, an aluminum medical equipment case sits quietly in a corner.

Written on its lid in black marker are the simple words: "Dr Zhang", "China Team", and a phone number.

The handwriting has faded over time. The number no longer works. Yet no one has erased it.

"We want these words to stay here forever," says Hosea Boniface, an anesthetist at the hospital, gently touching the case.

The case once belonged to Zhang Junqiao, a Chinese doctor who served in Tanzania as leader of the 27th Chinese medical team. On June 15, 2025, Zhang died while rescuing a local woman from the sea in Dar es Salaam. He was 38.

One year later, traces of his presence remain across Tanzania, in hospital corridors, in the memories of colleagues, in the lives of children he helped, and in the hearts of people who never forgot his kindness.

At the hospital, where Zhang spent much of his time training young anesthetists, colleagues still speak of him with admiration.

"He never got tired of answering our questions," recalls Boniface. "Sometimes he would demonstrate the same procedure over and over again until we fully understood."

Tanzania faces a chronic shortage of trained anesthetists, and Zhang devoted much of his time to mentoring local medical workers, according to Boniface, who added that many of the young doctors he trained can now perform procedures that once required foreign specialists.

"People here respected him not because of any title," says Liu Jia, leader of the 28th Chinese medical team in Tanzania. "They respected him because he truly helped others."

Far from the hospital, Zhang is remembered in other ways.

Every evening, children selling balloons weave through traffic along Dar es Salaam's busy seafront roads. Among them is 9-year-old Nefat, who still remembers a Chinese doctor who often stopped his bicycle to talk to her.

"He would ask whether we had eaten and how many balloons we had sold," she says.

In her memory, the Chinese doctor always had a smile on his face. "A lot of cars passed us, but no one stopped," Nefat says, lowering her head. "But he did."

When she learned of Zhang's death, she cried for days.

"I thought I would see him again one day," she says softly.

Another child whose life was changed by Zhang is Rweiss Ali Kato, a boy born with a giant abdominal hernia.

Rweiss' mother recalls the difficult years her son endured due to the untreated condition that left him in pain and distress.

"He would come home from school sad and tell me he felt like there was something hidden in his stomach," she says. "As a parent, it was very painful to see him like that."

A turning point came when a Chinese medical team conducting a free outreach clinic visited his school. After examining the boy, the team determined that his condition was treatable.

"I was overjoyed when I received the news," his mother, Mumin, says, recalling the life-changing moment for her son.

Spearheaded by Zhang, the Chinese medical team and the Chinese company China Railway Jianchang Engineering Company (East Africa) Limited joined hands to fully cover the cost of the treatment.

The surgery was successfully carried out in February 2025. Following the operation, Rweiss regained his confidence and returned to school a happier child, free from pain and stigma.

When reporters visited him again this year, he had just returned from playing football with friends.

"He has changed completely," the mother says. "Zhang changed his life."

The image that brought Zhang's story to wider attention was captured on the afternoon of June 15, 2025.

Mike, a beach photographer, saw a crowd gathering along the shore and rushed toward the commotion, describing how in rough waves, a Chinese man was struggling to bring a drowning woman back to safety.

"The sea was rough, and he was exhausted, but he kept going," Mike recalls.

He raised his camera and pressed the shutter.

The photograph showed Zhang holding the woman above the water, fighting the waves as he moved toward the shore. The woman survived, Zhang did not.

At the time, Mike knew neither the man's name nor his profession.

"But I knew one thing," he says. "He was saving a life."

"He was a gift from God to the people of Tanzania," Mike says. "Not everyone would do that, but he did."

For those who knew Zhang, the sacrifice was not surprising.

Whether in hospitals, communities, or villages, he was always the first to step forward when someone needed help.

While working in Shandong province, China, he was involved in public welfare activities for a long time, launching a first-aid public welfare project that has since conducted more than 400 sessions, training more than 20,000 people.

In order to popularize CPR knowledge, he converted his old house into a training base at his own expense. To help more people master first aid skills, he purchased teaching models and equipment on his own. After arriving in Tanzania, he maintained these selfless habits.

Shortly before his death, Zhang wrote on social media: "Serving people knows no borders. As a Chinese doctor, I am proud of my country and my profession."

One year after his passing, his knowledge, compassion, and sense of responsibility continue to ripple through the lives he touched.

The faded words on an old equipment case remain. So do the memories, and so does the legacy of a doctor whose life continues to inspire others long after he is gone.

Perhaps this is the best way to commemorate Zhang Junqiao.

2026 WORLD CUP

Oh Canada! Late winner downs South Africa

History meets heartache, as co-host nets in stoppage time

Above: Canadian players celebrate Stephen Eustaquio's winning goal in their 1-0 round-of-32 victory over South Africa in Los Angeles on Sunday. **Left:** Canada's Alistair Johnston and Eustaquio (right) share a smile after the match. **Left below:** Jubilant fans celebrate in Vancouver, Canada. REUTERS

Right after Canada finished its first knockout match victory in a World Cup, coach Jesse Marsch huddled his players on the grass of a stadium still in pandemonium and spoke from his heart — shouted, actually.

"You guys are Canadian heroes today!" Marsch declared. "Canadian heroes for the future children of this country who play this sport. The sport has a big future because of you guys. You should be so proud of who you are. You should be so proud of this game. You never lost belief. You went after it, point after point, moment after moment. You are Canadian heroes!"

Stephen Eustaquio's dramatic late goal had inspired Marsch to Ted Lasso levels of earnestness, and he didn't care who knew it.

Soccer has never been the main event on Canada's busy sports calendar, and Les Rouges are playing in only their third World Cup this summer. But Marsch realized this landmark 1-0 win over South Africa on Sunday is the type of achievement that can seize an entire nation's attention for a generation.

"We could have made life a little easier on ourselves if we had made a play earlier when we had some big chances," Marsch said. "But, obviously, the timing of the goal means that the win is incredibly dramatic, and I think the effect that it will have in Canada, and the inspiring of people, will be immense."

After 90-plus minutes of frustration and failure to break down a cagey South Africa at SoFi Stadium in Los Angeles, Canada made history in an instant, when Alistair Johnston's long pass into the box was cleared directly into the path of Eustaquio.

The midfielder, who plays professionally at nearby Los Angeles FC, coolly chested it down and blasted it off the bounce into the bottom corner of Ronwen Williams' net before sprinting away to celebrate with Canada's bench in the second minute of second-half stoppage time.

"We worked for it," Eustaquio said. "We have a special group. We feel like we are brothers. When we fight for each other, when we play for each other, special things like this can happen. I am over the moon, but at the same time I don't want to say that the job is finished."

Canada, which sits 30th in the most recent FIFA world rankings, advanced to face the Netherlands or Morocco in Houston on Saturday.

After playing its first three group matches in Toronto and Vancouver, Canada missed the chance to also make this bit of history at home when it lost 2-1 to Switzerland last Wednesday and got sent on the road for the knockout rounds. But Marsch's plucky team responded by winning this tournament's first round-of-32 match and reaching the round of 16 for the first time in its three trips to the World Cup.

Between their traveling fans and thousands of supportive locals, including several in Eustaquio's LAFC shirt who couldn't have imagined the day they were about to enjoy, the Canadians were the clear crowd favorite.

"We never stopped believing," Eustaquio said.

"And I think the goal is really something that we deserved."

After finishing second in their respective groups, both South Africa and Canada were playing for their nations' first knockout victories at a World Cup when they opened the round of 32 with the only match of the day.

ise David for a golden chance, but the forward hit it wide. The game then bogged down again — but Eustaquio made sure Canada avoided extra time.

"Steph is one of the people in the team that, I think, is the most reliable and understands what we're trying to achieve as a group, and understands how to manage moments in games and to be a leader, a true leader," Marsch said. "It was good to see him, in that moment, just being in the moment and thinking about the best way to strike the ball to give it the best chance to go in. Really composed and really well-executed."

Williams made five saves for South Africa, which played with remarkable heart in a largely rearguard action, hanging on until the final moments in the hope of securing another historic result.

Canada got a boost in the 75th minute, when star defender Alphonso Davies came on for his first World Cup action. The playmaking Bayern Munich defender missed Canada's group matches after suffering a third hamstring injury of the year last month, but finally returned to the same stadium where he tore a knee ligament in March 2025 in a CONCACAF Nations League match.

Davies immediately made the best pass of the day to set up Prom-

It stood firm defensively and created a handful of tantalizing chances, despite getting just one shot on goal.

"We lost the game because, when compared with that of our opponent, there was a lack of power and speed in our team," South Africa coach Hugo Broos said. "We had a difficult game, certainly. But when we look back, we can be fairly satisfied with what we did."

AP

Marsch: Eustaquio did late parents proud

Stephen Eustaquio delivered a moment his late parents would have been proud of, according to Canada coach Jesse Marsch, after the midfielder's dramatic stoppage-time winner sent his team into the World Cup last 16 with a 1-0 victory over South Africa on Sunday.

The 29-year-old settled a cagey affair with a powerful half-volley from outside the penalty area in the second minute of added time, capping what Marsch described as a richly deserved reward for a player who has endured profound personal tragedy.

"I couldn't think of a more deserving human being in a group of incredible human beings," Marsch told reporters after the win in Los Angeles.

"Maybe Steph is the most deserving to have a moment like that. So, I'm really happy for him, and I think, from somewhere, his parents are looking down, and they saw that."

Eustaquio lost both of his parents in little more than a year, his mother in April 2023 and his father in May 2024.

Marsch said Eustaquio embodied the leadership and composure his side had worked to develop.

"Steph is one of the people in the team that I think is the most reliable and understands what we're trying to achieve as a group," he said.

After playing all its previous games in Canada, the American acknowledged that his side had been disappointed to leave after the group stage, but said the move to Los Angeles had not proved disruptive, because his team was accustomed to playing south of the border.

"We're used to playing in the States. We actually play more games in the States than we do in Canada," he said.

Canada will face either Morocco or the Netherlands in Houston on July 4, with Marsch relishing the opportunity to test his side against one of the tournament's big guns, describing Morocco as "a modern giant" and the Dutch as "a traditional giant".

"I feel like it's a free hit, and we're going to go after it and do everything we can to see if we can find a way to get a win," he said.

REUTERS

'Boring' Bay Area fixtures confound critics with stellar attendances

Crowds have flocked to San Francisco Bay Area Stadium for games initially considered to be the World Cup's least glamorous. REUTERS

SANTA CLARA, California — In a region boasting vast tech wealth and global corporate influence, the San Francisco Bay Area's humble World Cup schedule landed with a dull thud, raising groans from fans over its lack of marquee matches.

While Kansas City welcomed Argentina and Boston hosted England, Bay Area locals subsisted on a more niche set of nations, with world No 16 Switzerland the highest-ranked visitor in five matches to date.

For Arab soccer enthusiasts, it has been a bonanza, with Qatar, Algeria and Jordan (twice) all gracing the home of the NFL's San Francisco 49ers.

With fans on social media ranking it the least glamorous fixture list of all the United States' 11 host cities, a paucity of nightlife near the stadium in sleepy Santa Clara and little buzz before the tournament, there were fears of a Bay Area bust.

"The World Cup was supposed to be a Bay Area bonanza. Why does it feel like a flop?" San Francisco Chronicle asked days before the tournament.

The narrative has shifted about 180 degrees since, with crowds having flocked to the area's matches.

"I follow European football, so, for sure, I was disappointed, I would have liked more balance in the teams we got here, for my own self-interest," James Fay, a recently retired CFO of a tech company, told reporters at last Thursday's Group J match between Australia and Paraguay.

"But, having a World Cup here is fantastic, there was no way I was going to miss it. I didn't get to go in '94, it's my first World Cup, so I'm coming, no matter what."

Diverse fandom

Fay was among a crowd of 68,827, a few hundred below the tournament's maximum capacity of 69,391. The lowest attendance reported by organizers was 67,966 for the first match between Switzerland and Qatar.

At each game, neutral fans have turned up in force.

Huge cheers from Americans at Thursday's match rang out when the scoreboard gave an update on the concurrent Group J match being played out between the US and Turkiye in Los Angeles.

Mexico fans from San Jose and other big Latino communities in the south of the Bay Area have been enthusiastic attendees, particularly for Paraguay's two group matches.

"It has been amazing to see the diversity and international fandom that has come into the Bay and participated in fan marches, attended games, and experienced everything we have to offer," the Bay Area Host Committee (BAHC) said in a statement.

Bay Area resident Nick Zhang went with two friends to Thursday's game and paid $330 for a nosebleed seat in the full glare of the afternoon sun.

"Well, there was a game on and we just wanted the experience. We're way up high, but we can still get a taste of it," he said.

Once disparaged for its "boring" schedule, the Bay Area is now having the last laugh, as it prepares to welcome the US on Wednesday for its round-of-32 clash with Bosnia and Herzegovina.

Ticket prices have spiked on reselling platforms, with the cheapest on StubHub being offered for $2,000.

Away from the stadium, organizers are preparing for a huge party at the main fan zone at San Pedro Square in San Jose, putting up a fourth giant screen for the Bay Area's World Cup swan song.

More than 350,000 people have visited the square since the World Cup started, according to BAHC.

"There's been some left-field teams coming to town, but the US will be a good finish to the party," James Martinez, a local student, said.

The 2008 Olympics: Games that keep on giving

Twenty-five years ago, Beijing won the right to host the Olympic Games. It marked the beginning of an extraordinary Olympic journey for China.

For me, the Beijing 2008 Olympic Games became one of the defining moments of my life as an athlete. I will always remember the feeling of those Games: the energy of the city, the pride of the people, the color and creativity of the opening ceremony, and the sense that the whole world had come together in one place.

Inside
Views, **page 7**

I also remember two venues in particular. The Water Cube will always be special to me as a swimmer. It was there that I experienced some of the most important moments of my career. The Bird's Nest became one of the defining images of Beijing 2008 — an iconic setting for an opening ceremony that brought Chinese culture and creativity to the world.

When I returned to Beijing for the 2022 Winter Olympic Games, this time as an International Olympic Committee member, I saw those memories in a new light. The Water Cube had become the Ice Cube — the Olympic curling venue. The Bird's Nest once again staged unforgettable Olympic opening and closing ceremonies.

These were striking examples of venues being given a second life. But they also pointed to something bigger.

The real legacy of an Olympic Games is never only about what remains after the flame goes out. It is about what the Games make possible afterward. Can more young people discover sports? Can more communities be active? Can athletes train and compete in better conditions? Can a city become better equipped for the future?

Those are the questions that should guide every Olympic host from the very beginning — to ensure that the Games deliver more for local communities while leaving a lighter footprint on the environment.

That is what sustainable Games should mean. It starts with responsible choices about resources — venues, transportation and energy. But its purpose is broader: to create benefits that last.

Beijing shows what that can look like.

Beijing debunks South China Sea statement

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Inside
Editorial, **page 6**

Beijing has blasted a joint statement released by 14 countries regarding the "2016 South China Sea arbitration award", urging those countries to "stop stirring up trouble over the South China Sea issue" and "cease undermining peace and stability in the South China Sea".

"China urges the relevant countries to earnestly respect China's territorial sovereignty and maritime rights and interests in the South China Sea," the Foreign Ministry said in a statement on Sunday.

The United States, the Philippines, Australia, Canada, Estonia, Germany, Italy, Japan, Latvia, Lithuania, New Zealand, Romania, Slovenia and the United Kingdom issued a joint statement earlier on Sunday.

The 14-nation joint statement claimed that the "award" rendered 10 years ago by the "arbitral tribunal in the South China Sea arbitration" is "a significant milestone", and that "there is no legal basis for China's expansive maritime claims in the South China Sea".

In response, the Foreign Ministry noted that, "If the 'award' were to be taken as a standard, many countries' islands and reefs would be denied the basis for claiming maritime rights and interests.

"May we ask, have those countries supporting the 'award' voluntarily waived the maritime rights and interests deriving from their relevant islands and reefs?" the ministry added in its own statement dismissing the 14-nation claims.

The ministry reiterated that China does not accept or recognize the "award", and it opposes and does not accept any claim or action based on it.

"Land territorial issues are not subject to the United Nations Convention on the Law of the Sea", and the "award" is nothing but a worthless piece of paper that is illegal, null and void, the ministry said.

The US and other countries have been persistently reinforcing their military presence in the South China Sea, throwing their weight around and fanning the flames, it warned. "These acts of militarization and coercion constitute the primary challenge to the current situation in the South China Sea," the ministry said.

For the past 10 years, the "award" has "become a tool for the Philippines to expand its territorial and maritime claims, exacerbated tensions in the region and provided a pretext for external forces to intervene and destabilize the South China Sea", the ministry noted.

The continued playing up of the illegal "award" by certain countries "goes against the aspirations of countries and people in the region for development and prosperity", the ministry said, adding that "such attempts are doomed to fail".

Wu Shicun, chairman of the Huayang Center for Maritime Cooperation and Ocean Governance, said that the "award" was "a political farce" executed by the then Philippine administration, manipulated by the US and assisted by Japan in an attempt to whitewash Manila's illegal claims and actions.

Also on Sunday, Japanese Foreign Minister Toshimitsu Motegi made a separate statement blatantly endorsing the "award", attacking China's lawful claims and mischaracterizing Japan as a "legitimate stakeholder who uses the South China Sea".

"China strongly deplores and firmly opposes this," a spokesperson for the Chinese Foreign Ministry said in a written response.

The spokesperson noted Japan's wartime atrocities against China and its people, as well as its illegal occupation of islands and reefs in the South China Sea, and said that now Japan is again attempting to meddle in the South China Sea.

"This reminds people of Japan's history of aggression and expansion, and heightens their vigilance against Japan's neo-militarist agenda," the spokesperson said.

According to the "award" supported by Japan, Taiping Dao in the Nansha Islands — an area that spans 500,000 square meters and has fresh water, vegetables, fruits and poultry to sustain human habitation — is not even considered an island and therefore cannot generate entitlement to an exclusive economic zone and continental shelf, the spokesperson said.

"By that 'standard', many of Japan's islands and reefs would likewise have no basis for claiming maritime rights and interests," the spokesperson added. The spokesperson questioned Japan's claim to the EEZ and continental shelf around Okinotori, which is nothing more than two tiny rocks of less than 10 square meters in the Pacific.

The head of the ministry's Department of Asian Affairs on Sunday summoned the chief minister of the embassy of Japan in China to lodge a stern representation and strong protest.

On Sunday, the Chinese Mission to the European Union also blasted a separate statement issued by the EU about the "award", which called for securing freedom of navigation and overflight.

A spokesperson for the Chinese mission said that the EU is not a stakeholder in the South China Sea issue, and the EU's statement "disregards the historical context and objective facts of the South China Sea issue, runs counter to the purposes and principles of the United Nations Charter, and is detrimental to the region's peace and stability".

XI'S VISION | CULTURAL DEVELOPMENT

Ruins highlight efforts to trace, preserve roots

Mesmerizing Yinxu site in Henan province marks 20 years on UNESCO heritage list

By **WANG RU**
wangru1@chinadaily.com.cn

Numerous exquisite bronze and other items from the earliest recorded time of Chinese civilization are testament to a widely spreading kingship of China's Central Plains, as well as China's oldest-known writing system and multiple historical legends, and have provided significant illumination for modern Chinese archaeology since the 1920s.

The Yinxu Ruins in Anyang, Henan province, which one expert described as the "brightest star" of Chinese archaeology, connect the early stage of China as a nation around 3,300 years ago to the modern age, and have mesmerized not only professionals, but also the Chinese general public, inspiring them to trace their literary roots.

Monday marks the 20th anniversary of the Yinxu Ruins being inscribed on the UNESCO World Heritage List. As the site celebrates this milestone anniversary, one of the most eye-catching attractions at the Yinxu Museum is something playful: a hair-drying cap shaped like an adorable owl.

Since its debut in 2024, the hair-drying cap has been a hit among tourists flocking to the museum. Featuring a lively, big-eyed owl look and strong practical value for daily use, it draws inspiration from an owl-shaped wine vessel unearthed from the tomb at Yinxu of Fu Hao, China's first-known female general and a consort of the Shang Dynasty (c.16th century-11th century BC) king Wu Ding.

Zhao Qingrong, director of the museum, said that when museum visitors wear available replica caps or clothing with elements of the Shang Dynasty, or they eat food that has been made in the style of those early days, "they are no longer something strange in your textbooks. Your taste buds and skin have a real interaction with them, which lingers better than a mere glance at exhibit cabinets".

"In this way, we transfer the obscure archaeological knowledge into an accessible aesthetic experience, so that people can connect with the Yinxu Ruins in their daily lives and thus develop an emotional bond with that remote era," she added.

The Yinxu Ruins, at the site of an ancient capital of the late Shang Dynasty, have yielded numerous exquisite bronze vessels as well as oracle bones, which bear inscriptions known as *jiaguwen* that are carved on animal bones to record events and for fortune-telling, and constitute the earliest-known formal writing system in China.

The preservation and popularity of such products are no accident. Over the past two decades, sustained top-level guidance and cultural protection efforts have laid a solid foundation for the innovative inheritance of Shang civilization.

SUMMER WONDERLAND WELCOMES NIGHT OWLS

Entertainment complex looks to elevate Shanghai's Fuxing Park into a nightlife hub

By **HE QI** in Shanghai
heqi@chinadaily.com.cn

As the dappled light filters through Fuxing Park's plane tree leaves at dusk, Shanghai's nighttime energy starts to permeate neighborhoods, parks and riverfronts.

Ranked No 1 in the night economy index of China Business News, the city is living up to its billing with a new nightlife wonderland, with the park at its heart.

"I really enjoy the nightlife in Shanghai," said Tommaso Bianchin, an Italian wine industry professional.

"I have friends who go to underground clubs and rooftop parties. The venues are great, people are friendly, and the standard is high."

Spanish DJ Lalo Lopez, who has performed globally, agreed: "I've attended many parties, in many countries, and Shanghai's nightlife is unique," said Lopez.

It's the diversity of nighttime offerings that is the main attraction, and diversity is the watchword for INS Land, a massive multi-story entertainment and lifestyle complex located in Fuxing Park.

Visitors dream of taking China's serenity, safety home

'Everyday' stability, sense of security impress tourists, foreign residents

By **ZHANG XIAOMIN**
in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

Visitors pose for a photo at the Shanghai Disney Resort on June 16. LIU YING / XINHUA

"What is it like night walking in China's Guangzhou, one of the most populated cities in the world? It's extremely safe. I'm wearing my very expensive watch. No one bothers you, no one is trying to pull you in their shops," British creator Ben posted on his social media account, OTWD.

His observation about the capital of South China's Guangdong province, casual as it seemed, struck a chord with a large number of foreign visitors to China.

When a man can stroll through one of the world's busiest urban centers late at night wearing an expensive timepiece — and nothing happens — his actions challenge assumptions about safety in densely populated cities.

As China gains in popularity as a travel destination, a growing number of foreign tourists are capturing moments through their lenses showing how safe China is, their images resonating deeply with expats and visitors. This "Chinese sense of security" has sparked spirited discussions on social media platforms both at home and abroad.

The growing perception that China is an extremely safe destination is backed up by statistics. In 2025, the number of criminal cases in the country dropped 12.8 percent year-on-year, reaching their lowest level in decades, while public order cases also declined, according to data from China's Ministry of Public Security. In addition, public confidence of public safety remained above 98 percent for the sixth consecutive year.

Perhaps more telling for an international audience is the Global Safety Report 2025, released in January 2026 by the US-based analytics firm Gallup. Among more than 140 countries and territories surveyed, China ranked third safest overall. The report also highlighted strong public confidence in local law enforcement and low levels of personal experience with crime.

The new normal

"When I first came to Beijing two years ago, I went outside at night and found there were still a lot of people walking around, and everything felt normal, like it wasn't even that late. At that moment, I thought 'this place is actually really safe'," said Salah Eddine Ben Mhmed, a 20-year-old student from Morocco, who is now studying at Dalian Polytechnic University in Liaoning province.

"It felt strange seeing people outside late at night without a worry. But now it feels completely normal to me," he added. He attributes this feeling to a combination of public order and a general trust that daily life is calm and well-managed.

This transition from a surprise to seeing it as normal is common among many long-term foreign residents in China.

Merlin Palmer, 40, a Canadian IT engineer who works in Beijing, arrived in China in 2012 and planned to stay only briefly. "I was thinking about traveling the world as an English teacher," he said.

That was before he met his wife Bonny Liu. Fourteen years later, he lives happily in Chaoyang district with his wife, 5-year-old son Arthur, and a puppy called Chocolate.

Palmer said living in Beijing had fundamentally changed his perspective on parenting and safety.

"Parents don't have to worry about guns or drugs, or racism or bullying," he said. "Arthur is in a classroom of 99 percent ethnically Chinese children, and he has never experienced any kind of 'othering' because of that. He is very much accepted and loved within his peer group."

Palmer credits not just legal protections, but also school food standards, community safety measures, and everyday kindness from strangers. "In China, there are a lot of policies about children's safety that may feel restrictive to some people, but in the end, they make a meaningful impact on the safety of children day-to-day."

Eddy, an American host at Dunhuang Media Center in Gansu province, pointed to the absence of gun violence as a major difference to the United States.

Growing up in an environment where school shooting drills were routine, he finds a special meaning in China's sense of security. He also pointed out that China's safety goes beyond law enforcement.

From fire safety education on campus to community awareness and shared responsibility, he believes the country's strong sense of security is built not only by institutions, but also by the people and communities who look out for one another every day.

Italian artist Federico Gentile, who visited Dalian during this year's Summer Davos forum in June, was equally impressed.

"People roam free and don't worry about anything. It's amazing to see a lot of happy families, having fun with their kids," he said.

During the May Day holiday, the "unattended luggage wall" at Liyuan station of Wuhan metro in Hubei province went viral.

Tourists neatly lined up their suitcases along the station wall before heading out to explore the city. This unguarded and perfectly orderly wall of luggage went viral on Chinese social media, becoming a symbol of the country's trademark "worry-free" travel.

Foreign Ministry spokesperson Mao Ning also shared a video on social media with the caption, "In Central China's Wuhan, unattended luggage lined the walls of a metro station, left behind by tourists eager to explore the city. Safe and worry-free!"

Unattended luggage walls and designated luggage storage areas are not unique to Wuhan.

They can also be found at metro stations in Changsha, Hunan province, Foshan in Guangdong, Nanjing, Jiangsu province, and Fuzhou, Fujian province, and other cities. This sense of security goes beyond trusting that one's suitcase will remain safe; it reflects a deeper confidence in the sense of security in China that people have come to rely on.

Positive impression

A playful post by Chinese vlogger Alan Jun on Facebook gained wide recognition. It posed the question: "'Is it safe to travel in China? Please don't lie.' An American netizen asked this question. Every city in China is extremely safe. The only unsafe place is the night market, where you will spend all your money, lose sleep, overeat, and gain weight. So you must not go out at night."

Under that post, netizen Properly_Basic replied: "As someone who lived in China for a bit, it is amazing how you can go outside at like 1 am without the worry of someone kidnapping you."

Another user, Alan Camp, commented: "I had 14 days in China. Beijing, Yantai (Shandong province), Shanghai, Qingdao (Shandong), Guangzhou and many other smaller cities. It's incredible how efficient and safe everything is. I treasure my time spent making friends and experiencing so many things."

Mark Owens, a member of the Oregon House of Representatives and a farm owner, visited the Inner Mongolia autonomous region, Beijing and Shanghai in October 2025 as part of a trade delegation — his first trip to China.

"The first couple of nights, I had trouble sleeping, so I got up early and I'd go for a walk. As the sun was coming up, I felt very, very safe in Beijing. I went out after dinner by myself and felt very, very safe. I mean, very, very clean, very polite, just a very good experience," he told China Daily.

Students from the University of Waterloo in Canada who took part in a Chinese culture immersion program at Beijing Normal University in October 2025 had similar positive impressions.

"Before visiting, I had heard many conflicting descriptions of what life there might be like. However, my experience showed me a place full of warmth, innovation, history, and everyday beauty," one student, Gia-Thanh Yvonne Ly, said.

Mudupeola Aladetokunbo Caxton-Martins added: "I could go out at 3 am and I would see other locals out too; this also added a safety net as I didn't feel alone and knew that there were also others around me."

Natalie Hermila Garcia Munoz, who has traveled to 24 countries, said "none compared to Beijing" — citing the advanced subway, the safe late-night streets and the world-class hospitality.

Raine Mimoza Hutton said: "I came back home with a completely unique perspective on China ... I feel that all the negativity surrounding China in the news and media creates a significant shadow over all the amazing things the country has to offer."

> "I could go out at 3 am and I would see other locals out too; this also added a safety net as I didn't feel alone and knew that there were also others around me."

The roots of reassurance

When Serbian influencer Saitie, who has lived in China for over four years, was asked by friends how China maintains such a high-trust society, he offered two reasons: the prevalence of technology, and — more importantly — the dramatic improvement in average living standards over the past two decades.

"There's no point for a person to go out and steal stuff and therefore face the consequences for that," he said.

His down-to-earth observation aligns with broader analysis.

Professor Wang Jianxin, dean of the school of public security at People's Public Security University of China, said: "China's ability to maintain long-term social stability alongside rapid economic growth reflects a distinct path of social security governance."

He identified the key factors as "the leadership of the Communist Party of China, sound laws and good governance, technological empowerment, and public mobilization".

Commentator Nie Zhiwang said: "The Chinese sense of security is by no means merely about low crime rates: it is a people-centered, inclusive, comprehensive, and safety-net type of security."

For individuals, it means walking alone late at night without fear, not worrying about children at school, and confidently leaving belongings temporarily unattended. For society, it means stable public order, harmonious neighborhoods, and resolvable conflicts. For the nation, it reflects the governance effectiveness of maintaining long-term order and stability across a country with a massive population and vast territory.

This security rests on three pillars: coordinated development that keeps violent crime low, refined grassroots networks that nip risks in the bud, and continued economic improvements.

In Guangzhou, Ben walked the night streets with his expensive watch and felt totally safe. In Dalian, Italian artist Gentile heard the streets ring with the laughing of families and children at play. These scenes capture a deeper meaning of security in China: it is not merely the absence of danger, but the presence of a confident, everyday existence.

That everyday life — the "Chinese experience" — is what many foreign visitors most want to take home with them, yet cannot pack in their luggage.

Yang Gao in Toronto, Lia Zhu in San Francisco, Chen Meiling and Wang Songsong in Beijing, Hu Yumeng and Ma Jingna in Lanzhou, and Liu Mengtong in Dalian contributed to this story.

TOP NEWS

65 years on, treaty with DPRK hailed

Xi highlights cooperation and support between two sides over the past decades

Xi Jinping, general secretary of the Communist Party of China Central Committee and Chinese president, and Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the Democratic People's Republic of Korea, exchanged congratulations on Saturday on the 65th anniversary of the signing of the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance.

In his message, Xi said that in 1961, the older generation of leaders of China and the DPRK signed the China-DPRK Treaty of Friendship, Cooperation and Mutual Assistance, laying an important political and legal foundation for consolidating the friendship forged in blood between the two peoples.

The treaty has played an important role in carrying forward China-DPRK friendship and safeguarding peace and stability in the region and beyond, he said.

Over the past 65 years, the two sides have upheld the spirit of the treaty, supported each other, stood united, cooperated closely and worked together, vividly demonstrating the defining features of China-DPRK relations — friendship passed down from generation to generation, a shared future and mutual support, he said.

Xi pointed to a successful state visit to the DPRK in June, when he reached important consensus with Kim on consolidating and carrying forward the traditional friendship between China and the DPRK and enriching it with new dimensions, providing strategic guidance and a new blueprint for the development of China-DPRK relations in the new era.

Facing a rapidly evolving world undergoing profound changes unseen in a century, Xi voiced willingness to work with Kim to further strengthen strategic communication, keep China-DPRK relations on the right track and guide bilateral friendly cooperation to deliver greater benefits to the two peoples, in order to make positive contributions to promoting regional peace and development.

Xi said that no matter how the international landscape evolves, the firm position of China's Party and government to attach great importance to the traditional friendship between China and the DPRK will remain unchanged; the firm support for Kim in leading the DPRK's socialist cause will remain unchanged; and the determination to safeguard the common interests of both sides and maintain a favorable strategic environment will remain unchanged.

He expressed confidence that, under the leadership of the WPK headed by Kim, the DPRK people will fully implement the decisions and arrangements of the Ninth Congress of the WPK and continue to achieve new and greater successes in their socialist cause.

Kim said that the two sides signed the DPRK-China Treaty of Friendship, Cooperation and Mutual Assistance 65 years ago, laying a solid legal foundation for the enduring development of the fighting friendship and unity of mutual assistance and cooperation between the DPRK and China, forged in the bloody struggle for independence against imperialism and for the great cause of peace and socialism.

Over the past decades, through all the vicissitudes of history, the DPRK and China have stood by each other with unwavering support and close cooperation, fully demonstrating to the world the everlasting and unbreakable nature of their friendship — a relationship that is special in terms of traditional bonds, shared socialist cause, and firm commitment to carrying it forward from generation to generation, Kim said.

The friendly and cooperative relations between the DPRK and China, as a strategic choice and precious common wealth of the two parties and two peoples, are being elevated to a new strategic height and are making important contributions to safeguarding the sovereignty, security and development interests of the two countries and upholding regional and global peace and stability amid the complex and volatile international situation, Kim said.

It is the unwavering position of the WPK and the DPRK government to advance the traditional friendly and cooperative relations between the DPRK and China, with socialism at its core, to keep pace with the changes of the times and the aspirations of the two peoples and to achieve more dynamic development in all fields, he added.

GDP deflator likely to turn positive in Q2

By **ZHOU LANXU**, **ZHANG CHENXU** and **ZHONG NAN**

China's second-quarter GDP deflator is likely to turn positive for the first time in more than three years, sending the clearest signal yet that the country's price dynamics are improving, helping support corporate earnings and consumer confidence, analysts and executives said.

The GDP deflator is a tool that is used to measure price changes of all goods and services produced in an economy over time.

Ahead of the release of China's economic data for the first half of the year on Wednesday, the projection comes amid improving sentiment about the Chinese market among global enterprises and investors, even as additional policy support is seen as necessary in the second half to reinforce domestic demand and address structural pressures in the economy.

The GDP deflator is closely watched by economists as the broadest gauge of economy-wide inflation. It reflects the gap between nominal GDP growth and real GDP growth.

A positive reading signals rising prices across the economy, while a negative reading could point to deflationary pressure. China's GDP deflator has remained negative for 12 consecutive quarters through the first quarter of this year, when it stood at about -0.1 percent, weighing on the income growth of businesses and households as prices trended down.

Sun Xuegong, director-general of the department of policy study and consultation at the Chinese Academy of Macroeconomic Research, an academy affiliated with the National Development and Reform Commission, said China's GDP deflator has likely turned positive in the second quarter.

"Such a change would improve the profitability of market entities, lift their expectations and make the on-the-ground experience of businesses and households more in line with the growth in macroeconomic data," Sun said, adding that stronger nominal growth would also help boost the share of China's economy in the world total.

Su Jian, director of Peking University's National Center for Economic Research, said the second-quarter GDP deflator may turn positive at around 1.9 percent, helped by a low comparison base, higher prices of some global commodities, and firmer domestic prices of some consumer durables.

"A positive GDP deflator would suggest that the imbalance between supply and demand has eased and deflationary pressure is moderating. Improving price dynamics would support corporate profitability, thus help restore household and business expectations, and reinforce recovery in domestic demand," Su said.

Such a recovery in price dynamics can be seen in the consumer price index. Using the prices of a basket of consumer goods to gauge inflation, China's CPI has maintained a growth of at least 1 percent year-on-year for five consecutive months as of June, official data showed.

Su added that he estimates that China's real GDP to grow 4.9 percent year-on-year in the first half of the year after a 5 percent growth in the first quarter, while first-half nominal GDP growth may reach about 6.7 percent.

Robin Xing, chief China economist at Morgan Stanley, raised the forecast for China's full-year GDP deflator to 0.5 percent. Combined with the United States' investment bank's 4.8 percent real GDP growth forecast, that would imply the first time in four years that annual nominal growth would return above 5 percent.

"Nominal GDP is what companies care about, as it is closely related to their revenue and profits," Xing said.

The improving earnings are bolstering global investors' interest in China's capital market, with UBS expecting 11 percent earnings growth for all A shares in 2026, up from 3.9 percent in 2025, and remaining positive on China's artificial intelligence tech hardware names for the rest of the year amid strong earnings momentum.

Multinational companies are also reinforcing their commitment to the Chinese market. Joe Bao, president for China at Kone, said the Finnish elevator manufacturer is strengthening its supply chain resilience and responsiveness in the Chinese market, having established its Southern China headquarters in Shenzhen, Guangdong province, early this year to drive digital innovation and strengthen service capabilities.

Analysts, however, cautioned that the foundation for a rebound in prices remains fragile as the current recovery was bolstered more by international energy prices than domestic demand.

The People's Bank of China, the country's central bank, has vowed to enhance the forward-looking, flexibility and targeted nature of policy at the second-quarter monetary policy committee meeting, acknowledging the challenges of weak demand, structural divergence and external shocks.

Hub: Area rolls out bilingual signage

From page 1

This summer, INS Land unveiled its evolution from a 20,000-square-meter entertainment landmark into a neighborhood block-sized "urban nightlife wonderland", connecting the park and the city's Sinan Mansions area. The complex integrates e-sports, music, live performances, dining and socializing.

Fan Meichen, deputy general-manager of Sinan Mansions, which is organizing themed events and parties every weekend throughout the summer, said that Soul House, a newly opened immersive theater bar, has been fully booked every day since opening in June.

Soul House features a 24-hour access gate at Fuxing Park and offers a park shuttle. A walkable nighttime loop integrating culture, commerce, sports, tourism and exhibitions has since formed beneath the plane trees.

"Visitors can have a drink at INS Land, take the mini train through the park, then head to Sinan Mansions to experience Soul House. It makes for a truly diverse experience," Fan said.

The diversity doesn't stop there.

"The proportion of foreign visitors has increased significantly in the Sinan Mansions area," Fan said, adding that "the neighborhood has rolled out bilingual signage and service points".

It's not a recent trend, as evidenced by the INS Land club Hero Dome.

Ranked No 12 on the list of the world's Top 100 Clubs, Hero Dome hosted the inaugural Asian edition of global EDM festival phenomenon Tomorrowland last year, with 20,000 tickets selling out almost instantly.

According to a 2025 China nighttime economy development report co-released by the China Tourism Academy and Landsky, nighttime spending now makes up 32.9 percent of daily consumption nationwide, with key drivers transitioning from "dining, drinking and shopping", to "novelty, diversity and socializing".

Xia Tianyi, a co-founder of INS Land, sees more potential to develop and build on the city's current success. There are areas where the city's nightlife potential "remains largely untapped", he said.

INS Land will partner with nearby merchants to build an ecosystem of flexible, self-guided entertainment options to elevate the entire Fuxing Park area into a new highlight of Huangpu district.

Legacy: Sports give people hope, ambition

From page 1

The Beijing 2008 Olympic Games did not just leave behind Olympic venues. They helped accelerate the city's transformation, with investments in transportation, public spaces and other infrastructure that continue to serve residents today. They have also helped drive a major increase in sports participation, building momentum for a broader sporting culture in China — one in which more people move, play and take part in sports.

The Beijing 2022 Olympic Winter Games took this legacy to another level. Five venues from 2008 were reused, all Games venues were powered by renewable energy, and low-carbon technologies were introduced. The Games also accelerated the development of the Beijing-Zhangjiakou high-speed railway, significantly cutting travel times between the two areas.

Together, these examples show what the Olympic legacy can mean when it reaches beyond the event itself: more opportunity, more participation and a stronger place for sport in people's lives.

During my most recent visit to China, I saw that legacy in action. I saw it in the scale and energy of the 2025 National Games across Guangdong province and the Hong Kong and Macao special administrative regions; in the pride people take in their sporting culture; and in the enthusiasm of people of all ages for sport and physical activity.

Most important, however, those Games brought winter sports to more than 350 million people across China. Yanqing and Zhangjiakou have become hubs for winter sports events and training, with facilities that serve the public and local athletes alike. This is creating new opportunities and real social and economic benefits for local communities.

Sports are about far more than competition. They bring people together. They help young people build confidence and learn important values. They support healthier communities. They create belonging. And they give people hope and ambition.

At a time when the world is increasingly divided, this is also why the Olympic spirit matters. The Olympic Games remind us that people from every part of the world can come together in peace and friendship. They remind us that, even when we come from different cultures and backgrounds, we can still share moments of joy, respect and admiration.

Beijing's Olympic journey — from its successful bid 25 years ago to the Olympic Games in 2008 and the Winter Games in 2022 — shows the value of thinking beyond the event itself.

The best Olympic legacy is not simply what is left behind when the Games end. It is what carries on: in people's lives, in communities and in the generations still to come.

The author is president of the International Olympic Committee and a two-time Olympic swimming champion. The views do not necessarily reflect those of China Daily.

Yinxu: Discovery extended history

From page 1

Since the 18th National Congress of the Communist Party of China in 2012, President Xi Jinping, who is also general secretary of the CPC Central Committee, has shown great concern for the preservation of cultural relics and made important instructions for work in this regard.

Xi visited the Yinxu Ruins and Yinxu Museum in 2022, during which he said: "I have long been yearning to visit here. This time I come here for a deeper study and understanding of the Chinese civilization so that we can make the past serve the present, and draw inspiration for better building the modern Chinese civilization."

He noted that fine traditional Chinese culture is the root of the Party's new theories. The ultimate approach of adapting Marxism to the Chinese context and the needs of the times is to integrate the basic tenets of Marxism with China's specific realities and fine traditional culture.

Xi also pointed out that the *jiaguwen* inscriptions preserved the evidence of the Chinese written language of 3,000 years ago, helping to place the beginning of China's recorded history nearly 1,000 years earlier than previously believed.

This was not the first time he highlighted the importance of *jiaguwen*. In 2019, Xi sent a congratulatory letter on the 120th anniversary of the discovery of the oracle bone inscriptions, describing them as the roots of fine traditional Chinese culture and saying that the discovery is of epoch-making significance to Chinese civilization and even human civilization.

Li Xiaoyang, head of Anyang's cultural heritage bureau, said Xi's words fully reflect the important role of *jiaguwen*.

"The discovery of oracle bones in the late 19th century came at a time of cultural crisis, yet it miraculously restored Chinese people's confidence in their ancient civilization," Li said.

He also said that 15 archaeological excavations carried out entirely by Chinese scholars at the Yinxu Ruins from 1928 to 1937 confirmed the site to be a late capital of the Shang Dynasty, making the site a sacred place in Chinese archaeology. Prior to the Yinxu findings, the earliest period in Chinese history supported by existing written records was traced to inscribed bamboo slips from the Warring States Period (475-221 BC).

"Therefore, this discovery pushed China's reliable written history back to the late Shang period, extending the timeline of documented Chinese history by about 1,000 years," said Li.

Based on that, the Yinxu Ruins became the starting point for tracing Chinese civilization.

During his Anyang visit in 2022, Xi called for attaching more importance to and putting more efforts into archaeological research to carry forward the project of tracing the origins of Chinese civilization.

Over the past decades, archaeologists have gradually built a chronological framework of the Shang Dynasty and even earlier, starting from Yinxu.

"Knowing Yinxu as the last Shang capital, we have then traced earlier periods through archaeological work. In the 1950s, archaeologists found another capital site in Zhengzhou, Henan, which was identified to be an early Shang capital based on typological comparisons of pottery vessels. Then, in 1999, they discovered another city to the north of the Huanhe River, and most scholars believe it was a capital for the middle Shang period," said Li.

"In this way, we have generally made clear the early, middle and late Shang periods' capitals, and all the research started from the Yinxu Ruins," he added.

Indigenous American family finds horseback bonds on rolling grasslands in North China's Inner Mongolia

Clayson Benally interacts with a Mongolian horse in West Ujimqin Banner of Xilin Gol League, North China's Inner Mongolia autonomous region, on June 26. PHOTOS BY LI ZHIPENG / XINHUA

This summer, the rolling grasslands of Xilin Gol in North China's Inner Mongolia autonomous region welcomed a group of indigenous American horse lovers.

Clayson Benally, a 49-year-old horse trainer and artist from Arizona, the United States, traveled thousands of miles with his family to meet Julaa, a 12-year-old ethnic Mongolian girl.

The young rider is the star of the big-screen documentary *Horse Power*, an international collaboration that explores humanity's enduring bond with horses across continents and cultures.

"It's the horses that brought us all together. That's something that words cannot express," Benally said. "When I watched the movie, one of the opening scenes is just here in Inner Mongolia. And my heart cried out to come here," he said.

Julaa's family raises more than 20 horses and nearly 150 sheep on their 156 hectares of contracted grassland. Julaa's aunt prepared her guesthouse for the American visitors days in advance, stocking up on mutton and fresh vegetables.

After a lunch on the grasslands, local herdsmen demonstrated their time-honored skills, performing classic Mongolian horse-roping and penning routines.

"This is something that I've never seen or experienced. I just think about how incredible and beautiful and alive the culture is here," he said.

Top: Clayson Benally tries the traditional Mongolian horse-roping on June 26.
Above from left: Benally watches a man playing the horsehead fiddle on June 26. Benally rides a horse with a herder on June 26. Benally tries on traditional Mongolian clothes on June 26.

Xilin Gol, honored by the China Horse Industry Association as "China's Hometown of Horses" in 2010, is home to some 340,000 horses, a living testament to its enduring cultural heritage around horses.

Benally's 53-year-old sister Jeneda, a professional singer, spent her birthday during the trip and received a memorable gift — a *morin khuur*, or traditional Mongolian horsehead fiddle.

The soulful, lingering strains of Mongolian long-tune folk songs moved Jeneda to tears. "Your music speaks straight to my soul," she told the local performers. "I hope these fleeting, precious moments will grow into lasting friendships."

For Jeneda's 19-year-old daughter Dyatihi, the most indelible impression came from driving along No. 99 Highway, a route that instantly reminded her of iconic Route 66 in the US.

Xilin Gol's No. 99 Highway hosts China's first dedicated grassland musical highway. When vehicles travel at a steady speed between 35 and 60 kilometers per hour, drivers and passengers are treated to a 120-second musical journey.

"No. 99 Highway here is unique and cool, because it is wrapped in music. It is as if the highway itself sings."

WORLD

Gulf clashes intensify as tensions rise

Iran closes strait, US presses offensive amid regional powers' call for restraint

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

Fighting between Iran and the United States sharply escalated over the weekend, prompting the Gulf and Arab countries to engage in interception and issue warnings, as Tehran and Washington wrestled for control over the Strait of Hormuz and accused each other of violating the truce.

The latest collateral damage left three people injured in Qatar, including one child, as a result of falling debris from interception operations, the country's Interior Ministry said on Sunday.

Missile warning sirens were sounded across Bahrain. The United Arab Emirates said its air defense systems were actively engaging with missiles and drone threats, and Kuwait's military said explosion sounds heard were the result of air defense systems intercepting hostile attacks.

Iran's Islamic Revolutionary Guard Corps announced the Strait of Hormuz was closed until further notice and until US interventions cease. The IRGC had previously warned that foreign interference and the establishment of an illegal shipping route would draw a firm response.

The latest developments come after the US Central Command announced on Sunday that it had completed last week's third round of strikes against Iran, holding Tehran's forces accountable for attacking another commercial ship in the strait.

US President Donald Trump threatened on Friday to "decimate and destroy" Iran if it made an attempt on his life. Iranian media reported on Saturday that Supreme Leader Mojtaba Khamenei vowed to avenge the death of his father, former supreme leader Ali Khamenei, saying it was the will of the nation.

3 nights of attacks

In a statement, the US Central Command said US forces hit about 140 Iranian military targets, including missile and drone sites, naval capabilities, ammunition storage facilities, communication networks and coastal surveillance locations.

"During three nights of strikes this week, CENTCOM has struck more than 300 targets at the direction of the commander in chief to degrade Iran's ability to attack civilian mariners and commercial vessels freely transiting the strait," CENTCOM said. "Commercial vessel transits through the vital international maritime corridor continue."

In retaliation, the IRGC said they struck US aircraft carrier logistical support centers and refueling platforms at the Omani port of Duqm in a heavy and surprise attack on Sunday.

The IRGC also said they struck the US Prince Hassan airbase in Jordan with ballistic missiles the same day, destroying its command and control center and MQ-9 Reaper drone hangars in retaliation for US strikes on Iran's southern coast, Iran's Mehr News Agency reported.

Iranian Foreign Minister Abbas Araghchi said on Saturday that Iran "has so far kept its word", unlike the United States.

"That violation follows other violations and missteps by the United States. Reality check: There can only be mutual compliance," he said on X. Earlier in the day, Araghchi met with Oman's Foreign Minister Sayyid Badr bin Hamad Albusaidi in Muscat.

> "The two sides agreed to continue these talks at the technical and political levels to reach the necessary agreements in accordance with international law."
>
> **Oman's Foreign Ministry,** on bilateral talks between Oman and Iran regarding navigation in the Strait of Hormuz

Oman's Foreign Ministry said bilateral talks were held on Saturday regarding navigation in the Strait of Hormuz and ensuring its safety and freedom, "in light of the developments and repercussions stemming from recent events".

"The two sides agreed to continue these talks at the technical and political levels to reach the necessary agreements in accordance with international law," the ministry said.

On Sunday, Pakistani Deputy Prime Minister and Foreign Minister Mohammad Ishaq Dar also held a phone conversation with Araghchi, according to a statement from Pakistan's Foreign Ministry.

Dar stressed the need for the parties to follow the path of de-escalation and show restraint, as agreed in the Islamabad Memorandum of Understanding reached last month, the statement said.

"He further underscored that dialogue and diplomacy remain the only viable path to resolving disputes and achieving lasting peace and stability in the region," it said.

Dar also reiterated Pakistan's readiness to continue playing a constructive role in promoting and maintaining regional peace and stability, and said the two leaders agreed to remain in close contact, it added.

S. Korean chipmaker raises $26.5b in Nasdaq debut

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

South Korean memory chipmaker SK Hynix debuted on the Nasdaq on Friday after completing its US listing, capitalizing on surging demand driven by the global artificial intelligence boom.

The company priced its American Depositary Receipts at $149 each on Thursday before they opened at $170 in Nasdaq trading on Friday. An ADR is a type of certificate that allows United States investors to buy a foreign stock without trading directly on an overseas exchange.

The sale of 177.9 million ADRs raised $26.5 billion, making it the largest US share sale by a foreign issuer and the second-largest public offering after SpaceX's $85.7 billion IPO in June.

SK Hynix said the proceeds will be used to build new chip factories in South Korea and purchase manufacturing equipment, including extreme ultraviolet lithography scanners from Dutch supplier ASML.

Chief executive Kwak Noh-jung told Bloomberg after the offering that customers are signing long-term supply contracts because they expect the chip shortage to "last for longer", adding that he believes supply constraints could last well into the next decade.

> "The real story of the semiconductor industry ... is about a multilateral ecosystem in which South Korea, Japan and the Netherlands are just as important as either (the US or China)."
>
> **Ker Gibbs,** former president of the American Chamber of Commerce in Shanghai

The listing comes as SK Hynix rides an unprecedented surge in demand for high-bandwidth memory chips, which enable high-speed, low-power data transfer in AI systems and are essential for hardware used by customers including Nvidia and Google.

SK Hynix, which recently deepened its partnership with Nvidia on advanced memory chips, has outperformed rivals Samsung and Micron over the past year. Its first-quarter revenue nearly tripled from a year earlier, while its shares have climbed about 260 percent this year.

As hyperscalers — large-scale cloud service providers — such as Amazon, Microsoft and Oracle race to expand AI data centers, demand for memory chips has consistently outpaced supply, pushing up prices. Apple has raised prices for Macs and iPads, citing higher memory component costs.

The AI boom has also lifted Asian chip suppliers. Taiwan-based printed circuit board maker Unimicron Technology recently raised $1.36 billion through a global depositary share sale, with its stock up more than 700 percent over the past year.

Analysts describe the current environment as a memory "supercycle", with Samsung, SK Hynix and Micron all benefiting. Some view SK Hynix's US listing as a move to broaden its investor base and narrow its valuation gap with Micron, though others caution that market volatility remains despite strong demand.

'Inflation' warning

Some analysts have warned that "memory inflation" could eventually curb spending on AI infrastructure, smartphones and personal computers, saying the industry has entered the middle stage of the current cycle.

South Korean companies led by SK Hynix and Samsung plan to invest more than $500 billion in new domestic memory fabrication plants. Analysts warn the expansion could create oversupply if AI memory demand shifts by the time the facilities come online.

For some observers, the listing carries significance beyond financial markets.

"The real story of the semiconductor industry is not about the US versus China — it is about a multilateral ecosystem in which South Korea, Japan and the Netherlands are just as important as either of the great powers," said Ker Gibbs, former president of the American Chamber of Commerce in Shanghai.

Gibbs explores that argument in his book *The Fragile Dragon*, comparing semiconductors with oil as strategic resources that nations both depend on and compete over.

He also pointed to history as a cautionary lesson, arguing that the US should tread carefully as it tightens restrictions on China's access to chip technology. In his view, the two countries need to manage their differences without cornering one another.

Death of Lindsey Graham puts pressure on Senate Republicans

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

The sudden and unexpected death of US Senator Lindsey Graham could make things more difficult for Republicans in the Senate, as their thin 53-47 majority is already being strained by the absence of Senator Mitch McConnell.

A temporary replacement for Graham can be named by the governor of South Carolina, though a permanent senator will be elected in November. There was no word on Sunday who that temporary replacement might be, and candidates to fill the open seat in South Carolina during the mid-terms are expected to put their names forward this week.

Fox News reported that at least two South Carolina Republicans from the House of Representatives, Nancy Mace and Ralph Norman, have indicated they are considering a Senate run.

Graham was chair of the Senate Budget Committee, which is working through a process to push forward parts of Trump's voter ID bill. He was also considered a big supporter of the war against Iran, which could be critical as the Senate is due to hear a request for additional funding for that conflict.

According to a preliminary finding from the Washington medical examiner, the cause of Graham's death was aortic dissection — which is a tearing in the aortic wall — due to cardiovascular disease, though a final report is pending toxicological tests.

President Donald Trump called Graham "one of the greatest people and Senators I have ever known" in a social media post on Sunday.

McConnell, 84, has also been missing from the Senate for a month after being hospitalized for undisclosed reasons, though his office has said he "continues to improve".

His wife, former transportation secretary Elaine Chao, had been travelling in China "to support her family's philanthropic endeavors", her spokesperson told CNN, adding that "the Senator's health did not warrant an immediate return to the US".

McConnell had suffered a concussion and broken ribs after one of several falls in 2023, and then froze mid-sentence during a news conference months later.

Graham, 71, was first elected to the Senate in 2002. He was previously elected to the House of Representatives in 1994, and had served as a defense attorney and prosecutor in the US Air Force.

Once a Trump critic who called him the "most flawed nominee in the history of the Republican Party", as well as "crazy", later became one of the president's biggest defenders.

Graham told Fox News in May he had introduced a bill "that would allow President Trump to put tariffs on China for buying Russian oil and gas", and later went on to disparage China and its relations with other countries.

He continued with a blunt warning to China: "I'll do business with you on Monday and put tariffs on Tuesday".

The sanctions bill is still being held up in the Senate. China has called it "illegal unilateral sanctions".

Graham was considered a foreign policy hawk, who advocated for US intervention overseas. He had just returned from his 10th trip to Ukraine, which he supported in its conflict with Russia. He had also opposed president Barack Obama's nuclear deal with Iran, and had called for pre-emptive strikes against the country.

Massachusetts Senator Elizabeth Warren posted: "Even though we disagreed on much, he was always willing to negotiate, with humor and wit. My heart goes out to his loved ones."

Editorials

Hyping up illegal 'arbitral award' will only undermine stability in South China Sea

Leveraging its role as this year's chair of the Association of Southeast Asian Nations, the Philippines is attempting to hijack the negotiations aimed at concluding the long-awaited Code of Conduct in the South China Sea by pushing for the agreement to be anchored on the illegal and invalid so-called "arbitral ruling" of 2016.

The "ruling" of the Permanent Court of Arbitration is null and void. China did not participate in the "hearing". It neither accepts nor recognizes the prejudicial and politically motivated "award", nor will it ever accept any claim or action arising from it.

The distorting of international law by the "ruling" exposes the Philippines' real intention of pursuing its own selfish interests by fostering divisions and stirring up tensions in the South China Sea.

On Sunday, the United States, Japan and other external forces took the overt step of issuing a joint statement with the Philippines to mark the tenth anniversary of the illegal "arbitral award".

As the Chinese Foreign Ministry responded in a statement, a decade after its issuance, the so-called "ruling" has not only failed to resolve the maritime disputes between China and the Philippines — it has instead been weaponized by Manila to expand its territorial and maritime claims. Far from contributing to peace, the "ruling" has aggravated regional tensions and furnished extra-regional powers with a convenient pretext to meddle in and destabilize the South China Sea. In effect, it has become a perennial stumbling block to China-Philippines ties and a corrosive force against regional stability. Were the "standards" enshrined in this "ruling" to be applied universally, many nations would find themselves stripped of the very basis for their own maritime claims.

In a separate statement on Sunday, a Chinese Foreign Ministry spokesperson responded to Japanese Foreign Minister Toshimitsu Motegi's remarks "commemorating" the anniversary by raising pointed questions that laid bare Tokyo's hypocrisy in backing Manila. For instance, if the "standards" of that "ruling" were applied consistently, how could Okinotori — nothing more than two rocks of less than 10 square meters in the Pacific — possibly justify a Japanese claim to Exclusive Economic Zone and continental shelf of hundreds of thousands of square kilometers?

By the "standards" of the "ruling", many of Japan's islands and reefs would likewise have no basis for claiming maritime rights and interests. Since Japan has publicly endorsed the "award", China has every reason to believe that Japan has accepted the same "standards" and voluntarily renounced the corresponding maritime claims.

As a matter of fact, the more Manila seeks to buttress its position with outside backing, the more clearly it reveals the tenuous legal and factual basis upon which its claims rest.

By attempting to make its illegal claims a prerequisite for pushing ahead with the COC talks, Manila seeks to entrench its unlawful gains by coercing the other negotiating parties into compromise.

As long as the Philippines insists that the "award" is valid and should be anchored with the COC, there will be no way to resolve the disagreements that exist over such issues as the COC's applicable maritime scope and dispute settlement mechanism provisions. This makes it impossible for any progress to be made in talks over the COC. With this major obstacle unresolved, the claim by the Philippines that the COC can be concluded before the end of this year is both empty and irresponsible.

China is committed to properly managing maritime differences in the region through bilateral dialogue with the parties directly involved. At the same time, the country will continue firmly defending its territorial sovereignty and maritime rights and interests in the South China Sea. Any attempt to challenge China's lawful rights and interests and undermine peace and stability in the South China Sea is doomed to fail.

Hostilities risk spiraling out of control

Barely weeks after the United States and Iran signed the Islamabad Memorandum of Understanding, an interim deal intended to end hostilities and create a framework for a broader settlement, the agreement is in jeopardy.

The immediate trigger appears to have been disputes over the interpretation of the MoU's provisions governing navigation through the Strait of Hormuz. Yet the renewed confrontation is not simply another chapter in the rivalry between Washington and Tehran. It has evolved into a three-party strategic contest in which Tel Aviv's calculations also influence the pace and direction of events.

Israel has never concealed its willingness to prevent any US-Iran accommodation. From its perspective, even a temporary understanding risks reducing pressure on Tehran while leaving "unresolved concerns" over Iran's regional influence and nuclear issue. Recent reports suggest that Tel Aviv has been "coordinating" with Washington while simultaneously warning Tehran against retaliation. Israel's strategic intentions differ from those of parties seeking to preserve regional stability.

This matters because the MoU was always less a peace agreement than a ceasefire held together by political convenience. It rested upon ambiguous language, diverging strategic objectives and fragile domestic calculations on both sides. Such pacts survive only when all parties concerned possess strong incentives to preserve them. That condition is disappearing.

Washington's own calculations illustrate why. The US administration continues to face conflicting pressures. Military restraint satisfies voters weary of endless Middle Eastern crises. Yet any perceived concession toward Iran invites fierce criticism from domestic hawks. Rising oil prices threaten inflation, consumer confidence and electoral prospects, while renewed military action risks producing precisely the energy shock that the earlier agreement sought to prevent. Unsurprisingly, Washington has simultaneously resumed military operations while signaling its willingness to return to negotiations — an apparent contradiction that reflects political necessity rather than strategic coherence.

Military force has repeatedly demonstrated its limitations. Months of strikes have neither fundamentally altered Iran's strategic judgments nor produced a durable diplomatic breakthrough. Instead, every exchange of missiles further erodes trust while increasing the probability that a miscalculation or third-party action could trigger a broader regional war.

Energy markets understand this reality better than politicians. The world's consumers ultimately finance every failure of diplomacy in the Middle East. That is why the greatest danger today lies not merely in renewed hostilities but in the gradual normalization of perpetual low-intensity conflict. If the MoU collapses without a credible diplomatic successor, the region risks settling into a familiar yet dangerous equilibrium: intermittent strikes, periodic retaliation, disrupted shipping lanes and repeated diplomatic resets that never address the underlying disputes. Such instability benefits few beyond those who profit politically or economically from permanent confrontation.

As China's deputy permanent representative to the United Nations Sun Lei stressed at a UN Security Council briefing on the Iranian nuclear issue on Friday, a ceasefire and cessation of hostilities must hold in the Gulf.

"China urges all relevant parties to overcome disruptive factors, refrain from the use or threat of force, preserve and implement the MoU, reach a solution that accommodates the concerns of all parties, lift the sanctions against Iran at an early date, and achieve substantive progress in the political settlement process," Sun said.

The proper settlement of the Iran nuclear issue must respect the legitimate aspirations and lawful rights and interests of the parties concerned. Iran should continue to uphold its commitment not to develop nuclear weapons. As a non-nuclear-weapon state party to the Non-Proliferation Treaty, Iran enjoys the legitimate right to the peaceful use of nuclear energy. The US should take concrete actions to create conditions for the political settlement of the Iran nuclear issue, Sun added.

The Middle East has accumulated more than enough examples of wars that were easier to begin than to end. Another prolonged US-Iran confrontation will not produce a decisive winner. It will only weaken regional security, unsettle global markets, burden already strained economies and deepen divisions throughout the international system.

The choice confronting related parties is therefore stark. They can allow strategic mistrust, domestic politics and regional rivalries to dismantle an imperfect but valuable diplomatic opening. Or they can recognize that however unsatisfactory the MoU may have been, its implementation remains infinitely preferable to another round of instability. Even a fragile peace is always better than permanent war.

The world should not have to relearn that lesson yet again.

Precision landing boosts space program, signals self-reliance

As a space journalist who has covered dozens of launches across the country, I long assumed that I had grown accustomed to the routine of countdowns and the roar of liftoffs.

Yet standing atop a building at the Hainan International Commercial Aerospace Launch Center on Friday morning, waiting for the Long March 10B rocket to lift off, there was the same mix of nervousness, excitement and anticipation I felt at my very first launch assignment.

When the first stage was successfully captured by the cable-net recovery system roughly six minutes after stage separation, cheers erupted among reporters.

On the way back to the hotel, I was replaying the recovery footage on loop on my phone, swapping clips and screenshots with fellow reporters. That split second when the booster locked safely into the net is the kind of frame that remains etched in a reporter's memory for years.

Having witnessed earlier recovery attempts — of Long March 12A and ZQ 3 models — I know firsthand just how formidable the challenge of rocket reusability is. Guiding a massive booster back through the atmosphere with pinpoint precision, reigniting its engine at the right moment, maintaining aerodynamic stability and executing a controlled recovery require flawless coordination across propulsion, navigation, materials science and real-time command systems.

Previous tests underscored how many variables must align for success. That is why Friday's breakthrough feels deeply gratifying.

I share the pride of the researchers and engineers at the China Academy of Launch Vehicle Technology, whose perseverance turned an ambitious vision into reality.

What makes this milestone even more remarkable is China's independent path of innovation. Unlike conventional landing on ground pads or offshore drone ships used by the United States and earlier domestic programs, the Long March 10B debuted the world's first operational sea-based net-capture recovery system. By transferring much of the landing hardware from the rocket to the recovery vessel, engineers reduced dead weight and opened a distinct and potentially cost-effective technical route. It is a vivid reflection of the ingenuity of Chinese scientists and engineers and the country's growing scientific and technological strength.

Beyond the technical feat, the Long March 10B carries far-reaching strategic significance. Designed to support large-scale deployment of low-Earth orbit constellations and high-volume commercial launch missions, it promises to enhance China's competitiveness and influence in the global space sector.

More importantly, the Long March 10B is not a standalone model. It is an integral part of the Long March 10 family built for China's manned lunar missions.

Every commercial mission will validate engine reusability, recovery system reliability and rapid turnaround launch capability, forging a development model where commercial operations feed technological progress for future space missions.

This iterative approach will help build expertise for China's future manned lunar landings and deep-space exploration.

To be sure, we must remain clear-eyed. A considerable gap still separates China from the US in mature, operational reusable rocket technology, and accelerated, steady progress remains essential.

But after witnessing Friday's historic success, I have full confidence that China's space community will keep closing that gap and take its place among the world's leading space powers.

What They Say

Increasing grain production key to food security

Editor's note: *Last month, China issued a plan to accelerate the modernization of agriculture and rural areas during the 15th Five-Year Plan (2026-30) period. A key goal is to raise the country's production capacity of grains to around 1.45 trillion* jin *(725 million metric tons) by 2030, with an emphasis on both the volume and the quality of agricultural products. Tu Shengwei, a researcher at the Chinese Academy of Macroeconomic Research of the National Development and Reform Commission, spoke to People's Daily Overseas Edition on why China is pushing to increase both the output and quality of grain production. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Food security has emerged as a universal challenge in recent years due to the rising frequency of extreme weather events, a complex and volatile international landscape, and heightened uncertainties in the global grain market.

Thanks to sustained efforts, China has made marked improvements in agricultural infrastructure, machinery and technologies in recent years. Major breakthroughs in agricultural science and technology have lifted the contribution rate of scientific and technological progress to agricultural growth to over 64 percent, placing China among the world's top innovators in the field. Advanced technologies, including high-end farm machinery, drones and artificial intelligence, are now widely used across production chains, sharply boosting efficiency.

By implementing the latest initiative to raise grain output, enhancing yield per unit area of staple crops, improving the quality of farmland, seeds and machinery, and adopting more efficient farming practices, the country is well-positioned to achieve the goal of increasing its grain production capacity to around 1.45 trillion *jin* by 2030.

Increasing the grain production capacity will ensure a sufficient supply of high-quality food. Moreover, grain prices underpin the prices of various other commodities, and ample grain output helps prevent fluctuations in food prices.

Currently, China has a secure supply of rice and wheat, with sufficient stocks of these two staple grains. However, the production capacity for high-quality rice that provides a good mouthfeel, high-gluten and low-gluten wheat remains inadequate. The plan addresses this by calling for an increased supply of these products.

To achieve this, efforts should be made in various fields to expand cultivation based on local conditions and improve mechanisms that reward superior quality with better prices to ensure that premium grain products reach the market effectively.

The plan says the production capacity of corn and soybean should also be boosted. China's grain consumption pattern is changing. The consumption of rice and wheat is declining, while feed grains such as corn and soybean are likely to become major drivers of future growth in demand.

There is a significant imbalance between the supply and demand of soybean in China, making the expansion of soybean output a top priority. The supply of high-yield, high-oil soybean should be increased.

Promoting high-yield, high-oil soybean varieties will help expand domestic supply, reduce reliance on imports, and upgrade the country's grain and oil processing industry.

The plan also calls for strengthening farmland protection and improving farmland quality. Farmland is the cornerstone of grain production and the fundamental resource for securing food supply.

Over the next five years, it is essential to enforce strict farmland protection measures, develop high-standard farmland and enhance farmland water conservancy facilities to reinforce the foundation for grain production.

VIEWS

Vassil Girginov

Legacy of 2008 Olympics goes beyond economics

When Beijing was awarded the 2008 Olympic Games in July 2001, a seven-year journey began, culminating in the grand opening in the iconic Bird's Nest stadium on Aug 8, 2008.

The seven-year period between awarding the Olympics and their opening allows the hosts to develop and implement their vision of the Games.

The legacy of the 2008 Beijing Olympic Games must be seen in the socio-political and economic context of China. In China's bid for the Games, then President Jiang Zemin highlighted the opportunity to advance the Olympic spirit and deepen cultural exchanges between China and the world. Beijing proposed three major themes: "Green Olympics", "High-Tech Olympics" and "People's Olympics".

Global Lens

The concept of "People's Olympics" sought to redefine humanism as a core Chinese cultural value, aiming to construct a moral order to counterbalance the materialism in China's rapid march to modernization and offer an alternative to the commercialization of the Games. China sought to reinterpret Olympian principles, enriching the Olympic spirit and promoting global harmony.

While economic impacts often dominate discussions about the legacy of the Olympics, the intangible impacts, though difficult to measure, are equally important.

The Games were a massive undertaking with an organizing budget of 20.5 billion yuan ($3 billion) in revenue and 19.34 billion yuan in expenditures, yielding a surplus of over 1 billion yuan.

Twelve of the 37 venues were specifically constructed for the event. The Beijing Olympics were the first to offer full digital coverage globally, allowing hundreds of millions of viewers across the world to follow the action online.

Three intangible legacies of the Games stand out: health, sports policy and education. The organizing committee introduced the concept of "Olympic Health Legacy" and established a system to evaluate the impact of a mass event on the health of the host population.

MA XUEJING / CHINA DAILY

These included changes in health behaviors of individuals, improvements in public health services and enhancements in the quality of the external hygienic environment.

From 2001 to 2007, 140 billion yuan was spent on environmental improvement, which was far more than the $12.2 billion promised in the bidding reports.

The Games elevated the role of sport in China and enhanced the status of mass sport. From a policy development perspective, China's Olympics experience streamlined policy-making and planning for mega events.

The coordination required by the Games fostered policy coherence across public, voluntary and private sectors, exemplified by Beijing's "dual-city" benefit, which reduced venue costs for the 2022 Winter Olympics.

A great deal of organizational learning also took place, with Chinese sports organizations engaging with national and international sports federations, leading to improved sport governance.

Aug 8 was declared National Fitness Day, when public sports facilities are required to open free of charge to the public, promoting public health and sports participation.

Significant investments were made in mass sport from the lottery public welfare fund, with funding increasing over time.

The Games relied on tens of thousands of volunteers, supported by a large network of "city volunteers" stationed across Beijing, marking a cultural shift toward a formalized civic volunteer network that remains active in major public events.

Public investments, organizational learning, cultural change, and improved policy coherence have advanced sport in China, embracing social and economic values beyond health benefits and political gains.

Education was the chief mechanism for promoting Olympian values. The Beijing 2008 Olympics Education Programme was the largest of its kind in the Games history, integrating Olympian values — excellence, friendship and respect — into the curriculum of over 400,000 schools across China.

The program had three main components, including the Heart-to-Heart international school pairings, Olympic Values Education Programme teaching resources and curriculum integration, and the model schools program across China. It reached approximately 400 million children and left a lasting cultural and civic legacy for China's younger generation.

The Olympics do not belong to a country or an institution, but to all humanity.

When a city hosts them, it enters into a contract: the Olympic Movement allows the host city to invest the accumulated cultural capital of the Games, and, in return, the city promises to deliver certain legacies.

Olympic legacy is not automatically established. Beijing successfully leveraged the opportunities presented by the Games by mobilizing the energy of society to deliver lasting benefits.

When China found its own rhythm

When Beijing won the right to host the 2008 Olympics on July 13, 2001, I was a girl with a dream and little sense of how profoundly that moment would shape my life.

Twenty-five years later, I have lived that transformation from several vantage points: as an athlete who won China's first Olympic silver medal in rhythmic gymnastics in 2008, and as the head coach who led the Chinese team to Olympic gold in Paris in 2024, ending more than four decades of European dominance in the event.

Yet the most important change was not the medal. It was the moment China stopped asking how to look more like everyone else.

For much of its history, rhythmic gymnastics was governed by a distinctly European aesthetic.

Movement, music and choreography were judged against conventions that emerged largely from Eastern Europe.

Like many latecomers to the sport, China began by studying those standards, hiring foreign choreographers and trying to narrow the gap.

It was a necessary stage of development. Before a country can contribute to a global language, it must first learn to speak it.

But eventually a different question emerged: If sport is a universal language, why must we speak it with a borrowed accent? Why could the world not encounter contemporary China through this sport?

The answer was not to drape routines in obvious national symbols. Cultural confidence is not costume design.

Over the years, my colleagues and I built a long-term archive of Chinese cultural materials: classical dance, traditional music, historical imagery and regional artistic traditions.

We took athletes to museums and historical sites, invited experts in Chinese dance and folk music into training camps, and studied international judging rules with equal intensity.

Our goal was not to make routines that looked "Chinese" at first glance. It was to create works whose emotional logic could be understood anywhere.

When audiences watch a routine inspired by Dunhuang murals or ancient Chinese poetry, they do not need prior knowledge of Chinese history.

They need to feel wonder, tension, serenity or strength.

Cultural expression succeeds internationally not when it demands explanation, but when it creates recognition.

That is why routines such as *Flying Apsaras, Heroes of Heaven and Earth*, *Water Dragon's Chant* and *Phoenix Soaring to the Sky* were designed around universal emotions while drawing on distinctly Chinese artistic traditions.

In recent years, I have noticed a subtle but meaningful shift in how international judges and coaches respond.

Chinese routines are no longer treated merely as interesting variations from the periphery. Increasingly, they are discussed as creative references in their own right.

This reflects a broader change in China's relationship with the world.

For a long time, Chinese culture was often observed, analyzed or categorized from the outside. Today, in some fields, it is beginning to influence how the conversation itself is conducted.

True confidence is not insisting that one's culture is unique. It is understanding global rules well enough to participate fully while still speaking in one's own voice.

That voice, however, would mean little without a second transformation: the move from heroic endurance to scientific training.

When I was preparing for the 2008 Beijing Olympics, success depended largely on relentless repetition and personal sacrifice. My generation owes an enormous debt to coaches who built the foundation of Chinese rhythmic gymnastics through sheer perseverance.

As a coach, I have come to see that modern elite sport requires more than determination. It requires evidence.

Today our program integrates physical conditioning, rehabilitation, sports science, nutrition and psychological support into a unified system.

Training decisions are increasingly guided by data rather than intuition alone.

Just as important, we pay closer attention to the long-term physical and mental well-being of athletes whose careers span childhood, adolescence and adulthood.

That shift has changed the meaning of coaching. A coach is not simply a technician correcting movements; a coach is a long-term guardian of human development.

I often tell my athletes that a group routine succeeds only when different personalities learn to move with one heartbeat. We do not train every athlete identically.

Each receives a development plan tailored to her technical weaknesses, temperament and future potential. The goal is not uniformity, but unity.

This evolution has also been accompanied by greater openness to the world.

China has benefited enormously from international exchange. We learn from foreign coaches, judges and training systems, while increasingly sharing our own experience with overseas colleagues who come to China to observe and collaborate.

Sport is one of the few arenas where civilizations can engage one another without requiring complete agreement.

A common set of rules creates space for different cultural expressions to coexist. China's contribution should not be to reject international standards, but to enrich the diversity that exists within them.

Looking back, the 25 years since Beijing's Olympic bid was approved trace not only my personal journey, but also the journey of Chinese women in sport.

More women now serve as head coaches, researchers, administrators and participants in international sports governance.

That change is not simply a sporting achievement; it reflects a broader expansion of opportunities for women in Chinese society.

When my athletes tell me they see in me a confident and capable Chinese woman, I regard that as a responsibility greater than any medal.

China once entered rhythmic gymnastics as a student. Today it enters as a participant with something of its own to say.

We will continue to learn from the world and to pursue scientific excellence. But we will also continue to present Chinese culture not as a museum piece, but as a living, evolving source of creativity.

Olympic gold may have announced our arrival. Finding our own voice is what made the journey worthwhile.

Reflecting on what remains after the flame goes out

Editor's note: *July 13 marks the 25th anniversary of Beijing's successful bid to host the 2008 Olympic Games. In a conversation with China Daily journalist Li Wei, Professor Angela J. Schneider, director of the International Centre for Olympic Studies at Western University and the first director of Ethics and Education for the World Anti-Doping Agency, and Zhou Guanpeng, a research associate at the center, reflect on the legacy that remains after the Olympic flame is extinguished. Through the lenses of sport, technology, sustainability and human well-being, they examine how the Beijing Olympics have continued to shape society and the public imagination nearly two decades later.*

Li Wei: What do you remember most about the 2008 Beijing Olympic Games?

Zhou: When I think about the twenty-five years since Beijing won its Olympic bid in 2001, I return to several images from the 2008 opening ceremony. Firework footprints moved along Beijing's Central Axis toward the Bird's Nest. Then an ancient sundial appeared. A sundial: the shadow of the sun. It makes time visible by reading the shadow cast by light.

Perhaps Olympic legacy works in the same way. The visible light is easy to see: venues, ceremonies, medals, technology, global attention. The harder question is: After the flame goes out, what truly remains, and whose life does it change?

Schneider: Legacy is not only what still stands after the Games. It is what continues to serve human beings. In my work, I distinguish between performance excellence and human excellence.

The first asks: how fast, how high, how strong? The second asks: what kind of person, community and life does sport help us cultivate?

If we take that distinction seriously, Olympic legacy cannot be measured only by buildings, spectacle or records. We must also ask about human legacy: whom do these achievements still serve? Do they serve athletes and citizens, or only a spectacle that has already passed?

Zhou: The children who watched the fireworks in 2008 may now be parents. Venues once belonging to champions may now belong to students, walkers, skaters and families. More than a century ago, Chairman Mao Zedong warned in *A Study of Physical Education* that sport could have "form without substance".

He did not treat the body as an accessory to the spirit, but as the ground of knowledge, will and moral life. When we speak of Olympic legacy today, do we face a similar question: Is sport merely a ceremony or spectacle to be watched, or a practice people actually live?

Schneider: I would add to that question. Participation is not only a matter of numbers. A crowded venue does not necessarily mean a meaningful sporting culture. We must ask whether people enter the internal goods of sport: the joy of learning skill, the discipline of sustained practice, the confidence formed through effort, and the experience of testing oneself with others under fair conditions. When sport enters daily life in this way, it is no longer only leisure. It becomes part of a fuller human life. Such a legacy is not static. It has to be used, practiced and understood again.

Li Wei: If Olympic legacy is ultimately measured by how deeply sport enters everyday life, how should we judge whether a host city has succeeded? Is it enough that venues remain open, or must they also become part of people's daily habits and social relationships?

Zhou: That brings us to another question: are we building smarter Olympics, or wiser ones? The scroll sequence in the 2008 opening ceremony offers at least one clue. Painting, writing, dance and music were not separate performances. The body was writing, the ink was dancing, movement became image.

Ancient form and modern technology appeared in the same scene. The point did not seem to be that technology betrays nature.

It seemed to ask whether technology can remain fitting to the body, to rhythm and to meaning. From your perspective, how should technology in sport be judged?

Schneider: I would not begin by asking whether technology is natural or unnatural. That often misleads us, because "nature" is not, by itself, a clear ethical standard. I would ask: what does the technology serve?

If it makes sport safer, fairer and more accessible, reduces waste, and helps more people participate, it can deepen sport.

But if it turns athletes into performance machines, spectators into data consumers, and venues into monuments no longer belonging to city life, it weakens sport. A truly sustainable Olympics is not only more efficient environmentally. It must also be ethically accountable to human beings.

Zhou: So sustainability is not only an engineering problem. Beijing has many visible examples of venue reuse, but a deeper question is whether these spaces have returned to public life. If venues and technologies merely prove that a city is stronger, faster and better organized, they may be smart. If they help ordinary people keep moving, meeting, learning and recovering bodily life, they may become wise.

Schneider: Yes. The Olympic movement is based on a public trust. It does not belong only to committees, sponsors or host cities.

It also belongs to athletes, citizens and future generations. A sustainable venue is one that returns to public life. A sustainable technology supports meaningful effort rather than replacing it. A sustainable Olympic city is not merely more spectacular. It is more fit for better human life.

Public trust means that Olympic legacy must remain open to public judgment: does it give people more chances to move, to meet, and to understand themselves and others through sport?

Li Wei: The third question may be the deepest: when the world is faced with so many challenges, what can the Olympic Games still hold together?

Zhou: In the movable-type sequence, the performers evoked the ideals of "friends coming from afar" and "all within the four seas are brothers and sisters". Then the blocks formed the character *he*, harmony. Finally, the blocks opened, and people appeared from underneath and waved.

That harmony was not produced by machinery alone. It was coordinated human movement. It seemed to resonate with the Olympic ideal: not erasing difference, but forming shared practice within difference.

Schneider: That is important. What sport gives to ideals is practice.

Harmony in sport is not the absence of conflict. Competition itself is conflict under shared constraints. Fair play, as I understand it, is not merely following rules or being polite. It is respect for the game.

Respect for the game changes how we see opponents. An opponent is not an enemy to be eliminated, but a necessary partner in the pursuit of excellent sport. Without a worthy opponent, one cannot truly test oneself.

Zhou: Then harmony is not sameness, but coordination within difference. It does not imagine a world without conflict. It asks conflict to enter rules, limits and mutual recognition.

Schneider: Yes. Two athletes may come from divided countries, speak different languages and carry different histories. Yet in competition they can recognize one another through shared rules.

That recognition is limited, but it is real. It cannot solve geopolitics, but it can teach a disciplined way of living with others and the world. The value of the Olympic Games is not that they make the world suddenly agree. It is that they allow people, while difference remains, to enter a practice shaped by rules, respect and effort.

Zhou: So the twenty-fifth anniversary of Beijing's successful bid should not be only a memory of success. It should become a question: after the ceremony ends, can the city, its venues, its technologies and its citizens continue to practice this deeper legacy?

Schneider: That is the key question. If we must name it, since 1993 I have called it the "spirit of sport" which is based on the internal goods that create the joy of sport.

But I would not use that phrase as a slogan. It means skill, fair challenge, meaningful effort, respect for opponents, and the cultivation of a fuller human life. Beijing's most lasting Olympic legacy will not be measured only by buildings that still stand, but by what still moves: bodies, habits, public spaces, shared memory, and the continuing possibility that competition can become a practice of human flourishing.

The light once illuminated a city; the shadow tells us whether that light still gives direction to human life.

The views don't necessarily reflect those of China Daily.

GLOBAL VIEWS

FABIO MASSIMO PARENTI

Win-win cooperation

The EU should prioritize mutually beneficial innovative ties with China instead of portraying the country's rise as a shock

WANG XIAOYING / CHINA DAILY

Speaking at the Summer Davos forum in Dalian in June, Chinese Premier Li Qiang introduced the concept of "China Opportunity 2.0". More than a slogan, it represents an attempt to help the world understand China's economic transformation — from the world's factory to a global platform for innovation.

The 2026 Summer Davos took place at a significant moment when the global economy continues to see moderate growth, geopolitical fragmentation, trade uncertainty and intensifying technological competition. Against this backdrop, the forum's theme, "Innovating at Scale", captured one of the defining challenges of the time: Innovation alone is no longer enough; the real challenge is the ability to rapidly deploy innovation throughout the productive system and society as a whole.

If the first phase of China's opportunity was built primarily on the extraordinary expansion of its domestic market, its openness to foreign investment and its integration into global value chains, "China Opportunity 2.0" is increasingly driven by the country's capacity to generate innovation, develop cutting-edge technologies and rapidly transform them into large-scale industrial applications.

A growing body of international evidence suggests that China's innovation system has reached a new level of maturity. In recent years, China has become the world's largest holder of patent applications, one of the leading investors in research and development, the largest market for electric vehicles, and a global leader in batteries, renewable energy, industrial robotics, digital infrastructure and applied artificial intelligence. Universities, enterprises, research institutes and local governments increasingly operate within an integrated innovation ecosystem that accelerates the transfer of technology from laboratories to industrial production.

What distinguishes China's model today is not only its ability to invent new technologies, but above all the speed at which these technologies are deployed at scale. The rapid integration of AI into manufacturing, logistics, healthcare, public services and consumer markets provides perhaps the clearest example of this systemic capability. It is also the rationale behind recent government initiatives such as the "AI+" initiative to create new forms of smart economy and improve AI governance.

In other words, innovation in China is quickly translated into the real economy. This close integration of scientific research, industrial policy and manufacturing capability has become one of the defining characteristics of the country's current stage of development.

The notion of "China Opportunity 2.0" therefore reflects a qualitative transformation. The opportunities offered by China partly lie in participating in one of the world's most dynamic innovation ecosystems.

This evolution also carries important implications for Europe. In recent years, European Union-China economic relations have largely been influenced by the West, through the lens of "de-risking". Strengthening the resilience of strategic supply chains is certainly an important objective. Yet the risk — as current developments suggest — is that the political debate is becoming almost entirely focused on competition while overlooking the opportunities created by selective and mutually beneficial technological cooperation.

The EU and China remain two of the world's largest economies and share common interests across a wide range of areas, including energy transition, climate change, population aging, food security, public health, industrial digitization and the development of AI for good.

Some of the major challenges of the 21st century require economies of scale, substantial investment and continuous innovation. No country, regardless of its level of development, possesses all the resources needed to address these challenges alone.

From this perspective, "China Opportunity 2.0" can also be understood as an opportunity for scientific and industrial cooperation. Europe continues to possess significant competitive strengths in basic research, precision manufacturing, chemistry, biotechnology and high-end industrial production. China, meanwhile, offers growing R&D innovation applications, advanced engineering and industrial capabilities, an exceptionally broad manufacturing base, substantial investment capacity and a domestic market capable of rapidly commercializing innovation.

These characteristics are potentially complementary rather than inherently antagonistic. Naturally, important differences remain. Issues concerning market access, intellectual property protection, regulatory transparency and competitive conditions continue to shape bilateral relations. Ignoring these concerns would be unrealistic. Nevertheless, addressing such differences through dialogue and negotiated solutions is generally more productive than progressively reducing opportunities for cooperation.

Experience consistently shows that innovation flourishes in environments characterized by openness, knowledge exchange, talent mobility and international investment. By contrast, growing technological fragmentation risks slowing global scientific progress, increasing development costs, and reducing humanity's capacity to tackle shared challenges.

From this perspective, the message emerging from the Summer Davos forum extends well beyond China itself. The central question is how to reform the international system and further various kinds of cooperation between the Global North and the Global South, as well as among Global South countries, to ensure that the benefits of innovation are broadly shared.

China regards scientific and technological innovation as one of the principal drivers of national modernization, higher productivity, high-quality growth and long-term international competitiveness. Within this framework, innovation, industrial development and strategic planning are viewed as deeply interconnected. Whether or not one agrees with this model — which continues to evolve — it is difficult to deny that it has generated significant achievements across a number of technological and manufacturing sectors. For this reason, understanding China's economic transformation has become an analytical necessity before it is a political one.

Europe now faces an important choice. It would be better to say that Europe should not continue to view China's transformation primarily through the prism of geopolitical competition. It can adopt a more nuanced approach — one capable of distinguishing between areas where competition is necessary and where cooperation continues to generate mutual benefits.

"China Opportunity 2.0" does not imply the absence of competition, nor does it eliminate differences in national interests. Rather, it suggests that in today's knowledge economy, innovation and interdependence will remain inseparable dimensions of global economic development. For Europe, recognizing this reality with pragmatism may well become one of the defining tasks of the years ahead.

Trade wars bring risks

If Europe labels China an industrial threat, it will fail to fully recognize that Chinese technologies may facilitate its green transition

SHI YU / CHINA DAILY

For much of the past two decades, Europe's trade policy toward China was built on an assumption that engagement would benefit both sides — China was a vast market for European cars, machinery, luxury goods and technology; Europe was a rich consumer market for Chinese manufactured products. Yet things changed. In 2019, the European Union formally described China not only as a partner, but also as an economic competitor. The EU-China Comprehensive Agreement on Investment, once seen as a symbol of deeper EU-China economic engagement, was politically frozen. Then came the pandemic, the Ukraine crisis, the energy crisis and, with it, rising concerns over supply chain security. Europe started to turn toward "de-risking". Trade with China is no longer viewed as a market opportunity, but increasingly as a risk.

Following the EU summit from June 18 to 19, where discussions on how to bolster Europe's competitiveness and counter "global macroeconomic imbalances" took center stage, a new proposal requiring EU companies to diversify their sources of key supplies — in the hope of stepping up the latent "de-risking" efforts — is on the agenda. Yet a full-blown trade war with China would be very dangerous for Europe.

First, a trade war would make Europe's green transition more expensive. Price is the gateway to demand, and demand lays the foundation upon which European clean-tech capacity will eventually be built. Chinese electric vehicles, batteries, solar panels and renewable technologies are demand creators. Because of lower costs, their mass adoption becomes possible. Once consumers buy EVs, governments build charging infrastructure. Once solar panels become affordable, households, companies and cities invest in distributed energy. Once batteries become cheaper, storage, recycling, grid modernization and smart-energy services become commercially viable. In this sense, affordable Chinese clean technologies can help create the market conditions in which European green industries themselves may grow. Europe cannot develop a full renewable-energy ecosystem if renewable deployment is slowed by high costs. Demand must come before scale; scale must come before competitiveness. If Europe raises prices too quickly in the name of protecting industry, it will weaken the very demand that industry needs.

Second, energy security remains a critical challenge for Europe. Europe has learned from the Ukraine crisis that energy dependence is never only commercial. When the security environment changed, dependence became a vulnerability. Europe has since moved away from Russian energy, but it has not fully escaped its dependence on imported fossil fuels. In some sense, Europe has simply changed suppliers. The United States has become a major provider of liquefied natural gas to Europe. This may be geopolitically safer, but it is still dependence and dependency does not disappear when the supplier changes; it merely changes the actor who has leverage. Even allies can use dependence as an instrument of pressure.

That is why a trade war with China over clean technologies could be irrational. In the short run, the balance of trade might look better; but such a strategy would sacrifice Europe's energy resilience in the long run, and Europe would remain vulnerable to geopolitical shocks and external coercion. A wiser path would be for Europe to use Chinese clean-tech supply and investment as a transitional accelerator while building European capacity, instead of starting a broad trade war that slows the transition.

Third, Europe faces internal divisions. Energy dependence is not only a foreign-policy problem but also a threat to European unity. The energy crisis following the Ukraine crisis revealed how differently member states respond to external shocks. Some wish to cut Russian gas entirely, others do not; some turn to nuclear power, others reject it; some have stronger fiscal capacity to subsidize households and businesses, while others lack the resources. As a result, every energy crisis becomes an intra-European political crisis. If Europe fails to make energy cheap and abundant, these divisions will deepen with each subsequent crisis, as we have already seen with the ongoing Strait of Hormuz crisis.

Fourth, the nature of the EU itself creates distinct constraints. Europe is a slow-moving bureaucratic machine. This gives it strength but it also creates rigidity. The United States can change trade policy quickly when its administration changes. Europe cannot. Once tariffs, legal procedures, trade barriers and regulatory frameworks are set in motion, reversal becomes slow and politically costly.

That is why Europe should be especially cautious before starting a trade war with China. Trade wars, like other forms of war, are easy to begin and difficult to end. They create vested interests; they harden political narratives; they make compromise look like weakness; they turn technical disputes into questions of pride. Once China is framed primarily as a threat to Europe's industry, it becomes harder to acknowledge that Chinese technology may also be useful to Europe's green transition. Recent conflicts have taught a simple lesson: wars often begin with confidence and end with exhaustion. Economic wars are no exception. They may start as limited measures, but they can expand and spiral out of control. Europe should not sleepwalk into such a conflict.

The smarter path is therefore to reduce strategic vulnerability in the long run, not limit its vision to the short-term balance of the books. That means resisting the temptation of a broad trade war with China, which is dangerous not only economically but strategically. Instead, Europe should pursue a dual strategy: using affordable Chinese clean-tech imports to accelerate the green transition today while systematically building the European industrial and technological capacity that will reduce dependence tomorrow.

Strategic autonomy will not be achieved by raising the cost of Europe's own transformation. It will be achieved by making the green transition faster and more resilient. Europe's choice is not between dependence on China and protectionism. The real choice is between a pragmatic strategy that uses global clean-tech capacity to accelerate European renewal, and a defensive strategy that traps Europe longer in its old nightmares and insecurities.

MNCs tap China's industrial ecosystem

Nation's robust supply chains, AI, green drive help firms scale up

By ZHONG NAN
zhongnan@chinadaily.com.cn

For senior executives from multinational companies including Germany's Covestro AG and the United States' Boeing Co and Carrier Global Corp, June brought a steady stream of visits to China, where they unveiled expansion plans, launched new projects and participated in the fourth China International Supply Chain Expo in the world's second-largest economy.

Among them, Covestro made a major investment announcement in late June. The German chemicals producer will build a new methylene diphenyl diisocyanate production line with annual capacity of 660,000 metric tons at its integrated site in Shanghai. MDI is a synthetic chemical used primarily to manufacture polyurethane foams and coatings.

Holly Lei, senior vice-president of Covestro, said the investment, which coincides with the 25th anniversary of the groundbreaking of the group's Shanghai integrated site, reflects Covestro's confidence in China's integrated industrial ecosystem, innovation capabilities and deep talent pool, while strengthening long-term supply for customers in China and across the Asia-Pacific region.

Covestro's decision reflects a broader trend of multinational companies increasingly viewing China not only as a major market, but also as a strategic hub for innovation, manufacturing and resilient supply chains.

Backed by China's continued move up the value chain and broader market opening-up, its supply chains are evolving beyond the traditional role of the "world's factory" into a key anchor for global innovation and industrial collaboration, providing multinational companies with greater certainty in an increasingly volatile global economy.

As global trade and investment undergo profound changes, China is strengthening industrial and supply chain resilience while expanding high-standard opening-up through wider market access, an improved business environment and measures to stabilize foreign investment, said Li Xingqian, vice-chairman of the China Council for the Promotion of International Trade.

The government rolled out a 15-measure action plan to stabilize foreign investment in late June, with steps to expand market access, streamline investment procedures, strengthen investment promotion, improve services for foreign businesses and refine foreign investment management, according to the Ministry of Commerce.

The plan prioritizes expanding market access in services, finance and pharmaceuticals, among other sectors, while streamlining processes for cross-border mergers and acquisitions, data flows and domestic reinvestment by foreign firms.

Wang Ya, head of the department of foreign investment administration at the Ministry of Commerce, said the measures are expected to encourage multinational companies to further integrate into China's industrial ecosystem by expanding investment in research, advanced manufacturing and high-end services, helping China consolidate its position in global industrial and supply chains.

Boeing is among the companies responding to these opportunities. The US aircraft manufacturer inaugurated a new maintenance facility in Shanghai last month that was developed in cooperation with Chinese partners and is one of the largest of such facilities in Asia.

Landon Loomis, president for China at Boeing Co, predicted that over the next 20 years, Boeing expects the size of China's commercial aircraft fleet to double, driving demand for about 250,000 additional aviation professionals, including pilots, maintenance technicians, cabin crew and ground service personnel. The company will continue to increase investment in human capital development in the country.

"Boeing currently works with around 40 suppliers in China, with components produced by these suppliers incorporated into Boeing aircraft delivered worldwide," said Loomis, adding that the continued expansion of e-commerce and global trade is expected to drive long-term demand for air cargo services and support growth in Boeing's freighter business.

That long-term confidence is shared across industries. Michael Gierges, president of climate solutions for Asia-Pacific, Middle East and Africa at Carrier, said the US intelligent climate and energy solutions provider no longer views China simply as a regional market, but as a key driver of the group's global growth strategy.

China's push to expand computing infrastructure and advance green urban development will create fresh growth opportunities for Carrier to deepen investment in manufacturing, supply chain development, innovation and digital technologies in the country during the 15th Five-Year Plan (2026-30) period, said Gierges.

"Cooling systems account for a significant share of data center energy consumption, making efficiency improvements increasingly important," he added.

Reflecting this long-term commitment, Carrier, the parent company of Toshiba HVAC and Viessmann Climate Solutions, has continued to expand its manufacturing footprint in China. It launched a new air-cooled chiller production line at its facility in Shanghai's Baoshan district, with investment exceeding 100 million yuan ($14.7 million) in January.

Together with additional production lines yet to be commissioned and supporting facilities, the project's total investment is expected to reach 400 million yuan.

The continued inflow of foreign investment underscores the confidence of multinational companies in the Chinese market. Foreign direct investment in China's high-tech industries expanded 19.4 percent year-on-year to 130.14 billion yuan in the first five months of 2026. The sector accounted for 39.8 percent of the country's total FDI, up 9.4 percentage points from the same period last year, statistics from the Ministry of Commerce showed.

In the meantime, investment from the United Arab Emirates, Malaysia, Switzerland and the US surged by 285.5 percent, 108.6 percent, 49.4 percent and 17.3 percent on a yearly basis, respectively.

Pushing back against the so-called "China Shock 2.0" narrative, which portrays China's development as a disruption to the global economy, Huang Yiping, dean of Peking University's National School of Development, said that while trade tensions persist, growing investment, green transition needs and shared support for multilateralism continue to sustain China's economic cooperation with the world, particularly with the European Union.

China and the EU can deepen cooperation in green development and advanced manufacturing by combining China's large-scale industrial capacity with Europe's strengths in low-carbon technologies, industrial innovation and high-end engineering, said Huang.

Practical cooperation can also be expanded in industrial artificial intelligence, high-end services and third-country markets, enabling both sides to leverage their complementary strengths and generate new growth opportunities, he added.

Market watchers said that rather than displacing other economies, China's industrial upgrading is creating new opportunities for cross-border innovation, investment and industrial cooperation.

Vaughn Barber, chairman of the China-Australia Chamber of Commerce, echoed that view. "China's open and resilient industrial ecosystem offers opportunities for deeper cooperation," he said.

By leveraging complementary strengths, Chinese and Australian companies can accelerate energy transition, advance industrial upgrading and create long-term value through practical partnerships, said Barber.

AI, digitalization and green technologies are emerging as the next frontier for multinational companies in China, with the country's industrial ecosystem providing an ideal environment for commercialization and industrial application.

Lin Chunmei, president and general manager of Corning China, said the US industrial materials manufacturer has consistently worked alongside its industry partners in China, evolving from technology introduction to collaborative innovation and from "bringing in" to "going global".

Lin said AI is rapidly reshaping the global industrial landscape, creating new demand for critical technologies and infrastructure.

"Leveraging our long-standing expertise in materials science and key components, Corning will continue to support next-generation computing infrastructure while actively contributing to the upgrading of China's industrial ecosystem," she added.

System-level certainty delivers confidence companies demand

REPORTER'S LOG
By Zhong Nan

Throughout June, I traveled from Beijing to Urumqi in Xinjiang Uygur autonomous region to cover major trade events, including the fourth China International Supply Chain Expo and the ninth China-Eurasia Expo. I found myself asking executives from multinational companies the same question: Has anything fundamentally changed about investing in China?

Their answers were rarely identical, but they almost always pointed in the same direction.

The more executives I interviewed, the more I noticed an interesting pattern. Tariffs were mentioned. Geopolitics came up. Supply-chain diversification was part of almost every conversation. Yet none of those topics became the center of the discussion. What they wanted to talk about instead was China's manufacturing ecosystem — and why it remains remarkably difficult to replicate.

That contrast made me rethink a common assumption. China's competitive advantage today is no longer defined primarily by low-cost manufacturing. It increasingly lies in something much harder to replicate: system-level certainty — the ability to innovate, manufacture and deliver efficiently within an integrated industrial ecosystem.

A French executive described China's manufacturing ecosystem as "the place where problems get solved overnight." It was the clearest explanation I heard for why companies continue investing here despite growing external uncertainties.

During factory visits and interviews, I noticed executives talked less about saving money than about saving time. In advanced manufacturing, speed itself has become a competitive advantage. Design changes quickly reach suppliers, tooling is modified within hours and production resumes with minimal disruption. Engineers, suppliers and customers often operate within the same industrial cluster, solving problems face to face rather than across continents.

That ecosystem delivers what every business values most: certainty. Products move from prototype to mass production faster, supply disruptions are resolved more efficiently and production scales without rebuilding supplier networks, thanks to dense industrial clusters in regions such as the Yangtze River Delta region and the Guangdong-Hong Kong-Macao Greater Bay Area.

Whether interviewing CEOs from ABB, Danfoss, Decathlon, Maersk or Schneider Electric, I kept hearing different versions of the same conclusion. Many multinational companies are diversifying parts of their production networks, but few believe another location can match China's combination of supplier density, engineering capability, logistics efficiency, manufacturing scale and infrastructure.

Increasingly, they describe China not only as one of their largest markets, but also as an innovation hub and strategic manufacturing base.

Chinese manufacturers are also competing less on costs than on innovation. Across industries from electric vehicles and industrial equipment to medical devices and consumer electronics, companies are investing more heavily in research and development, developing proprietary technologies and moving further up the value chain.

Conversations with executives have also shifted from labor costs toward innovation, engineering capability and commercialization speed. The focus is becoming less about where products are assembled and more about where ideas can be brought to market most efficiently.

None of this suggests China's industrial upgrading is complete. High-end semiconductor design software, certain advanced medical technologies and stronger global brand recognition still require sustained investment and technological breakthroughs.

Perhaps the biggest misconception I encounter is the belief that China's manufacturing competitiveness depends primarily on subsidies or inexpensive labor. Yet executives making big-ticket investment decisions rarely emphasize either. Instead, they point to reliable suppliers, experienced engineers, integrated industrial clusters, resilient logistics and confidence that production will continue even when uncertainty grows elsewhere.

Those capabilities cannot be replicated simply by relocating a factory in India, Vietnam and Mexico, or imposing another tariff. They are the result of decades of industrial accumulation, continuous innovation and close collaboration across entire supply chains.

As global businesses navigate geopolitical tensions and supply-chain restructuring, the conversation is becoming less about whether China remains the world's factory. It is increasingly about how China is evolving into a source of innovation, industrial collaboration and system-level certainty.

Chinese firms reshape global industrial chains

EAGLE EYE
By Liu Xiaochun

ILLUSTRATION GENERATED BY AI

Global industrial chains and structures are constantly evolving, alternating between periods of relative stability and of profound disruption. Industrial restructuring refers to periods of accelerated change, such as the one currently underway. The forces behind such restructuring can broadly be divided into two categories: geopolitical competition and technological change. The two are closely intertwined, although their relative importance varies over time. At present, both are driving the reconfiguration of global industry, with geopolitical competition playing the dominant role.

Historically, major waves of global industrial restructuring have been initiated and led by advanced economies, with their large corporations possessing technological and financial advantages. Other countries and firms have generally played reactive roles, gradually adapting as a new global industrial equilibrium emerged. The current round is different. China and Chinese companies have shifted from passive responders to active participants in shaping global industrial restructuring.

At the early stage of this transition, China proposed the Belt and Road Initiative, anticipating changes in the global economic landscape. At the corporate level, overseas expansion initially emerged as a response to changing market conditions. As more companies expanded abroad, however, Chinese enterprises have increasingly become an important force in reshaping global industrial and supply chains.

This new wave of international expansion has several distinctive characteristics.

First, an unprecedented number of Chinese firms have entered overseas markets within a relatively short period. Unlike earlier waves of industrial relocation, which were concentrated in a limited number of destinations, Chinese companies are investing across every continent. Participants range from large corporations to small and medium-sized enterprises and even individual entrepreneurs.

Second, overseas expansion now spans virtually every industrial sector. Rather than concentrating on labor-intensive manufacturing, Chinese companies are expanding across the full industrial spectrum, including advanced manufacturing, new energy vehicles, financial technology, telecommunications infrastructure, consumer brands, e-commerce and technology start-ups. Many young tech firms are pursuing offshore markets from the very beginning of their development.

Third, Chinese companies are increasingly expanding abroad as integrated industrial clusters rather than as individual firms. One of Chinese manufacturing's greatest competitive strengths lies in the coordination and efficiency of its industrial and supply chains. Many companies find that production supported by Chinese supply networks remains more efficient and cost-effective than relying entirely on local suppliers. As a result, entire industrial ecosystems — including suppliers, managers, engineers and technical personnel — are moving overseas together, creating a new model of global industrial organization.

Fourth, the scale of this expansion is unprecedented. Given the size of China's economy, both the number of companies and the volume of investment are exceptionally large. For many developing economies and smaller markets, Chinese enterprises quickly become significant industrial participants, raising local industrial capacity while also creating competitive pressure for existing businesses.

Fifth, this globalization is being driven by companies from a developing country rather than advanced economies. Historically, multinational expansion benefited from the economic, technological and geopolitical advantages of developed countries. Chinese companies often operate under different perceptions in host countries. While many governments welcome Chinese investment, Chinese firms may encounter social and commercial challenges that differ from those historically experienced by Western multinationals.

These characteristics are generating new opportunities as well as new challenges.

For many countries in the Global South, China's manufacturing capabilities, infrastructure expertise and integrated supply chains create an opportunity to accelerate industrialization and infrastructure modernization. Cluster-based investment can establish complete industrial ecosystems, infrastructure and business models within relatively short periods, potentially shortening development paths that historically required decades.

At the same time, as Chinese companies expand internationally, Chinese technological standards, industrial standards, digital technologies and business practices are increasingly being adopted overseas. In the past, Chinese firms generally participated in supply chains organized by multinational corporations and therefore followed externally established rules and standards. Today, Chinese companies are increasingly organizing their own international industrial and supply chains, particularly in emerging industries where they possess technological leadership.

The expansion of Chinese companies also presents short-term challenges for host economies. Although Chinese investment can contribute to industrial upgrading, economic growth, trade and improvements in living standards, it may also create adjustment pressures for local industries and interest groups. Different countries, reflecting their own political systems, legal frameworks, cultural particulars and national interests, are likely to respond in different ways. While some may adopt restrictive measures, many are expected to balance short-term pressures against long-term development opportunities.

Chinese companies themselves are entering largely uncharted territory. Their international operations generate service needs that differ from those traditionally associated with multinational investment, including legal protection, security, cross-border financing, payment and settlement, treasury management and other forms of professional support. Respecting local laws, customs and cultures remains essential, but these measures alone may not fully address the challenges arising from this new phase of globalization.

Supporting Chinese companies operating overseas should therefore become an important component of China's participation in global industrial restructuring. Financial regulation should adapt to growing cross-border capital flows by coordinating the management of domestic and international financial resources. Policies governing credit, insurance, bond issuance, foreign exchange, cross-border payments and related financial services should evolve in line with the needs of internationally expanding companies and international practice.

Shanghai should be developed into a comprehensive service center for Chinese companies operating abroad by strengthening its role in cross-border financing, forex trading, payment and settlement, treasury services and international legal, accounting and arbitration services. Large commercial banks should establish integrated domestic and overseas service systems capable of supporting industrial clusters rather than serving companies individually. Insurers, investment banks and other financial institutions should accelerate their offshore presence so that they can better support Chinese companies overseas.

China should also use this development to promote its approaches to green finance and sustainable investment internationally, encourage futures exchanges to develop products and trading models that better serve actively globalizing Chinese companies, and foster cooperation between large and small financial institutions to build integrated service chains for overseas businesses.

Beyond financial services, greater policy coordination is needed. While respecting companies' commercial decisions, the geographic distribution of overseas industries should receive appropriate strategic guidance. More Chinese standards should gradually evolve from market practices into internationally recognized institutional standards. Tax incentives, stronger protection for overseas personnel and assets, and broader policy support should also be considered to facilitate the long-term development of Chinese enterprises operating — and wishing to operate — abroad.

A partnership through thick and thin — and primed to grow

MAIN STREET
By Sultan Ahmed Al Jaber

Sultan Ahmed Al Jaber

There is a Chinese saying that sums up the partnership between the United Arab Emirates and China. "A long road tests a horse's strength; time reveals a person's heart." In other words, the strongest partnerships take time to build, are tested by distance and are reinforced by results. The UAE and China have been building ours for more than 40 years, through every market cycle.

Last year, non-oil trade between our two countries crossed 800 billion yuan ($118 billion) for the first time, growing by nearly a quarter in a single year, making China the UAE's largest trading partner, and the UAE China's largest partner in the Middle East and Africa.

In April, His Highness Sheikh Khaled bin Mohamed bin Zayed Al Nahyan, crown prince of Abu Dhabi, led a senior UAE delegation to Beijing, where two dozen agreements were signed across the sectors of energy, technology, finance and infrastructure.

Recently, I visited Shanghai to help keep the positive momentum going and turn shared ambition into commercial reality, because a partnership this strong is not meant to stand still.

Both our countries align national purpose with economic growth through strategic clarity. China's 15th Five-Year Plan (2026-30) sets out a clear ambition — to translate advances in science and technology into substantial, people-centric progress.

The UAE is equally focused on building the economy of the future through artificial intelligence, advanced manufacturing and the energy that powers them. We see ourselves as a natural partner for that journey across the energy value chain that makes all progress possible.

UAE companies are building from a position of strength. China is Abu Dhabi National Oil Company's single largest customer for our cost and carbon-competitive crude and refined products. Chinese companies are among our most significant partners across our upstream concessions, downstream businesses and operating companies.

And through Masdar, our renewable energy champion, our collaboration goes beyond the barrel into new energies, where we partner across the wind, solar and the battery value chain.

Recently, we took our partnership deeper across four key pillars.

Regarding supply, during my recent visit, Abu Dhabi National Oil Company announced a new agreement to deliver an additional 134,000 barrels of crude per day to China, providing more of the dependable, competitively priced energy its economy runs on.

Backed by a $150 billion investment program, we are raising our crude production capacity to five million barrels a day by 2027, while continuing to invest in resilient routes to market. Our Murban crude is light, low in sulfur and among the lowest-carbon-intensity oil produced anywhere, and it reaches Chinese ports on one of the shortest voyages of any major supplier.

Regarding distribution, we have finalized an agreement to build four new next-generation gas vessels, in addition to two already under construction. Shanghai's shipyards are building the fleet of the future and together, we will help supply energy across the economies of the Belt and Road region.

As for petrochemicals, we are making progress on our joint venture with Borouge and Wanhua Chemical to develop a state-of-the-art polyolefin complex in Fujian province. At the same time, through our international investment arm XRG, Covestro is expanding its advanced materials production in China.

Together, these investments will strengthen integrated supply chains and expand the availability of specialty plastics and critical materials essential for high-tech manufacturing, data centers and the circular economy of the 21st century.

Regarding clean energy, through Masdar, we are expanding our partnership across the renewable energy and battery storage value chain. Chinese companies already provide the components for many of our solar projects and will be an integral partner in the world's first round-the-clock solar project in the UAE, supplying the batteries that will help provide 1 gigawatt of uninterrupted clean power for industrial and domestic consumers in Abu Dhabi.

This level of collaboration reflects a partnership in motion that moves the UAE-China relationship beyond supply and demand into co-investment, industrial collaboration and value creation across the board.

Chinese companies are part of the fabric of the UAE's economy, contributing directly to our continued economic success. Building on that foundation, there is significant opportunity to expand investment, strengthen industrial ties and create even greater shared value.

In a fast-evolving world, partnerships that can deliver both stability and transformation matter more than ever. The UAE-China partnership is already proving to be one of the most consequential.

The writer is the United Arab Emirates' minister of industry and advanced technology. He is also managing director and group CEO of Abu Dhabi National Oil Company, executive chairman of XRG, ADNOC's international investment company, and chairman of renewable energy company Masdar.

Police crack down on FIFA World Cup betting rings

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Police in several Chinese cities have cracked down on illegal online gambling linked to soccer World Cup matches, detaining multiple suspects and warning the public to stay alert to betting scams disguised as "high odds", "expert predictions" or "guaranteed profit" opportunities.

As the 2026 FIFA World Cup gains momentum, gambling rings have used match traffic to lure internet users through social media posts, chat groups, offshore gambling websites and rebate schemes, police said.

Authorities in Huzhou and Hangzhou in Zhejiang province, Xi'an in Shaanxi province, Jiangyou in Sichuan province and Yulin in the Guangxi Zhuang autonomous region have recently uncovered cases involving hidden betting operations, promotion of gambling and illegal fund flows. While the cases share similar methods, each also showed varied tactics used to attract gamblers or evade investigation.

In Huzhou, police found that four suspects, including one surnamed Yang, had repeatedly posted "guaranteed profit" and "high-odds cashback" advertisements on social media before the World Cup began. The group allegedly drew users to soccer betting chat groups, updated match odds, issued betting "guides" and directed members to gambling websites or group operators. Four suspects were detained, and the case involved more than 1.5 million yuan ($221,000) in fund flows.

In late June, police in Jiande, Hangzhou, broke up another illegal gambling ring and detained eight people. The case involved more than 1 million yuan in fund flows.

Police said the group operated a so-called overseas World Cup betting market, using high odds and claims of accurate predictions to lure internet users, relatives and friends into placing bets. Unlike the Huzhou case, the group relied on cross-border gambling websites, assigned personnel to manage betting markets online and profited from rebates.

Police in Jiangyou also dismantled a ring that secretly promoted "World Cup exclusive markets" through instant messaging groups and WeChat groups. Investigators said the suspects used offshore websites offering high odds and multiple betting options, while arranging personnel to manage betting markets. To evade investigation, members frequently changed chat accounts and used temporary payment channels. The case involved more than 300,000 yuan and four main suspects were detained.

In mid-June, police from Xi'an's Weiyang district uncovered a group that used social media groups to update odds, open online betting games, recruit gamblers and settle funds offline. After identifying the group during early morning analyses on June 18, police formed a 20-member task force to trace clues, identify suspects, collect electronic evidence and check fund flows. The case, which involved more than 100,000 yuan, was solved within 19 hours and led to the detention of seven suspects.

Additionally, cybersecurity police in Yulin, Guangxi, uncovered a gambling promotion case under the "Clean Net 2026" campaign. Since May, police have found large numbers of gambling adverts in pictures, text and videos on multiple social media platforms. Investigators said a 25-year-old suspect surnamed Chen had organized a studio to provide traffic promotion and operational support for gambling websites. Chen and others were detained, and the case is under further investigation.

Police said soccer World Cup-related online gambling is deceptive, spreads quickly and may lead to fraud, money laundering and other crimes. Several online platforms have also launched special campaigns to remove illegal betting information, block accounts, delete posts and comments, and report clues to police.

Authorities reminded the public that online gambling is illegal and that promises of "sure wins" or "high returns" are often traps. Internet users should avoid joining betting groups, clicking gambling links or transferring money to strangers, and should report gambling-related information to the police.

Tour of Lhasa

Cyclists ride past the Potala Palace during the finale of the 2026 tour of Lhasa, Xizang autonomous region, on Sunday. The event featured men's and women's elite road races and open mountain bike races, covering a total distance of 190 kilometers and attracting more than 800 competitors. Plans for three-tier eldercare network

System to extend from urban centers to remote rural communities by 2029

By LI LEI
lilei@chinadaily.com.cn

The Ministry of Civil Affairs has unveiled a plan to build a national eldercare network over the next three years by integrating fragmented care resources into a three-tier system that extends from urban centers to remote rural communities.

The ministry aims to have the network in place by 2029 and further strengthen it by 2035, according to a guideline released on Wednesday.

At a news conference following the guideline's release, officials elaborated on the three-tier structure, which consists of county-level elderly care service management platforms, township- or subdistrict-level service centers and village- or community-level service facilities.

The system is designed to provide seamless care across home-, community- and institution-based settings.

"The three-tier network is not a simple hierarchical structure, but an organic whole," said Sun Wencan, deputy director of the ministry's department of elderly care services. The county-level platform serves as the system's "brain" and "nerve center", he said.

It coordinates with provincial- and municipal-level high-quality elderly care providers to perform functions such as service demonstration, industry guidance, emergency response, resource coordination and data aggregation.

> "The three-tier network is not a simple hierarchical structure, but an organic whole."
>
> **Sun Wencan,** deputy director of the Ministry of Civil Affairs' department of elderly care services.

Township-level service centers function as the system's "backbone" and "bridge", providing services including professional care, visitation care, family support and other extended services.

Established on the foundation of renovated high-quality elderly care institutions and comprehensive senior service centers, one regional center can serve multiple townships or subdistricts, Sun said.

At the grassroots level, village- and community-based facilities operate as the network's "terminals", providing daytime care, home-based services, short-term respite care, meal assistance and visitation services.

These facilities are designed to identify the needs of older residents and deliver services close to home, he added.

Beyond outlining the network's structure, Sun noted that its purpose is to address both the strict care needs of seniors with disabilities or cognitive impairment and the diverse needs of healthy, active older adults through services such as meal assistance, social engagement and recreational programs.

For frail and disabled seniors, county-level platforms will coordinate professional care for those with severe disabilities, while township-level centers will provide centralized care for people with milder conditions, supplemented by home-based services and respite care for family caregivers.

The plan builds on China's rapidly expanding elderly care system. By the end of 2025, the country had 396,000 elderly care institutions and facilities, with nursing beds accounting for 67.5 percent of all beds in elderly care institutions, Sun said.

Public county-level elderly care institutions have achieved full coverage nationwide. About 30 percent now function as comprehensive county-level elderly care service management platforms, while more than 60 percent of townships and subdistricts have established regional elderly care service centers.

Officials from Beijing's Dongcheng district and Nanping in Fujian province shared local best practices at the news conference, highlighting efforts ranging from urban resource coordination to improvements in rural elderly care services.

"We will promote these experiences and guide local governments to accelerate the improvement of the three-tier system to better meet the diverse and multilevel needs of senior residents," Sun said.

Panda turns one

A giant panda cub is officially named "Wangshu" during its first-birthday celebration at Chongqing Zoo on Sunday. The female cub, which weighed just 188 grams at birth, has grown to 36.5 kilograms in her first year. TANG YI / XINHUA

Single-Atom Catalysis research earns science award

By LI MENGHAN
limenghan@chinadaily.com.cn

Zhang Tao

As the invisible engines of modern chemistry, catalysts help produce the gasoline that powers cars, the fertilizers that promote food cultivation and the polymers used to make clothing, making them indispensable to modern life.

For more than a century, however, the chemical industry has faced a costly obstacle. Its most effective catalysts rely on rare and expensive precious metals such as platinum and palladium, which are even more valuable than gold. In conventional industrial processes, these metals are used in the form of nanoparticles or clusters, leaving a large percent of the metal atoms buried inside the material and unable to take part in chemical reactions. As a result, most of the precious metal is wasted.

After decades of research, Zhang Tao, an academician of the Chinese Academy of Sciences, and his team proposed the concept of Single-Atom Catalysis in 2011. Instead of using groups of metal atoms, the approach spreads individual metal atoms across the surface of a supporting material, allowing each atom to act as an active site where chemical reactions take place.

This increases the use of precious metal atoms from only a few percent to nearly 100 percent.

The breakthrough was first demonstrated using platinum-group metals and has since been extended to more than 40 elements in the periodic table. In recognition of its fundamental contribution to catalysis research, the work received the first prize of the State Natural Science Award in Beijing on Wednesday.

"The defining feature of Single-Atom Catalysis is that it allows us to study catalytic reactions at the level of individual atoms rather than larger particles," said Zhang, who is also a professor at the Dalian Institute of Chemical Physics of the CAS.

"Through theoretical studies, we have explained why Single-Atom Catalysis remains stable and how they behave during chemical reactions," said Li Jun, a team member who is also a CAS academician and a professor at Tsinghua University.

"This has changed catalyst research from relying largely on trial and error to designing catalysts based on scientific understanding," Li added.

Zhang said the new understanding has broad applications and has sparked worldwide interest in turning the concept into practical technologies, ranging from pharmaceutical manufacturing to the production of fine chemicals. Thousands of research groups from nearly 100 countries and regions have published more than 20,000 academic papers on the subject.

"This is not merely an academic pursuit, but a strategic response to national needs," Zhang said. "Securing independent control over core catalyst technologies is vital for our energy security and chemical industry."

Behind the achievement lies a decades-long journey from theory to practical application.

When Zhang first proposed the concept in his doctoral dissertation in the 1980s, the technology needed to verify it did not exist.

"In the beginning, we had the idea but no way to observe it," Zhang said. "It felt as if an elephant stood right in front of you, yet in the pitch-black darkness, without a flashlight and with the path choked by weeds, it remained invisible."

The technical limitations of the time made the work that much harder. The domestically produced chromatograph used by the team was basic and plagued by severe signal fluctuations, while power outages were common.

"Often, just as you were about to collect the final data, the power would flicker, erasing an entire day's work," Zhang said. He often spent days in the laboratory, sleeping on a straw mat on the floor while waiting for the equipment to produce stable data.

Zhang said his determination was shaped in part by his early experiences in the mountains. Born in 1963 in Ankang, in the Qinba Mountains of Shaanxi province, he returned to his hometown to teach at a high school after graduation. Driven by a strong passion for scientific research, he later decided to pursue graduate studies.

"I taught during the day and prepared for my master's entrance examinations by lamplight at night, wrapped in a thick cotton-padded coat and felt boots to keep warm during the winter," he said. The experience taught him self-discipline, independence and perseverance, qualities that later helped him overcome repeated setbacks in research.

He also emphasized the importance of interdisciplinary collaboration. Zhang led the development and testing of the catalysts, connecting theoretical research with practical applications, while Li, a theoretical chemist, developed the scientific framework explaining why single atoms remain stable and how they drive chemical reactions.

"With advances in artificial intelligence and computer simulation, we are now using our understanding of these active sites to design and identify better catalysts more efficiently," Zhang said. "The combination of fundamental research and new technologies is expected to support the development of new energy and greener chemical manufacturing worldwide."

China seeks to attract more intl sci-tech institutions

BEIJING — In addition to hosting frontier research facilities and high-tech enterprises, Beijing is now turning its focus to attracting international science and technology organizations, doubling down on efforts to boost its scientific appeal.

The Chinese capital has recently started expanding its dedicated cluster of international sci-tech bodies, adding service stations, exhibition halls, meeting rooms and cross-border network workspaces to accommodate more institutions.

This expansion drive extends beyond Beijing. More international sci-tech organizations have established headquarters and core branches in China, from coastal economic powerhouses to inland western regions, spanning fields from digital Earth science to aerospace.

The Space Universities Administrative Committee of the International Astronautical Federation, with its headquarters in Paris, has established a permanent secretariat in Dalian, a port city in Liaoning province.

According to Yu Xiaozhou, committee chair and professor at Dalian University of Technology, China's appeal lies in its varied scenarios, massive data and long-term observation records of existing projects.

These are critical inputs for frontier basic research, and they are also "the main reason why the IAF values China so highly and is willing to pursue global cooperation with us," Yu said.

Complete industrial chains are another key attraction, according to Chen Kai, deputy director of the International Society of Sensing Technology.

Co-founded by institutions from 10 countries and regions, including the United Kingdom and Canada, the new society was established in May in Chengdu, Sichuan province. Chen said the city's strong research ecosystem and industrial foundation were decisive factors in its selection as the headquarters.

The concentration of sci-tech organizations in China not only promotes innovation in research and industries but also contributes to enhancing both the capacity and fairness of global science governance.

With rising concerns about fragmentation and rival blocs in international science, China-based groups are becoming "unbiased hubs" for cross-border cooperation, said Li Fei, an associate researcher at Zhejiang University.

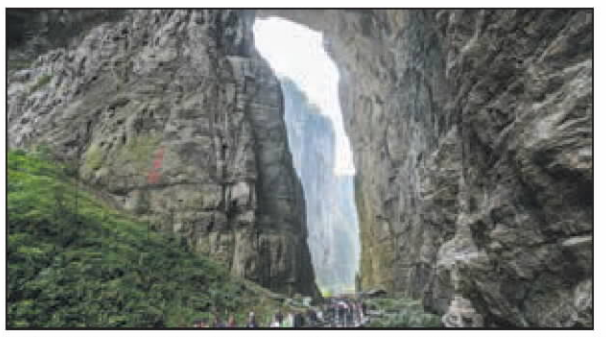
"Global science governance is shifting from a Western-dominated club model to a more inclusive partnership model," Li noted.

The global science program, "An Eco-Secured Community with a Shared Future for Mankind", is a typical example. Launched by Chinese scientists, it aims to mobilize global expertise to address pressing ecological challenges. At its Beijing office, Thato Mokhethi, from Lesotho, was sorting reports as a program participant.

"Beijing is a nice place where I can talk to other scientists and think about the future of humanity together," the young African scholar said. The group is responsive to countries keen on advancing the program, and she is willing to share her findings with researchers in her home country, she added.

The push on global science collaboration is underpinned by China's policies.

Since 2016, China has laid out plans to encourage international science organizations to set up within the country. Besides Beijing and Shanghai, provinces including Shandong and Hainan have rolled out their own incentives, and economic powerhouses like Guangdong and Jiangsu provinces have offered cash rewards for successful headquarters or branch offices.



Chinese provinces and cities are continuing efforts to enhance their global appeal. Beijing, for instance, recently announced that it would ease cross-border data flows, internet access and personnel entry for international sci-tech groups based in the city.

Karst landscape creates sustainable opportunities

Chongqing village seizes on World Heritage Site status for tourism bump

By **HOU LIQIANG** in Chongqing
houliqiang@chinadaily.com.cn

When Ran Yijie packed up his marketing degree and left his city job in 2021 to return to the rugged mountains of Chongqing, his neighbors thought he had lost his mind. He had successfully escaped the isolation of Jingzhu, a village once defined by severe rocky desertification, crushing poverty, and a mass exodus of its youth.

Today, nobody is questioning his sanity. Ran's family home is now a thriving local restaurant generating over 100,000 yuan ($14,000) annually, anchoring a massive reverse brain drain that is reshaping the economic landscape of Southwest China.

Driven by the strategic development of the nearby UNESCO Wulong Karst World Natural Heritage Site and the booming Fairy Mountain National Tourist Resort, Jingzhu has transformed from a dying hinterland into a magnet for young entrepreneurs and outside investors. In a crowning achievement, the United Nations World Tourism Organization has recognized it as one of the world's "Best Tourism Villages".

Wulong Karst, including the Three Natural Bridges, Furong Cave and the Houping Giant Doline, was inscribed on the UNESCO World Heritage List in 2007 as part of the South China Karst.

Karst landscapes are formed by limestone that has been eroded by dissolution, producing ridges, towers, fissures and sinkholes.

The economic numbers coming out of the region underscore a lucrative market centered around the rocks. In 2025, Wulong's scenic areas pulled in 52.1 million tourist visits, including nearly 800,000 international travelers, generating 25.1 billion yuan in total tourism revenue.

Jingzhu, with a population of 2,000 and located just six kilometers from the Fairy Mountain resort, has capitalized heavily on this influx.

Gao Yan, Party secretary of Jingzhu, said after Wulong's successful world heritage inscription and the opening of the Baotou-Maoming Expressway, villagers began developing high-altitude fruit picking and rural restaurants for tourists. After Fairy Mountain was upgraded into a national-level tourist resort in 2015, the village started to cultivate integrated enterprises covering leisure vacations, study tours, commerce and agriculture.

The timing, Gao said, allowed Jingzhu to leverage its proximity to the heritage site to expand its development.

In 2025, the village recorded over 1.5 million tourist visits, and tourism revenue of over 100 million yuan. Per capita disposable income among villagers has surpassed 27,000 yuan, a figure significantly higher than similar rural villages in Chongqing municipality.

Tourists visit the Three Natural Bridges scenic area in Wulong, Chongqing, in April. HE PENGLEI / CHINA NEWS SERVICE

"Local people have benefited from the heritage site," said Chen Zhang, head of the village's agriculture, culture and tourism development company. He said villagers' incomes have increased by more than 10 percent annually on average since the World Heritage Site was named.

Chen said fruit farmers no longer worry about sales. A grape grower once told him that revenue from the crop could reach about 600,000 yuan per hectare. At peak times, he said, as many as 350,000 long-stay visitors live in the nearby resort area for months, and many drive directly to the village to pick fruit.

"We do not really have to go out and sell," Chen said. "They come to us."

Thriving enterprises

Restaurateur Ran is among a number of young villagers who have found a way to share in that growth. With support from local authorities, he turned his family's idle house into a restaurant serving local cuisine. He said the local government covered the renovation costs as part of a homestay alliance policy, under which idle village houses are upgraded for business use and later returned to villagers, with the improvements left in place.

His mother, who began as a kitchen helper, prepares a local specialty soup, and his father has opened a small store beside the restaurant.

In recent years, nearly 200 people have either returned from outside or come to Jingzhu to develop new enterprises. They run homestays, grow fruit and operate restaurants, turning once-empty courtyards into bustling tourist hubs.

The village has 46 homestays and rural inns. Blueberries grown in the village can sell for 120 yuan per kilogram, while grapes and other high-altitude specialty fruits generate more than 150,000 yuan per hectare on average, according to village authorities.

The development has not come at the cost of abandoning ecological protection, with local officials saying Jingzhu maintains a forest coverage rate of about 75 percent, and a negative oxygen ion concentration of around 35,000 per cubic centimeter.

The village's approach, they said, is to keep the core heritage area under strict protection, allow appropriate use in buffer and surrounding areas, and help residents increase income through catering, homestays, fruit farming and other peripheral industries.

That approach reflects a broader model explored in Chongqing's Wulong district.

Liu Baodang, deputy secretary-general of the World Heritage Expert Committee of the National Forestry and Grassland Administration, said Wulong has put in place a three-layer protection and development system.

The core layer is strictly protected, the surrounding layer is developed through community participation, and the outer layer supports nature education, tourism, sports and cultural activities. "Protection and development no longer work against each other," Liu said.

In the core area, protection is enforced through legal and administrative mechanisms. Wulong established a world natural heritage prosecutors' office in 2024, integrating criminal, civil, administrative and public interest litigation functions related to environmental and resource protection.

Over the past three years, local authorities have handled more than 80 criminal cases related to environmental resources and more than 110 public interest litigation cases. More than 27 million yuan has been invested in heritage protection over the last five years. Construction projects are required to undergo planning and site checks before development.

Outdoor sporting competitions and activities have become another route for sustainable use. Fairy Mountain's scenic road is a core section of the China International Mountain Outdoor Sports Open, which has been running for more than two decades and has attracted competitors from over 70 countries, said Huang Wei, deputy head of Wulong's culture and tourism commission.

Wulong has 24 hiking routes spanning 774.64 km, he said. In 2024, its outdoor sports industry generated more than 1 billion yuan in revenue and received more than 10 million sports tourism visits, creating stable employment for more than 3,000 residents.

Chen Weihai, a researcher at the Institute of Karst Geology of the Chinese Academy of Geological Sciences, said Wulong Karst is of world-class quality. The three natural bridges within 1.5 km of the Three Natural Bridges form one of the world's largest beaded natural bridge groups, while the Houping Giant Doline cluster provides important evidence for studying karst development and regional geological change.

For Jingzhu village, however, the significance of the World Heritage Site is also visible in more ordinary scenes: A young man returning home to cook local dishes, families turning idle houses into businesses, fruit growers selling directly to visitors and old courtyards filling with people again.

The karst landscape neighboring Jingzhu brought tourists. Tourists brought business. Business helped bring young locals back.

"Without the World Natural Heritage Site, Jingzhu would not be what it is today," said Xie Yong, an official with the Fairy Mountain subdistrict government.

He said the village's "ecology plus culture and tourism" approach has become more than a development model. It is a path to rural vitalization built on the protection and sustainable use of natural heritage.

Life thrives on Mount Emei as conservation takes root

By **HOU LIQIANG** in Emei, Sichuan

Mount Emei has marked the 30th anniversary of its UNESCO World Heritage listing with a wave of biodiversity breakthroughs, successfully saving two critically endangered species once thought to be lost forever.

Through artificial breeding, precision tracking and a new smart monitoring network, local conservationists have successfully revived the *Parakmeria omeiensis* (a rare magnolia tree) and rediscovered the chevron-spotted brown frog — a "Lazarus taxon" that had vanished from scientific records for decades.

These breakthroughs are part of a broader ecological turnaround on the mountain. Over the last five years alone, local authorities have documented three animal species entirely new to science, alongside three newly recorded plant species and 16 newly recorded animal species.

The *Parakmeria omeiensis* is an evergreen tree endemic to Mount Emei and classified as a plant species with extremely small populations, said Yu Daoping, a researcher with the Sichuan Provincial Academy of Natural Resource Sciences.

The plant was first recorded by botanist Zheng Wanjun during fieldwork on Mount Emei in 1940 and was named in 1951 after its type locality, Yu said. It then disappeared from scientific observation for decades before researchers rediscovered one individual on a cliff in 1987. By 2012, only 74 wild individuals had been found, and the current wild population remains at just over 90 plants, Yu said.

In 2012, the species was included in China's conservation program for plant species with extremely small populations. It is also under first-class national protection and is listed as critically endangered by the International Union for Conservation of Nature.

Yu said the magnolia is valuable not only because of its rarity, but also because members of the magnolia family are considered ancient groups among angiosperms. The species offers important evidence for studies of the origin, development and evolution of flowering plants and is also a reference indicator for regional forest ecosystem quality.

After more than 30 years of work, researchers have mastered seed propagation, grafting and other artificial breeding techniques, overcoming difficulties in fruiting, germination and seedling growth under natural conditions, Yu said. To date, more than 3,200 seedlings have been cultivated, and over 800 plants have been reintroduced in eight operations at five sites on Mount Emei, with survival rates remaining above 90 percent in the wild.

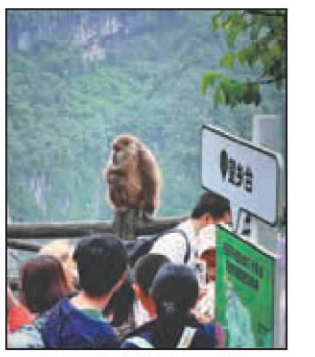
Another case is the chevron-spotted brown frog, or *Rana chevronta*, a critically endangered amphibian endemic to Mount Emei.

Liang Dong, an engineer at the ecological station of the Mount Emei forestry management office, said the frog has an extremely small population and a very narrow distribution range.

The species was first discovered in 1965 and named in 1978 by Hu Shuqin and Ye Changyuan, then researchers of the Chinese Academy of Sciences, Liang said. For decades afterward, no living individual was recorded. Relying on field notes left by earlier zoologists to identify the historical discovery site, researchers found three individuals in 2024.

Liang said the frog lives in coniferous and broadleaf mixed forests at an altitude of about 1,800 meters, and feeds on insects and small animals. The site where it was rediscovered was the same as the location where it was found in 1965, and the timing of the two discoveries was also close, he said.

Researchers from the Chengdu Institute of Biology of the Chinese Academy of Sciences, Chengdu Normal University, Sichuan University and local institutions have strengthened studies and protection of the species in recent years, Liang said. The next step is to explore artificial breeding to increase its population.



Habitat quality is crucial for the frog, he added. Monitoring work showed that the chemical oxygen demand level at one breeding site was only 5 to 8 milligrams per liter, indicating very clean water, according to Liang.

"Last year we tested the water at its breeding site, and the chemical oxygen demand level was only 5 to 8 milligrams per liter. What does that mean? It means even the drinking water from the tap at our homes might not be as clean as that water," he said.

To support such conservation work, monitoring capacity has also been strengthened. According to local conservation authorities, a biodiversity monitoring demonstration project has deployed 73 infrared cameras, including 22 smart devices capable of real-time data transmission. The grid-based network now covers 85 percent of the target area.

The system has collected 2,956 valid wildlife image records and identified 46 wildlife species, including one under first-class national protection, 16 under second-class national protection and five species on the IUCN Red List of Threatened Species.

It has also helped authorities crack one poaching case. The project team plans to complete the deployment of 100 infrared cameras by the end of September and further explore artificial intelligence image recognition after the rainy season.

A macaque sitting on a railing on Mount Emei is at the center of tourists' attention in July 2024. DU LIANYI / CHINA DAILY

Known for its rich ecological resources, Mount Emei is home to more than 3,700 higher plant varieties and over 2,300 wild animal species, according to local conservation authorities. The mountain also serves as the type locality — the exact place where the very first specimen of a new species was collected — for 253 plant and 157 animal species.

LIFE

Lead singer Li Wei (center), bassist Zheng Jun (top left), guitarist Zeng Huizhen (top right), keyboardist Zeng Qingli (above left), and drummer Liu Shuangqing rock the stage in a graduation concert at Hubei Engineering University in Xiaogan, Hubei province, blending heartfelt farewells with a punk-inspired performance. PHOTOS PROVIDED TO CHINA DAILY

Rocking out a goodbye to students

Five dorm matrons surprise graduates with unforgettable performance, **Chen Meiling** and **Liu Kun** in Wuhan report.

The lights suddenly went out, and the audience fell silent. The drummer raised her sticks, held them aloft for a split second, then brought them crashing down.

"Hey, you in West Zone Dorm 19! What are you still doing after lights out?" "Girls in Sanli Dorm! If you don't sweep up all that hair, I'll think I've wandered into the Spider Cave!"

More than 2,000 glow sticks swayed across the arena. Onstage stood five dormitory matrons — familiar faces students had seen almost every day for years. But this was a side of them no one had seen before.

At a recent graduation concert at Hubei Engineering University in Xiaogan, Hubei province, a rock band made up of five dormitory matrons brought the house down.

The lineup featured lead singer Li Wei, bassist Zheng Jun, keyboardist Zeng Qingli, drummer Liu Shuangqing, and guitarist Zeng Huizhen. Usually seen hurrying through dormitories in work uniforms, the five women took the stage in punk-inspired outfits.

Zheng had her hair braided into tiny plaits for the first time in her life. Zeng Huizhen, who usually oversees the men's dormitories and is known for her stern demeanor, wrapped a sun-protection face covering around her head to complete her edgy look.

Averaging 50 years old, the women performed an original song, *Go Shine*, written for the occasion, as a heartfelt farewell to the graduating class.

The contrast between their everyday jobs and rock-star personas, combined with humorous and touching lyrics peppered with local dialect, drew wave after wave of cheers. Videos of the performance quickly went viral online.

Singer Li, 46, is the youngest in the band. She got a wild perm especially for this performance.

"My palms were sweating from nerves before going on stage. I never get flustered when chatting with hundreds of students during dorm inspections, yet standing under the bright lights of the huge gymnasium stage made my legs go weak. We kept encouraging each other right before our performance," she says.

"But the moment we stepped onto the stage and heard the students cheering, with glow sticks lighting up the crowd, all my nerves disappeared. All I could see were the kids, smiling and full of excitement."

Li has worked as a dormitory matron for four years. Her days are spent keeping dormitory records, making nightly rounds, mending torn clothes, and lining up electric scooters outside the buildings. Thanks to her outgoing personality, students affectionately call her Sister Wei.

Her favorite lyrics read: "If you're wronged and have nowhere to turn, just buy a ticket and come back. ... A window in the dormitory building will always stay open for you."

"I want them to know they don't have to carry every burden alone," she adds.

Practice makes perfect

None of the five women had any real musical experience before joining the band.

"I can't even read sheet music, let alone play an instrument," says keyboardist Zeng Qingli, 49.

For a month, they rehearsed during work breaks in the dormitory duty room. With the curtains drawn and their instruments unplugged, they silently counted beats and practiced finger movements.

"We didn't want to make noise that might disturb students studying for exams or sleeping in the dorms," says Liu, the drummer.

The rock band's performance captivates students at the venue, and its videos draw more than 3 million views online.

She says the rehearsals were meant to remain a secret.

"But some students walking past the duty room late at night heard us humming and guessed we were preparing for a performance," Liu says.

"They even told us not to push ourselves too hard."

Without a drum kit at home, Liu lined up washbasins, rice bowls and pot lids in her kitchen, using chopsticks as drumsticks while following tutorial videos on her phone.

"My husband laughed at first, saying I'd turned the kitchen into a band rehearsal room," she says.

"Later, he sat with me every day, helping me keep time."

The idea for the performance began when the university's facilities and logistics department and the Communist Youth League Committee started planning a performance for the graduation concert. Graduates from the School of Literature, Journalism and Communication suggested writing a song dedicated to the dormitory matrons who had cared for them throughout their university years.

The concert's faculty adviser believed rock music best captured the energy and optimism of graduates about to begin a new chapter in life.

To create an original song, Ouyang Chengxiu and his students interviewed classmates and dormitory matrons, collecting stories that reflected everyday moments and the deep bonds between them.

The lyrics recall students pretending to be asleep when they heard the matrons' jangling keys, hiding laptops beneath blankets, tucking takeout into wardrobes, or climbing over campus walls late at night with excuses about buying medicine.

The song went through more than 10 revisions before it was finalized.

"Our concept was built around contrast and resonance," Ouyang says. "We wanted to break the stereotype that dormitory matrons are simply there to check rooms."

The five performers were selected from across the university. After speaking with them, Ouyang's team realized how many moving stories they had.

No matter how late students returned, the matrons always left a door open for them. Years after graduation, many former students still send local specialties from their hometowns or greetings during festivals. "We wove those genuine moments into the lyrics," Ouyang says.

Memories and wishes

The four-minute performance quickly went viral, drawing more than 3 million views on Sina Weibo. Many viewers say it brought back memories of their university days.

"I don't know them personally at all, but I'm in tears," one netizen writes.

Lei Wenjia, an English major who attended the concert, says she was stunned when the dormitory matrons walked onstage with their punk-inspired performance.

"The atmosphere was electric from start to finish. It made this graduation concert a truly unforgettable experience," she says.

For Lei, the song was filled with memories, heartfelt reminders and warm wishes. "I'll carry all of them with me as I begin the next chapter of my life," she says.

To Lei, the matrons were more than dorm supervisors. They reminded students to close their windows before it rained and to pack warm clothes when temperatures dropped, comforted them when they were upset, and shared their happiest moments.

Cao Yixi, who graduated with a degree in primary education, describes the matrons as dependable guardians who were always there whenever students ran into trouble.

"They could solve almost anything," she says. "Once I dropped something into a drain, and my dormitory matron lent me a long pair of tongs to retrieve it. It felt like there was nothing she couldn't do, and we could always turn to her for help."

Two days after the June 14 concert, at the university's graduation ceremony, Zeng Qingli fought back tears as she addressed the graduating class.

"There won't be any aunties reminding you to turn off the lights at night anymore. But I hope you'll always keep a light burning in your hearts and remember to take good care of yourselves," she says.

Zeng Qingli's duty room is like a treasure chest for over 3,400 students: sewing kits, bike pumps, screwdrivers, first-aid kits, and umbrellas. It stocks all kinds of daily supplies students might need. A well-worn registration book bears dense records of key and item borrowings. On average, at least five or six students come to her every day, and she always greets them with a smile.

"It feels like only yesterday that I watched them move into the dormitories," she says. "And now, it's time to say goodbye."

The five women shared one final message with the graduates: "Go after your dreams with courage and let your light shine. If you ever feel worn out, you're always welcome to come back. Don't compare yourself with others, no matter how your life turns out. Peace, smooth days and happiness matter most.

"Stay in touch with your family and your alma mater. When you have time, come back to Xiaogan and Hubei Engineering University. The corridors will still feel familiar, and we'll still be here. Just call out to us when you return, and we'll greet you with a smile and ask, 'Have you eaten yet?'"

The challenges and triumphs of rescuing stranded whales

HAIKOU — "A whale is stranded in the shallows and in critical condition!" This distress call had barely come through when Li Haiqin, 49, grabbed his life jacket and first-aid kit and rushed to the scene.

It may have been just another day for the head of a cetacean rescue team in Sanya, South China's Hainan province, but this mission exemplified his 14-year commitment to saving stranded whales and dolphins.

After founding the rescue team in 2012, Li has participated in more than 40 whale and dolphin rescue operations. In his eyes, every lost whale or dolphin deserves every possible effort to help it find its way back home.

With the skill of an experienced rescuer, he coordinates on-site rescue operations in an orderly fashion, directing fellow rescuers to use wet towels to prevent whales or dolphins from drying out. At the same time, he gently comforts the animals and spares no effort in their recovery.

A rough-toothed dolphin named "Yangyang" was found stranded in the shallow waters of Yalong Bay, Sanya, on April 24, 2025.

Lying on its side and showing signs of extreme weakness, the dolphin had its blowhole blocked by mud and sand at the time of discovery.

Upon receiving the alert, Li rushed to the scene and coordinated rescue efforts with the coastal police and local fishermen. Thanks to their joint efforts, "Yangyang" was successfully returned to the sea.

In Li's view, there is no easy path to saving a life. Every successful rescue is earned through perseverance, hard work and an unyielding commitment that never wavers.

On Jan 3, 2024, a short-finned pilot whale named "Haitang" was found stranded in Haitang Bay in Sanya, with severe shark-inflicted wounds and in critical condition.

Li promptly organized a team to transfer the animal to a shore-based rescue site, where treatment was provided with assistance from scientific experts, coast guard personnel and firefighters. Following 145 days of treatment and monitoring, "Haitang" recovered and was returned to nature.

Cetaceans, as flagship species of marine ecosystems, serve as a critical barometer of ocean health. Stranding-related deaths, caused by disease or disorientation, have become an intractable problem worldwide.

In China, more than 100 such incidents occur each year, and rescue efforts are often met with daunting challenges.

Li Haiqin (second from left) participates in a rescue effort for a short-finned pilot whale in Sanya, South China's Hainan province, in 2024. XINHUA

Over the years, Li has endured countless cuts and bruises of all sizes while navigating tidal flats and submerged reefs. Some of his wounds festered for as long as two months.

Li now envisions a conservation approach that goes beyond emergency response, evolving into an integrated model encompassing rescue operations, public science education and skills training.

"Rescuing stranded whales and dolphins is extremely challenging, and the success rate remains low. But as long as there is even a glimmer of hope, we will never give up," the rescuer says.

LIFE

Performers share their journeys into an art that once lacked a community, and how they gave the genre a distinct identity, which in turn provided them with hope, **Chen Nan** reports.

Street dance moves into the mainstream

What do hip-hop dance moves and kung fu have in common? More than many people may think. Both demand rigorous training, reward improvisation, and celebrate physical mastery. These common threads will take to the stage on July 24 at New York City's Lincoln Center, where Chinese performers will blend the two art forms during Chinese Arts Week, part of the Lincoln Center's Summer for the City program.

Chinese dancers will weave together breaking, popping and martial arts, offering audiences more than a display of technical virtuosity. For the artists behind the production, the performance is intended as a statement about how Chinese street dance has evolved from an imported youth culture into a distinctly Chinese artistic language.

"We hope to present a more multidimensional, open and confident image of Chinese street dance," says Xia Rui, one of the performance's principal organizers. "Chinese street dance is not simply a copy of Western street culture, nor is it just youth entertainment centered on technical display. After years of development, it has become a contemporary artistic language through which young Chinese people express themselves, engage with tradition, and connect with the world."

In addition to the July 24 show, the Chinese street dance delegation will begin its US tour with a performance at the festival's opening reception in New York on July 23 and then travel to Philadelphia for a public performance on July 25. The tour concludes on July 26 with a youth street dance cultural exchange in New York, followed by creative workshops and a series of flash mob performances in the city.

As a major promoter of the dance genre in China, Xia is the deputy director of the China Hip-Hop Union Committee, founded by the China Dancers Association in 2013.

For Xia, presenting the showcase at the Lincoln Center carries symbolic weight.

"We want audiences to see that Chinese street dance is youthful, vibrant and creative. It is rooted in Chinese culture and Eastern aesthetics and is capable of engaging in equal dialogue with other cultures," he notes.

That confidence did not emerge overnight.

When 38-year-old dancer Chen Jie — better known in the dance battle scene as A K — first discovered street dance, China barely had a community for it.

His performance at the Lincoln Center will expand on an earlier television work into a new work, a reimagining of Sun Wukong, or the Monkey King, combining hip-hop and breaking with projections, shadow imagery and music built around traditional Chinese musical instruments such as the *pipa* (a four-stringed lute), *suona* (a double-reed woodwind instrument) and *guzheng* (Chinese zither).

"American audiences have Marvel superheroes," he says. "China has its own hero — Sun Wukong."

The legendary Monkey King from the classic novel *Journey to the West* overcomes repeated setbacks through determination, a quality that resonates with Chen.

"My own story is very similar," he says. "I've encountered many obstacles, but I've kept moving toward my goal."

As a primary school student, he saw what a television program simply described as "popular dance". Soon after, he learned from his classmates who practiced something called street dance.

"I went to watch," recalls Chen, who was born and raised in Zhanjiang, Guangdong province. "I thought it looked incredibly cool. I fell in love immediately."

Learning was far more difficult than it is today. There were no online tutorials or social media clips to imitate. His older brother introduced him to Michael Jackson performances on DVDs, and Chen replayed them endlessly, studying the iconic moonwalk and every movement and musical accent.

His family struggled to understand his obsession.

"They didn't know what I was doing," Chen says. "Only after I won a competition in Guangzhou (Guangdong) did they stop criticizing."

Years of persistence followed before the trophies arrived. He trained first as a breaker before discovering hip-hop, whose groove, rhythm and musicality felt more natural.

"When I found hip-hop, I knew immediately it was the dance genre I'd been searching for," he says.

Today, Chen, who has gained a large fan base after appearing on hit reality shows such as *Street Dance of China*, sees street dance as carrying responsibilities that extend beyond competitions.

"I want young people to see hope. Street dancers are not troublemakers dancing on street corners. If we do this well, we can give others strength," he says.

He has spent years teaching children, including students in remote mountain communities, traveling for hours by bus to conduct workshops.

"I was a quiet child myself," he says. "Dance made me confident. Seeing that happen for other children is one of the happiest things I've experienced."

China's street dance landscape has changed dramatically during his career.

"People, from 4-year-olds to 60-year-olds, are learning street dance," Chen says. "That wasn't imaginable before."

For the youngest performers, however, Chinese street dance has always been more than imitation.

Wu Mingrui, a 16-year-old popper, first danced in kindergarten after a teacher demonstrated a few simple moves.

"I learned them very quickly," she says. "I was always chosen to lead the performances. My mother realized I had talent."

She began studying popping at age 7. A video of a young South Korean female popper convinced her that the style's explosive power was not limited to men. "I realized girls have strength too," she says.

She remembers hearing doubts that popping demanded physical abilities girls simply did not possess.

"People thought girls would always struggle physically compared with boys," she says. "That only made me want to prove them wrong."

She trained relentlessly, often spending 12 hours every weekend in the studio.

At 9, she won her first competition while competing against adults.

"I never expected to win. When the judges raised my hand, I burst into tears. That moment made me believe maybe I really could do this," she recalls.

Her understanding of dance has changed with experience.

"I used to think of myself as an athlete," she says. "Now I think street dance is really about expression. Dance doesn't have one standard like sports. It's how you communicate your emotions."

She hopes audiences also see something else.

"I want people who watch me dance to feel that women are powerful," she says. "Girls can dance just as well as boys."

At the Lincoln Center, Wu will perform *Daomadan*, a work that combines street dance with Chinese opera traditions and martial arts, disciplines she has studied formally in preparation for the performance.

Daomadan translates to "knife-and-horse female role". *Daomadan* is a role type in traditional Chinese Opera, featuring a female warrior who combines martial arts, dance, acrobatics, and singing.

"Street dance wasn't originally connected with martial arts," she says. "Creating something new from both traditions is exciting. It's a way to share Chinese culture."

That approach also reflects Xia's broader philosophy.

"The point is not to insert traditional elements into street dance," he says. "The challenge is allowing traditional culture to become the inner character of the work."

He argues that successful cross-cultural performance does not depend on audiences recognizing every cultural reference.

"Even if people don't understand a different culture," Xia says. "They should still feel its spiritual strength, its physical rhythm and its aesthetic character.

"Street dance has explosive energy, kung fu has inner power. Street dance values freestyle expression, while Chinese culture offers deep spiritual roots. When those qualities truly come together, it isn't simply a fusion — it becomes a new contemporary Chinese expression."

For Xia, China's street dance ecosystem has been built over the years through national organizations, competitions, education, and artist development.

International appearances, he believes, should become part of an ongoing cycle rather than isolated events.

Ultimately, he hopes Chinese street dance will move beyond occasional overseas performances toward sustained artistic partnerships.

"The most important thing is not for the world to know that China also has street dance," Xia says. "It is for the world to understand that Chinese street dance is making its own cultural contribution."

Turkiye, Sri Lanka host cultural exchange events with Chinese cities

ISTANBUL/COLOMBO — The cultural exchange event "Encounter and Enlighten" recently opened in Istanbul, Turkiye, highlighting exchanges with Nanjing, Jiangsu province, as well as in Colombo, Sri Lanka, where exchanges between the city and Ningbo, Zhejiang province, were featured. The series of events highlights intercity dialogues on topics including mutual learning among civilizations and urban development.

The events were attended by representatives from governments, academia and cultural institutions.

In a video message addressing the Nanjing-Istanbul Urban Civilization Dialogue held on July 2, Frederique Aubert, head of the culture unit at the UNESCO Regional Bureau for Science and Culture in Europe, which is based in Venice, noted that both Nanjing and Istanbul possess rich cultural heritage and that their heritage conservation practices can serve as models for the preservation and sustainable development of historic cities worldwide.

Right: Guests visit an exhibition during the cultural exchange event "Encounter and Enlighten" in Colombo, Sri Lanka, on July 4. The event arrived in Colombo, featuring a themed dialogue with China's city of Ningbo, Zhejiang province. **Left:** Experts lead a discussion during the Nanjing-Istanbul Urban Civilization Dialogue held in Istanbul, Turkiye, on July 2. PHOTOS BY XINHUA

Huriye Merve Gedik, head of the City History, Promotion and Tourism Department of the Istanbul Metropolitan Municipality, said that Istanbul and Nanjing are both historic cities that have flourished along waterways and prospered through the accumulation of civilization.

The dialogue facilitates the two cities in deepening mutual understanding and creates opportunities for practical cooperation, such as preserving ancient city walls and utilizing cultural heritage, Gedik said.

Also on that day, renowned writers, poets and Sinologists from China and Turkiye held in-depth discussions on literary creation and cross-cultural communication in the AI age, and announced a two-way resident-poet project.

In Sri Lanka's capital, Colombo, the event held on July 4 focused on cultural construction amid the development of port cities.

At a themed dialogue with the eastern Chinese city of Ningbo, Mayor of Colombo Vraie Cally Balthazaar told journalists that both port cities are undergoing tremendous transformation and that Colombo looks forward to learning from Ningbo in city planning and the integration of culture and tourism.

At a session devoted to sharing stories of life, culture and connection associated with the two cities, Yasiru Ranaraja, founding director of the Belt and Road Initiative Sri Lanka, recounted the historical visits by ancient Chinese Buddhist monk Faxian and navigator Zheng He to Sri Lanka, highlighting the port city's important role in Sri Lanka-China exchanges since ancient times.

Organizers of the "Encounter and Enlighten" cultural exchange events in Turkiye and Sri Lanka included China's State Council Information Office, Chinese diplomatic missions in the respective countries, and the Chinese city-level governments involved.

LIFE

Willow craft branches out

A centuries-old weaving tradition fuels rural livelihoods, exports and sustainable design through constant creativity and skilled craftsmanship, **Zhao Ruixue** reports.

In the quiet town of Caozhuang in Linshu county, Shandong province, villagers are busy in mid-June weaving willow products ordered months earlier by overseas buyers. Among the most popular items is a hand-woven sleigh lined with soft velvet, designed as a Christmas decoration.

"Customers visit months in advance to place orders. These festive willow crafts add warmth to homes and capture the spirit of Christmas," says Zhang Zhiquan, general manager of Linyi Olvy Agricultural Comprehensive Development Co Ltd.

Beyond sleighs, Christmas tree skirts, storage baskets and delicate willow deer ornaments have also become seasonal best-sellers.

Walking into the Olvy garden in the town, visitors are instantly immersed in a handcrafted paradise filled with diverse ingenious crafts woven from willow branches, wood and ropes.

At the garden entrance, a simple fence made of interlaced willow twigs and small wooden stakes showcases the primitive power of nature.

Every corner of the garden features handmade willow creations, including delicate tables, chairs and pavilions. Rows of functional and decorative willow works range from storage boxes, woven baskets and framed mirrors to delicate small ornaments.

"We love willow products because so many things today are machine-made. Handmade baskets bring warmth to a home," says Carlos Rocher Arnal, a buyer from Spain shopping for Christmas gifts.

He is looking for baskets to fill with wine, chocolates, and other presents for teachers, doctors, lawyers, friends, and family — a long-standing Christmas tradition in his country.

"I'm looking for items with handles, or some small containers to put two or three bottles and some chocolates," he adds.

Top: Villagers prune willow trees on June 10 in Linshu county, Shandong province. **Middle left:** A villager lays freshly woven willow products out to dry in Linshu on June 10. **Middle right:** Locally made wicker products are displayed at the Olvy garden in Linshu. **Above:** Zhao Qingyue, a county-level inheritor of Linshu willow weaving, demonstrates the traditional craft in Linshu county. PHOTOS BY LIANG BEN / FOR CHINA DAILY

Willow weaving in Linshu dates back to the Sui (581-618) and Tang (618-907) dynasties, according to historical records. The craft flourished during the Song (960-1279) and Yuan (1271-1368) dynasties before reaching maturity in the Ming (1368-1644) and Qing (1644-1911) dynasties.

Over centuries, artisans developed techniques including flat weaving, pattern weaving, block weaving and edge wrapping. Today, the craft is mainly practiced in Henan, Shandong, Hebei and Anhui provinces.

Linshu willow weaving was added to China's national intangible cultural heritage list in 2021.

With practiced hands, Zhao Qingyue, 68, a county-level inheritor of the craft, bends, loops and folds flexible willow branches into intricate woven patterns.

"In Caozhuang, weaving willow is as common as farming. Almost everyone here knows the craft," Zhao says.

Historical records show that villagers were already weaving baskets, grain containers and winnowing pans during the Tang Dynasty.

What began as a practical rural craft has grown into one of Linshu's pillar industries. Today, local producers make dozens of categories of products, from baskets and furniture to garden decor.

Willow products from Linshu are exported to more than 80 countries and regions, accounting for more than a quarter of China's total willow product exports, according to statistics provided by the county government.

The industry generated 950 million yuan ($139.8 million) in output in the first four months of this year, a year-on-year increase of 16.58 percent. Exports during the same period reached 268 million yuan, up 9.38 percent from the previous year, according to the latest figures.

Nearly 100,000 residents in Linshu county are engaged in the willow weaving industry.

"Weaving willow lets me turn my passion into a career. That makes my work deeply rewarding," says Zhao.

While inheriting tradition, local practitioners keep innovating to inject vitality into the ancient craft.

"Traditional craftsmanship shouldn't be confined to old designs," says Zhang, who has learned willow weaving since childhood. He combines willow with iron, wood, rattan and straw, blending traditional techniques with contemporary aesthetics to expand the product range.

His company has developed more than 20,000 designs and color options of willow products, with over 90 percent exported to markets including the United States, Spain and Japan.

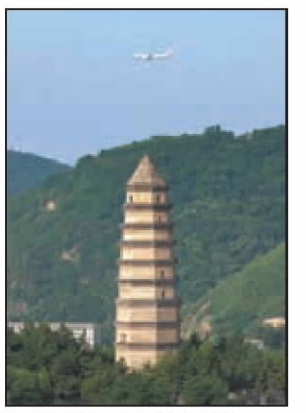
"Today, handmade willow crafts are used in homes around the world, bringing natural texture and warmth to gardens, living rooms and studies," Zhang says.

One of the company's enduring bestsellers is a fan-shaped firewood basket woven from unpeeled and white willow.

"This product is highly versatile. It works equally well for storing firewood by the fireplace, organizing garden tools or displaying fruit and flowers, which explains its lasting appeal," he says.

The company is also developing a woven willow or rattan sleeve that fits around a metal ice bucket, combining practicality with natural style.

"We believe it will become another popular product," Zhang says.



He is equally optimistic about China's domestic market. "Willow weaving reflects a natural, low-carbon and environmentally friendly lifestyle, which increasingly resonates with consumers," he says.

Cao Jiayue contributed to this story.

Historic heartland cultivates greener future

Left: Tourists join a traditional village feast in Shenshan village, Maoping town, Jinggangshan city, Jiangxi province, on July 4. ZHOU MI / XINHUA **Right:** Air China Flight CA1279 flies over Pagoda Hill in Yan'an, Shaanxi province, on June 24. Air China has launched "red tourism" routes from Beijing to historic revolutionary destinations including Jinggangshan, Zunyi and Yan'an. CHEN XIAO / XINHUA

NANCHANG — Deep in the forested mountains of Pulong village in Jinggangshan, East China's Jiangxi province, Li Yunyan tends more than 90 beehives. What began as a modest sideline has grown into a reliable livelihood.

The 46-year-old, who has limited mobility, has relied on beekeeping for years. But with only a few dozen hives and little access to markets, expanding the business once seemed out of reach.

"In the past, I had only 30 to 40 beehives and had to carry honey out for sale," Li says. "The mountain roads were difficult, and even high-quality honey could not always fetch a good price."

That changed when local Party organizations helped connect villagers directly with businesses. Beekeepers received technical training, expanded their colonies and gained access to stable procurement channels.

Now, enterprises collect Li's honey directly from his doorstep, eliminating the burden of transporting it. For residents unable to undertake physically demanding work, beekeeping and other eco-friendly industries have become dependable sources of income.

Li's story reflects a broader transformation in Jinggangshan, long celebrated as the cradle of the Chinese revolution and now emerging as a model of green development.

Among old revolutionary bases across the country, Jinggangshan carries special historical significance. In 1927, Chairman Mao Zedong led a fledgling group of Chinese revolutionaries deep into the mountains around Jinggangshan, where they established the first rural revolutionary base of the Communist Party of China.

Ninety years later, Jinggangshan reached another milestone: in 2017, it became the first region in China to be removed from the national list of impoverished counties — three years before the country achieved its nationwide poverty alleviation goal in 2020.

Transformation has continued at the village level as rural vitalization is pushed forward under the leadership of the CPC, which marked its 105th founding anniversary with a gathering on July 1.

The strategy has focused on objectives such as ensuring rural areas are equipped with modern living conditions and narrowing the urban-rural divide.

Shenshan village offers a vivid example. Located near Jinggangshan's main scenic area, the village has developed cultural tourism by designing themed travel routes, improving hospitality services and establishing a tourism association to standardize operations.

Peng Xiaying, the village's first farm-stay owner, initially worried about the financial risks. But with encouragement from local officials and paired-up support, she took the leap and her business is thriving amid booming tourism in Jinggangshan.

"I get dividends from the sales of yellow peaches and local tea, and I run a farm-stay business and a homestay. That brings me over 90,000 yuan ($13,000) a year," she says.

Per capita annual income in Shenshan reached 36,000 yuan last year. Once a fading mountain settlement with fewer than 30 permanent residents, the village is now home to around 180 people and has become a popular rural tourism destination.

Inspired by the success of neighbors like Peng, Huang Jinlong returned home after years of working elsewhere and converted his old farmhouse into a boutique homestay.

"Even before the summer holiday started, all 10 rooms were fully booked," Huang says. "Two busy months here bring in more income than a year of working away from home."

Building on its rich revolutionary heritage, Shenshan village has woven together its revolutionary landmarks, tea gardens, and Hakka-style homes into a vibrant tapestry of rural tourism — offering immersive Red-themed study tours and authentic cultural experiences that bring history to life.

The village now receives more than 300,000 visitors a year, up from 98,000 in 2016.

To sustain growth, Shenshan set up a tourism company and brought in a professional team to develop wellness retreats and study tour offerings. These experts introduced fresh ideas and skills — including livestreaming sessions right from the tea gardens — opening up new markets for local produce.

Zhang Ying, an official with the company, says the livestreaming initiative is expected to generate an additional 200,000 yuan in annual income for the village. "We're very optimistic about the future," he adds.

Jinggangshan's signature produce also includes bamboo shoots and camellia oil. In 2025, sales of these products reached 1.4 billion yuan, with some shipments making their way to markets in Europe and North America.

Tourists exploring Jinggangshan's revolutionary heritage and mountain scenery often purchase local delicacies as souvenirs. Recognizing the opportunity, Peng began making Hakka rice cakes last year, adding another source of income to her growing business.

For villagers whose lives once revolved around cutting bamboo on the mountain slopes and tending to rice paddies down in the fields, the lush mountains and clear waters have not changed, but their value has been transformed beyond recognition.

"We never imagined life could become like this," Peng says.

2026 WORLD CUP

Three Lions repel Viking horde with Bellingham brace

Haaland held goalless as England claims extra-time win over Norway

England's Jude Bellingham celebrates scoring his side's equalizing goal in its 2-1 World Cup quarterfinal win over Norway in Miami Gardens, Florida, on Saturday. AP

Jude Bellingham locked arms with teammate Harry Kane as England fans belted out their rendition of the Beatles' classic *Hey Jude*.

Bellingham had certainly earned the serenade. He scored twice on Saturday — an equalizer in the first half and the go-ahead goal in the third minute of extra time — to give England a 2-1 win that lifted it past Norway and into the World Cup semifinals for the first time since 2018.

The Real Madrid star has now matched Kane with six goals in this tournament, two behind France's Kylian Mbappe and Argentina's Lionel Messi, and one shy of Norway's Erling Haaland, who was held scoreless by England. Bellingham also scored twice in the round of 16 when England beat co-host Mexico.

England, winner of the 1966 World Cup and facing pressure to return to the title match, is now one win away from getting there. The Three Lions will face Argentina in the semifinals.

"The game is split into loads of different facets. Some of it is technical, tactical," Bellingham said. "For me, the biggest one is psychological and how you can manage setbacks, how you can manage adversity. This team showed, yet again, that they can do it, and that's a really valuable skill and trait to have."

Not everyone was thrilled with England's performance, though.

"We made life very, very difficult for ourselves today," coach Thomas Tuchel said in a contentious interview with Fox Sports.

"The result is fantastic. We're in the last four. It's amazing, but not happy with the performance ... in every sense."

Tuchel clarified in his news conference that he was "proud and happy" with how his squad has overcome adversity, but added, "I'm also a football coach, and I also have demands.

"I think we can play faster. I think we can play more clinically."

Bellingham seemed to disagree with his coach's critique after England prevailed in the heat and humidity of South Florida, with temperatures reaching 33 C at the start of warmups.

"Well, whatever," Bellingham said, shaking his head. "It's difficult out there. It's a tough shift.

"My thoughts and appreciation go to the players out there who put in a great shift."

Andreas Schjelderup scored in the 36th minute for Norway, a team that reached its first quarterfinals and took the internet by storm with its "Viking row" and the charisma of Haaland, their fearsome 6-foot-5 striker.

Haaland, however, failed to score for the first time in 15 competitive games for his country.

The Manchester City striker had scored seven times in his four games at the World Cup, carrying Norway to the quarterfinals in their first appearance at the global showpiece for 28 years.

That run included eliminating Brazil in the last 16, as Haaland struck twice to knock out the five-time winner.

This time, though, he ended the match sitting dejectedly on the bench, after he was subbed out for Jorgen Strand Larsen in the second half of extra time.

"It was not a tough decision to take him out," Norway coach Stale Solbakken said.

"He was finished. Maybe I should have taken him out 10 minutes before. He also got a dead leg in the second half, so that, combined with the fatigue, he did everything he could."

Norway nearly went ahead 2-1 in the 56th minute when Torbjorn Heggem put a rebound past goalkeeper Jordan Pickford after a corner kick.

Following a video review, the goal was disallowed because of a foul by Haaland in the box. Haaland was also denied by Pickford on a point-blank header in the first half.

Schjelderup, making just his second start of the tournament, fired a shot that caromed off the right post and into the net to stun an England team that had dominated possession to that point. Bellingham's equalizer from close range elicited a huge roar from the crowd.

'Amazing generation'

Haaland said Norway's World Cup performances had inspired a new generation, despite the disappointment of its quarterfinal loss.

"How we put Norway on the map is maybe one thing that touches me the most," said Haaland.

"Hopefully now, we can establish something when it comes to Euros, World Cups and everything, because our generation is amazing, and, also, all this gives motivation to young people back in Norway that it's possible to play on the world's biggest stage in a Norwegian shirt."

Haaland's brand as a global superstar has soared in recent weeks, with waves of new American fans taking to his affable off-field personality, as well as his goalscoring prowess.

He is hoping Norway can build on its success in the United States to become a powerhouse in the coming years.

"It's kind of difficult to take in this kind of a show, or the roller coaster that we've been on now for the last six weeks," added the 25-year-old.

"I think this changes Norway, I think it changes me. I've said it many times, we're building something in Norway.

"It's about maintaining this, because, again, we've shown that it's possible to be one of the biggest football nations in the world."

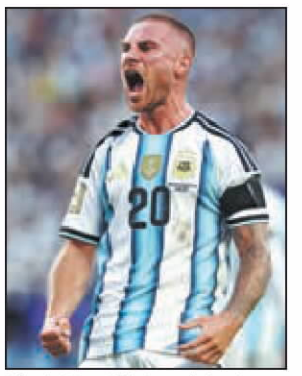
'Suffering' Argentina eventually gets the better of 10-man Switzerland

KANSAS CITY, Missouri — Late goals from Julian Alvarez and Lautaro Martinez deep into extra time gave Argentina a dramatic quarterfinal win over 10-man Switzerland on Saturday, setting up a heavyweight last-four clash with England in Atlanta on Wednesday.

Lionel Messi's Argentina side kept alive its bid to become the first team to retain the World Cup since Brazil in 1962 with a 3-1 victory that sparked pandemonium among its sea of supporters and ended Switzerland's fairy tale run.



The Swiss had reached the World Cup quarterfinals for the first time since 1954, but fell a match short of an unprecedented semifinal appearance.

The match looked headed for a shootout, before Alvarez whipped a gorgeous long-range shot into the top corner in the 112th minute that Gregor Kobel, at full-stretch, had no chance of saving.

Martinez added a third for the defending champion nine minutes later, when he calmly slotted home the rebound of Thiago Almada's shot.

Alexis Mac Allister had given Argentina the lead in the 10th minute, meeting Messi's corner at the front post with a flicked header that sailed beyond Kobel and into the far corner.

After a largely uneventful first half, the contest burst into life in the second, as Switzerland repeatedly tested Emiliano Martinez, forcing the Argentina goalkeeper into a string of sharp saves.

Alexis Mac Allister celebrates scoring Argentina's first goal against Switzerland in their World Cup quarterfinal. AFP

As the Swiss piled on the pressure, they were rewarded in the 67th minute, when Dan Ndoye slid a right-footed finish through Martinez's legs.

But, in the 72nd, the Swiss were reduced to 10 men when Breel Embolo got a second yellow card for simulation. It came after a lengthy VAR review for mistaken identity, with the referee overturning his initial decision to caution Argentina's Leandro Paredes. Embolo was inconsolable as he left the pitch.

Argentina responded by pinning Switzerland back for long periods, cheered on by fans who made Arrowhead Stadium feel more like La Bombonera.

Switzerland weathered wave after wave of pressure, but its resistance was finally broken in the closing moments of extra time.

Argentina coach Lionel Scaloni said the late nature of the victory was further proof that his team have grown comfortable operating in challenging situations.

"We knew that we were going to suffer, and this is part of our blood, this is part of our DNA, and this brings peace of mind," he said.

"We know what it feels like to be dominated by the opponent, to concede an equalizer, so, today, we kept our composure. The team knew how to remain calm and, of course, we will never give up.

"To reach a semifinal, you need to suffer. You need to go through it."

Swiss coach Murat Yakin, however, was left seething.

"We were punished because of a rule that, in my opinion, is completely unacceptable," he said.

"It's very painful that we were eliminated that way. I don't think we deserve that today, and, in my opinion, my boys are the real heroes; they put all their heart and their passion into their performance. I am very proud. They are very proud."

Even Scaloni acknowledged that "luck was on our side because one of their players was sent off".

Yakin, though, wasn't done with his criticism of Portuguese referee Joao Pinheiro: "The referee made the wrong decision. It was, in my opinion, a harmless foul, if it even was a foul. I know they will protect their referee, but this rule destroyed our game today."

TENNIS

Noskova wins first Grand Slam after dishing herself up a bathroom pep talk

LONDON — Linda Noskova placed fingers in both of her ears to drown out the noise from the Centre Court crowd.

She draped one of Wimbledon's strawberry-red towels over her head.

And, eventually — after she had wasted five match points and a 5-2 lead, and conceded the second set of a drama-filled final — she left the court completely for a bathroom break.

During Noskova's brief time off the court, two shiny objects caught her attention: the Venus Rosewater Dish that is awarded to the women's champion and the smaller dish for the runner-up.

"I was like, 'I'm not going to take the small one. I'm taking the big one. I have been so close. This will probably be the heartbreak of my life,'" Noskova said. "'I'm going to leave my soul on court in the third set, whatever it takes.'"

The 21-year-old Noskova did just as she promised herself, overcoming her second-set meltdown to beat Karolina Muchova 6-2, 5-7, 6-3 in an all-Czech final for her first Grand Slam trophy on Saturday.

When Noskova finally finished it off with a service winner on her sixth match point — and first of the third set — she covered her face and dropped down to the grass on her back.

Minutes later, Noskova was being awarded the Venus Rosewater Dish by Catherine, the Princess of Wales.

"It's never easy to get the last point," Noskova said during her victory speech. "Karo, you really made me work for it."

Noskova became the third Czech woman in four years to win the grass-court major, after Marketa Vondrousova in 2023 and Barbora Krejcikova in 2024.

Muchova and Noskova played doubles together at the 2024 Paris Olympics and finished fourth.

"I am so glad that I could play my first Grand Slam final with you," Noskova told Muchova during her speech. "We made history today. All our Czech fans at home are proud of us, no matter the result. It was a good day for both of us."

Petra Kvitova, who won Wimbledon in 2011 and 2014, was in attendance, as was the greatest Czech-born player of them all, Martina Navratilova — who won a record nine singles titles at the All England Club and was seated next to the Princess of Wales in the Royal Box — and Jan Kodes, the 1973 men's champion.

Linda Noskova of Czech Republic poses with the Venus Rosewater Dish after beating compatriot Karolina Muchova in the Wimbledon women's singles final on Saturday. AP

Kipling's poem

An excerpt of the poem "If" by Rudyard Kipling that was placed above the players' entrance to Centre Court more than a century ago summarizes the challenges Noskova had to overcome.

"If you can meet with triumph and disaster," the excerpt reads. "And treat those two imposters just the same."

It's not the first time that Noskova has had to overcome adversity at Wimbledon.

Her mother died just before she played the tournament two years ago.

"I definitely would not be standing here without her, so thank you," Noskova said in a dedication to her mother during her speech, blowing a kiss skyward.

Navratilova wiped away tears listening to Noskova's tribute.

Moments earlier, Muchova began her runner-up speech by calling Noskova "my ex-friend".

"I'm kidding, obviously," Muchova quickly added.

"You're so young and this was your first final of a Grand Slam, and the way you handled it was really unbelievable. You deserve it."

It was the 29-year-old Muchova's second Grand Slam final after getting beaten by Iga Swiatek at the French Open in 2023.

Wasted chances

Blasting aces and winners from all over the court early on, Noskova looked like she was going to run away with it, almost like Swiatek's 6-0, 6-0 rout of Amanda Anisimova in last year's final, which lasted all of 57 minutes.

Saturday's match was just 68 minutes old when Noskova earned her first match point — which ended when she landed a backhand into the net.

Two points later, there was another backhand miss from Noskova; then Muchova took advantage of a net-cord shot on Noskova's third match point in the same game.

Serving for the title in the next game, Noskova double faulted on her fourth match point.

And then, on the fifth occasion to end it, Muchova produced a big serve and forehand winner.

In all, Noskova lost five straight games.

"It's hard to watch," Tracy Austin said on the BBC as she called the match alongside John McEnroe. "We know what that feels like when you start to get tight and you can't loosen up, and then the lead starts to unravel."

Noskova said: "Winning it this way, really having to fight for it, having all these ups and downs, it matters a lot. I have to learn a lot from this match."

XI'S VISION | PEOPLE FIRST

Focus on people at heart of CPC's strength

Better lives, notable strides impress foreign observers

By **ZHAO JIA**
zhaojia@chinadaily.com.cn

Visitors tour the Museum of the Communist Party of China in Beijing on Tuesday, ahead of the CPC's 105th founding anniversary, which falls on Wednesday. WEI XIAOHAO / CHINA DAILY

At the Museum of the Communist Party of China, a site in Beijing devoted to permanent and comprehensive exhibitions of the CPC's history, there is a large wall motto that reads: "This country is its people; the people are the country."

Many visitors come to the wall and raise their phones to take a photo, capturing in a single frame a theme that Xi Jinping, general secretary of the CPC Central Committee, placed at the center of his speech at the ceremony in 2021 marking the 100th anniversary of the CPC's founding.

As the Party has fought to establish and consolidate its leadership over the country, it has in fact been fighting to earn and keep the people's support, Xi said.

The Party has in the people "its roots, its lifeblood and its source of strength", he added.

Five years on, as the CPC celebrates its 105th anniversary on Wednesday, more and more foreign diplomats and international observers have said that the meaning of the people-centered approach, a fundamental principle of the CPC, has become increasingly clear to them through the changes they have witnessed in China and in the lives of its people.

For Khalil Hashmi, Pakistan's ambassador to China, the CPC's people-centered approach is best understood through results he has seen with his own eyes — above all, the scale of China's poverty reduction.

"I think results and actions speak louder than words," Hashmi said, noting that China's success in lifting hundreds of millions of people out of poverty was unprecedented in human history.

China declared victory in its fight against absolute poverty in 2021, when all 98.99 million rural residents living below the current poverty line had been lifted out of poverty, 832 poor counties had been removed from the poverty list, and 128,000 impoverished villages had shaken off poverty.

To Hashmi, poverty reduction is the clearest measure of what governance can mean for ordinary people. It shows how a long-term national goal can be translated into changes in people's lives through sustained leadership, strategy and implementation, he said.

Hashmi served at the Pakistani embassy in Beijing from 2008 to 2010, before returning as ambassador in 2023. He said the contrast between the two postings gave him a direct view of how China's development has reshaped the country's environment, economy and society.

Beijing's air quality and urban environment have improved markedly, he said. The expansion of high-speed rail has made travel between cities faster and more convenient, becoming part of daily life for many people.

China's progress in green technologies offered another example. From electric vehicles and batteries to charging stations, solar panels and wind turbines, China has built an ecosystem of increasingly affordable technologies that serve Chinese consumers and are also accessible to many developing countries, Hashmi said.

For him, these changes were evidence of the Party's ability to set a direction, mobilize resources and sustain implementation over time.

"At its core, the vision, the leadership, the strategy and the policy come from the Communist Party of China," he said.

Sisouphanh Keobandavong, a senior official with the Lao Ministry of Foreign Affairs, said China's progress is closely linked to the CPC's people-centered development philosophy.

By putting the common interests and well-being of the people first, China has achieved major advances in economic development, scientific and technological innovation and living standards, he said.

That experience, particularly in poverty reduction and rural vitalization, is of direct relevance to Laos, where poverty reduction remains an important task, Sisouphanh said.

For Laos and other developing countries, the lessons include setting clear development goals around national interests and people's well-being, directing support to less-developed areas, and shaping policies through research, monitoring and evaluation, he added.

Other observers said that putting people at the center also requires the ability to keep development goals consistent long enough for them to make a difference in people's lives.

Fazeel Najeeb, Maldivian ambassador to China, said one feature that has stood out to him is the continuity that marks China's policies.

In some developing countries, development priorities may change from one government to the next, making it difficult for long-term plans to produce lasting results, he said, noting that China sets priorities through five-year plans, carries them out steadily and builds on them in subsequent planning periods.

WORLD WATCH
By Vincent Meriton

Party-led development has provided inspiration across globe

On July 1, China marks the 105th anniversary of the founding of the Communist Party of China, inviting reflection on one of the most remarkable development transformations in modern history.

As a former vice-president of Seychelles and chairperson of the Association for the Promotion of Friendship Between Seychelles and China, I have observed firsthand some aspects of this extraordinary transformation. And what strikes me is not simply its scale, but its speed, depth and breadth within a few generations.

Few nations have lifted so many people out of poverty, built such extensive infrastructure, transformed industrial capacity and emerged as a global leader in technology and innovation in such a short time.

When historians look back, China's experience will rank among the most significant development stories.

Only a few decades ago, hundreds of millions of Chinese lived in poverty. Infrastructure was limited, and many regions remained isolated from economic opportunity.

Today, China boasts world-class transportation networks, advanced manufacturing, globally competitive technology sectors and one of the largest middle-income populations in the world.

Perhaps the most impressive aspect is China's success in lifting hundreds of millions of people out of extreme poverty — widely recognized as one of the greatest poverty reduction efforts in human history.

New mechanism to keep ties with EU on right track

By **ZHANG ZHOUXIANG** in Brussels and **ZHONG NAN** in Beijing

The launch of the China-EU trade and investment consultation mechanism is expected to provide a regular platform for dialogue to address bilateral economic differences, said market watchers and business leaders.

While trade frictions between China and the European Union may persist in the near term, the new mechanism could help prevent disputes from escalating and keep bilateral economic relations on a more predictable track, they added.

According to a joint statement issued on Tuesday, Chinese Commerce Minister Wang Wentao and European Commissioner for Trade and Economic Security, Interinstitutional Relations and Transparency Maros Sefcovic identified four initial work streams during the inaugural meeting of the China-EU trade and investment consultation mechanism in Brussels on Monday.

The work streams cover trade and investment balancing, export controls, intellectual property rights and World Trade Organization reform, the statement said.

Zhao Yongsheng, a professor of European studies at the University of International Business and Economics in Beijing, said that the mechanism comes at a time when both sides continue to face structural differences over trade and industrial policies.

SUMMER FUN FLOWS ALONG BEIJING WATERWAY

Liangma River has become a hot spot where city residents can bank on having a good time

By **XING WEN**
xingwen@chinadaily.com.cn

Residents and tourists enjoy leisure activities on the Liangma River in Beijing on June 20. WEI XIAOHAO / CHINA DAILY

In Beijing, a city known for its fast-paced lifestyle, summer evenings along the Liangma River paint a contrasting scene. As dusk descends and neon lights spill off surrounding skyscrapers and flicker in the water's ripples, the river turns into a summer playground for the city's residents.

Laid-back bliss unfolds both on and off the water. Swimmers, paddleboarders and kayakers glide past, while hydrofoil riders zip through narrow gaps between inflatable dinghies. On the banks, picnic blankets dot the grass and open-air karaoke mixes with swimming strokes.

"This is probably the best summer vibe I've ever seen in my life," said George Bobyk, a doctoral student from the University of Chicago, who is participating in a summer language program at Tsinghua University. "My friends told me this is the best place in Beijing, so I knew I had to check it out," he said in fluent Chinese.

Having grown up in Cambridge, England, Bobyk is no stranger to riverside life, but what struck him about Liangma was how it is fully integrated with the urban landscape.

Various watercraft are available for rent at several water sports clubs located along the river.

Ding Ting, who had worked in Beijing's internet industry for over a year but chose to leave the capital, went paddling on the Liangma River with a friend during a recent return visit, and said it had changed her perspective on the city. "For the first time in Beijing, I wasn't surrounded by hurried crowds. Instead, I saw children and adults relaxing and having fun," she said.

She recalled that a runner stopped and offered to take a photo of Ding and her friend, and an elderly man who played an electronic wind instrument on the riverbank was taking their song requests.

Ding said she felt that this offered more possibilities for genuine human connection in the bustling metropolis. "It's a more relaxed space where social connections can happen more spontaneously," she said.

During the Ming Dynasty (1368-1644), the river served as grazing land for imperial horses. After the Liangma Bridge was built during the Qing Dynasty (1644-1911), tea houses and taverns sprang up along its banks. However, around the year 2000, unregulated car washing and unprocessed domestic sewage had polluted the waterway.

China Vibes

The turning point came in 2019, when a government-enterprise partnership in Chaoyang district launched a river restoration project that included dredging the waterway, renovating bridges, and adding public leisure spaces, children's play areas, fitness zones and greenways along the river's banks. It is now one of Beijing's must-visit destinations for both locals and tourists.

"Through scientific planning, ecological restoration, functional upgrades and public participation, urban waterways can become more vibrant, communities can become more livable, and cities more dynamic. The Liangma River serves as a model for building modern, people-oriented cities, ultimately achieving an integrated balance of ecological, cultural, social and economic value," said Xu Chenxi, a researcher at the institute of megacity economic and social development of the Capital University of Economics and Business.

'Thank you, Chinese doctor!' echoes across 50 years of trust

Party members lead medical teams to build bonds, healthcare in Madagascar

By **MA JINGNA** and **HU YUMENG** in Lanzhou

Years after their missions were completed, many Chinese medical doctors still remember their patients in Madagascar, an island country off the southeastern coast of Africa.

Similarly, many Malagasy patients will be forever grateful to the visiting doctors who helped change their lives.

During his first mission to Madagascar in 2010, Qiang Yaosheng, a surgeon from the First Hospital of Lanzhou University in Gansu province, treated a 13-year-old girl suffering from severe intestinal obstruction. Her family could not afford the surgical supplies needed for the emergency operation, so Qiang used his own savings to ensure the surgery proceeded.

Two years later, shortly before completing his mission, Qiang was walking along a rural road when a young woman suddenly recognized him. "Thank you, Chinese doctor!" she called out.

Qiang soon realized it was the girl he had treated.

For Chinese medical workers in Madagascar, the phrase "Thank you, Chinese doctor" has come to reflect decades of trust built through medical care and personal connections.

He Fengxiao, a cardiac surgeon at Lanzhou University Second Hospital, joined a medical mission to Madagascar in 2023, and experienced a similar sense of trust that extended beyond the hospital setting.

"People knew we came there to save lives. We treated many complicated conditions and helped many locals recover," he said. "When we walked outside, local residents were very friendly and greeted us from a distance."

That trusting relationship has been built patiently over more than half a century.

Since 1975, a total of 24 medical teams from Gansu have served in Madagascar, with personnel making 725 visits, some multiple times. The teams have treated 5 million patients and performed over 130,000 surgeries, according to the Gansu Health Commission.

This effort is part of China's broader medical cooperation program. In December 1962, following a global appeal from the newly independent Republic of Algeria for emergency medical assistance, the Communist Party of China was the first to respond and sent its first international medical aid team the next year.

Over the past six decades, more than 30,000 visits by Chinese medical workers to 76 countries and regions have been made, providing care for nearly 300 million patient visits and supporting over 130 medical facilities, according to China's National Health Commission.

As the number of CPC members in the medical teams grew, Party branches have been established locally to organize study sessions and collective activities, helping strengthen coordination and unity among team members.

From the early days, Party members often took the lead not only in medical work, but also in adapting to life overseas and building connections with local communities.

TCM opens doors

When the first Chinese medical team from Gansu arrived in Madagascar in 1975, one of the biggest challenges was not treating diseases, but gaining the trust of local patients.

At the beginning, few people came to seek treatment. For more than 10 days, Chinese doctors looked for ways to connect with the local community.

Tang Shicheng, former deputy director of Gansu Provincial Hospital of Traditional Chinese Medicine, decided to begin with acupuncture, a traditional Chinese medicine treatment he was familiar with.

He demonstrated it on himself, inserting needles into his own leg.

Curious locals asked whether it hurt. Tang said "no" and invited them to try acupuncture. "After that, patients gradually began to come in, and queues soon formed across departments. That was how our work began," he recalled.

Tang's acupuncture treatment was embedded in locals' memories. In the 1970s, a Malagasy newspaper in Ambovombe reported how Chinese doctors brought hope to patients through TCM, describing some recoveries as "miracles".

Left: Doctors from Madagascar receive training from their Chinese peers at Lanzhou University First Hospital. YANG MINGZE / FOR CHINA DAILY **Right top:** Ma Shirong examines a patient in Madagascar. **Right above:** Chinese medical team members work with Malagasy staff to prepare disinfectant in a laboratory. PHOTOS PROVIDED TO CHINA DAILY

One patient, Fotoa Jean Jacques, who suffered from paralysis, gradually regained the ability to speak and walk after receiving acupuncture treatment from Tang.

Wang Jiaqi, former deputy director of Gansu Provincial People's Hospital, said trust was already established during his mission in the 1990s. Wang said a former Madagascar ambassador to China regularly turned to the Chinese medical team for treatment, though he had many doctors in his own family. "He told us that what impressed him most was the dedication of Chinese doctors, their careful treatment of Malagasy patients and their willingness to serve the people here," he said.

Qiang treated a complex case involving a large thyroid tumor. To reduce surgical risks, his team carefully optimized every step, from preparation for surgery and anesthesia planning to incision design.

"After the surgery was successful, word quickly spread," Qiang said. "Relatives of a Malagasy official even reached out through overseas Chinese networks to seek treatment from us. That kind of word-of-mouth recognition is the strongest confirmation of our clinical work."

Over time, Chinese doctors became a familiar presence not only in hospitals but also in the broader community. Overseas Chinese and employees of Chinese enterprises in Madagascar regularly sought their help, while patients from neighboring island countries such as Comoros and Mauritius even traveled by boat for treatment.

Stronger local capacity

When the first Chinese medical team arrived in Madagascar in 1975, the local medical environment was vastly different from what they had experienced at home.

Hospitals often faced shortages of equipment and supplies, forcing doctors to make difficult decisions in restricted conditions.

Even today, many regional hospitals continue to deal with limited equipment, shortages of supplies and unstable power. For doctors, an operation might involve unexpected challenges.

"There were even flies during surgery," said Wang Jianhua from Gansu Provincial People's Hospital, who served in Madagascar for four years from 2018. "We had to improvise. We could not stop, because the patient would die."

In rural areas, the pressure was even greater. A single doctor could be responsible for tens of thousands of residents, Qiang said.

For many Chinese doctors, improving local healthcare started with solving problems they encountered every day.

He Fengxiao recalled that some surgical procedures in Madagascar were delayed because patients' families needed to purchase basic supplies such as gauze and sutures after doctors decided to operate.

"For some families, these materials were a heavy financial burden. They had to borrow money, which could affect the progress of surgery," He said.

To address this, Chinese medical teams prepared emergency kits containing commonly used surgical materials to ensure urgent procedures could proceed.

Since 1975, Chinese medical teams have continued to provide medical supplies and equipment, either purchased by the teams themselves or donated from within China. Support gradually expanded from basic surgical instruments and medicines to advanced equipment such as digital X-ray machines and CT scanners.

In recent years, that support has included advanced diagnostic equipment. A digital radiography system, donated with support from the First Hospital of Lanzhou University, was put into operation in 2026 at the University Hospital Center of Anosiala in Ambohidratrimo, Madagascar, improving imaging diagnosis.

Previously, medical staff relied on slower and less precise imaging systems, and patients sometimes had to travel long distances for further examinations.

The new digital system has helped shorten examination times, improve image quality and make medical diagnosis more accessible for local residents.

Chinese medical teams have also continued to train local doctors, introduce standardized procedures and help build a more sustainable healthcare system.

He said thoracic surgery was once limited by shortages of equipment and lack of standardized procedures. In some chest trauma cases, local doctors had to rely on improvised containers instead of proper negative-pressure drainage systems, posing safety risks.

Chinese doctors helped introduce medical instruments to local doctors, demonstrate standardized procedures, and train local teams through case discussions and surgical guidance.

"Medical cooperation is not only about treating patients, but also about helping local doctors develop the ability to handle more complex cases independently," He said.

Training, exchanges

In the respiratory and critical care ward of the First Hospital of Lanzhou University, Malagasy physician Rabeson Tahiana follows Chinese doctors during routine rounds.

Moving from bed to bed, they discuss patients' conditions, sometimes using AI translation tools to bridge gaps in language and medical terminology.

Tahiana and four other doctors from the University Hospital Center of Anosiala, Madagascar, are currently participating in a six-month training program at the hospital. They observe clinical practices, participate in daily medical work and learn from Chinese doctors across different specialties.

"The Chinese doctors are highly skilled and well organized," Tahiana said.

The program provides access to advanced respiratory technologies, including bronchoscopy and pulmonary function testing.

"This training allows us to bring new techniques back to Madagascar and improve care for our patients," he said.

Rasolohery Honjaniaina, who has worked with Chinese medical teams in Madagascar for six years, said the cooperation had continuously improved her clinical practice.

"Each Chinese colleague has helped me in my daily work. It has been a valuable experience of exchange and learning," she said.

For Chinese doctors, the goal of training is to support the development of a self-sustaining local medical workforce. Knowledge and skills learned in China, they said, will become part of the local healthcare system and continue to benefit communities.

"China's medical technology is developing rapidly. Coming here allows doctors to learn new knowledge and methods. We share our experience without reservation," Wang Jianhua from Gansu Provincial People's Hospital said.

A shared responsibility

Over the past five decades, Chinese medical assistance in Madagascar has continued across generations, carrying forward both professional skills and a shared sense of responsibility.

When Ma Shirong, a CPC member and a physician from Gansu Provincial People's Hospital, first arrived in Madagascar in 1990, he brought a *Xinhua Dictionary* to assist with daily work. When his mission ended, he left it to the next team, writing on the first page: "Please cherish it and pass it on."

Years later, doctors who used the dictionary told Ma that the small book had helped them greatly during their missions.

"For me, it was not just a dictionary. It carried the experience and memories of generations of medical workers," Ma said.

The missions also reflected the continuity of the teams' discipline and sense of responsibility while overseas.

They cleared land, planted vegetables and dried local fruits such as lychees to improve their lives. They also invited locals to join in activities such as planting trees and working in the fields, creating more opportunities for mutual understanding and friendship.

This spirit of unity continued with teams that worked on Chinese enterprises in Madagascar. The China Railway 18th Bureau, for instance, carried out joint Party activities such as studying China's diplomatic policies and organizing health education programs on common diseases.

For Chinese medical workers, overseas missions also mean representing their country through everyday interactions.

"People may not know your name, but they know you are Chinese. Your words and actions can influence how they see your country," He said, adding that this awareness encouraged him to communicate more with local residents and pay closer attention to his behavior.

"When you are overseas, you understand the meaning of your motherland more deeply," Wang Jianhua said. "Seeing the Chinese flag far from home reminds you of where you come from and the responsibility you carry."

Today, cooperation between Gansu and Madagascar continues to evolve, with a new team carrying forward the experience, skills and commitment built by generations of medical workers.

Earlier this year, China launched its initiative of "100 Medical Teams in 1,000 Villages", setting a goal of conducting more free clinics and medical consultations in about 1,000 residential areas of host countries by 2027.

A Chinese medical team from Shandong province has been working on health education and free consultation activities related to schistosomiasis in Tanzania. They also visit schools and local orphanages to treat children and donate medicines, earning widespread praise from the local residents.

The Zambian government on Friday commended the 26th Chinese medical team from Henan province for its contribution to improving healthcare delivery in the country.

Yang Mingze, Wu Yuexuan and Tong Yunshan contributed to this story.

CPC 105TH ANNIVERSARY

Membership of CPC surpasses 101 million

People from new professions enrich Party structure, strengthen foundation

By CAO YIN
caoyin@chinadaily.com.cn

The steady growth in the number of Communist Party of China members from new sectors and emerging businesses is diversifying the Party's composition and supporting China's socioeconomic development, experts said on Tuesday.

The experts shared their opinion as the Organization Department of the CPC Central Committee released a report on the eve of the Party's 105th anniversary, which falls on Wednesday. The report revealed that Party membership touched nearly 101.29 million by the end of 2025, marking an increase of over 1.01 million from the previous year.

The report provided details about the occupational backgrounds of Party members, which showed that they came not only from government agencies, universities, rural areas and businesses, but also from a wide range of other professions.

The "other professions" category included individuals from new business models and emerging sectors, such as ride-hailing drivers, couriers and livestreamers. Experts emphasized that the inclusion of these nontraditional workers has diversified the Party's membership structure, reflecting broader economic and social progress.

Official data showed that the number of Party members from "other professions" increased from 7.48 million by the end of 2021 to nearly 7.9 million by the end of 2025.

Xin Ming, a professor at Beihang University's School of Marxism, noted that this rise showed that the CPC is open to recruiting advanced individuals from all walks of life whose thinking aligns with the Party's principles. "This openness has increased the Party's appeal among emerging sectors and new employment groups, enriching its membership structure and strengthening its foundation," he said.

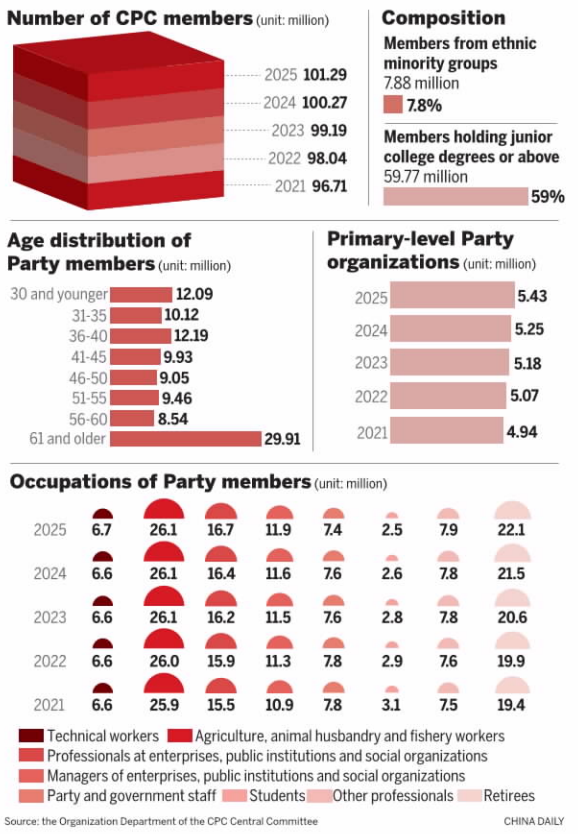
Bao Jipeng, a deliveryman from Longnan in Gansu province, joined the Party in 2025, as he wanted to contribute meaningfully to society.

Longnan, once plagued by poor transportation and underdeveloped logistics, has seen significant improvements over the past few years. In Maba village, Yulong township, where Bao hails from, Party members led efforts to build roads, transforming the area from an isolated pocket to one with better connectivity. Bao recalled the influence of those Party members in his article published in People's Daily, saying that they inspired him to serve the villagers.

Due to improved infrastructure, almost every village in Longnan now has road access, facilitating the swift delivery of parcels even to remote areas. As online shopping increased among villagers, Bao embraced his role as a courier.

Over the past decade, he has traveled more than 120,000 kilometers and delivered over 250,000 parcels without a single customer complaint. For Bao, efficient deliveries are crucial, especially for farmers whose harvests depend on timely supplies.

"My motivation to join the Party was to excel in my job," Bao said in the article. Currently, there are four Party branches within Longnan's express delivery industry, providing him with a strong sense of belonging.



"I consider my Party membership as a new beginning and I am committed to serving the villagers with improved services," he said.

Dai Yanjun, a professor from the Party School of the CPC Central Committee, said that as socioeconomic growth spawns new jobs, more people, particularly young ones, are joining the Party. "Whether motivated by self-advancement or inspired by veteran members, this trend underscores the Party's enduring influence," he added.

To bolster Party building in emerging sectors, some regions have initiated innovative approaches. Jiangsu province, for example, has established mobile Party organizations in communities, delivery stations and livestreaming studios, facilitating both online and offline management and education of Party members in these sectors.

Dai emphasized the need for Party building to permeate every sector as society evolves, advocating for more innovative and industry-specific activities, while Xin from Beihang University underscored that regardless of operational changes, the Party organization's leading and exemplary role must remain steadfast.

According to the report, the CPC had over 5.43 million primary-level organizations by the end of 2025, an increase of 181,000, or 3.4 percent, from the previous year, highlighting the Party's expanding grassroots presence.

Members of the No 6 Geological Team of the Shandong Provincial Bureau of Geology and Mineral Resources carry out a gold mine survey in Nigeria in July 2025. PROVIDED TO CHINA DAILY

Resolve forges gold exploration legacy

By LI MENGHAN
limenghan@chinadaily.com.cn

For generations of geologists on the No 6 Geological Team of the Shandong Provincial Bureau of Geology and Mineral Resources, members of the Communist Party of China have set the standard by volunteering for the toughest assignments, pressing ahead where others saw only dead ends and passing on a spirit of dedication that has transformed China's gold exploration.

That spirit has helped the team discover 14 superlarge gold deposits and 128 large, medium and small deposits in nearly seven decades, reshape international gold metallogenic theory and identify more than 2,800 metric tons of gold reserves, which is nearly one-fifth of China's total discovered gold reserves.

As the CPC marks its 105th anniversary on Wednesday, 198 Party members, who make up around half of the team's strength, reaffirmed their commitment to carrying forward the tradition.

"As Party members, we answered the State's call to find gold without hesitation, and we delivered. And that promise will continue to echo beneath the mountains and the seas," said Ding Zhengjiang, leader of the team, who started working as a geologist in 1999.

Efforts praised

In 2022, the team received a letter of reply from Xi Jinping, general secretary of the CPC Central Committee, who praised generations of geologists for enduring harsh conditions to yield rich fruits in mineral resource exploration and encouraged them to strengthen exploration efforts and pursue sci-tech breakthroughs.

Ding, 49, said that Xi's reply to the team's letter came as a great surprise and a source of encouragement. "Some of our veteran members teared up. To be remembered, recognized and asked to go deeper — that means everything," he added.

In the 1950s, China produced only about 6 tons of gold each year, while the country's industrialization drive demanded far more. In 1958, a group of 94 young geologists were sent to the mountains of Zhaoyuan in East China's Shandong province.

Back then, gold was of vital importance for the newly founded People's Republic of China, because it was a crucial source of foreign exchange reserves, Ding said.

"Zhaoyuan was chosen as the starting point of the mission, because despite decades of war that left the mines there shattered, it was once the richest gold belt in the country. However, the task was challenging — finding the gold everyone thought had been mined out," he said.

Spirit of dedication

Party members took the lead under conditions Ding described as "cruel", because "every step forward could have been the last".

Team members slept on wooden planks in drafty thatched huts and survived on coarse grains and pickled vegetables. Armed only with hammers, compasses and magnifying glasses, they entered abandoned mine shafts by the dim glow of carbide lamps, recording geological data while risking cave-ins.

After four years of mapping and trenching, the team identified 48 gold-bearing quartz veins in the Linglong mining area, breathing new life into the century-old mining district.

The defining breakthrough came by challenging prevailing international theory, which held that the principal fault zones of the Jiaodong Peninsula were incapable of hosting large gold deposits. In late 1965, three team members trekked through knee-deep snow to Sanshan Island and collected 105 rock samples. Laboratory analysis showed that more than half of these samples contained industrial-grade gold.

The team then decided to drill directly into the fault zones. In 1969, it discovered a superlarge deposit containing 67 tons of gold, giving rise to the Jiaojia-type altered-rock gold deposit model and reshaping geological understanding of gold mineralization.

The pioneering spirit continued as shallow resources became depleted. In 2007, the team discovered a 51.83-ton superlarge deposit in the deep section of the Sizhuang mining area in Laizhou, Shandong, opening a new era of deep exploration. More discoveries followed, transforming the Jiaojia fault zone into a gold belt with reserves exceeding 1,000 tons.

The team's technological advances have matched its determination. It has completed more than 5.2 million meters of drilling, which is 600 times the height of Qomolangma, known as Mount Everest in the West. The team has also broken the national record for small-diameter drilling efficiency six times and set a national drilling-depth record on three occasions.

Ding said the team has also expanded offshore, leading China's first combined land-sea seismic survey for deep gold deposits in the waters off Shandong and identifying a new offshore gold belt.

In addition, the team has carried out geological surveys in more than 10 countries, including the United States, Algeria, Sudan, Tajikistan and Australia, and identified 156 tons of gold resources overseas, he added.

Party: Long-term vision brings tangible outcomes

From page 1

"I think one of the most important aspects of the system is the continuity of policies," Najeeb said, calling it one of the most striking features of China's governance.

Such continuity matters, he said, because development requires time before its benefits can be fully seen in people's lives.

The importance of the consistency of strategy and the direction behind it also stood out to Ion Chicu, former prime minister of Moldova.

For example, the development of the Guangdong-Hong Kong-Macao Greater Bay Area showed the long-term impact of reform and opening-up, as well as China's sustained focus on high technology, he said.

For any country or people, hard work alone may not lead to success without the right strategy and direction, he noted, adding that in China's case, long-term vision has enabled people's efforts to produce tangible development achievements.

Davidson I. Ishmael, minister of state in Barbados' Ministry of Health and Wellness, said China's people-centered governance can also be seen in the opportunities created for individuals to build businesses and pursue careers.

During his visit to the Greater Bay Area, Ishmael said he heard stories of people who became entrepreneurs through opportunities generated by the region's development, while others were able to pursue careers in globally competitive industries.

Such stories show how development can translate into personal opportunities, he said. The region has built a growing innovation and entrepreneurship ecosystem, including 84 bases for young people from Hong Kong and Macao that have attracted more than 7,000 projects.

China's opening-up is not only about strengthening the country's connections with the world, Ishmael said, but also about enabling its own people to share in the opportunities created by development.

Success: Balance of modernization, culture highlighted

From page 1

Beyond statistics, this achievement has demonstrated a vital principle: Development must ultimately be measured by improvements in people's lives. Better housing, education, healthcare and economic opportunities represent development in its most meaningful form.

As someone who has spent much of his career in public policy and development planning, I understand the complexity of social and economic transformation. Many factors have contributed to China's success, but one important element has been the CPC's ability to provide long-term strategic direction and policy continuity. Development requires vision, planning, stability and the capacity to implement reforms over many years and sometimes across generations.

China's successive development plans have prioritized areas fundamental to national progress: infrastructure, education, industrialization, technology, innovation, food security and poverty reduction. Investments in these areas have created the foundations for economic growth and social advancement.

For many countries in Africa and across the Global South, there are valuable lessons to be learned from China's experience. The first is placing development at the center of national policy, as growth serves to improve ordinary lives. The second lesson is investing in people: Roads and ports matter, but so does investment in education, skills and healthcare. The third is the value of long-term planning. Too often, developing countries become trapped in short political cycles that make sustained reform difficult. China's experience demonstrates what can be achieved when national development goals are pursued consistently over decades.

At the same time, every country has its own history and development path. China's model cannot simply be copied elsewhere. Solutions must reflect local realities. But principles can be shared: strategic planning, investment in people, strong institutions, pragmatic policymaking and a commitment to continuous improvement.

Another aspect I have found particularly interesting is China's effort to balance modernization with cultural continuity. Rapid industrialization often places pressure on societies to preserve identity and social cohesion. Yet China has sought to combine economic progress with a continued emphasis on culture, heritage, family values and collective purpose. The coexistence of world-class infrastructure and innovation alongside visible respect for history and tradition is an achievement from which many countries can learn.

China's development story has also increasingly become a global story. Through initiatives such as the Belt and Road Initiative and expanded engagement with Africa and the Global South, China has become an important development partner for many countries. Cooperation increasingly extends beyond trade and infrastructure to include education, technology transfer, skills development, digital connectivity, green development and cultural exchange — creating new opportunities for mutual learning and South-South cooperation.

As chairperson of the Association for the Promotion of Friendship Between Seychelles and China, I have seen firsthand the growing importance of people-to-people exchanges. Educational partnerships, cultural exchanges and initiatives such as the Confucius Institute in Seychelles have built bridges between our peoples, particularly among younger generations. These human connections complement economic and diplomatic cooperation and ensure that friendship between nations is rooted in mutual understanding and respect.

For Seychelles, relations with China have developed steadily over five decades, founded on mutual respect, friendship and cooperation. We have benefited from exchanges in education, health, infrastructure, culture and people-to-people engagement. These relationships demonstrate how international cooperation can contribute to national development while respecting the sovereignty and priorities of partner countries.

As China continues its journey toward high-quality development and modernization, there are new challenges but also new opportunities. China's development journey is not simply an economic success, but one of the most ambitious and far-reaching transformations in modern history — demonstrating what can be achieved when a nation combines vision, stability, planning and investment in its people and a clear sense of purpose. And the broader significance of its experience is evident.

As the CPC marks its 105th anniversary, that achievement deserves recognition — not only for what it has meant for China, but also for the inspiration it offers to other developing nations seeking their own paths toward prosperity, stability and human development.

That may well be the most important lesson from China's remarkable CPC-led development journey.

The author is former vice-president of the Republic of Seychelles. The views do not necessarily reflect those of China Daily.

CPC 105TH ANNIVERSARY

Red Crag resonates with young audiences

Six decades on, new adaptation celebrates power of communist faith in enjoyable, immersive play

By **GUO JIATONG**

Produced by the China Railway Art Troupe, the production was staged five times in the city from June 11 to 13. **Left:** Actors perform the play *Red Crag* at Tongji University in Shanghai. **Right:** Actors prepare backstage before a performance of *Red Crag*. PHOTOS BY WANG XIANG / XINHUA

At Tongji University's auditorium, thunderous applause erupted as the cast of *Hongyan*, or *Red Crag*, took their final bows. Many students gave the cast a standing ovation, cheering and applauding, with some wiping away tears of emotion.

From June 11 to 13, the stage adaptation of *Red Crag* was performed at Tongji University in Shanghai. Directed by Wu Yuze of the China Railway Art Troupe, it drew a strong response that reflects a broader trend: more than six decades after the publication of the classic revolutionary novel, the stage version is finding renewed resonance among younger audiences.

The production has attracted increased attention this year as China marks the 105th anniversary of the founding of the Communist Party of China.

Based on the 1961 novel of the same name, the play depicts Communist revolutionaries imprisoned in Chongqing in the years leading up to the founding of the People's Republic of China in 1949.

Scenes such as Jiang Jie embroidering a national flag in prison, Little Radish Head, a child prisoner, secretly passing messages behind bars, and Xu Yunfeng, an underground Communist Party member, facing execution with composure, have long been part of China's cultural memory.

For Wu, the new adaptation places faith at the heart of the story.

"People today face many uncertainties," Wu said. "Whether it is personal values, beliefs, or confidence in the future, many are searching for inner spiritual strength to support themselves."

To reach younger audiences, the creative team — whose average age is around 30 — updated elements of the staging while remaining faithful to the original story.

"Many audiences tend to associate 'red classics' with a fixed set of expectations," Wu said. "We wanted to challenge that by creating something more engaging — a play audiences can truly enjoy and immerse themselves in."

The adaptation highlights espionage and suspense elements. Lighting design, multimedia effects and tighter scene transitions are also used to heighten dramatic tension throughout the performance.

"The novel revolves around underground Communist operatives," Wu said. "Our goal is to make sure that every scene moves the story forward and keeps audiences eager to find out what happens next."

For actress Wang Wei, who plays Jiang Jie, preparation meant extensive field research in Sichuan and Chongqing.

She traveled to Zigong, the hometown of Jiang Zhujun — the real-life inspiration for Jiang Jie — where she visited memorial halls, studied archival materials, and toured the school that the revolutionary once attended.

Over nearly six months, cast members also visited sites such as Zhazidong and Baigongguan prisons in Chongqing, studied the script repeatedly and worked through historical documents together.

Wang said the field research helped her move beyond a symbolic interpretation of the role.

"Jiang Jie is not only a fearless revolutionary. She is also a wife and a mother," she said. "It is precisely because they were ordinary people who still made extraordinary choices that they became heroes."

Wang recalled a scene in which Jiang Jie watches guards tear up a photograph of her child.

Though she initially forces herself to look away, having prepared for death as a revolutionary, the sight of the torn photograph awakens her maternal instinct. Before walking to the execution ground, she quietly gathers the fragments and holds them tightly in her hand, carrying the image with her into her final moments.

"I also have children, so I completely understand that feeling as a mother," Wang said. "For her, that kind of longing and sorrow can be even more painful than physical torture."

Playing Jiang Jie has also changed Wang beyond the stage, leaving her more grounded and confident. "When I face difficulties in life or work, I often think about how they would have handled similar situations," she said.

For actor Cao Wei, who portrays Xu Yunfeng, the challenge lies in expressing calm in the face of death.

One line from the play has stayed with him: "Death is such a powerless threat to a revolutionary."

"His calm comes from his deep belief that victory will come," Cao said. "Although Chongqing had not yet been liberated, he could already see the dawn of victory."

The role has also reshaped how he sees his profession.

"There was one moment when I suddenly realized I am not only an actor," he said. "Through theater, we are passing on the spirit of the revolutionaries to new audiences."

He said audience reactions often reinforce that sense of connection. In Chongqing and Chengdu, viewers frequently remain seated after performances. Some bow; others wave silently before leaving.

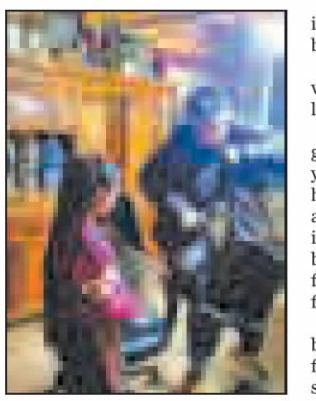
"You can see it in their eyes — they truly relate to these characters and what they represent," Cao said.

The play has also left an impression on younger members of the cast.

Among them is Wu's daughter, who plays Little Radish Head. Wu said she knew little about the historical background before joining the production. After taking part in the play, however, she began asking when she could join the Communist Party, and when she could bring flowers, candy and toys to the character she portrays.

"To her, Communist Party members are the bravest, smartest and strongest people," Wu said.

For Wu, moments like this reflect how widely the production has resonated. "At first, we were simply setting out to create a good play," he said. "But over time, we realized it can work like a spark, quietly influencing young people."



Premiered in Beijing last June and performed at the Party School of the CPC Central Committee in late September, the production has since toured cities including Chengdu in Sichuan, Changsha in Hunan and Nanchang in Jiangxi, and will continue touring universities and railway bureaus across the country.

"We hope audiences can find something they truly believe in," Wu said. "Above all, we intend to showcase the ideals, resilience and unwavering faith embodied by the revolutionary heroes. Once you hold fast to this revolutionary belief, life feels more meaningful."

CPC volunteers find different ways to shape China's grassroots future

By **MENG WENJIE**

Left: Fan Jiang promotes local agricultural products and intangible cultural heritage during a livestreaming event in Baodi district, Tianjin, in January. **Right:** Li Tinghui delivers new clothes for children to a family in need in Nagchu, Xizang autonomous region, in December 2025. PROVIDED TO CHINA DAILY

At the age of 21, Li Tinghui visited the Xizang autonomous region for the first time. The moment he stepped off the train, the plateau left an impression that never faded.

"I just knew I would come back here to work one day," he recalled.

That thought soon became reality. Now 30, Li has spent seven years in Nagchu, a city known for its vast landscapes and for being one of the highest-altitude urban areas in China. Life here is defined by just two seasons: a brief summer when down jackets are still necessary, and a long, harsh winter.

Li is from Hebei province. In 2019, he joined the "Go West" program, a volunteer initiative that sends university graduates to China's less developed western regions. When his service period ended, he chose to stay.

Life at more than 4,500 meters above sea level is never easy. Vegetation is scarce, and heating in some areas still relies on burning yak dung.

The thin air has taken a toll on Li's health, causing chronic altitude sickness and an enlarged heart. Yet he has never considered leaving.

"In university, I felt like I was living in an ivory tower," he said. "Only here did I feel grounded and truly connected to people."

Over the years, Li has worked on urban planning, public services, ecological restoration and other grassroots tasks. With his colleagues, he has helped replace pit latrines with flush toilets and contributed to greening projects by planting rapeseed flowers and pine trees across the city.

He has also helped organize community skills competitions covering 29 categories, from handicrafts to technical repair work. Winning entries have been showcased at national exhibitions, and some participants — with local government support — have gone on to start their own businesses and increase their incomes.

"I hope that in my day-to-day work, I can do each small task well so that local people truly benefit," Li said.

Beyond his official duties, he has long been active in public welfare, raising donations for school supplies, sanitary products for girls and warm clothing for families in need.

His efforts have also extended to disaster relief. After a 6.8-magnitude earthquake struck Dingri county in 2025, he rushed to the site with supplies, helping set up tents and prepare meals amid aftershocks and damaged homes.

"I used to find *The Communist Manifesto* difficult to fully grasp," said Li, who has been a CPC member for four years. "But in Xizang, through real work, I came to understand what it means to serve the people."

While Li's work is rooted on the snowy plateau, 37-year-old Fan Jiang, a CPC member for 15 years and a member of the All-China Youth Federation, has taken a different path: building the digital rural economy.

In 2019, Fan began using social media to support rural development in his hometown in Shanxi province. He discovered that Shanxi had rich traditional medicinal resources, though only a small share had been developed.

Together with his team, Fan spent six months creating more than 40 food- and medicine-based products, including drinks, pillows and sachets, which were later launched at the 2021 Central China Investment and Trade Exposition.

His work soon expanded beyond Shanxi. Since 2022, he has joined a youth rural revitalization project led by the Communist Youth League of China, working across more than 20 provinces to promote local products through livestreaming.

Rather than relying on aggressive sales tactics, Fan's livestreams focus on rural traditions and regional culture. He recalled one session in Jilin province where viewership surged from around 2,000 to 20,000 when an intangible cultural heritage inheritor demonstrated traditional bow-making.

"When products are combined with local character and storytelling, they gain new life," he said.

Fan then launched a training program for livestream hosts to support young people returning to their hometowns to start businesses. He also helped build a rural livestreaming alliance with 285 hosts and a combined following of over 440 million, featuring more than 3,000 products from counties across the country.

"We are not training influencers, but a new generation of digital farmers rooted in rural areas," he said. "What matters most is seeing farmers benefit after each session, and young people returning home through our program. That tangible impact means a lot to me."

Although Li and Fan work in different fields, both have chosen paths defined by close engagement with local communities. Success is measured not by personal recognition, but by whether their work changes ordinary lives.

"I may have given up a comfortable life, but I have gained the genuine trust of the people. That is what happiness has come to mean for me," Li said.

CPC 105TH ANNIVERSARY

Biljana Vankovska

China's civilizational vision in an age of uncertainty

In left-leaning circles across the globe, a quiet crisis persists. Despite relentless pressure, marginalization, and even demonization, many who still carry the torch of emancipatory politics grapple with historical disappointments while clinging to hope for a more just world. As the founder of the Italian Communist Party, Antonio Gramsci, once noted, the struggle between pessimism of the intellect and optimism of the will demands moments of reflection.

There is no better occasion for such reflection than the milestone anniversary of a living socialist project.

The 105th anniversary of the founding of the Communist Party of China is not merely a commemoration of the past, but also an invitation to reimagine the future.

My recent visit to the Memorial of the First National Congress of the CPC in Shanghai left me deeply moved by the historical context, the biographies, the struggles, and the unwavering vision of those early pioneers: a small boat, a clear compass, and the courage to chart a new course against all odds.

Where some post-socialist societies in Eastern Europe abandoned their emancipatory compass to align with the "one civilization" pattern, China's path demonstrates how dialectical adaptation can renew socialism without surrendering its core values.

Socialism with Chinese characteristics is not a retreat from principle, but a synthesis: it anchors modern development in ancient civilizational continuity, places human well-being at the center of governance, and integrates foreign policy with domestic priorities.

This external dimension is particularly significant. China is often misunderstood — either portrayed as a "future hegemon" or criticized for its "strategic restraint".

In reality, Beijing has no interest in hegemonic domination.

Its internationalism operates on two tracks: principled solidarity with progressive movements, and a deeper, long-term commitment to civilizational dialogue.

This second track has been cultivated over a century and finds its clearest expression in the concept of "mutual learning among civilizations".

The "clash of civilizations" thesis, popularized in the 1990s, presumed that cultural differences inevitably breed conflict, a narrative that conveniently legitimized intervention and civilizational exceptionalism. The CPC's framework offers a direct alternative.

MA XUEJING / CHINA DAILY

It starts from a materialist and historical understanding: civilizations are not static entities locked in eternal rivalry, but dynamic processes shaped by exchange, adaptation, and collective struggle.

Mutual learning does not mean relativism or the erasure of identity. It is the recognition that in an era of polycrisis, no single tradition holds a monopoly on wisdom.

Differences are not a threat to a shared human future; they are its foundation.

This resonates deeply in the Balkans. My own region has lived through the consequences of imposed civilizational hierarchies and institutional engineering.

The tragic dissolution of Yugoslavia sparked countless Western academic prescriptions, yet imported models of managed multiculturalism have rarely delivered genuine coexistence.

In Bosnia and Herzegovina or North Macedonia, differences are often administratively frozen rather than dynamically engaged.

Ironically, while Western universities proliferate "intercultural studies" programs, they rarely point to China's practical approach to civilizational dialogue. To learn from others, one must first understand oneself. China's model begins with civilizational self-awareness: honoring one's own heritage without imposing it as a universal template.

It then extends outward: engaging with other traditions not to assimilate them, but to build mutual understanding and prevent the misunderstandings that fuel conflict.

This is not merely an academic ideal; it is an anti-imperialist stance rooted in peace, solidarity, and the strengthening of people-to-people bonds.

A superficial glance at today's world might suggest the US scholar Samuel P. Huntington's prophecy is unfolding. However, it is chaos by design, and yes — there are alternatives.

The West represents a demographic and historical minority; the Global South constitutes the overwhelming majority of humanity, offering countless examples of civilizational resilience and resistance to cultural homogenization.

China's depth is immense, but so is the intellectual and cultural wealth of Iran, India, Africa, and Latin America. Each carries living archives of alternative modernities.

Together, they form the backbone of a new cultural order based on mutual respect.

This vision has now been formalized in the Global Civilization Initiative proposed by China. For the Balkans, a region long treated as the periphery of competing empires, the GCI is not a distant diplomatic concept. It aligns intuitively with our historical memory of the Non-Aligned Movement and our age-old reality of multicultural coexistence.

It affirms that we, too, have civilizational contributions to offer, rather than reasons to feel inferior or subordinate.

What is needed now is civilizational confidence: the same clarity and courage that guided those pioneers on a small boat near Shanghai over a century ago. Mutual learning among civilizations is not a rhetorical exercise.

It is an operational framework for a world that refuses to be divided into clashing blocs.

As we navigate fragmentation and uncertainty, the CPC's 105-year journey reminds us that the future cannot be monopolized; it has to be co-authored.

Humphrey P. B. Moshi

CPC's 105-year journey from fights to heights

The Communist Party of China, founded in 1921, has been the sole governing party of the People's Republic of China since 1949. Truly, in these 105 years, Chinese society has undergone remarkable transitions in a variety of dimensions. It has ushered in a new era of socialism with Chinese characteristics, eradicated absolute poverty, and finished building a moderately prosperous society in all respects. These are unprecedented milestones, outcomes, and historic feats. Despite these achievements, the CPC has now set out on a new journey to achieve the Second Centenary Goal of developing China into a great modern socialist country through the "Chinese path to modernization", which was put forward during the 20th National Congress of the CPC held in October 2022.

In the new journey, the leadership of the CPC will continue to be the defining feature of socialism with Chinese characteristics. That is why its contribution to socioeconomic development, national rejuvenation and people's well-being will remain sustainable.

President Xi Jinping has stressed the importance of meeting the needs of the people. That has always been China's strategy — of putting people first, over and above, everything else.

Second, the commitment to embracing globalization and multilateralism remains unshakable, given the emphasis on the need to promote high-level opening-up, and promote the sustainable development of cooperation platforms such as the Belt and Road Initiative and the Forum on China-Africa Cooperation.

Likewise, the cooperation platforms have accelerated social and economic development in developing countries, particularly African countries.

In a nutshell, given China's deep integration with the global economy, stability and growth of the economy are central to global economic recovery in the era after COVID, the Russia-Ukraine conflict and the oil crisis triggered by the US-Iran war.

Third, modernization cuts across all priorities. This means that China's development would be informed, as in the past, by the dynamics of the day, both regionally and globally. As always, this development will be blended with Chinese characteristics. In this regard, continuous adjustment to the unfolding future challenges and opportunities becomes a basic rule.

In other words, the capacity for adaptation to the changing circumstances has to be developed, nurtured and enhanced.

Indeed, the main drivers for coping with the unfolding dynamics, whether climate change or pandemics, are human capacity development and scientific and technological innovations.

Fourth, in the future, adherence to the Five Principles of Peaceful Coexistence will remain firmly anchored on solid ground when cooperating with other countries, both developed and developing. This commitment is underpinned by the national policy of opening up to the outside world, which is guided by the principle of mutual benefit.

It should be noted that the above-mentioned principles were put forward in 1954, and their spirit was widely recognized at the 1955 Bandung Conference. Subsequently, they inspired the establishment of the Non-Aligned Movement, whose principles China has consistently supported and adhered to.

Fifth, the emphasis China placed on promoting peace and development is another area of continuity. Indeed, it should be noted that China did not launch aggressive wars or plunder foreign resources to become the world's second-largest economy.

However, China's aversion to war and love for peace should not mean it will look the other way if its territorial integrity and sovereignty are violated by an external force.

The five areas analyzed above, added to China's track record of unwavering commitment to globalization and multilateralism, its upholding of governance principles, and a leadership that "walks the talk", make us more than confident that China's development has gained renewed momentum, that, on the one hand, will continue to profoundly impact the world in all spheres, and, on the other hand, will enable China to, ultimately, build a modern socialist country that is prosperous, strong, democratic and culturally advanced, harmonious, and beautiful.

We sincerely congratulate the CPC, the PRC leadership and the Chinese people for the work well done. Keep it up!

Xie Maosong

Why Chinese governance model has always chosen long-termism

In an age of short attention spans, compressed political cycles and increasingly fragmented societies, China presents a striking contrast: its plans last for decades.

As the nation commemorates the 105th anniversary of the Communist Party of China and launches the 15th Five-Year Plan (2026-30), the world is increasingly focused on how China has sustained strategic continuity amid sweeping economic and social transformation.

The answer lies not just in institutions and policies but in a deeply embedded political philosophy that prioritizes long-term governance, supported by values deeply rooted in the Chinese culture: continuity, adaptation and collective purpose.

China's long-term orientation is most visible in what Chinese leaders often describe as the country's two greatest achievements: rapid economic development and enduring social stability.

These successes did not happen by accident.

China's governance model integrates long-term national goals with medium-term planning and annual implementation. Its Five-Year Plans are not isolated policy documents; they are phases in a broader developmental trajectory. Long-term objectives are translated into concrete milestones, ensuring continuity over decades rather than abrupt shifts with each political cycle.

Such sustained planning is particularly valuable during periods of uncertainty. As global markets face recurring disruptions, China has deployed macroeconomic coordination and countercyclical adjustment to maintain stability while pursuing long-term development goals.

The phenomenal rise of China's electric vehicle industry is a testament to this approach. A decade ago, few had expected that Chinese new-energy vehicles would become central players in the global market.

This achievement is not an outcome of market forces alone. It resulted from a combination of government planning, industrial policy, technological innovation and long-term investment. Multiple battery technologies were allowed to compete simultaneously.

Public policy and private entrepreneurship reinforced one another. Development finance, industrial funds and patient capital helped sustain innovation through years of uncertainty.

It's noteworthy that this industrial policy itself is not unique to China. Many advanced Western economies once relied heavily on similar approaches during their industrial ascents. The difference lies in the persistence, not in the invention.

Behind these policies stands a governing organization with an extraordinary belief in continuity.

The CPC's organizational structure extends from the national leadership to local communities across the country, providing not only administrative reach but also the ability to mobilize resources, coordinate priorities and implement decisions on a vast scale.

Yet, organizational capacity alone cannot ensure durability. A political system needs legitimacy. For the CPC, that legitimacy is anchored in the principle of serving the people. Unlike political systems organized around competing interest groups, China's governing philosophy emphasizes balancing diverse interests within a broader public good. The goal is not simply to aggregate competing demands but to reconcile immediate interests with long-term national objectives.

Economic dynamism and social stability are viewed as mutually reinforcing, not competing, goals.

This philosophy is deeply rooted in Chinese political tradition. Throughout history, governance in China has been judged by virtue as much as power. Political authority was expected to serve society rather than represent particular factions.

While modern China is very different from ancient China, the belief that a government should pursue the long-term well-being of the whole society continues to influence political thinking.

This helps explain why many Chinese scholars describe the CPC not just as a political entity but as a "civilizational party" — an organization that sees itself as both a governing body and a carrier of a broader historical mission.

The CPC's relationship with Chinese society is central to this model. The Party's long-standing "mass line" emphasizes learning from local communities, identifying successful grassroots practices and transforming them into broader policies.

Pilot programs are tested, evaluated and expanded gradually. In this sense, governance combines top-down coordination with bottom-up experimentation.

Long-term governance, however, requires more than planning and public support. It also requires adaptation. An enduring theme in Chinese civilization is the idea that permanence and change are not opposites but complements. Stability is achieved not through rigidity but through continuous renewal.

This principle explains why China's leaders emphasize both consistency of direction and flexibility of method. Strategic continuity is maintained while adjusting policies to the changing circumstances. Markets are encouraged to generate growth and innovation, yet excessive speculation and disorder are subject to regulation.

Economic dynamism and social stability are viewed as mutually reinforcing, not competing, goals.

Equally important is the Party's emphasis on self-renewal. Chinese leaders argue that long-term governance can endure only if the governing organization reforms itself continuously. This belief underpins ongoing efforts to strengthen Party discipline, combat corruption and improve governance capacity.

At its core, China's long-termism is sustained not only by institutions but also by culture.

Chinese civilization is the world's longest continuous tradition. Classical texts such as the *Book of Changes* (I Ching) stress the importance of perseverance while adapting to changing conditions. The ideal is neither blind conservatism nor constant disruption, but the ability to remain rooted while evolving.

This cultural inheritance shapes China's approach to development, governance and its global role. China's long-term vision extends beyond its borders. The four global initiatives promoting shared development, modernization and the idea of a community with a shared future for humanity reflect a belief that national prosperity and global stability are interconnected.

China's future, in this view, cannot be separated from the future of the wider world.

The deeper logic of China's governance, therefore, is not simply about planning further ahead. It is about integrating political leadership, economic development, cultural continuity and national purpose into a cohesive long-term framework.

From the founding of the People's Republic of China, the aspiration of "Long live the People's Republic of China" is linked to another purpose: "Long live the great unity of the peoples of the world". The connection between these two ideas continues to shape China's approach to long-term governance today.

Editorials

Party's leadership continues to advance country's modernization drive in new era

A gathering is being held in Beijing on Wednesday morning to mark the 105th anniversary of the founding of the Communist Party of China.

At the event, Xi Jinping, general secretary of the CPC Central Committee, will confer the July 1 Medal, the Party's highest honor, on model CPC members. He will also give an important speech that not only reviews the Party's history but also serves as a guideline for building the Party in the future.

At 105, the Party's institutional strength is inseparable from China's long-term development and modernization agenda.

The CPC had nearly 101.29 million members and over 5.43 million primary-level organizations as of the end of 2025. Party building represents a broad institutional strategy designed to improve leadership capacity, policy coordination, organizational discipline and implementation.

Understanding the role of Party building in the development of the CPC is essential to understanding the country's development, which has demonstrated that modernization depends not only on economic resources or technological innovation but also on the effectiveness of the institutions responsible for translating national priorities into practical outcomes.

Since the 18th CPC National Congress in 2012, the CPC Central Committee with Xi Jinping at its core has set forth a series of new ideas, thoughts and strategies on the Party's self-governance and on efforts to strengthen the Party, forming Xi Jinping Thought on Party Building. The Thought reflects an institutional logic by emphasizing political leadership, organizational cohesion, self-governance and continuous improvement of the Party's governing capacity.

Sustaining high-quality development increasingly requires effective coordination across industrial upgrading, scientific innovation, financial stability, environmental protection and social welfare. Such challenges place greater demands on governance than growth alone.

Xi Jinping Thought on Party Building integrates Party leadership with national rejuvenation, institutional modernization and governance reform through an effective institutional design.

The Thought stresses that upholding the Party's leadership is the defining feature of socialism with Chinese characteristics.

It emphasizes the need to uphold the centralized, unified leadership of the CPC Central Committee, exercise full and rigorous Party self-governance, stay true to the Party's original aspiration and founding mission, take the Party's political building as the overarching principle, and build cohesion and forge a solid ideological foundation with the Party's innovative theories.

It also stresses the need to enhance Party consciousness, improve an organizational system featuring cohesion across different levels and effective implementation, cultivate high-caliber officials capable of shouldering the mission of national rejuvenation, improve Party conduct on a regular and long-term basis, supervise and govern the Party in all respects with strict discipline, take coordinated steps to ensure that officials do not have the audacity, opportunity or desire to commit corruption, run the Party with systems and regulations, and fulfill the political responsibility of full and rigorous Party self-governance.

A country's modernization should not be judged solely by income levels or technological sophistication but also by governance effectiveness, long-term policy consistency and the ability to balance development with stability. Within this framework, Party building becomes part of a broader governance architecture intended to support Chinese modernization.

The growing external uncertainty underscores the importance of maintaining domestic policy coherence, institutional resilience and implementation capacity at home. Strong organizational leadership, in this view, is regarded as a source of strategic stability during periods of global volatility.

The effectiveness of Party building will ultimately be judged by measurable outcomes: whether it continues to enhance governance quality, sustain high-quality development, strengthen institutional resilience and improve public well-being.

It is of great significance for the entire Party to apply Xi Jinping Thought on Party Building to plan and advance the Party's development and exercise full and rigorous Party self-governance with higher standards and more concrete actions.

By doing so, the Party can leverage its 105-year legacy to better navigate a complex economy, a rapidly evolving society, and an era of increasing global uncertainty.

China-EU economic ties not zero-sum game

In a major move underscoring the importance of dialogue over confrontation, Minister of Commerce Wang Wentao and European Commissioner for Trade and Economic Security Maros Sefcovic co-chaired the inaugural meeting of the China-EU trade and investment consultation mechanism in Brussels on Monday.

The "intensive, focused and constructive" talks surrounding key economic and trade issues sent a clear signal that China and the EU remain committed to addressing economic and trade differences through dialogue.

To prevent disputes from escalating into a trade war, the two sides agreed to set up four initial work streams under the mechanism to further discuss the trade and investment balance, export controls, intellectual property and World Trade Organization reform, along with the establishment of a joint monitoring mechanism to exchange relevant data, monitor trade flows and support technical work with a view to improving transparency, enhancing mutual trust and managing trade frictions.

This is an institutionalized approach to the management of their differences. While differences are inevitable, having an efficient dialogue platform and a framework of rules provides a formal consultation process for resolving frictions.

Progress has been made on specific issues, with both parties acknowledging the positive results of the dialogue on export controls on rare earth elements and other critical minerals, and expressing their intention to strengthen dialogue in this field.

They agreed that increased market access measures and initiatives can contribute to the healthy development of the trade relationship. They also agreed on the need to take further facilitation measures to maintain the stability of global industry and supply chains. The exchange of market access lists and the agreement to gradually address each other's concerns are concrete actions in that direction.

From Europe's perspective, the "trade imbalance" is the top concern. Yet a fact that the EU is reluctant to face is that the increasing trade gap is not the result of China's policy direction, but rather a natural outcome based on comparative advantage and market competition. The root cause lies in the EU's mounting restrictions on exports of high-tech products to China.

The European Commission's decision to restrict EU funding, including through the European Investment Bank and European Investment Fund, for solar, wind, and energy storage projects using inverters from so-called "high-risk countries", including China, along with the draft revisions of the bloc's Cybersecurity Act and the Industrial Accelerator Act, has severely impacted normal bilateral cooperation and the stability of global industry and supply chains.

To prevent trade frictions from escalating, the EU must keep the broader picture of China-EU economic ties in mind and address China's concerns with sincerity. It must stop implementing new restrictions targeting Chinese companies and products, as cooperation cannot coexist with the building of barriers.

It is crucial for the EU to recognize that China is not the source of the bloc's problems, but rather a partner in resolving them.

As the EU's major trading partner for goods, China is prepared to enhance dialogue and consultation with the EU through all available channels, including the newly established trade and investment consultation mechanism. By properly managing differences and frictions, China aims to promote practical cooperation and work toward balanced growth in China-EU trade.

The scale of China-EU trade — at 5.93 trillion yuan ($873.16 billion) last year, an increase of 6 percent year-on-year — indicates that neither side can afford to disengage from the other. Escalating economic and trade frictions would harm the shared interests of both sides.

It is encouraging that Sefcovic stated that the EU does not intend to escalate trade frictions and is willing to strengthen dialogue and consultation with China to manage differences. Both sides have reportedly tasked their teams with intensifying efforts and agreed to hold another ministerial meeting in autumn. China-EU economic ties are not a zero-sum game. They should take this meeting as a starting point, move forward together and ensure that China-EU economic relations remain stable and enduring amid challenges.

Revisiting classics a reminder of dialogue of civilizations

In both the Greek and Chinese traditions, the classics don't preserve abstract theories that are detached from reality, but accumulated wisdom about how human beings should govern states, cultivate character, maintain social order, confront suffering and lead meaningful lives.

Classic works have often emerged in moments of social transformation and civilizational uncertainty. Plato wrote *The Republic* in the aftermath of political upheaval and the execution of his mentor Socrates, asking how justice and civic order might still be possible. Likewise, *The Analects of Confucius* emerged in an age of political fragmentation and moral disorder; Confucius' journeys were themselves attempts to seek workable forms of ethical and political life.

It is perhaps for this reason that civilizations often return to their classical traditions during periods of historic transition and renewed cultural confidence. According to the Chinese philosopher and classicist Liu Xiaofeng, the rise of successive generations of scholars dedicated to the study of the ancient classics has often accompanied periods of heightened reflection on a civilization's cultural inheritance and historical identity.

From the organization of Greek texts under the Hellenistic kingdoms to the Roman inheritance of Greek civilization, from the recovery of lost Greek and Latin manuscripts by scholars during the Renaissance period to the rise of German classical philology alongside the formation of modern states, broader historical renewal has always been accompanied by the reinterpretation of foundational texts.

China experienced comparable moments as well: major dynastic high points, including the Han (206 BC-220), Tang (618-907), and Qing (1644-1911) periods, were often marked by large-scale efforts to preserve, collate and reinterpret the classical canon. Such returns to the classics are not merely nostalgic gestures. Rather, societies undergoing historical change often look back at ancient foundational texts in search of continuity, legitimacy, and moral orientation.

The United States is another example. As a comparatively young nation, the intellectual elite there used to look up to Greece and Rome as sources of cultural continuity. At the University of Chicago, Robert Maynard Hutchins established a core curriculum in Western civilization centered on Greek and Roman classics, requiring students to engage with the works of writers such as Homer, Plato, Aristotle and Virgil alongside later European thinkers. Beneath the project lay the conviction that a modern society still requires a shared relationship with the foundational questions and texts of civilization.

Such efforts also point toward a deeper intellectual possibility. Contemporary political discourse often remains confined to immediate policy concerns, ideological categories and strategic competition. By returning to classical texts, scholars attempt to raise the level of discussion — from short-term political arguments toward the deeper philosophical questions underlying political life: justice, education, morality, order and human nature. The emphasis on philology, close reading and historical interpretation reflects the belief that classical works should not merely be cited for modern-day agendas, but encountered as living sources of thought capable of reshaping how contemporary societies understand themselves.

This broader perspective may also offer an alternative to some very influential theories of inevitable civilizational conflict. Samuel Huntington's "clash of civilizations" theory assumes that human beings are defined primarily by large civilizational blocs grounded in religion, culture and historical memory. For Plato and Aristotle, however, human beings stand out for their universal capacity to reason and the cultivation of excellence rather than civilizational membership alone. Confucian thought, too, understands the self through ethical relationships, social obligations and the cultivation of *ren*, or benevolence, within a network of family and ritual life. In different ways, both traditions imply that harmony does not require the elimination of differences, and that meaningful dialogue across civilizations remains possible because human beings share capacities for moral cultivation, rational inquiry and ethical life.

Seen in this light, the renewed interest in classical traditions may help move discussions beyond the assumption that civilizations encounter one another primarily through competition, ideology or power politics. By returning to the foundational texts through which societies first articulated their understandings of justice, order, morality and human flourishing, scholars may reopen the possibility of a deeper intellectual reciprocity — one in which civilizations meet not as rivals, but as participants in a shared human conversation.

What They Say

Industrial sector needs to fully tap domestic market

Editor's note: *Industries across the world are undergoing major changes due to geopolitical shifts and technological advancements. Xu Zhaoyuan, deputy head of the Department of Industrial Economy under the Development Research Center of the State Council, spoke to China Economic Times on China's ability to navigate these changes and the steps needed to further improve its industrial sector. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Amid the reshaping of the global industrial landscape, China's industrial system has several competitive advantages. The massive scale of China's manufacturing sector delivers enormous output volumes, which reduce R&D spending and equipment depreciation costs for every unit of output. The large production scale also leads to higher efficiency.

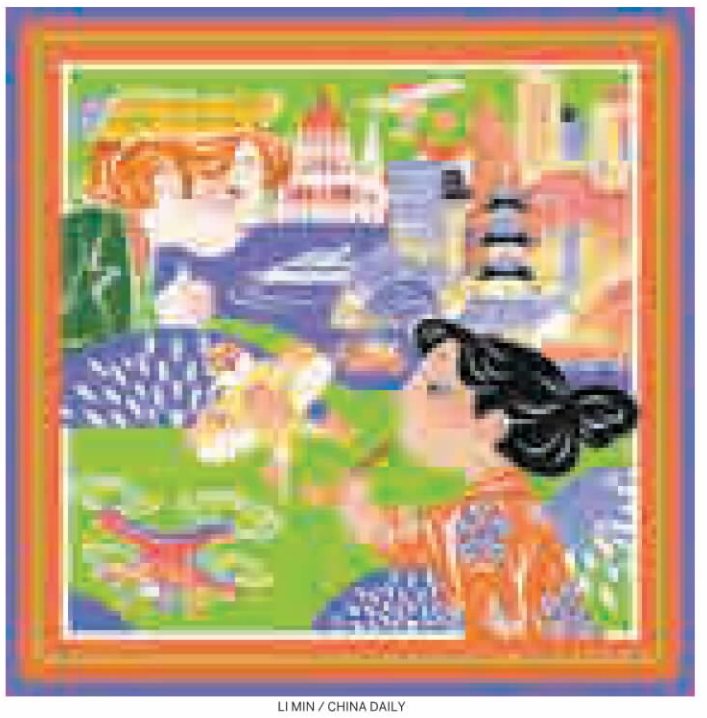
In 2025, China overtook Germany and Japan to secure 10th position in the World Intellectual Property Organization's Global Innovation Index. It was the first time the country was in the top 10 in the GII, and marked China's transition from a technology follower to a frontier innovator. More importantly, China's innovations are no longer confined to laboratories. They are deeply aligned with industrial demands. Scientific discoveries are swiftly turning into engineering practices.

China's comprehensive industrial system provides robust industrial support to emerging sectors in the country, shortening the lead time from prototype development to mass production and facilitating cross-sector integration.

The country's population of more than 1.4 billion and a large middle-income group generate tremendous market demand, acting as catalysts for technological progress. Products such as new energy vehicles, 5G terminals and smart home appliances receive massive real-time user feedback in China's market, driving algorithm iteration and design refinement.

China has built a 5G network and a large-scale industrial internet system. This infrastructural advantage enables AI, big data analytics and digital technologies to be deeply integrated into production management.

In the next 25 years, China should fully tap into its superlarge market. It should develop a unified national market, improve systems to better promote fair competition and strengthen quality standards and the protection of intellectual property. These measures will drive enterprises to improve the quality of their products, build stronger brands and move up the value chain.



The country needs to cultivate not only major enterprises with core technologies that are capable of integrating resources globally, but also a multitude of small and medium-sized enterprises that demonstrate competitiveness in niche sectors.

China's industries serve as a "stabilizer" for the global supply chain. The country will continue to provide the world with products and services featuring advanced technology, reliable quality and reasonable prices. Additionally, China supports domestic enterprises in making more direct investment overseas, especially in green and low-carbon sectors.

GLOBAL VIEWS

LI MIN / CHINA DAILY

LEVENTE HORVÁTH

Building bridges in times of 'de-risking'

Supply chain cooperation serves as a model of open resilience in the era of Globalization 2.0

The fourth China International Supply Chain Expo, held in Beijing from June 22 to 26, came at a time when global supply chains are undergoing profound transformation. The challenge facing governments and businesses today is how

to enhance economic security while maintaining competitiveness in an interconnected world. While China promotes international cooperation through platforms such as the CISCE, the European Union increasingly emphasizes "de-risking" and supply-chain nationalism.

Much of the recent debate has focused on geopolitics and the rise of new economic powers. Yet a deeper economic transformation is taking place. The first phase of globalization was primarily about the internationalization of products and trade. Today, a new phase — Globalization 2.0 — is emerging, characterized by the globalization of production networks, logistics systems, technologies and supply chains. Global supply chains are not disappearing; they are being reorganized and diversified.

This debate is particularly relevant for China-EU relations. China remains the EU's second-largest trading partner in goods, while the EU continues to be one of China's most important export markets. Despite growing discussions about "de-risking", economic interdependence remains substantial. Hungary offers a useful example of how a European country can adapt to these changing realities and integrate itself into emerging Eurasian supply chains.

China-Hungary economic relations have undergone significant transformation over the past two decades. During the early 2000s, cooperation was driven primarily by trade. Bilateral trade expanded to $20.8 billion in 2025.

Since the second half of the 2010s, investment has been the defining feature of bilateral economic cooperation. In 2025, China maintained its position as the largest source of foreign investment in the country. Hungary has become one of Europe's most important destinations for Chinese investment.

And the broader trend of supply chain cooperation embedded in bilateral trade and investment is also very significant. The following are four pillars that support supply chain cooperation between Hungary and China.

First, logistics. Connectivity has become a strategic asset in modern supply chains. Budapest has emerged as one of Central Europe's most important gateways for Chinese passenger and cargo traffic, with direct flights connecting Hungary to seven major Chinese cities.

Hungary is also part of the China-Europe Railway Express network, while the modernization of the Budapest-Belgrade railway is expected to strengthen trade links between Asia and Europe. These developments have enhanced Hungary's role as a logistics hub connecting Eastern and Western markets.

Second, manufacturing. Hungary's strong industrial base, particularly in the automotive sector, has provided a solid foundation for deeper integration into global value chains. It is estimated that the automotive industry accounts for more than 16 percent of Hungary's exports and remains one of the country's most important manufacturing sectors.

This industrial ecosystem has made Hungary an attractive location for Chinese manufacturers seeking access to European markets. As a result, the relationship has evolved from a traditional trade partnership into a deeper integration of production networks.

Third, green transition. The most dynamic area of China-Hungary cooperation is the green economy. The global shift toward electric mobility and renewable energy is reshaping industrial value chains, and Hungary has positioned itself at the center of this transformation.

Leading Chinese companies, including CATL, BYD, EVE Energy, Huawei and Wanhua, have established major operations in Hungary. Their investments span battery manufacturing, electric vehicles, energy storage technologies, advanced materials and renewable energy solutions.

These projects do not represent isolated investments. Together, they form an integrated industrial ecosystem that connects Chinese technological capabilities with European manufacturing and consumer markets.

Hungary's role in battery production has expanded particularly rapidly. By 2020, Hungary had become the world's sixth-largest exporter of batteries, a remarkable achievement for a country of fewer than 10 million people. Current projections suggest that Hungary's battery manufacturing capacity could eventually reach about 250 gigawatt-hours annually, potentially supplying more than one-third of Europe's battery demand.

Chinese participation in Hungary's green transition extends beyond batteries and EVs. Chinese companies are also involved in renewable energy projects, including one of Hungary's largest planned solar developments.

Naturally, environmental concerns related to battery production and large-scale industrial projects can be addressed through strict regulation, transparent standards and continuous monitoring. Sustainable development remains essential for the long-term success of these investments.

Fourth, innovation. The most important long-term trend is the gradual movement up the value chain. China-Hungary cooperation is increasingly expanding from trade and manufacturing to new frontiers such as research, development and innovation.

Several Chinese companies have established regional R&D centers in Hungary. Huawei and BYD are among the companies expanding innovation-related cooperation, while partnerships between Chinese companies and Hungarian universities continue to grow.

This evolution demonstrates how participation in global supply chains can gradually generate higher-value activities beyond manufacturing itself. For Hungary, it represents an opportunity to move from assembly-based production toward innovation and knowledge creation.

Hungary's experience demonstrates that the restructuring of global supply chains does not necessarily lead to fragmentation. Instead, it can create new opportunities for connectivity, diversification, industrial upgrading and innovation.

By focusing on logistics, manufacturing, green technologies and research cooperation, Hungary has positioned itself as an increasingly important bridge between Chinese industrial capabilities and European markets.

As discussions at the CISCE and across Europe continue to focus on economic security and supply-chain resilience, Hungary's experience suggests that resilience can be strengthened through openness, diversification and mutually beneficial cooperation. In the era of Globalization 2.0, the most successful countries cannot be those that isolate themselves from global supply chains, but those that learn how to join them.

The author is the director of the Eurasia Center at John von Neumann University in Hungary, the former consul general of Hungary in Shanghai and a visiting scholar at Fudan Development Institute. JIANG QINGQUAN AND ZHANG XIAOSAN

Making AI a force for all

The BRICS collaborative framework is reshaping global governance of smart systems, ensuring that its future is written through the collective wisdom of a multipolar world

As artificial intelligence weaves itself into the fabric of economies and societies, a central question is no longer what AI can do, but who gets to shape its future and who shares in its benefits. Against the backdrop of accelerating technological evolution, the BRICS countries have articulated a clear and compelling answer: Global AI governance must meet the needs of all countries.

Jiang Qingquan

Zhang Xiaosan

Through a combination of high-level political consensus, institutional innovation and practical, development-first cooperation, the BRICS countries are offering a distinctive governance model that is steadily reshaping the global conversation on artificial intelligence.

The values embedded in the BRICS approach did not appear in isolation. They represent the steady ascent of a concept that China has championed for several years — AI for good. In 2023, China launched the Global AI Governance Initiative, putting people-centered development, the idea of "AI for good", as well as the principles of mutual respect, equality and mutual benefit, at the heart of the international discourse. That proposition gained remarkable traction in 2024, when the United Nations General Assembly unanimously adopted a resolution on AI capacity-building that China co-sponsored, a move that firmly linked governance to development. By the time the BRICS leaders' statement formally endorsed these principles in 2025, what began as a vision had unmistakably become a common voice of the Global South.

Today, "AI for good" serves as the working guideline within the BRICS cooperation framework. It means ensuring that AI systems serve sustainable development through a people-centered vision. It involves jointly developing ethical benchmarks that prevent the misuse of AI while preserving space for innovation tailored to national realities. The BRICS countries can advance harmonized frameworks for AI ethics and safety that emphasize both risk mitigation and developmental benefits. Joint programs to combat AI-generated misinformation, promote algorithmic transparency and integrate AI literacy into public education should be designed not as exclusive standards but as shared public goods available to all interested partners. The framework can specifically highlight the need to safeguard vulnerable groups from algorithmic bias, ensuring that AI systems respect linguistic, cultural, geographical and demographic diversity.

In July 2025, the 17th BRICS Summit adopted the BRICS Leaders' Statement on the Global Governance of AI, a historic document that laid out principles, which are representative, development-oriented, accessible, inclusive, dynamic and responsive. This was more than a diplomatic milestone. It signaled the rise of a governance philosophy that places the needs of the Global South at the center of the international AI agenda, while respecting the digital sovereignty of every nation.

AI development should not become the privilege of a few countries, nor a manipulation tool in the hands of elites. Otherwise, global AI governance may deepen existing inequalities by imposing one-size-fits-all regulatory frameworks before the vast majority of nations have had a chance to build fundamental AI capabilities. The BRICS framework, by contrast, focuses on development with a people-centered vision. Rather than beginning with complex restrictions that may inadvertently exclude, it prioritizes empowering countries of the Global South to fully participate in global AI governance.

The BRICS leaders' statement explicitly affirms the right of all nations to reap the benefits of the digital economy and emerging technologies while upholding fundamental rights. It calls for expanding digital infrastructure, sharing open-source datasets and AI models, and cultivating homegrown talent. This political commitment has already translated into concrete actions. Under the BRICS cooperation framework, joint AI research and development centers are being established, and skills training programs are reaching numerous engineers and students across the BRICS countries. By making accessibility and inclusion non-negotiable starting points, the BRICS approach provides a new paradigm to help transform AI from a potential source of widening divides into an engine of shared progress.

Bold principles require operational engines to turn vision into reality. That engine was given a powerful boost in September 2025 when Chinese Premier Li Qiang proposed the AI+ International Cooperation Initiative at a high-level meeting on the Global Development Initiative. The proposal advocates embedding AI into key areas such as people's livelihoods, scientific research and industrial transformation, with the overarching goal of making AI a truly international public good that benefits humanity.

The initiative dovetails seamlessly with the BRICS governance principles. It is not a distant pledge but an actionable cooperation matrix. Within the BRICS framework, this translates into projects that directly tackle the "high willingness, low capacity" dilemma some developing countries face. For example, China and Brazil have piloted AI-enabled smart agriculture projects to help smallholder farmers boost yields and manage resources sustainably. This embodies the BRICS conviction that AI governance should be measured not only by the rules it sets, but by the tangible benefits it delivers to ordinary people.

These efforts are backed by a growing ecosystem of shared resources. BRICS countries can work on interoperable computing platforms, mutual recognition of data governance standards and joint open-source AI innovation communities. The China-BRICS New Quality Productive Forces Research Center, which opened in Beijing this January, promotes academic dialogue and research on new quality productive forces under a hybrid cooperation model. All of this reinforces one core insight: Once capabilities are broadly distributed, legitimate governance rules will emerge from inclusive, representative processes that honor the diverse developmental priorities of all nations.

The BRICS approach to AI governance is reshaping the global landscape by demonstrating that technological progress and inclusive governance can advance hand in hand. It shows that Global South countries need not choose between embracing AI's transformative potential and safeguarding their sovereignty and values.

By championing development-first and people-centered pathways, concrete "AI+" cooperation and the shared value of "AI for good", BRICS is helping build a world where AI serves as a force for all.

Looking ahead, the bloc's continued emphasis on open collaboration, shared capacity-building and UN-centered multilateralism offers a blueprint for global AI governance that leaves no country and no person behind. In an era of rapid technological change, the BRICS message is clear: The future of AI should be written not in a single language or from a single perspective, but through the collective wisdom of a multipolar world committed to shared prosperity.

20 YEARS
QINGHAI-XIZANG RAILWAY TRANSFORMS REGIONAL LOGISTICS

Landmark high-altitude line has brought people, trade closer than ever. **Luo Wangshu** reports from Xining, Golmud, Lhasa and Nyingchi.

A passenger train runs on the Qinghai-Xizang Railway on Jan 4, 2017. ZHANG ZHENQI / FOR CHINA DAILY

Timeline

1958
Construction begins on the Xining-Golmud section, the first phase of the Qinghai-Xizang Railway. The project is suspended in 1961 because of economic difficulties.

1974
Construction of the Xining-Golmud section resumes, with some 60,000 workers joining the project on the plateau.

September 1979
Track laying is completed on the Xining-Golmud section, allowing provisional operations to begin.

May 1, 1984
The 814-kilometer Xining-Golmud section officially enters operation.

June 29, 2001
Construction begins on the Golmud-Lhasa section, the railway's second phase and its most technically challenging stretch, which requires solutions to permafrost and other high-altitude engineering difficulties.

July 1, 2006
The 1,142-kilometer Golmud-Lhasa section opens to traffic, marking the full operation of the Qinghai-Xizang Railway and ending Xizang's history without rail service.

Aug 16, 2014
The 251-kilometer Lhasa-Shigatse Railway, an extension of the Qinghai-Xizang Railway, opens, further improving Xizang's railway network.

June 25, 2021
The 435-kilometer Lhasa-Nyingchi Railway opens. Fuxing bullet trains make their debut in Xizang, ending the region's history without electrified railways.

SOURCE: CHINA STATE RAILWAY GROUP

Upgrades minimize line's footprint on the plateau

By LUO WANGSHU

Ecological protection measures along the Qinghai-Xizang Railway have steadily evolved over the past two decades, with wildlife passages, waste treatment systems and daily patrols minimizing the operational footprint on the fragile plateau environment.

According to China State Railway Group, nearly 60 kilometers of dedicated wildlife passages have been integrated into the line to keep historical migration routes open. These measures have contributed to a rebound in the Tibetan antelope population, which has risen from fewer than 20,000 individuals in the 2000s to more than 70,000 today.

The railway, which fully opened in 2006, bisects a complex tapestry of grasslands, wetlands, water-source areas, permafrost zones and wildlife habitats. On the plateau, where damaged vegetation can take years to recover, environmental mitigation has become a permanent feature of daily operations and maintenance.

Much of this infrastructure is easy for passengers to miss. The line utilizes low-temperature sewage treatment equipment designed for plateau conditions, alongside closed wastewater discharge systems on trains. Remote station sites rely on electric and solar heating rather than fossil fuels, while sealed waste containers line the route for centralized collection.

While these systems may sound ordinary, operating them on the plateau is not. Sewage treatment has to work in cold, low-oxygen conditions. Waste has to be kept from scattering across open grassland. Heating choices matter in remote station areas where the environment is highly sensitive.

For Zhang Delong, a permafrost maintenance specialist at the Golmud railway maintenance depot, ecological protection is part of standard maintenance planning.

In sensitive sections, he said, teams consider not only tracks, bridges and roadbeds, but also the land beside the line. Work schedules, materials and access routes must be arranged carefully, especially in areas close to national parks, grasslands and wildlife habitats.

During wildlife migration seasons, some maintenance work is delayed until animals have moved through. If fences are damaged, they are repaired quickly so that livestock and wild animals are kept away from the tracks and guided toward safer crossings.

All maintenance waste is collected and taken back to depots for disposal. Sand-control work, Zhang said, is also more than a railway safety measure. By reducing windblown sand, it helps protect nearby grassland as well as the line itself.

Tibetan antelopes feed as an elevated freight train runs by in Haixi prefecture, Qinghai province, on June 3. WANG JIAN / FOR CHINA DAILY

Further south in Amdo county of Nagchu city, Xizang, Jangchub Dorje, deputy director of the local forestry and grassland bureau, said protection also means reducing the human cost of living close to wildlife.

In areas where herders and wild animals share the same landscape, authorities have improved compensation insurance for damage caused by wild animals and built bear-proof fences to reduce conflict, he said.

For Tsering Samdrup, a railway protection worker in Amdo, environmental work is inseparable from patrol work. His section lies near wildlife corridors linked with the Hoh Xil and Changtang national nature reserves, where animal movement is frequent.

The area was once close to uninhabited, with only a few nomadic households across dozens of kilometers. Today, protection workers help keep railway operations, livestock movement and wildlife activity from interfering with one another.

Tsering Samdrup is not an environmental scientist. But when he checks fences, watches animal movements or helps keep livestock away from the line, he is taking part in the railway's coexistence with the plateau.

The result is not a claim that a railway can cross such terrain without impact. Rather, the Qinghai-Xizang Railway shows a practical approach to reducing disturbance, keeping migration routes open, repairing damage quickly and constantly adjusting.

A train can cross the plateau in a matter of hours. Making room for the land, water and wildlife around it is a permanent commitment.

Sonam Wangdrak first saw a train not on a track, but in a school textbook.

He was raised in Lhorong, a remote county within Chamdo city, Xizang autonomous region — a mountainous territory where childhood was measured by livestock herding and highland barley fields rather than transit timetables. When he asked his teacher to describe a train, the answer stayed with him: "A train is many times faster than the horse you ride."

In 2003, following his father's advice to acquire a technical skill, Sonam Wangdrak was admitted to a vocational railway school in Lanzhou, Gansu province. The journey from his isolated home took six days, requiring a transit on horseback, followed by long-distance regional buses. He finally boarded his first conventional passenger train in Golmud, an industrial outpost in Qinghai province.

"It felt so cool, fast and steady," he recalled.

The infrastructure that once existed only as a textbook illustration became his profession. After joining the regional railway system in 2007, he qualified to pilot locomotives onto the high-altitude plateau. By 2021, he was selected as one of the primary drivers operating the advanced Fuxing bullet trains on the Lhasa-Nyingchi and Lhasa-Shigatse lines.

Two decades after the first tracks linked Lhasa to the rest of China's national rail network, Sonam Wangdrak's career reflects the social and economic transformation. The expansion of the Qinghai-Xizang Railway has structurally redefined transport, logistics and urbanization across the plateau.

Terminus to network

The engineering spine of the network is the Qinghai-Xizang Railway, which stretches 1,956 kilometers southwest from Xining, the capital of Qinghai province, to the Xizang capital of Lhasa. While the lower-altitude Xining-to-Golmud leg opened in 1984, the complex high-altitude segment connecting Golmud across the mountains to Lhasa opened on July 1, 2006, ending Xizang's historical isolation from national rail infrastructure.

According to data from China State Railway Group, to mark July 1, 2026, the 20th anniversary of Qinghai-Xizang Railway's full operation, the corridor has managed over 104 million passenger trips and transported 824 million metric tons of freight since its inception.

During its initial construction phase, engineering debates focused on whether rail lines could permanently withstand extreme thin air, expansive permafrost zones, high winds and fragile alpine ecosystems. Twenty years later, the focus has shifted from basic structural survival to network integration.

For its first eight years, Lhasa operated purely as the final terminus of the line. That isolation ended in 2014 with the opening of the westward Lhasa-Shigatse Railway toward China's southwestern border. The network expanded again in 2021 with the debut of the eastward Lhasa-Nyingchi Railway, creating Xizang's first fully electrified, high-speed rail corridor.

This infrastructure forms a comprehensive Y-shaped regional network, linking central Lhasa with the critical prefecture-level hubs of Shigatse to the west, and Lhokha and Nyingchi to the east.

At Lhasa Railway Station, daily operations reflect this expansion. Scheduled passenger train pairs on the Qinghai-Xizang Railway have increased from five per day in 2006 to 13 pairs in 2026. Daily departures have grown from a maximum of 3,000 passengers in 2006 to more than 10,000 on regular days, said Li Jia, head of the station.

"The station has not become smaller," Li said. "What has become shorter is the time passengers spend entering and leaving it. And outside the station, the city has grown."

The Liuwu New Area, the district surrounding the station on the south bank of the Lhasa River, has transitioned from barren hills and agricultural plots into a high-density modern commercial sector.

Integrated logistics

The network's impact on logistics is visible in both passenger travel and bulk freight data.

For Sun Yanqing, a 44-year-old Tibetan tourist from the rugged Yushu prefecture in Qinghai, Lhasa has long carried personal meaning. He recalled his first trip to Lhasa around 2000, which required an arduous 24-hour overland journey by road from Golmud. This year, he completed the trip via a direct train from Xining with his family.

"When I was young, we always heard how good Lhasa was and wanted to come," Sun said. "After coming once, I wanted to come again. Every time I come, it is different."

Further north along the line in Amdo county — a high-altitude zone in Nagchu city near the Qinghai-Xizang border — 74-year-old resident Kelsang Tsering said that the railroad has completely altered local trade. For regional merchants, a supply trip to Lhasa to buy or sell wholesale goods once consumed up to a week by road; via the rail line, traders routinely complete orders and return within 48 hours.

After the railway opened, he also saw more visitors come to Tsona Lake and the Tangula Mountains.

Annual inbound and outbound freight volume to and from Xizang rose from 360,000 tons in 2006 to 8.31 million tons by the end of last year, according to Lu Jianbin, an official with the Xizang Development and Reform Commission.

"Compared with road transport, railway freight has cut costs by about 60 percent and improved efficiency by nearly three times," Lu said. "That has helped move daily necessities, vegetables, fruit and consumer goods onto the plateau, while carrying local agricultural, pastoral and specialty products to wider markets."

Engineering and ecology

The logistical efficiency realized by traders and passengers depends on a railway corridor built through some of the world's most hostile terrain. Approximately 960 km of the line run above 4,000 meters, where oxygen levels are roughly 60 percent of those on the plains. About 550 km run across permafrost zones.

For Zhang Delong, a permafrost maintenance specialist at the Golmud railway maintenance depot, the problem is that the ground itself is never entirely still.

"Routine railway maintenance is often built on accumulated experience, but permafrost maintenance is different. Experience alone is not enough, because conditions are changing," Zhang said.

Much of the work, he said, is about keeping permafrost relatively stable. Water must be drained away from the roadbed, while crushed-rock slopes, sun shields and cooling devices help stabilize the foundation.

Zhang compared some of the insulation work to "putting a quilt over the roadbed to keep the heat out".

For Tsering Samdrup, a railway protection worker in Xizang's Amdo county, the difficulty is felt above ground. His patrol section near the northern foot of the Tangula Mountains sits at about 4,700 to 4,800 meters above sea level, where winter temperatures can fall below -20 C.

When a train passes, protection workers raise their right arms in salute and the driver sounds the horn. Tsering Samdrup calls it "a signal of closeness" between the guards and the train.

"Every time I see a train pass safely through our section, I feel I have done something meaningful," he said.

Crossing a fragile plateau

The railway's story on the plateau is also one of caution.

Liu Lanhua, a researcher at the energy conservation, environmental protection and occupational safety and health research institute of the China Academy of Railway Sciences, said environmental protection was built into the project from the beginning.

"The Qinghai-Xizang Plateau has a unique ecosystem with weak resistance to disturbance and limited self-recovery capacity," Liu said.

The project moved away from the old approach of "building first and treating environmental problems later", he said, and instead emphasized prevention, protection, whole-process control and site-specific measures.

According to China State Railway Group, nearly 60 km of dedicated wildlife passages were arranged along the railway, and their use rate has remained stable at 100 percent.

The Tibetan antelope population has grown from fewer than 20,000 in the early 2000s to more than 70,000. Greening work along the railway has covered more than 1,000 km, the group said.

Jangchub Dorje, deputy director of the forestry and grassland bureau of Amdo, said daily protection work includes clearing wildlife passages, checking sensitive areas, picking up waste and helping damaged grassland recover.

For Tsering Samdrup, the work can be as simple as standing quietly in the right place. In the early years, he said, some animals did not immediately use the passages built for them.

"We do not shout, and we do not chase them," he said. "If they move in the wrong direction, we stand in a line, quietly, like a barrier. Then we guide them toward the bridge opening and let them pass."

The gesture is small, but it captures a larger point: on the plateau, a railway cannot simply cross the land. It has to learn how to live with it.

Completing the loop

Sonam Wangdrak still remembers June 25, 2021, when the Lhasa-Nyingchi Railway opened and Fuxing high-speed trains began running on the plateau. Along the route, he saw people in Lhokha city welcoming the train with traditional dances. When the train reached Nyingchi city, residents greeted it with *hada* scarves and song.

Today, he often returns to his home county to talk to children about railway work. His hometown, Lhorong in Chamdo city, is also watching railway construction move closer as the Sichuan-Xizang Railway gradually takes shape. Sonam Wangdrak hopes that one day he can drive a train there.

The Qinghai-Xizang Railway has made Xizang closer. But on the plateau, closeness has never been only a transport question. It means opportunity, but also responsibility; wider markets, but also ecological constraints; faster movement, but also more careful protection.

Daqiong and Palden Nyima contributed to this story.

Transit corridor becomes unmissable tourism route

By LUO WANGSHU

For Min, a 64-year-old traveler from Guizhou province who gave only her surname, the Qinghai-Xizang Railway was far more than a transit route to Lhasa — it became the focal point of her journey.

She and her husband first planned to travel to the Xizang autonomous region by train and return by air. But after checking the schedule, she realized that part of the landscape between Golmud and Xining would pass in darkness on the inbound journey. So they changed their plan and decided to return by train as well.

"We wanted to see the part we missed," she said. "Lhasa was the destination, but the most beautiful part was the journey there and back."

For many travelers, the railway has changed how Xizang is experienced. Flying takes visitors quickly to the destination. The train lets the plateau unfold gradually — snow mountains, grasslands, lakes and distant settlements appearing outside the window as the line climbs toward Lhasa.

That experience is now being developed into more specialized tourism products.

On June 25, a plateau tourist train made its debut at Xining Railway Station. The train is designed as a long-distance travel product combining rail transport, sightseeing and onboard accommodation.

The 11-car train has a capacity of 132 passengers, with nine sleeper cars, one sightseeing car and one multifunctional car. Each berth is equipped with oxygen supply, while the sightseeing car has large viewing windows for passengers to take in plateau scenery along the route.

For older tourists such as Min, such details matter. She said the soft sleeper was comfortable and more affordable than she had expected. When some passengers experienced altitude discomfort, oxygen facilities on the train offered reassurance.

Her children had worried before the trip, but she kept in touch through video calls. "They asked if I had altitude sickness," she said. "I told them I was fine."

For Sun Yanqing, a 44-year-old Tibetan tourist from Yushu, Qinghai province, the railway has changed the way different generations in his family travel to Lhasa.

He first came around 2000, before the railway opened, traveling by road from Golmud for a day and a night. After the railway opened, he brought his parents to Lhasa by train. This year, he returned from Xining with his two children.

The trips, spread over more than two decades, gave him a personal measure of how travel to Lhasa has changed — from a tiring road journey to a train ride with oxygen supply, onboard attendants and medical support.

The change has also reshaped cities along the route — and raised a question that many tourism destinations face: how to welcome more visitors without overwhelming local communities.

Zhou Shuqin sees that question from two perspectives: as an official with Golmud's culture and tourism bureau, and as a resident who has lived in the city for more than 30 years.

She said the railway has helped Golmud become more visible as both a transport hub and a tourism stop. "The opening of the Qinghai-Xizang Railway gave Golmud a solid platform to reach the outside world," Zhou said. "Today, when people mention Golmud, many know it as an important hub."

Zhou said Golmud has tried to turn railway passenger flows into longer stays and wider local spending, linking transport with cultural tourism, local food and specialties.

For tourists, the railway may begin as transport. For cities such as Golmud, it has become a test of how to turn movement through a place into a reason to stop.

Passengers take pictures of Tsona Lake in the Xizang autonomous region, as their train, the Y972 train from Lhasa to Xining, passes by on April 8. YUAN RUILUN / FOR CHINA DAILY

Xi'an-Shiyan high-speed rail to fuel regional growth

By **LIU KUN** in Wuhan
and **WANG SONGSONG**

A puppet performance is held to entertain passengers aboard a train departing from Xi'an in Shaanxi province for Wuhan in Hubei province as the Xi'an-Shiyan high-speed railway officially opened on Tuesday. ZHAI XIAOXUE / FOR CHINA DAILY

The Xi'an-Shiyan high-speed railway, a key artery in China's expanding high-speed rail network, began operations on Tuesday, marking a major step in integrating the economies and cultures of the country's northwestern and central regions.

Construction on the 257-kilometer line began in December 2021. Designed for speeds of up to 350 kilometers per hour, the railway has reduced travel time across the Qinling Mountains, a boundary between northern and southern China, from over five hours to less than two.

The line includes 42 tunnels and 62 bridges, with a combined length of about 244 km, accounting for more than 90 percent of the total route. As a result of complex geological conditions and stringent safety requirements, it is regarded as one of the most challenging railway projects in the region.

The railway's operation is expected to significantly boost regional development.

The line connects with the existing Hankou-Shiyan high-speed railway, reducing travel time between Xi'an, Shaanxi province, and Wuhan, capital of Hubei province, to 2 hours and 41 minutes from the previous 4.5-hour journey via a detour route.

Ji Dexu, an official with the Xiangyang power supply section of China Railway Wuhan Group who took part in the railway project, highlighted its role as a game changer for regional development.

"It accelerates the flow of talent, information and capital. Xi'an's strengths in science, education and innovation can now better complement Shiyan's renowned tourism and automotive industries within a more closely connected economic circle," Ji said.

For residents, the railway brings a new level of convenience. Travelers can have breakfast in Xi'an, visit scenic attractions in Shiyan, Hubei, and return for lunch, all within the span of a morning. It also expands access to jobs, healthcare and educational resources along the corridor, Ji added.

The railway also creates a cultural tourism corridor linking Xi'an, home to the Terracotta Warriors, with Shiyan, home to the Wudang Mountain, a renowned Taoist sanctuary.

Xi'an-Shiyan-Hankou high-speed railway

Source: China State Railway Group CHINA DAILY

What truly sets the line apart is its full 5G coverage, even inside tunnels.

Chen Keyu, an assistant engineer involved in railway signaling technology, said signal base stations have been installed inside tunnels, along with specially designed cables installed on the tunnel walls to radiate signals along the track.

During nightly maintenance periods, technicians enter the tunnels to inspect the equipment and check its operating status.

"The goal is to ensure uninterrupted train communications throughout the tunnels," Chen said.

The improved connectivity has not gone unnoticed by passengers.

"Compared with my previous trips, the improvement in mobile signal quality is remarkably noticeable," said Liu Hang, who traveled on the line on Tuesday.

The Xi'an-Shiyan railway is part of China's broader high-speed rail expansion efforts.

On Saturday, testing began on the Xi'an-Ankang high-speed railway, which is scheduled to open by the end of the year.

With both routes in place, Xi'an has completed its radial high-speed rail network, becoming the third Chinese city to do so, after Zhengzhou in Henan province and Hefei in Anhui province.

It is unlikely to be the last. Over the next few years, a number of other major cities, including Nanjing in Jiangsu province, Jinan in Shandong province, as well as Chongqing and Wuhan, are expected to establish similar hub-and-spoke high-speed rail networks.

Space-ground asteroid monitoring network mulled

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

Chinese scientists and engineers are conducting feasibility studies on developing a space-ground integrated monitoring and early-warning network to address risks posed by near-Earth asteroids, according to a project leader.

"By now, more than 40,000 near-Earth asteroids have been discovered and cataloged worldwide. No asteroid has so far been identified that will definitely collide with Earth in the foreseeable future, but concerns over impact risks are not unfounded. A large number of near-Earth asteroids remain undetected," said Li Mingtao, chief scientist at the asteroid monitoring and early-warning research center under the China National Space Administration.

"Major space powers are continuously improving their asteroid monitoring and early-warning capabilities. We must never let our guard down, but there is also no need for excessive anxiety," Li said.

He noted that near-Earth asteroid impacts are a common challenge for all people across the world. As a responsible major space power, China is carrying out feasibility studies on a space-ground integrated monitoring and early-warning network as a core component of its planetary defense system.

For ground operations, according to scientists, the country will select suitable sites to build multiple large-aperture optical telescopes, forming a geographically balanced ground-based monitoring system that can detect distant objects across a wide expanse of the night sky with high precision.

Li explained that several factors would be considered in choosing optimal sites.

"First, since optical telescopes only operate at night, candidate locations must have a high rate of clear skies. Second, asteroid observations require stable atmospheric conditions — a measurement known as astronomical seeing. Areas with excellent astronomical seeing, typically high-altitude regions, are preferred because a thinner atmosphere causes less interference with observations," he said.

In short, the ideal sites have a high clear-sky rate, good astronomical seeing, and high elevation. That is why the telescopes in the monitoring network will most likely be located in remote, sparsely populated areas, he said.

In outer space, he added, scientists plan to deploy a space-based monitoring constellation. Free from atmospheric interference and the constraints of the day-night cycle, these orbiting instruments will focus on filling the blind spot of threats approaching from the sun's direction, enabling round-the-clock observations through coordinated ground and space operations.

Li noted that telescopes in the space-based constellation will be positioned slightly farther from Earth, so they can monitor a wider perimeter around Earth and provide longer early-warning lead time.

Once completed, the constellation will complement ground-based telescopes: ground-based instruments mainly monitor the night sky, while space-based telescopes cover the blind zone toward the sun. Together, they will deliver seamless, all-sky monitoring with no blind spots.

According to Li, once the monitoring network enters operation, its priority will not be known individual celestial bodies, but the yet-undiscovered near-Earth asteroids.

"For near-Earth asteroids larger than 1 kilometer in diameter, which could trigger global catastrophes, it is estimated that more than 95 percent have been discovered worldwide. So far, none of them are on course to hit Earth in the next 100 years," he said. "But for asteroids around 140 meters across — capable of destroying a small or medium-sized country — only about 45 percent are estimated to have been found, meaning more than half remain undetected. The discovery rate is even lower for asteroids tens of meters in size."

These undiscovered near-Earth asteroids pose the greatest risk. That is why major space powers are accelerating efforts to build monitoring and early-warning capabilities and catalog these asteroids as soon as possible, Li added.

China has made breakthroughs in models and algorithms for asteroid impact risk analysis, and is developing an early-warning system. The idea is that once a telescope detects a suspicious object, the system will automatically calculate its orbit and assess the impact probability.

Dialogue: Robust trade shows resilience of economic ties

From page 1

Huang Yiping, dean of Peking University's National School of Development, said those differences reflect broader questions about whether traditional industrial powers can adapt as China's competitiveness expands into sectors long regarded as their technological strongholds.

"Those structural differences are unlikely to disappear, but dialogue can keep competition manageable and preserve space for cooperation where interests continue to overlap," he said.

Business leaders noted that China and the EU remain important trading partners, as robust trade flows continue to demonstrate the resilience of bilateral economic ties.

According to data from the General Administration of Customs, the value of China-EU trade increased 10.3 percent year-on-year to 2.53 trillion yuan ($373 billion) in the first five months of this year, while China's imports from the EU grew 5.2 percent.

Speaking at a monthly news briefing in Beijing on Tuesday, Wang Yifei, a spokeswoman for the China Council for the Promotion of International Trade, said Chinese businesses hope that China and the EU will resolve trade issues through dialogue, while ensuring a fair, transparent and nondiscriminatory business environment.

For businesses in the EU, maintaining communications has become more important than ever because both economies remain deeply intertwined, especially in the manufacturing, investment and technology sectors.

Speaking to China Daily during a recent interview, Michael Schumann, chairman of the German Federal Association for Economic Development and Foreign Trade, said: "Europe cannot be (economically) independent from the United States, and it cannot be independent from China. Our economies, technologies, supply chains and security structures are far too deeply interconnected."

Businesses can translate political consensus into practical cooperation through investment, trade and industrial partnerships, he added.

Christophe Lauras, president of the French Chamber of Commerce and Industry in China, said that France and China have a highly complementary relationship in sectors such as aerospace, advanced engineering, luxury goods, agriculture, energy transition and healthcare.

"Many French companies plan to establish research and development centers in China, while Chinese companies are expanding globally by strengthening their presence in France. The next stage requires deeper integration to achieve mutually beneficial cooperation," Lauras said.

The commitment is also reflected in fresh investment. German chemical manufacturer Covestro announced on Tuesday that it will build a new production line for methylene diphenyl diisocyanate at its integrated site in Shanghai, with an annual capacity of 660,000 metric tons. Operations are expected to begin around 2030. MDI is a synthetic chemical used primarily to manufacture polyurethane foams and coatings.

Holly Lei, president of Covestro China, said the move underscores the company's long-term commitment to China and leverages the country's integrated industrial ecosystem, innovation capabilities and talent base to strengthen MDI supply for customers in China and the Asia-Pacific region.

Report warns against abuse of UNCLOS

China outlines limitations, challenges to the UN sea convention's authority

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China published an assessment report on the United Nations Convention on the Law of the Sea on Tuesday, highlighting its significance for multilateral diplomacy while cautioning against politicization and the abuse of the convention's dispute resolution mechanisms.

The Assessment Report on the United Nations Convention on the Law of the Sea: Achievements, Positioning and Challenges, released by the China Institute for Marine Affairs, examines the convention's role in shaping the postwar international legal order for the seas and oceans while identifying its inherent limitations and emerging challenges to its authority.

Zhang Haiwen, a professor at the institute, said UNCLOS was the product of nine years of negotiations between 1973 and 1982 involving more than 160 countries.

Unlike the 1958 Geneva Conventions, the Third United Nations Conference on the Law of the Sea adopted a "package deal" approach, requiring compromises among coastal states, flag states and landlocked countries.

"UNCLOS is of great significance for multilateral diplomacy," Zhang said. "Many of its provisions are a product of compromise and the balancing of interests."

The report cites the UNCLOS provision on maritime features as a prime example. It stipulates that rocks incapable of sustaining human habitation or economic life of their own are not entitled to an exclusive economic zone or continental shelf.

According to the report, scholars from Greece, Switzerland and Germany have pointed out that the provision lacks a clear definition and reflects the difficult consensus reached during negotiations. Preserving this internal balance is essential to maintaining the convention's broad acceptance, it said.

Although UNCLOS is often described as the "constitution for the oceans", Luo Gang, also a professor at the institute, said while the convention remains an important treaty, it does not surpass constitutional supremacy.

Unlike domestic legal systems, where constitutions typically occupy the highest position, international law has no universal hierarchy among its sources, with treaties, customary international law and general principles of law standing on equal footing, Luo said.

"Labeling it a 'constitution for the oceans' could create a 'false sense of security' and even become a 'straitjacket for the regime', constraining the law of the sea's ability to evolve over time," he said, citing scholars from multiple countries who argue that the metaphor ultimately hinders the development of the law of the sea.

Zhang noted that at the time UNCLOS was drafted, in the 1970s and 1980s, the emerging challenges related to artificial intelligence, climate change, sea level rise, marine debris and ocean acidification could not have been anticipated.

Beyond these inherent limitations, Zhang said the gravest threat comes from the deliberate misinterpretation of UNCLOS provisions and the abuse of its dispute resolution procedures, including attempts to create new rules through a teleological interpretation under the guise of interpreting and applying the convention, as well as overextending jurisdiction through the misuse of dispute settlement mechanisms.

"The convention's own limitations can be remedied through subsequent practice, but deliberate abuse and a 'pick-and-choose' approach are what truly threaten the convention's foundation," Zhang said.

Zhang Dan, another professor at the institute, said deep-sea mining has emerged as a major test of the convention's authority.

"Under international law, the seabed beyond national jurisdiction and its resources are the common heritage of mankind, with all rights vested in mankind as a whole and exercised on its behalf by the International Seabed Authority. All exploration and exploitation activities must be conducted within the framework established by the authority," Zhang Dan said.

However, the United States has sought to advance mining activities through unilateral authorization outside the International Seabed Authority's multilateral framework, Zhang Dan said. Such actions would erode the principle of the common heritage of humanity, weaken the authority's standing and multilateral procedures, and undermine both the convention and the comprehensive legal regime it established, he added.

Luo said the 2016 South China Sea arbitration, brought by the Philippines against China under the UNCLOS, inflicted "structural damage that is difficult to self-heal" on the convention's legal order.

China rejected the arbitration from the outset, arguing that the tribunal lacked jurisdiction because the case concerned territorial sovereignty and maritime delimitation.

"The Philippines repackaged its claims to sovereignty over land territory as maritime rights and unilaterally initiated arbitration using legal tricks, a move that ran counter to the object and purpose of the convention," Luo said.

According to the report, the Arbitral Tribunal disrupted the convention's carefully negotiated balance by attempting to replace the role of its drafters under the guise of interpretation and application. Rather than applying existing rules, it created new ones, undermining the multilateral foundation on which the convention rests.

"This has accelerated the politicization, instrumentalization and weaponization of the convention and its dispute settlement mechanisms," Luo added.

ASEAN urged to gear up for a digital pact

Deal will create new opportunities, but challenges also loom: Analysts

By **PRIME SARMIENTO** in Hong Kong and **LEONARDUS JEGHO** in Jakarta

As the Association of Southeast Asian Nations prepares to ink a landmark digital pact in November, analysts say the real measure of success will be found not in its potential economic gains but in whether member states can respond to the risks posed by emerging technologies like artificial intelligence.

Once signed, the Digital Economy Framework Agreement would become the world's first region-wide agreement on digital economy governance and have the potential to unlock a $2 trillion online economy. The agreement, Southeast Asia's most ambitious digital pact yet, will cover areas such as digital trade, cross-border e-commerce, data governance and privacy, AI and digital talent mobility.

Josua Pardede, chief economist of Permata Bank in Jakarta, has estimated that DEFA would raise digital penetration in the region from 14-15 percent to 26-28 percent.

Catherine Setiawan, an Indonesia-based coordinator and researcher for The Global Index on Responsible AI, said that DEFA can promote regional economic integration and regulatory certainty, which can attract investors to the region's digital economy.

But Setiawan noted that in implementing DEFA, Southeast Asian governments need to ensure that digital governance is "inclusive, rights-based, and responsive to emerging risks". She said this can be done through measures like developing robust data protection and cybersecurity regimes, establishing clear accountability mechanisms for digital platforms and strengthening consumer protection.

A thriving digital economy will not only boost business and investments in the region, but it can also help advance inclusive growth.

Luhut Tampubolon, a senior sales director at HCLTech, an India-based information technology services company, noted that an AI-driven governance system can help authorities monitor how national policies and programs are implemented in the most remote areas of any country.

Nearly three years after talks began in September 2023, ASEAN wrapped up negotiations on DEFA at the 57th Senior Economic Officials Meeting held in May. The pact is expected to be signed by Southeast Asian leaders at an ASEAN summit scheduled in Manila in November.

ASEAN's digital economy surpassed $300 billion in 2025 in gross merchandise value, according to a report published jointly by Google, Temasek and Bain & Company.

ASEAN's senior economic officials, in a joint statement released after their meeting in May, noted that ASEAN's digital economy is projected to reach approximately $1 trillion by 2030 under current growth trends. With the implementation of DEFA, the region's digital economy could potentially double in value to $2 trillion by that year.

AI's rapid expansion

An expanding digital economy, however, is also presenting challenges. The rise of AI, for example, has led to rapid expansion of data centers that can consume too many resources like water and energy.

Michael Gryseels, founder and managing partner at Antares Ventures, a Singapore-based venture capital fund, said he is very bullish on ASEAN's digital economy as the region has a large young population that has grown up with mobile phones and the internet. But he hopes the region's renewable energy sector can expand so that it can support the AI systems and data centers that require large amounts of electricity.

Deepraj Emmanuel Datt, a senior director at HCLTech, said that in implementing DEFA, ASEAN governments need to consider how to reduce the carbon footprint of data centers.

"Otherwise, the same AI that will benefit all of us will actually be disastrous to the environment," Datt told China Daily.

Setiawan of The Global Index on Responsible AI said ASEAN governments can include sustainability principles in the region's digital transformation agenda. She said the region can mobilize green investment, encourage sustainable AI development, and harmonize sustainability standards to address environmental implications.

Yao Ming (first from right), a basketball legend and chairman of Yao Foundation, speaks at a panel discussion titled "Opportunities in Emerging Consumer Markets" during the "Our Water Season III: Shanghai-New York City Dialogue" held at the Bloomberg headquarters in New York on Tuesday.
ZHAO HUANXIN / CHINA DAILY

Two metropolises seek common ground through city dialogue

By **MINGMEI LI** in New York
mingmeili@chinadailyusa.com

The Our Water Season III: Shanghai-New York City Dialogue launched in New York Bloomberg Tower on Tuesday.

Under the theme "Rivers of Opportunities", the forum brought together government representatives, business leaders, financial institutions, consumer brands and cultural figures to explore new opportunities for China-US cooperation, with a special focus on financial and consumer industry collaboration between the two cities.

Michael Bloomberg, founder of Bloomberg L.P. and Bloomberg Philanthropies, said Shanghai and New York share many defining characteristics as waterfront cities and global centers of commerce and culture.

Bloomberg, whose company has operated in Shanghai for more than three decades and who visited China in 2025, said exchanges between cities are more important than ever.

"Now the conversation has arrived, and another great waterfront city, and that's something New York shares in common with Shanghai," he said.

The former New York mayor said New York and Shanghai are both cultural, commercial and culinary capitals.

"Great cities just don't compete with each other. They learn from each other. That kind of exchange between cities has never been more important," he said.

Bloomberg noted that more than half of the world's population now lives in cities, placing urban governments at the forefront of addressing challenges ranging from public health and education to housing and climate change.

"We borrow ideas from other cities, and we're glad the other cities borrowed from us," he added.

Tang Zhiwen, minister at the Chinese Embassy in the United States, said exchanges between Shanghai and New York have become vivid examples of how China and the US can pursue mutual success through cooperation.

He said the two cities could take the lead in emerging fields including artificial intelligence, climate change, green shipping and smart cities, while promoting more high-level exchanges between the two countries.

Tang also noted that Shanghai has welcomed nearly 10,000 young Americans under China's initiative to invite 50,000 American youths to visit the country over five years.

Chen Yiqun, director-general of the Information Office of Shanghai Municipality, said waterways have long connected both cities to the world and continue to shape their future development.

"Water once carried both of our cities into the world. And now, water is asking something new of us: how do we keep our harbors and our waterfronts alive, open and growing for the next generation ... 'Our Water' exists to give cities like ours a place to compare notes, to learn from each other, and to keep growing together," she said.

She said the "Our Water" initiative provides a platform for cities to exchange ideas, learn from one another and jointly address shared urban challenges.

"When we talk today about finance, investment, consumption and innovation, we're not just talking about growth for growth's sake. We're talking about what it takes to keep a city open, adaptable and full of opportunity for the people who call it home," Chen added.

The forum also featured a fireside discussion, "Seeking Common Ground through Dialogues", between Da Wei, a professor of international relations at Tsinghua University, and Tom Orlik, chief economist at Bloomberg Economics, on China-US economic relations and opportunities for cooperation amid global uncertainty.

Orlik, who has lived in China for years, told China Daily that the experience has helped him better understand the country and appreciate the importance of people-to-people exchanges.

"Connections are really important for understanding," he said. "Both sides have more work to do to make it easier and more welcoming for those kinds of exchanges to take place."

Yao Ming, chairman of the Yao Foundation and a member of the NBA Hall of Fame, said sports have long connected people across cultures and borders: This year, the New York Knicks captured the 2026 NBA championship, while the Shanghai Sharks won the Chinese Basketball Association title. Yao also led the Sharks to their first CBA championship in 2002.

Reflecting on his years playing in the NBA, Yao said living in Shanghai while traveling extensively across the US broadened his perspective on exchanges.

"I try to learn from other people and make sure that becomes part of me," he said. "I learned so much from all the people I met and all the cities I visited."

Yao said Shanghai has become an increasingly important destination for international sporting events, including Formula One, reflecting the city's openness, youthful energy and deep cultural roots.

Fujimori takes over half of votes in Peru polls

LIMA — Peru's right-wing Popular Force candidate Keiko Fujimori secured more than half of the valid votes in the presidential election, official results showed on Monday.

According to figures released by Peru's National Office of Electoral Processes, or ONPE, on its real-time vote-counting platform, Fujimori received 50.135 percent of the valid votes, while her rival, Roberto Sanchez of Together for Peru, got 49.865 percent.

The results translated to 9,223,396 votes for Keiko Fujimori and 9,173,755 votes for Roberto Sanchez. Fujimori is the daughter of former president Alberto Fujimori, who governed from 1990 to 2000, while Sanchez served as a minister under then-president Pedro Castillo from 2021 to 2022.

The figures gave the right-wing candidate a lead of 49,641 votes, positioning her for what would be her first presidential victory after three previous bids.

Keiko Fujimori casts her vote in Lima on June 7.
MARIANA BAZO / XINHUA

According to official data from the ONPE, all 92,766 tally sheets from the June 7 election had been processed by Monday.

Roberto Burneo, president of the National Jury of Elections, said in recent days that the electoral authority was expected to officially proclaim the results on Friday.

The 51-year-old Fujimori vowed on Monday to restore "order and hope" after defeating Sanchez by the slimmest of margins in an election dominated by surging crime.

"Each time we draw closer to starting on the path of order and hope for all Peruvians," Fujimori wrote on X after being proclaimed the winner of the June 7 election runoff.

Fujimori will take office on July 28 for a five-year term.

"We have the responsibility of listening to both sides. The doors for dialogue are open," she said, alluding to rival Sanchez and others on the left.

Sanchez had yet to react to the announcement of the results.

XINHUA—AGENCIES

Heat wave exposes more than rising temperatures

Zhang Zhouxiang
Reporter's log

One of the lessons I learned after moving to Brussels one year ago was that Europeans and Chinese often mean very different things when they say summer.

Back in China, summer usually means air conditioners humming almost everywhere, like in apartments, offices, shopping malls and even university dormitories. Here in Europe, however, summer often means opening the windows and praying for a breeze.

Most years, that strategy works. But that wasn't the case lately, as Western Europe experienced a record-breaking heat wave.

France recorded one of the hottest days in its history, with the national average temperature reaching around 30 degrees Celsius and many cities exceeding 40 C. Southern England saw its hottest June day in decades, while Spain continued to endure temperatures above 40 C.

Fountains, usually places where tourists stop briefly to take photographs, suddenly became public cooling centers. Children splashed

in the water while adults sat along the edges, trying to catch every bit of mist drifting through the air. The cooling effect was limited, but it was free, and during a heat wave, that alone was enough to attract crowds.

Shopping malls and supermarkets also became unofficial shelters. Many supermarkets maintain lower temperatures to preserve meat, dairy products and frozen food. During the hottest afternoons, benches inside shopping centers were occupied not only by shoppers but also by people who simply wanted to escape the heat for a while.

Even the metro became a refuge. In several cities, I noticed people riding the subway outside rush hour with no apparent destination.

People accustomed to air conditioning may ask: Why don't Europeans just turn it on?

The answer is obvious to many in Europe: too few have air conditioning units.

Cost is the first obstacle.

Buying an air conditioner in Europe is far more expensive than many people in China would imagine. The unit itself is costly, but installation, labor and various service fees often nearly double the final bill. A household can easily spend more than 2,000 euros ($2,280) for a single installation, while a similar unit in China often costs only a fraction of that amount.

In a broader sense, industrial products in Europe are generally more expensive. Bicycles, household appliances and many everyday consumer goods all cost significantly more than comparable products in China. The reason is clear: much of Europe's manufacturing capacity has gradually shifted elsewhere over recent decades, while services and finance have become increasingly important parts of the economy. Consumers ultimately bear those higher costs.

But money is only part of the story, as many people living in Europe know that obtaining the legal certificates for installing an air conditioner is sometimes harder than buying one.

Many Europeans live in apartment buildings where the exterior walls belong to the entire building rather than individual residents, and hanging an outdoor compressor often requires approval from the building association. If the building is located in a historic district or protected area, additional permission from local authorities may also be necessary.

Noise regulations add another layer of complexity. Installation positions are carefully regulated so that outdoor units do not disturb neighbors.

To be fair, these rules are not entirely unreasonable. European cities contain countless buildings that are far older than modern electrical systems, while many historical neighborhoods are protected because they represent centuries of architectural heritage. Residents also tend to value quiet living environments. It is a social consensus that protecting old buildings and respecting neighbors are perfectly legitimate goals.

Yet living here also makes one wonder whether efficiency sometimes becomes the victim of procedure.

If my downstairs neighbor happened to come from an area that regularly experiences 50 C summers, would he enthusiastically support my air conditioner application? Or would he simply prefer the building to remain exactly as it has always been?

Another explanation often offered is environmental protection, stressing that Europe cherishes the environment more than itself.

Yes, Europe certainly takes environmental policies seriously. The attached bottle cap required under European Union rules has become one of the most visible examples. Instead of separating completely from the bottle, the cap remains connected after opening, reducing the likelihood that the small plastic caps become litter.

But living here also reveals some interesting contrasts. For example, paper still dominates everyday life in ways that surprise many newcomers from China.

My physical mailbox fills up every few days with supermarket advertisements, promotional catalogs and paper discount coupons.

Standing beside an overflowing mailbox after hearing constant discussions about sustainability inevitably raises an interesting question: How much paper does all this consume?

That contrast perhaps illustrates Europe better than any single environmental regulation.

This is a society that genuinely values order, consultation and long-term planning. Many regulations originate from reasonable intentions: protecting heritage, reducing waste, preserving neighborhoods and ensuring fairness. Yet those same strengths can sometimes become weaknesses when quick adaptation is required, which, as I see it, is a shortcoming of European society.

A prolonged heat wave demands flexibility rather than procedure. People need practical solutions today, not approvals several months later.

Europe's historical cities remain among the world's most beautiful places to live. Their architecture, public squares and urban character reflect centuries of careful preservation. China, meanwhile, has embraced rapid modernization on an extraordinary scale, making technologies such as air conditioning widely accessible within just a few decades.

Both paths involve trade-offs. But climate change is steadily making some trade-offs less negotiable.

Heat waves that were once considered exceptional are becoming increasingly common across Europe. Buildings designed for cooler weather now face temperatures their architects never imagined. Customs shaped by mild summers are being tested by a changing climate.

Perhaps Europe's relationship with air conditioning will eventually change as well.

Autos set to spur consumer spending

By **WANG KEJU**
wangkeju@chinadaily.com.cn

Export-bound vehicles await shipments in Taicang Port, Jiangsu province. JI HAIXIN / FOR CHINA DAILY

With the world's largest vehicle fleet, China's automotive sector is undergoing a fundamental transition, which analysts say could open up vast opportunities in the aftermarket, turning incremental demand into exponential consumption scenarios as reinforced by a robust new policy framework.

Their comments came as policymakers rolled out a new batch of measures designed to expand automobile consumption across the entire industry chain, with a particular emphasis on reforming vehicle circulation and bolstering the automotive aftermarket.

Data from the Ministry of Commerce showed that China's vehicle fleet has reached 370 million units, with passenger cars aged seven years or older now accounting for more than half, a threshold that signals a massive aftermarket opportunity.

"Consumers are shifting their focus from simply having a car to asking whether it is good to use and whether it meets diverse needs," said Zhu Keli, founding director of the China Institute of New Economy.

Automobiles are being redefined as personal mobility spaces, with their cultural attributes and service scenarios continuously expanding, Zhu noted, adding that this will create more value-added opportunities across the industrial chain.

According to a circular jointly issued by eight departments including the Ministry of Commerce, 40 cities nationwide have been designated as pilot zones for vehicle circulation reform. Each has been assigned distinct reform priorities tailored to local conditions.

Tianjin, for instance, is focusing on automobile modification, classic cars and racing events; Shenyang in Liaoning province on used car circulation; Yangzhou in Jiangsu province on RV camping; and Hangzhou in Zhejiang province and Shenzhen in Guangdong province on easing purchase restrictions.

The policy push to boost the auto aftermarket came as retail sales in the sector plunged 16.1 percent year-on-year in May, the sharpest decline among all major retail categories and a widening of 0.8 percentage points from April, according to the National Bureau of Statistics.

Data from the bureau also showed that the decline pulled total retail sales of consumer goods into negative territory for the first time since December 2022, with the headline figure falling 0.6 percent year-on-year to 4.1 trillion yuan ($604 billion).

To address the slowdown and tap into new growth sources, China launched this year's new energy vehicle rural promotion campaign, featuring a record 155 models — up more than 25 percent from last year — as policymakers target the vast countryside market where EV penetration remains far below urban levels.

NEV penetration in first- and second-tier cities has surpassed 60 percent and is approaching saturation, said Fu Yifu, a researcher at Jiangsu Su Merchants Bank. By contrast, penetration in rural areas remains below 20 percent.

"First- and second-tier cities have high NEV ownership and are nearing saturation, while county, township and rural markets have lower penetration rates, harboring enormous growth potential," Fu said.

He noted that the campaign can "fully activate the consumption potential of bulk commodities in rural areas, driving the entire upstream and downstream automotive industrial chain — production, circulation and services."

Replacing old, high-emission fuel vehicles and substandard low-speed EVs with NEVs will also support the green transition, while providing modern mobility solutions for farmers' daily commuting, agricultural transport and family travel, he added.

Economy on track to meet growth target

Improvements seen in manufacturing and non-manufacturing activities

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

Buoyed by improving market demand amid robust global appetite for artificial intelligence-related products and stronger pro-growth policy support, China's factory activity returned to expansion in June after standing at the boom-bust threshold a month earlier, official data showed on Tuesday.

The latest readings, analysts said, pointed to stronger new growth drivers and resilient export performance as key pillars of economic stabilization, bolstering confidence that China's economy will stay on track to meet its full-year growth target.

Data from the National Bureau of Statistics show that China's official purchasing managers' index for the manufacturing sector came in at 50.3 in June, up 0.3 percentage points from the previous month.

Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International, said the rebound was mainly driven by a faster recovery in market demand, as the new orders sub-index rose 1.3 percentage points to 51.2, the highest level in three months, according to the NBS.

"Domestic demand in the manufacturing sector improved notably," said Wen Bin, chief economist at China Minsheng Bank.

Wen said the steady implementation of the "Six Networks" initiative, measures to promote large-scale equipment upgrades and consumer goods trade-ins, as well as a mild recovery in the consumer market, had provided strong support for demand.

The improvement was not limited to domestic demand. On the external front, the new export orders sub-index returned to expansion territory at 50.1, according to the NBS.

"The notable easing of tensions in the Middle East, coupled with sustained momentum in the AI sector, also supported the rebound in export activity," Wen added.

Echoing that view, Wang said China's exports are expected to sustain robust growth in June, lending solid support to the overall performance of the manufacturing sector.

New growth drivers also provided strong support. The PMI for high-tech manufacturing stood at 53.5 in June, compared with 52.9 in May, while the reading for equipment manufacturing reached 52.5, up from 52.1 in May, with both staying firmly in expansion territory, according to the NBS.

"Advanced manufacturing continued to make robust progress, further strengthening its role as a key driver of economic growth," said Huo Lihui, an NBS statistician.

Highlighting AI's potential to reshape growth momentum, Cai Fang, a member of the academic divisions of the Chinese Academy of Social Sciences, said, "AI is expected to help China ease deflationary pressure, improve the balance between supply and demand, and foster a new cycle of economic growth."

The overall improvement in the PMI also offered an encouraging signal for industrial activity heading into the end of the quarter, said Lynn Song, chief economist for China at Dutch bank ING.

The bank expects China's GDP growth to moderate to 4.6 percent year-on-year in the second quarter. But with first-quarter growth having come in stronger than expected, Song said the economy remains on track to deliver first-half growth broadly consistent with the country's full-year target.

The improvement was also seen in non-manufacturing activity. China's non-manufacturing PMI, which includes sub-indexes for service sector activity and construction, stood at 50.2, edging up 0.1 percentage point from May, NBS data showed.

Despite the simultaneous pickup in manufacturing and non-manufacturing activity, economists cautioned that the recovery still needed to become more balanced, as traditional industries and small, medium-sized and micro enterprises continued to face pressure, and domestic demand had yet to gain a firmer footing.

Tang Guanghua, an analyst at Shenyin & Wanguo Futures, said more targeted support measures should be rolled out to help small, medium-sized and micro enterprises reach wider markets and improve demand flows through traditional industrial chains.

Taicang bolsters cooperation with European biz

By **CANG WEI** in Nanjing
cangwei@chinadaily.com.cn

Taicang, a dynamic city in Suzhou, Jiangsu province of East China, is fortifying its economic ties with Austria, reflecting a broader trend of European business expansion in the region.

As both sides explore new avenues for cooperation in smart manufacturing, the digital economy and sustainable development, Taicang continues to emerge as a pivotal hub for Austrian enterprises seeking to integrate into China's industrial landscape.

Last week, from Monday to Friday, Austrian Foreign Minister Beate Meinl-Reisinger embarked on a formal visit to China, a journey that included a significant stop in the city of Taicang.

Despite its modest population of under 850,000, Taicang has become a focal point for European business, particularly for German and Austrian enterprises.

The minister's visit to Taicang was brief but impactful, beginning with a stop at Starlinger Plastics Machinery (Taicang) Co Ltd. Greeted with a bouquet of seasonal lotus flowers symbolizing harmony, the minister toured the company's showroom and production facilities.

Founded in 1835, Starlinger has been a pioneer in plastic weaving and recycling.

Since establishing its Taicang branch in 2005, the company has grown into a vital hub for its operations across the Asia-Pacific region.

The minister's next stop was Ebner Furnaces (Taicang) Co Ltd, where she explored the company's showroom and learned about its history.

Established in 1948, Ebner is a specialized leader in energy-efficient heat treatment furnaces that settled in Taicang in 2002.

During her visit, the minister also met with Fan Bo, Party chief of Suzhou. The discussions focused on deepening exchanges in smart manufacturing, the digital economy, and green development.

Fan expressed hopes for more Austrian enterprises and high-end projects to find a home in Suzhou.

As Austria and China celebrate 55 years of diplomatic relations, Taicang is extending its collaborative reach across Europe.

Known as the "home of German enterprises", Taicang hosts more than 560 German companies.

As Taicang continues to host events celebrating Sino-Austrian ties, it is poised to explore new growth areas in electric vehicles, digital transformation and sustainable technologies.

"Taicang is now home to 49 Austrian enterprises, with a total investment of $195 million," said Zhang Luoyin, deputy director of the Sino-German (Taicang) SME cooperation demonstration zone management office.

"These companies span various sectors, from high-end equipment and smart warehousing to green materials and precision instruments," Zhang said.

Taicang's commitment to creating a supportive environment for foreign businesses is evident in its comprehensive services, and the city is trying to foster a stable, efficient and talent-rich environment to attract and nurture European enterprises, said Zhang.

Briefly

Electricity trading volume up in Jan-May

China's total electricity trading volume surpassed 3 trillion kWh in the first five months of 2026, up 24.8 percent year-on-year, the National Energy Administration said. During the period, electricity trading volume within provincial borders rose 28.5 percent from a year earlier, while inter-provincial and inter-regional power transactions increased 12.2 percent, the data showed.

Yuan strengthens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, strengthened 66 pips to 6.8109 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day. The central parity rate of the yuan against the US dollar is based on a weighted average of prices offered by market makers before the opening of the interbank market each business day.

XINHUA - CHINA DAILY

COMAC's C909 reaches new heights

By **LI JING**
lijing2009@chinadaily.com.cn

A Chengdu Airlines C909 aircraft operating a high-altitude route. XINHUA

Commercial Aircraft Corp of China's domestically developed C909 regional jet has carried more than 37 million passengers over a decade of commercial service, the planemaker said, underscoring the country's efforts to build a home-grown civil aviation industry as it expands the aircraft's presence in China's regional markets and overseas.

Sunday marked the 10th anniversary of commercial operations of the C909, formerly known as the ARJ21. Since its entry into service in June 2016, COMAC has delivered 186 aircraft to more than 10 customers, accounting for about 70 percent of China's regional jet fleet, according to the company.

The fleet has operated more than 860 routes serving over 180 cities, with the aircraft now flying more than 500 flights a day on average, COMAC said.

Earlier this month, a Chengdu Airlines C909 aircraft completed the inaugural flight on a new route linking Urumqi, Hejing and Kashgar in the Xinjiang Uygur autonomous region, becoming the second high-altitude route operated by the regional jet after the Kashgar-Tashikurgan service launched earlier.

The flight landed at Bayanbulak Airport in Hejing county of the Mongolian autonomous prefecture of Bayingolin at an elevation of more than 2,500 meters.

The latest deployment marks another operational test for the C909 in an environment characterized by lower air pressure, strong air currents and rapidly changing weather conditions, factors that place greater demands on aircraft performance and flight operations.

"The opening of this route further verifies the adaptability and reliability of the C909 under complex operating conditions," said Huang Liying, chief accountant of Chengdu Airlines.

The route will operate three times a week and is expected to improve access to the Bayanbulak grasslands, one of Xinjiang's best-known tourism destinations. Flight time from Urumqi to Bayanbulak is about one hour, a huge reduction on the approximately seven hours it takes by road.

"For local residents and tourists alike, the route significantly improves accessibility," Huang said, adding that it would help integrate regional tourism resources with transportation infrastructure.

The service comes as COMAC pushes to expand the operational footprint of its domestically developed aircraft beyond major trunk routes and into remote regions where aircraft must contend with difficult terrain and weather conditions.

Analysts say Xinjiang has become an important proving ground for the C909 because many routes across the vast region have relatively low passenger volumes and long travel distances, making smaller regional aircraft more economical than larger narrowbody jets.

Independent aviation analyst Li Hanming said regional jets such as the C909 are particularly suited to sparsely populated areas where traffic demand may not justify larger aircraft year-round.

Research led by COMAC senior economist Guo Caisen found that the C909 generated a contribution margin of 6,000 yuan ($883) to 10,000 yuan higher per flight hour than a Boeing 737 on low-density routes, highlighting one of its economic advantages in western China's regional aviation market.

COMAC said the C909 has become the backbone of China's regional aviation market after a decade of commercial operations. In Xinjiang and Inner Mongolia autonomous regions and Heilongjiang province, about 70 C909 aircraft now operate more than 460 routes, having carried more than 10 million passengers across roughly 200,000 flights.

The manufacturer has also expanded the aircraft overseas. It said the C909 now operates 25 international routes serving 28 cities in Southeast Asia, including Indonesia, Laos and Vietnam, and has carried more than 1 million passengers outside China.

The overseas operations have helped validate the aircraft's performance on short runways and in Southeast Asia's hot and humid climate while broadening COMAC's customer support network as it seeks additional export opportunities, the company said.

Chengdu Airlines, the launch operator, received the first C909 in June 2016 and has since expanded operations from domestic regional services to international and high-altitude routes.

FMCG market charts new growth path

Report highlights broad demand reallocation, stiff competition and affordability focus

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

Shoppers select fresh fruit at a supermarket in Wuzhou, Guangxi Zhuang autonomous region, on June 23. HE HUAWEN / FOR CHINA DAILY

The fast-moving consumer goods market in the country is entering a structurally slower but more complex growth phase, as value-seeking behavior, demographic aging and rapid channel disruption reshape how households spend, according to an industry report.

The findings in the 2026 China Shopper Report — tracking the evolution of urban FMCG consumption jointly by Bain & Company and Worldpanel by Numerator — portray a market that is no longer driven primarily by income expansion or population growth, but instead by reallocation of demand across cities, age groups and retail formats.

Total urban FMCG spending in China rose just 0.9 percent year-on-year in 2025, according to the report, as a 3.6 percent increase in volumes was largely offset by a 2.6 percent decline in average selling prices.

The pattern underscores a persistent "trading down" dynamic, in which consumers are buying more units but paying less per unit, reflecting both intensified competition and a heightened focus on affordability.

Early 2026 data suggest that volatility has persisted well into the new year. In the first quarter, volumes continued to expand 1.3 percent year-on-year. A rebound in April pushed FMCG sales back into positive territory. For the full year, the report expects conditions to broadly resemble 2025, with low single-digit growth and continued structural divergence across categories, channels and consumer segments.

The country's demographic transition sits at the center of the outlook. The report estimates that the population aged 60 and above has reached roughly 320 million, while single-person households now account for nearly a quarter of all households. Together, these shifts are altering consumption baskets and shopping priorities, with older consumers and smaller households increasingly shaping overall demand patterns.

Against this backdrop, "value for money" has become the dominant consumer lens. Rather than simply opting for the lowest price, households are increasingly evaluating trade-offs between price, quality, pack size and channel convenience.

"Changes in the country's FMCG market reflect a broader reconstruction of the entire consumer landscape," said Derek Deng, a senior partner at Bain. He said demographic shifts, value prioritization and channel transformation are "collectively rewriting consumer shopping habits and decision journeys", adding that companies must respond more quickly to evolving demand signals to capture new growth opportunities.

Shoppers queue up to pay at a duty-free store inside CDF Haikou International Duty-Free City in Haikou, Hainan province, on June 6. SU BIKUN / FOR CHINA DAILY

Tier 4-5 cities drive growth

The report highlights a widening divergence between the country's large metropolitan centers and lower-tier cities. In 2025, Tier 4 and Tier 5 cities emerged as the primary engines of incremental growth. These markets are benefiting from ongoing urbanization, improved logistics infrastructure and rapid expansion of both modern retail and digital commerce channels, which together have significantly broadened product availability.

Within these lower-tier cities, older households recorded faster FMCG spending growth than younger households in Tier 1 and Tier 2 cities. Households with children in Tier 5 cities also stood out, maintaining relatively high consumption intensity despite broader value-consciousness, particularly in categories tied to childcare and daily necessities.

Online sales dominate

Digital channels continue to reshape the retail landscape. E-commerce accounted for 38 percent of urban FMCG sales value in 2025, reinforcing its position as the single largest channel in the market.

However, offline retail is not disappearing; several emerging offline models expanded rapidly. Online-to-offline reached a turning point in 2025. In the third quarter alone, O2O FMCG sales grew nearly 8 percent year-on-year, supported by faster delivery networks, platform-led promotional coordination and expansion beyond fresh food into broader grocery and household categories.

Warehouse membership clubs gained traction by emphasizing bulk value and curated assortments. For example, Sam's Club and Costco membership stores continued to gain traction in China, with Sam's Club reaching 63 stores by the end of 2025.

Snack-focused discount chains expanded rapidly, particularly in lower-tier cities where price sensitivity remains high but modern retail penetration is still increasing. Leading players have scaled rapidly, with Busy Ming Group and Wanchen Group reaching about 22,000 and 18,000 stores, respectively, in China by the end of 2025.

Discount stores also gained importance as consumers increasingly consolidated routine purchases into value-oriented formats. HotMaxx has led the format's expansion and is the largest player by scale, with around 900 stores by the end of 2025, followed by HitGoo, Hema NB, and Aldi.

Local brands do well

Domestic brands continued to strengthen their position across multiple categories, often outperforming multinational competitors in segments where local insights, faster product cycles and sharper pricing strategies proved decisive, according to the report.

Private label products are also emerging as a structural force in retail strategy. Sales rose more than 57 percent year-on-year in 2025 to reach 32.7 billion yuan ($4.82 billion), accounting for about 2 percent of total urban FMCG sales. While still relatively small, the growth rate signals accelerating retailer investment in in-house brands as a tool for differentiation and margin management.

"Emerging formats — including O2O, warehouse clubs, snack discount chains and hard discounters — are reshaping how consumers fulfill needs across different occasions," said Bruno Lannes, a senior partner at Bain. He said brand owners must move away from one-size-fits-all approaches and instead tailor strategies to specific shopping missions, channels and price expectations.

General Manager of Worldpanel by Numerator China, Li Rong, said Chinese households are becoming increasingly sophisticated in how they evaluate value. "Seeking value for money does not equate to simply choosing the cheapest option," she said. Consumers, she added, are still willing to pay for differentiated products when benefits are clear, but are more deliberate in weighing trade-offs across brands, stores and channels.

Product innovation

Despite slower growth, the report finds that product innovation remains highly active. New SKUs accounted for roughly 40 percent of total SKU counts between 2022 and 2025, reflecting continued experimentation by brand owners and retailers.

However, the effectiveness of that innovation remains limited. Only 3.9 percent of new products launched in 2024 achieved penetration of at least 1 percent within their first year, underscoring a significant gap between product launches and scalable success.

To address these challenges, Bain recommends that companies adopt a revised "core" framework. This includes re-anchoring demand planning around "circumstances" shaped by value-for-money expectations, redesigning "offerings" for localized relevance, optimizing "routes" through channel-specific strategies, and strengthening "execution" capabilities to operate in a low-growth, high-volatility environment.

618 shopping festival reflects structural shift in China's retail landscape

By WANG ZHUOQIONG

One of the country's largest mid-year e-commerce events, the June 18 shopping festival, or "618" as it is commonly known, highlighted this year a structural shift in the country's retail landscape, moving decisively away from price-driven competition toward margin protection, product innovation and artificial intelligence-enabled consumer engagement, according to industry insights.

Kathy Jiang, a partner expert at consulting firm Roland Berger, said across major e-commerce platforms, the long-running "lowest price guarantee" era appears to be fading. Platforms have increasingly deprioritized aggressive discounting strategies, while brands are recalibrating toward profitability, elevating net margin as a core KPI.

This marks a notable departure from previous 618 cycles, where promotional intensity and traffic acquisition costs dominated strategy. Instead, the focus is shifting toward sustainable growth and healthier unit economics.

On the demand side, consumer behavior during the shopping festival period is increasingly disciplined. Industry observations suggest that roughly 70 percent of shoppers now have pre-prepared shopping lists ready for the festival, significantly reducing impulse purchases and bundling-driven upselling.

"Rather than browsing for deals, consumers are prioritizing genuine need, product quality and post-purchase service," said Jiang. The result is a more selective and efficiency-driven consumption pattern, with higher expectations placed on both product performance and brand experience.

Another structural change is the shift in growth drivers. Instead of functioning primarily as a channel for inventory clearance, 618 is increasingly powered by new product launches and emerging categories, said Jiang.

On platforms such as Tmall, about one-third of the top 100 best-selling products are now new launches. Innovative products with differentiated features are increasingly able to command pricing power, signaling a stronger role for product originality in driving conversion.

Brands are also expanding into emotional and experiential value creation, shifting from pure transactional e-commerce toward long-term "user asset" management and positioning strategies.

A major structural transformation is the reconfiguration of the "People–Product–Place" model, with generative AI emerging as a critical new traffic gateway.

Platforms across China are embedding AI into core shopping journeys, including the Qwen app within the Alibaba ecosystem, JD's AI shopping assistant, and Douyin-integrated recommendations and discovery tools. ByteDance's Doubao is also part of this broader shift toward AI-mediated commerce.

These systems are increasingly responsible for product discovery, user matching and decision support — reshaping how consumers enter and navigate digital marketplaces.

Jiang said industry consensus suggests that brands are responding to these shifts by returning to fundamentals: stronger products and improved customer experience.

"Brands are accelerating investment in original product development and targeting high-growth niche segments," Jiang said. Emotional value, functional differentiation and brand equity are becoming central to pricing power, she added.

At the same time, data-driven reverse customization is gaining traction, allowing brands to reduce product testing costs and better align supply with real demand.

On the channel side, brands are increasingly focused on long-term user asset accumulation rather than short-term traffic spikes. This includes deeper engagement through content seeding, membership lifecycle management and loyalty ecosystems.

Optimizing visibility within AI-driven search and recommendation systems is also becoming a new competitive priority. For categories requiring higher consumer trust, brands are working to bridge online and offline channels into integrated online-to-offline experiences.

For global beauty groups such as The Estee Lauder Companies, this year's 618 underscores how AI is transforming not just marketing efficiency, but the entire consumer journey.

According to the company, AI tools are now deployed across four key areas: visual content creation, advertising optimization, beauty advisory services and operational management.

Product imagery and short videos are increasingly generated in seconds using AI models, enabling rapid multi-scenario content production for different consumer segments.

On the marketing side, automated bidding systems use behavioral data to match products with consumers in a "products find people" model, significantly improving targeting precision.

In customer service, AI-powered assistants embedded in flagship stores now respond instantly to skincare queries, compare product specifications and summarize review insights — compressing the consumer decision process.

Behind the scenes, AI is also streamlining operations, from data analysis to inventory and after-sales alerts, allowing teams to focus more on strategy and creativity rather than repetitive tasks.

Estee Lauder also found a broader psychological shift among consumers, with e-commerce no longer viewed purely as a transactional channel, but increasingly as a platform for brand storytelling and experiential consumption.

As seasonal marketing expands beyond the 618 shopping festival into year-round gifting occasions — such as Chinese New Year and Mother's Day — consumers are showing greater willingness to pay for emotional value and ritualized experiences.

In response, brands are expanding personalized gifting services, including engraving, custom packaging and occasion-specific design adaptations. For example, products such as fragrances and lipsticks are being repositioned as "emotional gifts", said the company.

Small teams summon big worlds

From online novels to glowing fantasy battles, AI is reshaping how China's short animated dramas are produced and consumed.

Covers of AI-generated short dramas produced by Tang Jiancong's small team using AI video tools. PROVIDED TO CHINA DAILY

By YANG LIU
yangliu@i21st.cn

Tang Jiancong does not need an army of animators to summon an immortal figure.

In one AI-generated short drama produced by his company, a white-robed master drops from the heavens into an arena where a female martial artist is losing ground to a fighter in an Iron Man-style mecha suit. A glowing shield wraps around the woman. Then the immortal steps forward and declares, "I, your master, will fight for you."

The clip comes from *Immortal Master Comes Back: My Disciples Are Top Tycoons*, a *xianxia* story — a Chinese fantasy genre — that blends traditional combat with futuristic technology, old legends with virtual worlds, and human warriors with robotics.

Yet all those elements can now be produced by a small team: one director who adapts the script, two people who generate clips using AI and a final editor who brings everything together, according to Tang, 32, founder of Shenzhen Aizao Technology.

Tang, a former programmer at Tencent, founded the company in 2025 after concluding that AI video would be "the next big thing".

"By then, ChatGPT had already shown what AI could do with text, and Midjourney had done the same for images," he said. "Video felt like the next frontier. We believed that was where the industry was heading, especially as people were already spending so much time watching short videos."

For Tang, the most striking change is not only what AI can put on screen, but how quickly and inexpensively it can now do so.

"For a 120-minute 2D animated drama, we can now finish production in about 20 days," he said. "Including labor and computing power, the cost can be kept under 300 yuan ($44.28) per minute."

Producing 3D animation with AI remains more expensive than 2D animation and varies by theme, but Tang said it can still be 10 to 100 times cheaper than traditional hand-drawn, frame-by-frame animation.

Tang's company is part of the broader surge in AI-generated animated short dramas, or AI *manju*, sweeping the industry.

According to market data firm DataEye, AI-simulated live-action *manju* accounted for 38 percent of the top 100 *manju* titles in January 2026, up from 7 percent a year earlier, reflecting how quickly AI animation has moved from experiment to mass production.

Xianxia stories have become one of the most natural genres for AI *manju*. They often require elaborate settings, magical battles, glowing weapons and large-scale effects — elements that are expensive in traditional animation but easier to generate with AI tools.

This means that web novels once considered too costly to adapt can now be turned into animated dramas by small production teams.

Tang said many viewers do not necessarily come looking for high art. They are drawn instead to fast-paced stories delivered with enough visual energy to keep them watching.

Jin Sheng, vice dean and associate professor at the School of Animation and Digital Arts, Communication University of Zhejiang, said the appeal lies in the immediate pleasure of seeing online stories brought to life.

"It gives viewers quick visual satisfaction — a kind of 'dopamine rush'," Jin said.

For many viewers, he added, whether a drama is made with AI is less important than whether it is exciting.

"As long as the content is good and attractive, that's enough," he said.

Keeping humans involved

While AI makes such production possible, the process is not as automatic as it may appear.

Industry insiders often describe the refinement stage as "gacha", borrowing a term from randomized game mechanics.

"AI generation has a lot of randomness," Tang said. "The results don't always match what you had in mind. It can't get every shot right on its own, so people have to step in."

According to him, the work still depends heavily on human taste: which expression feels right, which camera angle has impact, which frame should stay and which should be discarded. Creators have to repeatedly generate clips, compare the results and choose the best version.

Voice dubbing also remains largely human. Tang said AI-generated voices still struggle with intense emotion, especially grief, anger and deep sadness.

"AI is AI, after all. Its emotions aren't as rich or layered as a human's," he said.

That continuing need for human judgment is reshaping the skills the industry values.

Tang's company offers online courses for people hoping to enter the AI video business. About 40 percent of its trainees, he said, come from traditional film and design backgrounds, seeking a lifeline in a changing industry.

Universities are adapting as well. At the Communication University of Zhejiang, for example, senior students majoring in animation and digital arts work with companies to produce AI-generated dramas.

> "Great works demand time and investment. Only those who survive fierce market competition will have the chance to create true masterpieces. It is simply a matter of time."
>
> **Jin Sheng,** vice dean and associate professor at the School of Animation and Digital Arts, Communication University of Zhejiang

Jin said about one-fifth of senior students take part in such projects during their final year, learning how to use AI tools while also strengthening their command of storytelling, composition and direction.

"Equipping my students with the most current, cutting-edge skills is the fastest way to help them adapt to the industry," Jin said.

The goal, he added, is not to train students to rely entirely on AI, but to help them become more well-rounded creators — people with aesthetic judgment, directorial vision and a strong grasp of narrative structure.

"I hope each of them can become a complete team," Jin said. "That way, they can survive in the market no matter how the industry changes."

Raising the bar

The same technologies that have opened new opportunities have also created new problems.

Advances in AI video tools, including multimodal systems such as Seedance 2.0, have lowered the barrier to entry for animation production.

"Right now, almost everyone is using Seedance to make videos," Tang said.

But a lower barrier also means a flood of uneven work.

Platforms have begun tightening control over AI-generated short dramas. Hongguo, a Chinese short-form drama platform under ByteDance, said it removed more than 1,700 policy-violating *manju* in the first quarter of 2026.

In May, Hongguo issued clearer and stricter content guidelines, clamping down on themes related to history, politics, minors, pornography and excessive violence, aiming to provide much-needed clarity for the industry's bewildered producers.

The initial gold rush is giving way to pressure for higher standards.

"Great works demand time and investment. Only those who survive fierce market competition will have the chance to create true masterpieces. It is simply a matter of time," Jin said.

For Jin, the lesson is clear: embracing AI does not mean abandoning basic creative skills. Story structure, visual rhythm, emotional judgment and aesthetic taste remain essential. AI can generate countless images, but humans still decide which ones matter.

The industry, he said, is undergoing a transition similar to cinema's shift from film to digital. The tools are changing, the workflow is changing, and the definition of an animation team is changing with them.

"Once that shift begins, the tide of history is hard to stop," Jin said. "In the short term, there will certainly be many problems, but people will keep working on them, and things will improve over time."

AI has made animation faster and cheaper. The next challenge is making it better.

A quiet bridge of books

What began as one reader's longing for Chinese books has grown into a warm gathering place for readers across Britain.

By **CHEN XUE** and **XIONG XINYI**

Lyu Shasha did not open Weidu Bookshop in London to make a grand statement about cultural exchange. She was trying to solve a simpler problem: Chinese readers in Britain missed the books they could once find so easily back home.

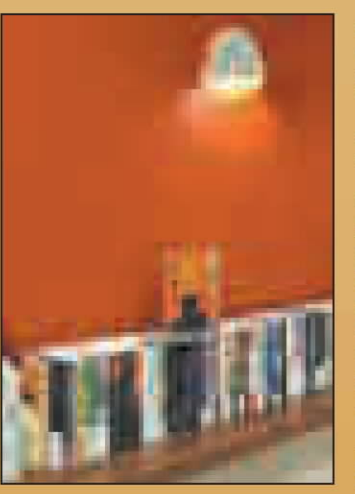
It was a longing she knew well. Since moving to the UK in 2016, Lyu had often returned from trips to China with Chinese books packed into her suitcase. The longer she lived abroad, the more she felt their absence.

Britain has no shortage of bookshops, libraries or public reading culture, but for readers seeking carefully selected Chinese-language books — especially contemporary literature and humanities titles — the options are limited.

In 2024, while sorting through the books she had brought back from China over the years, Lyu spent more than 10 days going through the shelves in her study. Each time she picked up a volume, she could remember exactly where, when and why she had bought it: a market in Beijing, a bookshop in Nanjing, a trip to Hong Kong.

"All those memories just pull me back to China," she said. "Wherever I am, Chinese books nourish my spirit, but that joy is always shadowed by a sense of lack."

That feeling eventually led Lyu to open Weidu Bookshop, an independent Chinese bookstore in London, in 2024.



Before opening the shop, she spent four months selecting every title by hand. She brought in books from major Chinese literary and humanities publishers, including People's Literature Publishing House, and sourced some titles directly from publishers such as Imaginist rather than relying solely on wholesalers. She deliberately left out market-driven bestsellers, success manuals and feel-good quick fixes.

"In an age of AI and information overload, what's truly scarce is not information but judgment and taste," Lyu said. "We chose every book by hand. It's a slow way of doing things, but that's where the bookstore's foundation is."

The result was a shop shaped less by size than by intention. Alongside contemporary fiction, essays, poetry, history and social thought, Lyu created a children's section and launched graded reading boxes for Chinese-language learners. The selections ranged from classical poetry and history books adapted for young readers to the Chinese-language *Harry Potter* series.

Above: Visitors browse Chinese books at Weidu Bookshop's booth during a Chinese New Year celebration in London on Feb 21, 2026. **Below:** Books on display at Weidu Bookshop in London. PROVIDED TO CHINA DAILY

The work behind the store was slower and more fragile than the shelves might suggest. Books arrived from China by sea freight, and once they reached the UK, local deliveries could be unpredictable. Occasionally, a parcel would disappear, and resolving the problem was not always easy.

"These books had come all the way here," Lyu said. "Losing one, knowing it might just sit somewhere unread, especially hurt."

After the store opened, the demand Lyu had sensed became visible. Orders went out across the UK — to cities, villages, university towns and school dormitories.

One regular customer in southwest England ordered seven or eight books every two weeks. They had never met, but Lyu began slipping handwritten notes into the parcels, and the reader sometimes wrote back. When one package went missing, Lyu enclosed a letter with the next order. The reader later replied by email, saying that just seeing her handwriting had been enough.

What surprised Lyu was that the shop's reach extended beyond the Chinese community.

She once noticed a British man in his 20s browsing so quietly in the shop that she assumed he could not read Chinese. In fact, he could, and the books he had been looking at were not easy ones. Another customer, a British woman who had lived in Shanghai a decade earlier, came in saying her Chinese was no longer good enough and that she had decided to pick it up again. She and Lyu talked about books and Beijing, where she is heading this September to study at Peking University.

Those encounters gradually changed Lyu's understanding of Weidu Bookshop. She had opened it to serve native Chinese readers living abroad. But over time, the shop also became a place where non-Chinese readers could encounter a China that felt current, literary and alive.

> "Through a modern Chinese bookstore, British readers can see what China is doing now — not a China trapped in history or imagined from afar."
>
> **Lyu Shasha,** founder of Weidu Bookshop in London

"Through a modern Chinese bookstore, British readers can see what China is doing now — not a China trapped in history or imagined from afar," Lyu said.

To keep that sense of immediacy, Lyu updates the selection regularly, introduces monthly new arrivals and creates themed reading lists on subjects such as women's writing and Dunhuang, the Gansu city known for the Mogao Caves. At the London Book Fair, the shop has also become a window for Chinese publishers and contemporary authors hoping to reach British readers more directly.

In 2025, Lyu published her first annual list of the most popular Chinese books among UK readers. Displayed in university libraries and more than 80 venues across the country, the list gave shape to a readership that had often been scattered and quiet.

Lyu never set out to build a cultural bridge, though that is what Weidu Bookshop has quietly become.

"Day by day, the conversations, the people, the small encounters really do add up, brick by brick," she said.

As for what comes next, Lyu is measured but determined.

"If nothing major changes, I'll keep going," she said. "Running the bookshop has turned out to be more meaningful than I ever expected."

Deep Dive

As China places growing emphasis on cultivating innovation-driven talent, educators are increasingly asking how early engineering thinking should begin. For Li Yi, PhD, the answer is clear — it begins long before university.

A senior mathematics educator and STEM curriculum designer at the High School Affiliated to Renmin University of China, Li has led the development of an integrated program aimed at nurturing "outstanding future engineers".

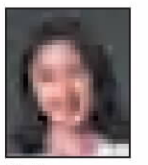
With a doctoral degree in information and communication engineering, Li brings an interdisciplinary perspective to education, bridging technical expertise and classroom practice.

Learning STEM to solve real-world challenges

By **MENG WENJIE**
mengwenjie@i21st.cn

At the High School Affiliated to Renmin University of China, STEM education is not treated as a collection of separate subjects, nor simply as a way to help students master advanced knowledge or prepare for competitions. Instead, the school has developed a program designed to cultivate the way engineers think.

"We want students to learn how to identify problems, build models, analyze data, design solutions and test them in practice," said Li Yi, who led the program's development. "Engineering education at the secondary school level should help students connect knowledge with real life."



The program follows a three-tiered STEM curriculum spanning foundational, intermediate and advanced levels. Foundational courses introduce all students to essential concepts in mathematics, science and technology. Intermediate courses emphasize interdisciplinary projects that build early engineering awareness and hands-on problem-solving skills. Advanced courses immerse highly motivated students in complex, research-oriented projects that mirror authentic engineering challenges.

Through this structured progression, students are encouraged to develop five core competencies: modeling thinking, data thinking, computational thinking, design thinking and engineering thinking.

Project-based learning lies at the heart of the program. Students have explored topics including urban traffic modeling, population forecasting, sustainable energy systems, drone swarm design and epidemiological simulations.

These projects require them to integrate knowledge across disciplines, analyze real-world data, build prototypes and evaluate solutions critically.

Li said such projects help students understand that engineering is closely connected to society.

Li Yi

"Many of the problems we choose are connected to real social and industrial needs," she said. "Students learn that technology should benefit people and that innovation also comes with responsibility."

The program has now served more than 3,000 students and produced notable outcomes. More than 200 students have received national and international awards, including recognition in the High School Mathematical Contest in Modeling and other STEM innovation competitions. Several student research projects have also been published in academic journals and conference proceedings.

Many graduates of the program have gone on to leading universities, including the Massachusetts Institute of Technology and Carnegie Mellon University, pursuing advanced study in fields such as quantum communication, algorithm engineering and robotics.

Behind these student achievements is a sustained effort to support teachers' professional growth.

As part of the program, educators receive ongoing training and participate in international exchanges. Teachers from different disciplines — including mathematics, information technology, physics, biology and engineering — are also encouraged to work together to design integrated courses, ensuring that students receive guidance from multiple perspectives.

More broadly, the program adds to ongoing discussions about how secondary schools can better prepare students for an increasingly technology-driven future. It offers one possible model for integrating engineering thinking into pre-university education, showing how rigorous STEM learning can be both intellectually demanding and socially meaningful.

Li is also exploring how artificial intelligence can enhance STEM education. Through AI-assisted learning tools, intelligent feedback systems and data-visualization platforms, the program is helping students refine ideas, test hypotheses and improve engineering designs in more adaptive and immersive learning environments.

"AI can make STEM learning more personalized and more interactive," Li said. "But the core remains the same: students need to learn how to ask meaningful questions and solve problems creatively."

For Li, the future of STEM education lies not simply in teaching technical skills, but in cultivating a generation of thoughtful innovators capable of addressing complex human challenges.

"Engineering education is not just about training future engineers," she said. "It is about helping young people build the confidence and ability to change the world around them."

2026 WORLD CUP

GERMANS SHOOT OUT

Paraguay becomes first team to defeat four-time champion on penalties at a World Cup

Paraguay goalkeeper Orlando Gill denies Germany's Kai Havertz in a penalty shootout to decide their round-of-32 clash in Boston on Monday after the match ended in a 1-1 draw. **Inset:** Paraguay's Gustavo Gomez celebrates his team's historic 4-3 shootout win. AP

Jose Canale wasn't in the starting lineup in either of his previous two appearances for Paraguay in this World Cup.

He made his first start a memorable one.

Canale scored the first of his side's spotkicks, Orlando Gill made two key saves in the shootout, and Paraguay beat Germany 4-3 on penalties Monday in Foxborough, Massachusetts, to complete another big upset at the 2026 World Cup.

It was a major triumph for the landlocked South American country of seven million people, which is surrounded by soccer giants like Argentina and Brazil. And it was the latest surprising exit by Germany, a four-time champion that has struggled at the World Cup since it last lifted the trophy in 2014.

"I think we deserved one more game, to be honest, considering everything that was said, everything we went through," Canale said. "What I want to highlight from our team is how united we are. Today was a game we really needed to show our true colors."

Paraguayans celebrated in the streets of the capital, Asuncion, screaming, jumping and hugging when the match ended. Some cried and dropped to their knees in disbelief, with the familiar beat of the team's song *Soy Albirrojo* reverberating through the crowd.

As well as notching up its first-ever knockout stage goal, Paraguay made history by becoming the first team to defeat Germany in a penalty shootout at the World Cup.

The Germans missed three of its six spotkicks, the last by Jonathan Tah, who blasted his attempt high over the crossbar, setting up Canale for the winner. Tah's miss followed a save by German goalkeeper Manuel Neuer of Fabian Balbuena's attempt that would have won it for Paraguay.

Tah also thought he had the go-ahead goal in extra time. He headed in a corner kick by Nathaniel Brown in the 102nd minute, but officials concluded after a video review that Waldemar Anton has pushed Gill to the ground before the shot, and the goal was disallowed.

The round-of-32 match ended 1-1 after extra time. Paraguay took the lead when Julio Enciso scored on a header late in the first half, but Kai Havertz equalized in the 52nd minute for Germany.

"We had to analyze every player, every detail. Thanks to that, I was able to only miss two penalties," Gill said. "This is for all the people of Paraguay."

Paraguay, which entered the match ranked 41st by FIFA, was a huge long shot to beat Germany, the 10th-ranked team in the world.

Paraguay will now face the winner of Tuesday's match between France and Sweden in the round of 16 on Saturday in Philadelphia. Should it overturn the odds amid the United States' 250th anniversary celebrations, Paraguay would return to Foxborough for the quarterfinals on July 9.

Germany had won six of seven penalty shootouts in major tournaments, including six straight since losing to the former Czechoslovakia in the 1976 European Championship final.

"It's not enough for German football," coach Julian Nagelsmann said.

In the only previous World Cup match between the two teams, Germany beat Paraguay 1-0 in the round of 16 at the 2002 tournament. Nearly a quarter-century later, Paraguay got its revenge.

Paraguay had appeared in five previous knockout games, but failed to score in each. It had advanced only once, winning on penalty kicks against Japan in the round of 16 at the 2010 tournament in South Africa. It fell that year to eventual champion Spain in the quarterfinals.

Monday was Germany's first knockout game since the 2014 final in Brazil, when the Germans beat Argentina 1-0. The Germans were eliminated in the group stage at the last two tournaments.

"We had very big plans for this World Cup. It's very difficult to have disappointed again," Havertz said. "It was difficult to create chances and keep the pace."

Paraguay broke the early stalemate Monday in the 42nd minute, with some perfect ball movement to set up Enciso.

Miguel Almiron split Germany's Aleksandar Pavlovic and Brown with a left-footed pass to Matias Galarza. Galarza sent a cross to Enciso, who was unmarked by Germany's defenders and easily headed it past Neuer.

In the second half, Havertz took a cross from Florian Wirtz, which he got just enough head on to redirect it past Gill.

Germany, whose 10 goals in the group stage was tied for the most of any team, struggled to find a way through Paraguay's 4-5-1 setup. The Germans had 78 percent of the possession in the first half.

Paraguay was without defender Omar Alderete, who left with an injury in the second half of its 0-0 draw against Australia. Canale started in his place.

AP

Nagelsmann won't 'run away' following early World Cup exit

Germany coach Julian Nagelsmann said he wanted to stay in his job, despite the defeat on penalties to Paraguay that sent the four-time World Cup winner crashing out of the last 32 on Monday.

Nagelsmann has a contract up to the 2028 European Championships, but Germany's premature exit from the World Cup will put the 38-year-old under intense scrutiny.

"I'm not someone who runs away," he told German broadcaster ZDF.

"I want to continue, but in football you don't always have it in your own hands.

"If the DFB (federation) wants me to, then I will prepare for the European Championship and the Nations League."

The loss to the South American side was the first time that Germany has ever lost a penalty shootout at a World Cup — it finished 4-3 after Jonathan Tah blasted his kick way over the bar.

Former Liverpool manager Jurgen Klopp, who was at the match in Foxborough, Massachusetts, working for German broadcaster MagentaTV, has long been rumored as a future coach of the national team.

But Klopp refused to be drawn on the possibility on Monday.

"I understand that my name is being mentioned, but this is not the moment to talk about it — and especially not with me," Klopp said.

Midfielder Nadiem Amiri said Germany still has a bright future, but conceded the pain of defeat makes it hard to look too far ahead.

Several of Germany's core players may not be around for the next World Cup in 2030, but Jamal Musiala and Florian Wirtz should be in their prime by then.

Ninth China-Eurasia Expo spurs trade and business ties in Xinjiang

By YUAN SHENGGAO

Urumqi, located in Northwest China's Xinjiang Uygur autonomous region, took center stage by hosting the ninth China-Eurasia Expo from June 25 to 29.

Continuously upgrading toward greater professionalism, cutting-edge innovation and pragmatic cooperation, the expo adapts to evolving global development trends and practical regional demands, achieving milestones in exhibition scale and expanding Eurasia's cooperation networks.

This year's expo gathered participants from 49 countries, regions and international organizations, with 27 countries and regions setting up pavilions. The United Arab Emirates, South Korea, Russia and Thailand debuted their standalone exhibitions, showcasing distinctive industries and premium products to boost cross-border exchanges and mutual learning.

More than 3,000 domestic and overseas enterprises and institutions revealed their latest technologies, products and solutions across the 140,000-square-meter exhibition venue, demonstrating vitality in Eurasian economic and trade cooperation.

Clockwise from left: A networking event for Chinese and Central Asian businesses is held in Urumqi during the ninth China-Eurasia Expo. PROVIDED TO CHINA DAILY An exhibitor at the Belarus booth records a short video on June 25. DING LEI / XINHUA Visitors inspect products at the Uzbekistan booth on June 26. SHI FENG / XINHUA

Diplomatic praise

Khalil Hashmi, the ambassador of Pakistan to China, hailed the expo's record-breaking scale as a testament to global confidence in Xinjiang's role as a hub for China-Eurasia economic and trade cooperation.

He highlighted that Pakistan, as one of this year's guest countries of honor, featured an enlarged pavilion, showcasing the friendship and robust economic and trade ties between China and Pakistan.

"We have set up pavilions at previous expos, but this year's status as a guest country of honor marks a new milestone in bilateral relations," Hashmi said. He added that the growing number of participating nations and enterprises reflects international business communities' optimism about Xinjiang's development potential, recognizing the region as a vital platform for win-win trade and investment cooperation.

The ambassador expressed confidence that the expo will continue to serve as a bridge for interconnected development and common prosperity across Eurasia and beyond.

Selcuk Unal, the Turkish ambassador to China, emphasized the millennia-old Silk Road bonds that link Turkiye and China. Five Turkish enterprises participated in the expo, with more business representatives traveling to Xinjiang to explore market opportunities.

He looked forward to new cooperation deals and trade contracts between Turkish companies and Chinese partners to deepen Eurasian commercial exchanges.

The president of the UAE China Xinjiang chamber of commerce and fellow townsmen association, a nine-time attendee of the expo based in Dubai, said that the event has become a key platform connecting Xinjiang with Middle Eastern markets.

He highlighted the natural complementary advantages between Xinjiang and the UAE: Xinjiang boasts abundant agricultural and sideline product resources, while the UAE has strong market demand for such goods.

Frequent bilateral promotional activities and in-depth cooperation via the expo have laid a foundation for future collaboration. He expected more pragmatic and win-win cooperation achievements to occur at this year's event.

Key events

Centering on four areas — trade promotion, investment cooperation, consumption expansion and innovative collaboration — the expo hosted over 80 themed economic and trade activities. These covered new product launches, cross-border trade matchmaking and investment promotion negotiations.

Highlight events included the Kazakhstan-themed Export to China session, the Central Asian diplomatic and entrepreneur dialogue, and an international buyer matchmaking forum.

On June 27, the expo's international buyer matchmaking forum was held at the Xinjiang International Conference and Exhibition Center, building a face-to-face cooperation platform for global suppliers and purchasers.

Participants from various sectors, including light manufacturing, agricultural products, textiles and apparel, new energy equipment, digital trade and cultural tourism, delivered industry presentations.

Enterprises from multiple Chinese provinces conducted in-depth negotiations with foreign buyer delegations, signing a batch of cooperation agreements spanning intelligent technology, agricultural machinery, engineering construction and commercial services.

Another highlight was the Kazakhstan-themed Export to China event on June 25, attracting more than 400 officials and entrepreneurs from both countries. It aimed to expand imports from Kazakhstan, leverage Xinjiang's unique geographical advantages, and deepen bilateral economic and trade cooperation by helping Kazakh enterprises tap into the Chinese market.

Meanwhile, the China (Xinjiang) Pilot Free Trade Zone's Investment Promotion and Industrial Cooperation Matchmaking Conference attracted more than 200 representatives from the business bureaus of 12 provincial-level regions, think tanks, research institutes, industrial parks and companies.

The event announced five major cooperation achievements and eight key platforms, with three core zones in Urumqi, Kashgar and Khorgos showcasing their development strengths.

A milestone was the expansion of the free trade zones alliance, with the China (Inner Mongolia) Pilot Free Trade Zone joining the Guangxi Zhuang autonomous region, Yunnan province, Heilongjiang province and Xinjiang to form a coordinated development cluster.

The five border regions jointly launched a three-year action plan for collaborative innovation of free trade zones (2026-28). The plan focuses on practical cooperation in institutional innovation exchange, cross-border logistics connectivity, industry chain coordination, market regulation linkage and talent resource sharing to fuel high-level opening-up along China's border areas.

CHINA DAILY

GLOBAL EDITION 中国日报 THURSDAY, JULY 2, 2026

Xi Jinping, general secretary of the Communist Party of China Central Committee, who is also Chinese president and chairman of the Central Military Commission, stands with model CPC members who were awarded the July 1 Medal, the Party's highest honor, at the Great Hall of the People in Beijing on Wednesday. SHEN HONG / XINHUA

CPC urged to build on legacy, forge ahead

'Time stops for no one, and neither does history,' Xi tells grand anniversary gathering

By **MO JINGXI**
mojingxi@chinadaily.com.cn

Xi Jinping, general secretary of the Communist Party of China Central Committee, called on the Party not to rest on its past achievements, but to continue striving toward national rejuvenation and new historic accomplishments, at a grand gathering marking the 105th anniversary of the founding of the CPC on Wednesday in Beijing.

The CPC's 105-year history is a source of pride, but the Party must never become complacent or stop moving forward, Xi said.

He underscored the importance of meeting the goal of fully realizing socialist modernization by the middle of the century.

"Time stops for no one, and neither does history," he said.

Xi, who is also Chinese president and chairman of the Central Military Commission, made the remarks while addressing an audience of around 3,000 at the Great Hall of the People in Beijing.

Founded in 1921 against the backdrop of a weak China plagued by foreign humiliation and poverty, the CPC has grown from a small group of just over 50 members into the world's largest governing party, with nearly 101.29 million members and tremendous global influence.

Xi said that over the past 105 years, the CPC has remained true to its founding mission of seeking happiness for the Chinese people and rejuvenation for the Chinese nation, achieving historic accomplishments through unremitting struggle.

The Party has led the Chinese people of all ethnic groups in writing the most magnificent epic in the nation's history, he said.

The CPC's 105 years of unremitting endeavor have fundamentally transformed the future and destiny of the Chinese people, opened up the right path toward national rejuvenation, demonstrated the strong vitality of Marxism, profoundly influenced the course of world history and forged a strong CPC, Xi said.

He added that the fundamental reason why the CPC has continued to achieve remarkable success over the past 105 years, and has been chosen by history and the people, lies in its fine qualities with no parallel among other political parties and political forces.

Xi also said the CPC has remained committed to pursuing truth and keeping to the right direction, staying deeply rooted among the people and courageously shouldering its historic missions while maintaining strategic initiative.

The Party has also followed the trends of development to remain at the forefront of the times, demonstrated the courage and ability to struggle while maintaining confidence in victory, and strengthened itself through constant self-improvement to remain vibrant, he said.

To fulfill the Party's missions in the new era and on the new journey, the entire Party must uphold its basic theory, basic line and basic policy to "remain undaunted by passing clouds and stay on course through wind and waves," Xi said.

Stressing that the Party must rely closely on the people to create new historical feats, Xi urged Party members to "further reinvigorate the enterprising spirit for getting things done".

He also called on the entire Party to actively respond to risks and challenges on the path ahead.

"China's development is now in a period where strategic opportunities coexist with risks and challenges, and where uncertain and unpredictable factors are on the rise. We must always be prepared to withstand major tests of high winds and raging waves, and even violent storms," he said.

Xi also stressed advancing full and rigorous Party self-governance and making sustained efforts to win "the tough, protracted and all-out battle against corruption".

"It is imperative that all of us in the Party never forget our original aspiration and founding mission, that we always stay modest, prudent and hardworking, and that we have the courage and ability to carry on our fight," he added.

Xi said that promoting the long-term prosperity and stability of the Hong Kong and Macao special administrative regions is essential to realizing national rejuvenation.

Xi's quotes

• Resolving the Taiwan question and realizing the complete reunification of the motherland are an unswerving historical mission of our Party and the shared aspiration of all Chinese people.

• We promote the building of a community with a shared future for humanity, providing Chinese wisdom, Chinese solutions and Chinese strength for addressing major issues facing humanity.

• Youth is a vital force in realizing the great rejuvenation of the Chinese nation.

Pragmatism drives China's economic transformation

WORLD WATCH
By Lin Jianhai

As the global economy becomes increasingly fragmented and countries struggle to sustain long-term growth, China's economic transformation offers experiences that transcend its borders.

Over the past four-plus decades, China has orchestrated one of the most extraordinary economic transformations in modern history. Since the launch of reform and opening-up in 1978, the country's economy has registered one of the fastest growth rates ever recorded by a major economy, expanding at an average annual rate of close to 9 percent. In the process, China has lifted hundreds of millions out of poverty, become the world's second-largest economy, and emerged as a major driver of global trade, investment and innovation. Today, China accounts for nearly a fifth of global economic output and remains the largest contributor to world economic growth.

The significance of this achievement lies not simply in its scale, but also in what it reveals about the process of economic development itself. Too often, discussions of China's rise focus on whether it "validates" a particular model of "capitalism" or "state intervention". This misses the larger point.

China's success reflects a pragmatic willingness to experiment, adapt and evolve as circumstances changed.

Four key experiences remain highly relevant today.

First, development is an evolving process, not a rigid blueprint. Unlike many countries, China pursued gradual and sequential reform. Agricultural reforms came before industrial reforms. Special economic zones served as testing grounds before market-oriented policies were expanded nationally. Successful experiments were scaled up, while unsuccessful ones were revised or abandoned.

This pragmatic approach generated political support, reduced social disruption and allowed policymakers to learn from experience.

8 honored with July 1 medals

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

Xi Jinping, general secretary of the Communist Party of China Central Committee, conferred the July 1 Medal, the Party's highest honor, on model CPC members on Wednesday at a gathering marking the Party's 105th founding anniversary at the Great Hall of the People in Beijing.

The eight recipients of the medal are outstanding representatives of Party members from various sectors, who uphold firm ideals and beliefs, remain loyal to the Party, and dedicate themselves to the Party, the country and the people, according to the decision of the CPC Central Committee on awarding the July 1 Medal.

The decision was read out at the gathering by Cai Qi, a member of the Standing Committee of the Political Bureau of the CPC Central Committee and a member of the Secretariat of the CPC Central Committee.

The recipients put people first, always think and work together with the people, and tirelessly strive for the interests of the people, the decision said.

They forge ahead with a sense of mission and responsibility, establish and practice a correct understanding of governance performance, work diligently and tackle challenges in ordinary positions, and strive to create achievements that live up to the expectations of the Party, the people and the times, the decision noted.

They follow fine work conduct and maintain political integrity and honesty, winning widespread praise from the entire Party and society, it added.

The decision called on all Party members to follow their example and work in solidarity to contribute to the building of a modern socialist country in all respects and to the great rejuvenation of the Chinese nation.

The medal was first conferred in 2021, which marked the centenary of the founding of the CPC. The award is granted every five years.

Beyond individual recognition, the medal, which honors role models from all walks of life, carries wider social value.

Designed with simplicity and solemnity as its core concept, the medal, with red, gold and white as its main colors, features key elements such as the Party emblem and the five-pointed star.

Outstanding Party members, Party workers and grassroots Party organizations from across the country were also honored at Wednesday's gathering.

CPC 105TH ANNIVERSARY

Xi's article on county Party chiefs released

Role of grassroots officials in serving the people wholeheartedly stressed

An article by Xi Jinping, general secretary of the Communist Party of China Central Committee, on how to excel as head of the CPC county committee was published on Wednesday.

The article by Xi, who is also Chinese president and chairman of the Central Military Commission, was published in this year's 13th issue of the Qiushi Journal, a flagship magazine of the CPC Central Committee.

The article is a speech delivered by Xi at a seminar for county-level Party chiefs at the Party School of the CPC Central Committee on Jan 12, 2015.

He noted in the article that in the Party's organizational structure and in the State power structure, the county level serves as a crucial link connecting higher and lower levels, and it constitutes a vital foundation for boosting economic development, ensuring people's well-being, maintaining social stability and safeguarding the country's long-term stability and security.

Xi urged county-level Party chiefs across the country to draw inspiration from the spirit of Jiao Yulu, an exemplary role model for grassroots Party officials.

The article emphasized that loyalty to the Party is a key criterion for county-level Party chiefs, who must consciously align themselves with the CPC Central Committee and resolutely uphold its authority.

To be a good county-level Party chief, one must always keep the people at heart, serve the people wholeheartedly and foster a correct understanding of what it means to perform well, the article underscored.

It also noted that a good county-level Party chief must shoulder the responsibilities with full dedication and actively work out concrete solutions to tackle tough challenges.

Furthermore, the article highlighted that a good county-level Party chief must strictly uphold disciplinary rules, exercise power in a just, law-based and honest way, set an example in studying, respecting, abiding by and applying the law, and be adept at advancing county governance under the rule of law.

Global leaders commend CPC's great achievements

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

Leaders of foreign political parties and governments have conveyed warm congratulations to the Communist Party of China Central Committee and General Secretary Xi Jinping on the 105th anniversary of the CPC's founding.

In their messages, they spoke highly of the great achievements the CPC has made, and expressed firm confidence that under the leadership of General Secretary Xi, the CPC will continue to make new progress.

Kim Jong-un, general secretary of the Workers' Party of Korea and president of the State Affairs of the Democratic People's Republic of Korea, said the CPC has led the Chinese people in overcoming various hardships and obstacles, vigorously advancing the great cause of socialism with Chinese characteristics, and writing a glorious chapter in the history of the Chinese nation's development.

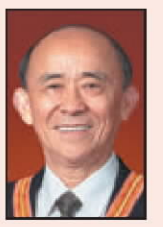
Indonesian President Prabowo Subianto, who is also chairman of the Great Indonesia Movement Party, said the achievements the CPC has made in successfully leading China in eradicating poverty and delivering well-being for the Chinese people have always served as a model for his party to learn from.

Maldivian President Mohamed Muizzu, who is also president of the People's National Congress party, expressed his gratitude to China for its steadfast support for the development of the Maldives. Muizzu said that his party cherishes its long-standing friendship with the CPC, while stressing the importance of deepening the partnership between the two parties.

Recep Tayyip Erdogan, chairman of Turkiye's Justice and Development Party, or AKP, and Turkish president, spoke highly of the initiatives and vision put forward by Xi for safeguarding global stability and prosperity. The AKP stands ready to strengthen interparty exchanges with the CPC and promote the in-depth development of cooperation between the two countries, Erdogan said.

Mahmoud Abbas, chairman of the Executive Committee of the Palestine Liberation Organization and Palestinian president, said that he highly appreciates the great achievements China has made in various fields, and expressed his gratitude to China for its long-standing and firm support for the just cause of the Palestinian people in restoring their legitimate national rights.

William Ruto, head of Kenya's ruling United Democratic Alliance and Kenyan president, emphasized that the CPC's achievements have inspired constructive reflection across the Global South on national development and governance, and have further reinforced Kenya's resolve to pursue a path of transformative growth.



Other leaders who sent congratulatory messages included those of Belarus, Serbia, Nauru, Malaysia, Singapore, Vanuatu and Samoa.

Grand celebration

A gathering to mark the 105th founding anniversary of the Communist Party of China is held at the Great Hall of the People in Beijing on Wednesday. HUANG JINGWEN / XINHUA

Meet the July 1 Medal recipients

Ma Shanxiang, 69, is a retired community worker in Chongqing. Ma joined the Communist Party of China in January 1979 and devoted over 30 years to serving residents and mediating disputes. He assisted more than 20,000 people and handled over 2,500 mediation cases. His approach to community work provided valuable insights for strengthening grassroots governance, including ideological and political education.

Wang Yuchang, 90, worked as a deputy manager of a department store in Xiaoxian county, Anhui province, after serving in the military. Wang, who has been a Party member since July 1964, enlisted in the military at 18 and developed expertise in missile technology. He later improved the techniques for missile propellant refueling and assembly procedures. He also shot down two U-2 reconnaissance aircraft by employing a tactic featuring an extremely short radar activation time and lightning-fast launch procedures. For his service, he became a recipient of first-class merit and Chairman Mao Zedong received him.

Li Liancheng, 74, is Party secretary and director of the village committee of Xixinzhuang village in Puyang county, Henan province. Li joined the Party in February 1986, and pioneered a collective economy model under which "every household has shares, everyone works and every family receives dividends". He led the village's transformation from a poor flood plain community into a national civilized village and a model of rural vitalization. Li also helped neighboring villages develop and conducted over 1,000 free training sessions for rural Party officials at a dedicated training facility, involving more than 100,000 participants.

Uhas Sulayman, 70, is a former deputy chief physician at a hospital in Yumin county, Xinjiang Uygur autonomous region. He joined the Party in November 1993 and spent decades trekking through remote mountain pastures. He traveled over 200,000 kilometers, treated more than 100,000 patients, and helped deliver over 3,200 newborns. He also established a volunteer healthcare service team and transformed his courtyard into a venue for sharing stories about healthcare development and ethnic unity in border regions.

Wu Yaqin, 65, is the first Party secretary at a community in Changchun, Jilin province. Wu joined the Party in September 1998 and has since devoted 30 years to grassroots governance. She has mediated over 1,000 disputes and developed community governance methods. She has also established a workshop, and developed more than 10 courses on community governance and Party building, which have reached nearly 30,000 grassroots governance officials.

Chen Junwu, a former consultant to the science and technology committee of China Petrochemical Corp and an academician of the Chinese Academy of Sciences, passed away in May 2024 at the age of 97. Chen joined the Party in April 1956 and devoted over 70 years to the petrochemical industry. He served as chief designer of China's first fluid catalytic cracking unit, propelling the nation's oil refining industry to the global forefront. He also tackled the global challenge of producing olefins from coal-based methanol and authored a book on China's mid- to long-term carbon emission reduction targets.

Zhao Yafu, 85, is a researcher at an organic farming cooperative in Jurong, Jiangsu province. Zhao joined the Party in February 1966 and has worked for over 60 years in hilly areas to develop modern agriculture and vitalize rural communities. He has introduced new crop varieties and farming techniques across more than 233,000 hectares, boosting farmers' incomes by over 30 billion yuan ($4.4 billion). He has put his research into practice on the land and ensured that the benefits reach farmers directly.

Zhong Jue, 89, is a professor at Central South University's College of Mechanical and Electrical Engineering in Hunan province and an academician of the Chinese Academy of Engineering. Zhong joined the Party in January 1986 and has been engaged in research for decades — from the first Five-Year Plan (1953-57) to the 15th Five-Year Plan (2026-30) period. She has solved production bottlenecks in high-performance aluminium hot rolling and overcome multiple technological bottlenecks that had long constrained the industry, contributing to China's rise as a global leader in aluminium processing.

Unveiling the secret to a 105-year-old institution's enduring vitality and strength

Mo Jingxi
Reporter's Log

When I entered the Great Hall of the People on Wednesday morning, I saw people wearing red rosettes and medals exchanging greetings and taking photos ahead of a grand gathering marking the 105th anniversary of the founding of the Communist Party of China.

The lively scene, set against the Party's history of more than a century, made me wonder what has enabled a 105-year-old political party not only to endure, but also to remain vigorous and forward-looking.

I asked several attendees the question.

Wu Meili, 69, a retired community mediator from Zhejiang province, initially responded as though I were asking about the secret to her own good health. "A strong body and a positive mindset," she said.

But soon enough Wu turned her focus to the Party. Its vitality, she said, comes from remaining true to its original aspiration of serving the people wholeheartedly.

Wu, who spent 42 years mediating disputes, said that what kept her going was doing each small task well and hearing a simple "thank you" from the people she helped.

Chen Fenxin, a veteran CPC member and a village Party chief from Shaanxi province, spoke of faith and gratitude.

Having grown up in a region deeply influenced by the revolutionary traditions of Yan'an, an old revolutionary heartland of the CPC, he views the Party's relationship with the people not as an abstract principle, but as something rooted in the experiences of his family and community.

His remarks took me back to Yan'an, a city in northern Shaanxi, where I made a visit only days earlier.

It was my first trip to the renowned revolutionary base, where Chairman Mao Zedong and other members of the older generation of revolutionaries lived and worked for 13 years. They stayed in cave dwellings and endured acute material shortages, and yet, they remained confident that their cause would one day change the fate of this country and its people.

More than 80 years ago, Mao delivered his well-known speech, titled "Serve the People", in Yan'an, declaring that the CPC's contingent was formed to liberate the people and work entirely in their interests.

China has changed dramatically since then, but the commitment to serving the people has remained a constant throughout the Party's history.

Guided by the fundamental principle of serving the people wholeheartedly, generations of CPC members have united with and led the Chinese people in an unremitting struggle, making possible all that China has achieved today.

Now, more and more young people are taking up the baton.

Among the younger faces I spotted in the hall was Zhang Zixi, a 21-year-old trap shooter, who attended as a representative of the sports community. Last year, she applied for Party membership.

Zhang told me that she was particularly encouraged by General Secretary of the CPC Central Committee Xi Jinping's call to young Chinese people to "run well their leg of the historic relay", pave the way with their youth and let their ideals shine.

For Zhang, those words have translated into a concrete goal — to train harder, to achieve better results and to see China's national flag raised at international competitions.

As I looked around me in the auditorium, the answer to my question began to unfold.

I realized that the source of the Party's enduring vitality is not a secret after all. One must stay rooted among the people, keep working, keep renewing, and never stop passing the baton.

CPC 105TH ANNIVERSARY

Hong Kong marks Party's anniversary with events

By **ATLAS SHAO** in Hong Kong
atlasshao@chinadailyhk.com

The Hong Kong Special Administrative Region will host a series of events to celebrate the 105th anniversary of the founding of the Communist Party of China.

At a launch ceremony on Wednesday, which marked both the 105th anniversary of the CPC's founding and the 29th anniversary of Hong Kong's return to the motherland, the SAR government said the lineup will include thematic events highlighting the nation's achievements in space exploration and green transformation, as well as activities across all 18 districts of Hong Kong.

The celebrations are aimed at enhancing residents' understanding of the nation's major achievements, fostering national confidence and strengthening patriotic sentiment, especially among young people, Hong Kong SAR Chief Executive John Lee Ka-chiu said.

Lee said that under the visionary concept and successful implementation of the "one country, two systems" policy, Hong Kong enjoys the unique advantages of having the strong support of the motherland while remaining closely connected to the world.

He said the Chinese nation has made remarkable achievements in improving people's livelihoods and developing the economy under the leadership of the CPC. The nation's development has provided a fundamental guarantee for Hong Kong's prosperity and progress, while the central government has consistently demonstrated deep care and steadfast support for the city, he added.

Fishing boats carrying China's national flag and the flag of the Hong Kong Special Administrative Region sail through Victoria Harbor in Hong Kong on Wednesday, to celebrate the 29th anniversary of Hong Kong's return to the motherland. WANG SHEN / XINHUA

Hong Kong's transition from chaos to order and its progress toward greater prosperity demonstrate the vitality of the "one country, two systems" framework, Lee said.

Also addressing the ceremony, Zhou Ji, director of the Liaison Office of the Central People's Government in the HKSAR, said this year marks the beginning of the 15th Five-Year Plan (2026-30), and the nation has high expectations for Hong Kong.

By integrating into and serving the country's overall development, Hong Kong will achieve better development and enjoy greater prosperity and stability, while making even greater contributions to building a strong country and advancing the rejuvenation of the Chinese nation, Zhou said.

He added that the central government has fully supported Hong Kong in responding to various challenges while preserving the city's distinctive position and strengths.

After the ceremony, Hong Kong legislator Kenneth Fok Kai-kong said the country's rapid economic development and long-term social stability have been achieved under the leadership of the CPC.

"We must fully and faithfully implement the 'one country, two systems' policy, support the SAR's governance, better integrate into and serve the national development strategy, jointly safeguard Hong Kong's long-term prosperity and stability, and contribute Hong Kong's strength to the great rejuvenation of the Chinese nation," Fok said in a written reply.

Earlier on Wednesday, the SAR government held a reception to celebrate the anniversary of Hong Kong's return to the motherland. Lee said the SAR government will accelerate the formulation of the city's first five-year plan and the development of the Northern Metropolis to consolidate Hong Kong's advantages.

A video featuring the city's first astronaut, payload specialist Lai Ka-ying, was shown at the reception. Lai, who is serving aboard the Tiangong space station, said she hopes Hong Kong will become more prosperous and stable with the nation's support.

Lu Wanqing contributed to this story.

Worker who revived electronics giant honored

By **LI HONGYANG**
lihongyang@chinadaily.com.cn

Xiao Shengli still remembers the weight of the moment in 1994. The Yonghong Equipment Factory, a State-owned manufacturer of semiconductor devices in Tianshui city, Northwest China's Gansu province, was on its knees.

Debts had soared past 90 million yuan ($13.24 million). Wages had gone unpaid for three months. Workshop machinery mostly stood idle, veteran workers were despairing, and the young were fleeing. The enterprise was sliding toward bankruptcy.

When he was handed this "mess", Xiao did not hesitate. Facing the anxious eyes of the remaining workforce, he took the factory head's post and made a solemn pledge: keep the enterprise alive, stabilize the workers, and revive growth.

What followed were brutal reforms. He launched measures, including layoffs and efficiency drives, but he started with his own family.

He persuaded his wife — a department head — to take early retirement. This meant she gave up her job and career earlier than planned, likely with a lower lifetime income and pension than if she had continued working. Then he sent his son away to find work in another city.

Xiao Shengli

Word spread quickly through the factory. Resistance melted. A disheartened workforce began to pull together.

To win back orders, Xiao and his core personnel squeezed into packed green slow trains, survived on dry bread and stayed in cheap guesthouses. They went door to door, rebuilding trust.

The effort worked: the old plant swung back to profit.

"The most critical step was to concentrate resources on integrated circuit packaging and testing. In 1996, more than 4 million yuan was poured into upgrading a plastic-encapsulated integrated circuit production line. That year, sales revenue broke through 10 million yuan for the first time — a foundation on which everything else would be built," Xiao said.

The numbers today tell the story of what grew from that "bet". By the end of 2025, Tianshui Huatian Electronics Group — the company that emerged from the ashes of Yonghong — had boosted its annual packaging capacity from 200 million units in the early 2000s to 90 billion units. It holds 778 patents, including 362 domestic invention patents and 40 international invention patents.

Huatian now ranks third in the Chinese mainland and fifth globally in semiconductor packaging and testing.

On Wednesday, Xiao was honored as one of the outstanding members of the Communist Party of China at a gathering in Beijing, which marked the Party's 105th founding anniversary.

Xiao, who graduated from Xi'an Jiaotong University in Shaanxi province in 1969, has never left the semiconductor business since then. He said that it is this lifetime of single-minded commitment that fuels his refusal to step away.

"The thousands, now tens of thousands of workers, who have struggled alongside the enterprise, are a responsibility I cannot lay down. As long as my health permits, I will guard the industry we built together," the 79-year-old said.

Alongside that personal sense of duty sits a driving national mission.

"For decades, the entire chip supply chain has been constrained by others. Packaging and testing are key links; each breakthrough we achieve bolsters China's confidence in its push for self-sufficiency. With advanced packaging breakthroughs and domestic substitution at a critical stage, I should be charging at the front," he said.

He said talent is the means to get there. "Outstanding employees are a company's most precious wealth."

By relying on its internal talent development system, Huatian has trained more than 3,000 skilled workers who now form the backbone of the business.

Meanwhile, the engineering master's program jointly established with Xi'an Jiaotong University is also nurturing a group of professionals specializing in packaging and testing — a quiet rebuttal to the assumption that talent must drain from the west to the coast.

"Huatian is where it is today because several generations of technicians and young researchers have carried the baton," he said.

"Seeing this enterprise, to which I have dedicated my entire life, continue to grow brings me a sense of fulfillment and peace of mind that nothing else can replace."

Community centers support gig sector's employees

Having finished a delivery, Hou Bo rode his electric motorbike to Yijiashan community in Yiwu, Zhejiang province — known as "the world's supermarket". Instead of rushing to grab his next order, he stepped into a community service center, took a cup of free chilled mung bean soup and topped up his water bottle.

"It's sweltering out there, and the center is a welcome break," said Hou. The community service center is an initiative implemented by the local community Communist Party of China organizations, offering one-stop support for over 6,000 food delivery riders in the area.

Party organizations in urban communities, which lead local social governance, are striving to support tens of millions of workers in new forms of employment similar to Hou's, exploring ways to integrate them into urban life and ease hardships.

"In the past, many workers would leave after a few months because of the high living costs," said Pan Zhiyong, manager of a courier station in Shanghai's Putuo district. "But when you have somewhere to rest and somewhere to live, you start to feel at home," Pan said.

With the help of local Party organizations, a community service center catering to the daily needs of people in new forms of employment and other gig workers has been built on a former parking lot in the district. It offers a 24-hour rest area, emergency medicines, charging stations, showers and laundry facilities.

To ease the housing pressures affecting gig workers, shared apartments are provided. Monthly rent for a spot starts from as low as 500 yuan ($73).

Such moves mirror a wider national trend amid the rapid growth of the digital economy and platform economy. In Beijing, more than 14,000 service hubs are clustered around zones packed with couriers and other flexible work personnel, providing seating, drinking water and rain shelters.

Wu Tao, a professor of grassroots Party building at the China Executive Leadership Academy Pudong, said the role local Party organizations play in fostering connections among people is vital to sound governance, particularly in urban communities characterized by high population density and frequent mobility.

As workers in new forms of employment, particularly delivery riders, constantly move through neighborhoods, office buildings and commercial districts, primary-level Party organizations have found that they are uniquely positioned to contribute to community governance.

New forms of employment refer to jobs that have emerged with the rise of the internet and the digital economy, including roles like food delivery couriers, ride-hailing drivers and online marketers, who rely on internet platforms for their work.

In Songnan township of Shanghai, couriers helped redesign a residential parcel-locker area after sharing suggestions based on their daily delivery experience.

"Delivery workers are often the first to notice problems in a neighborhood," said Yang Yang, a local Party official in Songnan.

The Yijiashan community of Zhejiang has even established volunteer teams that encourage delivery workers to participate in food safety monitoring, meal deliveries for elderly residents and emergency assistance.

Beyond providing support, primary-level Party organizations are also seeking to expand opportunities for long-term career development.

At the service center in Yijiashan community, training sessions on logistics certification, short-video production, livestream e-commerce and new media operations are held regularly. Apart from rest spaces and work opportunities, equal access to public services is also provided to workers in new forms of employment. Local authorities have opened cross-regional medical insurance payment channels for delivery couriers, as well as a pilot program on occupational injury insurance.

Further initiatives are underway to offer this group a more promising life in the city.

XINHUA

CPC's natl development drive lauded

Experts commend its stewardship in advancing global standing, growth

By **LIU JIANQIAO** in Beijing
and **WANG XIAODONG** in Nairobi

Chinese modernization is steadily advancing, and China's development has contributed to shared global prosperity while offering valuable experiences for developing countries pursuing their own paths to modernization, according to global experts.

As the Communist Party of China marks its 105th anniversary, its journey reflects resilience, innovation and strong leadership. Under the Party's leadership, China has undergone a profound transformation, they said.

Founded in 1921 against the backdrop of foreign aggression, poverty and failed attempts to save the nation, the CPC set out on a mission aimed at securing happiness for the Chinese people and rejuvenation for the Chinese nation.

Under the leadership of the CPC, China has grown into the world's second-largest economy, achieved major advances in science and technology, significantly improved living standards and become an important source of stability and certainty in a turbulent world.

Michael Borchmann, former head of the European and International Affairs Department of the German state of Hesse, said one of the key reasons for China's success is the CPC's unwavering commitment to a people-centered approach.

"The Party regards itself as a servant of the people, without private interests of its own, and derives the legitimacy of its governance largely from the satisfaction and support of the population," he said.

"A defining feature of this transformation has been that the Chinese people took their destiny back into their own hands. They cast off foreign humiliation and oppression, successfully lifted hundreds of millions out of poverty, and regained their national confidence and self-respect," he added.

Humphrey P. B. Moshi, professor of economics and founding director of the Center for Chinese Studies at the University of Dar es Salaam in Tanzania, said that since 1949, China has achieved remarkable progress and historic accomplishments under the CPC's stewardship.

Chinese society has undergone profound transformation in many respects, ushering in a new era of socialism with Chinese characteristics, eliminating absolute poverty and building a moderately prosperous society in all respects, Moshi said.

Peter Kagwanja, president and chief executive officer of the Africa Policy Institute, a think tank in Nairobi, Kenya, said China has transformed itself from one of the world's poorest developing countries in the 1980s into the world's second-largest economy.

> "China offers lessons and inspiration to Africa and the Global South. Its growth is an inspiration for Africa."
>
> **Peter Kagwanja,** president and chief executive officer of the Africa Policy Institute

Under the leadership of the CPC, China has made rapid progress across a number of sectors, including infrastructure, science and technology, education and healthcare, he said.

"Through its Belt and Road Initiative as well as its four global initiatives — the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative — China has amassed immense global influence, becoming a major player in international trade and diplomacy," he added.

"China offers lessons and inspiration to Africa and the Global South. Its growth is an inspiration for Africa. Poverty is not a curse for any civilization. Africa can also rise and lift its people out of poverty," Kagwanja said.

The CPC's 105-year history demonstrates that effective state governance is built on disciplined leadership, sustained capacity building, robust accountability and continuous institutional reform, said Mafa Kwanisai Mafa, a Zimbabwean Pan-Africanist researcher and political commentator.

"As nations of the Global South carve out their own sovereign paths to modernization, the CPC's century of self-improvement and decades of governance practice will remain an indispensable touchstone for scholarly inquiry, high-level policy deliberation and thoughtful localized adaptation for generations to come," Mafa said.

"In a world marked by growing geopolitical tensions, China has contributed to sustained international cooperation that is inclusive of the Global South. This has only been possible because the country is well governed," said Lawrence Loh, director of the Centre for Governance and Sustainability at the National University of Singapore.

The international community stands to benefit from China's development plans, particularly through further market opening, stronger innovation and digital partnerships, expanded trade and investment, and faster progress in the global green transition, he added.

Victor Raballa in Nairobi, Zhang Zhouxiang in Brussels and Vivien Xu in Hong Kong contributed to this story.

Space tests to aid blood and brain research

Shenzhou XXIII crew conducts a host of experiments on board Tiangong

By **ZHAO LEI**
zhaolei@chinadaily.com.cn

The Shenzhou XXIII mission crew has carried out a number of science and technology tasks since its arrival at the Tiangong space station a little over a month ago, the China Manned Space Agency has announced.

To support space medical experimentation, the Shenzhou XXIII astronauts — mission commander and spaceflight engineer Colonel Zhu Yangzhu, spacecraft pilot Colonel Zhang Zhiyuan and science payload specialist Lai Ka-ying — assisted one another to conduct ultrasound examinations on multiple body parts including the neck, wrist and abdomen.

The collected data is being used for research on blood vessel and blood flow characteristics, as well as the remodeling of sensitive muscle groups.

Zhu's team used a robot called Xiaohang to perform touch interaction tests. The results will help optimize the motion planning algorithms for in-orbit robots in future missions.

The astronauts also used electroencephalogram acquisition devices to conduct multiple experiments that cover visual-motor processing and behavioral responses to lighting conditions.

In addition, the crew members applied near-infrared brain functional imaging equipment to gather relevant data to help researchers explore the impact of long-duration spaceflights on astronauts' brain functional networks, as well as the brain's spontaneous adjustment and adaptation mechanisms in response to external environmental changes in space.

In the field of microgravity physics, Zhu and his teammates installed and repaired several world-class experimental apparatus.

Moreover, they used a diagnosis instrument, which incorporates diagnostic methods in traditional Chinese medicine, to collect physiological data, providing solid support for researchers to monitor astronauts' health in long-duration spaceflight, according to a news release from the space agency.

Apart from their routine duties, the Shenzhou XXIII astronauts used a hot air oven to prepare a dish that no crew had ever attempted — roasted pumpkin.

In 2025, astronauts from the Shenzhou XX and Shenzhou XXI missions demonstrated to the public how they used this specially designed oven to cook grilled chicken wings and steak, enjoying the first-ever space barbecue in front of the camera with great relish.

According to Liu Weibo, an engineer at the Astronaut Center of China, this world-first "space oven" can extract cooking fumes and collect food residues inside its chamber, while sealing food in place and heating it evenly.

Before China, the United States had delivered an oven in 2019 to the International Space Station and had astronauts bake cookies in microgravity as part of an experiment.

However, the cookies they made were never eaten and were instead sent back to Earth for research purposes.

The Shenzhou XXIII crew launched into space on May 24 and arrived at the Chinese space station the next day, marking China's 17th manned spaceflight and also the 11th crewed mission aboard the Tiangong.

Rodin arrives in Wenzhou

A drone unveils a statue of *The Thinker* during the opening ceremony of the Rodin Art Center in Wenzhou, Zhejiang province, on Tuesday. A Rodin-themed exhibition opened the same day, featuring more than 70 European sculptures, including 22 works by Auguste Rodin on display in China for the first time.
ZHENG PENG / FOR CHINA DAILY

New elephant protection rules realistic, expert says

By **YAN YUJIE** in Xishuangbanna, Yunnan and **ZHENG JINRAN**

Yunnan province's revised wildlife protection regulation recognizes the growing complexity of Asian elephant conservation by expanding protection efforts beyond nature reserves to habitat connectivity, scientific monitoring and human-wildlife coexistence, an internationally renowned elephant expert has said.

The revised Yunnan Provincial Regulation on the Protection of Terrestrial Wildlife, adopted in May and set to take effect on Aug 15, strengthens measures covering habitat protection and restoration, ecological corridors and migration routes, wildlife monitoring and patrols, and emergency rescue.

Ahimsa Campos-Arceiz, a Spanish ecologist and professor at the Xishuangbanna Tropical Botanical Garden of the Chinese Academy of Sciences, said the revised regulation reflects an important evolution in conservation thinking.

"I think the revised regulation is more realistic," he said. "Traditionally, conservation focused mainly on species conservation or protected areas. Increasingly, we want to move toward a more holistic approach."

Rather than viewing elephants as a species confined to protected areas, the regulation recognizes that they move across landscapes shared with people, Campos-Arceiz said.

"Elephants do not only live inside protected areas, they also live outside, where they interact with people. They need to move from one place to another, not stay in the same place forever," he said. "This new regulation acknowledges that complexity."

Campos-Arceiz made the remarks at the ongoing 62nd annual meeting of the Association for Tropical Biology and Conservation in Xishuangbanna, where more than 700 scientists and conservation practitioners from over 60 countries and regions have gathered to discuss topics ranging from tropical forest resilience and cross-border conservation to artificial intelligence and human-wildlife coexistence.

Among the regulation's new measures is support for protecting wildlife habitats beyond existing nature reserves.

It allows local governments to establish conservation zones in important wildlife concentration areas, migration routes and ecological corridors, while encouraging local community participation.

Habitat connectivity is essential because Asian elephants require extensive home ranges to survive, Campos-Arceiz said.

An adult elephant can consume about 150 kilograms of vegetation a day, requiring large home ranges because food resources need time to regenerate. Isolated populations are therefore less resilient than those able to move across connected landscapes, he said.

He cautioned, however, that the role of ecological corridors is often misunderstood. "The function of corridors is not to reduce conflict," he said. "Their role is to promote population connectivity."

Because corridors often pass through landscapes where people live and work, encounters between elephants and communities remain inevitable. Corridors therefore need to be combined with monitoring, early-warning systems and other management measures rather than being viewed as a standalone solution, he said.

"There is no single way to promote human-elephant coexistence. There needs to be multiple approaches to make it work."

The revised regulation also requires local governments in areas heavily affected by wildlife to strengthen monitoring and early-warning systems, emergency planning and preventive measures. It also stipulates compensation for personal injury and property losses caused by protected wildlife and encourages the development of wildlife damage insurance.

Campos-Arceiz said these measures collectively reflect the regulation's holistic approach, reducing risks for nearby communities while allowing elephants to move freely across the landscape.

Looking ahead, Campos-Arceiz said advances in drone technology, genetic research and long-term ecological monitoring will help make Yunnan's wild elephant population one of the best understood in the world, enabling increasingly precise conservation.

However, he said, better science alone will not eliminate conflict.

"We don't expect human-elephant conflict to finish," he said. "What we want is to make the conflict not too intense."

LOCAL SHOPPING EXPLORATIONS DELIVER THE GOODS GLOBALLY

Overseas visitors wowed by the variety, abundance and affordability of produce found in farmers' markets across China

By **ZHAO YIMENG**
zhaoyimeng@chinadaily.com.cn

Foreign residents shop for fresh vegetables at a market in Beijing's Chaoyang district on Wednesday. WEI XIAOHAO / CHINA DAILY

American-born content creator Adrianna Leigh Rommeswinkel could hardly contain her excitement.

"I've never seen this many onions in one place," she said in fluent Chinese while filming a video at a wholesale market in Dongguan, Guangdong province.

Around her were bags of various vegetables, including eggplants, fennel and asparagus. Blueberries sold for 6 yuan ($0.88) a box, and strawberries were priced at 10 yuan for two packs. The vegetables and fruits were so fresh that shoppers could still smell the soil on some of them.

"This is what real value for money looks like," said Rommeswinkel, known online as Addy. "You don't know how much these would cost in the United States!"

Her video, one of a growing number posted by foreign visitors and expatriates, has become part of a social media trend — tourists flocking to neighborhood farmers' markets.

Across platforms such as Xiaohongshu, or RedNote, TikTok and YouTube, foreign influencers are documenting encounters with unfamiliar vegetables, live seafood, inexpensive fruit and vendors willing to clean, cut and prepare purchases on the spot.

Markets selling leafy greens, ginger, fish and seasonal fruit are a routine part of daily life for Chinese residents. Yet, videos featuring foreigners marveling at white strawberries, dozens of vegetable varieties or freshly harvested produce regularly attract thousands of comments and shares.

In Tianjin, American social media influencer Evan Kail recently posted a video showing himself shopping for ingredients at a local market. "As a foreigner, even if you don't speak any Mandarin, it's super easy to come here and get around," he said to his followers.

Kail spent about 50 yuan buying green onions, tomatoes, bananas and a jar of chili bean paste for a home-cooked meal, which he estimated would cost roughly 280 yuan in the US. He was particularly impressed that vendors offered to slice vegetables and prepare ingredients according to customers' needs.

A Danish couple touring a farmers' market in China expressed similar amazement in a video posted online, "So many beautiful food items," one of them said while examining rows of vegetables. "There are so many vegetables we've never seen in Denmark."

Around the world, abundant and affordable fresh produce is far from guaranteed.

Across Northern Europe, long winters and short growing seasons mean consumers rely heavily on imported fresh fruit and vegetables during much of the year.

In South Korea, napa cabbage — a staple ingredient in kimchi — periodically experiences sharp price hikes when extreme weather damages harvests, according to media outlet Korea JoongAng Daily.

China, meanwhile, produced more than 800 million metric tons of vegetables and nearly 360 million tons of fruit in 2025, placing it among the world's largest producers.

Per capita consumption of vegetables and edible fungi rose from 96.9 kilograms in 2014 to 108.6 kg in 2024, according to data from the Ministry of Agriculture and Rural Affairs.

Today, supermarkets and traditional markets offer strawberries in winter, tropical fruit in inland cities and vegetables sourced from distant provinces thousands of kilometers away.

Much of the progress can be attributed to the Vegetable Basket program, launched in 1988 to strengthen food supply systems and ensure stable access to essential agricultural products.

Over the decades, authorities have built production bases that support the movement of vegetables from southern regions to northern cities and from western growing areas to eastern consumption centers. The expansion of greenhouse farming has further reduced seasonal constraints.

At the same time, investments in transportation and cold-chain logistics have transformed distribution networks. Produce harvested in one province can now reach consumers in another within a matter of hours.

China currently supplies approximately 1.92 million tons of vegetables and 230,000 tons of meat each day to meet consumer needs, according to the ministry. As food security concerns shift from quantity to quality, policymakers are increasingly focused on eating better rather than simply eating enough.

Earlier this year, the No 1 Central Document, China's annual rural policy blueprint, called for improving the quality and efficiency of the country's vegetable basket industries. China will focus on stronger agricultural technology, improved crop varieties, better logistics and more efficient links between farmers and markets, it said.

Experience: Openness a powerful engine of growth

From page 1

For developing countries, the message is clear: Successful reform is often less about finding the perfect design than about creating institutions and mechanisms capable of learning and adaptation.

Second, markets and governments are not rivals. For decades, development debates were framed as a choice between state-led and market-led growth. China's experience suggests that this is often a false dichotomy.

Markets provide incentives, competition, entrepreneurship and efficiency. At the same time, the government plays an important role in maintaining macroeconomic stability, investing in infrastructure and education, and supporting long-term development objectives. Sustainable development requires capable markets operating within an effective policy and institutional framework.

Third, openness is a powerful engine of growth. China's integration into the global economy accelerated technology transfer, attracted investment, expanded exports and exposed domestic companies to international competition. Participation in global markets has transformed China from a largely closed economy into a manufacturing and technological powerhouse. This shows that national development and participation in the global economy can be mutually reinforcing rather than contradictory.

This is particularly important today. Rising geopolitical tensions and growing protectionist pressures have led many countries to reassess economic integration. While legitimate national security concerns cannot be ignored, history suggests that openness generally leads to faster growth, higher productivity and greater innovation.

Fourth, economic miracles rarely occur without sustained investment in infrastructure, education and human capital. China's modernization was supported by massive improvements in transportation, communications, energy systems and public services. Equally important was the steady expansion of educational opportunities and scientific capacity. China now produces more than 5 million science, technology, engineering and mathematics (STEM) graduates annually, providing a strong foundation for continued technological innovation, industrial upgrading and future productivity growth.

China's growing strengths in advanced manufacturing, renewable energy, digital technologies and artificial intelligence reflect investments made over many years. For policymakers elsewhere, the implication is clear: Development requires long-term vision and persistent effort.

Economic development is never a finished project. Countries that succeed are not those that discover a permanent formula for growth.

To achieve successful development, solving real problems, learning from experience, maintaining the flexibility to adapt as circumstances change and ultimately improving people's lives are crucial. In an increasingly uncertain world, that may be by far the most relevant experience today.

The author is an advisory professor at Shanghai International Studies University and a former secretary of the International Monetary Fund. The views do not necessarily reflect those of China Daily.

Foreign diplomats visit province to learn lessons of transformation to global tech, innovation hub

By ZHOU JIN
zhoujin@chinadaily.com.cn

Foreign envoys to China visit the headquarters of Mingyang Smart Energy Group in Zhongshan, Guangdong province, to learn about the development of sustainable energy solutions. PROVIDED TO CHINA DAILY

Guangdong's rise impresses, inspires ambassadors

Jaime FlorCruz arrived in China in 1971 as a young Philippine student to undertake a three-week journey across the country.

Shenzhen in South China's Guangdong province was one of the stops on his travels. At that time, the city was little more than a fishing village. Within a few decades, however, he has seen Shenzhen develop into a global center for innovation, advanced manufacturing, technology, finance, and entrepreneurship.

During his visit in June, FlorCruz, now Philippine ambassador to China, reflected on the extraordinary transformation of the city into a leading global technology and innovation hub.

"Today, it is not only a symbol of China's reform and opening-up, but also a demonstration of what vision, experimentation and long-term commitment can achieve," he said.

FlorCruz, a former journalist, said his introduction to China via Guangdong was the start of a lifelong journey learning about, reporting on, and engaging with the country.

He was one of 60 diplomats from 37 countries who visited Guangzhou, Shenzhen, Zhongshan and Zhuhai in Guangdong last month.

The visit allowed them to witness the province's innovation ecosystem through technology giants, advanced manufacturing companies, renewable energy enterprises, rural vitalization and the engineering marvel of the Hong Kong-Zhuhai-Macao Bridge.

For many of the diplomats, Guangdong is more than China's largest provincial economy. During the five-day visit to the four cities, they also witnessed what they called a clear vision for the future that combines technological innovation, sustainable development, cultural heritage, and international cooperation.

Experimental experience

FlorCruz believes that Shenzhen's rise reflects a key aspect of China's development model: experimentation before expansion.

China usually launches pilot programs, then scales up the process, he said. "It experiments, adjusts, and if the model works, it is replicated elsewhere," he said.

What began as a bold experiment in Shenzhen's Special Economic Zone eventually expanded to other parts of the country, including Pudong New Area in Shanghai, the Beijing-Tianjin-Hebei region, Xiong'an New Area and the Hainan Free Trade Port, he noted.

Shenzhen is also a good example of how a city can progress if there is strong leadership at the top, united support among the residents, and collaboration between the government and the public sector.

Mongolian Ambassador to China Nyamaa Enkhbold said the trip highlighted China's success in winning public understanding and participation in the reform process.

He was impressed by the government's ability to help people embrace new ideas and become active participants in development.

"The most difficult thing is to change people's mentality," he said. "If you think something is too difficult and that you cannot do it, then you cannot do anything. But when you see other examples and learn from them, you start to think: if China can do it, why can't we?"

The ambassador, who first visited China in 1991, said that the country's progress over the past four decades has been extraordinary. "China was a completely different place at that time," he said. "In almost 40 years, it has developed beyond recognition."

Visiting Guangdong, the cradle of China's reform and opening-up, offered Enkhbold important insights into Mongolia's own transformation as it refines its development agenda.

Mongolia recently adjusted its five-year development plan and is paying close attention to China's 15th Five-Year Plan (2026-30), the ambassador said. Given the close economic ties between the two neighbors, policy coordination is of strategic importance, he added.

"At the moment, around 80 to 90 percent of Mongolian foreign trade and foreign investment is linked to China," Enkhbold said. "It is vitally important for us to align our policies and coordinate with the goals of our two countries."

Kenyan Ambassador to China Willy Bett said Shenzhen's experience in establishing itself as a special economic zone provides lessons his country can draw on.

He said Kenya now operates a number of special economic zones and is learning how to manage them effectively — from developing infrastructure to establishing the regulations and policies necessary for their operation.

Bett pointed out that China's special economic zones were established earlier under specific laws, which shaped policies, infrastructure layout, and legal frameworks.

"These are the experiences we are now picking up from Shenzhen to help our special economic zones work better for investors," he said.

Glimpse into the future

In addition to learning about experimental development in Shenzhen, the foreign envoys saw flying taxis, and robots playing the piano and brewing coffee. They also observed the fully intelligent manufacturing process for new energy vehicles and learned about the province's clean energy solutions.

Austrian Ambassador to China Wolf Dietrich Heim said one of the most memorable moments was seeing electric vertical takeoff-and-landing aircraft up close. "It was quite impressive to see in real life," he said, noting that some companies have already received certification for urban operations.

PHOTOS PROVIDED TO CHINA DAILY

> "Today, it is not only a symbol of China's reform and opening-up, but also a demonstration of what vision, experimentation and long-term commitment can achieve."
>
> **Jaime FlorCruz,** Philippine ambassador to China

He also showed keen interest during his visit to Guangzhou Automobile Group Co. "China is now very successfully producing electric vehicles that are being manufactured in Austria, and from there are sold in many European countries," he said. Austria and China have a lot of successful cooperation in the mobility sector, and in energy and green transformation, the ambassador added.

At the headquarters of Mingyang Smart Energy Group, a wind turbine manufacturer and clean-energy solutions provider based in Zhongshan, representatives and foreign diplomats held talks on cooperation and other business matters.

Last year, the company signed a strategic cooperation agreement with Sindh province of Pakistan, with Khalil Hashmi, the country's ambassador to China, signing the agreement in person. "And now I am here at the headquarters of this great company," Hashmi said, adding that Pakistan is restructuring its energy mix by adding solar, wind, hydro and nuclear power.

The country is negotiating with Chinese enterprises to launch more projects and advance bilateral energy cooperation, he said.

Kenya's ambassador Bett said the country is also advancing its transition to non-fossil energy sources, with over 90 percent of its energy currently derived from renewable resources.

"This is something we are advocating for, and seeing happen now," he said. The company's implementation of net-zero strategies provides important models for collaboration.

He added that, given Kenya's aspirations, partnerships with Chinese provinces and companies are essential to accelerating the adoption of clean energy solutions and driving sustainable industrial development.

Gateway to the world

Guangdong has long served as China's gateway to the world, and many ambassadors pointed to the province's combination of local dynamism and global connectivity.

Bett described the policy of opening-up as "a blessing to the whole world", saying that opening of China means the technologies produced domestically will be shared globally and Kenya will benefit from it.

Bett said China's growing number of imports and tariff-free treatment for many African exports could create opportunities for products such as Kenyan coffee and avocados to reach more Chinese consumers.

He highlighted the deepening ties between Kenya and Guangdong, particularly Guangzhou, which has become a major hub for Kenyan traders.

"Enhanced connectivity is playing a vital role in bringing our peoples and businesses closer together," he said, adding that direct flights between Guangzhou and the capital Nairobi have significantly strengthened links between Guangdong, Kenya, and the East African region.

"These connections are facilitating tourism, investment, business travel, and cargo movement, while opening new opportunities for cooperation between our respective enterprises and institutions," Bett added.

Looking ahead, Kenya hopes to further deepen cooperation with the province in trade, investment and tourism, he said.

As the province is an integral part of the Guangdong-Hong Kong-Macao Greater Bay Area, one of China's most economically dynamic city clusters, the ambassadors also expressed their interest in leveraging their visit to deepen bilateral and multilateral cooperation with the GBA.

FlorCruz from the Philippines said that the GBA represents the next evolution of China's development philosophy.

The region seeks to bring together Guangdong's manufacturing and innovation strength, Hong Kong's international financial and professional services, and Macao's strengths in tourism, as well as international exchanges, he said.

FlorCruz said the GBA's significance extends far beyond southern China. It is increasingly shaping economic activity and supply chains throughout Asia and beyond, he said, adding that business decisions made here increasingly affect economies across the region.

"Many of the industries driving growth here are precisely the sectors where the Philippines hopes to attract greater investment and cooperation. We welcome partnerships that create jobs, transfer knowledge, develop skills, strengthen industries, and help our economy become more competitive and innovative."

Last year, Turkiye's trade with Guangdong reached $7.8 billion, which accounts for about 15 percent of the country's total trade with China, according to Turkiye's Ambassador to China Selcuk Unal.

Unal said cooperation with the province involves machinery, equipment, food products and industrial goods.

Guangdong has become an important destination for Turkish investment, while Chinese companies from the province are increasingly investing in Turkiye, he said. "We are going to investigate more ways to increase collaboration between Turkish and Chinese companies," Unal said.

Shared opportunities

As diplomats looked beyond Guangdong's present achievements, many focused on what China's next stage of development could mean for the world.

China is implementing its 15th Five-Year Plan, which is guiding economic and social development through the second half of this decade.

Unal said that Turkiye is carefully studying the plan. He believes there will be more, and better, opportunities to coordinate joint efforts for a fairer trade basis.

Fiji's Ambassador to China Robert Lee said one of the most striking aspects of China's development is its commitment to long-term planning.

"China's development is a spectrum," he said. "Whatever stage of development a country is in, it can find a relative point on that spectrum that China has gone through."

During his Guangdong visit, Lee said he was impressed by the clarity of development goals and the determination to achieve them. "For small island countries, we need that kind of focus," he said. "China is showing what is possible."

China is also engaging with the world, and it is demonstrating that not just in words but through actions.

The Fijian ambassador said the country's 15th Five-Year Plan is expected to bring significant benefits not only to China but also to other countries as Chinese enterprises expand abroad. As Chinese companies invest overseas, they are increasingly expected to adhere to higher standards, particularly in environmental protection, governance, and inclusive development.

He emphasized that this includes ensuring local communities benefit from investment and that host economies share in the gains of development. "There is a strong commitment to win-win cooperation rather than a win for one side alone," the ambassador said.

Such priorities create important opportunities for cooperation and shared growth, he added.

Luis Oswaldo Lopez Alvarez, ambassador of El Salvador to China, said China's 15th Five-Year Plan presents significant opportunities for cooperation, particularly in emerging sectors such as clean energy and agricultural technology.

He noted that during the Guangdong visit, discussions and demonstrations on new energy development, including ocean-based energy applications, were especially interesting and offered potential areas for further exploration in Latin America.

The ambassador said the visit allowed him to better understand China's development journey and the hard work, discipline and commitment that have driven its transformation over the past decades.

He believes that in the future China will continue to make progress through its long-term planning and vision.

"We have a lot in common, and I see great opportunities for our countries to deepen cooperation and work more closely together for the benefit of our peoples," he said.

China ready to deepen ties with Colombia

Xi extends congratulations to Latin American nation's president-elect

By ZHOU JIN
zhoujin@chinadaily.com.cn

Chinese President Xi Jinping has extended congratulations to Abelardo de la Espriella on his election as Colombian president, expressing willingness to deepen bilateral exchanges and cooperation in various areas.

In his congratulatory message sent on Monday, Xi noted that China and the South American nation are strategic partners.

$23.02 billion
the value of bilateral trade between China and Colombia in 2025, up 9.5 percent year-on-year, according to data from China Customs.

Since the establishment of diplomatic relations 46 years ago, China-Colombia relations have withstood the test of the changing international landscape and maintained a sound momentum of development, he said.

Political mutual trust between the two countries has continued to deepen, the friendship between the two peoples is deeply rooted in their hearts, and high-quality Belt and Road cooperation has continued to achieve new progress, he added.

Xi said that he attaches great importance to the development of bilateral ties and stands ready to work with De la Espriella to advance the China-Colombia strategic partnership to a new level, so as to deliver greater benefits to the two countries and their peoples.

Also on Monday, Vice-President of China Han Zheng extended congratulations to Jose Manuel Restrepo Abondano, vice-president-elect of Colombia.

De la Espriella, 47, led the presidential runoff election on June 21.

Colombia's National Electoral Council on June 24 officially declared the right-wing candidate president-elect for the 2026-30 term.

The new president will take office on Aug 7.

As a nontraditional political figure, he advocates shaping national governance through an iron-fisted approach to security and drastic cuts in public spending, according to Xinhua.

Statistics show that China is Colombia's second-largest trading partner, while the South American nation is China's sixth-largest trading partner in Latin America.

According to data from China Customs, bilateral trade value reached $23.02 billion in 2025, up 9.5 percent year-on-year.

In May last year, the two countries signed a cooperation document on jointly building the Belt and Road Initiative.

On the rails

People look at the locomotive of an Etihad Rail train, the United Arab Emirates' first passenger train, on its inaugural journey at Mohammed bin Zayed City station in Abu Dhabi on Tuesday. The train, with several Chinese companies participating in its construction, will eventually connect four of the country's seven emirates, according to state news agency WAM. The Dubai station will open on Sept 30, while the main station in the neighboring emirate of Sharjah is set to be operational on March 30, 2027, according to the news agency. FADEL SENNA / AFP

Concrete actions needed to build stable Sino-US relations

By ZHAO JIA
zhaojia@chinadaily.com.cn

Foreign Minister Wang Yi has said that China and the United States should extend the cooperation list and create more positive agendas, while shortening the list of problems and managing various risks and hidden dangers, as the two countries work to build a constructive China-US relationship of strategic stability.

Wang made the remarks on Tuesday during a phone call with US Secretary of State Marco Rubio.

The Taiwan question has a bearing on the overall China-US relationship, Wang said, expressing the hope that the US side will handle Taiwan-related affairs with utmost caution.

In May, President Xi Jinping and US President Donald Trump reached a series of important common understandings in Beijing, including on building a constructive China-US relationship of strategic stability, which provides strategic guidance and sets the direction for bilateral ties over the next three years and beyond.

During the meeting, Xi said "constructive strategic stability" means positive stability with cooperation as the mainstay, healthy stability with competition within proper limits, constant stability with manageable differences and lasting stability with expectable peace.

In the phone conversation, Wang told Rubio that building such a relationship is what the two peoples desire and what the international community expects, and it also serves the fundamental interests of both countries.

The two sides should remove disruptions, overcome obstacles and move firmly in this right direction, he added.

Noting that building a constructive China-US relationship of strategic stability is not a slogan, Wang said that it requires concrete action, efforts in the same direction and sustained work over time.

He called on the two sides to uphold the spirit of equality, respect and mutual benefit, and translate the important common understandings reached by the two heads of state into specific policies and concrete measures.

Both sides agreed that the phone call between the two foreign ministers was positive and constructive, according to a press release by China's Foreign Ministry. They agreed to jointly implement the important common understandings reached by the two heads of state and continue to maintain communication in flexible ways.

President Trump made a three-day historic and landmark state visit to China in May, the first by a US president in almost nine years and his second visit to China as president following his November 2017 trip.

The two heads of state also reached important common understandings on keeping economic and trade ties stable, expanding practical cooperation in various fields, properly addressing each other's concerns, and enhancing communication and coordination on international and regional issues.

China-Eurasia Expo showcases advances in AI, robotics and drones

By YUAN SHENGGAO

Smart innovation took center stage at the ninth China-Eurasia Expo, bringing new highlights to the landmark Eurasian economic and trade gala.

For the first time, the expo set up a dedicated zone for new quality productive forces, spotlighting cutting-edge advances in artificial intelligence, the digital economy and low-altitude economy.

A rich array of smart products were showcased at the event, including laser-assisted robots that boost cotton planting efficiency, an intelligent aerospace system for cross-border ecological conservation, and intelligent robotic equipment.

Leveraging the expo's role as a national-level open platform, the Xinjiang Uygur autonomous region is harnessing AI to streamline industrial, technological and trade linkages.

The expo acts as a cooperation hub that integrates domestic and overseas resources, distinctive industries and global markets, energizing Xinjiang's opening-up and unlocking broader market, investment and growth opportunities for global players in the AI sector.

The exhibition showcased Xinjiang's latest strides in data center development, smart agriculture and smart city construction across Urumqi, Karamay and other key regions. Endowed with abundant green power and energy resources, Xinjiang is reshaping the landscape of global computing capacity.

Nearly 40 enterprises from Karamay displayed more than 170 exhibits, covering oil and gas chemicals, digital computing power, new energy and advanced materials, smart agriculture, as well as cultural and creative industries.

Traditional oil and gas equipment and high-end fine chemical products underscored the city's solid energy industry foundation, while innovative offerings such as energy storage devices, industrial drones and intelligent management systems marked its new breakthroughs in digital and green industries under the national "East Data, West Computing" strategy.

Business representatives from the United Arab Emirates visit a science and technology stand at the ninth China-Eurasia Expo and discuss cooperation opportunities on June 26. SUN ZHENSONG / FOR CHINA DAILY

From left: A flying robot exhibited at the expo. PROVIDED TO CHINA DAILY A visitor tests an autonomous mining truck system. QIN MEIHUA / FOR CHINA DAILY

Hami, as a gateway city along the Silk Road Economic Belt, presented exhibits spanning modern coal chemical engineering, titanium-magnesium and superhard advanced materials, new energy equipment, hydrogen energy, computing power, the low-altitude economy and modern logistics.

It also serves as a hub for cross-regional data transmission, as a center of the national integrated computing power network and as a national pilot city for coordinated computing and power development. The city hosts cross-border fiber-optic exit hubs for China's three major telecom operators, boasting compound strength in energy, computing, telecommunications and logistics.

"We hoped, via the expo, to further promote Hami's resource strengths, making our computing resources better empower domestic development, and also expand outreach to the countries involved in the Belt and Road Initiative, sharing China's wisdom and models to fuel growth across the region," said Li Chao, deputy head of an energy and computing integration institute in Hami.

> "We hoped, via the expo, to further promote Hami's resource strengths, making our computing resources better empower domestic development, and also expand outreach to the countries involved in the Belt and Road Initiative..."
>
> **Li Chao,** deputy head of an energy and computing integration institute in Hami

Moving forward, Hami will build a pioneering computing power zone for the digital Silk Road and a national demonstration zone for coordinated computing and power development. Centered on cross-regional data cooperation, the city will press ahead with key projects including green power supply and industrial clustering.

Guided by China's "East Data, West Computing" strategy and bolstered by its unique geographical edges, Xinjiang is accelerating the construction of a national-level computing hub that is to serve the Eurasian continent.

The region has built four major computing clusters in Urumqi, the Changji Hui autonomous prefecture, Karamay and Hami, with intelligent computing capacity totaling nearly 30,000 petaflops.

Its continuously upgraded cross-border communication network consists of 28 optical cables connecting Central and West Asia, delivering a total bandwidth of 4,660 gigabits per second. The infrastructure lays a foundation for cross-border computing scheduling, digital technology sharing and digital service exports.

Another highlight of this year's expo was the inaugural independent exhibition zone for the low-altitude economy, where multiple top-level industrial drones were revealed. The showcase demonstrated China's robust new quality productive forces and deepened industrial and economic cooperation between China and Eurasian nations.

United Aircraft, a leading domestic industrial player, brought five flagship drone series to the expo, covering scenarios such as large-scale delivery, plateau emergency rescue, oil and power facility inspection, smart agricultural operations and medical supply delivery in remote areas.

The company presented a systematic low-altitude solution tailored to Eurasia's complex terrains, revealing its development layout rooted in Xinjiang, which radiates to Central Asia and expands globally.

The expo also catalyzed the implementation of a comprehensive low-altitude economic cooperation framework signed between United Aircraft and Xinjiang Airport Group.

The two sides will jointly build a full-coverage low-altitude operation network across Xinjiang, and set up equipment technology centers and comprehensive operation service platforms targeting the Central Asian market.

Taking Xinjiang's status as China's western gateway, the partnership will promote China's mature, replicable low-altitude industry development model across Eurasia.

In addition, two synthetic biology enterprises based in Wusu — Xinjiang Guanghe Green Energy Biotechnology and Cathay (Wusu) Biomaterial — showcased their industrial achievements and advancements in fostering new quality productive forces at the expo.

A subsidiary of the Beijing-based Guanghe Green Energy Biotechnology, Xinjiang Guanghe established its presence in Wusu in 2025, specializing in the research and industrial application of microbial proteins. Meanwhile, Cathay (Wusu) Biomaterial, a repeat participant at the China-Eurasia Expo, has secured new practical cooperation outcomes at each session.

一城 CITY TALES 一街

Editor's note: *From a deteriorating residential block to a cultural hot spot, Wuhan's Lihuangpi Road offers a case study in preserving history while embracing contemporary city life.*

RESTORING URBAN MEMORY

Significant landmark and the street it sits on evolve into a vibrant tourism destination, showcasing its legacy while meeting modern demand, report **Yang Feiyue** and **Zhou Lihua** in Wuhan.

On a typical sunny afternoon, visitors can be seen sipping coffee beneath the red-brick arcades of a century-old Russian-style landmark distinguished by its domed tower, arched walkways and sprawling twin courtyards, browsing a tea exhibition tracing trade routes across Eurasia, or simply pausing for photographs.

Few would guess that just a few years ago, this landmark building on the historical Lihuangpi Road in Jiang'an district, Wuhan, Hubei province, was a crumbling residential block divided into hundreds of cramped rooms.

Known today as Bagong House (Banov's House), the complex has become one of the most recognizable stops on Wuhan's growing city-walk circuit. Yet its transformation is also emblematic of a broader story unfolding across Lihuangpi Road, a former concession-era street that has evolved into one of the city's most vibrant cultural destinations.

Stretching just 604 meters, Lihuangpi Road encapsulates more than a century of Wuhan's modern history.

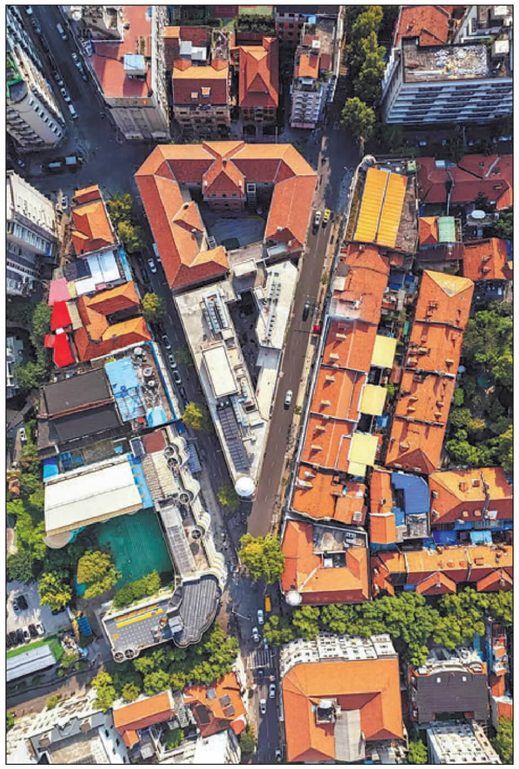
As Hankou opened to international trade in the late 19th century (when it was Qing Dynasty (1644-1911) then in the country), British, French, German, Russian and Japanese communities established a presence in what is now central Wuhan, bringing banks, trading houses and Western-style architecture to the city.

The road was laid out in 1900 in what was then the Russian residential area, known as Ima Street before adopting its current name in 1946.

Today, the street functions as an open-air museum featuring 17 historical buildings ranging from former banks and trading companies to churches, hospitals and residences. The street is also home to several important revolutionary heritage sites, including the memorial hall of the former site of the August 7 Meeting of 1927, a pivotal moment in China's modern revolutionary history, and the former residence of Soong Ching Ling, a prominent Chinese political figure and social leader.

The challenge facing local authorities over the past three decades has been how to preserve this complex historical legacy while maintaining its relevance to contemporary urban life.

Yang Li, deputy director of the culture and tourism bureau of Wuhan's Jiang'an district, says the district's conservation philosophy has undergone several stages since Lihuangpi Road was first designated for protection in 1997.



Initial efforts focused primarily on safeguarding individual historical sites, particularly revolutionary landmarks. Later, large-scale surveys expanded the inventory of protected buildings. More recently, conservation work has shifted toward district-wide renewal and quality improvement.

Following Lihuangpi Road's designation as a national-level tourism and leisure district in 2023, the emphasis moved further from preserving isolated structures to promoting integrated conservation and cultural tourism development.

"Our goal is not just to restore old buildings but to help them continue serving contemporary urban life," Yang says.

That philosophy is vividly embodied in Bagong House's restoration.

Built in 1910 by Russian tea merchants, Bagong House was originally a high-end apartment building, offering housing for bank employees and trading firms, making it an important witness to Hankou's modern urban life.

An aerial view of the Bagong House neighborhood. The whole building is constructed with red bricks, featuring a V-shaped floor plan with a triangular courtyard at its center. PROVIDED TO CHINA DAILY

Over time, however, the building lost its glory.

After the founding of the People's Republic of China in 1949, the property was taken into public ownership and repurposed as staff housing for bank employees. Over decades of residential use, residents added lofts, partitions and makeshift structures to meet growing housing demand, dramatically altering the building's internal layout.

By the time restoration planning began in 2018, the building had been subdivided into 437 rooms.

"The situation was quite severe," recalls Wang Xiang, the architect in charge of the Bagong House conservation and restoration project and director of the second design institute (ancient architecture research center) of the CITIC General Institute of Architectural Design and Research.

Original courtyards had become storage areas. Wooden structural elements had deteriorated. Walls had cracked. Doors and windows were missing. The red-brick facade was severely weathered.

Yet, beneath the layers of alteration, the building's original spatial logic and architectural character remained largely intact.

The restoration team did not rush into construction. Instead, they began with a thorough investigation.

They invited former residents to return and share their memories of the building through oral histories. They pored over archives and consulted with heritage experts. The goal was to reconstruct the building's original appearance as faithfully as possible.

"First, we had to understand what it originally looked like," Wang says.

The restoration followed four principles: preserving the original state of the cultural relic, recognizability, reversibility, and minimum intervention.

One of the most important decisions was to restore the building's original spatial logic.

Because Bagong House had been designed as a luxury apartment complex, the team determined that a boutique heritage hotel was the most compatible contemporary use, preserving the building's residential identity while giving it a new function.

Today, the building contains 45 guest rooms, most of them suites, reflecting the scale and layout of the original apartments.

Original wooden staircases, timber floors, decorative moldings, and window openings were preserved to the greatest extent possible.

One of the most challenging aspects of the restoration was conserving the red-brick facade.

The team inspected more than 560,000 bricks one by one, treating each according to its condition — some were patched, others replaced. Traditional techniques were revived to reproduce the original craftsmanship.

For architect Wang, the most successful transformation occurred in the building's courtyards. Two courtyards, once cluttered with storage, were reopened as shared public spaces. One now hosts cultural exhibitions and community events; the other has become an open garden surrounded by cafes and restaurants.

"They belong not only to hotel guests but also to local residents and visitors," Wang says.

Bagong House's cultural significance extends beyond its architecture. As an important heritage site along the historic tea road, the building now houses a permanent exhibition that tells the story of Hankou's role as a major tea trading center in modern China and the trade network that carried tea from China through Mongolia and Russia to Europe.

The integration of heritage interpretation, hospitality and public space reflects a wider strategy along Lihuangpi Road.

Historical buildings throughout the district have been adapted into museums, cultural venues, bookstores, cafes, and creative businesses while maintaining their historical character.

Meanwhile, revolutionary heritage sites have adopted new approaches to engage younger audiences.

At the memorial hall of the August 7 Meeting, visitors can participate in immersive theatrical experiences that combine historical storytelling with puzzle-solving activities. Digital technologies, including virtual-reality installations, are used to create more interactive experiences.

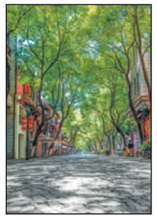
The results are increasingly visible.

According to Jiang'an district authorities, visitor numbers to the Lihuangpi Road area rose from approximately 11 million in 2024 to 15 million in 2025, an increase of more than 36 percent.

Much of that growth has been fueled by the rise of city walks, a trend that has encouraged younger travelers to explore historical neighborhoods on foot.

But local officials believe the district's popularity stems from more than social media exposure.

For Wang, lead architect of the restoration project, the site's popularity reflects years of efforts to reconnect the district's historical buildings with everyday life.



"What people see today is not the result of a single project," he says. "It comes from the gradual restoration of the entire historical area and the creation of a cultural environment that encourages people to engage with these buildings."

On the road of entrepreneurial dreams

By YANG FEIYUE and **ZHOU LIHUA** in Wuhan

On a Friday evening in Wuhan, Hubei province, warm yellow lights begin to flicker on under the plane trees along Lihuangpi Road in Jiang'an district, lighting a stretch of market stalls.

The air is filled with the aroma of coffee. A street musician sends soft, rippling notes through the crowd. Visitors gather before the century-old Bagong House (Banov's House), creating the perfect scene for a photograph. A young couple crouches in front of a stall, carefully opening a bright yellow blind box. Inside lies a piece of turquoise sourced from Shiyan, in northwestern Hubei.

"It feels like you've dug it up yourself!" says Ma Tianyu, the 24-year-old vendor, smiling at her customers.

This is the Youth Market on Lihuangpi Road, a 604-meter-long stretch built in 1900 that was once part of the Russian residential area and is now a national-level tourism and leisure district. And the most vibrant scenery here is no longer just the 17 European-style buildings or the red-brick walls, but the dreams of a new generation of entrepreneurs.

Ma was nervous when she first set up her stall in September 2023. A junior at China University of Geosciences (Wuhan), she had tried cross-border livestreaming and run a campus photography team.

When her teacher suggested trying the newly launched Youth Market on Lihuangpi, she gave it a shot, with just half a stall.

That day, she sold crystals, rough stones and mineral specimens. From morning till dusk, there was barely a moment to sit.

"I went home with a hoarse throat," she recalls. When she counted the day's earnings — over 4,000 yuan ($588) — Ma was stunned.

"I'd tried many markets in Wuhan, but Lihuangpi Road felt different," she says.

"It's an ecosystem. The Soong Ching Ling Memorial Hall, Bagong House, the site of the August 7 Meeting of 1927, a pivotal moment in China's modern revolutionary history, are nearby. Many tourists come specifically to see this place," she explains.

The crowd, mostly young people in their 20s and 30s, is a perfect match for her products. "It felt like I'd left a world of children and entered a world of adults," Ma laughs.

In August 2024, with help from the local Youth League Committee, Ma and her partner, Han Yue, moved into a second-floor studio in the neighborhood. The window faces the iconic Bagong House.

"When I get tired, I stand up and look out. The street is bustling, and the weather is nice. It refreshes me, and then I go back to work."

The two young women sell mineral blind boxes, crystal bracelets and custom jewelry — most priced between 69 yuan and several hundred yuan. Their breakout product came from an unexpected source: a 10-year-old boy.

"We used to sell 'see-through' mineral boxes — transparent, everything visible. People would pick them up, look, and put them down," Ma says. One day, the boy stared at the box for a long time and said, "If it were a blind box, I might actually buy one."

When Ma asked why, he told her that blind boxes are exciting because it's like "digging it out yourself."

She and Han took his advice. Within two weeks, the "see-through" box became a bright yellow blind box, printed with the words, "A letter from the earth". On its first day, all the boxes sold out.

Now, since her first half-stall, Ma's products have expanded from mineral blind boxes to custom jewelry and crystal accessories. Her average daily transaction value has grown to hundreds or even thousands yuan.

Ma is one of hundreds of young entrepreneurs who have found success in the Youth Market on this historical street.

Officially launched in September 2023, the market now runs every Friday through Sunday, hosting about 100 stalls along a 100-meter stretch of Lihuangpi Road. By late 2025, it had held 200 sessions involving more than 500 students from over 20 colleges.

"The market isn't just a place to sell," says Yang Peidi, who oversees the market.

"It's a launchpad. Many of these vendors have their studios right upstairs — it's a 'workshop upstairs, market downstairs' model. We keep entry costs low and control the mix of products: no more than two woodcarvers at a time, for example, to avoid unhealthy competition," he adds.

For promising vendors, further support is available at the Chuangjian Jiang'an youth innovation center, located about 800 meters from Lihuangpi Road. The center offers a year of rent-free workspace, free intellectual property legal advice, and low-interest loans. Since 2025, 50.85 million yuan in such loans have supported 210 small businesses.

Zhang Jinfeng, 33, is one of those who found her footing here.

She has been making leather goods for 11 years since she moved from southwestern Sichuan to Wuhan in 2015 as a fresh graduate, after stumbling upon a video of an overseas craftsman.

"I thought, 'If he can do it, so can I'," she recalls. She then bought tools and leather and taught herself.

For the first three years, she mostly took orders through her social media feed. But growth was slow. She began trying out markets across the city. In 2022, she joined the Youth Market (on trial then) on Lihuangpi Road for the first time. It poured that day. As she scrambled to cover her leather goods — rain is leather's enemy — a customer told her not to worry and she would wait in a nearby coffee shop.

When the rain stopped, the customer returned and bought a bag.

That moment stayed with Zhang, as in most markets she had tried, customers came and went in a rush.

"There's a rhythm to commercial markets — fast in, fast out. No one has time to listen to your story," she says. "But Lihuangpi Road is different. People slow down."

That day, Zhang decided that these were the customers she wanted to build her business around.

"My leatherwork takes hours, sometimes days, to complete. It is a slow business, and I have found many customers here appreciate that," she says.

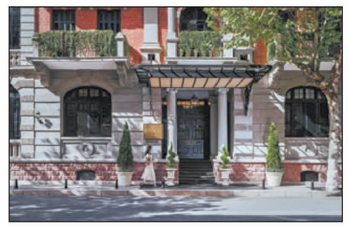
In April 2025, she moved her studio from Huangpi, a suburban district of Wuhan, to a second-floor space right above her Lihuangpi Road market stall.

Now, she sells at a ground-floor stall and cuts, stitches, and assembles leather in a second-floor studio directly above it.

"My bags cost several thousand yuan," she explains. "If a customer sees them for the first time at a stall, they might hesitate. The stall could be gone next week. But if I bring them upstairs to see my workspace, choose the leather, and watch me work, I build trust."

The model has paid off. More than 60 percent of her repeat customers come from market encounters. "If someone thinks of a leather item they can't find anywhere else, they probably think of me."

In her spare time, Zhang stands by her second-floor window, looking down at the street below. The tall plane trees forming a green tunnel, the sunlight falling on red-brick walls, and the outdoor cafe tables have a way of soothing one's mind, she says.



"This is a street that makes you, almost without realizing it, slow down," Zhang says. "And when you look around, everyone is smiling."

Ma Tianyu also likes to glance out the window when work gets tiring. "The street is lively, the weather is good, and the old building across the way is beautiful to look at," she says.

"Lihuangpi Road is where my dream started, and it will be where my dream continues."

Above: Shaded by plane trees, visitors stroll at a leisurely pace along Lihuangpi Road. **Below:** After restoration, the century-old Bagong House has been transformed into a boutique hotel that reflects the city's historical and cultural heritage. **Bottom:** A three-story Western-style building that houses the memorial hall of the former site of the Communist Party of China's Central Committee in Wuhan. Anniversary address offers Party guidance to build China into a modern socialist nation

The 105th anniversary of the founding of the Communist Party of China has offered the opportunity for the Party's leadership to articulate how it views the Party's future trajectory at a time when profound changes are transforming both the domestic and international landscape.

Addressing a gathering marking the occasion, Xi Jinping, general secretary of the CPC Central Committee, called on Party members to remain steadfast in their convictions and work tirelessly to fulfill the Party's missions in the new era and on the new journey.

Hailing the 105-year history of the Party as the "most magnificent epic" of the Chinese nation, he urged the Party to press ahead to build China into a modern socialist country on schedule.

His address reaffirmed the Party's consistent emphasis on political continuity and long-term planning in pursuit of the country's high-quality development objectives.

Underscoring continuity as an important source of policy stability, he stressed that "time stops for no one", and that the whole Party must adhere to its basic theory, basic line and basic policy to "remain undaunted by passing clouds and stay on course through wind and waves".

"It is imperative that all of us in the Party never forget our original aspiration and founding mission, that we always stay modest, prudent, and hard-working, and that we have the courage and ability to carry on our fight," Xi said.

Equally prominent was the emphasis he put on the people as the driving force behind national development.

China's modernization is linked not only to economic growth but also to improving public well-being, expanding opportunities and strengthening grassroots governance.

Xi's address echoed this perspective by underscoring the importance of relying closely on the people to create new historical feats. Xi urged Party members to "further reinvigorate the enterprising spirit for getting things done".

The sustainable development of China ultimately depends on broad public participation and should bring about tangible improvements in people's livelihoods.

Global economic headwinds, geopolitical tensions and accelerating technological competition have all contributed to a more challenging international landscape. Against this backdrop, Xi called on the whole Party to actively respond to risks and challenges on the path ahead.

"China's development is now in a period where strategic opportunities coexist with risks and challenges, and where uncertain and unpredictable factors are on the rise. We must always be prepared to withstand major tests of high winds and raging waves, and even violent storms," Xi warned.

That entails resilience and preparedness as enduring priorities rather than temporary responses to specific events. So greater emphasis should be placed on coordinating development with security and strengthening governance capacity across multiple sectors.

The world has entered a new period of turbulence and transformation, with humanity once again standing at a crossroads of choice. Yet China's vision for international engagement remains constant.

"We must continuously promote the building of a community with a shared future for humanity," Xi said.

China will continue promoting multilateral cooperation and dialogue as the means to find solutions to shared global challenges. Xi's address reinforced that position by linking China's domestic modernization with its broader engagement in international governance.

The importance attached to Party self-governance also featured prominently throughout Xi's remarks. Continuous efforts to strengthen discipline, improve governance effectiveness and maintain organizational vitality have become characteristics of Party-building endeavors.

He stressed advancing full and rigorous Party self-governance with sustained efforts to win "the tough, protracted and all-out battle against corruption".

The CPC has grown from a small group of just over 50 members when it was founded in 1921 to be the world's largest governing party with tremendous global influence. According to the latest census, the CPC now has nearly 101.29 million members and over 5.43 million primary-level Party organizations.

At the gathering, Xi conferred the July 1 Medal, the Party's highest honor, on model CPC members, whose work spans scientific innovation, rural vitalization, public services and community development. The recognition of their achievements demonstrated how dedication, professionalism and service at the grassroots level are regarded as essential contributions to Party building and national development.

Viewed together, the Wednesday gathering presents a coherent picture of China's current development priorities. Mutually reinforcing political continuity, people-centered development, resilience in the face of uncertainty, international cooperation and strengthened Party governance will help the country advance on the next stage of its modernization journey.

Upholding sovereignty defends rule of law

In the South China Sea, the rule of law is the bedrock of peace and stability. On Tuesday, the People's Liberation Army Southern Theater Command and the China Coast Guard conducted patrol operations in the waters surrounding China's Huangyan Island.

And Chinese Foreign Ministry spokesman Lin Jian confirmed last month that Chinese researchers had conducted a comprehensive survey for a deeper understanding of the island's ecosystem.

Turning a blind eye to the legitimacy of these moves, the Philippines has repeatedly attempted to discredit them through misleading narratives.

Since June, the PLA Southern Theater Command has increased patrols in these territorial seas as a legal and necessary countermeasure against repeated violations and provocative acts by the Philippines and some external forces. China is simply exercising its right to self-preservation and legal administration over its own land and waters.

The Chinese Ministry of Natural Resources released the "Assessment Report on the United Nations Convention on the Law of the Sea — Achievements, Positioning, and Challenges" on Tuesday. The report lays bare the hypocrisy underlying the so-called "rules-based order" pretext that the Philippines and its allies invoke to encroach upon China's core interests in the South China Sea.

The report was released against the backdrop of the continued abuse of the United Nations Convention on the Law of the Sea by the Philippines to promote its illegal "South China Sea arbitration case".

Let's be clear: The 2016 arbitration was a political farce disguised as a "legal proceeding". China's position of nonacceptance and nonparticipation was a defense of the integrity of UNCLOS itself.

As the report elaborates, the Philippines' core strategy relies on legal manipulation. It packaged a dispute over "territorial sovereignty" — which UNCLOS explicitly has no jurisdiction over — as a dispute over maritime rights. By ruling on maritime rights, the illegal tribunal implicitly ruled on sovereignty, overstepping its mandate.

This is a "procedural trick", a weaponization of international law that undermines the credibility of UNCLOS and threatens to turn the oceans into a theater of confrontation.

Since joining UNCLOS nearly 30 years ago, China has been one of the most consistent and faithful practitioners of the Convention. It has walked the walk by fully implementing the Declaration on the Conduct of Parties in the South China Sea and steadfastly advancing the consultations on the Code of Conduct in the South China Sea.

While the Philippines plays tricks with the law, China encourages dialogue. While the United States distorts "freedom of navigation" to justify its gunboat diplomacy, China promotes the Global Security Initiative focused on shared security.

The report rightly criticizes those who preach a "rules-based international order" while blatantly practicing double standards. Certain countries use UNCLOS like a menu — picking and choosing provisions that suit their "freedom of navigation" provocations while ignoring rules that protect coastal state sovereignty. They misuse terms such as "international waters" to obfuscate the legal concept of an Exclusive Economic Zone, and they encourage the Philippines to act as a proxy in a destabilizing game.

It is time for all parties to stop indulging in such tricks and return to the negotiating table to accelerate the finalizing of the COC in the South China Sea. As the common home of regional countries, the South China Sea should become a sea of peace, friendship and cooperation.

Opinion Line

Nordic countries show EU there is an alternative path

When some in Europe talk about China these days, the conversation often oscillates between "anxiety" and "arithmetic". The "anxiety" is geopolitical; the "arithmetic" concerns "trade imbalances". Yet the more interesting story may lie in one part of Europe that has historically displayed pragmatism over panic: the Nordic region.

Foreign Minister Wang Yi's weeklong visit to Denmark, Sweden, Finland and Norway starting on Thursday is a reminder that some of Europe's earliest diplomatic ties with the People's Republic of China were built less on ideology than on realism and a shared belief that different countries benefit from an open international order.

In recent years, China has deepened cooperation with the Nordic countries in technology, trade, investment, the green transition and people-to-people exchanges, and both sides have repeatedly found common ground on multilateralism, free trade and climate governance.

Wang's trip comes after the inaugural meeting of the China-European Union trade and investment consultation mechanism. It is important for Beijing to engage those European voices that still believe trade disputes should be managed through negotiation rather than through an escalating cycle of restrictions.

China is Denmark's largest trading partner in Asia and its second-largest overseas investor. The bilateral trade in goods reached $18 billion in 2025. Denmark exports pharmaceuticals, agricultural products, precision instruments and energy equipment; China exports machinery, textiles and consumer goods. Around 500 Danish companies — from shipping and pharmaceuticals to wind power and biotechnology — operate in China.

China is Sweden's largest trading partner in Asia, while Sweden is China's largest trading partner in the Nordic region. Bilateral trade reached $19.37 billion in 2025. Swedish companies in China span telecommunications, home appliances, pharmaceuticals and retail. Chinese investment in Sweden has also become substantial.

Finland's partnership with China has increasingly focused on future-oriented cooperation. Trade remains broadly balanced, with China importing significant volumes of Finnish goods and technology while exporting consumer and industrial products. More importantly, the relationship has been reinforced by logistics connectivity, including multiple China-Europe freight rail links connecting Chinese cities with Helsinki and beyond.

China is Norway's largest trading partner in Asia, and the bilateral goods trade exceeded $11.4 billion in 2025. The two countries have developed long-standing cooperation on environmental governance, culminating in a joint statement on establishing a green transition dialogue during the Norwegian prime minister's 2024 visit to China. Few areas are more strategically important for Europe than the race to decarbonize industry, shipping and energy systems.

A fashionable narrative in Brussels is that the EU's economic relationship with China is defined primarily by "trade imbalances". The Nordic data, however, suggest a more nuanced picture: trade that is relatively balanced, investment that flows both ways and cooperation that generates mutual gains.

The deeper question is whether the EU wants to reduce risk or reduce opportunity. China's 15th Five-Year Plan (2026-30) prioritizes advanced manufacturing, green technologies, digital infrastructure and domestic consumption. For European companies with competitive strengths in pharmaceuticals, clean energy, industrial equipment, logistics and high-end services, this represents what some economies have come to recognize as the advent of "China Opportunity 2.0".

To reject that opportunity wholesale would be an odd form of economic self-denial for a continent struggling with slow growth, aging populations and competitiveness concerns.

None of this means the EU should ignore differences with China. The Nordic countries have various disagreements with Beijing, but these have not become a veto on cooperation. Mature diplomacy consists precisely in expanding areas of common interest while managing areas of disagreement.

That may be the real significance of Wang's Nordic itinerary. The numbers from Copenhagen, Stockholm, Helsinki and Oslo suggest that engagement with Beijing has produced something more complicated than dependence: it has produced mutually beneficial engagement. And in a fragmenting world, that remains an asset worth preserving.

— LI YANG, CHINA DAILY

What They Say

Manufacturing growth momentum continues

Editor's note: *China's official purchasing managers' index for the manufacturing sector rose to 50.3 in June, up 0.3 points month-on-month, data from the National Bureau of Statistics showed on Tuesday. Xinhua News Agency spoke to Huo Lihui, an NBS statistician, and Wen Tao and Wu Wei, both analysts at the China Logistics Information Center, to interpret the data. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

The primary driver of this growth is domestic demand. At the same time, external demand showed signs of recovery, with new export orders index rebounding to 50.1 in June, marking a return to expansion territory.

Supported by demand, the manufacturing sector maintained steady growth in output. On a quarterly basis, the production index stood at 51.4 in June, higher than both the first-quarter average and the level recorded a year earlier.

Sales also remained relatively smooth in June. The finished goods inventory index fell 1.6 points from the previous month to 47.7, suggesting that inventories were being cleared at a faster pace.

While stronger production activity boosted purchases of raw materials, the growth in prices of manufacturing raw material slowed down significantly in June, largely due to the decline in international prices of major commodities such as crude oil and industrial metals.

The data also point to a clear shift toward new growth drivers in the manufacturing sector, with consistent improvements in the industrial structure. This positive trend has strengthened business sentiment. The manufacturing business activity expectation index rose to 54.3 in June, up 0.4 points from the previous month, reflecting growing confidence among manufacturers.

The nonmanufacturing business activity index also improved in June, rising 0.1 point from the previous month to 50.2. As more reserve projects move into the construction phase, the demand related to infrastructure development is expected to rise further. More specifically, the construction business activity index increased by 0.2 points from the previous month, while the sector's business activity expectation index came in at 51.1, indicating that expansion is expected to continue.

The improvement in manufacturing activity is also spreading to the distribution sector. In June, the wholesale business activity index climbed above 52, up by more than 4 points from both the previous month and the same period last year. Meanwhile, the new orders index also rose above 50, increasing by more than 5 points from both a month earlier and a year earlier.

As policies aimed at stabilizing growth and expanding domestic demand gain further traction, latent demand in both investment and consumption is expected to translate more quickly into actual demand, reinforcing the foundations for steady and sustained economic growth.

One issue that warrants attention is that the new orders index has fluctuated more sharply than the production index this year, mainly because exports remain susceptible to changes in the international environment. Given persistent geopolitical uncertainties, the sustainability of the recovery in market demand will require close monitoring.

VIEWS

China and the World Roundtable | Wisdom of Governance for Shared Growth

Editor's Note: *The 2026 Think Tank Forum on National Governance in Developing Countries was held in Beijing on June 26 under the theme "Mission and Contributions of Political Parties". The forum was co-hosted by the Party School of the CPC Central Committee (National Academy of Governance), Institute of Party History and Literature of the CPC Central Committee, China International Communications Group and China Daily. Below are excerpts from speeches by four participants, as reported by China Daily's Li Wei.*

Chinese governance stays true to its mission

BRI anchors global initiatives implementation road map

José Luis Centella is chairman of the Communist Party of Spain.

The Belt and Road Initiative is a foundational framework that provides a practical platform and institutional support for implementing the four major global initiatives proposed by President Xi Jinping: the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative, and the Global Governance Initiative.

The BRI framework translates these initiatives from vision into action by providing the mechanisms and momentum for implementation. Together, the BRI and the four global initiatives form a comprehensive road map for building a global community with a shared future for humanity.

The Global Development Initiative seeks to accelerate the implementation of the Sustainable Development Goals through pragmatic cooperation, thus narrowing development gaps and strengthening capacity building. The BRI provides the material foundation for this vision through infrastructure connectivity, financial integration and digital cooperation.

The Global Security Initiative advocates dialogue and consultation, mutually beneficial cooperation, and rejects bloc confrontation and zero-sum rivalry.

By fostering positive economic interdependence, enhancing regional connectivity and promoting inclusive development, the BRI serves as both a stabilizer and a binding force.

The Global Civilization Initiative calls for equality among civilizations, respect for cultural diversity, and deeper exchanges and mutual learning. Through training programs, academic exchanges, think tank cooperation and people-to-people interactions, the BRI transforms these principles into tangible practice.

Finally, the Global Governance Initiative envisions a more just, equitable, representative and development-oriented system of global governance. The BRI creates the practical space to advance this vision by establishing new platforms for multilateral cooperation, promoting cooperation without any political conditions, and amplifying the voice of the Global South.

Against this backdrop, the historical mission of political parties is to recognize that governance modernization is not merely a technical undertaking.

It is equally a matter of vision, collective leadership and the capacity to build broad social consensus.

Progressive political parties across both the Global North and the Global South face three common tasks: to chart development paths suited to their national conditions; to build modern, efficient and transparent systems of governance; and to make full use of the BRI and the four global initiatives to advance their modernization.

SHI YU / CHINA DAILY

In an increasingly uncertain world, conflicts can be resolved only through dialogue and negotiation.

Working in concert, the BRI and the four global initiatives point the way toward a more inclusive, balanced and development-oriented model of global governance.

CPC governance illuminating for Latin America

Héctor Villagrán Cepeda is a professor at the Beijing Language and Culture University.

China and Latin America share profound historical affinities.

The Communist Party of China, through a century of evolution, has built a comprehensive and systematic organizational governance system that underpins long-term national stability and sustainable development. This experience is not a rigid model to copy mechanically, but a set of practical, actionable lessons worthy of Latin American parties' localized reference.

A chronic problem for Latin American party politics is the four- or five-year electoral cycle that dominates all policy logic.

The CPC's core organizational strength lies in its capacity to formulate long-term national development strategies in phases and maintain consistent implementation across successive leadership teams.

For Latin American parties, this means constructing internal institutional mechanisms to lock in long-term national development frameworks, decoupling core national strategies from partisan turnover, and establishing permanent internal research bodies to conduct forward-looking studies on industrialization, rural revitalization, and regional integration so that social progress does not stall with changes in the power structure.

Latin America suffers from party fragmentation and weak grassroots engagement. Most political parties rely heavily on elite networks, media campaigns and celebrity candidates, while maintaining only a limited presence in rural, marginalized and indigenous communities, as well as labor unions.

The CPC's distinctive organizational strength lies in its extensive grassroots network, with party branches embedded in villages, communities, factories, schools, enterprises and social organizations, creating direct links with people across society.

These branches serve as permanent platforms for gathering public concerns, mediating conflicts, delivering public services and mobilizing participation.

For Latin American parties, the lesson is to move beyond election-driven mobilization by establishing a lasting grassroots presence, strengthening dialogue with local communities, and transforming party organizations into year-round public service providers rather than campaign machines.

There exists no universal, one-size-fits-all party governance model. The CPC's organizational system evolved from China's unique historical, cultural, and national conditions. Instead of mechanically copying it, Latin American parties should adapt the referenced experiences to their own regional realities, indigenous cultures, institutional frameworks, and social structures.

Sinology, civilization and the mission of governance

Duan Peng is the president of Beijing Language and Culture University.

The CPC has led the Chinese people toward modernization by giving an ancient civilization a modern political form. Whole-process people's democracy, common prosperity, and high-quality development are not borrowed doctrines.

They are contemporary expressions of a civilization that has continually renewed itself, translating China's enduring political tradition into modern governance.

Developing countries face common challenges: reducing poverty, sustaining growth, safeguarding security, preserving cultural identity, and building independent narratives. The deeper question is how to modernize without being defined by external discourses, drawing instead on their own civilizational heritage.

A mission gives governance its civilizational direction. Its success, however, depends on whether political parties can forge a consensus on good governance while respecting their differences. Such consensus does not require uniformity.

It grows from a genuine understanding of one another's civilizational logic. Bridging that gap demands more than linguistic translation — it requires people who can interpret one civilization through the lens of another.

These individuals need not copy China's experience, but adapt governance principles proven in practice to local realities and turn them into institutions that suit their societies.

For too long, political parties across the developing world have been spoken for rather than heard.

The answer is not louder messaging, but a shift from political advocacy to the exchange of governance knowledge.

Sinologists are natural interpreters, making Chinese governance intelligible across cultures while enabling other countries to explain their own development paths in concepts and narratives that resonate globally, securing a more equal voice in global governance.

Today, there is an opportunity to build a more pluralistic, development-oriented body of global knowledge — not to promote a single model, but to encourage equal dialogue, mutual learning, and stronger governance across the developing world.

As barriers to knowledge recede, greater understanding among political parties can translate into deeper cooperation, enriching global governance with the experience and wisdom of the developing world.

The new mission of political parties

Tamara Duisenova is the director of the Academy of Political Management of Kazakhstan and the former deputy prime minister of Kazakhstan.

Throughout history, political parties have been more than just participants in political systems. They are institutional vehicles through which societies respond to the challenges of the time.

During the formation and consolidation of nations, political parties united people around a shared vision of national development. Their historical mission, therefore, has never been limited to winning elections. Rather, it has been to forge social consensus about the future.

Every era places different demands on political institutions. The 20th century was characterized by political parties mobilizing hundreds of millions of people in pursuit of national goals.

Today, the political landscape has changed. People now have instant access to information and unprecedented opportunities to voice their opinions. They no longer seek merely to be heard — they aspire to help shape decisions.

Citizens want a say in setting priorities for urban and rural development, participating in the allocation of public resources, contributing to national policymaking discussions, and overseeing the implementation of public decisions.

Against this backdrop, the historical mission of political parties is evolving. Today's political parties must do more than represent social interests; they must also build effective mechanisms that enable citizens to participate in national governance.

In the interconnected world, political parties shoulder responsibilities that extend well beyond their domestic roles.

They are also becoming important actors in public diplomacy — promoting mutual understanding among nations, facilitating the exchange of governance experience and fostering trust, without which sustainable development cannot be achieved.

We attach great importance to the development of the China-Central Asia dialogue mechanism and firmly believe that closer cooperation between political parties will significantly contribute to strengthening friendship between our peoples.

The views don't necessarily reflect those of China Daily.

Cheng Guodong and Niu Fujun

The engineering triumphs of building the world's highest railway

On July 1, 2006, the sound of a train whistle echoed through the Kunlun Mountains, heralding a new era for the Xizang autonomous region. The Qinghai-Xizang Railway, a marvel of modern engineering, linked the world's highest plateau to China's national rail network, ushering in unprecedented connectivity for the region.

Beneath the tracks lies a fragile foundation of frozen ground that is highly sensitive to temperature changes. Maintaining its stability has required not only engineering prowess but also sustained scientific efforts spanning more than half a century.

When we first tackled this challenge, the global experience in permafrost engineering was sobering.

Projects in cold regions worldwide faced alarmingly high rates of deformation and structural damage. Permafrost is not a static entity. It changes with the seasons, expanding and contracting as ice melts and refreezes. Over time, this cycle can quietly destabilize even the strongest structures.

Conventional engineering relied on insulation — raising embankments and adding protective layers to cocoon the ground in thermal stability.

But we soon realized that this approach had its limits in a warming climate. Ice cannot be preserved indefinitely by simply covering it with a blanket.

The Qinghai-Xizang Plateau required a new approach. We proposed an "active cooling and protection" strategy, working with nature rather than against it.

The idea was to build a system that works like a natural refrigerator without electricity. By redesigning embankment materials and structure, we created a self-regulating thermal system — enhancing heat release in winter while minimizing heat absorption in summer. Over the course of a year, the ground effectively cools itself.

Technologies such as shaded surfaces, ventilation ducts, thermosyphons, and crushed-rock layers were integrated into a cohesive system. Together, they allowed the railway foundation to maintain long-term thermal stability using only natural energy flows. No external power was required — just the seasonal rhythm of the environment.

This innovative approach has redefined permafrost engineering internationally. The Qinghai-Xizang Railway has become a scientific demonstration of construction in one of the world's most climate-sensitive regions.

The inaugural journey of the train on July 1, 2006 covered 1,142 kilometers and took just over 13 hours.

As night fell and the train crossed the Kunlun Mountains, some of us fell asleep. This was surprising because at altitudes above 4,000 meters, we had expected discomfort.

But the ride was smooth, the oxygen supply stable, and the temperature carefully controlled. In that moment, engineering success was no longer abstract but directly experienced.

In many ways, that was only the beginning. Since then, continuous monitoring systems have tracked the thermal behavior of permafrost along the route. The data confirm the success of the cooling system but also point to an emerging challenge: climate change.

Temperatures across the plateau are rising, and changes in precipitation patterns are accelerating permafrost degradation, increasing risks such as ground settlement and slope instability.

This raises a difficult question: can the original engineering design withstand a warmer future? To explore this, we turned to an unexpected natural laboratory in northern China.

In Pingquan, Hebei province, far south of the Qinghai-Xizang permafrost zone, a surprising phenomenon exists: isolated patches of permafrost survive in a region with an average annual temperature of 7.3 degrees Celsius.

In summer, surface temperatures exceed 30 degrees Celsius, yet less than one meter below a layer of crushed rock, the ground remains below freezing temperatures. Locals once used this natural "cold storage" to preserve food.

Field studies revealed the mechanism. In winter, cold air circulates through the porous rock layer, removing heat through strong convective exchange. In summer, that same structure blocks heat penetration. The result is a natural thermal valve — seasonal, self-regulating, and remarkably stable.

The same principle is used for the railway: crushed rock layers are not passive insulation, but active thermal regulators driven by natural convection.

Pingquan provides a powerful real-world validation. If permafrost can survive in such a warm region under the right conditions, then the engineering logic behind the Qinghai-Xizang Railway remains robust — even in a warming climate — provided that cooling systems are properly maintained and adapted.

Still, the challenge is no longer purely technical. It is temporal. The climate is changing faster than expected, and engineering systems must evolve accordingly.

Ongoing research now emphasizes preventive mitigation, system-wide cooling strategies, structural reinforcement, and improved water management.

Twenty years on, the results are undeniable. By 2026, the railway has transported over 100 million tons of freight. Trains continue to run at 100 kilometers per hour across the permafrost zone — a record speed for any railway built on frozen ground anywhere in the world.

The Qinghai-Xizang Railway has often been described as a miracle of modern engineering. But it is not a miracle in the mystical sense. It is the product of sustained scientific inquiry: of field observation in extreme conditions, of theoretical breakthroughs, and of decades of continuous monitoring and refinement.

Beneath the steel tracks lies another infrastructure — less visible, but equally important. It is the infrastructure of knowledge: hypotheses about ground ice formation, models of thermal dynamics, and thousands of data points collected under harsh high-altitude conditions.

The railway is, in this sense, not only a transport corridor. It is a living laboratory of how humans can work with one of the most fragile environments on Earth.

As China prepares further upgrades to the line, including electrification, the journey of the "sky road" continues. Its future will depend not only on stronger trains or faster systems, but on whether science can continue to stay one step ahead of a changing climate.

For now, the Qinghai-Xizang Railway stands as both an achievement and a reminder: that even on frozen ground at the edge of habitability, human infrastructure can endure — when it is built not against nature, but in conversation with it.

Cheng Guodong is an academician of the Chinese Academy of Sciences, recipient of the International Permafrost Association Lifetime Achievement Award and a researcher at the Northwest Institute of Eco-Environment and Resources of the Chinese Academy of Sciences and Shanghai Normal University; and Niu Fujun is a researcher at Shanghai Normal University and former executive deputy director of the State Key Laboratory of Frozen Soil Engineering.

GLOBAL VIEWS

ONG TEE KEAT

Vanguard of the world's majority

The CPC can take pride in its 105-year legacy in helping reform global governance in the interest of inclusivity and fairness

The birth of the Communist Party of China in 1921 was a timely, historically necessary response to a nation then languishing under the miserable subjugation, intimidation and sovereign butchery perpetrated by the foreign imperialist powers. From its very inception, the CPC's revolutionary trajectory has been indissolubly intertwined with the well-being of the Chinese people and the future of the nation, remaining firmly rooted in the popular interests it vows to represent.

The founding of the People's Republic of China in 1949 — forged through the blood, toil, tears and sweat of the CPC — marked the tectonic emergence of a transformed China on the world stage. Crucially, the dire, immediate necessity of rebuilding an impoverished, war-torn nation did not deter the young administration from proactively partaking in the formulation of the Ten Principles of the Bandung Conference. These principles laid the indispensable foundations for the Non-Aligned Movement during the height of the Cold War. By steadfastly standing alongside the developing world, the CPC chose the right side of history. This unwavering alignment has long resonated with the deepest aspirations of the global majority. Today, China's consistent, unyielding commitment to the United Nations Charter continues to rekindle global hopes for promoting a fairer, more just and inclusive international order.

In resisting hegemony, China, under the visionary stewardship of the CPC, has consistently been recognized as a steadfast flag-bearer for the vulnerable and the oppressed. The high-profile commemorations hosted by Beijing in 2025 — marking the 70th anniversary of the Bandung Conference and the 80th anniversary of victory in the Chinese People's War of Resistance Against Japanese Aggression (1931-45) and the World Anti-Fascist War — stood as profound testaments to the Chinese commitment to preserving global peace and multilateralism under the institutional framework of the UN Charter.

Plainly put, the CPC's modern statecraft remains anchored in the structural interests of the global majority — aligning its future trajectory with the very ideals that defined its inception 105 years ago.

Furthermore, the strategic rollout of China-initiated global frameworks demonstrates Beijing's readiness to assume greater institutional responsibilities in contemporary global governance. This sophisticated suite of doctrines — spanning the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative — forms a comprehensive, mutually reinforcing architecture. Together, they constitute pragmatic Chinese solutions grounded in international law to pressing systemic challenges, all of which are inextricably linked to the preservation of sustainable peace and collective order.

The Global Development Initiative, launched in 2021, strategically centers on sustainable development, encompassing vital pillars such as poverty alleviation, climate finance and digital connectivity, thereby aligning seamlessly with the UN 2030 Agenda for Sustainable Development. China's monumental achievement in lifting 800 million people out of abject poverty over the past several decades stands as an undeniable testament to the CPC's ideological commitment to emancipating its people from destitution. Eradicating extreme poverty 10 years ahead of the UN schedule is an inspirational feat that serves as a blueprint for others to learn from.

To the Global South, which has long chafed under traditional, donor-driven conditionalities imposed by the Global North, the Global Development Initiative offers an alternative paradigm: practical, demand-driven and horizontally integrated cooperation, backed by dedicated mechanisms such as the Global Development and South-South Cooperation Fund. A concrete manifestation of this cooperative spirit is the sustainable development center in Shanghai, established in partnership with the United Nations Development Programme to accelerate the implementation of the 2030 Agenda.

The Global Security Initiative, launched in 2022 and endorsed by over 130 countries and regions as well as international organizations, champions the doctrine of indivisible security — asserting that no state should unilaterally enhance its own security at the expense of others' legitimate concerns. Rejecting the imperialist playbook of deploying troops or establishing coercive military alliances on foreign soil, China has focused on capacity building, notably planning 1,700 training opportunities for security governance personnel globally in 2025. Bilaterally and regionally, this vision is mainstreamed through platforms such as the Forum on China-Africa Cooperation, which unites China with 53 African nations and the African Union Commission.

This year also marks the third anniversary of the Global Civilization Initiative. Focusing on robust civilizational dialogue, the initiative has been pivotal in restoring cultural confidence across the developing world. By flatly rejecting assertions of cultural superiority, it successfully debunks the West-centric myth that Westernization represents the singular path to modernization.

Ultimately, the CPC has proved its vigor in evolving from a grassroots-based revolutionary party into a force of governance that remains highly innovation-relevant in changing times. Formed as an important pillar to implement the concepts in China's Global Artificial Intelligence Governance Action Plan, the World AI Cooperation Organization is well-poised to coordinate international AI regulation, foster inclusive technological development, and decisively bridge the digital and intelligence gaps that threaten to leave the Global South behind.

LI MIN / CHINA DAILY

From the Chinese perspective, the core issue of our era is not technological competition within a framework of zero-sum rivalry; rather, it is how the global majority can harness innovation to improve productivity, expand human opportunity and strengthen collective competitiveness. Plainly put, the CPC's modern statecraft remains anchored in the structural interests of the global majority — aligning its future trajectory with the very ideals that defined its inception 105 years ago.

LI XING

Not replicable, but a reference

China's experience demonstrates that multiple pathways to modernization are both possible and legitimate

For much of the 20th century, modernization was presented as a singular path associated with Western political and economic institutions. Yet the experiences of many developing countries suggest that there is no universal formula for national development. Different societies have pursued modernization through diverse trajectories, institutional arrangements and governance models.

China's global rise over the past four decades has become one of the most significant examples of this diversity. With its transformation from a poor agrarian society to the world's second-largest economy, China has lifted hundreds of millions of people out of abject poverty, built world-class infrastructure, and emerged as a major technological and industrial power. While debates about the "China model" continue, its experience offers valuable insights into the relationship between political leadership, state capacity and modernization — particularly for countries across the Global South.

At the heart of China's development experience is a hybrid governance system that combines Communist Party of China's leadership, market dynamism and social cohesion. Rather than viewing the State and the market as competing forces, China's approach seeks to integrate them within a broader developmental strategy. The market plays a central role in resource allocation and innovation, while the State provides strategic direction, long-term planning and institutional coordination. This State-market relationship is underpinned by a professional bureaucracy capable of pursuing national development goals, with State-owned enterprises serving as strategic actors and the private sector contributing entrepreneurial dynamism and economic vitality. Together, they form a coordinated framework that supports sustained economic growth, industrial upgrading and technological modernization.

A key feature of this model is the leadership of the CPC. Unlike many Western liberal systems where political parties and public administration are largely separate, and where political competition can generate frequent shifts in policy priorities, China's integrated structure links long-term national objectives with policy implementation. This arrangement has enabled the government to pursue ambitious development goals over extended periods while maintaining policy continuity and institutional coherence. Whether in infrastructure development, poverty reduction, industrial upgrading or technological innovation, long-term policy coordination and continuity have been a defining characteristic of China's modernization process.

In this sense, the Chinese political system possesses two distinctive strengths: the ability to pursue long-term strategic goals and the flexibility to adjust policies in response to changing circumstances. These characteristics have attracted increasing attention from scholars and policymakers worldwide. Even Francis Fukuyama, best known for his "end of history" thesis, recently acknowledged in an interview that China's continued success has challenged some of his earlier predictions. In his work *Political Order and Political Decay*, Fukuyama also identifies several deficits confronting contemporary liberal democracies, including the growing influence of interest groups operating under the banner of civil society and non-governmental organizations, partisan polarization, the judicialization of governance and the tendency for economic power to be converted into political influence.

SHI YU / CHINA DAILY

China's experience raises important questions about the relationship between modernization and governance models. Its political system seeks to address these challenges through strong policy coordination, long-term planning and the capacity for continuous institutional adaptation and policy correction under the leadership of the CPC. For many years, development discussions were dominated by the assumption that economic modernization would inevitably lead countries toward a single political trajectory, such as multiparty systems, interest groups and the separation of power. China's rise challenges this assumption. The China model suggests that countries may pursue modernization through different institutional pathways shaped by their own histories, cultures and social conditions.

At the same time, China's development experience demonstrates that modernization requires more than economic growth. Education, social welfare, public administration and institutional effectiveness have all played important roles. Over the past several decades, China has invested heavily in human capital, expanded social protection programs, strengthened public services and improved administrative capacity at multiple levels of government.

These efforts have contributed to relatively high levels of public trust in government. Surveys conducted by Western institutions such as Harvard University's Ash Center, Edelman and Ipsos have consistently found strong public confidence in Chinese governance. While political systems differ across countries, the broader lesson from China is that State legitimacy depends not only on how governments are chosen, but also on how effectively they govern and deliver economic development, social progress and improved living standards.

Many international surveys suggest that perceptions of China vary significantly across regions. While skepticism toward China remains strong in many Western countries, attitudes are generally more favorable across much of the Global South. This divergence reflects differing historical experiences, development priorities and perspectives on development and governance. Recently, global perceptions appear to be evolving. According to the latest Gallup World Poll, China's global leadership approval rating has surpassed that of the United States, reflecting both rising approval of China's international role and declining confidence in US leadership in many parts of the developing world, and increasingly the developed world.

China's path to modernization does not provide a universal blueprint for development, nor should it be understood as one. Every country must find its own path based on its history, institutions and social conditions. Nevertheless, China's experience offers several broader lessons: the importance of effective political leadership, the value of long-term strategic planning, the need to balance state and market forces, and the central role of state capacity in promoting development. Market and capital play indispensable roles in generating growth and prosperity, but they should not dictate national development objectives.

This lesson resonates strongly across the Global South. Developing countries face diverse challenges, ranging from poverty and inequality to infrastructure deficits and technological gaps. As a result, many governments are increasingly interested in policy approaches that emphasize state capacity, developmental planning and national policy autonomy. Ultimately, the most important lesson may be that modernization is not a single destination reached through a prescribed route. It is a process shaped by national circumstances, political choices and social priorities. China's experience reinforces an increasingly important idea: successful modernization does not require following one model. It requires building structures capable of translating national aspirations into sustainable development outcomes.

The growing cooperation between China and other Global South countries is shaping the emerging global order. This strategic relationship is reflected in expanding trade, investment, infrastructure cooperation and diplomatic engagement. Organizations and mechanisms such as BRICS, the New Development Bank, the Asian Infrastructure Investment Bank and the Belt and Road Initiative have expanded opportunities for South-South cooperation and development financing. At the same time, China's calls for reform of global governance institutions increasingly reflect calls for greater representation and voice for developing countries.

As the 21st century unfolds, the debate over modernization is likely to become increasingly diverse and pluralistic. In that debate, China's experience will remain an important reference point — not because it offers a formula to replicate, but because it demonstrates that multiple pathways to modernization are both possible and legitimate.

Fresh path seen for global RMB

Expert predicts yuan will become world's 2nd most important currency

By **ZHOU LANXU, WANG KEJU** and **ZHANG CHENXU**

The long-standing view that a currency cannot become globally important without full convertibility and a fully liberalized capital account is increasingly being challenged, with economists arguing that the renminbi may prove otherwise.

They said that geopolitical tensions are making financial markets less central to currency internationalization, while trade, investment and other real-economy linkages are likely to play a bigger role, creating fresh opportunities for the Chinese yuan to expand its global role and even surpass the euro over time.

Peng Wensheng, chief economist at China International Capital Corp, said the increasing use of financial sanctions by the United States amid geopolitical tensions could prompt more economies to adopt some form of capital account control or management in response.

Such a rise in capital flow restrictions may reduce countries' reliance on financial assets as universal stores of purchasing power, prompting them to place greater weight on real-economy assets, Peng said at a recent seminar held by the Tsinghua University PBC School of Finance.

"That is China's advantage — China has the world's largest manufacturing system, and is the world's largest (goods) trading nation," Peng said, adding that these strengths could increasingly underpin the RMB's internationalization through trade, investment and other real-economy linkages and intergovernmental cooperation.

Financial market opening, meanwhile, should remain an important part of the process rather than the sole driving force of the yuan's global use, he added.

In an exclusive interview with China Daily, Zhu Min, former deputy managing director of the International Monetary Fund, also pushed back against the assumption that the RMB cannot become a major international currency without full convertibility and a fully liberalized capital account — which allows capital to move totally freely across borders.

"We need to correct this old mindset," Zhu said, pointing to the IMF's Special Drawing Rights basket, a collection of major international currencies that gives the RMB a 12.28 percent weighting after the dollar and the euro, as proof that such constraints are not necessarily insurmountable.

> "There is still plenty of room to expand RMB settlement in China's trade."
>
> **Zhu Min,** former deputy managing director of the International Monetary Fund

"There is still plenty of room to expand RMB settlement in China's trade," Zhu said.

"China imports a large volume of commodities, creating significant scope for settling those purchases in the RMB and pricing commodities in the currency."

Data from the People's Bank of China, the country's central bank, showed that the amount of cross-border RMB settlement under China's current account — covering goods and services trade — came in at 1.67 trillion yuan ($245.8 billion) in May, up from 1.31 trillion yuan a year ago.

The proportion of cross-border RMB receipts and payments under the capital account has risen to around 60 percent, according to the PBOC.

Lu Ting, chief China economist at Nomura, said the Chinese yuan would eventually surpass the euro to become the world's second most important international currency, driven by real-economy linkages.

Unlike the Japanese yen, whose internationalization after Japan fully liberalized its capital account in the 1990s relied increasingly on international financial markets and carry trades — a form of cross-border financial arbitrage — the RMB is more likely to gain wider international use through trade and the global expansion of Chinese companies, Lu said.

"I believe the RMB will one day overtake the euro. It could happen in the next 10 or 20 years, provided China continues moving forward steadily," he said, adding that China should continue opening up its financial markets and providing sufficient RMB liquidity to overseas market participants.

Overseas institutions and individuals now hold more than 10 trillion yuan of onshore RMB financial assets, with PBOC Governor Pan Gongsheng vowing to further enhance the internationalization level of China's financial markets in June.

Vol. 38 — No.1892

Products of Chaozhou Three-Circle Group Co Ltd on display during an expo in Shanghai. PROVIDED TO CHINA DAILY

Five mainland firms launch HK listing plans; aim to raise up to $5.6b

By **CHENG YU**
chengyu@chinadaily.com.cn

Five Chinese mainland technology and advanced manufacturing companies have simultaneously launched initial public offerings on Hong Kong stock exchange on Tuesday, seeking to raise up to HK$44.1 billion ($5.6 billion) in one of the market's biggest single-day fundraising pushes this year.

The companies — Luxshare Precision Industry Co Ltd, Chaozhou Three-Circle Group Co Ltd, Nexchip Semiconductor Corp, Guangdong Dtech Technology Co Ltd, and robotics maker ROKAE — span industries including consumer electronics, advanced ceramic materials, semiconductor manufacturing, printed circuit board tooling and industrial robotics.

Luxshare Precision, a key supplier to Apple, accounts for more than half of the planned fundraising, targeting up to HK$24.27 billion through the sale of 383.5 million shares.

The company is expected to price the offering on July 8 and begin trading on July 10. It is seeking to establish a dual A+H listing as it expands its international financing channels.

Wang Peng, a researcher at Beijing Academy of Social Sciences, said: "The wave of listings highlights a broader shift in Hong Kong's equity market, where capital raising has increasingly been dominated by advanced manufacturing and technology companies rather than financial institutions and property developers."

> The wave of listings highlights a broader shift in Hong Kong's equity market ..."
>
> **Wang Peng,** a researcher at Beijing Academy of Social Sciences

"The proceeds are expected to support research and development, capacity expansion and overseas growth as Chinese manufacturers seek to strengthen their global competitiveness," he said.

China's IPO market has accelerated sharply in the first half of 2026, with both the A-share market and HKEX recording higher listing activity and fundraising volumes than a year earlier.

In the first half of this year, Hong Kong's IPO market raised about HK$210.3 billion, more than the combined total raised during the same period over the previous four years, Wind data showed. Some 71 new A-share listings raised a combined 70.57 billion yuan ($10.4 billion), an increase of nearly 89 percent from a year earlier.

According to Wind, 156 companies were expected to complete IPOs across China's A-share market and HKEX during the first six months of the year, including 71 on the A-share market and 85 in HKEX.

Investor demand has also remained robust. Of the 151 newly listed stocks on the two stock markets in the first half, 79 more than doubled in price on their trading debut, representing over half of all new listings.

Notably, technology-related industries dominated listings on the A-share market. Electronics companies accounted for 12 IPOs, followed by 11 machinery manufacturers, reflecting Beijing's continued emphasis on developing new quality productive forces through advanced manufacturing, semiconductors and high-end equipment.

Cross-listed "A+H" offerings have become an increasingly important feature of the market. Some 24 companies completed listings in both markets during the first half, up from seven a year earlier, while eight of HKEX's 10 largest IPOs this year were A+H listings.

Li Kang, co-leader of the TMT Industry at EY Greater China, said in an interview that companies filing for IPOs in the first half of the year displayed clear focus on China's new quality productive forces.

It reflected how capital markets are efficiently channeling resources toward sectors with the highest technological barriers to entry and strongest growth potential, thereby supporting technological self-reliance and industrial upgrading, Li said.

AI, energy upgrade lift industrial profits

China's major industrial firms posted accelerated profit growth in the first five months of 2026, driven by surging demand for AI-related electronics and new-energy materials, official data showed.

Industrial firms with an annual main business revenue of at least 20 million yuan ($2.9 million) saw their combined profits reach 3.14 trillion yuan in the January-May period, up 18.8 percent year-on-year, according to the National Bureau of Statistics.

The growth surpassed the 18.2 percent rise in the first four months. In May alone, industrial profits rose 21.1 percent, the NBS data showed.

Industrial revenue grew 5.5 percent year-on-year in the first five months, up 0.3 percentage points from the January-April period, as industrial production remained robust and producer prices continued to rise, said NBS statistician Yu Weining.

Equipment manufacturing remained a key driver. Profits in the sector climbed 14.1 percent during the period, contributing 5.2 percentage points to overall industrial profit growth. Within this sector, the electronics industry posted a 103.9 percent profit surge, contributing 43.1 percent to overall industrial profit growth, as the global AI boom fueled an explosion in demand for high-end computing and memory products.

Raw materials manufacturing also posted robust gains, with profits surging 83.1 percent and contributing 10.2 percentage points to overall industrial profit growth.

Driven by rising demand from new-energy and AI industries, copper and aluminum prices remained elevated, pushing profits in the nonferrous metals sector up 117.1 percent. The petroleum processing industry returned to profitability, while the chemical sector saw profits rise 71.6 percent.

High-tech manufacturing maintained double-digit profit growth, rising 44.7 percent and contributing 8.0 percentage points to overall industrial profit growth. Within this sector, optoelectronic device manufacturing and discrete device manufacturing saw profits rise 53.8 percent and 40.6 percent, respectively.

Corporate cost burdens continued to ease. For every 100 yuan of operating revenue, industrial firms incurred 84.95 yuan in costs in the January-May period, down 0.59 yuan year-on-year.

XINHUA - CHINA DAILY

Airline bets on Sino-African trade ties

By **LI JING**
lijing2009@chinadaily.com.cn

A model of an Ethiopian Airlines cargo plane during a recent expo in Shanghai. PROVIDED TO CHINA DAILY

Ethiopian Airlines is expanding its cargo network and airport partnerships in China, as it bets on growing China-Africa trade, rising cross-border e-commerce and Beijing's expanded zero-tariff access for African imports to sustain long-term freight growth, company executives told China Daily.

China, Africa's largest trading partner, has become the airline's top strategic cargo market globally, accounting for more than 40 percent of international transit cargo handled through its Addis Ababa hub, Dereje Derero, managing director of cargo and logistics services at Ethiopian Airlines, said in an interview.

"The Chinese market has the highest strategic priority in our global cargo business over the next three to five years," Derero said.

The strategic expansion comes as China deepens economic ties with Africa. Since May 1, China has extended zero-tariff treatment to all 53 African countries with which it has diplomatic relations, widening a policy previously limited to the continent's least-developed economies.

China's commerce ministry said in a statement that the zero-tariff policy is intended to boost African exports, encourage investment in Africa and make China-Africa trade more balanced and sustainable. Bilateral trade reached a record $348 billion in 2025, according to China's General Administration of Customs.

Derero said the policy is a catalyst for rebalancing two-way cargo flows, which have traditionally been dominated by Chinese exports to Africa.

"The zero-tariff policy will help generate more return cargo from Africa, improve aircraft utilization and increase demand for cold-chain transport of products such as Ethiopian coffee, flowers and fresh produce," he said.

Cross-border e-commerce has become the fastest-growing category of Chinese exports to Africa, with shipment volumes rising by more than 20 percent from a year earlier, while exports of new energy products and infrastructure equipment are also supporting freight demand, he added.

Chinese e-commerce platforms such as Temu and SHEIN are expanding rapidly across Africa, creating sustained demand for air freight through Ethiopian Airlines' cargo gateways in Shenzhen and Guangzhou in Guangdong province and Hong Kong Special Administrative Region, Derero said.

The airline currently operates a fleet of 20 freighters, including Boeing 777, 767 and 737 cargo aircraft, and serves 11 cargo destinations across China, with some routes operating five to seven freighter flights per week. To boost capacity, the carrier signed a lease agreement earlier this year with aircraft lessor AerCap for two Boeing 777-300ERSF converted freighters, due for delivery in 2028.

Despite a normalization in freight rates from the COVID-19 pandemic highs, Derero said global freighter capacity remained structurally tight because of persistent airspace disruptions in the Middle East as well as higher fuel costs.

General cargo rates between China and Africa have largely returned to pre-pandemic levels, although e-commerce shipments, cold-chain cargo and time-sensitive goods continue to command premium pricing, he said.

During last week's Transport Logistic Shanghai exhibition in Shanghai, Africa's largest airline by fleet and network signed cooperation agreements with airport operators in Guangzhou in Guangdong province, Ezhou in Hubei province and Zhengzhou in Henan province, and held discussions with authorities in Chengdu in Sichuan province to explore potential China-Africa cargo links.

Girum Abebe, country director of Ethiopian Airlines China, said the airline was exploring the launch of a direct freighter route linking Southwest China with Africa as it expands cooperation with Chinese airports and local governments.

‘City of the future’ reshapes smart living

Big data, artificial intelligence, IoT make futuristic services reality in Xiong’an

By **LI JIAYING**
lijiaying@chinadaily.com.cn

What does a city of the future look like?

In Hebei province’s Xiong’an New Area, a traffic light adjusts its timing in milliseconds to ease a growing queue of vehicles. Beneath the streets, sensors quietly confirm that oxygen levels inside an underground utility tunnel remain stable. Nearby, residents return home by swiping their access cards as community systems automatically log their arrival.

Inside the Xiong’an Urban Computing Center — also known as the “Eye of Xiong’an” — a giant digital dashboard tracks the heartbeat of China’s newest city in real time. Here, advanced technologies such as artificial intelligence, big data and the internet of things are designed not only to make urban management smarter, but also to make everyday life safer, more convenient and more responsive to people’s needs.

“The computing center serves as the digital brain of Xiong’an,” said Wang Zixuan, an official with the industry, information technology and data bureau of Xiong’an New Area.

From the very beginning of planning, Xiong’an decided to adopt the concept of building three interconnected cities — one underground, one above ground and one in the cloud, and together, they provide the backbone for the dynamic virtual replica of the city, enabling managers to respond to urban operations in real time, Wang said.

For residents, however, much of that technology works quietly in the background.

One example is a community care service built on utility monitoring. “If an elderly resident living alone shows no water or gas activity for an unusually long period, the system automatically sends an alert to the local community, prompting staff to check on the resident,” Wang said.

The same digital intelligence extends across the city’s transportation network.

Every municipal road in Xiong’an has been built to digital road standards. As traffic patterns change throughout the day, signal timings can be adjusted automatically, helping ease congestion and improve travel efficiency, Wang added.

Supporting these services is an extensive digital infrastructure. Xiong’an has deployed more than one million connected sensing devices and built over 500 kilometers of digital roads.

Together, they form an interconnected network that helps manage transportation, public facilities, neighborhoods and underground utility systems more efficiently.

A smart tractor is showcased at the Collection of Future City in Xiong’an, Hebei province, on June 23. GONG JINGLU / XINHUA

An AI-powered robot makes coffee at a cafe at Xiong’an business service center in Xiong’an on March 25. ZHU DONGXU / XINHUA

A short drive away, an exhibition hall offers visitors a different glimpse into the future of agriculture.

An apple-picking robot smoothly moves toward a tree on its tracked chassis. After scanning the branches with its vision system, its robotic arm gently reaches out, twists a ripe apple from the branch and places it into a collection basket — all in less than 10 seconds.

Developed by a research team at Hebei Agricultural University, the robot is capable of identifying fruit and distinguishing healthy apples from damaged ones before picking, with a fruit damage rate of less than 5 percent when picking, said Chen Chongchong, a professor from the university’s mechanical and electrical engineering school.

“Most fruit growers today are elderly farmers, and labor shortages become especially severe during harvest season,” Chen said, adding that this robot can significantly improve harvesting efficiency while reducing operating costs.

He added that the robot’s strong climbing capability allows it to work in orchards with different terrains, while the research team is developing specialized AI models for harvesting other types of fruit.

From easing traffic congestion and caring for elderly residents to helping farmers harvest fruit, Xiong’an is leveraging advanced technologies to transform futuristic concepts into everyday experiences.

According to the new area’s industry, information technology and data bureau, Xiong’an is building an innovation ecosystem centered on digital infrastructure, technology demonstration and real-world application scenarios.

“Application scenarios serve as the bridge between technology and industry, connecting research with the market,” said Liu Xiang, deputy director of the bureau, adding that the new area is ramping up efforts to identify the most promising technologies, teams and projects, and provide them with the best possible environment to grow, mature and achieve commercial success.

Transit hub paces Xiong’an-Beijing integration

By **CHEN MEILING**
in Xiong’an New Area, Hebei
chenmeiling@chinadaily.com.cn

A flagship transit-oriented development landmark is taking shape at the heart of Xiong’an New Area in North China’s Hebei province. The megaproject is poised to roll out a commercial complex and forge a fully connected one hour transport circle between Xiong’an and Beijing in the second half of this year, accelerating cross-city industrial and talent connectivity.

The Xiong’an City Square and International Trade Center project features a three-floor underground interchange for rail transit with nine buildings above ground, realizing the vision of “entering the city the moment you step out of the transport station”. Construction at the site was ongoing heading into July.

Above ground, there are headquarters of seven central State-owned enterprises that are moving from Beijing such as China Huaneng Group and Sinochem Holdings, alongside science and innovation centers of four major State-owned banks, and about 300 innovative institutions.

Underground, four transit lines intersect there: the Jing Xiong Express, the Xiong’an-Xinzhou High-speed Railway, and Xiong’an metro lines M1 and M2, enabling seamless transfers within three minutes.

The Xiong’an Terminal Station on the Jing Xiong Express allows Beijing Daxing International Airport passengers to complete check-in and baggage drop-off in advance, with a half-hour direct trip to the airport and about an hour to get to Beijing’s Lize Financial Business District, according to Yu Ruiyong, assistant to the general manager of Xiong’an Xiongshang Development Co, a subsidiary of China Xiong’an Group.

People visit the construction sites of Xiong’an City Square and International Trade Center in Xiong’an New Area on June 25. CHEN MEILING / CHINA DAILY

> “Our goal is simple: though you leave Beijing (for Xiong’an), you still feel like you’re in Beijing.”
>
> **Yu Ruiyong,** assistant to the general manager of Xiong’an Xiongshang Development Co

“Our goal is simple: though you leave Beijing (for Xiong’an), you still feel like you’re in Beijing,” said Yu, adding that the project aims to further accelerate Beijing-Xiong’an integration by significantly shortening inter-city traffic time.

He added that the express, with a length of 86.26 kilometers, will be operated more like a bus, while the price and opening time will be announced via government notice in the near future.

Further more, the Xiong’an Intercity Railway Station on the Xiong’an-Xinzhou High-speed Railway will connect with the Xiong’an Terminal Station, and head for Baoding in Hebei and Xinzhou in Shanxi province.

Passengers can transfer within several minutes by an underground walkway.

The Xiong’an International Trade Center has nine buildings — six office buildings, a Kempinski hotel, a shopping mall run by CapitaLand, and the Xiong’an Terminal Station.

The main structure of the project has been topped out. Exterior landscapes, supporting municipal works and indoor electromechanical installation have all been completed, and the interior design is currently underway, said Zhang Tao, deputy general manager of Xiong’an Xiongshang Real Estate Co, a subsidiary of China Xiong’an Group.

The overall construction progress of the center has exceeded 80 percent, and the center is scheduled to be completed in the second half of this year. Investment promotion work is also in full swing, said Zhang.

The center covers a land area of approximately 200 *mu* (13.33 hectares), with a total construction area of around 1.06 million square meters — about 670,000 sq m above ground and roughly 390,000 sq m underground.

Luo Shuang, deputy director of the administrative committee of Xiong’an Qidong district, explained that the complex is designed as a full-chain supporting zone catering to relocated personnel, offering integrated transport, office, commercial and hotel facilities.

A well-equipped 15-minute community living circle with residential buildings, educational, cultural and sports facilities laid out across the area is expected to create a high-quality living environment featuring balanced work and residence. Residents can access a full range of supporting services within their daily activity radius, according to Luo.

“Employees of Sinochem can simply take the elevator downstairs and walk straight to the Xiong’an Intercity Railway Station and Xiong’an Terminal Station via underground passages within minutes,” said Luo, adding that the scenario vividly embodies the philosophy of transit-city integrated development.

In the east of the complex there are eight shipping ports heading for Baiyangdian Lake scenic spot.

Industrial firms boost sales via livestreaming

By **CHEN MEILING** in Handan, Hebei

Ding Kelun, 42, traveled all the way from Zunyi, Southwest China’s Guizhou province, to pick up his newly bought truck in Cheng’an county of Handan, North China’s Hebei province, in late June, after seeing the vehicle on seller Wu Ranran’s livestreaming promotion.

He said he knew the company Handan Boang Special Vehicle Manufacturing from Wu’s Douyin account. After discussing details about buying a truck on WeChat, Ding drove about 20 hours to the company in April to see if the truck was really as good as Wu said, and finally decided to make the deal at a price of 400,000 yuan ($59,000).

Wu, who now has 170,000 fans since she began livestreaming in 2024, said in the past, sellers had to drive vehicles to places like petrol stations to do marketing, and as such could only reach potential customers in Handan and nearby cities.

“As competition became more fierce, and profit became less, we developed livestreaming platforms so we could reach clients across the country,” she said.

Now the company has 20 livestreaming personnel and last year sold 1,300 trucks — about double the number before it started livestreaming — with sales of 350 million yuan. Around 85 percent of those orders were from livestreaming and 70 percent from outside Hebei. Last year, Wu’s personal livestreaming sales alone exceeded 100 million yuan.

Wu said the local government has many good policies that support livestream marketing, such as organizing training for livestream hosts and opening green channels for drivers to apply for a temporary license plate.

The transformation of Boang epitomizes how Handan, a heavy industrial city, is helping traditional industries embrace the digital economy.

In recent years, Cheng’an has vigorously promoted the “one product, one livestream” e-commerce model. Cameras are focused on production lines, assembly workshops, testing labs and shipping warehouses, drawing viewers and inquiries through real-life scenes.

Over the past one and a half years since the launch of this initiative, 107 industrial enterprises in the county have launched livestream sales. From January to May, livestreaming enterprises generated revenue of 15.8 billion yuan, a year-on-year increase of 15 percent, according to local authorities.

The local government built a 7,800-square-meter “one product, one livestream” industrial park, with a logistics warehouse, a product exhibition hall, 18 shared livestreaming rooms and training classes. They are all available free to local enterprises.

There, two young women were passionately introducing screws in front of cameras. They work for Yibang Machinery Technology (Handan), a fastener producer, which previously sold by the ton, now sells by the piece via livestreaming.

“Though each screw sells for about 3 yuan, and the logistics cost is about 1.5 yuan, the goal is to link directly to customers and promote our brand, so that big merchants can notice us,” said Yang Jianhui, chairman of the company.

The company used to rely entirely on distributors and agents. The sales teams had to travel extensively to visit clients one by one. Distributors also required them to tie up large sums of capital on inventory stock. Now, customers place orders and settle payments instantly through online storefronts, which suggests greater profit margin, he said.

Yang agrees livestreaming industrial products is not as fun as others, but he doesn’t mind if only three to five people are watching because those who stay are more likely to purchase.

Each day the company receives about 1,000 livestreaming orders from clients such as repair shops, processing factories and construction teams, at an average of 40 yuan per order. The repurchase rate has reached 70 percent.

Since starting in August, the company has about 6,300 fans, and livestream sales have contributed 20 percent to its total, which reached 15 million yuan from January to March.

Guo Yanwen, director of the county’s development and reform bureau, said so far livestreaming has realized fruitful results for promoting the county’s industrial development and has become a driving engine for its economy. The growth rate of added value of industrial enterprises above designated size across the county reached 9 percent from January to May.

The public e-commerce service center at the park houses government departments including market regulation, finance, taxation and administrative approval, delivering one-stop, zero-distance government services for e-commerce businesses.

To help firms reduce costs, the local government has negotiated with courier companies. The delivery fee for parcels weighing under one kilogram has fallen to 1.6 yuan, a 36 percent reduction.

LIFE

Beloved opera flowers again

Three years after its premiere, *The Wild Rhododendron* returns with fresh emotional depth, **Chen Nan** reports.

Above: A scene from the Chinese opera *The Wild Rhododendron*, which returns to the National Centre for the Performing Arts in Beijing from July 1 to 4. **Left:** Tenor Wang Hongwei (front), who plays the role of Red Army soldier Pan Xingyi, rehearses at the NCPA on June 24. **Left below:** Bass singer Guan Zhijing (front), who plays the vicious local despot Hu Hansan, in a rehearsal. PHOTOS PROVIDED TO CHINA DAILY

In a rehearsal room at the National Centre for the Performing Arts in Beijing, a familiar melody rises — a tune that has lived in the memories of generations of Chinese audiences.

"Little bamboo raft drifting on the river, towering green mountains moving along the banks ..."

As tenor Wang Hongwei begins to sing *The Red Star Guides My Journey*, the song seems to unlock a door to the past. For many in the room, the melody is more than music; it is a reminder of childhood, of a beloved story passed down through families, and of a time when cinema and theater shaped the imagination of millions.

The years appear to fade away. A classic story returns, carrying both the emotions of the past and a new meaning for the present.

Despite the exhaustion of traveling between Beijing and Tianjin and a voice marked by a demanding schedule, Wang, 58, the president of the Tianjin Conservatory of Music, quickly steps back into the world of the stage. His portrayal of Pan Xingyi — a father, a soldier and a man driven by conviction — once again carries the warmth, courage and determination that have defined the character.

The moment captures the emotional power behind *The Wild Rhododendron*, of which the song is a part. The original Chinese opera by the National Centre for the Performing Arts returns from July 1 to 4, marking the 105th anniversary of the founding of the Communist Party of China.

Adapted from Li Xintian's classic novel *Sparkling Red Star*, the opera revisits a story deeply embedded in Chinese cultural memory.

The original novel, first published in the 1970s, became widely known after it was adapted into a film by the August First Film Studio in 1974. Its young hero, Pan Dongzi, became one of the most recognizable childhood figures for generations of Chinese audiences, while the movie's soundtrack also captured their hearts.

The Chinese opera, which premiered in 2023, reimagines the story through music and a more intimate dramatic lens. Composer Zhang Qianyi created the score, while Fu Gengchen — composer for the famous film adaptation — was invited as music adviser, linking the new production with the cultural memory of the earlier work.

At the center of the story is young Pan Dongzi, whose father, Pan Xingyi, joins the Red Army during a time of conflict and leaves his son a small red star — a symbol that becomes a guiding force throughout his life.

But the Chinese opera shifts its emotional focus beyond the boy hero. It brings a new figure to the foreground: Dongzi's mother, an ordinary village woman whose transformation from wife and mother into a courageous revolutionary becomes the heart of the story.

This revival is not simply the return of an old production. It is an attempt to rediscover a classic through a new perspective.

> "The story is no longer just a sequence of beautiful music. It has stronger tension, deeper meaning and greater emotional movement."
>
> **Wang Hongwei,** president, Tianjin Conservatory of Music

For Wang Hongwei, returning to the role of Pan Xingyi after three years has changed the way he understands the character.

"The character has become closer to me, and more personal," he says. "A great role requires time to settle and mature."

Wang believes that distance has allowed him to discover new layers in the role — not only through technique, but through his own experiences as a performer.

The new production strengthens the relationships between the characters. Earlier versions focused more on musical storytelling, but this revival expands the emotional exchanges between Pan Xingyi, Pan Dongzi's mother and their son.

One of the most important changes is a farewell scene between the husband and wife. Originally written as a solo aria, it has been transformed into a duet, allowing the audience to feel the weight of their separation more deeply.

"The story is no longer just a sequence of beautiful music," Wang says. "It has stronger tension, deeper meaning and greater emotional movement."

The opera opens in 1934, when Pan Xingyi prepares to leave with the Red Army. Before dawn, Pan Dongzi's mother makes straw sandals and packs supplies for her husband. Their farewell is quiet, filled with the sorrow of a family that understands separation may be permanent.

Before leaving, Pan Xingyi gives his young son the red star.

That small object becomes the beginning of Pan Dongzi's journey.

After the army withdraws, a returning landlord and his militia bring fear to the village. Facing violence and oppression, Pan Dongzi's mother joins the villagers' resistance.

At the same time, the Red Army struggles through the Long March (1934-36), crossing snow-covered mountains and vast grasslands, while underground fighters continue their battles in the forests.

These two journeys — one across battlefields and mountains, the other through the courage of ordinary villagers — reveal the opera's central idea: history is shaped not only by famous figures, but also by countless individuals who choose courage when faced with impossible choices.

"Dongzi's mother is not born a hero," says soprano Wang Zhe, who plays the role. "She becomes one through her experiences, through responsibility, and through the choices she makes."

Her final sacrifice becomes the opera's emotional climax. When a secret gathering is discovered, she risks her life to protect others, drawing the enemy away and sacrificing herself.

The flames that take her life later transform into a vision of blooming rhododendrons — the flower that inspires the opera's title.

The boy who once watched his parents leave grows into a young soldier, moving forward beneath the imagined light of the red star.

For Wang Hongwei, performing *The Wild Rhododendron* is also a conversation with the past.

"Classics already exist before us," he says. "But our generation has its own understanding. Our voices, techniques and life experiences are different from decades ago."

He hopes to bring something personal to Pan Xingyi — not only the history of the character, but also the emotions of an artist who has spent a lifetime on stage.

In recent years, Wang Hongwei, as an educator, has also explored how history and revolution-themed works can connect with younger audiences. For him, such operas are not simply performances.

"They are a kind of inheritance," he says. "Through art, we bring people closer to history and closer to the heroes who came before."

Deep-sea time capsule reveals China's trade with Europe

OSLO — About 600 meters below the surface of the Skagerrak Strait off southern Norway, large quantities of Chinese porcelain have rested for more than two centuries inside an 18th-century merchant vessel.

Now, Norwegian maritime archaeologists are bringing parts of the ship's cargo back into public view, opening a rare window onto the movement of Chinese porcelain into Europe and its place in 18th-century consumer life and trade networks.

Known to researchers as the Porcelain Shipwreck, the wreck contains Chinese porcelain, glass goblets and bottles, chandelier fragments, grain, textiles and other organic materials. Some recovered objects have been put on display at the Norwegian Maritime Museum in Oslo.

For researchers, the finding is not only a spectacular deep-sea archaeological discovery, but also a time capsule that may help explain how goods from China, northern Europe and possibly the Baltic region converged in one maritime trade system.

The wreck was discovered by Espen Saastad, a watch designer from Porsgrunn in southeastern Norway who also operates a small remotely operated vehicle, or ROV, and seabed survey company.

Saastad recalls the first time he and the museum team approached the wreck with an ROV. "We saw a lot of white items," he says. "When we were getting really close to the wreck, we saw all these plates, all these cups, the jar, and all these crystal things from the chandeliers."

Saastad says they quickly suspected that the objects must be Chinese porcelain. "It was a really fantastic experience in the boat, and everybody was very excited."

Left: Chinese porcelain in a shipwreck in the Skagerrak Strait off southern Norway. **Right:** Pieces of Chinese porcelain recovered from a shipwreck in the Skagerrak Strait. PHOTOS BY XINHUA

Frode Kvalo, a maritime archaeologist at the Norwegian Maritime Museum and project leader of the Porcelain Shipwreck, says the work is being carried out in stages. The first task is to understand what kinds of materials, trade goods and ship's equipment remain at the site, and how they are distributed, before a full excavation can be planned.

According to the museum, the wreck is believed to be a fully laden 18th-century merchant vessel. Based on observations so far, the vessel appears to have had a round stern and may have been a galliot, a type of merchant ship characteristic of northern Europe. The wreck measures about 22 meters in length and includes the remains of two masts.

So far, researchers have identified large quantities of Chinese porcelain, chandelier parts, glass goblets, bottles, and barrels of grain. Crates found at the site may contain textiles and organic materials, possibly including tea, herbs or medicines.

A brick recovered from the ship's galley bears the stamp of Luebecker Ratsziegelei, a brick factory in the German city of Luebeck that operated from the 15th century until 1772.

Kvalo says the importance of the wreck lies in its good state of preservation, the high quality of the objects and the unusual cargo composition, which brings together Chinese porcelain, northern European glassware, chandeliers, grain, textiles and other organic materials.

The depth also makes the project significant. Kvalo says Norwegian archaeologists had not previously worked on a shipwreck in the open sea at a depth of 600 meters, and archaeological work at such depth had not been carried out in northern Europe before.

Many questions remain unanswered. Researchers do not yet know where the ship came from, where it was heading, why it sank, or what happened to the crew. Because the vessel appears to have carried valuable cargo, Kvalo says there may be historical records related to its loss, including customs lists, insurance records and other archives.

Among the most eye-catching findings are the porcelain pieces, many of them Chinese blue-and-white ware. Some pieces are Batavia ware, with a brown-glazed exterior and blue-and-white decoration inside. Some may be Blanc de Chine, a type of white porcelain.

Knut Myrer, an Oslo-based Asian antiques and art specialist and a longtime member of an Oriental ceramics society, was among the visitors viewing the recovered objects in the museum. Standing before the display, he said that the porcelain appears to be typical Chinese export ware made for the European market, probably dating from around 1745 to 1760.

Chinese ceramics experts in Jingdezhen, Jiangxi province, a city long known as China's "porcelain capital", have also followed the archaeological discovery and offered a more detailed assessment after examining images of the porcelain.

Weng Yanjun, director of the Jingdezhen Imperial Kiln Museum and Institute, says the style of the blue-and-white porcelain pieces is close to Qianlong-period specimens in Jingdezhen's ancient ceramics database.

According to Weng, Batavia ware was a major category of export porcelain ordered by European countries from Jingdezhen. Small dishes and bowls with blue-and-white decoration and brown glaze were often used for coffee and tea.

Myrer says Chinese porcelain was used in Europe for drinking tea, coffee and chocolate. Large quantities of Chinese tea were exported to Europe in the 18th century, and paintings from the period show people in fine clothes drinking tea from Chinese porcelain, he says.

For Myrer, the finding shows the global influence of Chinese porcelain in the 18th century and its role in European consumer culture. Chandeliers represented high-status goods associated with elite society, while Chinese porcelain was increasingly embraced by the emerging middle class, he says.

The Norwegian Maritime Museum is now working on further research, conservation and public display.

Sven Ahrens, senior curator and director of research and heritage management at the museum, says the immediate priority is to continue fieldwork during favorable summer weather. The team hopes to recover more objects that can be shown to the public.

Ahrens and Kvalo both say they hope to cooperate with Chinese experts in the future, especially after more artifacts are recovered. Weng also says there is room for cooperation between China and Norway in restoration, kiln-site comparison, scientific analysis, and digital documentation.

Kvalo says only a limited number of objects have been brought up so far, including cups and plates, while many more remain on the seabed. "When we have done the excavation, there will be possibilities to bring in foreign experts, also from China, to study things," he says.

He also praises China's experience in deep-water archaeology, noting that China has conducted underwater archaeological work at about 1,500 meters in depth.

The recovered objects are undergoing conservation work, including desalination.

The Norwegian Directorate for Cultural Heritage has provided 2.9 million Norwegian kroner ($293,000) to support the project. Researchers say the amount is far from enough for a full excavation.

The museum is preparing a project plan and budget. If more government funding is secured, it hopes to use a larger vessel and conduct a full excavation in the coming years.

2026 WORLD CUP

China's still hitting goals at the World Cup

Despite its team missing out on the global showpiece

By **SUN XIAOCHEN**
sunxiaochen@chinadaily.com.cn

Diehard soccer fans from China have been in attendance throughout the World Cup, including at Mexico's iconic Azteca Stadium, while Chinese toy brand PopMart took part in the opening ceremony in Mexico City. **Inset:** Chinese referee Ma Ning shows a yellow card to Jordy Alcivar (5) of Ecuador during its Group E match with Curacao. AP / XINHUA / FIFA

Everyone is there from China, except for its soccer team.

As the 2026 FIFA World Cup enters the knockout phase, China's involvement with soccer's global showpiece is gaining momentum as well, underlined by fervent fan following, sponsorship investment, tech and infrastructure support, and engagement in many other areas.

Of course, Team China's disappointing sixth straight failure to qualify for the FIFA flagship event has taken some of the fun away, but the country's soccer diehards, who've been used to enjoying the show as onlookers anyway, are making their cheers heard and presence felt across the three host nations of the United States, Canada and Mexico.

Despite long journeys between venues, and the eyewatering cost of tickets and accommodation, a vocal contingent of Chinese fans has made its way to almost every heavyweight clash during the group stage of the tournament, sharing once-in-a-lifetime experiences in viral posts on Chinese social media platforms, such as watching their sporting idols score up close, joining "Mexican Wave" celebrations in the stands and making new friends at fan carnivals.

"Team China didn't make it, but we're all here," He Sheng, a soccer fan and social media influencer from Sichuan province, said in a video he posted on Weibo, showing him cheering with a group of compatriots outside the iconic Azteca Stadium in Mexico City before the tournament's June 11 opener.

"The World Cup belongs to fans from all over the world, not only for those coming from the participating nations," he said.

While true, it comes with a huge price.

After missing out on their chances during FIFA's official ticket lottery in January, Gu Xin and his wife, a soccer-loving couple from Shanghai, each had to spend $1,700 — more than twice the original face value of $700 — to secure tickets on a resale platform for Argentina's group match against Austria in Dallas, Texas, on June 22.

"We hesitated for a while due to the super expensive ticket price, but decided to go anyway. You cannot miss (Lionel) Messi's potential World Cup finale," Gu said with pride, knowing that his expensive gamble more than paid for itself when Messi scored twice in that match to make history as the tournament's all-time leading scorer.

Chinese enterprises are also matching the enthusiasm of fans with their high visibility. Tech giant Lenovo, dairy brand Mengniu and home appliances manufacturer Hisense are reaping the rewards of their brand exposure on and off the pitch, having secured official sponsorship at varying tiers in FIFA's commercial system, with a reported total investment of over $500 million.

The new match replay footage from the referee's camera on the pitch, powered by Lenovo's AI technology, is among the broadcasting highlights of the tournament, offering viewers a more immersive experience. Hisense supplies ultra-high-definition displays for every VAR review, while Mengniu, a longstanding World Cup sponsor, sent six Chinese teenagers to act as flagbearers for the opening match, showcasing youth exchanges between China and FIFA.

The Azteca, an iconic host venue of three World Cups, which has, so far, proved a talisman for the home team Mexico, owes a fair share of its magic to Chinese expertise, too. The China Railway Construction Engineering Group played a key role in its structural reinforcement and roof upgrade during a 20-month renovation project ahead of the 2026 tournament.

Back home, during just the first two months of the year, the world renowned manufacturing hub of Yiwu in East China's Zhejiang province shipped over $550 million worth of fan merchandise — from team jerseys and mini replicas of the World Cup trophy, to noisemakers and themed accessories — to the three host nations, according to a report by Economic Daily.

As the 2026 World Cup enters its dramatic knockout stages, China's involvement at soccer's global showpiece continues, underlined by a fervent fan following, cultural events. sponsorship investment, tech and infrastructure support, and engagement in many other areas on and off the field.
YIN GANG / FOR CHINA DAILY

Even without a team competing, China still has its representatives on the turf, not with a ball at their feet, but whistles hanging around their necks.

Chinese referee Ma Ning, flanked by assistant Zhou Fei and dedicated VAR official Fu Ming, made history by becoming the first all-Chinese crew to officiate a World Cup game when they took charge of the Group E encounter between Ecuador and Curacao on June 20.

Ma delivered a solid performance as the match referee in the 0-0 draw at Kansas City Stadium, issuing one yellow card to Ecuador and five to Curacao. He was also involved in the Group I match with Norway and France on June 26 as the fourth official, while Zhou acted as reserve assistant referee.

It represents the most significant World Cup involvement by a Chinese match official in more than two decades.

"Someone had told me that I am too old to make it to the World Cup again after the last edition in Qatar," the 47-year-old Ma, who served only as a fourth official in 2022, told China Central Television before this year's tournament. "I just want to prove them wrong and show the quality of Chinese officials."

He sure did, as well as all the other individuals and groups from China having contributed to the quadrennial celebration of the world's most popular sport.

It's now up to the Chinese team to fill in the last missing piece.

The global governing body stays optimistic.

"There is so much potential to be unlocked across China, and they have such an important role to play within the region and as a FIFA member," Mattias Grafstrom, secretary-general of FIFA, said during a visit to Beijing in May.

Safeguards in pipeline for e-commerce

Amendments would provide legal basis for countersteps against foreign entities

By **CHENG YU**
chengyu@chinadaily.com.cn

China proposed amendments on Saturday to its e-commerce law that would, for the first time, build a solid legal basis for taking reciprocal countermeasures against foreign entities that impose discriminatory restrictions on Chinese e-commerce companies.

The draft amendments, which were jointly released by the State Administration for Market Regulation and the Ministry of Commerce, represent the first major revision to China's e-commerce law since it took effect in 2019.

One of the biggest changes is the new countermeasure provision, which lays the legal groundwork for China to take reciprocal actions against countries, regions or entities that adopt discriminatory measures targeting Chinese e-commerce businesses.

The proposal would empower Chinese authorities with legal justifications, under China's unreliable entity list, to investigate foreign entities that harm the legitimate interests of Chinese companies, and would impose corresponding restrictions when deemed appropriate.

Hong Yanqing, a professor at the Beijing Institute of Technology's School of Law, said, "The significance of the new provision lies not only in creating stronger countermeasures than those already available under existing laws, but also in establishing a clear legal entry point for addressing discriminatory practices in the e-commerce sector."

"When foreign measures discriminate against Chinese e-commerce businesses through platforms, payment, logistics, data, cloud services, advertising, app distribution and supply chain compliance mechanisms, the legal framework will be able to identify and respond to such practices in accordance with the law," he said.

Hong said that introducing countermeasure provisions reflects a broader trend among major economies. The European Union, for example, has adopted a wide range of response measures, including restrictions on trade in services as well as limits on the protection or commercial use of intellectual property.

The EU measures "extend across services trade, investment, financial services, government procurement, intellectual property and supply chain-related activities. E-commerce and digital trade sit at the intersection of all these areas, making them particularly vulnerable to such restrictions," he said.

Regarding China's draft amendments, Hong said that "rather than relying on catch-all legal provisions or ad hoc policy responses in individual cases, the amendments clarify the triggering conditions, regulatory responsibilities and procedural principles in advance. This makes it easier to distinguish between legitimate commercial activities and politically motivated exclusion, enabling foreign-invested companies, platform operators and cross-border e-commerce businesses to make informed compliance decisions".

Beyond overseas protection, the revisions also strengthen enforcement power against platform operators in the e-commerce sector.

Maximum fixed fines for certain violations would increase from 2 million yuan ($295,000) to 5 million yuan. For particularly serious offenses that result in severe social consequences, regulators would be allowed to impose fines of up to 5 percent of a company's previous year's revenue, replacing the current fixed penalty.

Xue Jun, director of Peking University's e-commerce law research center, said that the draft amendments do not simply increase penalties for e-commerce operators but also introduce more flexible enforcement mechanisms.

"For example, ordering a business to suspend operations can have a significant impact on its continued operation. The amendments therefore introduce additional enforcement options, including suspending new user registrations or halting specific business activities," he said.

"This allows enforcement measures to be better aligned with the severity of the violation, ensuring that the punishment is proportionate to the misconduct," he added.

US marks 250th Independence Day

By **BELINDA ROBINSON** in Washington
belindarobinson@chinadailyusa.com

Americans marked the nation's 250th Independence Day in the capital on Saturday amid extreme heat and a charged political atmosphere, as United States President Donald Trump addressed a crowd on the National Mall before a massive firework display was held, following hours of delay due to an incoming storm. Yet for many, the milestone also sparked reflections on national pride and political divisiveness.

The event to commemorate the birth of America began after storms prompted a roughly two-hour evacuation of the National Mall just after 7 pm Washington time.

Trump spoke to a large crowd of people inside a cordoned-off area with heavy security, overlooked by the Washington Monument. Thousands more people lined the streets nearby, unable to get in.

He spoke of iconic and challenging times in US history and, to illustrate his point, used flags such as one from Abraham Lincoln's casket and another that was on the plane with the Wright Brothers.

Throughout the activities marking the milestone in the nation's story, revelers all across the East Coast battled extreme, brutally hot temperatures of 43 C to 46 C, the National Weather Service said.

A woman named Gail, 75, from Virginia, visited the White House during the Fourth of July weekend with her husband, her son and daughter-in-law. She said that she had found the extreme heat hard to manage, adding that it was even tougher on her husband.

Earlier, on Saturday morning, the city's National Independence Day Parade, hosted by the National Park Service, was canceled due to an extreme heat warning from the weather service.

Also in the area, dozens of members of the white nationalist group Patriot Front wearing face masks and carrying Confederate battle flags held a march. No arrests were reported, according to the Metropolitan Police Department, The Associated Press reported on Saturday.

Local subway stations were packed, and organizers of the celebrations on the National Mall in Washington, DC added water and cooling stations along with medical support at the fair to keep revelers cool.

Amid the party-like atmosphere, throngs of people in Washington were met with a heavy security presence estimated to include thousands of law enforcement officers, agents and 5,000 National Guard troops along with military-style vehicles, the AP reported.

The White House could barely be seen by visitors, as it was barricaded behind high black metal gates.

Elsewhere, at least eight people, including four children, were shot and injured late on the US Independence Day holiday in New York City's Coney Island neighborhood, ABC News said on Sunday, citing the New York City Police Department.

Among the injured were two men, two women, and four children, ages 14, 12, 7 and 6. All were taken to hospitals. Seven victims were listed in stable condition, while a 21-year-old woman was in critical condition.

Authorities said a firearm was recovered at the scene, but no arrests had been made so far.

Amid the nation's 250th birthday, Americans also reflected on divisiveness in politics as well as national pride.

"Well, our leaders need to get their act together and be able to just talk," said Randy Tennant, 78, from Syracuse, New York. "They don't talk now. They just argue. They put each other down; 25, 30 years ago, they used to talk together."

Only four in 10 American adults surveyed said they felt "proud" about the country's 250th anniversary, according to an April poll by The AP-NORC Center for Public Affairs Research.

According to the latest Gallup poll, only 46 percent of Americans believe everyone has an equal opportunity to achieve the American Dream.

"I would say America, 250 years old, is in a midlife crisis, for sure," Ryan Hilligoss, a New York resident, told China Daily. "With all the oligarchy that's going on, with the economics, the American Dream is very limited."

Other visitors expressed mixed feelings about the milestone, saying that the anniversary offered an opportunity to both celebrate the country's achievements and reflect on its economic and political challenges.

"I think the 250th year represents growth, different perspectives, divisiveness, all the above," said Shuba Maniram, another New York resident.

Peter Christian, who lives in California, said two major problems confronting the country are widening wealth disparities and a growing unwillingness to compromise. "Wealth disparity is causing a serious problem," he said.

Chelsea Ge in San Francisco and Shi Guang in New York contributed to this story.

WORLD WATCH

Future of humanity hinges on AI rules

Artificial intelligence has evolved from machine learning toward deep learning, becoming a transformative force that increasingly shapes our societies. However, this has also generated growing concerns about ethics, governance and human rights.

At the AI Impact Summit held in New Delhi, India, in February, the problems posed by the rapid deployment of AI were viewed from the perspective of the democratization of access to AI resources, which may be regarded as a new right. According to this new right, AI must have a clear social orientation directed toward basic sectors such as education, health and agriculture, and technological security must regulate those applications that pose an existential risk.

It was in this context that Secretary-General of the United Nations Antonio Guterres stated that "the future of artificial intelligence cannot be decided by a handful of countries or left to the whims of a few billionaires".

The human dimension of this debate was the focus of Magnifica Humanitas, Pope Leo XIV's first encyclical letter, which, while acknowledging that technological development has significantly improved human living conditions, notes that it has also revealed the ambiguity of tools that can cause harm when not oriented toward good.

He cautions that emerging technologies, interwoven into the fabric of daily life, are shaping decision-making processes and deeply affecting the collective imagination, and "never has humanity had such power over itself".

With new technologies opening up what the pope described as "a horizon extending in directions that are imaginable but not yet fully predictable", this is already a reality that affects national security, industrial policy and trade, shaping a new geopolitical scenario — in short, a new world order.

PLUSH TOY HAS EAGER TOURISTS FLOCKING TO URUMQI

After viral clips, cuddly sheep might be starting to outnumber the real thing in northwestern China

By **FANG AIQING** and **MAO WEIHUA** in Urumqi

A new craze has swept through Urumqi and is moving quickly across Northwest China's Xinjiang Uygur autonomous region.

An army of plush toy sheep has formed a stronghold in the Erdaoqiao community of Tianshan district, a century-old grassroots trading hub for ethnic products and a popular tourist hot spot.

Visitors stepping into the landmark Xinjiang International Grand Bazaar, or the nearby Jinquan mall, will find themselves immersed in a shepherd's dream — surrounded by squishy, well-appointed lambs.

The uninitiated might even start to wonder: Do the sheep now flooding the streets of Urumqi outnumber those grazing on the vast, magnificent grasslands of Narat or Bayanbulak?

Abdulla Amirila (left) decorates a plush toy sheep for visitors at the Xinjiang International Grand Bazaar in Urumqi, Xinjiang Uygur autonomous region, on June 11. QIN MEIHUA / FOR CHINA DAILY

The particular species romping, unfettered, through the regional capital has a disarming smile, big round eyes and wears Uygur or Kazak headgear, gauzy skirts or Xinjiang's iconic Atlas silk, and can often be found covered in colorful, shiny gem-like accessories.

It doesn't have a formal name yet. Some call it the "Xinjiang Labubu", but that doesn't do justice to the tens of thousands of iterations from across the region and beyond.

Each sheep is tailor-made. The buyer chooses the decorations and tells the vendor how they want their toy sheep styled, and each one is expertly assembled on the spot.

At the epicenter of this woolly mammoth of a trend is 19-year-old Abdulla Amirila.

'EastDiet' — a homegrown way to better health

Study indicates China's eastern coastal eating habits can lower risk of obesity, heart disease

By LI YINGXUE
liyingxue@chinadaily.com.cn

At neighborhood markets in Hangzhou, Zhejiang province, summer mornings begin long before the city has fully woken.

Stalls brim with freshly harvested lotus seed pods, leafy greens glistening with dew, seasonal mushrooms, freshwater fish from nearby rivers and ponds, and tofu and vegetables that have long been staples of local kitchens.

For generations, these foods have simply been part of everyday life in the eastern coastal region south of the Yangtze River. They were never marketed as "superfoods" or assembled according to a scientifically designed nutrition plan. Rather, they emerged naturally from a landscape rich in waterways, fertile farmland and a deep respect for the seasonal availability of produce.

Now, modern science is looking at whether this traditional way of eating may offer important lessons for the future of public health.

A study recently published in Nature Health has identified what researchers call the "EastDiet" — an eating pattern associated with lower risks of obesity and cardiovascular disease and rooted in the food traditions of China's eastern coastal region.

Led by Professor Zhu Shankuan at Zhejiang University's School of Public Health, the study was conducted in collaboration with the National Institute for Nutrition and Health under the Chinese Center for Disease Control and Prevention and the Nutrilite Health Institute.

The findings suggest that people who adhere to this diet have a roughly 22 percent lower risk of major adverse cardiovascular events, and a 17 percent lower risk of central obesity. Among men, the protective effect was even stronger, with cardiovascular risk reduced by as much as 36 percent.

What makes the discovery even more interesting is that the EastDiet was not created in a laboratory or developed as a meal plan. Instead, researchers identified it by analyzing the eating habits of thousands of ordinary people.

The study seeks to answer an increasingly important question: beyond the Mediterranean diet, is there a healthy diet deeply rooted in Chinese culture and lifestyle that can also be validated by modern science?

Zhu said this question was the starting point of the research.

"The concept of the EastDiet was not something we designed ourselves," he said. "We didn't begin with a predetermined answer and ask people to follow it. We wanted to see whether a healthier dietary pattern already existed within the real population."

A real-world recipe

For decades, discussions about healthy eating habits have largely revolved around the Mediterranean diet.

Rich in olive oil, nuts, whole grains, fruits, vegetables and seafood, the diet has been linked to lower risks of cardiovascular disease and metabolic disorders, making it one of the most widely recommended dietary models in public health.

But China's culinary traditions, food systems and eating habits differ dramatically from those of the Mediterranean region. From the hearty stews of the northeast and the spicy cuisine of Sichuan and Chongqing to Cantonese soups and the freshwater specialties of the eastern coastal region, China's food culture is far too diverse to fit neatly into an imported framework.

If healthy eating should be grounded in everyday life, could China already have its own healthy diet?

Seeking answers, Zhu's team turned to existing data.

The study drew on the WELL-China cohort, which recruited nearly 10,000 residents from three urban districts of Hangzhou between 2016 and 2019. Researchers followed 8,931 healthy adults for an average of 6.3 years.

Rather than deciding in advance which foods were healthy, the team employed an unsupervised clustering approach, allowing patterns to emerge naturally from data based on the consumption of 22 food groups.

Two major dietary patterns surfaced. Nearly 46.8 percent of participants fell into one distinct cluster, which researchers named the EastDiet.

The pattern was characterized by higher consumption of vegetables, fruits, whole grains, nuts, dairy products and eggs; greater intake of seafood and freshwater fish; more soy products, mushrooms and starchy root vegetables such as sweet potatoes, taro and lotus root; and lower consumption of refined grains, fried foods, red meat, processed meat and alcohol.

Shi Yuwei, the paper's first author and a doctoral student at Zhejiang University, said the logic behind the EastDiet is straightforward.

"It is essentially a diet with more plant-based foods, more whole grains replacing refined staples, a greater diversity of high-quality protein sources, and less processed food and excessive red meat," Shi explained.

The pattern aligns closely with modern nutritional recommendations, yet it was not invented by nutrition scientists. "It has always existed in Chinese daily life," Zhu said.

What makes region special?

A closer look at the diet reveals unmistakable characteristics of China's eastern coastal region.

Freshwater fish and aquatic products, tofu and other soy foods, bamboo shoots, mushrooms, lotus root, taro and a wide variety of seasonal vegetables all feature prominently in the dietary pattern.

Yu Bin, founder of the Michelin two-star restaurant Jie Xiang Lou in Hangzhou, said this is hardly surprising.

The diet, he said, was shaped not by health-conscious planning but by geography and generations of accumulated culinary wisdom. "Hangzhou places tremendous emphasis on *terroir* (the combination of soil, climate, and sunlight) and seasonal freshness," Yu said.

In the eastern coastal region's culinary tradition, the changing seasons dictate not only the landscape but also what is put on the dining table.

Spring brings shepherd's purse, Indian kalimeris and bamboo shoots. Summer offers lotus seed pods, water caltrops and tender freshwater delicacies. Autumn is the season of lake crabs and aquatic produce, while winter features winter bamboo shoots and preserved foods.

This seasonal rhythm naturally increases dietary diversity, a characteristic increasingly recognized by nutrition researchers as a hallmark of healthy eating.

Modern nutritional science suggests that good health rarely comes from eating a single "superfood". Instead, it emerges from a varied and balanced diet.

The traditional food culture of China's eastern coastal region appears remarkably consistent with contemporary understandings of healthy eating.

The region's dense network of rivers and lakes has also shaped its protein sources. Unlike many regions where livestock has historically dominated the dinner table, freshwater fish, shrimp and other aquatic products have long played a central role in local diets. Soy products such as tofu, dried bean curd and tofu sheets further diversify protein intake.

What may appear to be ordinary dietary choices today, researchers argue, form the nutritional backbone of the EastDiet.

The study also uncovered a culturally intriguing feature: people adhering to the EastDiet generally preferred lighter flavors. For many consumers accustomed to heavily seasoned food, "light" flavors are often associated with blandness.

Yu disagrees. "People should be able to taste the ingredient itself," he said. "Freshness comes from the ingredient. Seasoning should be restrained."

This philosophy has long shaped Hangzhou cuisine, where steaming, braising, poaching and gentle simmering are widely used to highlight natural flavors rather than mask them.

What traditional cooks describe as *qingdan xianhua* — light, fresh and smooth — is, in essence, respecting the ingredient's original taste.

Remarkably, this culinary philosophy aligns closely with modern nutritional advice to reduce excessive salt, sugar and ultra-processed foods.

Unlike the Mediterranean diet, which relies heavily on olive oil, China's eastern coastal food culture developed its own form of what might be called "subtraction cooking" — preserving natural flavors while minimizing unnecessary calories and sodium.

Microbes matter

If culinary traditions explain how the EastDiet emerged, biomedical science is beginning to explain why it may be beneficial.

The researchers found significant associations between the EastDiet and 96 circulating blood metabolites. They also identified 21 gut microbial genera linked to the dietary pattern.

Many of these microbes are involved in the fermentation of dietary fiber and the production of short-chain fatty acids, compounds increasingly associated with reduced inflammation, improved metabolic health and cardiovascular protection.

The study further found higher levels of several beneficial metabolites among EastDiet followers, including indole-3-propionic acid (IPA), a gut-derived compound that has attracted growing attention for its potential protective effects against cardiometabolic disease.

Together, the findings suggest a biological pathway linking diet, gut microbes, metabolism and disease risk.

Nutritionist Gu Zhongyi was not surprised by the results. "Food shapes the gut microbiome," he said. "The foods people eat over time select certain microbial communities, and those microbes in turn influence metabolism."

At the same time, Gu cautioned against overinterpreting the findings. "This remains an observational study," he said. "Further randomized controlled trials are needed before causality can be firmly established."

Still, he believes the study's greatest strength lies in its real-world relevance.

"This isn't an idealized dietary intervention designed in a laboratory," he said. "It reflects what people are actually eating. Seeing a roughly 20 percent health benefit under real-life conditions is already very meaningful."

Cost-effective benefits

For ordinary consumers, the value of the EastDiet lies less in complex metabolic pathways than in its practicality. Gu argues that the diet offers not a rigid menu but a set of principles that can be adapted to modern life.

One of the most important lessons, he said, is reducing reliance on refined carbohydrates.

The EastDiet incorporates a variety of root vegetables, including sweet potatoes, taro and lotus root, to replace some of the refined rice and wheat products that dominate many modern diets.

This simple substitution can increase fiber intake, stabilize blood sugar levels and provide fuel for beneficial gut microbes. Meanwhile, tofu, dried bean curd, mushrooms and other traditional ingredients remain affordable and widely available throughout China.

"They are among the most cost-effective health foods you can find," Gu said.

For young urban professionals increasingly dependent on food delivery services, he recommends focusing on achievable improvements rather than perfection. "The first step is finding reliable restaurants," he said.

He also encourages consumers to ensure each meal contains vegetables and quality protein while limiting fried foods and heavily seasoned dishes.

"Healthy eating doesn't have to be expensive, nor does it require a complete lifestyle overhaul," Gu said. "Small changes sustained over time often produce the biggest results."

A Chinese model

To determine whether the EastDiet was unique to Hangzhou, researchers subsequently validated the findings in an independent cohort spanning multiple Chinese cities.

The results were strikingly consistent. Both the dietary pattern itself and its association with lower risks of central obesity were replicated across the validation cohort.

The findings suggest that the EastDiet may represent more than a regional eating habit. It could serve as the foundation for a broader Chinese framework for healthy eating.

The research team has already extended follow-up data through early 2026 and plans to develop an EastDiet scoring system that can be used in future intervention studies and public health assessments.

Zhu said the study's significance extends beyond nutrition science.

For decades, discussions about healthy eating in China have often looked outside the country for answers. This research suggests that some of those answers may already exist within China's own culinary traditions.

"We can think of the EastDiet as a Chinese version of the Mediterranean diet," Zhu said. "But unlike a diet that was designed, this one grew naturally out of the real lives of Chinese people."

From the fish, lotus roots and soy foods of China's eastern coastal region to the metabolomic maps and microbiome analyses of modern laboratories, the EastDiet represents more than a new scientific concept.

It is a rediscovery of a way of eating that has existed for generations — one that modern science is only now beginning to measure, understand and validate.

As dietary habits around the world become increasingly homogenized and chronic diseases continue to rise, the evidence emerging from China's own dining tables may offer a new vision of healthy eating for the future.

Toy: Style, creativity are key to attracting customers

From page 1

Short videos of Abdulla Amirila, a tall, handsome guy with a slicked-back hairdo, carefully decorating little cuddly sheep while chatting with customers, went viral on social media around mid-May, sparking nationwide sheep hysteria.

Online, these adorable companions now appear aboard flights and bullet trains, traveling across Xinjiang, and then back home with their new owners.

The past two months must have been a whirlwind, but clearly overwhelming. "I'm pretty happy about it," Abdulla Amirila told China Daily.

"I'll get to yours," he said, pointing to one customer, "after I finish yours," he added, pointing to another, in one viral clip where he is surrounded by crowds waiting to buy the sheep toys. After each order, he is usually asked to pose for a group photo.

A basic lamb with headpiece, earrings, necklace and rhinestones takes two or three minutes, and a skirt adds a couple more, pushing it to five or six, said Abdulla Amirila, who turns out about 400 sheep a day. However, he said he hasn't yet run out of ideas. A regular sheep costs 40 yuan ($5.90), while one with a skirt is 60 yuan.

The stall gives out 150 line-up tickets daily from 9:30 am. Each customer is limited to three lambs — one skirted and two regular. Online orders run alongside, with 150 lambs a day being made by Abdulla Amirila or his family.

Ma Bojie, a visitor in his 40s from Tianjin, said he had lined up for two days straight starting at 6 am to snag sheep for family and friends back home. One 41-year-old traveler from Harbin, Heilongjiang province, said she came straight from the airport. After waiting three hours and still in line, she noted it was worth it just to see the toys' handsome creator.

At the Xinjiang International Grand Bazaar's Jianglaicheng cultural-commercial complex, there is an area where visitors can have a go at making their own. Parents come with children, lovers craft shared memories, and some boyfriends can be seen picking accessories and handling glue guns under the watchful eyes of their girlfriends via video calls.

It's hard to tell which of the more than 1,000 business owners at the Jinquan mall came up with the idea of dressing up the lambs, but the competition — a battle of creativity and style — is fierce.

Mamatjan Munup has introduced rarer, curly-fleeced lambs in gray and brown, along with distinctive accessories and purple or navy-blue eyes. Maryamgul Mamat, a housewife-turned-vendor, has been designing and sewing her own Atlas silk skirts for the lambs at home and creating luxurious lamb "couples" for wedding souvenirs, rather than using trinkets commonly sold at Jinquan for decoration.

Her teenage daughter Yusum Mahmut, who helps out during summer break, put it simply: "Everyone has their own style. It's about chemistry. If it clicks, you'll probably like my lambs."

People visit the guided-missile destroyer *Nanning* at the Chinese People's Liberation Army Hong Kong Garrison's naval base on Stonecutters Island in the Hong Kong Special Administrative Region on Saturday. The showcase event, which concluded on Sunday, featured open-house events and cultural exchange activities. ZHU WEI / XINHUA

HK residents inspired by PLA fleet's visit

By GANG WEN in Hong Kong
gangwen@chinadailyhk.com

Residents of the Hong Kong Special Administrative Region have praised the nation's naval power, saying that they feel a strong sense of pride, as two People's Liberation Army Navy warships neared the end of a five-day port call.

A PLA Navy fleet, consisting of the guided-missile destroyer *Nanning* and the guided-missile frigate *Hengyang*, sailed into the waters of the Hong Kong SAR on Thursday morning, a day after the 29th anniversary of the city's return to the motherland. The ships, which docked at the PLA Hong Kong Garrison's naval base at Stonecutters Island, have attracted a large number of visitors and hosted exchange activities featuring open-house events.

Over the weekend, the vessels and their crew welcomed members of the public aboard on guided tours, with 14,000 free tickets snapped up online within minutes.

At a welcoming ceremony on Thursday, Hong Kong SAR Chief Executive John Lee Ka-chiu said the warships' visit highlights the nation's defense capabilities and maritime responsibilities, boosting residents' national confidence and pride.

He said that the port call — the third of its kind to the SAR in a year — fully demonstrates the central government's "great care, support and high regard" for the city.

The open-house events organized by the fleet allowed residents to experience the country's military strength firsthand, while inspiring patriotism among the younger generation and motivating them to contribute to the nation's rejuvenation, Lee added.

In a message to the SAR government and Hong Kong residents, the fleet conveyed a "deep sense of honor and duty" among its crew, with the hope of strengthening ties and "writing a new chapter together".

Public enthusiasm had been evident even before the ships docked. Crowds had gathered along the waterfront from early Thursday morning, with people saying that they felt a sense of security and pride in the country's military strength.

The fleet held an open session for young people and student groups on Friday. Students of different ages formed long queues outside the Ngong Shuen Chau naval base to board the vessels. Soldiers and officers introduced the warships' operations, briefing the visitors on the main weapons, navigational instruments and missile systems, as well as the crew's quarters.

The visitors also viewed the fast-attack craft, torpedo launchers and helicopter decks.

Law Siu-hei, a final-year undergraduate student at Lingnan University and a member of the Hong Kong Army Cadets Association, described what he saw as "stunning", such as his first impression of the massive warships up close and his tour of their interior facilities.

Having missed previous PLA Navy visits to Hong Kong, Law said he hopes there will be more opportunities in the future for him to witness the PLA Navy's strength firsthand.

During a public tour of the ships on Saturday, a resident surnamed Lam said he had secured a free ticket with the help of his four children.

Another visitor, Samuel, said he was particularly interested in seeing the growth of the nation's defense capabilities.

"Looking back at history, when our country's military power was insufficient, we were invaded by aggressors. Now, with this level of military strength, we can properly protect our own country," he said.

The Macao SAR authorities had also arranged for about 400 residents, including youth groups, teachers, students and families, to tour the warships over the weekend.

The *Nanning* is a domestically-built Type 052D guided-missile destroyer capable of area air defense, anti-ship strikes and anti-submarine warfare, while the *Hengyang*, a Type 054A guided-missile frigate, is equipped for surveillance, anti-surface, anti-air and anti-submarine operations.

The vessels are named after Nanning, the capital of the Guangxi Zhuang autonomous region, and Hengyang, a major city in Hunan province.

Lesley Liu and Roys Zhang contributed to this story.

AI: More efforts needed to fight hurdles

From page 1

For this reason, the effect of AI on human rights has become one of the defining challenges of our time.

International and regional frameworks — including UNESCO's Recommendation on the Ethics of Artificial Intelligence, the Organization for Economic Cooperation and Development's AI Principles, and the European Parliament's guidance — consistently stress human rights, nondiscrimination, transparency, accountability and respect for human dignity throughout the AI life cycle.

Nevertheless, significant challenges remain. Currently, there is no universal regulatory framework regarding the use of AI; regulatory efforts are important, such as the European Union's AI Act. China has also contributed to the international discussion through the Global AI Governance Initiative, which emphasizes a people-centered approach and international cooperation. In Latin America, more regulations governing AI have been adopted at the national level.

However, the reality remains that AI transcends national borders in the digital sphere, and the limits of AI applications are ultimately determined by the deployment of more advanced AI systems.

Under the influence of algorithms or AI decisions, human rights may be subordinated to efficiency, algorithmic bias and a false sense of objectivity.

The safeguarding of human rights depends on the capacity and willingness of states and their governments to exercise their power in this regard. But humanity appears to be losing its decision-making capacity, its ability to resolve conflicts, and its aptitude to prevent environmental catastrophe. We are in danger of power migrating to those who control the technology or, worse still, of allowing technology itself to decide what is best for humanity.

The next question is whether robots should be granted "human" rights or whether, as some researchers predict, humanity is destined or condemned to evolve into a race of man-machines or machine-men, which will model new rights, new personalities and, therefore, a new society that will incorporate a new intelligent social contract, displacing the traditional Rousseauian social contract and replacing the moral, legal, social, economic and political norms that exist.

In light of these scenarios, the true challenge posed by the rise of AI is not merely technological but profoundly human: to ensure that the expansion of AI strengthens individuals and contributes to the common good, without undermining human dignity, individual autonomy, democratic values, the very essence of states and the fundamental rights on which our societies are founded.

The author is the former prime minister, and former minister of justice and human rights, of the Republic of Peru. The views do not necessarily reflect those of China Daily.

E-commerce: Companies encouraged to stress on innovation

From page 1

Chinese policymakers have in recent years shifted their focus from regulating internet platforms to promoting the sector's high-quality development, encouraging companies to compete through innovation and service quality rather than price wars.

The current e-commerce law was drafted largely around conventional online retail platforms before the rise of new e-commerce forms.

Therefore, the latest draft amendments cover operators of newer business models, including live-streaming platforms, social commerce and artificial intelligence-enabled e-commerce services.

It also expands legal protections to groups that have become increasingly pivotal to the platform economy, including gig workers such as food delivery riders and ride-hailing drivers.

Scope of injury cover for gig workers widened

Policy serves as a broader push to drive 'employment-friendly' development

By LI LEI
lilei@chinadaily.com.cn

A number of policy measures have been rolled out over the past few months to better protect gig workers, who experts described as the backbone of China's labor force and a vital buffer against unemployment amid economic headwinds.

According to official estimates, over 200 million people are currently engaged in flexible work, of whom about 84 million operate in platform-based roles.

In a landmark move that took effect on Wednesday, the Ministry of Human Resources and Social Security launched a nationwide program extending work-related injury insurance to gig workers employed in the ride-hailing, instant delivery and intracity freight sectors.

The pilot program, initiated in July 2022, enrolled 29.9 million workers from across 11 major platforms and 17 provinces till the end of June. The ministry announced that additional platform-based occupations will be included in the program by 2027.

Work-related injury insurance is a cornerstone of China's social safety net, forming part of the widely recognized "five insurances" that also include pension, medical, unemployment and maternity coverage.

It is the inherent flexibility of gig workers that exposes them to gaps in social protection. Injury, unemployment and pension insurance premiums of traditional employees are covered by their employers. Platform workers, by contrast, often operate across multiple platforms that typically position themselves as mere information intermediaries — a setup that leaves workers in a precarious legal gray area.

The new occupational injury policy marks a significant departure from tradition by removing the prerequisite that workers must have an established employment relationship to qualify for coverage.

Instead, platforms now pay premiums on a per-order or per-day basis, with coverage triggered the moment a worker accepts a gig.

"To deal with flexibility, we need flexibility," said Li Chang'an, a professor at the University of International Business and Economics' Academy of China Open Economy Studies.

He said that flexible employment represents a dominant form of emerging work models and serves a distinct function in alleviating joblessness. The combination of minimal entry requirements and strong integration with the digital economy is making this type of work especially appealing, particularly to younger individuals.

Dou Liguo, who manages a delivery outlet in Beijing, has witnessed these changes firsthand. In 2013, his coverage area was four times larger than what it is today, yet he had only 20 couriers on his team. Now, operating in a much smaller territory in Fangshan district, he needs more than 30 couriers to meet the daily demand.

Gao Qijie, 31, who lives in Suzhou, Jiangsu province, turned to ride-hailing in early 2023 after the supermarket where he worked closed down. "I only have a middle school education. The entry threshold for ride-hailing is lower than other jobs, and the hours are much more flexible," he said. While he worries about the platforms not sharing pension and medical insurance costs, for him the job is a lifeline against unemployment.

Jiang Ying, a labor law professor at China University of Labor Relations, called flexible employment a "shock absorber" in times of economic turbulence. "Food delivery, ride-hailing and livestreaming can quickly absorb displaced workers, offering transitional income and staving off mass unemployment," she said.

The nation's support for gig workers is part of a broader push to build an "employment-friendly" development model — a concept first introduced in the 15th Five-Year Plan (2026-30) and reaffirmed in this year's Government Work Report, which places "stable employment" first among four key stability goals, followed by stable businesses, markets and expectations.

In June, the State Council, China's Cabinet, unveiled a plan to put the "employment first" strategy into action over the 2026-30 period. Among other measures, the blueprint pledges to promote the sound development of flexible work, broaden development channels, strengthen public services and protect workers' rights.

The latest expansion of workplace injury coverage addresses one of the most pressing concerns for gig workers: Despite facing high risks linked to algorithmic management, many lack a clear employer and have long remained unprotected.

In recent years, authorities have stepped up efforts to rein in platform algorithms that undermine gig workers' pay, rest, safety and right to information and participation.

Regulators have launched special campaigns to tackle recurring issues related to algorithms adopted by major platforms, pushed platforms to lower commission rates and moved to eliminate or reduce fines.

Officials are also advocating stronger protection during severe weather, capping maximum working hours to prevent overwork, and pressing platforms to revise labor rules to ensure algorithms treat workers more equitably.

Front-line workers said more can be done. Xiao Hailin, a 33-year-old FedEx employee in Beijing, started delivering part-time for Meituan in May. He works two to three hours most evenings, earning an extra 1,000 yuan a month, and limits himself to two orders per shift for safety. He said platform delivery windows are often too short, encouraging risky riding.

Dou, the delivery outlet manager, noted that platform algorithms pre-calculate daily mileage and order volumes, and that penalties are steep for late deliveries or procedural errors — 50 yuan per overdue delivery, he said.

WORLD IN FOCUS

Back-to-back 7.2 and 7.5 tremors leave over 2,900 dead, millions displaced in Venezuela's worst quake in a century

Rescuers and volunteers search for possible victims in Caraballeda, La Guaira, Venezuela, on June 28, following the twin earthquakes. MAURICIO VALENZUELA / AFP

Double Strike

Double earthquakes in Venezuela struck just 39 seconds apart on June 24. This rapid one-two punch decimated the country's infrastructure, leaving at least 2,954 people dead by Saturday, marking the strongest to hit the South American nation in more than a century.

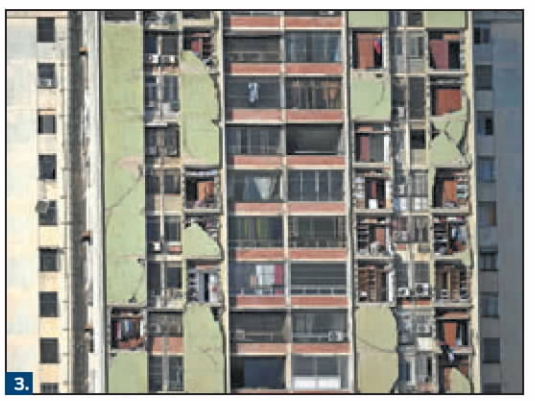
The initial 7.2 magnitude earthquake weakened hundreds of buildings. The second, stronger 7.5 magnitude quake hit less than a minute later, causing structures that were already compromised to suffer catastrophic, total collapses. Both ruptures occurred at very shallow depths of roughly 10 kilometers.

According to the United Nations, many residential and commercial structures in Caracas and the hard-hit coastal state of La Guaira were not built using earthquake-resilient engineering practices.

"Approximately 58,870 buildings were likely damaged or destroyed across the affected region" based on satellite radar data gathered on June 25, the day after the earthquakes, according to researchers Corey Scher and Jamon Van Den Hoek of Oregon State University.

Tens of thousands of people were still reported missing, in a South American country already mired in economic crisis and political limbo after the US forcibly seized then-president Nicolas Maduro in January.

Local hospitals are entirely overwhelmed, forcing international rescue teams and the UN to quickly scale up operations. Emergency workers are hampered by widespread mobile network and internet outages, as well as chaotic, debris-clogged roads, according to the UN.



Millions more people are feared to be lacking sanitation and other basic needs after one of Latin America's most devastating earthquakes.

The UN migration agency said that based on population and damage data, up to 6.76 million people could be affected, and would require shelter, water, sanitation, healthcare and essential relief items. The UN estimated $6.7 billion in physical damage from the earthquakes — equivalent to 6 percent of Venezuela's GDP.

Trump holds calls with Putin, Zelensky

Conversations discuss conflict in Ukraine amid fresh drone strikes

Workers stand near charred vehicles at a parking lot in the eastern Zaporizhzhia region on Saturday, following a Russian airstrike. REUTERS

MOSCOW — US President Donald Trump spoke with his Russian and Ukrainian counterparts Vladimir Putin and Volodymyr Zelensky on Saturday to discuss the conflict in Ukraine ahead of a NATO summit in Ankara, the Kremlin and Zelensky said.

The calls were both to mark the 250th birthday of the United States, both sides said.

"This conversation, the fourth such exchange this year, was naturally not merely a routine protocol exchange but business-focused and highly constructive," said Yury Ushakov, the Kremlin's foreign policy aide.

"It allowed for a frank discussion of pressing issues on the bilateral and international agenda," Ushakov said.

"The presidents naturally addressed the issue of a settlement in Ukraine, taking into account, in particular, Donald Trump's upcoming participation in the NATO summit in Turkiye on July 7 and 8," he said.

Ushakov said the two leaders also discussed issues including Iran and the Middle East during the 85-minute call.

During the dialogue, Putin laid out the real battlefield situation, where Russian troops are advancing along the full line of contact. Ushakov said European countries hold a flawed perception of the overall dynamics and ground realities along the contact line amid the Ukraine conflict.

On bilateral ties, Putin and Trump underscored the importance of sustaining consistent communication, including on military-political and economic fronts, he said.

"There exist vast prospects for mutually beneficial cooperation between our two nations in these spheres," he said. "Trump stressed that an early resolution to the Ukraine conflict would serve as a prerequisite to unlocking such cooperation."

Earlier on Saturday, Zelensky said he and Trump had also discussed the more than four years of conflict in Ukraine, calling it a "very good phone call".

"President Trump and I discussed the current situation on the frontline as well as our diplomatic efforts. There is a real prospect to put an end to this war, and America's resolve is decisive," he wrote on X.

"We have agreed to continue these discussions during the NATO summit in Ankara," he added.

Heads of state and delegations from 32 countries, including Trump, are expected to arrive in Ankara starting Tuesday for the summit.

Front-line news

On the front lines, Putin said on Friday that Russian forces have completed the "full liberation" of the Lugansk People's Republic.

The elimination of Ukrainian military formations continues across the territories of the Donetsk People's Republic, as well as the Zaporizhzhia and Kherson regions, he added.

Also on Friday, Russia said its forces had taken full control of the city of Konstantinovka in eastern Ukraine.

"The main news is that Konstantinovka has been completely taken," Kremlin spokesman Dmitry Peskov was quoted by RIA Novosti as saying on Friday. The city is a key stronghold located in Donetsk.

Following the announcement, Putin said on Friday that the capture "carries great strategic significance", while visiting one of the temporary command posts of the joint force grouping.

However, Ukraine denied on Saturday Russia's announcement. Ukrainian army spokesman Andriy Kovalyov told Agence France-Presse that Konstantinovka remained under its control, while Zelensky dismissed Moscow's announcement as "a lie".

"The situation remains difficult", Kovalyov said, but the city "is under the control of the Ukrainian Defense Forces".

The conflicting claims came after Russia also said Ukrainian drones had struck its second-largest city, St. Petersburg, and the surrounding region.

St. Petersburg Governor Alexander Beglov said the city of 6 million had been subjected to a "large-scale" drone attack, with the city's oil terminal struck. He said there were no casualties and that the aftermath of the attack had been dealt with.

Alexander Drozdenko, governor of the surrounding Leningrad Region, said a drone had struck the area of Vysotsk Port, about 170 kilometers northwest of St. Petersburg on the Baltic Sea. The port handles oil, grain, coal and liquefied natural gas.

Drozdenko said 72 drones had been shot down over the region, and there was minor damage in several settlements.

In Moscow, Mayor Sergey Sobyanin said air defense forces had shot down 28 drones targeting the capital since the beginning of Friday.

In his latest update, Sobyanin said eight more drones heading toward Moscow were shot down on Friday night.

"Emergency service crews are working at the debris site," he said.

Briefly

OIL MARKET

OPEC+ increases production quotas

Seven OPEC+ members decided on Sunday to again raise oil production quotas as Gulf countries reel from the Middle East war. Ministers from key OPEC+ countries Saudi Arabia, Russia, Iraq, Kuwait, Kazakhstan, Algeria and Oman met virtually on Sunday and "decided to implement a production adjustment of 188 thousand barrels per day", a statement said, adding that "this adjustment will be implemented in August 2026". Between the first quarter and May, the combined production by Saudi Arabia, Iraq and Kuwait — three of the seven countries raising their quotas — fell by some 6 million barrels per day, OPEC data showed.

DPRK

Top leader oversees weapons system test

Kim Jong-un, top leader of the Democratic People's Republic of Korea, oversaw on Friday a performance test of the weapons systems of destroyer *Kang Kon*, the Korean Central News Agency reported on Sunday. The destroyer conducted on Friday "a test-fire of strategic cruise missile and a test of major weapons systems such as naval artillery, automatic machine guns and electronic warfare means", the report said. Kim said it is necessary for the country "to further speed up the projects to maintain and steadily expand the reliable war deterrent and capability to fight a war".

DR CONGO

Ebola deaths near 500 as cases rise

The Democratic Republic of Congo has reported 1,528 confirmed Ebola cases, including 492 deaths, as the country's latest outbreak continues to expand. The DR Congo's public health authorities said in a report on Saturday that a total of 239 patients have recovered, while 628 confirmed patients are in isolation or hospitalized. Authorities have also identified 185 suspected cases. The report said weekly confirmed cases have continued to rise, with epidemiological weeks 25 and 26 recording the highest levels, each exceeding 300 cases, indicating continued community transmission.

Gunfire in US cities replaces holiday fireworks

By **SHI GUANG** in New York
shiguang@chinadailyusa.com

The sound of fireworks over the Fourth of July holiday in many US cities was actually the crack of gunfire.

A police officer in New York was shot in the back of his ballistic vest and injured during an encounter with an 18-year-old who was armed. A second officer was also hurt while arresting the suspect after a foot chase. Police said the two officers were parked in an unmarked vehicle when the armed suspect approached the car, prompting the officers to exit the vehicle and engage with him.

"This has the stop," said Scott Munro, president of the Detective's Endowment Association. "Our members are out there day and night, hours and hours protecting the people of the city of New York, doing a job that they took an oath to take and they need to be respected, and thank God this detective is going home," Munro said at a news conference on Sunday.

The shooting of the officer came after at least eight people were shot in Coney Island, including four children. All were in stable condition, apart from one 21-year-old woman listed as critical. New York police said a masked gunman opened fire on the group, who were having a family barbecue, then fled on foot.

"There is no place for this kind of violence in our city. We will not tolerate it. We will fight it with every single tool at our disposal," New York Mayor Zohran Mamdani said at a news conference.

"As we mourn alongside those whose loved ones have been hurt, let us also recommit ourselves to the work of building a city where every celebration is safe and every holiday is joyful," Mamdani said.

Police are still trying to identify the suspect.

In Chicago, 21 people were shot in a number of incidents, two of whom died, and three others were stabbed.

The most severe incident involved a shooting of six people, who Chicago police said were standing in a crowd when unidentified individuals opened fire on them. The victims, between the ages of 17 and 20, were all listed in good condition.

That shooting occurred just nine minutes after a 17-year-old girl was shot on the same block. The girl remained in critical condition with a gunshot wound to the chest, and police are trying to determine how or if the two incidents are linked.

Chicago police said that over the Fourth of July weekend, 18 people were shot, three of whom died, and two officers were injured.

Authorities said at least 52 people were shot across the country, with five dead so far, the New York Times reported.

According to criminologist James Fox, July 4 and July 5 are the two most violent days of the year in the US.

"Holidays and celebrations, they often involve drinking, sometimes drug use, and unfortunately also guns," Fox told the New York Times. "If there's lots of strangers, altercations and arguments can arise," he said.

This year's soaring temperatures can also be a factor contributing to heated encounters.

Elsewhere in the US:

- Six people were shot and one died in San Antonio, Texas.
- Five people were shot at a party in a suburb of Detroit, Michigan.
- One woman was killed and eight injured in Fort Wayne, Indiana.
- Seven people were injured in Hilton Head, South Carolina when gunfire was exchanged between two groups at a public beach.

In 2024, the latest year with complete data, 44,447 people died from gun-related injuries in the US, according to Pew Research. The largest percentage of those, 62 percent, were suicides, while 35 percent, or 15,364, were homicides, though that is down from a record 20,958 during the COVID peak in 2021.

Of the remaining homicides, 636 involved law enforcement, 450 were accidental, and 404 were undetermined.

Pew Research reported that 76 percent of all homicides in the US in 2024 involved a firearm, and while that is down slightly from recent years, it is still among the highest percentages since 1968, the earliest year for which the Centers for Disease Control and Prevention has online records.

Adjusted for population growth, there were 12.8 gun deaths per 100,000 people in 2024, down from the peak of 16.3 per 100,000 in 1974, Pew Research reported.

Envoy hails strong China-Cuba relations

By **SHAO XINYING** and **PAN YIQIAO**

Alberto Blanco Silva

As the Communist Party of China marks its 105th founding anniversary, Cuba's ambassador said China's development has not only validated its own path of modernization, but also anchored a unique, history-defying bond that bridges continents and generations.

Alberto Blanco Silva extended his warmest congratulations to the CPC and the Chinese people, hailing a comradely spirit that has withstood decades of international turbulence.

Having first arrived in China in the mid-1980s, shortly after joining the Communist Party of Cuba, Blanco said he has watched the country's transformation over four decades.

"Without the CPC, there would be no New China," he said. "It proves the success of socialism."

From major cities to rural communities in various Chinese provinces, Blanco sensed that people "have a strong sense of happiness and fulfillment".

He attributed the achievements to the CPC's ability to uphold policy continuity while constantly adapting through theoretical and practical innovation.

In his view, China's modernization has not only improved the lives of its own people but also created opportunities shared with other developing countries and the Global South.

Describing bilateral bonds as "brotherly", the veteran diplomat highlighted a threefold paradigm: equality between nations of different sizes, solidarity between socialist states, and cooperation between China and a Latin American country that has maintained diplomatic ties since 1960.

He believes those principles are not merely in official documents but have been forged through generations of people-to-people exchanges.

Recalling the history of the first Chinese immigrants in Cuba in 1847, Blanco spoke highly of their arduous fight alongside Cubans during the country's wars of independence.

"Not a single Chinese Cuban was a deserter, and not a single one was a traitor," he said, citing the words inscribed on the iconic monument in Havana dedicated to their honor.

Now, he added, Chinese culture has become an integral component of Cuban identity.

Solidarity remains vivid

Such solidarity remains vivid in recent memory. After the 2008 Wenchuan earthquake in Sichuan province, Cuban medical teams rushed to China to assist in rescue efforts despite language barriers.

Many of the interpreters who accompanied them were Chinese students who had studied medicine in Cuba, illustrating how educational exchanges had evolved into a bridge connecting the two peoples during times of crisis, Blanco said.

Education has been one of the cornerstones of bilateral cooperation, he said. Cuba has been welcoming Chinese students, and vice versa.

Between 2006 and 2016, more than 3,000 Chinese students received training in Cuba in fields including medicine, tourism and language studies, he said.

Currently, the vast geographic distance between the two nations is shorter thanks to direct flights, turning the ancient Chinese idiom, "a bosom friend afar brings a distant land near", into a daily reality. With the visa waiver policy, Blanco expects growing exchanges in culture and among young people.

Deeper cooperation in biotechnology, renewable energy and agriculture remains crucial as Cuba continues to withstand the impact of the decades-long United States embargo. China's steadfast support has shown that Cuba "never stood alone", he said.

With 2026 also marking the 90th anniversary of the victory of the Long March of the CPC-led Red Army, Blanco said the endurance and resilience exhibited during that historic journey continue to inspire countries today.

For him, that spirit remains relevant not only to China's future, but also to developing countries seeking their own paths to modernization.

"Our shared history, mutual solidarity and common goals demonstrate an infinite strength," Blanco said. "Together, we are proving the vitality of the socialist cause."

Liu Tianyun contributed to this story.

COMMENT

Editorials

Von der Leyen's China 'ultimatum' another symptom of EU's challenge, not a solution

The irony is glaring. When US President Donald Trump openly threatens 100 percent tariffs on European goods if the European Union dares to tax digital services, European Commission President Ursula von der Leyen is reserved — as if Europe deserves its fate.

However, she displays no such "reticence" when it comes to the EU's trade differences with China, declaring that Brussels has "all instruments on the table" unless Beijing delivers "tangible results" by October.

What she seemingly fails to appreciate is that all Western leaders who have employed such maximalist rhetoric regarding trade with China in recent years have eventually sat down for talks to resolve their concerns.

The first talks of the China-EU trade and investment consultation mechanism last week between China's Commerce Minister Wang Wentao and EU Trade Commissioner Maros Sefcovic were exactly that: "intensive, focused and constructive", in Sefcovic's own words. To follow this with belligerent public deadlines is to undermine the very process Von der Leyen claims to champion. It is highly improper, and frankly puzzling, for a politician of her standing and experience.

She may be talking tough to Beijing to divert internal attention from her weak hand in the EU's trade and security dispute with Washington. Last year's trade talks with the US were characterized by EU concessions, inviting sharp criticism from EU capitals. Now, it seems that she is trying to reclaim the mantle of a "defender" of European interests by picking a fight with Beijing shortly after Trump issued new tariff threats to the EU.

But while Von der Leyen issues "ultimatums", she seems out of step with many EU members. Chinese Foreign Minister Wang Yi will wrap up a weeklong tour to Denmark, Sweden, Finland and Norway on Wednesday. He also met Austria's top diplomat in Beijing late last month. In Stockholm, Wang met with the Wallenberg family — pioneers of European investment in China since the 1970s — who pledged to continue to invest in China, deeply engage in China, and integrate into China's market. Swedish Prime Minister Ulf Kristersson affirmed support for strengthening dialogue between the EU and China and properly handling differences.

Other discussions between Wang and officials and business representatives in the host countries these days have sent similar signals. Von der Leyen should take heed that individual EU economies and businesses want stable, healthy economic ties with China.

One only has to recall the recent case of Chinese-made electric vehicles to realize that Von der Leyen's "threats" are unwarranted. The dispute stoked by the EU was eventually resolved through negotiation after months of EU blustering.

If some EU policymakers genuinely believe that the bloc's €360 billion ($411.91 billion) trade deficit with China last year represents leverage rather than the EU's own structural weakening of competitiveness in some sectors and its banning of high-tech exports to China, they are indulging in a convenient delusion. With such reasoning, the deficit becomes grounds for launching a trade war should Beijing refuse to yield. Yet if trade deficits were a source of bargaining power, any economy running a "trade imbalance" would have a ready-made "justification" for economic confrontation. The proposition collapses under its own weight.

A trade deficit is not a weapon but a phenomenon — of consumption patterns, industrial capacity, comparative advantage, etc. To treat it as casus belli for a trade war is an admission of analytical failure cloaked in political bravado.

Over the past decades, the EU has enjoyed "comfortable" prosperity partly because Russia provided cheap energy, the US guaranteed its security and China offered a vast market and affordable supplies. Now, under Von der Leyen's leadership, the bloc risks fouling its nest on all three fronts simultaneously.

When China extends its hand to the EU for far-sighted cooperation and global coordination — across trade, green transition, and multilateral governance — certain European politicians respond by stubbornly paddling their oars in the stagnant waters of a zero-sum game, animated by a musty Cold War mentality. Their failure to envision mutual gain and manage differences is a direct contributor to Europe's declining competitiveness.

If the EU shuts out China's competitive green products, it will succeed chiefly in making its own green transition costlier and its industrial base less competitive. In trying to protect itself from Chinese competition, the bloc is poised to damage its own economic future.

The EU's industrial edge has dulled, in no small part because its political class has allowed its strategic judgment to atrophy, mistaking protectionist posturing for statecraft and rhetorical brinkmanship for resolve. In a world that demands agility, they offer rigidity — and call it "principle".

China has years of experience responding to extreme pressure and will strictly defend its legal rights and interests. It is willing to use established consultation channels with the EU for equal-footed talks. But it will never succumb to threats. Von der Leyen's attempt to apply pressure only exposes which side is blinking first. The EU cannot afford to trade its economic future for a display of bravado that fools no one.

If the EU fixates solely on carving up the existing economic pie "equally" with China, while neglecting the far harder task of making that pie larger, it will ultimately find its own slice shrinking — not because China is taking it, but because the EU cannot see the bigger pie.

Deterrent to secessionists and external forces

The China Coast Guard is continuing routine law enforcement patrols in the waters east of China's Taiwan island. The patrols which commenced on June 1 aim to ensure orderly navigation and to safeguard the lawful rights and interests of China, as well as the lives and property of Chinese fishermen.

The patrols also serve as a strong deterrent against the Taiwan secessionist forces and the external forces they seek to rely on.

In another development, Chinese marine researchers carried out a comprehensive environmental survey in waters east of Taiwan island last month to gather scientific data on the region's ecological conditions and support marine conservation efforts. All this indicates that Beijing has placed the waters concerned under a comprehensive management framework.

These measures are necessary to counter the attempt of Japan and the Philippines to initiate their so-called "maritime delimitation talks" over the waters, where China has an exclusive economic zone and continental shelf according to international law.

Together with previous jurisdictional actions by the Chinese central government concerning China's Taiwan region, such as deciding whether it can participate in international bodies in the capacity of an observer, protecting the interests of overseas Taiwan compatriots, and punishing "Taiwan independence" separatist forces, the measures collectively establish a comprehensive system for the central government's substantive jurisdiction over Taiwan.

Enhanced jurisdiction over waters east of Taiwan is a timely, forceful deterrent to those harboring a malicious intention to split the Chinese island from the motherland. Lai Ching-te, the secessionist-minded leader of the Democratic Progressive Party authorities on the island, has shamelessly shown support for the unlawful "delimitation initiative" proposed by Tokyo and Manila.

Clearly, Lai and his secessionist followers have no inclination to wake up from the daydream of relying on external support to advance their agenda.

Raymond Greene, director of the so-called "American Institute in Taiwan", attempted to redefine the conditions for maintaining the "status quo" and cross-Strait dialogue in a recent interview, which demonstrates indulgence of the DPP authorities' fallacious "Taiwan independence" narrative.

In fact, even local media in Taiwan were quick to point out that Greene's remarks run counter to US President Donald Trump's position on the Taiwan question. "We're not looking to have somebody say, 'Let's go independent because the United States is backing us'," Trump said in an interview following his state visit to China in May, adding that he is not looking for US soldiers to "travel 9,500 miles to fight a war" over Taiwan.

Greene's remarks, however, reflect the traditional mindset of the China hawks in Washington. This mindset reinforces the Lai authorities' illusions of "seeking independence through military means" and "by relying on the US".

As Chinese Foreign Minister Wang Yi urged in a phone conversation with US Secretary of State Marco Rubio last week, the US side should handle Taiwan-related affairs with the utmost prudence, as the Taiwan question has far-reaching implications and even a slight wrong move could affect the whole situation.

Opinion Line

Tokyo reveals how its 'security' choices strain regional stability

Akio Fujii, executive chair of Nikkei's editorial board, recently wrote a second open letter to the US president. In an earlier letter after Washington's "reciprocal tariffs" last April, Fujii had asked whether the policy truly serves US interests, arguing that weaponizing trade might hurt others initially, but will ultimately impose costs on the United States itself.

In the latest letter, Fujii writes that the US is "losing the world's trust" and that its soft power "appears to be declining". For decades, Washington has cast itself as the "principal guardian" of a "rules-based international order". From the General Agreement on Tariffs and Trade to the World Trade Organization and the Bretton Woods Institutions, the US embedded its own interests into international rules and presented those as universal principles. However, as the US increasingly uses the political logic of "Make America Great Again" to reshape rules to suit its immediate domestic and strategic interests, its narrative is weakening.

The pattern is visible in a series of recent US actions — from tariff wars to the forcible seizure of Venezuelan President Nicolas Maduro and his wife, and the US-Israeli military campaign against Iran since late February.

This shift affects not only the US' competitors, but also its allies. The prolonged disruption of the Strait of Hormuz demonstrated how the consequences of US policy can quickly spread through energy markets, financial systems and global supply chains, eventually reaching ordinary people worldwide through higher prices, inflation and growing economic insecurity.

Fujii's letter is notable precisely because it reflects an unease emerging from within the US-led system itself: if Washington becomes less bound by the rules it once championed, the "security architecture" built around "US leadership" will also become less predictable.

For Japan, this creates a structural dilemma of its own making. Since the end of World War II, Japan has anchored its security and development in the US-led international system. However, if the US repeatedly treats rules, allies and commitments as expendable, it will eventually exhaust the trust of its allies.

This is the deeper anxiety behind Fujii's letter. Japan is not a distant observer of US unpredictability. It is among the countries most directly exposed to it. The more Washington swings between competing priorities, the more Japan is drawn into the policy shifts, crisis management choices and strategic calculations of its principal ally.

Among Japan's right-wing politicians, the policy direction pursued by Prime Minister Sanae Takaichi is particularly troubling. Instead of responding to uncertainty with restraint, Japan is moving away from its postwar "defensive posture" toward deeper alliance integration and greater reliance on military instruments. Takaichi's erroneous and dangerous remarks on China's Taiwan region, together with the expansion of the country's military capabilities, higher military spending, relaxed arms export restrictions and deepening "security" collusion with the Philippines and other US-aligned partners, show how far Tokyo has gone in remilitarization.

Given its past militaristic aggression, which caused profound suffering across the Asia-Pacific, neighboring countries will naturally question whether Japan's expanding military capabilities signal a further erosion of the postwar constraints.

In seeking "security" by following the US, Japan is placing its "security" in the hands of a country that has become more unilateral, more transactional and less predictable.

The US' 250th anniversary provides an occasion for Washington to rethink its relationship with the world. But instead of reflecting on the consequences of its actions, the US is becoming more unpredictable. At the same time, Japan is becoming more right-leaning. The result is East Asia's security environment is becoming increasingly strained. That is the real anxiety behind Fujii's open letter.

— SONG PING, CHINA DAILY

What They Say

AI governance calls for effective legislation

Editor's note: *China intends to accelerate legislation to improve artificial intelligence governance. Legal Daily spoke with Zhi Zhenfeng, a research fellow at the Institute of Law at the Chinese Academy of Social Sciences, and Dai Xin, deputy dean of the Law School at Peking University, about that. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

China has developed a toolkit of AI governance mechanisms by regulating social media, online gaming, e-commerce and other digital sectors. This has enabled the country to establish an effective legislative approach that is suited to the fast-moving nature of AI.

The approach is marked by China first introducing targeted, sector-specific regulations to address concrete issues, and moving toward a comprehensive national AI law once the necessary conditions are in place.

AI technologies are applied across highly diverse industries with vastly different risk profiles and regulatory needs. Sector-specific legislation therefore provides more precise institutional solutions, avoiding the excessive generality that often accompanies comprehensive legislation. Judicial practice, local legislation and regulatory pilot programs can generate valuable experience and institutional models, laying a solid foundation for future national legislation.

At the moment, legislative priorities should focus on removing institutional barriers that constrain AI development within the existing framework of sectoral legislation, while addressing critical gaps in areas such as data circulation, intellectual property adaptation and the allocation of legal liability.

Over the next three to five years, China's AI legal framework should concentrate on several key priorities. First, it should facilitate the efficient circulation of essential production factors, including data, algorithms and computing power, while establishing clear rules governing the lawful use of training data, data ownership, data transactions and benefit-sharing mechanisms.

Second, China should further improve mechanisms governing algorithm registration, transparency requirements and security assessments, and, when appropriate, elevate these rules from administrative regulations to higher-level legislation in order to strengthen their legal authority and enforceability.

Third, the legal framework should clearly define the responsibilities of AI developers, service providers and users, while improving mechanisms for liability allocation, infringement remedies and dispute resolution to better protect the legitimate rights and interests of individuals and legal entities.

Fourth, efforts should be made to better link AI legislation with the evolving global AI governance architecture. While safeguarding national security, China can deepen international collaboration and contribute Chinese wisdom and solutions to global AI governance.

The agenda framework should guide or require all stakeholders across the AI sector to give due consideration to fundamental social values and the protection of public rights and interests.

At the same time, AI legislation must strike an appropriate balance between stability and flexibility. While establishing clear safety red lines, the legislation should leave adequate room for technological experimentation and industrial innovation. While providing transparent compliance pathways covering data governance, algorithmic models and AI applications, complementary social protection mechanisms should be strengthened to sustain public trust and confidence in AI technologies and their development.

China should deepen its global cooperation in AI research, application and governance, while continuing to build a comprehensive and pragmatic legal and regulatory framework.

VIEWS

China and the World Roundtable | Joint Efforts for Global Food Security

Editor's Note: *Following the recent meetings between leaders of China and the United States and amid growing concerns about global food security and trade tensions, the 2026 China-US Subnational Cooperation Dialogue: Think Tank Dialogue was organized by the Institute of World Economics and Politics at the Chinese Academy of Social Sciences in Beijing on June 18. It brought together experts and scholars from both countries to discuss Sino-US agricultural cooperation and the resilience of the global food system. Following are excerpts from the discussions.*

Sino-US agricultural cooperation vital for food security

Agriculture can steady China-US relations

Liao Fan is director of the Institute of World Economics and Politics at the Chinese Academy of Social Sciences.

During President Donald Trump's successful visit to China in May, the leaders of the two countries held productive talks and reached important common understandings on agriculture. Both sides agreed to take concrete steps to reduce non-tariff barriers and improve mechanisms for market access for agricultural products.

China and the US both have well-developed agricultural industrial chains and vast agricultural markets. Their competitive agricultural products are also highly complementary, creating broad space for cooperation. Since the establishment of diplomatic relations, agriculture has been an important area of China-US economic and trade cooperation, as well as a key pillar of the broader bilateral relationship.

As one of the world's most important bilateral relationships, China-US relations must be properly managed. Despite the ups and downs in bilateral ties in recent years, agricultural trade between the two countries has shown strong resilience.

Food security is a basic guarantee for human survival and development. Achieving global food security requires not only stronger cooperation among governments, but also the wisdom and input of think tanks.

Against this backdrop, the Think Tank Dialogue on China-US agricultural cooperation carries special significance. It provides an important platform for agricultural experts from both countries to exchange views, engage in candid discussion and offer ideas on deepening agricultural cooperation.

At a time when global food systems face mounting challenges, such dialogue can help the two countries expand common ground, manage differences and contribute to solutions for global food security.

Bilateral cooperation carries global responsibility

Susan Thornton is vice-chair of the United States Heartland China Association.

This dialogue on agriculture takes place at an important moment in Sino-US relations. The recent visit of US President Donald Trump to China, high-level interactions in May, and the 2026 Heartland Connect & US-China Agriculture Roundtable held in Zhengzhou, Henan province, in June show that the two countries share deep concerns and mutual interests in agriculture — not just commercially, but also in education and rural cooperation.

Agriculture is a core link between the two countries. Both China and the US manage large and complex food systems that, despite structural differences, are highly complementary.

Both countries also share the responsibility for global food security. Ensuring a stable and resilient agricultural supply chain requires cooperation rather than isolation, especially as global food systems face increasing pressures.

At the same time, agriculture is confronted with structural challenges, including climate stress, resource constraints, demographic shifts and rural revitalization. These challenges are too complex for one country to solve alone, underscoring the importance of sustained dialogue at different levels.

Youth engagement is a key element of this process. Exchanges between students from China and the US are crucial for building long-term understanding in agriculture and rural development.

Agriculture and food systems are the foundation of human society. Agricultural cooperation is essential for enhancing the resilience and stability of the global food system, especially at a time when uncertainty is increasing. We believe that Sino-US cooperation will shape the future of the world and leave a lasting impact on future generations.

MA XUEJING / CHINA DAILY

Agriculture as stabilizer in Sino-US relations

Dan Glickman is a former US secretary of agriculture.

Positive working relationships are important in public service. This is particularly true in Sino-US relations, where it is not always possible to reach an agreement on every issue. Serious issues still divide the US and China, but collaboration remains important, particularly in agriculture. Agriculture remains an area where China and the US can find common ground and cooperate effectively. Both countries share common interests in agriculture and face the same challenges, including climate change, drought, floods, and pest outbreaks.

The increasing unpredictability of weather conditions due to climate change has made agricultural production more difficult across the world.

There are significant mutual interests in agricultural trade between the two countries. US farmers export livestock, poultry, soybeans and other agricultural products to China, and there is strong interest in maintaining stable agricultural trade relations with China. Agricultural equipment and machinery are also part of bilateral exchange.

The US and China are not enemies. They may be competitors in some fields, but in many areas their interests are aligned. Cooperation yields greater benefits than confrontation, and maintaining a stable bilateral relationship is therefore very important.

Education exchanges are an important part of the relationship, with Chinese students having a long-standing presence in US agricultural universities.

The Sino-US relationship is of great significance for both nations. As the world's two largest economies, there is broad space for bilateral cooperation in agriculture, science, public health and other fields, despite the competition in certain areas.

Unlocking untapped potential of agricultural cooperation

Huang Jikun is dean of the College of Modern Agriculture at Peking University.

There is immense potential for cooperation between China and the US in agriculture. The two countries can work together in areas such as scientific research, education, trade, and support for agricultural development in less developed regions, particularly Africa. Although this potential has been widely recognized, there has been a decline in momentum in recent years, which highlights the need for stronger engagement and more systematic cooperation.

In science and technology, climate change poses a global challenge that cannot be addressed by one country alone. Agriculture is a major source of greenhouse gas emissions and also the sector most affected by climate change.

Therefore, there is substantial room for cooperation in reducing emissions from agriculture and improving adaptation to climate impacts, which would contribute to global food security and agricultural resilience.

Food security and agricultural sustainability are also global issues that require joint efforts.

In biotechnology, there is significant potential for collaboration in areas such as bio-breeding, gene editing, and the industrialization of biotechnology. Policy coordination in these fields is important for supporting agricultural innovation and ensuring stable development of global agricultural trade.

China and the US are highly complementary in agricultural trade. The US has abundant land resources, while China has a large population and limited arable land. This structural complementarity supports trade in key commodities such as soybeans, corn and cotton. Stable import and export expectations are important for both sides and create predictable agricultural markets.

Beyond bilateral relations, cooperation also has potential in supporting agricultural development in Africa and other developing regions. Joint efforts in technology transfer, capacity building, infrastructure development, and the application of biotechnology and data technology could help reduce hunger and improve global food security.

Overall, enhanced communication and more regular exchanges among researchers, enterprises, educators and policymakers from China and the US can translate the cooperation potential into practical outcomes and long-term benefits.

Balancing interdependence and security in agricultural trade

Anna Ashton is the founder of Ashton Analytics.

Sino-US agricultural trade is part of a global system of interdependence that has evolved over decades and continues to deliver clear benefits. Agriculture is not just an economic sector but also a fundamental human necessity. Food security and agricultural stability are essential for every society and are deeply intertwined with global peace and development.

In recent years, however, discussions about interdependence have increasingly been reframed through the lens of security. This shift has contributed to expanding restrictions, particularly in high-technology sectors.

While such measures are often justified as necessary for national security, they also generate broader consequences, impacting other industries and the functioning of global supply chains. Trade is becoming more politicized, and at times even treated as a strategic instrument.

Agricultural trade has not been immune to these dynamics. The tariff measures during the 2018-20 trade tensions and the subsequent responses significantly reshaped commodity flows between major economies.

Despite these disruptions, engagement between Chinese and US agricultural companies, universities, and institutions continues. These interactions suggest that there is a strong foundation for cooperation and a shared interest in stability.

Beyond agriculture, there is significant potential for broader bilateral cooperation. For instance, in public health, China has made notable progress in diabetes prevention.

Its experience could be shared to help reduce systemic risks and improve outcomes on both sides.

China and the US should avoid politicizing agriculture and instead strengthen cooperation to reduce systemic risks. The lesson of 1945 remains relevant: the greatest vulnerability comes from mistrust between parties.

Global agriculture faces fragmentation, rising risks

Han Yang is a senior fellow at the Development Research Center of the State Council.

Global agriculture is entering a phase of uncertainty and fragmentation, where it is being shaped by geopolitics, climate change and rising economic complexity. The recent Sino-US leaders' meeting in May, which emphasized building a more stable bilateral relationship, was significant not only for economic stability, but also for the resilience of global agricultural supply chains.

Historically, global agriculture has moved through three broad stages. The Green Revolution period was defined by expanding supply and relatively low food prices. The early 21st century saw both rising production and structural upgrading, driven by technology and rapidly growing demand from emerging economies.

In the past decade, and especially after 2020, there has been a marked shift. The growth in supply has slowed, while demand for food grains remains strong. Global markets remain broadly balanced, but regional imbalances, policy uncertainty and geopolitical tensions have become more pronounced.

At the same time, the impact of climate change has become more visible. Some key producing regions have experienced output fluctuations, while global stocks in major exporting countries have declined, reducing the buffer capacity of the global food system.

Energy and agriculture are more closely linked now. Rising energy and fertilizer costs are directly increasing agricultural production costs and putting pressure on farmers' incomes, particularly in developing economies.

Meanwhile, trade fragmentation is increasing logistics costs and weakening the efficiency of supply chains.

Risks to key transportation routes and growing policy uncertainty are pushing agricultural trade toward regionalization, making the global system more fragile and less predictable.

Beyond these trends, global agricultural governance faces deeper structural challenges, including persistent technological gaps between regions, rising climate risks, tensions between emissions reduction and development needs, and increasingly fragmented regulatory systems.

In this context, strengthening international cooperation in agricultural technology, climate adaptation and digital tools is essential for improving supply chain resilience and safeguarding global food security.

The views don't necessarily reflect those of China Daily.

James Shikwati

China's vision of global governance resonates with Africa's aspirations

The recently released white paper, "More Just and Equitable Global Governance: China's Principles, Proposals and Actions", resonates with Africa's aspiration to amplify its voice and agency in the international arena.

As geopolitical tensions rise, Africa faces two major historical challenges: the legacy of the 1884 Berlin Conference, which defined the modern national borders in Africa, and the post-World War II international system.

The primary objective of the Berlin Conference was not to foster internal cohesion or regional prosperity in Africa but to establish European spheres of influence on the continent. It left a legacy of fragmentation, extraction, raw material export and systemic dependence on Western markets that lasted for over a century. Although the post-World War II international system established a multilateral framework through the United Nations, it concentrated trade, finance and security authority in Western hands.

As African countries navigate the current global realignment, they must draw lessons from history to enhance their statecraft, industrialization and trade strategies.

Global Lens

The shift toward a multipolar, and multi-market global system presents a unique opportunity to restructure trade and finance, unlocking the benefits of Africa's diversity. Beijing's white paper on global governance is an entry point for aligning the strategic objectives of the African Union's Agenda 2063 and the African Continental Free Trade Area.

Beijing upholds the United Nations Charter as a legal shield to protect countries from external political pressure and as a counterweight to Western unilateralism.

This is particularly appealing to African countries that want to reduce their exposure to geopolitical rivalries and proxy conflicts, and are keen on maintaining sovereignty.

The white paper opposes protectionist measures and promotes "open, inclusive, and non-discriminatory trade architectures", a principle that is reinforced by China's May 1 policy granting zero-tariff access to 53 African countries.

This arrangement is a compelling opportunity for the private sector to invest in value addition within Africa to serve the Chinese market of 1.4 billion people with a combined GDP of $20.6 trillion. Unified market standards across all 53 participating countries will make it easier for the AfCFTA to adopt such standards across the African market.

The call for reform of the international financial architecture to prevent its misuse as an instrument of economic coercion also resonates deeply with African nations. Historically, they have faced tough conditions from Bretton Woods institutions that tied access to capital to structural adjustments.

The white paper suggests alternative financing frameworks such as the New Development Bank and proposes the possibility of an African Monetary Fund. Diversifying currency regimes and expanding local currency settlement mechanisms could shield Africa from transaction risks and inflation tied to trading in US dollars and other foreign currencies.

The white paper also focuses on securing technological sovereignty in frontier sectors. Africa's participation in artificial intelligence is minimal, with an estimated 1 percent of the world's computing capacity and less than 2 percent of talent. This poses a significant threat to the continent's future in a world increasingly dominated by "tech-feudalism".

China invites Africa to take agency in crafting technology governance. The African Union should take proactive steps to participate in establishing rules for new frontiers, including AI, cyberspace, and outer space, to ensure they reflect international consensus rather than standards set by a few actors.

The white paper offers comprehensive proposals for addressing the severe and complex challenges facing the world, highlighting the Global Governance Initiative as China's response to global governance challenges, China's contribution to global governance, and a vision for a peaceful future.

It lays out two choices — a future marked by peace, dialogue and win-win cooperation or one marred by war, confrontation, and zero-sum competition.

For Africa, this means redefining multilateralism centered on the UN Charter, sovereign equality that rejects unilateral bullying, Global South agency, and the establishment of new rules and frameworks in technology and development, marked by institutional coordination and long-term planning.

The white paper "More Just and Equitable Global Governance: China's Principles, Proposals and Actions" provides African countries with an opportunity to debate, discuss and adapt its contents to suit their local conditions.

Africa should use the document to understand China better and leverage Beijing's commitment to Global South solidarity to negotiate investment and trade terms and deeper technology exchanges to enhance localized value addition.

Historically, the continent has adopted institutional frameworks developed externally without sufficient adaptation to its local contexts. This time, African agency should take center stage to ensure that the document is not merely copied.

The author is the founder and director of the Inter Region Economic Network, a Nairobi based think tank.

GLOBAL VIEWS

ZHAO WENJIE, SEMIARTO AJI PURWANTO AND VAISNAVA VIDIA MAHATMA

Food security synergy

There is a lot of room for China and Indonesia to learn from each other and strengthen cooperation in agricultural and rural modernization

LIU YANRAN / FOR CHINA DAILY

As important members of the Global South, both China and Indonesia have achieved rapid economic and social development in recent years and also made progress in agricultural and rural modernization.

Zhao Wenjie

Semiarto Aji Purwanto

Vaisnava Vidia Mahatma

Over the past two years, a joint research team from China Agricultural University and Universitas Indonesia found that, thanks to the effective promotion of policies integrating agriculture with culture and tourism, many villages in China's Yunnan province are no longer synonymous with poverty and backwardness in the traditional sense. Rural industries have become more diversified, farmers' livelihood resilience has significantly improved, and rural areas are realizing transformative development. These achievements are attributed to the impetus of China's rural vitalization strategy.

The Indonesian government also attaches great importance to rural poverty reduction and development. After Prabowo Subianto took office as president in 2024, the government made safeguarding food security and promoting rural transformation key administrative priorities, increasing infrastructure investment in rural areas and pushing for the transition of traditional agriculture toward intensive and large-scale operations. The most notable achievement is that by the end of 2025, Indonesia no longer needed to import rice due to a substantial production surplus. Also, it is estimated that the country's rural poverty rate dropped to 10.72 percent in 2025.

Given some similarities in agricultural and rural development between China and Indonesia, the two countries have actively learned from each other's development experiences and continuously deepened practical cooperation over the past few years. This has better aligned the complementarity of their agricultural resource endowments, thereby promoting agricultural and rural modernization in both countries.

During Indonesian President Prabowo Subianto's visit to China in November 2024, the two countries issued a joint statement on advancing the comprehensive strategic partnership and the China-Indonesia community with a shared future, which proposed to expand cooperation in poverty alleviation, agricultural and rural vitalization and modernization. This laid a solid foundation for deepening multidimensional agricultural cooperation between the two sides and steadily advancing exchange of governance experience related to rural poverty reduction and rural vitalization.

China and Indonesia have comparative advantages in agricultural development, which helps smallholder farmers in both countries better integrate into the global value chain, accumulating a material foundation for agricultural and rural modernization. It is particularly worth mentioning that since the Regional Comprehensive Economic Partnership took effect in 2022, measures facilitating agricultural trade have advanced steadily. As one of the world's largest aquaculture producers, Indonesia has continuously made new breakthroughs in aquatic product exports to China. Data released by the Indonesian Ministry of Trade showed that in 2025, Indonesia's export volume of aquatic products to China surpassed 490,000 metric tons, with an export value of approximately $1.04 billion.

China and Indonesia rank second and fourth globally in population, respectively, making food security a top priority for both. In recent years, China has continuously strengthened cooperation with Indonesia on advanced agricultural technologies, such as hybrid rice, and supported the establishment of demonstration fields in several major rice-producing regions. It is estimated that of the more than 80 hybrid rice varieties approved by the Indonesian government, over 60 originated from China. Such agricultural technological cooperation not only assists Indonesia in enhancing its food security but also plays a positive role in improving the livelihood resilience of smallholder farmers.

China and Indonesia also value cooperation in frontier fields such as digital agriculture. For example, as one of the world's largest durian producers, Indonesia saw Chinese authorities conduct accession assessments for its durian plantations and packaging facilities, paving the way for Indonesian durians to enter the Chinese market. Subsequently, starting in 2025, the Indonesian Ministry of Agriculture, alongside agricultural enterprises from both countries, jointly established a national-level digital platform for Indonesia covering the entire chain of planting, traceability, cross-border trade and marketing. This will help realize full-process digital management of Indonesian durians from field to consumer, assist smallholder farmers in integrating into the global value chain, and enhance the international competitiveness of Indonesian agricultural products. Of course, agricultural and rural development in China and Indonesia face similar challenges. The concept of village in China, or *xiangcun*, is essentially equivalent to Indonesia's *kampung* (peri-urban/rural-urban interface). At present, the modernization of both *xiangcun* and *kampung* lags behind that of cities, making the acceleration of the pace of modernization a vital task.

Not long ago, the Chinese government released a plan to accelerate agricultural and rural modernization during the 15th Five-Year Plan (2026-30) period, proposing to better advance Chinese modernization through the acceleration of agricultural and rural modernization. Indonesia similarly focuses on rural transformation and modernization. Overall, there is a lot of room for China and Indonesia to learn from each other and strengthen cooperation in agricultural and rural modernization.

First, China's experience demonstrates that relying on forward-looking layouts such as five-year plans and continuously increasing investment in key areas such as rural infrastructure, industrial development and market expansion can effectively narrow the development gap between rural and urban areas, accelerating the agricultural and rural modernization process.

Second, sound governance efficacy is a necessary prerequisite for solving rural development challenges. China has achieved the rapid development of *xiangcun* by formulating the rural vitalization strategy paired with strong implementation mechanisms, which underscores the importance of national macro policies and their enforcement systems to agricultural and rural modernization.

Third, as populous countries, both China and Indonesia place food security at a strategic height and have taken concrete actions. The two countries can further leverage the conveniences created by the RCEP, exert their respective agricultural comparative advantages, and promote the steady development of agricultural trade and investment. This will inject more vitality into improving the quality and efficiency of the agricultural industry while elevating food security levels.

Fourth, in the current era of rapid technological advancement, strengthened cooperation between the two countries in frontier agricultural technology fields such as digital agriculture will facilitate the deep integration of the agricultural industry chain and provide a paradigm of cooperation for the unity and self-strengthening of the entire Global South.

LI ANJIE

From waste to worth

China is transitioning from energy-intensive wastewater treatment to carbon-negative biorefineries for a circular economy

With the implementation of China's 15th Five-Year Plan (2026-30), the paradigm of green and high-quality development has evolved from a conceptual vision into a strategic imperative. Central to this strategy is the circular economy, which entails the transition from the conventional linear "take-make-dispose" model to a closed system of circulation, thereby converting waste into valuable resources. In the field of wastewater treatment, what starts as an energy-intensive burden is transformed into a carbon-negative resource hub that offers a replicable model for global environmental governance.

For decades, China's wastewater industry has been centered on pollutant removal — an energy-heavy process that generates large volumes of sludge requiring disposal. Turning treatment plants where wastewater varies in volume, quality, pollutant levels and recovery potential into "resource factories" requires targeted designs and tailored solutions. For example, wastewater from food processing and breweries is rich in organic matter that produces biogas and recovers valuable proteins, while papermaking wastewater contains fibers and lignin for recycling and power generation. In the case of municipal wastewater treatment, the most foundational node of urban water circulation, the organic-rich matter can be purified through advanced treatment into reclaimed water for industrial cooling, landscape replenishment and car washing.

The 15th Five-Year Plan has set the policy direction. Across China, pioneering projects are already demonstrating what is possible. China's latest national blueprint has now provided clear policy direction for this transition. A leading example is Tianjin's Zhanguizhuang plant, one of China's largest integrated urban water-recycling facilities. It treats up to 450,000 cubic meters per day, with 100 percent of its reclaimed water supplied for industrial cooling, municipal use and river-flow augmentation. The plant achieves threefold full utilization: All reclaimed water goes to industry, communities and river replenishment; all sludge is processed into nutrient-rich soil for landscaping; and on-site solar panels and water source heat pumps contribute to measurable cuts in the plant's operational carbon footprint. This "triple-utilization" model — water reuse, sludge-to-soil conversion and energy recovery — exemplifies the circular transformation envisioned in China's 15th Five-Year Plan.

Not all circular transformations require new chemistry; sometimes they require rethinking the interface between infrastructure and the city. Hangzhou's Yuhang Phase IV plant is a fully buried municipal wastewater treatment facility — its tanks, screens and blowers entirely below ground level. Above the fully buried plant, an ecological park of more than 50,000 square meters opens to the public for walking, exercise and relaxation. The plant has a design capacity of 150,000 cubic meters per day, with a reclaimed water reuse rate exceeding 96 percent, supplying local river flow augmentation and urban greening. What was once an unwelcome neighbor has become a green urban space where residents enjoy their leisure time, demonstrating that circular water thinking can simultaneously deliver resource efficiency and livable, people-centered urban space. Together, these two cases show that China's circular water transition is not only a technical achievement but a social one, turning former liabilities into community assets and proving that green infrastructure can be both high-performing and welcomed in the heart of the city.

WANG XIAOYING / CHINA DAILY

While some cities focus on energy self-sufficiency or ecological integration, others — especially in China's arid northwest — must prioritize water security itself. Yinchuan, capital of the Ningxia Hui autonomous region, receives barely 200 millimeters of rainfall annually against around 1,600 mm of evaporation, with per capita water availability below one-half of the national average. There, reclaimed water is not a luxury but a necessity. Yinchuan's No 1 Reclaimed Water Plant supplies over 40 million tons of reclaimed water each year, primarily for ecological flow augmentation in the city's canals and rivers, and for industrial cooling. By closing this urban water loop, the plant provides a crucial link in the city's water-security architecture — turning what was once waste discharge into a lifeline for an arid, rapidly urbanizing oasis city.

Other cities have made their own breakthroughs. Chongqing's Luohuang Sludge Treatment Center gasifies sludge into steam, producing around 130,000 tons per year — equivalent to saving 17,000 tons of standard coal. Zhejiang's Haining Dingqiao plant upgraded its technology, increasing its treatment capacity by 75 percent while cutting energy use by 54 percent, marking China's transition from "following" to "leading" in wastewater treatment technology.

These achievements show that there is no one-size-fits-all model for "resource factories" — every place can find its own way forward based on local conditions.

However, they also raise a harder question of how to scale. For now, China operates thousands of municipal wastewater plants, most of which were designed for pollutant removal, not resource recovery. Retrofitting them requires not just technology, but aligned incentives — revised discharge permits that reward energy and nutrient recovery, green financing mechanisms that make retrofits bankable, and technical standards that allow modular solutions to be adapted to local conditions.

Beijing illustrates how a megacity can close the urban water-energy loop at scale. Its municipal wastewater source heat pumps heat and cool approximately 1.6 million sq m of space, displacing fossil-fuel heating and cutting carbon emissions by an estimated 50,000 tons a year. Complementing this, Beijing's Gaobeidian Sludge Treatment Center produces around 20 million cubic meters of biogas annually, which can generate electricity, supply heat or power equipment, turning sludge into a fully utilized resource stream. It effectively embodies the 15th Five-Year Plan's vision of a circular urban water-energy nexus. The next frontier of China's circular water transition should be systematic deployment.

China's experience shows that wastewater treatment plants can simultaneously become energy stations, fertilizer plants and reclaimed water factories. Starting with the first batch of benchmark plants, China is forging its own distinctive path toward wastewater resource recovery. This not only supports domestic energy security, carbon neutrality goals and the circular economy, but also offers a replicable Chinese model for global environmental governance.

Nation on track to hit GDP target

By **ZHANG CHENXU** and **ZHONG NAN**

Confidence in China's economic prospects remains strong among officials, economists and global business leaders, as the world's second-largest economy continues to demonstrate resilience, vitality and long-term growth potential despite external headwinds.

They said China remains well positioned to achieve its annual growth target of 4.5 to 5 percent, and make further progress in innovation-led growth supported by a solid start to the year, effective macro policy support and the rapid expansion of new growth drivers.

With buoyant growth prospects, a vast domestic market and expanding innovation capacity, China will continue to be a key growth engine for the rest of the world, they added.

Jiang Ying, chair of Deloitte China, said she is confident in the long-term prospects of the Chinese economy, citing its consistent performance in recent years and a strong first quarter as signs of underlying resilience.

"I'm very confident about the long-term prosperity of the Chinese economy," Jiang said in an exclusive interview with China Daily on the sidelines of the 2026 Summer Davos forum. "The Chinese market provides certainty to the world."

At a time when global businesses are facing rising uncertainties, China's stable expectations and predictable growth have become increasingly valuable, she said.

"Predictability and stability are probably the best dividend and the greatest advantage that the Chinese market now offers to the global economy," Jiang said. "That is what everyone is looking for amid rising uncertainties."

The forum, also known as the World Economic Forum's 17th Annual Meeting of the New Champions, was held under the theme "Innovating at Scale" in Dalian, Liaoning province, from June 23-25.

"The theme of this forum is very fitting for China — innovating at scale," said Ben Dawson, president of Cisco Asia-Pacific, Japan and Greater China.

Dawson told China Daily that China's long-term appeal lies not only in the scale of its market, but also in its ability to translate technological ambition into large-scale industrial applications.

With a presence in China spanning 32 years, Cisco has witnessed the country's digital transformation and the growing momentum of its AI development, supported by a strong industrial base, sustained investment in manufacturing and the faster adoption of advanced technologies across traditional sectors, Dawson said.

Such confidence in China's growing innovation strength is echoed by other multinational companies with long-term operations in the country.

Yin Zheng, executive vice-president of China and East Asia operations at French industrial conglomerate Schneider Electric, said China has become an important engine of global economic growth and a key source of technological and industrial innovation.

"China's solid energy foundation and strong industrial system have reinforced each other, creating powerful momentum for innovation to be developed and applied at scale," Yin said on the sidelines of the 2026 Summer Davos forum.

"China is now one of Schneider Electric's four major global research and development bases, and an important source of innovation and growth for us," Yin said. "Leveraging China's innovation strengths, Schneider Electric will continue to increase its investment in research and development in the country."

Echoing that view, Ruan Fang, managing director and senior partner at Boston Consulting Group, told China Daily that China's strongest growth opportunities are emerging in advanced manufacturing and artificial intelligence.

China, the world's second-largest economy, has grown into a major hub of innovation, driven by its vast domestic market and a significantly faster pace of iteration, she said.

The latest official data also underscored the strong momentum of China's new growth drivers and innovation-related sectors.

A visitor takes photos of exquisite intangible cultural heritage exhibits at Dalian International Conference Center, the main venue of the 2026 Summer Davos forum, on June 23. PAN YULONG / XINHUA

A humanoid robot performs together with actors at the cultural night of the 2026 Summer Davos forum in Dalian on June 24. LIU LINGYI / XINHUA

In the first five months, industrial enterprises with annual main business revenue of at least 20 million yuan ($2.93 million) reported total profits of 3.14 trillion yuan, up 18.8 percent year-on-year, with the growth rate accelerating by 0.6 percentage point from the January-April period, data released by the National Bureau of Statistics showed.

The electronics manufacturing sector remained a major growth engine, with profits surging 103.9 percent year-on-year in the first five months and contributing 43.1 percent to the overall profit growth of major industrial firms, according to the NBS.

"The rapid advance of artificial intelligence worldwide has spurred a surge in demand for advanced computing and memory chips, providing a strong boost to profit growth in the electronics sector," said Yu Weining, a statistician at the bureau.

High-tech manufacturing also maintained solid growth, with profits rising 44.7 percent year-on-year in the first five months, NBS data showed.

Wang Guanhua, a spokeswoman for the NBS, said at a news conference on May 18 that one of the most notable features of China's current economic performance is the faster transition from traditional growth drivers to new ones.

"China has made fresh progress this year in upgrading industries, empowering development through digital technologies and advancing green transformation," Wang said. "The continued growth of new quality productive forces has provided important support for economic expansion."

The strong momentum in advanced manufacturing and AI-related sectors has further bolstered optimism among global financial institutions about China's growth prospects.

Deutsche Bank has upgraded its forecast for China's 2026 real GDP growth to 4.9 percent, after the country's first-quarter growth came in stronger than expected.

NBS data showed China's GDP reached 33.42 trillion yuan in the first quarter of 2026, expanding 5 percent year-on-year in real terms and hitting the upper end of the country's annual growth target range.

Alexander von zur Muehlen, CEO of Deutsche Bank for Asia-Pacific, Europe, Middle East & Africa, and Germany, said the bank's confidence in the Chinese market is rooted in the country's continued shift toward high-quality development and the further opening-up of its financial markets.

Deutsche Bank is not alone in taking a more positive view. Morgan Stanley in May lifted its forecast for China's GDP growth this year to 4.8 percent from 4.7 percent.

Robin Xing, chief China economist at Morgan Stanley, said the revision was supported by resilient exports and robust AI- and green-related investment, which are expected to generate positive spillovers for industrial upgrading and capacity modernization.

Although China's monthly macroeconomic indicators for April and May showed some moderation in consumption and investment, analysts said the broader recovery remains on solid footing, supported by resilient exports, strong manufacturing capabilities and the continued expansion of new growth drivers.

Looking ahead, China is scheduled to release its second-quarter economic growth data on July 15. Wen Bin, chief economist at China Minsheng Bank, said GDP growth may ease to around 4.5 percent in the second quarter, but would still remain broadly in line with the country's annual growth target range, underscoring the economy's underlying resilience.

In particular, Wen said the moderation in real GDP growth should be viewed alongside improving price conditions, which could point to a broader recovery in nominal activity.

With PPI growth continuing to pick up in April and May and CPI staying above 1 percent year-on-year in both months, the GDP deflator is likely to return to positive territory after 12 consecutive quarters of contraction, he said.

"That would help improve nominal GDP growth," Wen added.

A recent report by the China Macroeconomy Forum also struck an optimistic tone, saying China's economy is likely to follow a U-shaped trajectory this year as pro-growth policies and major projects are gradually rolled out and their effects become more visible.

With policy support continuing to take effect, the report said, China has a solid foundation to achieve its annual growth target of 4.5 to 5 percent in 2026.

Still, economists said the structural divergence in the economy deserves close attention.

While industrial production and exports have continued to show resilience, consumption has shown signs of moderation — a trend that underscores the need for stronger policy support to further unlock domestic demand and consolidate the recovery momentum, economists said.

Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities, said the uneven recovery reflects the broader structural transition underway in China's economy.

New growth drivers such as artificial intelligence and high-end manufacturing are gradually taking the place of older engines such as real estate and infrastructure investment, Luo said.

Taking a broader view, Huang Yiping, dean of Peking University's National School of Development, said that despite the challenges facing the Chinese economy, the country has been steadily advancing economic rebalancing.

"If you look at the trajectory of the Chinese economy over the past 20 years or more, the macroeconomic structure is much better now," Huang said at a forum during the 2026 Summer Davos forum.

However, he also cautioned that the rebalancing process remains far from sufficient, especially as domestic consumption still needs to play a stronger role in supporting growth.

"China needs to boost consumption, and it needs to do so in a more proactive way," Huang said.

Luo said the recovery of domestic demand hinges on whether the economy's key transmission mechanisms can be further smoothed.

For households, stable employment and stronger income growth are essential to improving consumer confidence and willingness to spend, he said.

For businesses, a recovery in demand needs to translate into stronger profits and renewed capital expenditure, Luo said.

In the property sector, stabilizing home prices will be important for restoring sales momentum and reviving investment, he added.

Wen said policy support is expected to be further strengthened around midyear, with fiscal and monetary measures working together to stabilize growth.

On the fiscal front, special-purpose bond issuance is likely to accelerate in the second half of the year, while new policy-based financial instruments are expected to be gradually channeled into concrete projects, helping support major projects and infrastructure investment, according to Wen.

On the monetary front, the policy window for interest rate and reserve requirement ratio cuts may open as PPI growth peaks around midyear, leaving room for more timely policy adjustments, he added.

"More incremental policies are expected to boost consumption, stabilize the property sector and support employment," Wen said. "Together, these measures will help stabilize the economy and strengthen the recovery momentum."

BUSINESSINSIGHT

Charting nation's next phase of development

EAGLE EYE
By Liu Shijin

After more than three decades of rapid expansion, China's economy reached a cyclical peak in the first quarter of 2010 and has since gradually shifted into a phase of medium-speed growth, with the binding constraints on growth evolving from supply shortages to demand insufficiency.

From a comparative international perspective, China is now positioned in the income range where per capita GDP exceeds $10,000 but has yet to cross the threshold into high-income economies, remaining in this transitional band for several years.

Historical experience suggests that economies at this level often enter a structurally sensitive and relatively unstable phase of development, where growth patterns and structural dynamics undergo notable adjustment.

Against this backdrop, the outline of the 15th Five-Year Plan (2026-30) highlights the pivotal role of this period in advancing the process of basically achieving socialist modernization.

It has been identified as a key stage for consolidating development foundations and pushing forward comprehensive efforts, with a focus on strengthening comparative advantages, removing structural bottlenecks and addressing weak links.

In essence, the objective is to secure strategic initiatives amid intensifying global competition, achieve major breakthroughs in strategic tasks central to Chinese modernization, and lay a more solid foundation for the realization of basic socialist modernization.

Among the structural challenges facing the economy, insufficient consumer demand remains the most pressing. While China's current development context is markedly different, the interaction between income disparity and an incomplete social security system continues to mirror structural patterns observed in earlier stages of development, thereby reinforcing demand-side constraints.

At the same time, China's growth drivers are undergoing a profound transformation as the economy enters a new development phase. In this process, three categories of advantages stand out.

The first is the latecomer advantage in economic catch-up, which is relatively low-cost and easier to realize, but requires sustained openness, humility and a willingness to learn.

The second is the advantage emerging from a new wave of technological revolution characterized by digitalization and green transformation, in which China has already reached either a parallel or leading position in certain areas, with the key challenge lying in maintaining and strengthening this momentum.

The third is the advantage of an ultra-large-scale economy, which extends beyond the consumer market to encompass production, investment, trade, innovation, finance and monetary circulation, representing a dimension that has often been underappreciated but holds substantial long-term potential.

Taken together, China is currently in a critical window of structural transformation and growth momentum switching, with far-reaching adjustments expected across consumption, industrial structure, foreign trade, investment, financial systems, urban-rural relations, intra-urban structures, and income distribution.

The quantitative expansion that defined the high-growth era is gradually giving way to a development model oriented toward higher technological content, greater value added, and stronger sustainability.

Within this transition, effectively identifying and leveraging the three aforementioned advantages, while advancing strategies such as building a manufacturing powerhouse, a consumption powerhouse and a financial powerhouse, will be essential for achieving structural upgrading and long-term development goals.

In this context, structural reform remains the fundamental instrument for sustaining economic momentum. At its core, reform begins with further ideological liberation, removing institutional constraints that hinder the high-quality development of productive forces and suppress social creativity and vitality.

Although reform inevitably involves the adjustment of interest relationships and requires balancing diverse concerns, certain principles remain paramount: local interests must serve the broader national agenda, and short-term or narrow gains must yield to long-term collective welfare.

Vulnerable groups, in particular, must be adequately protected in the process. Ultimately, reforms aligned with long-term systemic objectives will benefit all members of society.

Historical experience also shows that timing is crucial, as reforms are often delayed under favorable conditions and implemented at higher cost when pressures intensify. This underscores the importance of proactive adjustment.

An enabling environment that is open, tolerant and supportive of initiative is therefore essential, with the principles of respecting labor, knowledge, talent and creativity playing a key role in unleashing innovation and entrepreneurial vitality, as emphasized in the outline of the 15th Five-Year Plan.

Looking ahead, the 15th Five-Year Plan period marks a decisive stage in China's transition toward high-income status and the consolidation of socialist modernization.

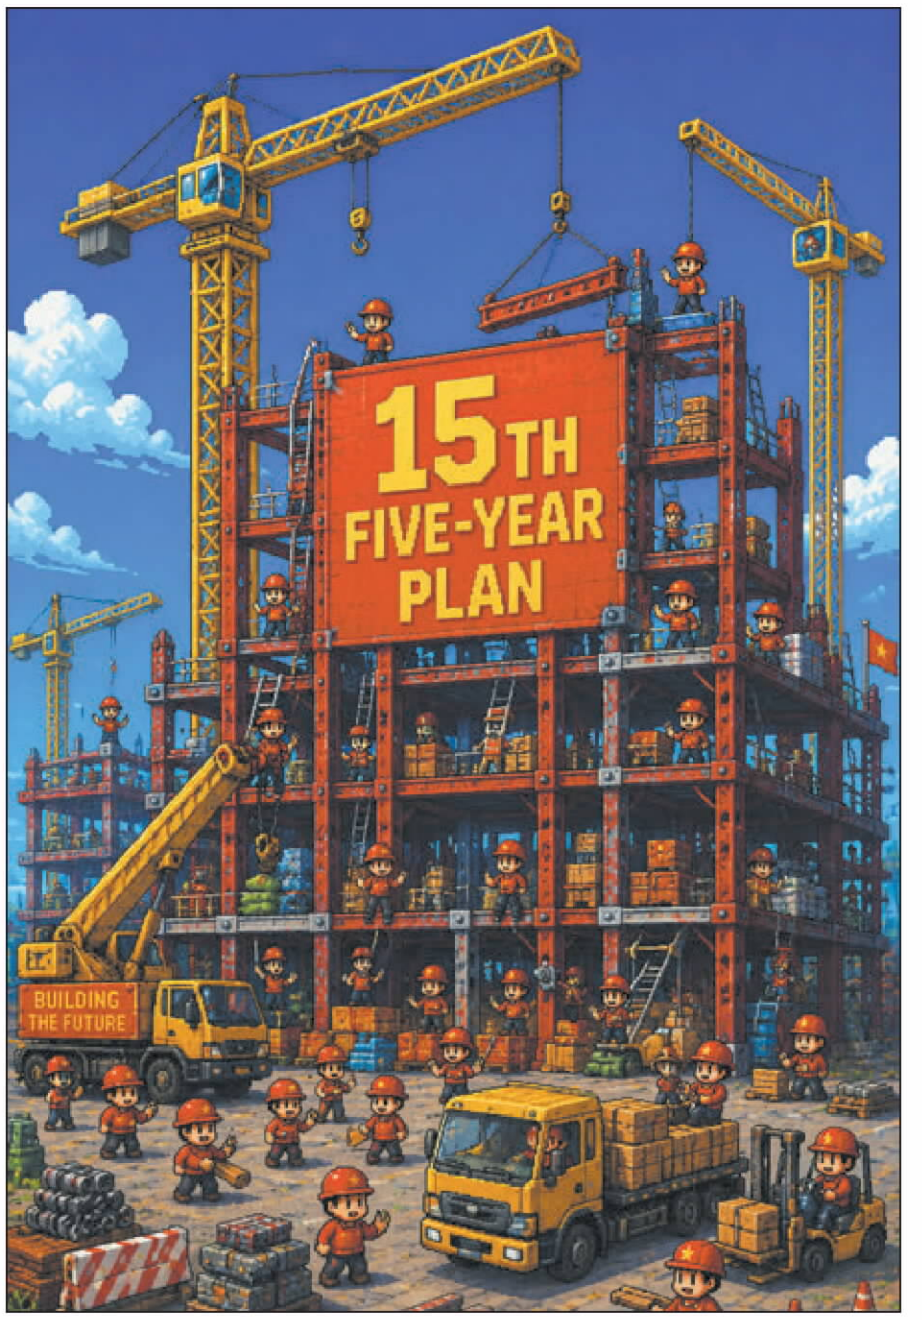

ILLUSTRATION GENERATED BY AI

Unlike earlier phases characterized primarily by incremental adjustments within a relatively stable growth framework, this stage requires the establishment of a new growth framework, as both external conditions and internal dynamics — including demand, supply and growth drivers — are expected to undergo profound and even structural shifts.

In particular, consumption is set to play a more prominent role, as China's consumption-to-GDP ratio remains approximately 20 percentage points below the international average, indicating a significant structural gap that needs to be addressed.

Consumption upgrading will not only involve domestic goods and services, but also greater engagement with foreign products and services, thereby enhancing the internationalization of consumption patterns.

At the same time, development-oriented consumption in areas such as education, healthcare, elderly care and cultural, sports and entertainment services should increasingly be viewed as investment in human capital, contributing to improved labor quality and stronger innovation capacity.

In this sense, consumption is expected to move to the forefront of growth policy, gradually shifting emphasis away from investment as the primary stabilizing force.

Industrial restructuring will follow a similar logic of transformation. The development of a manufacturing powerhouse does not necessarily imply an increasing share of manufacturing in GDP; in fact, this share may continue to decline as the economy evolves.

The key focus lies instead in the development of high-tech and knowledge-intensive producer services that support manufacturing upgrading.

The integrated system of "manufacturing plus related producer services" provides a more accurate reflection of industrial transformation, capturing both technological self-reliance and innovation-driven growth.

Meanwhile, the upgrading of consumer services will be concentrated in sectors such as education and training, healthcare, information services, financial services and human resource services.

As economic complexity increases, traditional experience-based industrial policy becomes less effective, making a fair and competitive business environment increasingly important.

Legacy industries formed during the high-growth period, particularly in heavy and chemical sectors, will require substantial capacity adjustment, with the exit of inefficient production relying on both market mechanisms and policy coordination.

In foreign trade, despite a more challenging external environment, China's continued export strength reflects rising industrial competitiveness.

However, a sustained large trade surplus also implies relatively lower domestic consumption, and therefore reflects, and reinforces, consumption insufficiency.

In the long run, such imbalances are not sustainable. This necessitates a more balanced trade strategy that maintains export competitiveness while expanding imports, alongside a greater share of trade settlement in renminbi.

This shift implies moving from foreign exchange accumulation toward broader RMB internationalization, enhancing its global liquidity and usability.

As the use of RMB expands internationally, its functions should increasingly align with the scale of China's real economy, which may in turn support RMB appreciation, improving productivity and reinforcing competitive upgrading over the medium to long term despite potential short-term pressure on exports.

Financial structure will also undergo significant evolution. As industrial upgrading deepens and knowledge intensity increases, the financial system is expected to shift from bank-dominated intermediation toward capital-market-led allocation.

With the declining appeal of real estate and traditional savings instruments, household wealth is likely to flow more actively into capital markets, providing greater liquidity and supporting a new stage of financial development.

Ultimately, the objective is to support a steady transition toward a development path that facilitates China's progression toward high-income status and the realization of socialist modernization.

China building more diversified, innovative financial system

MAIN STREET
By Lian Ping

Pan Gongsheng, governor of China's central bank, provided a comprehensive overview of the evolving characteristics of the country's financial structure and changes in financing data in his keynote speech at the 2026 Lujiazui Forum on June 17.

Examining the issue from the perspectives of China's transition to a new stage of economic development, industrial upgrading and financial supply-side reform, Pan offered an in-depth analysis of the underlying logic and key drivers behind the adjustment of the country's financing structure.

Framed within the broader goals of high-quality development and building China into a financial powerhouse, he also outlined the medium- and long-term direction of China's financial market modernization, the coordinated development of equity, bond and bank financing, and institutional opening-up of the capital market, providing an authoritative policy framework for assessing key issues such as the expansion of direct financing, optimization of the financial structure and cross-border capital management.

Pan said China's financial system has long been dominated by bank lending, while financial markets remained relatively underdeveloped. In recent years, however, the share of indirect financing centered on bank loans has continued to decline, while the proportion of direct financing, including bond and equity financing, has steadily increased, signaling profound changes in the country's financial structure.

Historically, newly added indirect financing consistently accounted for more than 80 percent of the increase in total social financing. In 2025, however, loans represented only 45 percent of new additions to total social financing, while bond and equity financing together accounted for 47 percent, surpassing loans for the first time. In particular, bond financing has become the largest contributor to the growth of direct financing due to its relative stability and flexibility.

In the 1990s, indirect financing accounted for nearly all of China's outstanding social financing. By the end of 2025, its share had fallen to around two-thirds, while direct financing had risen to approximately one-third.

Today, the historic transformation of China's financial structure is characterized by shrinking household credit, slower growth in corporate lending offset by faster expansion of direct financing, and rapid growth in government financing. The internal composition of direct and indirect financing has also diverged significantly. Direct financing is now primarily supported by bond issuance, with government bonds accounting for the bulk of the increase in financing. Indirect financing, meanwhile, continues to be dominated by renminbi-denominated corporate loans, while household lending has declined sharply.

Pan said these profound changes fundamentally reflect the deep adjustment of China's economic structure, the transition from old to new growth drivers, the evolving alignment between the financial system and industrial upgrading, and the continuous deepening of financial supply-side structural reform.

There is little doubt that this major transformation in China's financial structure is not accidental. Rather, it is the result of multiple long-term factors acting in concert, particularly the upgrading of the country's economic structure. It represents an adaptive adjustment of the financial system to changes in economic development, industrial composition and market demand. It is also an inevitable outcome of financial supply-side reform and an objective requirement for achieving high-quality economic development.

Over the next five to 10 years, the share of China's direct financing is expected to continue rising steadily, resulting in a more diversified financial system in which equity, bond and bank financing complement one another.

Equity financing is expected to become a major driver of direct financing growth. Continued reforms to the registration-based IPO system will further lower listing thresholds, streamline listing procedures and facilitate financing for more technology companies, small and medium-sized enterprises, and innovative enterprises. Meanwhile, private equity and venture capital markets are expected to continue expanding, with government guidance funds playing a greater leveraging role in channeling private capital toward seed-stage and early-stage technology companies.

Government bond issuance will remain the cornerstone of China's direct financing market. To achieve its 2035 development goals, China is expected to maintain a proactive fiscal policy for an extended period, supporting steady growth in government bond issuance and sustaining the expansion of direct financing.

Corporate bond financing is likely to become another major growth engine. Issuance of medium- and long-term corporate bonds is expected to increase rapidly, accounting for a larger share of the market while further optimizing bond maturity structures to better meet the long-term financing needs of the real economy. Issuance of specialized instruments — including technology innovation bonds, green bonds and rural revitalization bonds — is also expected to expand rapidly.

At the same time, China's credit rating system will continue to improve, and bond default resolution mechanisms will become more robust. Greater connectivity between domestic and international bond markets will further improve market liquidity and the efficiency of capital allocation.

Financial product innovation will accelerate to meet increasingly diverse financing needs. More equity financing products tailored to SMEs and technology companies are expected to emerge. China will continue developing specialized bond products and may introduce new instruments such as floating-rate bonds and green convertible bonds. A broader range of differentiated investment funds and asset management products will also be introduced to better accommodate investors with varying risk preferences.

China will continue expanding the opening-up of its capital markets, steadily advancing the internationalization of its financial markets and promoting institutional opening-up. The country will move forward with the internationalization of the renminbi and the gradual convertibility of the capital account, enrich the offshore renminbi product ecosystem, and strengthen the renminbi's role in international pricing, settlement and reserve holdings.

At the same time, China will improve its macroprudential management and cross-border capital flow monitoring systems, refine its cross-border risk early warning and resolution mechanisms, and achieve a dynamic balance between high-level opening-up and secure development.

The writer is chairman of the China Chief Economist Forum and president at the institute of international finance of the CCEF. CHINA

Plans to hike education standing

China to prioritize return of overseas graduates, intl expansion and research

By **ZOU SHUO**
zoushuo@chinadaily.com.cn

China aims to significantly enhance its international influence, competitiveness and voice in education during the 15th Five-Year Plan period (2026-30), according to an education development plan recently issued by the State Council, the country's Cabinet.

The plan outlines how China will make better use of world-class educational resources and innovation factors to achieve these goals. International exchanges in basic research will be deepened, and leading research universities will be encouraged to launch or participate in major global scientific initiatives.

Services for Chinese students studying abroad will be improved, while efforts to encourage overseas graduates to return to China and contribute to national development.

High-level foreign science and engineering universities will also be welcomed to establish cooperative programs in China.

Developing globally recognized Chinese education brands is another priority.

The plan calls for stronger ties with partners in Europe and North America while expanding cooperation with neighboring nations, countries and regions involved in the Belt and Road Initiative and Global South countries.

China will share its standards and practical solutions in areas including vocational education, basic education, engineering, artificial intelligence education and teacher training.

The international Chinese language brand will be further promoted, while the "Study in China" brand and the country's capacity for overseas schooling will also be strengthened. People-to-people and cultural exchanges will be actively encouraged, according to the plan.

On global education governance, China will make use of multilateral platforms such as UNESCO, BRICS and the Shanghai Cooperation Organization to deepen cooperation and strengthen its leadership role in areas including girls' and women's education, digital and intelligent education and STEM subjects.

Data released by the Ministry of Education in April shows that in 2025 more than 570,000 Chinese students pursued higher education overseas and about 535,600 returned to China after completing their studies. China, meanwhile, hosted 380,000 international students from 191 countries and regions during the 2024-25 academic year.

Wu Peng, dean of the Overseas Education College at Jiangsu University, said that "significantly enhanced" global influence in education during the 15th Five-Year Plan period should be measured by substance rather than sheer numbers.

Regarding international students, Wu said the growth of degree-seeking and postgraduate enrollment is more important than total enrollment figures.

He also called for a comprehensive service system covering pre-enrollment support, campus life and post-graduation employment.

"We cannot simply admit students and leave them to fend for themselves. A closed-loop, service-oriented management system is essential," he said.

Wu added that China's strengths in vocational education, AI and STEM teaching should be integrated into the education systems of countries and regions involved in the Belt and Road Initiative.

Nauvao Purl, a United States citizen studying at the University of International Business and Economics, encouraged more US students to come to China for face-to-face exchanges. She reflected on Yung Wing, the first Chinese student to graduate from a US university more than 170 years ago.

"What I learned from Yung Wing is that discomfort and uncertainty — the often awkward spaces — are exactly where the most important work happens," she said.

Purl said she arrived in China with preconceptions shaped by movies, food and social media, only to find a far more complex reality.

"The real China — strangers asking where I'm from, professors staying after class because of their passion and classmates studying incredibly hard — can only be experienced, never fully understood through books," she said.

She urged her peers to "show up" in person, tell stories instead of arguing, embrace the role of cultural bridge-builders and remain patient when engaged in people-to-people diplomacy.

US delegation explores Wuhan's growing tech sector

By **LIU KUN** in Wuhan
and **CHEN MEILING**

Descendants of Flying Tigers veterans, teachers and students from the Flying Tigers Friendship School in the United States interact with robots at the Hubei Humanoid Robot Innovation Center in Wuhan, Hubei province, on Thursday. ZOU HAO / FOR CHINA DAILY

Representatives from China and the United States exchanged views on robotics and artificial intelligence during a people-to-people exchange event in Wuhan, Hubei province.

Jeffrey Greene, a veteran pilot and chairman of the Sino-American Aviation Heritage Foundation, led a delegation of about 100 people, including descendants of Flying Tigers veterans, as well as teachers and students from Flying Tigers Friendship Schools, on a five-day visit to Wuhan, which concluded on Sunday, for a series of cultural and technological activities.

On Thursday, the delegation visited the Hubei Humanoid Robot Innovation Center, where members watched humanoid robots dance, write calligraphy, make coffee, pour tea, play chess and engage in conversations.

"I saw videos on Instagram of robots doing little dances, but then they would fall over. These robots can hop on one leg and move all around. They are totally stable — super cool," said Haley Rasilla, a student in the delegation. "It exceeds my expectations — way more futuristic than anything I've ever seen in America. It's crazy."

Erik Lutz, a councilman in the city of Pico Rivera, California, and a representative of the foundation, said he was impressed by robots designed for medical care, cleaning and construction. "We're seeing the future," he said. "The two most powerful countries working in cooperation will provide for the longevity of our civilization."

The innovation center includes a data acquisition site, a simulation training ground, industrial and commercial application zones, an interactive intelligent application zone, and an integrated humanoid robot application zone.

At a roundtable forum themed "Innovation for Good, Intelligence to Future" held at Wuhan University of Technology on Friday, students from the two countries discussed opportunities and challenges facing college students amid the AI revolution, focusing on technology ethics and industry-university-research collaboration.

Matthew Garrett Embree, who recently graduated from the University of California, Santa Cruz, with a degree in computer science, said overreliance on AI is concerning.

"Many of the students in my classes eventually stopped learning how to program and would just write prompts instead," he said. "AI is a powerful tool, but it's still important to learn the basics and understand the fundamentals of whatever topic you're studying. I think this applies across all fields."

David Cornelis Howe, who graduated from Alfred University in New York with a degree in mechanical engineering, said he used AI extensively during his studies, even when large language models were still in the early stages of development.

"I noticed they made a lot of mistakes early on, so I didn't really trust them at first," he said. "But as I went through school, I realized the technology was improving very quickly."

He said AI is most valuable when it helps users understand concepts or guides them through a process rather than simply providing answers.

"I think it's very important that we don't let AI take away our critical thinking skills and our ability to make decisions for ourselves," he added.

During the visit, the delegation also rode Wuhan's suspended monorail, known as the "sky train", the first of its kind in China. Unlike conventional monorails, the trains hang beneath elevated steel tracks, showcasing the country's advances in rail transit technology.

The visitors also learned about Wuhan's modernization at the Hankow Customs Museum, watched traditional opera performances and explored the region's history at the Hubei Provincial Museum and Yellow Crane Tower.

Jurassic fossil fills gap in evolution of bird tails

By **LI MENGHAN**
limenghan@chinadaily.com.cn

A 150-million-year-old fossil unearthed in Fujian province has revealed what researchers say is the smallest known long-tailed bird from the Late Jurassic period, filling a critical gap in scientists' understanding of how dinosaurs' long tails evolved into the short, compact tails of modern birds.

The findings show that the number of caudal vertebrae decreased before the remaining bones fused into a single structure — the fused pygostyle typical of modern birds — helping resolve a long-standing debate in evolutionary biology. The study was published in the journal Science Advances on Thursday.

The fossil was discovered on March 24, 2024, by a joint research team from the Institute of Vertebrate Paleontology and Paleoanthropology of the Chinese Academy of Sciences and the Fujian geological science research institute. The discovery followed over 400 days of field work at the Zhenghe Fauna site, a fossil-rich area in Zhenghe county, Nanping, Fujian province, known for yielding well-preserved ancient animal fossils.

Researchers named the new species *Zhengheornis buyu*. The first part of the name refers to the discovery site, while *buyu* is derived from *Guoyu*, an ancient Chinese book, and means "unexpected" — a tribute to the specimen's surprising tail anatomy.

That unexpected anatomy addresses one of the most enduring paleontological questions: how ground-dwelling, long-tailed dinosaurs evolved into today's lightweight, short-tailed birds. While the origin of feathered wings is well documented, the evolution of short bird tails has long remained a mystery because relevant fossils are incredibly rare.

Zhou Zhonghe, an author of the study and a professor at the Institute of Vertebrate Paleontology and Paleoanthropology, said genetic studies have long suggested that tail shortening could result from just a few simple genetic mutations.

"Because long-tailed and short-tailed birds appear almost simultaneously in the fossil record, without intermediate forms, many evolutionary biologists argued that a transitional species having a shortened, but no fused pygostyle was biologically unlikely and probably never existed," Zhou said.

Previous fossil evidence appeared to support that view. The earliest birds with modern, fused pygostyles emerged abruptly near the end of the Jurassic period, at the dawn of bird evolution, while other contemporary birds and their dinosaur relatives kept their long tails.

However, the discovery of *Zhengheornis buyu* challenges the long-held assumption by providing the long-sought transitional form.

Dating between 148 and 150 million years old, the well-preserved, fully connected skeleton has a tail composed of only 15 caudal vertebrae and lacks a fused modern pygostyle. That is significantly fewer caudal vertebrae than in other early birds, such as *Archaeopteryx*, which had 23 to 24, *Jeholornis*, which had 22 to 27, and other early bird-like dinosaurs, which typically had more than 30.

> "This mix of ancient and advanced features proves a step-by-step evolutionary path."
>
> **Wang Min,** professor at the Institute of Vertebrate Paleontology and Paleoanthropology of the Chinese Academy of Sciences

"This mix of ancient and advanced features proves a step-by-step evolutionary path: the loss of caudal vertebrae and overall tail shortening happened before the remaining bones fused together in early bird evolution," said Wang Min, the study's lead author and a professor at the institute.

The researchers said the shortened but flexible tail likely offered important functional advantages. By reducing body weight, shifting the center of gravity forward, and making the tail less rigid, *Zhengheornis buyu* could move its tail feathers more effectively. This would have improved its flight stability and control compared with its longer-tailed contemporaries like *Archaeopteryx*.

The species also sets a new record as the smallest known member of the broader dinosaur-bird family tree that includes birds and closely related bird-like dinosaurs. Using size-scaling equations, the researchers estimated that the animal weighed only 74 to 163 grams in life. Its thigh bone measured just 63 percent of the length of that of *Microraptor zhaoianus*, previously considered the smallest known bird-like dinosaur, and was about 10 percent smaller than the smallest known *Archaeopteryx* specimen.

The team said such extreme miniaturization suggests that early bird-like dinosaurs shrank in size much more rapidly than previously believed.

Zhengheornis buyu is the fourth ancient bird species reported from the Zhenghe site. Family tree analyses indicate that the bird was not specially adapted for a life spent purely on the ground or purely in trees, suggesting it was an ecological generalist capable of thriving in various environments. The coexistence of multiple, vastly different body shapes also indicates that birds had already split into many diverse species by the end of the Jurassic period.

"This landmark discovery not only settles long-standing academic debates regarding when early birds began to diversify but also adds a crucial piece to the puzzle of how dinosaurs transformed into birds," Wang said.

Supportive measures fuel increase in Shanghai's inbound foreign visitor arrivals

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Shanghai recorded 21.13 million inbound and outbound trips in the first half of the year, including nearly 3.17 million inbound foreign visitor arrivals, up 22 percent year-on-year, the city's border inspection authorities announced recently.

The city has stepped up efforts to integrate its culture, commerce, tourism, sports and exhibition sectors, helping make it one of the most attractive destinations for foreign travelers entering China. Meanwhile, the country's expanded visa-free policies have continued to drive growth in inbound tourism since the beginning of the year.

In the first half of 2026, about 2.05 million foreign travelers entered Shanghai under the visa-free policy or the 240-hour visa-free transit policy, accounting for more than 60 percent of all inbound foreign arrivals, according to authorities.

During this period, border inspection authorities also inspected 146,000 inbound and outbound vehicles, vessels, trains and aircraft.

A total of 22,000 international vessels entered or departed the city's ports, while authorities facilitated crew changes for more than 25,000 seafarers, helping ensure smooth cross-border shipping and stable foreign trade and supply chains.

Shanghai's cruise ports were also bustling during this period, with border inspection authorities processing 744,000 inbound and outbound cruise passengers.

The country's first pilot "destination-free cruise" route was officially launched in Shanghai on June 6 and quickly emerged as a new growth driver for the cruise industry.

A representative of the Pujiang border inspection station said the station introduced a series of measures to reduce customs clearance times and improve departure efficiency on the pilot route, including pre-departure inspections, advance registration, arrival-based passenger classification and fast-track lanes.

Foreign travelers complete arrival immigration procedures at Shanghai Pudong International Airport on May 22. GAO ERQIANG / CHINA DAILY

As China continues to welcome more international visitors, an increasing number of foreign travelers are exploring every corner of Shanghai, seeking experiences ranging from popular attractions to niche destinations.

In early February, Frans-Jan van Meer, a 50-year-old supply chain manager from the Netherlands, was busy picking out what he described as "more Chinese and exotic" Labubu blind boxes at the Bund Finance Center as gifts for his children back home.

An increasing number of foreign visitors flock to the landmark Yuyuan area to shop for gold jewelry and ornaments featuring traditional Chinese motifs such as dragons, phoenixes, zodiac animals and bamboo.

Others head to the South Bund Soft-Spinning Material Market for custom-made clothing in both Western and Chinese styles, attracted by the market's fast turnaround times, competitive prices and high-quality craftsmanship.

Charles Wilders, an English teacher from the United Kingdom, told China Daily, "In the UK, it's very expensive to get suits made, particularly on Savile Row. Whereas here, it's more affordable for really, really great quality."

"It's not only about the price. It's actually the design and fit," added Jan Schutte, a German professor at the Shanghai Theatre Academy, who said the market is the "first place" he recommends to friends visiting Shanghai.

He Qi contributed to this story.

Wetland project tests blueprint for Yangtze protection

Ecological restoration in Anhui sees rare species return, bolsters flood prevention capacity

By **LI MENGHAN**
limenghan@chinadaily.com.cn

On the shores of Anhui province's Chaohu Lake, China's fifth-largest freshwater lake, reeds bend in the wind across restored wetlands, while egrets pick their way through shallows that, just a decade ago, reeked of fertilizer runoff.

This is Shibalianwei wetland, a 27.6-square-kilometer expanse in Hefei's Feidong county that has undergone one of the most ambitious ecological reversals in the Yangtze River Basin. Once carved into nearly 13 sq km of intensive fish ponds and rice paddies, it has been transformed into China's first ecological wetland designed to serve simultaneously as a flood storage basin, a water purification system and a wildlife sanctuary.

As endangered Oriental storks were spotted raising their chicks for the first time ever in the wetland in May this year, the 2-billion-yuan ($294.8 million) project stands as a critical blueprint for the country's broader Yangtze River Protection Strategy, testing whether heavy hydraulic engineering can coexist with regional ecological and economic development.

The name Shibalianwei, meaning 18 linked polders, tells a tug-of-war story between humans and nature. For centuries, the mudflat was laced with 18 earthen embankments, each one a small barrier against water that wanted to spread.

However, as grain and aquaculture demand surged in the 1980s, local populations pushed the land too far. They drained marshes, dug ponds and doused the soil with agricultural chemicals. By the early 2000s, the ecological consequences were stark, with notorious algae blooms, collapsing fish stocks and degraded wetland functions.

"Back then, the water smelt bad, and the fish grew smaller every year," said Yao Jiqiang, 70, a former fisherman who spent around two decades raising fish in the waters.

The turning point came in 2016, when the comprehensive treatment of Chaohu was elevated to a national priority under the Yangtze River Protection Strategy — a shift from fragmented local efforts to a holistic, basin-wide campaign.

Song Xiaofei, director of the bureau of natural resources and planning in Feidong county, said Shibalianwei is envisioned as a multifunctional shield for the city. "This project involves a flood storage basin to absorb excess runoff during peak floods, a natural bio-filter to cleanse nutrients from the Nanfei River before they reach the lake, and a restored habitat for migratory birds along the East Asian–Australasian Flyway," he said.

To make room for the new ecosystem, the physical and social landscape had to be radically restructured. In 2018, in a coordinated push to reclaim the wetland, 12,000 residents from 56 villages were resettled into modern housing. Operating rights for 350 hectares of fish ponds were reclaimed from 377 aquaculture households, and all remaining intensive shoreline aquaculture was fully phased out.

With the land cleared, bulldozers breached the embankments that had choked the waterways for half a century, allowing fresh water to surge back into the parched channels.

The dredging of 533 fish ponds provided millions of cubic meters of sediment, which was used to construct 33 elevated filtration islands within the wetland. Rather than hauling the muck away at great expense, engineers first drove piles to stabilize the soft sludge, then planted metasequoia and Chinese tallow directly into the newly formed land. These trees anchor the soil with their roots, gradually absorbing nitrogen and phosphorus from the water.

They also planted more than 12,000 fruit-bearing trees — peach, persimmon and apricot — to feed migratory birds. In total, 410 hectares of habitats were reconstructed, ranging from shallow marshes and deep-water zones to swamp forests, providing shelter for returning wildlife.

Torrential rains in July 2020 brought the Yangtze basin its worst flooding in decades, threatening Hefei's urban defenses. In response, the construction of smart inlet and outlet sluice gates was fast-tracked later that year.

Designed to handle 450 cubic meters per second, the completed wetland now acts as a giant sponge, capable of absorbing more than 100 million cubic meters of floodwater within three days.

At full operation, it is expected to lower Chaohu Lake's water level by approximately 14 centimeters and the urban river level by 20 cm.

"Shibalianwei has a total flood storage capacity of 109 million cubic meters. It can be filled in three days and drained in seven, transforming a destructive disaster into a controlled hydraulic operation," said Li Jiazheng, general manager of Hefei Shibalianwei Ecological Construction Management Co, the State-owned company responsible for the wetland's restoration, conservation and management.

Li added that this operational flexibility, bolstered by smart sluice stations and early-warning surveillance cameras, allows it to handle a wide range of flood scenarios on the Yangtze River. This technological integration transforms flood storage from a passive endurance test into an active, precision-controlled operation.

That dual mandate — flood retention and ecological restoration — was underscored by President Xi Jinping during his 2020 visit to the area, affirming the wetland's role not just as a hydraulic buffer but as a living filter for the lake.

Today, acting as the "kidney" of Chaohu, the wetland filters around 600,000 cubic meters of water daily from the Nanfei River. Monitoring data show that ammonia nitrogen and phosphorus concentrations have been cut by over 30 percent compared with the inflow. The water has jumped from inferior Class V — the lowest grade for surface water, essentially polluted and unusable — to Class III, which is clean enough to support aquatic life and safe for indirect human use.

Complementary industry

In the retained paddy fields surrounding the restored wetland, rice is grown together with Chinese soft-shelled turtle in the same plots — a traditional Chinese practice known as integrated farming.

The turtles feed on weeds and insects, while their droppings naturally fertilize the rice. In return, the standing crop provides shade and habitat. No chemical fertilizers or pesticides are applied, resulting in both premium eco-labeled rice and high-value aquatic products under the "Shibalianwei" brand.

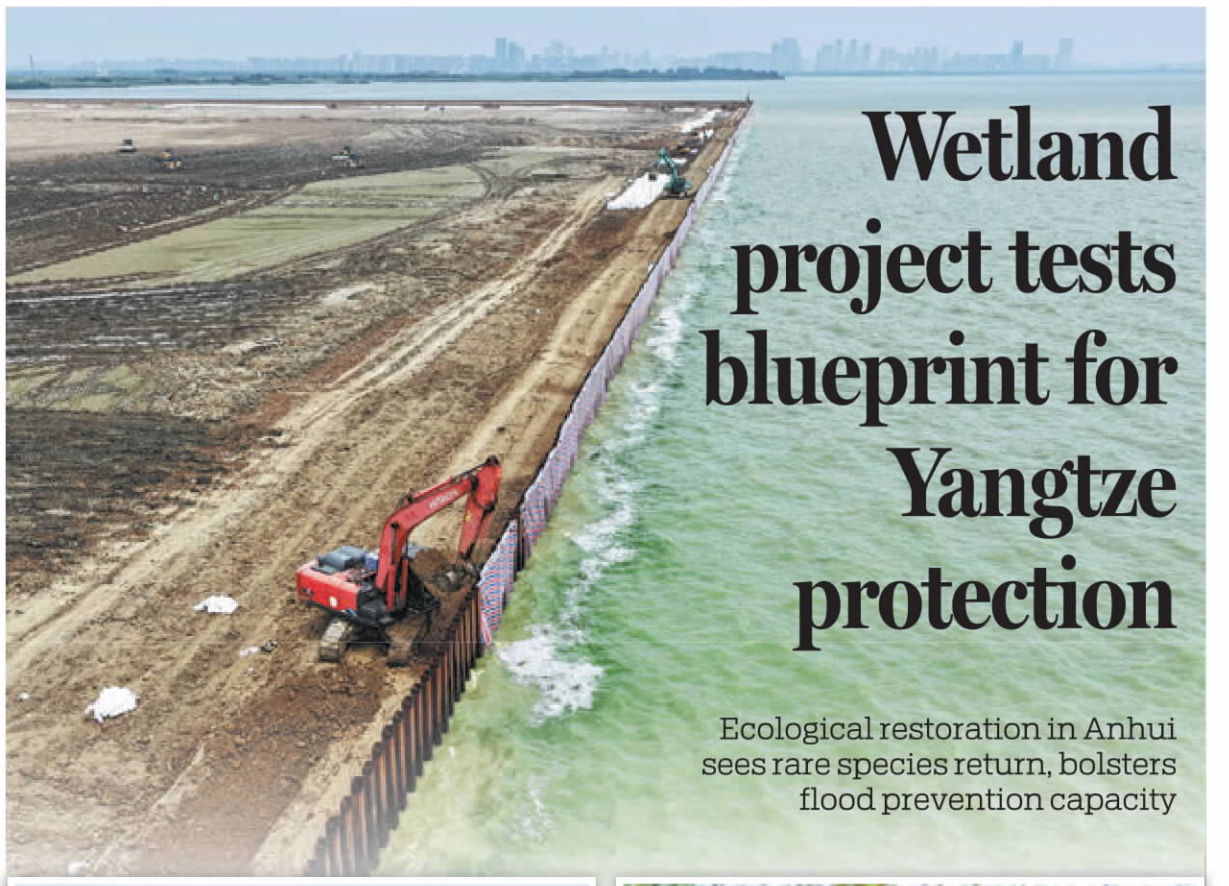
The same fields take on a second role after the autumn harvest. Across the 192 hectares of farmland within the wetland, water levels are raised plot by plot to between 30 and 50 cm, turning the paddies into shallow foraging grounds for endangered species such as the Siberian crane, Oriental white stork and Baer's pochard.

Leftover rice stalks and scattered grains — together with aquatic plants, lotus roots and other natural vegetation — become an important food source for wintering birds, allowing the wetland to double as a seasonal sanctuary without sacrificing a single harvest.

The restoration fundamentally transformed the relationship between humans and nature.

When asked to stop fishing in 2020, Yao Jiqiang felt adrift. Despite his uncertainty, he supported the restoration. "I didn't want future generations to look at a dead lake," he said.

After surrendering his boat and nets, Yao became a wetland ranger, spending his days mowing the marsh grass before it dies back and rots into the water, monitoring birds and ensuring no one disturbs the wetland. Without the constant fish waste and chemical fertilizers of the past, the water has cleared dramatically.



"I used to hate birds for eating my fish. Now, I keep the water clean for them," Yao added.

Mei Dangfu, 75, was among the first of the locals to be relocated. Initially unsettled by the disruption, he has since embraced his new life in a modern 90-square-meter apartment.

The transition was smoothed by an ecological employment priority for locals. Mei landed a security post at the wetland. "I'm happy to see that the number of overwintering swans has increased in recent years," Mei said.

Monitoring data confirm these observations. Since restoration began, plant species have risen from 331 to 412, fish from 36 to 64, and birds from 63 to 232.

Winter bird-watching, spring flower viewing and science education tours draw tens of thousands of visitors annually. Combined with ecotourism and specialty aquaculture, the wetland generates over 20 million yuan in annual output value and creates more than 100 local jobs.

Former waste dump transformed into fields of corn

By **LI MENGHAN**

On the western outskirts of Hefei, Anhui province, a vast expanse of crops breaks through the soil on a plot that, just three years ago, lay buried under more than 10 million cubic meters of construction debris.

The site, once the No 3 Spoil Dump for the Yangtze-to-Huaihe River Diversion Project — the province's mega water infrastructure initiative designed to supply water to millions — was long considered a permanent ecological scar. Today, it has been engineered into 960 hectares of high-standard farmland, yielding successful harvests of rice, corn and rapeseed.

The transformation highlights how, under China's current 15th Five-Year Plan (2026–30), Anhui province is pioneering market-oriented reclamation models. Rather than treating infrastructure waste and food security as separate issues, local governments are partnering with private agribusinesses to ensure infrastructure projects leave behind usable land.

To address the damage left by years of dumping, engineers employed a layered reclamation approach. They first stripped and stockpiled whatever topsoil remained salvageable, then cut down the irregular mounds and regraded the debris in successive lifts. This process eliminated voids, prevented uneven settlement and restored drainage gradients across the site — prerequisites for any land intended to bear heavy agricultural machinery.

Sterile red sandstone spoil, which is unsuitable for crop growth, was buried deeper than one meter to isolate it from root zones. The preserved topsoil was then backfilled to the surface to rebuild the plow layer, where root systems develop and nutrients concentrate.

On the flattened terrain, agricultural infrastructure was upgraded. Fragmented plots were merged into contiguous fields to enable large-scale mechanized cultivation. Irrigation channels were dredged and lined to prevent seepage, while farm roads were rebuilt to support efficient drainage during heavy rains and machinery access.

The harder challenge, however, was soil recovery, as previous dumping had broken down soil aggregates and depleted organic matter.

To tackle this, researchers from the Institute of Soil Science of the Chinese Academy of Sciences in Nanjing analyzed local soil conditions and introduced green manure rotations, which involve planting cover crops and plowing them back into the earth while still green, allowing the nitrogen-rich biomass to decompose and rebuild soil fertility naturally. The team also applied organic compost at roughly 30 metric tons per hectare to gradually bring fertility up to high-standard farmland specifications.

Unlike conventional reclamation — which often means simply leveling debris and covering it with imported soil — the site adopted an integrated construction and operation model, with project teams responsible not only for reshaping the land but also for ensuring it could produce crops reliably.

In September 2023, the Ministry of Natural Resources launched a four-year pilot program on low-efficiency land redevelopment in 43 cities, districts and counties, targeting inefficient land use and irrational spatial layouts resulting from rapid urbanization. Hefei was among the designated pilot cities, bringing slag-dump reclamation under a more rigorous framework.

The reclaimed site is now operated by a leading agribusiness under a land-leasing model. Every April, golden blossoms across the restored terraces briefly turn the former dump into a suburban attraction, drawing photographers and weekend visitors.

The Anhui government said it has prioritized clearing the backlog of unremediated spoil sites and abandoned mines, integrating ecological restoration with food security goals rather than treating them as separate challenges.

The "Porcelain Capital" is promoting its ceramic culture through workshops, group tours and outreach initiatives such as international exhibitions and trade fairs. PHOTOS PROVIDED TO CHINA DAILY

A new window into China

Bringing together diplomats, artisans and business leaders, a cultural trade event turns the country's rich heritage into a catalyst for international exchange, **Yang Feiyue** reports.

After nearly a decade in China over two diplomatic postings, Tinatin Shishinashvili thought there was little left to surprise her. Then she stopped at a booth displaying a blue-and-white teacup — one that any visitor to Turkiye would recognize instantly as the country's iconic tulip-shaped tea glass, rendered here in Jingdezhen's signature cobalt glaze.

"Silk and porcelain — everyone knows these," said Shishinashvili, senior counselor at the embassy of Georgia in Beijing, as she browsed exhibits at the Finest Cultural Gifts From China cultural and tourism trade promotion event in late June.

"But China has so much more to offer. There are products, art forms and cultural expressions that people overseas have simply never encountered," she added.

Moments earlier, she had been deep in conversation with representatives of the China Oriental Performing Arts Group, one of the country's most prestigious performance ensembles, about possible cooperation.

An idea was beginning to take shape: Could Georgian traditional dance, with its soaring leaps and women gliding across the stage in flowing dresses, one day be performed alongside Chinese classical productions?

As she made her way through the exhibition hall, she paused to listen to the stories behind the products on display.

She lingered at the Jingdezhen booth, asking about the workshop where the teacups were made, and the artisans who painted each brushstroke by hand.

She said she would love to visit the city in Jiangxi province, walk through the kiln sites, and watch the craftspeople at work. "A porcelain learning tour to Jingdezhen is now on my list."

Shishinashvili's experience reflected a broader theme running through the event: how Chinese cultural products, creative industries and ideas are reaching new audiences overseas, while those encounters are reshaping perceptions on both sides.

The event was designed to facilitate those encounters. Co-hosted by the Ministry of Culture and Tourism's Department of Industry Development, the Department of Services for Foreign Ministry Home and Overseas Offices, the Beijing Municipal Bureau of Culture and Tourism, and the Beijing Dongcheng district, the cultural and tourism trade promotion event brought together diplomats from 14 countries and regions, officials from the Shanghai Cooperation Organization and representatives from cultural and tourism enterprises across China.

Addressing participants, Miao Muyang, director-general of the Ministry of Culture and Tourism's Department of Industry Development, described cultural and tourism trade as both an important driver of international economic cooperation and a bridge for exchanges and mutual learning among civilizations.

Guangzhou Nansha Marina, established in 2011, has become one of the major players in the country's yacht industry. PROVIDED TO CHINA DAILY

Since 2022, the ministry has organized 18 editions of the initiative at home and abroad, creating platforms that connect Chinese enterprises with overseas buyers, cross-border e-commerce platforms and industry partners.

This year's event featured more than 30 exhibitors representing intangible cultural heritage, cultural technology, performing arts, creative products, and lifestyle brands.

Organizers said the goal was not only to showcase products and services with market potential, but also to create opportunities for dialogue, business matchmaking and long-term partnerships.

> "There are products, art forms and cultural expressions that people overseas have simply never encountered."
>
> **Tinatin Shishinashvili,** senior counselor at the embassy of Georgia in Beijing, talking about exhibits at the Finest Cultural Gifts From China event

Reaching out

Representing the Jingdezhen Trade Business Ceramics Cultural Tourism Industry Operation Management Co at the Beijing event, Fu Yao, the company's general manager, spoke enthusiastically about Jingdezhen's efforts to bring its thousand-year-old porcelain tradition to new international audiences.

As visitors examined ceramic jewelry, tea sets and contemporary cultural products displayed at her booth, she recalled a moment from the Milan Handicraft Fair, one of Europe's leading showcases for artisanal craftsmanship.

European visitors would pick up the porcelain pieces, turn them over in their hands and study the brushwork in disbelief. "They simply couldn't believe that human hands could produce something so precise," Fu says.

Although Jingdezhen is celebrated in China as the "Porcelain Capital" and its wares once traveled along maritime trade routes to royal courts across Europe, many overseas consumers know little about how the pieces are made.

"Only when people spend several days in Jingdezhen, make pottery themselves and experience the process firsthand, can they truly understand why this city has produced 1,000 years of ceramic culture," she says.

Recent visa facilitation measures have encouraged more international visitors to stay longer in Jingdezhen rather than treat it as a brief stopover, she says.

Many now take part in pottery workshops, tour historical kiln sites and explore the city's ceramic markets, gaining a deeper appreciation of the craftsmanship behind every finished piece.

The city's outreach has also expanded through international exhibitions and trade fairs.

Among the products on display in Beijing was a Turkish-style tea glass decorated with Turkish textile motifs, illustrating how Jingdezhen artisans are adapting traditional craftsmanship for overseas markets.

The product has generated nearly 2 million yuan ($295,000) in sales in Turkiye, Fu says.

Potential market

More than 2,000 kilometers to the south, where the Pearl River meets the South China Sea, Xu Fengjuan has witnessed firsthand the growing international interest in Guangzhou's Nansha district.

"When we first started attending international events, people were curious, but they knew little about China's yacht industry," says Xu, executive deputy general manager of Guangzhou Nansha Marina.

"Many assumed we were still at a very early stage."

The marina was established in 2011 with the ambitious goal of building a facility that met international standards, at a time when China's modern yacht industry was still in its infancy.

"There were few standards, limited infrastructure and very little experience to draw on," Xu says. "We had to learn everything from scratch."

Over the following decade, the club developed a full range of services, from berthing and maintenance to licensing support and training programs. It also became one of the first marinas on the Chinese mainland to receive the 5 Gold Anchor Platinum accreditation from The Yacht Harbour Association, the industry's highest honor.

But for Xu, the more meaningful progress has been less visible.

Creating conditions for easier movement of yachts within the Guangdong-Hong Kong-Macao Greater Bay Area required years of coordination among customs, maritime and regulatory authorities. Those efforts reached a milestone in mid-June, just days before the Beijing trade promotion event, when the first official Greater Bay Area yacht free-travel voyage departed from the Nansha yacht club.

"We spent years working with different departments and introducing international best practices," Xu says.

"Progress came step by step."

Today, about one-third of the club's roughly 100 members come from Hong Kong and Macao, a sign of growing regional connectivity.

The club has also invested heavily in youth sailing programs. Since 2014, young sailors trained in Nansha have competed in regattas in Portugal and the United States.

Its annual yacht expo and sailing regatta have also attracted a growing number of manufacturers, dealers and sailing enthusiasts from around the world.

Xu says she has noticed another shift in recent years. Overseas yacht organizations that once had little contact with China are now reaching out directly.

European clubs have contacted Nansha to arrange visits, explore partnerships and learn more about developments in the Greater Bay Area.

"Fifteen years ago, we were studying international standards and learning from others. Now, people come here to see what we are doing," Xu says.

The change reminds her of something she often hears from first-time visitors.

"They arrive with one impression of China," she says. "After they spend time here, they leave with a different one."

Hong Kong Ballet unveils dazzling stage lineup

By **CHEN NAN**
chennan@chinadaily.com.cn

Hotpot, neon lights, kung fu cinema, and high fashion are not the ingredients one would typically associate with classical ballet. Yet, the Hong Kong Ballet is blending them into an exuberant celebration of the city's cultural identity with the launch of its 2026/27 season, aptly titled Hong Kong Bling.

Drawing inspiration from Hong Kong's vibrant 1970s heyday, when film, music and fashion flourished with global influence, the new season is set to bring an eclectic mix of world premieres, award-winning productions and community initiatives that reflect both the city's rich heritage and its contemporary creative energy.

The program was unveiled on June 23. Artistic director Septime Webre describes the upcoming season as a theatrical hotpot, where diverse cultural influences come together to create something greater than the sum of their parts.

"Hotpot is more than a meal; it is a living expression of togetherness and community," Webre says.

"Generations of family and friends have transformed individual ingredients into something greater and richer, enjoyed around the table together."

He likened the company's new season to that communal dining experience, combining the glamour of 1970s Hong Kong — from glitzy disco culture and neon-lit streets to martial arts films and bold fashion — into "something memorable and meaningful".

The centerpiece of the season is an ambitious trio of productions exploring identity, transformation and human resilience.

Among them is the world premiere of *Bruce Lee: Hong Kong Legend*, created and directed by Webre. The large-scale production celebrates the martial arts icon through ballet, blending classical dance with action choreography, an original score that fuses orchestral music with Chinese instruments and contemporary pop, and designs by Oscar-winning art director Tim Yip.

> Just as we gather together to share meals, we can gather at the theater and in the community to experience creativity and artistry that reflects the Hong Kong Ballet today."
>
> **Septime Webre,** artistic director of the Hong Kong Ballet

Another major premiere, *Dunhuang: In Search of Light*, reunites choreographer Hu Song Wei Ricky and Mai Jingwen. Inspired by the novel *Siddhartha* by German-born Swiss writer Hermann Hesse, who received the Nobel Prize in Literature in 1946, and the ancient grottoes in Dunhuang, the production follows a young man's spiritual journey toward enlightenment, combining classical ballet with immersive visual storytelling. It also marks the Hong Kong Ballet's first collaboration with the Dunhuang Academy in Gansu province.

Another highlight is *Coco Chanel: The Life of a Fashion Icon*, choreographed by Annabelle Lopez Ochoa. The ballet examines the complicated life and legacy of the designer whose influence reshaped the fashion world.

Classical favorites also remain firmly on the menu.

Audiences can look forward to the return of *The Nutcracker*, Webre's interpretation of the classic, as well as the swashbuckling *Le Corsaire: The Pirate Hunter!*, known for its athletic choreography and spectacular stagecraft.

Families are also catered for through Summer Fling, an interactive studio event featuring excerpts from the company's repertoire, opportunities to meet dancers and ballet workshops for children.

Beyond the stage, the Hong Kong Ballet continues to strengthen its role as one of the city's cultural ambassadors. Its internationally acclaimed *Romeo + Juliet*, set in 1960s Hong Kong, will tour Beijing in August and Chengdu, Sichuan province, in September, following performances in New York, London and Seoul.

Webre highlights the company's expanding community outreach, including the growth of the Hong Kong Academy of Ballet, its "Dancing to Hong Kong's Heartbeat" initiative and "Silver Ballet" programs designed for seniors. More pop-up performances and collaborations across the Guangdong-Hong Kong-Macao Greater Bay Area are planned for 2027.

"Just as we gather together to share meals, we can gather at the theater and in the community to experience creativity and artistry that reflects the Hong Kong Ballet today," Webre says.

"It's rooted in tradition yet boldly contemporary, stylish and deeply connected to both the city and the world."

LIFE

HAPPINESS HELD BY MANY STRINGS

Chinese mythology and traditional puppetry hit the international stage in France, sharing a cultural universe with new audiences, **Chen Nan** reports.

What if the legendary heroes, historical figures and cultural icons of Chinese mythology didn't just live in ancient texts but stepped onto a small stage in France, pulled by strings, shadows and breath?

At this year's Avignon OFF Theatre Festival, one of the world's largest and most dynamic performing arts festivals held every July in the southern French city of Avignon, a new curated program titled Tradition Renewed will do just that, placing Chinese mythology at the heart of an international stage.

From July 15 to 25, the program transforms China's ancient mythological universe — gods, creators, tricksters, and immortals — into something audiences don't simply watch, but "encounter".

Curator Yao Shuo describes the initiative not as a single sweeping epic but as a constellation of mythical fragments.

"Chinese immortals as a theme are not meant to be a singular grand narrative. The mythological theme satisfies audience curiosity," Yao says. "Tradition Renewed is about multiple voices rather than one big story."

Rather than treating deities as distant relics, the program invites audiences into mythology as something fluid and alive — playful, shifting, and unexpectedly intimate.

"We invite audiences to experience Chinese mythology as something that can be retold, reimagined, and even slightly broken, so it feels newly alive," he adds.

Among the participating artists are the Quanzhou string puppetry ensemble and the Quanzhou Marionette Show Inheritance and Protection Center from Fujian province, represented by troupe head Dai Xun, who brings both classical repertoire and newly reimagined works to Avignon for the first time.

Rooted in Minnan (the southern area of Fujian province) culture, Quanzhou string puppetry was listed as a national intangible cultural heritage in 2006 and inscribed in UNESCO's Register of Good Safeguarding Practices in 2012, reflecting both its historical depth and ongoing vitality.

This year, the troupe presents a 60-minute curated program bringing together seven classic and newly created works. At its center is *Nezha*, a recent production that quickly became a domestic hit after being created last March.

"It became very popular, with many performances completely sold out," says Dai.

Quanzhou string puppetry will be highlighted during the upcoming Avignon OFF Theatre Festival. PHOTOS PROVIDED TO CHINA DAILY

Top: QFunTheater's Children's Experimental Troupe will bring a production adapted from the mythological classic *Shan Hai Jing*, along with elements of shadow puppetry, to France. **Above:** 300-year-old Huai Diao Opera, a form of traditional Chinese opera from Cixian county, Hebei province, will be staged in France.

A rebellious mythological figure since his earliest literary appearances in the Ming Dynasty (1368-1644), Ne Zha has long been reinterpreted across generations, making him a flexible symbol for contemporary storytelling.

Behind the spectacle lies extraordinary technical precision.

"Behind every movement are thin silk strings — each gesture controlled with astonishing delicacy, yet capable of expressing vast emotional and narrative worlds," Dai says. "It is a living demonstration of Quanzhou puppetry techniques: a small stage containing an entire universe, where tradition and contemporary imagination move in seamless rhythm."

The program also includes reworked traditional and contemporary pieces under the umbrella presentation *Living Puppetry: Ancient Art with New Looks*, blending classical structures with updated dramaturgy and stage technologies.

For the Avignon setting, adaptation has been crucial. The troupe's large domestic casts have been scaled down to suit smaller international venues.

"When selecting works, we chose pieces that have already been validated by audiences in China," Dai says. "We normally do 800 to 900 performances a year, and these are among our top 10 most-performed works."

He adds that the selection is designed to balance tradition, innovation and accessibility for audiences unfamiliar with Chinese puppetry.

Dai's own path into the profession began in Quanzhou, Fujian province, where he grew up near a puppet troupe before entering a performing arts school in 1992.

"After school, I would go watch performances. At the time, people said this art could support a livelihood. It became a kind of dream job," he recalls.

His early fascination came from the craft's technical brilliance.

"When I was a child, I was amazed by the skill — it felt fun and fascinating. But training is very hard and often very boring, especially basic skills. It takes years before you can perform on stage."

Yet for Dai, the appeal of puppetry remains fundamentally human.

"What doesn't change is that people love puppetry. Children and older audiences alike enjoy the feeling of control and interaction — like a kind of game. Through puppets, you can express things the human body cannot easily do," he says. "You can even communicate with ancient heroes, as if interacting with them directly."

Another highlight of Tradition Renewed comes from Huai Diao Opera in Cixian county, Hebei province. With a history of around 300 years, the form is known for its high, arching, and emotionally charged vocal style.

The new production is based on a script recorded more than 30 years ago by veteran artist Xie Zhuqing and is jointly produced by the Cixian Hongyi Huai Diao Culture and Art Center and the Hebei Bangzi Opera Theatre.

At its core is a reinterpretation of the myth of Nyuwa repairing the sky, in which the goddess restores cosmic order after a catastrophic collapse of heaven, saving humanity through sacrifice and creation.

"We wanted to let Huai Diao Opera stand again on a contemporary stage, not as a museum piece, but as a living performance language," says Xie.

In its most striking sequence, the production introduces intelligent robotics onto the stage for the first time, enabling human performers and machines to move in synchronized choreography — an unexpected encounter between centuries-old opera aesthetics and emerging technology.

The performance remains anchored in Huai Diao's powerful traditional vocal style, enriched with modern stagecraft and visual effects.

The third major work in the program is based on the mythological classic *Shan Hai Jing* (The Classic of Mountains and Seas), created by QFunTheater's Children's Experimental Troupe. The entire creative process, from writing and performance to stage design and multimedia, is led by children aged 4 to 14, offering a strikingly youthful reinterpretation of ancient mythology.

The production also features the Wang family shadow puppetry tradition from Huaxian (Huazhou), Shaanxi province, one of China's most important shadow theater schools. A nationally listed intangible cultural heritage passed down through five generations, it is making its theatrical debut in Avignon.

Beyond performances, Tradition Renewed expands into workshops, exhibitions and professional forums. A curator-led open day on July 22 will connect Chinese troupes with international audiences.

Looking ahead, Yao, the curator, says this inaugural edition is only the beginning.

"This is the first year," he says. "Next year, we plan to collaborate more directly with international artists, expanding the dialogue beyond Chinese traditions into shared creative territory."

Technological upgrade creates lasting impact for Zigong lanterns

By **YANG FEIYUE**
yangfeiyue@chinadaily.com.cn

The 32nd Zigong International Dinosaur Lantern Festival recently drew to a close after a five-month run, nearly twice as long as the sessions held a decade ago.

The extended season allowed the city to reduce peak-period crowding and host more than 350 cultural and tourism events across Zigong in Southwest China's Sichuan province, including folk parades, intangible cultural heritage exhibitions, music performances, temple fairs, and night tours.

The longer run was made possible by innovations in the lanterns themselves.

Zigong has made lanterns for generations. Its festivals are legendary, drawing millions of visitors from across China and around the world each year.

The craft dates back to the Tang Dynasty (618-907), and for centuries, Zigong's lantern makers have passed their skills from master to apprentice. But for most of its history, the craft had a hard limit: the displays were always temporary, lasting two or three months and then discarded. After each festival season, workers would dismantle the lanterns, and the materials would be scrapped. That was simply how it worked.

Shi Fei, chief planner and designer of the 31st Zigong International Dinosaur Lantern Festival in 2025, decided to change that.

His team upgraded the materials, experimenting with new fabrics, coatings and structural designs. Short-lived lanterns now can last from six months to a year. They also introduced thematic designs, digital lighting and interactive rides. Visitors no longer just walk past the lanterns and glance at them. They can step inside some displays, trigger lighting effects with their movements, and even control color changes through touch panels. Those efforts helped turn a seasonal craft into a year-round attraction.

The 2025 festival, which ran from Jan 17 to early May, generated 149 million yuan ($22 million) in ticket revenue, up 46 percent from last year, thanks to a 40 percent increase in visitor numbers.

The longer duration also created a lasting impact. The 32nd festival saw ticket sales reach 106 million yuan by Feb 22, up 12.53 percent from the previous year. The festival this year welcomed its one-millionth visitor just 31 days after opening — a milestone that previously took much longer to reach.

For Shi, the goal was never to freeze tradition in time. He has said repeatedly that intangible cultural heritage cannot survive behind glass. It must be used, experienced, and adapted. The aim is to help tradition endure and attract people to see it.

Across Zigong, the broader industry is following a similar path. Speaking at the China Tourism Entrepreneurs Summit in Xiamen, Fujian province, a major gathering in early June which brought together more than 1,000 industry leaders under the theme of building a tourism powerhouse, Shi notes that the intersection of traditional craftsmanship and modern tourism requires continuous innovation. His work on the Zigong lantern festival, he says, was driven by a simple question of how to make a centuries-old craft relevant to travelers who have seen everything.

Shen Hongyue, president of Zigong's lantern industry association, says that the sector has evolved from simply supplying lantern products to providing integrated services for nighttime cultural tourism projects, which are now steadily becoming part of new nighttime tourism and consumption scenarios across China.

Zigong now accounts for 85 percent of China's lantern market and 92 percent of the global market, with annual industry-wide revenue surpassing 8 billion yuan, according to Shen. The industry employs hundreds of thousands of workers, from traditional craftspeople to digital designers and project managers.

The local lantern craft has become a global export, with Zigong lanterns appearing at festivals in more than 80 countries, including the United States, France, Japan, and Singapore, according to local industry players.

The annual Zigong lantern trade conference held in May saw contracts worth nearly 1.03 billion yuan signed, reflecting the industry's growing commercial reach.

French host and Sino-French cultural exchange envoy Christophe Hisquin, who has participated in more than 400 international events, experienced the emotional pull of lanterns firsthand at an industry conference in Zigong in May.

"I have seen many lights in my life, but Zigong's lanterns are unique; the warmest and most futuristic," he says.

What moved him, he explains, was not just the craftsmanship or that being a visual feast, but the feeling that Zigong lanterns are a living history of civilization.

Dai Bin, president of the China Tourism Academy, has long argued that technology must serve culture, not the other way around.

"Our technology needs cultural leadership," he said during the 2026 Two Sessions. "Without the cultural essence, a purely technical spectacle cannot last."

He believes technology-powered tourism must be "people-centered" and "applied for good" — making traditions more accessible.

What visitors seek, he says, is emotional and cultural connection. Technology's role can enable that connection.

Wang Tayi, a veteran of the Universal Beijing Resort project, believes China now possesses the industrial capacity and technological sophistication to transform traditional crafts into globally competitive attractions.

He points to Huawei and BYD as evidence that Chinese design and engineering can compete at the highest level. The same, he argues, can be done with a lantern.

"We are looking forward to seeing this cooperation set a new benchmark for the innovative development of the cultural tourism industry," Wang says.

Lanterns in vivid shapes of traditional auspicious elements, including fishes and babies, as well as ancient architecture, were a big draw at the 32nd Zigong International Dinosaur Lantern Festival that recently drew to a close after a five-month run. PROVIDED TO CHINA DAILY

LIFE

Crossings that turned the tide

Film revisits a legendary campaign that reshaped the Long March and secured the Red Army's survival, **Xu Fan** reports.

More than 30,000 against 400,000. The two numbers capture the stark imbalance between the Communist Party of China-led Red Army and the encircling Kuomintang troops during one of the most decisive military campaigns of 1935.

At first glance, the odds seemed insurmountable. Yet, the vastly outnumbered Red Army not only survived but also turned the campaign into a pivotal moment in the Long March (1934-36), the epic two-year military trek that paved the way for the eventual victory of the Chinese revolution and the founding of the People's Republic of China in 1949.

Known as the "Four Crossings of the Chishui River" campaign — which Chairman Mao Zedong later described as "the proudest achievement" of his military career — the legendary operation has recently been brought to the big screen in *Crossing*, which opened in theaters nationwide on June 26.

Released as a tribute to the 90th anniversary of the victory of the Long March, the film opens in the aftermath of the Battle of Xiangjiang River, one of the bloodiest engagements of the Long March. Fought in 1934, the battle was a setback for the Red Army, leaving more than 50,000 soldiers dead, wounded, captured or missing.

After the Zunyi Conference in Guizhou province, Mao regained military command and abandoned rigid conventional tactics in favor of highly mobile warfare. Facing an encirclement by some 400,000 Kuomintang troops led by Chiang Kai-shek, he directed the Red Army across the border region of Sichuan, Guizhou and Yunnan provinces to confuse, outmaneuver and wear down the pursuing enemy.

From Jan 19 to March 22, 1935, the Red Army crossed the Chishui River, which flows through three provinces, four times, ultimately breaking out of the encirclement while preserving the core strength of the CPC-led forces with minimal losses.

Beyond vividly recounting the historic campaign, the film also focuses on ordinary Red Army soldiers. Told through the eyes of veteran Zhao Defa and a homeless orphan, A'jin, who volunteers to assist Zhao and his comrades, the story explores the courage, conviction and resilience that made the force so formidable.

Director Xu Zhanxiong, known for *The Pioneer* — a 2021 biopic about Li Dazhao, a founding member of the CPC — told China Daily that his original motivation was to "retell a story that every Chinese person has encountered in history textbooks in a way that truly moves audiences, while inspiring younger generations to explore history more deeply".

The project took shape during the 19th Changchun Film Festival in 2024, when Xu was approached by Yu Dong, founder of Bona Film Group, which has produced several acclaimed revolutionary blockbusters including *The Battle at Lake Changjin* and *The Founding of an Army*. Xu recalls being struck by Yu's passion for bringing the campaign's lesser-known stories to the screen.

"Every time Yu talks about the campaign, he speaks with remarkable familiarity and profound knowledge. His genuine passion is infectious and inspires everyone around him," says Xu.

In October that year, Xu and the film's creative team set off on their first research trip to Guizhou, one of the campaign's major battlefields. Retracing the Red Army's route, they visited historic sites including Tucheng Ancient Town in Xishui county, where Mao directed his first battle after regaining military command, and Loushan Pass, a strategic mountain pass more than 1,500 meters above sea level at the junction of Zunyi and Tongzi counties.

"The Battle of Loushan Pass marked the Red Army's first major victory after the start of the Long March, and it was fought with extraordinary intensity," Xu says. He adds that Mao later wrote a famous poem, expressing his confidence that the Red Army would overcome every hardship on its road to ultimate victory.

During a visit to a museum in Zunyi, Xu learned that there was no bridge across the Chishui River when the Red Army made its first crossing. Instead, soldiers gathered bamboo poles, wooden planks and small boats from local villagers to build makeshift pontoon bridges that swayed beneath their feet as they crossed.

The film's 107 scenes were shot entirely at 32 locations across Guizhou, with nearly 2,000 students from Guizhou Police College and Qiannan Minzu Polytechnic volunteering to play Red Army soldiers. Although filming took place during last winter's freezing weather, the youngsters, wearing straw sandals and carrying heavy gear through muddy terrain, completed the demanding shoot without a single person dropping out, according to the producers.

Executive producer Andrew Lau says he was deeply impressed by their dedication. "They were about the same age as the Red Army soldiers — mostly in their 20s — and worked alongside the cast under extremely harsh conditions. At times, looking at them through the camera, I felt as if I were seeing the young Red Army soldiers of 90 years ago," says Lau.

Actor Liu Ye lost 8.5 kilograms to portray Mao during one of the most grueling periods of the Long March, when the revolutionary leader endured illness, hunger and bitter cold.

The film marks Liu's third time portraying Mao, following *Beginning of the Great Revival* (2011) and *The Founding of an Army* (2017). He recalls one memorable behind-the-scenes detail: although he rarely eats spicy food in real life, Liu chewed chili peppers during filming to better reflect Mao's well-known fondness for them, enduring a burning sensation in both his mouth and stomach to stay true to the role.

The film also features several prominent figures from the Kuomintang side, including its leader Chiang and Guizhou warlord Wang Jialie. Wang's army was mockingly known as the "two-gun troop", a nickname referring to the fact that many of his soldiers carried both a rifle and an opium pipe. Since Wang did not ban opium poppy cultivation and instead profited from the trade during his rule over Guizhou in the early 1930s, widespread opium addiction was tolerated within his ranks.

More than a year after filming wrapped, Xu says the project's greatest impact on him was gaining a firsthand understanding of how extraordinary the campaign truly was. "The path the Red Army soldiers walked is nothing short of a miracle in human history. Every step they took, every drop of blood they shed — all of it helped shape the course of history," he says.

Tajik students build skills in China classrooms

TIANJIN — At the intelligent surveying and mapping training center of Tianjin Urban Construction Management and Vocation Technology College in North China, 21-year-old Tajik student Jonibek Ismoilov was busy fine-tuning equipment settings.

Around him, he and his classmates set up circuits, monitored data and recorded measurement results, while conversations in both Chinese and Russian filled the classroom.

In September 2024, Ismoilov and seven other students became the first group of students from the Luban Workshop in Tajikistan to come to this northern Chinese municipality to study. After completing the first two years of courses at the local Luban Workshop, they arrived in China as the first batch of students in the "2 plus 2" joint training program, where they received further instruction in engineering surveying, the operation and maintenance of surveying equipment, new power systems, and wind-solar hybrid technologies.

Lu Ban was an outstanding craftsman and inventor who lived in China more than 2,500 years ago.

The Luban Workshop is an international vocational education brand launched by Tianjin Municipality. Combining academic education with vocational training, it provides advanced training facilities and equipment, sends Chinese teachers and technicians to train instructors locally, and invites them to China for exchanges and hands-on learning, all in an effort to cultivate technical talent.

In March 2022, the Luban Workshop in Tajikistan was jointly launched by Tianjin Urban Construction Management and Vocation Technology College and Tajik Technical University. It began operating in November that year.

"The Luban Workshop gave us the opportunity to study in China. It focuses not only on classroom learning, but also on hands-on practice. We operate the equipment ourselves and take part in practical training, which has helped me understand how professional knowledge is applied in real engineering projects," Ismoilov says.

He has systematically studied practical surveying courses, gradually mastering professional skills through repeated training, from precision instrument operation to standardized circuit installation and real-time data monitoring.

Now, Ismoilov can read professional materials fluently and complete practical training independently. After finishing his current studies, he hopes to pursue a master's degree in Tianjin, specializing in advanced surveying technologies.

Another student benefiting from the Luban Workshop is Bakhtiyor Bozorzoda from Tajik Technical University. When he first enrolled, he felt uncertain whether geodesy and cartography were the right fields for him. But the advanced surveying equipment, digital mapping technologies and virtual simulation courses introduced at the workshop helped him see the discipline in a new light and sparked a lasting interest.

Students and teachers from Tajik Technical University take part in a Luban Workshop training session at Tianjin Urban Construction Management and Vocation Technology College in Tianjin in July 2024. XINHUA

During his studies, Bozorzoda gained hands-on experience with high-precision instruments and digital mapping technologies. He also came to Tianjin for practical training and skills competitions, where he learned about China's advanced surveying equipment and modern engineering practices, further strengthening his career aspirations.

"I hope to continue my studies in China, learn more advanced surveying technologies, and contribute to infrastructure development in Tajikistan," Bozorzoda says.

Today, the Luban Workshop in Tajikistan has been operating for nearly four years, having provided learning and training opportunities for more than 2,900 undergraduate and graduate students. Its programs now span nine departments and 13 majors, including civil engineering and architecture.

Meanwhile, increasingly close exchanges between vocational education practitioners from China and Tajikistan have continued to improve the workshop's teaching quality.

Since 2022, Wu Zhengpeng, a teacher from Tianjin Urban Construction Management and Vocation Technology College, has embarked on a "two-way journey" across the Pamir Mountains. As a Chinese instructor at the Luban Workshop in Tajikistan, he has trained local teachers using advanced Chinese instruments and comprehensive teaching resources, building a learning platform more closely aligned with industrial needs.

"This is not a one-way exchange. We work closely with our Tajik colleagues to develop teaching plans and explore new approaches together. Through ongoing collaboration, we are building talent training models that better meet local needs," Wu says.

A total of 25 Tajik teachers have also participated in training programs in China. "Chinese teachers are both mentors and friends. They have offered many valuable ideas during teaching exchanges. Modern training equipment and specialized courses have greatly increased students' enthusiasm for learning," says Parviz Khujaev, a professor at Tajik Technical University.

Qudrat Davlatzoda, president of the university, says the Luban Workshop is a model of mutual respect and pragmatic cooperation between Tajikistan and China.

"It has not only brought us valuable experience and deep friendship, but also significantly improved the university's teaching and research capabilities, injecting new momentum into its development," he says.

To support local industrial development, Tianjin Urban Construction Management and Vocation Technology College has signed a strategic cooperation agreement with more than 10 China-funded enterprises operating in Tajikistan, establishing an industry-education alliance for talent development. The program provides targeted training and short- to medium-term vocational skills training for enterprise employees.

Li Qingbin, Party secretary of the college, says the Luban Workshop in Tajikistan has filled a gap in China-Tajikistan cooperation in vocational and technical education.

"It has provided much-needed talent for local economic and social development while building a bridge for people-to-people exchanges and mutual learning between the two countries, helping more young people grow into 'Silk Road craftsmen' serving the Belt and Road Initiative," Li says.

WORLD CUP 2026

France's Kylian Mbappe lets out a victorious roar at the final whistle after his side beat Paraguay in the World Cup round of 16 on Saturday.
Inset: A crying fan in the Paraguayan capital Asuncion watches as her team falls to a 1-0 defeat against France. REUTERS / AP

Mbappe on the spot to force France into quarters

Les Bleus overcome physical Paraguay test to edge their way into final eight

Kylian Mbappe laughed and smiled — and scored, of course — when Paraguay tried to bait him and his French teammates into fouls and provoke fights, as hot heads became a recurring theme during one of the steamiest World Cup games on record.

After the final whistle, Mbappe kept on walking and left Paraguayan goalkeeper Orlando Gill hanging, as Gill extended his right hand in a show of sportsmanship.

In response, Gill threw the ball right at the No 10 on Mbappe's jersey.

Mbappe had already got the last laugh though, as he scored his 19th career World Cup goal, and France survived stifling heat to beat Paraguay 1-0 on Saturday, sending Les Bleus into the quarterfinals for the fourth straight time.

"We knew what kind of match it was going to be," Mbappe said afterward. "We can also get our hands dirty, we know how to do it. We know how to play ugly football. Guess they were thinking we were going to show up in tuxedos, but we were ready."

France moves on to a quarterfinal tie on Thursday in Foxborough, Massachusetts, against Morocco, which beat Canada 3-0 in the last 16 earlier Saturday.

That game will be a repeat of the 2022 semifinal which France won 2-0, before it went on to lose the final on penalties to Argentina.

"Morocco are one of the best teams. We played them four years ago in Doha and they also got to the Africa Cup of Nations final," France coach Didier Deschamps said.

He will hope his squad recovers quickly from the Paraguay clash, and that key midfielder Aurelien Tchouameni is back after missing Saturday's game with a thigh injury.

"We have a few days now to recuperate. We have some tired players and a few little knocks too."

With an extreme heat warning in effect throughout the match as temperatures hovered around 38 C, Mbappe finally broke through against a physical, defensive-minded Paraguay side when he converted a penalty kick in the 70th minute.

That was enough for Les Bleus.

Mbappe was awarded the penalty when Diego Gomez was pulled up for tripping Desire Doue after a video review.

Mbappe then stutter-stepped his way to a 19th goal in as many World Cup appearances, and one score behind all-time tournament record holder Lionel Messi.

Mbappe and Messi each have seven goals in this tournament, and are joint top in the Golden Boot race.

Mbappe won that award four years ago, despite Messi and Argentina beating France in the final.

Mbappe — who could be seen frequently trash-talking the Paraguayans in Spanish — is now the only player to score at least three knockout-stage goals at three World Cups.

In the second half, Mbappe botched a breakaway attempt, and Manu Kone had his top-corner shot knocked away by Gill.

Gill also stopped two strong attempts by Mbappe in second-half stoppage time.

The 26-year-old Gill had bested German great Manuel Neuer in a penalty shootout in the previous round, beating Germany on June 29 in one of the big upsets of this World Cup.

But, he lost his cool after the loss to France when he chucked the ball at Mbappe.

"I tried to shake his hand, but since he didn't pay me any attention, I lost my temper," Gill said.

"But anyway, that was all I did. I calmed down afterward."

For the criticism that hydration breaks have watered down the pace of play at the World Cup, they were never more needed for the players than in the midst of a scorching heat wave.

Sprinklers showered the Kentucky bluegrass field during the breaks and at halftime.

"Given our style of play, it was harder to produce a high intensity," Deschamps said.

Spectators fled for the concourse at halftime, seeking shade and refuge from the sun.

Or maybe they were just looking for some action of any kind.

Paraguay rightback Juan Jose Caceres (4) collides with France striker Kylian Mbappe (10) during a feisty World Cup round-of-16 match in Philadelphia on Saturday. AP

Les Bleus scored 13 goals in the first five games of the tournament, but were stymied in the first half by a Paraguay team trying to turn the match into a scrap.

Tempers flared when Andres Cubas took down Mbappe, and the teams briefly pushed and shoved each other.

Matias Galarza also threw his right elbow into Mbappe and sent him crashing to the grass.

Yet, despite the physical, gritty efforts of La Albirroja, it's France that's moving on. Les Bleus are 5-0 in this year's tournament, outscoring their opponents 14-2.

Paraguay coach Gustavo Alfaro, though, said his side had "fought like lions".

"France couldn't find the answers, and it took a bit of individual skill and a penalty given by VAR to make the difference, which their football had not been able to do," Alfaro said after the game.

"It took us 16 years to get back to a World Cup, while Mbappe won the World Cup the first time he played in it, got to the final in his second and now is fighting to be the top scorer.

"We worked so hard to get a different result, but I will leave here with the knowledge that we came to compete and we did."

Deschamps also chose to dwell on the positives from the occasionally bad-tempered encounter: "As I said to the players, we've had easy games so far, so it is good to have a tough one."

AGENCIES

Deschamps hails players for keeping their cool in fiery encounter

France coach Didier Deschamps hailed his side for keeping its cool against an aggressive Paraguay team in heatwave conditions on Saturday, as the favorite reached the quarterfinals of the World Cup.

"It wasn't easy," Deschamps told French broadcaster M6.

"They used every resource possible. It is maybe not the kind of football that brings people to the stadium, playing with that aggression, exaggerating everything."

France had scored 13 goals in its four World Cup outings prior to this game, but on Saturday it struggled to create any clear scoring chances, despite totally dominating possession.

France's most creative players — Michael Olise, Ousmane Dembele and Bradley Barcola — all found the going tough against a niggly Paraguayan team looking to cause another upset after ousting Germany in the last 32.

"We stayed focused on our game. It was difficult, they had lots of men behind the ball and they defended well," added Deschamps.

"Obviously, the temperatures made it hard to play with intensity, and without that (intensity from us) they defended well."

The match was played in the late afternoon heat, with temperatures hitting 38 C in Philadelphia as the city celebrated the United States' July 4th holiday weekend, which also marked the 250th anniversary of the nation's founding.

Deschamps was also left perplexed that his team collected three yellow cards, while not a single Paraguay player was booked.

"I am not going to criticize the referee, but we finished the game with three bookings, and yet, there were a lot of things going on," Deschamps said in his post-match news conference, also suggesting that he and his team were subjected to verbal aggression, too.

"I won't criticize Paraguay. Every team can play however they want, but I could do without the insults.

"The most important thing is that there were no incidents at the end. But, all that matters is that we have qualified."

Deschamps said he had to resort to using two of his strongest players to protect captain Kylian Mbappe against Paraguayan aggression toward the end of the match.

"We kept our nerve and that is an essential thing. It doesn't win you the game, but it is important," he added.

"This experience will help us. After all, we have a lot of players who are playing at their first World Cup," he added.

"I wouldn't say it had been easy for us up to now, but now we have had a different type of game."

AFP

Morocco makes more World Cup history with win over co-host Canada

HOUSTON — Morocco is heading back to the World Cup quarterfinals and coach Mohamed Ouahbi believes his team has established itself among soccer's elite.

Azzedine Ounahi scored twice to lead Morocco to a 3-0 win over Canada in the round of 16 on Saturday, making the country the first African nation to reach the quarterfinals at multiple World Cups.

"We are no longer a surprise," Ouahbi said.

"Now, when people talk about Morocco, we're a major contender, and it's a great source of pride. I think it's only the beginning, and I hope we continue to have runs like this."

Morocco, seventh in the FIFA rankings entering the tournament, earlier dispatched the Netherlands in a penalty shootout to reach the round-of-16 match with Canada, while consigning the Dutch to their earliest World Cup exit.

And despite already making history in this World Cup, Morocco has much higher goals.

"We want to keep going," Ouahbi said. "We don't want to stop."

It's Morocco's second straight appearance in the final eight after becoming the first African team to reach the semifinals in 2022.

"We are so proud to represent Africa, because it's a continent with a lot of talent and Africa deserves to be at the highest level of football," goalkeeper Yassine Bounou said.

Neither team was able to break through until Ounahi took a free-kick from Achraf Hakimi and sent a right-footed shot through traffic from outside the box. It nestled into the bottom right corner to put Morocco ahead in the 50th minute.

Ounahi then made it 2-0 on a right-footed shot from the middle of the box off a pass from Brahim Diaz in the 82nd.

Soufiane Rahimi added some further gloss with a third goal in the final minute of stoppage time.

Morocco will now meet France, which beat Paraguay in the later game, in Foxborough, Massachusetts, on Thursday.

The loss ends a historic run for World Cup co-host Canada, which won its first-ever knockout-round game, beating South Africa 1-0 to reach Saturday's match.

The country was playing in the World Cup for just the third time, and the run enchanted a nation that is normally far more interested in hockey.

Canada coach Jesse Marsch shared his postgame message to the team. "I told them that I was proud of them, and I challenged them to understand that we can play like this all the time against the best teams in the world," he said.

Morocco's two-goal hero Azzedine Ounahi is hoisted into the air by his teammates following their 3-0 victory over Canada in the World Cup round of 16 in Houston on Saturday. AP

"We can be better on the day. And, then, the challenge is, can we hold that standard for 90 minutes?"

Marsch lauded how his team performed against a squad of Morocco's caliber and how Canada controlled the match for much of the day.

"The way we pushed, the way we were in the match, the quality we showed, the overall impact in the match, we were better," he said. "We were better than the seventh-best team in the world today."

Ouahbi had a strong response when told of those comments.

"In terms of intensity, they were good," he said. "They were good for 98 minutes. Were they better? It's hard to say. It takes some nerve to say that when you lose 3-0."

Canada had a couple of chances to score late. Jonathan David had a freekick from outside the box in the 78th minute, but his shot sailed over the crossbar.

Just after that, Tajon Buchanan's shot from about 30 yards was stopped with a diving save from Bounou — one of just three Bounou, who was born in Canada to Moroccan parents, had to make.

The win sparked huge celebrations among Morocco's fans back home. Within minutes, thousands poured into the streets of Casablanca, Morocco's largest city. Horns honked as supporters climbed onto car roofs, waving flags and chanting.

Traffic ground to a halt along the Corniche Boulevard, one of the city's main avenues, where ecstatic Atlas Lions supporters danced, set off fireworks and waved flares. Other major boulevards across Casablanca were also jammed with jubilant fans.

Canada reached the round of 16 despite missing star Alphonso Davies for the majority of the tournament due to a hamstring injury. The Bayern Munich player logged only 15 minutes as a substitute in the victory over South Africa, but wasn't available Saturday.

"His hamstring didn't feel right," Marsch said.

"We were hoping that, by the time he woke up this morning, he would feel better, but he didn't."

This game was a rematch from the last World Cup, when Morocco beat Canada 2-1 in the group stage. Morocco went on to finish fourth overall.

It was an extremely physical match with eight yellow cards being shown. Hakimi and Canada's Richie Laryea both received yellows in the 40th minute after Hakimi shoved Laryea to the ground. Laryea pushed him back and a minor scuffle ensued.

Morocco midfielder Ismael Saibari left with an injury in the 22nd minute.

Xi greets Trump on US independence anniversary

By **JI HAISHENG**
jihaisheng@chinadaily.com.cn

President Xi Jinping has sent a congratulatory message to United States President Donald Trump on behalf of the Chinese government and the Chinese people, marking the 250th anniversary of America's Declaration of Independence, Foreign Ministry spokeswoman Mao Ning said on Monday.

The message was seen as the latest engagement between the two leaders after Trump's visit to Beijing in May, his second visit to China since November 2017. At the time, the two leaders actively sought the right way for two major countries to get along with each other, reached a number of common understandings and agreed on a new vision of building a constructive China-US relationship of strategic stability.

"I look forward to working together with you to set the course and steer the giant ship of China-US relations, so as to make 2026 a historic, landmark year that opens up a new chapter in China-US relations," Xi told Trump during their meeting in May.

Foreign Minister Wang Yi told reporters after the meeting that the year 2026 holds special meaning for the two countries, as it marks both the start of China's 15th Five-Year Plan (2026-30) and the 250th anniversary of US independence.

The US held grand celebrations on Saturday to mark the 250th anniversary of its independence, with nationwide festivities including a massive fireworks show. Trump commemorated the milestone with an address from the National Mall in Washington, DC.

The date traces back to July 4, 1776, when the Declaration of Independence was adopted, proclaiming the 13 American colonies' separation from British rule.

Venting their ire

CPC's approach to governance rooted in Yan'an

Early days of hard work, austerity in Shaanxi province fueled Party's historic turning point

By **MO JINGXI**
mojingxi@chinadaily.com.cn

In the weeks before July 1, when the Communist Party of China marked the 105th anniversary of its founding, visitors streamed through the Yan'an Revolutionary Memorial Hall in Northwest China's Shaanxi province for a closer look at the formative years of the Party.

Among them was Peter Wilson, the United Kingdom's ambassador to China, who visited Yan'an in June.

At the museum, Wilson stopped before a life-size reconstruction of the Great Production Campaign launched by the CPC in the 1940s to overcome economic blockades and achieve greater self-sufficiency. Two soldiers of the Eighth Route Army were depicted bending over a rough stretch of earth, hoes in hand, breaking ground in what had once been barren wasteland outside Yan'an.

On the wall were four Chinese characters: *mai tou ku gan*.

Wilson read them out in Chinese. The phrase can be rendered as "put one's head down and work hard".

The moment reflected the larger purpose of his visit. Wilson had come to learn about the 13 years when the CPC Central Committee was based in Yan'an and Mao Zedong and other veteran revolutionaries lived and worked there. It was during this period that China's revolutionary cause moved from a low point into an upsurge and reached a historic turning point.

Later, standing outside Mao's former cave dwelling at the Yangjialing revolutionary site, Wilson said that he had not expected that the CPC would grow in strength under such austere conditions.

"Foreigners also need to understand your history," he said. "I think it is very important to come here and visit the sites where history unfolded."

Understanding how China views its own history, he added, helps outsiders understand its future.

From 1935 to 1948, the Shaanxi-Gansu-Ningxia Border Region, with Yan'an at its center, was the seat of the CPC Central Committee, and was where the CPC endured military encirclement, economic blockade and severe material shortages.

Growth concept benefits all globally

By **CHENG YU**
chengyu@chinadaily.com.cn

"China Opportunity 2.0" does not imply that Beijing will take a bigger share of the global manufacturing pie, but rather it would help the world to bake a larger one as its industrial capabilities become increasingly embedded in global supply chains, executives and experts said.

The country highlighted "China Opportunity 2.0", a new concept of growth driven by innovation, advanced manufacturing and deeper integration with the global economy, at the 17th Annual Meeting of the New Champions of the World Economic Forum, or Summer Davos, in Dalian, Liaoning, in June.

Joerg Gnamm, head of global manufacturing at consulting firm Bain & Company, said: "China's next phase of growth will be defined not simply by producing more goods, but by exporting advanced manufacturing capabilities, industrial know-how and scalable innovation."

CHINESE CALENDAR ENTERS A BERRY SPECIAL TIME

Minor Heat heralds the harvest of bayberries, a sweet and tart treat

By **LI YINGXUE** and **CHEN YE** in Hangzhou

As the solar term Minor Heat, or *xiao shu*, arrives on Tuesday, early summer in eastern China moves into its most intense phase. In Xianju county of Taizhou, Zhejiang province, bayberries have reached full ripeness, marking the height of one of the region's most closely watched seasonal harvests.

Before dawn — around 3 am — the hills of Xianju are already dotted with moving lights. Growers wearing headlamps climb through orchards in the dark, carefully picking fruit at its peak maturity. Wu Yuyong, director of the Specialty Technology Promotion Center at the Xianju County Agriculture and Rural Affairs Bureau, still recalls the scene vividly.

"From a distance, the whole mountain looks like scattered stars," he said. "It is quite spectacular."

Harvested fruit is quickly transported for sorting and processing. The main variety is Dongkui bayberry, widely recognized across China for its large size, juiciness and balanced sweet and tart flavor. When fully ripe, the fruit turns from bright red to a deep purplish black.

Grower Zhang Hongjun, who has worked with bayberries for nearly 30 years, said that color is the key indicator of ripeness.

"Black means it is fully ripe," he said. "Red berries are still slightly sour, while darker ones are sweeter."

In early summer, it is widely regarded as a refreshing fruit that helps balance rising temperatures.

Xianju has developed a staggered cultivation system based on elevation differences. Fruit from lower-altitude orchards is now finishing harvest, while mid- and high-altitude areas are entering peak season.

Fresh bayberries harvested in Cixi, Zhejiang province, on April 21. XU YU / XINHUA

China Vibes 中国风尚 — FOOD —

"For every 100 meters of elevation, maturity is delayed by about two to three days," Wu said. The system extends the harvest window from early June into midsummer, as fruit ripens progressively across the mountainous landscape.

Its latitude puts Xianju within a prime fruit-growing belt. Its mountainous terrain, humid climate and pronounced day-night temperature differences help fruit accumulate fructose and flavor. The region's volcanic rhyolitic geology further contributes to slightly acidic soil that is well suited to bayberry cultivation.

Today, Xianju has about 10,000 hectares of bayberry orchards.

Eating bayberries during Minor Heat is also part of China's broader tradition of seasonal eating, in which diets follow natural rhythms. Sour and sweet fruits are especially favored in summer, with acidity stimulating appetite and sweetness providing balance.

In Xianju, the bayberry season also brings household traditions such as making bayberry wine. Fresh fruit is preserved with sugar or fermented into liquor, extending its seasonal presence beyond the harvest period.

Zhang, the grower, said the Xianju bayberry brand has been "maintained across generations", reflecting both economic value and local identity. The fruit represents not only income, but also regional reputation.

The industry has also built a modern logistics system to match growing demand.

Wu Haojie, head of SF Express's Xianju bayberry project, noted that "after harvesting, the fruit is immediately sent for precooling, grading and packaging". "It is then transported nationwide through cold-chain logistics," Wu said.

Sorting standards have become increasingly precise. Premium Dongkui bayberries can weigh more than 35 grams each, comparable in size to table tennis balls.

The fruit is then packed with ice bags in insulated boxes to maintain freshness. From Xianju, shipments now reach more than 200 cities across China. Many destinations receive deliveries the next day, while orders are also flown from Shanghai to overseas markets including Singapore, Italy and France, primarily serving Chinese communities abroad.

Japan descending into abyss of neo-militarism

WORLD WATCH
By Atsushi Koketsu

This year marks the 89th anniversary of the July 7 Incident, also known as the Marco Polo Bridge Incident, which was the starting point of Japan's full-scale invasion of China. Eighty years ago, the Tokyo Trials set new precedents by judging war crimes under the new legal norms of "crimes against peace" and "crimes against humanity". The Tokyo Trials were groundbreaking because they delivered justice to the victims of Japan's aggression and contributed to the realization of world peace.

Japan was supposed to learn from these trials and transform itself from a military state to a peaceful nation under a pacifist Constitution. However, there has been no sincere reflection on the mistakes of the past, and Tokyo didn't seriously draw lessons from the trials. This is the fundamental reason for the country's rightward political shifts and remilitarization.

The politics of postwar Japan were heavily influenced by the country's prewar imperial system. Emperor Hirohito, who reigned from 1926 to 1989, was a key figure and the highest authority who started the war of aggression. He not only escaped prosecution in the Tokyo Trials, but many Japanese regarded him as someone who ended the conflict. Britain, the Netherlands, China and others had argued for his prosecution and demanded that he abdicate because the imperial system was the foundation of Japan's militaristic ideology.

However, the United States retained the imperial system to smooth the postwar occupation of Japan. Washington wanted to gain the support of the Japanese people by not punishing their emperor.

China's cool reply to heated air-con debate

Innovative firms tackle European rules and traditions as temperatures soar

By **ZHANG ZHOUXIANG** in Brussels and **XING YI** in London

Above right: An installer puts in a new air conditioning unit during a hot day in Belgrade, Serbia, on June 30. DARKO VOJINOVIC / AP

The recent severe heat wave in Europe has subsided, but with another one already on the horizon, the rush to find air conditioners continues.

As late as July 6, searches for "air conditioner" on Amazon and JoyBuy across much of Western Europe still returned the same message: "out of stock".

The heat wave was at its most severe in the June 22-28 week, when daytime highs exceeded 35 C in many major European cities. Milan recorded 37 C on June 26, while Paris climbed above 40 C. Even Brussels and Berlin, located farther north, reached 38 C and 39 C respectively.

Yet in much of Europe, where summers were historically shorter and milder, household air-conditioning ownership remains as low as 20 percent, according to the International Energy Agency.

This summer, however, Chinese suppliers are reporting surging orders from Europe, driven by products that offer affordable prices, low energy consumption and compliance with local regulations.

Europe has barriers holding back air conditioner penetration. Installation fees can exceed 1,000 euros ($1,143), and consumers usually have to wait weeks for installation slots during peak periods. There are also other restraints that need to be considered, such as strict noise regulations, bans on exterior wall modifications for historic buildings, and widespread public concerns that the mass use of air conditioners will push up energy consumption and derail climate action targets.

In response, Midea home appliances said it spent three years developing the PortaSplit, which features an outdoor unit that fixes onto a window bracket with no drilling required. The weight of the outdoor unit has been reduced to less than 10 kilograms, allowing most adult users to install it by themselves. Addressing Europe's high electricity prices, the product also boasts industry-leading energy-saving technologies.

"Made in China is far from simply duplicating products originally developed for the Chinese domestic market and launching them directly overseas. Instead, it means redefining product lines to align with the specific demands of local consumers," said Xiong Xueqin, sales director of Midea RAC Europe Region.

"From this targeted product, what European consumers could see is that Chinese enterprises excel not only in manufacturing, but also in innovation."

Other Chinese home appliance manufacturers have also rolled out innovative cooling products designed for the European market.

In response to Germany's strict nighttime noise control rules, Haier has lowered the minimum operating noise of its air conditioners to 18 decibels, "which is roughly the volume of turning pages in a quiet library," said Yu Shipeng, director of Haier Air Conditioning Overseas Market.

At Ningbo Heallux International Trading Co in Zhejiang province, workers have been busy packing tower fans fitted with intelligent display screens, a product that has become a bestseller in Europe. Hu Benchun, director of the company, told Xinhua that the product was designed for the European market. Between January and May, export of the fan surged roughly 60 percent from last year.

Quest for relief

When the record-breaking heat arrived, demand immediately overwhelmed supply and led to stock shortages across Europe.

But even if a customer is able to buy an air conditioner, he or she finds installation often involves layers of administrative procedures.

In Paris, for example, if an installation alters the appearance of a building — by attaching an outdoor compressor to an exterior wall, drilling through the facade or mounting equipment outside a balcony — homeowners generally must first make a submission to the local authorities before any work can begin. The formal review period alone is typically one month.

Besides, many Parisians live in apartment buildings where exterior walls are considered common property. Any installation affecting those areas often requires approval from the condominium association, whose general assemblies may meet only once a year.

Large parts of Paris consist of historic buildings, many located within protected heritage districts. In such cases, projects may also require authorization from the Architectes des Batiments de France, the body responsible for preserving France's architectural heritage.

"Generally speaking, after spending six months or even a year dealing with all these procedures, the frustration has already outweighed the heat," said Zhang Yuanyuan, a Chinese woman who has lived in Paris for more than seven years without installing an air conditioner in her apartment.

Faced with soaring temperatures, empty shelves, lengthy approval procedures and high installation costs, not everyone chose to wait.

Among them was Denis Yurchak, an Austrian software engineer that founded online-calling website Yadaphone, who documented on X his quest to secure one of the few air conditioners still available in Europe.

He was searching for Midea's PortaSplit. The unit was co-developed by Midea's engineering teams in China and Germany, which proposed the product concept after identifying the "pain point" of local AC users, and conducting testing and iterations since 2024.

The design eliminates the need to drill through walls or permanently alter a building's facade, making it attractive for renters and residents of historic European buildings where installing traditional air conditioners can be legally or practically difficult.

So far, there have been no publicly reported cases of European users being fined or penalized by local authorities for using the product.

On June 23, after seeing weather forecasts predicting an exceptional heat wave in Austria, Yurchak decided it was finally time to buy an air conditioner.

The first model he checked was a Comfee portable air conditioner. Yet the model that sold for about 200 euros the previous year had risen to around 650 euros, so he turned to the PortaSplit and found that every retailer he checked was sold out.

On secondhand marketplaces, units with an original retail price of around 899 euros were being offered at double or even triple that amount, with some listings climbing into several thousand euros.

The shortage became so severe that someone created a website called braucheklima.de — literally "need air conditioner" in German — to monitor inventory updates across major appliance retailers in real time.

"So I set up three AI agents looking for this AC 24/7 and have been monitoring the market myself," Yurchak wrote on X.

He first considered buying the product from Hungary, the only European Union country where it still appeared to be available. The plan ultimately failed because the retailer would deliver only within Hungary, and no forwarding company was willing to transport the unit across the border.

Then, shortly after 2 am on June 25, one of his AI agents detected a single PortaSplit that had just appeared in stock in Linz, Austria, about 200 kilometers from his home.

"I jumped on my phone, rushed through the reservation form, and went to bed happy," he wrote.

The next morning, he grabbed a coffee and set off before dawn. But by the time he arrived at the store, the listed price had increased from 749 euros to 849 euros. It was after he demanded to talk to the manager that they agreed to sell it at the reservation price. "I was happy like a child — this was the only Midea left in the whole country, and it was mine!"

Hot political issue

Hours after finally bringing the unit home, Yurchak reflected on the contrast in approaches to air-conditioning that many Europeans have increasingly begun discussing.

"Before moving to Europe, I lived in Russia, and it was completely normal for people to have ACs there," he said.

"Even though Russia is much poorer than the EU by every metric, and I dare say much colder, people install ACs to live through the two or three weeks of 30 C heat in summer comfortably.

"I never regretted moving to the EU — I like living here and contributing with my tax. But the EU AC madness makes me wanna just wake up in my air-conditioned apartment in Moscow and forget all these damn mobile AC units that barely cool the room."

Across Europe, particularly in France, complaints about the difficulty of buying and installing air conditioners have spread rapidly across social media this summer, and what was once largely a consumer issue has increasingly become a political one.

For years, many environmental advocates argued that wider adoption would increase electricity demand, raise carbon emissions and ultimately worsen climate change.

Yet, with the record heat of 2026, voices in favor of wider air-conditioning access have risen. Among the loudest has been French far-right leader Marine Le Pen, who has proposed what she describes as her "grand air-conditioning plan" as part of her campaign ahead of France's next presidential election.

Her proposal has drawn criticism from across the political spectrum, but relatively few opponents argue against air-conditioning itself.

Among the most outspoken is French left-wing leader Jean-Luc Melenchon, who argues that installing air conditioning everywhere "would only make things worse", saying it would ultimately increase the damage caused by climate change.

Many others who once firmly opposed wider air-conditioning now argue that it should not be installed everywhere or relied upon as the only solution. The tone of the debate has shifted from whether Europe should use air conditioning to where and how it should be used.

"We are looking at all the social media posts and it feels that we can have a real positive impact on people's lives and many people call PortaSplit a 'lifesaver' and tell about their great experience online," said Manuel Seethaler, head of residential air-conditioning public relations and strategy at Midea Europe GmbH.

"We are always improving the current version either via software upgrades or introducing new window brackets, to allow more applications. For example, PortaSplit started sales in the United Kingdom this year, and of course it was sold out in a short time," he said.

Xiong, from the Midea Group, said the company has sold over 200,000 units in Europe this year. The top three sales countries are Germany, France and the UK.

"We have many containers at the seaports or that are about to arrive at the ports, which will be cleared through customs soon and delivered to the sales channels, so customers can receive the products shortly," said Xiong.

"Meanwhile, the factories are producing them as quickly as possible. We are also shipping some containers via China-Europe Railway Express, which can reach end-users more quickly compared with sea freight."

Asked whether she lived in an air-conditioned home, Sasha, a young woman in Brussels, smiled and said she had suffered through several summers without one.

Her classmate Karli said her family had bought an electric fan much earlier this year because experience had taught them, "Every year, if there is a heat wave, fans sell out."

Zheng Wanyin contributed to this story.

Party: Huge strides made since times of hardship

From page 1

Those years helped shape the Yan'an spirit, characterized by firm and correct political direction, emancipating the mind and seeking truth from facts, serving the people wholeheartedly, and self-reliance through hard work.

Xi Jinping, general secretary of the CPC Central Committee and Chinese president, has visited Yan'an several times since the 18th National Congress of the CPC in 2012.

During a fact-finding trip to Shaanxi in February 2015, he described the fine traditions and conduct that were developed during the Yan'an period, together with the Yan'an spirit, as "an invaluable asset of our Party". The connection was also personal.

About an hour-and-a-half drive from downtown Yan'an lies Liangjiahe, a village in the hills of northern Shaanxi. Xi arrived there in early 1969, before turning 16, and spent seven years living and working alongside local farmers. He later became the village Party secretary.

Xi led villagers in building dams, digging wells, constructing a biogas digester, opening a supply store and setting up an iron workshop to improve agricultural production and address difficulties in daily life.

After visiting the cave dwelling where Xi lived, Wilson said he was struck by the number and variety of books Xi had read there, including works by Soviet writers and Henry Kissinger's doctoral dissertation.

Shi Chunyang, who worked alongside Xi and later became the village Party secretary, told Wilson that Liangjiahe once struggled with coal and firewood shortages.

After reading a report about the use of biogas in Sichuan province, Xi traveled there as part of a team to study the technology. Upon returning, he led villagers in building a digester to provide fuel for cooking and gas for lighting. In July 1974, the first biogas lamp on the northern Shaanxi plateau was lit.

Reflecting on his Liangjiahe years in a memoir published in 2002, Xi wrote that he had "roots deep in the northern Shaanxi plateau" because the experience cultivated his enduring commitment "to do practical things for the people".

Li Shufeng, vice-president of the China Executive Leadership Academy Yan'an, said Xi's years there marked the beginning of his experience as a public servant.

Xi spoke of the changes in Liangjiahe during a speech in the United States city of Seattle in September 2015. He recalled that Liangjiahe once had no paved roads, and villagers had lived in cave dwellings.

He said that when he returned in 2015, the village had blacktop roads, families lived in brick-and-tile houses and had internet access, elderly residents received basic old-age care, villagers had healthcare coverage and children attended school.

The changes had made him keenly aware that "the Chinese dream is, after all, the dream of the people" and could only be fulfilled when closely connected with the people's aspiration for a better life, Xi said.

Li said that Xi's grassroots experience had also made Liangjiahe a window through which foreign visitors could seek to understand the CPC's approach to governance.

In 2020, Thongloun Sisoulith, then prime minister of Laos, visited the village. He later told People's Daily that he was most impressed by how Xi had eaten, lived and worked alongside villagers and helped them develop production.

A leader should "share the people's joys and hardships, and learn from them", he said.

Other political leaders and delegations from Asia, Africa and elsewhere have also visited Liangjiahe to learn about Xi's years there.

Li said books, documents and news reports are still important ways to study China, but they offer limited information compared with visiting historical sites in person.

Entering the cave dwellings where Mao once worked or where Xi lived as a young man allows visitors to place the hardships of the past beside changes they can observe for themselves, he said.

The contrast gives them a more concrete understanding of how the CPC connects its revolutionary history with its present approach to governance and modernization.

The CPC's decision to pursue self-reliance and hard work under the difficult conditions of the Yan'an period could offer inspiration to countries trying to chart their own course, he added.

In October 2022, less than a week after the 20th National Congress of the CPC, Xi led members of the Standing Committee of the Political Bureau of the CPC Central Committee back to Yan'an.

Xi said the spirit of self-reliance and hard work must never be repudiated, no matter how prosperous the country becomes.

He called for down-to-earth, practical efforts, a sustained focus on managing China's own affairs well, and reliance on the country's own strength to support national development.

The Yan'an spirit is a precious asset of the Party and "should be passed down from generation to generation", Xi said.

Concept: Factories gain from rapid feedback loop

From page 1

"It is not only about China capturing more of the pie. It is also about Chinese capabilities being combined with global ecosystems," Gnamm added.

As geopolitical tensions prompt some multinationals to diversify production, debates have intensified over whether China's expanding manufacturing capacity is crowding out industrial economies elsewhere, a claim that China has repeatedly refuted.

Gnamm said the framing overlooks what increasingly distinguishes China's manufacturing sector. "What stands out in China is the combination of scale, speed and the ability to integrate across the full value chain. That enables impact at scale," he said.

He added that China's manufacturing ecosystem remains structurally distinct due to its complete domestic supply chains and rapid innovation cycles.

He said that factories also benefit from rapid feedback loops between production, engineering and customers, enabling products and manufacturing processes to evolve much faster than in many overseas markets.

The third advantage, he added, is organizational discipline in scaling innovation. Once a solution has been proven effective, it can be replicated across multiple plants and regions far more quickly than in many other markets.

Earlier this year, the World Economic Forum added 16 Chinese factories among a new batch of 23 Global Lighthouse Network factories. It means that China now hosts 109 of the world's 238 lighthouse factories, which are widely seen as the benchmark for the most advanced factories globally.

According to Hou Wenhao, a partner at market consultancy firm McKinsey & Company, such achievements not only reflect the broad adoption of smart manufacturing technologies in China, but also its strong capabilities in large-scale implementation, technological innovation, scenario expansion and efficient commercialization.

Multinational firms operating in China are building deeply localized industrial ecosystems that increasingly serve both the domestic market and global operations, vividly demonstrating what exactly is "China Opportunity 2.0".

Yum China, which operates more than 18,000 restaurants in China, likens its business to "a bamboo forest" rather than "a collection of individual trees". Describing the company's nearly four decades of investment in China, Yum China CEO Joey Wat said the real moat is formed by the "underground bamboo root system", which consists of 35 logistics centers serving more than 2,600 cities and counties and a network of over 850 suppliers.

An intercontinental ballistic missile, carrying a dummy warhead, is launched from a strategic nuclear submarine of the People's Liberation Army Navy at an undisclosed location in the Pacific Ocean on Monday.
LI XIANGCHAO / FOR CHINA DAILY

China successfully tests nuclear-capable missile

PLA Navy: Launch was part of training, complied with intl law and was not aimed at any country

By ZHAO LEI
zhaolei@chinadaily.com.cn

China successfully conducted on Monday a flight test of its nuclear-capable intercontinental ballistic missile, or ICBM, from a nuclear-powered strategic submarine, marking the farthest such trial of any Chinese naval missile to date.

During the historic trial launch, which is the first to be made public in nearly four decades, the submarine operated by the People's Liberation Army Navy launched the long-range missile carrying a dummy warhead from an undisclosed sea area at 12:01 pm.

The dummy warhead "precisely hit the designated target waters in the Pacific Ocean", PLA Navy spokesman Senior Captain Wang Xuemeng said in a brief statement.

The missile test was "a routine arrangement as part of China's annual military training", he said, noting that prior notification in this regard was provided to relevant countries.

Wang added that the test complied with international law and established international practices, and was not aimed at any specific country or target.

The PLA Navy has yet to release more details about the test, such as the specific type of submarine and missile involved in the operation, the launch and hit locations of the missile, and the distance covered by the missile.

The last time China made public the flight test of a submarine-based ballistic missile was in September 1988, when a Type 09II submarine — the nation's first class of nuclear-powered ballistic missile submarine — launched two JL-1 nuclear-capable missiles from the Bohai Sea.

The JL-1 was constrained by its short operational range, and it served as a symbol of the PLA Navy's possession of nuclear capability rather than a usable deterrent. It was retired from active service many years ago.

The PLA Navy currently deploys two types of submarine-based ICBMs — the JL-2, which was declassified in an October 2019 parade, and the JL-3, which was unveiled during a parade in September last year.

According to observers, the JL-2 and the JL-3 feature intercontinental hit ranges, multiple warhead capacity and strong penetration capabilities, promising reliable assets to deliver nuclear counterstrikes.

The PLA Navy also has an unknown number of nuclear-powered ballistic missile submarines in the Type 09IV series.

Nuclear missiles launched from deep-sea submarines are very difficult to detect and track, and can be used on short notice, so they are tasked with realizing sea-based nuclear deterrence and counterstrikes.

Song Zhongping, a retired PLA Rocket Force officer and military affairs commentator, said that submarine-based strategic missiles constitute the sea-launch leg of China's nuclear triad and form the backbone of the nation's second-strike nuclear counterattack capability.

"The successful test of the submarine-based ballistic missile demonstrates that China owns a formidable tool to counter nuclear blackmail," Song said.

"Two years ago, we had tested a land-based ICBM. The latest trial launch, together with the earlier one, has confirmed that our nuclear counterattack platforms are mature and reliable, lending greater deterrence to China's nuclear triad," he added.

Responding to questions on the missile flight test at a news briefing later in the afternoon in Beijing, Foreign Ministry spokeswoman Mao Ning said the whole process was carried out in a safe, standardized and professional manner.

"We hope relevant countries will not read too much into it," she said.

Militarism: Yasukuni ideology being revived

From page 1

Instead, it embedded the renunciation of war in the country's Constitution and abolished the military.

Two issues need to be highlighted here. First, under the new Constitution and amid Cold War tensions, Japan was allowed to rearm under US guidance. The transformation of the National Police Reserve to the National Safety Force, and finally the establishment of the Self-Defense Forces in 1954, marked a significant shift.

The SDF, coordinating with the 53,000 US troops stationed in Japan, totals nearly 250,000 personnel and has now grown into a force with offensive capabilities. Joint US-Japan military exercises are actively conducted and reinforce war readiness. Article 9 of the pacifist Constitution, which renounces war, has been rendered toothless.

Additionally, with the removal of restrictions on arms exports, Japan is attempting to forge quasi-military alliances with countries such as the Philippines through exporting weapons. The shift from peace diplomacy to military diplomacy is becoming evident. The establishment of a de facto US-Japan integrated operations structure bypassed parliamentary debate, transforming the SDF into a force ready for "wartime conditions".

Second, prewar power dynamics — the power of an imperial system — continued in Japan even after World War II, exemplified by figures such as Nobusuke Kishi, a bureaucrat who ran the "puppet Manchukuo" alongside then-prime minister Hideki Tojo. Tojo was sentenced to death in the Tokyo Trials and executed, while Kishi, also a Class-A criminal and maternal grandfather of former prime minister Shinzo Abe, was purged from public office and imprisoned for about three years. But his purge was later rescinded, and he joined active politics, eventually becoming the country's prime minister in 1957. Supported by anti-communist organizations, Kishi and other right-wing conservative politicians with deep roots in militarism have eroded the pacifist foundation of Japan's Constitution.

Today, Japan's military alliance with the US has been further strengthened, and aligning with this trend, right-wing politicians have continued to run the country. Prime Minister Sanae Takaichi has also capitalized on this trend and demonstrated a strong militaristic stance in both words and actions. In November, she went to the extent of saying that a "Taiwan contingency would be a survival-threatening situation for Japan".

The provocative statement directed at China was unbecoming of the prime minister of a pacifist nation; it sounded more like something from the leader of a militarist nation. It is only natural that the Chinese government and people, who had focused on building a "strategic mutually beneficial relationship" with Japan, were outraged.

Postwar conservative powers that have led Japanese politics, supported by the emperor system and anti-communist organizations, can be considered the abyss of today's conservatism and militarization in Japan. Nurtured by the existence of the imperial system, in a transformed form, prewar militarism survived and has sprouted new roots in Japan. The Yasukuni ideology, which is at the core of today's new militaristic ideology, is also being revived. The notorious Yasukuni Shrine, where the remains of several war criminals are enshrined, is sometimes described as an invasion shrine. The appointment of a former SDF admiral as the chief priest of the shrine is symbolic of this revival.

If this trend continues, Japan could once again become the aggressive state it was under imperial rule before the war. Japanese conservative politicians and their supporters are aiming for hegemony over Asia by using the US-Japan military alliance and advancing military expansion. This strategy also involves instilling hostility toward China and the Democratic People's Republic of Korea in the minds of the public to divert attention from the pacifist ideals and to consolidate as well as expand conservative politicians' power.

What is important for Tokyo is to cultivate a proper understanding of history and establish a friendly and amicable relationship with China as well as a strategic, mutually beneficial relationship. It is increasingly necessary to pursue independent and autonomous peace diplomacy rather than a subservient defense diplomacy that aligns with the US. The promotion of China-Japan friendship will be the most effective and durable security policy for Japan.

400-day flight brings Tianwen 2 to target asteroid

By ZHAO LEI

China's Tianwen 2 asteroid sampling spacecraft has rendezvoused with its target, a near-Earth asteroid called 2016 HO3, and has started to conduct scientific surveys, according to the China National Space Administration.

On Monday, the administration announced that the Tianwen 2 robotic probe reached a position about 20 kilometers away from 2016 HO3 last week, and then started flying alongside the asteroid.

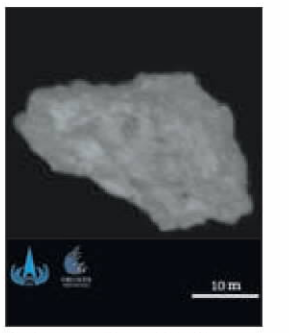
It also released an image of 2016 HO3, which was taken by the spacecraft's camera.

Before that point, the spacecraft had traveled around 1 billion km in a 400-day interplanetary journey, the administration noted, adding that in the following steps, the probe will conduct detailed scientific explorations in a phased manner to acquire data on the asteroid's topography, material composition and internal structure to support preparations for the sampling mission.

During its asteroid approach, the Tianwen 2 probe obtained images of the celestial body.

The mission team on the ground used optical navigation data, which was collected during the approach process, to refine the asteroid's ephemeris and reduce its position error — previously determined solely by ground-based observations — from hundreds of kilometers down to within a few kilometers, according to the administration.

The Tianwen 2 mission, which is China's first attempt to bring pristine asteroid samples to Earth, was launched on May 29, 2025, when a Long March 3B rocket carrying the robotic probe blasted off from the Xichang Satellite Launch Center in Sichuan province.



En route to the asteroid, the probe conducted a series of operations, including deep-space maneuvers and mid-course corrections.

The craft detected and identified the asteroid for the first time on June 6.

The following day, it executed capture control to synchronize its motion with that of the asteroid at a distance of 30,000 km, achieving coplanar flight with the celestial body. It reached a position about 2,000 km from the asteroid on June 19.

The asteroid 2016 HO3, which is also known as 469219 Kamo'oalewa, orbits the sun and is a constant companion of Earth. It is too distant to be considered a true satellite of Earth, but is the best and most stable example to date of a quasi-satellite of the planet.

Tianwen 2 will study the celestial body up close using a suite of 11 instruments, including cameras, spectrometers and radars, before deploying special devices to collect samples from its surface.

An image released by the China National Space Administration shows the asteroid 2016 HO3 as captured last week by the Tianwen 2 robotic probe from a distance of about 20 kilometers.

'My heart is so full'

Singapore family's search for Chinese roots leads to extraordinary reunions

Visitors at the filming location of the movie *Dear You* in Jieyang, South China's Guangdong province, on June 19. This movie became a hit earlier this year focusing on the historical tradition of *qiaopi* — remittance letters sent by overseas Chinese migrants. PROVIDED TO CHINA DAILY

When Jasmine Goh-Chew boarded a plane for Chaozhou in South China's Guangdong province in May, she carried with her a small hope.

The 11-day family vacation was planned around Teochew cuisine, family time and an opportunity for her elderly parents to see the ancestral homeland they had never visited. But she also packed a faded letter written in 1993 from a relative in China to her aunt in Malaysia, which she hoped might lead them to family they had never known.

It did. By the end of the trip, her family would reconnect not with one branch of relatives, but three.

"We came for a holiday with no expectations at all that we would find our long-lost families," said the 51-year-old mother of four children whom she homeschools.

"But I told my husband: it's now or never. Dad's getting old."

The family — Jasmine, her husband Raymond Chew, three of their four children, her parents, her mother-in-law, her older sister and brother-in-law, and her sister's father-in-law — had barely arrived in Chaozhou when chance intervened.

At the airport, an employee struck up a conversation and asked whether they had come to *xunqin* — to search for relatives. Yes, if such a thing were even possible, Jasmine replied. The employee mentioned volunteer groups that specialize in helping overseas Chinese trace long-lost family members.

A few days later, while watching a performance of traditional *yingge* dance, they met another local who took them to a nearby cafe.

Inside was a library lined with *qiaopi*, remittance letters sent home by overseas Chinese, some dating back to the 1930s. Penned by homesick migrants who had left for Nanyang, or Southeast Asia, in search of work, they spoke of longing, sacrifice and families separated by oceans.

The cafe works with volunteers and the local authorities to preserve *qiaopi* culture while helping overseas Teochews trace their roots.

It was there that Jasmine met volunteer leader Zeng Jianpeng of Menggui Chaoshan, meaning "Dream of Returning to Chaoshan", a network of more than 3,000 volunteers spread across Guangdong, Fujian and Jiangxi provinces in China.

Zeng, 54, has spent a decade helping to reconnect families separated by migration, war and the passage of time.

When he first heard Jasmine's request, he was baffled.

"I heard that Madam Goh-Chew wanted to find relatives in three different places and wondered why one person was searching for three hometowns," said Zeng.

"It was only when I met the family that I realized she was searching on behalf of three different branches of the family — her father's family, her mother's family and her husband's family."

Following the clues

Around a dozen volunteers immediately fanned out to begin the search.

For Jasmine's mother's family, there was only the 33-year-old letter written by a man surnamed Chua in Shantou, to Jasmine's late aunt in Malaysia. Nobody remembered exactly how he was related to the family.

1,000 families

Over the past decade, Menggui Chaoshan has reunited more than 1,000 families, including at least 18 from Singapore and more than 80 from Malaysia, as well as overseas Chinese from countries like the US, Canada and France.

The address on the envelope led nowhere. Street numbering had changed. With help from local police, volunteers eventually tracked down the sender's descendants.

"They had always known they had relatives in Singapore," said Zeng. "But they didn't really know who they were because the older generation had all died."

When the two families finally met, something incredible happened.

More than 30 years earlier, neither family's elders were literate and able to write. On the China side, a young woman had penned the letter on behalf of the Chua patriarch. Back in Singapore, Jasmine, then a teenager, had replied on behalf of her aunt, something she had completely forgotten. Neither side imagined they would ever meet.

Three decades later, each woman arrived carrying the letter the other had written.

Top: Visitors at the filming location of the movie *Dear You* in Jieyang, South China's Guangdong province, on June 19. PROVIDED TO CHINA DAILY
Above: *Qiaopi* letters, old passports and other documents at an exhibition in Beijing on June 18. SONG JIARU / FOR CHINA DAILY

The surprises did not end there.

As the families pored over the *zupu*, or genealogical record, they discovered that the man whose letter Jasmine had kept for 33 years was her mother's eldest brother, who was left behind in China and later raised by another family. And the woman who wrote the letter on his behalf was his daughter and Jasmine's first cousin.

"The reunion didn't simply reconnect two families," said Zeng. "It reconstructed their family tree."

For Jasmine's 79-year-old mother, Chua Kee Chu, the encounter was almost beyond belief.

"I never thought in my lifetime that I could meet them," she said. "I was very moved."

The search for the relatives of Jasmine's father was more straightforward but no less meaningful.

All 85-year-old Goh Kian Chen knew was that his father had come from a place called Goubian Village.

The problem was that there were three villages with that name. The volunteers eventually found the right one, and with it, Goh's cousin and the house his father once lived in.

"I wanted to do this for him, to let him step into his father's house," Jasmine said.

"It's not just finding a house," Goh added. "It's discovering your roots and where you came from."

The hardest search was for Raymond's family.

The only clue was a photograph of his grandfather's gravestone before it was exhumed from Choa Chu Kang Cemetery. It bore the words "Xiwei Village".

But across the larger region known as Chaoshan that includes Chaozhou, more than 10 villages bear that name.

Volunteers compared village histories, surnames and migration records before narrowing it to one village in Shantou.

Even then, time was running out.

"Madam Goh-Chew's family only had two or three days before returning to Singapore," Zeng recalled.

"We mobilized our volunteer network, published an appeal through our WeChat public account and posted videos online. Very quickly, information came back identifying the exact household."

The reunion revealed another forgotten family story.

Raymond learned that his grandfather, like countless migrants who left for Nanyang, had faithfully sent remittances home every month.

"That HK$100 arrived every month, usually on the 28th or 30th," Zeng said. "They told us that money kept them alive. It was their livelihood."

Not every reunion begins with tears. Some Chinese relatives were initially worried the Singaporeans had come to claim ancestral property. The Singaporeans wondered whether these strangers were really family. The volunteers deftly played mediator until everyone realized neither side wanted anything except connection.

One evening, the newly reunited families went together to watch *Dear You*, the hit Chinese movie about family bonds, loss and reconciliation, which was showing in movie theaters.

"We watched together, and we cried together," Jasmine said.

Over the past decade, Menggui Chaoshan has reunited more than 1,000 families, including at least 18 from Singapore and more than 80 from Malaysia, as well as overseas Chinese from countries like the United States, Canada and France.

Representative case

Zeng calls Jasmine's case "one of the most representative overseas Chinese cases" the group has handled.

"Success depended not on luck, but on preparation," he said. "They arrived with letters, photographs of gravestones, village names and other valuable clues."

Since the release of *Dear You*, interest in tracing family roots has surged, particularly among Malaysians, while filming locations across Chaoshan have become tourist attractions in their own right.

Jasmine's own journey, however, did not end when she flew home.

She has since become one of the volunteer group's newest members, helping Chinese families find their relatives in Singapore. She has already helped reunite two families. A third chose not to reconnect, a decision the volunteers respected.

"We went without thinking we would find our families," she said.

"And yet, having found them, we are all now deeper in our roots. We've continued talking to our new families, and reminisced about the past and the history lost.

"My heart is so full. It's something I want other people to experience too."

THE STRAITS TIMES, SINGAPORE

Tourism, climate put Indonesia's 'walking shark' under pressure

JAKARTA — The Raja Ampat epaulette shark, locally known as the "walking shark", is facing growing threats from tourism development and the impacts of climate change, prompting a push for concrete measures to protect the species' habitat and ensure its survival.

The shallow coastal waters of the Raja Ampat archipelago in Southwest Papua are home to the population of the shark *Hemiscyllium freycineti*, one of 10 known "walking shark" species discovered worldwide, six of which are mainly found in eastern Indonesian waters.

While it can swim, the small fish with a recognizable spotted pattern on its body is known for moving by using its pectoral and pelvic fins to "walk" across shallow reefs, a behavior earning it the moniker "walking shark".

A recently published study has found more biological and spatial ecological information about the shark, which has a population density of up to 2,462 individuals per square kilometer, the highest recorded globally for the genus.

The study, published in the *Frontiers in Fish Science* academic journal on June 17, suggested that coral reefs are mainly used by sharks as nursery habitats, or places where juveniles are produced. During an observation period from February 2024 to April 2025, researchers observed 69 percent of immature sharks in coral reefs.

Meanwhile, adults of the nocturnal fish were observed foraging among sea grass and mangrove roots.

Unlike many other marine animals, the Raja Ampat epaulette shark rarely travels far, with individuals tending to remain in the same area throughout their lives. The researchers found the maximum recorded movement of the shark was around 475 meters, with none observed moving between islands.

The lack of inter-site movement may leave the species more vulnerable to the smallest disturbances to their habitat, as the shark is unable to relocate when its home environmental conditions deteriorate, said Edy Setyawan of the Elasmobranch Institute Indonesia, the study's lead author.

He was most concerned about the rapid expansion of tourism infrastructure in Raja Ampat, particularly the construction of overwater accommodation in areas that serve as important feeding grounds for sharks, including in Arborek village, one of six study sites in the Dampier Strait.

"With the development of tourism in Raja Ampat, many homestays are being built above sea grass beds," Edy told The Jakarta Post.

"Those sea grass ecosystems are important habitats where 'walking sharks' forage for food. When they are damaged, the sharks lose their critical resources."

The sharks also face threats from climate change, especially rising seawater temperatures.

Edy's study suggested the fish can tolerate water temperatures up to 36 C, but scientists are concerned that global heating may increase the frequency of marine heat waves, which could affect the shark's health and long-term survival.

The walking shark also faces less visible threats from nutrient pollution caused by untreated wastewater generated by tourism activities in Raja Ampat, said marine ecologist and conservationist Agustin Capriati.

"Excess nutrients accelerate algae growth and damage coral reefs," said Agustin. "If coral ecosystems deteriorate, 'walking sharks' will gradually lose their habitats."

A 2023 Marine Affairs and Fisheries ministerial regulation designated "walking sharks" as a fully protected species. The International Union for Conservation of Nature listed the species as "nearly threatened".

Limitations of regulation

But Edy argued the regulation only prohibits people from catching or consuming the fish, and that it lacks a clear plan to conserve the species on the ground.

"In practice, people know the species exists," Edy said, "but conservation efforts remain limited because the fish is not viewed as having economic value".

Sarminto Hadi, the ministry's director of species and genetic conservation, said the protected status was intended to prevent direct commercial exploitation of the species in its natural habitat.

The policy, he added, was based on scientific assessments highlighting the species' vulnerability due to its inability to migrate when its habitat is disturbed.

Agustin noted that conservation regulations remain poorly enforced in most marine protected areas across the country, including in the Dampier Strait. Further monitoring is needed, she added, to ensure the long-term survival of "walking sharks" with tourism development in Raja Ampat continuing to expand.

Raja Ampat made headlines in May 2025 following protests by the environmental group Greenpeace over an Indonesian state-owned company's nickel mining on Gag Island, located about 50 kilometers from Arborek Island, and the threat it posed to marine biodiversity in the region.

The government suspended mining operations following the outcry, then allowed them to resume last September.

'Entrenched' polarization shrouding US future

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

CROSS CURRENTS

As the United States marks the 250th anniversary of its founding, polls show growing public pessimism about the country's political future. Experts say deepening polarization is eroding confidence at home and weakening Washington's ability to provide stable global leadership.

A survey released on Saturday by Elon University in North Carolina found that 68 percent of respondents believe political divisions will worsen over the next 50 years, while 64 percent have little or no confidence that US political institutions will make mostly good decisions over that period.

Jason Husser, director of the Elon University Poll, said political polarization was the issue respondents viewed most pessimistically.

"We've now basically had a generation and a half, or arguably two generations, of significant political divide in the United States, and very few people see a clear way out of deep, entrenched political polarization," he said in the survey report.

Similarly, an April poll by The Associated Press and the National Opinion Research Center at the University of Chicago found that 27 percent of respondents identified political interests or values as the country's main source of division, followed by leaders, government or elites (14 percent) and economic interests or values (14 percent).

A Gallup poll released last month also reflected the bleak public mood. Only 19 percent of US citizens said the signers of the Declaration of Independence would be pleased with the country's development, while 77 percent believed the nation's founders would be disappointed, up from 71 percent in 2013 and 42 percent in 2001.

He Yun, an associate professor at Hunan University's School of Public Administration and a researcher at Tsinghua University's Belt and Road Institute, said the polls reflect not merely a temporary shift in public sentiment but a deeper structural crisis in people's sense of national identity.

The disappointment stems from multiple sources, she said. "Trust in the political system has declined, as the public increasingly believes political institutions are unable to represent the broader public interest."

Meanwhile, social cohesion has weakened as divisions along partisan, ethnic and class lines have become more entrenched, she said.

"The promise of the 'American Dream' has also faded. Income inequality, unequal access to education, rising housing costs and declining intergenerational mobility have left many people less confident about the future," she added.

Chen Hong, director of East China Normal University's Asia-Pacific Studies Center, said many issues in the US have become increasingly politicized, with partisan rivalry deepening social divisions and heightening tensions.

"Partisan rivalry is only a symptom of deeper structural problems, including a widening wealth gap, persistent racial tensions and declining public trust in political institutions," Chen said.

"Combined with the current administration's confrontational and highly mobilizing political style, these factors have further intensified social divisions. To a considerable extent, polarization has gone beyond the scope of normal democratic political competition," he said.

Healthy competition

Healthy democratic competition, He said, is built on respect for established rules, acceptance of election results and recognition of the legitimacy of political opponents.

"In contrast, US politics has increasingly become a contest over the rules themselves, encompassing disputes over election results, judicial independence, media credibility and the limits of executive power," she said.

Both experts said such policy swings are making it harder for allies and partners to predict Washington's long-term strategic direction.

"For example, the current US administration has increasingly treated tariffs as bargaining chips and invoked national security as a broad justification for policy measures, approaching relations with allies and other trading partners through the lens of short-term transactional interests," Chen said.

A recent survey by the Pew Research Center covering 36 countries found global views of the US have deteriorated amid growing concerns over its foreign policy and the state of its democracy.

"Rising uncertainty in US foreign policy will have far-reaching consequences," He said.

"US allies are expected to accelerate efforts to hedge against strategic risks by reducing their reliance on Washington in security, technology and supply chains," she said.

"It will also become more difficult to build stable expectations for global governance, as Washington's shifting approach to multilateral institutions — alternating between engagement and withdrawal — undermines international coordination on issues including climate change, trade, public health and financial stability," she said.

The international order will likely enter a prolonged period of low trust and heightened volatility, He said. While the US will remain a major country, its ability to shape the global order will be increasingly constrained by deepening domestic divisions, she added.

Washington seeks advantage on trade partners

By **YANG GAO** in Toronto
gaoyang@chinadailyusa.com

The US decision not to support the extension of the United States-Mexico-Canada Agreement beyond 2036 is aimed at strengthening Washington's leverage in future trade talks rather than signaling an end to the pact, experts say.

Under the USMCA, the agreement remains in force until 2036. If all three parties agree during the review, the agreement can be extended for another 16 years.

Julian Castro-Rea, a political science professor at the University of Alberta, said Washington's decision should not be interpreted as an attempt to end the USMCA.

"Indeed, the agreement stays in place until 2036, with yearly revisions. This is not at all putting an end to the review process," he told China Daily.

Castro-Rea described the US position as "clearly a negotiating tactic, aimed at intimidating US' North American trade partners".

"But it is barely effective, as the partners and even the markets are by now used to the Trump administration's explosive declarations followed by limited action or even withdrawal," he said.

He said Canada and Mexico have become more experienced in dealing with Washington's negotiating style.

According to Castro-Rea, the US is expected to seek a reduction in its trade deficit with Canada and Mexico, a higher share of US-made content in vehicles sold across North America, and greater access to Canada's dairy market.

Mexico, meanwhile, is seeking lower US tariffs on its exports, while Canada is expected to prioritize reducing US tariffs on steel, aluminum and finished vehicles, he said.

Kim Richard Nossal, a professor emeritus of political studies at Queen's University, said the outcome was largely expected because the two alternative scenarios — terminating the agreement or extending it for another 16 years — were both unlikely.

"A complete termination would be too costly for the United States given the highly integrated supply chains that tightly link the North American economy," Nossal told China Daily.

"But a renewal for another 16 years was also unlikely given that President Trump had completely changed his mind about the USMCA and given that the negotiations for renewal, particularly with Canada, had not advanced enough," he said.

Instead, Nossal said the current arrangement serves Washington's interests.

"This option — which extends the agreement for another 10 years, with annual reviews — suits the United States just fine," he said.

"Existing supply chains are preserved, and most goods will continue to move across the border without tariffs.

"For Canada and Mexico, this option clearly is the second best," he said.

"Both countries wanted the agreement to be renewed for the full 16 years, since this provides maximum predictability that is key for investment decisions.

"But the extension with annual reviews — which puts both countries at a continual disadvantage over the next 10 years — is preferable to the termination option," Nossal said.

According to Castro-Rea, the coming months are likely to be dominated by bilateral negotiations rather than dramatic changes to the agreement itself.

"Conversations will resume on a bilateral basis to address the contentious trade issues between the three countries," he said.

He expects Washington to continue using tough rhetoric while seeking separate understandings with Ottawa and Mexico City.

NATO's push for higher defense budgets criticized

ISTANBUL — As Turkiye prepares to host the NATO summit on Tuesday and Wednesday, thousands of demonstrators took to the streets in Istanbul, Ankara and Izmir over the weekend to denounce the alliance's push for higher defense spending.

Demonstrators carried banners reading "NATO wants war, workers want peace" and "Budget for the people, not for NATO", while chanting slogans against the alliance.

In Istanbul, workers, civilians and members of political parties joined large rallies across the city, voicing their opposition to NATO's pressure on member states to increase military expenditures.

During a demonstration organized by the Confederation of Progressive Trade Unions of Turkiye, Chair Arzu Cerkezoglu said expanding war budgets threatens social security and places a heavier economic burden on ordinary people.

"We want more jobs, not more weapons. We want more schools, not more missiles. We want more hospitals, not more military spending," Cerkezoglu said.

The protests come as the Ankara summit is expected to discuss the pathways to deliver the commitment agreed by NATO member states at the 2025 summit to raise their defense spending to 5 percent of GDP by 2035, a long-standing demand from Washington.

On Sunday, police detained more than 100 people during an anti-NATO protest in Ankara, according to the Cumhuriyet daily, as authorities imposed a ban on demonstrations in the capital ahead of the summit.

Baris Doster, a scholar at the Marmara University in Istanbul, said the protests reflect public anxiety over the costs of rising militarization.

"NATO is not an ordinary, simple defense and security organization," Doster said. "It is an organization with economic, political and ideological preferences. It is the gendarme of capitalism, imperialism and liberalism under US leadership."

Raising the spending target to 5 percent by pushing allies to purchase more weapons, ammunition and military equipment would primarily benefit the US defense industry at the expense of their own domestic economies, he said.

XINHUA

Xi vows closer ties with Peru, Montenegro

China seeks mutual benefit, long-term partnership in messages to two leaders

President Xi Jinping underscored on Monday China's commitment to strengthening partnerships with Peru and Montenegro, extending a message to congratulate Peru's president-elect and exchanging messages with Montenegro's president to mark the 20th anniversary of diplomatic relations.

In the message to congratulate Keiko Fujimori on her election as president of Peru, Xi said China and Peru are comprehensive strategic partners, and that the relations between the two countries maintain good momentum for development.

High-level exchanges between the two sides have been frequent, practical cooperation in various fields has achieved fruitful results, and people-to-people friendship enjoys deep public support, he said.

Noting that this year marks the 55th anniversary of diplomatic ties between China and Peru, Xi said he attaches great importance to the development of China-Peru relations. He added that he stands ready to work with President-elect Fujimori to carry forward the traditional friendship between the two nations, and steer the comprehensive strategic partnership to new heights to better benefit the two peoples.

Also on Monday, President Xi and Montenegrin President Jakov Milatovic exchanged congratulations on the 20th anniversary of diplomatic relations between the two countries.

Xi noted that China and Montenegro enjoy a deep traditional friendship. Over the past 20 years since the establishment of ties, the two countries have consistently respected each other, treated each other as equals, and pursued mutual benefit and win-win cooperation, setting a model of friendly relations and common development between countries of different sizes, he said.

Xi expressed his readiness to work with Milatovic, taking the 20th anniversary of diplomatic relations as a new starting point, to carry forward and promote bilateral traditional friendship, continuously deepen mutually beneficial cooperation, and guide China-Montenegro relations to a new level, so as to better benefit the two peoples.

For his part, Milatovic said Montenegro and China have consistently developed friendly and cooperative relations on the basis of mutual respect and understanding.

The Montenegrin side stands ready to take the anniversary as an opportunity to further consolidate and deepen friendly relations with China, expand cooperation in various fields, benefit the people of both countries, and make positive contributions to promoting world peace and development, he added.

SUDAN

Over 300 children killed or injured in war

More than 300 children have been killed or injured in the past six months in the war in Sudan, mostly from drone strikes, UNICEF said on Monday. The war between the Sudanese military and the paramilitary Rapid Support Forces is now concentrated in the Kordofan, Darfur and Blue Nile states, with drone warfare causing 60 percent of casualties, according to UNICEF. "Children are being caught in a relentless cycle of violence, displacement and deprivation," said Sheldon Yett, UNICEF representative in Sudan.

GAZA STRIP

Hamas dissolves Gaza governing body

Hamas announced on Monday the dissolution of the Government Emergency Committee in Gaza and the transfer of the administration of the Gaza Strip to the National Committee. Head of the Government Emergency Committee Mohammed al-Farra has submitted his resignation, Ismail Thawabta, director-general of the Hamas-run media office in Gaza, said at a news conference. The step was taken "to alleviate the suffering of citizens resulting from the ongoing war ... the delay in reconstruction, the continued siege, the closure of crossings, and the failure of the Israeli army to withdraw", he said.

FRANCE

Jewelry worth millions stolen from museum

Burglars stole jewelry worth millions of euros from the museum of French luxury glassmaker Lalique in a daring early-morning raid on Sunday, just months after a stunning gem heist at the Louvre in Paris. A gang of masked thieves broke into the museum in Wingen-sur-Moder in northeastern France around 5:30 am, forcing a door open before heading for the jewelry room and smashing open six display cases, a source close to the investigation told Agence France-Presse. "Around 20 pieces of jewelry were stolen," the source said. "The loss is currently being assessed but could amount to several million euros, likely close to 4 million ($4.56 million)."

History remembered: compass showing the path humanity must not stray from

Tuesday marks the 89th anniversary of the Lugou Bridge Incident, the start of Japan's full-scale invasion of China.

The weathered stone arches of the 834-year-old bridge stretching over the Yongding River in Beijing's southern suburb stand as an eternal witness to Japan's wartime brutality, yet that country's narrative of the incident continues to obscure and distort the facts.

Many Japanese textbooks offer ambiguous, blame-shifting descriptions of the incident, erasing the premeditated military provocation and painting the full-scale war as the result of "an accidental clash" between Japanese and Chinese troops.

This systematic distortion of history amounts to a blatant refusal to acknowledge Japan's wartime aggression — let alone accept responsibility for the suffering it inflicted upon its neighbors.

Declassified historical files irrefutably prove the incident was a carefully orchestrated military plot of Japan. Long before July 1937, political circles in Tokyo had prearranged a regional conflict to coincide with Japan's Tanabata Festival. A sharp military troop surge in North China further exposed Japan's aggressive intentions, as the Japanese forces in Beijing nearly tripled within four months in 1936, laying the groundwork for the deliberate provocation of conflict.

Japan's distortion of wartime truth extends far beyond the incident. Channel NewsAsia's recent investigative documentary series on Japan's infamous Unit 731 presented the long-concealed atrocities of Japan's state-run biological warfare program to the world.

An archival book, *Black Box: Unit 731*, published on Sunday in Harbin, Heilongjiang province, where the notorious unit was based from 1936 to 1945, further unveils solid documentary evidence of the unit's systematic wartime crimes and how Unit 731 personnel traded experimental data for postwar immunity, escaping all judicial punishment to occupy elite social positions.

The Chinese people harbor indelible memories of the suffering caused by the war. However, their remembering of this period of history is not to perpetuate hatred, but to draw lessons from the past to cherish and safeguard peace.

History rarely repeats itself exactly, but, as has been said, it often rhymes. All countries in the region must remain highly vigilant to the emergence of neo-militarism in Japan today.

Eighty-one years ago, the Chinese people thoroughly defeated the Japanese militarist aggressors. Under the banner of the national united front against Japanese aggression established at the initiative of the Communist Party of China, the nation stood up to fight the Japanese invaders with an iron will.

This victory was a vital part of the World Anti-Fascist War, with China's immense sacrifices — over 35 million casualties — underpinning the defense of human civilization and global peace.

The Lugou Bridge Incident and other Japanese war crimes against the Chinese people are recalled to honor fallen heroes, cherish peace, create a better future and prevent the right-wing forces of Japan from rewriting history.

History cautions that humanity rises and falls together. Only when all nations treat each other as equals, coexist in peace and support each other can we uphold common security, eradicate the root cause of war and prevent the recurrence of historical tragedies.

The Chinese people's victory against Japanese invaders 81 years ago was a historic turning point for the Chinese nation, which emerged from the grave crises of those times to embark on the journey toward its great rejuvenation.

The Chinese People's War of Resistance Against Japanese Aggression (1931-45) shows that might may rule the moment, but right prevails forever.

Chinese modernization follows the path of peaceful development. The country always stands on the right side of history, unwavering in its commitment to uphold justice and peace.

War is a mirror. It shows us the true value of peace. Although peace and development are the trends of the day, the world is far from peaceful. The sword of Damocles still hangs overhead. All countries should learn from history and devote themselves to peaceful coexistence.

Prejudice, hatred and war bring only suffering; respect, equality and shared prosperity are the right path.

Old playbook makes NATO destabilizer

As the two-day North Atlantic Treaty Organization summit starts in Ankara, Turkiye, on Tuesday, the internal fractures within the transatlantic alliance are already apparent. Just days prior to the summit, US President Donald Trump took to social media to describe the relationship between the United States and the other NATO members as "ridiculous" and "not reciprocal".

His repeated complaints of the US' NATO allies free-riding on defense issues and his threats to reconsider the US' security commitments have cast a shadow of uncertainty over a summit that was supposed to showcase unity.

At last year's summit in The Hague, almost all member states — under US pressure — agreed to increase defense spending to 5 percent of GDP by 2035; a military spending goal unprecedented since the Cold War. Under the agreement, 3.5 percent would be spent on "core defense" and 1.5 percent on security-related initiatives. The Ankara summit will supposedly review the implementation of this commitment.

Many NATO member states have acknowledged that they face significant challenges achieving the 5 percent goal due to problems with funding allocation and fiscal sustainability. Spain has opted out of the spending goal, while Italy plans to take a detour by reclassifying a mega bridge project as defense expenditure to meet NATO's spending target. The Ankara summit, therefore, is expected to face severe tests in terms of making any progress related to the defense spending plan.

Adding to the rift between the US and other NATO members is Trump's expressed disappointment with some NATO allies' refusal to support the US in the military campaign it launched with Israel against Iran.

Analysts have noted that the US wants Europe to contribute more financially and follow its instructions. Europe, while aiming to keep the US engaged in the NATO framework, seeks autonomous decision-making for its own benefit. These diverging demands are making it difficult to bridge the rifts in the alliance, leaving the summit's prospects fraught with uncertainty.

Despite the internal challenges, in a move to show the bloc's vitality, NATO Secretary General Mark Rutte has extended formal invitations to the defense ministers of the alliance's four "Indo-Pacific" partners — Japan, the Republic of Korea, Australia and New Zealand — to join summit-related events in Ankara. The move underscores NATO's deepening engagement with the region, raising serious concerns about the potential consequences for Asia-Pacific stability.

NATO claims that the "Indo-Pacific" is important for the alliance, given that developments in that region can directly affect Euro-Atlantic security. This approach will only further complicate the security situation in the Asia-Pacific. Regional countries can manage their own affairs using their own wisdom and methods without external intervention. The involvement of NATO will only make the security situation in the region more unpredictable.

In the process, the Sanae Takaichi government of Japan has disgracefully flirted with NATO and facilitated its entry into the region, using the alliance as a vehicle to fast-track Japan's remilitarization and to enhance Japan's profile as the US' linchpin bridging its Asia-Pacific and transatlantic military architectures.

NATO should be wary of serving as a stepping stone for Japan's neo-militarists. It is time for the bloc to reflect on its own behavior and abandon the flimsy pretexts for its eastward expansion.

Today's world is not that of NATO's founding. Resorting to old playbooks to survive is not just anachronistic — it is dangerous.

If NATO were truly committed to peace and stability, it would embrace common, comprehensive, cooperative and sustainable security — not the narrow, exclusive security it peddles for one of its members.

The alliance should respect the sovereignty and territorial integrity of all nations. Military, technological and economic prowess does not equal moral ascendancy.

Unless NATO learns to recognize the importance of noninterference, mutual respect and diverse development paths as pillars of security, it will remain trapped in Cold War thinking, unilateralism and bloc rivalry — a war machine forever trading others' security for its own.

Beautiful game's ugly truth: FIFA's red card 'suspension'

When Folarin Balogun's name is read out before the match between the United States and Belgium in the Round of 16 of the 2026 FIFA World Cup on Monday, US time, at Lumen Field in Seattle, it might be greeted with loud boos. Not because spectators doubt his talent — he has got three goals in three matches so far — but because they doubt the process that led to his one-match red-card ban being suspended.

Football has always been forgiving when it comes to mistakes, but selective justice is another thing. FIFA's extraordinary decision to suspend Balogun's red-card ban after a reported intervention from US President Donald Trump has transformed a disciplinary controversy into an institutional embarrassment. FIFA insists it merely exercised discretion under Article 27 of its disciplinary code. Yet rules that bend due to the US president having a word in the ear of the president of football's governing body cease to look like rules; they become suggestions.

Belgium has every right to protest. It is not merely facing the US for a place in the last eight. It is facing an opponent given an exception unavailable to everyone else. The Royal Belgian Football Association's argument is simple: an automatic suspension is supposed to be automatic. If a red card can suddenly become negotiable, every future disciplinary decision becomes a political campaign rather than a legal process.

Football's greatest strength was always its promise that 90 minutes flatten hierarchy. The whistle recognized neither passport nor president. Until now. But, one telephone call appears to have achieved what appeals panels, coaches and lawyers could not. The optics are ruinous. An organization that endlessly lectures the world about protecting football from political interference has seemingly become remarkably accommodating when the interference comes from the White House.

This is not an isolated symptom. The tournament itself is beginning to look like an entertainment product optimized for business executives rather than football supporters.

Nothing demonstrates this absurdity better than the technology. The ball now contains a chip so exquisitely sensitive that a strand of hair can apparently trigger forensic reviews lasting several minutes. Every microscopic contact is analyzed with scientific obsession. Yet the same competition demonstrates extraordinary flexibility when applying its disciplinary code. Precision for pixels; elasticity for principles.

Then come the hydration breaks. Officially they exist for players' welfare. Conveniently, they also create perfectly packaged advertising windows worth millions. Football pauses not because exhausted midfielders demand it, but because broadcasters do. FIFA does.

Spare us also the FIFA president's spin that the extra ad revenue goes to the broadcasters. We weren't born yesterday. Everyone knows FIFA is also raking it in.

FIFA demands microscopic consistency from referees but offers macroscopic discretion to itself. Integrity has become disposable. Money and politics have squeezed something precious out of this World Cup: football's soul.

FIFA's inability to prevent the Iranian team from being subjected to unfair treatment and intense political pressure during this World Cup reinforced the uncomfortable impression that the organization's celebrated neutrality functions selectively. Principles seem robust when convenient and negotiable when inconvenient.

Balogun himself should not become the villain. Players accept the decisions placed before them. The real issue sits far above the dressing room.

When the Seattle crowd reacts to his name before kick-off, those boos — if they come — will not be aimed at the talented striker. They will be directed at an institution that has managed the remarkable feat of making the world's most popular sport look smaller than the politics surrounding it. That is a far more damaging own goal than any red card could ever be.

— LI YANG, CHINA DAILY

What They Say

Time-sharing would help expand 'last mile' AI usage

Editor's note: *China is rapidly expanding the use of artificial intelligence technology in the manufacturing sector. Yang Chao, director of the second research office of the department of innovative development, which is under the Development Research Center of the State Council, spoke to China Economic Times about how the country can harness the potential of AI for the benefit of the sector and the broader economy. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

To cover the "last mile" of intelligent transformation, it is necessary to help micro, small and medium-sized enterprises use AI through an approach that is lightweight and inclusive.

Governments should take the lead in providing public AI services in industrial parks so that micro, small and medium-sized enterprises operating in the parks can rent the services according to their needs. This will not only enable the enterprises to share the services but also the cost of the services.

Innovative financial solutions, such as equipment leasing, can be adopted to rent out AI equipment on a monthly basis so that companies don't have to spend large sums of money to purchase equipment.

China's AI industry has abundant application scenarios. The country contributes approximately 30 percent of the world's manufacturing growth, and has numerous industrial scenarios, including factory quality inspection, intelligent scheduling, flexible production lines and predictive equipment maintenance. These scenarios form a complete loop for data iteration and feedback.

Moreover, China has a large consumer base, including a large number of AI users. This helps create a robust data flywheel that enables the continuous improvement of domestic models.

China's AI industry offers highly cost-effective services. Domestic large models are attracting developers and users worldwide, as their API calls cost only a small fraction of the fees charged by leading overseas products.

For the AI industry to continue to flourish, innovation, application and security compliance are essential. China has swiftly developed its legal and policy framework for AI governance, including interim measures adopted in 2023 to manage generative AI services, the Cybersecurity Law, which was revised in 2025, and the guidelines issued in May this year to regulate the use of AI agents and facilitate their innovation.

Nevertheless, the following measures are needed to fully unlock the potential of the country's AI industry. There should be a classified and tiered supervision system. The registration process should be streamlined for low-risk AI applications that are only used internally by enterprises.

At the same time, strict measures should be taken to ensure data security for enterprises using these applications and access management should be improved.

For high-stakes scenarios such as critical infrastructure, there should be stringent protocols, such as security assessments, red team testing, permission isolation and final reviews conducted by humans.

Enterprises' compliance costs should be substantially reduced. Efforts should be stepped up to develop a system of market-oriented, third-party compliance services and facilitate mutual recognition of certification results.

AI application scenarios should be expanded to create more opportunities for the application of AI technology. Prudent and inclusive regulatory sandboxes should be promoted.

VIEWS

China and the World Roundtable | Uncovering the Truth behind Japan's Historical Distortions

Editor's Note: *Certain forces on China's Taiwan island have been distorting history for their selfish gains, downplaying the atrocities committed by Japan during its colonial rule there and advocating so-called friendship with Tokyo. On May 27, the Taiwan research center of the Institute of Modern History, Chinese Academy of Social Sciences, held a seminar to expose these falsehoods. Three experts share their views, as reported by China Daily's Li Huixian.*

Japan's colonial rule a dark chapter of Taiwan island

LI MIN / CHINA DAILY

Japan's centuries-long scheme reveals expansionist ambition

Wang Xiaoping is a research fellow at the Institute of Modern History, Chinese Academy of Social Sciences.

Studying colonial history is not about stirring up hatred, but about uncovering the truth; not about dwelling in the past but about safeguarding the future. Japan's long history of coveting China's Taiwan island, and the military suppression, political control, economic plunder, cultural assimilation and destruction it engaged in during its occupation of the island expose the manipulative lie of so-called "friendship" between the island and Tokyo, as touted by the island's separatist forces.

Japan's 50-year occupation of Taiwan was not merely an outcome of the 1895 Treaty of Shimonoseki, but the culmination of Japan's long-standing expansionist strategy, a strategy that dates back to the late 16th century when feudal lord Hideyoshi Toyotomi, who unified Japan, envisioned using the Korean Peninsula as a springboard to conquer China and dominate East Asia. This aggressive vision laid the groundwork for Japan's continental policy, and remained the underlying logic of sustaining national development through military expansion well into the Meiji era.

Japan's southward expansion began with the Ryukyu Islands. In 1609, Japan's feudal domain of Satsuma invaded Ryukyu, capturing it and forcing it into vassalage and tribute. Over the ensuing nearly 300 years, Ryukyu maintained its tributary relationship with China, while being compelled to accept Satsuma's domination and heavy tribute obligations.

After the Meiji Restoration of 1868 — which returned Japan to direct imperial rule under the Emperor — Japan's national strength swelled rapidly, accelerating its expansionist efforts. In 1879, Japan dispatched troops and officials to incorporate Ryukyu into its territory; the centuries-old Ryukyu Kingdom collapsed.

During its annexation of Ryukyu, Japan also set its sights on Taiwan island. In 1871, Ryukyuan fishermen were caught in a storm and landed in Taiwan, where clashes with local indigenous communities led to casualties. Japan exploited the incident, framing it as an "assault on Japanese nationals" and launching a punitive expedition in 1874.

Although Japan withdrew under diplomatic pressure from the Qing (1644-1911) government of China and international criticism, the operation helped it achieve key strategic objectives: testing the Qing government's coastal defense capabilities and diplomatic red lines, fabricating the false logic that Ryukyuans were Japanese nationals, conducting a combat rehearsal for future southward expansion, and gaining crucial experience for larger-scale aggression.

In 1894, Japan instigated the First Sino-Japanese War and in the following year compelled the defeated Qing government to sign the unequal Treaty of Shimonoseki, ceding the entire island of Taiwan and its affiliated Penghu Islands to it, marking the beginning of a 50-year-long bloody colonial rule.

Japan's colonial rule over the island was characterized by brutal suppression of civilian uprisings and large-scale massacres. Taiwan island residents were denied the right to stand for election or vote, economically exploited, and subjected to cultural assimilation efforts aimed at erasing their history and national identity. Under the autocratic rule of the governor-general and a police-dominated administration, they lived in an isolated, surveilled and brutally oppressive giant prison. During World War II, many Taiwan compatriots were conscripted and sent to the battlefield.

Therefore, any rhetoric that glorifies Japanese colonial rule, downplays the massacres, or distorts history betrays historical truth and desecrates civilization.

Colonizers plundered rather than modernized island

Cheng Zhaoyun is a research fellow at the Institute of Modern History, Chinese Academy of Social Sciences.

"Taiwan independence" separatists peddle the theory that the island saw modernization during Japanese colonial rule, while overlooking Japan's invasion and exploitation, even venerating colonial figures such as Yoichi Hatta.

However, this so-called "modernization" was essentially continued colonization of the island.

Instead, the island's modernization began under the late Qing Dynasty (1644-1911), with progress in sectors such as transport and industry, including railways, steamships, telegraphy, postal services and coal mining.

When Japan occupied the island, Taiwan already had a stronger economy under the late Qing Dynasty compared with Japan in the early days of the Meiji Restoration. Therefore, it is misleading to attribute Taiwan's growth solely to Japanese colonization.

The so-called colonial modernization was, in reality, Japan's exploitation of Taiwan's resources and people.

The colonial authorities seized large tracts of newly cultivated or ambiguously titled land, stripping local farmers of their land on dubious pretexts and transferring it to Japanese enterprises.

By the time of the island's restoration, more than six million of its residents held less than 30 percent of the land, with the rest being held by the Japanese.

Since the early 20th century, Taiwan's sugar production was largely shipped to Japan, with *zaibatsu,* such as Mitsui and Mitsubishi, monopolizing the island's modern sugar industry. Sugarcane farmers were stripped of any say in the cultivation and pricing of the crop.

Although rice production increased, it was mostly exported to Japan at low prices, forcing Taiwan people to turn to sweet potatoes. Emerging industrial sectors such as electricity and chemicals were also dominated by Japanese capital, which funneled substantial profits back to Japan, investing them in other industries and even overseas expansion.

The island's foreign trade was also controlled, with agricultural products and raw materials largely exported to Japan. In return, the Chinese island imported expensive fertilizers from Japan.

Following its full-scale invasion of China in 1937, Japan imposed a wartime regime on Taiwan, further exploiting its manpower, finances, trade, and agriculture. Farmers were allowed to keep only minimal grain for subsistence, with the rest requisitioned. Being tied to Japan's war chariot, Taiwan suffered heavy bombing by the US military during late World War II, which severely damaged its farmland, factories and other infrastructure.

Taiwan's postwar economic difficulties, including food shortages and unemployment, were direct results of Japanese colonial rule.

Japanese colonization left the Chinese island's economy structurally deficient. The colonial authorities integrated Taiwan into Japan's economic sphere through unified tariffs, currency and other measures.

By 1939, Taiwan's foreign trade was almost entirely dependent on Japan and its occupied territories.

Before the 1930s, Tokyo treated Taiwan primarily as an agricultural base, with industrialization limited to food industries such as rice and sugar. After the 1930s, industrialization was promoted to meet wartime needs, focusing on fertilizers, cement, aluminum, papermaking, and shipbuilding, but the industrial structure remained unbalanced.

During Japan's colonial rule, Taiwan residents were excluded from senior management roles in government and business.

Indigenous Taiwan capital was restricted to traditional sectors such as agriculture and small-scale crafts, while being barred from modern manufacturing, thus suppressing local investors. Local workers earned less than half of what Japanese workers in Taiwan did, and even their wage growth lagged significantly behind increases in labor productivity.

All of this proves that the claim that "Japan modernized Taiwan" is a complete fallacy.

Tours reveal misery under Japanese rule

After Japan seized the Chinese island of Taiwan, people on the Chinese mainland had gradually realized Japan's colonial oppression in Taiwan. In response to Japan's propaganda about its "achievements", tours of prominent figures such as Sun Yat-sen, Zhang Taiyan, and Liang Qichao to the island have exposed how Japan's colonial rule there was far from the "success" it was being made out to be.

Chen Zhongchun is the director of the Institute of History at the Graduate Institute for Taiwan Studies at Xiamen University.

Zhang Taiyan, a philosopher who visited the island in late 1898, refuted the Japanese claim that the occupation of Taiwan was "divinely ordained" and resisted the sycophantic trend of eulogizing the colonizers.

His criticism on issues such as heavy taxation, electoral injustice and educational inequality reveals the harsh reality of colonial rule. Similarly, Liang Qichao, a prominent Chinese thinker, offered incisive critiques in letters during his 1911 visit from Japan to the island of Taiwan. His observations profoundly influenced and encouraged Taiwan compatriots to resist oppressive rule.

While in Japan, Liang had come across newspaper and magazine commentaries praising Japanese rule in Taiwan, while friends he had from the island painted a starkly different picture.

People on the Chinese mainland, too, were curious to know the actual situation across the Strait. This prompted Liang to travel to the island and investigate.

Upon arrival, Liang was warmly received by the islanders, which convinced him that they still cherished deep sentiments for the motherland. He observed that Japan deliberately restricted access from the Chinese mainland to Taiwan.

Also, contrary to Tokyo's claims, his investigation revealed that the island people had suffered immensely under Japanese dominion.

In his fourth and fifth letters, Liang expressed great disappointment about the claims of development made about the island — while certain so-called modern administrative facilities on the island were not uncommon elsewhere in the world, Japan engaged in rampant economic exploitation and educational discrimination on the island.

Beneath the ostensibly "orderly" society on the island, Liang observed the profound suffering of its people. His poems reveal how Japanese colonial authorities expropriated farmers' land, selling it to Japanese sugar companies and leaving the dispossessed farmers to starve in winter. Others had no choice but to sell themselves into labor.

Liang's observations also highlighted discrimination in the field of education, with quality education being reserved for Japanese children, while children from Taiwan island were relegated to inferior schools with limited curricula.

Liang's worry — about Taiwan residents losing a sense of belonging to the motherland as the colonialists suppressed the Chinese language and his compatriots being rendered illiterate — is foreseeable.

Just as revealing is Japan's import policy and its effect on prices on the island. According to Liang, Japan's severing of Taiwan's economic ties with the Chinese mainland led to increased prices and a higher cost of living on the island.

Nearly all daily necessities, from straw sandals to noodles, were imported from Japan but sold at much higher prices in Taiwan. The colonizers' arbitrary pricing resulted in price hikes that far outpaced wage growth, leaving the people economically crushed and with no way out of colonial oppression.

The views don't necessarily reflect those of China Daily.

How I keep my date with strolls even on hot and sunny afternoons

Kang Bing

The author is former deputy editor-in-chief of China Daily. kangbing@chinadaily.com.cn

While the central government is concentrating on curbing desertification, local governments are leaving no stone unturned to plant trees, bushes and grass on bare land.

As summer temperatures keep rising across China, meteorologists have been warning people not to venture out into the afternoon sun to avoid getting sunburns or, worse, suffering heatstroke.

However, I, a retired man who loves taking a stroll now and then, have mostly laughed away such warnings and have been keeping my date with walks three times a day.

I venture out not because I am immune to hazards from the heat but because of the trees lining both sides of the street bordering the four edges of my apartment complex. Of the four roads, 1,000 meters long in total, two are under the cover of paulownia trees, one shaded by locust trees and the fourth is lined with lilac, cherry and crab apple flowers. Taking an afternoon stroll under the shade of those trees has always been a pleasant experience for me.

Planting trees alongside streets seems to have become a priority of municipal authorities planning cities in China.

For thousands of years, wood and grass have either been burned as fuel or used as animal feed across China, depriving many regions of greenery. By the 1970s, desertification had escalated to such an extent that sandstorms were a regular feature in northern China, with more than a dozen being reported every year.

It was against this backdrop that the central government decided to take nationwide greening actions.

The Three-North Shelterbelt Forest Program — called Sanbei Gongcheng in Chinese — was launched across around 46.7 percent of the country's land area. The more than 70-year-long project — which started in 1978 and will go on until 2050 in northeastern, northern and northwestern China — has increased the area's forest cover from 5 percent in the late 1970s to 14 percent now.

Billions of trees have been planted and desertification has largely been checked. Beijing, for instance, now experiences only two or three sandstorms each year as compared to more than a dozen a year 30 years ago. In fact, studies suggest that the few sandstorms sweeping northern China in recent years originated not in China but in neighboring countries.

While the central government is concentrating on curbing desertification, local governments are leaving no stone unturned to plant trees, bushes and grass on bare land.

For city planners, sidewalks are ideal spaces for planting trees. Having visited a few dozen countries, I have the feeling there are more trees on the sidewalks of Chinese cities than in many developed countries.

To confirm the same, I checked online data only to conclude that it is not available in a comparable form. I was just about able to confirm that the forest coverage of Beijing was 44.95 percent in 2024, while New York City's tree canopy cover stood at 23.4 percent (as of 2021) according to the NYC Urban Forest Plan. As a Beijing resident who has visited New York several times, I feel this comparison is reliable.

That is reason enough for us to give a thumbs-up to the local governments that have been carrying out tree planting programs in the Sanbei areas over the past 50 years. I doubt there is another government in the world that has the vision and courage to launch such a long and costly project in an area nearly half the size of Europe.

Planting trees is just the first step in the goal of growing trees on sidewalks. During my umpteen walks around my block over the past few years, I have seen trucks with water tanks watering the trees and bushes, gardeners trimming the trees, and workers wrapping up tree trunks to help the plants survive harsh winters.

I also saw workers paving the sidewalks every two or three years to get rid of roots that were cracking the pavement. I understand that lots of money must have been spent on keeping the trees healthy and our sidewalks smooth.

Such investments may not lead to any "grand achievements" that help some politicians get more votes. But the efforts certainly provide us citizens with a better living environment, enabling us to take a stroll even on a hot mid-summer day.

GLOBAL VIEWS

WANG JUN / FOR CHINA DAILY

DAVID GOSSET

Transformation and the road ahead

The Party continues to play an enduring and irreplaceable role in shaping China's modernization trajectory

The 105th anniversary of the founding of the Communist Party of China in 2026 offers an occasion not only for commemoration but also for reflection on more than a century of political struggle, national transformation and institutional evolution.

The anniversary provides a meaningful moment to revisit the historical trajectory of the Party and its enduring role in shaping Chinese modernization.

The story begins in 1921, in a modest setting in Shanghai, where the CPC was founded under difficult and uncertain conditions. At the time, China was fragmented, weakened by internal division and external pressure, and searching for pathways toward national renewal. The early founders of the Party were a small group of intellectuals and revolutionaries driven by the belief that China required a fundamental transformation to regain sovereignty, stability, unity and dignity. From these humble beginnings, the CPC would gradually grow to become the central force in Chinese political life.

The early decades of the Party were marked by struggle and survival. Among the most defining episodes was the Red Army's Long March (1934-36), a remarkable and arduous military feat that has since become a foundational narrative in the Party's collective memory. Covering thousands of kilometers across some of China's most difficult terrain, it symbolized endurance, cohesion and ideological commitment under extreme pressure. Though a military maneuver, it became politically and symbolically a consolidation of leadership and resolve.

This period was followed by another existential struggle. The Chinese People's War of Resistance Against Japanese Aggression (1931-45) was a decisive chapter in modern Chinese history, during which the CPC expanded its influence and legitimacy through both military resistance and the mobilization of rural populations. The experience of national survival against external aggression deeply shaped the Party's understanding of sovereignty, unity and national strength.

In 1949, after years of civil war, the People's Republic of China was founded. This marked a fundamental turning point in Chinese history. For the CPC, it represented the transition from a revolutionary movement to a governing party. For the country, it signaled the beginning of a new State-building project aimed at restoring territorial unity, rebuilding institutions and addressing widespread poverty and instability.

The subsequent decades were complex, marked by ambitious social and economic experiments, periods of rapid mobilization and significant internal challenges.

A particularly decisive turning point came in 1978 with the reform and opening-up policy initiated under Deng Xiaoping. This moment reshaped China's development trajectory. Economic reforms introduced market mechanisms, encouraged foreign investment and gradually integrated China into the global economy. Over the following decades, China experienced one of the most rapid and large-scale transformations in modern history, lifting hundreds of millions of people out of extreme poverty and becoming a central actor in global trade and industry.

From the perspective of governance, the CPC has progressively developed a distinct model of political and economic organization. This model emphasizes long-term planning, strong State capacity and adaptive policy experimentation at local levels. It is also closely linked to China's pursuit of what it terms "Chinese-style modernization". This concept refers to a modernization path that seeks to combine economic development and technological advancement with social stability, common prosperity, cultural continuity, ecological sustainability and national sovereignty. Unlike modernization models historically associated with Western industrialization, Chinese-style modernization is presented as a development framework rooted in China's own historical experience, political system and civilizational traditions while remaining open to global economic integration.

Over time, the Party has placed increasing emphasis on institutional coherence, anti-corruption campaigns, technological modernization, environmental policy and national rejuvenation. These priorities reflect both domestic imperatives and China's evolving position in the global system. In this sense, the CPC is not only a governing body but also the core institutional framework through which China articulates and implements its strategic objectives.

Looking forward, China has set out a series of ambitious long-term goals, including the realization of national modernization objectives and the strengthening of technological self-reliance, economic resilience and global influence. The coming years are viewed as a critical period during which these objectives will be further defined and pursued.

Since the 18th CPC National Congress in 2012, Xi Jinping, general secretary of the CPC Central Committee, has put forward a series of new ideas, new thinking and new strategies for governing and strengthening the Party in response to the major questions of the times. Xi Jinping Thought on Party Building articulates several core principles: the CPC's leadership is the defining feature of socialism with Chinese characteristics; the centralized, unified leadership of the Party Central Committee must be upheld; and full and rigorous Party self-governance must be advanced unwaveringly.

Understanding contemporary China requires an in-depth understanding of the CPC itself. The Party is deeply embedded in the country's institutional structure, development strategy and political culture. The 105th anniversary, therefore, is not merely a historical marker. It is an opportunity to revisit the long arc of Chinese political development — from revolutionary beginnings in Shanghai, through war and State formation, to economic transformation and global integration. It also invites reflection on the continuity of objectives that have persisted across generations: national sovereignty, development, stability and modernization.

At the same time, it is an occasion to recognize that China's path remains dynamic and evolving. The challenges of economic transition, demographic change, environmental sustainability and international relations continue to shape policy debates and strategic thinking within the country.

In this sense, the anniversary is both retrospective and forward-looking. It connects a century of history with the uncertainties and ambitions of the future. As China moves further into the 21st century, the CPC remains a central actor in defining the direction of that journey. For the international community, engaging with China inevitably involves engaging with the Party's historical experience, institutional logic and strategic vision.

The 105th anniversary thus serves as a reminder that China's contemporary identity is deeply rooted in its historical trajectory and that its future will continue to be shaped by the evolving relationship between its past, its governance system and its aspirations on the global stage.

OLE DÖRING

Maturing self-development

CPC's 105-year journey proves itself a party dedicated to serving the people and addressing the challenges in the country's progress

In July 1921, the Communist Party of China was founded in Shanghai. Its mission extended far beyond the struggle for the communalization of the means of production that shaped European communism following Marx and Engels. China's path to finding its own place in a new world — initially shaped, for better or worse, by Europe and the United States — has been a process of self-cultivation. Anyone visiting the sites today that commemorate the Party's history and culture is likely to be struck by the vibrant energy and thematic diversity of this movement.

Yet the roots of the CPC reach deep into the 19th century and into China's interior. A folk open-air theater on the grounds of a cultural industry base in Shaoshan, near Changsha, the capital of Central China's Hunan province, reenacts the fundamental motifs of the march toward a new China. The performance begins with the steel fetters of the new heavy industry, which alienates people from themselves and whose blazing flames seem beyond control. The price paid for the new goods and opportunities is high. The common people experience exploitation, new forms of warfare, and more sophisticated oppression, while the decrepit Qing Dynasty (1644-1911) collapses amid its own luxury. At the same time, ideas emerge, carrying hope for new forms of social participation: trade unions, cooperatives, the press, new professions, scientific foundations for education, medicine and agriculture. The world grows larger, horizons draw nearer, everything changes.

How was China to preserve the peace of a simple life? This was a question about dignity and justice in the everyday lives of Chinese people, about traditional virtues and human values for modernity, the birth of human solidarity among the disadvantaged. It was about the bewildering shock of collective powerlessness in the face of a world turned upside down, where a "small" Japan suddenly ravaged China's traditional breadbasket and culture with immense brutality; it was about the courage, determination, foresight and fortune of the few individuals who paved the way for the CPC. The Party and its members took their destiny into their own hands and forged ahead through the Long March — whose 90th anniversary falls this year. Following the founding of the People's Republic of China in 1949, they established a new framework for national sovereignty and territorial integrity.

In the current Year of the Fire Horse, steam, flame and locomotion take on a symbolism of their own. After 105 years, with the 15th Five-Year Plan (2026-30) for economic and social development, China is now definitively galloping into the phase of its cultural self-determination, following decades of catch-up modernization. The heat of progress, the pressure of social restructuring, and the harshness of competition are being shifted into a calmer gear. With a cool head and a gentler hand, the energy of the growth momentum is being channeled, the thrust balanced, and development steered to a new level. In this process, the "Chinese Dream" is not a feverish delusion but renders achievable the desire of the vast majority of the Chinese people to develop China, by the middle of this century, into a modern socialist country that is prosperous, strong, democratic, civilized and peaceful. A key building block on this path is the comprehensive reform of the education system, presented in early 2025 by the CPC Central Committee and the State Council to build a strong education system by 2035 to support the country's modernization drive and national rejuvenation.

In Changsha, Central China's Hunan province, where late Chairman Mao Zedong spent his youth, visitors can witness veritable pilgrimages of large crowds of all ages, educational backgrounds and income groups. The history of the CPC is personalized, kept alive through stories of individual fates and memorable events. The essence of politics enters through the stomach, through the eyes, hearts and minds; in rituals, all this merges into a shared experience. Statues, photos, films or stories connect into a felt and perceived coherence.

An essential difference from the historical models that New China oriented itself toward and worked through is the ancient virtue of development through learning. No Chinese institution embodies the nature of modern China's development as fully as the CPC. The trust of an educated, entrepreneurial, rebellious, proud and smart people is not secured permanently by words alone. Decades of struggles of all kinds have made the population allergic to false promises and alert to pragmatic projects. Thus, the CPC must continually prove itself at the current level of challenges and opportunities. Its power comes with the duty to understand itself as a serving organization. This is why the fight against corruption is of paramount importance.

The contrast with the political parties of Europe and the United States, which have increasingly specialized in the self-serving preservation of power at the expense of public welfare, could hardly be starker. If good medicine is what makes people healthy, and good economic management leads to fair prosperity, then good politics makes society wealthier, healthier and more cultivated. The more than 100 million members of the CPC represent approximately 7 percent of China's population: a disciplined, serving group that is increasingly meeting the demands of modern political management.

What there is to celebrate on the CPC's anniversary lies in the new form of political constitution that China has forged for itself through the CPC as its path into modernity. There are many approaches to understanding the history and work of the CPC. The date of 105 years gives us a fine occasion to thoroughly review them.

Chinese memory chip stocks surge

Upcoming Nasdaq debut of SK Hynix buoying performance of peer firms

By **MA SI**
masi@chinadaily.com.cn

Chinese memory-chip-related stocks surged on Monday, led by Shenzhen Longsys Electronics Co Ltd, partly as investors reacted to the impending US listing of South Korean memory chip giant SK Hynix.

Longsys jumped as much as 13 percent in early trading before consolidating gains to close at 681.8 yuan ($100) in Shenzhen. Other memory chip stocks followed suit. CECport hit the daily upside limit, while companies such as JCET advanced.

The sector's momentum was amplified by SK Hynix's upcoming Nasdaq debut. The chipmaker is set to debut on Friday, raising approximately $29 billion in what could be the largest-ever US IPO by a foreign company, Bloomberg reported.

The listing, to be conducted through American Depositary Receipts, or ADRs, under the ticker "SKHY," aims to bridge the valuation gap with US rival Micron Technology.

The timing coincides with explosive growth in the memory chip market. Market research firm Gartner said global chip sales are expected to approach 9 trillion yuan in 2026, up 64 percent year-on-year, with memory chip sales estimated at around 4.3 trillion yuan.

Market researcher TrendForce's latest memory pricing survey said the DRAM market will see extremely tight supply in the third quarter, with contract prices expected to rise 13 to 18 percent quarter-on-quarter. NAND Flash contract prices are likely to increase 10 to 15 percent quarter-on-quarter.

The booth of SK Hynix during an expo in Shanghai. LONG WEI / FOR CHINA DAILY

DRAM and NAND are key memory chips widely used in smartphones, PCs, tablets and other digital products.

While artificial intelligence inference and data center deployments continue to drive demand, price increases have moderated from previous quarters as consumer PC and smartphone customers reach their affordability limits, TrendForce said.

"AI remains the core driver," TrendForce added. Memory suppliers are shifting capacity toward higher-margin server products, constraining supply for consumer segments and keeping prices elevated even as PC and smartphone demand weakens.

The global supply shortage and surging AI demand for high-bandwidth memory have fueled the memory supercycle. Meanwhile, China's domestic memory industry is making strides, though a gap with Western leaders persists, experts said.

CXMT Corp, China's largest manufacturer of DRAM chips, is expected to launch its IPO later this year, while the listing plan of Yangtze Memory Technologies, China's only company capable of end-to-end 3D NAND flash chip manufacturing, has also received approval.

Shen Meng, director of Chanson & Co, a boutique investment bank, said market watchers are closely monitoring SK Hynix's Nasdaq performance as a potential reference for the two Chinese IPOs.

Roger Sheng, vice-president of research at Gartner, said that Chinese memory chip firms have made significant progress, but there remains a significant gap in both advanced technologies and production capacities between Chinese memory leaders and their global counterparts, pointing to substantial room for expansion.

COMAC eyes specialized aircraft mkt

By **LI JING**
lijing2009@chinadaily.com.cn

As Commercial Aircraft Corp of China (COMAC) seeks to deepen its global footprint, industry analysts say specialized aircraft could offer a more practical route into overseas markets than competing directly for commercial passenger aircraft orders.

That strategy was on display from Thursday to Saturday, when the Chinese aircraft manufacturer made its debut at the 21st Kazakhstan-China Commodity Exhibition in Almaty, showcasing a C909 medical aircraft in its first appearance in Central Asia, alongside a scale model of the C909 firefighting plane.

The exhibition highlighted COMAC's efforts to broaden the C909's overseas applications beyond passenger transport. While the regional jet has gradually expanded commercial services in Indonesia, Laos and Vietnam, the company has also developed business jet, cargo, medical, firefighting and emergency-command variants to create new export opportunities.

"Special-mission aircraft face lower competitive barriers to overseas markets than passenger aircraft and have the potential to become an important entry point for COMAC's international expansion," said Zhu Keli, founding director of the China Institute of New Economy.

The Kazakhstan appearance came less than a week after the C909, formerly known as the ARJ21, marked a decade of commercial operations. Since entering service in 2016, the aircraft has carried more than 37 million passenger trips, with 186 aircraft delivered to more than 10 customers, accounting for about 70 percent of China's regional jet fleet, according to COMAC.

The aircraft now operates in Indonesia, Laos and Vietnam, where it has carried more than 1 million passengers, and its international presence remains concentrated in Southeast Asia.

Analysts say Central Asia could become COMAC's next overseas growth market, reflecting both the region's operating conditions and deepening economic cooperation between China and Kazakhstan.

"The choice of a medical aircraft demonstrates a broader market strategy rather than simply promoting a single aircraft model," Zhu said.

The displayed C909 medical aircraft was converted from the baseline regional jet. The aircraft can be configured for different medical missions, including transporting medical teams, providing healthcare services in remote areas and evacuating patients.

The "flying hospital" is equipped with intelligent ophthalmic diagnostic and surgical equipment, enabling screening, imaging, surgery and rehabilitation onboard.

For Central Asia, the medical version addresses practical needs. Much of the region is characterized by vast territory, mountainous terrain and dispersed populations, while advanced healthcare resources are concentrated in major cities. Air medical transport can significantly reduce transfer times for critically ill patients, particularly in remote areas served by smaller regional airports.

"The C909's ability to operate at high-altitude airports, in high-temperature conditions and on relatively short runways makes it well suited to many regional airports across Central Asia," Zhu said.

Industry analysts say that advantage stems from the structure of the market. Airlines face high switching costs due to investments in pilot training, maintenance systems and spare parts inventories.

By contrast, specialized aircraft are typically procured by government health authorities or emergency agencies, with purchasing decisions placing greater emphasis on public service requirements, operating costs and bilateral cooperation than on airline fleet commonality.

"Special mission aircraft allow COMAC to avoid direct competition with established passenger aircraft in the early stages, while helping establish local maintenance capabilities and partnerships that could support future passenger aircraft sales," Zhu said.

COMAC has already pioneered this approach in Southeast Asia. The company showcased the C909 medical aircraft at the Singapore Airshow, and conducted its first overseas medical mission in Laos this year, where Chinese and Lao doctors carried out eye and ENT surgeries and training programs aboard the aircraft.

The latest push coincides with robust China-Kazakhstan economic growth.

China has been one of Kazakhstan's largest trading and investment partners. According to data from the General Administration of Customs, bilateral trade exceeded $48 billion in 2025. The cooperation under the Belt and Road Initiative has expanded beyond transport infrastructure into manufacturing, healthcare and advanced technology.

Kazakhstan has invested more than $35 billion in transport and transit infrastructure over the past 15 years and is accelerating development of the Trans-Caspian International Transport Route as companies seek alternative Eurasian trade routes amid geopolitical uncertainty.

"The region has the conditions to become another important overseas market after Southeast Asia," Zhu said. "It benefits from its proximity to China, expanding Belt and Road cooperation and growing demand for medical and emergency-response aircraft."

Zhu cautioned, however, that the market would likely develop more gradually than Southeast Asia, where commercial passenger operations expanded first.

In Central Asia, demand is expected to be driven initially by government procurement of medical and emergency response aircraft before broader regional passenger services emerge.

City building block for Lego's success

By **ZHENG ZHENG** in Shanghai
zhengzheng@chinadaily.com.cn

Legoland Shanghai Resort welcomed more than 2 million visitors in its inaugural year, ranking top in both first-year visitor numbers and guest satisfaction among Legoland resorts globally, said a senior official at its anniversary celebrations on Sunday.

"Legoland Shanghai delivered a very strong first year," said John Jakobsen, chief strategic portfolio development officer of Merlin Entertainments.

"This not only confirms the huge potential of China's family market, but also gives us strong confidence in the vitality of China's cultural tourism market."

Jakobsen described the resort in Shanghai as the biggest project that Merlin Entertainments has ever undertaken.

"Our expectations were high because this is a strong market for Legoland. The Lego brand is already famous in China, creating a fantastic foundation. We have never seen guests as satisfied and positive with their experience as those here in China."

Drawing from 58 years of Legoland experience across 10 parks worldwide, the Shanghai facility incorporates unique elements tailored to Chinese preferences. These include Monkie Kid Land, unique to Shanghai, and a custom-designed Miniland celebrating China's cultural landmarks. New food, beverage and retail concepts developed in Shanghai are also being replicated at Legoland parks globally.

"Legoland Shanghai has definitely been an inspiration and a beacon for what other Legoland parks can do in other countries," Jakobsen said.

Chen Jie, general manager of Legoland Shanghai Resort, said the park's most dedicated annual pass holder visited 254 times within the year. Annual pass holders from Shanghai — as well as Jiangsu and Zhejiang provinces — account for 76.5 percent of membership, while visitors from Beijing and the provinces of Guangdong and Shandong showed the fastest growth among long-distance provinces.

The park has maintained a roughly 50-50 split between ticket revenue and secondary consumption, with its main retail store becoming the top-performing Lego store nationwide, Chen said, adding that ride-hailing orders to and from Jinshan district where the park is located on the Didi platform after the resort's opening jumped 735 percent compared with the first half of 2025.

Zhuang Jian, chairman of Legoland Shanghai Resort and Party secretary of Shanghai New Jinshan Investment Share Holding Group Co Ltd, said Jinshan district welcomed over 20 million tourists since the opening of the resort, with revenue from cultural, sports and entertainment industries quadrupling.

Statistics show that Jinshan's total tourism revenue reached 6.78 billion yuan ($996 million), up 20.3 percent year-on-year, while the accommodation and dining sectors led citywide growth in 2025.

The resort's location in Jinshan offers accessibility to Shanghai's metropolitan area while connecting to the broader Yangtze River Delta region. Passenger traffic at nearby Jinshan North Station surged 44 percent since the park's opening.

On the anniversary date, China's first Legoland-themed train was unveiled on the G1509 route — running between Nanjing South and Sanming — offering passengers an immersive Lego experience with direct access to the station.

A view of Legoland Shanghai Resort. PROVIDED TO CHINA DAILY

The district has created bundled ticket products with local attractions, as visitors holding Legoland tickets can receive free access to multiple district attractions and discounts at 51 local businesses. The resort has also partnered with iconic Shanghai attractions — including Oriental Pearl TV Tower and Shanghai Zoo — to launch multivenue ticket packages.

Jakobsen emphasized the company's commitment to maintaining momentum.

"We continue to bring cutting-edge concepts and world-class experiences here for China," he said, adding that the success of Legoland Shanghai has created a platform that can be replicated in other Chinese cities.

Chery opens auto plant in S. Africa

PRETORIA, South Africa — Chinese automaker Chery has launched a manufacturing plant in Rosslyn, north of South Africa's administrative capital Pretoria, marking its transition into a local manufacturer and deepening its long-term commitment to the South African market.

Addressing the launch ceremony last week, Chery Chairman Yin Tongyue said the investment reflects the company's long-term commitment to South Africa.

"We have moved from being an importer to a manufacturer, and from a market participant to a long-term partner in South Africa's industrial story," he said.

Chinese Ambassador to South Africa Wu Peng said that two remarkable journeys have converged — the Rosslyn plant, a historic factory that embodies the legacy of South Africa's automotive industry, and Chery, a dynamic Chinese automaker, joining hands to move forward together.

"This partnership not only stands as a vivid testament to the deepening cooperation between China and South Africa, but also injects fresh momentum into our bilateral cooperation in the auto sector and opens up broader prospects for future development," Wu said.

According to Chery, production at the Rosslyn plant is scheduled to begin in mid-2027, with an initial output of 15,000 vehicles planned for the third and fourth quarters of that year. At full capacity, the plant is expected to produce 50,000 vehicles annually on a single-shift basis.

The company said that it has committed to retaining all 692 existing employees while creating nearly 3,000 direct and indirect jobs across manufacturing, supply chains and related services. It also plans to expand localization and develop the facility into a comprehensive automotive hub integrating research and development, manufacturing, supply chain operations and skills development.

The investment forms part of Chery's broader vision to establish South Africa as its African manufacturing, export, research and development, and operational headquarters, the company added.

Founded in 1997 and headquartered in Wuhu, East China's Anhui province, Chery operates in more than 130 countries and regions.

Briefly

Huawei releases Tau Scaling Law V2

Huawei has released the Tau Scaling Law version 2 paper, which details the tech giant's new chip innovation and relevant engineering information. It revealed the paper version 1 in May. The version 2 paper shows details regarding engineering implementation, actual measurement data and product evolution roadmap relevant to the main framework.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 19 pips to 6.8066 against the US dollar on Monday, said the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day. The central parity rate of the yuan against the greenback is based on a weighted average of prices offered by market makers.

5G, AI transforming manufacturing

China Mobile Zhejiang driving local enterprises to embrace smart production

By REN QI in Jinhua, Zhejiang
renqi@chinadaily.com.cn

In the bustling manufacturing hubs of Zhejiang province, a quiet but profound revolution is underway as the traditional hum of manual assembly lines is being replaced by the precise, synchronized movements of robotic arms and automated guided vehicles.

At the heart of this transformation is the integration of 5G networks and artificial intelligence, spearheaded by China Mobile Zhejiang Branch, which is empowering local enterprises to cultivate new quality productive forces and leap from traditional manufacturing to intelligent production.

The robust computing power driving this industrial evolution stems from the China Mobile Yangtze River Delta (Jinhua) Data Center. As one of the largest data centers in East China, the facility spans 280 *mu* (18.67 hectares) and is built to national A-level standards, earning a diamond five-star internet data center certification. With over 3 billion yuan ($441.6 million) already invested, it currently houses 13,000 racks with an IT capacity of 86 megawatts.

Recognized by the Ministry of Industry and Information Technology as a 2025 national-level green computing facility, it maintains an advanced power usage effectiveness of 1.24, saving 34 million kilowatt-hours of electricity and reducing carbon emissions by 18,000 metric tons annually.

A 5G-powered sun

Nowhere is the application of this computing power more evident than at Ronma Solar Energy Group's 5G smart factory in Jinhua, Zhejiang. As a State-level high-tech enterprise focusing on monocrystalline silicon solar cells and photovoltaic modules, Ronma Solar Energy Group has become a benchmark for the deep integration of high-end equipment manufacturing and the digital economy.

Walking into the factory's massive workshop, one is greeted by a futuristic scene: hundreds of automated guided vehicles navigate autonomously without magnetic strips or QR codes, relying instead on 5G-enabled visual navigation and AI algorithms for real-time dynamic mapping.

Xiong Zhoushi, general manager of China Mobile Jinhua Branch, highlighted the unprecedented scale and stability of this digital infrastructure. "Our factory spans 580 meters in length and 100 meters in width. We have over 800 devices, including 223 AGVs, all connected via 5G. Since it began operating, there has not been a single network interruption," Xiong said.

Xiong further explained the intricate automated workflow. "Our workshop has 14 process steps. For instance, after a battery cell completes the oxidation process, it is automatically loaded onto an AGV, which then follows programmed instructions to move seamlessly to the next production stage. Everything is unmanned and automatically controlled by our software systems. Our daily production capacity for battery cells is 3.78 million pieces, and actual output has reached 3.7 million. This 97 percent capacity utilization rate is currently the highest in the country's photovoltaic industry."

The integration of AI has penetrated every facet of Ronma's operations. The factory utilizes a digital twin platform that creates a precise 1:1 mapping of the physical production line. This allows for automatic roaming and first-person AI digital human inspections, which automatically pop up equipment ledgers as they pass by machines. This transparency even allows overseas clients to remotely check their order progress, reducing overseas client reception costs by 14 percent.

He Liang, dean of the Ronma Solar Research Institute, emphasized the transformative impact of these technologies on quality control and energy management.

"We've integrated AI visual inspection to replace manual checks, effectively solving issues like missed inspections and false positives. Our accuracy rate for identifying various defect categories now exceeds 90 percent, which has significantly reduced our labor needs," said He.

"Furthermore, we've implemented an intelligent AI model for parameter tuning during high-temperature processes. This model dynamically analyzes massive amounts of data to optimize variables, lowering energy costs by 9 percent. We also use predictive maintenance algorithms to detect hotspot risks, attenuation abnormalities and electrical connection issues before they cause downtime," added He.

Above: Staff members from China Mobile Jinhua Branch conduct equipment debugging at a workshop of Ronma Solar Energy Group in Jinhua, Zhejiang province, in November 2023. **Below:** An AI inspection robot patrols the production facilities of Zhejiang Shouxiangu Pharmaceutical Co in Jinhua in 2026 to verify that staff workers are following operating procedures. **Bottom:** A view of the China Mobile Yangtze River Delta (Jinhua) Data Center's server room in 2025. PHOTOS PROVIDED TO CHINA DAILY

> "A 120-minute AI short drama can now be completed in about two weeks. Our team can produce around 10 such dramas a month."
>
> **Lai Enhui,** AIGC head at Zhejiang Gewu Zhizhi Culture Media

Cross-industry renaissance

Beyond the energy sector, China Mobile's digital empowerment is catalyzing upgrades across diverse traditional industries.

In the textile industry, Zhejiang Truelove Blanket Technology Co, known globally as the "World Blanket King", has partnered with China Mobile to build the first cloud-based 5G textile intelligent inspection factory. Utilizing 5G's low latency and high reliability, the system monitors the operational status of 8,000 yarns in real time. If a yarn breaks or skips, the system instantly identifies it and halts the machine. Now, a single female worker can oversee 12 machines simultaneously. Defect lengths have been reduced by 90 percent, saving the company nearly 3 million yuan in annual labor costs.

Similarly, Zhejiang SAFUN Industrial Co, a national manufacturing single-champion enterprise, has utilized an AI research and development design agent to overhaul its development process. By leveraging intelligent parsing, virtual simulation and knowledge reuse, the company has slashed its research and development cycle from two months to just five days, which is expected to boost overseas orders by 30 percent annually.

In the traditional Chinese medicine sector, Zhejiang Shouxiangu Pharmaceutical Co has built the country's first "50G PON + Wi-Fi 7" 10-gigabit pharmaceutical park. The company is now taking its AI integration a step further with its "AI Ancient Formula" project. By utilizing a dual-model strategy of "Tongyi Qianwen + DeepSeek", the system digitizes ancient texts like *Danxi Xinfa* to automatically generate prescription plans. To support this, their computing resources are expanding from dual A100 GPUs to an 8-card A100 setup. Soon, an AI Q&A agent will allow managers to ask conversational questions like, "What was the wall-breaking qualification rate of *lingzhi* (ganoderma lucidum) spore powder in Workshop A last week?" and receive instant, data-driven answers.

Even the cultural sector is experiencing a digital renaissance. In Hengdian World Studios — known as China's Hollywood — the newly established Film and Television Cultural Industry Brain has accumulated over 3.9 billion pieces of structured data.

Lai Enhui, AIGC head at Zhejiang Gewu Zhizhi Culture Media, pointed out the drastic changes in production speed. "A 120-minute AI short drama can now be completed in about two weeks. Our team can produce around 10 such dramas a month," Lai said. Utilizing China Mobile's MoMA cloud model services, studios can render complex visual effects securely in days rather than months, while also pioneering new formats like AI comic dramas.

To ensure these technological leaps are not isolated success stories, China Mobile is actively working to replicate these models across the manufacturing spectrum.

Ni Jun, deputy manager of the government and enterprise department at China Mobile Jinhua Branch, outlined their strategic roadmap. "We are currently focusing on three major local industries: power tools, textiles and magnetic materials. Our approach is to first build a benchmark enterprise to extract standardized digital solutions," Ni said.

"We rely on our strong grid-based operational capabilities. In Jinhua, we have 74 grids covering all towns and streets. Our grid managers can visit factories door-to-door to discuss digital transformation plans. We diagnose each enterprise's current digital maturity and provide tailored AI scenarios — filling in exactly what they lack — to drive industrywide cost reduction and intelligent transformation," he said.

Jewelers tap tech for innovative marketing

By REN QI in Jinhua

In Yiwu, Zhejiang province, globally renowned as the "capital of small commodities", speed is the ultimate currency.

The city is home to over 8,000 jewelry enterprises and 3,000 factories, producing over 1 million types of products that are sold to more than 100 countries and regions. Accounting for two-thirds of the domestic market and two-fifths of the international market, Yiwu sees nearly 10,000 new trendy items launched daily. In this fast-fashion ecosystem, the ability to quickly produce high-quality visual marketing materials is vital.

Historically, jewelry companies relied heavily on human models and professional photography teams. A single product image could cost up to hundreds of yuan, and the production cycle often stretched to one or two weeks. This sluggish pace severely bottlenecked the rapid product turnover required in today's hyper-competitive e-commerce landscape, leaving smaller merchants struggling to keep up.

Sensing this critical market need, China Mobile Zhejiang Branch has formed an "AIGC + E-commerce Scenario Commando" team. After conducting in-depth research into the jewelry industry belt, they launched the "AI E-commerce Xingcan" platform.

Powered by advanced large language models and multimodal technology, the platform acts as a 24/7 "silicon employee". Merchants simply upload a smartphone photo of their product, and within 40 seconds, artificial intelligence generates a complete set of five commercial-grade images. A promotional video takes just three minutes.

Lin Muyun, owner of Zhuoheng Jewelry, has witnessed firsthand the transformative power of this technology. "Our company launches an average of 100 new products every day, which means we need to simultaneously generate 500 images and 200 videos for domestic and international platforms," Lin said. "With the AI platform, efficiency has surged by 90 percent, and our visual production costs have plummeted by 96 percent. The most direct impact is the noticeable increase in customer stickiness. Last year, our e-commerce client base grew by 12 percent, and our cross-border sales now account for 50 percent of our total business."

Lin emphasized that the true value lies beyond mere cost-cutting. "AI has eliminated massive amounts of hidden opportunity costs. In the past, we had a bloated workforce where highly skilled designers were trapped in repetitive 'cog-in-the-machine' tasks, sometimes spending three months revising a single image based on vague client feedback," Lin said. "Now, AI instantly visualizes ideas. It frees our core talent to focus on 'soul' tasks — actual product research, development and strategic operations."

The platform is also democratizing technology for smaller players. China Mobile has introduced a "token operation model" that provides inclusive computing power, lowering the barrier to entry for small and medium-sized enterprises.

For instance, Li Chong, owner of Qintong Jewelry, runs a shop with her college-aged daughter. By using the AI platform to generate personalized scene images and build a unique personal IP around her daughter's image, the mother-daughter duo saves between 500,000 yuan ($73,620) and 600,000 yuan in photography fees annually, allowing them to redirect their energy entirely toward product development and store operations.

As AI-generated content proliferates, concerns regarding copyright and platform compliance naturally arise. China Mobile has proactively integrated safeguards to protect merchants.

Hong Hui, project manager at China Mobile Jinhua Branch, has addressed these operational risks. "Before any commercial image is generated, the uploaded photos undergo strict automated compliance and copyright checks within our system, aligning with national data standards," Hong said.

New evidence details Japanese army's biochemical warfare

Document outlines records, coordinated crimes carried out by military units

By ZHOU HUIYING in Harbin
zhouhuiying@chinadaily.com.cn

The Exhibition Hall of Evidences of Crime Committed by Unit 731 of the Japanese Imperial Army in Harbin, Heilongjiang province, has released newly examined evidence documenting atrocities committed during the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

The evidence consists of registration files for the Imperial Japanese Army's Kwantung Army Chemical Department.

Established in 1939 in Qiqihar, Heilongjiang province, the department, also known as Unit 516, was primarily responsible for the Japanese army's research and use of chemical weapons in China.

Dedicated to the development of nerve, blister, choking and irritant agents, it was one of Japan's core chemical warfare units.

The newly released document is a standardized record completed by former members of Unit 516 upon their return to Japan after the war, making it an important official military record.

The newly released evidence.
HE SHAN / XINHUA

The document was transferred to the National Archives of Japan in 2000 and was gradually declassified.

During an evidence collection trip to Japan in 2023, researchers from the museum obtained the document after extensive searches, communication and negotiations. Following systematic collation and research, its contents have now been made public.

The document contains 148 pages covering information on 108 individuals, including military-affiliated appointed civil officials, military-affiliated employees, army technical warrant officers, military-affiliated servants, army medical lieutenants, veterinary corporals, artillerymen and chemical technicians.

"It is a standardized document used by the Japanese government to record the demobilization of Japanese soldiers after the war," said Jin Shicheng, director of the museum's education and publicity department.

"It includes information such as names, places of origin, family information, military branches, landing times and locations, ranks, prewar units, times and places of disarmament, and postwar experiences."

"The initial establishment of Unit 516 involved 250 personnel," Jin said. "Following the discovery and publication of a personnel roster of Unit 516 in 2022, it was confirmed that the unit had 414 members."

"The newly released document records 108 individuals. After systematic sorting and verification, 17 duplicate records were identified, bringing the known number of personnel in Unit 516 to 505," he said.

"Due to frequent transfers, secondments and temporary assignments during the war, the figure does not represent the total number of individuals who served in Unit 516," Jin added. "Further historical materials are needed to complete the record."

Previous research, based on confessions by convicted Japanese war criminals, confirmed that Unit 516 collaborated with Unit 731 and Unit 100 to carry out poison gas experiments.

"In the newly released document, information on former member Hiroshi Kusunoki clearly shows his participation in veterinary training at the education department of Unit 100 while serving with Unit 516, further demonstrating the close cooperation between Unit 516 and Unit 100," Jin said.

"Combined with previous research, the records confirm that Units 731, 516 and 100 formed a biochemical warfare system covering humans, animals and the environment through personnel exchanges and technology sharing."

Jin said the document provides crucial evidence for a more comprehensive understanding of the scale, organizational structure, coordinated crimes, personnel transfers and postwar trajectories of Unit 516.

"It further confirms that Japan's wartime chemical warfare crimes were large-scale, organized crimes carried out through a top-down system," he said.

Vlogger wins 500,000 yuan for viral Xizang video

By DAQIONG in Lhasa
and **GUO YANQI**

A viral video documenting a 2,229-kilometer taxi journey from Chongqing to Lhasa, Xizang autonomous region, has earned Chinese vlogger Li Yaode a 500,000 yuan ($73,574) reward from regional authorities, most of which he said he will donate, prompting discussion over tourism promotion, public incentives and the influence of online creators.

The reward came less than a month after Xizang's cultural and tourism authorities launched a program offering tiered awards for original tourism videos promoting the region. The top prize of 500,000 yuan is available for videos that receive more than 5 million likes and become online sensations.

Authorities in Xizang announced on Sunday that Li's 22-minute video, posted the previous day, had met the criteria for the top award. They said the video generated significant organic online engagement and that the prize would be paid promptly.

In the video, Li is seen leaving Chongqing on June 26 in an electric taxi and arriving at the Potala Palace in Lhasa on Thursday. During the weeklong journey, he documented scenery, local cuisine and encounters along National Highway G318, while two taxi drivers from Chongqing took turns behind the wheel.

Upon arrival in Lhasa, Li said the journey reminded him to remain brave and free.

"Do not care too much about how others see you," he said. "Life is meant to be experienced."

By Monday afternoon, the video had garnered more than 21 million likes, over 1.7 million comments and 9.9 million shares on Douyin, the Chinese version of TikTok.

In a statement on Sunday, Xizang's cultural and tourism authorities thanked Li for promoting the region, saying the reward recognizes high-quality cultural and tourism content while demonstrating the authority's commitment to providing incentives for eligible works.

The department also invited more content creators to document Xizang's natural landscapes, intangible cultural heritage and everyday life.

In a follow-up video posted after the award was announced on Sunday, Li said he would give each of the two taxi drivers 10,000 yuan and donate the remaining 480,000 yuan.

The video's popularity sparked widespread online discussion.

Many netizens said it has inspired them to travel and presented a vivid and personal portrait of Xizang. Others praised the authorities for honoring their public commitment to reward outstanding content creators.

Li's donation plan also prompted suggestions from the public. Some urged him to donate directly to schools, families or individuals in need rather than making a one-time donation to an organization. Others suggested he work with Xizang authorities to support local communities so that the reward would, in turn, benefit the region.

Media commentaries praised the incentive program while also urging caution against blind imitation.

Li Qinyu, chief commentator at The Paper, said Xizang's fulfillment of the reward promise could encourage more creators to participate in tourism promotion, shifting the model from official publicity toward broader public participation.

However, Beijing News noted that Li's taxi journey to Xizang was expensive and difficult to replicate, warning of risks including altitude sickness, slippery mountain roads and rapidly changing weather. The newspaper also suggested that reward programs could consider additional indicators beyond the number of likes, such as increases in tourism-related searches, inquiries and bookings.

Nanjing former official gets death sentence for bribery, other offenses

By CAO YIN
caoyin@chinadaily.com.cn

Yang Youlin, former executive deputy director of the administrative committee of the Nanjing economic and technological development zone in East China's Jiangsu province, was sentenced to death on Monday by the Changzhou Intermediate People's Court after being convicted of multiple crimes, including accepting more than 2.2 billion yuan ($324 million) in bribes.

The court sentenced Yang to death for accepting bribes, deprived him of his political rights for life and ordered the confiscation of all his personal assets.

He was also sentenced to 11 years and six months in prison and fined 1 million yuan for embezzlement, 11 years in prison and a 1 million yuan fine for offering bribes, five years for misappropriation of public funds, four years for abuse of power, and six months in prison plus a 100,000 yuan fine for money laundering.

Combining all the sentences, the court imposed the death penalty. His illegal gains and related proceeds were ordered to be confiscated and turned over to the State treasury, according to the ruling.

The court said that from 1993 to 2023, Yang exploited a series of positions in Nanjing, including as an adviser to the Nanjing Niushou Mountain Cultural Tourism Zone and executive deputy director of the administrative committee of the Nanjing development zone, to seek benefits for others in project contracting, business operations, land transfers and capital turnover in exchange for bribes totaling more than 2.2 billion yuan.

From 2014 to 2016, while serving as executive deputy director of the administrative committee of the Nanjing development zone, Yang colluded with others to embezzle 12 million yuan in public funds, the court said. Between 2005 and 2023, he offered more than 25 million yuan in bribes to officials to obtain improper advantages.

From 2001 to 2002, while serving as director of the construction bureau in Jiangning district, Yang twice misappropriated a total of 15 million yuan from State-owned enterprise funds under the bureau for use in others' business operations.

From 2003 to 2009, while serving as director of the district's construction bureau and deputy head of the administrative committee of the district's development zone, Yang abused his power by unlawfully arranging land expropriation, demolition and construction projects, causing serious adverse social effects. He also illegally rebated land transfer fees, resulting in State financial losses of 23 million yuan.

In addition, Yang concealed and disguised 1 million yuan in criminal proceeds from bribery by lending the money to a company under his control, the court said.

The court said Yang's crimes warranted the death penalty because the amount of bribes he accepted was "extremely large", the circumstances were "extremely serious", and the losses caused to the country and the people were "extremely huge".

Although Yang reported criminal activities committed by others, which was verified as meritorious service, the Changzhou Intermediate People's Court said the nature, circumstances and social harm of his bribery offenses meant such service did not justify a more lenient sentence.

The case was publicly heard on March 18 and April 28. Prosecutors and Yang's defense lawyers presented evidence and arguments during the hearings, which were attended by more than 30 people.

Public records show that the 69-year-old Nanjing native began his career at a local engine plant in October 1976.

He became head of the housing and urban-rural development bureau in Jiangning district in 2000, deputy head of the district's development zone administrative committee in 2002, executive deputy director of the Nanjing development zone administrative committee in 2012, and chairman of the Nanjing Niushou Mountain Cultural Tourism Company in June 2016.

Under Chinese law, a death sentence handed down by a lower court must be reviewed and approved by the Supreme People's Court before it can be carried out.

Gansu visit sparks intl praise for poverty alleviation

By MA JINGNA and **HU YUMENG**
in Lanzhou

China's poverty alleviation experience garnered praise from political party representatives and think tank experts from 27 countries during a recent tour of Gansu province, where they witnessed the transformation of one of the country's once-poorest regions into a model of poverty alleviation and rural vitalization.

The visit, organized by the International Department of the Communist Party of China Central Committee, included a stop in Bulenggou village in Dongxiang county, Linxia Hui autonomous prefecture, where delegates observed firsthand how targeted poverty alleviation and industrial development have transformed the local community.

Speaking at the Party School of the CPC Gansu Provincial Committee in Lanzhou, Nie Dianzhong, vice-president of the school, said the nation's poverty alleviation efforts combine practical technologies, institutional innovation and a development philosophy focused on preventing households from slipping back into poverty while fostering people's motivation for self-development.

As an example, Nie highlighted Gansu's digital monitoring platform, which integrates data from several government departments to identify households at risk of returning to poverty and provide targeted assistance within a 48-hour period.

"I believe much of China's poverty alleviation experience offers valuable lessons for developing countries, particularly those across the Global South," Nie said, adding that exchanges such as the visit help deepen mutual understanding and promote mutual learning.

The delegates echoed that assessment.

Aklesso Atcholi, executive secretary of the Union for the Republic of Togo, who led the delegation, said China's success in eradicating absolute poverty has contributed "Chinese wisdom and Chinese solutions" to global poverty reduction efforts. He said Togo hopes to strengthen exchanges with China and learn from its experience in poverty alleviation and grassroots governance.

Liam Isaac Ellis, a central committee member of the Communist Party of Australia, described China's approach as "an excellent model" as it empowers people to overcome poverty themselves rather than rely solely on financial assistance.

"This is a much more sustainable approach," he said.

Ellis added that what impressed him most was China's determination to pursue poverty alleviation without settling for "compromises and half measures".

For Wazim Dill Mohammed, an alderman of the Couva-Tabaquite-Talparo Regional Corporation in Trinidad and Tobago, the most striking impression was Gansu's journey of transformation.

"Having been told this was one of the poorest regions here, and having seen photographs of dirt roads and mud roads, seeing what it has become today, I am shocked and amazed," he said.

Hu Changsheng, secretary of the CPC Gansu Provincial Committee, said Gansu was once one of China's principal battlefields in the fight against poverty. Through targeted measures, stronger support mechanisms and coordinated efforts at all levels, the province eliminated absolute poverty along with the rest of the country and is now working to consolidate those gains through rural vitalization and high-quality development.

Wu Yuexuan contributed to this story.

Job initiatives address labor market imbalances

Measures taken to ensure opportunities for record number of graduates

By ZOU SHUO in Beijing
and **LIU KUN** in Wuhan

China has dramatically expanded its targeted employment programs and industrial alignment strategies as a record 12.7 million college graduates enter the workforce this year. Following the State Council's recent approval of the 15th Five-Year Plan (2026-30) for employment, local governments are expanding funding for initiatives ranging from rural vitalization roles to high-tech manufacturing subsidies to combat structural mismatches in the labor market.

The national push follows strong economic markers from last year, when China added 12.67 million new urban jobs and maintained a surveyed urban unemployment rate of 5.2 percent. However, with the 2026 graduate influx, provincial authorities are pivoting toward even more localized talent placement.

In Henan province, the government has doubled its flagship rural vitalization assistant program, scaling recruitment from 5,000 posts last year to 10,000 this year. The two-year program offers fresh graduates a monthly salary of 3,500 yuan ($515), social insurance and a transitional window to prepare for civil service exams while assisting in village governance and rural e-commerce.

"Going back to a village is not necessarily a bad thing for young people," said Zhao Keqing, a 2025 graduate of Shangqiu Normal University working in rural Henan. "There is a lot we can do in the vast countryside."

Since last August, she has helped organize cultural activities for seniors and facilitated the installation of table tennis tables and chessboards for local children.

"Now I see them playing in our courtyard every day. It really gives me a sense of recognition and fulfillment. For a fresh graduate, that feeling of being valued is very important," she said.

Zhao views the two-year role as a valuable transitional period for graduates facing job market pressures.

"I can take civil service or public institution exams during my term. This position gives me a chance to try things out, to see what I'm really suited for," she said. "No matter what I do in the future, the experience of working at the village level is something no other job can give me."

For postings like Zhao's, the main responsibilities include consolidating poverty alleviation achievements, promoting rural industries and assisting in village governance. Many have used their professional expertise to lead villagers in e-commerce livestreaming, planting Chinese medicinal herbs and cultivating ornamental flowers.

In 2025, 461,400 job positions were created in Henan through 53 targeted measures. The province's total skilled workforce now exceeds 20 million, according to the provincial government.

Song Chenyang, a 2025 master's graduate from Henan Polytechnic University, took a different path through the university's student enterprise service program.

She was hired by Wafer Works (Zhengzhou) Corp, a semiconductor company in the Zhengzhou Airport Economy Zone, under a special government program for the classes of 2023, 2024 and 2025 who had yet to find stable jobs. The company designed a three-month systematic training plan and a mentorship mechanism to ease her transition from campus to industry.

Zhang Chunyang, of the company's recruitment department, said that as a technology-intensive enterprise in rapid expansion, the company used to favor experienced engineers. Last year, however, it began recruiting recent graduates for the first time.

The company pays competitive wages and provides full social insurance coverage, while the provincial government provides a monthly subsidy of 2,200 yuan to the company per hire. The program recruited some 10,000 university graduates across Henan in 2025.

Workers produce automotive electronics at a factory in Guangshan, Henan province, in May. The county offers a series of policies to encourage farmers and migrants to secure jobs near their homes. XIE WANBAI / FOR CHINA DAILY

Emerging industries

Further south in Hubei province, where 306,500 new urban jobs were created in the first quarter of 2026 alone, employment strategies are targeting logistics and cutting-edge industries.

Zhang Qian, a 32-year-old former migrant worker, started as a sorter at Ezhou Huahu International Airport — Asia's first dedicated cargo hub — and within two years became a terminal operations supervisor, earning more than 10,000 yuan a month.

Xu Haiyan, who once worked in aviation logistics in Hangzhou, Zhejiang province, returned home to become a human resources supervisor at the same airport. The airport has directly employed nearly 2,000 local residents.

At an artificial intelligence research institute in Ezhou, Wang Shiyun, 25, a master's graduate in computer science, decided to work in the city thanks to the stable accommodation support — a clean, comfortable three-bedroom apartment in a residential complex, shared with just one other person.

She is one of nearly 30 young researchers at the institute, which was established to build a full AI industry chain.

"I don't need to rush to work and can live and work in a calm and easy environment," she said.

Skills training is a key pillar of the strategy. In Hubei's Shiyan, a traditional auto hub, Quan Rongxuan, an uncertified welder, joined a government-funded training program, earned certification, and now earns up to 10,000 yuan a month.

For older workers, caregiver training has opened new paths. Zhu Fengjiao, 56, returned from Guangzhou, Guangdong province, to start a training school in Ezhou. Her "Ezhou caregiver" brand has produced graduates working as far away as Beijing.

Upskilling

In Guangdong, the nation's manufacturing epicenter, the strategy has focused heavily on upskilling. The province created nearly 1.5 million new urban jobs in 2025, largely supported by its industry-education-evaluation skills ecosystem. Rather than just training students, the program trains the educators.

Recently, nearly 100 teachers from dozens of technical schools underwent intensive retraining at robotics hubs like Kuka Autonomous Mobile Robotics in Foshan to align classroom curricula directly with modern factory floor demands.

Lin Lishan, a teacher from Guangdong Technician Institute, said through the program, she has further clarified the path for intelligent manufacturing professional development, updated her teaching concepts, and improved her course development and practical teaching abilities.

Huang Qiongying from Guangzhou Electronic Commerce Technical School described herself as a translator between industry and education. "As front-line teachers, we are not just knowledge transmitters but translators between industry and education. This training was not just an update of knowledge but a journey of teaching transformation," she said.

Guangdong has also launched the "million talent heading for Guangdong" initiative, which has attracted more than 1.1 million college graduates to the province for work and entrepreneurship.

During the 14th Five-Year Plan (2021-25) period, Guangdong provided over 10 million subsidized vocational training sessions, according to the provincial government.

Guangdong creates around 300,000 policy-supported jobs annually and holds more than 2,000 online and offline recruitment events. Graduates facing difficulties receive one-on-one assistance, the government said.

The province also works to stabilize employment for migrant workers. Through interprovincial labor cooperation, Guangdong has helped secure jobs for more than 24 million out-of-province migrant workers, including over 4.6 million people who have been lifted out of poverty, it added.

'Sprint' aims to secure jobs for new workforce entrants

By ZOU SHUO

The Ministry of Education has launched a "100-day sprint" employment initiative for the 2026 graduating class, running from June to August, to help college graduates secure jobs during the critical period before and after leaving campus, according to a notice issued by the ministry recently.

The notice said efforts should be made to create a favorable environment for graduate employment and to promote higher-quality and fuller employment for new graduates.

A record 12.7 million college graduates are expected this year, according to figures previously released by the ministry.

Education authorities and universities have been urged to accelerate the implementation of employment-support policies, using quizzes and short videos to raise awareness of social security subsidies, tax incentives and startup loans, the ministry said.

In provincial regions, universities, schools and departments where employment progress lags, institutions should establish one-on-one contact with local human resources officials. They should also conduct targeted visits to companies and organize small-scale, specialized campus job fairs.

Recruitment for policy-backed positions, including civil service posts, public institutions and State-owned enterprises, will be accelerated, with all hiring scheduled to be completed by the end of August.

Targeted assistance will be provided to disadvantaged graduates through one-on-one support and employment capacity-building initiatives. Each disadvantaged graduate will be offered at least three stable job opportunities.

Strict regulations governing employment data reporting will be enforced, with violations subject to serious penalties. Continuous tracking and support will also be provided after graduates leave campus to ensure uninterrupted employment services.

The ministry has called on local education departments and universities to implement the "top-leader responsibility system" for employment and strengthen accountability.

During the campaign, more than 4,000 campus job fairs are expected to be held nationwide, providing over 5 million job vacancies. The National College Student Employment Service platform will host more than 10 themed online job fairs, offering more than 1.5 million positions, the ministry added.

Efforts to help vulnerable college graduates secure employment have intensified, with universities and provincial authorities rolling out targeted support mechanisms.

At Huazhong University of Science and Technology in Wuhan, Hubei province, a "university-college-class" three-tier mechanism has been established to create individual files and tailored plans for each struggling student, according to Liu Bo, the university's Party secretary.

The university conducts nearly 300 organized corporate visits annually, holds around 2,000 job fairs, and has developed over 300 research assistant positions through major national sci-tech innovation platforms, he said.

More than 3 million yuan ($443,000) in job-seeking subsidies is distributed each year. As a result, in recent years, all vulnerable graduates who wish to work have secured jobs — a 100 percent placement rate. Nearly 80 percent of them have entered strategic emerging industries, and more than 90 percent have taken jobs in key national development regions, he said.

In Yunnan province, the employment of college graduates, especially those facing difficulties, has been made a top priority. The goal is to ensure that no student is left behind on the path to employment, said Yang Hongqiong, a senior provincial education department official.

A pairing mechanism involving 28,000 teachers has been established to assist 71,000 struggling graduates, with more than 201,000 support sessions provided. The province has allocated an annual special fund of 8.25 million yuan, which has so far trained 63,300 disadvantaged graduates, she said.

Special employment assistance campaigns are also carried out for graduates with disabilities, female college graduates, retired military personnel graduates, and those majoring in medicine, she added.

Graduates take part in a career fair at Zhengzhou University in Zhengzhou, Henan province, in March, where some 300 enterprises offered about 10,000 positions. ZUO DONGCHEN / FOR CHINA DAILY

CULTURAL 文明中国 HERITAGE

Bridging past and future

Old structures tell lasting stories as tradition meets innovation, ensuring remarkable landmarks remain part of everyday life, **Yang Xiaoyu** reports.

On an early summer afternoon in Taishun county, a mountainous region of Wenzhou city in Zhejiang province, tourists stroll across Beijian Bridge, a quaint wooden arch bridge spanning a river teeming with red carp. Partly veiled by ancient trees, its weathered red structure stretches 51 meters and is topped by a covered corridor with tiled roofs, flying eaves and carved dragons.

First built in 1674 and rebuilt and repaired several times over the centuries, Beijian Bridge is one of Taishun's 32 historical covered bridges, known in Chinese as *langqiao*. The term was coined in the 1940s by architect and historian Liu Dunzhen, who encountered such bridges "traversing rivers like rainbows with covered houses on top" during his travels in China's southwestern provinces.

The covered corridor shields the timber structure from the elements while providing shelter for travelers.

"I grew up by the Beijian Bridge," says Chen Songnian, deputy director of the Taishun Museum, pointing toward his ancestral house nearby. "Every day I crossed it on my way to school and often came here to hang out with friends."

Chen was speaking during a media trip organized by the National Cultural Heritage Administration to highlight achievements of the Three-Year Action Plan for the Protection of Covered Bridges (2023-25). The tour took journalists to Taishun in Zhejiang, and the counties of Shouning and Pingnan, both in Ningde city, Fujian province, an area of mountains and deep ravines.

"Covered bridges were the heart of local communities," Chen says. "They not only connected villages but also served as shelters, marketplaces, information hubs, and places of worship. Today, they remain deeply woven into the cultural identity of the Taishun people."

Jointly launched by the Publicity Department of the Communist Party of China Central Committee, the Ministry of Culture and Tourism, and the National Cultural Heritage Administration, the action plan recognized covered bridges as an independent category of cultural relics for the first time, strengthening their protection, research and public use.

Over the past three years, a nationwide survey documented 2,193 covered bridges as cultural relics, an increase of more than 61 percent, while conservation efforts have improved significantly nationwide.

Chen Songnian, deputy director of the Taishun Museum in Wenzhou, Zhejiang province, has had a bond with the historic Beijian Bridge since childhood.

Engineering masterpiece

The mountainous borderlands of Fujian and Zhejiang are home to more than 800 covered bridges, one of the world's largest concentrations. More than 100 historic examples, including Beijian Bridge, embody "the traditional design and practices of Chinese wooden arch bridge building".

The craft was inscribed on UNESCO's List of Intangible Cultural Heritage in Need of Urgent Safeguarding in 2009 after urbanization, timber shortages and a dwindling number of master builders threatened its survival. Renewed efforts by governments and local communities led to its transfer to UNESCO's Representative List of the Intangible Cultural Heritage of Humanity in 2024.

Experts trace the origins of Chinese wooden arch bridges to the Northern Song Dynasty (960-1127), as depicted in the famous 12th-century scroll *Along the River During the Qingming Festival*.

According to Su Xudong, a veteran scholar from Pingnan who helped prepare the UNESCO nomination, the defining feature of the craft is the beam-weaving technique. Using *sunmao* (mortise-and-tenon) joints, craftsmen interlock timber beams into a sturdy arch resembling an upside-down basket.

"The beam-woven arch achieves the largest span of any all-timber structure in the world to date," Su says. "Its wide span reduces the number of piers, allowing floodwaters and boats to pass more easily while also lowering construction costs."

In 2012, the Fujian-Zhejiang Wooden Arch Covered Bridges, nominated by seven counties across the two provinces, were added to China's tentative list seeking World Cultural Heritage status. They were included again in the updated 2025 list. This sustained presence signals that the bridges may be moving closer to meeting World Heritage criteria, experts note.

Rising from the ashes

Yet, these treasured bridges remain vulnerable to disasters, particularly floods and fires.

In September 2016, Typhoon Meranti triggered flash floods that swept away three nationally protected Taishun bridges — Xuezhai, Wenxing and Wenzhong — in just two hours.

"It was a devastating day for the people of Taishun. Many broke down in tears," recalls Zeng Jiakuai, a national-level inheritor of the traditional design and practices for building Chinese wooden arch bridges.

"But even before the floodwaters receded, local residents spontaneously joined the rescue effort, salvaging more than 90 percent of the wooden components and drying them in their own courtyards, making the restoration possible," he says.

Zeng led the restoration of Wenxing Bridge. Working alongside cultural relics departments and experts, his team followed the principle of "using original components, original materials and traditional craftsmanship whenever possible". With government and community support, all three bridges were rebuilt the following year, preserving their historic character and structural integrity.

In 2021, the restoration of Taishun's wooden arch bridges became the only Chinese case included in the ICOMOS-ICCROM publication, Analysis of Case Studies in Recovery and Reconstruction.

A year later, tragedy struck again. In August 2022, Wan'an Bridge in Pingnan — China's longest surviving wooden arch-covered bridge at 98.2 meters with six arches — was destroyed by fire. Originally built in the 11th century, it had survived repeated restorations following earlier fires and floods.

The disaster prompted urgent state action, leading to the launch of the Three-Year Action Plan.

Huang Minhui, a municipal-level inheritor of traditional wooden arch bridge-building techniques in Ningde, led the Wan'an restoration as his family has a long-standing history of rebuilding and repairing the bridge.

Like the Taishun project, the team adhered to the principles of minimal intervention and "restoring the old as old". Over 200 surviving wooden components were salvaged, polished, treated with preservatives, and reused. When the bridge reopened in August 2024, visitors could see fire-scarred original pieces integrated with new ones — a deliberate reminder of the bridge's history.

Modern armor

The disasters in Taishun galvanized public support for stronger protection and accelerated legislative efforts.

In 2017, local community leaders proposed specific laws. Four years later, the nation's first local regulation, the Wenzhou Taishun Covered Bridge Protection Regulations, was enacted. Detailed implementation rules followed in December 2023, adopting a "one bridge, one policy" approach for the county's 32 historic covered bridges.

Hu Rong'en, a professor at Shanghai University of Political Science and Law, commends the legislation: "Protecting covered bridges through legislation helps regulate activities that may affect them, including rural construction projects, while also supporting their bid for World Heritage status."

Taishun's efforts have inspired neighboring regions. Ningde promulgated regulations in January 2024; Nanping (in Fujian)'s will take effect on Oct 1; and Lishui, in Zhejiang, is advancing its own.

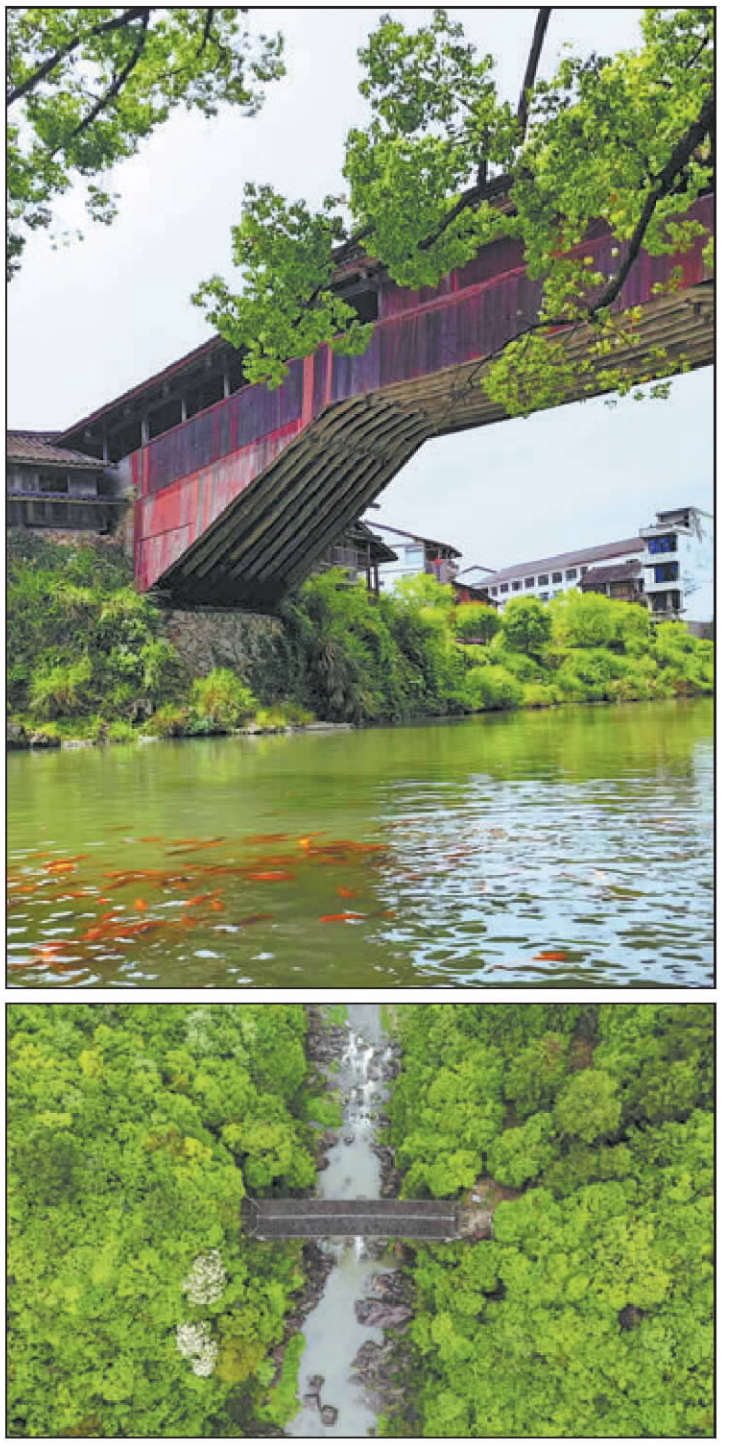
Beyond legislation, technology has become another vital layer of protection.

Many of the bridges stand deep in the mountains, accessible only by winding roads, making routine inspections especially challenging during bad weather.

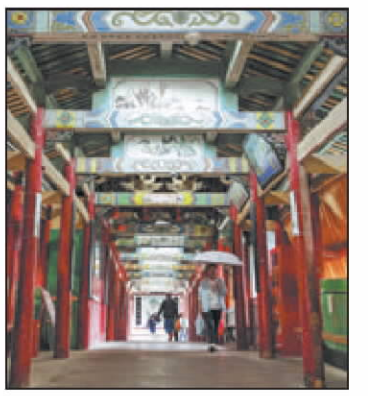
At the Taishun Museum, housed in a building shaped like a covered bridge, Chen, the deputy director, demonstrates the Taishun Cultural Heritage (Covered Bridges) Supervision and Protection Platform.

"We have equipped our covered bridges with AI-powered thermal imaging cameras. If abnormal temperatures or open flames are detected, the system immediately triggers an alarm to warn people on the bridge to evacuate, while simultaneously alerting the monitoring center," Chen says.

"In addition to smart cameras, Taishun's ancient covered bridges are fitted with temperature-sensing cables and devices that monitor traffic and water flow," he adds. "The platform issues an alert whenever it detects unusual activity."



The platform, launched in 2022, integrates data from the firefighting, water conservancy, meteorology, and law enforcement departments, and links over 700 intelligent monitoring terminals countywide.



"These technologies have made the work of grassroots heritage guardians much easier," Chen says.

In Ningde, Fujian, the province's first video monitoring and early warning platform for wooden arch bridges now provides round-the-clock intelligent surveillance.

"Many covered bridges have been equipped with firefighting IoT devices including smoke alarms, thermal imaging cameras, and automatic sprinklers," Ou Donghai, director of the Ningde Cultural Heritage Protection Center, told reporters at the Baixiang Bridge in Pingnan, which was destroyed by fire three times throughout its history.

Ou says Ningde is also working with universities on high-precision 3D laser scanning and BIM (building information modeling). "These tools support daily monitoring and can simulate disasters such as fires and floods, helping improve emergency planning and response," he says.

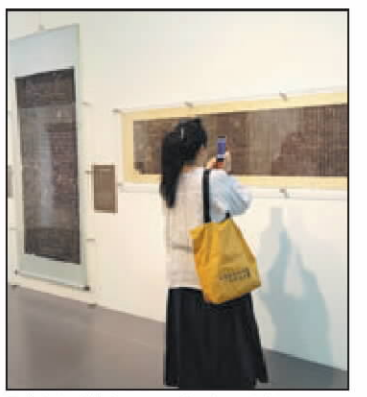
Chiseling history into stone creates enduring legacies

By **WANG RU**
wangru1@chinadaily.com.cn

Inscribed stone tablets, a marvelous combination of calligraphy and carving, stand as silent poetry, etching history into eternity. For millennia, Chinese literati have turned to stone to immortalize their words, believing that only through the chisel could the emotion and spirit in their calligraphy outlast time itself.



An ongoing exhibition, *The Inheritance and Glory of Craftsmanship of Suzhou Stone Inscription*, at the Beijing Stone Carving Art Museum, brings this ancient tradition into focus. Featuring the forgotten carvers and the enduring legacy of inscription mastery in present-day Suzhou, Jiangsu province, the exhibition runs until Aug 9.

According to Li Qing, the museum's director, in ancient China, craftspeople were often required to carve their names on the artifacts they made so that each piece could be traced and remain enduring enough to be passed down through generations. The system, which began in the Spring and Autumn Period (770-476 BC), lasted for more than two millennia.

Following this system, the exhibition guides visitors on a journey that traces the stele-carving techniques of the Song Dynasty (960-1279) in Suzhou through 45 rubbings of precious stone tablets from the Suzhou Museum of Inscribed Stone Tablets, thereby paying tribute to lesser-known carvers.

"In the Song Dynasty, when Suzhou flourished, its tablet carving also became prosperous," says Wang Yihan, curator of the display. "Carvers emerged as recorders of their times and immortalized the city's memories, secrets of star maps, geographical outlines, and emperors' lineage on stones, creating four famous tablets that still stand as national treasures at the Suzhou Confucian Temple today."

The four tablets' rubbings are highlights of the exhibition. They show the city layout of Pingjiang prefecture (now Suzhou), a star map based on celestial observations, the geographical reach of the Northern Song (960-1127) era, and the emperors' lineage from Huangdi, known as the Yellow Emperor, the first ancient emperor of Huaxia, ranked first among the "Five Emperors" and revered as the "Primordial Ancestor of Chinese Civilization", to Emperor Lizong of the Southern Song (1127-1279) period.

Tablet rubbings on display at the Beijing Stone Carving Art Museum show how history is etched into eternity. PROVIDED TO CHINA DAILY

Among them, two rubbings of Suzhou's layout are showcased, demonstrating one of the earliest Chinese efforts to restore cultural relics. More than 700 years after the stele was created, Suzhou scholar Ye Dehui and several others noticed it in 1917, though by then it was severely weathered. However, they managed to restore it. The two rubbings show the tablet before and after its restoration, says Wang.

In the Ming Dynasty (1368-1644), literati gathered in Suzhou, which was then the cultural and economic center of the Jiangnan region (the area south of the lower reaches of the Yangtze River). Their close cooperation with the carvers became a legend at the time, helping forge the careers of some famous carving families.

Another rubbing on display shows a stele erected to pay tribute to Northern Song politician and writer Fan Zhongyan (989-1052). The image of Fan on the tablet appears grand in posture, gentle yet firm, alongside words commending his contributions.

According to Wang, Suzhou has many steles commemorating Fan because of his service as the top administrative official there. He made many contributions, the most important of which was the development of education.

"Fan established Suzhou Prefectural School, one of the largest and earliest schools in that era, which was also the Suzhou Confucian Temple. The pattern of functioning as both a school and a temple to worship Confucius influenced many other areas," says Wang.

"The school's establishment also laid a solid foundation for Suzhou to become a place that values the cultivation of talented people. In its later history, it produced more than 3,000 people who successfully passed the imperial exams and 51 top candidates," she adds.

The stele was carved by Wu Yingqi, a member of the Wu family, which was known in the Jiangnan area for its members' proficiency in tablet carving since the Yuan Dynasty (1271-1368).

"The Wu family worked as carvers for generations. With their stable carving techniques and profound understanding of calligraphy, they were deeply involved in the artistic creations of literati in the Jiangnan area," says Wang.

"Every chisel mark reveals the craftsman's heart; every stone tablet records the passage of time. This is the strength and spirit that runs through the exhibition," she adds.

The therapeutic power of lotus flowers

Struck by rheumatoid arthritis, renowned late ink artist is celebrated in a new exhibition in which her early-to-late works trace the evolution of her career, **Lin Qi** reports.

In the early 1980s, ink artist Zhou Sicong (1939-96) faced an illness that could have jeopardized her successful career. She was struck by symptoms of rheumatoid arthritis (RA), including joint deformities in her hands. She was hospitalized from time to time, which is why she could no longer devote herself fully to painting, nor could she travel into nature as she once loved to do.

Whenever she felt better after her medical treatments, Zhou would explore motifs that did not require as much control from her less dexterous fingers. That was how she discovered the lotus flower, a recurring subject in her later works, which gave her great comfort.

She said painting lotus flowers brought great solace to her ill body and soothed her heart. "The lotus exudes a sense of serenity," she said. "It may lack the regal elegance that one finds in blooming peonies, or the playful mood of a field of flowers. Yet, one or two lotus flowers, even their withered stems and fallen leaves, would create a deep resonance in my mind."

As summer descends on Beijing, where Zhou grew up, worked, and was nourished by its prosperous lotus pools, her family, friends and old colleagues at the Beijing Fine Art Academy have collaborated to present *The Power of Truth: Zhou Sicong's Path of Artistic Transformation*, an ongoing exhibition at the academy's art museum through July 19.

The exhibition is one of the 2025 projects selected for the National Art Museum Youth-curator Support Program, organized by the Ministry of Culture and Tourism. The program serves as a platform for young museum curators to showcase their in-depth research via curated exhibitions. It was created under the umbrella of the Beijing Fine Art Academy's 20th century Chinese art masters series, which was launched to share research on renowned resident artists, including Qi Baishi (1864-1957) and Yu Fei'an (1889-1959).

The exhibition, in memory of the 30th anniversary of Zhou's passing, brings together her works from public and private collections, including pieces from the Beijing Fine Art Academy, where she began working in 1963 after graduating from the Central Academy of Fine Arts.

The exhibition shows the works she created while studying at the CAFA, as well as figure paintings from the early stages of her career.

"Zhou received rigorous academic training at the CAFA under the guidance of noted artists Jiang Zhaohe (1904-86) and Li Keran (1907-89)," says Wu Hongliang, director of the Beijing Fine Art Academy. "Jiang, a figure painter, and Li, known for his innovations in landscape paintings, taught her the rhythmic vitality of ink art."

A monumental work from this period is the series of paintings titled *Miners*, which, together with several sketches, is on show. It is the result of a joint project by Zhou and her husband, Lu Chen, also an ink artist and professor of Chinese painting at the CAFA, that depicts the plight of miners and their families in Northeast China during the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

In a new exhibition, Zhou's early-to-late works trace the evolution of her career.

In ancient times, those who earned scholarly titles in the imperial examination would receive plaques from the imperial court, local authorities, high-ranking officials, or their own clan. The inscriptions are their scholarly titles, such as *jinshi*, referring to those who passed the final and most difficult stage of the imperial examination.

In addition, officials often presented another kind of plaque to congratulate scholars and praise their literary talent. These plaques abound in extravagant praise, offering a glimpse into the social interactions and networking among the gentry and officialdom.

Each of these plaques was treasured by the scholars' later generations, who carefully preserved and passed them down over time. If damaged or lost, plaques were replicated with identical inscriptions and signatures, but the style and craftsmanship could differ by era.

The custom of presenting longevity plaques for birthday celebrations of the elderly was prevalent among the upper strata of society, including the gentry and wealthy, influential families. The inscriptions on such plaques often quote the classics, either praising the celebrant's virtue or conveying wishes for longevity, health and happiness.

During the Ming and Qing dynasties, local authorities or the gentry class would present plaques to commend the achievements or virtues of an individual or family, aiming to establish behavioral models and promote Confucian ideas. Wang says that these types of plaques hold significant value for the study of local history, folklore and ethical values.

One significant exhibit is a large, red-lacquered wooden plaque with gold inscriptions, bearing the four Chinese characters "*ming bo zhe xi*", which translates to "fame spreads to western Zhejiang".

The calligraphy was composed by Wang Jie, a prominent Qing Dynasty scholar-official, as evidenced by his seals on the plaque. Yet the recipient was Ling Menglong, an assistant county magistrate in Zhejiang.

According to Wang Zhonghua from the Liaoning Provincial Museum, it is unusual for such a high-ranking official to write a plaque for a low-ranking county official. It reflects that Ling's diligent governance, care for the people, and remarkable achievements earned him widespread esteem.

"This exhibition helps carry forward fine, traditional Chinese culture. It promotes core values such as loyalty, filial piety, virtue, pursuit of learning, and reverence for the elderly, which are deeply embedded in these inscriptions. It also popularizes traditional art such as calligraphy and seal carving, raising public awareness of aesthetics and culture," she says.

"Freed from their architectural contexts, these plaques allow us to appreciate them directly and consider their enduring cultural and intellectual significance today."

Rectangular wooden plaques carved with elegant Chinese characters are on display in *Emblems of Virtue: Exhibition of Plaque Artifacts*, at the Liaoning Provincial Museum, Shenyang, Liaoning province. PHOTOS BY YANG YONG / FOR CHINA DAILY

Conveying cultural charm above doors and beneath eaves

By XU LIN
xulin@chinadaily.com.cn

Rectangular wooden plaques carved with elegant Chinese characters showcasing various calligraphy styles are on display in *Emblems of Virtue: Exhibition of Plaque Artifacts*, drawing visitors to pause and admire their refined artistry. The exhibition is being held at the Liaoning Provincial Museum, Shenyang, Liaoning province, until July 29.

Suspended above door lintels and beneath eaves in halls, chambers, pavilions, and terraces, these wooden plaques, known as *bian'e*, stand as a distinctive feature in traditional Chinese architecture.

The exhibition displays 76 exquisite plaques from the Ming (1368-1644) and Qing (1644-1911) dynasties from the collection of the Shenzhen Museum in South China's Guangdong province. Most were collected from Hakka regions in Fujian, Guangdong and Jiangxi provinces.

Jointly organized by the two museums, it showcases the artistic charm and profound cultural essence embodied in these plaques, while also reflecting the cultural lives and social customs of the time.

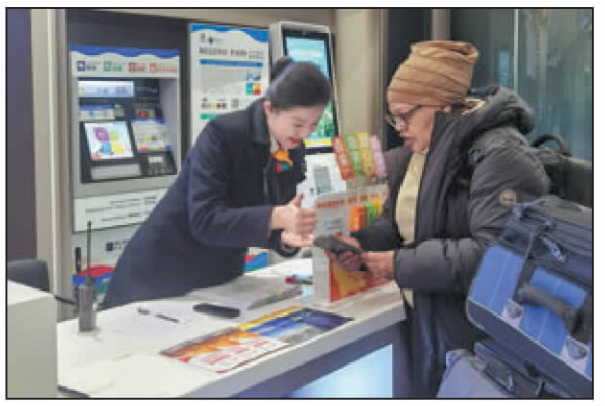
Boasting a history of more than 2,000 years, alongside rich cultural connotations, traditional Chinese plaques integrate poetry, prose, calligraphy, seal carving, lacquer craftsmanship, architectural art, and folk culture.

"Through concise and refined wording and profound implications, traditional plaques appraise people's virtues and vices and express one's lofty ideals and moral integrity," says Wang Zhonghua, director of the academic research department at the Liaoning Provincial Museum.

She explains that these exhibits often feature regular and running scripts, with a focus on brush technique and artistic style, reflecting the refined elegance of ancient Chinese scholars. The inscriptions use classical, concise wording that conveys profound implications aligned with traditional Confucian philosophies.

Hall and residence name plaques, inscribed with characters ending in *tang* (hall) or *di* (residence), are closely associated with a clan or family. Such plaques strengthen clan identity and tie family honor closely to social status.

Hall name plaques were often hung in studies or main halls to express personal ideals and aspirations, in ancestral halls to announce lineages, or outside shops to attract customers with auspicious messages.



On display is a plaque inscribed with *yiyi tang*. The first two characters, *yiyi* — taken from *The Analects* (Lunyu), a compilation of Confucius' ideas — convey the earnest hope that the brothers in the household would remain closely bonded and live together harmoniously.

Residence name plaques were primarily hung at the main entrances or within mansions to represent a family member's social status or scholarly attainment. Their inscriptions are simple and direct, merely stating the owner's identity or political rank.

From runway to city street

As China looks to attract more international visitors, airports and airlines are reimagining every stage of the journey as part of the destination experience, **Yang Feiyue** reports.

Minutes after stepping off an international flight at Beijing Daxing International Airport, overseas visitors can buy a local SIM card, link a foreign bank card to Alipay, pick up a public transport pass and ask for directions in their own language.

For Wang Qiang, deputy general manager of the airport's aviation business department, those services are about more than convenience.

"We want tourists to experience Chinese and Beijing culture the moment they land," he says. "The key is to help them feel comfortable and informed from the start, so they want to come back."

Increasingly, airports are no longer being viewed solely as transportation infrastructure. They are becoming the first chapter of the travel experience.

That idea sat at the heart of a discussion on aviation-tourism integration during the Beijing Fragrant Hills Tourism Summit of the World Tourism Cities Federation in June, where industry leaders from China and abroad explored how airlines, airports and tourism operators can work together to create a more seamless journey for international visitors.

The conversation comes as China seeks to capitalize on a strong rebound in inbound tourism.

According to the Chinese Academy of International Trade and Economic Cooperation under the Ministry of Commerce, China welcomed 82 million international visitors in 2025, up 26.4 percent year-on-year. Travel service exports reached a record $55.2 billion, an increase of 49 percent year-on-year and 1.6 times that of 2019.

The shift also reflects a broader national strategy.

In December 2025, the Ministry of Culture and Tourism and the Civil Aviation Administration of China jointly issued an action plan calling for deeper integration between aviation and tourism. The plan aims to significantly improve travel services by 2027 and create a more connected experience for international and domestic travelers alike.

For Wang, the airport's role has fundamentally changed.

"Airports used to be defined as transportation infrastructure: getting passengers from one place to another, safely and on time. That's it," he told summit participants. "But now, the airport has become the traveler's first impression of the city — and sometimes the last."

Daxing, the starfish-shaped airport, which opened in 2019, has steadily expanded its tourism-oriented services.

In January 2025, it launched the "Beijing Service" counter in the international arrivals area, offering more than 20 services ranging from SIM card registration and transportation cards to mobile payment assistance for overseas travelers.

The airport has also introduced AI-powered visual translation devices capable of real-time interpretation in eight languages and expanded its "three-way call" language service, which connects frontline staff members with translation students from Beijing Foreign Studies University.

For travelers with time to spare, Beijing Capital International Airport in the northeast of the city now offers complimentary half-day city tours for certain transit passengers.

Wang also points to efforts aimed at showcasing culture rather than simply facilitating movement. Daxing's international departure area features the China Garden, inspired by classical Suzhou landscaping, alongside rotating exhibitions from the National Museum of China and an annual airport carnival celebrating its anniversary.

"The question is no longer how to move passengers efficiently through a terminal," Wang says. "It's how to help them begin exploring the destination before they even leave the airport."

Airlines are undergoing a similar rethink.

Liu Li, chief representative for public affairs and aviation cooperation in China for Finland's flag carrier Finnair, says the airline has increasingly focused on turning the flight itself into part of the travel experience.

Recently, Finnair commissioned Finnish musician Lauri Porra to compose an album titled *Matkantekijä: Music for Travellers*, performed on the traditional Finnish string instrument known as the kantele. The music accompanies passengers through different stages of the journey, from the business-class lounge and boarding process to in-flight service and landing.

Top: (From left) An international visitor asks about travel options at Beijing Daxing International Airport's service counter. An interior view of Daxing airport. A staff member helps international visitors at the airport. **Above:** Inbound visitors pose for a photo with airport staff members.
PHOTOS PROVIDED TO CHINA DAILY

The airline's long-haul business-class cabins also feature textiles from Finnish design house Marimekko, including classic patterns inspired by the country's landscapes.

"The one thing we have been working on is making the flight itself the first experience of Finland," Liu says. "That allows us to weave culture and tourism into every part of the journey."

The approach reflects a broader shift taking place across the aviation industry.

Rather than treating a flight as dead time between destinations, airlines are increasingly trying to make it part of the destination itself. For Finnair, that means introducing Finnish design, music and aesthetics long before passengers arrive in the country's capital Helsinki.

If Finnair demonstrates how airlines can turn a flight into a cultural introduction, destinations such as Edinburgh offer a lesson in what happens after passengers land.

Robert Lang, chair of Edinburgh Tourism Action Group's China Ready Initiative, compares aviation and tourism to a 400-meter relay race.

"You might have the best individual runners," he says. "But if you drop the baton in the exchange, you lose."

The baton, he explains, is data, coordination and consistency.

In Edinburgh, airport data are shared with tourism authorities, while changing market trends can trigger rapid adjustments in marketing and visitor services. Success depends less on the strength of any individual organization than on how effectively they work together.

The same logic applies at a larger scale.

Romulo Vallejo, director of statistics and research at the Dominican Republic's Ministry of Housing and Urban Development, argues that airports and destinations should be developed together rather than sequentially.

He pointed to Punta Cana as an example.

When Punta Cana International Airport opened in the mid-1980s, it handled fewer than 4,000 passengers during its first year. In 2025 alone, the airport served more than 11 million passengers and accounted for over half of all air traffic in the Dominican Republic.

The airport and destination grew side by side.

"Build the runway and the destination together and both will thrive," Vallejo says.

Behind the industry's enthusiasm lies a larger economic calculation.

Research from China's Ministry of Commerce shows that inbound tourism revenue currently accounts for less than 0.5 percent of China's GDP. In Thailand, the figure exceeds 10 percent, while in many European countries it ranges between 1 and 3 percent.

The gap represents significant room for growth.

For You Xugong, general manager of Beijing Best Tour Ltd, the challenge is coordination.

Airlines plan routes. Tourism companies design experiences. Hotels provide accommodation. Travelers, however, experience them as a single journey.

"The question is how to make those different parts work together," he says.

Industry associations, he suggests, could help aggregate demand and create stronger incentives for airlines to tailor services and routes.

"If an association can tell an airline that we can bring 100,000 passengers, the airline will listen," he says.

According to the Beijing Municipal Bureau of Culture and Tourism, Beijing received 2.67 million inbound visitor trips from January to May, up 35.3 percent year-on-year. Tourism spending reached $3.64 billion, an increase of 42.4 percent.

Yet integration remains easier to discuss than to achieve.

Liu Huiyuan, chief operating officer of TUI China, which specializes in leisure tourism, says that airlines and tourism companies often operate on different business cycles and incentives.

Most cooperation is still project-based, and there is not yet a long-term mechanism that aligns both sides, he says.

He also points to a structural challenge: airlines operate on fixed schedules and long planning cycles, while tourism demand can shift rapidly in response to holidays, policy changes and market trends.

What is emerging, however, is a broader redefinition of travel.

For decades, aviation and tourism were treated as separate industries. One moved people. The other entertained them after they arrived. Increasingly, destinations are trying to erase that distinction.

Back at Daxing airport, Wang still thinks about first impressions.

The goal, he says, is no longer simply to move passengers from one place to another. It is to make them curious enough to keep exploring.

The plane ticket, in other words, will no longer be just transportation.

It will be the first chapter of the journey.

Tech tourism thrives in Optics Valley

WUHAN — Riding the wave of China's flourishing "experience economy", visitors to Wuhan, the capital of central China's Hubei province, are enjoying a host of new interactive experiences while playing with humanoid robots.

At the Hubei Humanoid Robot Innovation Center, pupils from a primary school are playing the classic children's game "Red Light, Green Light", their laughter ringing through the room.

Unlike previous generations, their playmate isn't another child, but a robot. After the robot issues a command, the children race forward; when the robot's arm stops moving, they instantly "freeze" in place.

Notably, their playground is also special. The Hubei center is a place dedicated to "cultivating and training new robots".

Here, visitors can do more than just observe the practical uses of humanoid robots. They can also play games with them and experience firsthand how data are collected and actions are trained.

Launched in June 2025, the Hubei Humanoid Robot Innovation Center is now one of China's largest robot innovation centers in terms of area and application scenarios.

It is based in the East Lake High-tech Development Zone, also known as the Optics Valley of China, where visitors can gain deeper insights into the city's rapidly growing high-tech cluster thanks to its increasingly popular tech-driven tourism.

The center has four sections dedicated to robot action training, data collection, application practice, and talent cultivation, respectively.

It is designed to facilitate the full chain of robot innovation from technology cultivation to industrial implementation, with four major functions: proof of concept, pilot testing services, data integration, and scenario validation.

To train the humanoid robots, the center immerses them in real-world application scenarios. For instance, the data collection section provides simulated home scenes that one might find in a kitchen, bathroom, and living room, as well as a milk tea shop, pharmacy, restaurant, warehouse, and others.

In another experience zone, there are no physical humanoid robots. Instead, trainers wear VR headsets to conduct remote control training for the robots.

Here, visitors can experience how robots are trained with VR equipment. For instance, while they are reaching out to gently pick a rose and place it into a vase, a blue "virtual hand" appears before their eyes, synchronously following the human hand's movements to perform the same action. This customized VR equipment can capture the trajectory of hand motion in real time, allowing the system to continuously enhance its intelligent interaction capabilities via simulated learning.

Visitors interact with a robotic dog during the World Robotics Carnival in Wuhan, Hubei province, in June last year.
DU ZIXUAN / XINHUA

"Now, the robots are still in their learning phase. Through remote control by human operators, they can learn the hand movements people use in doing housework. Once sufficient data are collected, there is the prospect of them entering and serving households in the future," says Hu Longdan, a staff member at the center.

Just a 20-minute drive from the humanoid robot center, a modern smart factory welcomes visitors. Here, tourists can "encounter" robots hard at work on the factory floor.

In this factory for Xiaomi smart home appliances, an air conditioner rolls off the production line every 6.5 seconds. Seven unmanned transport lines connect the factory floor, enabling efficient goods logistics.

As the tourist shuttle enters the injection-molding plant, visitors see the production line operating with disciplined rhythm and efficient precision. They can watch how a smart factory works with full automation: robots are transferring goods to unmanned vehicles, which then take the cargo along dedicated tracks to a 24-meter-high automated warehouse.

Now, this smart factory has become a popular tourist destination, with increasing numbers of visitors flooding in to experience and explore the facility. In May, the factory received a record number of 3,485 visitors, a 31 percent month-on-month increase.

Amid the nationwide wave of tech innovation and the experience economy, the Optics Valley of China has launched tech tourism-themed routes, enabling visitors to experience, interact with, and gain insights into hardcore technology, which used to be hidden away in labs and plants.

Data show that, from March to June, tech-experience tourism sites in the Optics Valley of China have received around 480,000 visitors, with estimated revenue exceeding 11 million yuan ($1.6 million).

2026 WORLD CUP

Norway's Erling Haaland leads the team and their supporters in the "Viking Row" following their World Cup round-of-16 victory over Brazil in East Rutherford, New Jersey, on Sunday. AP

Erling Haaland celebrates with Andreas Schjelderup (21) after scoring Norway's second goal on Sunday. AP

Vikings row into quarterfinals

Haaland brace leaves Brazil floundering in Norway's wake

Erling Haaland scored, and Andreas Schjelderup jumped on his teammate's back. Haaland scored again, and Schjelderup did it again.

The weight was nothing for the towering Norway striker who, after heading in the go-ahead goal in the 79th minute, and scoring again before the end of regulation time, had carried his nation into the World Cup quarterfinals for the first time ever with a 2-1 defeat of Brazil in New Jersey on Sunday.

"Maybe this will write history in Norway," Haaland said. "Everyone just need to enjoy themselves. This is just an insane day. It's one of the most insane days in Norwegian history. Just enjoy it, embrace it and enjoy the moment."

After being a nonfactor for much of the afternoon and having limited touches, Haaland spoke at the second-half hydration break with coach Stale Solbakken, who told him to drain his energy and go for it.

Haaland turned it on when it mattered most, getting the right side of his head on the ball after a perfect setup by Schjelderup, who entered at halftime. Barely minutes later, Haaland scored his seventh of the tournament, through Danilo's legs, to tie Argentina's Lionel Messi and France's Kylian Mbappe in the race for the Golden Boot.

"It felt it was a gift from God that it actually went into the net," Haaland said after scoring in a 14th consecutive competitive international match. He has 27 goals in that stretch, and 62 overall in 54 appearances for Norway.

At the other end, goalkeeper Orjan Nyland was stellar. He made a crucial stop early, diving to his left to deny Bruno Guimaraes' shot from the spot in the 14th minute, then got his left hand on a shot by Endrick late on, when Norway was hanging on to a one-goal lead.

The only goal Nyland allowed was to Neymar on another penalty, late in stoppage time, which only changed the final score, not the result.

The 34-year-old said the defeat would be his final game for Brazil.

Nyland, who at 35 is his team's oldest player, was a huge factor in a victory that ranks among the most significant in the country's soccer history — at least on the men's side.

Norway's women won the World Cup in 1995, but the men have only qualified four times and not since 1998. In those four attempts, the men had not gone further than the round of 16.

"I think that all Norwegians are experiencing the night of a lifetime," Solbakken said. "Some people say that we have changed Norway forever. They will probably party for a week or so."

Norway will now go on to face England on Saturday in Miami Gardens, Florida. Solbakken said he had more than a dozen friends already booking trips to South Florida.

For Brazil, though, the postmortem of another World Cup disappointment begins, and will likely start with Guimaraes, who became the first Brazil player to fail to convert a World Cup penalty since Zico in 1986. The decision to have him take it instead of Vinicius Junior may be questioned and criticized for quite some time.

Coach Carlo Ancelotti said that he and his staff did a yearlong statistical study that determined, with Neymar not on the field and Raphinha injured, Guimaraes was the right choice.

There were plenty of other missed opportunities, including Casemiro missing Neymar on a cross for what could have been the tying goal.

"We really fell short in the opportunities that we did create," captain Marquinhos said. "We had a penalty kick, we had some other chances as well, but here's the World Cup for you. Those that make the least mistakes are able to move forward to the next round, and to be victorious."

Some will also point to the absence of injured midfielder Lucas Paqueta.

Regardless, Brazil goes home having massively underachieved compared with the nation's expectations, which were pretty much set at win or bust for the five-time World Cup champion.

The soccer powerhouse had its streak of quarterfinal appearances at the tournament end at eight, losing before that stage for the first time since 1990.

It was Brazil's seventh consecutive loss to a European opponent in the knockout round at the World Cup, dating back to a win over Germany in the 2002 final.

Norway got defender Julian Ryerson back from his injury that sidelined him the past two games, and Solbakken was rewarded for making changes at halftime, with Schjelderup setting up each of Haaland's goals.

"During the game, you have to make the calls and decisions that you feel are appropriate," Solbakken said.

"It's a gut feeling that Oscar (Bobb) and Andreas might make a difference, and I felt more secure, with them on the pitch, in the way I wanted us to play the second half. And, then, you saw what happened."

Those moves played a role in what is certainly one of this World Cup's big upsets, though it was not nearly as massive as Norway's group stage victory over Brazil at the 1998 tournament by the same scoreline.

Norway has shown how far it has evolved as a soccer nation since then, with knocking Brazil out of the World Cup the latest step in that process.

Yellow-clad Selecao fans outnumbered those in Norwegian red, many of whom were performing their signature "Viking Row" in the stands — with Brazil supporters even cheering it before kickoff. They were stunned silent when it returned after the game, with Haaland banging the drum and leading the celebration.

"I've peaked a couple of times during this tournament, but this was a new peak," Haaland said.

AP

Balogun ban postponed after Trump call

The United States' World Cup campaign took an extraordinary turn on Sunday, when FIFA made the unprecedented decision to suspend Folarin Balogun's automatic red-card ban, clearing the striker to face Belgium in Monday's last-16 clash after US President Donald Trump personally urged FIFA President Gianni Infantino to review the case.

The move thrust FIFA's disciplinary process into the global spotlight, prompted an angry response from Belgium and ensured that one of this tournament's biggest talking points would center not on tactics or team selection, but on the relationship between soccer's governing body and political power.

Within minutes of the announcement, the decision had ignited one of the tournament's biggest media storms, as pundits, commentators and former players argued over whether FIFA had upheld justice or undermined its own rules.

FIFA did not respond to requests for comment about the decision and Trump's call with Infantino.

US striker Balogun was shown a red card during his team's victory over Bosnia and Herzegovina after planting his boot into the ankle of Tarik Muharemovic. The 25-year-old was sent off after a VAR review, with US coach Mauricio Pochettino contesting the decision at the time.

Trump called Infantino to ask world soccer's governing body to review the sending-off, according to a source briefed on the call.

FIFA is allowing Balogun to play without rescinding the red card.

"In line with article 27 of the FIFA Disciplinary Code, the implementation of the match suspension is suspended for a probationary period of one year," FIFA said in a statement.

"Thank you to FIFA for doing what was right, and reversing a great injustice," Trump wrote on Truth Social, as the White House celebrated Balogun's reinstatement with a post on X saying: "USA-USA-USA."

Pochettino welcomed the news in Seattle on Sunday.

"There's evidence from the past that makes it possible to suspend a punishment and to fulfill it later on, so I don't understand how people can be surprised," he told reporters.

England manager Thomas Tuchel questioned the suspension of the punishment. "VAR checked it and was of the opinion that it was a red card, so the decision is made," Tuchel said of the Balogun situation, not long after seeing one of his own players sent off against Mexico. "Who overturns this decision ... and on what grounds? How far does this go now? This is strange for me... Where does this start and where does this end?"

Ten-man England hangs on to beat Mexico in last-16 thriller

MEXICO CITY — Ten-man England weathered a Mexican storm at the Azteca Stadium to reach the World Cup quarterfinals for a third straight time with a riproaring 3-2 victory on Sunday, courtesy of a Jude Bellingham double, a Harry Kane spot kick and a courageous rear-guard effort.

"It's the best night of my England career. Just unbelievable. I can't put it into words right now," said Bellingham. "It's tough to kind of gather everything together, the goals, the penalty against, the penalty for, the red card. It was a chaotic game, but credit to Mexico, they were a different class... but this team showed character tonight and I'm proud.

"Big pressure moments in years gone by, watching as a fan, as a kid, England probably would have crumbled, but we stuck together until the last second," he added.

"The players who came on, the players that started, running themselves into the ground and giving everything. That is what this team is about."

Thomas Tuchel's side made it hard for itself against the tournament co-host, but handed the battling Mexicans their first-ever World Cup defeat at their iconic home stadium to set up a last-eight clash with Norway, which shocked Brazil 2-1 earlier on Sunday.

Mexico, who beat Ecuador 2-0 in the last 32 for its first knockout-stage win in 40 years, had only lost two competitive games at the Azteca in 89 matches since 1966, but England made it three with a performance of attacking verve and defensive grit.

Kane, hoarse after celebrating with his teammates and England's supporters, said: "It was a crazy game. We had to fight and we had to find something.

"I've just been singing, I can't really talk. The occasion, the team, everything against us, we found a way."

Bellingham scored twice for England in the space of 98 seconds in the first half.

Kane then scored from the penalty spot on the hour-mark, before giving one away at the other end shortly afterward, after a VAR check confirmed that, in trying to clear the ball, Kane had kicked the ankle of Mexico's Brian Gutierrez instead.

"I thought I got to the ball first, it was one of those days," Kane said. "The ref gave a lot against us. In the end it didn't matter, so I'm happy."

After the game was delayed by an hour due to thunderstorms, Mexico attacked from the start, backed by its fanatical support who raised the decibel level higher than ever, but England held firm and managed to take the sting out of the game.

England's Harry Kane (9) celebrates converting a penalty kick with fellow goalscorer Jude Bellingham (10) during their World Cup round-of-16 match against Mexico in Mexico City on Sunday. AP

Pickford saves

Mexico's only notable early chance came after 15 minutes when Raul Jimenez's diving header was brilliantly saved by Jordan Pickford after a pinpoint cross from Roberto Alvarado.

Pickford, who was to pull off several key saves, was making his 17th World Cup appearance to equal fellow keeper Peter Shilton as the all-time record-holder for England's men's team.

Player of the match Bellingham put England ahead with a superb diving header from Bukayo Saka's cross just past the half-hour mark and made it 2-0 within two minutes after another break down the right with skipper Kane providing the assist.

The Mexican crowd responded with chants of "yes we can", and the Mexico players responded by showing that, yes, they could.

Live-wire winger Julian Quinones volleyed home during a scramble inside the box from a freekick to get the host back right back into the match.

Soon after the halftime break, England went close to extending its lead when Nico O'Reilly hit the post, but the Three Lions were soon to be reduced to 10 men, when defender Jarell Quansah became only the fourth England player to be sent off at a World Cup for his rash, studs-up sliding challenge on Jesus Gallardo.

England kept its cool, though, and when Anthony Gordon ran through on goal he was fouled by keeper Raul Rangel, giving Kane his chance to make it three from the spot.

No breathing space

With just over 20 minutes to go England had its backs to the wall and had to dig deep to keep the Mexicans at bay.

Despite giving up most of the possession, it hung on for a famous victory in the last match of this World Cup to take place Mexico, and possibly the last to ever grace the iconic Azteca Stadium.

It was England's first visit to the Azteca since it lost to Argentina in the 1986 World Cup quarterfinals, where Diego Maradona scored his infamous "Hand of God" goal against a hapless Shilton.

"We needed everything. It was super difficult, and always, in the moments when we thought we caught the momentum, we had setbacks, but that's a proper mentality. Well done," said Tuchel.

"When the going gets tough, they never give up, they never lose belief. It was one step more."

Mexico had not lost a competitive game at home since 2013, but had to say farewell to a tournament it has graced with passion on the pitch, in the stands and across the country. Its fans sang their hearts out until the very end.

"You can't make mistakes, because they will punish you," outgoing Mexico coach Javier Aguirre said. "We made a couple of errors there, and it saddens me for the people, but my players can be at peace, because they did everything they could against a great team."

A breach can be seen on Tuesday on the Liulan Reservoir in Hengzhou, in South China's Guangxi Zhuang autonomous region. Heavy rains and gale-force winds triggered a series of disasters, including reservoir breaches and landslides, in Guangxi and the provinces of Hubei and Gansu, resulting in casualties and economic losses. CAI JIAHONG / YANGCHENG EVENING NEWS

All-out rescue, relief efforts urged

Xi calls for safeguarding lives, property as flooding, landslides, extreme weather hit several regions

By **SHI RUIPENG** in Nanning, **LIU KUN** in Wuhan and **ZOU SHUO** in Beijing

President Xi Jinping called on Tuesday for all-out efforts in emergency rescue, treatment of the injured and resettlement of affected people, after multiple regions were hit by flooding, landslides and extreme weather.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, also urged that every effort be made to safeguard people's lives and property while minimizing casualties and preventing secondary disasters.

Heavy rain and strong winds have caused dam breaches and landslides in South China's Guangxi Zhuang autonomous region, Central China's Hubei province and Northwest China's Gansu province, resulting in casualties and economic losses.

Given the severe and complex flood situation, Xi called on local governments and relevant departments to implement existing flood prevention measures, and thoroughly inspect and rectify potential hazards involving rivers, lakes, reservoirs and areas prone to geological disasters.

He also called for stronger monitoring, early warning and emergency preparedness, as well as solid disaster prevention and relief efforts to ensure safety of lives and property.

Premier Li Qiang also urged authorities to strengthen monitoring of rainfall and flood conditions, improve hazard detection and early warning, and carry out emergency rescue and relief with all-out efforts.

The Organization Department of the CPC Central Committee has allocated 60 million yuan ($8.8 million) from Party membership funds to support flood prevention and disaster relief efforts in five provincial-level regions.

Firefighters evacuate disaster-affected residents in Huanggang, Hubei province, on Tuesday. WANGSUN ZHIYUAN / FOR CHINA DAILY

Recent extreme weather has battered multiple regions across China, with record-breaking rainfall and landslides causing heavy casualties and widespread damage. Rescue operations continue as authorities race against time to save lives.

Typhoon Maysak, the 10th typhoon of this year, unleashed historically rare and prolonged torrential rains across the region, said Cai Yunge, executive vice-chairman of Guangxi.

Cai said the extreme weather had hit 63 counties and districts in Guangxi, with a total of 375,000 people affected. The death toll had risen to six, with 11 others reported missing, while 130,000 residents had been evacuated to safer ground as of Tuesday evening. Agricultural damage has been substantial, with approximately 12,900 hectares of crops destroyed, and economic losses still being tallied, he added.

Huang Lu, deputy head of Nanning's emergency management bureau, said 1,343 personnel from the fire, police and health departments, supported by 106 vehicles and 38 boats, were carrying out rescue operations and epidemic prevention work.

Temporary shelters have been established at six locations across Hengzhou and stocked with drinking water, food, bedding and lighting supplies. Eleven temporary medical stations have also been set up to provide round-the-clock medical services, according to local authorities.

The armed police detachment in Nanning sent more than 160 personnel and 14 vehicles, along with rubber boats and communication equipment, to the disaster-hit area.

On arriving in Yunbiao township of Hengzhou at 5:30 pm on Monday, rescuers found floodwaters in low-lying areas reaching depths of one meter. Some houses were submerged to the second floor, with water depths of up to three meters. An estimated 55,000 to 60,000 residents in the township were trapped, prompting urgent search and evacuation operations, the detachment said.

"We rushed to the site as soon as we got the order and carried out searches house by house — not a single person should be left behind," said Wei Hao, one of the armed police officers deployed to the scene.

Zhang Shaoqing, another member of the armed police detachment, said that rain continued throughout the night, and their clothes never dried. "Honestly, we were numb after a while, but every time we carried someone out and they said thank you, we felt we could keep going," Zhang said.

As of Tuesday afternoon, the detachment had rescued and evacuated 306 people, delivered 1,500 relief supply items and provided on-site medical assistance to 56 people.

In Gansu, a landslide struck a village in Tanchang county of Longnan at 6:56 am on Tuesday. As of 9 pm, rescuers had located 31 of the 33 people reported missing, five of whom died despite all efforts. Search operations continued.

In Hubei, severe convective weather — caused by the vertical movement of air driven by heat — swept across eastern parts of the province on Monday evening, bringing heavy rain, thunderstorms and tornadoes to some townships. As of Tuesday morning, the storms had affected 14,600 people, killing 11 and leaving one missing. As many as 331 people were injured, while 996 sought emergency shelter and 246 were relocated. The extreme weather destroyed 22 homes and damaged another 4,855.

XI'S VISION | SCIENCE AND TECHNOLOGY

Planning makes nation a sci-tech powerhouse

By **CAO DESHENG**
caodesheng@chinadaily.com.cn

From innovations in robotics to development of intelligent connected vehicles to establishment of a commercial spaceflight ecosystem, China's successful practices are transforming cutting-edge technologies into productive forces.

Fuelling this remarkable progress and the nation's strong momentum in science and technology is the top-level design and comprehensive planning led by President Xi Jinping, as well as the relentless efforts and high aim of researchers and enterprises contributing toward building China into a science and technology powerhouse.

Noting the strategic leading position of and the fundamental supporting role played by science and technology in the pursuit of Chinese modernization, Xi has, on various occasions, urged expediting high-level sci-tech self-reliance to realize the strategic goal of building a strong country in science and technology by 2035.

Addressing a meeting conflating the national sci-tech conference, the national science and technology award conference, and the general assemblies of the members of the Chinese Academy of Sciences and the Chinese Academy of Engineering in June 2024, Xi said the high-tech sector has emerged as both the forefront and the main arena of international competition, profoundly reshaping the global order and development landscape.

He outlined the key necessities for the development of sci-tech in China, including strong basic research and original innovation capabilities, a robust capacity to achieve breakthroughs in key and core technologies, significant global influence and leadership that make China a major innovation hub, strong ability to attract and nurture top-tier talent, and outstanding governance systems and capabilities in science and tech.

Two years on, China has made new breakthroughs in both basic and frontier research, taken new strides in strategic high-tech fields and achieved new results in high-quality development driven by innovation.

Liu Chunsheng, an associate professor at the Central University of Finance and Economics in Beijing, said that China's full-fledged innovation ecosystem is accelerating breakthroughs at scale.

The country has strengthened its computing networks, next-generation communications systems and green energy infrastructure, enabling more efficient flow of land, talent and data, Liu said.

"At the same time, it has established collaborative innovation networks that bring together State-owned enterprises, private firms, foreign investors, universities and research institutes, creating a dynamic environment where ideas can swiftly transition from the lab to the market," he said.

This year's Government Work Report, adopted at the annual session of the National People's Congress, China's top legislature, in March, indicates a strategic shift in funding allocation for basic research, which aligns with the nation's goals of becoming a global leader in science and technology.

The report emphasized the integration of technological and industrial innovation, highlighting that China plans to establish three international centers for sci-tech innovation.

A skateboard enthusiast leaps into the air at a skate park in Guangzhou, Guangdong province, on May 17. PROVIDED TO CHINA DAILY

HUIZHOU GETS ON BOARD WITH WORLD'S SKATERS

City in Guangdong has kids everywhere flipping over its industry-leading products

By **ZHENG CAIXIONG** and **LI WENFANG** in Guangzhou

Kick flips. Slides. Heel flips. One trick after another, Cheng Yufeng and his friends pull them off with an ease that turns heads — and draws bursts of applause.

Whenever these teenagers roll into Binjiang Park in Huizhou, Guangdong province, a crowd tends to gather. There's something magnetic about watching them practice: boards clattering, bodies in motion. Radiating energy, they are a regular sight in Huicheng district's green heart.

"I got into skateboarding by chance," said Cheng, a local high school student. "The moment I rolled off, it felt so cool that I just couldn't get enough of it."

He's far from alone. Huizhou, a city in the Guangdong-Hong Kong-Macao Greater Bay Area, has quietly earned itself the nickname of China's skateboarding capital.

The numbers back it up. Around 200,000 people in Huizhou regularly take part in roller skating, while close to 20,000 residents are active skateboarders. Every day, enthusiasts and fans converge on parks, transforming public spaces into urban sports hubs.

However, Huizhou's connection with skateboarding runs much deeper than just parks and passion. Two of the world's four leading companies in the high-end skateboard market have their roots in Huizhou. Huizhou Excel Sporting Goods Co and Chop Chop Woodshop Co together account for 35 to 40 percent of the global high-end skateboard market.

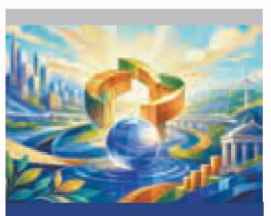
Europe's rush to cool off exposes policy folly

WORLD WATCH
By Warwick Powell



As record heat waves scorch Europe this summer, with temperatures shattering century-old records in France, Spain and beyond, a telling spectacle is unfolding. Europeans, long resistant to air conditioning due to architectural heritage rules, high installation costs and cultural habits, are scrambling for cooling relief. And where are they turning? To Chinese-made air conditioners.

Chinese customs data reveals that exports of air-conditioning units to the European Union surged dramatically — up 43.2 percent year-on-year in the first half of 2026 alone to $3.76 billion. Brands such as Midea, Gree and Hisense dominate, offering portable split units that bypass drilling restrictions in historic buildings. In Germany, secondary markets have seen units resold at 300 percent premiums, and shelves have emptied as consumers voted with their wallets for affordable, efficient Chinese engineering.

This is more than an anecdote. It is a stark metaphor for Europe's broader predicament. While Brussels obsesses over tariffs, subsidy probes and "de-risking" from China, the European public demonstrates the impossibility — and folly — of disengagement. The so-called "China Shock 2.0" narrative, peddled in elite circles, conveniently ignores the fact that Europe's industrial woes stem not from Chinese competition on the current account, but from chronic underinvestment on the capital account.

Trade flows reflect capacity built by investment decisions. European elites, fixated on import deficits and "unfair" advantages, overlook how their own financialized capitalism hollowed out domestic productive capabilities.

No will, no heir? Dealing with life after death

Civil Code tackles deceased estate challenges with new provisions

By CAO YIN
caoyin@chinadaily.com.cn

ART BY LU PING / CHINA DAILY

> "The system closes the gap that once left creditors with no one to pursue, and guarantees that estates without heirs are safeguarded from dissipation or depreciation. ...
> The executor named in the will, whether an individual or a third-party institution, can be given priority in being named as the estate administrator."
>
> **Jiang Zhen,** judge from Beijing Chaoyang District People's Court

If a person dies without an heir or a will, what happens to their life savings, and if that person had unpaid debts, who can creditors turn to?

These are not abstract legal puzzles. They became a stark reality in late 2025, when a 46-year-old woman in Shanghai, surnamed Jiang, passed away. She had no spouse, no children, and had lost both parents. After suffering a cerebral hemorrhage in October, she was cared for by a distant relative in her final weeks.

Her case gripped the nation, exposing anxiousness about a common issue: how does a rapidly aging society, with more people living alone, manage the final affairs of those who have no apparent next of kin?

The law, however, had already foreseen such a moment.

When China's Civil Code took effect in January 2021, it introduced a groundbreaking measure: the estate administrator system. This mechanism is designed to ensure that no estate is abandoned, no debt is left unpaid, and no valid claim falls into a legal void simply because there is no one to step forward.

The Supreme People's Court, China's top court, has since reiterated the system's importance, calling it a vital tool to tackle an "estate left unmanaged, assets being damaged or lost, and challenges posed by an aging population".

In Jiang's case, the court in Hongkou district — finding she had no legal heirs, no will, and no support agreement — ultimately appointed the local civil affairs bureau as her estate administrator at the end of 2025, as per the code's provisions.

Chen Yifang, chief judge of the top court's First Civil Division, recently warned against heirs who renounce an inheritance — whether to avoid managing the estate or to evade the deceased's debts — but who in practice continue to possess or dispose of the estate's assets.

The renunciation is invalid and such behavior "must not be tolerated", the judge said.

To guide judges in applying the system more accurately and to bring greater clarity to the public, the top court recently provided clear answers through a series of landmark cases on how to interpret the system, specifying who can serve as an estate administrator and what duties the role entails.

Meanwhile, grassroots court judges are also calling for more tailored rules — particularly for civil affairs departments that handle the deceased's property — and for additional measures to address the growing challenge of digital assets in the fast-evolving internet era.

Choosing an administrator

As demographic patterns shift and more people choose to live alone or stay single, the estate administrator system provides a much-needed legal solution for handling their posthumous affairs, according to Jiang Zhen, a judge from Beijing Chaoyang District People's Court.

"The system closes the gap that once left creditors with no one to pursue, and guarantees that estates without heirs are safeguarded from dissipation or depreciation," she said.

Citing the code, she noted that if the deceased had clearly designated in their will who should handle the estate, that arrangement must be respected. "This means that the executor named in the will, whether an individual or a third-party institution, can be given priority in being named as the estate administrator," she explained.

"It is important to say, however, that an estate administrator is not necessarily an heir," she added. "For instance, a law firm can be appointed an executor of a deceased person's will, but it doesn't have to be filled by an heir."

If no executor was named, the heirs should choose an administrator, said Chen, from the top court. If they cannot reach an agreement, all heirs must serve as joint administrators.

"Only when there is genuinely no heir or when all heirs have validly renounced their rights should civil authorities step in," Chen added.

If an heir provides a written renunciation of an inheritance, whether to avoid managing the estate or to evade the deceased's debts, but continues to possess or dispose of the estate's assets in reality, that renunciation is invalid.

One of the cases disclosed by the top court illustrates this point. An individual surnamed Yang died in 2024, owing 100,000 yuan ($14,788) to two people surnamed Hua and Ma. The creditors sued Yang's father, mother and daughter, trying to recover the money.

During the trial, the three heirs submitted written renunciations of their inheritance, so the local court refused the creditors' claims.

But after the ruling, the three heirs were discovered to have collected over 200,000 yuan in funeral subsidies, pension benefits and social insurance payments belonging to Yang. The creditors requested the court to name the local civil affairs bureau as the estate administrator, as the heirs had renounced their inheritance rights.

The local court said that the heirs had in fact taken control of the deceased's assets, although they had formally given up their inheritance. "In this situation, the renunciation was invalid, meaning the three must repay the debt," it said, adding the civil affairs bureau could not step in as a fallback administrator.

Chen said the case was an example of "fake renunciation to evade real debt", warning that the provision in the code allowing civil affairs bodies or village committees to act as administrators should not be abused. She underscored the necessity of such an arrangement, but described it as a form of public service and an alternative option.

Roles and duties

Being named an estate administrator is not a ceremonial role. The code spells out clear duties including taking inventory of the estate, listing all assets and debts, and providing a full and accurate accounting to heirs, banks, property registration authorities and creditors, Chen said.

She noted that administrators must also take reasonable measures to protect the assets from damage or loss — for example, by securing a vacant house or liquidating perishable property.

In another case disclosed by the top court, a man surnamed Liu took out a 550,000-yuan bank loan with a 10-year term, secured against his apartment in July 2020. When he died in March 2023, all his heirs renounced their inheritance. The bank then applied to the local court, which appointed the district civil affairs bureau as estate administrator to clear Liu's debts.

The local court also made it clear that costs arising from the administrator's work, including appraisals, auctions, and legal fees take priority. When Liu's apartment was sold, those reasonable expenses were deducted first, with the remainder going to repay the bank.

Jiang, from Beijing Chaoyang District People's Court, said specific requirements for estate administrators' duties are essential to ensure the deceased's assets can be protected. But, in practice, there were challenges for civil affairs authorities such as the difficulty of locating all assets.

The estate administrator system is not only relevant to singles, childless couples, those living alone, and bereaved parents who have lost their only child, but also to people with complex family structures, such as those who have been married multiple times or have many children, and those whose estates consist of diverse types of assets.

"For instance, some people own overseas property or company shares, which are not easy for civil affairs departments to track down," Jiang explained.

She suggested that civil authorities develop a comprehensive understanding of property registries and financial institutions to ensure that no asset is overlooked during the inventory process.

In November 2025, Beijing Haidian District People's Court issued a guideline on procedures for appointing estate administrators.

Lin Zhi, a judge from the court, said it summarizes the practical achievements over the five years since the code came into force, further introduces it to the public, and builds stronger legal consensus.

She said that the guideline clarifies for the public the role of estate administrators and the pathways for appointing them, whether through the courts or directly via civil affairs departments.

"For issues such as guardianship and healthcare that may arise during the aging process, it's significant to plan ahead," Lin said. "For example, by purchasing insurance to minimize the risk of being left without adequate care, and ultimately to ensure a better quality of life."

She called on residents to educate themselves about wills and to arrange for the disposal of their property in advance to reduce unnecessary disputes in the future.

Digital obstacles

Jiang said as digital technology becomes deeply embedded in every aspect of daily life, the governance of digital estates is emerging as a pressing issue that demands urgent attention.

Data released by the China Internet Network Information Center in February showed that China had approximately 1.1 billion netizens by the end of 2025. Almost every one of them is a video user, with 573 million playing online games.

Deceased internet users leave behind not only personal bonds and memories, but also vast and silent digital content: WeChat and Alipay balances, gaming accounts, social media profiles, chat records and cloud photo albums, according to Jiang.

Digital estate disputes can center on the inheritance of online shop operations and gaming assets, as well as access to data like chat logs and photos, she said, adding she and her colleagues had to deal with them on a case-by-case basis because there are no specific rules on digital estate settlement.

The Civil Code upholds the principle of protecting digital or virtual assets. But in reality, platform policies differ — some allow inheritance, while others retain ownership.

Last year, a Shanghai college student surnamed Zhou took an online platform to court after it refused to let him inherit his late mother's WeChat public account.

"She had put so much effort into it, and it was about to be shut down," Zhou said. "The bank card linked to it had been canceled upon my mom's death, meaning any future advertising revenue couldn't be collected."

Zhou said he filed the lawsuit to draw more attention to the digital estate inheritance issue. In the end, the platform proposed mediation to shift the account to Zhou's name.

The valuation of some digital assets also lacks clear legal provisions, making it difficult to determine in judicial practice.

Wang Qi, an associate professor at Beihang University's Law School, said that the value of assets, such as in-game items and social media accounts, is heavily influenced by market conditions, policies, and user engagement. With no open or legitimate trading market, there is no standard for valuation.

On the technical side, inheriting digital accounts faces hurdles such as login verification and encryption, Wang added. For example, if a short-video platform was inherited, it would require multiple layers of authentication, including passwords, mobile verification codes, and facial recognition.

As the number of digital "natives" continues to surge, judges and legal experts agree that clearer rules are urgently needed. They recommend that lawmakers and platforms move swiftly to establish standardized regulations on the use, transfer, and inheritance of digital property. Without such measures, millions of online assets will remain in legal limbo — a gap that the fast-evolving digital age has opened, and that the law has yet to close.

Shanghai set to host record world AI event

Over 1,100 firms, 300 global product debuts expected at conference opening on July 17

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

The upcoming World Artificial Intelligence Conference, one of the world's most influential AI events, will reach a record scale this year in its exhibition area, and is expected to attract over 1,100 companies, display more than 3,000 exhibits and feature more than 300 global product debuts, according to a news conference held on Tuesday in Shanghai.

Shanghai has successfully hosted the conference for eight consecutive years, with the event becoming an important platform for showcasing cutting-edge AI technologies from China and around the world, while also deepening international cooperation, said Chen Jie, vice-mayor of Shanghai.

"For the first time since its inception, the conference's exhibition scale exceeds 100,000 square meters. The intelligent computing and embodied AI segments will each bring together more than 200 companies. Leading companies, major State-owned enterprises and top multinational companies will join their ecosystem partners to showcase the latest AI-enabled applications across industries," said Chen.

He added that such an expansion in the scale and capacity of the conference is based on the city's thriving AI industry.

Shanghai's 394 AI enterprises above the designated size, each with annual revenue of at least 20 million yuan ($2.9 million), saw their combined industry scale exceed 637 billion yuan in 2025, up 39.5 percent year-on-year, emerging as a new driver of the city's economic growth, according to Chen.

Shanghai has built a complete ecosystem for AI development, integrating innovation, application, cooperation, ecological coordination and security governance, he added.

The city's booming AI industry reflects the sector's continued growth and development.

"The value of China's core AI industry is estimated to have surpassed 1.2 trillion yuan in scale by the end of 2025. At the same time, rapid advances in large models, AI agents and chips are expected to drive annual humanoid robot production above 100,000 units this year," said Gan Xiaobin, deputy director of the Ministry of Industry and Information Technology's department of science and technology.

According to Gan, the constantly deepening integration of AI and manufacturing is enabling Chinese industrial enterprises above the designated size to raise their adoption rate of AI to more than 30 percent.

Inside
See more, **pages 8-9**

Wang Ruomeng, an official of the National Development and Reform Commission, said the Chinese AI industry is estimated to grow at a rate of more than 30 percent this year, and the integration of AI into various sectors has become a driving force for the nation's economy.

"Since the guideline on advancing AI integration was issued by the State Council last August, the NDRC has worked together with relevant parties to promote AI to empower various industries and benefit Chinese people in their daily life," said Wang.

Sun Xiaobo, an official of the Ministry of Foreign Affairs, said the theme of this year's conference — AI Partnership for a Brighter Future — has two key messages.

"The word partnership shows that AI is empowering all kinds of industries and families, becoming an important assistant in our work and daily lives. In the meantime, global AI governance requires countries to work together to build global partnerships in AI and jointly promote the beneficial and inclusive development of artificial intelligence," said Sun.

Speaking on the sidelines of the news conference, Wei Shaojun, chairman and CEO of Chinese AI chip startup Dongfang Suanxin, said the company, which will attend the AI conference for the first time, will showcase its full product lineup, from chips to systems.

Founded in 2024, Shanghai-based Dongfang Suanxin specializes in integrated circuit design.

"Our current chips focus on the training level, while the next-generation products are expected to come out by the end of this year, with performance expected to match the level of mainstream international peers," said Wei.

Set to take place from July 17 to 20, the 2026 conference will feature six major sections, including forums, exhibitions, innovation incubation and talent exchanges.

The event is formally known as the 2026 World AI Conference & High-level Meeting on Global AI Governance. More than 140 forums will be held during the four-day event, bringing together over 1,400 guests from home and abroad.

An official said the overnight clashes left 26 people dead, including seven prison officers and 19 inmates. Authorities have launched an investigation into the cause of the violence that involved two rival drug gangs. ISHARA S. KODIKARA / AFP

Japan pays price for misled security moves

By **WANG KEJU** in Beijing and **MA SI** in Haikou

As China-Japan relations remain strained over Japanese Prime Minister Sanae Takaichi's erroneous remarks on Taiwan and her administration's accelerated military build-up, Japan's economy is increasingly feeling the pinch, with critical mineral exports from China plunging, supply chains buckling under pressure and billions in potential GDP losses looming, experts said.

What is truly pushing Japanese businesses into difficulty is not China's lawful measures to safeguard national security, but the systemic risks spawned by Japan's own misguided security trajectory, they added.

According to the General Administration of Customs, China's exports of rare earth magnets to Japan plummeted 34.6 percent to 123 metric tons in May compared with April, while monthly shipments have remained below 200 metric tons for three consecutive months.

Since the start of 2026, China has banned shipments of dual-use items and technologies, including rare earth elements, to Japan. Such items and technologies have both civilian and military applications.

The ban came on the heels of a downward spiral in China-Japan relations, triggered by Takaichi's remarks and her administration's military-related moves.

China's tighter export controls have prompted Japan to take unprecedented steps. Recently, All-Nippon News Network reported that Japan has launched its first-ever program to extract rare earth elements from discarded household air-conditioners.

Mitsubishi Electric, the Japanese company spearheading that recycling initiative, was added to China's export control list in late June for its involvement in defense electronics, radar and missile systems.

The June decision, which imposed a total ban on dual-use item exports to 20 Japanese entities and implemented heightened scrutiny against 20 others, followed a similar decision in February that targeted 40 Japanese entities.

Shen Yi, a professor at Fudan University's School of International Relations and Public Affairs, said, "The Japanese government's bet that it can continue its military expansion and provocative rhetoric without paying a real price is doomed to fail."

Shen noted that China accounts for roughly 70 percent of global rare earth mining and over 90 percent of smelting and separation capacity, giving the nation's policy tools the weight to alter Japanese corporate calculations.

China boosts self-reliance

Experts said that Japan's attempts to leverage its edge in the semiconductor sector through potential export controls will ultimately prove futile, as foreign restrictions are only accelerating China's push for self-reliance, turning what was meant as a chokehold into a catalyst for domestic substitution.

For instance, there is "significant progress" in the domestic production potential of photoresist, the light-sensitive material essential for etching microscopic circuits onto silicon wafers, sources from leading Chinese chipmakers such as Semiconductor Manufacturing International Corp and Huahong Group told China Daily.

Jiangsu Nata Opto-electronic Material Co, which developed one of China's first high-end deep ultraviolet photoresists, said the company's revenue from the product exceeded 10 million yuan ($1.5 million) in 2024, and it maintained a stable supply in 2025.

According to data from Japanese research company Global Net, last year, three Chinese chip equipment manufacturers ranked among the world's top 20 by sales volume for the first time.

This marks a sharp rise from just one company in 2022, prior to stricter restrictions imposed by the United States, underscoring China's accelerated progress in bolstering the domestic supply chain.

Roger Sheng, vice-president of research at US market research company Gartner, noted that the technological gap between Chinese companies and international industry leaders is continuously narrowing.

"This progress has provided strong support for domestic chip manufacturers in their technological upgrades and production expansion efforts, even amid restrictions on access to Japanese technology and equipment," Sheng said.

With the exception of lithography machines, domestic tools are now being increasingly used in Chinese semiconductor factories, he said, citing the example of Naura Technology becoming a key equipment provider for another Chinese company's advanced memory chips.

Strategy: Innovation accelerates at scale

From page 1

The centers in the Beijing-Tianjin-Hebei region, the Yangtze River Delta and the Guangdong-Hong Kong-Macao Greater Bay Area would then be turned into world-class innovation engines.

Elijah Mwangi, a scholar based in Nairobi, the capital of Kenya, said the perception of China trailing Western innovation is outdated, as Chinese firms are now leaders in areas such as 5G telecommunications, drone technology, fintech and artificial intelligence applications.

"What distinguishes China's approach is its ability to deploy innovation at scale. Technologies are rapidly integrated into everyday life, from digital payments and smart transportation systems to AI-powered services. The rise of Chinese AI firms has demonstrated that the race for technological leadership is no longer confined to Silicon Valley," Mwangi said in an article published by the China Global Television Network website.

On April 30, Xi attended a symposium on strengthening basic research in Shanghai, urging greater efforts and more solid measures to strengthen basic research and enhance China's capacity for original and groundbreaking innovation.

According to data from the Ministry of Science and Technology, China's total R&D investment exceeded 3.92 trillion yuan ($576 billion) in 2025, accounting for 2.8 percent of its GDP. Basic research funding last year hit nearly 280 billion yuan, accounting for 7.08 percent of total R&D spending, making it the first time that the funding has surpassed the 7 percent threshold.

China has projected an annual average increase of at least 7 percent in nationwide R&D spending during the 15th Five-Year Plan (2026-30) period.

Md Altab Hossin, a foreign expert working for the Entrepreneurship College of Chengdu University in Sichuan province, said that China's innovation-oriented development is not merely a slogan — it is the engine driving the nation toward a future defined by sustainability, intelligence and shared prosperity.

By sharing its renewable grids, electronic vehicle platforms, AI frameworks, humanoid robots and BeiDou signals, China is constructing a technological foundation upon which all of humanity can stand taller and receive the benefits, Hossin said.

Sport: Skating offers something profound

From page 1

"Skateboarding is undoubtedly a distinctive, advantageous product of Huizhou, with outstanding industrial scale advantages," said Du Yongbin, general manager of Huizhou Excel Sporting Goods. "Skateboarding originated in the United States, yet Huizhou manufacturers produce nearly 40 percent of the global high-end skateboards. That's primarily thanks to their superior quality — positioning the city as a core hub for the skateboard industry."

A national high-tech company with 20 years' experience, Excel Sporting has amassed more than 40 skateboard-related patents. Precision is baked into everything, providing a level of exactness that elite riders can feel under their feet.

"About one-third of the skateboards used at the 2020 Tokyo Olympics were manufactured by Excel Sporting," said Du.

"The competition board ridden by young Chinese athlete Cui Chenxi at the 2024 Paris Olympics was also custom-made by us," added Du.

Xu Yang, a core partner at the company, added that exports now account for up to 70 percent of total output. Excel Sporting is an authorized supplier of top domestic and international brands, including April, Real, Antihero, DGK and Justice. The premium boards they produce carry overseas retail prices of between $100 and $200.

Xu notes that every international client has been gradually accumulated through word-of-mouth referrals from long-term partners.

Du said the decks of mainstream professional skateboards are mostly laminated Canadian hard rock maple. Carbon fiber and fiberglass are added to premium models.

From raw material processing to a finished board, the production cycle spans 15 to 45 days.

For Du, skateboarding offers young people something profound. It improves fitness by developing core strength, balance and reflexes.

It tempers mental resilience: Learning means repeated failed attempts. That cultivates the ability to withstand pressure and the courage to take on challenges.

It also enriches social lives. Young skaters meet like-minded peers, expand their circles and develop teamwork awareness.

Trade: Wiser path demands pragmatic engagement

From page 1

For decades, European legacy manufacturers — epitomized by automakers — prioritized shareholder returns over reinvestment. Stock buybacks, lavish dividends and the return on capital employed took precedence over investment in research and development, vocational training and energy infrastructure. Labor became a cost to minimize, not a strategic asset.

Yet, even then, automation lagged behind. Energy markets favored spot-trading volatility over stable, affordable industrial power. The result: exorbitant electricity costs, skill shortages in batteries and software and factories uncompetitive against those fueled by consistent capital deployment.

China's trajectory tells a different story. Starting in the 1980s, European brands profited handsomely from China's market through joint ventures — such as SAIC Volkswagen — in which they treated the country as a low-cost assembler. The dynamic flipped post-2015. Beijing's industrial policy shift toward new energy vehicles and clean technologies, combined with private enterprises' relentless reinvestment, produced global leaders.

Chinese privately owned enterprises now drive the bulk of exports, mastering battery chemistry, vertical integration and hyper-automated production. The "students" have become the masters, exporting innovation back to Europe. Yet rather than emulate this capital discipline, European rentiers cry foul over the subsidies they once benefited from.

The air conditioner boom lays bare the hypocrisy. Amid heat-induced deaths and discomfort, protectionist impulses falter against consumer reality. Proposals for new refrigerant rules or tariffs risk pricing out relief for ordinary citizens to shield inefficient local producers. This mirrors the reality that tariffs on Chinese electric vehicles and plug-in hybrids may prop up legacy margins temporarily, but they accelerate Europe's slide to becoming an industrial museum. Simulations within the European Commission confirm that a full trade war would devastate the continent, which is more exposed than the US due to energy dependence and export reliance on China for machinery and chemicals. Beijing holds leverage over critical minerals such as lithium, graphite and rare earths. Indeed, this is cutting off one's nose to spite one's face.

The wiser path demands intellectual honesty and pragmatic engagement. European elites must shed Orientalist reflexes portraying China as a perpetual threat rather than a partner, and must also revitalize the dormant Comprehensive Agreement on Investment — signed in principle in 2020 but frozen by political posturing — repurposing it as a framework for stability, rule-of-law predictability and market access.

This would draw Chinese investment to European factories, not mere screwdriver plants.

Early signs exist of this: BYD in Hungary, Chery in Spain and Leapmotor in Poland. The EU should expand these via streamlined permitting, clean energy linkages, co-investment funds and logistical hubs.

European leaders should heed their citizens' urgent purchases: Disengagement is a luxury that the heat — and history — will not afford. Win-win cooperation, grounded in realism over ideology, remains the only viable route to renaissance.

The author is an adjunct professor at Queensland University of Technology in Australia and former policy adviser to former Australian prime minister Kevin Rudd. The views do not necessarily reflect those of China Daily.

US warned tariffs will raise costs

Businesses express concern, say levies could hit consumers and supply chains

By BELINDA ROBINSON
in New York
belindarobinson@chinadailyusa.com

US companies, retailers and trade groups have urged the Office of the United States Trade Representative to drop proposed tariffs on 60 countries and regions that the agency alleges have failed to curb trade in goods made with forced labor, arguing the measure would disrupt supply chains and raise costs.

The deadline for written comments was Monday, with public hearings set for Tuesday through Thursday at the US International Trade Commission in Washington. By the deadline, the USTR had received at least 980 submissions, according to its website.

Many businesses warned that additional tariffs would disrupt supply chains and increase costs for importers, manufacturers and ultimately US consumers.

"Layering additional tariffs on products that are already subject to existing trade measures can create unnecessary cost burdens and supply chain complexity for US manufacturers," said Eve Duchene, an executive assistant at Modules Technology in San Jose, California.

"As a supplier of advanced multilayer bare printed circuit boards … we are concerned that cumulative tariff actions on critical industrial inputs can increase costs without creating practical near-term sourcing alternatives," she said.

The USTR has proposed an additional 12.5 percent tariff on imports from 45 countries, including China, India, Nigeria, Japan and Australia, alleging they failed to address forced labor practices, Reuters reported.

Another 15 economies, including Canada, Ecuador, the European Union, Indonesia, Mexico and Britain, would face a 10 percent tariff because they have either adopted or committed to plans to tackle forced labor under US trade agreements, the USTR said.

The proposal, unveiled last month, followed a Section 301 investigation under the Trade Act of 1974, which concluded that the targeted economies had failed to ban or effectively prevent imports linked to forced labor, creating what the agency called an "uneven playing field" for US workers.

The proposed tariffs would exempt products already covered by Section 232 national security duties, including automobiles, steel, aluminum and copper.

"Chinese law fully prohibits forced labor," Xinru Huang of the China Association of Automobile Manufacturers said in comments submitted to the USTR. "If the United States insists on imposing tariffs, it will only raise costs for US importers and consumers."

The proposed tariffs would also exempt Canadian and Mexican imports that comply with the rules of origin under the North American trade agreement.

International trade groups and businesses warned in their comments that more tariffs will drive up costs.

Primary impact

Wei Zhao of the China Chamber of Commerce for Import and Export of Light Industrial Products and Arts-Crafts wrote that "American consumers will bear the primary impact" if the tariffs are imposed.

"Furniture prices will rise, exacerbating inflationary pressures and increasing the cost of living for ordinary households," Zhao said.

Reuters reported that other exemptions would include crude oil and petroleum products, rare earths and other specialty metals, beef, coffee, pharmaceuticals and aircraft parts.

Some US companies urged the USTR to revise the proposed exemption list. Leo Holt, president of Holt Logistics in New Jersey, whose affiliated companies operate marine terminals and logistics centers along the Delaware River, called for specialized dairy protein ingredients to be added.

"While we fully support the overarching US trade policy goal of ensuring market integrity and penalizing illicit labor advantages internationally, we write to urgently advocate for the addition of critical, specialized dairy protein ingredients to the Annex A product exclusion list," Holt said.

The proposal comes ahead of the July 24 expiration of a temporary 10 percent tariff imposed on Feb 20, the day the Supreme Court struck down earlier tariffs imposed under the International Emergency Economic Powers Act.

China, Nordic nations reaffirm cooperation

By ZHOU JIN
zhoujin@chinadaily.com.cn

China and four major Nordic countries — Denmark, Sweden, Finland and Norway — have agreed that China and Europe should foster a correct perception of each other, keep dialogue and cooperation at the forefront of their ties, and properly manage differences, the Foreign Ministry said on Tuesday.

Ministry spokeswoman Mao Ning made the remarks after Foreign Minister Wang Yi concluded a six-day visit to the four countries on Tuesday, his second trip to Europe this year amid mounting challenges in China-Europe relations.

Mao reiterated China's position that China-Europe economic and trade ties should be viewed in a more comprehensive, objective and positive light, calling on both sides to maintain and expand two-way opening-up and promote more balanced development. She said the European side should recognize the need to enhance its own competitiveness.

The four countries welcomed more constructive China-Europe economic and trade dialogue and supported efforts to properly manage trade frictions, pursue win-win solutions and achieve substantive outcomes, she added.

Wang welcomed businesses from the four countries to walk into the "fitness club" of the Chinese market, inviting them to strengthen their competitiveness while sharing opportunities created by China's vast market, complete industrial chains and diverse application scenarios, Mao said.

The four countries, meanwhile, welcomed more people-to-people exchanges with China and supported deeper cooperation in education, culture, tourism, language, scientific research, think tanks, youth, and local government exchanges, she said.

Wang's trip marked the first visit to Denmark by a Chinese foreign minister in 15 years and the first to Sweden in 22 years.

Political foundation

Denmark, Sweden, Finland and Norway were among the first European countries to establish diplomatic relations with the People's Republic of China. During Wang's visit, they reaffirmed their commitment to the one-China policy, helping consolidate the political foundation of bilateral ties, Mao said.

Describing the trip as one that advanced friendship, deepened mutual trust, expanded cooperation and built consensus, Mao said China and the four countries also agreed to strengthen cooperation in green and low-carbon development, scientific and technological innovation, while enhancing dialogue on global AI governance.

In a world of chaos and turbulence, Wang's visit underscored the broad consensus between China and the four Nordic countries on consolidating and developing bilateral relations well to address the uncertainty of the world through the stability of the bilateral ties, she added.

Feeling the vibrant pulse of the East on Jordan's streets

Cui Haipei
Reporter's log

FIRST PERSON VIEW

Traveling from the ancient seven hills of Amman to the strategic northern hub of Irbid, one can easily discern a strategic, undeniable shift: Jordan is turning its gaze eastward, anchoring its future cooperation with China in economy, culture and governance.

During my recent trip, before I sat down with officials and scholars, it was the vibrant encounters on the streets that truly brought this shift to life.

Having lived in the Middle East for quite a while, I thought I was already used to the sights of Chinese cars weaving through streets and goods filling store shelves. Yet, Amman still had a surprise for me on day one.

I was spontaneously approached by an 18-year-old boy whose Mandarin was strikingly fluent — a remarkable feat after just over a year of study. With his father running a trading business in Guangzhou, Guangdong province, the young man was beaming with excitement as he had just received an offer from a university in Qingdao, Shandong province.

In his eyes, China was not a distant, abstract concept, but a tangible land of promise, career prospects and limitless personal horizons. He represents a rising cohort of young Jordanians eager to decode the secret of China's development, embodying exactly what Samir Habashneh, chairman of the Jordan-China Cultural Cooperation Committee, told me, "China holds such appeal that anyone who has visited once longs to return."

If this boy mirrored the forward-looking optimism of Jordan's youth, another encounter in the capital highlighted the profound institutional goodwill toward China.

As I was about to walk back to the hotel, a police officer stopped me. When I told him I'm from China, he turned back to his guard booth and emerged with a color-printed flyer written in Chinese. It contained safety tips and emergency contact protocols tailored for Chinese visitors and investors.

That flyer, handed to me by a law enforcement officer, spoke volumes. It was the grassroots manifestation of what senior Jordanian officials describe as China's role of an "irreplaceable stabilizer" in the Levant region. China's impartial stance on the Palestinian question and its commitment to peaceful resolution have earned deep appreciation that trickles down from top officials to common people.

In Irbid, at Yarmouk University, this nationwide enthusiasm is taking a highly structured form. The country's second-largest public university has unveiled an ambitious blueprint for an on-campus "China Village".

A Jordanian student explains the Chinese characters *xuexi*, or study, during a United Nations Chinese Language Day event in Amman on May 12. XINHUA

Surpassing the scope of a traditional Confucius Institute, this complex is envisioned by the university's president, Malek Alsharairi, as a permanent exhibition platform for China's innovations in all aspects.

Remarkably, the campus is integrating Chinese arts into its curriculum, planning full undergraduate concentrations in Chinese theater, and ensuring that architecture and engineering students study Chinese design methodologies.

The rationale is shrewdly practical: Irbid sits just a two-hour drive from Damascus. As Syria and surrounding nations embark on post-war reconstruction, Jordan aims to position itself as the safe and ideal regional hub. Jordanian graduates who master both the Chinese language and a firm grasp of China's technical ecosystems will possess an unmatched competitive edge in the regional labor market.

Moreover, this drive is moving beyond elite academies into the realm of vocational training. Rafat Mousa Al-Sawafin, director-general of Jordan's national Vocational Training Corporation, expressed an urgent eagerness to partner with Chinese peers to upgrade their facilities and equipment, particularly in microchip design and IT.

It marks a crucial transition from pure language learning to an integrated "Chinese plus vocational skills" model — a synergy that Zhao Xiaoqiang, cultural counselor at the Chinese embassy in Jordan, said will "bind together the vitality of young generations".

Centuries ago, ancient Arab traders traveled the Silk Road, guided by the famous maxim, "Seek knowledge, even unto China." Today, standing at the crossroads of Amman and Irbid, it is clear that this ancient thread remains unbroken.

Whether it is a young student packing his bags for Qingdao, an officer proudly holding a safety flyer in Chinese, or a university building a village to showcase Eastern tech, Jordan's embrace of China is rooted in a shared quest for stability, modernization and mutual respect.

In a world fraught with uncertainty, this deepening bond offers a refreshing blueprint for cooperation over confrontation — a quiet, powerful momentum felt on every street corner of Jordan.

Opposition slams plan to oust Hungary's president

By JONATHAN POWELL in London
jonathan@mail.chinadailyuk.com

Hungary's opposition party Fidesz has warned of "tyranny" in government after Prime Minister Peter Magyar submitted an amendment to remove President Tamas Sulyok, which could come into effect as early as next week.

Fresh off an April landslide that ended former leader Viktor Orban's 16-year rule, Magyar has repeatedly pressed to remove the predecessor-appointed president, whom he calls "Orban's puppet".

In an amendment filed on Saturday, Magyar stipulates that "the mandate of the incumbent President of the Republic shall terminate on the day following the entry into force of the amendment to the Fundamental Law".

With a parliamentary supermajority, the governing Tisza Party is expected to pass the amendment.

As reported by Euronews, the Fidesz party has called for a demonstration on Thursday in support of Sulyok.

Parliamentary sources say a vote on the removal of the president could come as early as next week, though there is no official confirmation.

Beyond the presidency, the package would remove four constitutional judges by setting their retirement age at 70 and cap parliamentary deputies at a 12-year mandate.

Defiant, Sulyok says he will not resign and calls Magyar's move a threat to democracy.

"The question is whether this force will sweep away internationally recognized and required principles of the rule of law, as well as genuine representative democracy," Sulyok said on Sunday.

Constitutional grounds

The Budapest Times reported that, in a Sunday interview with Poland's Do Rzeczy publication, Sulyok said, "I have no reason to resign, and the prime minister has so far found no constitutional grounds for my removal."

The proposal refers to the "current president" rather than to the office of the presidency in general, which means it can only be interpreted as "a piece of legislation tailored to a specific individual, which cannot in any way be described as a solution consistent with the rule of law", he said.

Throughout his election campaign, Magyar repeatedly pledged to remove the president from office.

He contends that Sulyok failed to fulfill constitutional duties and did not defend opposition supporters during Orban's tenure.

Fidesz warned of "tyranny" and called for the demonstration. Orban, who is still the opposition party's leader, said: "The Tisza Party crosses all boundaries — human, moral and legal. Hungarian voters did not authorize this."

According to the opposition, Sulyok was duly elected in accordance with the Constitution, and his removal would amount to personalized legislation.

NATO summit kicks off amid defense push

Pressure mounts on military alliance as trans-Atlantic strains come to the fore

By **WANG MINGJIE** in London
wangmingjie@mail.chinadailyuk.com

NATO started its two-day summit on Tuesday in Ankara, Turkiye, amid protests in the Eurasian capital city against the military alliance's push for higher defense spending, which mounts pressure on Europe's already-strained budget and intensifies tensions between the continent and the United States.

US President Donald Trump, who has been gradually pulling some of US assets and military deployments out of Europe in the past few months, is expected to continue pushing NATO countries to spend 5 percent of their gross domestic product on defense.

Just days ahead of the summit, the president had said it would be "ridiculous" for his country to maintain what he described as its "one-sided" approach to NATO.

The president has at times piled on the pressure by questioning the usefulness and viability of NATO following the nonengagement of European allies in US' conflict with Iran. He recently reignited a feud with Italian Prime Minister Giorgia Meloni when his interest in acquiring Greenland kept unsettling Europe.

Janina Dill, a professor of global security at the University of Oxford's Blavatnik School of Government, said the summit reflects a much broader shift in Europe's strategic landscape, and Europe faces a historic turning point to take far greater responsibility for its own security.

"The system within which Europe has kept itself safe for the last 80 years is gone," she said. "The trans-Atlantic alliance is no longer there for Europe to keep itself safe." She said European countries must deepen their cooperation and significantly increase defense investment if they are to maintain strategic autonomy.

Angel Saz-Carranza, director of EsadeGeo Center for Global Economy and Geopolitics in Spain, said the alliance has adapted to the new political reality and is facing challenges to hold steady.

"The international community should watch whether allies can agree on a clearer division of responsibilities within NATO while keeping the US engaged in European security," he said.

During last year's summit in The Hague, under pressure from the US — which shoulders over 60 percent of NATO expenditure — other states agreed to hike their defense budgets from an average of about 2 percent of national annual GDP to 5 percent, by 2035 — a commitment Spain has refused, and which some countries are adapting to at a slower rate.

Smaller role

As to how the US will stay engaged, Pedro Brinca, an associate professor of macroeconomics at Nova School of Business and Economics in Portugal, said Washington's approach is "repricing its security guarantee" for NATO, while playing its smaller role as a backstop, rather than a first responder.

But even if European allies can fulfill the commitment, turning increased defense budgets into meaningful military capability remains a much greater challenge. Although Europe has launched ambitious initiatives, including the European Union's ReArm Europe Plan and the Security Action for Europe financing mechanism, Brinca said industrial fragmentation continues to undermine efficiency.

"The money is now real. The capability is not yet, and that distinction is the whole story," he said, noting that European NATO members continue to operate different weapons platforms, limiting economies of scale.

Saz-Carranza cautioned that Europe building credible military capabilities of its own will take time.

"The EU is on the right track and should be able to build stronger defense capabilities," he said. "However, this will be a decades-long process, since higher spending will need time to translate into real military capacity."

According to Brinca, disagreements over the recent conflict with Iran and Washington's frustration with some European allies' reluctance to participate militarily have also exposed underlying strains within the alliance.

Hamas dissolves administrative body in Gaza Strip

By **JAN YUMUL** in Hong Kong and **CUI HAIPEI** in Dubai, UAE

The Palestinian militant group Hamas said on Monday it was dissolving its civilian governing body in Gaza after almost two decades, transferring its responsibilities to the National Committee for the Administration of Gaza, or NCAG.

The head of the government's emergency committee, Mohammed al-Farra, has officially submitted his resignation, Ismail al-Thawabta, head of Hamas' government media office, said in an interview with AFP.

The development comes amid continuous Israeli strikes in the besieged enclave and southern Lebanon despite a US-brokered ceasefire.

Headed by Palestinian technocrat Ali Shaath, the NCAG is a transitional, technocratic, and apolitical Palestinian committee established this January under United Nations Security Council Resolution 2803 (2025) and US President Donald Trump's Comprehensive Plan to End the Gaza Conflict.

Hamas said the dissolution aims to "alleviate the suffering of citizens resulting from the ongoing war ... the delay in reconstruction, the continued siege, the closure of crossings, and the failure of the Israeli army to withdraw", as well as to eliminate pretexts for Israeli interference, Xinhua News Agency reported.

The Palestinian technocratic committee said it was "fully prepared" to assume its responsibilities over the enclave "as soon as the necessary resources and capabilities are available".

Palestinian factions welcomed the dissolution, calling it a sign of commitment to advancing Palestinian reconciliation.

Israeli Foreign Minister Gideon Saar dismissed the move by Hamas as a "trick" in a post on X.

He said Hamas' apparent willingness to make room for a technocratic government is designed to prevent its own disarmament and accused Hamas of seeking "to replicate the Hezbollah model in Gaza", referencing the Lebanese militant group.

Saar said a technocratic administration would be responsible for garbage collection and other municipal services, while Hamas would remain the dominant military force.

'Step forward'

Belal Alakhras, a research fellow at the University of Malaya in Kuala Lumpur, told China Daily that the decision to dissolve Gaza's emergency governing committee "is viewed as a step forward to move out of an impasse" that persisted since the ceasefire was signed last October.

He said that since then, Israel has continued to deal with Gaza in isolation, which only intensified once regional and international attention turned to the US-Israeli war on Iran and its fallout.

Alakhras noted that Israel maintained near-daily strikes that have killed more than a thousand Palestinians since the ceasefire, and expanded its military control to well over half the territory, occasionally using the presence of Hamas as a pretext for its refusal to move to the next phase of the agreement.

He said the dissolution of the civilian governing body has both local and international implications as Hamas is engaging with other local actors and international mediators and guarantors of the ceasefire to take responsibility for alleviating the suffering of the people in Gaza and ensuring the implementation of the agreement.

"The Israeli response by foreign minister (Saar) and other officials who dismissed the move is so telling as it reflects a tendency to continue enforcing the current impasse and isolation," said Alakhras.

"Prolonging the situation can make it even more complicated and possibly propel the Palestinian side to act differently and confront the ongoing hard situation. If the past three years indicate anything, it is that dealing with consequences is not enough, and it can be too risky," he added.

Affordability crisis hits US as healthcare, college fees soar

By **CHANG JUN** in San Francisco
junechang@chinadailyusa.com

Achieving the "American dream" may take the painstaking toil of generations, yet it takes only two bills to shatter it: a health insurance premium and a college tuition statement.

For Yang Lin, a data scientist at a Bay Area tech company, this August feels particularly stark. Her daughter is heading to a private college this fall as a freshman while her husband has been out of work since last September. When their company-subsidized health insurance terminated, she shopped around the marketplace and got a monthly quote of $2,400. "Are you kidding me?" she said, adding her daughter's college tuition alone runs $70,000 a year, with another $20,000 for room, board, and a meal plan.

"I'm afraid we are going to go broke," she said quietly. A first-generation immigrant, Lin is now the sole breadwinner for a family of three in one of the most expensive states in the US. "We are a living example of the working American family squeeze," she told China Daily. "I don't have an American Dream. If I have one, it's this: give me affordable health insurance now."

Lin is not alone. Elevated healthcare expenses and the rising cost of living in recent years have become the new normal, and have chronically exerted financial strains upon millions of US families.

According to a survey in 2025 by the West Health-Gallup Center on Healthcare, about 11 percent of US adults admitted that they could not "afford or access quality healthcare", which involved nearly 29 million people, the highest level since 2021.

Classified as "Cost Desperate" in the study, the group is disproportionately made up of Hispanic Americans at 18 percent, black Americans at 14 percent, and households earning under $24,000 annually at 25 percent.

In her 2026 research, Munira Gunja, a scholar at the Commonwealth Fund, and her colleagues found that roughly 8 percent of the US population is uninsured. Due to high deductibles and out-of-pocket costs, Gunja found US citizens are far more likely than people in comparable countries to skip filling a prescription, avoid a diagnostic test, delay treatment, or abandon a care plan their doctor recommended.

Gunja concluded that the causes of the US' "uniquely poor health performance" relative to its peers include the absence of universal coverage, a weak primary care infrastructure, steep out-of-pocket costs, and an insurance system of bewildering complexity.

Amy Liu, a registered nurse at a Santa Rosa, CA-based medical facility, told China Daily that many patients she received during night shifts sought emergency care. It means hospitals are legally required under federal law to provide medical screening and stabilizing treatment, regardless of patients' insurance status or ability to pay.

"Both the patients and the hospitals understand that. I guess that is the only solution for some of the affected families to get some sort of medical assistance," Liu said. "But the cost will not go away. Ultimately, the taxpayers will foot the bill. I regret that the whole medical system is failing Americans, many of them."

Similarly, the college bill is another mountain that tens of thousands of US families are carrying uphill, one that has negatively affected public perception of the merits of undergraduate and graduate education.

"College education, especially (for those) attending high-ranking schools, has become a luxury only the rich and the elite can afford," said Yanzi Luo, a Michigan resident who had to persuade her son to decline an offer from Harvard and attend the University of Michigan instead. "It was a hard decision for the family to make, but the difference between $90,000 and $30,000 a year is reason enough to choose," she said.

China urges end to US embargo against Cuba at UN debate

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

China on Tuesday voiced support for Cuba at a UN General Assembly debate on the decades-long US economic, commercial and financial embargo against the Caribbean country, saying the measures have caused serious hardship for the Cuban people and should be brought to an end.

The General Assembly voted earlier on Tuesday to proceed with the debate by 136 votes in favor, nine against and 30 abstentions, despite opposition from the United States.

Speaking at the debate, Fu Cong, China's permanent representative to the United Nations, said China supported the convening of the meeting and voted in favor of holding it. The 136 votes in favor "fully demonstrated the aspiration of the international community and the call for justice", he said.

The debate, convened at the request of Cuba, focused on "the necessity of ending the economic, commercial and financial embargo imposed by the United States of America against Cuba".

Fu said the US has, for more than 60 years, imposed an economic blockade and unilateral sanctions on Cuba, "causing enormous suffering to the Cuban state and people".

"Cuba has suffered accumulated losses of more than $170 billion as a result of the blockade, while hospitals, schools, water supply systems, grain storage facilities and other infrastructure related to people's livelihood have come under severe pressure," he said.

Cuba is facing serious fuel shortages, a worsening electricity and energy crisis, and continued obstruction in the supply of medicines, medical equipment and other essential goods, with vulnerable groups such as children and pregnant women bearing a heavy impact, Fu said.

Cuba, which depends heavily on fuel imports, has received only one oil tanker in the past six months, the Russian vessel *Anatoly Kolodkin*, carrying about 100,000 metric tons of crude oil, Xinhua News Agency reported. The country needs about eight fuel tankers a month to maintain normal operations.

"Such acts violate the purposes and principles of the UN Charter, including sovereign equality, the peaceful settlement of international disputes and the prohibition of the use or threat of force," Fu said.

They also "infringe upon the Cuban people's rights to subsistence and development, and undermine the international order based on international law and the basic norms governing international relations", he said.

"China urges the United States to stop its blockade against Cuba and all forms of coercive pressure, and to stop infringing upon the Cuban people's rights to subsistence and development," Fu said.

Fu called on the international community to support Cuba in safeguarding sovereignty, equality and national dignity, and to jointly resist illegal blockades, sanctions and military threats.

He said countries should uphold the purposes and principles of the UN Charter, adhere to sovereign equality, oppose interference in internal affairs, adhere to the peaceful settlement of disputes and oppose the use of force.

"No country can appoint itself as an international policeman, nor can any country style itself as an international judge," Fu said.

"The Chinese people empathize with the suffering of the Cuban people and China will, as always, provide Cuba with support and assistance within its capacity," Fu said.

He called on countries and UN agencies to step up humanitarian assistance to Cuba, help address shortages of fuel, food and medicines, ease the crisis facing the Cuban people and safeguard the bottom line of international humanitarianism.

Cuban Foreign Minister Bruno Rodriguez Parrilla welcomed the Assembly's decision to hold the debate, saying Cuba rejects the claim that it represents a threat to the United States and condemns Washington's policy of hostility and aggression.

"Cuba is not a threat. Cuba is the nation that is under threat," said Parrilla, noting Cuba's commitment to "peace, international law, multilateralism, truth and justice".

GDP robust despite some headwinds

Experts: Strong stimulus, AI-related investment seen as leading drivers

By **ZHANG CHENXU** and **JIANG XUEQING**

China's economy has shown resilience so far this year in the face of global energy supply shocks, underpinned by strong high-tech investment and robust exports, said the latest China Economic Update of the World Bank Group.

According to the update released on Tuesday, the world's second-largest economy is expected to expand 4.4 percent in 2026, against a backdrop of slowing global growth, which is projected at 2.5 percent for 2026.

With policy support, high-tech investment and buffers against global energy supply disruptions partly offsetting weaker domestic demand in the second quarter, analysts said stronger-than-expected fiscal stimulus and artificial intelligence-related investment could provide additional upside, potentially lifting growth above the current forecast.

China's GDP reached 33.42 trillion yuan ($4.92 trillion) in the first quarter, expanding 5 percent year-on-year in real terms and hitting the upper end of the country's annual growth target range, said the National Bureau of Statistics.

"Net exports contributed 0.8 percentage points to GDP growth, largely driven by strong exports of high-tech products," said the report, titled "Rebalancing Growth".

The high-tech sector also supported investment growth, with investment in the sector rising 4.5 percent year-on-year in the first five months, driven by strong AI-related demand at home and abroad, according to the World Bank.

Exports are expected to remain a key source of support in the second half, said Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities, adding that AI-related demand accounts for about one-fifth of total exports.

"Strong AI momentum will continue to provide a solid underpinning for exports," Luo said.

Cai Fang, a member of academic divisions at the Chinese Academy of Social Sciences, echoed such optimism. "AI could help China move beyond deflationary pressures, narrow the gap between strong supply and weak demand, and usher in a new growth cycle," Cai said.

Cai added that an annual potential growth rate of between 4.4 percent and 4.8 percent would be "both reasonable and desirable" for China, given its goal of doubling its 2020 per capita GDP by 2035 to reach the level of a moderately developed country.

Deutsche Bank also remains firmly optimistic about the long-term development of the Chinese economy and regards China as a key market in the Asia-Pacific region, said Christian Sewing, CEO at Deutsche Bank, who concluded his visit to the region last week.

"I spent the first couple of days in Beijing and, as always, left feeling energized. The speed of development and thirst for innovation are everywhere, so it's no surprise that it's a key market for both our clients and Deutsche Bank," Sewing said in a post on LinkedIn.

However, the World Bank cautioned that consumption remained subdued and the property sector continued to adjust amid weak housing demand.

"Supportive macroeconomic policies will still be needed in the near term, while structural reforms should advance gradually and fiscal support remains important for sustaining growth," the report said.

Lynn Song, chief economist for China at Dutch bank ING, said more measures to boost consumption could be rolled out, given the prominent role of strengthening domestic demand during the 15th Five-Year Plan (2026-30) period.

The government has recognized that domestic demand needs to play a larger role in sustaining growth, according to the report.

"Household consumption is expected to play a larger role as China's economy approaches the level of development of high-income countries," it added.

Tatiana Rosito, World Bank Division Director for China, Mongolia and South Korea, said strengthening the social safety net would be key to unlocking greater household consumption.

"Raising benefit levels, extending coverage to informal workers and providing access based on residence could give households the confidence to spend more rather than save," Rosito said.

UBTech Robotics recently launched the UWORLD U1 Series — a line of full-size ultra-bionic humanoid robots. HAO FEI / FOR CHINA DAILY

Calls for ethical home robot boundaries

By **MA SI**
masi@chinadaily.com.cn

Industry experts and regulators have called for the healthy and orderly development of the humanoid robotics sector, particularly in the emerging field of emotional companionship robots, stressing the need to clearly define ethical boundaries.

The comments came after the China Humanoid Robotics Committee of 100 and the China Machinery Industry Federation jointly issued an initiative on Saturday to guide the development of emotional companionship humanoid robots, urging the industry to collectively practice "technology for good" and promote robust industrial growth.

The initiative comes amid rising public attention to UBTech Robotics' newly launched UWORLD U1 Series — a line of full-size ultra-bionic humanoid robots unveiled on June 30. The series includes the semi-torso U1 Lite for 119,800 yuan ($17,622), the full-body U1 Pro (169,800 yuan), and the high-dynamic U1 Ultra, available in male and female editions.

Cumulative pre-orders have exceeded 13,361 units — more than 10 times the company's total full-size humanoid sales in 2025 — with deliveries set to begin in September.

The robot features 88 degrees of freedom and a proprietary dual-pivot bionic cervical spine, covering 90 percent of basic human movements. It is equipped with an emotional large language model that recognizes over 20 fine-grained emotions with over 90 percent accuracy.

Addressing public concerns over the two- to four-hour battery life, UBTech said that this is "the industry norm for full-size humanoid robots in mass production". On pricing, the company clarified that the U1 Lite and U1 Pro target households and individuals, while the U1 Ultra is designed mainly for commercial scenarios.

UBTech founder and CEO Zhou Jian said the current pricing has a profit margin, but costs may decline with scaled production.

On ethical concerns, UBTech emphasized that its bionic robots are positioned as "emotional companionship" devices — a direction recognized and encouraged by national policies — and explicitly stated they are "not boyfriends, girlfriends or partners".

UBTech has moved to operationalize the initiative's principles ahead of industry consensus. On the launch day in June, it established an artificial intelligence and robotics technology ethics committee, appointing legal expert Yan Jianguo as its chief expert.

The company pledged to fully implement the initiative's core directives, integrating its requirements throughout every stage, from research and development and industrial design to manufacturing, promotion, sales and application deployment.

Zhou outlined a three-stage vision for human-robot symbiosis: first replacing hazardous and repetitive labor; then expanding into daily companionship services; and ultimately achieving seamless human-machine integration. "The ultimate mission of technology is to remove the chains of survival labor, allowing humans to focus on creation, passion and emotion," he said.

Michael Tam, UBTech's chief brand officer, projected that China's ultra-bionic robotics market will surge from tens of billions to the trillion-yuan level between 2026 and 2036.

Pan Helin, a member of the Ministry of Industry and Information Technology's Expert Committee for Information and Communication Economy, said humanoid robots have always followed two distinct development paths.

One is the functional humanoid robot — designed for household chores and factory work. The other is the companion/bionic humanoid robot, which focuses on mimicking human facial expressions and gaits. These robots are not built for labor; their purpose is to provide emotional value. At present, these two tracks run in parallel — a robot that can offer emotional companionship cannot perform physical tasks, and a robot capable of labor lacks emotional intelligence. In the future, however, the two technologies will converge into a truly complete humanoid robot, he added.

Briefly

Yuan strengthens against greenback

The central parity rate of the yuan strengthened 12 pips to 6.8054 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System.

Logistics sector sees improved performance

China's logistics sector continued to expand in June, with the logistics business activity index edging up further, according to data released by the China Federation of Logistics and Purchasing. The index tracking the country's logistics market, an indicator of economic vitality, came in at 50.6 percent last month, up 0.3 percentage points from May, the data revealed.

XINHUA - CHINA DAILY

AI-related hiring rises as roles expand

By **LI JIAYING**
lijiaying@chinadaily.com.cn

Demand for talent in the artificial intelligence sector continued to gather pace in China's campus recruitment market during the first five months of the year, as companies stepped up hiring for AI-related roles and expanded recruitment beyond the internet sector, according to the latest industry reports.

According to a new report released by the Chinese recruitment platform Maimai, the number of campus job fair recruitment openings grew 3.56 percent year-on-year during the first five months — with growth primarily driven by AI-related hiring, which jumped 47.3 percent year-on-year over the same period.

As a result, AI's share of newly posted graduate positions climbed from 26.41 percent in 2025 to 37.56 percent this year, meaning that nearly four out of every 10 campus vacancies now require AI-related capabilities.

"Compared with previous years, the biggest change in this year's campus recruitment is the further expansion of demand for AI talent," said a recruitment employee at tech giant Alibaba. "More than 80 percent of our campus recruitment openings this year are AI-related, spanning frontier areas including large language models, multimodal AI, AI infrastructure and AI applications."

In terms of specific AI skills, based on a semantic analysis of job descriptions for campus recruitment positions posted during the January-May period, LLM skills emerged as the most sought-after AI capability, followed by AI agents, deep learning, machine learning and multimodal AI, the Maimai report showed.

The changing recruitment landscape is also influencing graduates' career choices. While internet giants remain the preferred employers for many students, interest is spreading rapidly toward hard-tech sectors.

According to the Maimai report, ByteDance, Tencent, Meituan and JD remained among the most searched employers by graduates from leading universities. At the same time, manufacturers specializing in areas such as semiconductors and automobiles have also attracted growing attention.

On the demand side, data from another online recruitment platform Zhaopin.com also point to the rapid growth in demand for AI talent beyond the digital economy and into more application scenarios, with 21 percent of campus recruitment demand for AI engineers coming from the high-end equipment and intelligent manufacturing sectors from January to May.

"The figures show that AI technologies are no longer confined to software development or chip design," a representative from the platform said.

"They are increasingly being integrated into the manufacturing sector, becoming foundational technologies that support the entire industrial value chain. This is also creating broader cross-industry career opportunities for highly skilled graduates."

Job seekers line up for interviews at a job market in Suzhou, Jiangsu province, last month. WANG JIANKANG / FOR CHINA DAILY

The rapid spread of AI demand across industries is prompting a rethink of how talent is trained and evaluated.

In the 2026 catalog of undergraduate majors released by the Ministry of Education in April, "interdisciplinary studies" was officially established as a new academic category, bringing together 15 majors in its inaugural intake.

These include 11 existing programs, such as future robotics and interdisciplinary engineering, as well as four newly introduced disciplines, including embodied intelligence and brain-computer science and technology.

The country has also unveiled an "AI+education" action plan, which calls for making AI a foundational course across universities, developing discipline-specific teaching materials and ensuring that all students acquire a basic understanding of AI.

China expanding influence in 5G, robotics

By **ZHENG YIRAN**
zhengyiran@chinadaily.com.cn

China is one of the earliest 5G pioneers and is also an leading player in the fast-evolving technology. It is not the only player, but it is one of the first and by far the largest 5G market, said a top executive.

John Hoffman, CEO and director of GSMA Ltd, said China has moved from "bringing innovation into the country" to "showcasing Chinese innovation to the world".

John Hoffman

"China is able to showcase not only the ability to successfully roll out 5G, but also to begin to commercialize it before anyone else. And that allowed a showcasing of the technology and the early applications and services that others around the world could see, could evaluate and potentially replicate," Hoffman said.

According to a notice released on June 23 by GSMA, China currently accounts for over 40 percent of global 5G connections.

Mobile technologies generated $1.5 trillion in economic value in 2025, equivalent to 7.2 percent of GDP, and are expected to rise to $2.1 trillion by 2030, the notice said.

Sihan Bo Chen, head of China unit at GSMA, said, "Those numbers tell the story of an industry that's moved far beyond connectivity into something much more ubiquitous — a platform for productivity, artificial intelligence-driven services and sustainable economic growth."

MWC26 Shanghai was held from June 24-26 during which a humanoid robot skills challenge took place.

"I don't know how humanoids are going to ultimately develop, but they have come very far in a relatively short period of time. You know, it is not only the convergence of AI and 5G connectivity, but also the mechanics of taking metal and silicone and putting it all together for something new and exciting," Hoffman said.

Hoffman said that a few months ago, when he visited Beijing, he was with a vice-mayor, who was telling him about the second half marathon robotic competition.

He added that the capabilities demonstrated by the robots this year far exceeded expectations.

"So, we're seeing advances at a much faster pace than expected. Based on what I've seen around the world, again, China is one of the global leaders in the development of robotics," Hoffman said.

Huang Tao, an independent expert in AI, said: "The opportunities in China's mobile economy are mainly reflected in the following aspects: the deep integration of 5G with cutting-edge technologies such as AI and robotics; promoting the digital transformation of the industry; and creating new growth points in intelligent manufacturing, smart cities and other fields.

"The continuous expansion of the mobile economy's contribution to GDP is expected to reach $2.1 trillion by 2030, creating market space. Also, the international exchange and cooperation platform gathers top global technology enterprises, promotes technological innovation and industrial synergy, and injects new impetus into the mobile economy."

Huang added, "It should be noted how the mobile economy can integrate with the real economy for development, help humanity overcome some dangerous scenarios while avoiding affecting small and medium-sized enterprises and households, and drive the industry to create more job opportunities."

Soccer fueling local late-night economy rise

Popular sport brings people together to enjoy food, drinks and camaraderie

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

On a recent late night in Nanjing, Jiangsu province, the sound of sizzling skewers and clinking glasses filled a Baoji barbecue restaurant. Highlights from the 2026 FIFA World Cup were played on a large screen. There was no designated fan zone or special match-night event. The soccer broadcast had simply become part of the restaurant's nightly rhythm.

Li Yuanyuan still remembers when soccer barely mattered to her business. She started with a single street-side BBQ stall. Today she runs more than 20 Baoji BBQ outlets and employs around 300 people. In 2025, her brand sponsored the Nanjing soccer team in the Jiangsu provincial city league, also known as Suchao.

"Prior to getting involved with Suchao, I didn't expect so many fans to come out just for soccer," Li said. "Soccer brings a unique kind of energy that people want to share."

Zhou Li, who runs a local soccer fan group of more than 500 members, was among the diners. He said his summer has revolved around two competitions: the World Cup airing in the early morning hours, and Suchao on weekends.

"Before, people watched games at home on TV or computers," he said. "Now it is part of eating out and hanging out."

A native of Suqian in Jiangsu, Zhou is now based in Nanjing. Every week, the 27-year-old gathers with his soccer friends at a BBQ venue. The gatherings are informal, but frequent enough that "eating skewers, drinking Coke and watching soccer" has become part of everyday life rather than a special occasion.

"This fusion of sports, local retail and catering is unlocking consumption demand," said Jason Yu, general manager of CTR Market Research. "It is translating community vibrancy into domestic consumption growth."

The trend can be seen across China, as more soccer fans are moving from private viewing at home to shared viewing in restaurants, night markets and neighborhood stores.

"Tournament matches of the World Cup take place in the early morning," Yu said. "That shifts viewing into restaurants, delivery and group settings rather than traditional retail hours."

Match nights now reshape operations across several of Li's restaurants. Large screens are installed near dining areas, with colorful decorations when bigger games are on.

"Stores now prepare additional refrigerated inventory before major matches, with beverage demand often peaking around halftime and post-match gatherings," Li said.

Baoji BBQ has embraced both the World Cup and Suchao craze with support from Jiangsu Swire Coca-Cola, which has worked with its stores on soccer-themed consumer experiences during major tournaments such as the World Cup.

The beverage company has supplied the stores with soccer-themed promotional items — including soccer balls, vuvuzelas and themed gifts to help create gathering spaces for soccer fans.

"A stadium is built for watching soccer," she said. "Here, we adapted the space, so people can enjoy the matches while eating together."

Li spoke highly of Coca-Cola's willingness to work with small businesses. "Coca-Cola is widely recognized, and they still spend time working with small business owners like us," Li said.

Working with the multinational has also pushed Li to strengthen operational standards as the business expanded from a roadside stall into a regional chain.

"We've learned a great deal about standardized operations and store management through working with Coca-Cola," she said.

Her business is part of a wider ecosystem of local stores, restaurants and neighborhood businesses that connect global brands with Chinese consumers in everyday life, and Li advised other international brands hoping to deepen their presence in the Chinese market to work closely with local businesses and communities.

Gilles Leclerc, president of The Coca-Cola Company Greater China and Mongolia, said their business in China depends heavily on its local partners.

"These partners in catering and retail sectors are central to how products reach consumers every day," he said. "Coca-Cola has been operating in China for more than 40 years, and throughout that time we've grown alongside local businesses. China is our home ground, and we are committed to growing together with our partners."

As well as directly benefiting local businesses such as Li's, such support also helps drive local consumption and creates jobs. Behind a single soccer viewing night is a broad network of distributors, delivery workers, restaurant staff, refrigeration services, packaging suppliers and neighborhood retailers operating around the extended late-night demand.

Within Coca-Cola's network in China, which spans manufacturing, logistics and retail distribution, the company estimates that each direct job supports an additional eight related roles across the value chain, forming a total of over 310,000 associated jobs.

China has more than 127 million individually owned business households, supporting nearly 400 million jobs across the services sector, according to official data.

As the 2026 FIFA World Cup gets underway in the United States, Canada and Mexico this summer, Coca-Cola China has invited participants from its catering and retail networks, including Li, to attend matches in person.

"When people cheer for a goal with a Coke in hand," said Li, who just returned from Canada, "it doesn't matter if it's a stadium or a small restaurant. It feels like the same passion — people sharing it together."

Back to match nights, Li is among a rising number of restaurant operators who have said that late-night soccer screenings are bringing longer customer stays, higher drink orders and more group dining occasions during tournaments.

Data suggest that where people watch matches has become closely linked to what they consume. That means that the real battleground for beverage producers has shifted from on-screen advertising to the street.

"True channel innovation isn't just about adding shelf space — it's about engineering new occasions," Yu of CTR said.

Jonathan Yan, a partner at global consultancy company Roland Berger, added that the World Cup represents a quintessential high-impact, high-context consumption scenario.

"It naturally drives behaviors such as group viewing and late-night dining, creating a significant uplift across beer, liquor and soft drinks alike," said Yan. "Most importantly, the true value of this scenario-based marketing lies in its ability to strengthen brand mind-share — an asset whose long-term worth far outweighs the gains of short-term sales conversion alone."

World Cup-themed installations are set up at a waterfront complex to create a vibrant soccer atmosphere in Qianhai, Shenzhen, Guangdong province, on June 21. PROVIDED TO CHINA DAILY

World Cup seen driving dynamic consumer ties

By WANG ZHUOQIONG

The 2026 FIFA World Cup is emerging as more than a global sporting event in China, with consumer sentiment, social engagement and brand investment pointing to its evolution into a broader cultural and commercial platform, according to industry reports.

About 59.2 percent of Chinese respondents expressed strong favorability toward the World Cup, according to Kantar's report.

Compared with perceptions three years earlier, consumers increasingly associate the tournament with traits including adventure, ambition and international appeal.

The shift reflects structural changes surrounding the 2026 tournament, including its expansion from 32 to 48 teams, and its first-ever three-nation joint-hosting format across the United States, Canada and Mexico. High-profile cultural programming, opening ceremony initiatives and expanded broadcasting partnerships have further increased the event's ability to generate value beyond the pitch.

The World Cup is increasingly functioning as a content ecosystem, creating opportunities for brands to build both short-term engagement and longer-term consumer connections.

The World Cup continues to command stronger interest among male consumers, but female audiences are showing comparable commercial potential, according to Kantar.

The report's Influencers Monitor data show that 71.8 percent of male respondents in China reported high favorability toward the soccer World Cup, compared with 43.3 percent among women. However, the difference narrows significantly when measuring purchase intention.

Nearly half of female respondents, or 49.3 percent, said they were willing to buy products or services from brands associated with the World Cup, compared with 50.6 percent of male respondents.

The findings suggest the tournament is moving beyond its traditional positioning as a male-focused sports property. Men remain the primary drivers of interest and online discussion, while both male and female consumers contribute to consumption and social sharing.

For marketers, the World Cup is increasingly becoming a broad demographic conversion platform rather than a niche sports audience opportunity, said the report.

Secondly, the report has found that consumer perceptions of the 2026 tournament have shifted notably compared with previous editions, with "adventurous", "boldly forward", "challenging spirit", "international" and "fun" among the attributes showing the strongest growth.

The change reflects the tournament's expanded scale and global format. As the first World Cup hosted by three countries and featuring 48 teams, the event carries a stronger sense of openness, diversity and unpredictability.

Compared with other major sports properties, the World Cup has developed a distinctive emotional appeal, becoming not only a competition, but also a platform for cultural expression.

Social media partnerships are reinforcing that transformation. Platforms including RedNote, an official broadcast and content partner, have helped extend the World Cup experience from passive viewing into user-generated discussion, sharing and participation.

For brands, the strategic focus is shifting from simply capturing event traffic to creating lasting associations with consumers. The tournament is increasingly functioning as a form of social currency.

Therefore, the 2026 World Cup is also demonstrating stronger "topic spillover", with social discussions continuing well after matches conclude, according to monitoring data from CTR.

During the first six days of the tournament, from June 11 to June 16, open social platforms played a central role in content distribution and audience interaction. Weibo accounted for 35 percent of World Cup-related content among major social platforms, while generating more than half of related interactions, according to CTR data.

User engagement patterns show that discussion is not limited to live broadcasts. Interaction peaks appeared around 9 am, with additional increases between 3 pm and 4 pm, and between 9 pm and 11 pm.

Viral content was concentrated during morning, afternoon and evening windows, reflecting a post-match consumption cycle, in which users review scores, highlights and key moments before joining broader conversations, said the CTR finding.

The increase in saves and shares suggests World Cup content is moving beyond immediate exposure toward longer-term circulation, with users preserving and redistributing content as part of ongoing discussions.

Marketing strategies around the 2026 World Cup are increasingly centered on narrative building, soccer culture and consumer touchpoints across multiple scenarios, according to CTR data.

About 81.9 percent of advertisers plan to invest in sports-related assets in 2026, while spending on digital out-of-home media is expected to rise 34.2 percent, driven by demand for more interactive and immersive formats.

The shift reflects a broader change in brand strategy. Rather than treating the World Cup as a temporary traffic opportunity, companies are increasingly using the event to strengthen cultural positioning and deepen consumer relationships.

The brands that benefit most will likely be those able to connect soccer's emotional appeal with their own values, creating experiences that remain relevant after the tournament ends.

As the World Cup expands from a sporting competition into a global content and social platform, the ability to convert short-term attention into lasting brand equity may determine the biggest winners of the 2026 marketing cycle, said the CTR report.

WAIC
2026世界人工智能大会
WORLD ARTIFICIAL INTELLIGENCE CONFERENCE

By **HU YUYAN**
huyuyan@chinadaily.com.cn

The 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, set to take place in Shanghai from July 17 to 20, will provide a global stage for fostering collaboration, governance and innovation in the field of AI.

Under the theme "AI Partnership for a Brighter Future", the event aims to highlight AI's transformative potential as a collaborative force while addressing shared challenges and opportunities through international cooperation, cutting-edge research and public engagement.

The conference is jointly organized by national entities such as the Ministry of Foreign Affairs, the National Development and Reform Commission, the Ministry of Industry and Information Technology, the Ministry of Education and the Ministry of Science and Technology, alongside the Shanghai government. With a focus on the transformation of AI from a technical tool to a collaborative partner, the event aims to boost global governance and shared growth of cities and industries.

"China looks forward to taking the conference as an opportunity to further strengthen international cooperation on AI with all parties," said Zhou Haibing, deputy head of the National Development and Reform Commission, at a recent news conference.

Zhen emphasized that AI governance is a global issue vital to the future of humanity, adding that China remains steadfast in its commitment to multilateralism, openness and inclusivity.

By promoting international cooperation and offering Chinese solutions to global AI-related challenges, the country aims to balance growth and security, ensuring that AI development serves the greater good, the senior official noted.

Unprecedented scale

This year's WAIC is set to achieve new milestones in scale and influence, bringing together over 1,400 prominent guests, including leading industry figures, top executives and venture capitalists. Twelve national ministries and commissions, eight key national laboratories, more than 10 international organizations, over 10 prestigious research institutes and 20-plus world-class universities will all take part. This edition marks a record-breaking gathering of professional expertise and industry influence in the event's history.

Complementing the extensive conference agenda is an exhibition that spans 100,000 square meters across three key locations in Shanghai. The Shanghai World Expo Exhibition and Convention Center will act as a comprehensive display hub for AI applications, enabling companies to showcase a wide range of solutions across multiple industries. Meanwhile, the West Bund area will offer a futuristic technology exploration area, and the Zhangjiang area will emphasize smart infrastructure as a driving force for innovation.

This exhibition will boast participation by more than 1,100 companies from across the globe, collectively presenting over 3,000 advanced exhibits. Among these, more than 300 new AI solutions are set to make their global debut.

Furthermore, key categories — such as intelligent computing and embodied AI — will feature contributions from upwards of 200 companies each, showcasing the scope and depth of entrepreneurship in the field.

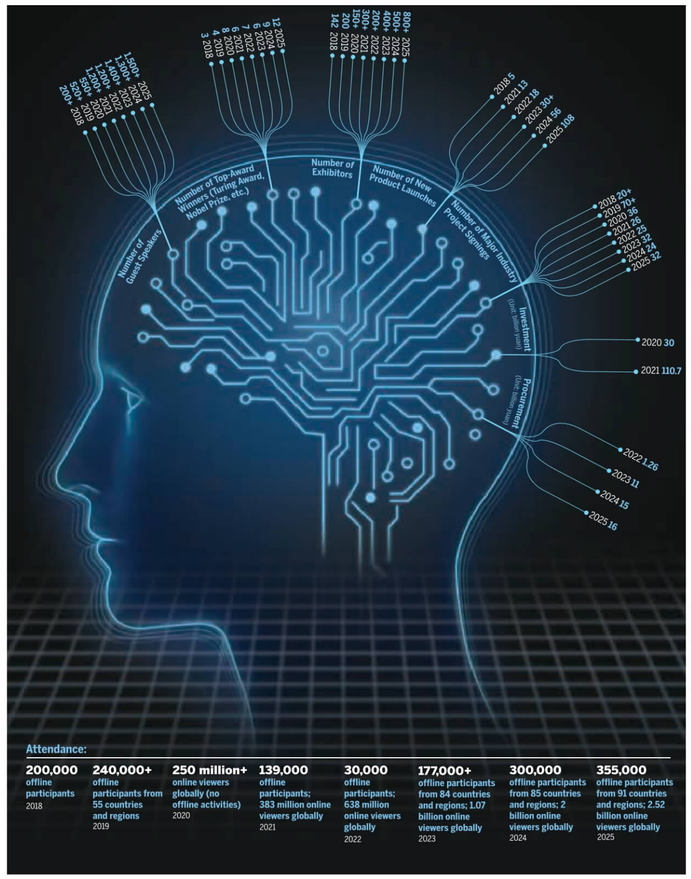
This year, 180 one-person companies, or OPCs, and startups representing the most dynamic and fast-growing areas of AI innovation will showcase their outcomes. Selected from a pool of 1,200 applicants, these companies are largely focused on industry applications, embodied and terminal AI solutions, infrastructure, and cutting-edge technologies. The first two sectors have emerged as particularly competitive arenas.

Creative format

A groundbreaking component of this year's conference is the debut of WAIC Academic, a high-level international academic forum that represents a significant milestone for AI scholarship. As one of the most closely watched initiatives of the event, WAIC Academic will feature a world-class lineup spearheaded by Turing Award recipients and renowned academicians from China and beyond.

To date, the forum has received 332 paper submissions, of which 284 have been accepted. The contributions come from more than 10 countries, including the United States, the United Kingdom, Japan, Singapore, France and Spain.

Participating institutions include renowned international universities such as Princeton, Cambridge, Imperial College London and Nanyang Technological University, along with top Chinese universities such as Tsinghua University, Peking University, Shanghai Jiao Tong University and Fudan University.



To invigorate innovation and cultivate young talent, the conference has revamped its awards system, which includes the SAIL (Super AI Leader) Award, the Young Outstanding Paper Award and the Yunfan Award.

New initiatives include an OPC challenge and a youth-focused competition designed to encourage individual innovation, as well as a host of AI-themed events tailored for younger participants. These efforts are aimed at nurturing the next generation of leaders, bridging the gap between theory and practice, and empowering promising talents to shape the future of AI innovation.

In addition to its industry-led events, WAIC 2026 will engage directly with the public through its innovative WAIC City Walk program. This initiative invites Shanghai's residents and visitors to explore AI applications in their daily lives via six curated thematic routes.

These routes connect more than 30 unique AI-focused landmarks, including shopping malls, museums, experience centers and neighborhoods, spread across 16 districts in Shanghai. By transforming the entire city into an interactive exhibition space, the program allows people to experience the tangible benefits of AI and its role in facilitating Shanghai's ongoing digital transformation.

From global AI governance discussions to localized industry applications, and from large-scale exhibitions to inclusive community activities, WAIC 2026 promises to present AI development in its most dynamic and multifaceted forms. By integrating themes of global governance, academic excellence, industrial collaboration and public engagement, the conference sets a bold vision for the next phase of AI development.

Event drives world's intelligent transformation

By **HU YUYAN**

The World Artificial Intelligence Conference has, over the past eight years, established itself as a premier platform for showcasing cutting-edge advancements and emerging trends in AI. By bringing together more than 8,100 scholars, industry leaders and technical experts from around the world, the WAIC reflects the maturation of AI into a global force across industries, science and governance.

Since its inaugural session in 2018, the WAIC has focused on positioning AI as a driver of industrial transformation. It has witnessed China's remarkable AI journey while providing a shared stage for global AI technology exchanges, product showcases and regulatory discussions.

These efforts have been reinforced by China's 14th Five-Year Plan (2021-25), which identifies AI as pivotal for advancing digital progress nationwide. The WAIC has become instrumental in showcasing this strategic positioning, serving as a testing ground for cutting-edge ideas, trend forecasting and practical applications.

Global engagement

In 2026, the visits of multiple state leaders to China and the agreement between China and the United States to launch intergovernmental dialogues on AI highlight that AI governance is now a critical topic in global relations. The future of AI should not be defined in isolation by any single entity but rather through inclusive collaboration that addresses the diverse needs of humanity, according to the WAIC's organizers.

The WAIC has emerged as a crucial platform for advancing these visions. Each year, the event provides a venue where ideas on global AI governance are translated into concrete plans. Initiatives such as the Shanghai Declaration on Global AI Governance and the United Nations Industrial Development Organization's Global Alliance on Artificial Intelligence for Industry and Manufacturing were launched at the WAIC, underscoring the event's role in shaping international AI policies.

In addition to fostering high-level agreements, the WAIC has developed an ecosystem that addresses specific needs within the international AI community. By anchoring its initiatives in thought leadership, youth empowerment, innovation incubation, cross-border engagement and industry matchmaking, the conference acts as a catalyst for sustainable growth and collaboration.

A robot serves soft drinks as a crowd of visitors take photographs at WAIC 2025. PROVIDED TO CHINA DAILY

For example, the event's first publication, WAIC UP! delves into the technological and humanistic questions surrounding AI. It has become a space for diverse voices, featuring Turing Award laureates, academicians, artists, designers and other creative thinkers. The signature event, WAIC UP! Night, has garnered nearly 6 million online views.

The WAIC also recognizes the importance of preparing the next generation to engage with AI by introducing WAIC YOUNG. Open to young people worldwide, the initiative features events such as When AI Meets Intangible Cultural Heritage, AI-generated music challenges and robot dog races, inspiring technological imagination among the youth.

Moreover, the WAIC has worked to create opportunities for smaller innovators worldwide with its WAIC Future Tech section. In 2025, this section showcased more than 200 projects from startups around the world. Over half of the founders were from the post-1990 generation and 70 percent of the projects had been established for less than three years. By organizing 60 pitch events, WAIC 2025 connected these projects with 200 investors, securing intended orders worth 268 million yuan ($39.43 million).

While China's AI industry has gained significant ground domestically, entering global markets has remained challenging due to trust deficits, high barriers to entry and limited cross-border collaboration. The WAIC has sought to overcome these obstacles through the AI GRAVITY program, which builds sustainable and trustworthy networks for global AI cooperation.

In 2025, AI GRAVITY expanded its reach into AIMX Singapore, hosting more than 3,000 visitors and over 200 supply-demand matchmaking meetings. Chinese enterprises such as AGIBOT and Alibaba International leveraged this opportunity to establish a stronger presence in Southeast Asia.

WAIC CONNECT, the official industry matchmaking platform of the conference, aligns real-world needs with mature technological solutions. Positioned as a "global AI industry super connector", WAIC CONNECT leverages one-on-one, in-depth services provided by industry veterans to build an efficient and reliable collaboration ecosystem for various industries.

WAIC CONNECT 2025 brought together more than 100 premium demand-side entities from eight fields, including urban renewal, global expansion, healthcare and smart finance, among others. In the global expansion section, participants included the United Arab Emirates' G2S Satellite & AI Technology Company and Jordan's Maher Yousef Commercial Group.

Platform for innovation

Beyond fostering international collaboration, the WAIC has showcased groundbreaking innovations and accelerated the integration of technological advancements into industries. The evolution of its exhibition framework illustrates the transformation of AI from foundational development to real-world applications and integration into the physical world.

The WAIC has consistently spotlighted advancements in foundational technologies, which are the bedrock of the AI industry. Its inaugural edition in 2018 introduced a dedicated zone for chips. Since then, domestic computing power has increasingly come into the spotlight, spanning training chips, inference chips and heterogeneous computing platforms. Companies such as Huawei, Cambricon and Horizon Robotics have gained visibility at the conference.

In recent years, the focus has expanded from standalone achievements to integrated solutions. Around 2022, the landscape shifted toward an integration of "chips + platforms + applications". High-computing-power GPUs, or graphics processing units, industrial simulation platforms, AI for Science pre-trained models and drug development platforms were prominently featured at the WAIC. This signified that AI had evolved beyond merely being a tool for image recognition and speech comprehension; it is now engaged in complex scientific computations, industrial simulations, and research and development processes.

In 2023, the global wave of generative AI solidified the WAIC's stature as a premier stage for large model demonstrations, showcasing innovations such as liquid-cooled clusters for AI-generated content developed by Chinese and international players. The conference not only reflected the rise of generative AI but also marked a transition in competition from simply developing models to ensuring their training stability, inference performance and large-scale deployment.

At WAIC 2025, enterprises showcased a new trend where large models were transitioning from capability demonstrations to engineering, commercialization and globalization. Features such as long-context processing, video generation and voice interaction were driving AI's evolution from being "usable" to "user-friendly".

The first eight WAICs captured the pulse of global AI developments — from generative AI to AI agents and industrial intelligence. As AI continues to advance, the WAIC evolves alongside it, solidifying its place as a global hub for the next wave of intelligent transformation.

What they say

Do not compete with Google, Baidu and Microsoft in general-purpose AI. Focus on fields where you already have deep expertise.
Andrew Ng
Founder of DeepLearning.AI

In the future, AI will make work lose its meaning. People should study engineering, physics or jobs involving human-to-human interaction.
Elon Musk
Co-founder and CEO of Tesla

To achieve AI for Good, AI must be knowable, controllable and reliable.
Pony Ma
Co-founder, chairman and CEO of Tencent

How to achieve collaboration between artificial agents and human agents is a challenge that goes far beyond human-computer interaction.
Joseph Sifakis
Turing Award laureate

Mathematics is the foundation of AI development. In turn, the development of AI can also provide important support for mathematical research.
Shing-Tung Yau
Fields Medal winner

Today's large language models are not the path to AGI; self-supervised learning is. ChatGPT does not truly understand the real world, and world models are the next key direction.
Yann LeCun
Turing Award laureate

Compared with the foundation models we have today, application models are still not good enough; compared with the computing power we have today, our foundation models are still not good enough; and compared with the power supply we have today, our computing power is still not good enough. So there is no need to worry about the power issue.
Wang Jian
Academician of the Chinese Academy of Engineering

Major countries should build an international network to study how to train AI systems to be content with assisting humans — rather than replacing or destroying them — even if AI becomes vastly more intelligent than people.
Geoffrey Hinton
Turing Award and Nobel Prize laureate

Editorials

For those fussing over China's lawful missile test: a tranquil conscience sleeps in thunder

The Chinese People's Liberation Army Navy announced on Monday that a strategic nuclear submarine had successfully launched a missile carrying a dummy warhead that landed precisely within the designated waters of the Pacific Ocean.

The test launch, part of the PLA Navy's annual training program, with relevant countries notified in advance, complied with international law and international practice, and was not directed at any specific country or target, the PLA Navy said.

Nonetheless, the test stirred up a flurry of baseless "accusations" from Japan, NATO and other parties keen on overinterpreting what was a straightforward legal action. They are attempting to mislead the international community by distorting China's legitimate action.

China is unwavering in its commitment to peaceful development and a self-defensive nuclear policy. Its nuclear forces are maintained at the minimal threshold required for national security, and any excessive interpretation by relevant countries is both unwarranted and unnecessary.

China's no-first-use policy has been the cornerstone of its nuclear strategy, setting it apart from the doctrines of other nuclear powers. By reinforcing its sea-based second-strike capability, a vital component of its "nuclear triad" of strategic nuclear forces, China is fortifying a deterrent. This deterrent is designed to negate the dangerous logic of "absolute military superiority", which some countries rashly pursue in the Asia-Pacific.

The irony is that finger-pointing parties, such as Japan, are clearly employing double standards, as they remain silent when their allies conduct multiple missile tests in the South Pacific.

Despite carefully cultivating an image of "nuclear victimhood", Japan's right-wing forces have been accumulating the materials and know-how required for nuclear weapons production. This pursuit stands in stark contrast to their willful silence on the nuclear nonproliferation implications of the AUKUS submarine arrangement, exposing a troubling inconsistency in their position.

Unsurprisingly, Japan has emerged as a cheerleader for the outcry against China's missile test. Under the Sanae Takaichi government, Tokyo has markedly accelerated its remilitarization drive, citing alleged "threats" from its neighbors as a pretext. In doing so, Japan has consistently engaged in provocative actions of various kinds, undermining regional stability.

In the latest move demonstrating its continued restraint, the China Coast Guard issued warnings and took lawful action to expel a Japanese boat that had trespassed into the territorial waters of Chiwei Island, part of China's Diaoyu Islands, on Tuesday.

This followed an incident four days ago, when Chinese vessels conducting scientific research in adjacent waters encountered Japanese harassment. As Chinese Foreign Ministry spokeswoman Mao Ning said on Tuesday, the operations of Chinese scientific research vessels in the waters surrounding the Diaoyu Islands constitute the legitimate exercise of China's sovereign rights and jurisdiction, are fully consistent with international law, and are beyond reproach. China firmly opposes Japan's interference in these lawful activities and has lodged solemn representations with Japan.

Japan's defense minister is at the NATO summit in Ankara, Turkiye, this week pushing hard to bring the alliance's war machinery into the Asia-Pacific — and NATO, eager to exploit Japan's military budget, is more than happy to play along. So it was only expected that Japan and NATO would join hands to make a fuss over China's missile test.

Beijing made clear the test was not aimed at any third party, yet those who owe historical debts to China — and those who harbor ill designs against it — can hardly hide their deep anxiety over Beijing's advanced strategic arsenal. That anxiety says nothing about a "China threat"; it says everything about Japan and NATO's own uneasy consciences.

By enhancing its strategic deterrence capabilities, China seeks to dissuade external forces and their allies from resorting to extreme military pressure that could undermine regional stability. All peace-loving nations clearly recognize China as a steadfast defender of regional peace — and those who choose to rattle their sabers at Beijing stand on the opposite side of that commitment.

Unicorn surge outcome of holistic ecosystem

China has expanded the number of its unicorn start-ups to 381 as of early last month, 38 more than the same time last year, cementing its position as the world's second-largest home for billion-dollar start-ups, according to the latest Global Unicorn Index 2026 released by Hurun Research Institute.

Eight years ago, the world's unicorn economy revolved around e-commerce. It then shifted toward fintech. Today, artificial intelligence has become the new gravitational center, with semiconductors, robotics, life sciences and new energy forming the next layer of high-tech competition. China has not merely participated in this transition, but also has become one of its principal architects.

According to Hurun rankings, China's unicorn count has risen from roughly 227 companies six years ago. This year's report records 80 new Chinese unicorns — roughly one every five days — while 26 graduated through public listings, the highest number of exits in five years, and some downgraded or closed. This reflects a healthier entrepreneurial pipeline in related industries in which successful companies are continually replaced by younger innovators.

DeepSeek's rise from its founding in 2023 to become one of the world's most valuable AI start-ups illustrates how quickly new technological champions can emerge when research capability, capital and market demand reinforce one another.

The real story is about ecosystems. Innovation flourishes when universities generate ideas, entrepreneurs commercialize them, investors provide patient capital and markets supply continuous feedback. China's increasingly integrated innovation ecosystem has quietly become its unique comparative advantage.

This reflects a sophisticated environment for innovation. Successful start-ups require not merely abundant capital but dense networks of talent, experienced founders, universities, industrial partners and sophisticated customers. They also depend upon what venture investors increasingly describe as "patient capital" — investors willing to tolerate uncertainty rather than demand immediate profitability. China's combination of government guidance funds, private venture capital and abundant application scenarios has gradually built precisely such an environment.

Rather than picking a handful of national champions, policy aims to cultivate entire innovation layers across sectors, allowing thousands of smaller enterprises to experiment across AI, semiconductors, biotechnology, brain-computer interfaces and 6G.

Equally important is the relationship between innovation and opening-up. China's AI companies continue contributing to global open-source communities. Robotics companies source technologies internationally while exporting competitive products. Foreign entrepreneurs continue relocating manufacturing to China because its industrial ecosystem remains exceptionally efficient.

The combination of global knowledge and domestic industrial capability creates what is being called "China Opportunity 2.0", which refers to participation in one of the world's fastest-moving innovation arenas and not just access to China's superlarge market.

At a time when international supply chains face growing uncertainty, China continues emphasizing high-standard opening-up, deeper international innovation cooperation and integration into global industrial networks. Rather than presenting technological development as a zero-sum contest, China is proving that advanced manufacturing, AI, green technologies and digital infrastructure can generate shared opportunities for international partners.

Statistics show that R&D investment in China by multinational corporations accounted for 14.3 percent of their total global R&D spending last year, and 14,000 new foreign-invested enterprises were established in China's scientific research and technical services sector, a year-on-year increase of 27.2 percent.

History shows that long-term innovation strengths depend less on "small yards, high fences" than on creating systems capable of generating repeated entrepreneurial experiments. That may ultimately explain why attempts to isolate China technologically have produced fewer results than many expected. Restrictions cannot break the increasingly dense connections linking Chinese laboratories, venture capital, manufacturers, digital platforms and enormous domestic markets.

The lesson to be drawn from Hurun's latest rankings is not triumphalist but structural. Countries build innovation power by constructing ecosystems. Judged by that standard, China's unicorn boom is less an extraordinary event than the increasingly predictable outcome of a system that has never ceased evolving — and one that continues to invite the world to grow alongside it.

Stage play on space scientist passes on pioneering spirit

Having covered China's space industry for 15 years, I have read extensively about the life of Qian Xuesen — the founding father of China's missile and space programs, who is also known as Hsue-Shen Tsien in the West.

Yet two weeks ago, when I watched the play *People's Scientist Qian Xuesen*, produced by China Aerospace Science and Industry Corp, I came across little-known facts about his extraordinary journey.

The play retraces Qian's return to China from the United States, his pivotal role in building China's space industry from scratch, and his leadership in developing multiple ballistic missile models. Since Qian had taken part in the US' missile program, the US had put him under house arrest after the founding of the People's Republic of China and banned him from leaving the US to engage in military programs elsewhere. When the house arrest was lifted as part of a deal between China and the US, Qian returned to China.

What struck me most was how the theatrical form breathes life into historical facts. Also, there could not have been a better time — we just celebrated the 105th anniversary of the founding of the Communist Party of China on July 1, and this October marks the 70th anniversary of the founding of China's space industry — to honor Qian.

When the People's Republic of China was founded, it started with virtually nothing in space science and technology. Qian and a handful of missile technology experts led teams of young engineers to pioneer the nation's missile programs.

There is a well-known story: when General Chen Geng, then deputy chief of the general staff of the People's Liberation Army and president of the PLA Military Academy of Engineering, asked Qian whether Chinese people were capable of developing missiles, he replied in a resolute manner, "Foreigners can do it. Why can't we? Are Chinese people lesser than them?"

This unyielding spirit is just what we need at a time when some foreign countries have imposed technological blockades on China. The goal is clear: to build China's science and technology sector into a world-leading force.

China has already made remarkable strides in its space journey. The Chang'e 5 mission returned with moon samples; the Chang'e 6 mission returned with samples from the far side of the moon; the country has launched a Mars exploration mission, built its own space station and the Beidou satellite navigation system, and launched numerous satellites to support economic development and national defense.

However, becoming a world-class space power requires not only hardware strength, but also strong, appealing soft power — and this remains a weak point for our space sector, particularly in the international public-opinion arena.

To address this, we must first strengthen our efforts at "space soft power" among the Chinese public. It is not enough to publish more news articles or produce more documentaries. What we need is a comprehensive space cultural system that encourages researchers, enthusiasts and young people to engage with popular culture about our space programs, through diverse and flexible forms such as animation, music, films and stage plays.

In this sense, CASIC's new play is an excellent, innovative attempt. Notably, all its creators and performers are employees of the State-owned conglomerate, who are able to tell Qian's story from an insider's perspective with genuine emotion. Their creative interpretation makes the historical figure more approachable and inspiring, giving the work strong emotional appeal and communicative power.

I sincerely hope that CASIC will take this play to a wider audience. For anyone interested in China's space program, this production is well worth watching — it not only tells a touching story of dedication, but also reminds us of the spiritual roots that have driven China's rise in outer space over the past 70 years.

— ZHAO LEI, CHINA DAILY

What They Say

Carbon goals will drive high-quality development

Editor's note: *China's carbon peaking and neutrality goals should steer the transformation and upgrading of the country's economic structure. Yu Zhaowu, a researcher at the Department of Environmental Science and Engineering at Fudan University, and Zhu Keli, founding director of the China Institute of New Economy, shared their insights on what the dual carbon goals mean for China's economy. Below are excerpts of their comments, as reported by the Chengdu-based Hongxing News. The views don't necessarily represent those of China Daily.*

China's carbon peaking goal is more than an environmental target. It is a fundamental driver of high-quality economic development. In the future, green and low-carbon development will be a core task for urban planning, industrial upgrading, the energy transition and technological innovation.

Today, carbon emissions constraints affect production, circulation and consumption. This is making the economy shift from the traditional development model of high energy consumption and high emissions toward a high-quality path of resource conservation and green growth.

When local governments formulate their respective action plans for the development of local industries, industrial parks and the energy sector, they should prioritize controlling both the intensity and total volume of carbon emissions. They should also focus on increasing the share of non-fossil energy in the total energy consumption and reducing carbon emissions in key industries.

They should establish assessment mechanisms to evaluate the carbon emissions of new projects before they are launched. They should include a strict evaluation of the energy efficiency and carbon footprints of high-energy-consuming projects.

At the same time, governments should formulate plans for developing green sectors such as wind and solar power and energy storage, and set their own timelines for achieving carbon peaking based on local natural resources.

Market-based measures, such as carbon emissions trading, green finance and green procurement, should continue to play their roles to promote the green transition of companies, encouraging investments in energy-saving retrofits, green power, carbon capture and eco-friendly materials.

The shift toward a green economy will drive the eco-friendly upgrading of nearly all industries, giving rise to many new sectors, including new energy, energy storage, green building, ecological restoration and carbon management services.

The transition will also create numerous new occupations, including carbon accounting, environmental, social and governance management and smart energy management. Urban development, in particular, will require interdisciplinary talents skilled in ecology, data and artificial intelligence. Essentially, the green economy will generate new productive forces and create high-quality jobs.

A unified, scientific and transparent carbon emissions statistics and accounting system is also needed. Carbon assessments should not focus merely on short-term emissions reduction, but also on long-term green capacity building.

A differentiated assessment mechanism should also be put in place. Regions vary widely in their development stages, industrial structures and natural resources. Targeted policies should be rolled out to balance carbon reduction with efforts to ensure economic growth, so that the green transition will act as a driving force rather than a hindrance for high-quality development.

Invalid 'arbitral award' muddied South China Sea

MA XUEJING / CHINA DAILY

It's been 10 years since the arbitral tribunal constituted under the United Nations Convention on the Law of the Sea (UNCLOS) issued the so-called South China Sea "arbitral award" on July 12, 2016, but some scholars — particularly those from claimant states — continue to celebrate it as a decisive clarification that reshaped the maritime claims and long-standing disputes in the region.

Recent commentary by some regional scholars reflects this narrative. They assert that the award forced adjustments in claims, marginalized China's "nine-dash line", and emerged as an influential legal framework that smaller states are codifying into domestic law.

These portrayals not only overstate the award's legal weight but fundamentally misrepresent the very nature of the South China Sea disputes.

The South China Sea disputes essentially relate to territorial sovereignty over islands, reefs and other features.

Although UNCLOS was not designed to adjudicate such disputes, the tribunal acted ultra vires by attempting to address these issues indirectly through the back door of maritime entitlements.

The 2016 "award" did not clarify UNCLOS, but distorted it. More importantly, by pretending to deal solely with maritime questions while quietly undermining the territorial foundations of China's claims, the tribunal evaded — and in effect prejudged — the central issue of sovereignty. This evasion is the main reason why the "award" is illegitimate, non-binding on China and ultimately harms regional peace and stability.

As its name suggests, UNCLOS governs maritime zones, navigation, resource exploitation and environmental protection. It does not confer or determine title to land territory. Article 298 explicitly allows states to exclude disputes relating to "historical title" and maritime delimitation from compulsory dispute settlement procedures.

China exercised this right. The 2002 Declaration on the Conduct of Parties between China and ASEAN members further commits all parties to resolve disputes through negotiation and consultation, not unilateral arbitration.

The Philippines' submissions to the tribunal were framed as questions about the status of features and the legality of certain activities. But in reality, they clearly aimed to challenge China's sovereignty over specific islands and reefs, particularly in the Nansha Qundao and Huangyan Dao.

Despite China's explicit objections and the fact that there were sovereignty disputes involved, the tribunal decided to proceed on the matter.

This was a brazen violation of the principle of state consent, which is the cornerstone of international adjudication.

As detailed in the Chinese Society of International Law's comprehensive 2018 Critical Study, the tribunal manifestly lacked jurisdiction over the Philippines' claims because they concerned territorial sovereignty, a matter outside the scope of UNCLOS.

By extending jurisdiction on this matter, the tribunal crossed a red line. It effectively treated the sovereignty of land features as irrelevant, while issuing rulings on maritime entitlements that could only make sense if sovereignty had already been assumed or denied. This was not neutral interpretation; it was an overreach that politicized the dispute settlement mechanism and set a dangerous precedent for other regions.

Any serious analysis of the South China Sea disputes must begin with the question of territorial sovereignty. China's claims over the islands are rooted in centuries of discovery, naming, administration and effective control. Historical records from the Han Dynasty (206 BC-AD 220) onward document Chinese knowledge and use of these islands. Successive Chinese governments exercised jurisdiction through patrols, fishing regulation, and mapping.

After World War II ended, China recovered the islands from Japanese occupation in accordance with the Cairo Declaration and Potsdam Proclamation. The nine-dash line, first published in 1947-48, reflected this historical title and the geographic extent of China's sovereign rights and jurisdiction.

The disputes largely emerged after the 1960s and 1970s, when certain countries began occupying features in the Nansha Qundao that had long been under Chinese jurisdiction or were unoccupied.

Vietnam expanded its presence on features in the 1970s and 1980s, while the Philippines occupied several features in the 1970s. These developments occurred against the backdrop of China's consistent assertion of sovereignty. The core disagreement remains unchanged: who owns the islands and reefs themselves?

But the 2016 tribunal attempted to sidestep this critical issue by focusing instead on "maritime entitlements" resulting from the features. Maritime entitlements flow from sovereignty over land territory under the principle of *la terre domine la mer*, which means that land dominates sea.

Without resolving the sovereignty question, any ruling on whether a feature generates an exclusive economic zone or continental shelf is inherently flawed and potentially prejudicial.

The tribunal's classification of most Nansha features as "rocks" under Article 121(3), entitled only to a 12-nautical-mile territorial sea, effectively reduced the maritime entitlements of China's territory without ever adjudicating the underlying title.

This was a classic case of deciding the consequences while evading the cause.

China's position is clear that it has consistent sovereignty over the islands and reefs of the four island groups (Nansha Qundao, Xisha Qundao, Zhongsha Qundao and Dongsha Qundao) within the nine-dash line, the maritime zones generated by those features under UNCLOS, and the historical rights in the surrounding waters.

The emphasis on Nansha Qundao as an integrated archipelago is not a post-2016 adjustment but a consistent legal and geographic position.

Some regional scholars' claims that China was "forced" to abandon the nine-dash line misread both history and official positions. The nine-dash line remains a valid expression of historical rights, while the articulation of island-group claims simply reflects the need to clarify entitlements in accordance with modern legal categories while preserving the foundation of sovereignty.

The tribunal's treatment of historical rights was particularly egregious. It ruled that historical rights incompatible with UNCLOS would be superseded. This interpretation ignored the fact that historical rights in the law of the sea predate and exist alongside UNCLOS as part of general international law and are preserved unless they directly conflict with the Convention's specific regimes.

China's historical rights in the South China Sea — traditional fishing grounds, seasonal resource use, and navigational practices — fall squarely within this legal tradition. By denying them outright, the tribunal not only erred legally but also disregarded the historical reality that many coastal states, including those now criticizing China, have long invoked similar historical rights in other regions.

On Article 121(3), the tribunal introduced novel and overly restrictive criteria that departed from State practice. It discounted the capacity of features when considered as part of an archipelago and ignored evidence of historical human habitation and economic life.

The ruling effectively stripped most Nansha features of significant maritime entitlements, thereby prejudicing the very sovereignty claims that depend on those entitlements.

This approach was inconsistent with how other states treat similar features and ignored the principle that maritime delimitation must take into account all relevant circumstances, including historical title and the configuration of coasts and islands.

These were not minor technical errors, but structural mistakes. By refusing to confront the territorial sovereignty dimension head-on, the maritime "rulings" of the tribunal became detached from the geographic and historical reality on the ground.

Those biased scholars highlight domestic legislation in the Philippines and submissions by Malaysia and others as evidence that the "award" is "not a dead letter". But these moves are selective and unilateral legal interpretations that sidestep the sovereignty issues at the core of the dispute.

The Philippines' 2024 Maritime Zones Act, for instance, attempts to legislate maritime entitlements around features whose sovereignty remains contested. Such actions by no means validate the "award"; they only illustrate how certain parties have tried to use the ruling to advance maximalist claims and complicate negotiations.

China's position of non-acceptance, non-participation, non-recognition, and non-implementation of the "award" is not a breach of international law. It is the legitimate exercise of a sovereign state's right when compulsory procedures are invoked in violation of agreed mechanisms and in matters relating to territorial sovereignty. Non-compliance with an illegitimate ruling does not undermine the rule of law, whereas enforcing such a "ruling" against a non-consenting party does.

Far from bringing clarity or promoting restraint, the 2016 "award" has provided external powers a convenient pretext to intervene, nudged certain claimants to pursue unilateral actions, and encouraged the framing of disputes in zero-sum legal terms rather than through pragmatic diplomacy.

The viable path forward lies in addressing the territorial sovereignty issues directly through bilateral negotiations between the states directly concerned, while advancing practical cooperation on maritime issues via the Code of Conduct process under the DOC framework.

China has consistently advocated this dual-track approach: settle sovereignty and delimitation disputes through peaceful negotiation, and manage daily differences through rules and mechanisms. This respects the historical and legal reality that territorial title cannot be created or extinguished by arbitral fiat, especially one lacking jurisdiction.

Ten years on, the 2016 "arbitral award" stands not as a clarifying milestone but as a politically motivated document that evaded the essential question of territorial sovereignty while issuing sweeping and erroneous conclusions on maritime entitlements.

It has neither clarified UNCLOS nor contributed to lasting stability. Instead, it has highlighted the dangers of bypassing state consent and historical title in complex, sovereignty-laden disputes.

The South China Sea will remain peaceful and stable not because of the flawed so-called "arbitral rulings", but because the countries concerned continue to engage in dialogue, exercise restraint, and seek mutually acceptable arrangements that respect each other's legitimate rights and interests.

China remains committed to this course while firmly defending its territorial sovereignty and maritime rights in the South China Sea — rights that predate and will outlast any single, contested legal proceeding.

Sporting events playing with environment's health

The FIFA World Cup 2026 which began on June 11 and will run till July 19, is set to be the largest sporting event so far in history.

While its scale is unprecedented — with 104 matches hosted across 16 cities in the United States, Canada, and Mexico — its environmental impact is also expected to be the greatest ever.

Numerous scientific studies indicate that transportation accounts for three-quarters of the environmental impact of a sporting event. Although prohibitive ticket prices and strict US visa restrictions may limit international spectators, those wishing to see multiple matches are likely to travel by air between 16 cities that are quite far apart, such as Mexico City, Toronto, New York, Los Angeles, Miami and Seattle.

Traditionally, the World Cup is hosted in a single country over a month-long period, as seen in South Africa (2010), Brazil (2014) and Russia (2018).

This year, it is being co-hosted by three countries of North America. In 2030, the tournament will be held across three continents and six countries. Centenary matches will be held in Argentina, Paraguay and Uruguay, before the tournament moves to Morocco, Portugal, and Spain. The geographical dispersion will end in 2034, when only Saudi Arabia hosts the tournament.

Meanwhile, the expansion in the number of teams in the final tournament from 32 to 48 has increased the number of matches.

While the number of matches has increased from 64 in 2022 to 104 in 2026, teams are based far from the cities where they will play matches. The Iranian team was based in Mexico, and its first match was in the US.

The environmental impact, particularly from transportation, is proportional to the duration of the event and the number of teams, matches and spectators.

With 104 matches, the 2026 World Cup will have a significantly higher environmental impact than the 2022 tournament in Qatar, which featured only 64 matches and took place within an area smaller than Beijing.

FIFA seems more interested in the enhanced ticket revenue that more matches will bring.

Global Lens

Major sporting events should place greater emphasis on sustainability when choosing locations because the proliferation of events cannot continue indefinitely.

The only upside for the environment is that the 2026 World Cup is using existing stadiums, though they are spread out, necessitating considerable travel.

In comparison, the Olympics have traditionally been held over 17 days in a single city or region, with fewer tourists requiring long-distance travel. For instance, the Paris 2024 Olympics attracted about 3 million tourists, of whom only 1.6 million came from abroad, according to statistics from the Paris Tourism Board.

The Tokyo 2020 Olympics and the Beijing 2022 Winter Games were held with very few on-site spectators due to COVID-19 restrictions, and only 1.3 million tickets were sold for the 2026 Milano Cortina Winter Games.

The IOC's hosting policy stresses the use of existing sports venues connected by efficient and affordable public transportation rather than building "white elephant" facilities that become useless after the Games.

The challenge with the environmental impact of sporting events is their continual growth, rather than stabilization or reduction in scale.

Their frequency has increased, as have the numbers of participants and competition venues. Events like the World Athletics Championships, initially held every four years, now take place every two years.

World Athletics has just announced the creation of the "Ultimate Championships" for years without world championships.

There is no sign of any slowdown in international sports organizations' quest to expand their activities. But this relentless increase risks exhausting the public's interest and thus diminishing the socio-cultural impact sought by host cities and the sports organizations themselves.

Paradoxically, the most environmentally friendly sporting event would be one that doesn't happen, but that would also be the worst from a socioeconomic standpoint.

A balance must therefore be found between environmental and socioeconomic impacts.

Major sporting events should place greater emphasis on sustainability when choosing locations because the proliferation of events cannot continue indefinitely.

Innovative multilateralism

The New Development Bank established by BRICS heralds the transition from the West-centric past to an equal-rights future

WANG XIAOYING / CHINA DAILY

Alessandro Golombiewski Teixeira

Xiang Menghuai

For a long time, the architecture of global financial governance has been deeply shaped by Western patterns of power distribution. Multilateral financial institutions represented by the World Bank have historically linked capital subscriptions to voting power, thereby reproducing structural inequality in representation and influence. Major decisions, for example, require an 85 percent majority vote, while the United States holds more than 15 percent of the voting shares, effectively giving Washington veto power over key institutional choices. This arrangement demonstrates how Western power can be constitutionalized through multilateral institutions. On the surface, such institutions appear rule-based and universal, yet their foundational rules preserve asymmetrical authority. Leadership is stabilized through institutional design, and legitimacy is partially secured by embedding dominance within formal procedures.

After the 2008 global financial crisis, emerging economies intensified their search for alternative institutional arrangements — specifically, the creation of their own development bank. The New Development Bank was established in 2015 as a collective initiative of the five BRICS countries — Brazil, Russia, India, China and South Africa. The NDB's equal-rights orientation is not merely rhetorical. From governance structure to operational model and normative orientation, the NDB has carried out systematic innovations, and its institutional design reflects a deliberate commitment to fairness.

In terms of governance structure, equal initial capital subscriptions among the five founding members established a formal parity that is unusual in multilateral banking. The institution's rules were designed to protect that parity by limiting the extent to which later capital adjustments could dilute the founding balance or empower non-founding members disproportionately. The NDB does not eliminate differences in national capability outside the organization, but it prevents those differences from being directly translated into internal dominance. Its decision-making procedures reinforce this structure. Major decisions require broad support rather than unilateral approval by any single member, and the rotating presidency prevents permanent monopolization of executive leadership. These arrangements collectively shift the exercise of authority from veto-based domination to negotiated consensus. In institutional terms, power becomes more distributed, less entrenched and more visibly tied to procedural legitimacy.

In terms of operational practice, one notable feature is the commitment to local currency financing, which seeks to reduce exchange-rate exposure for borrowers and lessen dependence on dollar-denominated lending. Although this does not seek to displace the global centrality of the US dollar at the moment, it creates a limited but meaningful sphere of financial autonomy for participating countries. At the same time, the NDB gives greater weight to country ownership and contextual variation. This approach aligns with a broader critique of one-size-fits-all conditionality and suggests a more plural understanding of developmental pathways.

In terms of normative orientation, by emphasizing economic rather than ideological criteria in project decisions, the NDB positions itself against the politicization of development lending. This stance does not remove all normative assumptions from finance, but it does mark a deliberate contrast with institutions perceived as vehicles for policy discipline anchored in Western liberal norms. This is vividly demonstrated through the NDB's recognition that the collective efforts of Global South countries matter a lot to their sustainable development. This reflects the core spirit of South-South cooperation: developing countries pursue common development through experience-sharing, technological cooperation and resource integration, rather than relying on one-way assistance.

It is particularly important to note that China's broader vision for helping reform global governance is highly consistent with the institutional practices within the BRICS framework. China has explicitly proposed the idea of building a community with a shared future for humanity, while advocating an equal and orderly multipolar world and inclusive and universally beneficial economic globalization. Within this framework, the institutions of BRICS, such as the NDB, do not seek to replace the existing system. Instead, they can offer competitive alternative institutional choices, thereby pushing traditional financial institutions toward reform. This also reflects China's vision of a new type of international relations characterized by mutual cooperation and win-win outcomes in the field of financial governance.

Today, we have entered the era of "greater BRICS cooperation". South-South cooperation has therefore gained solid and sustainable institutional vehicles from the gradual build-up of the BRICS cooperation mechanism. It is no longer limited to fragmented aid projects or temporary policy coordination. Instead, at the core level of global financial governance, developing countries are now jointly designing rules, sharing decision-making power and collectively assuming development responsibilities on the basis of equality.

From West-centric logic to equal-rights practice, the story of the NDB demonstrates one crucial reality: in global governance, emerging economies are not only capable of being rule-takers, but can also become rule-makers. This is also a vivid illustration of China working together with other countries to build a more just and equitable global governance system.

PATRICK MALUKI

Inflection point for Global South

The question isn't if Africa will connect, but who will write the rules, and whether those will lead to dependency or an equitable digital transition

LI MIN / CHINA DAILY

For three decades, the narrative of the Global South has often been defined by extraction — of raw materials, intellectual capital and political autonomy. Today, that narrative is being overwritten by code. Digital infrastructure is no longer a peripheral utility; it is the new institutional scaffold of the state and a multiplier of sovereignty itself. As we look toward the 2026 BRICS agenda, major emerging economies have an opportunity to fundamentally reshape the architecture of global governance by enhancing collective bargaining in the digital sphere.

The traditional view of broadband or data centers is myopic; they are not mere conduits for WhatsApp or Netflix. In the context of fragile institutional legacy — where colonial borders created artificial states and post-independence patronage systems fractured civil services — digital infrastructure offers a bypass. It is the first time many African citizens have encountered an impersonal, rule-based state.

Consider Rwanda's Irembo platform. By migrating more than 100 government services, from birth certificates to land registration, to a cloud-based e-government system, the average service delivery time was reduced from weeks to hours. But the true governance dividend was anti-fraud. When a land title is a hash on a distributed ledger rather than a paper file in a district commissioner's drawer, the channels for rent-seeking disappear. For the 2026 BRICS agenda, this is the model: automated transparency.

China's investments in the Commercial Bank of Ethiopia's digital backbone — enabled by Huawei's cloud infrastructure — illustrate both the tension and the triumph. The $600 million project helped move 40 million rural customers into the formal financial grid, allowing the government to disburse food subsidies directly via biometric authentication. Governance capacity surged not because Ethiopian bureaucrats became nobler, but because the system precluded the siphoning of funds.

The upcoming BRICS Summit, tentatively focused on equitable digital transition, finds BRICS at a strategic inflection point. The question is not whether Africa will connect, but who will write the rules of that connection — and whether those rules will enable self-determination or recreate dependency under new labels. For the Global South, digital inclusion without digital agency is simply a faster form of subordination. If BRICS treats connectivity as a gift rather than a governed common, it will replicate the very hierarchies it claims to oppose.

Specifically, the 2026 BRICS agenda must prioritize the bargaining chips, including norms, financing instruments and technical standards that can anchor sovereignty in practice. First, data localization should be secured as a right, not a barrier. The West frames data sovereignty as protectionism. For the Global South, it is survival. BRICS should push for a treaty recognizing that public interest data (health, land, identity) generated within a developing economy is a strategic asset. The 2026 agenda could adopt the "Kigali Principles" drafted in 2022 from ongoing African Union discourse, mandating that all government-procured cloud services must process high-sensitivity data within the continent of origin, using local encryption keys held by an independent judicial authority.

Open-source e-government stacks should be further standardized. Currently, an estimated 70 percent of African e-government platforms are built on proprietary Western codebases, locking states into perpetual licensing and vendor dependency. BRICS' New Development Bank should fund a repository of a shared, secure, auditable stack for civil registration, taxation and logistics. This would transform governance capacity from a national procurement exercise into South-South commons.

The 2026 BRICS agenda must mature past infantile debates to build a resilience audit framework. Sustainability is not merely environmental. In the digital realm, it is the ability to update, audit and abandon a system without external permission. Too many African states have been gifted "free" digital infrastructure that becomes a permanent annuity for the donor nation's tech firms. The 2026 agenda must prioritize technology transfer with teeth: local manufacturing of routers, training of professional local system administrators, and a BRICS-supported certification body for digital sovereignty auditors.

As the world gears up for the 2026 BRICS Summit, the Global South holds a singular advantage: it is not yet locked into legacy digital systems. Unlike London or New York, Nairobi can build a state from the cloud up. But this window is closing. The BRICS has to act swiftly and effectively to coordinate on digital standards, financing and sovereignty protections.

The 2026 BRICS Summit must answer a single, piercing question: will digital infrastructure serve as a vector for development or a vector for dependency? The answer lies not in the speed of the fiber, but in the integrity of the governance framework that regulates it — and in whether BRICS is prepared to treat digital sovereignty not as an afterthought, but as the core business of a just, multipolar order. For the first time in four centuries, the periphery has the code. It must resist the temptation to merely paste it.

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

China opposes unlawful sea boundary plan

DPP sabotages own people in catering to Japan, Philippines scheme

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

LI MIN / CHINA DAILY

The Democratic Progressive Party authorities' separatist agenda has undermined the interests of the people in Taiwan and the broader interests of the Chinese nation in its response to the unlawful maritime delimitation talks initiated by Japan and the Philippines, analysts said.

Following the May 28 announcement by Japan and the Philippines to launch maritime delimitation talks over their overlapping exclusive economic zones and continental shelves, including waters east of Taiwan Island, China protested the move and responded with a series of measures in the region aimed at safeguarding its maritime rights and interests.

Instead of safeguarding the shared interests with the Chinese mainland, the DPP authorities in Taiwan criticized the mainland's actions in the region.

Zhong Houtao, a professor at the University of International Relations in Beijing, said the DPP's response exposed its tendency to oppose anything related to the mainland while always taking a soft stance toward external forces in pursuit of its "Taiwan independence" separatist agenda.

'Delimitation talks'

China, Japan and the Philippines are maritime neighbors in the region of the proposed delimitation, and none of the three countries has delineated the boundaries of their exclusive economic zones or continental shelves in this area.

Geographically, China's Taiwan Island stands between Japan and the Philippines. Zhong said that by bypassing China, the delimitation negotiations between the two countries are aimed at advancing "leapfrog" maritime claims that include waters east of Taiwan Island.

China has expressed firm opposition to the launch of the delimitation talks. On May 29, Mao Ning, a spokeswoman for the Chinese Foreign Ministry, said that China has an exclusive economic zone and a continental shelf in the waters east of Taiwan. She said the so-called maritime boundary delimitation negotiations launched by the two countries seriously infringe upon China's maritime rights and interests while violating international law.

Mao said the delimitation negotiations between Japan and the Philippines are entirely illegal and invalid, and will have no impact on China's claims or its exercise of lawful rights in the waters east of Taiwan Island.

According to Article 34 of the 1969 Vienna Convention on the Law of Treaties, a treaty does not create either obligations or rights for a third state without its consent.

Minoru Kihara, Japan's chief cabinet secretary, declared that the Japan-Philippines maritime delimitation would have no legal effect on any third party. Philippine Secretary of Foreign Affairs Maria Theresa Lazaro claimed that despite China's opposition, the Philippines still planned to hold delimitation talks with Japan.

Lei Xiaolu, a professor at Wuhan University's China Institute of Boundary and Ocean Studies, noted that much of the maritime area east of Taiwan Island consists of waters where the claims of China, Japan and the Philippines overlap. She said that according to the principles of international law reflected in UNCLOS and international judicial practice, a bilateral maritime delimitation must not prejudice the claims or legal entitlements of a third state.

Under Articles 74 and 83 of the United Nations Convention on the Law of the Sea, the delimitation of exclusive economic zones and continental shelves between states with opposite or adjacent coasts is to be carried out by agreement, on the basis of international law, to achieve an equitable solution. Crucially, these articles also require the states concerned to act in a spirit of cooperation and restraint, ensuring they do not jeopardize or hamper the reaching of a final agreement.

"To achieve an equitable delimitation outcome, all parties should engage in negotiations based on full respect for and due consideration of each other's interests, especially in the maritime area with special geographical circumstances," Lei said.

The legal opinion of the China Institute for Marine Affairs of the Ministry of Natural Resources, published on July 2, said that the Japan-Philippines delimitation negotiations violate the principles of sovereign equality and good faith under international law, as well as obligations of cooperation and restraint, and therefore constitute an internationally wrongful act.

The institute urged the two parties to stop advancing their bilateral maritime delimitation negotiations immediately and to engage in consultations with China. It also warned that they should not use the delimitation process to challenge the one-China principle, under which Taiwan is an inalienable part of China, and the government of the People's Republic of China is the sole legal government representing the whole of China.

Resolute response

Over the past month, Chinese authorities have taken a series of coordinated measures in response to the Japan–Philippines maritime delimitation initiative.

Since June 1, the China Coast Guard has carried out routine law enforcement patrols in waters east of Taiwan, with the *Xiushan* vessel formation taking over operations from the *Daishan* formation on Saturday. Jiang Lue, a CCG spokesperson, said the *Daishan* formation conducted patrols, identity checks, fishery protection and rescue missions aimed at maintaining navigation order and protecting the rights of Chinese fishermen, including those from Taiwan.

Separately, from June 6 to 10, the Ministry of Transport organized a special maritime traffic law enforcement and surveying operation in the same area, inspecting 198 vessels and correcting three violations to improve navigation safety and maritime management. This was followed by an official maritime environmental survey from June 16 to 18 conducted by the East China Sea Bureau of the Ministry of Natural Resources, which utilized its research vessel *Xiangyanghong 22* to collect data on hydrological conditions, meteorological factors and other indicators to provide scientific support for marine ecological protection efforts.

Zhu Fenglian, a spokeswoman for the State Council Taiwan Affairs Office, said at a news conference on July 2 that the mainland coast guard's activities in the relevant waters represent a lawful exercise of jurisdiction to safeguard China's territorial sovereignty and maritime rights and interests.

Lei, the professor, pointed out that these activities were carried out within China's exclusive economic zone, where China, as a coastal state, has the right to exercise jurisdiction, including conducting maritime surveys, scientific research as well as law enforcement activities that may be necessary to ensure compliance with its laws and regulations under UNCLOS. Under UNCLOS, coastal states enjoy rights to explore and exploit living resources within their exclusive economic zones and may take measures such as boarding and inspection in accordance with the law.

"China adopted these measures to safeguard its legitimate rights and interests in response to provocations posed by Japan and the Philippines through the launch of the delimitation talks and deepened military cooperation," Lei said, adding that the actions have been carried out with restraint and with the aim of maintaining regional stability.

Commenting on the attempted bilateral delimitation, Zhang Xiaogang, spokesman for the Ministry of National Defense, told reporters on June 9 that if the two countries insist on pursuing this course, they will only bring consequences upon themselves. Urging the two countries to stop their illegal and provocative acts, Zhang said that China will take resolute and forceful measures to safeguard its national territorial sovereignty and maritime rights and interests.

Conflicting position

Following the announcement of the delimitation talks by Japan and the Philippines, Taiwan's external affairs department issued a release on May 31 expressing its "support". Later, on June 3, the authority adjusted its tone and called on the two sides to take the island's rights and interests into consideration.

The stance has drawn strong criticism in Taiwan, with opposition parties holding news conferences to condemn the DPP authorities' perceived inaction and weak response, accusing them of sacrificing fishermen's rights and interests. Cheng Li-wun, chairwoman of the Chinese Kuomintang, Taiwan's largest opposition party, criticized the DPP authorities for abandoning their responsibility to protect the island's fishing rights.

Zhong, the professor, pointed out that the proposed delimitation area is a traditional fishing ground for Taiwan's fishermen. "The areas in which Taiwan fishermen can operate will be significantly reduced if the delimitation goes ahead," he said.

On June 18, Taiwan leader Lai Ching-te claimed that the Japan-Philippines delimitation talks would not affect the rights and interests of any third party. Meanwhile, he criticized the Chinese mainland for using law enforcement actions to "expand" in the region, describing it as "the biggest threat" in this case.

Zhu, the spokeswoman, condemned Lai's DPP authorities for taking the opportunity to spread separatist fallacies advocating "Taiwan independence" and to incite anti-China sentiment, describing them as "accomplices of external forces that undermine the overall interests of the Chinese nation".

Zhong said that the DPP authorities, driven by their "Taiwan independence" separatist stance, have opposed anything related to the mainland. Instead of jointly safeguarding maritime rights and interests with the mainland, they have chosen to smear the mainland's law enforcement actions, he said.

"While the DPP authorities initially attempted to align themselves with Japan and the Philippines, Taiwan's practical interests are aligned with the Chinese mainland," Zhong said, adding that the DPP's separatist stance has placed it in a contradictory situation, effectively hamstringing itself as public dissatisfaction grows.

Ulterior motives

Analysts noted that Japan and the Philippines were seeking to enhance their regional standing through the delimitation efforts, despite being aware that such attempts have no legal effect.

In addition to maritime delimitation talks, Japan has stepped up defense and military cooperation with the Philippines through the entry into force of the Reciprocal Access Agreement, the signing of the Acquisition and Cross-Servicing Agreement, and negotiations on a General Security of Military Information Agreement.

Lei, the professor, said that Japan has been seeking to "normalize" its military development through cooperation with the Philippines, including joint military exercises and arms transfers. She added that, on the basis of a series of bilateral defense agreements, a Japan-Philippines "quasi-alliance" is already imminent.

Warning that Japan is using this so-called delimitation as a pretext to advance neo-militarism, Zhong said, "Japan and the Philippines are colluding with each other, each having its own schemes."

Zhong said that the two countries are seeking to promote strategic coordination across the East China Sea, the South China Sea and the waters surrounding China's Taiwan Island. He said that through such "three-sea coordination", Japan and the Philippines could expand their maritime interests and narrow China's strategic space in the region, as both are pursuing sovereignty claims over certain islands.

According to Zhong, Japan has sought to reclassify the Okinotori atoll as an island so as to expand its exclusive economic zone in the region. He added that the Philippines is also seeking to reinforce its claim over the Batanes Islands, which are under its administration and lie only about 140 kilometers from Taiwan Island.

Zhong said that while opposing the mainland in an effort to curry favor with external forces, the DPP's "Taiwan independence" separatist actions not only disregard historical facts and legal foundations, but also pose a serious challenge to the overall interests of the Chinese nation as well as Taiwan's practical interests.

Taiwan actress reunites with mainland cousin in Zhejiang

By **LI SHANGYI**

After three years of tracing her family roots on the Chinese mainland, Taiwan actress and producer Chien Virginia reunited with her cousin in Haining, Zhejiang province, in April.

Chien's grandfather was originally from Haining but returned only once after settling in Taiwan.

"He told me that we have relatives in Haining," Chien said.

Following her grandfather's passing, Chien began searching for relatives in Zhejiang. She gathered old family photos, compiled the family genealogy and underwent DNA testing, gradually piecing together clues about her family ties across the Taiwan Strait.

"Later, I reached out to the Taiwan affairs office in Haining to help locate our distant relatives," she said. To her surprise, she discovered that she still had many relatives in Zhejiang. Last year, the office helped her locate her cousin.

Chien Virginia

Chien has now chosen to develop her career on the mainland and is working as an actress at Hengdian World Studios in Zhejiang, the country's largest film and television production hub.

"Thanks to the assistance of local authorities, I was able to reunite with my cousin," Chien said. "I also want to take this opportunity to work in Zhejiang and reconnect with my relatives here."

There are many young people in Taiwan, like Chien, who are searching for their roots on the mainland. In June, a young Taiwan actor posted a video on a social media platform seeking help to trace his ancestry.

In less than two days, netizens and local residents had helped him trace his ancestral home to Shantou, Guangdong province. During the Dragon Boat Festival, which fell on June 19, he returned to his ancestral hall in Shantou to pay tribute to his ancestors.

Zhang Han, a spokeswoman for the State Council Taiwan Affairs Office, said that the growing number of young people from Taiwan returning to their ancestral hometowns on the mainland showed that people on both sides of the Taiwan Strait share the same roots and origin and form a community bound by blood ties.

She added that Taiwan affairs offices at all levels across the mainland are willing to provide necessary support.

After the State Council Taiwan Affairs Office spokesperson's Facebook account was opened in October 2025, several Taiwan netizens left messages asking for help in locating their relatives on the mainland. The Taiwan Affairs Office coordinated with relevant local offices to contact these individuals, verify information and actively advance efforts to help them search for their relatives.

Audio culture gains ground

Young Chinese are turning to podcasts and ASMR for comfort, companionship and a stronger sense of cultural belonging.

By **GUI QIAN** and **XIONG XINYI**

On restless nights in Beijing, Liang Ce places her phone on the bedside table, lowers the volume of rain sounds until they are barely audible and closes her eyes.

In her mind, she is back in Harbin, at her grandparents' single-story house in Heilongjiang province. Raindrops fall one by one from the eaves. Inside, her grandparents move about the room. Everything feels safe.

"Sound is like a safe house for me," said Liang, 31, who works for an education company. "When you feel frustrated, it can be very hard to get the comfort you need from the people around you. But you can simply type in a keyword and find it."

Podcasts are a weekend fixture for Liang. She chooses what to listen to according to her mood: a relaxed show hosted by a couple while doing housework, crime stories when she has company, a book-discussion episode when she wants to focus, and a slower-paced podcast to ease her toward sleep.

"Without sound or fragments of information coming into my ears, my brain just feels stuck. I instinctively want to put something on to fill the silence," she said.

When pressure at work builds into something heavy but difficult to define, Liang deliberately searches for content that can help her break it down. One podcast prompted her to ask herself a simple question: Was the pressure coming from her supervisor, from herself or from expectations she had set too high?

She applied the method to her own situation. "Once the pressure becomes specific, it drops by half," she said. "The other half, I will solve through action."

Listening also gives Liang a way to connect with friends. One podcast about a comedy competition left her and a friend deeply moved. It described how two female stand-up comedians had begun preparing their next set as soon as the previous season ended, working harder and with more composure than their male counterparts.

"We both felt so uplifted after listening," Liang recalled.

Liang's relationship with audio is deeply personal, but it reflects a much broader shift in the listening habits of young Chinese.

According to *The Power of Dialogue: The Public Value of Chinese Podcasts*, jointly released in 2025 by Fudan University's Center for Information and Communication Studies and the Xiaoyuzhou app, users aged 18 to 35 accounted for more than 83 percent of Xiaoyuzhou's podcast listeners.

Data from iiMedia Research show that China's audio entertainment market reached 611.01 billion yuan ($90.07 billion) in 2025 and is projected to expand to 741.58 billion yuan by 2029.

Sound connects

For some listeners, sound offers emotional shelter. For others, it provides a path back to local memories, language and cultural identity.

Based in Fujian province, A'ang (pseudonym) produces a podcast rooted in the culture of Minnan, or southern Fujian. She also runs Anotherear, a bookstore and art shop in Xiamen.

Her podcast, *RadioAnEar*, launched in 2021 with an episode recommending Hokkien music. Later episodes explored local folklore and folk beliefs, while new co-hosts joined the project.

Her work soon extended beyond producing episodes to creating spaces where other audio makers and listeners could meet. She previously ran an open podcast room program, lending equipment to visiting creators and helping them recruit live audiences.

"There was no single decisive moment. One thing simply led to another," A'ang said.

"Every time an episode goes live, I feel as though something has finally come to fruition," she continued.

After the show released a series about visits to local temples, listeners posted photographs of themselves at the sites featured in the episodes. Others shared new reflections on their relationship with the region, while some said the show had inspired them to start podcasts of their own.

"I started as a listener myself," A'ang said. "That feels like the most natural thing."

What attracts young people to the program, she believes, is a particular sense of recognition.

"They want to understand a Minnan culture that is connected to their own lives," she said. "It connects memories of the past with a sense of belonging in the future. It is a living, changing culture — the customs and everyday realities of people's lives."

> "Without sound or fragments of information coming into my ears, my brain just feels stuck. I instinctively want to put something on to fill the silence."
>
> **Liang Ce,** a longtime podcast listener

A bookstore offers a different experience from a podcast. It requires physical presence, touch and sustained attention. "It is more about adapting to the setting, so the threshold is higher," she said. "Sound in a bookstore is also part of the content."

Podcasts, by contrast, slip easily into everyday routines. Yet A'ang does not believe one medium will replace another.

"Some are thriving and some remain niche, but they coexist in a reasonable way," she said. "Together, they offer a richer range of sensory experiences. This is something we will need and value increasingly."

While A'ang uses voices and local stories to foster cultural connection, creators of autonomous sensory meridian response, or ASMR, build another kind of refuge through whispers, touch and carefully recorded everyday sounds.

Tang Yuzhou, who goes by MTkoala online, began creating ASMR content in 2014, before the format had gained much traction in China. Her earliest videos, filmed on a phone, captured her turning the pages of books.

To learn about recording equipment, she turned to guitar forums and online discussions about capturing live indoor music.

What she gradually discovered was that listeners were not simply searching for pleasant sounds. They were looking for someone to keep them company.

A comment from one listener has stayed with her. "Everyone is exhausted. Everyone needs someone who can comfort them like an older sister," the listener wrote. "But then you realize that asking for that may feel a little selfish. There are not that many older sisters in the world."

Tang now often records in the small hours, when the city is quiet enough for her microphones to capture the most delicate sounds. She uses several microphones — sometimes four at once — to create an immersive, three-dimensional soundscape.

She organizes her content into three categories: a "calming corner" featuring spa and body-care themes; a "story garden" built around characters, narratives and role-play; and a "no-voice corner" devoted entirely to sound without speech.

Her favorite content focuses on head care. One episode released last year drew inspiration from traditional head-care practices from the Republic of China period (1912–49). It featured hair combing, massage with a bian stone tool, hot compresses and a heated moxa pouch.

"Head treatments are especially effective at eliciting a strong ASMR response," she explained.

Asked what makes a sound worth recording, Tang has a straightforward answer: Anything can work if it is comfortable to hear — even the shaking of a small packet of desiccant.

"There is no such thing as a sound that belongs exclusively to ASMR," she said. "If it feels comfortable to listen to, it is a good sound."

Whether through remembered rainfall, regional stories or the quiet sound of a comb, young listeners are turning to audio as a form of emotional shelter — portable, personal and always within reach.

Top: Tang Yuzhou creates an ASMR video featuring typing sounds. **Middle:** A'ang (pseudonym) organizes an offline activity at her bookstore in Xiamen, Fujian province. **Bottom:** Liang Ce reads a book while listening to audio content. PROVIDED TO CHINA DAILY

Z WEEKLY

Ancient paper toy finds new life

From simple paper and sticks, Li Mei creates beauty and surprise, proving handcrafted traditions still touch hearts today.

By **CHEN XUE** and **XIONG XINYI**

Li Mei performs *fanlihua*, transforming a traditional paper toy into shifting shapes. PROVIDED TO CHINA DAILY

Li Mei was mid-sentence when she reached across the table, picked up what looked like a stick wrapped in tightly folded colored paper, and gave it a single twist.

It opened into a perfect sphere. Another twist, and three smaller orbs appeared. She kept going, each movement producing a new form: a flower, a crown, a lion's open mouth — one object, about 20 shapes. The routine took no more than a few seconds. Then she set it down and smiled, as if she already knew the reaction that would follow.

"Every time I demonstrate it, all it takes is one move, and people are stunned," she said. "They want to know how it works, and then they immediately want to try it themselves."

Li, 36, is a representative inheritor of the *fanlihua*-making technique, or paper-flipping flowers, a traditional Chinese paper handicraft. A former English teacher with more than a decade of classroom experience, she left teaching to help preserve the paper toy, which has a history of more than 300 years.

Her decision was not one dramatic leap, but a series of smaller turns that gradually brought her here.

Fanlihua originated in Beijing and spread across China over the centuries. But as Li learned more about the craft, she was surprised to discover that it had largely disappeared from its birthplace.

The tradition had survived, however, in her husband's family workshop in Shandong. Now an established brand called Zhuangyuan Workshop, it stands on the site of the former home of Song Dynasty scholar-official Chai Chengwu (934-1004). Students still come there to pray before exams, giving the name *zhuangyuan* — the top scholar in the imperial examination system — a meaning that remains alive today.

Li's father-in-law and his elder brother were the kind of craftsmen who could sit quietly for hours and devote themselves to a single task. That focus showed in every piece they made. But they were getting old — one in his mid-60s and the other in his mid-70s — and were ready to retire. If they did, the workers who had spent years in the workshop would be left with nothing.

"The materials are just paper and sticks, but what you can make with them is beautiful to look at and fun to play with," Li said. "Letting something like that disappear would be such a waste."

In 2023, she brought *fanlihua* to a Beijing temple fair to test the response. Many visitors were surprised to see a toy from their childhood making a comeback, and they were eager to show their own children how to play with it.

The older generation recognized it; the younger generation still found it fun. For Li, that was the proof she needed.

Since then, the work has become a two-place operation. The Shandong workshop handles production: cutting, binding, dyeing and preparing parts in advance so orders can be filled quickly. From Beijing, Li manages much of the rest: product development, custom commissions, community events and hands-on activities for visitors.

Her years in the classroom, as it turned out, had prepared her better than she first realized.

"The logic is the same," she said. "First, you capture their attention, explain what it is and why it matters. Then you do it together."

She still writes lesson plans and designs workshop courses. Only now, the subject is paper, color and movement.

At a recent session with nearly 50 fine arts students at Minzu University of China in Beijing, Li found that *fanlihua* could still speak to a generation with no memory of it.

When she asked how many had seen *fanlihua* before, only one or two hands went up. When she asked who knew how to play with it, no one raised their hand.

"They were all born after 2000," she said. "But the moment I showed them the transformation, they were completely absorbed."

By the time the students reached the dyeing step, their own artistic training had begun to show. Their color choices were bold and unexpected, Li said, and when the finished pieces opened successfully, they were excited by the toy itself and by the sense that they had made it their own.

Li's fluency in English has also become useful. At Beijing markets — from the Panjiayuan flea market in 2023 to the Longfu Temple area today — foreign visitors often react much like Chinese visitors seeing *fanlihua* for the first time: "amazing", "incredible", "unbelievable". Many are happy to buy the toy because it is compact, affordable and easy to carry home.

The workshop's Chinese loong design has sparked another kind of conversation. Visitors often ask, "How much is this dragon?"

Li corrects them gently. "This is not a dragon," she said. "This is Chinese loong."

To her, the distinction matters. The Chinese loong is auspicious and protective, different from the fearsome dragon many foreign visitors know from Western stories. When she explains the difference, some visitors lean in and ask more. Some even want to learn the Chinese pronunciation.

Chinese customers, too, sometimes buy several pieces at once, telling Li they plan to take them to family or friends in the United States, Canada or Malaysia. For her, those moments show that *fanlihua* can travel — not only as a toy, but as a small piece of Chinese culture.

Li has begun translating the play routines into English rhymes.

"Sunshine shines, good luck to you. Swing to the left, all colors show; swing to the right, colors glow," she recited, laughing. She admitted it is still a work in progress.

She is also preparing bilingual product pamphlets and an English-language curriculum. But for Li, the goal is the same in either language.

"People have grown too used to simply buying things," she said. "We have tremendous material abundance now, and mass-produced goods are all very affordable. But the authentic texture of handcrafted work has become incredibly precious today."

That simplicity is part of *fanlihua*'s appeal. To Li, the craft does not need elaborate materials or complicated technology to impress people. Its power comes from the surprise of transformation — and from the warmth carried in something made by hand.

"If we can introduce this uniquely Chinese craft to more foreign friends, I believe they will appreciate the down-to-earth wisdom behind it, just as we do," she said.

Global Insights

Chinese villages inspire Malawi's green development vision

Blessings Chiwosi

As a Malawian scholar in development studies, I arrived in Lingshui village in Beijing's Mentougou district expecting a cultural experience. But as the field visit unfolded, the village offered something deeper: a lesson in how rural communities can preserve history, strengthen identity, and turn local heritage into a source of development.

Having produced generations of imperial examination scholars, including 22 *juren* and two *jinshi* during the Ming (1368-1644) and Qing (1644-1911) dynasties, Lingshui is known as the "Juren Village". Its history reflects a long tradition of valuing education, discipline and scholarship.

What stood out most was how the village has preserved its identity. Ancient residences and courtyards of former imperial examination graduates have all been protected. Rather than being abandoned, these historical assets have been integrated into the village's present-day development.

The field study visit, organized by China Agricultural University for international students, later took us to Shuanglongxia Valley. Recognized as a national 3A-level scenic spot, the area has a vegetation coverage rate of about 95 percent and features streams, waterfalls and forests.

Mentougou has a long history of mining and resource extraction, but places such as Shuanglongxia now show how natural landscapes can be restored and used for conservation, recreation, tourism and environmental education. It brings to life the principle that "lucid waters and lush mountains are invaluable assets".

This lesson is especially relevant to Malawi's environmental and development challenges. Dzalanyama Forest Reserve is a clear example. It is a miombo woodland that supports biodiversity, helps secure water supplies and sustains local livelihoods. It provides much of Lilongwe's water through the Lilongwe Water Board, while nearby communities rely on charcoal, timber and fuelwood to meet daily needs. Yet weak governance, energy poverty and limited economic alternatives continue to drive illegal logging and forest degradation.

My experience in Shuanglongxia shows that degraded or threatened landscapes can be turned into engines of green development. Malawi can draw from this by investing in forest restoration, ecotourism, environmental education and community-based enterprises around areas like Dzalanyama. The reserve already has emerging opportunities for hiking, bird-watching, mountain biking and guided nature tours. With stronger planning, low-impact tourism infrastructure, community participation and fair benefit-sharing, Dzalanyama could support both conservation and livelihoods.

The broader message from both Lingshui and Shuanglongxia is that successful development is not built on extraction. It comes from treating rural areas as places of cultural, ecological and economic value.

Villages can preserve their identity while modernizing. Forests can protect ecosystems while creating jobs and income. Communities can move beyond survival-based resource use if governance, investment and local ownership create real alternatives.

For Malawi, this does not mean copying China's model wholesale. Malawi has its own history, institutions, communities and development priorities, so rural revitalization must be rooted in local realities, shaped by the voices of communities and supported by policies that link conservation with livelihoods.

Malawi's rural areas hold immense potential, but that potential will remain locked unless we begin to see heritage and nature as development assets rather than neglected spaces or sources of short-term extraction. Cultural sites, forests, mountains, rivers and traditional knowledge can all contribute to sustainable development if they are protected, properly planned and connected to local economic opportunities.

As a Malawian student in China, this field study deepened my appreciation of how development can be rooted in education, cultural preservation, ecological stewardship and long-term benefits for local communities. It also strengthened my belief that Malawi can build a more sustainable rural future if it protects and manages its natural and cultural assets wisely.

2026 WORLD CUP

CR7 bows out of final World Cup with 'clear conscience'

Star stays stoic following heartbreaking late defeat to Spain

Cristiano Ronaldo fights back tears after playing his last World Cup match for Portugal, as his dream of winning soccer's biggest prize ended with a 1-0 round-of-16 defeat to Spain on Monday. REUTERS / AP

Cristiano Ronaldo walked off the pitch after his final World Cup match for Portugal with a stoic look on his face and only the slightest hint of emotion. There was a brief wave to acknowledge cheering fans, and the same feeling he has had after past losses.

"Sad — it's normal after being eliminated like this," said Ronaldo, who briefly shielded his eyes with his right hand after the match.

The sixth and final World Cup for the 41-year-old superstar ended with a 1-0 loss to border rival Spain in the round of 16 on Monday.

"I've given everything, I've given my best, and I leave with a clear conscience," he said. "This is soccer, this is life for a soccer player. Sometimes you win and sometimes you lose."

Ronaldo, the only player to score goals in six consecutive World Cups and the leading international goalscorer with 146, said the day before that he hoped it wouldn't be his final match in this run, but he wanted to enjoy it to the fullest.

But he reiterated then — and again after the loss to Spain — that this was his last time at the quadrennial tournament.

The deepest he ever went with Portugal at the World Cup was on his first attempt, when his side reached the semifinals in 2006.

As for his other future plans, he wasn't ready to say.

"Yes, it was my last World Cup, but everything else, I'll have time to think about it, to be with my family and move on with life, and not make any hot-headed decisions," he said.

Ronaldo added, though, that he was leaving the World Cup stage "with a clear conscience".

"The truth is, the biggest title I won with the national team was in 2016 (Euros), which for me is just as significant as a World Cup, honestly," he said.

"That's why, I repeat, I'm leaving with a clear conscience, at my best, and that's it. Tomorrow is a new day, and life goes on."

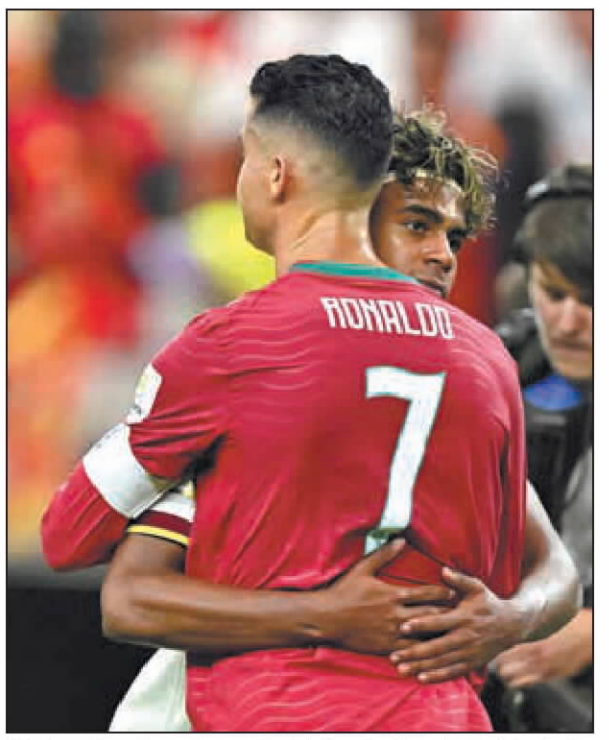
Ronaldo was denied a goal in the first half against Spain, when record-setting goalkeeper Unai Simon made an impressive leaping stop. That was one of his three shots.

Two of those were on target, including the one for which Simon was still in midair when he reached back to grab the ball with both hands. Ronaldo fired off a backward kick with his right foot after a header by teammate Joao Felix bounced off Simon's shoulder.

"He is an example, a role model to follow. This is somebody that we need to celebrate. We're talking about a football icon," Portugal coach Roberto Martinez said.

"There aren't too many Cristiano Ronaldos out there. I think we need to thank him. His dream was to win the World Cup and he chased it as an amazing example in the locker room."

Portugal had never won a major international tournament before Ronaldo. The first was the 2016 European Championship, before adding Nations League titles in 2019 and 2025.



Ronaldo's finale on soccer's biggest stage came eight years after he recorded a World Cup hat-trick at age 33, making him the oldest player to achieve the feat until Lionel Messi, who was 38 at the time, scored three goals for Argentina in a 3-0 win over Algeria on June 16.

Ronaldo's World Cup hat-trick came in a 3-3 draw with Spain in the 2018 edition's group-stage opener, which was considered one of the tournament's best matches, despite neither side reaching the knockout stage.

He scored three goals in this World Cup, and his 11 overall leaves him tied in ninth place on the all-time tournament scoring list.

A young fan holds a photo of Cristiano Ronaldo before Monday's match against Spain. AP

Messi rivalry

Throughout the tournament, Ronaldo largely avoided comparisons with Messi. Still, as his World Cup story closes, the contrast is difficult to ignore. Their rivalry defined an era, but never fully extended to the World Cup stage.

Messi guided Argentina to the 2014 final, and then won the title in 2022, while Ronaldo's runs repeatedly ended in frustration.

There was, however, the prospect of a World Cup meeting.

Had Portugal topped its group instead of finishing behind Colombia, and had both teams continued to advance, Ronaldo and Messi could have met in the quarterfinals.

"It would be top," Ronaldo said of the potential showdown after scoring twice in Portugal's 5-0 group-stage thrashing of Uzbekistan, his best performance at this year's tournament.

For a player who conquered nearly every other challenge the sport could offer, that sense of "what if" will accompany Ronaldo's World Cup farewell.

Martinez proud

Martinez praised his players' commitment after the heartbreaking 1-0 defeat.

"It was not a defeat in the sense of how we competed," Martinez said.

"We played against one of the favorites, we looked each other in the eye, and we stayed true to our values. We tried until the very end and gave everything we had."

The Portugal coach said knockout soccer is often decided by the smallest moments, rather than the overall balance of play.

"When you have great teams facing each other, that's what happens," he said. "Sometimes the ball goes in, sometimes it doesn't. Sometimes a substitute scores the decisive goal. Those details make the difference between winning a World Cup or not."

Martinez said Portugal's performance should be viewed in the context of the team's consistency in recent years, highlighting its ability to qualify regularly for major tournaments and compete with the world's elite, despite the country's relatively small population.

"We are only 10 million people, but we continue to produce outstanding footballers," he said. "What is important is consistency, focusing on the things you can control and continuing to compete at the highest level."

AGENCIES AND XINHUA

La Roja sets record with 6th clean sheet, as Simon extends his shutout streak

Spain broke a World Cup record with its sixth consecutive clean sheet and goalkeeper Unai Simon extended his record for the tournament's longest scoreless streak to 609 minutes in Monday's 1-0 win over Portugal.

La Roja broke the tie with Italy (1990) and Switzerland (2006-10) for the most consecutive World Cup matches without allowing a goal. Spain's streak began with a 0-0 draw in the round of 16 in 2022, when Morocco advanced after a penalty shootout.

There was also a surprising scoreless draw against Cape Verde in this World Cup's Group H opener. That was followed by four consecutive shutout victories, as Spain advanced into the quarterfinals.

Simon surpassed the previous record of 517 consecutive scoreless minutes during his side's 3-0 round-of-32 defeat of Austria on July 2. Famed Italy goalkeeper Walter Zenga set the standard in 1990 with five consecutive clean sheets at his home World Cup.

Simon's World Cup journey began in Qatar in 2022, after he started in Spain's 7-0 group-stage victory over Costa Rica.

He came into the Portugal game having made only four saves in this World Cup — Austria had no shots on target — and in Dallas on Monday, Simon had to make two saves in the first half against Portugal, both denying Cristiano Ronaldo.

The second of those saves was an impressive diving stop, when he was still in midair, reaching back to grab the ball with both hands. Ronaldo got that opportunity after teammate Joao Felix's header bounced back into play off the shoulder of the 29-year-old Athletic Bilbao keeper, who didn't face a shot on target after halftime.

Simon hasn't surrendered an international goal since a 2-2 draw with Turkiye in a World Cup qualifier in November.

"This record is thanks to all of his teammates as well," Spain coach Luis de la Fuente said.

"Their solidarity, their generosity, their effort, their sacrifice. Everybody runs for one another."

De la Fuente singled out Lamine Yamal's performance in Monday's 1-0 victory over Portugal for particular praise, saying it was one of the most important of the 18-year-old's burgeoning career, as the European champion advanced into the World Cup quarterfinals.

"For me, Lamine has played one of the most important matches of his life," De la Fuente said.

"Beyond whether he was brilliant or not, for me, it has been one of the matches that will help him grow the most."

Yamal arrived at the World Cup managing a troublesome hamstring injury and started Spain's campaign on the bench, as it was held to that goalless draw by Cape Verde.

He returned to the starting lineup after that shock result and scored once in Spain's 4-0 win over Saudi Arabia.

Against Portugal, the Barcelona forward had three attempts on goal, including two on target, helping Spain maintain pressure before Mikel Merino's late winner.

De la Fuente suggested that the physical toll of trying to stop Yamal may have contributed to Portugal defender Nuno Mendes' injury in the 56th minute, when he was forced off and replaced by Nelson Semedo.

"Lamine did a spectacular job. He suffered for the team, he defended for the team. When he had the ball, he always created doubt and uncertainty for the opponent. He generated a lot of fear," De la Fuente said.

"We still need Lamine, in this World Cup, to keep growing and delivering these kinds of performances," he added.

Blacklisting by Washington called destructive bullying

By ZHANG CHENXU and **ZHONG NAN**

The United States' latest addition of more than 40 Chinese entities to a so-called "forced-labor" blacklist amounts to economic coercion dressed up as law enforcement, officials and experts said, warning that such unilateral sanctions risk destabilizing global industrial and supply chains.

Coming just one day after lead economic and trade officials from both sides held talks on stabilizing bilateral ties, the move — the largest single expansion of the list — can only heighten tensions between the world's two largest economies and further erode mutual trust, they added.

"The US action is groundless, as Washington has continued to use so-called 'human rights' and 'forced labor' as pretexts for arbitrarily imposing unilateral sanctions on Chinese companies under its domestic laws," a spokesperson for China's Ministry of Commerce said on Saturday, voicing "strong condemnation" and "firm opposition" to the move.

The US Department of Homeland Security announced on Friday the addition of 43 Chinese companies to the entity list under the so-called Uyghur Forced Labor Prevention Act. The law, which took effect in June 2022, effectively bars goods linked to the Xinjiang Uygur autonomous region from entering the US market, in the name of combating so-called "forced labor".

Spanning industries from metals and electronics to apparel, cotton and food processing, the newly listed companies include capacitor manufacturer Hunan Aihua Group, snack food producer ChaCha Food and cotton supplier and processor Henan Tongzhou Cotton Industry Co, according to a US government notice.

The additions will take effect on Monday, raising the total number of listed entities from 144 to 187, a 30 percent increase, the US department said.

"The move is a typical act of economic coercion and seriously infringes upon the legitimate rights and interests of the companies concerned," the Chinese Commerce Ministry spokesperson added.

Notably, the latest restrictions were announced just a day after Chinese Vice-Premier He Lifeng held a video call on Thursday evening with US Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer, during which the two sides had what were described as "candid, in-depth and constructive" discussions on maintaining stable bilateral economic and trade relations.

"Just one day later, the US introduced such egregious measures that harm China's interests, seriously deviating from the consensus reached by the two heads of state," the spokesperson said.

Wu Xinbo, dean and professor of Fudan University's Institute of International Studies, said China and the US need sustained negotiations to manage differences and address outstanding issues amid an increasingly complex global environment.

Ongoing economic and trade dialogue is helping Washington gain a clearer understanding of Beijing's positions, he said, adding that China's policy responses have also, to some extent, reshaped Washington's approach toward Beijing.

"Such sustained engagement is more consistent with what is needed to build a constructive China-US relationship of strategic stability," Wu added.

The spokesperson reiterated that China has consistently opposed forced labor and said there is no such thing as so-called "forced labor" in Xinjiang, adding that the region enjoys social harmony and stability, sustained economic development and rising living standards.

The China Cotton Association said in a statement on Sunday that machine-picked cotton now accounts for more than 90 percent of Xinjiang's output, and that the entire chain, from planting to textile production, is highly automated. Cotton farmers and industry workers are protected by Chinese law and are free to choose their jobs, it said.

Bans and blame serve no real purpose

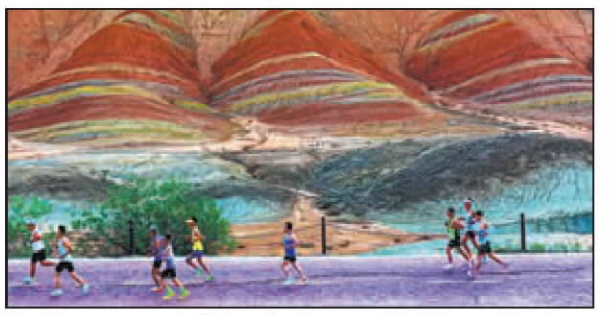
WORLD WATCH
By Anthony Moretti

Again. And again. And again. Seemingly once a week, the United States announces a new set of bans against Chinese organizations and technologies. And each time a new obstacle is put in place, the reality becomes clearer: Washington is scared. US officials know it. So, too, do international audiences.

Consider what has transpired in the US in the past couple of weeks.

On July 23, the Department of Defense updated its "List of Foreign Research Institutions Conducting Problematic Activities", imposing sanctions on more than 80 Chinese institutions. Universities and military organizations dominate the list, and the ban includes a "funding prohibition [that] extends to all employees of such institutions". In other words, every person is judged guilty no matter what he or she does.

Guilty of what exactly? Good luck getting a substantive answer to that. One US official said the moves were needed in order to preserve "the integrity of the American scientific enterprise".



Then on July 28, the US government announced a ban on imports of new Chinese humanoid robots, quadruped robots and grid-connected power inverters, citing national security risks.

Without offering any evidence, the head of the Federal Communications Commission claimed the move was wise because it would "secure America's critical supply chains". The FCC further justified the action by suggesting the devices could pose cybersecurity threats to critical infrastructure.

Note the inclusion of the word "could"; its use provides the rationale for the severe action undertaken. Just do not tell anyone in Washington that the flip side of the word "could" is the phrase "might very well not". That does not fit the tidy little narrative Washington constantly trots out about China being an unfair global partner.

The drumbeat continued on July 31.

Marathon runners set off at sunrise for a race at the Zhangye Danxia Geological Park in Gansu province on June 28. WANG JIANG / FOR CHINA DAILY

RAINBOW MOUNTAINS UNVEIL EARTH'S DIARY IN STONE

In Gansu's Zhangye Danxia park, nature's palette defies belief and attracts global pilgrims

By HU YUMENG and **MA JINGNA** in Lanzhou

As dawn breaks over the Zhangye Danxia Geological Park in Gansu province, the first light reveals rolling mountains bathed in myriad hues. As the ribbons of crimson, ocher, sage green and pearl gray grow brighter in the morning sun, it becomes obvious why these are known as the Rainbow Mountains of China.

The stunning natural palette looks almost unreal — so much so that on the lifestyle platform Xiaohongshu, or RedNote, the viral refrain is: "Were these painted?"

Photos of the hills taken after summer rains, when the colors deepen dramatically, have drawn millions of views, waves of disbelief and quiet pilgrimages from travelers determined to see the wonder for themselves.

XI'S VISION | HIGH-QUALITY DEVELOPMENT

Stability seen amid shift in growth drivers

Stepped-up policy efforts, stronger support for domestic demand likely, observers say

By ZHOU LANXU and **ZHANG CHENXU**

China's economic growth is expected to further stabilize in the second half of the year, as policymakers step up efforts to address structural challenges arising from the transition in growth drivers while strengthening support for domestic demand, experts and executives said.

The comments came after a meeting on Thursday of the Political Bureau of the Communist Party of China Central Committee, presided over by Xi Jinping, general secretary of the CPC Central Committee. The meeting called for efforts to accelerate the transition from old growth drivers to new ones and effectively implement a more proactive fiscal policy and an appropriately accommodative monetary policy.

Economists said the meeting addressed a major challenge facing China's economy, as rapidly expanding new industries have yet to fully offset the slowdown in traditional sectors, insufficient domestic demand and growing structural divergence.

Policy focus should not only be on stepping up macro policy stimulus and accelerating investment in emerging industries and industrial upgrading, but also on bolstering employment and income to foster broader growth, they added.

Zhu Feng, China chief economist at JPMorgan, said that growth momentum in the third and fourth quarters will likely improve from the second one, but divergence could persist amid the transition from old to new growth drivers.

New growth engines, led by artificial intelligence and the smart economy, are likely to continue buoying related investment, high-tech manufacturing and some export sectors, while domestic demand, real estate, private investment and durable goods consumption still need time to recover, Zhu said.

China's economy expanded 4.7 percent year-on-year in the first half, driven by resilient exports and industrial output as high-tech manufacturing sectors benefited from a global wave of AI-related capital expenditure. By comparison, retail sales remained subdued, while fixed-asset investment contracted.

GDP growth weakened to 4.3 percent in the April-June period. In July, the official manufacturing purchasing managers index fell to 49.2, the National Bureau of Statistics said, indicating that falling market demand has caused factory activity to contract for the first time in five months.

To cope with economic divergence, Zhu stressed the need to boost services consumption to absorb jobs released from traditional industries, given the labor-intensive nature of the services sector, while beefing up targeted support for smaller and private businesses to bolster their confidence.

"The key to meeting the annual growth target lies in accelerating fiscal policy implementation and, if necessary, introducing incremental fiscal measures, while better translating policy resources into growth in household employment and income, thereby boosting consumption and private investment," he added.

The meeting on Thursday said that pragmatic and effective incremental policies will be introduced in a timely manner, and it called for intensified efforts to effectively safeguard and improve people's well-being.

The People's Bank of China, the country's central bank, pledged at a meeting on Saturday to comprehensively utilize monetary policy tools and make timely adjustments to keep ample liquidity.

Yin Yanlin, deputy director of the Committee on Economic Affairs of the 14th National Committee of the Chinese People's Political Consultative Conference, said additional treasury bond issuance should be considered when necessary, and monetary policy should cut the reserve requirement ratio and interest rates at a proper time as imported inflation pressure eases.

Ming Ming, chief economist at CITIC Securities, said an 800 billion yuan ($118.5 billion) policy-based financial tool is likely to ramp up support for new types of infrastructure, including synergy between computing and electricity networks, helping drive a recovery in investment.

According to the National Development and Reform Commission, investment in computing network infrastructure in China could reach 4 trillion yuan during the 15th Five-Year Plan (2026-30) period. It also said that new growth drivers, including high-end manufacturing, the digital economy and modern services, had contributed more than 40 percent of economic growth in the first half of this year.

Such momentum is underpinning international institutions' confidence in China's economic transition. Moody's Ratings said in a commentary that credit conditions in China are expected to remain stable in the second half as fiscal and monetary support, strong exports and technological advances offset weak domestic demand.

Goldman Sachs has forecast that China's economy will grow 4.6 percent this year, within the annual target range of 4.5 to 5 percent, with exports a key source of resilience, thanks to China's manufacturing competitiveness.

For multinational companies, China's shift in growth drivers is creating fresh opportunities. "To gauge China's economic resilience, one must look beyond headline GDP figures and identify where growth originates," said Rogier Janssens, president of Merck China.

"Merck operates across healthcare, life sciences and electronics; in each domain, the picture is clear: China's market not only absorbs innovation but accelerates it," Janssens said.

Wang Keju contributed to this story.

Agarwood's sweet smell of success

Once associated with privilege, the high-value agricultural product is spreading its reach

By YANG FEIYUE
yangfeiyue@chinadaily.com.cn

For generations, fragrant agarwood has been associated with collectors, temples and scholars — and while ordinary consumers know its name, they seldom get to experience it.

Today, advances in cultivation, scientific research and product development are transforming the resin-rich wood into the foundation of a growing industry.

Across Hainan province, researchers, growers and entrepreneurs are betting that its fragrance, once associated with privilege, and its other products, can find a place in ordinary homes.

The Nada Agarwood Research Institute based in Hainan is taking a novel approach to marketing an agarwood resin they developed. The company has drawn inspiration from the empress's residence in Weiyang Palace in Chang'an (present-day Xi'an, Shaanxi province) during the Western Han Dynasty (206 BC-AD 24).

Known as Jiaofang Hall, or Pepper Hall, the palace's walls were covered in a plaster mixture of pepper and clay that filled the residence with a warm, pungent aroma — a symbol of refinement, status and fortune in that era.

At an agarwood exhibition in Beijing's Gongmei Building from March to May, the research institute featured a burning coil of incense that releases agarwood fragrance.

"The inspiration came from the Jiaofang Hall. But we replaced pepper with agarwood," said Yan Bin, founder and chairman of the company, which has spent two decades focusing on agarwood cultivation, research and product development.

"What we want to carry forward is the old Chinese idea of bringing fragrance into living spaces," Yan said.

Behind such ambition is a rapidly expanding market.

According to a 2024 report by Zhiyan Consulting, China's agarwood market size had grown to about 55 billion yuan ($7.6 billion) by 2023. Under an agarwood whole industry chain development plan (2023–30) by the Hainan government, the province aims to reach an annual output value of over 5 billion yuan by 2030.

Research efforts

Known in Chinese as *chenxiang*, or "sinking fragrance" — a name that refers to its high density, which makes the best pieces sink in water — agarwood is one of China's most prized aromatic woods.

Unlike ordinary timber, agarwood forms only when *Aquilaria* trees are damaged by nature, or it is deliberately induced through cultivation. In response to injury, the trees produce a dark, aromatic resin that gradually permeates the wood, creating the distinctive fragrance prized in incense, perfumes and traditional medicine.

Because the process is slow and unpredictable in the wild, high-quality agarwood has long been exceptionally rare.

When Dai Haofu began studying agarwood after returning from Germany in 2004, he quickly encountered an industry built more on reputation than science. The market was chaotic, and authentic research samples were difficult to obtain, he said.

Dai had originally come to Hainan to study marine resources, but switched his research to agarwood due to limited funds.

"At that time, agarwood was very rare and expensive," said Dai, head of the Haikou Comprehensive Experimental Station of China Agriculture Research System for Chinese Materia Medica. "Finding enough material for research was a major problem."

Unlike marine research, which required expensive boats and equipment, agarwood research could be done in a lab with small samples, which he managed to obtain from collectors, traditional pharmacies, and by visiting growing areas.

But he soon discovered that a large proportion of agarwood products sold by pharmacies were either fake or of very poor quality. Consumers had no way to tell the difference, as there were no scientific standards or reliable methods to verify authenticity.

Wild agarwood resources were limited, and cultivation was slow. Dai believed that better varieties, technology and standards could be achieved through the use of science.

In the beginning, gaining support for the project was difficult, Dai said. A turning point came in 2007, when Hainan's science and technology authorities began supporting major research projects on agarwood.

Working with growers in Guangdong province and other regions, Dai's team began selecting superior trees from natural populations, leading to a series of improved agarwood varieties. High-yielding and of superior quality, the new varieties were easier to induce resin production. Five of them were certified and approved by the Forestry Department of Hainan.

Traditional agarwood trees can require decades to produce valuable resin. New cultivation methods shortened that process significantly, from decades to about six years for some varieties.

"In nature, some trees grow stronger than others. We identify those advantages and reproduce them," Dai said.

Meanwhile, his team collected agarwood samples from 15 countries and regions, conducted systematic research on a chemical basis, and built a database of agarwood compounds. They also developed a rapid analytical method based on these compounds, helping to solve long-standing challenges in verifying authenticity and providing a scientific basis for quality evaluation.

Long prized for the quality of its wild agarwood, Hainan now hopes cultivated trees can restore that reputation on a much larger scale. Cultivation has expanded across Hainan and several southern provinces.

Most Hainan producers still sell raw material rather than higher-value finished products — something Dai believes must change. "Hainan still does too little processing. I'm encouraging relevant parties to do more."

From rags to riches

In Xiaogu village, Chengmai county, on the northern side of Hainan Island, every household now grows agarwood in their front and backyards. The trees have replaced the rubber plantations that once dominated the landscape.

It was not always this way.

The man who changed that is Cai Qinxin. The villagers once called him "Dog Smell". As the youngest of five children in a poor rural family, he often wore torn and dirty clothes.

At age 12, Cai followed his parents to fish the Nandu River that flows through both his home county and the agarwood-growing regions of Danzhou. A day's income was usually less than 50 yuan.

In 1993, while selling fish, Cai met a businessman from Shantou, Guangdong, who operated an agarwood processing factory. The monthly salary was 600 yuan, and Cai took a job immediately.

At the factory, he learned how agarwood was processed, from cutting raw wood to extracting oil. The work was physically demanding. Other workers processed five or six bags of wood a day. Cai processed more than 10. Each bag weighed around 40 kilograms. "I worked harder because I knew this was an opportunity," he said.

After one year, his salary was increased to 1,200 yuan. Three years later, the factory owner told Cai he had learned everything about agarwood processing and should go back home and start his own business. The owner gave him 50,000 yuan as a reward and start-up money.

In 1996, Cai returned to Xiaogu village and began processing agarwood in a small tiled house, but he struggled to find outlets to sell his products. He found a partner from the local agarwood association, who handled sales while Cai focused on processing. Their products eventually reached overseas markets, including the Middle East.

Despite the market potential, Cai saw that many villagers did not understand the value of agarwood. Many trees were cut down because farmers wanted to plant rubber — a supported crop that provided a steady income. Discarded agarwood was often treated as firewood. "I bought some of it for only a few cents per kilogram," Cai said.

His fortunes changed in 2006, when he visited an elderly villager who had found an old tree stump in a rubber plantation. The stump had been placed inside a house.

"The fragrance filled the room the moment I walked in," Cai recalled.

He recognized its value and bought it for 3,000 yuan. After processing, he sold it for 600,000 yuan. The piece later appeared at an auction in Hong Kong and was sold for 2.8 million yuan. The buyer gave him an extra 100,000 yuan.

"My whole family was extremely happy. We never expected this much money," Cai said.

In 2013, Hainan asked Cai to represent the agarwood industry at an international exhibition in Beijing, where he demonstrated traditional processing techniques. "The things I brought were sold out in half a day," he said. On the first day of the exhibition, his handmade agarwood bracelets sold for 460,000 yuan.

Returning from Beijing, Cai decided his village should plant agarwood. The following year, he helped establish an agarwood planting cooperative. Villagers provided land, and the cooperative provided investment, technology and sales channels. Profits were shared. Dozens of households now participate in agarwood cultivation and processing. The cooperative produces incense, bracelets, essential oils, tea and other related products.

Despite the industry's rapid growth, Cai has stuck with the traditional method of creating the resin.

"It takes hard manual work — using saws, electric drills and controlled burning — to imitate the natural forces that wound the trees so they can produce the fragrant resin," he said.

He is skeptical of attempts to accelerate production through chemicals. "Those methods may be faster, but they compromise the quality. Good agarwood needs time."

Betting on a slower tree

In 2020, Hang Yong cut down 23,000 profitable areca palms. At the time, areca prices were at an all-time high, and the trees could generate nearly 10 million yuan annually.

"Nobody understood," Hang said. "Even today, many people still don't understand."

Hang had no background in agarwood. Originally from the northern Inner Mongolia autonomous region, he worked in telecommunications before starting his own company.

In 2016, he arrived in Hainan seeking warmer winters. Like many, he imagined retirement. But instead of buying property, he wanted to build something of his own.

In 2017, when the Hainan government encouraged the building of shared farms with policy support, he established his own farm in Qiongzhong Li and Miao autonomous county, in central Hainan. At first, the farm focused on other crops, including areca palm. Then, in 2019, he met local agricultural experts who showed him the potential of agarwood.

Hang traveled to Maoming in Guangdong, a major agarwood distribution center, to visit planting bases, processing companies and markets. He saw how the industry worked and met the people who later became his partners.

"I visited the plantations, the processors and the traders," Hang said. "Only then did I decide this was an industry worth waiting for."

His decision to clear the areca, he explained, was based on the belief agarwood could provide income plus an industry — with processing, tourism, and a long-term value that a single crop could never match.

His friends thought he had lost his mind.

Since then, Hang has planted 400,000 agarwood trees. His farm, which spans 187 hectares, is now a major agarwood plantation in Hainan.

Hang also wants visitors to understand what agarwood actually is, so his farm combines agarwood forests with tourism experiences, providing camping areas, outdoor activities and ecological projects.

"Many people have heard of agarwood, but they don't know it comes from a tree. There has to be an experience," he said.

He believes filling that gap in knowledge represents the future market. "Agarwood has only just begun," he said.

Hang has signed strategic cooperation agreements with other major agarwood companies in Hainan.

"Ten years ago, all agarwood products could fit in a 10-square-meter room. Today, you couldn't fit them in a large exhibition hall. The market is still in its infancy. It's big enough for everyone," he said.

TOP NEWS

China Coast Guard personnel conduct drills on Saturday in the waters near Huangyan Island. According to the China Coast Guard spokesperson, the drills focused on operations such as visit, board, search and seizure, interdiction of forced entry and forced towing. PROVIDED TO CHINA DAILY

China carries out extensive drills off Huangyan

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

China's latest diplomatic, military and law enforcement actions with regard to Huangyan Island reflect a more targeted and coordinated response to the Philippines' increasingly aggressive maritime, legal and diplomatic moves, experts said.

On Saturday, the People's Liberation Army Southern Theater Command conducted joint naval and air exercises in the territorial waters and airspace off Huangyan Island and its surrounding areas, while the China Coast Guard carried out rights-protection law enforcement and control drills in nearby waters.

According to separate statements issued by the command and the coast guard, the exercises covered reconnaissance and early warning, deterrence patrols, sea and air control, boarding inspections, interception and compulsory towing.

Ren Yuanzhe, a professor of diplomacy and foreign affairs management at China Foreign Affairs University, said China's response has become more targeted and coordinated, with maritime law enforcement being used alongside diplomatic and public communication efforts.

"The response demonstrates China's resolve to safeguard its sovereignty and maritime rights, while maintaining restraint and leaving room for practical cooperation, including maritime search and rescue," Ren said.

The actions followed a series of Philippine activities near Huangyan Island in late July.

Over two consecutive days, Philippine government and coast guard vessels entered Chinese waters, the China Coast Guard said.

During the larger operation, the Philippines assembled seven government vessels, three coast guard ships, one fishing vessel and a large number of fishing boats near the island. Three Philippine government vessels ignored repeated warnings and deliberately entered Huangyan Island's territorial waters, prompting the coast guard to take measures including verbal warnings, interception and control, and the use of water cannons, it said.

Zhang Qiyue, assistant director of the Shanghai Institutes for International Studies' Institute for Global Governance Studies, said the latest Philippine actions were larger, more organized and more multidimensional than previous sporadic incidents.

"They combined large-scale operations at sea with legal and diplomatic moves, showing that Manila is seeking to advance its claims through several channels at the same time," Zhang said.

The Philippines also deposited with the United Nations Secretariat a nautical chart setting out its claimed baselines, territorial sea and contiguous zone around Huangyan Island.

China firmly rejected the Philippines' delimitation of the so-called "baselines of the territorial sea" in a Foreign Ministry statement on Friday, calling the move illegal, null and void.

The ministry stressed that Huangyan Island has never been part of Philippine territory, which has been defined by a series of international treaties, and that Manila's territorial claim is completely baseless under international law.

It also reiterated that the so-called "award" of the unilaterally initiated "South China Sea arbitration" is illegal, null and void and has no binding force.

The developments came as 2026 marks the 10th anniversary of the announcement of the so-called arbitration award.

Zhang said the Foreign Ministry statement represented a continuation and further clarification of China's long-standing position on Huangyan Island.

It also helped the international community better understand the historical background of the issue, the legal basis of China's position and the nature of the Philippines' actions, she said.

New measures tighten island's conservation

Mechanism improves ecological governance, curbs activities harmful to marine habitats

By **LI MENGHAN**
limenghan@chinadaily.com.cn

China's newly released management measures for the Huangyan Island National Nature Reserve are a significant step aimed at protecting the island's rich biodiversity, officials and experts said.

The 16-article management measures for the reserve, which is a newly established protected area in the South China Sea covering 3,523.67 hectares of coral reef ecosystems and rare marine habitats, were jointly issued on Saturday by the Ministry of Natural Resources, the National Forestry and Grassland Administration, the China Coast Guard and the People's Government of Hainan Province.

According to the measures, a coordination mechanism has been established to address major issues, strengthen collaboration and share information.

Huangyan Island, which is part of the Zhongsha Islands, features unique coral reef ecosystems and distinctive geological formations. It is home to numerous rare and endangered species, including hawksbill turtles, green sea turtles, giant clams, triton shells and tiger cowries, making it a marine biodiversity hot spot of significant ecological value.

Chen Danhong, director-general of the department of international cooperation at the Ministry of Natural Resources, noted that the measures were issued in response to urgent demands to protect the ecosystem as it faces heightened risks, including an abnormal rise in sea temperatures caused by climate change and extreme weather, human activities and potential outbreaks of harmful organisms.

"The measures provide an institutional basis for protection management and law enforcement. Their implementation will significantly improve the construction and management of the reserve, and they are of great significance for maintaining the health and stability of the South China Sea marine ecosystem," Chen said.

Under the measures, the Ministry of Natural Resources is responsible for boundary surveys, planning review, resource protection and utilization management, asset accounting and registration, as well as the protection of territorial sea baseline points. The National Forestry and Grassland Administration supervises the reserve and reviews adjustments, planning and construction. The South China Sea bureau of the Ministry of Natural Resources, the designated management institution, handles daily protection, resource monitoring and ecological restoration.

The Hainan provincial government cooperates with the China Coast Guard on administrative law enforcement, while the local government assists the management institution with disaster prevention, safety management and emergency response measures.

The reserve is divided into a core protection zone of 1,242.55 hectares and a general control zone of 2,281.12 hectares. The measures prohibit entry except for activities authorized by laws and regulations or organized by the management institution for protection and management purposes. Fishing, mining, excavating corals, coral reefs and giant clams, and other activities that damage rare marine species and natural ecosystems are prohibited without approval.

The coast guard will establish a routine patrol system in collaboration with the management institution, deploying patrol personnel and equipment to deter and report violations. Violations will be prosecuted under applicable laws including the Ecological and Environmental Code, the Sea Areas Administration Law, the Island Protection Law, the Wildlife Protection Law, the Coast Guard Law and the regulations on nature reserves.

Jin Yongming, a distinguished professor at Ocean University of China's School of International Affairs and Public Administration in Shandong province, said the multiagency management model of the Huangyan Island reserve is shaped by its marine environment and geopolitical sensitivity, noting that it involves foreign affairs, politics and security — issues no single department can handle alone.

"The release of these management rules represents a significant step forward in safeguarding China's lawful maritime rights and interests at Huangyan Island," Jin said.

Bans: US refuses to accept a multipolar world order

From page 1

On that day, the Department of Homeland Security added 43 more Chinese companies to the Uyghur Forced Labor Prevention Act Entity List in its largest-ever single expansion. Justifying the sweeping import bans under a "rebuttable presumption" of guilt, officials once again leaned heavily on broad rhetoric of national security and economic protectionism.

Two themes connect the bans announced in July.

First, there is a flawed belief inside the White House and among many who make up the political elite in Washington that the US is capable of going it alone in creating and sustaining the most sophisticated technologies. During both of his terms, the US president has spoken of a rebirth of US manufacturing; he has talked in tones of returning the US to those days long gone in which the country was the envy of the world because of what it produced and then sold domestically and internationally. There therefore needs to be a rationale as to why manufacturing is not returning and why the technological resurgence Washington has promised has not materialized, and it can't be because of decisions made in Washington.

Enter China. Claiming that China does not play by "the rules" allows for finger-pointing at a bogeyman. The sanctions offer fuel to the suggestion the US is responding forcefully and ethically.

More fundamentally, Washington increasingly appears to be redefining competition itself. Traditionally, economic leadership rested on producing better technologies, attracting more talent and creating more competitive industries. Increasingly, however, leadership is being pursued by restricting competitors' access to markets, capital, research partnerships and advanced technologies. Competition is no longer confined to outperforming rivals; it extends to shaping the conditions under which rivals are allowed to compete. That marks a significant shift in how economic power is exercised.

Second, the activities deliver a violent slap in the face to the US' long-standing professed belief in free trade.

In order to protect select domestic industries, Washington has repeatedly kicked to the curb one of its fundamental tenets: free trade is the best trade. Here again, one Washington insider after another will say that if only China played by "the rules" — yes, there is that phrase again — then these pesky bans might just go away.

Of course, those rules were written by the US. They are supported by other Western democracies. They are endorsed by the World Bank and other international agencies that are absolutely beholden to Washington. With all of that as the backdrop, maybe "rules" is not the correct word. Perhaps diktats is.

No, the US is not coming right out and saying it is running scared, but only the most naive of people cannot see the truth.

The US no longer holds sway on the international stage as it once did. It lacks the moral authority to lead by example. It alone does not produce the most cutting-edge items. It refuses to accept that a multipolar world defines the 21st century. Solid leadership would acknowledge those facts and adjust accordingly. But that is not Washington's way.

The world does not like that. Just a few days ago, a new poll released by the Pew Research Center found that people in 25 of the 36 surveyed countries held a more favorable view of China than of the US.

A nation confident in its people and in its ability to compete on the intricately connected world stage would roll up its sleeves and find real solutions. A scared nation blames and blames and blames.

Park: Views shift continuously depending on the weather and season

From page 1

The landscape was recognized as a UNESCO Global Geopark in 2020. Voted one of CNN's "24 Most Unusual Landscapes in the World" in 2025, the park is renowned for its otherworldly display of colors.

The Chinese name for the landscape, *danxia*, literally means "rosy clouds". It evokes the colors of the sky at dusk. First appearing in an ancient verse, the term was borrowed by Chinese geologists to describe these colorful landforms, conjuring up an image of the heavens spilling onto the earth.

A hashtag roughly translated as "Nature's Canvas" on social media has seen visitors from across China and beyond posting their own unedited proof of what they saw.

"The landscape is entirely natural," said Li Junling, deputy director of the scenic area's comprehensive management department.

Beneath the multicolored surface lies a geological epic: The thick layers of sandstone and mineral deposits from the time when dinosaurs still roamed the Earth were thrust upward by tectonic forces over millions of years and were then sculpted by wind and rain.

Some 35 distinct colors can be found in the park, each a page from the Earth's own diary — telling the story of a dry season, a flood, a shallow sea — a record of an ancient climate system.

The park, covering around 1,290 square kilometers, also straddles ancient Silk Road routes. Zhangye, known in ancient times as Ganzhou, was a crucial oasis in the Hexi Corridor, where merchants from Persia, Sogdiana and the Mediterranean once rested their camels and traded silk for spices. Centuries later, the Venetian merchant Marco Polo lingered here, describing a city adorned with temples and monasteries.

Today, travelers retrace his route on tour buses, yet the sense of wonder remains unchanged.

Mao Guodong, a Mexico-based traveler who returned to China for a two-month journey to explore its natural wonders, was awestruck.

"The landscape is breathtaking. It's truly one of nature's masterpieces," he said. Understanding how geological forces shaped the terrain turned a sightseeing stop into the highlight of his entire journey.

Chloe Choo, a visitor from Singapore, described the landscape as "absolutely breathtaking".

"I could hardly believe these colorful rocks were formed entirely by nature," she said. "The vibrant colors and straight layers look like the Earth painted itself."

Depending on the weather, season and angle of the sun, the views shift continuously, making the park a paradise for photographers. After rains, the colors deepen into jeweled tones; at sunrise and sunset, the hills blush as if lit from within.

For some families, the park serves as an outdoor classroom. At the No 4 viewing platform, Yang Ziwei from the Ningxia Hui autonomous region watched her daughter hold up a textbook — the cover image an exact match for the view before them. "Travel brings knowledge that can't be found in the classroom alone," Yang said.

WORLD IN FOCUS

Crumbling edifice

Cost of rebuilding more than damage for quake-hit Venezuela, experts say

Two people stand beside the rubble of a collapsed building in Caraballeda, Venezuela, on July 27, one month after an earthquake struck the area. FEDERICO PARRA / AFP

Two earthquakes that rocked Venezuela on June 24 caused $19.6 billion in direct physical damage, but the cost of rebuilding could be twice that much or more, the World Bank said in an early assessment released on July 23.

The 7.2 and 7.5 magnitude quakes killed about 5,000 people, according to the government, destroying residential buildings, infrastructure and nonresidential buildings in the northern areas of the country, including the capital Caracas.

The government estimates that nearly 17,000 people were injured and nearly 18,000 remain homeless. The disaster, the country's deadliest earthquake since 1812, came at a time when socioeconomic conditions were already precarious, with a poverty rate of over 76 percent.

"The earthquake caused an estimated $19.6 billion in direct physical damage, a staggering figure for any economy and one that demands a coordinated response," said Susana Cordeiro Guerra, the World Bank vice president who oversees Latin America and the Caribbean.

"Without timely additional investment, the negative impact on productive capacity and living standards will slow the path to recovery," she said.

The bank completed its global rapid damage estimation using remote-based earthquake modeling, local seismic data, satellite imagery and damage reports from government, humanitarian agencies and others on the ground. The estimate does not include the cost of "building back better" through structural improvements or upgrading the construction type. Those costs, including debris clearance, could be two to two-and-a-half times the replacement costs, which could drive the total bill to close to $50 billion.

'Far from over'

A month on, search efforts continue for bodies buried underneath rubble, but operations have evolved to focus on post-earthquake humanitarian aid and rebuilding. Recovering from the earthquakes in Venezuela will take years, according to the Red Cross.

"This disaster is far from over," said Scott Craig, spokesman for the International Federation of Red Cross and Red Crescent Societies.

Craig said that while in the immediate aftermath the focus had been on saving lives, now it was on caring for survivors.

"Survivors are living with anxiety, fear, sadness and sleeplessness as they grieve relatives, homes, jobs and livelihoods lost," he told reporters in Geneva.

Healthcare, mental health support and access to safe drinking water were the immediate priorities, he added, as many families were still relying on bottled water for drinking, cooking and washing.

"Recovery here will be measured in years, not weeks," said Craig. "Health centers, schools, water systems, power and sewerage were destroyed or badly damaged."

The pace of reconstruction would be a decisive factor in shaping the country's economic recovery and social outcomes. Without higher public and private investment, productive capacity and GDP would likely remain below pre-quake levels until at least 2036, the World Bank said.

Additional borrowing would add to Venezuela's already large debt stock, but could stoke stronger growth, which would gradually strengthen the country's fiscal position, it said.

China backs UN on AI governance

New agency seeks wider tech access, shared development for Global South

By **ZHAO HUANXIN**
at the United Nations
huanxinzhao@chinadailyusa.com

China will consult and cooperate with other countries through the broad platform of the United Nations on major issues concerning the future of global AI governance, guided by principles of openness, open-source cooperation, mutual benefit, joint contribution and shared benefits, China's Permanent Representative to the United Nations Fu Cong said on Friday.

Fu made the remarks during a briefing at the UN headquarters, organized by China's UN mission. The briefing took place two weeks after the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance was held in Shanghai.

Fu said the conference was more than a platform for dialogue, exchange, and cooperation; it brought stakeholders together to facilitate the global flow of innovation resources for AI development and inject fresh momentum into international cooperation.

"More importantly, it focused on the defining issue of our times: how to ensure that artificial intelligence develops in ways that benefit all humanity," he told representatives from more than 70 countries and international organizations at the briefing.

Fu noted that Chinese President Xi Jinping outlined China's vision for building a just and equitable global AI governance system, presenting four observations: boosting innovation-driven development, ensuring AI remains secure and under human control, promoting mutual learning between civilizations, and improving global governance.

One of the conference's major outcomes was the launch of the World Artificial Intelligence Cooperation Organization, or WAICO, the world's first intergovernmental international organization dedicated to AI. Representatives of 29 countries signed the founding convention.

"It represents China's concrete response to the aspirations of the Global South and an important step toward bringing countries together for AI development and global governance," Fu said, adding that the organization welcomes the participation of all countries.

The ambassador said WAICO is designed to complement and reinforce the UN's work on AI governance by focusing on capacity building, policy dialogue, technical cooperation, and AI applications.

"China stands ready to strengthen policy coordination, institutional cooperation, and practical collaboration with the United Nations, and to support the UN in playing an even greater role in global AI governance," he said.

"We see the UN as the main channel and the main platform for global governance on AI," he said during a question-and-answer session.

Asked about regulation, Fu said governments must balance innovation against risk. "If you have too much regulation, then you stifle innovation," he said, while warning that giving companies free rein could expose societies to AI's inherent dangers.

Speaking at the briefing, Amandeep Gill, the UN secretary-general's envoy on technology, described this year's World AI Conference as "qualitatively different".

'Step forward'

He also said the Shanghai gathering marked "a significant step forward" in making AI capacity-building an international priority.

Gill said the UN secretary-general focused on capacity, safety and sustainability, and stressed that different initiatives should complement one another, with the United Nations retaining a central role.

"I think the UN should remain the inclusive home for AI governance," Gill said at the Q&A session of the briefing.

The briefing also heard talks by other representatives from countries across Asia, Africa, Europe, Latin America and the Caribbean.

Moses Jere, a counselor and cyber/digital expert of Zambia's UN mission, said that computing remains the binding constraint for most African countries. The obstacle is neither ambition nor talent, but access to computing infrastructure, quality data, and comparable standards.

"The undertakings given in Shanghai on access to computing infrastructure and AI standards frameworks are therefore of real consequence," he said.

Asim Iftikhar Ahmad, Pakistan's permanent representative to the United Nations, said the establishment of WAICO is timely and significant, as it provides a platform for countries, particularly those of the Global South, to strengthen national capacities and promote shared development.

The ambassador said that developing countries need more than access to finished AI products. They also need the data, computing capacity, models, tools, and the technical support to develop and adapt AI themselves.

"In this regard, the outcomes of the conference and the high-level meeting provide a clear and action-oriented framework for future international progress," he said.

Other speakers welcomed the establishment of WAICO and called for the conference's initiatives to be translated into practical capacity-building support for developing countries, with the broader goal of making AI more inclusive, widely accessible and mutually beneficial.

Vol. 38 — No.1884

Migrants pass through a broken fence as they leave Spain's North African enclave of Ceuta toward the Moroccan town of Fnideq following an attempted crossing at the Bab Sebta border, on Saturday. ABDEL MAJID BZIOUAT / AFP

Migrant influx adds to Europe's woes

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Several European nations will push for a stronger border between the European Union and the world at a special meeting on Tuesday.

The talks were hastily arranged after more than 50,000 migrants swept over and around the border separating the North African Spanish enclave of Ceuta from Morocco on Thursday.

At least 72 people died during the mass influx, local officials said on Sunday. Most of the people who rushed into Spain's North African territory have returned to Morocco since the territory's largest mass migrant crossing.

"The latest figure that we have is 72," the government's delegate to Ceuta, Miguel Angel Perez Triano, told reporters, when asked about the number of fatalities.

Spain said on Friday it had escorted almost all of the migrants who entered Ceuta back over the border, but the sudden arrival of so many people demanding asylum and entry into the bloc led Italy to immediately suspend its participation in the EU's border-free travel area, known as the Schengen zone, a move Denmark and Finland supported.

The influx triggered a joint statement from 22 of the EU's 27 member states, calling on the bloc to strengthen its external borders and not allow weaknesses to "create the perception that illegal entry into the European Union is possible" because it would "encourage further attempts, undermine confidence in our common migration policy and have repercussions for all member states".

Spain responded to the criticism from fellow EU countries by saying most of the migrants who illegally entered Ceuta had headed back, and that nations that criticized its border enforcement in Ceuta had been "selfish, polarizing, and unlawful".

Spain's Prime Minister Pedro Sanchez wrote to President of the European Commission Ursula von der Leyen saying his country had quickly secured its border and prevented any "unauthorized onward movement toward continental Europe".

Fernando Grande-Marlaska, Spain's interior minister, said on Saturday the situation in Ceuta was almost back to normal.

"Almost all of (the migrants) have already left Ceuta," he said.

Tuesday's emergency talks are likely to be both a debriefing about what happened and a look at how to stop it happening again. And they will also likely include debate about the EU's Schengen Area.

The border-free travel zone that encompasses more than 450 million people and 29 countries in Europe means there is no need for checks at the borders between nations for people who are already within its external border.

Critics say it acts as a magnet for people who know they only need to crack one external border at its weakest point to have full access to the European continent.

Denmark's Prime Minister Mette Frederiksen said she wants the EU to look at all options, "including a suspension of Schengen cooperation".

Migrants who returned to Morocco on the weekend said hunger, exhaustion, and the lack of a warm welcome were their reasons for giving up on the idea of relocating to mainland Europe.

A waiter from Morocco told Reuters local people in the enclave had closed all the stores and made it clear they were not welcome: "They imposed a siege to force us to leave Ceuta by ourselves … They succeeded in their plan."

China, US business leaders seek deeper ties

By **MINLU ZHANG** in Washington
minluzhang@chinadailyusa.com

Chinese and US business leaders hold a meeting in Washington DC on Friday. SHA HANTING / CHINA NEWS SERVICE

Chinese and US business leaders met in Washington DC to explore opportunities for deeper cooperation as the two countries continued high-level engagement and economic and trade exchanges while managing differences.

The meeting, held on Friday, came a day after Chinese Vice-Premier He Lifeng, who is also China's lead person for China-US economic and trade affairs, held a video call with US Treasury Secretary Scott Bessent and US Trade Representative Jamieson Greer. The two sides had "candid, in-depth and constructive exchanges", while China expressed serious concerns over recent US trade and economic restrictions, according to Xinhua.

"There's this myth out there that American companies don't want to do business with China, that American companies are leaving China, or that they aren't investing in China or welcoming Chinese companies in the United States," Sean Stein, president of the US-China Business Council, or USCBC, said.

"All of those are myths. All of those are false," he said. "American companies are committed to being in China. They're committed to partnering with Chinese companies."

Stein made the remarks on the sidelines of a meeting between a Chinese business delegation and representatives of USCBC member companies. The event was organized by the China Council for the Promotion of International Trade, or CCPIT, and the USCBC.

The USCBC is a nonprofit association representing around 270 US companies doing business in China, with members including major US companies such as Apple, Nvidia, Boeing, Ford, Amazon, Coca-Cola, JPMorganChase and ExxonMobil. The CCPIT is the largest trade and investment promotion agency in China, representing China's business community.

Ren Hongbin, chairman of the CCPIT, said the Chinese delegation's visit was aimed at implementing the consensus reached by the two countries' leaders and creating more room for cooperation between the Chinese and US business communities.

'Improvement in relations'

"We have seen improvement in bilateral relations, especially after the meeting between the two heads of state," Ren said.

According to the USCBC member survey released in June, 92 percent of surveyed US companies in China were profitable last year and 95 percent said the Chinese market helps them "stay globally competitive".

"Those are huge numbers," Ren said, adding the survey results reflected "the commitment and strong interest of US companies in China".

Ren also said US companies are expected to make up the largest national group of business participants at the Asia-Pacific Economic Cooperation CEO Summit when China hosts the 2026 APEC Economic Leaders' Meeting later this year.

"APEC is an incredible magnet. It brings together some of the world's most advanced and dynamic economies," Stein told China Daily.

"It's an unparalleled opportunity not just to talk with one company or one country, but to engage with officials and businesses from across the region and build consensus on issues that matter to companies and economies alike," he said.

"This is really about plurilateral and multilateral diplomacy and creating an environment across multiple economies where companies can thrive and economies can grow."

The Washington DC meeting followed stops by the CCPIT-led Chinese business delegation in Utah and Illinois, where Ren said the group sought to strengthen ties and create more opportunities for cooperation between Chinese and US businesses.

Africa takes lead in BRI investment, report says

By **EDITH MUTETHYA** in Nairobi
edithmutethya@chinadaily.com.cn

Africa retained its position as the leading destination for the Belt and Road Initiative investment in the first half of this year, attracting $33.5 billion in Chinese investment, up 254 percent from the same period last year, as manufacturing and energy projects gathered pace amid shifting global trade dynamics.

A report, jointly published by the Green Finance & Development Center at Fudan University in Shanghai and the University of Queensland Business School in Australia, said Africa's strong performance was driven by increased investment in manufacturing, energy and infrastructure.

Ethiopia recorded the largest growth in BRI engagement globally, attracting more than $18.9 billion.

The East African country has secured the world's largest Chinese energy investment through green energy development agreements worth more than $14 billion between the Ethiopian Investment Commission and China's Ming Yang Smart Energy Group.

The project is expected to greatly facilitate Ethiopia's green transformation. In the first phase, the project will include a $7.5 billion 8.4-gigawatt renewable energy project comprising both wind power and solar energy.

In the second phase, the Chinese company will invest an additional $7.3 billion in green ammonia production, as well as the manufacturing of electric transmission and wind turbine equipment.

The investment is expected to accelerate industrial development, create jobs, facilitate technology transfer and boost foreign exchange earnings.

Egypt also recorded a sharp rise in Chinese investment announcements in the first half of the year, reaching $12.2 billion during the period, according to the report.

China's Xinfeng Steel is investing $10 billion in Egypt to develop an industrial and steel manufacturing complex in the Ain Sokhna industrial zone. The facility will focus on producing automotive steel and other large-scale industrial steel products.

Since its launch in 2013, the Belt and Road Initiative has significantly boosted infrastructure development, trade, and investment across Africa. Flagship projects continue to expand their positive impact on local development.

Highest level

Globally, BRI engagement reached its highest level for any first half since the initiative was launched, totaling $49.8 billion in investments and $76.5 billion in construction contracts.

Energy remained a major driver of Chinese overseas engagement. Total energy-related BRI investment reached $36.3 billion in the first half of this year, nearly double the level recorded during most first-half periods since 2013, surpassed only by 2025.

Investment in green energy reached a record high, with $14.3 billion committed to wind, solar and waste-to-energy projects, alongside $5.3 billion in hydropower. Overall, China's investment in green energy and hydropower more than doubled in the first half of the year, compared with the same period last year.

Since the launch of the BRI, cumulative Chinese engagement has exceeded $1.5 trillion, comprising $926 billion in construction contracts and $614 billion in investments.

Christoph Nedopil Wang, founding director of the Green Finance & Development Center, said he expects BRI engagement to remain strong through the rest of the year despite global economic uncertainty driven by US trade measures and volatility in fossil fuel markets linked to tensions around the Strait of Hormuz.

"With strong engagement in sectors requiring significant investment such as mining, manufacturing, and increasing ability to scale energy investment as well as data centers, I expect deal size to also remain large (in the future)," he said.

Editorials

Bessent's 'underwater kicking' allegation perfect metaphor for US' 'water polo' play

While it is a memorable metaphor, it is also an almost perfect inversion of reality. Speaking to Fox Business, US Treasury Secretary Scott Bessent compared Sino-US economic relations to a water polo match, claiming that "Under the water, the Chinese seem to have done a lot of kicking lately", and that "If we have to, we'll kick back".

But Washington has not ceased expanding restrictions on Chinese technology and industry. In May, it tightened artificial intelligence chip export controls by closing so-called "loopholes" for Chinese-headquartered companies operating overseas, extending US jurisdiction far beyond its borders.

In June, the Pentagon baselessly added 65 Chinese entities to its Section 1260H List of alleged "Chinese military companies". Then, in late July, the US Federal Communications Commission moved to block imports of Chinese-made advanced robotics and power inverters, despite acknowledging the restrictions would raise costs and slow aspects of the US' own AI development.

The pattern continued on Friday, when Washington placed over 40 Chinese entities on its so-called "Uyghur Forced Labor Prevention Act Entity List" — just one day after Chinese Vice-Premier He Lifeng held what both sides described as a candid and constructive video call with Bessent and US Trade Representative Jamieson Greer.

This is not evidence of Chinese "kicking", but a US campaign of "underwater kicking" that has become broader, more systematic and increasingly disconnected from its stated goal of stabilizing relations.

Bessent's metaphor therefore reveals more than what he perhaps intended. The US administration casts itself as the reluctant "rules-abiding" player, forced into a defensive posture by what it projects as Chinese "dirty tricks". Yet it is Washington that is resorting to such unsporting behavior, erecting new barriers across semiconductors, artificial intelligence, advanced manufacturing and trade.

The US has stretched "national security" to cover virtually all major sectors, disregarding the strong appeals of the US business community. By using administrative powers to disrupt commercial exchanges, Washington continues to push its de facto "decoupling" and "supply chain fragmentation" strategy. These coercive actions benefit no one — they are classic cases of market distortion and unilateral coercion.

Reuters recently photographed Bessent's own handwritten notes during a Cabinet meeting, revealing plans to purchase billions of dollars' worth of Japanese yen. The carefully visible notebook might be an exercise in signaling financial markets without making an official announcement — the very sort of below-the-surface maneuvering that Bessent hypocritically accused China of.

The US seeks to contain China's development while preserving stable ties. In practice, however, Washington treats periods of stability as tactical pauses — opportunities to secure what it still needs from China, notably rare earths, before pressing ahead with its broader strategy of constraining China's rise. That explains why before and after almost every dialogue between the two sides the US introduces another round of restrictions.

US Secretary of State Marco Rubio acknowledged this week that any economic or military conflict between the US and China would be catastrophic for both countries and the wider world. On that point, at least, there should be little disagreement.

Despite this, the US administration remains hellbent on pressing ahead with its ill-advised China policy — a strategy that has increasingly come to weigh on the US economy itself. It is no coincidence that Bessent's remarks coincided with second-quarter US GDP figures showing annualized growth slowing to 1.5 percent, down from 2.1 percent in the first quarter. Washington has long had a familiar instinct when domestic headwinds gather: redirect attention outward.

Bessent tried to dismiss the figures as "very noisy", blaming "technical factors". But a neutral observer might reach a rather different conclusion.

Bearing the bigger picture of Sino-US relations in mind, Beijing, for its part, has responded rationally to the US moves to protect China's legitimate rights and interests.

The US Treasury chief should remember one lesson from the sport he invokes. In water polo, the player kicking beneath the surface often does so because he is struggling to stay afloat. The US' technological lead remains in some sectors. But preserving that advantage requires confidence, not perpetual escalation. If Washington continues mistaking competition for a zero-sum game, it may find that the turbulence it complains about is largely of its own making.

Tokyo further dismantles postwar order

Japan's National Intelligence Bureau — the country's first centralized foreign intelligence body since the end of World War II — held its inaugural meeting on Friday, chaired by Prime Minister Sanae Takaichi.

This represents another troubling shift in Tokyo's security policies, as it is a significant step in Japan's systematic push toward remilitarization and a challenge to the postwar international order.

The 730-person bureau, set up under the National Intelligence Council Establishment Act that passed Japan's upper house in May, ends a postwar arrangement that left the country's intelligence divided across the Cabinet Office, the Foreign Ministry, the Ministry of Defense, the National Police Agency and the Ministry of Justice.

This design breaks with the long-standing tradition of decentralized intelligence checks and balances in postwar Japan. Even more concerning are the bureau's vague functional boundaries and the near absence of oversight. The concentration of power and the lack of supervision make it easy for the intelligence system to become a tool for right-wing politicians to manipulate politics and suppress dissent, rendering the checks and balances of the Diet and public opinion ineffective.

Viewed from a historical perspective, this system bears dangerously similar genetic traits to the espionage governance of Japanese militarism before and during World War II. The so-called "Special Higher Police", known as *Tokko* and established in 1911, once suppressed progressive forces domestically and acted as a vanguard of aggression abroad. The so-called "Cabinet Intelligence Bureau", established in 1940, provided an integrated intelligence hub for the invasion of China and the waging of the Pacific War.

Japan's wartime intelligence agencies were compulsorily dissolved following its defeat. However, the postwar settlement left the deeper structures of militaristic thinking largely intact. With Tokyo now establishing a modern intelligence framework under revised security legislation, the prospect of a militaristic intelligence ethos being revived — albeit in contemporary guise — is a risk that warrants serious attention.

Tokyo's deeper intention is to pave the way for military expansion. Since the Takaichi government took office, it has accelerated the push to lift the ban on "collective self-defense" and amend Article 9 of the pacifist Constitution.

Japan's military budget for the fiscal year 2026 exceeded 9.04 trillion yen ($57.36 billion) for the first time, a record high. The Japanese government has abandoned the principle of "exclusive defense", accelerated the development of long-range offensive weapons, relaxed arms exports and participated in joint military exercises with many other countries. Against this backdrop, the core task of the National Intelligence Bureau is precisely to build an all-encompassing intelligence hub for military expansion, forming a complete chain of "intelligence coordination — high-level decision making — military implementation".

Article 9 of Japan's Constitution renounces the country's right to remilitarization. But the Takaichi government is systematically abandoning its postwar commitments. From the "Special Higher Police" to the new intelligence system, the right-wing forces of Japan are revisiting the path of intelligence centralization.

For nations that suffered from Japanese aggression in WWII, the number "731", the code name of the Imperial Japanese Army's germ warfare unit, carries painful memories. For Japan to choose July 31 as the date to launch the new intelligence agency is nothing but an open insult and provocation.

Japan's push for intelligence system reform poses a serious threat to regional peace and stability. The international community must be highly vigilant against the moves being taken by Tokyo. In the face of the rise of neo-militarism in Japan, China should take targeted countermeasures with a firm commitment to safeguarding its national security. It is necessary for China to continuously enhance all-weather, multi-domain counterintelligence reconnaissance and deterrence capabilities.

Japan's intelligence-gathering and military activities should be closely monitored to ensure that China's core interests are not violated. A robust security firewall for technology, the economy and digital supply chains must also be established to tightly guard against Japanese intelligence infiltration and cognitive warfare threats.

Proposed law part of efforts needed to curb cyberbullying

At the end of July, China solicited public feedback on the draft of long-awaited legislation targeting online bullying. This legal framework is both necessary and timely, yet it represents just one step in a broader effort to combat the pervasive issue of cyberbullying.

Cyberbullying has become cross-platform and organized, impacting real-world lives. It disrupts online order, inflicts lasting psychological harm on victims and damages the online business environment. The harm caused by cyberbullying is as real and damaging as physical violence.

In recent years, incidents of online abuse have become alarmingly common, ranging from doxing — publicly revealing private information about someone with the intention of harassing or seeking revenge — to coordinated smear campaigns. Liu Xuezhou, a young man looking for his biological parents, took his own life after enduring relentless online speculation and harassment. Similarly, Zheng Linghua, a young woman known for her distinctive pink hair, ended her life following vicious attacks on her appearance. These heartbreaking tragedies are not isolated cases but rather indicative of a widespread social problem.

Dismissing online abuse as mere "internet quarrels" is a grave injustice to those who are the victims of it. Words can hurt deeply, and the anonymity and viral nature of social networking sites make it difficult to delete and escape torrents of abuse. Most victims feel powerless to fight back, often choosing silence and retreating into a shell in search of peace and safety.

The proposed legislation is a direct response to the pernicious nature of such deeds. If enacted, it would provide victims with the legal recourse they need to defend themselves, clearly define the responsibilities of governments, platforms, institutions and users, and ensure that offenders face real consequences for their actions.

This coordination across various fronts in the draft law is crucial because online bullying requires collective efforts. Platforms, in particular, must not prioritize engagement and online views over responsibility and user safety. They should take proactive measures to prevent and address abuse — through early warning systems, content moderation and accessible reporting channels — while cooperating with law enforcement agencies to identify and penalize offenders. Early intervention is essential to prevent harmful comments from spiraling out of control.

No victim should feel isolated or helpless in the face of online abuse. The cyberspace regulators need to conduct routine oversight, and the public security authorities must act swiftly on complaints — investigating, gathering evidence and providing timely support to victims. The rule of law must underpin online safety, ensuring a secure digital environment for all users.

It's encouraging to see the draft legislation requires educational authorities and schools to include anti-bullying content in their curricula, as individual internet users also have a crucial role to play in enhancing their legal awareness and digital literacy. Under the draft, if students are involved in online abuse, schools must intervene promptly and take preventive action to address the issue and support affected individuals. True progress will occur when every individual and institution embraces the values of respect for others, reverence for the law and accountability for their words and actions.

Ultimately, only by fostering a culture of respect and responsibility can we build a digital environment that protects everyone from harm and prevents us from harming others. This collective effort will help create a cleaner, more orderly cyberspace for all, where individuals can engage freely and safely without fear of abuse or harassment. The proposed law is part of that effort.

— CAO YIN, CHINA DAILY

What They Say

Plan aimed at developing more high-value patents

Editor's note: *The State Council, China's Cabinet, recently issued a plan to protect and utilize intellectual property. Officials of the China National Intellectual Property Administration attended a news conference at the State Council Information Office late last month to outline what China will do to improve IP production in the coming years. Below are excerpts of the remarks made by one of the officials, Liang Xinxin, who is director general of the administration's Strategic Planning Department.*

High-value invention patents cover four categories. The first are those in emerging industries of strategic importance, such as next-generation information technology and new energy sectors. The second are invention patents with an overseas patent family. The third are patents that have been maintained for more than 10 years. The fourth are invention patents that have won the National Science and Technology Awards or the China Patent Awards.

At present, patents in emerging industries of strategic importance account for over 70 percent of China's high-value invention patents. This share is expected to rise further during the 15th Five-Year Plan (2026-30) period.

A target was set to increase the number of high-value invention patents per 10,000 people to more than 22 during the 15th Five-Year Plan period, an increase of more than six compared with the end of the 14th Five-Year Plan (2021-25) period. This reflects the country's confidence in improving its innovation capacity.

The country has set out five priorities for protecting and utilizing intellectual property during the 15th Five-Year Plan period.

First, to further bolster the development of an innovation-driven economy, the country will continue refining patent laws, regulations and policies and ensure timely and effective protection for major scientific and technological innovations. It will also promote the commercialization of patents on a regular basis.

Second, the country will strengthen policy guidance to foster more renowned trademark brands with global influence and boost the development of the "brand economy".

In recent years, China has vigorously advanced the building of brands, cultivating a growing number of domestic brands that enjoy popularity both at home and abroad.

Third, China will continue to boost growth of different regions by promoting local special products. During the 14th Five-Year Plan period, the country's geographical indication products played an active role in creating jobs in rural areas and raising farmers' incomes. The country will further strengthen the protection of GIs to provide stronger support for comprehensive rural vitalization.

Fourth, China will work to better support the development of the digital economy. It will keep enhancing the protection of intellectual property in the integrated circuit sector by effectively implementing the newly revised Regulations on the Protection of Layout-Designs of Integrated Circuits. Meanwhile, it will advance efforts to formulate rules governing the protection of data-related intellectual property.

Fifth, the country will continue to uphold an open economy. It will strengthen the research on foreign intellectual property laws and policies, and improve its guidance for Chinese companies to handle overseas intellectual property disputes.

It will also align closely with high-standard international economic and trade rules, continue to provide equal protection for the intellectual property of both domestic and foreign-invested enterprises, deepen intellectual property cooperation with major trading partners, and strive to build a market-oriented, law-based and world-class business environment.

Spark curiosity to build the bridge

Every generation worries that the next is drifting away from classical culture.

The proposed remedies are consistently the same: teach more history, assign more classics, build more museums and preserve more heritage.

Yet, the anxiety never disappears.

Perhaps that is because we keep mistaking preservation for transmission. Culture survives not because it is protected, but because it is rediscovered. And for each generation, rediscovery begins not with obligation but with curiosity.

I learned this lesson in an unlikely place: a video game. As a child, I struggled through *Romance of the Three Kingdoms*, the Chinese historical epic that shaped generations of East Asian imagination. The novel is one of China's greatest literary achievements, but to a young reader it can feel forbidding.

Its language belongs to another era, the cast of characters is immense and the political intrigues demand patience that many children simply do not yet possess. I finished it because I thought I was supposed to.

Years later, I found myself playing a strategy game set in the Three Kingdoms period. For the first time, history became immersive rather than instructional. Instead of trying to remember alliances and famous battles, I was making decisions and fighting battles myself.

When the game ended, I did something no teacher had ever persuaded me to do: I began reading history voluntarily.

MA XUEJING / CHINA DAILY

Soon I was searching historical records, comparing fact with fiction, reading *Records of the Three Kingdoms*, and eventually writing a song about Sun Shangxiang, a legendary figure of the era — sister of Sun Quan and wife of Liu Bei.

Only later did I discover that my story was not unique. Across Chinese social media, countless young people trace their fascination with the Three Kingdoms not to a classroom but to a game.

That should tell us something. For decades, educators have debated how to convince young people that classical culture matters. Many creators have quietly found an answer: they stopped trying to persuade and started making culture irresistible.

The medium is not the point. Curiosity is. This realization shaped my work when I began writing my first solo album, drawing inspiration from figures including Pu Songling, a Qing Dynasty (1644-1911) writer, the fourth-century calligrapher Wang Xizhi and the Venetian traveler Marco Polo.

Marco Polo fascinated me for a particular reason.

In China today, many children recognize his name before they know anything about the man who crossed Eurasia in the 13th century. They know him instead as a hero in a mobile game.

A fictional character can be the door to a real historical figure.

When I decided to write a song about Marco Polo, I did not want to summarize his travels.

History textbooks already do that well enough. Instead, I immersed myself in the details of his journey — his years in what is now Beijing, his visits to Zhejiang, Jiangsu and Sichuan provinces in China, the vast distances he crossed, and the civilizations he encountered along the Silk Road.

Those discoveries reshaped my understanding of him.

So rather than retelling history, I embedded it inside a metaphor.

A worn pair of sheepskin boots carries the dust of Persian deserts. Silver coins bloom into lotus flowers. A scimitar leaves its trace on bamboo slips. These images do not explain history outright. Instead, they invite listeners to wonder about their origins.

Curiosity is more powerful than explanation because it nudges people to explore.

The lyric I value most says, "The greatest adventure is admitting you have never truly discovered."

It sounds paradoxical. Explorers are remembered for making discoveries.

But genuine discovery begins with abandoning certainty.

Marco Polo did not come to China merely to confirm what he already believed. He encountered a civilization larger, more sophisticated and more surprising than anything he had imagined. The real breakthrough was not geographical but intellectual. He recognized that his previous understanding had been incomplete.

That may be the most valuable lesson his journey offers.

Every society is vulnerable to inherited assumptions about places it has never seen. Every culture can get trapped in stories told by someone else. The only lasting antidote is curiosity — the willingness to look again, and to discover that reality is richer than imagination.

This is also why I hope more young people around the world will experience China for themselves. Not because they should travel out of obligation, and certainly not because a song tells them to.

The purpose of art is to inspire questions, not give instructions.

If a listener finishes my song about Marco Polo and decides to explore the Silk Road, to learn why a Venetian merchant traveled so far east, or simply to wonder what he actually found here seven centuries ago, then the song has already succeeded.

That is how classical culture survives. Not by demanding reverence, but by rewarding curiosity.

Creators often speak about preserving tradition, but preservation is only the beginning. Our responsibility is not to enshrine the past behind glass cases, but to make it resonate in the present — through film, games, music, animation, short videos or whatever form allows a new generation to encounter it as something living rather than distant.

The bridge matters more than the monument.

When I was a child, no bridge connected me to *Romance of the Three Kingdoms*. A game built one. Music allowed me to build another.

If my work inspires someone else to cross that bridge — to Pu Songling's strange spirits, to Wang Xizhi's calligraphy, to Marco Polo's long journey across Eurasia — then I have fulfilled what I believe every creator should aspire to.

Not simply preserve the past. But make someone eager to discover it.

The author is a Chinese singer, writer and actor.

Reimagining education in the era of AI

The intelligent society is a new stage of social development in which artificial intelligence is deeply embedded in daily life. From production lines to classrooms, AI reshapes how we learn, work and govern. This era is characterized by human-machine collaboration, cross-sector integration and co-creation.

In education, this transformation is bringing about systemic changes, reshaping knowledge generation, educational institutions and talent cultivation. The 2026 Stanford AI Index Report indicates that AI's influence on society has never been more pronounced. But while AI capabilities and adoption accelerate rapidly, education systems are still struggling to adapt.

The fundamental purpose of education is still human development. Education should enable learners to develop judgment, responsibility, creativity, cooperation and moral agency. AI undoubtedly creates significant opportunities for education.

It can support personalized learning, adaptive feedback, language access, remote tutoring and more responsive learner support.

However, these opportunities are accompanied by substantial risks. Without clear educational goals, ethical safeguards and institutional guidance, AI may intensify inequalities, encourage superficial learning and weaken learner agency.

Therefore, the key issue is not whether AI should be used in education, but under what educational principles, institutional arrangements and social responsibilities it should be used.

This concern resonates with UNESCO's call for a new social contract for education, which emphasizes education as a public endeavor and a common good grounded in human dignity, social justice, cultural diversity, care, reciprocity and solidarity, all geared toward sustainable development. AI isn't just another educational tool; it is reshaping the educational contract and the relationship among stakeholders in education. Education systems must therefore renew the foundational pact of learning and education to support human development, social responsibility and sustainable futures.

Three long-term tensions are particularly important in this process. First, the conflict between immediate gains and long-term human development. AI can improve efficiency, convenience and performance.

It can generate answers, summarize texts and produce polished outputs rapidly. But education cannot be evaluated only by short-term productivity or visible outcomes. It must also cultivate long-term capacities such as attention, judgment, character, resilience and responsibility. If education is organized primarily around efficiency, its formative function will be weakened.

Second, the tension between individual awareness and collective consciousness. In AI-rich environments, information, opinions and emotions are increasingly mediated and amplified by platforms and algorithms.

Learners may be exposed to collective judgments before they have developed the capacity for independent reflection. Education must therefore strengthen learners' ability to ask questions, evaluate evidence, resist conformity and form reasoned judgments.

Last, the tussle between instrumental rationality and habitual dependence. While AI tools can assist learners in solving problems more efficiently, excessive reliance on them may result in cognitive outsourcing, whereby learners mistake the acquisition of answers for the development of understanding. The educational challenge is not to keep learners away from AI, but to ensure that AI complements but doesn't substitute cognitive engagement, inquiry and reflection.

To address these tensions, education must cultivate Intrinsic, Authentic, Agentic and Active learners. IAAA learners are intrinsically motivated by curiosity, meaning and autonomy; authentically connected to real-world problems, personal identities and meaningful social contexts; agentic in exercising voice, choice, goal-setting and responsibility; and active in constructing knowledge through inquiry, experimentation, creation and reflection.

Such learners are not passive recipients of information or algorithmic recommendations. They are self-directed, using AI responsibly without becoming dependent on it, maintaining human judgment, and linking personal growth with public responsibility.

However, learner self-commitment requires more than individual will. It depends on the coordinated efforts of multiple stakeholders. The renewed education pact should be a multilayered agreement connecting society, government, schools, families, teachers and learners.

Society and culture provide the value foundation of the common good, equity, inclusion and shared responsibility. Government and policy provide institutional guarantees through public resources, regulation, accountability and governance.

Schools and families translate social expectations into learning environments, curriculum, pedagogy and developmental support. Teachers and students sustain the core human relationship of education through care, engagement, feedback and adaptation. At the center are IAAA learners, whose self-commitment and development give the entire pact its educational meaning.

China's recent strides in becoming a leader in education, advancing a learning society and promoting AI-enabled educational transformation provide a meaningful reference for this renewal. The Smart Education of China platform reflects the idea of digital education as public infrastructure, expanding access to quality learning resources and supporting lifelong learning.

The AI Plus Education Action Plan integrates AI with curriculum reform, teacher development, rural education support, talent cultivation and education governance. Its significance lies not just in AI application, but in building a coordinated educational ecosystem that supports high-quality education, lifelong learning and modernization.

The future of education in the intelligent society will not be determined solely by technological innovation.

It will depend on whether societies can embed AI within a broader educational pact that protects human dignity, strengthens learner agency, supports the development of IAAA learners, and advances inclusive, equitable and lifelong learning. Only when AI serves human development and sustainable futures can it truly serve education.

Sustainable procurement driving green growth and decarbonization

China's 15th Five-Year Plan period (2026-30) places new emphasis on green manufacturing and low-carbon industrial upgrading. This supports the national goal of peaking carbon emissions before 2030 and realizing carbon neutrality by 2060.

However, much of the debate around this transition focuses on factories, technology and finance. Less attention goes to procurement — the daily decisions buyers make about which suppliers to select and which contracts to sign.

Sustainable procurement means building environmental criteria into sourcing decisions from the start, not after price and quality are settled. This idea is moving from principle into practice worldwide.

Procurement carries more weight than its quiet reputation suggests. In many manufacturing sectors, the majority of a product's total carbon footprint sits upstream, in the materials and components a company buys rather than in what it makes. This means a buyer's sourcing decisions often shape a company's climate performance more than what its factory floor does.

Consider a common scenario. A senior buyer compares two suppliers of the same component. One offers a lower price. The other charges more but can document its energy use, water use and recycling.

When sustainability criteria exist from the beginning, buyers can make this choice with confidence. When those criteria are added later, they tend to disappear once cost pressure rises.

The calculation also looks different over time. A supplier with cleaner processes may cost more today but often proves more stable tomorrow, since it faces fewer regulatory penalties, less exposure to carbon pricing and steadier access to export markets with strict environmental rules. Buyers who weigh total cost over several years, rather than the price on a single invoice, tend to reach a different conclusion than those who do not.

This is where much of the real work of decarbonization happens. A buyer managing sourcing across China and wider Asian supply networks increasingly negotiates supplier commitments on emissions reporting as a routine part of contracting, alongside price and delivery timelines.

Global Lens

Training and shared investment in cleaner equipment matter more than strict rules on their own.

Phased supplier development programs help smaller manufacturers meet basic environmental benchmarks step by step. Training and shared investment in cleaner equipment matter more than strict rules on their own. Some call this buyer-led greening.

This kind of collaboration is expanding beyond manufacturing processes into product design itself. European buyers increasingly work with suppliers on packaging, durability and repairability, not simply requiring compliance but helping suppliers get there. As companies prepare for the EU's Packaging and Packaging Waste Regulation, this has become a routine part of supplier development rather than a one-time audit.

One of us witnessed this directly in a recent sourcing decision. Two suppliers offered similar products. The lower-cost one used conventional plastic packaging and could provide only limited documentation on material compliance. The other was willing to redesign its packaging with recycled materials, cut unnecessary plastic and provide full documentation, including PFAS-free and RoHS declarations. The second supplier was chosen. It reduced compliance risk, aligned with upcoming EU packaging rules and met customers' sustainability expectations.

A related factor is whether a supplier can provide replacement parts across a product's life cycle. Suppliers that support repair over full replacement help extend product life and reduce waste, a core principle of the circular economy the EU is promoting. This is also an opening for Chinese suppliers to strengthen their competitiveness by supporting longer product life cycles.

Digital tools are making this easier. Supplier traceability platforms and simple emissions-tracking software now let even mid-sized buyers verify claims that once required lengthy audits. As these tools become cheaper and more common, verifying a supplier's environmental performance is turning from a specialist task into a standard part of sourcing work.

International practice offers useful reference points. In the European Union, large retailers require tiered supplier disclosure, starting with basic energy reporting and expanding to full carbon accounting over several years. In Germany, automakers pair procurement standards with joint supplier training, so upstream vendors do not bear the full cost alone.

These examples show that the pace of change depends less on the strictness of a rule and more on the support that comes with it.

China's State-owned enterprises have already moved in this direction. A growing number of centrally administered firms build green criteria into procurement design, from supplier scoring systems to long-term sourcing contracts.

Extending this approach into private manufacturing supply chains, especially among small and medium-sized exporters, could speed progress further.

Smaller exporters often want to meet these standards but lack the resources. A shared, cross-provincial registry of green suppliers would build on the momentum already underway. It would allow a supplier that has been verified once to serve as a trusted partner for many buyers, rather than repeating the same disclosure work for each new customer.

This would also make China's own progress easier to see and measure. Consistent supplier data, gathered through routine procurement rather than special reporting exercises, gives policymakers a clearer picture of how the low-carbon transition is unfolding on the ground.

Supply chains do not decarbonize on their own. They decarbonize one sourcing decision at a time, repeated across thousands of buyers and suppliers every day.

As China advances its low-carbon transition, procurement deserves a bigger place in that story. It is not a technical afterthought.

It is the mechanism through which national targets turn into results on the ground, one contract at a time.

When village paths meet the world

China's booming rural inbound tourism builds new cross-border cultural connections

The "China Travel" map is experiencing a quiet shift. Overseas visitors who once contented themselves with city walks in Beijing and Shanghai are now boarding early-morning buses bound for rural areas, walking into tea terraces, ancient pear orchards and Miao embroidery workshops in Yunnan and Guizhou provinces, and other parts of China.

The rural turn in China's inbound tourism is not a fad. Behind it are practical enablers: relaxed visa waivers, smoother payment and language services, and a rural transport grid that now reaches once-isolated valleys. But the deeper pull is cultural. Foreign travelers are tired of algorithm-fed sameness; they want variety, warmth and the texture of other people's ordinary lives. Chinese villages — with their 100-year trees, harvest rituals and courtyard hospitality — offer exactly that.

Tourism, in this sense, is no longer a transactional industry. It is a medium through which the world re-encounters China outside the metropolis, and through which villagers meet the world without leaving home.

The keyword is resonance. Rural tourism works only when multiple actors see one another: Farmers want income yet wish to keep their rhythm of life; visitors seek novelty yet treasure sincere encounter; operators expect returns; and government must balance development, conservation and the public good. The task is not to erase these differences but to convert them into shared values. The most moving village scenes are about how a craft survives, why an old tree is never cut down, and how a festival turns a Tuesday into a ceremony. They are entries into Chinese society, written not on the page but in soil, thread and blossom.

The ancient pear orchard system, home to more than 9,400 pear trees over a century old in Shichuan town, Gansu province, was inscribed in 2025 as a Globally Important Agricultural Heritage Systems site by the United Nations Food and Agriculture Organization. The village did not fence the trees into a museum. It banned new construction in the core zone, gave every old tree a digital file, paired traditional pruning maintenance with modern sensors, and stretched a seasonal economy into a year-long cycle of blossoms, homestays, pear vinegar and farming workshops. During the 2026 pear-blossom season, Shichuan town drew over 1 million visitors; more than 85 percent of local households now earn from tourism-related work.

Conservation of the agricultural heritage is funded by the very revenue it helps generate. Heritage, in other words, is not the opposite of development. Handled well, it is the engine.

However, rural tourism depends on a delicate social compact. A village is a place to visit, but above all, a place to live: those who do not run guesthouses still breathe the noise, traffic and price vibrations. Outside capital brings markets but can leak profits; visitor cameras amplify praise and grievance alike. Whether tourism ends in co-creation or joint destruction depends on one central thing — fairness. Not simply equal splits of the ticket money, but proportionate voice and return. Villagers, as permanent stakeholders, must share both the benefit and the decision. Young returnees must find reasons to stay, as true wealth lies not in annual dividends but in accumulated skills, collaborative abilities and market insights — assets no external investor can take away.

Digital technology connects villages to broader markets and carries travel experiences farther. Short videos can take China's tea terraces to a screen in Lisbon; a visitor who keeps posting such videos, unknowingly becomes a narrator of China's story.

Scale, too, needs redesign. A single village has finite resources and reception capacity. For rural tourism to go further, villages must form a division of labor among themselves. For instance, Xidi, Xixinan and Nanxinan villages, in Anhui's Huangshan area, coordinate rather than compete on tourist resources. Xidi leans on cultural heritage, Xixinan on eco-art and Nanxinan on tofu cuisine and suburban leisure. They greet guests together at the high-speed train station. Xidi's "village partnership" model was showcased at the UN Tourism "Best Tourism Villages" 2025 annual conference and cited as a good-practice example. Neighboring places moved from poaching tourists to piping them to one another, from solo branding to shared brand.

The numbers give the trend its spine. China now has 19 villages on the UN Tourism "Best Tourism Villages" list — the most for any country — after the 2025 round added Digang in Zhejiang province, Huanggang in Guizhou province, Jikayi in Sichuan province and Dongluo in Jiangsu province.

Rural tourism, seen this way, is not a soft sidebar to China's development story. It is a hard case of how governance philosophy becomes lived income: protect the old tree, include the quiet villagers, let the visitor become a witness, let the neighboring village be an ally. The West often narrates rural revival as preservation versus progress. China's villages are suggesting a different equation — heritage as attraction, hospitality as diplomacy, and a single blossom season as a meeting point between the local and the global.

XU HONG AND HUANG CHENGKUN

From 'building villages' to 'developing villagers'

The country should combine investment in physical assets with investment in people to promote high-quality development of rural tourism

Xu Hong

Huang Chengkun

At the first meeting of the Central Commission for Financial and Economic Affairs under the 20th Communist Party of China Central Committee in May 2023, Xi Jinping, general secretary of the CPC Central Committee, stressed that "investment in physical assets should be closely integrated with investment in people".

The fourth plenary session of the 20th CPC Central Committee last October and the Central Economic Work Conference held at the end of 2025 made corresponding arrangements, while the outline of the 15th Five-Year Plan (2026-30) for national economic and social development further specified relevant tasks. The concept of "investing in people" represents a concrete application of the people-centered development philosophy in China's economic and social development in the new era.

As an essential component of Chinese modernization, rural vitalization is ultimately about the vitalization of people. In recent years, rural tourism has played an increasingly important role in promoting rural industrial integration, expanding channels for villagers' income growth, and unlocking the value of rural resources. However, it should also be recognized that rural tourism development should not be limited to "building attractions, upgrading spaces and attracting visitors". In some areas, villagers still have a limited role to play in decision-making, lack sufficient capacity to participate in tourism development and are weakly connected to the distribution of tourism benefits. Consequently, tourism development has not yet been fully aligned with the broader goal of improving the overall well-being and capabilities of rural residents. Achieving high-quality development of rural tourism requires closely combining investment in physical assets with investment in people.

First, rural tourism should shift from "building villages" to "developing villagers" by strengthening residents' capacity to participate in development. For a long time, some rural tourism initiatives have placed greater emphasis on external investment, infrastructure construction and landscape transformation, treating rural tourism simply as the process of "creating a tourism destination". Although roads have been improved, villages have become more attractive and tourist numbers have increased, local residents' capacity to participate in tourism industries, manage businesses and create value has not necessarily improved at the same pace. They are often involved only as land providers, low-skilled workers or service providers, becoming supporting actors rather than core participants in tourism development.

Sustainable rural tourism should enable local residents to become participants, operators and beneficiaries of tourism development. This requires not only continued investment in transportation, environmental improvement and public facilities, but also greater efforts to enhance villagers' entrepreneurial skills, service capabilities, market awareness and digital literacy. By helping residents develop modern tourism management skills in areas such as product design, brand marketing, customer service and e-commerce operations, rural residents can transform from passive recipients of tourism development into active creators of value.

Second, rural tourism should expand from "increasing economic income" to "improving quality of life", ensuring that local residents share the benefits of development. In the past, some regions focused primarily on attracting tourism projects and increasing consumption by visitors, while paying insufficient attention to the relationship between tourism development and villagers' everyday lives. As a result, some residents living in the tourism destinations have not been able to fully benefit from the growth of tourism.

High-quality rural tourism should integrate industrial development with community development by linking tourism initiatives with improvements in public services, living environments and cultural life. Tourism development can help upgrade rural infrastructure, improve living conditions and strengthen community cohesion through cultural activities. It can also create new opportunities to attract young people back to rural areas for entrepreneurship, transforming villages from simple tourism consumption spaces into places suitable for both living and working. At the same time, more effective benefit-sharing mechanisms should be established. Through the participation of village collective economic organizations, cooperative business models, and mechanisms such as equity participation based on local resources, tourism revenues can be distributed more equitably among residents. This can prevent tourism development from becoming a process that benefits only a small number of investors or operators.

Third, rural tourism should shift from "prioritizing investment in physical assets" to "empowering people", achieving coordinated progress between material development and human development. Physical construction alone provides only the "hardware" foundation for rural tourism. The capabilities, creativity and active participation of people ultimately determine the quality and sustainability of development. Therefore, rural tourism development requires an organic integration between investment in physical assets and investment in people. Infrastructure projects, digital platforms and tourism industries should be designed and implemented in ways that can better serve residents' development needs, allowing material investment to become a foundation for enhancing human capabilities and improving livelihoods. Meanwhile, by strengthening residents' abilities and encouraging their active participation, rural communities can further unlock the value of physical resources, enabling rural spaces, cultural heritage and tourism facilities to generate lasting vitality.

Over the 15th Five-Year Plan period, high-quality development of rural tourism requires a transition from simply investing in physical assets toward combining investment in physical assets with investment in people. Investment in physical assets provides the foundation for development, while investment in people stimulates endogenous vitality. Integrating industrial growth with human development is the essential path for rural tourism to become a sustainable force that advances rural revitalization and improves people's well-being.

Innovation boosts China's trade tempo

Industrial upgrades, robust supply chains create more choices for global consumers

By ZHONG NAN
zhongnan@chinadaily.com.cn

On the factory floor of Warsonco Intelligent Technology (Guangdong) Co in Dongguan, South China's Guangdong province, palletizing robots lifted cartons from conveyor belts and stacked them neatly onto pallets in late July, while engineers carried out routine performance checks before shipment.

Replacing labor-intensive manual handling, the palletizing robots can stack between eight and 12 cartons per minute. They can be programmed with up to 800 palletizing patterns and simultaneously handle two different product types, making them well suited for industries such as food processing, pharmaceuticals, consumer goods and printing.

The scene reflects a broader shift taking place across China's manufacturing sector, where artificial intelligence and automation are making industrial robots easier to deploy, operate and scale.

Xiao Fageng, the company's sales director, said as manufacturers worldwide face rising labor costs and growing demand for flexible production, Chinese robotics companies are increasingly developing AI-powered systems that lower technical barriers while expanding their presence in overseas markets.

Demand for the company's robots has been growing both in China and overseas. Its products are now sold in more than 50 countries and regions, and Warsonco expects total shipments to reach between 8,000 and 10,000 units this year, up about 60 percent from a year earlier, according to information released by Huangpu Customs in Guangdong.

Customs data showed China's industrial robot exports exceeded imports for the first time in 2025, making the country a net exporter of industrial robots. In the first half, China's industrial robot exports reached 6.29 billion yuan, up 18.6 percent year-on-year, with products shipped to 141 countries and regions.

Industrial robots are not the only high-end Chinese-made equipment riding the AI boom, as power infrastructure hardware has also seen surging global orders.

At a workshop of Jiangsu Yawei Transformer Co in Nantong, East China's Jiangsu province, workers were racing to complete large-capacity power transformers and dry-type distribution transformers destined for countries in the Middle East and Southeast Asia.

As power consumption per server rack at data centers has climbed from around 10 kilowatts to several hundred kWs — and in some cases even megawatt levels — reliable, high-capacity electricity supply has become critical. Once regarded as conventional grid equipment, transformers are becoming a cornerstone of AI infrastructure, said Li Luosheng, the company's manager for customs affairs.

"In the past, most of our exports were conventional transformer models," said Li. "Now, a growing proportion of our orders comes from AI data centers and overseas power grid upgrade projects, where customers place much higher demands on energy efficiency, reliability and delivery speed."

Jiangsu's exports of electrical equipment, including transformers, electrical control devices and wires and cables, reached 140.56 billion yuan in the first half of 2026, up 23.5 percent year-on-year, statistics from Nanjing Customs showed.

China's export mix has undergone a profound transformation over the past four decades. In the early years of reform and opening-up, labor-intensive products such as garments, furniture and household appliances helped Chinese manufacturers gain a foothold in global markets by leveraging competitive production costs.

With the country's industrial capabilities advancing, exports increasingly moved up the value chain, with higher-value and technology-intensive products taking a larger share.

Chen Bin, deputy director of the expert committee of the Beijing-based China Machinery Industry Federation, said the transformation has accelerated in recent years.

After electric vehicles, lithium batteries and photovoltaic products emerged as China's "new trio" of export growth drivers, a new wave of products — including industrial robots, commercial drones, 3D printers, artificial intelligence applications and innovative pharmaceuticals — is rapidly gaining global traction, said Chen.

Backed by a comprehensive industrial ecosystem, a deep engineering talent pool and sustained innovation, China's foreign trade is increasingly being driven by technological advancement rather than traditional cost advantages, he added.

The shift is already evident in China's latest trade figures. Alongside notable export growth in tech-intensive green products such as energy storage systems and electric-powered trucks, China's trade in hardware supporting computing power, including electronic components and computer parts, surged 56.6 percent year-on-year to 5.13 trillion yuan between January and June, data from the General Administration of Customs showed.

An aerial photo shows a bustling foreign trade container terminal with constant truck and vessel movements at Shanghai Port on July 14. LONG WEI / FOR CHINA DAILY

Customs officers from Ningbo Customs learn about the features and export demand for a new ice cream maker at a home appliance firm in Ningbo, Zhejiang province, on July 21. PROVIDED TO CHINA DAILY

Workers load trucks for export onto ships at Yantai Port in Shandong province on July 15. TANG KE / FOR CHINA DAILY

Wang Jun, the administration's vice-minister, said the country's AI-powered smart glasses, translation devices and robotic exoskeletons are among a growing range of intelligent products undergoing rapid innovation.

The rising contribution of these innovation-driven products has helped underpin China's broader trade growth. The country's foreign trade expanded 16.9 percent year-on-year to 25.47 trillion yuan in the first half, with imports growing faster than exports. Exports rose 13.4 percent, while imports climbed 22.1 percent, exceeding export growth by 8.7 percentage points, according to customs data.

Pushing back against the so-called "China Shock 2.0" narrative, which portrays China's development as a disruption to the global economy, Li Jiaying, an assistant researcher at Renmin University of China's Chongyang Institute for Financial Studies in Beijing, said China's export growth is increasingly driven by innovation rather than low-cost manufacturing.

The country's industrial upgrading has expanded global supply, improved production efficiency and created more choices for consumers and businesses worldwide.

"Rather than displacing other economies, China's technological progress strengthens global industrial and supply chains by delivering competitive products, accelerating innovation and supporting the worldwide green and digital transitions," she said.

Echoing that view, Ding Rijia, a professor of industrial economy at China University of Mining and Technology-Beijing, said that following Europe's energy shortage, demand for imported green equipment has risen sharply, while many developing economies are only beginning their energy transition, leaving substantial long-term demand unmet.

"China's export growth of technology-intensive and green products reflects its ability to respond to genuine global demand, with additional supply emerging because demand already exists," said Ding, adding the narrative that China's exports are driven by "overcapacity" and are undermining Western manufacturing is not supported by market realities.

That assessment is also reflected in the investment strategies of multinational companies operating in China. Stefan Floeck, ABB's division president of IEC Low Voltage Motors, said China will remain central to the Swedish-Swiss technology company's global motor business as the country's industrial upgrading and green transition continue to drive demand for more energy-efficient equipment.

"To capture these opportunities, we will continue investing in local research and development, manufacturing and supply chains to better serve Chinese customers while reinforcing China as an innovation hub and export base within the company's global network," said Floeck.

ABB's low-voltage motor business has invested more than 150 million yuan in recent years to upgrade its Shanghai manufacturing base, including research and development testing laboratories and production lines. Its domestic supply chain also supports exports from China to overseas markets.

Despite headwinds such as rising trade protectionism and persistent geopolitical uncertainties, China's exports are likely to remain resilient in the second half, said Wen Bin, chief economist at China Minsheng Bank. He attributed the outlook to the global AI investment cycle, the United States' relatively moderate tariff policy and measures to strengthen manufacturers' competitiveness.

Similar views were expressed by Lynn Song, chief economist for China at Dutch bank ING. "Exports have been one of China's primary growth engines in recent years, and this year's acceleration continues to beat expectations," he said.

"China's exports over the first half of the year already nearly match the levels seen through the first seven months of 2025, and the base case is for solid export growth to continue. Strong external demand remains one of the key pillars supporting China's industrial activity," said Song.

"It remains a key engine of growth for China and is likely to continue playing that role for the rest of the year," he said, while cautioning that potential new tariffs from the European Union and proposed US secondary sanctions related to Russian energy exports could pose risks to the country's export outlook.

Nation's shipbuilding edge runs deeper than shipyards

REPORTER'S LOG

By Zhong Nan

After covering China's shipbuilding industry for nearly a decade, I have recently noticed a new trend that is not immediately visible in global order books or production rankings.

Experts at the Beijing-based China Association of the National Shipbuilding Industry told me the industry's ecosystem is expanding beyond shipyards and traditional suppliers to include robotics, industrial software, artificial intelligence, advanced materials and clean-energy companies.

Modern shipbuilding has evolved far beyond assembling steel plates into a hull. Today it integrates millions of components and hundreds of mechanical, electrical and digital systems.

Nothing illustrates this transformation better than *Adora Magic City*, China's first domestically built large cruise ship constructed by China State Shipbuilding Corp in Shanghai.

Calling it simply a ship almost feels inadequate. It is, in many ways, a floating city. The vessel, which celebrated its maiden voyage on Jan 1, 2024, contains roughly 25 million individual parts, 107 integrated systems, 55,000 pieces of equipment and 4,750 kilometers of electrical cables, according to its builder.

What impressed me most was not simply its scale, but the way the project had to be organized. The vessel was constructed in sections before its major blocks were joined together. Electrical cabinets, piping units, cabins and interior spaces were prefabricated in workshops and later installed like pieces of a giant puzzle.

Walking through a shipyard in Dalian, Liaoning province, it became clear why robotics and digital technologies are finding a place alongside traditional manufacturing. Welding robots can work in narrow or hazardous spaces and help shipyards improve precision and productivity. Machine-vision systems can detect welding defects, while digital platforms can coordinate design, procurement, production and delivery.

Technology alone, however, is not enough. Behind every intelligent shipyard are experienced engineers, skilled workers and decades of industrial know-how. Shipbuilding remains a business where expertise is built over generations rather than acquired overnight.

During previous industry downturns, many countries lost experienced workers as shipyards cut capacity or closed. Once those skills and production knowledge disappeared, they proved difficult to rebuild without losing valuable time or knowledge.

Chinese shipyards took a different approach. Even during difficult years, major builders continued training engineers and skilled workers, investing in research and improving construction techniques.

Universities in Shanghai, Harbin, Heilongjiang province, and Wuhan, Hubei province, also maintained shipbuilding and marine engineering programs when many regarded them as offering limited career prospects. Some expanded into new maritime specialties.

When global demand recovered, Chinese shipyards already had the people needed to handle sophisticated projects. This long-term investment also explains why China's shipbuilding success cannot simply be attributed to subsidies.

Financial support, including subsidies, may help companies weather downturns or purchase equipment, but it cannot train welders, develop naval architects or rebuild supplier relationships overnight. If money is not an issue, many governments could rebuild their shipbuilding industries simply by having their finance ministries write ever larger checks. In reality, rebuilding an industrial system takes years, often decades.

The answer lies in the industrial ecosystem behind China's shipbuilding success. Building a large vessel requires hundreds of suppliers, ranging from steelmakers and engine manufacturers to cable producers, software developers, equipment makers and interior specialists. The absence of any critical supplier can delay an entire project.

Some countries still have shipyards and dry docks, but many no longer have the dense supplier networks that once surrounded them. A shipyard may be able to build a hull, but delivering a vessel requires the coordinated support of suppliers across the entire industrial chain.

As robotics, AI, batteries, alternative fuels, advanced materials and industrial software become more deeply integrated into shipbuilding, China's shipbuilding sector is evolving into a testing ground for advanced manufacturing. Increasingly, each new vessel serves as a platform where advanced manufacturing technologies are developed, tested and applied at scale.

Chinese AI strengthening economic resilience

EAGLE EYE
By Fu Minjie

ILLUSTRATION GENERATED BY AI

The technological and pricing shock brought by Kimi k3 to the large-language model ecosystem continues to reverberate through capital markets, with some US media outlets even describing it as a "DeepSeek Moment 2.0". It is widely believed within the industry that the six-to-12-month innovation gap between China and the United States in large models has been largely closed. Although product iteration may lead to periodic fluctuations in specific technical indicators, China's artificial intelligence innovation has remained among the global leading group, with its overall capabilities comparable to those of any leading AI power.

However, China's AI progress should not be assessed only by isolated benchmark scores. Its distinctive path lies in broader technological coverage, richer application scenarios and stronger empowerment of the macroeconomy. By extending AI across industries and into the real economy, China is reinforcing economic resilience and improving development quality across multiple dimensions.

The recent 2026 World Artificial Intelligence Conference, held in Shanghai, offers a vivid demonstration of China's broad-based AI innovation. With three major venues — Expo, Zhangjiang and West Bund — the exhibition covered more than 100,000 square meters and brought together over 1,100 domestic and foreign enterprises. More than 3,000 cutting-edge achievements were on display, with over 300 hard-tech products making their global debuts or industry premieres. These exhibits covered the full industrial chain, from chips and foundation models to intelligent robots and terminal devices, presenting a comprehensive picture of AI and the emerging intelligent society.

US economists originally defined AI as a technological revolution mainly in the services sector and as an extension of the internet services revolution, which led to relatively concentrated innovation tracks, limited technological penetration and expectations that the main impact would fall on mid and low-skilled white-collar workers. Yet China's AI practice has already moved beyond this early assessment, building a complete innovation chain that covers computing power, infrastructure, general-purpose large models and intelligent applications.

More importantly, China is accelerating AI's movement from the digital world to the physical world. The speed of this transition and the richness of application scenarios both rank among the highest globally. Coordinated innovation across industries and scenarios is reshaping global understanding of AI's application scope, innovation breadth and social significance. Meanwhile, diverse application scenarios can improve enterprises' digital foundations and technological adaptability, lower cross-sector innovation expenses, strengthen synergies among different fields, and continuously raise industrial technological capacity and total factor productivity.

China's technological innovation has always been anchored in the real economy, with the high-end transformation of manufacturing as its core direction. The recommendations for the 15th Five-Year Plan (2026-30) period make clear that China should build a modern industrial system supported by advanced manufacturing and accelerate high-level technological self-reliance. This requires sustained efforts to strengthen foundational manufacturing technologies, address weaknesses in basic industrial capabilities, upgrade traditional manufacturing, expand emerging manufacturing sectors and make forward-looking arrangements for future manufacturing. Taken together, these efforts are expected to systematically enhance manufacturing capacity and strengthen the ability to respond to risks.

Unlike the US path, which places greater emphasis on AI applications in service-sector innovation and substitution, China's AI development focuses more on connecting with the physical world and deeply integrating with real industries. Its core effort is to empower advanced manufacturing and connect the entire manufacturing chain. Relying on 520,000 industrial enterprises above designated size, 39 major industrial categories and 191 medium industrial classifications, China's complete industrial system can fully unleash AI's value as a general-purpose technology, accelerating full-domain penetration and forming a virtuous cycle of technological iteration and efficiency gains.

Practical cases are already abundant. Sinopec's "Fenghuo" industrial intelligence agent integrates more than 1 billion pieces of industry expert knowledge and achieves four-layer technological coupling across platform, model, digital twin and intelligent agent, helping reduce energy consumption per unit of output. Zhenhua Heavy Industries' welding defect recognition model has achieved an accuracy rate of over 98 percent, replicating the practical experience and image-recognition logic of senior craftspeople, making it a benchmark for "AI + manufacturing". Waigaoqiao Shipbuilding uses AI to streamline shipowner compliance verification, while Shanghai Turbine Works relies on intelligent algorithms to control blade production parameters more precisely. These examples show how AI is being embedded in large manufacturing enterprises.

At the policy level, the 15th Five-Year industrial internet action plan proposes that by 2028, the penetration rate of industrial internet platforms should exceed 55 percent and the total number of connected devices should surpass 120 million. The aim is to build a new-generation industrial internet ecosystem featuring ubiquitous connectivity, digital-intelligent integration, deep collaboration and open-source openness, thereby providing long-term support for the intelligent upgrading of the whole manufacturing chain.

China's AI ecosystem also contributes to global development by providing inclusive intelligent public goods.

Cost-effective open-source models are already benefiting global markets. Leading Chinese large models generally follow open-source and open-weight strategies, featuring intensive and efficient research and development models and low deployment costs. Their usage prices are only about one-tenth of comparable overseas products. Grounded in the principles of peaceful development and serving the people, these technologies provide affordable and easily deployable AI tools for developing countries. In essence, their low-cost model is strongly inclusive and has accelerated the global diffusion of large-model technologies.

Industry estimates show that Chinese open-source and open-weight large models are priced 60 to 90 percent lower than similar US products from OpenAI and Anthropic, while still covering most routine office and production needs. Their cost-performance advantage has made them popular among global tech start-ups, especially enterprises and consumers in developing countries and the Global South. Data show that US companies' use of Chinese AI models, measured by token share, averaged more than 30 percent per week and peaked at 46 percent.

Beyond market access, China is also actively supplying global AI public goods and promoting collaborative governance. China's AI development path balances industrial application with public value and actively participates in global AI governance. Following President Xi Jinping's proposal of the Global AI Governance Initiative, China has continued to position itself as a provider of international public goods in the AI field. It has released the AI Capacity-Building Action Plan for Good and for All and the "AI Plus" International Cooperation Initiative, while advocating for the establishment of a World Artificial Intelligence Cooperation Organization.

Inclusive measures are also being implemented globally. China has announced the construction of an international AI application cooperation center, promoted the wider deployment of the MAZU intelligent meteorological early warning solution in more countries, and offered 5,000 specialized AI training opportunities for developing nations. These efforts help AI technologies take root more quickly across countries, improve production and public services and strengthen developing countries' ability to manage natural disaster risks.

Ultimately, general-purpose AI can help countries address gaps in industry and scientific research, thereby strengthening overall economic resilience. This is an important expression of AI's general-purpose capability and a core value of China's AI development. Meanwhile, China is improving AI-related laws, regulations and supervisory systems, using both legal constraints and technical controls to prevent potential risks and ensure that AI always serves humanity and remains under human control.

More patient policy framework for China's economy

MAIN STREET
By Luo Zhiheng

China's economy can no longer be described simply as either strong or weak. Its defining characteristic is a structural transition accompanied by growing divergence, often described as K-shaped recovery. New growth drivers — such as artificial intelligence and advanced manufacturing — are gradually replacing traditional engines, including real estate and infrastructure. Against this backdrop, two trends stand out.

First, overall economic growth remains under pressure, as the property downturn continues to weigh on related sectors, including home appliances, furniture, ferrous metals and machinery, while also weakening local finances and local governments' capacity to support growth.

Second, economic divergence has become increasingly pronounced, as indicated by widening gaps between supply and demand, across industries, among income groups and between regions. This has created a gap between official macroeconomic indicators and the actual economic experience of households and businesses.

Over the medium and long term, China's economy has followed an L-shaped path. The slowdown began around 2010 when the country entered a period of growth deceleration and transition from old to new growth drivers. GDP growth fell from 10.6 percent in 2010 to 5 percent in 2025, more than halving in just 15 years. This year, growth has moved into the 4.5-5.0 percent range, marking the beginning of what may be called an era of "around 4 percent growth". Japan stayed in the 4-5 percent range for about two decades before slowing further, but by then its per capita GDP had reached around $30,000 and its social security system was relatively mature. China's per capita GDP remains below $14,000, making it essential to settle into a stable medium-growth range of 4-5 percent during the 15th Five-Year Plan (2026-30) period.

Each year, the economy has exhibited a U-shaped rhythm: a strong first quarter, pressure in the second, policy support in the third and a year-end lift in the fourth. After the September 2024 policy package, fourth-quarter growth reached 5.4 percent, following 5.3 percent, 4.7 percent and 4.6 percent showings in the first three quarters. This pattern reflects two underlying features: the economy remains highly dependent on policy support, while self-sustaining growth momentum is still weak and the vitality of households, businesses and local governments has yet to be fully restored.

The strong first-quarter performance is largely the result of policy-driven economic mobilization. After the Central Economic Work Conference sets annual priorities, fiscal and monetary policies are often front-loaded, and local governments accelerate projects and resource allocation, pushing construction and investment activity to a high level. By the second quarter, policy momentum naturally moderates, putting pressure on growth. This year, combined spending under the general public budget and government-managed funds rose 6.1 percent year-on-year in January-February, but fell to minus 0.3 percent in January-May, partly reflecting a limited pipeline of shovel-ready projects. The consumer goods trade-in program also boosted home appliance consumption with double-digit growth, but base effects and demand front-loading later became more evident.

Self-sustaining momentum remains weak. Falling property values have encouraged households to reduce debt, with the household leverage ratio edging down from 60.5 percent to 59 percent as many repaid mortgages early. Enterprises face weak demand, pressure along the property supply chain and low capacity utilization. Local governments' land sale revenue fell from 8.5 trillion yuan ($1.25 trillion) in 2021 to 4.2 trillion yuan last year, and declined another 28.7 percent year-on-year in the first five months of 2026, weakening their capacity and willingness to promote growth. Weaker local finances have also affected payments to firms and public services, further impeding household consumption. Government spending under the two budgets dropped from 30.6 percent of GDP in 2021 to 28.6 percent last year, meaning that 2-3 trillion yuan less flowed into the economy as income for enterprises and households.

Growth in the next stage will hinge on the performance of real estate and exports. AI-related products now account for about one fifth of China's export value and roughly half of export growth, making overall export outlook increasingly linked to AI development. Real estate is likely to remain a drag, while AI-supported exports may provide upward support, with a lower base also improving headline data.

The property downturn persists and three issues must be addressed. First, prices remain unstable. Although secondhand home prices in first-tier cities have risen for three consecutive months, national prices, sales and investment are still falling. In smaller cities, some inventory may become permanent as populations decline and outflows continue. Pressure comes from developers' cash-flow constraints, new-home discounts, higher-quality and "fourth-generation" housing products, and rising foreclosure sales. Second, a self-sustaining stabilization process has yet to take hold in the real estate sector. Local governments alone cannot break the cycle of property adjustments, falling fiscal revenue and weakened stabilization capacity. Therefore, central government support is needed to fill fiscal gaps. Third, fiscal pressure in some cities continues to worsen supply-demand conditions, as land supply increases despite high inventory. Stabilization therefore requires both supply control and demand support, backed by stronger transfer payments.

Rules regulate juveniles' liability

New measures standardize handling of cases involving suspects aged 12 to 14

By CAO YIN
caoyin@chinadaily.com.cn

China has introduced stricter and clearer rules for handling serious crimes committed by younger offenders, as part of broader efforts to curb violent crime while safeguarding the rights of juveniles.

The measures are outlined in a recent 15-article regulation jointly issued by the Supreme People's Procuratorate and the Ministry of Public Security. The regulation provides detailed guidance for implementing provisions of the amended Criminal Law, which took effect on March 1, 2021.

Under the amended law, the age of criminal responsibility in China is generally 16. However, minors aged 14 to 16 can be held criminally liable for serious violent offenses, including intentional homicide, intentional injury, rape and robbery.

Children aged 12 to 14 may also face criminal liability if they commit intentional homicide or intentionally inflict injuries that result in death or severe disability through extremely cruel means, with prosecution requiring approval from the SPP.

The regulation standardizes procedures for handling cases involving suspects aged 12 to 14 accused of such violent crimes and establishes clear criteria for prosecution.

Public security authorities must transfer such cases to the local procuratorate, which is required to investigate not only the suspect's age and details of the offense but also the individual's upbringing, family background, personality, social relationships, motives and conduct after the crime.

The findings must then be submitted to the SPP for final approval. During the review process, police may place the minor suspect in criminal detention in accordance with the law.

The regulation also specifies that determining whether a case is "heinous" should take into account factors such as the cause, motive, method, target and consequences of the crime, as well as the suspect's potential danger, likelihood of reoffending and broader social impact. In cases involving multiple suspects, each individual's role and level of participation must be assessed separately to determine whether the criteria are met.

To better protect the rights of minors, the regulation requires a suspect's legal guardian to be present during questioning and to be informed of the minor's legal rights. If the guardian is unable to attend or is also a suspect, investigators should notify another adult relative, the suspect's school or employer or a local community organization to participate.

Tian Yingjun, a lawyer from Yunnan province, said the regulation further improves China's legal framework for handling serious violent crimes committed by young minors by providing clear procedural guidance.

"The rigorous procedural design and comprehensive review requirements reflect China's cautious approach to protecting minors' rights while balancing punishment and rehabilitation," he said.

In recent years, China has strengthened measures to prevent and address juvenile delinquency while maintaining a zero-tolerance approach to crimes against minors.

According to the SPP's annual work report released in March, 24 minors aged 12 to 14 were prosecuted for serious violent crimes in 2025, underscoring the need to punish particularly heinous offenses. The Supreme People's Court reported that 2,356 juveniles convicted of serious violent crimes received prison sentences of more than five years in 2025, while 5,822 juveniles who committed relatively minor offenses received lenient treatment.

The report also said efforts are underway to strengthen the development of specialized schools and improve a graded intervention and rehabilitation system for minors engaging in misconduct as part of broader judicial measures to address juvenile delinquency.

Young Chinese embrace task of 're-raising' parents

By ZOU SHUO
zoushuo@chinadaily.com.cn

In a reversal of traditional family roles, a growing number of young Chinese people are taking on the task of "re-raising" their parents — teaching them digital skills, purchasing their health supplements, planning holidays and even escorting them to concerts — all in a bid to help them navigate a fast-changing world.

The trend, which has gained traction on social media under the hashtag "I re-raised my parents after growing up", has drawn widespread attention for redefining filial piety from passive duty to active, creative care.

At the heart of the trend is a widening digital divide. While older generations grew up in a relatively stable world, their children came of age in an era of smartphones, livestreaming and algorithm-driven recommendations.

As a result, young people often have a clear advantage in accessing information and navigating online services — skills that many parents have yet to master.

For many, re-raising begins with small but meaningful acts.

Hang Yunjie, an 18-year-old freshman at Beijing University of Chemical Technology, discovered the gap when he decided to buy fish oil for his father and reading glasses for his mother.

His parents had long relied on television advertisements or pharmacy recommendations when purchasing health supplements. Hang instead consulted online review forums and comparison blogs before making his purchases.

"My father admitted that my choice was better than his usual brand, but he still expects me to handle everything next time," Hang said. "He doesn't want to learn how to find the information himself."

Helping parents adapt to the digital age means encouraging them to recognize that some of their knowledge and habits have become outdated, he said.

"I managed to convince him that his old brand was inferior, but I failed to spark his curiosity about the digital world."

For Xu Yu, a 31-year-old office worker in Beijing, the most meaningful change came after buying his parents new smartphones and teaching them how to use food delivery apps.

"They used to come home exhausted from work and still had to cook. Now they can order whatever they want," he said.

He patiently guided them through registration, logging in, setting delivery addresses, choosing payment methods and adding notes for special requests.

"When I was a child, they worried about my meals. Now I want to make their lives easier."

Some young people are also helping their parents enjoy experiences they might never have pursued on their own.

Zhang Anning, a 22-year-old postgraduate student in Beijing, began her re-raising journey after realizing that her parents would never take the initiative to travel.

Inspired by trips she had taken with friends, she started planning holidays for them, from renting a car in Guizhou province so her father could drive to see blooming azaleas to booking sea-view rooms in Hainan province.

"I want them to experience the joy of traveling, just as they made sure I enjoyed my childhood," she said.

Zhang also serves as the family's photographer, using film cameras to document their trips.

"When I was little, they recorded my growth. Now it's my turn to record their travels and preserve these treasured memories."

> Conventional filial piety is about repaying a debt — they raised me, so I accompany them in old age. But going to concerts with my mother comes from genuine love because we have a close relationship."
>
> **Yu Tianxin,** a 19-year-old freshman at Beijing Foreign Studies University

Yu Tianxin, a 19-year-old freshman at Beijing Foreign Studies University, took an even more hands-on role by accompanying her mother to three concerts by pop singer Zhang Jie, arranging everything from tickets to hotel reservations.

Her most memorable moment came when her mother went to the restroom without her phone, forgot their seat numbers and wandered around the arena calling out Yu's name.

After concert personnel directed her mother to the general floor area, Yu eventually spotted her and, as she put it, "reeled her back" to her seat.

"It was exhausting, but also deeply satisfying," Yu said. "My mother was overjoyed. She had always wanted to see Zhang Jie, and spending that time together brought us much closer."

Yu distinguishes her actions from the traditional understanding of filial piety.

"Conventional filial piety is about repaying a debt — they raised me, so I accompany them in old age," she said. "But going to concerts with my mother comes from genuine love because we have a close relationship."

She has also stepped in to protect her parents from online scams.

When her father was about to spend 30,000 yuan ($4,400) on a fake antique promoted during a livestream, Yu uninstalled the shopping app from his phone and linked the account to her own device, preventing him from logging back in.

"He scolded me for three days, but I still think it was worth it," she said. "Both my parents are trapped by outdated perceptions. Sometimes I have to pull them into the present."

Yao Huasong, a sociology professor at Guangzhou University, views the trend as a positive evolution in intergenerational relationships.

In an article published by China Youth Daily, Yao said the phenomenon rests on three conditions: young people's stronger digital and information literacy, their willingness to invest time and patience in communicating with their parents, and parents' growing readiness to set aside traditional authority and engage in more equal dialogue.

Generational differences are inevitable, he wrote, but what matters most is how both sides respond to them.

He cited practical examples such as making regular video calls, ordering groceries online, arranging health check-ups and taking occasional family trips as meaningful expressions of "home-making".

"This represents a new interpretation of the traditional idea of raising children for support in old age," Yao wrote. "It deserves recognition and encouragement."

Abandoned coal mine cools homes in Jiangsu

By CHEN MEILING
chenmeiling@chinadaily.com.cn

This summer, 96 households in Xuzhou, Jiangsu province, have abandoned noisy air conditioners in favor of an innovative floor cooling system that provides comfortable temperatures, stable humidity and near-silent operation.

The system circulates naturally cool underground mine water through pipelines installed beneath the floor, creating radiant cooling throughout homes. Compared with conventional air conditioning, it consumes less energy and costs residents significantly less.

At the end of July, with outdoor temperatures in Xuzhou reaching about 36 C at noon, Wang Qingmei, 76, was observed at home cooking in comfort. A wall-mounted thermometer displayed an indoor temperature of 26 C.

"The floor is pleasantly cool, just the right temperature. It feels best to walk on it barefoot," she said.

Mine water is pumped to a heat exchange station, where a heat exchanger stabilizes the circulating water temperature in the pipeline network at between 20 C and 25 C before it is distributed to homes.

For Wang, the savings are substantial. In previous summers, running air conditioners to keep herself and her husband cool cost about 400 yuan ($59) a month for electricity. If the air conditioner stayed on for too long, her husband's neck would ache. If they turned it off, it became too hot to sleep.

Under the new system, residents pay 4 yuan per square meter for the entire cooling season. For Wang's home, a four-month cooling period costs about 410 yuan while maintaining a comfortable temperature around the clock.

"It's both quiet and comfortable," she said, adding that many neighbors have visited to experience the system and plan to use it next year.

What makes the project even more remarkable is that the cooling source comes from an abandoned coal mine that was once considered an environmental and financial burden.

After the Woniu Mountain coal mine was shut down, its mined-out voids gradually filled with groundwater, forming a vast underground cold-water reservoir. For years, the abandoned mine generated ongoing costs for safety monitoring and ecological restoration without creating economic value.

The turning point came when researchers from Xuzhou Coal Mining Group, which owns the mine, discovered that the mine water remains at a stable temperature of between 15 C and 20 C throughout the year and is available in abundant quantities.

The constant temperature makes the resource suitable for both winter heating and summer cooling. Heat can be extracted from the water during winter, while the naturally cool water provides cooling during summer.

The project also benefits from Xuzhou's existing infrastructure. The city operates Jiangsu's only large-scale centralized heating pipeline network, which can circulate hot water in winter and switch to cold water in summer, allowing dual-purpose use without installing an additional pipeline system.

"As a traditional industrial city, Xuzhou has many closed coal mines whose stored water is like a giant green charger, transforming abandoned resources into low-carbon energy carriers," said Zhang Tao, who oversees scientific research projects at Jiangsu Xukuang Thermal Power Co, a subsidiary of Xuzhou Coal Mining Group.

According to Zhang, surveys show strong public acceptance of centralized heating and cooling services, indicating solid market demand.

He added that the city's heating season lasts only about 110 days, from November to March. Extending infrastructure use with a 120-day cooling season from June to September can significantly improve utilization efficiency and asset returns.

The project's biggest technical challenge is Xuzhou's humid summer climate. Condensation can form on low-temperature pipelines and indoor surfaces, particularly in bathrooms and other high-humidity areas. Opening windows allows moist outdoor air inside, making condensation more likely on metal fixtures and tiled surfaces.

To solve the problem, the company partnered with Yunlong Lake Laboratory of Deep Underground Science and Engineering to develop a dedicated water-cooled dehumidifier that maintains indoor humidity at around 50 percent, a level considered comfortable for occupants.

The company is currently installing the dehumidifiers in residents' homes free of charge this year. The first group of users also received free cooling services from June 1 to July 31 and began paying for the service from Aug 1 to Sept 30.

The environmental benefits are equally significant, Zhang said.

According to the company's data, the system reduces energy consumption by about 50 percent compared with conventional air conditioners and cuts annual carbon dioxide emissions by approximately 50 metric tons.

Unlike air conditioners, which rely on air-to-air heat exchange and gradually lose efficiency because of heat waves, dust, willow catkins and restricted airflow through outdoor units, the floor cooling system uses liquid-to-liquid heat exchange, maintaining high efficiency with minimal performance degradation.

Conventional air conditioners also discharge heat into the atmosphere, contributing to the urban heat island effect. In contrast, the floor cooling system transfers heat back underground through mine water, achieving virtually zero atmospheric heat exchange, Zhang said.

The company plans to collect operational data after the cooling season ends before deciding on a broader rollout. It is also experimenting with using mine water for winter heating. Previously, the city's centralized heating relied on hot water supplied by power plants.

Zhang said a researcher from the United Kingdom visited to inspect the project and expressed strong interest in introducing the technology to a British town.

Although mine-water-based heating and cooling systems have been introduced elsewhere in China, they have all been installed in newly built residential communities. The Xuzhou project is the first to retrofit an existing residential community with the technology.

"It unlocks the energy potential of billions of existing buildings for the low-carbon transition, providing a replicable model for resource-exhausted cities across the country," Zhang said.

Guo Jun in Nanjing contributed to this story.

Remote prefecture turns excess solar into big data

Qinghai leverages cool climate, legal frameworks and massive solar output to create low-cost green computing hub

By LI MENGHAN
in Gonghe, Qinghai
limenghan@chinadaily.com.cn

On the windswept Talatan plain in Northwest China's Qinghai province, thousands of sheep graze beneath vast canopies of cobalt solar panels. For a decade, this fusion of pastoral agriculture and renewable energy turned a barren highland desert into an ecological success story. Today, however, regional authorities face a far more complex structural challenge: what to do with an overwhelming surge of green power that far outpaces local demand.

In response, Hainan Tibetan autonomous prefecture is executing a major strategic pivot, leveraging its massive energy surplus to transform from a simple power exporter into a high-altitude big data hub.

Local authorities have approved a 93-hectare green computing industry park in Chabcha town, the administrative seat of Gonghe county. The development has already secured 17 major projects representing 16.2 billion yuan ($2.3 billion) in total planned investment. The project is designed to process data for computing-intensive industries along China's populous eastern seaboard, including artificial intelligence model training, autonomous driving simulation and financial technology back-office operations.

The initiative directly addresses a severe economic imbalance. Last year, Hainan prefecture's clean-energy installations generated 47.7 billion kilowatt-hours of electricity, yet local industrial and domestic consumption absorbed just 1.7 billion kWh — less than 4 percent of the total output. While ultra-high voltage transmission lines export a significant portion of this surplus across eastern provinces, grid constraints and line capacity limits during peak production hours continue to pose long-term curtailment risks.

"We are turning watts into bits," said Ma Xianping, deputy director of the Hainan Prefecture Data Bureau, describing the strategy to consume excess energy locally rather than relying exclusively on long-distance transmission infrastructure.

Chabcha town has natural advantages for developing data centers. With an average temperature of 4 C, the town enables fresh-air cooling for 330 days a year, reducing cooling costs — which typically account for nearly 40 percent of a facility's power consumption — by an estimated 30 percent and shortening payback periods by around two years. Additionally, the thin, dust-free highland air reduces particulate buildup on server components, extending hardware lifespans.

These conditions, Ma said, make green computing a natural fit.

Clean energy makes up 97.26 percent of the park's power supply, with a power usage effectiveness of about 1.1 — well below the national average of 1.35. Electricity costs of around 0.42 yuan per kWh are among the lowest in China.

Clockwise from top: A concentrated solar power plant, with a molten salt tower at the center and heliostats around, is part of the Talatan Photovoltaic Park in Gonghe county, Qinghai province. LI XIAOGANG / FOR CHINA DAILY Sheep graze under photovoltaic panels in Talatan in July 2023. FENG LI / FOR CHINA DAILY Workers inspect panels at the industrial park in March last year. ZHANG ZHONGPING / FOR CHINA DAILY

Pastoral power

The digital expansion is being powered by the Talatan Photovoltaic Park, planned to cover 609 square kilometers on the plain. It is one of China's major gigawatt-level solar hubs and was certified in the Guinness World Records as the world's largest installed-capacity photovoltaic power generation. The green transformation is anchored in decades of ecological restoration efforts and rural livelihood gains, underpinned by legislative support.

Across Hainan prefecture, clean energy capacity has reached 36.58 million kW — 46 percent of the province's total — with cumulative investment of 180 billion yuan, and 68 major photovoltaic enterprises operating across the region.

The prefecture takes its name from its location south of Qinghai Lake. The Yellow River runs 411 kilometers through its five counties, while the headwaters of the Yangtze and Lancang rivers also originate in the broader Qinghai highland, making the region one of China's most ecologically consequential landscapes and one where the stakes of any industrial development are unusually high.

"With just one storm a year, from spring to winter's end; stones roll with the wind, and nothing will grow," said An Fengjun, deputy director of the prefecture's development and reform commission, reciting a local proverb. He said this used to be the stark reality of Talatan — roads swallowed by endless dunes, making every step a struggle.

The turnaround began in 2012, when construction of the photovoltaic park began. Local authorities realized the latent value of what had long been dismissed as wasteland. While facing severe desertification, Talatan offered nearly 3,000 hours of annual sunshine and vast stretches of flat, unused land — ideal conditions for utility-scale photovoltaics.

"What surprised us most was how quickly the land responded," An said. "The panels acted as windbreaks, cutting near-ground wind speeds by around half. Their shade reduced evaporation by about 30 percent, and rainwater together with panel-cleaning runoff seeped down along the supports, irrigating the soil."

An said that the ecological transformation came as an unexpected dividend. Within just a few years, vegetation cover, once negligible, recovered to more than 80 percent across the park. "On my way here this morning, I saw a hare darting across the road, and you can see foxes and even birds that had never been spotted here before," he said.

The lush growth, however, created a new problem: tall grass shading the panels and reducing power output, while dried winter grass raised wildfire risks. Manual clearing cost over 4 million yuan annually across the park before the arrival of what locals now call "photovoltaic sheep".

"The sheep eat the grass, and their manure fertilizes the soil, forming a virtuous cycle. Companies no longer spend huge sums on grass cutting, and herders get free pasture. It's a win for ecology, production and livelihoods," An said.

The park operates 14 photovoltaic pastures where more than 20,000 sheep graze from June through October under a scientifically managed rotation system. Panels are raised to around 1.5 meters and spaced wider to accommodate the herds. Surplus grass that the sheep cannot consume is given free to surrounding villages as winter fodder.

Zhou Jia, a deputy to the agriculture and environmental resources committee of the prefecture's people's congress, said the benefits extend beyond the fenced perimeter of Talatan. Given the plain's exceptional solar conditions, all five counties of Hainan prefecture have consolidated their village-level photovoltaic capacity — 50.5 megawatts shared across 173 villages.

"The model supports poverty alleviation," Zhou said, adding that village-level photovoltaic stations generated 32.78 million yuan in revenue in the first half of the year, averaging 189,500 yuan per village. Additionally, the stations fund 1,566 public welfare positions with monthly stipends of around 1,000 yuan.

Legal outreach

The transformation rests on a multitiered legal architecture.

At the national level, the Law on Prevention and Control of Desertification was adopted in 2001 and amended in 2023. Drawn from lessons learned in local practices, the Ecological and Environmental Code, which will take effect on Aug 15, stipulates that operators of photovoltaic projects and other commercial activities in desertified areas must implement measures to curb sand expansion. These laws have laid the groundwork for what has become the defining feature of Talatan — using photovoltaic installations as a tool for sand stabilization.

Zhou also pointed to the law on ecological protection of the Qinghai-Xizang Plateau, which came into force on Sept 1, 2023, giving statutory backing to the integrated clean-energy approach the prefecture has pioneered.

The law stipulates that the country supports building a clean-energy system dominated by sources including wind, solar, hydro, hydro-solar hybrid and geothermal across the plateau, while advancing green, low-carbon energy transitions. That provision codifies the plateau model of integrated renewable development that Hainan had been testing on the ground for more than a decade.

The Hainan model is anchored in the pairing of solar with the river. The Longyangxia Hydropower Station in the prefecture — known as the "first dam on the Yellow River" — is the backbone for China's first hydro-solar complementary system. The 850-megawatt Talatan Photovoltaic Park feeds its output into Longyangxia, with the two working as a single dispatchable unit.

"During the day, as solar output rises, hydropower dials back and water is stored. At night, the dam takes over, switching between sources within milliseconds," An said, noting that the hybrid model earned a Guinness World Record in 2022 as the world's largest water-solar complementary power station, and has since expanded past one gigawatt.

Building on these national and provincial legal frameworks, the prefecture's people's congress spent more than a year drafting its own regulation on promoting the development of the clean energy industry. The 34-article regulation, which will take effect on Sept 1, addresses grid integration bottlenecks, pricing mechanisms, storage infrastructure gaps and administrative procedures.

"Through legislation, clean energy development will become more standardized," said Ning Jianming, a deputy of the finance and economic affairs committee of the prefecture's people's congress. The drafting process began in 2024 with enterprise consultations, expert reviews and field investigations.

The regulation enshrines ecological protection as a nonnegotiable bottom line and mandates a recycling system for retired solar panels — a forward-looking provision given that the park's oldest arrays, installed around 2013, will approach their 25-year design life within a decade.

Ning said that the regulation is designed to align with those higher-level frameworks, turning policy guidance into tangible rules.

Zhou said that as legal outreach work continues, environmental stewardship has taken root in people's hearts. "The father protects the land, and the son inherits the benefit — that awareness is now deep in the bone," he said.

Rural vitalization law drives Datong's success

By LI MENGHAN in Xining

A plateau county in Xining, Qinghai province, has placed its yak products in 3,500 retail outlets nationwide while keeping livestock herds within ecological protection limits, supported by China's first county-level legislation on the vitalization of rural industry.

Datong Hui and Tu autonomous county is home to China's largest yak breeding base — the Qinghai Yak Breeding and Promotion Service Center — which spans more than 247 hectares and manages over 300 breeding bulls across all yak breeds found in Qinghai.

Hu Guangwei, deputy director of the center, said the Datong yak — introduced by the center in 2004 as China's first artificially bred yak variety — was developed over two decades through crossbreeding wild and domestic yaks.

"The offspring of the Datong yak are roughly 1.2 times heavier than ordinary domestic yaks, with some adult males reaching over 600 kilograms," Hu said, highlighting its potential to transform yak farming and boost herder incomes across Qinghai.

That potential is being realized at the county level. Li Cunde, deputy head of Datong's veterinary station, said that the county has promoted artificial insemination techniques for Datong yaks among local farming households, and this year alone has contributed to the upgrading of 3,700 head across 69 households.

"The Datong yak has a half wild yak bloodline, giving it strong adaptability to high-altitude, cold environments," Li said, adding that the calves grow faster than other Qinghai plateau breeds.

Li said that the county is home to 123,700 Datong yaks, accounting for 51 percent of the total cattle population, with annual sales of 38,000 head and a meat output of 5,600 metric tons. To bring these gains to herders, the county has been training farmers in artificial insemination and scientific breeding techniques.

"We shifted from traditional extensive grazing to standardized scientific breeding. Through winter-spring supplementary feeding and full-calf nursing, the growth cycle has been shortened by about half a year, and each Datong yak now brings herders an additional 2,000 yuan ($295) or more," Li said.

Three standardized slaughter facilities in the county process up to 60,000 head per year. Products carry traceability QR codes and are sold at major supermarket chains such as Metro and Sam's Club, he added.

Veterinary workers vaccinate yaks in Datong, Qinghai province, in April. PROVIDED TO CHINA DAILY

Li said that industrial expansion remains within strict ecological protection bounds. The county has six natural usable grasslands spanning over 166,700 hectares. This has created a virtuous cycle between production and ecological conservation.

Large-scale farms achieve manure resource utilization rates above 94 percent, and much of that manure is processed into organic fertilizer and applied to the county's expanding cool-climate vegetable fields, closing the loop between livestock and crop production.

"Cool-climate vegetables are varieties adapted to elevations between 1,800 and 3,000 meters, where cool temperatures, wide day-night swings and long sunshine hours give them a natural advantage," said Zhang Guangsheng, director of the county's vegetable technology service center. "They accumulate more dry matter and vitamins — they're sweeter, crisper and store longer."

Datong sits at an average altitude of 2,200 to 2,800 meters, with clean soil, minimal industrial pollution and irrigation from highland runoff — conditions that have earned the county national recognition as a "golden zone" for cool-climate vegetable production.

The county has 5,333 hectares under cultivation, producing 256,100 tons annually with an output value of 790 million yuan, Zhang said, adding that 39 products have received organic or green food certification, and pesticide residue compliance has remained above 98 percent.

More than 60 percent of output ships to areas including Shanghai, and Guangdong and Fujian provinces, with 11 dedicated supply bases covering over 667 hectares serving the Guangdong-Hong Kong-Macao Greater Bay Area. Specialty varieties such as pea shoots and broccoli sprouts can reach southern markets within 48 hours, Zhang added.

"Chemical fertilizer use has been cut by 20 percent through organic replacement, including yak manure from local farms," he said.

Through land transfers and on-farm employment, hundreds of households have joined the vegetable supply chain, boosting both incomes and local job creation.

Underpinning both industries is the regulation on the promotion of rural industrial vitalization, enacted by the county's people's congress in 2022 as China's first county-level legislation of its kind.

Drafted to address short value chains, weak branding and scattered resources, the 26-article regulation institutionalizes support for agricultural and livestock development, forming an effective policy support system — from conserving germplasm resources and building seed breeding bases, to providing financial incentives, promoting green organic production, cold-chain logistics, e-commerce, and the use of geographical indication brands such as Datong yak and locally designated vegetable labels.

"The regulation consolidates proven practices into legally binding norms, ensuring stability and continuity in our rural industry revitalization efforts," said Xie Ji, deputy head of the county government.

Bilibili World 2026 takes place in Shanghai from July 10 to 12. It's one of Asia's largest gatherings for ACGN fans. PHOTOS PROVIDED TO CHINA DAILY

Unlocking the fan-verse

International musicians and cosplayers converge at Bilibili World 2026, proving global pop culture knows no real borders, **Wang Xin** and **Wu Wanzhen** report in Shanghai.

Top: Chinese singer Tan Jing performs at the *Bilibili Macro Link* concert. **Above left:** Cambodia's Princess Norodom Jenna (right) is among the celebrity guests at Bilibili World 2026. **Above center:** Medovvika (right) and Armeyes from Russia draw attention with their cosplay of fairy-tale characters at the event. **Above right:** Cosplayers pose at the event.

Left: Voice actors attract a large crowd of fans at Bilibili World 2026. **Right:** The three-day event attracts a total of 400,000 visitors.

Viktoria Chernenkii and Denis Chernenkii — better known as Medovvika and Armeyes — are among Russia's best-known cosplayers. Recently in Shanghai, they transformed into Rapunzel and Flynn Rider from the Disney movie *Tangled*, bringing the fairy tale to life at the intersection of fantasy and reality.

Making their second trip to China, the couple flew from Moscow to attend Bilibili World 2026 from July 10 to 12 in Shanghai.

The event is one of Asia's largest gatherings for ACGN (animation, comics, games and novels).

They began preparing for their BW debut months before departure. Determined to portray her favorite character as authentically as possible, Medovvika commissioned a seamstress to handcraft her "historically accurate" costume six months in advance.

As for Rapunzel's iconic long, gorgeous blonde braid, Medovvika turned to China. About a month before leaving, she did what many Chinese cosplayers do — she reached out to a Chinese platform and placed a rush order to customize the wig.

"Only Chinese wigmakers know how to make the wig light, beautiful and detailed," recalls Medovvika excitedly.

The couple also researched BW's traditions and discovered that attendees often exchange handmade gifts. They prepared their own freebies for Chinese fans: beautifully printed cards featuring their cosplay photographs, paired with pieces of Russian chocolate.

Although they are leading cosplayers in Russia, they were still amazed by BW's scale, inclusiveness and the creativity of Chinese participants.

"Chinese cosplay is on another level when it comes to craftsmanship and detail. We don't have a venue this large in Russia. This festival isn't just huge — it has something for everyone, from gamers and photographers to anime fans," she adds.

Despite the language barrier, the eye-catching pair was frequently stopped by fellow attendees asking for photos.

They described Chinese fans as "polite, friendly, lovely and always ready to help", and hoped to meet more Chinese cosplayers in Russia in the future.

This year marked the first time BW sold tickets to overseas fans. The three-day event attracted a total of 400,000 visitors from over 30 countries and regions across the world, and featured 170 global exhibitors, more than 60,000 cosplayers and nearly 1,000 *itasha* exhibits — vehicles decorated with vibrant ACGN-themed artwork, according to video-sharing platform Bilibili, the event's organizer.

Among those spotted in the crowd was Cambodia's Princess Norodom Jenna. Kevin Feige, president of Marvel Studios, dropped teasers for the highly anticipated *Avengers: Doomsday*, drawing large crowds of fans like South Korean YouTuber Kim Chae-ho, who joined enthusiastic audiences eager for every new reveal.

Allison Franco and Alberto Franco, a couple in their 30s from the United States, even applied for passports and traveled abroad for the first time specifically to attend BW.

Wearing matching custom outfits inspired by video games, they spent six weeks preparing for the Shanghai trip and were particularly struck by the warmth and hospitality of the local people.

"We haven't had any issues that we thought we might have. Everyone has been so kind and gone out of their way to make sure we have a great experience ... I wanted to be one of the people who come over here (at BW), experience it and show my fans what it's like," says Allison Franco, a content creator with over 1.2 million social media followers.

She adds that Chinese ACGN-themed productions, such as *Heaven Official's Blessing* and *Link Click*, are "insanely popular" in the US.

Alongside the fan carnival, musicians from both China and abroad also came together for the annual ACGN-themed *Bilibili Macro Link* concert.

Now in its 14th edition, this year's concert featured music from seven popular Chinese games, including *Arknights*, *Azur Lane*, *Genshin Impact*, and *Wuthering Waves*.

Casey Lee Williams, a 27-year-old American vocalist who began recording music for animation at 14, says she is grateful to be part of the event.

After first singing for a Chinese game soundtrack in 2017, she has come to appreciate the industry's strong commitment to music and musicians.

Williams says China has given her "incredible" opportunities to perform over the past decade. Dressed as a character from *Wuthering Waves*, she performed one of the game's songs at the concert before embarking on a tour spanning Asia and the US later this year.

"Being together is the most important thing in the world. China's ACGN community really captures that spirit and brings people together in such a special way. On a global scale, togetherness is what matters most," she says.

Celebrated Chinese singer Tan Jing also drew inspiration from the passion of ACGN fans. Having released her first ACGN cover song in 2021, she performed her first video game song at this year's concert, prompting a sing-along from the audience.

"I'm delighted to see younger generations helping Chinese culture continue to evolve and gain global influence. More international participants are joining the event, and our traditional culture is crossing borders through music. I also hope to further explore cultural integration and musical innovation," Tan says.

Industry data show that in 2025, the revenue generated by China's independently developed games in overseas markets exceeded $20.45 billion.

Urban parks help in cockatoo conservation

Left: Winster Wong teaches students about cockatoos at St. Louis School in Hong Kong. **Right:** A snapshot taken by a student, Rooney Cheung, shows cockatoos flying to an artificial nest. XINHUA

HONG KONG — With fewer than 2,000 yellow-crested cockatoos left in the wild, Hong Kong may play a significant role in the species' survival.

In a recent study published in the international academic journal Evolutionary Applications, researchers from the University of Hong Kong found that these introduced cockatoos in Hong Kong retain unexpectedly high genetic diversity, potentially serving as a genetic reservoir for the species.

"It could function as a backup population for this species, which is critically endangered," says Astrid Andersson, lead author of the study.

Native to Indonesia and East Timor, yellow-crested cockatoos have seen their numbers plummet due to massive trapping for the pet trade and habitat loss. Currently, the vast majority of them are scattered across various islands of Indonesia.

Around 200 yellow-crested cockatoos have found refuge in Hong Kong, making up about 10 percent of the remaining global population. Andersson describes this number as ideal in comparison with the situation on some islands in Indonesia.

Surprisingly, instead of the countryside, these striking snowy-white visitors choose to live in bustling areas on Hong Kong Island. Victoria Park in Causeway Bay and Hong Kong Park in Admiralty serve as their main habitats.

"The cockatoos eat fruits, nuts, seeds, leaves and flowers. They find a lot of food in these urban parks," Andersson says, adding that the older, larger trees at these sites offer ideal nesting holes for the birds.

The research team has partnered with a local arborist to design and install artificial nest boxes to monitor the cockatoo population.

They place the boxes in areas where cockatoos are frequently seen, prioritizing spots where natural nests were lost to typhoons or safety-related tree pruning, thus ensuring the birds remain in familiar habitats.

Over the past year, more than a dozen nest boxes have been installed across various locations in the city, including urban parks and schools.

In October last year, Winster Wong, a teacher at St. Louis School in Sai Ying Pun, saw a pair of yellow-crested cockatoos repeatedly pecking at a hole in a campus tree, a behavior that lasted for about two weeks.

Realizing the birds were trying to nest, Wong remembered a video on the internet by the HKU team about artificial nest boxes and reached out to them. This led to the successful installation of two boxes at the school this April, with Andersson subsequently invited to speak at a morning assembly about the birds' plight.

"We want the students to be involved in it, not just bystanders. At this stage, we are trying to increase their awareness," Wong says, noting that the school plans to partner with HKU to launch cross-disciplinary activities that are professional yet accessible for students.

With the installation of the nest boxes, the cockatoos have been visiting the school more often.

Rooney Cheung, a student at the school, recalls spotting the cockatoos flying through the trees during a morning recess. He quickly grabbed his camera and captured the moment when they returned to the artificial nest, a snapshot that later clinched an award in a competition themed around the environment and humanity.

"The nest box is a human creation, while the cockatoos represent nature. I submitted the photo because it felt like a perfect fit for the theme," the 15-year-old says.

Other students have also found creative ways to engage. Owen Yu built a model tree with blocks to create an ideal habitat for the birds.

"I used to have little interest in nature, but now I know the birds are precious, and I hope to help them thrive," Yu says.

This shift in perspective resonated across the campus, even among those who initially found the birds' famously loud calls a little annoying.

The artificial nest boxes were carefully designed with Hong Kong's climate in mind, particularly its high temperatures and extreme rainfall. Built to prevent rainwater from seeping in, the structures also provide protection against predators such as civet cats, snakes and other birds.

Furthermore, each box is equipped with a live camera that enables the researchers to monitor the birds' behavior. Yet, the cockatoos, with strong beaks, frequently damage the boxes and appear particularly sensitive to cameras, sometimes breaking the devices.

Andersson notes that while the cameras are "not cheap" and pose maintenance challenges, they are vital to showing whether the nest boxes are being used. They allow researchers to track eggs, chick survival and parental feeding.

"This type of information has never been recorded for this species," she says.

Beyond scientific research, the live feeds carry significant educational value. Andersson notes that some schools use tablets in the classroom to stream the footage, so students can observe what is happening in the nest boxes in real time.

Marking a clear success for the project, at least one chick has already hatched in one of the boxes. "It's very hopeful for the continuation of this project," says Andersson, who aims to increase the number of boxes to around 50.

Moving forward, the team plans to partner with more schools, corporations and individuals, while hosting public talks and nest box design workshops to keep raising awareness.

Shedding light on ancient history

Suspended 60 meters above the valley floor, the Hanging Temple transforms into a canvas for a breathtaking show, revealing the secrets of its 1,500-year existence, report Bai Shuhao and Zhu Xingxin in Datong, Shanxi province.

Before the sun slips behind the mountains, no one quite knows how the Hanging Temple will appear after dark.

For nearly 1,500 years, the monastery has clung to a sheer cliff face in northern China's Shanxi province, suspended between rock and sky. It appears almost frozen in time, but at night it waits for light to awaken it again.

"I'd seen so many photos and videos of it on social media," says Joe Burns, a British travel vlogger visiting the temple for the first time. "But in reality, it's much smaller than I imagined."

Perched more than 60 meters above the valley floor on the cliffs of Hengshan Mountain near Datong, the Hanging Temple is one of China's oldest and best-preserved cliffside wooden structures. From a distance, its red timber columns and yellow, glazed roof tiles resemble a finely crafted wooden box tucked into the mountain.

The temple occupies just 472 square meters. Some corridors are so narrow that only one person can pass at a time. On one side stand statues representing China's three major philosophical and religious traditions — Confucianism, Buddhism and Taoism. On the other is open air. Visitors inch carefully along the walkways, gripping the railings as they search for an answer to a question almost everyone asks upon arrival: How can a temple seemingly float in midair?

"People's first reaction is always the same," says Yang Jianlin, director of the nighttime multimedia production *Why Hanging Temple Endures*. "Why was it built here? What was the purpose?"

His work, staged against the cliffs surrounding the temple, attempts to answer a mystery that has endured for more than a millennium.

The projection spans more than 37,000 sq m of cliff face and recently received Guinness World Records recognition as the world's largest cliff projection show. Since tickets went on sale in late May, every performance has sold out, drawing more than 2,000 visitors each evening.

Yang grew up in Shanxi, not far from the temple. After more than a decade working in live tourism performances, he says one unlikely source of inspiration for the show was *Black Myth: Wukong*, the blockbuster Chinese video game that introduced many international audiences to Shanxi's ancient architecture.

"It made me realize these buildings shouldn't only be places people visit," he says. "They can become immersive experiences where people step directly into history."

But transforming one of China's most treasured ancient monuments into a stage for a large-scale light show has also raised questions.

Supporters hope the production reveals dimensions of the temple that daytime visitors cannot see. Critics worry that dazzling projections might disturb the quiet dignity of a sanctuary that has overlooked the valley in solitude for centuries.

Before the performance, Burns imagines what awaits him.

"I think there will probably be lasers, projections, all kinds of effects to make the place stand out," he says.

Painter Li Zhengming, a member of the China Artists Association, is more cautious. Having sketched historic architecture across Shanxi and watched similar productions elsewhere, he worries that many light shows emphasize spectacle while neglecting the history and culture of the buildings themselves.

"Light shows are fine," Li says before the performance. "The key is whether they handle the details well."

At 8 pm, just before the show is due to begin, a loudspeaker announces a 10-minute delay because the sky is still too bright.

Then darkness arrives.

The temple disappears almost completely into the mountain. Even those who have spent the afternoon touring it struggle to locate it against the black cliffs.

The performance opens not with the temple itself but with an herbal merchant carrying astragalus, a medicinal plant long cultivated in the region. Speaking directly to the audience, he reflects on the crowds that hurry through the temple each day.

Top: A scene from the nighttime multimedia production *Why Hanging Temple Endures*. **Above:** British travel vlogger Joe Burns (in pink shirt) and other international visitors wait for the performance to begin. **Left:** The show features both digital projections and live-action performances. PHOTOS BY ZHU XINGXIN / CHINA DAILY

"People visit in daylight," he says. "It's too noisy, too rushed. They never hear what the temple is trying to tell them. That's why you've stayed — to wait for this moment."

The audience slowly follows guides toward the cliff as a narrator repeats the question that gives the production its title: Why Hanging Temple endures?

The answer unfolds not through architecture alone but through history.

The projections first transform the cliff into a battlefield. Horses charge. Weapons clash. Blood-red light washes over the mountainside.

During the Northern Wei Dynasty (386-534), when the imperial capital was established in Datong, Taoist reformer Kou Qianzhi is believed to have envisioned an "airborne temple", elevated above worldly noise and closer to the heavens. Yet, even as the monastery sought spiritual distance, the land beneath it remained a frontier marked by centuries of warfare and shifting dynasties.

Datong stood between the agrarian empires of central China and the northern nomadic peoples. Its very name — meaning "Great Harmony" — reflected a long-standing hope for peace.

The projections then reconstruct the temple's construction. Craftsmen appear suspended from the cliff, chiseling into solid rock one hammer strike at a time. The audience watches as cantilevered beams are driven into the mountainside, re-creating the engineering method that still supports the temple today.

Historical figures, including Tang Dynasty (618-907) poet Li Bai and Ming Dynasty (1368-1644) traveler Xu Xiake, also appear, recalling their own journeys to the site and their admiration for its improbable beauty.

Burns records much of the performance on his phone.

"The projections cover the entire mountain. It's hard to believe you're looking at the real Hanging Temple.

"I didn't think it would incorporate the actual Hanging Temple into it," he adds. "Now I can see why it's a world-record show. The whole cliff face becomes part of it, and the temple itself is only a small part. Really, really spectacular."

Li, who was skeptical when he arrived, finds himself persuaded.

"They've explained the entire historical process so clearly," he says. "The visual impact of every scene is beyond words."

However, Yang insists that protecting the monument remained the project's priority.

The production uses cold-light projection equipment positioned more than 100 meters away from the temple. No permanent hardware has been installed within the protected heritage zone, and the light exposure is significantly lower than ordinary sunlight, he says, allowing the performance to avoid any direct impact on the structure.

In its final movement, the battlefield disappears.

Spring blossoms spread across the mountains. Summer forests return. Autumn paints the valley in crimson leaves. Winter covers the cliffs in snow.

"Kou Qianzhi never lived to see the temple completed," Yang says. "But through technology and animation, people today can finally witness how his vision became reality."

In the end, the production returns to the question with which it began: Why Hanging Temple endures?

If its construction began with one man's aspiration, Yang suggests, it has survived because generations of ordinary people continued to repair it, preserve it and bring their own hopes there.

"A thousand years later, it is our generation that protects this ancient building," he says. "Back then, it carried people's wishes for peace and a better world. Today the country is peaceful, the mountains are beautiful. The ancient wishes have, in many ways, become our own."

Cultural performances let villagers find new voices in the arts

Left: Villagers perform in a short stage play in Yinan county, Linyi city, Shandong province, in October 2024. **Right:** Another short play presented by Yinan villagers on June 10. PHOTOS BY XINHUA

JINAN — On mornings during the slack farming season, Yang Suhua, a villager from Beicun in Yinan county, Shandong province, hurries to a scenic spot in neighboring Changshanzhuang village, where she now works as a performer in addition to her farm work, a role she never could have imagined just a few years ago.

This scenic area offers a well-preserved rural landscape that dates back to the Chinese People's War of Resistance Against Japanese Aggression (1931-45).

Local authorities there have turned old courtyards and revolutionary heritage sites into open-air stages, with no raised platforms or elaborate lighting. The performers are largely local villagers like Yang, who, after training, stage skits and plays in the local dialect. These performances bring to life the stories of the village women who risked their lives during the war to deliver supplies, tend to the wounded and relay messages.

"Now we don't have to leave home to chase our dreams, and we get paid for it too," Yang says during a break between performances.

"As the story unfolds, the audience is often drawn into the narrative, transitioning from being mere spectators to becoming part of the story itself," says Li Xipeng, chairman of the scenic area management. "This immersive experience allows visitors to truly feel the revolutionary culture as if they were there."

These folk performances have revived the region's revolutionary heritage while also boosting the local economy. Beyond performing on stage, villagers from surrounding communities have found multiple ways to raise their income, such as leasing land, taking day jobs at the scenic site, and selling local products to tourists. Now, the annual per capita disposable income in the area exceeds 15,000 yuan ($2,208).

Across China, new forms of cultural expression are lowering the barriers for rural communities to engage in creative activities. Farmers are no longer just characters in stories told by others. Instead, they are increasingly becoming storytellers, performers and beneficiaries in their own right.

In Tandi village of Sishui township, Guangdong province, a short-drama crew had set up cameras right next to lychee orchards. Wang Youxiang, a local villager taking part in the production, stood nearby, listening to the director's instructions and occasionally offering her own suggestions on how rural life should be shown on screen.

Wang recalls that in the past, all she knew was growing lychees. During the off-season, her only pastime was watching TV. Now, she has appeared in several short-drama productions. "I get to act and I get to make friends," she says.

Short-drama crews have brought more than cameras to the village — they've brought new business. Villager He Qinghai says the productions have put money in locals' pockets through acting fees and opened up new markets for their lychees.

Keen to look good on screen, families have tidied up their courtyards and spruced up village lanes. Neighbors are now swapping acting tips and learning from each other. The village looks different and so do its people.

Meanwhile, in the mountainous regions of Guizhou province, music is playing a similar role in transforming rural lives. Yu Chengliang, a teacher from Maluhe village in Tunjiao township, has introduced "rare" instruments including the saxophone, trumpet and drum set to the local school, establishing a village orchestra.

Through self-study, he turned himself into a multi-instrumentalist proficient in over a dozen instruments, and has taught the children hands-on. With his mentorship, more than 300 students have acquired instrumental skills, and music now serves as both their hope and their driving force to be able to step out of the mountains for a different future.

Yu's efforts have also touched the left-behind elderly in the village. Luo Kailian, 74, has been a member of the village orchestra for more than a decade.

"I used to think that playing musical instruments was a pastime for city dwellers and had nothing to do with us rural seniors," she says. "But over the years, learning music from Yu has kept me cheerful every day and made life feel more promising."

LIFE

Ancient craftsmanship meets modern creators

Liao Dynasty wooden masterpieces are getting a meticulous miniature reboot, **Zhu Xingxin** and **Zhou Huiying** report in Datong, Shanxi.

Despite having visited the Yingxian Wooden Pagoda in Yingxian county, Shanxi province, and Huayan Temple in Datong, Veldesen Yaputra was still astonished when he stood before the miniature models of Liao Dynasty (916-1125) architecture at the Datong Sculpture Museum.

Yaputra, from Indonesia, is a graduate student majoring in architecture at Tsinghua University. As an internet celebrity blogger, he was invited to participate in Discovering Shanxi's Ancient Chinese Architecture — A Visual Journey Through Cultural Heritage held from July 15 to 20.

More than 10 visual artists and overseas bloggers from nine countries explored Shanxi's rich architectural heritage, including a visit to an exhibition on the construction techniques behind the "eight great Liao structures", which opened on June 13 at the Datong Sculpture Museum.

It is the first time that the eight surviving wooden structures from the Liao Dynasty in China have been showcased together in the form of detailed models.

"These models faithfully reproduce the buildings' colors, carvings and intricate decorative details," he says. "When viewing the actual buildings, it's impossible to appreciate every element at once. But in miniature, the relationships between the structures — especially the complex *dougong* interlocking bracket system — become immediately clear.

"Visiting the original sites gives you a sense of how the architecture blends with the surrounding mountains and streets, while the miniature models offer a completely different perspective, allowing you to closely examine the construction techniques," he adds.

Liao Dynasty wooden structures inherited the robust style of the Tang Dynasty (618-907) and incorporated the intricate elegance of the Song Dynasty (960-1127), holding a significant place in the history of ancient Chinese architecture.

Renowned architect Liang Sicheng once described these buildings as "millennial national treasures".

Today, only eight complete Liao Dynasty wooden structures remain in China — the Mahavira Hall of the Shanhua Temple, and the Bhagavad Sutra Hall of the Huayan Temple, both in Datong, and the Wooden Pagoda of the Fogong Temple in Yingxian county, all in Shanxi province; the Manjusri Hall of the Geyuan Temple in Laiyuan county, and the Mahavira Hall of the Kaishan Temple in Gaobeidian city in Hebei province; the Guanyin Pavilion and the gate of the Dule Temple in Tianjin's Jizhou district; and the Mahavira Hall of the Fengguo Temple in Yixian county, Liaoning province.

A young visitor looks at a model of the Guanyin Pavilion of Tianjin's Dule Temple at the exhibition. ZHU XINGXIN / CHINA DAILY

"With two national-level precious relic sites — the Mahavira Hall of the Shanhua Temple and the Bhagavad Sutra Hall of Huayan Temple, Datong naturally bears the responsibility of preserving this architectural heritage and passing on its construction techniques," Yin Xuenian, director of the city's cultural relics bureau, said at the exhibition's opening ceremony.

"In recent years, Datong has been actively promoting the restoration, research, and utilization of ancient buildings from the Liao and Jin (1115-1234) dynasties, continuously improving the protection system for cultural relics, exploring the craftsmanship and architectural philosophy embedded in Liao buildings, and breathing new life into these thousand-year-old masterpieces."

The exhibition showcases physical models of the "eight great Liao structures", covering eight major ancient construction techniques, including brickwork, tilework, stonework, large woodwork, small woodwork, ridge decoration, and ironwork.

It also displays traditional building tools, offering visitors a comprehensive look at the craftsmanship and aesthetic principles behind ancient Chinese architecture.

Wang Xiaolong, deputy director of Shanxi Academy of Ancient Building and Painted Sculpture & Fresco Preservation, says Liao Dynasty wooden structures represent a crucial stage in the evolution of Chinese architecture and reflect the cultural integration of multiple ethnic groups.

"The 'eight great Liao structures' are essential benchmarks for the study of architectural styles and historical periods," he says. "Shanxi preserves three of the finest surviving Liao buildings, each possessing exceptional architectural and research value.

"Timber-frame construction, defined by its wooden framework, *dougong* bracket system and mortise-and-tenon joints, is one of the most distinctive achievements of Chinese civilization," he says. "The Yingxian Wooden Pagoda, for example, demonstrates remarkable innovation through its alternating bright and hidden structural layers, reflecting ancient builders' exploration of stability in tall wooden buildings."

Treasure house

Shanxi is widely regarded as a treasure house of ancient Chinese architecture. According to Wang, every major surviving Tang Dynasty timber structure is located in the province, and wooden structures from the Five Dynasties and Ten Kingdoms (907-960) period, Song Dynasty, Jin Dynasty (1115-1234), and Yuan Dynasty (1271-1368) here account for more than 70 percent of the nation's surviving examples from each period.

Wooden structures from before the Yuan Dynasty make up 82.5 percent of the national total.

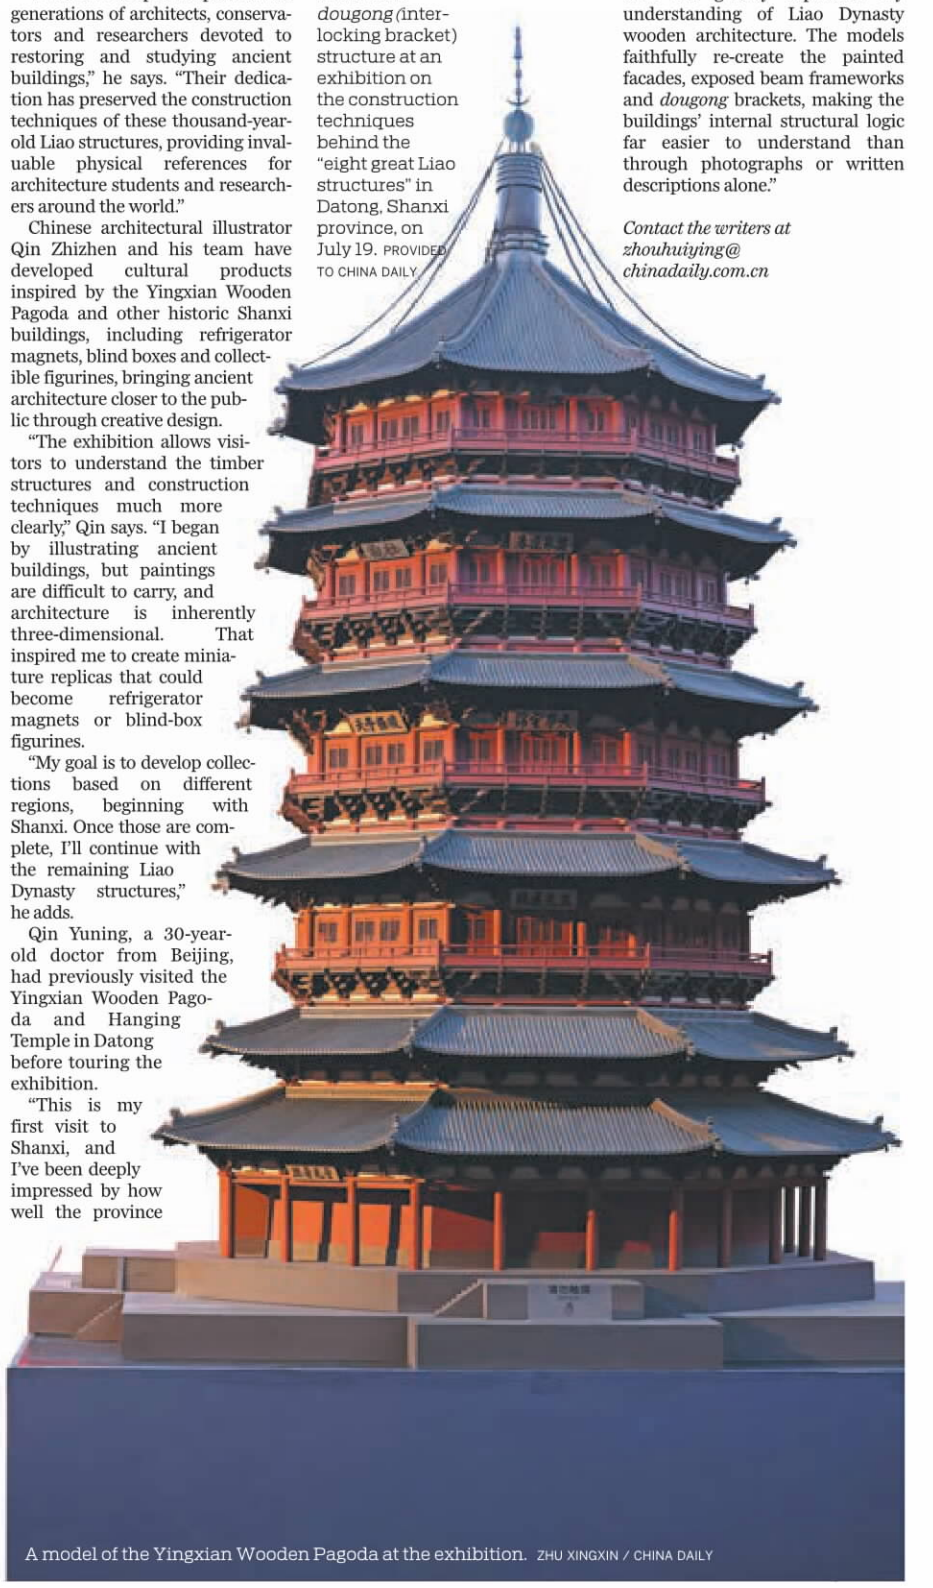
"Although Shanxi also has the largest number of surviving Liao Dynasty wooden structures, they account for only 37.5 percent of the national total," Wang says. "The province's three surviving examples are exceptionally valuable and were included among China's first group of nationally protected cultural relics in 1961."

As a young architectural creator and international cultural communicator, Yaputra believes the preservation of ancient architecture should resonate with today's generation.

"Young people today cannot simply repeat the construction methods of ancient craftsmen," he says. "Every era has its own cultural mission, and new technologies and fresh perspectives are how contemporary society can continue this cultural legacy.

"I have the deepest respect for the generations of architects, conservators and researchers devoted to restoring and studying ancient buildings," he says. "Their dedication has preserved the construction techniques of these thousand-year-old Liao structures, providing invaluable physical references for architecture students and researchers around the world."

Chinese architectural illustrator Qin Zhizhen and his team have developed cultural products inspired by the Yingxian Wooden Pagoda and other historic Shanxi buildings, including refrigerator magnets, blind boxes and collectible figurines, bringing ancient architecture closer to the public through creative design.



"The exhibition allows visitors to understand the timber structures and construction techniques much more clearly," Qin says. "I began by illustrating ancient buildings, but paintings are difficult to carry, and architecture is inherently three-dimensional. That inspired me to create miniature replicas that could become refrigerator magnets or blind-box figurines.

"My goal is to develop collections based on different regions, beginning with Shanxi. Once those are complete, I'll continue with the remaining Liao Dynasty structures," he adds.

Qin Yuning, a 30-year-old doctor from Beijing, had previously visited the Yingxian Wooden Pagoda and Hanging Temple in Datong before touring the exhibition.

"This is my first visit to Shanxi, and I've been deeply impressed by how well the province has preserved its ancient architectural heritage," he says. "The exhibition has greatly expanded my understanding of Liao Dynasty wooden architecture. The models faithfully re-create the painted facades, exposed beam frameworks and *dougong* brackets, making the buildings' internal structural logic far easier to understand than through photographs or written descriptions alone."

China's scenic peaks welcome a new robotic workforce

JINAN — On the misty stone trails of Mount Tai in East China's Shandong province, an unusual new worker is turning heads. A robotic dog now carries supplies uphill and hauls waste back down, blending cutting-edge technology with one of China's oldest pilgrimage routes.

About a meter long and finished in silver-gray, the four-legged robot climbs the mountain's steep stone steps with remarkable stability. Strapped to its back is a bulging nylon canvas bag filled with bottled water. Moving at a constant pace alongside tourists, this four-legged machine is not a sci-fi prop, but the latest member of the mountain's workforce.

Famed for its challenging terrain, Mount Tai has relied on human porters for centuries to transport goods. Now, robotic dogs are taking on part of that physically demanding work.

Despite its compact size, the machine can carry a static load of up to 120 kilograms and operates for four to six hours on a single charge. Equipped with high-resolution cameras, LiDAR, and multiple sensors, it can detect obstacles and negotiate slopes of up to 45 degrees, according to officials at the scenic area.

The technology is also helping tackle a long-standing environmental challenge. Mount Tai generates about 24,000 metric tons of waste every year, and removing it across the rugged landscape has traditionally depended on manual labor.

"The robotic dog is expected to significantly reduce physical strain while improving efficiency," says Wang Yunpeng, a manager at the scenic area.

Each trip carries 30 to 45 kilograms — similar to what a human porter would transport. With quick battery replacements, the robot can keep working throughout the day. Since entering service, it has also become a tourist attraction, with hikers regularly stopping to photograph its sure-footed climb.

A robotic dog that would be deployed to deliver heavy loads including garbage on a test run at the Mount Tai scenic area in Tai'an, Shandong province, in 2024. SUI XIANG / XINHUA

Posing for a picture alongside the robotic dog, Wang Liang, a visitor from Qingdao, Shandong province, says he hopes the machine will see continuous upgrades to better serve Mount Tai's tourism.

The robotic dog is part of the broader Smart Mount Tai initiative. Last year, the scenic area introduced AI-powered climbing exoskeletons, among the first large-scale deployments of the technology in tourism.

Weighing just 1.8 kilograms, the wearable device uses artificial intelligence algorithms to reduce a climber's physical effort by over 30 percent.

These technological integrations are part of a comprehensive digital transformation at Mount Tai, which has incorporated AI, IoT, cloud computing and VR/AR to build an intelligent management system covering fire dispatch, crowd control and smart tourism services.

This localized evolution aligns with China's broader push to integrate AI into daily life and key industries, a strategy outlined in national guidelines last year. The AI Plus Initiative targets extensive AI adoption across six key areas by 2027: technology, industry, consumption, social services, governance and global cooperation.

Other scenic destinations are moving in the same direction. At Mount Huangshan in Anhui province, AI travel assistants, cargo drones and climbing exoskeletons have already been introduced.

In Hangzhou, East China's Zhejiang province, tourism departments have introduced biomimetic robotic fish to West Lake, one of China's most iconic and historic scenic destinations. This autonomous device patrols the water to monitor temperature and pH levels, detect invasive species, and transmit real-time ecological data to command centers.

Together, these projects illustrate how AI is rapidly moving beyond research labs and into practical, everyday use across China's tourism sector.

SPORTS

BASKETBALL

Just like LeBron James on July 26, back in 2019, first baseman Bryce Harper chose Philadelphia in free agency. He led the Phillies to the 2022 World Series, but couldn't quite finish the job. "The city loves a winner," Harper said of the 76ers' new signing. **Inset:** James, then with the Los Angeles Lakers, talks with Philadelphia 76ers' forward Joel Embiid (right) after an NBA game in 2022.
AFP / AP

Like Harper, James wants to win Philly a title

Both chose the city as free agents on a mission to fulfill their respective teams' championship ambitions

LeBron James and Bryce Harper spent their careers on a parallel path toward stardom.

They were teenage phenoms who graced the cover of Sports Illustrated (back when magazines were cool) and both prodigies were No 1 overall draft picks straight out of high school.

When Harper earned his first chance at testing free agency, there was only one city, one contract that was right for him.

Philadelphia.

It took a few years, but Harper has some company to fight with him on the short list of top elite athletes who have signed in Philadelphia.

Harper and the Phillies in MLB.

Pete Rose and Kyle Schwarber and the Phillies.

Saquon Barkley and Reggie White and the Eagles in the NFL.

With perhaps the most significant signature to be scrawled in Philadelphia in any July since 1776, James has followed Harper from free agency to Philly, rocking the NBA and signing a two-year deal for the bargain-basement price of $8 million — only a smidge more per season than the 76ers' first-round pick Labaron Philon Jr will earn — that stamped the Sixers as the most compelling team in the league this season.

Keeping tabs on the much-hyped deal, Harper noted: "He's going to have a great couple of years here, and obviously everyone's going to expect him to win a championship here like everywhere else."

"So nothing new for him. He's had all the pressure since he was in high school, or younger than that."

Here's the difference between James and all the superstars in the city that played before him.

He's LeBron James.

Meaning, his reach is so far beyond the court — from fame around the globe and his bank account, to the cash register and pop culture — that there is no fair comparison. He is No 4 on Forbes' real-time list of wealthiest athletes at $1.4 billion, so his pay cut may not even be noticed in the ledger book. James has commercials and movie roles, and endorsement deals that alone would out-earn every single player on the Sixers.

Joel Embiid, league MVP and two-time scoring champ. He's not LeBron.

Jaylen Brown, NBA Finals MVP and champion. He's not LeBron.

Tyrese Maxey, an All-Star and the real franchise player in Philly. He's not LeBron.

"I think it's pretty cool to have one of the greatest basketball players ever to play in the same city," Phillies shortstop Trea Turner said. "So I'm excited for those who haven't gotten a chance to see him play."

Who those people might be is anyone's guess. James is a 22-time All-Star, a 21-time All-NBA selection, a four-time Most Valuable Player, a four-time NBA Finals MVP, a three-time All-Star Game MVP, and was a member of the NBA's 75th anniversary team.

Back in 2018, three billboards near a highway in Cleveland tried to entice LeBron James, then with the Cleveland Cavaliers, to sign for Philadelphia. Eight years on, and it seems James finally took notice. AP

He's also coming off a season where he averaged 20.9 points, 6.1 rebounds and 7.2 assists per game. For his career, he's averaged 26.8 points, 7.5 rebounds and 7.4 assists in more than 1,600 games.

"He's played in big markets before," Harper said. "He knows exactly what he needs to do."

Harper has largely lived up to the 13-year, $330 million contract signed ahead of the 2019 season, when he spurned the Washington Nationals for the Phillies and owned the richest contract in baseball history. He led the Phillies to the 2022 World Series, but came away empty-handed, won the National League's MVP award in 2021 and helped win back-to-back NL East titles.

Barkley rushed for more than 2,000 yards in his first season with the Eagles and led them to a Super Bowl championship, and Rose was the missing piece to help Hall of Famers Mike Schmidt and Steve Carlton win the Phillies a World Series in 1980 — the first MLB title in the franchise's history.

The 76ers have almost seemed to wait as long for a parade down Broad Street.

They have won titles in Philadelphia in only 1967 and 1983 and have improbably failed to advance out of the second round of the Eastern Conference playoffs since 2001.

And yet, somehow, one of the most famous athletes — strike that, people — walking and dunking in America today decided he wanted to play in Philadelphia.

"I'm not going for money. I'm not going for family," James posted on social media on July 24. "What am I really playing for at this point? I still want to sacrifice. I still want to work. I still want to grind. I still want to compete, to win and to have a chance at the feeling of winning."

James celebrated his decision on Instagram with a career highlight reel set to Philadelphia rapper Meek Mill's *Dreams and Nightmares*, the adopted sports anthem of the city's teams that is blasted ad nauseam throughout Philly's respective sports complexes.

The video ends with the lyric, "hold up, wait a minute. Y'all thought I was finished?" and cuts to a 76ers' logo.

James isn't finished — even if his best isn't yet to come.

He won NBA titles at each of his three previous NBA stops in Cleveland, Miami and the Los Angeles Lakers and could be the first player to ever win a title with four teams.

The countdown to opening night is on.

The stakes have really never been higher for the franchise. If they can't win with LeBron, Embiid, Brown and Maxey — can they ever?

Get ready, everyone.

And skip the advice.

James doesn't need any tips on surviving the deep fryer of fandom in Philly.

"He can do whatever the hell he wants," Harper said.

"But the city loves a winner. So win."

AP

RUGBY

Lafaele was a star for Japan, now he's not sure he belongs

TOKYO — Timothy Lafaele is among the many rugby players who have not only made their lives and playing careers in Japan, but hold Japanese passports, even though they were born outside the country.

In Lafaele's case, he has played 28 times for Japan's national team, including a monumental victory over Ireland in the 2019 Rugby World Cup, which Japan hosted.

He was a star back then, as Japan's rugby prowess shocked many.

But, under new rules proposed by local rugby officials that are set to go into effect in December when the Japan Rugby League One season opens, Lafaele and the others will be classed as foreigners, clouding their future in Japan.

This will limit their playing opportunities on domestic teams where Japan-born players are given preference.

Seiji Makino, a lawyer who is representing 24 players in a suit pending before several Japanese courts, said he's hopeful changes can be made before the season opens — through the courts or through negotiations with rugby officials.

"This is a very simple story," Makino said Thursday. "It is about players who built their lives and careers in Japan under one set of rules and are now having the ground moved from under their feet."

He and Lafaele spoke on Thursday in Tokyo at a news conference hosted by the Foreign Correspondents' Club of Japan.

Lafaele said the rule change came "out of the blue".

He declined to discuss any link to current politics around immigration in Japan, and also declined to talk about the effect on his contract.

The rugby rule change comes as Japanese Prime Minister Sanae Takaichi has been pushing tougher policies on immigration and foreigners. Many Japanese complain of struggling with stagnant salaries and rising prices — and some link it to a surge in foreigners to sustain a shrinking workforce as Japan's aging population declines.

> It quite saddens us. To come to Japan, having given so much to the rugby here and the community, and being treated this way, it just saddens us."
>
> **Timothy Lafaele,** on Japanese rugby's changing eligibility rules

Lafaele, who is Samoan-born, came to Japan at 18, played for a Japanese university and now has a Japanese passport.

But that's no longer good enough to guarantee playing time in Japanese rugby's top professional league.

The new rules specify that players had to reside in Japan for "at least six of nine years" of elementary and junior high school to qualify for the highest category of eligibility.

"I probably could answer for all the boys that are represented on this case," Lafaele said.

"It quite saddens us. To come to Japan, having given so much to the rugby here and the community, and being treated this way, it just saddens us."

Lafaele added. "To me, when this rule first came, I did feel insulted."

Of the 24 players who filed the case, only five want to be identified. Many fear that speaking out could cause more problems.

Makino was asked if there was a racial element to the new rules, and he said he didn't think "of it as racism" at the core of the dispute.

Players, though, are left in the lurch wondering about their future.

"It's been a hard time for the players these last couple of months," Lafaele said. "Some players are forced into retirement. Some players are just waiting at home at the moment for this decision to change so they can have the opportunity to provide for their families and get playing contracts. It's been a tough time for most of the players."

Many sports bodies across the globe consistently bend eligibility rules for commercial reasons, or to gain a competitive edge, and changing eligibility rules often faces pushback, particularly when local players seem to be sidelined.

Japanese rugby officials say the player pool of Japan-born players is shrinking, and limiting foreigners will help boost it.

Lafaele said he supports the idea of nurturing more native players, but doubts limiting the foreign influence will help.

"I don't think kids will look at this competition and say 'there are too many foreigners, I'll stop playing,'" Lafaele said.

"I see both sides of it. I see where the Japanese boys are coming from. They see it as more opportunities for them to play."

Xi calls for advancing sci-tech innovation

Acceleration of self-reliance, focus on frontier fields emphasized

By **MO JINGXI**
mojingxi@chinadaily.com.cn

President Xi Jinping called on Wednesday for accelerated efforts to achieve high-level self-reliance and strength in science and technology, saying that China must press ahead toward the goal of becoming a leading country in science and technology by 2035 and ensure that sci-tech innovation provides solid support for and guidance to Chinese modernization.

Xi, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, made the remarks while addressing a meeting in Beijing.

The meeting brought together the national science and technology award conference, the general assemblies of members of the Chinese Academy of Sciences and the Chinese Academy of Engineering, and the 11th national congress of the China Association for Science and Technology.

Since the 18th National Congress of the CPC in 2012, China has made historic achievements and undergone historic changes in science and technology, Xi said, adding that the country is accelerating its shift from a participant and contributor in global sci-tech development toward a pioneer and leader in innovation, with a rise in innovation capacity that is among the fastest in the world.

Xi stressed that a new round of scientific and technological revolution and industrial transformation is profoundly reshaping not only the way people live and work, but also the global development landscape.

China must adapt to the new circumstances and requirements, take more forceful measures to effectively address problems in its sci-tech development, and fully implement the CPC Central Committee's plans and arrangements for sci-tech work, he said.

Xi also said that China should strengthen its capacity to make systematic breakthroughs in sci-tech innovation and improve the overall efficiency of the national innovation system.

He called for a focus on frontier fields such as artificial intelligence, quantum technology and life sciences, key areas including integrated circuits and advanced manufacturing, and strategic fields such as the deep sea, deep space and deep Earth.

Major projects and programs should be deployed in an integrated manner, while original innovation and breakthroughs in key and core technologies should be advanced in a coordinated way, he said.

Xi emphasized the need to promote the deep integration of sci-tech innovation and industrial innovation, and to open up channels for accelerating the transformation of scientific and technological advances into real productive forces.

He noted that the relatively low rate of translating scientific and technological achievements into practical applications has long been a prominent problem.

Sci-tech innovation should be guided by application needs, while industrial innovation should generate scientific questions, Xi said, urging efforts to strengthen the national technology transfer system, create diversified application scenarios and high-level industrial clusters, and promote the application and iterative upgrading of independently developed technologies and products.

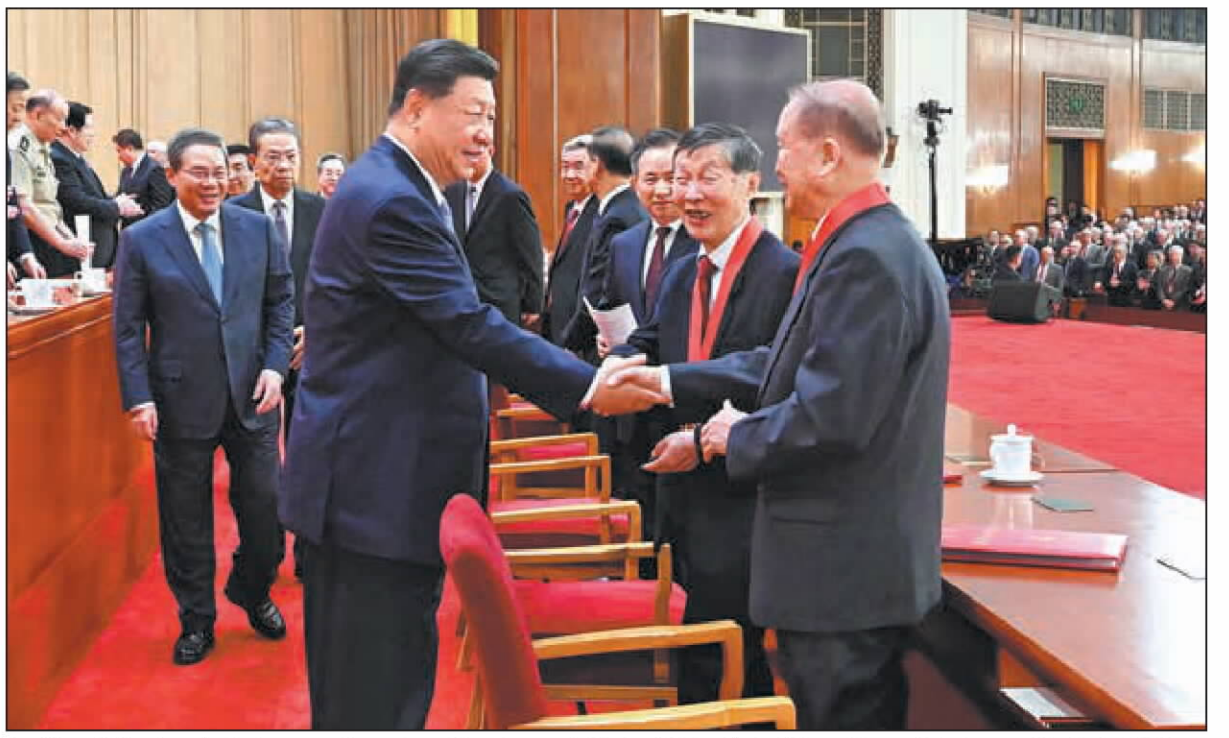
The future of science lies in the youth, Xi said, calling for improved mechanisms to integrate science and education in talent cultivation and for greater efforts to foster outstanding young sci-tech talent.

He said support for researchers should be increased, and more teenagers with scientific potential should be encouraged to pursue careers in science and technology.

He also said China should seize the window of opportunity created by global talent flows and actively attract outstanding young talent and teams from overseas.

During the 14th Five-Year Plan (2021-25) period, China's total social investment in research and development maintained an average annual growth rate of 10 percent, with R&D intensity reaching 2.8 percent in 2025, exceeding the average level of countries of the Organization for Economic Cooperation and Development for the first time.

This has not come easily and fully reflects the firm resolve of the Party and the country to develop science and technology, Xi said. At the same time, he noted that in practice, problems such as waste in research funding and inefficient or repetitive sci-tech investment still exist to varying degrees.



Xi stressed the need to make sci-tech innovation investment more effective, ensuring that increased investment is matched by greater efficiency.

Xi said China should deepen reform of sci-tech evaluation and make good use of it as a guiding tool for scientific research and innovation.

He also said China should strengthen sci-tech ethics and security governance, and promote the development of science and technology in a way that is beneficial, safe and controllable, so that it better serves the people.

At the meeting, Xi presented China's top sci-tech award for 2025 to Chen Liquan, a pioneer in China's lithium battery sector, and Ben De, a radar technology expert.

Wednesday's meeting honored 258 projects and 11 scientific and technological experts. In addition, the China International Science and Technology Cooperation Award for the year 2025 was conferred on nine foreign experts.

President Xi Jinping, who is also general secretary of the Communist Party of China Central Committee and chairman of the Central Military Commission, greets Ben De (first from right) and Chen Liquan (second from right), winners of China's top sci-tech award for the year 2025, after a meeting on Wednesday in Beijing. China remains a bright spot, says IMF report

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

The International Monetary Fund's World Economic Outlook update, which was released on Wednesday, projected global growth at 3 percent this year, down from an average of 3.5 percent between 2024 and 2025, with a few economies, including China, emerging as bright spots.

The negative impact of the United States and Israel's war with Iran on global supply chains and the rapid and positive deployment of artificial intelligence tools worldwide are the two biggest factors shaping global economic activity across countries, the IMF report said.

It projected China's growth at 4.6 percent for 2026, which is 0.2 percentage points higher than its April forecast. That growth is "driven by front-loaded public infrastructure investment and a surge in high-tech manufacturing and in exports, even as domestic consumption remained soft".

The IMF expected global growth to be around 3.4 percent in 2027.

The report noted that it was too early to judge the full impact of the war on supply chains and manufacturing purchasing managers' indexes, as it pointed to softer momentum ahead.

According to the report, the effects of the war in the Middle East were being partly offset by accelerated demand for global technology led by advances in AI and its adoption.

"The possibility of renewed conflict in the Middle East looms large and could extend commodity price volatility, further threaten supply chains, raise prices, and weigh on financial conditions. Trade fragmentation could accelerate, possibly hurting output and increasing prices," the economic outlook said.

A "re-escalation of geopolitical tensions" due to developments in the Middle East posed an imminent risk to the baseline forecast, the report said, adding that this would hurt growth and compound inflationary pressures.

CLIFF-HUGGING ROAD DRIVES TOURISM TO REMOTE VILLAGE

Years after residents carved out a literal path to prosperity, their hand-hewn highway is thrust into the global spotlight

By **TAN YINGZI**
and **DENG RUI** in Chongqing

A canyon road in Southwest China's Chongqing — that's all it took to stop millions of people mid-scroll. What pushed it into the global spotlight? A repost from Elon Musk on X.

China Vibes

The road in question is the Lanying Cliff Road in Chongqing's Wuxi county. It stretches just over a kilometer, clinging to a near-vertical cliff face — less than three meters wide in places — with a vertiginous drop of 1,500 meters on one side.

It all started when a Chinese blogger shared a video showcasing Tesla's "full self-driving" system navigating the treacherous thoroughfare.

Musk retweeted it.

Within a single day, the clip amassed more than 32 million views.

While the self-driving tech was impressive, it was the road it traversed that stole the show.

"How on earth is that road done?" one user asked. Another put it even more plainly: "More than the Tesla, hats off to whoever built this road."

Perched above the Lanying Grand Canyon, the road has been celebrated as the most beautiful cliffside road in China.

But beauty comes at a price, and for years, residents of nearby Zhoujiaping village lived in profound isolation, trapped by geography and reliant on the mountains for survival. With no connecting road, any trip for basic necessities meant a trek that took at least 13 hours each way over precarious mountain terrain.

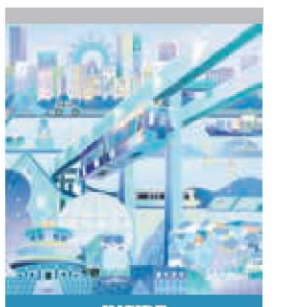
A youth-centered approach to demographic change

WORLD WATCH
By Nadia Rasheed

Across the world, demographic change is reshaping societies. More than two-thirds of people now live in countries where fertility is below replacement level, while virtually every country is experiencing population aging. These trends affect far more than population numbers. They shape labor markets, health systems, social protection, pensions, education, gender equality and sustainable development. Above all, they raise important questions: What kind of future do young people want? What barriers stand in their way? And how can policies help them realize their aspirations?

The theme of this year's World Population Day, "Realizing the hopes and aspirations of young people — today and for the future", brings these questions into focus. World Population Day falls on Saturday.



A new United Nations Population Fund report, "Lives, Choices and Futures: What young people want and what shapes their decisions about relationships and parenthood", provides one of the largest bodies of evidence to date on how young people view partnership, parenthood and the future. Drawing on the views of more than 108,000 internet-connected young adults ages 18 to 39 in 73 countries, it concludes that young people are not rejecting family life.

Across regions, many continue to value partnership, marriage and parenthood. More than two-thirds of respondents said that their ideal living arrangement involved marriage. An ideal family size of two children was reported in five of the seven regions surveyed, while larger ideal family sizes were more common in East and Southern Africa and West and Central Africa.

But aspirations alone do not shape life choices. The ability to form a partnership, have children or build a secure future depends largely on the practical conditions people face.

Survey respondents identified financial security, stable employment and emotional readiness as the most important preconditions for becoming parents, while economic and housing pressures were among the most commonly reported barriers to forming partnerships.

INDEPTH

Relocated villagers scaling new heights

Former mountain dwellers settle into better lives, jobs and prospects for children

By **LIU BOQIAN** in Qiandongnan, Guizhou
liuboqian@chinadaily.com.cn

On market days, 47-year-old Yang Anshun's barbershop is always full. The space is so small that customers waiting for their turn often end up on the steps outside, chatting until a chair is free.

In Guandong township, Guizhou province, the streets are packed with people. Villagers fine-tune their Dong *pipa* — a traditional lute — stalls overflow with seasonal vegetables and fresh meat, and rows of ethnic clothing hang on display. Even sneakers bearing the Nike logo appear among the goods.

Yang is short, lean and slightly swarthy. His hair is neatly trimmed, and he wears brown leather shoes — a barber who still takes pride in his appearance.

When the township hosts its regular fairs on dates ending in "4" or "9" on the Chinese calendar, his barbershop barely has a quiet moment. A haircut costs only 10 yuan ($1.47), but the steady flow of customers keeps business ticking along.

His shop is in Guiyun, the largest relocation community in Congjiang county.

Neat apartment blocks line the area, alongside public squares, leisure facilities and the town's biggest market. The residents come from villages scattered across the county, many of them from steep mountain areas with winding roads and barren land.

"Back home, my wooden house was dark and damp. My family kept cattle in one part and lived in the other," Yang said with a smile. "When officials came to check whether our family qualified for relocation, they only needed one look to see that we were struggling."

He also spent time working in Guangdong province. "Farming at home did not bring in much money," he said.

Dengba village, Yang's hometown, is about 40 kilometers from the county seat. In 2019, his family was approved for relocation because of their difficult living conditions, and local authorities arranged a three-bedroom apartment for them in Guiyun.

He lives there with his wife and three children. Schools and kindergartens are nearby, and last year the county's largest high school was also moved to near the community.

Yang said six or seven other households from his village also moved here.

He runs two barbershops in the area and owns two mobile barber carts converted from three-wheel vehicles. Yang said he makes about 4,000 yuan a month. "I have to stay busy, and I run a few small businesses," he said. "I charge only 10 yuan because I know it is not easy for everyone to earn money."

This year, he paid for his eldest daughter to study beauty and hairstyling in Guiyang, the provincial capital, hoping that one day she will open her own shop.

Shi Laobu, from Wangdong township, is another relocated resident. Her hometown is about a three-hour motorcycle ride away.

She runs a small vegetable stall in the local market. "It was not that selling vegetables brought in too little money before," she said. "It was that there was nowhere to sell them. At home, we grew rice and vegetables, but we could only eat them ourselves."

She no longer has to farm full time. By buying and selling vegetables, she earns a modest but steady income.

Shi said the biggest change is not the 100 or 200 yuan she makes each day at the stall, but easier access to education.

Like many mothers in the community, she values convenient schooling above all else.

She has three children, all attending a primary school about 500 meters from the market. "We live here, the children go to school here, and we make money here. Everything can be done right at our doorstep," she said.

Leaving poor conditions

Local officials often explain the need for relocation with a simple idea — a single piece of land cannot sustain the people on it.

Peng Jinbin, director of the provincial ecological migration bureau, said Guizhou carried out the country's largest relocation campaign. During the 13th Five-Year Plan (2016-20) period, the province moved 1.92 million people, about 16.4 percent of the national total, with 95.3 percent of them resettled in urban areas.

Congjiang lies in southern Guizhou, on the border with the Guangxi Zhuang autonomous region. More than 90 percent of its land is mountainous, with elevation differences of up to 700 and 800 meters. Many villages are isolated, difficult to reach and built on barren land.

"We have Miao, Dong and Zhuang communities among six ethnic groups here, and people came from 20 townships across the county," said Wu Jinke, secretary of the community Party branch.

"Because many residents had poor living conditions back home, construction began around 2018. By 2019, all 1,608 apartments had been assigned, and the occupancy rate is now basically 100 percent," he explained.

Guiyun has become a kind of super community.

According to local authorities, it covers about 16.73 hectares and has resettled 6,625 people. The community has two kindergartens and one primary school, while the county's largest high school is within 1 km.

For many villagers, however, leaving their old home does not mean letting go of the land. The fields they kept in their hometowns still give them a sense of comfort, especially because relatives continue to farm them.

"I still have two *mu* (0.13 hectares) of farmland back home, and my brother is farming it now," Yang said. "He chose not to relocate. He still has his own land, so he stays busy."

Still in the hills

In Danyang village of Qingyun township, the county seat is 80 minutes away via a rough mountain road.

Halfway up the hillside, several scattered brick-and-timber houses stand, with a few European-style villas visible in the distance. Villagers said the villas were built with money earned from working away from home.

In the distance, the mountains of Guangxi come into view, along with the wild monkeys that often appear there. Life here still moves slowly.

According to village officials, Danyang now has 112 households, after 27 moved away. Most of the young people who remain go outside the village for work, while others grow medicinal herbs such as Uncaria and isatis root.

"I actually envy those who moved to the city," said Shi Qibiao, one of the villagers who stayed behind. "They have new houses and it is easier to see a doctor. But I am old now and have grown used to village life."

When reporters arrived at his home, the 65-year-old was outside drying pieces of traditional Dong indigo cloth.

"Beautiful, isn't it?" he asked.

"Life here is relaxed," he said. "Every few days, vendors come by car to sell daily goods. I grow a *mu* of grain and some vegetables myself. Every day I buy a little meat to eat, but not too much, or it would not be good for my health."

Shi Jianong, secretary of the village Party branch, said relocation began in 2017 with a simple evaluation. Households were selected if they were poor or if an entire community agreed to move together.

For elderly villagers who stayed behind, the local government also provides public welfare jobs such as forest patrollers, road maintenance workers and cleaners. Shi Qibiao, for example, works as a forest ranger and receives a yearly subsidy of 10,000 yuan.

His wife now lives elsewhere to care for their grandson, who is studying away from home. He lives alone in the large house.

Building new futures

Wu said relocation is not the end of the story.

Nearly seven years after it began, the real challenge lies not only in providing physical dwellings, but in helping villagers build stable livelihoods and adjust to new ways of life.

At Congjiang Shenyao Health Care Products, the county's largest bath-product factory, workers make herbal bath products using traditional Chinese medicine.

In the packaging workshop, they box concentrated bath liquid for shipping across the country. Most of the workers are women in their 40s and 50s.

A woman surnamed Yang, who is nearly 50, said she lives nearby and earns 120 yuan a day.

Yaoyu is a popular traditional bathing practice that involves dissolving herbal medicines in hot water, and is believed to have health benefits. It has also been developed into an industry that local officials say is being modernized to create jobs.

By 2025, the area planted with herbs used for *Yaoyu* bath products had reached 43,000 *mu*, with 47 processing companies and an industrial output value exceeding 150 million yuan.

The company's owner said hiring became much easier after villagers moved into the nearby community. Some mothers stay home to care for their children, while older residents want work close to home. The factory has created more than 300 jobs.

Even so, Wu said employment remains one of the most pressing issues for relocated communities. With a weak industrial base and limited local opportunities, many residents still choose to work outside the county.

"Most still go out to work," Wu said. "Those who stay local are mostly employed in industrial parks or in the market."

To help residents find jobs nearby, the community organizes training every quarter in electrical work, domestic services and cooking, and recommends jobs to those who complete the courses.

At the community market, many stalls are reserved for relocated households. Women sell vegetables and rice noodles, while others run grocery stores and breakfast shops. On market days, the street fills with people.

"Sometimes you can hardly walk through," Wu said with a smile.

Beyond shopping, the market has also become a place where neighbors get to know each other.

The community brings together many ethnic groups. Many older residents do not speak Mandarin and are unfamiliar with urban community life.

Wu said one of the most important jobs for local cadres now is to keep organizing activities so residents can talk to one another more and get to know one another better.

"Back in the villages, everyone knew each other," he said. "Now that they have moved together, they have to adjust to new neighborhood relationships."

"Even though the relocation happened long ago, there is still a lot of work ahead of us," Wu said.

As the market day draws to an end, the street is still packed with people.

Vendors call out, children laugh, and electric scooters whiz past the stalls. For many relocated families, these ordinary sights and sounds are gradually replacing the silence of the deep mountains they once called home.

Winners receive ducks and pigs' legs as prizes after a chess competition held in a relocation community in Congjiang, Guizhou province, in September. PROVIDED TO CHINA DAILY

Report rebuts Philippines' claims in South China Sea

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

Inside

Comment, **page 6**

The Philippines' territorial claims over China's Huangyan Island and some islands and reefs of China's Nansha Islands in the South China Sea lack a historical and legal basis and expose major flaws in Manila's legal position, according to a report released on Wednesday.

The report, titled Historical and Legal Critique of the Philippines' Territorial Claims in the South China Sea, was released in Beijing by the Ministry of Natural Resources' China Institute for Marine Affairs.

Compiled by scholars of history and international law, the report examines whether the Philippines' territorial claims in the South China Sea are consistent with the generally recognized rules of international law and credible historical records.

The report noted that the Philippines' territorial boundaries were established through three international treaties during the Spanish and American colonial periods. After independence, the country inherited and confirmed those boundaries through its Constitution and laws, the report said.

However, since the 1970s, the Philippine government has attempted to expand its territorial scope by amending its Constitution, issuing decrees and making statements claiming sovereignty over Huangyan Island and some islands and reefs of the Nansha Islands, it said.

The report also noted that the Philippines' claims over Huangyan Island and the Nansha Islands are groundless.

Based on credible historical materials and the recognized rules of international law, the report said that the Philippines' claims in the South China Sea after independence lack a historical and legal basis.

It said that the Philippines does not have sovereignty over Huangyan Island or any island or reef of the Nansha Islands. The evidence cited by Manila, as well as measures including domestic legislation and illegal occupation, cannot substantiate its territorial claims in the South China Sea, the report said.

Xu Heyun, deputy director of the marine affairs institute, said the Philippine government's legal position has been inconsistent, shifting frequently and contradicting itself in logic.

"For example, various official maps of the Philippine Islands published by the United States excluded Huangyan Island and the Nansha Islands from Philippine territory, including a 1902 map of the Philippine Islands drawn by the Bureau of Insular Affairs of the US Department of War," she said.

Wang Nan, an associate professor at Beijing Jiaotong University, said that in the 1990s, official Philippine maps also marked Huangyan Island outside the country's territorial sovereignty, a position that was reflected in official correspondence from different levels of the Philippine government.

For instance, in a letter issued on Feb 5, 1990, the Philippine ambassador to Germany said that, according to the Philippines' National Mapping and Resource Information Authority, Huangyan Island was outside the scope of Philippine territorial sovereignty, Wang noted.

In addition, the report said the Philippines' territorial expansion attempts have caused serious harm.

It said that Manila has distorted historical facts, misapplied international law, misled international public opinion and taken illegal and radical actions, seriously threatening peace and stability in the South China Sea.

Xu, from the marine affairs institute, said the Philippines' attempt to break through territorial boundaries defined by a series of legally binding international treaties and extend its claims to Huangyan Island and some islands and reefs of the Nansha Islands lacks historical basis, clearly violates the established rules of international law on territorial acquisition, and is neither historically nor legally tenable.

"The Philippines' illegal actions not only challenge the international legal order, but also pose a major threat to regional peace and stability and the maintenance of the international order," she said.

Sino-Dutch ties highlighted at trade meeting

Netherlands urged to keep chip supply chain stable, foster a fair business environment

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China has urged the Netherlands to foster a fair, transparent and predictable business environment for Chinese companies investing in the country and maintain the stability of semiconductor industrial and supply chains, the Ministry of Commerce said in a statement on Wednesday.

Commerce Minister Wang Wentao called for efforts to properly resolve business disputes between the two sides, when co-chairing the 18th meeting of the China-Netherlands Joint Economic and Trade Committee on Tuesday in Beijing with Sjoerd Sjoerdsma, Dutch minister of foreign trade and development cooperation.

Their meeting comes at a time when semiconductor cooperation has become one of the most closely watched developments in China-Netherlands economic relations.

The two sides have faced growing economic and trade frictions in recent years following the Dutch government's export restrictions on advanced chipmaking equipment, and its measures affecting Nexperia, an overseas subsidiary of Chinese company Wingtech Technology.

The Dutch official's visit also follows a key consensus reached in a meeting in Brussels last week between China and the European Union on the new characterization of China-EU economic and trade relations. During the meeting, China and the EU agreed to be each other's stable and balanced key trading partner.

On Tuesday, Wang told Sjoerdsma that China hopes "the Dutch government will play a positive and constructive role within the EU, encouraging the EU to work with China in the same direction and manage differences through dialogue and consultation".

According to the ministry's statement, China is ready to work with the Netherlands to deepen cooperation in areas including advanced manufacturing, technological innovation, the green transition and modern services.

Wang said that China welcomes Dutch companies to invest in the country and share the opportunities created by its vast market.

Sjoerdsma said that the Netherlands is willing to further strengthen policy communication and coordination with China, deepen trade and investment cooperation, provide a stable and transparent business environment for Chinese companies investing in his country, and promote the steady development of EU-China and Netherlands-China relations.

Zhou Mi, a researcher at the Chinese Academy of International Trade and Economic Cooperation in Beijing, said that despite a broad foundation for industrial cooperation, China and the Netherlands still face differences in sectors such as semiconductors.

"If specific differences are properly managed through dialogue, it will help strengthen business confidence, stabilize industrial and supply chains and create a more predictable environment for companies in both countries," Zhou added.

In a statement issued recently, the Brussels-based China Chamber of Commerce to the EU said that maintaining stable and resilient global semiconductor supply chains serves the shared interests of China, the Netherlands and the EU.

Sjoerdsma, who started a three-day visit to China on Tuesday, is accompanied by a business delegation comprising representatives from 17 Dutch companies in sectors including logistics, agriculture and high technology.

Coen van Oostrom, president of the Confederation of Netherlands Industry and Employers, who is a member of the visiting delegation, noted that Dutch businesses have been investing in China for decades. China is one of the most important markets for Dutch businesses and it will continue to remain so in the future, he added.

Bright future at hand

Outlook: Risks more balanced this month

From page 1

Global headline inflation is expected to increase from 4.1 percent in 2025 to 4.7 percent in 2026 before declining to 3.9 percent in 2027, the report said.

While the risks to the global economy are more balanced this month compared with April, they are still "tilted downward", according to the report, which is titled "Global Economy in Crosscurrents of War and Technology".

In the first quarter of 2026, global growth turned out to be stronger than expected. It slowed from 3.8 percent in the fourth quarter of 2025 to 3 percent in the first quarter of 2026, instead of the 2.7 percent forecast in the April edition of the economic outlook report.

This was due to the steady increase in the share of renewable energy in global energy production and the fact that many economies were less energy-intensive than they had been a few years ago.

Looking to the near future, the economic outlook said that better global economic stability can be achieved by "restoring price stability, supported by clear communication, central bank independence, and strong financial oversight, while rebuilding fiscal buffers and using fiscal tools sparingly through temporary, targeted support that preserves price signals".

On technology, it added that the most important factors are "structural reforms to promote energy security, AI readiness, domestic rebalancing, and international cooperation being strengthened to relieve the strain of ongoing tensions".

Cliff: Once-forgotten corner reimagined

From page 1

The road wasn't built by heavy machinery or grand engineering companies. It was painstakingly carved by the villagers themselves, using traditional steel drills and hammers. The work took more than four years.

When it was finally completed in 2005, they had carved a "road to prosperity" along the sheer cliff face. By the time the road was built, only 83 people still lived in the village.

"On the day this road was fully opened, people cried," said Yang Zhihan, one of the road's construction leaders. "We no longer had to cross mountains to make a living."

In recent years, the county of Wuxi in Chongqing has leaned into its dramatic landscapes, vitalizing rural areas by harnessing rich ecological and cultural resources.

The Lanying Grand Canyon is now a national 3A-level scenic spot, with the cliff road as its breathtaking centerpiece.

A turning point came in 2008, when the local government paved the roads and added essential infrastructure: a visitor center, viewing platforms, hiking trails, stalls for local agricultural products, restrooms and parking lots. What was once a forgotten corner of rural China has been reimagined as a comprehensive cultural and tourism destination.

> "On the day this road was fully opened, people cried. We no longer had to cross mountains to make a living."
>
> **Yang Zhihan,** one of the Lanying Cliff Road's construction leaders

"Last year, I traveled this route with two friends, and at one point, the car had to reverse while turning because there wasn't enough space. The driver's foot slipped, and we almost couldn't brake in time. It felt like everyone in the car saw their ancestors flash before their eyes," joked 21-year-old Zhang Lyu, a tourist from Shaoguan, South China's Guangdong province.

Wang Kunbo, a 39-year-old tourist who traveled with his family by car from Taiyuan, the capital of North China's Shanxi province, said on Tuesday, "The cliff road is indeed narrow, but there are passing points (at regular intervals) and several viewing platforms to enjoy the absolutely stunning scenery."

Zhou Xuqing, an official of Lanying township, said Zhoujiaping has seen significant economic growth as a result of tourism, with locals opening 12 farm stays that, combined, have generated more than 3 million yuan ($441,265).

In addition to tourism, Wuxi's dramatic terrain has another selling point: It's a proving ground. Just like the driver in the Tesla video, car manufacturers and professional testing organizations are drawn to its natural testing grounds. Standout routes include the Ninggang Road in Ningchang township, with 106 hairpin turns, and the Lingpaishi Road in Dahe township, notorious for its 18 consecutive switchback turns. If a vehicle can handle these roads, it can handle almost anything.

Population: Societies need to create supportive conditions

From page 1

Many respondents also expressed concerns about inequality, conflict and uncertainty about the future.

These findings challenge the view that lower fertility simply reflects young people's decisions to delay or forgo family life. In reality, many are adapting their choices to their circumstances.

The policy implication is clear: Rather than prescribing a single path, societies need to create supportive conditions that enable young people to pursue their aspirations with confidence and hope for the future.

This calls for long-term, coordinated investment in young people's lives: quality education and skills; stable, meaningful employment; affordable housing; social protection; and accessible health services, including sexual and reproductive health information and care.

In addition, policy responses need to take into account the growing influence of technology and artificial intelligence on how young people learn, work and connect. Digital innovation should expand opportunity and strengthen — rather than serve as a substitute for — meaningful human relationships, trust and community.

The way work and care are organized is equally important. Communities and workplaces have an important role to play in helping young people balance work, care and family life.

Gender equality is central to this agenda. The survey found that respondents were more likely to disapprove of mothers with young children being employed than fathers with young children being employed. Such expectations can limit women's choices and place a disproportionate share of unpaid care work on them.

Policies that support shared caregiving — including paid parental leave for both parents, affordable childcare, flexible work arrangements, protection from workplace discrimination and support for maternal and reproductive health — strengthen families while also advancing gender equality, economic participation and social resilience.

These global insights are highly relevant for China, as it navigates its demographic shifts, including population aging, the changing patterns of family formation and the evolving expectations of younger generations. The 15th Five-Year Plan (2026-30), with its people-centered focus on high-quality development and stronger public services, provides an important foundation for responding to these realities.

By strengthening employment security, skills development, education, health services, inclusive childcare, eldercare and family support systems, China can help reduce practical pressures facing young adults and enable them to plan their futures with greater confidence.

This approach places young people at the center of demographic policy — not merely as recipients of support, but as vital partners in development. Policies are more effective when guided by their voices, experiences and aspirations. Their creativity, ideas and energy can help drive innovation, strengthen communities and build resilience across generations.

World Population Day is a reminder that demographic progress should be measured not only by population figures, but also by whether people have the opportunity to build secure, fulfilling lives and contribute fully to society.

At the United Nations Population Fund, we are committed to working with China and partners to help create the conditions in which young people can realize their aspirations and contribute to a more inclusive and sustainable future for all.

The author is the representative of the United Nations Population Fund to China. The views do not necessarily reflect those of China Daily.

Chinese table tennis stars bring 55-year legacy of friendship to US campus

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

Until this week, 70-year-old Southern California resident Bob Taylor had little knowledge of Ping-Pong Diplomacy.

That changed when he joined hundreds of students, teachers and families at La Salle College Preparatory High School on Monday to watch members of the Chinese National Table Tennis Team play exhibition matches with local students, commemorating the 55th anniversary of the historic exchanges that helped open a new chapter in relations between China and the United States.

Accompanied by his daughter and granddaughter, Taylor said the event reminded him that sports can bring together people from different backgrounds and generations.

"I am so glad to see all these young people can get together, not just our La Salle kids and Chinese kids, but all kids everywhere," Taylor said.

"That's what's great about sports. Everybody is having a great time and doing their best to compete. That's the way the young generation is going to run our country someday."

The campus visit followed the recently concluded World Table Tennis US Smash tournament and formed part of activities marking the 55th anniversary of China-US Ping-Pong Diplomacy.

In his welcoming speech, Chinese Consul General in Los Angeles Guo Shaochun said Ping-Pong Diplomacy in 1971 opened the door to friendly exchanges between the Chinese and US peoples and started a new chapter in bilateral relations.

"The story of the 'small ball moving the big ball' transcended sports itself and had a profound impact on China-US relations and the international landscape," Guo said.

During a recent summit in Beijing, both countries' presidents emphasized the importance of expanding people-to-people exchanges, he said. The visit by the Chinese national team represented a "significant practice" of implementing the important consensus reached by the two heads of state, he added.

"I hope today's event will help all of you deepen mutual understanding, build lasting friendships and become a new generation of ambassadors for China-US friendship, jointly writing a new chapter of Ping-Pong Diplomacy in the new era," Guo said.

He Xiao, secretary-general of the Chinese Table Tennis Association, said the campus visit was a concrete effort to implement the consensus reached by the two heads of state while carrying forward the spirit of Ping-Pong Diplomacy.

Exchanges between Chinese and US table tennis players have continued over the past 55 years — from reciprocal visits and joint training to cross-national doubles partnerships and campus outreach, he said.

The exhibition featured some of China's leading players. Men's doubles champions Wen Ruibo and Yuan Licen played runners-up Lin Shidong and Huang Youzheng, while women's doubles champions Wang Manyu and Kuai Man faced teammates Wang Yidi and Chen Yi, drawing enthusiastic applause from students packed inside the school gymnasium.

Among those taking part was La Salle student Shaan Ngan, who joined the friendship exhibition with members of the Chinese team.

"It's really interesting to hear how long of a history we've had with it," Ngan said. "It's a really good way for two countries to bond over something so fun like ping-pong."

Youth exchanges

Player Lin said he hoped the visit would encourage exchanges between young people in the two countries by carrying forward the spirit of Ping-Pong Diplomacy.

"I can also see that some students at this school have excellent table tennis skills," he said. "I hope they keep at it."

For Perry Martin, president of La Salle College Preparatory, the event carried lessons extending well beyond sports.

Recalling the legacy of Ping-Pong Diplomacy, Martin said peace does not always begin with "grand speeches or signed agreements", but can start with simple acts of respect and human connection.

"Our students are not simply watching an exhibition. They are witnessing how sports can become diplomacy, how respect can become friendship, and how a school can become a bridge between nations," he said.

Robert Packard, La Salle's corporate director and chief financial officer, said exchanges like this help young people overcome stereotypes.

"It breaks down barriers," Packard said. "There's so much hate in the world, and by bringing representatives from China to the US, we're reminded that we're all just friends."

NATO summit exposes strains

Trump slams European allies, renews Greenland claim amid persistent divide

By **JONATHAN POWELL** in London
jonathan@mail.chinadailyuk.com

NATO's European leaders sought to win US President Donald Trump's renewed commitment to the alliance at a summit in Turkiye on Wednesday, after he strongly criticized European allies as "disappointing" for their stance in the Iran war.

On his arrival in the Turkish capital Ankara on Tuesday evening, Trump lashed out at allies for failing to back the US over Iran, saying he might have boycotted the meeting had it not been for his friendship with the host, Turkish President Recep Tayyip Erdogan.

"I was very disappointed with NATO," Trump said, singling out the United Kingdom, France, Spain, Germany and Italy for not doing enough to support the strikes on Iran.

He added that "we weren't treated well" by the allies, even as he reiterated that he did not want or need their help.

Trump also reopened old wounds, by insisting the United States should control Greenland, a semiautonomous Danish territory, and threatening to withdraw all US forces from Europe if the continent continues to reject the plan.

He said Greenland is "very important for the United States, but it's not important for Denmark".

"We need it for protection of the world, not just the United States … It doesn't help Denmark but it helps us," he said.

The US has already announced troop drawdowns in Europe, reduced the forces it allocates to NATO defense plans — including an aircraft carrier, aerial refuelers, fighter jets and drones — and begun a six-month review of its posture on the continent.

Responding to Trump's remarks, Denmark's Prime Minister Mette Frederiksen said her country is "ready to defend every inch of NATO, including our own territory", in the event of an attack, and would rely on allies to honor their mutual-defense commitments.

"We hope that all, including all allies, will respect the Greenland people's right for self-determination," she said, adding that the territory is "of course not for sale".

"One of the reasons why we have built NATO many, many years ago is if anything happens to one of us, then everybody should stand up for each other," she said.

The Ankara gathering was intended to showcase progress toward NATO's spending goals, Reuters reported. The bloc's secretary-general, Mark Rutte, said Estonia, Latvia, Lithuania, Poland, Denmark and Greece have already raised their outlays and that European members revealed a raft of arms deals worth at least $50 billion on Tuesday.

"There's no doubt about the commitment," Rutte said before chairing the summit, while noting that Washington expects "Europeans and Canada to bring their spending in line with the United States".

European leaders say they are stepping up to shoulder more of the continent's security, but insist on a predictable, orderly transition to prevent vulnerabilities in their defenses.

Even so, Trump has demanded "loyalty" and branded NATO a "paper tiger" after several allies refused to grant US forces unrestricted base access for strikes on Iran.

Spain becomes target

Trump singled out Spain as "a terrible partner in NATO" and renewed his threats to cut off trade.

"Spain is a wasted cause," he said. "We don't want to do any trade business with Spain anymore. … Cut off all trade with Spain, including visits."

In response, the office of Spanish Prime Minister Pedro Sanchez said it was treating Trump's statements as business as usual, adding that bilateral relations benefited both countries.

Spanish Health Minister Monica Garcia was more blunt. "We are a sovereign, democratic country that defends multilateralism and peace," she said on X. "What's terrible is confusing diplomacy with bullying."

Reuters contributed to this story.

Visitors flock to China pavilion at Tanzanian trade fair

DAR ES SALAAM — At the heart of the 50th Dar es Salaam International Trade Fair in Tanzania, a steady stream of visitors has been flocking to one of the event's busiest attractions — the China pavilion.

From high-tech agricultural machinery to sleek electric vehicles and advanced industrial technologies, the pavilion has drawn strong interest since the fair opened on June 28. Running through July 13, the annual event, popularly known as *Sabasaba*, has attracted thousands of visitors seeking new ideas, partnerships and business opportunities.

For Dawson Kahwa, a businessman from Dar es Salaam, the China pavilion offered more than a showcase of products — it provided a glimpse into the future.

"I have seen high-tech agricultural machinery such as irrigation pumps that could transform farming in Tanzania if adopted by our farmers," he said during China Day, an event highlighting China's trade, investment, technology and cultural cooperation with Tanzania.

Kahwa was among hundreds of visitors who thronged the pavilion on Monday, drawn to innovative technologies and practical solutions to local challenges.

Across the exhibition hall, displays of modern equipment and digital technologies showcased the breadth of China's industrial capabilities. Demonstrations of irrigation systems, agro-processing tools and smart technologies attracted particular interest from farmers, entrepreneurs and policymakers looking to improve productivity and efficiency.

Dennis Londo, Tanzania's deputy minister for industry and trade, underscored the importance of strengthening partnerships that deliver tangible benefits.

"As we celebrate China Day, let us renew our commitment to building stronger trade and investment partnerships that deliver real outcomes for our people," he said.

China has become one of Tanzania's key trade and investment partners, making significant contributions to the country's industrial growth, infrastructure development, technology transfer and job creation, he said.

'Transformative' policy

Londo also hailed China's zero-tariff policy for 53 African countries as a transformative opportunity.

"The zero-tariff arrangement provides our producers and exporters with direct access to one of the world's largest consumer markets," he said. "It creates favorable conditions for Tanzanian products to compete more effectively and expand their presence in China."

Technology and innovation would be critical to enabling Tanzania to seize these opportunities, he added, calling for deeper cooperation with Chinese enterprises in advanced manufacturing, digital transformation, renewable energy and agro-processing.

Chinese Ambassador to Tanzania Chen Mingjian highlighted the strong and growing economic ties between the two countries.

"China has been Tanzania's largest trading partner for 10 consecutive years," she said, adding that bilateral trade reached $5.12 billion in the first five months of 2026.

More than 300 Chinese companies operate in Tanzania in sectors including agriculture, manufacturing and tourism, contributing to the country's industrialization, she added.

Chen also noted the popularity of Tanzanian products among Chinese consumers, such as coffee, cashew nuts and gemstones, particularly at China's international trade expos.

She reaffirmed China's commitment to expanding opening-up and promoting trade liberalization, saying the efforts would create new opportunities for cooperation with Tanzania and Africa.

France's Le Pen says she'll run for president in 2027

By **JULIAN SHEA** in London
julian@mail.chinadailyuk.com

Former French presidential candidate Marine Le Pen announced on Tuesday she will run for president in 2027, after an appeals court shortened her ban on running for office, even as it upheld her conviction for embezzling European Parliamentary funds.

Le Pen came second to President Emmanuel Macron in both 2017 and 2022, and has been well-placed in opinion polls for next year's election.

She immediately launched her campaign website and urged voters to back her, creating an unprecedented situation in France, with a lead candidate heading to the ballot after a guilty verdict for a public funds-related offense.

"Tonight, I am a candidate in the presidential election," Le Pen said in a prime-time interview on TF1 TV, hours after the ruling. "The French will have the last word."

In March last year, the 57-year-old former leader of the far-right National Rally party received a five-year ban from holding public office after being found guilty of using parliamentary funds to pay her own party employees, rather than parliamentary assistants.

She was also given a four-year jail term, two years of which were suspended, with the other two to be served at home wearing an electronic tag — a ruling she had been seeking to overturn — to allow her a fourth run at the presidency next year.

The court fined her 100,000 euros ($114,300) but reduced her public office ban from five years to 45 months, 30 of which are suspended, and also cut the jail term to three years, two of which are suspended, and one is wearing an electronic tag.

As the ban has been running since last year's ruling, the required 15-month ban has already been served.

The appeal court said that although it had confirmed Le Pen's guilt, it had also taken into account "the voter's freedom of choice, a prerequisite for the expression of democratic suffrage".

Le Pen said she was taking Tuesday's judgment to the country's highest court, the Cour de Cassation, which has the effect of suspending the ruling, including its requirement that she wear an electronic ankle tag. She reaffirmed that she did nothing wrong.

"There is no longer any scenario in which I will not run in 2027," she said defiantly on TF1.

Le Pen followed in the footsteps of her father Jean-Marie Le Pen, the former leader of the old National Front party, as leader of the rebranded National Rally, before stepping down in November 2022, to be succeeded by 30-year-old Jordan Bardella.

She previously said she would not run for the presidency while under electronic monitoring because it would interfere with campaigning and undermine her credibility.

The National Rally had started preparing for the possibility that Bardella would be its candidate.

Reuters contributed to this story.

Intl leaders call for restraint

United States and Iran resume fighting as both blame other for breaking agreement

By SHI GUANG in New York
shiguang@chinadailyusa.com

International leaders called for restraint in the fighting between the United States and Iran as hostilities flared up once again, with both sides blaming the other for undermining the memorandum of understanding designed to bring a peaceful solution to the conflict.

Secretary-General of the United Nations Antonio Guterres expressed alarm about the renewed military confrontations in the Gulf.

"These incidents risk derailing the diplomatic progress achieved between Iran and the United States," Stephane Dujarric, spokesman for the secretary-general, said in a statement.

"A return to full-scale hostilities would have catastrophic consequences — for the peoples of the region, for international peace and security, and for the global economy," Dujarric said. "The secretary-general urges Iran and the United States to urgently resume negotiations and to address outstanding issues through diplomacy."

US President Donald Trump said on Wednesday that the MoU signed with Iran to end the conflict was "over", though he left room to continue diplomatic talks.

"It's just a waste of time dealing with them. I'll let our wonderful negotiators keep talking if they want, but I don't see it," he told reporters while in Ankara, Turkiye for a NATO summit.

The US blamed Iran for attacks on three commercial vessels passing through the Strait of Hormuz. In response, the US military said it launched "powerful strikes", including against Iranian air defense systems, radar sites and over 60 small military boats, marking the largest US military operation against Iranian assets since the April ceasefire took effect. Tehran's reply came quickly, with the Islamic Revolutionary Guard Corps saying they hit 85 US military facilities in Bahrain and Kuwait.

The US military said it was continuing attacks on Wednesday, "to further degrade their ability to threaten freedom of navigation in the Strait of Hormuz", US Central Command posted on X.

Iran's Parliament Speaker Mohammad Baqer Qalibaf described the US attacks as "major violations" of the MoU.

"The era of bullying and extortion is over," Qalibaf wrote on X. "It leads nowhere. We don't fold."

Earlier, Iranian Foreign Minister Seyed Abbas Araghchi said negotiations on a final agreement with the US "will not commence" if threats continue.

China called on both sides to fully implement the signed MoU, resolve disputes through dialogue and negotiations, and refrain from resorting to force.

"We are closely monitoring the latest developments. A renewed conflict serves no party's interests and military measures cannot resolve fundamental issues," Foreign Ministry spokeswoman Mao Ning said.

In the memorandum of understanding, signed in Switzerland last month, Washington and Tehran created a political framework for de-escalation and committed to negotiate a final agreement within 60 days. The MoU said that Iran would not pursue nuclear weapons and would accept international supervision over its enriched material stockpile. The US, in turn, promised sanctions relief, economic engagement and a gradual rollback of military pressure.

The exchange of fire "further complicates already fraught talks to end the war", the European Union's top diplomat Kaja Kallas said on Wednesday on X, adding that EU foreign ministers would talk with their Gulf counterparts on Monday about how to "preserve freedom of navigation" in the Strait of Hormuz and the Red Sea.

The US also revoked a sanctions waiver that temporarily allowed Iran to export limited amounts of oil.

Global oil prices surged nearly 6 percent immediately after Trump's remarks, with Brent crude climbing above $78 per barrel. Crude benchmarks had cooled off recently, falling from peaks above $100 a barrel to levels seen before the conflict began in late February.

Though some shipping has resumed through the strait, with a reported 36 ships having transited on Monday, that is still down significantly from the more than 100 vessels doing so daily before the conflict.

China, Turkmenistan advance sustainable transportation

By MINLU ZHANG
at the United Nations
minluzhang@chinadailyusa.com

From a green and smart inland waterway transport program in southwest China's Chongqing municipality to a green methanol fuel project in Hong Kong, Chinese practices in sustainable transport were highlighted on Wednesday at a UN side event on advancing the United Nations Decade of Sustainable Transport from 2026 to 2035.

The event, held on the sidelines of the 2026 UN High-level Political Forum on Sustainable Development, was co-hosted by the permanent missions of China and Turkmenistan to the United Nations, the UN Department of Economic and Social Affairs, and the China International Center for Sustainable Transport Innovation and Knowledge.

Sun Lei, China's deputy permanent representative of China to the United Nations, stressed that transport is an important carrier linking development and people's livelihoods.

He put forward a four-point proposal for global cooperation: strengthening planning guidance and deepening global connectivity; accelerating low-carbon upgrading and promoting green transport transformation; focusing on livelihood gaps and developing inclusive and equitable transport; and improving whole-chain management to strengthen transport safety.

"China is accelerating efforts to build itself into a country with strong transport networks," Sun said, adding that China has implemented a number of cross-border connectivity projects through Belt and Road cooperation and the Global Development Initiative.

"China will continue to share replicable green and smart transport solutions with the world and work with all parties to promote global sustainable development," he said.

Bjorg Sandkjaer, the assistant secretary-general for policy coordination in the Department of Economic and Social Affairs, said transport serves as a key link connecting economic growth, inclusive development and climate action, and is directly related to the overall implementation of the 2030 Agenda for Sustainable Development.

Sandkjaer called on governments, international institutions and the private sector to work with all stakeholders to build close partnerships and fully implement the priority actions of the decade.

Vepa Hajiyev, permanent representative of Turkmenistan to the UN, said Turkmenistan has always placed sustainable transport cooperation "high on its diplomatic agenda".

"Turkmenistan stands ready to further deepen practical cooperation with China in connectivity, transport energy and cross-border logistics, make full use of the Group of Friends of Sustainable Transport mechanism, and hold regular multilateral exchanges to jointly provide useful transport development models for developing countries," Hajiyev said.

The Chinese delegation presented Chongqing's "Qianli Qingzhou" initiative, a green and smart transformation program for inland waterway transport, as well as a green methanol fuel project by Hong Kong and China Gas Company Limited, or Towngas, which explores the transition of traditional coal chemical production toward cleaner transport fuels.

The Chinese delegation shared the China International Center for Sustainable Transport Innovation and Knowledge's achievements in building platforms for global practice sharing, investment and financing matching, capacity building, and scientific and technological innovation cooperation.

The UN Development Programme introduced a package of assistance programs to promote inclusive slow mobility in less developed areas; the Asian Infrastructure Investment Bank presented green transport financing solutions tailored to developing countries; and "99", a Brazilian ride-hailing platform under DiDi, showcased a localized digital and inclusive mobility case in Latin America.

Cambodia inaugurates China-funded road project

By YANG HAN in Hong Kong
kelly@chinadailyapac.com

Cambodia inaugurated a 45-kilometer upgraded section of the China-funded National Road 7 on Tuesday, with Prime Minister Hun Manet hailing it as a key project boosting trade, tourism, and regional connectivity.

Speaking at the inauguration ceremony in Kampong Cham city in southeastern Cambodia, Hun Manet said the upgraded section — stretching from the Skun Market roundabout to the Kizuna Bridge roundabout in Kampong Cham city — connects the central region to the northeastern provinces, serving as a vital economic artery.

"This road will facilitate public transit, stimulate trade and tourism, and enhance the quality of life for residents and commuters," he was quoted by Xinhua News Agency as saying.

The National Road 7 is a key transport thoroughfare connecting the capital Phnom Penh with Kandal and Kampong Cham provinces that also links Cambodia to the Lao border. The 196-km road is an early Chinese aid project, with construction beginning in 2004. It has been one of the busiest roads in the kingdom since it opened in 2008.

According to the Cambodian government, the upgrade and expansion project took 27 months and was undertaken by the China Road and Bridge Corporation, funded by a preferential loan from the Chinese government, with additional funding from the Cambodian government.

The upgraded road, expanded from two to four lanes, will handle rising traffic, speed up commercial and agricultural transport, and strengthen the logistics sector.

It is also expected to boost tourism in Kampong Cham, home to ancient temples, nature resorts, and historical sites.

Noting that the section will generate an estimated economic internal rate of return of up to 15.27 percent, Hun Manet said this new achievement reflects close cooperation between Cambodia and China. He thanked China for its extensive aid toward Cambodia's socioeconomic development and poverty reduction.

"This road section vitalizes regional travel and trade, accelerating socioeconomic growth across Kampong Cham and neighboring high-potential provinces," said Cambodian Minister of Public Works and Transport Peng Ponea.

Noting that China's assistance improves logistics and drives national economic growth in line with Cambodia's development and global trends, he also thanked China for its ongoing financial and technical support in expanding and rehabilitating Cambodia's transport and infrastructure.

Ironclad friendship

After witnessing the inauguration, Chinese Ambassador to Cambodia Wang Wenbin wrote in a Facebook post that the expanding network of roads and bridges in Cambodia reflects the country's dynamism and growth, and stands as a symbol of the ironclad friendship between China and Cambodia.

"They truly are 'roads of opportunity' and 'bridges of cooperation', of which I am confident that more will be built in the future," Wang said.

The inauguration of the expanded National Road 7 marked a major milestone under the government's Pentagonal Strategy-Phase I, a socioeconomic policy agenda of the Cambodian government, said Thong Mengdavid, deputy director of the China-ASEAN Studies Center of the Cambodia University of Technology and Science.

Mengdavid told China Daily that the upgraded road, which will also be toll-free, would halve travel time to 30 minutes, transforming the congested bottleneck into an efficient transport corridor.

"For local farmers and traders, this means fresh agricultural products such as rubber, cashews, and cassava can reach markets and processing plants faster and at a lower cost," he said.

In addition, with improved infrastructure in the area, more investment is expected to flow into the region, thus creating more employment opportunities, stabilizing regional supply chains, and enhancing connectivity, Mengdavid added.

NYC high-rise to be fixed as columns buckle

Workers began making emergency repairs to stabilize a Manhattan high-rise on Tuesday evening after buckled columns and sagging floors forced evacuations in and around the midtown construction site. The scene unfolded throughout the day after the precarious conditions were spotted in the morning at the 1970s-era building, which is being converted into luxury apartments. Construction workers at the site and people in nearby buildings — including a school, diplomatic offices and several hotels — in the busy corridor of midtown were rushed out after firefighters were called there around 8 am. By early afternoon, Mayor Zohran Mamdani said the building remained unstable and called it "an extremely serious situation". City officials going floor-by-floor later found no additional movement of the damaged columns, giving on-site contractors the green light to move forward with emergency repairs, his office said.

VENEZUELA

Airport damaged by quakes to reopen

Venezuela's Acting President Delcy Rodriguez said on Tuesday the international airport damaged in last month's twin earthquakes would reopen as soon as possible using an alternative runway. Simon Bolivar International Airport is in La Guaira, north of Caracas and near the epicenter of the June 24 quakes that toppled scores of residential buildings and killed nearly 3,700 people. One of Latin America's worst earthquake disasters has left thousands of people homeless and thousands more still missing, especially in badly damaged La Guaira, where families are still digging in the rubble. The airport has been partially open to humanitarian flights.

Advancing Chinese modernization in new era through sci-tech innovation

President Xi Jinping delivered an important speech at a meeting in Beijing on Wednesday that brought together the national science and technology award conference, the general assemblies of the members of the Chinese Academy of Sciences and the Chinese Academy of Engineering, and the 11th national congress of the China Association for Science and Technology.

Calling for accelerated efforts to achieve high-level self-reliance and strength in science and technology, and leverage sci-tech innovation to underpin and drive Chinese modernization, Xi's speech is of strategic importance in guiding the country to tackle the tough challenges it faces in building up its science and technology during the 15th Five-Year Plan (2026-30) period and beyond.

"We must seize the historic opportunity, rise to the challenges of the times, accelerate efforts to achieve high-level self-reliance and strength in science and technology, and make steady progress toward the 2035 goal of becoming a leading country in science and technology," Xi said.

Since 2012, China has implemented an innovation-driven development strategy, deepened sci-tech reform and achieved major advances in frontier research and strategic high-tech industries. Underscoring China's growing innovation capacity, R&D spending grew by around 10 percent annually on average during the 14th Five-Year Plan (2021-25) period, with R&D intensity reaching 2.8 percent of GDP in 2025, surpassing the OECD average for the first time.

Despite these achievements, China must be sober-minded as original innovation remains insufficient in some key fields, the structure of the country's scientific talent pool requires further optimization, and the efficiency of research investment can still be improved. Some institutional and regulatory bottlenecks also continue to constrain innovation in certain sectors.

As global sci-tech competition increasingly shifts to the frontiers of basic research, addressing these weaknesses with greater urgency and determination will be essential. To resolve the problems and strengthen the country's innovation capabilities, it is necessary to further improve the overall effectiveness of its national innovation system, while allowing the market to play a decisive role in allocating innovation resources and enabling the government to better fulfill its responsibilities.

Guided by the "four orientations" framework — facing the world's scientific frontiers, the main economic battlefield, the country's major needs and the people's life and health — efforts should be made to step up coordination among planning, policy, mission portfolios, research teams, infrastructure platforms and regional innovation initiatives.

In carrying out research programs, major national sci-tech initiatives must be prioritized. This means concentrating efforts on frontier fields such as artificial intelligence, quantum computing and biosciences; key industries such as semiconductors and advanced manufacturing; and strategic frontiers including deep-sea, deep-space and deep-earth exploration. In the process, the country needs to plan for major research infrastructure, build indigenous capacity in high-end instruments, scientific data and journals, and actively leverage AI to facilitate research.

It is imperative to explore innovation-driven development paths tailored to local circumstances, and establish comparative advantages. Blindly chasing short-lived trends or engaging in "involution-style" competition must be avoided.

Alongside stronger intellectual property rights protection and faster commercialization of research outcomes, the country needs to invest in talent, improve the efficiency of research funding, optimize evaluation practices, and tighten ethics and safety governance. It is also vital to step up risk evaluation, monitoring and rapid-response capabilities in sci-tech security, while ensuring that high-level research goes hand in hand with high-caliber protection, particularly for critical infrastructure.

Meanwhile, China will deepen its engagement in global sci-tech governance, actively present its vision and solutions to the international community, and elevate its voice and influence in international rule-making. By doing so, the country can contribute more original innovations and solutions to the progress of humanity while advancing Chinese modernization.

US curbs on win-win cooperation costly

As artificial intelligence developers in the United States continue to raise prices and usage costs soar, Chinese AI models are quietly gaining ground in the US market.

Since February, the percentage of tokens that come from Chinese models used by US companies on OpenRouter, a leading global AI platform, has exceeded 30 percent each week, peaking at 46 percent. In contrast, according to a CNBC report, in the first half of 2025, the US usage figure for these fundamental units of data processed by AI models was only 4.5 percent.

While matching the capabilities of top-tier overseas models, Chinese alternatives are priced at perhaps one-tenth the cost or even less, empowering global users to deploy AI in their respective application scenarios more rapidly and affordably.

The emerging commercial potential of what has been dubbed the "token economy" is already evident in the encouraging financial reports from some Chinese AI companies. Some industry insiders foresee China becoming the world's "token factory" by capitalizing on its energy strengths.

However, while US companies are eagerly embracing Chinese AI technology, Washington is eyeing the rise of China's AI with unease. One lawmaker proposed a "Decoupling America's Artificial Intelligence Capabilities from China Act" early last year in response to the "DeepSeek shock".

Such moves are already a staple in the telecommunications sector. In the latest move, the US Federal Communications Commission announced on Tuesday that it is adding California-based Digitalsystem Technology to a list of companies deemed to pose risks to US "national security" because of its "connections" to Chinese telecom companies. Last month, the agency also stated it would prohibit the use of Chinese equipment in undersea internet cables, citing what it considers "an unacceptable risk to national security".

Additionally, the FCC is reportedly drafting a ban on imports of Chinese inverters, baselessly claiming they could "disrupt" power supplies. These suppressive moves follow earlier FCC bans on new foreign models of drones and routers, which primarily target Chinese products. The unwarranted crackdown not only deprives Chinese businesses of a fair, just and nondiscriminatory environment, but also harms the US' own interests.

The US' politicized crackdown on Chinese high-tech enterprises will only raise costs for US businesses and harm the interests of US consumers. This approach contradicts fundamental market principles and undermines the mutually beneficial economic and trade relationship between China and the US.

Cooperation benefits both sides, whereas conflict harms both. US policymakers should stop their unwarranted suppression of Chinese high-tech companies, including pressuring their allies to implement high-tech trade embargoes.

On Tuesday, Dutch Trade Minister Sjoerd Sjoerdsma said in Beijing that his country and China were cooperating "extremely well" to resolve a dispute involving chipmaker Nexperia. Chinese Commerce Minister Wang Wentao, at a meeting with his Dutch guest, expressed the hope the Netherlands will help maintain the stability of semiconductor supply chains and resolve corporate disputes.

The visit coincides with the US pushing the Multilateral Alignment of Technology Controls on Hardware, which aims to further expand export controls on semiconductors to China. The Dutch government is lobbying the US to reconsider the restrictive move as it would constrain Dutch semiconductor giant ASML's ability to sell to China.

In contrast to the US' hegemonic approach in the high-tech sector, China has advocated a collaborative strategy, emphasizing the importance of international cooperation to achieve shared innovation progress. This approach highlights the potential benefits of pooling resources, knowledge, and expertise across borders to address global challenges and drive technological advancements that can benefit all nations.

As a leading advocate, promoter, and pioneer in AI capacity building, China has introduced the Global AI Governance Initiative. This initiative aims to help countries share the benefits of artificial intelligence and bridge the global AI divide. It emphasizes a people-centered approach, prioritizing human well-being, social security and respect for national sovereignty, while promoting AI as a tool for sustainable development and addressing global challenges such as climate change.

In this rapidly evolving technological landscape, nations should prioritize cooperation over confrontation to ensure that technology serves humanity's best interests.

Opinion Line

Cartographic revisionism stretches bounds of credibility

The report released on Wednesday by the China Institute for Marine Affairs, a think tank under the Ministry of Natural Resources, titled "Historical and Legal Critique of the Philippines' Territorial Claims in the South China Sea", raises a fundamental question: what happens when a state seeks to redefine boundaries decades after accepting them as the basis of its own sovereignty?

The report argues that the Philippines' contemporary maritime claims sit uneasily alongside the very legal instruments from which the country derives its territorial legitimacy. The internationally recognized boundaries of the Philippines were established through a succession of treaties during the Spanish and American colonial periods, most notably the 1898 Treaty of Paris, and were subsequently reflected in successive Philippine constitutions. These documents constitute the legal architecture upon which the modern Philippine state was built.

That creates an obvious paradox. The Philippines cannot easily invoke those treaties as the foundation of its sovereignty while simultaneously treating their territorial limits as optional.

This inconsistency becomes particularly striking in Manila's claims over China's Huangyan Island and some islets, shoals and reefs of China's Nansha Islands in the South China Sea. Since the 1970s, the Philippines has progressively expanded its unlawful claims, relying on false arguments ranging from geographical proximity to selective interpretation of history. Yet proximity has never constituted legal title under international law.

Official Philippine maps published well into the late 20th century consistently placed Huangyan Island outside Philippine territory. International jurisprudence has long attached significance to the principle of estoppel, whereby states cannot casually reverse positions on which others have reasonably relied. Maps alone do not determine sovereignty, but official state cartography can provide compelling evidence of how a state defined its own territorial boundaries at a given time.

The issue, therefore, is less about discovering overlooked historical evidence than about revising an established historical narrative to accommodate evolving political objectives.

Such revisionism carries consequences beyond bilateral relations. If every state were to redraw its frontiers through retrospective historical claims, few international boundaries would remain immune to challenge.

That principle becomes particularly relevant in the South China Sea. Stability depends less on absolute agreement than on shared acceptance that legal commitments impose lasting constraints. Once treaties become infinitely malleable, diplomacy gives way to perpetual contestation.

Nor should external forces ignore the contradiction embedded in this debate. Washington frequently presents itself as the "defender" of a "rules-based" international order. But its endorsement of the Philippines on the South China Sea issue is apparently to serve its own geopolitical agenda in the Asia-Pacific. Rules command respect only when applied consistently, not when they coincide with immediate geopolitical interests. Japan also plays an ugly role by supporting the Philippines' provocations toward China in the waters.

International law provides mechanisms for peaceful negotiation and confidence-building. But those mechanisms depend upon a common willingness to distinguish between historical evidence and political aspiration. That distinction has become increasingly blurred in Manila's approach. The Wednesday report depicts a legal narrative that has evolved less through newly uncovered evidence than through shifting political calculations.

Manila cannot simply edit inconvenient chapters without weakening the legal foundations on which its own claims rest. The international system still depends upon one essential discipline: legal consistency. Once governments begin treating established boundaries as endlessly negotiable through retrospective "reinterpretation", uncertainty will spread far beyond any single reef or shoal.

In geopolitics, as in law, credibility is cumulative and contradiction is costly. A nation seeking to redraw its maps should first reckon with the maps it has already drawn.

— LI YANG, CHINA DAILY

What They Say

New efforts needed to match skills with demand

Editor's note: *China aims to develop high-quality employment during the 15th Five-Year Plan (2026-30) period. Shanghai Observer spoke to Wu Ruijun, director of the Institute for Talent Development Strategy at East China Normal University; Ding Xiaoqin, chief researcher in the Chinese Modernization Institute at Shanghai University of Finance and Economics; and Zhan Yubo, vice-director of the Institute of Economics at the Shanghai Academy of Social Sciences, on the integration of high-quality development and employment. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

China's demographic shifts have made the traditional growth model increasingly unsustainable. At the same time, industrial upgrading, technological developments and the rapid advancement of artificial intelligence are reshaping the labor market, leading to pronounced structural employment mismatches.

Although record numbers of university graduates enter the labor market each year, sectors such as advanced manufacturing, elderly care and the digital economy still face a persistent shortage of workers. This paradox of labor shortage amid employment challenges highlights the need to integrate employment objectives into industrial policy, demographic strategy and technological innovation.

As China develops new quality productive forces, accelerates its digital transformation and expands the green and silver economies, equal attention should be given to cultivating emerging occupations and creating new employment opportunities.

Establishing comprehensive labor market forecasting and employment monitoring systems in key industries will better align education with market demands. Dynamic adjustments to academic disciplines, enhanced industry-academia collaboration and a lifelong vocational training system will equip workers with the skills needed to adapt to industrial transformation and technological change.

A unified and efficient national labor market, supported by modern employment services and information sharing, will facilitate labor mobility and improve the matching of skills with jobs, allowing industrial upgrading and employment optimization to advance in tandem.

Enterprises should be encouraged to adopt employment-friendly digital transformation strategies. Promoting the integration of AI with the real economy can foster new growth engines in areas such as intelligent manufacturing and digital services.

At the same time, the development of occupational standards and certification systems for emerging professions should be accelerated. Targeted digital skills training and reskilling programs are essential to help workers transition into new occupations.

For those affected by technological change, stronger social protection and transitional support, including training subsidies and job retention programs, are necessary to ensure that technological progress translates into broader employment opportunities, higher incomes and improved living standards.

Employers should modernize their hiring practices by moving beyond an excessive reliance on academic credentials, seniority or institutional background. Instead, greater emphasis should be placed on practical skills, professional competence and job performance. A more inclusive labor market should provide opportunities for university graduates, skilled workers, career changers and workers in emerging forms of employment.

Enhancement of social security and occupational injury protection for flexible workers, together with greater public recognition of skilled workers, grassroots professionals and entrepreneurs, will help cultivate a culture that respects work, values skills, encourages innovation and supports entrepreneurship.

VIEWS

China and the World Roundtable | China-South Asia Cooperation Essential to Common Prosperity

Editor's Note: *The 7th China-South Asia Cooperation Forum opened in Kunming, Yunnan province, on June 11 under the theme "Strengthen Cooperative Partnerships for a Community with a Shared Future with Neighboring Countries". The forum brought together senior diplomats, representatives of regional organizations and experts from South Asia and neighboring countries. Below are selected excerpts from keynote speeches delivered at the forum, as reported by China Daily's Li Yingqing and Yao Yuxin.*

South Asia, China to build a shared future by cooperation

Collective action is essential in a changing world

Iruthisham Adam is the minister of Foreign Affairs of the Maldives.

The world is undergoing a profound transformation. Geopolitical tensions, economic uncertainty, climate-related challenges and growing pressures on multilateral institutions continue to reshape the international landscape.

The ongoing conflicts and crises around the world highlight the importance of dialogue and diplomacy in safeguarding international peace and security.

For small island developing states such as the Maldives, the effects of such crises are often amplified, highlighting their vulnerability to external developments and the importance of a peaceful and stable international environment.

In the face of ongoing crises, collective action remains indispensable. One nation cannot address the complex challenges of the time alone.

China has consistently emphasized consensus, common prosperity and cooperative approaches to global challenges. These principles continue to resonate across the region, reflecting shared aspirations for development and stronger regional ties.

Ultimately, the strength of any relationship lies not only in shared interests, but in the trust, understanding and goodwill that sustain it.

Technology and innovation will drive future growth

Arun Hemachandra is Sri Lanka's deputy minister of Foreign Affairs and Foreign Employment.

The international community faces economic uncertainties, climate challenges, technological transformations and growing geopolitical complexities. At such a time, solidarity, mutual trust and partnership among neighboring countries have become more important than ever.

The vision of building a community with a shared future is based on the principles of mutual respect, peaceful coexistence, inclusiveness and win-win cooperation. Stronger regional partnerships are essential for addressing common challenges and unlocking new opportunities for growth and development.

Future cooperation needs to focus on promoting trade, attracting investment, enhancing connectivity, accelerating digital transformation, and expanding opportunities in tourism, renewable energy, agriculture and the blue economy.

Educational exchanges, youth engagement, cultural interactions, academic collaboration and tourism cooperation are essential for fostering mutual understanding and building lasting friendships among nations.

Innovation and technology are equally important drivers of future growth. By strengthening cooperation in digital technologies, artificial intelligence, innovation and capacity building, countries can better equip themselves to meet the demands of a rapidly evolving global economy.

Greater regional cooperation in climate adaptation, disaster risk reduction, renewable energy and sustainable development is essential to safeguarding the collective future.

By advancing South-South cooperation, strengthening connectivity, promoting sustainable development and deepening people-to-people exchanges, countries can unlock new opportunities for growth and resilience.

China-South Asia trade still has vast untapped frontiers

Mohd Golam Sarwar is secretary-general of the South Asian Association for Regional Cooperation.

The South Asian Association for Regional Cooperation was established in 1985 to elevate the welfare and quality of life of the peoples of South Asia, engineer collective solutions to shared challenges, and build an enduring spirit of friendship, trust and mutual respect among its member states.

Four decades later, SAARC stands as the embodiment of hope for regional peace, stability, progress and solidarity — bound by a shared history, culture and destiny.

As a valued observer country, China shares a relationship with SAARC that the region deeply treasures.

China remains the primary economic and trade partner for South Asian nations. Bilateral trade volume now exceeds $200 billion annually, having doubled over the past decade with an average annual growth rate of 6.3 percent.

While traditional synergy in agriculture, energy, minerals and infrastructure remains strong, cooperation is rapidly expanding into pioneering frontiers.

Today, China and South Asia are actively collaborating in green energy, photovoltaics, electric vehicles, low-carbon initiatives, digital technologies, intelligent manufacturing and cross-border e-commerce.

To ensure this economic relationship is both sustainable and mutually enriching, there should be a deeper and more resilient equilibrium in regional trade volumes.

The China-South Asia Expo, which showcases advances in bio-medicine, green energy, advanced manufacturing, cultural tourism, wellness and modern agriculture, can inject fresh momentum into the regional economy and create common ground for development.

SHI YU / CHINA DAILY

Partnership, not polarization, is South Asia's choice

Khalil Hashmi is Pakistan's ambassador to China.

South Asia is home to almost a quarter of humanity, endowed with abundant natural resources and a great talent pool. Yet, the region has lagged behind other regions such as Southeast, Central and Northeast Asia.

Despite the demographic dividend, the social and economic indicators of South Asian countries leave much to be desired.

The region faces complex challenges: conflicts, poverty, climate vulnerability, water insecurity and uneven development. Countering these challenges requires a bold vision, statesmanship and new development partnerships.

South Asia's history over the past 75 years demonstrates that building a truly peaceful and prosperous region hinges on resolving long-standing disputes and adhering to international law and the United Nations Charter.

A new blueprint for a development partnership between China and South Asia should be based on principles of peaceful coexistence, cooperation, solidarity and shared prosperity.

It is time to consider establishing a standing China-South Asia Development Forum as an annual platform, hosted on a rotational basis among South Asian countries.

The region stands at an important crossroads. The choice should be partnership over polarization, development over discord, and hope over despair.

Development must serve both people and planet

The focus on deepening cooperative partnerships and building a community with a shared future reflects what the Himalayan region has practiced for generations — living in harmony with nature, respecting each other's sovereignty and seeking mutual benefit.

Bhutan's Gross National Happiness philosophy places the well-being of people and the protection of the environment at the center of all development.

China's vision of ecological civilization, captured in the principle that "lucid waters and lush mountains are invaluable assets", speaks the same language. Yunnan province is a living example of this wisdom — its breathtaking landscapes, rich biodiversity and harmonious multi-ethnic culture mirror the spirit of the Himalayas that connects Bhutan, Nepal, India, Bangladesh and China.

Karma Dorji is a former minister of Industry, Commerce and Employment of Bhutan.

The great rivers that flow from these shared mountains nourish hundreds of millions across the region.

China's extraordinary achievement in lifting nearly 800 million people out of extreme poverty through people-centered, long-term strategies offers powerful lessons for the Global South.

Future cooperation should move beyond transactional cooperation toward genuine, long-term friendship built on mutual respect, non-interference and win-win outcomes.

Green energy, digital economy, cultural tourism, agriculture, health cooperation and people-to-people exchanges provide tremendous potential to deepen understanding and build the human bridges that make all other cooperation sustainable.

Cooperation is foundation of Asia's shared future

Himadrish Suwan is the chairperson of the Confederation of Young Leaders and director-general of the Indian Institute of Governance and Leadership.

The world is undergoing a deep transformation, economic interdependence is deepening, and technological change is accelerating at an unprecedented pace. In such a world, cooperation among neighbors is no longer optional — it is essential for stability, prosperity and peace.

China and South Asia together represent nearly half of humanity. This is not merely a geographic reality, but also a civilizational responsibility.

Former Indian prime minister Atal Bihari Vajpayee once observed: "You can change your friends, but you cannot change your neighbors." This is not merely a reflection on geography — it is a strategic truth. Neighborhoods are permanent.

As two ancient civilizations, two major economies and two leading voices of the Global South, India and China are not only bilateral partners in complexity — they are also indispensable actors in shaping the Asian century.

When youth connect, stereotypes dissolve. When societies understand each other better, strategic space for stability expands. Let this be the century in which Asia does not merely rise, but rises together.

The views don't necessarily reflect those of China Daily.

Khalid Taimur Akram

Why Party-building thought matters for governance

Global Lens

One of the central questions in comparative politics is how governing parties sustain effectiveness over long periods of time. While different political systems provide different answers, China's experience offers a distinctive perspective.

Rather than relying primarily on electoral competition or frequent institutional redesign, the Communist Party of China has placed growing emphasis on strengthening itself through strict Party governance, organizational discipline and continuous self-improvement.

This approach has become one of the defining features of Xi Jinping Thought on Party Building. At its core is the concept of the Party's "self-reform" — the idea that a long-governing ruling party must constantly reform itself if it is to remain effective, responsive and capable of leading national development.

China's rapid industrialization, modern infrastructure, technological advancement and unprecedented poverty reduction have attracted worldwide attention.

While these achievements are often attributed to industrial policy, long-term planning or economic reforms, they also reflect a deeper institutional foundation. Effective governance requires not only sound policies but also organizations capable of implementing them consistently across a country of more than 1.4 billion people.

For this reason, President Xi Jinping has repeatedly stressed that Party building is inseparable from national governance.

A disciplined, capable and clean governing party is viewed not simply as a political objective but as a prerequisite for effective State capacity.

One important aspect of this philosophy is comprehensive Party self-governance. Over the past decade, anti-corruption efforts have become one of the most visible manifestations of this approach. Corruption weakens public trust, reduces administrative efficiency and undermines long-term development.

Through strengthened supervision, stricter disciplinary mechanisms and greater institutional oversight, China has sought to reinforce accountability throughout the Party and government.

High-profile investigations involving officials at different levels demonstrate the intention to enforce discipline regardless of rank. More broadly, anti-corruption is viewed not as an isolated campaign but as part of a broader effort to improve governance by strengthening institutions and preserving public confidence.

Yang Youlin, former executive deputy director of the administrative committee of the Nanjing economic and technological development zone in East China's Jiangsu province, was sentenced to death on Monday by the Changzhou Intermediate People's Court after being convicted of multiple crimes, including accepting more than 2.2 billion yuan ($324 million) in bribes.

Another defining feature of Xi's Party-building philosophy is the emphasis on institutional learning. Governance is treated as a continuous process of identifying weaknesses, evaluating performance and refining policy implementation. Rather than assuming that existing institutions remain permanently effective, the Party seeks to improve its organizational capacity through constant adjustment and internal reform.

This concept of self-reform therefore extends beyond anti-corruption. It encompasses organizational renewal, institutional resilience and the ability to adapt to changing domestic and international circumstances. The objective is not change for its own sake, but continuous improvement in governance capacity.

China's policymaking process reflects this philosophy. Major reforms frequently begin as carefully designed local pilot programs before being expanded nationwide.

Experiences from different provinces and municipalities are evaluated, refined and incorporated into national policy where appropriate. Successful practices are institutionalized, while unsuccessful ones are adjusted or discontinued.

Such an approach allows the government to accumulate policy experience rather than repeatedly starting from scratch. Institutional memory becomes a source of long-term governance capability, enabling continuous improvement instead of cyclical reinvention.

China's campaign to eliminate extreme poverty illustrates this model.

Beyond financial investment, success depended on extensive data collection, detailed policy evaluation, local implementation mechanisms and continuous administrative adjustment. Governance capacity was strengthened not only through resources but through the ability to learn systematically from implementation.

This was the story of "cliff village", perched 800 meters above the ground in Sichuan province's remote Daliang Mountains — equivalent to a 200-story building. In 2016, the local Party secretary led the replacement of perilous vine ladders with steel staircases, transforming access.

The village went viral online, and a local shepherd became a popular vlogger and tour guide filming the steel ladders, cliffs, cloud seas, and sunrises. The steel ladder brought the greatest benefits to local students with a new modern school built. Life became much better.

The same principle increasingly applies to technological development. China's progress in artificial intelligence, digital governance and advanced manufacturing reflects not only scientific investment but also institutional coordination, long-term planning and policy continuity. These are areas where organizational effectiveness becomes as important as technological capability itself.

Countries employ different mechanisms to ensure accountability. Some rely primarily on competitive elections and changes of government. Others emphasize institutional checks and balances, judicial oversight or administrative professionalism.

China's model places greater emphasis on internal Party supervision, organizational discipline and continuous institutional improvement. Each system reflects its own historical experience and political traditions.

For scholars of comparative governance, China's experience offers an important case study. Rather than evaluating political systems solely according to institutional form, increasing attention is being paid to governance effectiveness, policy implementation and State capacity. Researchers continue to examine how Party discipline, organizational reform and administrative modernization interact to influence economic development and public administration.

China's growing international role has further intensified interest in these questions. Through trade, investment, infrastructure cooperation and development partnerships, China has become a major participant in global governance.

Many developing countries are increasingly interested not simply in China's economic achievements but also in the institutional mechanisms that have supported long-term policy continuity and national modernization.

Xi has consistently argued that reform is never complete. As technological innovation accelerates, demographic changes deepen, environmental pressures increase and geopolitical uncertainty grows, governance itself must continue evolving.

In this context, Party building is presented as an ongoing process rather than a one-time institutional adjustment.

As China pursues high-quality development in an increasingly complex international environment, the evolution of its Party-building philosophy will remain central to understanding both its governance model and its future trajectory.

SHI YU / CHINA DAILY

KONSTANTINOS GRIVAS

Beyond the Thucydides Trap

In a world searching for new foundations, Greece and China show how ancient civilizations can help construct a more harmonious international order

For decades, international relations have been dominated by theories emphasizing competition, confrontation and the supposedly inevitable clash of interests. Such approaches often assume that emerging countries and established powers are destined to become adversaries and that the international order is shaped primarily through economic pressure and military superiority. Yet in the 21st century, the world is becoming too interconnected, pluralistic and culturally diverse to be understood through such simplistic binaries.

This is where Greece and China enter the picture.

These are not merely two nation-states maintaining diplomatic relations. They are two of humanity's oldest continuous civilizations, whose intellectual traditions have profoundly influenced the course of world history.

Greek civilization introduced philosophical inquiry, dialectical reasoning and a conception of truth emerging through dialogue rather than dogma. Chinese civilization developed equally profound traditions centered on harmony, balance, relational thinking and the cultivation of social order. Although they emerged independently, both traditions share a remarkable openness toward complexity and a resistance to rigid, absolutist categories.

Indeed, one of the most valuable contributions of Chinese civilization to contemporary global discourse lies precisely in its rejection of binary thinking. The Confucian search for harmony and the Taoist appreciation of complementary opposites offer an intellectual framework very different from the zero-sum assumptions that often dominate modern geopolitics. Rather than viewing international relations exclusively through the prism of winners and losers, friends and enemies, such traditions encourage the search for equilibrium, coexistence and creative management of differences.

Similarly, the authentic Greek intellectual tradition differs substantially from deterministic interpretations often associated with modern strategic thought. Greek thought emphasizes freedom, creativity and the open-ended nature of history, believing that human beings are not imprisoned within historical inevitabilities — they retain the ability to shape their future through wisdom, dialogue and responsible action.

In this sense, both civilizations challenge the notion that conflict is destiny.

The significance of China's Global Civilization Initiative lies precisely in its recognition that culture and civilization are not secondary issues but central dimensions of international affairs. For too long, global discussions have been dominated by economic indicators, military balances and technological competition. While these factors remain important, they cannot by themselves provide answers to humanity's deeper challenges.

Civilizations matter because they shape how societies understand power, cooperation, human dignity and historical change.

This is why cultural cooperation between Greece and China possesses strategic importance extending far beyond cultural diplomacy in the narrow sense. Exchanges between universities, research institutions, museums, cultural organizations and intellectual communities can contribute to a broader dialogue concerning the future of humanity itself.

Such cooperation can help generate alternative perspectives on global governance, development and international coexistence. It can also demonstrate that cultural diversity is not an obstacle to cooperation but one of its most important foundations.

The relationship between Greece and China also possesses a significant geoeconomic dimension.

Greece occupies a pivotal position at the crossroads of Europe, Asia and Africa. Greek-owned shipping remains one of the principal arteries of global commerce. Meanwhile, China has emerged as one of the world's leading economic and technological powers.

The Belt and Road Initiative has created a framework within which these complementary advantages can converge. Greece participated actively in the initiative through the development of the Port of Piraeus, transforming the port into one of the most important maritime hubs connecting Asia and Europe.

Yet the deeper significance of the BRI extends beyond infrastructure. Historically, the ancient Silk Road was not merely a trade route. It included channels through which ideas, beliefs, technologies and cultural traditions traveled across continents. In a similar way, contemporary connectivity can become a vehicle not only for economic prosperity but also for civilizational dialogue.

There is also a maritime dimension to this relationship that extends beyond economics. Ancient Greece became a civilization of the sea, connecting peoples, ideas and markets across the Mediterranean world. Modern China is once again strengthening maritime connectivity across Eurasia and beyond. In this sense, the cooperation between Chinese economic dynamism and Greek maritime expertise represents more than a business partnership. It symbolizes the meeting of two historical traditions that have long understood the sea not as a barrier separating societies but as a bridge connecting them. The Port of Piraeus stands today as a tangible manifestation of this shared vision of connectivity.

The partnership between Greece and China therefore combines two dimensions that are rarely found together, namely profound cultural affinity and tangible strategic cooperation.

As the international system enters a new era, humanity requires frameworks capable of moving beyond deterministic visions of inevitable confrontation. The dialogue between Greek and Chinese civilizations offers precisely such a possibility. It reminds us that history remains open; cooperation is not weakness and civilizations can enrich one another without abandoning their identities.

In a world searching for new foundations, the encounter between Greek and Chinese civilizations may become one of the most important examples of how ancient civilizations can contribute to the construction of a more harmonious and genuinely multipolar international order.

WOJCIECH NOWIAK

Sharing experiences for common prosperity

'China Opportunity 2.0' brings innovation and investment dividends to the EU and all global partners in an era plagued by supply chain decoupling and trade barriers

At the opening plenary of the 17th Annual Meeting of the New Champions, also known as the Summer Davos, which was held in Dalian, Liaoning province, on June 24, Chinese Premier Li Qiang referred to "China Opportunity 2.0". This year marks the start of China's 15th Five-Year Plan (2026-30) for economic and social development. The plan has not been formulated only for domestic development; rather, it is an element of contemporary China's policy of openness to the world. It is also related to global innovation cooperation based on China's economic development practices. It is evident from the Chinese path to modernization that innovation drives development and shapes the future. This has shown the resilience of China in the face of geopolitical changes. Thanks to the implementation of innovative policies during the 14th Five-Year Plan (2021-25) period and earlier five-year plan periods, China has proved to be among the economies most resilient to various global fluctuations such as unilateralism and protectionism.

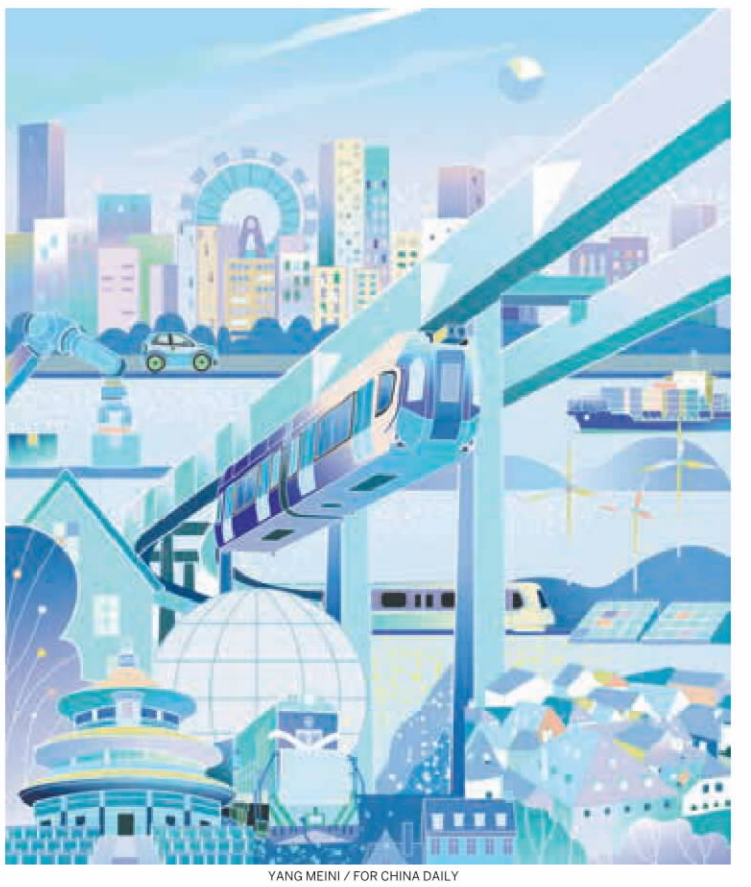
On the one hand, understanding these processes is important, particularly for European Union politicians trying to resolve the Ukraine crisis and torn by internal disputes over relations with the United States and NATO countries in Europe. On the other hand, this understanding applies to opinion-forming bodies, including the media, because they help shape the messages that reach practically everyone. European countries would better embrace "China Opportunity 2.0" — through positive ties with China — to tap their development potential, rather than fabricating "China Shock 2.0" to justify their inability to upgrade their economies.

It is worth noting that some clear-minded European politicians and objective opinion-forming circles have grasped the main idea regarding crisis resilience, which is based on stability, innovation, dynamism and integration. Reviewing China's achievements in the past years, there is growing consensus that stability supports economic growth and improves people's lives. Innovation is central to China's position as a hub for rapidly emerging technologies, products and business models.

The growing vitality of the Chinese economy, the vibrancy of its market and the high potential of its domestic demand reflect dynamism, as evidenced in its status as the world's second-largest economy. China's growing openness amid rising protectionism is seen in its zero-tariff policy for 53 African countries with which it has diplomatic ties. Now, China is presenting the world, including the EU, with the message: Innovation-based development is key to China's long-term, sustained economic success. And China is also sharing its experience with others to achieve common prosperity. In the past, China's large market and low-cost production factors provided "market dividends" for the world. Today, through "China Opportunity 2.0", China is sharing with the rest of the world the dividend from its innovation through technological advancements and industrial upgrading. The combination of these dividends creates greater opportunities and potential for growth worldwide.

"China Opportunity 2.0" therefore holds practical significance for the EU. It is hoped that the "innovation dividend" can also be beneficial for EU economies and societies.

For enterprises around the world, "China Opportunity 2.0" also means an overall strengthening of innovation and investment opportunities with a high return. An increasing number of foreign enterprises have come to China to establish research centers and regional headquarters and to integrate deeply with China's innovation and industry chains. This is a clear transition from "made in China" to "created in China". It is estimated that in 2025, 14,000 foreign-funded enterprises were established in research and technology services, up 27.2 percent year-on-year. Are there or can there be EU entities among these companies? Of course, yes. EU companies can quickly find partners throughout the process, from R&D to prototyping to mass production, making innovation easier and more efficient. This not only helps companies succeed in the Chinese market but also increases their global competitiveness. It should be borne in mind and understood that success in the Chinese market is synonymous with the opportunity of global success. China's fast-growing innovative enterprises can generate returns for investors around the world. For global development, "China Opportunity 2.0" means more accessible advanced technologies and widespread results.



China has an open approach to innovation. Many of its innovations are open-source. This enables more countries, especially developing countries, to access new technologies and products, increasing their capacity to develop and addressing some of the challenges that hold back global development. EU countries should pay special attention to this, because if they distance themselves from China, they also distance themselves from one of the major hubs of innovation. China serves as an innovative reference to the rest of the world. The EU can learn from it in a more cooperative and positive way.

China, as an innovation leader, has another important message: Technology has never developed so quickly before, but the risk of losing control is increasing. That is why China's proposal also applies to global innovation management. Artificial intelligence has greatly increased the efficiency of innovation, and breakthroughs are occurring across all frontiers. But the risk of losing control and making ethical mistakes is also increasing. That is why joint management, and not the creation of barriers to cooperation, is important.

China has unequivocally proved that it supports deepening connectivity and cooperation to build greater synergies for innovation. In this new round of technological revolution and industrial transformation, no country or company can succeed alone. A connected global market enables a more efficient flow and allocation of inputs and significantly reduces innovation costs.

Does the EU want to distance itself from these proposals? The answer should be no. Therefore, the more it taps into "China Opportunity 2.0", the more benefits there are for the global community. Representatives of the business world who accompany the heads of state from some European countries visiting Beijing know this. China's growing competitiveness in advanced manufacturing, clean energy, AI and robotics creates new opportunities for multinational companies.

Fresh options for Chinese investment

New projects closely tied to supply chain security, clean energy, high tech

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

Chinese firms are entering a new phase of global expansion, shifting from exporting products to building overseas supply chains and expanding capabilities, reflecting a more mature and diversified global strategy, industry experts said.

Ning Loh, managing director and head of global credit strategy at Moody's Ratings, said: "Chinese companies have developed strong manufacturing capabilities with cost advantages and very deep and developed domestic supply chains. The country is moving away from lower-value exports to a much broader global strategy around technology and Chinese brands."

Loh said the latest wave of Chinese outbound direct investment has been "more strategic, selective and diversified", as companies are expanding overseas to offset slowly recovering domestic demand, mitigate geopolitical and tariff risks and internationalize their supply chains, production capacity and technologies.

Unlike earlier waves of outbound investment, which centered on securing natural resources and pursuing large mergers and acquisitions in developed markets, today's investments are closely tied to supply chain security, clean energy, advanced technologies and critical minerals, he added.

The shift is evident when taking a look at where Chinese companies are investing, the sectors they are targeting and the motivations behind their overseas expansion.

South and Southeast Asia — along with Latin America — have emerged as major destinations for Chinese investment, while North America's share of China's outbound direct investment has declined.

The sectoral focus has also changed markedly. Whereas Chinese companies previously concentrated on traditional infrastructure, property services and financial assets, the past five years saw investment increasingly directed toward electric vehicles, batteries, advanced technologies, renewable energy, critical minerals and electronics.

Born in Malaysia and having lived in Thailand, Loh said he has witnessed the transformation firsthand through the rapid rise of Chinese EV brands across Southeast Asia.

"A couple of years ago, very few people had heard of brands like Chery or BYD," he said. "Now, they are among the best-selling cars and have completely changed the market."

He said artificial intelligence is also accelerating the overseas expansion of Chinese companies by enabling them to localize faster, improve customer service and reduce costs.

The rapid deployment of AI, together with broader technological and innovation upgrades, is expected to fuel a new wave of overseas expansion by Chinese service providers across sectors including technology, logistics and travel, said a Moody's Ratings report released on June 10.

Loh said overseas expansion has become an increasingly important strategy for Chinese companies as domestic demand remains relatively weak compared with the country's manufacturing capacity. Expanding abroad allows companies to diversify their markets while reducing exposure to trade tensions and tariffs. At the same time, China is seeking to secure reliable access to critical minerals and key technological inputs needed to support the sectors driving its economic growth.

Sherman Hung, deputy CEO & head of institutional banking group at DBS China, said supply-chain diversification is a natural part of Chinese companies' global expansion, driven by the need to expand market reach, maximize profitability and build resilience.

"What we observe across our ASEAN network is companies optimizing their Asia-Pacific footprint by establishing regional manufacturing and logistics hubs — creating a synergistic model that combines Chinese capabilities with regional nodes," said Hung.

"On industrial upgrading, Chinese enterprises have built genuine global competitiveness in renewable energy, EVs, smart equipment and advanced manufacturing. Their outbound investment increasingly represents an extension and localization of those capabilities, not just a search for cheaper inputs."

Looking ahead, Hung said the green economy is expected to remain the most prominent investment option, with Chinese companies in clean energy and energy storage leveraging their scale advantages to meet growing global demand.

He also highlighted two other areas with significant growth potential: consumer-related sectors in emerging markets and high-end manufacturing, where China's expertise in smart production and factory management is increasingly being adopted overseas.

"Emerging markets, particularly ASEAN, are becoming the preferred destination for a growing number of Chinese enterprises going global, driven by their growth potential, geographical proximity, cultural affinities and favorable policies. Since the RCEP (Regional Comprehensive Economic Partnership) came into effect, regional trade and investment facilitation has further lowered the threshold for Chinese companies entering ASEAN markets."

Hung said a defining feature of the current phase of Chinese companies' global expansion is an increasing focus on localized operations, adding, "Companies are placing greater emphasis on building brands, channels and teams within target markets to deeply integrate into the local economy."

Simplified tax refunds to boost spending

By **REN QI**
renqi@chinadaily.com.cn

Core measures of the upgraded version 2.0 departure tax refund policy, including a fully paperless process and a random inspection system for small amounts, were officially rolled out earlier this month, allowing inbound travelers to immediately experience seamless efficiency.

"Previously, processing a tax refund required paper invoices and forms, which took time to print and were easy to lose, but now the entire process can be completed with just one code," said a Romanian traveler. On July 1, he purchased a watch in Beijing, generated an electronic form by scanning a code at the store, and quickly verified it at the Beijing Capital International Airport customs window.

This paperless system allows travelers to generate a universally applicable "departure tax refund service code" via mobile browsers anytime after entering the country. It enables them to process refunds at any designated store or departure port nationwide and track electronic invoices and progress online, making the procedure fully traceable.

Efficiency is further boosted by a new regulation effective July 1, which applies random physical inspections to refund applications under 10,000 yuan ($1,471). "My documents were not selected for physical inspection today, so I completed all procedures in just a few minutes, which makes us more willing to buy quality domestic products," said Yang Liqin, a Hong Kong traveler who received a 530-yuan refund for a camera at Shenzhen's Futian Port.

Travelers line up for departure tax refunds at Shanghai Pudong International Airport.
PROVIDED TO CHINA DAILY

To facilitate this, Shenzhen Customs has set up prominent signs and assigned dedicated personnel to direct travelers based on their refund amounts. Sun Yiming, an official at Shenzhen Customs, explained the rationale: "This risk-management approach exempts most small-amount applicants from physical checks, eliminating queues for minor refunds while ensuring smooth operations for those selected."

The digital shift also benefits daily operations. "During peak seasons, writing refund applications used to cause long queues, but now the system automatically generates and sends electronic forms to travelers' phones, saving time and eliminating printing needs," noted a staff member at the Lawson tax refund store at Beijing Capital International Airport.

An official from airport customs stated, "By scanning the traveler's exclusive code, we can retrieve complete electronic documents for online verification, meaning we no longer need to stamp paper applications."

For those still preferring paper, Shanghai Customs introduced smart verification terminals supported by an integrated platform to retrieve digital records if physical invoices are forgotten, helping process 253,000 applications worth 2.3 billion yuan in the first half of the year. Meanwhile, Hangzhou Customs has collaborated with tax, banking and airport authorities to deploy 24/7 "E-Customs Pass" self-service stations to assist travelers.

These streamlined services complement an expanding supply of eligible goods nationwide. "The refund process is simple, and the money arrives instantly, making me want to buy more cultural gifts for my family before returning home," said Marina Ivanova, a Russian tourist drawn to local specialties in Dalian, Liaoning province.

Merchants are seeing tangible economic benefits from the policy. "Since becoming a 'buy-and-refund' store in April, our daily foreign customer foot traffic has doubled, with these sales now accounting for 6 percent of our total revenue," said Zhang Jin, manager of an Adidas store in Chongqing.

Chongqing recently expanded its "buy-and-refund" stores to 78, achieving full coverage of its core commercial districts, with eligible goods now spanning 3C electronics, jewelry, apparel, beauty products and cultural heritage items.

Dassault Systemes' business in China expands

By **WANG KEJU**
wangkeju@chinadaily.com.cn

China's economic resilience, underpinned by its swift policy action and rapid technological innovation, is translating into robust confidence among foreign businesses to scale up investment and expand their presence in this critical market, a senior executive told China Daily.

Samson Khaou, executive vice-president of Dassault Systemes, noted that last year marked the twentieth anniversary of the company's operations in China, during which it witnessed a fundamental shift in how the Chinese economy engages with technology.

"Two decades of experience serving the Chinese market taught us that confidence is driven not just by short-term economic cycles, but by the consistency of government policy and the pace of technological upgrading," Khaou said.

He observed that over the past 20 years, Chinese companies have moved from simply adopting technology to actively shaping it. "This gives us strong confidence that innovation is still thriving in China," he added.

Dassault Systemes is not alone. A May survey by the European Union Chamber of Commerce in China reinforces this view, with 48 percent of respondents saying that Chinese firms in their industry are more innovative than European counterparts.

View of the booth of Dassault Systemes during an expo in Wuhan, Hubei province. PROVIDED TO CHINA DAILY

With a solid base of 60,000 customers, Khaou said Dassault Systemes has seen strong resilience in how Chinese companies are optimizing operations and using technology to drive innovation and excellence in manufacturing and engineering.

"That resilience, in turn, reinforces the company's confidence to continue investing in China on a global scale," he added.

In April, the company announced plans to build an innovation center in Jinhua, Zhejiang province, to bring advanced technologies to the local small and medium-sized enterprise ecosystem.

"Separately, in 2025, through our collaboration with China Telecom's Tianyi Cloud in Nanjing, we are making Dassault Systemes' SaaS, or software-as-a-service, solutions more accessible to customers in China — part of our continued investment in the market," Khaou said.

He added that the center serves two key purposes: first, to ensure that new technologies developed on the company's platform can be taught and disseminated to SMEs; and second, to build joint ventures in segments where China leads the global market, enabling co-development of technologies that will drive local expansion and eventually serve global markets.

In particular, Khaou noted that China is now "leading artificial intelligence on the global stage". The AI boom, he said, is fostering a new generation of entrepreneurs equipped with deep knowledge of how to harness AI for product and service innovation, a trend becoming increasingly visible in China.

China has issued a plan to deeply integrate AI with the manufacturing sector, spanning large AI models, industrial datasets and application scenarios.

According to the Ministry of Industry and Information Technology, China has built a multi-tiered smart factory ecosystem, which comprised over 35,000 basic-level, more than 8,200 advanced-level, over 500 excellence-level and 15 flagship smart factories nationwide as of 2025.

To better capitalize on the AI trend in China, Dassault Systemes is developing AI models, which combine physical AI with industrial AI, rather than relying on large language models, as part of its latest industrial software solutions, according to Khaou.

Khaou said the company looks forward to enhancing the competitiveness and innovation capabilities of traditional industrial manufacturers, especially for smaller businesses.

Briefly

Foreign exchange reserves down in June

China's foreign exchange reserves stood at $3.4163 trillion at the end of last month, down by $26 billion, or 0.75 percent, from the level at the end of May, official data showed. In June, the US dollar index rose, while prices of major global financial assets were mixed, State Administration of Foreign Exchange noted. A combination of factors, including exchange rate translation and changes in asset prices, led to a decline in China's foreign exchange reserves last month, the administration added.

Chinese mainland shares close lower

Chinese mainland shares closed lower on Wednesday, with the benchmark Shanghai Composite Index down 0.49 percent at 3970.88 points. The Shenzhen Component Index closed 1.87 percent lower at 14939.73 points.

XINHUA - CHINA DAILY

Consumer vouchers in pipeline for summer holidays

XINING — China on Wednesday launched a national summer holiday cultural and tourism consumption campaign, with more than 450 million yuan ($66 million) worth of consumer vouchers to be distributed.

Organized by the Ministry of Culture and Tourism, the campaign aims to improve the supply of seasonal tourism products and services and encourage people to enjoy travel during the summer holidays.

Running from early July to late August, the campaign is expected to feature more than 30,000 activities nationwide, catering to popular travel demands, such as summer getaways, coastal vacations, night tourism, cruise trips and study tours.

The ministry, along with other relevant agencies, will put a series of support measures in place, ranging from travel information guides to preferential financial policies. This campaign comes as China has set a target of significantly enhancing people's access to and satisfaction with tourism by 2030, according to a new five-year tourism development plan issued on Tuesday.

China boasts a diverse tapestry of attractions, from breathtaking natural landscapes to profound cultural heritage sites, all supported by modern infrastructure such as high-speed rail and 5G networks. This combination provides a robust foundation for continued consumption growth.

The evolving consumption habits of the younger generation are also reshaping market dynamics, as they are driving the shift toward cultural tourism and more tailored experiences, and opening new opportunities for related sectors, including dining, accommodation and transportation.

This rise in cultural tourism has led to new business models, such as nighttime cultural tourism. The cross-industry integration invigorates the consumer market and injects new vitality into the cultural tourism industry. Consumption vitality burst during the recent May Day holiday, with the sales revenue of related sectors growing by 14.3 percent year-on-year, indicating a further release of spending potential.

Improved transport making regions richer

Flow of goods, visitors being bolstered with expanded expressway network in Guizhou

By **HAN JINGYAN**
hanjingyan@chinadaily.com.cn

Chen Min, a 45-year-old fruit vendor in Liuzhi special district in Southwest China's Guizhou province, never thought that her small business would become internationalized.

Born in the town of Longhe, Chen started selling fruits from a roadside stall in the town three years ago. In addition to the locally produced fruit she sells, Chen buys non-local fruit from a market near Liuzhi East Station.

"I often buy wholesale bananas, mangos and dragon fruit from a trader coming from Kunming in Yunnan province which borders Guizhou," said Chen, pointing to the dozen types of fruit on her food stand. "Some tropical fruits come from Laos, which are transported to Yunnan via the China-Laos Railway."

The 1,035-kilometer railway, which runs between Kunming South Station and Vientiane South Station in Laos, went into operation in December 2021, transporting over 3,800 kinds of goods in addition to passengers.

The railway has become an important logistics channel connecting China, Laos and Southeast Asian countries.

"Besides those non-local fruits, the plums, peaches and watermelons are locally produced," she said, adding that she can earn over 100,000 yuan ($14,730) annually from selling fruit.

Chen said she is now betting on the expanded Shanghai-Kunming Expressway, which runs through Liuzhi and serves as a crucial horizontal transport artery connecting western Guizhou with Yunnan and Southeast Asia.

The 2,730-km Shanghai-Kunming Expressway, which was fully connected on Sept 8, 2011, has faced pressure as the existing four-lane road section in Guizhou has had to battle congestion amid fast economic growth.

To alleviate congestion and aid regional economic development, Guizhou decided to expand the Anshun-Panzhou section of the expressway, with the expansion starting in 2022, said Li Shifu, Party secretary of the APFJ-3 division of China Railway No 4 Engineering Group in building the section.

Invested by Guizhou Transportation Investment Group, the Anshun-Panzhou expressway cost some 32.311 billion yuan and has 97 km within Liupanshui, Li said.

"With the new Anshun-Panzhou section being put into operation later this year alongside the existing expressway, fruit coming from Laos and from Kunming will be faster, while transport costs will fall," Chen said, adding that this will help her earn more.

China has been bolstering its road network, with the Ministry of Transport saying the country invested some 779.7 billion yuan on building roads during the first five months of this year.

Experts estimate the nation's roads transported some 21.2 billion metric tons of goods during the first half, as well as 23 billion trips for passengers during the period.

Agricultural advancement

Administered by the prefecture-level city of Liupanshui, county-level Liuzhi houses some 750,300 residents coming from 32 ethnic groups in 15 towns, and its agricultural produce is noticeable.

Liuzhi netted a regional GDP of 19.387 billion yuan in 2025, an annual hike of 6.0 percent, said Yao Hong, magistrate of Liuzhi, promising to increase the local GDP by 6.5 percent in 2026.

Chen Min (center), a 45-year-old fruit vendor in Liuzhi special district in Guizhou province, sells fruit from her roadside stall. LI SHIFU / FOR CHINA DAILY

The modernization of agriculture in Liuzhi is accelerating, Yao said, adding that "we have turned mountainous agriculture into a distinctive product and achieved a new leap in traditional industries".

Wei Mingxiang is the head of a professional strawberry and vegetable planting cooperative in Mugang town, grouping five families.

Set up in July 2014, the cooperative is engaged in strawberry, konjac and vegetable planting, netting some 600,000 yuan each year, Wei said.

With 96 vegetable greenhouses on a land of some six hectares, the group can produce over 1,500 kilograms of "Chocolate" brand strawberries per 600 square meters between November and early April.

"During the holidays and weekends, people from the cities of Anshun and Guiyang, our provincial capital, would drive to our greenhouses to pick strawberries," Wei said.

In busy days, he would hire a dozen local farmers to help.

He said he hoped that the new Anshun-Panzhou expressway will help bring more visitors. The section starts at the county seat of Puding county in Anshun and ends at Panguan town in Panzhou under Liupanshui.

Yao said that his district will prioritize characteristic agricultural industries to let farmers earn more and faster.

It will build over 333 hectares of high-standard vegetable bases, cultivate 6,086 hectares of tea plants, grow 16,670 hectares of vegetables, and 9,066 hectares of high-quality fruit this year, he said, noting that it also aims to raise 320,000 pigs, 36,700 beef cattle, 39,900 sheep and 3.83 million poultry this year.

More development pillars

Li said that during the past few years in constructing roads in Liuzhi, he has come to see that the district awaits more pillars to boost its socioeconomic progress.

With the opening of the Nayong-Qinglong Expressway on Sept 26, 2025 and the Liuzhi-Anlong Expressway on Sept 28, 2025, Liuzhi is able to usher in diverse industries.

Besides agricultural output, Liuzhi is rich in over 20 types of mineral resources, including coal, iron, sulfur and limestone, with confirmed coal reserves reaching 3.3 billion tons, as well as abundant coalbed methane deposits hitting some 65 billion cubic meters, Li said.

By focusing on "six major industrial chains", the whole district strives to earn more than 30 billion yuan from coal chemicals, over 30 billion yuan for new energy battery and material bases, and over 5 billion yuan for fluorine chemical bases by the end of the 15th Five-Year Plan (2026-30) period, Yao said.

Last year, Liuzhi's coal production increased by 34.85 percent compared with the end of the 13th Five-Year Plan (2016-20) period.

This year, Liuzhi will continue boosting its coal industry, focusing on expanding its current production capacity, and developing more mining areas, Yao said.

By 2030, the total economic output in Liuzhi is expected to hit 28 billion yuan, with an average annual growth rate of 6 percent, Yao said.

That's why Liuzhi is so eager to see the expansion of local traffic network, Li said.

Rich tourism resources

Yin Shigang, Party secretary of the CREC4 project department in building the Anshun-Panzhou expressway, said Liuzhi has garnered such titles as "China's Most Beautiful Leisure Resort" and "China's Ecological Charm City" with its beautiful mountains and rivers.

Set up in the 1960s with a total area of 1,792 square kilometers, Yin said Liuzhi is the core area of the ancient Yelang Kingdom — a tribal region composed of many tribes during the Warring States Period (475-221 BC), and its unique tourism integrates ethnic cultural customs, natural scenery and renowned historical sites.

Figures show that between 2021 and 2025, the district's tourism sector greeted 49 million tourists, generating revenue of 70.617 billion yuan.

With the forthcoming opening of the Anshun-Panzhou expressway, the development of Liuzhi's tourism will be faster, Yin said.

Earlier this year, Zhou Huabao drove his family from his hometown in nearby Guangxi Zhuang autonomous region for a visit to Liuzhi.

They made trips to Yanjiao ancient town, Suojia Miao ethnic ecomuseum in Suojia town, and Niuchang, attending special folk activities such as the June 6 Buyi ethnic event.

"The scenic spots in Liuzhi are very interesting," Zhou said, noting how they made a lasting and positive impression on him.

Liuzhi magistrate Yao said that with the expected operation of the Anshun-Panzhou expressway, the district will further promote the integrated development of tourism and strive to achieve a 5 percent year-on-year hike in tourism consumption.

Yin said as Liuzhi is a picturesque place with more than 40 rivers and streams, and high mountains, protecting the local environment has been a priority for them while constructing the expressway.

"During our construction work, we tried our best to maintain the original natural terrain, minimizing the impact of construction on the environment," Yin said.

Yin worked with over 2,400 employees, including 215 local ethnic minority workers who are glad with the new expressway in their hometown.

Construction boosts livelihoods, skills capacity

By **HAN JINGYAN**

Since joining State builder China Railway No 4 Engineering Group in 2006, Zhong Lei, a 44-year-old employee, has been working in the country's southwest for years.

His experience has made him understand that a construction job has a multitude of benefits — infrastructure connectivity, beautified environment, elevated wealth for people and bolstered industrial vitality.

Born in Dazhou, Sichuan province, Zhong joined CREC4 after graduating from Hefei University of Technology with a major in civil engineering. He later moved to Guizhou province to help build the Chongqing-Zunyi section of Lanzhou-Haikou Expressway.

With some 25,500 staff, CREC4's businesses are distributed across 31 provinces, municipalities, and autonomous regions on the Chinese mainland, as well as in 38 countries and regions, including Angola, Mongolia and Indonesia.

In 2022, Zhong was promoted to serve as work safety supervisor at the APFJ-3 division of CREC4 in expanding the Anshun-Panzhou section of the Shanghai-Kunming Expressway.

The Anshun-Panzhou section, which costs some 32.31 billion yuan ($4.75 billion), passes through Liuzhi special district in Guizhou.

"Hefei-based CREC4 has a clear aim in its construction work — building a top-quality project, and nurturing its staffers into versatile talent capable of working for various posts," Zhong said.

Following this principle, he began to pay vital attention in helping cultivate more professional workers from those who joined in building the Anshun-Panzhou expressway.

Governing 15 towns and three subdistrict communities, with a total population of over 750,300, Liuzhi houses 253 villages and urban neighborhood communities.

One-third of the villages of Longhe town, where Zhong's project department is located, are Miao ethnic villages, and most young people rely on migrant work to improve their lives, he said.

They designed a work-for-relief program to help the local residents, Zhong said.

Li Shifu, Party secretary of the APFJ-3 division, said CREC4's construction team has reached 2,746 in number since the building work started in 2022, including temporary workers from Liuzhi.

"Our project department has organized 35 free training sessions and pre-job training on steel bar binding and welding for over 300 local people, and finally hired some of them for the construction work," he said.

Through systematic and practical pre-job coaching, multiple ethnic minority groups and local migrant workers have mastered practical construction techniques, such as concrete pouring, steel bar binding and welding, successfully transforming ordinary villagers into skilled industrial workers, Li said.

Yang Wenfu, a Miao ethnic worker from Longchang village in Longhe, joined the CREC4 construction team after training.

"Previously, I had to depend on my 0.2-hectare paddy field and rapeseed fields to make a living, but now, as a steel reinforcement worker, I can proficiently tie and knot steel bars to earn a handsome monthly salary to support my children in education," he said.

As work safety supervisor, Zhong has also helped organize 664 safety education and training sessions, with over 5,300 participants.

"Our training covers such areas as work safety knowledge and laws, safety technical regulations, hidden danger reporting mechanism and process, major risk notification and prevention," Zhong said.

Li said building a highway can bring a series of benefits — profit and employees' skill enhancement for CREC4, better flow of goods and people for the nation, and cash income for the local residents participating in the construction work.

Li noted that since their construction work started, they have provided 2,347 jobs for locals, including 215 ethnic minority workers, paying them 138.58 million yuan as salaries and helping the local workers increase their annual income by 36,000 yuan each year.

"Meanwhile, our 2,746 staffers working here have also boosted the economy of Longhe through our daily spending," he said.

Zhong Lei (left), an employee from China Railway No 4 Engineering Group, inspects construction work at the Anshun-Panzhou section of the Shanghai-Kunming Expressway. PROVIDED TO CHINA DAILY

"CREC4 staffers have enabled our villagers to learn skills and steadily increase their income at their doorsteps. They have truly built a bridge of friendship, injecting strong momentum into the rural vitalization in Longhe," said Wang Yongyue, Party secretary of Longhe.

To show their gratitude, during traditional Miao festivals, the villagers of Yongfeng often invited Li's colleagues to participate in cultural activities, enjoying art performances and Miao dances, expressing their sincere thanks to the builders with long-table banquets.

Luo Tiantian, a 43-year-old native of the Buyi ethnic group, is a staff member of Li's project department. He said he feels honored, and it is a memorable experience to participate in the construction in his hometown.

"I will hold myself to high standards while in engineering construction, and not let down people's trust," Luo said.

CHINA

Left: Residents have lunch in their flood-damaged home in Zhenlong township, Hengzhou, Guangxi Zhuang autonomous region, on Wednesday. Continuous heavy rain and landslides have left over 20 villages isolated, causing power and communication outages and destroying roads and bridges. Emergency teams are working to repair damaged infrastructure, and ensuring relief supplies. CAI JIAHONG / YANGCHENG EVENING NEWS **Right:** A drone is used to deliver food, drinking water and medical supplies to flood-stricken villages in Hengzhou. PROVIDED TO CHINA DAILY

Guangxi relief efforts in full swing

Drone deliveries, satellite phones used to assist flood-affected communities

By SHI RUIPENG and **ZHANG LI** in Nanning

Volunteer drone pilots, commercial operators and professional rescue teams are helping deliver food, medicine and other essential supplies to flood-hit communities in Hengzhou, Guangxi Zhuang autonomous region, as damaged roads and inundated villages complicate relief efforts.

Heavy rainfall triggered by Typhoon Maysak caused reservoir breaches and widespread flooding on Monday, leaving some villages inaccessible by road and prompting emergency responders to expand the use of drones for supply deliveries.

Among those answering the call was Wang Guijun, a volunteer drone operator specializing in agricultural operations and cargo transport using heavy-lift drones. After seeing news of the flooding online, he traveled to Changtang village in Xiaoyi township on Tuesday to join other volunteer pilots supporting relief operations.

Since then, he has flown dozens of supply missions each day, delivering food, drinking water and other necessities to isolated communities.

"The floodwater has receded, but thick mud still blocks the village roads," Wang said. "We can only deliver supplies to the villages by drone."

Drone deliveries have become an integral part of broader relief efforts as local authorities work to reach communities cut off by flooding.

In Zhenlong township, where landslides, flooded roads and safety risks around the Liulan Reservoir disrupted transportation, emergency responders maintained contact with isolated communities via satellite phones while sending staff members and volunteers on foot to assess damage and identify residents' needs.

The local emergency command center adopted a relay distribution system, transporting relief supplies by truck to a primary school before volunteers carried them to stranded villages. About 40 staff members and volunteers are taking part in the operation to help meet residents' basic needs.

Rescuers from China Anneng Construction Group have also used drones to conduct precision supply drops, delivering more than 120 emergency packages while ground crews worked overnight to reinforce damaged access roads and restore transportation links.

In Yunbiao township, where flooded roads and collapsed buildings left some residents stranded on rooftops and in mountainous areas, professional drone teams have joined volunteers in rescue operations.

Wu Sujun, chairman of Guangxi Xingfei Aviation Technology, has led a drone team from Nanning to the disaster area, where his company has deployed more than a dozen drones over the past three days in coordination with local emergency authorities.

The aircraft have been used to deliver emergency supplies to residents in areas that are difficult to reach by conventional rescue vehicles.

Wu said the operation had also highlighted the need for more heavy-lift cargo drones and standardized emergency training for drone operators to strengthen future disaster response.

"We'll stay here as long as we're needed," he said.

Additional drone teams have also arrived from outside Guangxi to support flood relief, bringing heavy-lift aircraft and experienced operators to assist with aerial supply deliveries and other emergency response tasks.

Cai Yunge, executive vice-chairman of the Guangxi Zhuang autonomous region, announced the latest rescue figures at a news briefing on Tuesday. By Tuesday, authorities had mobilized 8,342 rescuers, more than 1,700 engineering and rescue vehicles, over 5,700 boats and specialized rescue equipment, as well as 40 social rescue organizations with more than 300 volunteers.

Rescue efforts remain focused on mitigating reservoir risks, searching for trapped residents, draining flooded areas and delivering essential supplies to affected communities.

Rescue ops over after landslide kills 21 in Gansu

By MA JINGNA, HU YUMENG in Lanzhou and **HU QING**

Search and rescue operations have concluded after a landslide in Tanchang county, Longnan, Gansu province, left 21 people dead, local authorities said at a news conference on Wednesday.

The landslide occurred at 6:56 am on Tuesday at a local forestry farm in Renzang village, Nanhe township, trapping 33 workers from the forestry farm who were passing through the area, local authorities said.

Five workers were rescued uninjured, while seven others sustained minor injuries. The injured are receiving treatment at local hospitals and remain in stable condition, authorities said.

Forty geological disaster experts immediately conducted on-site inspections using professional equipment and determined that the landslide measured about 130 meters long, 40 meters wide and 2 meters thick, covering an area of approximately 5,400 square meters, according to Yang Yaoxian, director of the Longnan natural resources bureau.

The accumulated debris was estimated to be 8 to 10 meters thick, with a total volume of about 10,000 cubic meters, Yang said.

He said the landslide was triggered by a combination of factors, including the area's steep terrain, unique geological conditions and erosion at the toe of the slope.

Yang added that the landslide mass remains unstable and poses a risk of secondary slides. Risk-control zones have been established, covering the landslide and surrounding areas. No residents live within the affected zone.

More than 700 rescue personnel, including firefighters and other emergency responders, were deployed, along with four search and rescue dogs and more than 300 vehicles and pieces of equipment, to carry out emergency operations, said Suo Feng, director of the Longnan emergency management bureau.

On Wednesday, China's Ministry of Finance and the Ministry of Emergency Management allocated 30 million yuan ($4.4 million) to support search and rescue, evacuation, emergency geological disaster response and inspections for potential secondary disaster risks in Gansu, according to Xinhua News Agency.

Super Typhoon Bavi raises extreme weather concerns

By WANG XIAOYU
wangxiaoyu@chinadaily.com.cn

Super Typhoon Bavi is forecast to batter southeastern China over the weekend, bringing torrential rain to parts of eastern, central and northern China from Thursday, according to Chinese meteorologists.

As of Wednesday afternoon, Bavi was moving west-northwest at about 15 to 20 kilometers per hour, packing maximum sustained winds of up to 216 km/h, the National Meteorological Center said.

The typhoon is expected to make landfall around Saturday evening or Sunday along the coasts of Zhejiang and Fujian provinces.

From Thursday through July 15, Bavi is expected to bring heavy rain to parts of eastern, central and northern China.

Some areas in the Guangxi Zhuang autonomous region, Hubei province and the coastal regions of Zhejiang and Fujian are forecast to receive 300 to 500 millimeters of rainfall.

"Some regions will see precipitation 40 to 80 percent above the average for the same period, while a few areas could receive more than double their normal rainfall," the center said on Wednesday.

Xiang Chunyi, the center's chief forecaster, attributed Bavi's intensity to a combination of favorable conditions, including high sea surface temperatures along its path that have provided abundant thermal energy, a steady moisture supply feeding the storm's core and a stable inner core structure.

Bavi's strength is estimated to be comparable to that of Typhoon Lekima, which made landfall in Zhejiang and Shandong in 2019 and dumped up to 600 mm of accumulated rainfall in some areas.

Xiang said that after making landfall, Bavi is expected to move deep inland, bringing extensive and prolonged rainfall to a broad swath of provinces, including Zhejiang, Fujian, Hubei, Anhui, Henan and Shandong.

The meteorological center has urged fishing vessels to return to port and offshore workers on wind farms and oil platforms to evacuate promptly.

Coastal tourist destinations, particularly those on islands and along the shoreline, should remain on high alert and suspend operations if necessary.

Local governments in coastal areas have been advised to reinforce tall trees, temporary structures and high-rise buildings against strong winds.

The public is urged to closely monitor weather forecasts and short-term nowcasts, avoid unnecessary travel, stay away from tall buildings to reduce the risk of falling objects, and prepare emergency supplies if needed.

Huang Meijin, chief forecaster at the Fujian Provincial Meteorological Bureau, warned that Bavi would also bring destructive winds over both land and sea, urging authorities to guard against damage to onshore infrastructure.

Thunderstorms are expected to develop on Friday, intensify on Saturday and gradually weaken on Sunday.

In Zhejiang, water resources authorities have activated a Level IV emergency response for flood and typhoon preparedness under China's four-tier emergency response system — with Level I as the highest — while maritime safety authorities have launched a Level III emergency response.

Xinjiang doctor honored for years of selfless service

By WANG XIAOYU
wangxiaoyu@chinadaily.com.cn

As a young rural doctor, Uhas Sulayman used to travel on horseback through mountain pastures to reach patients in his hometown of Yumin county in the Xinjiang Uygur autonomous region.

More than five decades later, now in his early 70s, he continues to provide medical services to local residents — no longer on horseback, but at a neighborhood health facility.

"When I officially retired in 2015, many people urged me to rest. But I felt that my responsibility as a Party member was to keep serving those in need. I just needed to change the place where I do so," he said.

Over the course of his career, Uhas has traveled more than 200,000 kilometers, treated more than 100,000 patients and helped deliver more than 3,200 babies. He joined the Communist Party of China in November 1993 and was awarded this year's July 1 Medal.

When he began practicing medicine at a local hospital in Yumin county after graduating from medical school in 1975, there were no paved roads, communication devices or ambulances. Local herders lived scattered across remote mountain valleys and vast grasslands, making access to healthcare extraordinarily difficult.

Carrying a medical kit on horseback, Uhas responded to every call for help to the best of his ability, regardless of how long the journey or how harsh the weather was. At the time, a one-way trip to the farthest winter pasture could take more than a day, and blinding snowstorms often made it impossible to find the right direction.

To this day, stories of his selfless dedication continue to resonate among local herders. One such story dates back to a blizzard in 1987, when Uhas assisted with a difficult premature delivery and saved the newborn's life by sucking mucus from the infant's airway.

> "When I officially retired in 2015, many people urged me to rest. But I felt that my responsibility as a Party member was to keep serving those in need."
>
> **Uhas Sulayman,** rural doctor in the Xinjiang Uygur autonomous region

For patients facing financial hardship or living with disabilities, Uhas has often provided free medical services and paid for their medication out of his own pocket.

His daughter, Mayra, recalled that her father was often a stranger to her during her childhood, sometimes staying away from home for four or five months at a time. However, she vividly remembers accompanying him on house calls during summer vacations.

"When we arrived, the herders would greet us like family. Watching my father save a newborn during a delivery planted the seed in my heart to become a doctor," said Mayra, who went on to study preventive medicine and has since returned to work in her hometown.

In addition to continuing to provide healthcare guidance at a community health facility, Uhas has launched a health service project that has so far recruited 350 volunteers and organized 1,500 health education events.

"I've lost count of how many patients I've treated," he said. "As a doctor, doing my utmost to protect the people's health is my duty."

POLICY REVIEW

Safety net introduced for rural disabled

Long-term support aims to prevent society's most vulnerable from returning to poverty

By LI LEI
lilei@chinadaily.com.cn

SHI YU / CHINA DAILY

China has introduced a sweeping policy framework to prevent tens of millions of people with disabilities in rural communities from slipping back into poverty, shifting from emergency relief to long-term, normalized support in the countryside.

The directive, jointly issued by 20 government departments, including the National Development and Reform Commission, the Ministry of Agriculture and Rural Affairs and the China Disabled Persons' Federation, is one of the country's most comprehensive disability policy packages in recent years.

It comes as the world's second-largest economy marks the fifth anniversary of eradicating extreme poverty on the Chinese mainland and seeks to consolidate those gains.

"Efforts must be made to ensure that no large-scale relapse into poverty occurs among disabled people," the document said, describing disabled people as important contributors to China's modernization while also acknowledging they are a special group in need of extraordinary care and attention.

At the core of the policy is a shift from time-limited poverty alleviation to permanent support. Local governments are directed to provide a broader range of assistance for disabled people in rural areas, including stronger social security and education programs to meet basic needs, alongside what officials describe as "development-oriented assistance" — skills training, employment opportunities and income-generating support designed to foster self-reliance.

The directive also calls for expanded rehabilitation, nursing care, accessibility improvements and cultural services, while strengthening legal assistance to safeguard the rights of people with disabilities.

Nearly 80 percent of China's estimated 85 million registered people with disabilities live in rural areas, according to the Ministry of Agriculture and Rural Affairs. Although many rose above the poverty line through targeted poverty alleviation programs over the past decade, they remain especially vulnerable to falling back into poverty.

In Yongshou county, Shaanxi province, local officials have seen this vulnerability firsthand.

Geng Qiuwa, 54, has a physical disability, while his wife has an intellectual disability. The couple grows wheat on a small plot that provides enough food for themselves but little additional income.

After village officials identified the family as needing assistance, they began receiving a monthly government subsidy of 1,350 yuan (about $200). Geng also earns 600 yuan a month working as the village's water manager, a public welfare position.

"We identified him through household visits, verified his situation and reported it to the township level," said Chen E, a village official in Yongshou.

Geng's family typifies households with multiple disabled members, where limited labor capacity and few income sources heighten the risk of returning to poverty.

The new directive calls for assistance tailored to individual circumstances. Those unable to work will receive social assistance to meet their basic living needs. Those with some working capacity will be encouraged to improve their livelihoods through small businesses, cooperatives and other income-generating opportunities. Local Party organizations and officials are expected to play a leading role in providing targeted support in healthcare, employment, business development and mobility.

That approach is already taking shape in Yongshou.

The local disabled persons' federation has equipped six severely disabled residents with accessibility facilities, including handrails, accessible toilets, wheelchairs and crutches, while arranging regular in-home medical visits.

In another case, village officials helped Geng Ziwen, a 17-year-old with an intellectual disability, enroll in a special education school in the nearby city of Xianyang, where he has spent the past two years learning daily living skills and receiving vocational training.

For Geng Xinyuan, a 69-year-old bedridden stroke survivor, grassroots workers ensured he was enrolled in the subsistence allowance program to cover his basic living expenses.

While Yongshou illustrates the policy's emphasis on social protection and accessibility, another county is exploring its development-oriented approach by helping disabled people gain marketable skills and employment.

In Pingshun county, Shanxi province, a pilot program launched in 2024, with support from Alibaba's rural special envoys, trains students at a local special education school in intangible cultural heritage crafts, including wood carving, beading and Chinese knot weaving.

Wang Fang, who has taught at the school for two decades, said the approach represents a fundamental departure from traditional assistance.

"When I first started, help meant donations — stationery, clothes, rice and oil. It solved immediate needs but not long-term livelihoods," she said. "Now we're teaching skills that can generate income."

The school has established a workshop where students develop fine handcraft skills. Those who meet production standards make beaded bracelets, key chains and woven products that are sold through charity events. The proceeds are reinvested in materials and training, with part distributed to students as incentives.

The initiative has since expanded into the community.

Wang Pingping, 26, a former student with a physical disability, began managing a community workshop in April.

"We have four disabled trainees now," she said. "Two are wheelchair-bound and cannot leave home, so we send them video tutorials and materials. Two others come occasionally, but mostly their family members attend training and then teach them at home."

The workshop operates under a contract-processing model, with suppliers providing raw materials, setting quality standards and purchasing finished products. Although still in its pilot stage, Wang Fang said some trainees are already producing work that meets commercial standards.

The experience highlights the gap between policy goals and practical challenges.

Hou Xiaonuan, 23, who uses a wheelchair and joined the workshop in April, said the training has given her renewed purpose after years of staying at home.

"The biggest difficulty is mobility. I can't go out independently for work or activities," she said.

Wang Fang said the greatest obstacle is securing stable market demand.

"We've trained over 200 people in weaving and beading skills," she said. "But we don't have stable commercial orders. People have the skills, but there's no steady flow of work to turn those skills into income."

The directive acknowledges those challenges, calling for "order-based" and "targeted" vocational training linked directly to market demand. It also encourages e-commerce platforms and livestreaming sales to help disabled artisans reach consumers.

For now, the Pingshun workshop remains a pilot, with 10 regular trainees, a handful of trial orders and considerable optimism.

"I truly hope more people will learn about our workshop, and that more disabled friends across the country can join us," Wang Fang said.

"The biggest fear for disabled people in the countryside is that help comes in gusts and then stops. Normalized assistance is exactly what we need to hold the line against relapse," she said.

Guo Yuhe contributed to this story.

Policy Digest

Plan to promote integrated rural connectivity services

The Ministry of Transport and five other departments have jointly issued an action plan to advance integrated passenger transport, freight logistics and postal express services in rural areas, aiming to establish an intensive, efficient and sustainable rural transport service system.

In line with the plan, integrated rural passenger-freight-post services will basically cover all eligible county-level regions by the end of 2027.

It also targets building more than 220,000 comprehensive passenger-freight-post service stations at county, township and village levels nationwide, alongside over 20,000 integrated passenger-freight-post routes in rural areas.

The plan envisions that by the end of 2028, integrated rural passenger, freight and postal services will cover more than 45 percent of villages in eastern and central regions, and over 40 percent in western China.

With the integrated operation mechanism in place, more than 35 percent of villages in eastern and central regions and over 30 percent in western areas will receive mail and parcel deliveries at least once a day, it says.

Guidelines support founding of intl sci-tech entities

China has made public a set of guidelines to support and standardize the establishment and registration of international science and technology organizations, clarifying eligibility criteria and application procedures.

The guidelines were jointly drafted by the Ministry of Civil Affairs, the Ministry of Science and Technology, and the China Association for Science and Technology.

According to the policy document, such organizations must have qualified Chinese or foreign initiators, who will serve as their initial members. Names of such organizations are to obtain official approval and contain words, such as international, world, global or Asia, to indicate their international or regional attributes.

In addition, they are also required to have legal assets and funding sources, with donated operating funds of no less than 2 million yuan ($294,000) upon establishment.

The application covers five key stages: confirming a supervisory unit, receiving review from the unit, undergoing examination by the registration authority, obtaining a registration certificate upon approval, and completing subsequent procedures such as seal engraving, tax registration and corporate bank account opening.

New circular seeks to foster diversified cinema operations

China Film Administration and the State Administration for Market Regulation have jointly released a circular aimed at invigorating cinema operations by transforming them into integrated cultural spaces for watching movies, socializing, entertainment and consumption.

The document specifies 10 measures across three key areas to drive innovation in cinema business formats, operational models and services.

Regarding the integration of diverse business formats, the notice supports cinemas to innovate with distinctive food and beverage offerings by introducing premium catering, selling light meals and baked desserts, as well as setting up coffee-book lounges. It also encourages cinemas to expand cultural and creative retail models by establishing dedicated stores for movie merchandise and for cultural and creative products.

On brand development, the circular encourages cinemas to boost intellectual property operations and brand building, and develop diverse venues including art cinemas, tech cinemas, community-based cinemas and other themed cinemas, so as to cultivate cinema brands with distinctive cultural identity and market influence.

In addition, the circular encourages cinemas to upgrade their equipment and technologies, and pledges support for the screening of virtual reality films.

Craft workshop brings community to once-isolated residents

By LI LEI

For 23 years, Hou Xiaonuan's world was bound by the walls of her family home.

Born with a congenital disability that left her reliant on an electric wheelchair, she had never held a job, let alone imagined a career. Beading and knot-tying were solitary hobbies — pleasant pastimes, but nothing more.

"I had no direction," she said. "Every day just blurred into the next."

That changed in April, when a community poster caught her eye. A newly launched social workshop was recruiting disabled artisans to produce handcrafted bracelets, key chains and woven ornaments. Hou signed up on impulse and soon found herself part of a new approach to rural disability assistance.

The workshop follows a simple but effective model: it provides training and materials, then connects finished products with paying buyers. For participants who cannot travel — Hou among them — staff members deliver supplies to their homes and collect completed products. Training videos are sent via smartphone, and a WeChat group provides daily encouragement and troubleshooting. Hou's home was also fitted with a ramp and bathroom safety rails — improvements that she said solved real problems in daily life.

The first few weeks were daunting. "I was terrified I wouldn't be able to learn, that my work wouldn't be good enough," Hou said.

The workshop's manager, Wang Pingping — herself a former special education student with a physical disability — offered patient, hands-on guidance.

"She told me to go slowly and not give up," Hou said. "Other trainees shared tips in our group. I realized I wasn't alone."

With steady practice, Hou's skills improved. The workshop has begun taking small trial orders from suppliers, and while stable contracts remain elusive, producing items for sale has transformed her sense of self.

"I used to think I could only receive help," she said. "Now I know I can create value with my own hands."

That shift from recipient to contributor is what Wang Fang, a veteran teacher at the county's special education school who helped launch the workshop, has witnessed in dozens of students.

"When they first arrive, many see themselves as burdens," she said. "But when they earn their own money — even a small amount — their whole demeanor changes. They stand taller, speak louder."

That emotional transformation, however, depends on economic sustainability.

A national disability policy issued by 20 central government departments in March explicitly endorses such "development-oriented" approaches and calls for expanding stable commercial orders and skills training across rural China.

Wang Fang said that support is urgently needed. "We've trained over 200 people, but without consistent orders, skills alone won't pay the bills," she said.

The workshop has already given Hou something she never expected: a community.

"We share techniques in our group chat," she said. "Even though we're working from home, we're in this together."

Her mobility remains limited, as public transportation is still challenging. But the isolation that once defined her life has begun to ease.

Her hope is simple: "That more disabled friends like me can find this opportunity — to stand on their own, through their craft."

Guo Yuhe contributed to this story.

LIFE

Threads of change: Stitching the future

Once confined to framed silk artworks, traditional needlework is expanding into global brands, cultural experiences and digital platforms, reshaping a centuries-old craft into a fast-evolving creative industry, **Yang Feiyue** reports in Suzhou.

Top: Wu Haoxi guides an international visitor trying Suzhou embroidery at her workshop in Suzhou, Jiangsu province. **Above left:** Wu works on a Suzhou embroidery piece. **Above right:** A galaxy-inspired embroidery by Zhang Xue, a fourth-generation Suzhou embroidery artisan from Suzhou. PHOTOS PROVIDED TO CHINA DAILY

A Zippo lighter engraved with Suzhou silk embroidery. A Hello Kitty collaboration reimagined in fine stitches. A porcelain tea canister in which silk embroidery is embedded into ceramic form.

These objects do not immediately resemble what many would associate with Suzhou embroidery, or *Suxiu*, one of China's most refined traditional crafts with a history spanning more than two millennia.

Yet for Zhang Xue, a fourth-generation embroiderer based in Suzhou, Jiangsu province, they represent exactly where the craft is heading.

"We believe almost anything can be embroidered," he says, presenting a series of collaborations that span global brands, lifestyle products and cultural intellectual properties.

For centuries, Suzhou embroidery was defined by its delicacy and restraint, with silk threads layered into landscapes, flowers, birds and figures with near-photographic precision. Traditionally framed as artworks or high-end decorative pieces, they were meant to be observed rather than used.

But a quiet transformation is underway.

Across Suzhou, embroidery is increasingly moving beyond the frame into products, experiences, educational systems, and digital platforms that are reshaping how the craft is made, taught and consumed.

Zhang's trajectory reflects this shift.

Born into a family of embroiderers spanning four generations, he grew up surrounded by silk threads, wooden frames and the rhythmic repetition of needlework. His mother continues to specialize in traditional fine embroidery, often reproducing classical Chinese paintings with meticulous detail, while earlier generations of his family devoted their lives to mastering classical techniques.

Zhang, however, has taken a different path that leads outward from tradition rather than inward.

He has worked on nearly 100 collaborations with intellectual property holders and brands, ranging from international consumer labels to Chinese fashion companies and lifestyle brands.

These projects vary widely in scale. Some involve limited-edition collectible pieces, while others adapt embroidery designs into patterns for broader commercial use.

For Zhang, the craft is no longer confined to framed works.

"It can become a language for communicating with contemporary audiences," he says.

One of his most distinctive experiments lies in combining embroidery with porcelain. Working with ceramic makers, he developed pieces that integrate silk embroidery into ceramic vessels, ranging from tea canisters to decorative vases.

The concept draws on three symbolic materials long associated with China's cultural exchange with the world: silk, tea and porcelain. By combining them into a single object, Zhang aims to reinterpret traditional cultural symbols through contemporary design logic.

The result is something in between — a hybrid object shaped by heritage and market demand.

While designers like Zhang are pushing embroidery into new commercial territories, another transformation is unfolding on the ground, in the form of participation.

At a Suzhou embroidery experience center operated by practitioner Wu Haoxi, visitors are not simply observers but also makers.

Students, tourists, corporate groups and international guests have been invited to pick up needles and try their hand at stitching basic patterns. For many, it is their first encounter with embroidery as a tactile experience, Wu notes.

The center hosts hundreds of activities each year, ranging from school programs to cultural exchanges involving visitors from home and abroad.

For Wu, embroidery is as much about memory as it is about technique.

"I grew up watching my family stitch," she says. "By the time I picked up a needle, it felt like continuing a conversation that had been going on for generations."

Participants often begin hesitantly, struggling with threading needles or maintaining even stitches. But by the end of a session, many leave with a completed bookmark or hand-held fan.

"The experience is all about the memory of having touched the thread," Wu says.

Beyond tourism and experience-based learning, Suzhou embroidery is also developing structured talent pipelines that extend beyond the city.

One such initiative involves trainees from Jinzhou in Northeast China's Liaoning province. A group of around 100 young learners was brought to Suzhou for intensive training, beginning with foundational stitching techniques and gradually moving toward design concepts and creative applications.

The program is divided into phases, consisting of initial training at vocational institutions, followed by hands-on learning in Suzhou-based workshops. After completing their training, participants are expected to return to their home region, where they can contribute to the development of local embroidery industries.

The model reflects an emerging approach in heritage industries: distributed cultivation. In this system, Suzhou functions as a training hub for wider regional development.

The approach is also reflected in the broader education structure surrounding embroidery in the city, which now spans primary school courses, university electives, vocational programs and public workshops.

Behind these changes is a sustained framework of institutional support.

Suzhou high-tech zone, also known as Suzhou New District, has been one of the key centers of embroidery development. It has established a structured system of support for traditional textile crafts and provided funding for embroidery-related talent development projects since 2017.

In addition to financial support, the region has built physical and cultural infrastructure to support industry clustering, including embroidery-themed commercial streets, exhibition spaces and museums. Together, these form an integrated cultural environment that connects production, display and commerce.

Rather than treating embroidery solely as a heritage asset, local development strategies increasingly position it as part of a broader cultural and creative industry.

Recent local initiatives have begun exploring how artificial intelligence, digital design tools and cross-border e-commerce systems can be integrated into traditional craft production.

In May, Suzhou high-tech zone launched a program known as the "Stars Plan", which includes an "AI embroidery" support system developed to provide design tools, digital services and international market access for practitioners.

Despite rapid transformation, many embroiderers emphasize continuity rather than disruption.

One of Wu Haoxi's most personal works, *Child's Eye View of the World*, began with drawings made by her daughter. A child's sketch of Beijing's Tian'anmen was translated into silk thread, forming part of a broader composition that depicts everyday life, educational scenes and cultural exchange.

A single red thread runs through the entire piece, linking each scene.

For Wu, that thread represents connection — not only between individuals and generations, but also between tradition and modern life.

"The techniques remain rooted in history, and the silk remains unchanged, but the contexts in which embroidery exists have expanded," she says.

Jingdezhen's porcelain legacy: A magnet for artists worldwide

Left: Foreign artists attend the 2026 Congress of the International Academy of Ceramics in Jingdezhen, Jiangxi province. **Right:** Ceramic artists from around the world gather during the congress on June 28. PHOTOS BY LIU BIN / XINHUA

NANCHANG — For many creators, Jingdezhen, China's porcelain capital, serves as a massive, living workshop, with numerous local artisans dedicating themselves to a specific niche within the craft in the eastern Chinese city.

Such intricate division of labor is a centuries-old tradition, in which young apprentices spend years perfecting a single step in the porcelain-making process. Today, this comprehensive industrial chain in the city sustains over 100,000 workers.

Jingdezhen, in Jiangxi province, home to more than 60,000 ceramic studios, is hosting the 2026 Congress of the International Academy of Ceramics. The event has brought together ceramic artists and experts from around the globe to discuss the inheritance and innovation of ceramic culture.

Since the Song Dynasty (960-1279), ceramics crafted in Jingdezhen have been exported to Central Asia, West Asia, Europe and Africa. Today, the city still retains its global appeal, drawing over 5,000 ceramic enthusiasts from around the world at peak times.

For international artists, the city's most magnetic appeal lies in its vast, collaborative network of master craftsmen, each playing a distinct and indispensable role.

French visual artist Karima Duchamp is among those captivated by this dynamic. After a three-month residency in Jingdezhen last year, she has returned as an IAC member.

During her previous stay, she painted on clay bodies but struggled with the firing process. In a local alley, she watched a craftsman seamlessly slide a multi-meter-long clay body into a kiln without a single flaw. This refined skill, honed over decades, instantly won her trust.

"I didn't just 'borrow hands'. I borrowed Jingdezhen's fire," Duchamp says, adding that the expertise of local kiln masters was crucial in realizing her creation.

"Jingdezhen always helps me bring my creative ideas to life," says Croatian visual artist Sandra Ban, echoing Duchamp's view. Returning to the city half a year after a three-month residency, she added that the city's synergistic craftsmanship is particularly liberating for artists tackling irregular or oversized designs.

"Ceramics is a universal language, and craftsmanship is the bond connecting humanity and nature," says Ban. "Handmade porcelain in Jingdezhen stands in contrast to mass-produced goods. Every single piece carries the warmth of human touch."

The city's dedication to craftsmanship is etched into its landscape. Along the Zhushan Bridge, 72 bronze statues line both sides, capturing the entire traditional porcelain-making process, from throwing to firing.

"Hands serve as a bridge between the heart and the clay," says 87-year-old Liu Yuanchang, a master of Chinese arts and crafts. "For over a millennium, it has been a division of labor, yet also a symphony."

Liu adds that while artisans exist elsewhere, few places have organized these "hands" into an ecosystem like Jingdezhen. "Foreign artists bring ideas and creativity, and the hands of Jingdezhen help realize them."

Experts believe that this is the irreplaceable secret of Jingdezhen: it does not require outsiders to be all-round craftsmen. Instead, it offers highly specialized hands, allowing creativity to materialize with maximum efficiency.

Australian artist Fleur Schell says that Jingdezhen's scale and comprehensive ceramic industrial chain have attracted many of her friends and colleagues from Australia to work in the city. "It feels like anything is possible," she says. "You could make anything in ceramic here."

PHOTOS PROVIDED TO CHINA DAILY

Regional relics tell of daily living in SE Asia

Exhibition displays artifacts and more from Myanmar and Thailand, highlighting their deep exchanges with China, report **Xu Lin** and **Liu Kun**.

From intricate Thai shadow puppets and finely crafted ceramics to Myanmar's colorfully painted marionettes in ornate costumes and elegant red lacquerware boxes, accompanied by Southeast Asian music, visitors to an exhibition are as captivated as if they were on a tour through the region.

The ongoing exhibition, *Peacock and White Elephant: People and Their Lives between the Ayeyarwaddy and the Mekong*, runs until Sept 6 at the Hubei Provincial Museum in Wuhan, Central China's Hubei province.

It features a careful selection of 86 pieces or sets of cultural relics originating from Thailand and Myanmar, owned by the Linden Museum in Stuttgart, Germany. Ranging from Buddhist sculptures, ceramics, lacquerware, and silverware to musical instruments and shadow puppets, the exhibition offers a full panorama of daily life and the region's cultural shifts from the 8th to the 21st century.

This exhibition is part of the two museums' partnership, first established with a memorandum of understanding in 2017 and renewed in 2024.

Adopting a social-history perspective, the exhibition follows the natural rhythm of a full day and is structured around three core themes — familial routines, monastic life and communal festivals.

The first chapter on familial life begins with household Buddhist shrines used for morning prayers and moves to utensils and objects tied to food and dining culture.

"This temporal, everyday approach helps ordinary visitors feel a genuine connection, because nothing bridges the distance better than the everyday moments we all share," says Wei Mian, the exhibition's co-curator from the Hubei Provincial Museum.

She compares the curatorial process to a film director casting actors. The selected pieces determine the exhibition's narrative logic and visual language.

To maintain coherence, she and fellow co-curator Georg Noack, from the East, Southeast and South Asia Department at the Linden Museum, insist, from the outset, on jointly approving every artifact in the exhibition.

"My co-curator has extensive experience in Southeast Asian culture and artifacts, while I have a better sense of what Chinese audiences expect from an exhibition on foreign artifacts," Wei says. She notes that, despite the distance, they worked closely through frequent calls and emails to finalize the exhibition's many details.

Their selection followed two guidelines: objects that demonstrate cultural exchanges between China, Southeast Asia and India while retaining distinctive local features, and everyday items that reflect regional history, folk customs and religious beliefs.

The traditional attire worn by boys in Myanmar for the ritual when they become novice monks.

> "I specifically chose a jasmine aroma with Southeast Asian notes, offering Chinese audiences a scent that feels familiar yet intriguingly exotic."
>
> **Wei Mian,**
> co-curator from the Hubei Provincial Museum

Porcelain and lacquerware receive particular attention, given their deep cultural ties to China and their role in illustrating cross-cultural exchanges.

Wei says that when visitors see a 15th-century Thai ceramic bowl with a carp decoration, its white base and black motifs resemble wares from the Cizhou kilns in Hebei province, a major folk kiln complex in northern China.

"The carp depicted here is a major freshwater food source in the region. However, the painting style and the carp's form differ from those found on Chinese Cizhou ceramics," Wei adds.

In the 18th and 19th centuries, the royal family and nobility of Siam (now Thailand) cherished the exquisitely decorated Benjarong porcelain, which features traditional Thai motifs and polychrome enamels.

"It's said that many such pieces were made in Jingdezhen, Jiangxi province, and Guangzhou, Guangdong province. By that time, many Chinese merchants in Southeast Asia were already conducting import trade," Wei says.

"Yet the exact decoration process remains unclear. It's uncertain whether Thai artisans traveled to China to paint the patterns, if Thai designs were sent to Chinese craftsmen, or whether plain porcelain pieces were first fired in China and later decorated in the region."

She points out that visitors will recognize that some of the ceramic bowls, plates and vases on display are decorated with popular Chinese motifs, such as lotus flowers and peonies, all showcasing cultural exchange in action.

Another must-see is a set of instruments for the traditional Hsaing Ensemble from 20th-century Myanmar, comprising ornately decorated percussion instruments such as drums and gongs set on elaborate frames and stands. Its principal instrument is a circular set of tuned drums, played by the ensemble's leader, who sits at its center.

Such music is not confined to the past. It remains an integral part of community life today, performed at festive occasions, such as weddings, temple celebrations, coming-of-age ceremonies, funerals, and mourning rites. It also accompanies traditional dances, theatrical performances and martial arts competitions.

"Far more than just a set of musical instruments, it accompanies local people, and ensemble players are deeply integrated into every aspect of local people's lives," Wei says.

By placing a 20th-century artifact at the end of the exhibition, she aims to show that tradition is not a relic of the past — it is a living, breathing force that still shapes how people live today.

As visitors walk through the exhibition hall, they are accompanied by various genres of Southeast Asian music, including those created by the instruments on display, alongside a soft jasmine fragrance. Multiple jasmine diffusers are discreetly hidden among artificial grove installations in the exhibition hall to create an immersive sensory experience.

"People in Myanmar and Thailand adore jasmine. Local women wear jasmine flowers in their hair, and the fragrance is widely used as car air fresheners. Chinese people also have a deep fondness for jasmine," Wei says. "I specifically chose a jasmine aroma with Southeast Asian notes, offering Chinese audiences a scent that feels familiar yet intriguingly exotic."

Yale alum promotes Dunhuang culture from ancient Silk Road hub

Edward Kuperman (right), also known as Gu Aihua, talks to guests at the Third World Conference of Sinologists in Dunhuang, Northwest China's Gansu province, on June 3. ZHANG WENJING / XINHUA

LANZHOU — After graduating from Yale University, 24-year-old American Edward Kuperman made a choice few of his peers would have expected.

Rather than staying in the United States or heading to one of China's bustling metropolises, he settled in Dunhuang, a small oasis city in Northwest China's Gansu province.

Kuperman, better known by his Chinese name Gu Aihua, didn't come to this decision by accident. His story marks a new chapter in Dunhuang's long history as a meeting place of civilizations along the ancient Silk Road, where cultural exchange continues to thrive in the 21st century.

"Dunhuang offers a unique gateway to observing, understanding, and telling China's story," Kuperman says.

Before stepping into his role as the first full-time foreign presenter at a local media center in Dunhuang in April, Kuperman had already built a decade-long connection with China, which began with his first Chinese language class in middle school.

Back then, however, he never imagined Chinese would be so challenging to learn, or that he would stick with it for years, Kuperman recalls.

His devotion to Chinese culture deepened through classical literature. In one of China's must-read classics, *The Romance of the Three Kingdoms*, he found the figure Zhuge Liang in many ways embodying his own vision of an ideal personality — one marked by wisdom, principles and a sense of responsibility.

"'A gentleman may be killed, but he cannot be humiliated.' I really admire that sense of integrity and moral conviction in traditional Chinese culture," he notes.

These early impressions of China were later reinforced through a series of short-term experiences in the country, which deepened Kuperman's determination to return and stay longer.

At 17, he spent 40 days living with a host family in Suzhou, a city in East China's Jiangsu province. Though he initially struggled to follow everyday conversations, he wasn't discouraged. Instead, the challenge motivated him to double down on his studies. Later, during his years at Yale, he also joined exchange programs at Tsinghua University in Beijing, where full immersion further strengthened his fluency.

Now, in the eyes of his colleagues, the young American can not only express himself naturally in Chinese but also use more specialized, less commonly used vocabulary with ease. Yet for Kuperman, there is still a long way to go before he truly reaches an ideal level of understanding of the country, something he believes can only come after 20 years of living and working in China.

That is why he feels fortunate to have chosen Dunhuang as the starting point of this long journey. The city's unique natural landscape, cultural atmosphere and warm-hearted people have become the very reasons that motivate him to passionately share Dunhuang's culture with the world.

Since his arrival, his colleagues have helped him settle in. Once, a taxi driver even refused to accept payment for a short ride. In return, Kuperman aims to give back to the city with the same kindness he has received.

Once, a Dutch tourist lost a backpack at a night market in Dunhuang. With the help of Kuperman and local vendors, it was eventually recovered three hours later, a timeframe many would have considered too long for it to be found again.

Kuperman told the relieved tourist, "In China, nothing gets lost." The tourist nodded in agreement.

A video of the incident later gained public attention online, leaving a deep impression on Kuperman and reinforcing his belief that it is not necessary to repeatedly tell foreign visitors about China's convenience or safety.

"Facts just speak for themselves. That's even better," he says.

Now, Kuperman produces interviews, street conversations and short daily videos that feature valuable artifacts preserved in local museums and showcase Dunhuang's culture, history and contemporary stories to international audiences.

While his posts have yet to attract large view counts, Kuperman is not in a rush to chase online traffic, as he believes that true international communication starts with concrete, real-life details.

"A real person standing in a real setting, talking about a specific issue or experience, is often far more convincing than grand narratives," he notes.

For Kuperman, conversations like these are needed now more than ever in a world marked by growing uncertainty. And Dunhuang, once a thriving hub along the ancient Silk Road, continues to serve as a platform where people from different cultures can meet, exchange ideas, and better understand each other.

"My encounter with China has been a journey of broadening horizons and rethinking the world," Kuperman says. "It has also made me reflect on my own role and reminded me of the true value of communication between the East and the West."

China and ASEAN embrace shared heritage

In Dunhuang, experts highlight digital innovation and sustainable practices to revitalize joint legacies, **Ma Jingna** and **Hu Yumeng** report in Lanzhou.

Cultural heritage is becoming more than just a record of the past for China and ASEAN countries. The two sides are expanding cooperation beyond traditional conservation, and placing greater emphasis on digital technologies, sustainable development, creative industries and youth engagement as they seek to preserve and revitalize their shared cultural legacy.

That evolving partnership was at the heart of the China-ASEAN Cultural Heritage Dialogue, held in Dunhuang, Gansu province, on July 2. The event brought together around 150 heritage professionals, archaeologists, scholars, policymakers, technology experts, and youth representatives from China, Malaysia, Indonesia, Vietnam, the Philippines, and Cambodia, as well as international organizations, to explore how cultural heritage can become a stronger driver of regional cooperation and people-to-people exchanges.

The event comes as China and ASEAN celebrate the fifth anniversary of their Comprehensive Strategic Partnership, with cultural heritage emerging as an increasingly important pillar of regional cooperation.

"We were never isolated from one another," said Ivan Henares, chairman of the Southeast Asian Cultural Heritage Alliance.

Long before modern nation-states emerged, trade, diplomacy and the exchange of knowledge connected China and Southeast Asia, shaping ports, cities, architecture and traditions across the region, he said.

"Even the food we enjoy today tells stories of centuries of dialogue. Heritage is not simply about preserving monuments or traditions. At its heart, it is about maintaining connections between people, places and cultures."

Henares said today's shared challenges, including climate change, rapid urbanization and the loss of traditional knowledge, require closer regional cooperation.

"China has much to offer in scientific conservation, digital innovation and heritage interpretation, while Southeast Asia has valuable experience in community-based conservation, living heritage and managing diverse cultural landscapes," he said. "Our different practices complement each other."

For Zhang Xiaogang, deputy head of the Dunhuang Academy, the city itself demonstrates why such exchanges remain relevant today.

Located at the crossroads of the ancient Silk Road, Dunhuang became a meeting place where civilizations encountered, influenced, and enriched one another. "Dunhuang cultural heritage embodies the openness, inclusiveness, mutual learning, and coexistence that characterized the Silk Road," Zhang said.

"The ancient Silk Road promoted economic development and cultural exchanges across continents. Today, countries face the common task of pursuing peace and development, making it all the more important to carry forward the Silk Road spirit."

From top: Guests attend the China-ASEAN Cultural Heritage Dialogue in Dunhuang, Gansu province, on July 2. Participants exchange views at the event. Guests visit an exhibition during the meeting in Dunhuang. PHOTOS PROVIDED TO CHINA DAILY

If history provides the foundation for China-ASEAN heritage cooperation, participants agree that innovation is opening new pathways for the two sides to protect, revitalize and share their cultural heritage.

Digital technology emerged as one of the strongest themes throughout the dialogue, with experts highlighting how artificial intelligence, big data and digital modeling are reshaping both heritage conservation and public engagement.

Xu Lubin, deputy director of the Bureau of Cultural Relics and Heritage Management under the Liangzhu Archaeological Site Administrative Committee in Zhejiang province, said technologies such as digital twin modeling, environmental monitoring and intelligent early-warning systems have helped transform the site from traditional manual inspections to a digital management system integrating archaeological research, conservation, and monitoring, while safeguarding its authenticity and improving management efficiency.

Such technological innovation is also creating new opportunities for cross-border cooperation. Heritage institutions in China and Southeast Asia are increasingly sharing digital tools and conservation experience as they confront common challenges.

The Yungang Research Institute has expanded exchanges with Cambodia's Angkor Wat through exhibitions and professional dialogues on heritage conservation.

Li Lihong, associate research librarian at the institute's Digital Conservation Center, said AI, 3D laser scanning and high-precision digital documentation are enabling researchers to preserve grottoes in unprecedented detail and even assist in the virtual restoration of damaged relics.

"AI is becoming an important tool for heritage conservation," Li said. "But technology cannot replace human expertise. Instead, it provides new possibilities for protecting and understanding cultural heritage."

Cambodia is exploring similar approaches in its own conservation work.

Im Sokrithy, director of the Department of Research, Training and Communication at Cambodia's APSARA National Authority, said digital twin technology is also being used at the Banteay Chhmar temple complex to support conservation and research. He expressed hope that China and ASEAN countries could build more open platforms for sharing data and expertise to better preserve heritage for future generations.

Participants said innovation should extend beyond conservation itself to generate broader cultural and economic value.

Heri Yogaswara, head of the Archaeology, Language and Literature Research Organization at Indonesia's National Research and Innovation Agency (BRIN), said stronger research networks and international cooperation are essential to maximizing the social and economic value of cultural heritage. Indonesia is working to better connect archaeological research with creative industries, digital innovation and cultural tourism so that heritage conservation can generate broader public benefits, he said.

"We hope to strengthen collaboration with China and other ASEAN partners in research, innovation and infrastructure," he said. "Research should not stop at academic discovery. It should also contribute to creative industries and benefit society."

That broader vision also places heritage within the framework of sustainable development.

Li Hong, representing the UNESCO World Heritage Institute of Training and Research for the Asia and the Pacific Region in Shanghai, said heritage should contribute to sustainable development by integrating environmental protection, economic vitality, cultural continuity, and community well-being into everyday management. "Through research, planning and good governance, heritage can become an important force that benefits communities while passing cultural values on to future generations."

As heritage cooperation expands, participants also highlighted the importance of stronger institutional support.

Liu Chao, chairman of the Intellectual Property Publishing House, called for China and ASEAN countries to jointly build databases for traditional knowledge and cultural heritage, deepen cooperation on protected geographical indications, and expand training opportunities for young professionals.

The launch of the China-ASEAN Cultural Heritage IP Incubation Capacity Enhancement Program reflects that ambition. The initiative will bring together heritage practitioners, students, researchers and media professionals from across the region to explore how cultural heritage can be transformed into creative products while strengthening long-term exchanges.

Another recurring theme was the role of the younger generation. Participants agreed that deeper China-ASEAN cooperation will depend not only on protecting cultural heritage, but also on equipping young researchers, heritage practitioners, students, and content creators with the skills and platforms to reinterpret and communicate that heritage in contemporary ways.

"Heritage protection is ultimately about ensuring these connections continue for future generations," Henares said. "I hope this dialogue will lead not only to exchanges of ideas, but also to new friendships, new partnerships and new cooperation."

A scholar's passion for glass painting

TIANJIN — Laura Maria Cinquini, an Italian PhD candidate in world history at the University of Turin, has returned to Tianjin, a city in North China, to continue her research on Chinese glass painting.

Her latest visit brought her back to Zhang Chunlin, a representative inheritor of a Tianjin intangible cultural heritage item involving glass-painting techniques of dyeing, etching, and grinding.

Cinquini's research focuses on modern and contemporary Chinese glass painting. "I have been studying this field for several years, trying to trace the overall historical thread of this painting tradition. While previous scholars have mostly concentrated on ancient glass paintings, I am more interested in its modern and contemporary development," she says.

Glassmaking dates back to ancient Egypt and later spread to Italy through the Roman Empire, with Italy having played a significant role in the history of glass painting.

This art form was introduced to China by missionaries and gradually merged with traditional Chinese painting techniques, forming a distinctive Chinese glass-painting style.

In the 1920s and '30s, glass paintings became a common sight in Chinese households, often presented as popular gifts for weddings and business openings. Tianjin's glass-painting industry remained prosperous until the 1980s and was once an important category of Chinese export paintings, before later losing much of its export appeal.

Luo Shuwei, a Chinese cultural historian, notes that glass painting is a product of early cultural exchanges between China and the West.

"Tianjin was a key trading port in the Qing Dynasty (1644-1911). Early glass paintings were mainly used for interior decoration, but later incorporated elements beloved by Chinese people, such as auspicious patterns, folktales and figures, making them fashionable gifts for weddings, birthdays, housewarmings, and shop openings," Luo says, adding that Tianjin's glass paintings, characterized by their adoption of traditional Chinese ink painting techniques, carry a unique local flavor and represent the folk memory of a specific era.

Cinquini's fascination with Chinese glass painting began at the State Museum of Hanover in Germany, where she interned during her master's degree at the University of Bologna. She helped curate a private exhibition of Chinese glass paintings collected by a German couple, marking her first close encounter with this art form and sparking her academic pursuits.

While conducting research, Cinquini came across an online article about Zhang Chunlin and decided to travel to China to meet him. In August 2025, she made her first solo trip to Tianjin, determined to explore this intangible cultural heritage.

Zhang, a fourth-generation inheritor of the dyeing, etching, and grinding techniques used in glass painting, grew up immersed in the craft. He began learning glass painting from his father at the age of 6 or 7. Over the past five decades, Zhang has become one of the few craftsmen to master all three techniques and can, notably, integrate them in his creations.

"It moved me deeply that an Italian researcher is so passionate about Chinese glass painting that she would cross half the globe to find me. Her dedication and eagerness to learn are truly admirable," Zhang says.

"Glass painting came from the West but took root in China. The fusion of Chinese and Western elements, appealing to both refined and popular tastes, is a testament to the mutual exchange and influence of Eastern and Western arts," Zhang adds.

After a few days of discussions and meetings, Cinquini left with a promise to document what she had learned about Tianjin's glass-painting heritage and to return with more questions.

The two have stayed in touch.

"Cinquini shares her research progress with me. She is meticulous in her scholarship, often verifying a single point repeatedly. I am delighted that her research will help more people around the world learn about Tianjin's glass painting and its continuous innovation," Zhang says.

In April 2026, Cinquini returned to Tianjin with more research topics. This time, she not only observed but also tried her hand at glass painting.

In Zhang's studio, he sketched a design of two birds on a branch with a Chinese brush and guided her through the coloring process. Cinquini immediately recognized the motif as the traditional "double longevity" pattern commonly seen in glass painting. Though she had studied glass paintings for years, it was her first time actually painting one.

"From Italy to China, I have visited many places and seen many glass paintings from different periods, but this is my first time creating one myself, which makes this trip unforgettable," she said after finishing her debut piece.

During her latest China tour, Cinquini also visited Yibin, Yinchuan, Guilin, Guangzhou, Macao, and Hong Kong, tracing the footprints of Chinese glass painting across the country.

"This skill, introduced from the West, has taken root in China and become a medium reflecting life and recording the times," she observes.

Via field investigations and conversations with inheritors, Cinquini has gained an in-depth understanding of the history, techniques and cultural significance of Chinese glass painting, amassing substantial material for her research.

Now an active researcher and promoter of the craft, Cinquini says: "I am in my second year of the PhD program, so I still have ample time for research. There are many more stories to uncover about Chinese glass painting, and I will keep coming back to China."

She plans to compile her findings into a book and introduce Tianjin's glass painting to Europe, while building connections with scholars, collectors and museum experts from both China and the West to introduce this unique intangible heritage to a broader audience.

"I hope to build a cultural bridge between the East and the West through glass painting," Cinquini says with conviction.

2026 WORLD CUP

Pharaohs toppled by Messi's comeback kings

Argentina wins it late, rebounding from 2-0 down

Left: Enzo Fernandez celebrates scoring Argentina's late winner in Tuesday's 3-2 round-of-16 victory over Egypt. **Right:** Argentina's Lionel Messi tries to evade the clutches of Egypt's Karim Hafez. REUTERS / AP

It was another World Cup epic from an Argentina team that simply doesn't know when it's beaten.

Trailing 2-0 against Egypt with 11 minutes of regulation time to play on Tuesday, the defending champion rallied for an improbable 3-2 victory and a spot in the quarterfinals.

"We have a phenomenal group, a group that never gives up no matter the difficulties and adversity. We're always together," said Enzo Fernandez, who scored the winning goal in stoppage time.

An emotional Messi broke down after the final whistle, tears of relief and joy streaming down his face after a nerve-shredding victory.

"Turning a match around like that — coming back from 2-0 down — it wasn't easy, especially given how this World Cup is playing out and the fact that no one is just rolling over," Messi said.

"It was a moment of pure happiness and relief; we wanted to stay in the tournament. We didn't want today to be the end, we didn't want to go home."

Argentina will play Switzerland in the next round on Saturday in Kansas City, Missouri.

For much of Tuesday's game, it looked like it would be a painful exit for the 39-year-old Messi in what is likely to be the last of his six World Cups.

Egypt led after goals in each half from Yasser Ibrahim and Mostafa Zico and could have been ahead 3-0 if not for a video review that ruled out another score.

Argentina looked down and out, its bid to be the first team to win back-to-back World Cup titles since Brazil in 1958 and 1962 all but dead.

Cue a monumental comeback.

"The heart of Argentinians is always something that pushes, that we keep going no matter what, that we give everything until the end. And honestly, with the score 2-0, we looked a bit beaten," Argentina striker Julian Alvarez said. "There was little time left, but we always manage to get something more by fighting until the end."

Cristian Romero started the rally by scoring with a header in the 79th minute. Messi scored his eighth goal of the tournament and record-extending 21st goal at the World Cup in the 83rd to level the score at 2-2 and Fernandez completed the comeback in injury time.

"Four years have passed since Qatar, and we've come to enjoy another World Cup — and we want to win it again. That's what we're aiming for," Fernandez said.

Argentina is no stranger to heroic matches at the World Cup.

There was the 3-2 win over West Germany in the 1986 final. Then the 3-3 draw and eventual shootout victory against France to reclaim the title four years ago.

Cape Verde pushed Argentina to the brink in the last round, before the defending champion eventually won 3-2 in extra time.

Tuesday's match was even more dramatic, with Messi having a first-half penalty saved and another effort hit the post.

"I'm so emotional," Argentina coach Lionel Scaloni said.

"What a group of players, brothers."

Egypt took a surprising lead in the 15th minute when Ibrahim got ahead of Lisandro Martinez to meet Marwan Attia's cross and head the ball into the bottom corner.

Argentina was quickly given the chance to level the match when Haissem Hassan tripped Nicolas Tagliafico in the box moments later. Referee Francois Letexier pointed to the penalty spot and Messi stepped up with an expectant crowd waiting for him to score.

Egypt goalkeeper Mostafa Shobeir had other ideas, diving to his left to block the shot for Messi's second penalty miss of the tournament, after also failing from the spot against Austria in the group stage.

Despite being the all-time leading World Cup goalscorer, Messi has now missed four of eight penalty kicks at the tournament.

After Messi hit the post later in the half, Shobeir pulled off another great save to stop Alvarez from close range.

Egypt thought it had doubled its lead in the second half, when Zico finished off a sweeping attack, but its celebrations were cut short when, after a video review, it was adjudicated that a foul had been committed earlier in the move and the goal was disallowed.

The Pharaohs did get their second in the 67th from a similar break, and this time Zico's effort counted. It just wasn't enough.

"We looked better compared to the reigning champions. We were better in everything, but the result," Egypt coach Hossam Hassan said.

Hassan said he would not watch any further games at this year's World Cup, believing his team should have had a penalty before Argentina broke away for the winning goal.

"I'm not convinced with this outcome. I'm not convinced with the way things unfolded during this match," he said. "I do not want to try to put it nicely here, with beautiful wording, selected wording, and saying hard luck, and so on and so forth.

"We have been treated unfairly today," Hassan said. "We have suffered injustice."

AGENCIES

Egypt coach seethes at 'unfair' treatment from match officials

For Mohamed Salah and Egypt, what could have been a glorious celebration turned ugly at the end.

On the cusp of upsetting the defending World Cup champion, the Pharaohs squandered a two-goal lead late in the game and fell 3-2 to Lionel Messi and Argentina in the round of 16 on Tuesday.

Egypt coach Hossam Hassan held up both arms in an "X" shape — the signal in soccer for calling out racial abuse — and stated flatly that his upstart squad was victimized by a soccer establishment that wanted Messi and Argentina to advance to the quarterfinals in their pursuit of a second straight title.

"We have been treated unfairly today," Hassan said. "We have suffered injustice."

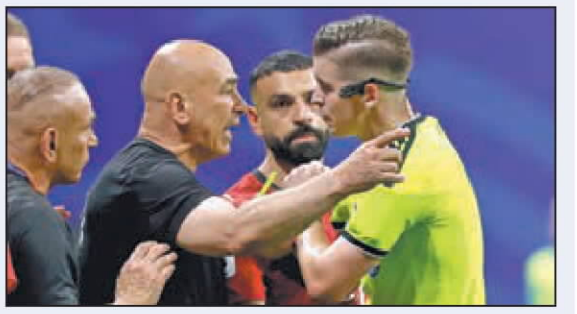
In a tournament already marred by reports that US President Donald Trump influenced FIFA to overturn the one-game suspension for US striker Folarin Balogun, Egypt turned up the heat on soccer's governing body.

"I just would like to say that we would have deserved a win," Hassan said, "but we are leaving with honor, with pride, regardless of this defeat."

Hassan, who has been outspoken during the tournament, particularly in his support of the Palestinians and against the treatment of the Iranian team, was upset that a potential second goal was overturned by VAR for a foul by Egypt at the start of a sweeping, box-to-box play.

Egypt took a 2-0 lead anyway on Mostafa Zico's goal in the 67th minute, but there was still enough time for Argentina to pull off a comeback for the ages at the home of the NFL's Atlanta Falcons.

Even retired NFL quarterback Tom Brady took to social media to point out the similarities to the comeback he pulled off against the Falcons in the 2017 Super Bowl, when the New England Patriots rallied from a 28-3 deficit late in the third quarter to win 34-28 in overtime. "Yeah, so that might top 28-3," Brady wrote on X.



Hassan, however, couldn't care less what Brady had to say. The coach was still seething that the VAR didn't feel a need to intervene and ask referee Francois Letexier to review what Egypt saw as a foul on Salah in the area, denying what could've been a penalty kick in the waning minutes, instead sparking the play that led to Argentina's winner.

"The effect of this outcome goes way beyond the defeat itself, because we haven't seen neither respect nor fair play," Hassan said. "Because a penalty was ruled out. A second ball that should have been called as a penalty for us was not even checked by the VAR.

"What I told the referee was just that this is unfair," the coach said. "I was saying maybe he's carrying a scar, maybe he has something to hide.

"Whoever has something to hide sometimes fails to hide what he is hiding and this was exactly what I felt during that conversation."

AP

Vargas sends Switzerland into last 8 in shootout win over Colombia

VANCOUVER, British Columbia — In a match with few fireworks, the Swiss were patient against the Colombians and their enthusiastic fans.

After Tuesday's game ended in a scoreless draw after extra time, Ruben Vargas converted the decisive penalty to help Switzerland advance to the World Cup quarterfinals, beating Colombia 4-3 on penalties.

Switzerland will face defending champion Argentina on Saturday at Arrowhead Stadium in Kansas City, Missouri, after Lionel Messi's side defeated Egypt 3-2 earlier in the day.

Switzerland had not reached the quarterfinals of a World Cup since hosting the tournament in 1954. And the Swiss were short-handed Tuesday, without young midfielder Johan Manzambi, who was injured in training on Monday.

Manzambi, a 20-year-old midfielder who plays for German club Freiburg, has three goals so far at the World Cup, becoming one of the tournament's breakout stars. The Swiss were also without Luca Jaquez and midfielder Michel Aebischer.

Vargas, who has scored two goals so far at this World Cup, also left Monday's training early, but came on in second-half stoppage time.

In the shootout, Colombia defender Davinson Sanchez's penalty attempt hit the crossbar and Switzerland goalkeeper Gregor Kobel saved an attempt by Cucho Hernandez.

FIFA president Gianni Infantino was among those at BC Place, where the sellout crowd of 52,497 was overwhelmingly clad in yellow in support of Colombia.

"They had the crowd on their side, so it was a tough game for us," Kobel said. "We know we had some stretches of the game where we had to defend and stay strong mentally. Obviously, we had a few players missing so, yeah, it was a big challenge for us."

Colombia failed to qualify for the last World Cup in 2022. Los Cafeteros made the quarterfinals at the 2014 tournament in Brazil, defeating Uruguay in the round of 16, before losing 2-1 to the host.

Switzerland's Ruben Vargas (left) celebrates with teammates after landing the winner in a penalty shootout at the end of a scoreless World Cup round-of-16 match against Colombia on Tuesday. AP

"The dream was enormous," Colombia midfielder Jhon Arias said. "The country showed us that it believed in us, that it lived every moment with us, and I think that only makes the pain even greater."

The Swiss reached the round of 16 at the past three World Cups, but failed to advance with a smaller field of 32 teams.

"We worked very hard, and now we have this opportunity," Switzerland coach Murat Yakin said.

"This is going to be a very interesting matchup from our point of view. We will try to compete against the reigning champions, and it's going to be amazing. Switzerland against Argentina in a quarterfinal.

"I am so excited. I think that I need maybe a couple of hours more, or another day, to process what just happened, and then, tomorrow, we will start focusing on Argentina."

The match was tightly contested by two teams with contrasting styles, the Swiss with a more organized and methodical approach, and Colombia more attack-oriented and physical. Switzerland had a slight edge in possession.

Gustavo Puerta had the first good chance for Colombia, with a shot from distance in the 21st minute that was pushed away by Kobel.

The Swiss got one of their best opportunities in the 30th, with Fabian Rieder's blast at Colombian goalkeeper Camilo Vargas, who punched the ball down. Minutes later, the stopper smothered another attempt from Dan Ndoye.

The Swiss had a freekick in the 52nd minute, but Rieder's attempt curled around the wall and went into the side netting.

In the first period of extra time, Jhon Lucumi's header hit the crossbar and caromed away, as Colombia put pressure on Kobel.

"I don't think you can overstate what a huge success this is — for us, for this team, for Switzerland, for such a small country. To be among the top-eight teams in the world is incredible," Kobel said.

"It's an unbelievable feeling. I'm incredibly proud."

Colombia and Switzerland also met in the group stage at the 1994 World Cup in the United States, with Los Cafeteros winning 2-0.

MODERNIZATION FOR ALL

Kazakhstan experiences China speed

Astana's light rail shows how Belt and Road cooperation helps to advance modernization

By ZHAO JIA in Astana, Kazakhstan
zhaojia@chinadaily.com.cn

When the first phase of Astana's light rail transit system opened on May 16, Kazakh President Kassym-Jomart Tokayev took a ride on the new line and expressed thanks to the Chinese government and Chinese builders in Chinese, quoting the ancient proverb, "A journey of a thousand miles begins with a single step".

"I felt very proud," said Ji Chenglong, executive manager of the Astana light rail transit project at China Construction Sixth Engineering Bureau Co. Ji arrived in Astana with his team in July 2023. Working through winter temperatures as low as -40 C, they adapted materials and construction methods to local conditions and overcame the challenges of building an urban rail system in extreme cold.

The project applied Chinese standards and technologies across design, construction, equipment and operations, including fully automated self-driving trains and intelligent dispatching.

Ji said that average daily ridership has exceeded 70,000, well above the design-stage projection of 25,000. During construction, the project created more than 2,000 local jobs, while the project team conducted ongoing technical exchanges and provided on-the-job training tailored to the project's needs, he added.

"Seeing more and more residents enjoy the convenience brought by the light rail has deepened my understanding that infrastructure is not simply about steel and concrete. It is an important means of improving people's lives and promoting development," he said, adding that this is the true meaning of Belt and Road cooperation.

Ji said he still remembered that President Xi Jinping once said the ultimate goal of the Belt and Road Initiative is "to explore new ways for countries from near and far to achieve common development and to open up a 'path of happiness' that benefits the whole world".

The Astana light rail is a vivid example of that path taking shape in Central Asia, Ji said. "From a light rail line to a modern city, and from engineering cooperation to closer bonds between peoples, Belt and Road cooperation is not only a path of connectivity, but also a path of common development, friendship and cooperation, and greater well-being for the people," he said.

Askar Umarov, head of the Central Communications Service under the Kazakh president, said he believes that Kazakhstan and China are at a critical stage of development and revitalization, and are companions on the path to modernization.

Liz Gill, a freelance journalist from the United Kingdom, experiences the craft of making Dongba paper in Lijiang, Yunnan province, in September. WANG JIAN / FOR CHINA DAILY

TOURISTS FOLLOW PAPER TRAIL TO NAXI CIVILIZATION

Thousand-year-old craft of making Dongba sheets is finding its way around the world

By YANG FEIYUE and **LI YINGQING** in Lijiang, Yunnan

In Lijiang in southwestern Yunnan province, paper is crafted to endure. Handmade Dongba paper, once reserved for recording the sacred scriptures of the Naxi people, is now earning a place in the luggage of travelers from around the world.

A growing number of domestic and international visitors have left the UNESCO World Heritage-listed Old Town of Lijiang with Dongba paper products tucked into their luggage — notebooks filled with travel memories, postcards inscribed with ancient pictographs bearing blessings, and handmade paper lamps whose soft glow will follow them home.

Some visitors share their finds on social media, posting photos of the paper's fibrous texture and the enigmatic characters adorning it, introducing this centuries-old craft to a wider audience.

The alchemy of Dongba paper begins in the mountains surrounding Lijiang. It is traditionally made from the bark of the Wikstroemia shrub, which grows at elevations above 2,000 meters. The bark is soaked, softened, pounded into pulp, meticulously spread onto bamboo screens and then sun-dried — a process repeated dozens of times.

Beijing firmly opposes Japan's defense white paper

By LI SHANGYI in Beijing and **HOU JUNJIE** in Tokyo

China voiced firm opposition on Tuesday to Japan's newly released defense white paper, accusing Tokyo of hyping up the so-called "China threat" to justify expansion of its own military capabilities.

Chen Xi, a spokesman for the Chinese Ministry of National Defense, said the white paper is filled with false narratives and exaggerates a so-called "security crisis in the surrounding region".

Describing Japan's move as a case of "a thief crying 'stop thief'", Chen said the white paper serves as a pretext for its own military expansion. "We are strongly dissatisfied with and firmly oppose this move," he added.

Japan released on Tuesday the roughly 600-page white paper, titled "Defense of Japan 2026", which continued to portray the regional security environment as "increasingly severe".

The report claimed China's military developments "present an unprecedented and the greatest challenge" for Japan, and alleged that the Chinese mainland's military activities around Taiwan have become increasingly frequent.

The white paper retained the wording of its 2025 edition, claiming that the international community is facing its greatest challenge since World War II and has entered a new era of crisis.

In response, Chen said Japan's ruling authorities have continued to uphold the banner of an "exclusively defense-oriented policy" while accelerating revisions to its three key security documents, steadily increasing defense spending and developing long-range strike capabilities.

Japan has also promoted the weaponization and militarization of space and portrayed the expansion of its defense industry as a driver for economic growth, Chen said. He added that Tokyo is attempting to embed military expansion and war preparations into the country's institutions, economy, industries and public discourse.

Chen warned that Japan's "new militarism" has become a growing concern, posing a serious challenge to the postwar international order and a genuine threat to regional peace and stability. "The Taiwan question concerns China's sovereignty and territorial integrity and serves as the political foundation of China-Japan relations. It is a red line that cannot be crossed," he said.

The spokesman urged Japan to deeply reflect on its history of aggression, stop interfering in China's internal affairs, refrain from misleading the Japanese public and the international community, and avoid going further down the wrong path of "remilitarization".

Experts based in Japan said the country's continued military build-up has become a source of regional instability. Makoto Ito, director of the Japan Institute of Constitutional Law, told China Daily that Japan's security environment would improve if it remained committed to diplomatic and security stances that reassure its neighbors.

Ito noted that Japan's security and defense policies in recent years have deviated from its pacifist Constitution. "And yet, these policies continue to be advanced and are communicated to the public through official documents such as the defense white paper," he said.

Kumiko Haba, a distinguished professor at Josai International University in Tokyo, told China Daily that the administration of Japanese Prime Minister Sanae Takaichi is moving in an extremely dangerous direction, warning that it could evolve into a government prepared to wage war.

Haba said the current Liberal Democratic Party government has prioritized strengthening military capabilities, reopening debate on the three nonnuclear principles, expanding the defense industry and seeking to reinforce the Japan-United States alliance.

Japan's defense spending has been rising steadily, and it is already moving ahead of schedule toward the target of reaching 2 percent of the nation's GDP.

In March, Japan deployed its land-based Type 25 anti-ship missile in Kumamoto prefecture. With an upgraded 1,000-kilometer range, the missile far exceeds Japan's territorial defense requirements and possesses clear offensive capabilities. In April, Japan fully lifted restrictions on the export of lethal weapons.

Haba said that Japan is seeking to align itself with the US' agenda by abandoning its identity as a peace-oriented country and moving toward participation in war in pursuit of a new phase of national development.

Xinhua contributed to this story.

Nation matching steps with UN to renew multilateralism

WORLD WATCH
By Siddharth Chatterjee

The United Nations General Assembly adopted Resolution 2758, restoring the lawful seat of the People's Republic of China in the United Nations, on Oct 25, 1971. In doing so, it restored one-fourth of humanity to the world's foremost multilateral institution, making the UN whole. Fifty-five years on, that decision endures as a defining milestone in the evolution of the international order.

The anniversary arrives at a sobering moment. Armed conflicts grind on across several regions, geopolitical rivalry is growing, trust among major powers has frayed, and humanity faces a convergence of challenges — climate change, pandemics, food insecurity, technological disruption and widening inequality — that no border can contain.

Seen across the span of 55 years, the story of China and the UN is one of remarkable evolution. A country that reentered the organization cautiously in 1971 has become one of its central pillars. As a permanent member of the UN Security Council, China is today the second-largest contributor to both the regular and the peacekeeping budgets of the United Nations. Among the Council's permanent members it deploys the most peacekeepers, with more than 50,000 Chinese personnel having served under the blue helmet from Africa to the Middle East. Some have given their lives for international peace and security.

What began as a restored seat has grown into sustained engagement across the UN's agencies — on public health and pandemic response, climate and biodiversity, agriculture and food security, digital cooperation and humanitarian relief. Through South-South cooperation, the Global Development Initiative and expanding partnerships, China increasingly shares its experience, technology and resources in support of the 2030 Agenda for Sustainable Development.

Multilateral cooperation is a vaccine reaching a remote village before an outbreak spreads. It is former child soldiers trading rifles for schoolbooks. It is a farmer planting a drought-resistant seed, or a family receiving shelter in the hours after catastrophe.

Such outcomes are possible only when governments, organizations and communities act through institutions that command global legitimacy.

Serving as UN resident coordinator in China gave me a rare vantage point from which to view China's partnership with the UN. What struck me was not merely the scale of China's engagement but its readiness to work through multilateral channels on challenges reaching beyond its borders. When the global health crisis tested every health system on Earth, I watched China reach out to many nations at once, delivering vaccines and sharing clinical experience and non-pharmaceutical interventions with countries across the Global South. The most consequential moments seldom made headlines. They took the form of patient collaboration — between Chinese ministries, UN agencies and international partners — to strengthen health systems, advance the green transition and modernize agriculture.

Is El Nino's economic risk too hot to handle?

Experts say 'climateflation' to impact bank rates, food output

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

Tourists pose for a selfie on Westminster Bridge on July 29 in London, England, as a fourth consecutive summer heatwave was gripping southern England.
BEN MONTGOMERY/ GETTY IMAGES

Across the globe, the looming "super El Nino" is sparking warnings from economists, planners and experts about its potentially devastating impact on economies and societies.

A key area of the Pacific Ocean used to measure the strength of El Nino last week reached its warmest and most intense level ever recorded for the 15th week since it formed, which is early in its lifetime, scientists at Columbia University reported.

The El Nino weather event won't peak for several months and is expected to last through to spring 2027. The United Nations' World Meteorological Organization cautioned on Friday that it will likely trigger extreme heat, drought and rainfall well into next year.

The WMO warned of the strong chance of drought and wildfires in Indonesia, India and other parts of Asia, south and east Australia, chunks of South America and southern regions in Africa. Other areas, including much of the United States and fire-struck Southern Europe, will receive above average rainfall, the agency said.

"This El Nino, developing against the backdrop of unprecedented ocean heat and rising temperatures, provides governments and communities with a window of opportunity to anticipate risks and act before impacts unfold," said WMO Secretary-General Celeste Saulo.

For many economists, however, the consequences are already becoming evident. Investors and policymakers are increasingly concerned that climate shocks could reinforce inflationary pressures already facing economies around the world.

"Heat kills — both lives and livelihoods," said Gernot Wagner, a climate economist at Columbia Business School.

"And it is often rather small changes in the average that lead to large threshold effects," he said.

He cited research showing that "only one additional day above 32 C in any given year lowers annual payroll by 0.04 percent".

"That may seem like a small effect. It is not," Wagner told China Daily. "One hot day in any given year shows up in annual productivity statistics, and El Nino only exacerbates these effects."

Wagner said the impacts extend well beyond labor productivity.

"'Climateflation' is a real phenomenon, and one that can already be measured," he said.

"Single heat waves lead to often large spikes in prices of individual agricultural products, which reverberate throughout the economy," he said.

Emerging economies at risk

The weather phenomenon, which typically occurs every two to seven years, could take a heavy toll on emerging economies, pushing up food prices and slowing growth.

Emerging markets are particularly vulnerable as households spend a larger proportion of their income on food, experts said. Also, agriculture plays a big role in their economies, raising the risk that central banks will have to keep policy tighter for longer.

"We came into this year with many central banks thinking they had space to cut. And now we see central banks stopping cutting, and some of them are hiking (rates)," Gillian Edgeworth, a fixed income portfolio manager at Wellington Management, told Reuters.

"I don't think we're moving to a world where there's rapid rate cuts in emerging markets in the second half of the year."

India is among the most vulnerable economies as it depends heavily on the annual monsoon, which typically delivers nearly 70 percent of the country's rainfall.

The country's meteorological department has warned rainfall could be the lowest in more than a decade, threatening crop yields and raising the prospect of higher food prices.

With inflation above the central bank's 4 percent target, analysts warned a super El Nino could force it to tighten monetary policy. However, a revival in monsoon rains late last month accelerated planting of summer crops across much of India, sharply reducing an earlier sowing deficit caused by lower rainfall.

Across much of Asia, higher energy and fertilizer costs are already weighing on external balances and economic growth, complicating central banks' efforts to stabilize currencies and contain inflation.

Central banks in the Philippines, Indonesia, South Korea, Pakistan and Sri Lanka have already hiked interest rates at least once this year.

"El Nino is just going to make inflation more sticky," said Gary Tan, equity portfolio manager at Allspring Global Investments.

"People are forecasting rate hikes for the second half of the year, especially for the ... Asian countries, which are kind of the most impacted by El Nino such as India, Indonesia, Vietnam, Thailand," he said.

In South America, Colombia is among the Latin American economies most exposed to El Nino-related weather shocks, as below-average rainfall can hit food supplies and electricity prices.

The country's reliance on hydropower makes reservoir levels a key inflation indicator. Low water levels can force greater use of costlier thermal generation, pushing up electricity prices and inflation.

Analysts warn a severe El Nino could keep Colombian monetary policy restrictive for longer.

Peru's central bank has warned that inflation could exceed its target this year and growth could suffer, citing high oil prices and El Nino's impact on fishing and agriculture.

Argentina, by contrast, may benefit from higher rainfall, which could support grain output, export revenues and foreign-exchange inflows. Central banks in Brazil, Mexico and Chile are expected to take a wait-and-see approach as they assess any impact on inflation and growth.

Africa vulnerable

An impending super El Nino is likely to inflict a combined $10 billion to $20 billion hit on affected African countries and trigger mass migration from hard-hit areas, the African Development Bank's top climate expert told Reuters.

As well as the threat to food and water security, government finances and banking sectors could also be undermined if disasters damage infrastructure and leave cash-strapped countries struggling to repay the connected loans.

"Just this event is going to reduce heavily affected countries' GDP by one to two percent on average, which is about $10 billion to $20 billion across the continent," said Anthony Nyong, the ADB's director for climate change and green growth.

The development bank's most recent forecast in May, which did not take into account a super El Nino, predicted Africa as a whole would see 4.2 percent economic growth this year, rising to 4.4 percent in 2027, assuming the conflict involving the United States, Israel and Iran eases.

Governments in Africa were also getting snared in what Nyong described as the "climate finance trap", where they lack the resources to respond to crises and are forced to raid health, education or infrastructure budgets to meet costs.

The 2023-24 El Nino caused severe drought in Southern Africa and heavy rains or flooding in East Africa. These conditions led to widespread crop failures, surging food prices and record-breaking sea-level spikes along the continent's coastlines.

The ADB has estimated Africa's farmers are already facing nearly $330 million in lost income this year, while fishing industries could also be hit hard due to rising sea temperatures and storms.

"When these shocks happen, countries take two steps back," Nyong said. "We don't want our countries to slide into poverty."

He said the ADB stood ready to restructure projects to help countries manage El Nino's impacts and it would work with them to tap additional multilateral support such as the Green Climate Fund, the world's largest dedicated climate fund.

Humanitarian pressures would add to the problems, Nyong said. The bank has identified Sudan, South Sudan, the Democratic Republic of Congo, Somalia, Mali, Burundi and even Nigeria as countries that could face particularly severe impacts.

"When this El Nino comes there is going to be mass migration," he said, adding that the price of maize — a key food staple in many affected countries — was expected to double. "You are not going to stay put, you are going to move," he said.

The African Union Commission has called on its members to step up preparedness for the expected impact of El Nino.

"The 2026-27 El Nino event is projected to be the strongest since 1950. This is not a distant possibility. It is an imminent risk that demands immediate preparation at national, regional and continental levels," Moses Vilakati, AU commissioner for Agriculture, Rural Development, Blue Economy and Sustainable Environment said on Thursday in Addis Ababa, Ethiopia, while opening the extraordinary session of a special technical committee looking at the weather pattern.

Many regions of the continent are likely to experience severe droughts, devastating floods, prolonged heat waves, disruptions to food production, water shortages, disease outbreaks and increased humanitarian needs.

"These impacts will not only affect vulnerable households; they will also place considerable pressure on national economies, public finances and regional stability," he said.

"This is neither speculative nor unprecedented. We have already witnessed the devastating consequences of delayed action," he warned, citing the 2023-2024 El Nino that affected millions of people in Africa.

Strengths, weaknesses

As climate risks become more synchronized across regions, globalization has created new vulnerabilities, Wagner, the climate economist at Columbia Business School, said.

"The more globalized — and hence specialized — our supply chains become, the higher the vulnerability of such extreme events, whether heat, droughts, floods, or other weather extremes that, due to climate change, are increasingly correlated," he said.

That growing correlation, he said, is changing the economics of risk itself.

"Single extreme events are costly. Correlation due to climate change makes them all the more costly," he said.

He compared the problem to insurance.

"The way to ensure against individual extreme events is by hedging — one flood or wildfire in one region may be bad, but others will be fine.

"With climate change, that is increasingly no longer the case — droughts and floods and other extremes the world over are suddenly connected, correlated with each other. Hedging away from extremes in one place is increasingly no longer possible," he said.

The solution, Wagner argued, lies in both adaptation and emissions reductions.

"Invest, invest, invest — in resiliency measures, of course, but also in cutting greenhouse gas pollution in the first place. Only by cutting additional carbon dioxide going into the atmosphere to zero will we be able to stabilize global climate over the long term," he said.

While many economists warn that El Nino could contribute to higher food prices, agricultural scientist Walter Baethgen argues it should not be seen solely through the lens of a possible disaster.

"My view of El Nino is different from the most popular one," said Baethgen, a senior research scientist at Columbia University's International Research Institute for Climate and Society. "I see El Nino as an opportunity."

The weather event is valuable because it is one of the few major climate phenomena that can be forecast months in advance, giving governments, humanitarian agencies and farmers time to prepare, he said.

Baethgen said seasonal forecasts allow farmers to make informed adjustments that reduce risk instead of radically changing production.

"It's a smart way of using this information," he said, describing how producers may shift part of their acreage toward crops favored by expected weather conditions without abandoning diversification altogether.

He also challenged the widespread perception that El Nino necessarily leads to global food shortages.

Wetter conditions often improve crop production in parts of the US and southeastern South America, while drier weather can reduce harvests in regions such as southern Africa, Australia and parts of Asia.

"It's not bad everywhere. For some things, it's very good," he said, adding that "the negative impacts ... are typically compensated by positive impacts in other regions."

Because agricultural gains and losses often occur simultaneously across different agricultural production regions, Baethgen said the relationship between El Nino and global food prices is far more complicated than many assume.

"El Nino is one of many factors affecting world food prices," he said. Geopolitical events, energy prices and fertilizer costs can sometimes have an even greater influence on global markets than climate alone, he added.

Institution: Increasing engagement highlighted

From page 1

When catastrophic floods inundated Pakistan in 2022, I launched an emergency appeal from Beijing alongside Pakistan's then ambassador to China. China was among the first countries to respond with timely assistance, supporting both immediate relief and longer-term recovery.

Similarly, after the earthquake that devastated Myanmar in 2025, the Chinese government, together with the UN in China, quickly mobilized emergency humanitarian assistance and relief for those affected.

Such actions epitomize China's increasing global engagement, which extends beyond economic development to encompass humanitarian solidarity. They also reflect China's commitment to South-South cooperation and its willingness to work through the UN to address global challenges. Effective multilateralism rests not on rhetoric but on the discipline of showing up, again and again.

Every great test facing humanity is a shared one. No nation, however powerful, can halt a pandemic, stabilize the climate, govern emerging technologies or deliver the Sustainable Development Goals on its own. That truth does not render the UN less relevant; it makes it indispensable.

As is dialogue. In the end, every conflict arrives at a negotiating table. The only question is how much suffering precedes it. To press for political solutions is not weakness but the highest form of strategic wisdom.

Nowhere was this clearer than in Beijing in March 2023, when China helped Saudi Arabia and Iran restore diplomatic relations after seven years of rupture — an agreement to reopen embassies and revive dialogue between two rivals whose estrangement had fueled conflicts across the Middle East. Few had anticipated a breakthrough; fewer still had expected it to be brokered in the Chinese capital. Such efforts reflect a principle woven into the very fabric of the UN Charter — that durable peace is never imposed by force, but built through diplomacy, mutual respect and perseverance.

Fifty-five years after Resolution 2758, the question before us is no longer one of representation but of responsibility. The true measure of leadership lies not in the power to shape events alone, but in the willingness to strengthen the institutions through which all nations may shape them together.

Our shared future depends not on retreating from multilateralism but on renewing it — with confidence, with courage and with common purpose. In an age of fracture, that remains humanity's surest hope.

The author served for nearly three decades with the United Nations, most recently as UN resident coordinator in China (2021-26). He is currently CEO of Global Neighbours, a Vienna-based think tank, and a distinguished visiting professor at Tsinghua University.

Religious rites

Monks make offerings to Panchen Erdeni Chos-kyi rGyal-po on Monday at Jokhang Temple in Lhasa, the capital of the Xizang autonomous region. Drones deliver convenience to sailors

By **CHEN MEILING** in Beijing and **LIU KUN** in Wuhan

Twelve-year-old Liu Ziqi celebrated her birthday aboard a ship docked in Yichang, Hubei province, recently. What made the day memorable was a specially delivered birthday cake, a first for the young girl.

Liu's parents operate a cargo vessel that ferries goods between Shanghai and Chongqing, and the girl has lived on board with them since she was a baby.

"She celebrates every birthday on the Yangtze River. However, we have never been able to go ashore and buy a cake," said Liu Ge, her mother.

What made this year different was the low-altitude instant delivery service extended by local authorities to meet the needs of tens of thousands of crewmembers who operate the numerous vessels plying the river every day.

Liu Ge placed the order for the cake through an app. The delivery rider collected the cake from the shop and took it to the drone base. The drone pilot located the vessel using the Yangtze Beidou app. With the cake loaded in a basket, the drone lifted off and headed straight for the ship. "It's as efficient as ordering a takeout ashore," Liu Ge said.

The family's vessel remained docked in Yichang for three days as it waited for its turn to pass the Gezhouba Dam and the Three Gorges ship locks.

Earlier for supplies, the family had to depend on mobile "supermarket" ships, in which the number of products is typically limited and the price is often higher than in shops ashore.

"The other choice was to go ashore on public ferries that run on fixed schedules, or pay for a small vessel that cost 100 yuan ($14.8) for a round trip," the mother said, adding that the drone delivery service is fast, cheap and offers more choices when it comes to shopping.

Sailors plying on the route have been making the most of the service.

For Li Wenchuan, a 22-year-old sailor, the drone delivery was a godsend as he could get medicines for a stomachache quickly by paying a nominal fee of 10 yuan. Captain Fu Yibo replaced his vessel's storage batteries after having them delivered by the drone service. First mate Zhang Zhongkun ordered chilled milk tea, fried chicken and grilled skewers to cheer up his crew, something that would have been difficult to do in the past.

After months of trials, the low-altitude instant delivery service was officially flagged off in late July. Including the trials, more than 10,000 orders have been placed so far, with the number of daily orders ranging between 30 and 40, said Huang Yuhua, who is in charge of the drone comprehensive service base.

Yichang sits at the junction of the upper and middle reaches of the Yangtze River, and hosts the Three Gorges Dam and Gezhouba Dam.

Data from Yichang maritime bureau shows that since March, around 700 vessels on average waited for lock passage each day on the Yangtze River's Yichang section. During peak periods, that number could rise to 1,000 vessels, carrying approximately 9,000 crewmembers.

Each day only about 70 to 80 ships can pass the locks.

Vessels typically wait seven to eight days to be granted passage. The maximum waiting time can stretch to 15 days during maintenance work and flood seasons. As sailors remain on board for a long time, buying fresh produce and spare parts becomes a challenge, Huang said.

"Traditional supply methods such as shuttle boats and supply vessels are time-consuming, and fresh produce tends to spoil easily. In addition, crewmembers face safety risks when taking small boats ashore to shop," he added.

The drone delivery service currently covers waters within approximately 3 kilometers. After cargo arrives at the takeoff and landing site and passes predeparture inspection, the maximum travel time for the farthest delivery takes about 80 seconds, Huang added.

Delivery fees are based on distance and weight, ranging from 10 yuan to 50 yuan. 5G-Advanced base stations are deployed along the river to ensure stable communication signals. When the drone reaches target waters, the pilot makes manual adjustments to identify the vessel name and accurately locate the waiting crewmembers.

Emergency medicine and critical supplies can be delivered to moving vessels. The drones can operate in light rain and snow. Deliveries are suspended when visibility drops below 200 meters or wind force exceeds Grade 7.

In the future, Huang said they would build a complete delivery system along the Yangtze River, establish an online shop, and add more takeoff and landing points for the drones.

"We do not merely treat sailors as passing visitors," said Zhu Hanhong, director of Yichang bureau of economy and information technology, adding that the delivery service extends the city's public services to the river.

Craft: Paper's durability surprises travelers

From page 1

"Unlike industrial paper, where uniformity is the goal, Dongba paper keeps the traces of nature," said Zhang Jian, a product designer who runs a Dongba paper workshop in the old town.

Plant fibers remain visible across the surface, creating subtle textures and organic patterns. No two sheets are ever alike.

"Every sheet has its own character," Zhang said. "We try to preserve the natural qualities of the raw material. The fibers themselves are what make the paper beautiful."

For centuries, Dongba paper was used by Naxi priests to record religious scriptures in a pictographic writing system that remains central to Naxi cultural heritage. Its natural resistance to insects and aging has helped preserve those texts for generations.

Today, the same durability has become part of its modern appeal.

"We used to see foreign tourists occasionally. Now we see them every day," said Zhang, who has spent nearly 23 years giving this thousand-year-old craft a modern makeover.

Turning Dongba paper from a religious material into everyday products was not easy.

Zhang spent his early years experimenting with ways to make the traditional paper suitable for modern life. Today, his workshop produces a range of cultural products, from journals and bookmarks to decorative pieces featuring Dongba script.

Han Yuchen, who oversees sales and outreach of Dongba paper sales, believes that its appeal goes beyond mere portability.

"Many visitors are surprised when they hear that such a delicate-looking paper can last for hundreds of years," he said. "They want to know more about how it is made."

Postcards are often the first thing overseas visitors pick up, followed by notebooks and paper lamps.

Featuring images of Lijiang's scenery alongside Dongba characters, postcards can be personalized with handwritten blessings before being sent home. The paper's natural texture gives the writing a warmth that mass-produced cards cannot replicate, Han said.

Dongba paper lamps have become an unexpected hit. Made by folding a single sheet of Dongba paper into a lampshade, they emit a soft glow that reveals the natural fibers. Each lamp has its own pattern, shaped by the plant material itself.

"Many European and US visitors say the texture fits beautifully with their home decoration," Han noted. "They like the feeling of bringing something natural and handmade into their homes."

Notebooks are another favorite. One best-selling journal, roughly A5-sized with raw edges and a leather cover, sells for more than 180 yuan ($27). Though pricier than standard notebooks, they serve as a premium repository for personal memories.

Chinese AI models gain favor overseas

Alibaba unveils latest Qwen version as businesses embrace cost-effective tech

By **CHENG YU**
chengyu@chinadaily.com.cn

Alibaba Group has launched its 2.4-trillion-parameter Qwen3.8-Max model that can analyze 200-page financial reports and process more than 100 hours of video content, putting it directly among the world's top-tier large language models.

Several sources told China Daily that Alibaba's latest Qwen model has entered the "deep testing" phase in Tesla's vehicle systems in China and is expected to be used for Tesla's in-car platform soon.

The development comes as more and more companies from the United States adopt Chinese artificial intelligence models, which they believe offer frontier-level performance at substantially lower costs.

In the latest Arena benchmark rankings, one of the most widely followed third-party evaluations of AI model performance, Alibaba's Qwen models ranked just behind US-based Anthropic's Claude series.

Alibaba said that Qwen3.8-Max is expected to become open-source next week, following the release of Qwen3.8-27B, further expanding access for developers building AI applications.

Qwen3.8-Max's application programming interface pricing in China has been set at 12 yuan ($1.67) per million input tokens and 36 yuan per million output tokens, with cached input tokens priced at 1.5 yuan per million tokens.

International pricing is also significantly lower than comparable frontier models, with input and output costs respectively at about 40 percent and 24 percent of Anthropic's Claude Opus prices.

Chinese AI models have been continuously gaining traction overseas. According to OpenRouter data, weekly usage of Chinese LLMs stood at 14.1 times that of US models as of July 27, marking the 13th consecutive week that Chinese models ranked first on the platform in terms of weekly token consumption.

Late last month, Coinbase CEO Brian Armstrong said the cryptocurrency company had adopted China-developed AI models, including Zhipu AI's GLM-5.2 and Moonshot AI's Kimi K2.7, as default tools for engineers through an internal AI gateway. Through model switching, intelligent routing and caching optimization, Coinbase has cut its AI costs by nearly half.

San Francisco-based AI startup Lindy switched from Claude to DeepSeek-V4 in June, and said its API expenses had exceeded its entire payroll costs before the transition.

"It is not about low pricing anymore," said Wang Peng, a researcher at the Beijing Academy of Social Sciences. "Companies globally are increasingly weighing performance against cost, privacy, flexibility and suitability for AI agents and enterprise workflows."

Morgan Stanley said in a research note that Moonshot AI's Kimi K3, the full model weights of which became officially open-source on July 27, represented a broader trend of Chinese LLMs catching up with US leaders in model scale, performance and pricing.

Peng Jiahao, a researcher at the Shanghai Artificial Intelligence Research Institute, said: "The pace of AI development is increasingly moving in China's favor. But both Chinese and US AI models are still facing challenges in reaching short-term breakeven and the AI industry is still far from achieving widespread profitability."

Relations: Goal is to build projects with lasting value

From page 1

Umarov said that China's achievements in economic development, digital transformation, technological modernization and the implementation of long-term national strategies offer valuable practical insights for Kazakhstan.

China is an important strategic partner of Kazakhstan, and understanding the thinking behind China's domestic and foreign policies has significance beyond academic research, he said.

"The more deeply we understand China's decision-making logic and long-term development goals, the more effectively we can improve the quality and efficiency of our cooperation," Umarov said.

Manarbek Kabaziyev, deputy chairman of the board of the Foreign Policy Research Institute of Kazakhstan's Foreign Ministry, said the next decade of Belt and Road cooperation should be evaluated not by the number of projects, but by whether they create lasting value, spur innovation and strengthen trust among countries.

Infrastructure is not an end in itself, he said, but a foundation for higher-level cooperation. Kazakhstan should build on improved connectivity to develop a future-oriented modern economy, with transportation corridors supporting not only trade but also closer industrial, investment and technological links.

Aliya Mussabekova, head of the International Security Department at the Kazakhstan Institute for Strategic Studies under the president of Kazakhstan, said bilateral economic cooperation has moved beyond traditional trade, with the focus expanding from infrastructure and resource development to manufacturing and high-tech industries. This shift is increasingly supporting the modernization of both countries.

China-Kazakhstan trade reached a record $48.7 billion in 2025, up 11 percent year-on-year, according to Chinese figures. Data from Kazakhstan's national investment promotion company shows that cumulative Chinese investment has exceeded $30 billion, with more than 8,000 Chinese-backed enterprises operating there.

Mussabekova said the two countries' development priorities also converge in digitalization and artificial intelligence. Kazakhstan has designated 2026 as its Year of Digitalization and Artificial Intelligence, while China has made digital development, technological innovation and AI national priorities, opening further opportunities in the digital economy, satellite and remote-sensing technologies and space communications.

Yet a lasting and stable strategic partnership cannot be built solely on economic indicators, she noted, saying that "long-term strength depends even more on mutual trust between the two peoples".

That trust is also being strengthened by closer people-to-people ties. A mutual visa-free agreement for ordinary passport holders took effect in November 2023, and Kazakh figures show that the number of Chinese visitors to Kazakhstan reached nearly 1 million in 2025.

Education cooperation is giving those ties a longer-term foundation. At L.N. Gumilyov Eurasian National University, a Luban Workshop jointly established with China gives students access to AI, robotics and digital manufacturing.

Gulmira Bekmanova, vice-rector for digitalization at the university, said the workshop is "not merely a laboratory or a classroom" but a practice-oriented teaching platform where students learn both advanced technologies and how to apply them to real-world problems.

"The Luban Workshop has become an important symbol of Kazakhstan-China educational cooperation," Bekmanova said.

Ceuta crisis raises EU frontier concerns

By **JULIAN SHEA** in London and **HOU CHENCHEN** in Beijing

The interior ministers of the 27 European Union member states held a virtual meeting on Tuesday to discuss tightening up internal borders following the scenes at the Spanish enclave of Ceuta in North Africa over the weekend.

The EU's migration chief said on Tuesday the bloc successfully met a "test" of its border security and "resilience to disinformation" in the handling of a migrant rush into Spain's North African territory of Ceuta.

"These past few days were a test of our European resilience, a test of the security of our external borders," EU Commissioner for Internal Affairs and Migration Magnus Brunner told reporters following Tuesday talks with the bloc's interior ministers.

"Europe, I think, has definitely passed this test."

Member states recognized Madrid's "immediate and efficient" response, Spanish Interior Minister Fernando Grande-Marlaska told reporters on Tuesday.

The minister added that Madrid had worked as fast as possible to install a maritime barrier off Ceuta's coast.

As for Schengen Area issue, Marlaska said: "It is clear that in no way was the Schengen Area compromised in this crisis" as the North African enclave is not included in the agreement.

He added that "there was no possibility of any secondary movement" of migrants from Ceuta to continental Europe.

France's interior minister also said on Tuesday that EU ministers had agreed the Schengen Area was "not the problem" after calls to suspend Spain from the bloc following the influx of migrants.

As the meeting unfolded, another migration incident was playing out in the English Channel, underscoring the multiple border pressures Europe is facing.

French and British teams rescued 157 migrants who were trying to cross the English Channel after the engine of their boat caught fire, French maritime authorities said.

Helping hand

EU has offered Spain aid, including emergency financial assistance, to help strengthen the protection of the external border in Ceuta, said Brunner, EU migration chief.

He added that the events in Ceuta last week, when about 70,000 people came over the border from Morocco into the Spanish enclave, were fueled by criminal smuggling networks and social media disinformation.

The Euronews website reports that the incident happened after false rumors began to circulate on social media saying that the border was open, with others showing where coast guard patrols were active, and more suggesting places where people could swim across.

Media agencies said there is a specific local angle that goes some way toward explaining the sudden nature and scale of the crisis, however.

The BBC noted that for decades, there has been an unresolved territorial dispute between Morocco and neighboring Algeria over the Western Sahara region, which was previously under Spanish control, making for a diplomatically sensitive three-way relationship in the area.

The broadcaster commented that a similar, smaller influx into Ceuta took place in 2021 after a regional opponent of Morocco was allowed treatment at a Spanish hospital, and that the latest incident came just two weeks after Spain's prime minister paid a visit to Algeria. It also observed that the authorities in Rabat have "already shown readiness to deploy migration pressure as a retaliatory tactic against Spain".

Happy birthday Bao Li

The Smithsonian's National Zoo and Conservation Biology Institute in Washington marks the fifth birthday of Bao Li, one of a pair of giant pandas who arrived in Washington in October 2024. The bear enjoyed a special panda-friendly "fruitsicle" cake made by the Zoo's Department of Nutrition Science on Tuesday morning, as crowds gathered at the David M. Rubenstein Family Giant Panda Habitat. SHA HANTING / CHINA NEWS SERVICE

Asian economies face risks to food security

Region sees challenges amid El Nino, Mideast energy supply shocks: Experts

By **PRIME SARMIENTO** in Hong Kong
prime@chinadailyapac.com

Asia's economies are staring down a double shock: a looming super El Nino threatens to deepen food insecurity just as the Middle East crisis drives up energy and fertilizer costs.

Analysts said a prolonged dry spell could slash crop yields and push food prices further out of reach for consumers already squeezed by surging inflation.

"The impact of El Nino is just among the many crises that we are facing at the moment," said Paul Teng, a visiting senior fellow in the Climate Change in Southeast Asia Programme at the ISEAS-Yusof Ishak Institute in Singapore.

Teng said geopolitical tensions in the Middle East, which have driven global oil prices higher, are rippling through Asia's transport and farm sectors, fueling inflation across the region. The surge has been compounded by what he called a "fertilizer shock", as the Middle East is a major exporter of crop nutrients.

He said that rising fertilizer costs are forcing farmers to cut back either on usage or on the land they plant this season. The squeeze on inputs is expected to weigh on harvests in the next crop cycle, adding another layer of pressure to food prices.

"On top of that is El Nino, which is like adding oil to fire," Teng told China Daily, referring to the periodic weather pattern that is expected to intensify further from this month, heightening the risks of extreme weather.

Oil prices started skyrocketing soon after the United States and Israel began attacking Iran on Feb 28. The Asian Development Bank, or ADB, said as the crisis in the Middle East evolved, inflation also rose across the developing Asia-Pacific region.

Headline inflation in the region increased from 2.9 percent in January to 4.1 percent in May on the back of higher global energy prices, the ADB said in its latest economic outlook report published in July.

The Manila-based lender said that since March, governments across the region have introduced measures to limit pass-through to consumer prices, including fuel subsidies, tax cuts, price controls, releases from strategic petroleum reserves and energy conservation policies. But inflationary pressures persist, with higher logistics and fertilizer costs spiking food prices.

The ADB sees inflation across the region hitting 4.3 percent by end-2026, up from the 3 percent recorded in 2025.

'Ripple effects'

Japanese investment bank Nomura said in its latest report that El Nino may lead to trade protectionism in the coming months. It noted that in the past, countries like India, Indonesia and Vietnam have resorted to export restrictions or outright export bans to prevent surge in domestic food prices. But while these measures can help in reining in local prices, the export bans have "ripple effects" as prices go up for food importers, it said.

The World Meteorological Organization, or WMO, said in a July 31 report that El Nino continues to intensify steadily and is expected to dominate global climate patterns until October 2026. The WMO also forecast a positive Indian Ocean Dipole, or IOD — a climate pattern defined by differences in sea-surface temperatures that affects regional weather. An IOD can amplify regional climate impacts, including drought, floods and wildfire risks.

Khor Yu Leng, an economist at Segi Enam Advisors in Singapore, said the El Nino plus positive IOD combination presents a "higher-risk scenario" for Asian agriculture as this will reinforce dryness in most parts of Southeast Asia.

She said that rice is the "immediate flashpoint" because the Asian staple is a thinly-traded commodity and as such, weather disruptions and export controls can trigger outsized price spikes.

Khor said El Nino's impact on palm oil, a key cash crop, "tends to be more lagged, but potentially broader". She said El Nino-linked dryness reduces fresh fruit bunch yields several months later while extreme rainfall and floods can also disrupt harvesting and logistics.

Unlike rice, palm oil is deeply integrated into the global food, oleochemical — chemical compounds derived from natural fats and oils, typically of plant or animal origin — and biofuel supply chains. Khor said this is why tighter palm oil supply can spill quickly into edible oils and energy markets.

She also cited corn as the "hidden protein inflation story" because Asian countries rely on imports from Brazil and Argentina. If El Nino hits South American corn harvest, Khor said Asian livestock raisers have to deal with higher feed costs.

China's electric buses fuel Baku's green transport

BAKU — "When I began driving electric buses, I could immediately tell that they were very different from the buses I had driven before. They run quietly and smoothly, with hardly any noise or vibration. Most importantly, they are environmentally friendly," said Nurlan Salmanli, a 34-year-old bus driver in Baku.

Salmanli previously drove buses powered by compressed natural gas. Ahead of COP29 in 2024, 160 BYD electric buses imported from China entered service in Baku, the Azerbaijan's capital, replacing the conventional buses on the routes he operated.

"Passengers really like them, especially older people and families with children. These modern buses make public transport in Baku more convenient and comfortable, and help reduce noise on the streets. I hope to see more buses like these in the future," Salmanli said.

Salmanli's experience reflects a broader transformation taking place in Baku's public transport system as Azerbaijan accelerates its transition toward greener mobility. According to BYD, an electric bus traveling 90,000 kilometers a year can save about 27,000 liters of diesel and reduce carbon dioxide emissions by approximately 66 tons annually.

Data released by the Azerbaijan Land Transport Agency in spring 2026 showed that about 2,350 buses operate in Baku each day, including more than 300 BYD electric buses. Some of these buses were assembled locally at the Azerbaijan Energy Automotive Factory, or AEAF, in the Sumgayit Industrial Park, about 30 km northwest of Baku.

"I have been involved in the AEAF project since its early stages. When the first bus rolled off the production line, we felt very happy and proud. It was the beginning of a new stage for our factory and our team," said Orkhan Gambarov, the factory's deputy director for production.

The factory was established through a joint initiative of the Azerbaijan Business Development Fund, SARDA Group and BYD. Its first locally assembled 12-meter BYD electric bus was delivered in September 2025.

According to Gambarov, major components are delivered to the factory, where assembly, quality control and the necessary inspections are carried out. To date, the factory has delivered 300 locally assembled BYD electric buses.

"Since the beginning of the project, the Chinese team has provided us with great support. Our Chinese colleagues have supported us at every stage, from technical issues to quality control. They have also shared their production experience and knowledge with our local team," Gambarov said, adding that the strong collaboration between the Chinese and local teams has been one of the main reasons for the project's success.

'Fascinating field'

The factory currently has about 100 Azerbaijani employees. Among its first technical staff members was Rizvan Gulaliyev, who is now a chief foreman at the plant.

He said electric bus production was a new and fascinating field for him, and that the project had helped him acquire valuable knowledge and hands-on experience in electric vehicle manufacturing.

"Chinese specialists conducted training directly on the production line and demonstrated the correct sequence of assembly operations. They also trained us to operate the equipment, conduct diagnostics and follow quality standards. I hope to grow with the factory and become a more skilled specialist in modern automotive technologies," Gulaliyev said.

The Project Management Department under Azerbaijan's Ministry of Economy coordinates and oversees the implementation of the AEAF project. Zamir Dibirov, head of the department, said cooperation with Chinese companies helps Azerbaijan transition from being solely an importer of green technologies to becoming a producer and operator of new-energy transport solutions, with the potential to serve regional markets.

"Azerbaijan highly values its cooperation with China and would welcome greater participation by Chinese companies in the country's new-energy and advanced manufacturing sectors. We see considerable potential in battery technologies, charging infrastructure, smart mobility systems and other fields," Dibirov said.

Jingdezhen's porcelain heritage recognition a lesson in shared protection

Yang Han
Reporter's log

FIRST PERSON VIEW

What does it mean for a country to be among the ones with the most World Heritage sites in the world?

For China, that question carried added weight on July 25, when the Jingdezhen Handicraft Porcelain Industry Sites became the country's 61st UNESCO site.

Held from July 19 to 29, the 48th session of the UNESCO panel added 25 new sites to the World Heritage List, including the first-ever inscriptions for three African countries — Comoros, Sao Tome and Principe, and South Sudan. The committee also granted emergency protection to three newly inscribed World Heritage sites and added three previously recognized sites to the danger list.

Among them, Jingdezhen stood out not only as China's sole nomination for 2026 but also as the first site explicitly themed around porcelain, and China's first-ever "industrial heritage" nomination.

Located in East China's Jiangxi province, the Jingdezhen Handicraft Porcelain Sites comprise five component areas that trace the evolution of handicraft porcelain production from the 10th to the 19th centuries in the city now often known as the "porcelain capital" of China.

But beyond the numbers, what struck me most was the shared commitment among nations to protect heritage as a legacy for all humanity, and how China's role in that effort was perceived by those I spoke with.

"China is bringing a lot to the World Heritage List," said Alessandro Balsamo, head of the Nominations Unit at the UNESCO World Heritage Centre. "And of course, this is not just an honor to be on top of this list, but it represents also a big responsibility."

"It is very important for all the countries to share their experience on their sites," said Aseela Almoalla Alhashmi, director-general of the Fujairah Environment Authority and a member of the United Arab Emirates delegation.

During the session, the UAE successfully had Wadi Wurayah, a national park in Fujairah that hosts 1,099 species, inscribed as its first UNESCO-listed natural heritage site.

When I asked about China's growing role in international heritage cooperation, Alhashmi mentioned that she had also participated in the World Congress of Biosphere Reserves in Hangzhou in 2025 and said she believes the Global Civilization Initiative proposed by China is important for the world and future generations.

For smaller nations with limited resources, this cooperation is even more practical.

Sandra Mascarenhas, scientific coordinator of the Tarrafal Concentration Camp at the Cultural Heritage Institute of Cabo Verde, told me that her country, which has only one World Heritage Site, depends on international cooperation with partners such as China to secure financial support and capacity building.

"Last year, we were in Guangzhou, (where) there was a symposium about cooperation between Africa, China and UNESCO," said Mascarenhas. "It was very good because it helped us reformulate our nomination and helped us achieve some monetary funds."

During the latest event in Busan, South Korea, there was also a series of side events co-organized by governments, institutions and companies from China, sharing China's experience in nominations, the adoption of technology in heritage protection, and the country's call to advance international cooperation in the sector.

Every one of those events saw the rooms filled to capacity and some were so packed that latecomers had to stand along the walls. Many participants stayed on after the session to exchange ideas with Chinese organizers. It was a clear sign of the international community's interest in China's heritage experience.

As Balsamo, the UNESCO official, told me during the interview, the honor of being among the top on the World Heritage List comes with a big responsibility to show the way for other countries and to become partners in multilateral cooperation.

In Busan, I saw that responsibility being acknowledged with more than just words. At a time when heritage is facing unprecedented challenges from climate change and geopolitical conflicts, that partnership feels all the more valuable in protecting the shared legacy of all humanity.

WORLD

Hostilities escalate over the Black Sea

MOSCOW/KYIV — The Russia-Ukraine hostilities have escalated over the Black Sea and its coastal areas, authorities said.

Ukrainian drones have targeted multiple Russian resort cities along the Black Sea coast, while Russia has struck Ukrainian vessels transporting military supplies.

Seven people were killed and at least 40 others were injured in a Ukrainian drone attack on Arkhipo-Osipovka, a Black Sea resort village in Russia's Krasnodar Krai region on Monday, according to the regional emergency response center.

Meanwhile, the Russian Defense Ministry reported on Monday that its unmanned aerial vehicles struck four bulk carriers ferrying military cargo that supported military operations of the Ukrainian Armed Forces.

The ministry said that two bulk carriers unloading military supplies were targeted at the port of Mykolaiv, a river port situated on the Southern Bug River, about 65 kilometers inland from the Black Sea. Two other cargo ships carrying military material were attacked in the Black Sea waters.

Escalating attacks by both sides on shipping in the Black Sea have reawakened fears that global food security could be put at risk.

Turkiye on Tuesday repeated its appeal for both Russia and Ukraine to ensure the safety of navigation in the Black Sea after two Turkish-owned ships were attacked by drones after leaving the Russian port of Novorossiysk.

A Turkish Foreign Ministry statement expressed concerns that the conflict is increasingly spreading across the Black Sea, threatening civilian shipping, and warned such incidents could have broader consequences, including for the global food supply, as important amounts of grain, fertilizers and other key produce move through those waters.

In other developments on the battlefield, five people were killed and six others injured in a Ukrainian drone attack on Tuesday morning in Moscow Oblast, regional governor Andrei Vorobyov said on his Max channel.

Elsewhere, a regional official in Sumy in Ukraine's northeast said Russian attacks killed one person in Sumy on Tuesday.

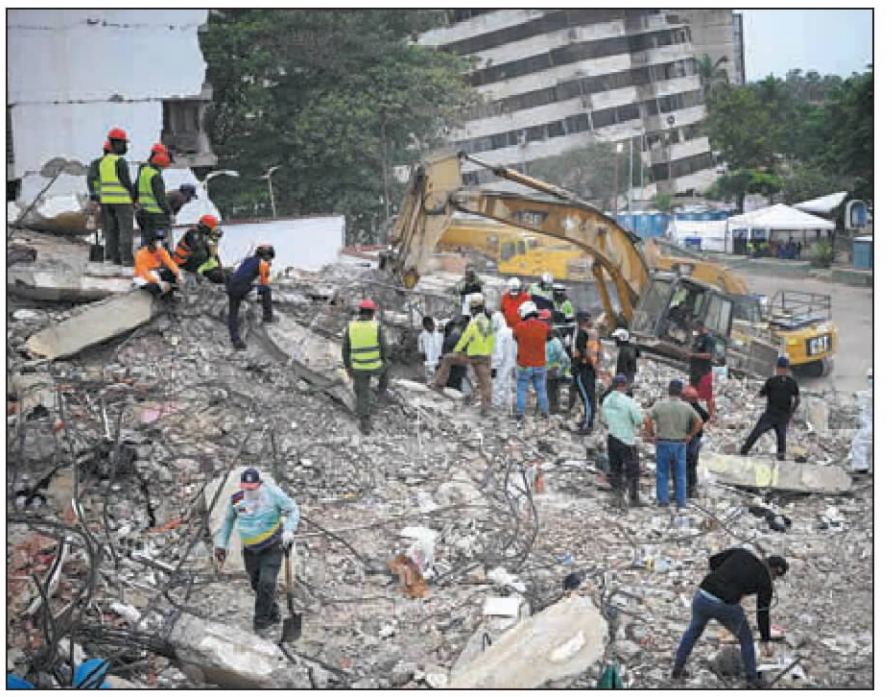
Oleh Hryhorov, the regional governor, said on Telegram that three locations in the Kovpakivsky District were struck, with private homes and infrastructure coming under attack.

One day earlier, Ivan Fedorov, a regional chief, said Russian planes dropped eight powerful glide bombs in a span of 90 minutes on residential districts of Zaporizhzhia, killing one person and wounding dozens of others.

In another development, Ukrainian President Volodymyr Zelensky dismissed Ukraine's ambassador to the United States, Olha Stefanishyna, according to a decree published by the presidential office on Monday.

Stefanishyna, who had served as ambassador since last year, said in a Facebook post that she had requested to be relieved of her duties for personal reasons. She described her service in Washington as "the greatest honor" of her life.

"We have increased the supply of American weapons and maintained support precisely when the political environment in Washington was not in our favor," she said.



Zelensky has not announced a successor to the post.

The move comes after a government reshuffle launched by Zelensky in July and at a time when Kyiv is seeking continued US military support amid its conflict with Russia.

Zelensky had appointed new national security and foreign intelligence chiefs earlier this week.

Report gauges AI's effect on developing nations

World Bank assessment sees less job risk, but higher barriers to accessing benefits

By LIA ZHU in San Francisco
liazhu@chinadailyusa.com

While developing economies face lower job displacement risks from artificial intelligence compared with developed nations, gaps in infrastructure development, institutional capacity and relevant skill sets largely restrict their access to the benefits that AI has to offer, said a recent World Bank report.

According to the World Development Report 2026, which was released on Tuesday, only 4.5 percent of existing jobs in low- and middle-income countries are at risk of automation by generative AI, compared with 14.2 percent in high-income countries.

At the same time, AI could meaningfully boost productivity in 16.2 percent of jobs in developing nations, which is not far below the estimated 18.7 percent for high-income countries.

While the labor market in developing economies is less concentrated in occupations that are most exposed to generative AI, the figures suggest that workers and businesses could still use the technology to improve performance.

The World Bank described the report as "the first comprehensive assessment" of the implications of AI for developing economies, offering a perspective that has often been overlooked in academic and policy discussions focused largely on developed nations.

"AI has thrown developing economies a lifeline, and they should seize it," said Indermit Gill, senior vice-president and chief economist at the World Bank Group in a news release.

Weakest average growth

Developing economies are currently experiencing their weakest average growth performance in three decades, the World Bank said, adding that AI could be particularly valuable in cases where shortages of skilled manpower and institutional capacity have hindered development.

According to the report, AI tools can help doctors diagnose illnesses, support teachers in adapting teaching methods, guide farmers in making planting decisions, provide advice to small businesses, and enable banks to assess borrowers without conventional credit histories.

Governments could use AI to improve tax collection, social programs, healthcare services, education curriculums and disaster response, thereby extending limited public-sector capacity across larger populations, the report also said.

Gill noted that developing economies do not require large AI models or big data centers to reap the benefits of the technology. "By adapting small, low-cost AI tools to local conditions, they can bring better medical care, education, judicial services and agricultural extension within the reach of millions," he said.

The World Bank cautioned that "such optimism should not be unbridled", indicating countries that could benefit most from AI are often the least prepared to embrace the technology.

Harnessing the power of AI calls for a dependable foundation involving a stable electricity supply, affordable high-speed internet, capable institutions and skilled workers, but many developing economies have yet to achieve universal access even to electricity and the internet, it said.

The report shows that developing economies account for just 5 percent of high-performance computing capacity and 12 percent of secure internet servers. In sub-Saharan Africa, for example, almost one-third of rural schools still lack a stable electricity supply, and more than two-thirds lack dependable internet connections.

While AI could significantly boost performance globally before the end of the decade, the opportunity is not guaranteed for all, the World Bank said. It added that the most advanced AI systems are being developed by a small number of countries and companies, while many developing economies still lack the basic infrastructure needed to effectively use AI.

Although adopting existing generative AI tools is less expensive, imported systems may perform poorly when applied to languages, cultures and public services inadequately represented in their training data. For example, more than 2,000 languages spoken in Africa are neglected in major language models, according to the report's concept note.

Another concern, the report said, is that governments that lack the expertise or data needed to embrace these systems could become dependent on a small number of AI solution vendors, and those dominant vendors could shape standards and regulatory frameworks in those countries.

Three-step strategy

The World Bank called on developing economies to follow a three-step strategy — adopting available AI tools, adapting them to local conditions and advancing toward frontier development over time.

This approach would allow governments to initially focus on practical, lower-cost applications, rather than making expensive attempts to reproduce the most advanced models before basic foundations are in place, it said.

Gaurav Nayyar, director of the World Development Report 2026, warned that the window to get it right is narrow. "Developing countries that build the foundations now — power, connectivity, skills and institutions — will be positioned to adopt and adapt AI for their people," he said.

Chinese market keeps wine exports flowing

By ALEXIS HOOI in Sydney
alexishooi@chinadaily.com.cn

Australian wine exports fell to a record low in line with global consumption trends, but the Chinese mainland remained its largest export market by value in the pillar sector, according to the latest analysis.

The exports fell year-on-year by 7 percent in value to A$2.3 billion ($1.6 billion) and 6 percent in volume to 598 million liters in the year ended June 2026, statutory authority Wine Australia's export report released on July 29 showed.

It was the first time that export volume had fallen below 600 million liters since 2004, with the fall mirroring "a broader global trend of declining wine consumption over the past decade", it said.

Peter Bailey, market insights manager at Wine Australia, said the challenges facing Australian wine exporters are not unique, with other wine-producing nations facing the same conditions.

Data from multiple sources suggested that the decline in wine consumption globally reflected changing consumer behavior that is "reshaping demand around the world", he said.

'Historic downturn'

The total export figures "reflect increasingly difficult trading conditions across many of Australia's key export markets, driven by a historic downturn in global wine consumption", according to Wine Australia.

Worldwide wine consumption has fallen to its lowest level since 1961, as consumers increasingly moderate alcohol intake, face cost-of-living pressures and shift toward alternative beverages, it said.

While global trading conditions remain challenging, Australian wine continues to perform relatively well in many key markets, Bailey said.

The Chinese mainland remained Australia's largest export market by value, despite exports falling 15 percent to A$756 million, according to Wine Australia.

The Chinese market is no longer being driven by the restocking of Australian wine, Bailey said, amid "a more mature and demand-led phase" that also reflected a smaller and slower-growing sector.

Michael Harvey, senior analyst in dairy and consumer foods at global agribusiness banking cooperative Rabobank, told China Daily that the wine sector is going through a period of rebalancing and resizing.

"There are some weather conditions that played a role, but there's also been clearly a structural decline in the size of the industry. So we're actually seeing some vineyard removals, which is why we're seeing reduced production in Australia to reflect the challenging operating environment," said Harvey, who is based in Melbourne, Victoria state.

"Margins are under pressure for a lot of the wine, a lot of the vineyards and growers, which is why we're getting a supply response. So that naturally has led to less production," he said.

"There's also a structural reset in terms of the amount of alcohol we're consuming, so that's a trend you've seen in a lot of key markets and China would be part of that," Harvey said.

"At some point in time it'll find a better balance and you'll start to see some stabilization," he said, adding that there are still segments in the sector that are performing well.

"Premium wines are performing better than some of the other varieties, so it's not a linear decline everywhere."

Jack Wu, managing director Greater China for major Australian winemaker Treasury Wine Estates, noted that China has long been an important market for Penfolds, and the brand has built a strong connection with Chinese consumers over many years.

The winemaker is headquartered in Melbourne and includes the popular Penfolds label in its portfolio.

"We're focused on growing that relationship for the long term by staying close to how people are shopping and enjoying wine, supporting healthy and sustainable channels, and creating more occasions for consumers to discover and share Penfolds," he said.

Feline revival

The Amur Tiger Center releases on Monday an adult Siberian tiger named Ymit into the Ile-Balkhash State Nature Reserve as part of a joint program with Russia to repopulate the area with tigers, a species declared extinct in these parts decades ago. AMUR TIGER CENTER / TASS

EUROPE

Romania reroutes cooling water to reactor

Romania blew up a rock outcrop on Monday to help divert vital cooling water from the drought-hit Danube River to its sole working nuclear reactor, an unprecedented measure that underscores the scale of an energy crunch across the region. In neighboring Hungary, authorities said they might be able to eke out two more days of power from their only atomic plant, which has been hit by falling levels in the Danube that it also relies on as a coolant. Heat and drought have lowered river levels across large parts of Europe, raising concerns about water supplies, river transport and power generation. Both governments have asked people and companies to cut power use to ease demand.

AFRICA

Ebola death toll rises to 1,700 in DR Congo

Ebola has killed more than 1,700 people in the Democratic Republic of Congo in the fastest-growing outbreak of the disease, data showed. As of Tuesday, 3,802 cases had been recorded, with 1,707 deaths, according to latest update. It is not clear when the outbreak will reach its peak, Africa CDC Director-General Jean Kaseya said on Tuesday.

ETHIOPIA

Landslide kills 14 in Amhara region

Fourteen people were killed in a landslide near a monastery in Ethiopia's Amhara region, the state-run Amhara Media Corporation said late on Monday. The landslide occurred near the Tsadkane Mariam Monastery in Amhara's North Shewa zone, the broadcaster said. Search teams supported by excavation machinery were working to recover bodies, it said. The Amhara Media Corporation report did not say what caused the landslide, but independent news reports said it was triggered by heavy rains. Ethiopia is in its main rainy season, which runs from June to September.

Litigation against Section 301 tariffs clear sign of growing divide in the US

The new challenge to the United States administration's tariff policy reflects the increasing discontent that is being aggravated by the inflation caused by energy price hikes due to the Middle East crisis triggered by Washington and Tel Aviv. While the litigation initiated by a coalition of 25 states, mostly Democrat-led, against the Section 301 tariffs on Monday underscores the growing partisan divide, businesses oppose the tariffs primarily because of the rising costs imposed on the economy.

Those hoping the judges of the US Court of International Trade hearing the lawsuit brought by the states will simply strike down the tariffs should temper their expectations. Unlike the earlier International Emergency Economic Powers Act case, in which the US president was judged to have exceeded his authority, the US administration enters the dispute in a stronger position.

This time the US administration has imposed tariffs under Section 301 of the Trade Act of 1974, which expressly authorizes the president to impose tariffs in response to "unfair" foreign trade practices. The government's argument is that it has acted within the limits of the authority the US Congress delegated. The court is therefore unlikely to spend much time debating whether tariffs make sound economic policy. It will instead ask two narrower questions: Did Congress authorize tariffs of this breadth, imposed in this manner?

Historically, Section 301 investigations have focused on specific countries, specific conduct and proportionate remedies. Section 301 was never conceived as a blank check for redesigning global trade policy. Congress enacted it as a targeted enforcement mechanism against identifiable "unfair" foreign practices, not as a universal tariff authority affecting nearly all US imports.

The new tariffs, covering imports from 59 economies and the European Union on the basis of alleged "forced-labor" concerns, represent a dramatic expansion of the statute's traditional reach. The plaintiffs therefore argue that Section 301 has become a substitute vehicle for policies the US Supreme Court has already rejected. As they claimed, the US administration has merely exchanged one statutory label for another while pursuing the same sweeping tariff regime.

If the "forced-labor" investigations are found merely to provide legal cover for replacing invalidated IEEPA tariffs, the US administration's position will become more vulnerable. So whether the courts are willing to scrutinize the factual basis of those "forced-labor" findings may prove just as important as interpreting the statute itself.

Judges should exercise their own independent judgment when interpreting Section 301 rather than accepting the Office of the US Trade Representative's reading of it. And the court's increasingly influential Major Questions Doctrine requires clear congressional authorization before government agencies exercise powers of vast economic and political significance. A tariff regime affecting almost the entire US import market plainly raises questions of that magnitude.

So the administrative record assumes unusual importance. The court will examine whether the USTR followed the Congress-prescribed procedures — investigations, public hearings, factual findings and reasoned explanations — or whether tariff rates were chosen first and justified later.

Tariffs remain taxes, and taxes ultimately fall on someone. The US administration's dealmaking tool has become an instrument of economic coercion directed as much at US businesses as foreign governments. The litigation is likely to take years reaching the Federal Circuit and perhaps the US Supreme Court. In that time, the tariffs will continue to tax the US economy unless they are revoked.

While many blame US tariff policies for the rise of unilateralism and protectionism, the deeper concern lies in the political and institutional soil from which those impulses have grown. The real issue is a Congress that has increasingly tolerated the expansion of executive authority for partisan interests. Courts can police the boundaries of executive power, but only Congress can redraw them. Whether the polarized legislature can still rise above partisan divisions and vested interests to reclaim its constitutional authority over trade will ultimately determine whether the US' political system can overcome its challenges through self-correction.

Hyping 'China Shock' won't benefit Germany

The claim by Tanja Gonner, chief executive of the Federation of German Industries, or BDI, in a Monday report of Frankfurter Allgemeine Zeitung, that a "China Shock 2.0" "threatens" the entire German industrial system is a lamentable and deeply flawed example of scaremongering.

Reportedly, Germany is mapping out vulnerabilities in China's supply chain in order to use this information as leverage in a possible trade war with China.

Some Western politicians and analysts find it far easier to make China a scapegoat than to confront the real challenges festering at home — whether soaring energy costs, suffocating bureaucratic red tape, or the painfully slow pipeline from lab to market. If their real objective were industrial renewal rather than political point-scoring, they would not have overlooked the "China Opportunity 2.0" that proponents of the "China Shock 2.0" narrative have intentionally erased from the debate.

The experience of German businesses in China tells a very different story from Gonner's alarmist warnings. China reclaimed its position as Germany's largest trading partner in 2025, with a bilateral trade of 253 billion euros ($299 billion), up 2.7 percent from 2024, underscoring the depth of their economic complementarity.

The point was reinforced this February, when German Chancellor Friedrich Merz arrived in China accompanied by senior executives from dozens of Germany's biggest companies, visiting some of the leading Chinese technology companies in search of deeper industrial partnerships.

If German boardrooms truly believe the rhetoric of "China Shock 2.0" and the Merz government believes a trade war with China is unavoidable, they have a curious way of showing it.

German enterprises have long been beneficiaries of China's market and supply chains. The BDI must understand that the competitive pressure its members feel is a normal feature of a dynamic global market. Instead of advocating an assertive posture, it should encourage German companies to explore the very market that has fueled their growth and to tap into the opportunities created by China's 15th Five-Year Plan (2026-30) with an open mind.

If some German industries are still not convinced, they need not look any further than Volkswagen, which has adjusted its research and development strategy based on the success of its R&D center in China. This has accelerated the company's transition from "hardware-defined vehicles" to "software-defined vehicles". Just as Volkswagen recognizes China's EV success as an "opportunity" to be seized, the German government should abandon its unfounded allegations of "currency manipulation" and "overcapacity" and play a constructive role in China-European Union trade consultations.

For multinational corporations, partnering with China today means embedding themselves in a vibrant ecosystem of innovation. It means gaining access not just to market share, but to a dynamic environment for self-iteration, technological upgrading and the cocreation of next-generation solutions.

The real and present concern for the German economy is its own inertia. Many Chinese travelers returning from Germany remark that a country once synonymous with punctuality and precision no longer feels quite the same. Train delays and disruptions to urban transport have become commonplace, while China's high-speed rail and metro systems — once seen as playing catch-up — now operate with a level of speed, reliability and punctuality that is taken for granted.

Anecdotes are not data, but they often capture broader truths. The contrast serves as a reminder that Germany, like some other advanced economies, faces its own structural challenges and would benefit from a more sober assessment of its domestic transition rather than attributing every competitive setback to China.

None of this is to deny Germany's unique strengths. It remains a global leader in advanced machinery, chemicals, industrial automation, environmental technology and precision manufacturing. Chinese companies have long regarded their German counterparts not as rivals to be feared but as partners from whom much could be learned. If a technological gap is grounds for fear, then should China have labeled the arrival of German companies in the 1980s and 1990s a "Germany Shock 1.0"?

What some in Germany appear to find harder to accept is that, in a growing number of industries, the flow of knowledge between China and Germany has become two-way. In fields such as electric vehicles, digital infrastructure and aspects of advanced manufacturing, the former student has, at least in some respects, become a teacher.

FIFA boss' profiteering risks ruining the beautiful game

Under Sepp Blatter, FIFA became synonymous with patronage and scandal to many. Yet his successor Gianni Infantino, as head of the world football body, risks eclipsing even that legacy. His failed attempt to sell a stake in the World Cup to Thrive Capital, an investment company run by Josh Kushner, brother of Jared Kushner, the son-in-law of the United States president, looked uncomfortably like an offering to Washington, using football's greatest prize as political currency.

In essence, FIFA sought to sell a 20 percent stake in a new commercial subsidiary controlling World Cup revenues to a private equity firm tied to the US president's inner circle. The plan would reportedly have earned Infantino a commissioner-style role, paying around $30 million a year — five times his current salary.

The question now being asked is what else Infantino expected in return for further strengthening his standing with a US president he has repeatedly described as a close friend.

The backlash to the plan was predictable and entirely justified. The Union of European Football Associations and others were angered not only because they learned of the proposal through media reports, but because it violated a basic principle: the World Cup is not a private asset to be monetized for a handful of investors. Should commercial partners with political connections acquire a financial stake, the pressure to influence decisions will inevitably follow. At that point, FIFA would cease to be the guardian of the tournament and become its broker.

If investors closely associated with the White House stand to profit directly from football's biggest event, can FIFA credibly claim political neutrality? Countries already facing strained relations with the US, such as Iran, would have every reason to question whether commercial interests and political preferences might shape the tournament's administration. Even the perception of such influence would damage the World Cup's credibility.

With the deal abandoned and revolt spreading inside FIFA, Infantino's swagger has disappeared. Reports suggest Infantino repeatedly tried to reach the US president by phone before seeking support from US Secretary of State Marco Rubio under the banner of promoting football as the US' "soft power". Few were persuaded. As an insider bluntly put it, this was about saving his job, not promoting the sport. On Tuesday, FIFA denied the reports.

Infantino should remember that FIFA is still rebuilding its reputation after years of corruption scandals. Fresh questions have already emerged over allegations that political pressure influenced disciplinary decisions during this year's World Cup, including controversy surrounding the overturning of a red card shown to US striker Folarin Balogun. Whether those claims withstand scrutiny or not, immediately pursuing a business arrangement that appeared to favor the associates of the FIFA boss' close pal displayed astonishingly poor judgment.

Infantino insists he is expanding football's reach. He has proposed a bigger World Cup, more teams, more matches — and as hasn't escaped notice — more money-making opportunities. Expansion looks more like commercial opportunism than sporting vision. Every additional fixture creates more broadcasting slots, sponsorship inventory and advertising revenue, while concentrating influence among an ever-smaller circle of powerful hands.

The same philosophy underpins some of Infantino's so-called "innovations" such as mandatory "hydration breaks". Officially introduced for player welfare, they also create perfectly timed commercial pauses that interrupt football's natural rhythm. Infantino presents every change as progress, yet too often the beneficiaries are broadcasters, sponsors and executives rather than supporters.

Football belongs to the people. The FIFA president is supposed to protect that inheritance, not mortgage it. Infantino's failed World Cup stake sale exposed a governing philosophy in which the game's greatest treasure is no longer a public trust, but another asset to be traded among the powerful. That is precisely why the revolt against him deserves to succeed.

— LI YANG, CHINA DAILY

What They Say

Revised rules will help boost innovation in IC design

Editor's note: *The China National Intellectual Property Administration has published explanations for revisions to the country's Regulations on the Protection of Layout-Designs of Integrated Circuits, publicized by the State Council on Monday. The experts include Huang Yunhua of the intellectual property institute of the China Industrial Control Systems Cyber Emergency Response Team, Li Shunde of the Institute of Law of the Chinese Academy of Social Sciences, and Cui Guobin of the School of Law at Tsinghua University. Below are excerpts of their comments. The views don't necessarily represent those of China Daily.*

Today, the process nodes of transistors for conventional integrated circuits are approaching their technological and physical limits. Disruptive technologies such as photonics and quantum technology have emerged, propelling the integrated circuit industry into the post-Moore's Law era, where competition revolves around new architectures, mechanisms, materials and devices.

Globally, countries are exploring ways to overcome the physical limitations of conventional integrated circuits and trying to develop new technologies for integrated circuits.

The revisions of the regulations include "the layout-designs of integrated circuits incorporating photonic, quantum and other functions" as designs eligible for protection. This reflects an accurate assessment of and proactive response to technological developments in the integrated circuit sector.

Integrated circuit design determines the performance, power consumption and competitiveness of chips. The revised regulations will enhance the protection of cutting-edge integrated circuit intellectual property and establish a system suited to the pace of technological innovation in China's integrated circuit industry.

Since 2022, there has been a rise in the number of applications filed in China for the registration of integrated circuit layout-designs incorporating photonic and quantum devices. The revised regulations are expected to further inspire innovators, boosting innovation and development in China's integrated circuit technology.

The revisions add an "originality statement" to the documents required to be submitted when registering a layout-design. This official document, submitted to the China National Intellectual Property Administration, defines the design's originality scope and demonstrates that it meets the required legal standards.

Exclusive rights to a layout-design are granted upon registration with the administration. Layout-designs which are not registered will not be protected under the regulations.

The revisions introduce a registration revocation procedure initiated by third parties. Anyone who finds that a registration fails to comply with the regulations may request the intellectual property administrative department of the State Council to revoke the registration.

To encourage the creation and utilization of layout-designs, the revised regulations say that legal persons or non-legal-person entities should grant reasonable rewards and remuneration to eligible people in accordance with the Law on Promoting the Transformation of Scientific and Technological Achievements and other relevant national rules.

The revised regulations also include a punitive damages system, saying that where an intentional and serious infringement upon the exclusive rights to a layout-design is committed, "the amount of compensation may be fixed at between one and five times the amount determined in accordance with the aforesaid methods." This provision reflects the goal of strengthening protection for layout-designs.

Clustering can rewrite the story of rural China

For years, China has invested heavily in rural revitalization, yet many villages remain trapped in a cycle of scattered resources, duplicated infrastructure, and limited industrial scale.

The core reason is straightforward: local governance and funding have traditionally treated each administrative village as an independent development unit. That approach is now changing.

China's "No. 1 central document" for 2026 advocates for a "classified, orderly, zone-based promotion of rural revitalization". The policy signals a profound shift from single-village autonomy to cluster-based, cross-village cooperation.

China's rural population has declined steeply from its 1995 peak of 859 million to 451 million in 2025, a decrease of 47.5 percent. Villages have moved along vastly different trajectories: some have grown steadily amid urban-rural integration, some have merged seamlessly into nearby towns, while others have shrunk and declined due to sustained population outflow.

The previous model allocated budgets village by village, leading to fragmented investment. A single village cannot sustain a specialty industry, build a competitive tourism brand, or attract professional operators.

Neighboring villages competed instead of cooperating, resulting in redundant roads, duplicated facilities, and price undercutting. This led to a lose-lose situation where many villages struggled to achieve economies of scale and public resources were spread too thin.

The new cluster development framework is built on three principles.

First, classified positioning assigns tailored development paths to individual villages based on their growth potential, location and resources.

Second, phased progress prioritizes improvements in transportation and public infrastructure before rolling out public services and industrial projects.

Third, spatial integration groups neighboring villages with complementary resources into functional clusters. These clusters transcend rigid administrative boundaries to integrate land, capital and talent, achieving economies of scale unattainable by individual villages.

A typical cluster may combine one village's natural scenic resources, another's specialty agricultural products, and a third's surplus rural labor. Spatial restructuring reduces redundant infrastructure spending and encourages functional specialization.

MA XUEJING / CHINA DAILY

Instead of competing for identical projects, villages within a cluster focus on differentiated roles in production, processing, tourism and logistics based on their strengths. The result is coordinated revitalization that transforms rural decline into collective growth.

Zhejiang province has taken the lead in piloting this approach. In 2025, the province identified 226 provincial-level core villages for driving the development of 1,447 surrounding villages. These rural clusters host 1,094 key projects, with planned investment nearing 33 billion yuan ($4.85 billion) over the next three years.

Three institutional innovations underpin the effective operation of rural clusters.

First, cross-village Party building alliances establish collaborative governance mechanisms, breaking administrative barriers between villages. Second, professional management teams serve as impartial coordinators, replacing outdated zero-sum competition with cluster-wide win-win planning that allows all villages to share the benefits of unified regional branding and industrial development.

Third, binding institutional rules firmly protect farmers' legitimate rights, ensuring that there are no changes in collective asset ownership, no damage to traditional rural landscapes and cultural features, and no forced merger of villages. These safeguards are critical to maintaining grassroots trust and long-term social stability.

It is important to clarify that cluster development does not aim for uniform prosperity for every village. Population decline and the gradual disappearance of some small villages are natural outcomes of demographic and economic changes.

The cluster model allows resources to shift away from shrinking settlements while maintaining basic public services for the remaining residents. This realistic approach avoids unnecessary fiscal expenditure and prevents the futile effort of sustaining unviable villages.

Rural depopulation, aging and fragmented public investment are universal global challenges, faced by both developed and developing economies alike.

Many countries have relied on village-centric rural development policies. Though well-intentioned, these programs often fall into the same trap of fragmentation and low efficiency.

China's cluster development formula offers valuable global insights. Reconfiguring governance from isolated villages to functional rural clusters can unlock latent resources and developmental potential that conventional village-level planning cannot achieve.

While no single model can be copied wholesale across borders, the core principle is universal: development requires scale, and administrative boundaries should not determine rural modernization.

Embracing cluster-based thinking will drive China's rural revitalization and offer practical references for global rural governance.

Shenzhen's journey from exports to expertise

Over the past year Chinese companies expanding overseas have drawn global attention with everything from Labubu collectibles to electric vehicles and even coffee brands. Yet beneath these eye-catching exports lies a more profound and consequential trend: the quiet emergence of truly global businesses that integrate technology, supply chains, and industrial capabilities with local investment.

Global Lens

China's outbound direct investment reached $174.38 billion in 2025, up 7.1 percent year-on-year, according to China's Ministry of Commerce. Analysts point out that a significant share of these flows is directed toward the Asia-Pacific region, where manufacturing-heavy greenfield investment and capacity development projects are expanding rapidly, particularly across ASEAN economies.

At the heart of this outward momentum is Shenzhen, long a symbol of China's reform and opening-up era, and today the country's powerhouse of foreign trade, innovation and advanced manufacturing. As China's top-performing city for foreign trade, Shenzhen is exporting not just products, but entire industrial ecosystems. Its giant corporations such as Huawei, Tencent and BYD are building strong operations across the ASEAN region.

Take BYD for example. The global leader in EVs has established a manufacturing base in Rayong in Thailand and another EV facility in Subang in Indonesia.

BYD isn't just selling cars in these markets, it is transplanting the industrial model of Shenzhen — battery technology, supply chain coordination and local employment — in a local market while building a regional manufacturing node.

To be sure, this is not a recent development. This transfer of Shenzhen's industrial knowledge and technological innovation has been going on for a long time.

When a BYD battery pack crosses the border, it carries decades of electrochemical research, a finely tuned manufacturing ecosystem built over generations, and, increasingly, a local partnership structure that transfers real industrial knowledge to the destination economy.

DJI tells a different version of the same story. The Shenzhen-based drone maker holds an estimated 70 percent of the global market for consumer drones. Its agricultural drones are widely used across Southeast Asia to automate planting and protect crops. In markets such as Thailand, Vietnam and Malaysia, the company has trained thousands of local operators and developed a dense network of dealers and service providers.

DJI did not just build a market presence, but created an embedded local ecosystem of drone pilots, distributors and service firms.

In this sense, Shenzhen's "exports" today are fundamentally different from what "Made in China" meant 20 years ago.

Today, leading Shenzhen enterprises are not just shipping products abroad; they are exporting their operational expertise and innovation frameworks to build global industrial ecosystems.

It is therefore fitting that the APEC Economic Leaders' Meeting in November will be hosted in Shenzhen. This marks the third time China has hosted APEC, after Shanghai in 2001 and Beijing in 2014. But while those editions signaled financial and political capital, Shenzhen has been chosen for its industrial capabilities and openness to global trade.

China's theme for the APEC meet, "Building an Asia-Pacific Community to Prosper Together", paired with its priorities of openness, innovation and cooperation, closely reflects Shenzhen's own development trajectory. This city has grown by keeping its doors open and promoting greater global engagement and trade.

The APEC Economic Leaders' Meeting is a genuine opportunity for Asia-Pacific economies to engage seriously with Chinese partners in new energy, AI infrastructure and advanced manufacturing.

They stand to gain not just products but production know-how, investment, and supply chain integration, building on a trend that is already underway: from Vietnam's electronics clusters anchored by Chinese supply chain investment to EV manufacturing hubs across the region.

Forty-five years ago, Shenzhen was mostly rural farmland. Today it is home to some of the world's most innovative technology companies and has become a powerful argument for what open, collaborative globalization can achieve. As APEC leaders gather there in November, they won't need a presentation to understand the Shenzhen model: outside the conference halls they will have living proof of what the next wave of international collaboration — Globalization 2.0 — looks like.

Can artificial intelligence help prepare graduates for tomorrow's jobs?

Artificial intelligence is rapidly reshaping the labor market, automating tasks such as routine copywriting, basic data analysis, conventional coding, repetitive administrative tasks and entry-level design work. As these jobs disappear or change, employers are increasingly demanding a different mix of skills from graduates.

This transformation comes at a difficult moment for higher education. While the number of university graduates continues to grow, structural unemployment has become more pronounced.

Under pressure to improve graduates' job prospects, universities across China are restructuring their academic programs. Many institutions are introducing AI-related majors, promoting "AI plus X" interdisciplinary education or adopting broader admissions models.

Responding to changes in the labor market is both reasonable and necessary. Universities cannot ignore technological, industrial and employment shifts. But they must also confront a harder question: Can they transform themselves quickly — and responsibly — to meet these new demands?

Building a robust academic program takes time. Universities need qualified faculty, coherent curricula, appropriate facilities and opportunities for practical training. These elements cannot be created simply by changing the name of a department or adding several technical courses.

Without sufficient preparation, professional restructuring can easily become an emergency response to employment anxiety.

Courses might focus narrowly on training students to use the latest tools, while education itself is reduced to preparing for currently available jobs. Though seemingly practical, such reforms risk creating deeper problems: an oversupply of similarly trained graduates, weak foundational knowledge, limited adaptability and a gradual erosion of the university's educational mission.

Introducing a new major does not automatically produce better talent. If universities rush into fashionable fields without understanding their intellectual foundations, required capabilities or real industrial demand, they may simply replace one mismatch with another.

The problem is compounded by the speed of technological change.

Technology often evolves faster than the university education cycle. A field that appears highly promising when students begin their degrees may have changed fundamentally by the time they graduate.

Specific tools may become outdated, and established methods may be replaced by new technological paradigms.

AI should be incorporated throughout teaching and learning. Students should learn to use intelligent tools effectively and responsibly.

Universities that merely chase each new trend could therefore produce graduates who are doubly disadvantaged: lacking the depth of traditional disciplinary education and also unprepared for the next stage of technological change.

Academic reform must therefore involve a deeper redesign of curricula, teaching methods and talent-development models.

Rather than building isolated AI schools or programs, universities should develop strong "AI plus X" platforms. Artificial intelligence should be integrated with engineering, medicine, agriculture, the natural sciences, the humanities and the social sciences. This requires deeper cooperation between departments and breaking down long-standing barriers.

The aim is not to turn every student into an AI specialist but to help students in different fields understand how intelligent technologies can reshape their disciplines, expand their analytical capabilities and solve real-world problems.

Universities also need to strengthen cooperation with businesses, government agencies and research institutions. External partners can provide practical expertise, industrial resources and an understanding of emerging workplace needs.

Such cooperation can help connect the education chain, the talent chain and the industrial chain, reducing the gap between what students learn and what society actually needs.

However, labor-market adaptation should not become the only purpose of universities. No matter how disruptive technology becomes, the fundamental responsibilities of education remain unchanged. Universities must cultivate moral character, foster independent thinking, transmit culture, encourage innovation and support the holistic development of the individual.

Real education reform is not about blindly following technological trends. It requires universities to embrace innovation while maintaining a clear sense of what education is ultimately for.

AI should be incorporated throughout teaching and learning. Students should learn to use intelligent tools effectively and responsibly. But universities must also place human development at the center of education. The more powerful technology becomes, the more important judgment, creativity, ethical responsibility and critical thinking will be.

Universities can adjust their academic structures to meet national and social needs. At the same time, they must preserve the diversity of the academic ecosystem. Not every institution should establish the same programs, pursue the same fashionable disciplines or adopt the same development model.

A wave of identical AI-related programs could lead to a new form of homogenization, in which universities lose their distinctive strengths while competing for the same students, teachers and resources. Higher education needs diversity, not a situation in which every university begins to look the same.

The rise of AI should be seen not merely as a disruption of higher education, but as an opportunity to reshape it.

The primary task for universities is not to create more AI majors, but to reconsider what universities should teach — and how they should teach — in an age when information and technical assistance are increasingly easy to obtain.

Knowledge acquisition alone can no longer define the value of university education. Students must learn how to evaluate knowledge, connect ideas across disciplines, identify meaningful problems and make responsible decisions. They must be able to work with machines without allowing machines to replace their own capacity for thought.

The graduates best prepared for the AI era will not be those who have merely mastered the latest software. They will be those with strong disciplinary foundations, broad humanistic perspectives, the ability to use intelligent tools and the independence to question their outputs.

Preparing such graduates is not only a practical response to employment pressure; it is essential to build a stronger education system and secure the country's long-term development.

GLOBAL VIEWS

ANDREA RENDA

Symphony, not a solo

The EU can cooperate with China on open-source solutions, and treat AI as a means to achieve sustainable solutions rather than an end in itself

At the opening ceremony of the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai, President Xi Jinping said that "AI development should not be a solo performance by a single country, but a symphony of international cooperation". And the agreement on the establishment of the World AI Cooperation Organization was signed during the meeting. This will address a real challenge. The race for tech sovereignty in the AI sector is fragmenting the global AI landscape to unprecedented levels, to the detriment of innovation and access, especially for developing countries.

AI keeps moving at breathtaking speed, with ever more powerful models topping the charts every week. US labs still lead in multiple aspects, but Chinese open-weight models — DeepSeek, Qwen, GLM and Kimi — have their own edges. In the United States, top labs announce mind-blowing compute investments while companies such as OpenAI and Anthropic chase billionaire initial public offerings to monetize their lead. Four companies have now crossed a $4-trillion valuation, a figure without precedent. The US is rolling back regulation, blocking states from legislating and fast-tracking data centers that increasingly need their own power based on the conviction that it is engaged in an existential race for AI leadership with China.

Michael Kratsios, the US administration's top AI official, has spoken openly of "promoting the export of full-stack US AI technology packages to allies and partners worldwide". At the same time, it is likely that Washington tends to weaponize other countries' AI dependence — on models, the cloud and the advanced GPUs that mostly come from Nvidia. The US' measures on non-US users access to Anthropic's Mythos and Fable 5 have only pushed other countries to double down on their tech-sovereignty plans meant to reduce reliance on single foreign suppliers.

The European Union feels this acutely. Despite years of regulation to force competition and interoperability, dependence on big tech has stayed almost the same. Amazon, Microsoft and Google own almost the entire cloud market; Alibaba gets the crumbs, and European operators barely register.

The European Commission's first answer was to build its own compute — aware that at least 70 percent of global data-center capacity sits in the US and China. In recent years, the EU has announced 19 AI factories, with at least seven "gigafactories" of at least 100,000 advanced GPUs each on the way. But this simply swaps dependence on hyperscalers for dependence on Nvidia: Almost 90 percent of these factories have chosen Nvidia GPUs. This is hardly a win for the EU's tech sovereignty.

The deeper problem is that Europe is chasing the US model — data-hungry, energy-hungry, water-thirsty infrastructure built in the obsessive pursuit of artificial general intelligence, however vaguely defined. Is that what Europe needs? Probably not. European countries don't need the most power-consuming AI; they need stacks fit for real use cases in transport, health, energy, manufacturing, government and finance. For each, the optimal solution rarely looks like a one-size-fits-all gigafactory. Emulating the US model with less money is like "chasing Icarus with smaller wings".

The EU should work together with China to steer AI toward the public interest, the global good and the benefit of humankind.

China offers Europe a more attractive template. Whatever US commentators claim, Beijing is not primarily racing toward AGI. It is leaning on cheaper, more sustainable compute — less advanced GPUs, ordinary CPUs — and deepening its use of open standards to develop solutions that are fit for purpose. Often that means smaller models on smaller data, running centrally or at the edge, sparing needless costs in energy, training, inference and fine-tuning.

This is what Europe, a global industrial powerhouse, should do. The European Commission's Apply AI Strategy points toward this goal — but it comes with almost no dedicated funding. The EU's Tech Sovereignty Package, published on June 3 — comprising two legislative proposals and two strategic frameworks — promises to boost European data capacity at scale in the form of an open-source stack offering secure, high-performing solutions across sectors. If it works, Europe could emerge as a more sovereign AI power, wrapped in a regulatory framework built for fundamental rights, competition, interoperability and sustainability — now being overhauled in the name of genuine simplification.

SHI YU / CHINA DAILY

Will the plan work? It may depend on how the EU adapts its China policy in the face of reality: Europe and China are deeply complementary. Europe depends on China for rare earths and much else; China needs the European market and technologies such as ASML's lithography for advanced chips. Duplicating such unique expertise would waste enormous resources.

No single country can set AI rules for the whole world. It is significant to promote EU-China collaboration that might be exactly the step toward a fairer, more sustainable and more sovereign AI future. The two sides are hardly "like-minded", yet they share strikingly similar perspectives: open-source solutions and the vision of AI as a means to achieve sustainable outcomes rather than an end in itself. China has initiated the establishment of WAICO, a coalition comprising 29 countries; while the EU's 27 member states enjoy privileged collaboration with several leading middle powers.

The EU and China should make deeper AI cooperation a goal — and pursue it with common agendas. Now is the moment to reckon and restart. With quantum AI and a new generation of powerful agents and robots on the horizon, the world cannot afford to wait for alignment to arrive on its own.

XU MINGQI

Protectionist measures could harm EU's interests

Brussels' most effective response to its trade deficit with China should be to collaborate with Beijing to boost exports of goods and services, rather than 'building walls' or 'setting limits'

The European Union recently intensified its implementation of protectionist measures targeting Chinese trade and investment. These actions, including the Foreign Subsidies Regulation, the proposed Industrial Accelerator Act, the NIS 2 Directive and amendments to the Foreign Direct Investment Screening Regulation, echo past United States' accusations that cite China's "overcapacity" and "undervalued renminbi" as grounds for imposing high tariffs and restrictions on Chinese goods. Since 2019, when the EU officially described China as "a partner for cooperation, an economic competitor and a systemic rival", China-EU relations have increasingly been influenced by geopolitical and ideological biases, undermining mutual trust. Economic and trade frictions have been politicized. The previously cooperative and mutually beneficial economic relationship has been misconstrued as a zero-sum game, leading to growing tensions despite shared goals in global governance and multilateralism.

EU policymakers and think tanks have been significantly influenced by US geopolitical and economic strategies regarding China. During his first term, US President Donald Trump adopted aggressive political posturing, imposing high tariffs against China, alongside strict export controls, while aiming for technological decoupling. This escalated China-US geopolitical and economic competition, directly impacting the EU's 2019 shift in its China policy to the "triple positioning" of a cooperation partner, an economic competitor and a systemic rival.

Although the concept of "de-risking" was proposed by European Commission President Ursula von der Leyen in 2023, its core ideas stem from US initiatives such as supply chain restructuring and "re-coupling", "friend-shoring" and "near-shoring", all aimed at "de-risking" from China. Consequently, "de-risking" has come to represent a coordinated US-EU policy toward China, with the EU aligning itself with the US' sanctions against Chinese tech companies.

WANG XIAOYING / CHINA DAILY

Despite strained US-EU relations during Trump's second term, marked by Washington's many unfriendly policies targeting the EU, political parties within the EU establishment continue to maintain their geopolitical biases. They even echo US justifications for imposing economic pressure on China in their quest for advancing unilateral trade protectionism.

There is no inherent geopolitical competition between the EU and China. Historically, both sides viewed bilateral trade and investment as mutually beneficial, forming the foundation for steadily growing trade relations. According to China's Ministry of Commerce, in 2025, bilateral trade reached $828.1 billion, and in the first half of 2026, the number was $447.88 billion, a 14.2 percent year-on-year increase. EU investments in China have exceeded $150 billion, while Chinese direct investment in the EU has reached $125 billion.

The two sides share consensus on global governance issues such as upholding a United Nations-based international order, climate action, aiding developing countries, maintaining international financial stability, supporting multilateral free trade, combating cross-border crime and tax evasion, and enhancing global health security. However, certain ideological factions within the EU seek to politicize economic differences, undermining the fundamental nature of mutual cooperation and dragging China-US competition into China-EU relations, ultimately harming the EU's interests.

In its trade disputes with the US, China has reciprocated with restrained countermeasures. This has led the US to recognize the futility of unilateral protectionism, resulting in mutual agreements to remove high tariffs and irrational export restrictions. Following Trump's visit to China in May, the two sides established trade and investment councils to discuss bilateral trade and investment issues, fostering a constructive strategic relationship.

If the EU goes ahead with its protectionist measures against China, Beijing would inevitably respond with countermeasures. Given China's effective counterstrategies against the US, the EU could face great challenges. In 2025, China-US bilateral trade saw an 18.7 percent decline, but following a compromise agreement, China's imports from the US rebounded to rapid growth, with year-on-year increases of 20.36 percent and 25.85 percent in May and June, respectively. A similar conflict between China and the EU would disrupt the 8.7 percent growth in Chinese imports from the EU in the first half of 2026.

According to General Administration of Customs, the EU's dependence on the Chinese market is greater than that of the US, with EU exports to China reaching $268.17 billion in 2025, nearly doubling the $139.7 billion of US exports to China. A trade war would inflict greater damage on the EU than it did on the US. Therefore, recognizing the underlying reasons for the declining competitiveness of industries such as automotive and machinery, reforming innovation-stifling regulations and bureaucracy, and encouraging collaboration with Chinese enterprises would be in the EU's long-term best interests.

The EU previously viewed bilateral trade imbalances as a non-issue due to its overall trade surplus. However, recent years have seen a shift in perspective. If the growing trade deficit with China is a concern, the EU can engage in technical negotiations with China to address the imbalance. Accusations of "overcapacity", "subsidies" and "undervalued renminbi", previously used by the US, overlook factors such as declining industrial competitiveness and rising energy prices due to geopolitical tensions, which have accelerated industrial relocation. Resorting to unilateral protectionism for short-term gains is counterproductive. High tariffs imposed by the Trump administration failed to revive uncompetitive US industries, and the EU cannot expect protectionism to safeguard its industries and jobs.

China's Ministry of Commerce has provided scientific explanations regarding "overcapacity", "subsidies" and "undervalued renminbi", urging the EU to understand China's position. China does not accept baseless criticisms of its economic model and industrial policies but acknowledges the EU trade concerns. The ministry reiterated China's stance of not pursuing trade surpluses, committing to increased imports, and emphasizing "constructive dialogue to dispel misunderstandings and address concerns". It is the response to the concerns of the EU that China began to increase its imports from the EU in 2026, reversing the negative growth situation. The year-on-year growth rate in the first half of the year reached 8.7 percent. The most effective policy for the EU to deal with the trade deficit with China is to increase the production and export of goods that still have a comparative advantage, and to cooperate with the Chinese government and enterprises to increase the export of goods and services to China, rather than setting restrictions.

The essence of international trade and investment is to enhance corporate profits and national welfare, while unilateral protectionism is a proved policy mistake.

Factories set to maintain healthy pace

Boosting consumption will be a leading policy priority in second half

By **ZHANG CHENXU**
zhangchenxu@chinadaily.com.cn

China's manufacturing sector is expected to remain resilient and sustain its expansion in the second half despite a slight moderation in momentum in July, as policymakers step up efforts to bolster domestic demand while ensuring a smooth transition from old growth drivers to new ones, experts said.

Their comments came as the RatingDog China General Manufacturing Purchasing Managers' Index — which gauges operating conditions in the sector — edged down to 50.9 in July from 51.7 in June, marking a four-month low but remaining above the 50-point mark, that separates expansion from contraction, for an eighth consecutive month, a private survey showed on Monday.

Highlighting the necessity of consolidating the manufacturing sector's expansion momentum, experts said boosting domestic demand will be a key policy priority in the second half, with policy support expected to place greater emphasis on coordinating demand expansion with supply optimization.

Despite the moderation, the survey showed that export activity returned to expansionary territory in July after two consecutive months of contraction, while overall new orders grew for a 14th consecutive month — the longest stretch of gains since 2018 — though the pace of growth slowed from June.

Meanwhile, cost pressures eased further, with input price inflation slowing to a six-month low — signaling that elevated inflationary pressure was being effectively contained — while output prices remained broadly unchanged, the survey said.

"China's manufacturing sector continued to expand in July, though at a slower pace, underpinned by sustained growth in new orders and a further easing of cost pressures," said Yao Yu, founder of RatingDog, adding that renewed growth in new export orders was an encouraging sign.

Looking ahead, manufacturers remain upbeat about output over the next 12 months, with optimism picking up slightly from June on expectations of stronger market demand, new product development and capacity expansion, Yao added.

That optimism, however, came amid lingering pressure on market demand. The official manufacturing PMI fell to 49.2 in July from 50.3 in June, slipping into contraction territory for the first time in five months, while the new orders subindex dropped to 48.5, the National Bureau of Statistics said on Friday.

"The decline mainly reflects still-soft domestic demand, compounded by disruptions from extreme weather," said Xiong Yuan, chief economist at Guosheng Securities, adding that the official reading pointed to continued pressure on the broader economy amid the ongoing transition from old growth drivers to new ones.

At a tone-setting meeting in late July, the Political Bureau of the Communist Party of China Central Committee made arrangements for economic work in the second half, calling for efforts to accelerate the transition from old growth drivers to new ones, step up countercyclical adjustments, expand domestic demand and optimize supply.

"This signals a stronger policy push and a growing sense of urgency to expand domestic demand," said Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities.

Luo expects faster fiscal spending and more efficient use of bond funds — alongside progress on the six major infrastructure networks — to provide a stronger boost to investment and consumption.

Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International, also saw room for additional fiscal and monetary support, and expects a package of pragmatic and effective incremental policies to be introduced around the end of the third quarter.

"By our estimates, there is room to issue an additional 700 billion yuan ($103.7 billion) in local government bonds by year-end, while the central government has greater room for additional borrowing," Wang said.

On the monetary front, Wang projects that the People's Bank of China, the country's central bank, could cut policy rates by 10 basis points and lower the reserve requirement ratio by 0.5 percentage point.

Rising demand for RMB trade settlement

By **JIANG XUEQING** in Shanghai
jiangxueqing@chinadaily.com.cn

Singapore's DBS Bank is seeing steadily rising demand for renminbi-denominated trade settlement and financing, as Chinese companies deepen commercial ties with the rest of Asia and the international use of the Chinese currency expands.

China's cross-border interbank payment system, known as CIPS, reflects this trend, with its average daily transaction value rising from about 680 billion yuan ($100.7 billion) in 2025 to roughly 830 billion yuan in June. "This clearly shows that there is greater adoption of RMB for payments to counterparties in China," said Han Kwee Juan, group executive and group head of institutional banking at DBS Bank.

Han Kwee Juan

Demand for offshore renminbi has also surged in the dim sum bond market. As of June 22, issuances of dim sum bonds had reached nearly 820 billion yuan this year, up 47 percent from a year earlier, according to market tracker Wind Info. The growing appetite for offshore RMB financing underscores rising demand for cross-border payments into China, Han said.

DBS has seen more corporate clients choosing to settle trade transactions in RMB, particularly through CIPS. Increasingly, overseas companies are asking the bank to facilitate RMB payments to their Chinese counterparties, reflecting broader acceptance of the currency in regional trade.

The bank has also expanded its RMB financing business. DBS China recently joined three other banks in providing an 8-billion-yuan leveraged buyout facility to support the privatization of ANE Group from the Hong Kong stock exchange, using a strategic seven-year term loan structured under the free trade non-resident account framework.

Han attributed the growing international use of the RMB to expanding trade between China and the rest of Asia. As trade volumes rise, more Chinese exporters are requesting overseas customers to settle transactions in RMB where possible, a trend he expects to continue.

With operations spanning the Chinese mainland, Hong Kong and Singapore, DBS is positioning itself to facilitate cross-border capital and trade flows across the region. The bank is seeing particularly strong demand to connect financial flows between China and Singapore, as well as between China and the Association of Southeast Asian Nations economies.

Trade and investment between China and ASEAN continue to strengthen. "We do see the strength of the Chinese economy and manufacturing in data centers and AI infrastructure, together with EVs, and all these will contribute to create a flow of trade and investments between China and ASEAN. And we think that trend will continue for the next few years," Han said.

Greater offshore RMB liquidity — supported by record dim sum bond issuance and the availability of the Chinese currency through free trade non-resident accounts — is also making it easier for companies to finance trade and investment with China, he added.

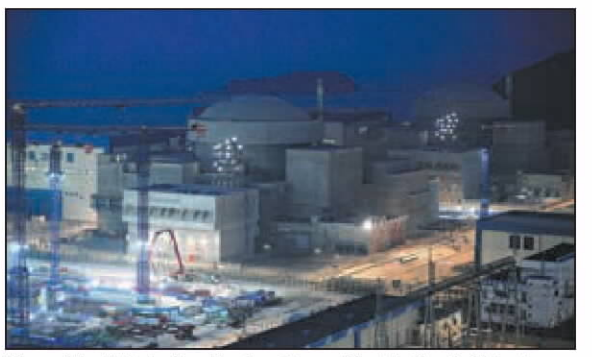
Han said Chinese companies are increasingly well positioned to export technology and expertise to ASEAN markets, particularly in electric vehicles and large-scale battery storage. Regional demand for these technologies is expected to support deeper economic integration.

He also said China's economic transition is progressing as policymakers intended.

"We're seeing great growth in the area of high-tech manufacturing, EVs and renewables, as well as in the area of AI infrastructure. All these are contributing to the growth that we're seeing," he said.

Taipingling plant boosts power output

By **ZHENG XIN**
zhengxin@chinadaily.com.cn



Unit 2 of the Taipingling Nuclear Power Plant in South China's Guangdong province officially began generating electricity on Monday, marking the full completion and operation of Phase I of the first "Hualong One" third-generation nuclear power project in the Guangdong-Hong Kong-Macao Greater Bay Area.

Operated by China General Nuclear Power Group, the milestone signals a major step forward for the region's green energy transition, delivering stable, low-carbon baseload power to the country's southern economic powerhouse.

Based on the average utilization hours of domestic nuclear power plants in 2025, the two units of Phase I are projected to generate more than 18 billion kilowatt-hours of electricity annually, said CGN.

This massive output is sufficient to meet the annual production and living electricity demands of nearly 2 million people, while reducing carbon dioxide emissions by approximately 16.63 million metric tons each year, delivering substantial environmental benefits, it said.

The announcement came after China greenlit 8 new nuclear reactors last week, accelerating its atomic energy expansion and cementing its dominance in the global push for next-generation clean energy.

View of the Taipingling Nuclear Power Plant in South China's Guangdong province. XINHUA

Six of the new reactors will employ the domestically designed Hualong One, China's third-generation nuclear power technology with full intellectual property rights. It is also one of the most widely accepted series of third-generation nuclear power reactors in the world.

As the inaugural batch of the 15th Five-Year Plan (2026-30) period, these projects set a definitive tone for China's energy blueprint during the most critical window for its climate commitments, said Li Jinkai, a distinguished professor at the School of Economics at the Beijing Institute of Technology.

China's nuclear power construction has entered a stage of large-scale, batched and normalized development, he said.

Located in Huizhou, the Taipingling project received official national approval in April 2019, with construction of Unit 2 breaking ground in October 2020.

A single Hualong One unit generates nearly 10 billion kWh of electricity annually, saving over 3 million tons of standard coal. Furthermore, its research and construction have integrated a complete supply chain of nearly 6,000 upstream and downstream enterprises, effectively steering the upgrading of China's manufacturing industry, according to CGN.

According to the National Energy Administration, the country's nuclear power generation reached approximately 467 billion kWh in 2025, while completed investment in nuclear power engineering hit a record 161 billion yuan ($23.84 billion) last year, with five approved projects featuring private capital participation.

Private companies are also becoming a vital force in energy technology innovation. In 2025, all 10 approved nuclear power units introduced private capital, with private shareholding reaching up to 20 percent.

According to the 15th five-year plan for new power system construction, jointly released by the National Development and Reform Commission and the NEA, China will vastly expand its clean energy capacity across a diverse portfolio by 2030, including nuclear power.

Landmark green energy shipment by Chinese firm

By **ZHENG XIN**

China's green fuel sector achieved a historic milestone last week as a vessel carrying 3,750 metric tons of green ammonia set sail from Lianyungang Port in East China's Jiangsu province bound for South Korea, marking the nation's largest single-batch export of the zero-carbon energy to date.

Produced by State Power Investment Corp, the shipment represents the first time Chinese green fuel has gained international market recognition based on its full lifecycle carbon reduction contributions.

The delivery signifies that China's entire wind-solar-hydrogen-ammonia industrial chain has officially upgraded from technical demonstration to large-scale international commercial delivery, the company said.

Completed and commissioned in July 2025, the green energy-producing facility is supported by 800,000 kilowatts of installed renewable energy capacity. It stands as the world's largest single-unit green ammonia plant with an annual output capacity of 32,000 tons of green hydrogen and 180,000 tons of green ammonia, it said.

Long utilized as a vital component in fertilizers, ammonia is now gaining traction as a viable low-carbon fuel for the shipping industry. However, conventional ammonia is largely produced using coal and natural gas, which fails to take advantage of its green-energy potential.

Meanwhile, green ammonia — made using renewable power — offers a zero-carbon alternative, but its growth has been hampered by high technology costs and a spatial gap between where renewable energy is generated and where fuel demand is located.

Industry experts believe that through proprietary core technologies and authoritative international certifications, Chinese-made green ammonia products are now officially becoming deeply embedded in the global green fuel supply chain.

"The expansion from technical demonstration to commercial export, and from product supply to standard-setting, demonstrates that this 3,750-ton export shipment does not merely represent a cross-border delivery of green fuel," said Lin Boqiang, director of the China Center for Energy Economics Research at Xiamen University.

"The international market's endorsement of Chinese products based on their lifecycle carbon reduction fully demonstrates the core global competitiveness of China's clean energy capabilities, industrial standards and development paradigms."

Lin said the country's commitment to achieving carbon neutrality before 2060 is driving growing momentum around low-carbon ammonia, particularly through pilot projects targeted at supplying green fuel to the shipping sector.

Producing and consuming roughly one-third of the world's ammonia supply — and home to some of the globe's busiest ports and shipping corridors — China is uniquely positioned to lead the deployment of clean marine fuels, he added.

Its independently developed "green power-hydrogen-ammonia" flexible coordinated control system has successfully tackled a major global technical challenge — namely, reconciling the intermittent and fluctuating nature of wind and solar power with the continuous stability required for the production of green chemicals.

State Power Investment Corp said that compared with traditional coal-based synthetic ammonia produced in China, the 3,750 tons of green ammonia bound for South Korea will reduce carbon dioxide emissions by more than 10,000 tons across its entire lifecycle — an environmental benefit equivalent to the annual carbon absorption of approximately 1 million trees.

The shipment comes as global demand for traceable and verifiable green fuels continues to climb.

Possessing a dual identity as both a clean fuel and a green industrial feedstock, green ammonia is rapidly becoming a vital commodity in the global low-carbon transition, the company added.

Briefly

Marine economy posts steady growth in H1

China's gross ocean product reached 5.5 trillion yuan ($810.09 billion) in the first half of 2026, up 5.1 percent year-on-year, according to data released by the Ministry of Natural Resources. The amount accounted for 7.9 percent of the country's gross domestic product, the ministry said, noting that the marine economy is experiencing steady growth with a positive development momentum.

Yuan weakens against greenback

The central parity rate of the yuan weakened 19 pips to 6.7917 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

Marine tourism boom fires up summer travel

Integrated fishery resorts, coastal leisure consumption spur marine economy

Top: An aerial image shows Genghai No 1, the country's first integrated intelligent large-scale ecological marine ranch complex, in Yantai, Shandong province. Genghai No 1 was built with a total investment of about $62.2 million.

WANG CHENGLONG / FOR CHINA DAILY

JINAN — At 9 am, a passenger ferry departs on schedule from a wharf in East China and arrives minutes later at a giant flower-shaped offshore structure over the sea.

The complex combines marine ranching with tourism under an innovative "blue granary" model, offering visitors an immersive experience including fish viewing, ecology sessions and virtual-reality movies.

Named Genghai No 1, the integrated facility beyond the Fisherman's Wharf in the city of Yantai, East China's Shandong province, was built with a total investment of 420 million yuan ($62.2 million).

Wang, a visitor from Jinan, capital of Shandong, joined the "Little Ocean Steward" program with her daughter. She fed fish in offshore cages, observed the harvesting process and learned about marine ecology through guided demonstrations.

"Taking my daughter to the seaside used to mean playing on the beach," Wang said. "Now she can learn about the ocean while seeing firsthand how technology is transforming modern aquaculture."

China boasts abundant marine resources with 18,000 kilometers of mainland coastline and another 14,000 km of island coastline, according to official data.

During the peak summer travel season, coastal destinations across the country are rolling out diverse marine tourism experiences, underscoring the growing vitality of China's marine economy.

According to the operator of Genghai No 1, the complex has grown into an offshore resort integrating modern aquaculture, marine tourism, scientific research, public education, dining and accommodation.

Equipped with a "5G+ marine ranch" smart management system, it produces 150,000 kilograms of premium seawater fish annually and welcomes more than 150,000 visitor trips each year.

Similar tourism-driven growth is surging in many places along China's coastline.

In Zhelin Bay of Raoping county, South China's Guangdong province, the Xi'ao fishery-tourism platform, covering more than 3,000 square meters, features specialty restaurants, a seaside cafe, starry-sky cabins and boutique seaview guestrooms.

At the ocean pastoral fishery tourism park on Nanji Island in East China's Zhejiang province, visitors stroll along suspended floating walkways above the sea and enjoy recreational fishing.

In Haitang Bay of Sanya, South China's Hainan province, night fishing has emerged as a new coastal scenario combining sightseeing, cuisine and social interaction. The local "night fishing plus dining" projects have lifted the nighttime departure rate of recreational fishing yachts from less than 30 percent to more than 95 percent.

> "The ocean is a foundational resource and an emerging market for the modern tourism industry, as well as a new strategic space for China's efforts to build itself into a world-leading tourism destination."
>
> **Dai Bin,** president of the China Tourism Academy

The diversification of marine tourism has extended leisure activities well into the evening, and driven a rise in demand for related industries, including water sports equipment.

At Hetong (Weihai) Sporting Goods Co Ltd in the city of Weihai in Shandong, production lines are operating at full capacity as workers rush to complete a batch of inflatable paddleboards destined for overseas markets.

"The popularity of water sports tourism has fueled strong order growth," said Wang Yongfeng, the company's general manager. "Our shipments exceeded 90,000 paddleboard sets in the first half of the year, up 150 percent year-on-year."

Liu Zhiqing, deputy general manager of Weihai Heliyuan Carbon Fiber Technology Co Ltd, said the company's production capacity in 2026 has expanded three to four times compared with previous years, with water sports equipment now accounting for 55 to 60 percent of its total carbon fiber sales.

According to the Ministry of Natural Resources, China's gross ocean product exceeded 11 trillion yuan in 2025, up 5.5 percent year-on-year and accounting for 7.9 percent of the country's GDP.

Against this backdrop, China is cultivating the marine economy, including marine tourism, as a new growth engine.

Dai Bin, president of the China Tourism Academy, said, "The ocean is a foundational resource and an emerging market for the modern tourism industry, as well as a new strategic space for China's efforts to build itself into a world-leading tourism destination."

He called for stronger market connectivity, industrial cooperation and policy coordination to build a coordinated marine tourism landscape featuring closer land-sea integration and differentiated regional development.

Themed tourist trains on faster growth track, driven by demand surge

BEIJING — Passengers boarding a themed sightseeing train in the eastern Chinese city of Fuzhou, Fujian province, last week stepped into a carriage that felt more like a classical Chinese garden.

Decorated with local bamboo and tea elements and Song Dynasty (960-1279)-inspired interiors, the train running through Wuyishan National Park turns the journey itself into a unique cultural experience.

This train is part of a broader boom in an emerging train-plus tourism model, in which railway operators combine transportation with sightseeing, cultural experiences and entertainment to meet a growing appetite for immersive, hassle-free vacations.

In Shangrao, East China's Jiangxi province, a tourist train brings local culture onboard through live performances and interactive theatrical experiences. "Since entering service in late April, the train has maintained an occupancy rate of more than 90 percent," said Qin Zhonghao, head of the operator's sightseeing train business.

Official data support this trend. China operated 1,797 tourist trains in the first half of the year, nearly doubling the 972 trains during the same period of 2025, according to the national railway operator China State Railway Group. Railway operators also launched 445 themed trains tailored for concerts, sporting events, exhibitions and other activities.

The rising buzz around tourist trains highlights just how quickly new ways to experience travel are taking off in China's service sector.

The country's recently released five-year plan for expanding consumption calls for fostering new business models and consumption scenarios centered on improving consumer experiences. In the first half of the year, service retail sales rose 5.3 percent year-on-year, far outpacing the 1.1 percent growth in goods retail sales.

Against this backdrop, industry experts believe a train ticket is no longer merely a means of transportation. Instead, it is now a gateway to a wider tourism ecosystem, linking travelers to fresh experiences and opening up new opportunities for spending on travel-related services.

When the Northeast China Football League tournament kicked off in May, the local railway operator introduced dedicated fan trains offering one-stop travel packages that combined match tickets with sightseeing opportunities.

"To watch the opening ceremony, three friends and I traveled from Tongliao in the Inner Mongolia autonomous region on a fan train," said Wang Lei, a football fan. "Besides the matches, we also had time to visit Shenyang Imperial Palace, Xingshun night market and Beishichang cultural district, all places I had wanted to explore. The trip was definitely worthwhile."

In Northwest China's Shaanxi province, the local railway operator has launched more than 70 themed tourist trains this year featuring study tours, wellness trips and flower-viewing excursions. Developed jointly with tourism authorities, the travel packages integrate round-trip rail tickets with admission to scenic spots, hotel stays, cruises, cultural performances, shuttle transportation and onboard cultural activities.

Passengers pose for photos inside a steampunk garden-themed carriage of the Tianjin Fantasy Express on July 29. SUN FANYUE / XINHUA

"In the past, passengers bought a point-to-point train ticket. Today, they're buying a complete travel experience," said Hui Lixia, deputy director of the passenger transport department at China Railway Xi'an Group Co Ltd.

By giving transportation an even bigger role in tourism, this trend encourages the development of local tourism resources and helps convert passenger flows into broader consumer spending, said Zhang Linshan, a researcher at the Chinese Academy of Macroeconomic Research under the National Development and Reform Commission.

Looking ahead, policymakers see further room for growth. In June, multiple authorities, including the Ministry of Commerce, the Ministry of Culture and Tourism and China State Railway Group, jointly issued a guideline to promote the integration of railways and tourism, with the goal of developing more than 160 dedicated tourist trains nationwide by 2030.

Experts said they believe the next stage of development will require a wider range of products at different prices to meet increasingly diverse consumer needs.

Wang Jia, an associate professor at the School of Tourism, Nanchang University, called for closer collaboration among rail operators, travel agencies, hotels, scenic attractions and cultural businesses.

With improved themed services and deepened cooperation with the tourism sector, the train-plus tourism model will inject fresh momentum into China's summer economy and its rapidly expanding services consumption, analysts said.

Intl tai chi contest

Polina Sapunkova, 19, from Russia, competes in a tai chi single fan competition during the 8th Chenjiagou International Chen-Style Tai Chi Championship in Chenjiagou village, Jiaozuo, Henan province, on Monday. The championship, held from Saturday to Wednesday in the birthplace of Chen-style tai chi, brought together nearly 1,000 participants from home and abroad. The event aimed to promote the legacy of Chinese traditional culture through martial arts. ZOU HONG / CHINA DAILY

Disaster prevention stepped up

New plan highlights entire risk zones in addressing increasing geological threats

By LI MENGHAN
limenghan@chinadaily.com.cn

Facing increasingly severe geological disaster threats, China will accelerate a shift in risk management from individual hazard points to entire risk zones while advancing precise and intelligent prevention to minimize casualties and property losses, according to a new five-year plan released by the Ministry of Natural Resources.

The implementation plan for national geological disaster prevention and control during the 15th Five-Year Plan period (2026-30) comes as extreme rainfall increasingly triggers sudden, clustered and cascading disasters in areas outside traditional high-risk zones, exposing the limitations of point-based prevention.

Despite significant progress in recent years, China's geological disaster prevention and control situation remains severe. By the end of 2025, nearly 280,000 geological disaster hazard points had been registered nationwide, threatening 11.48 million people and property worth more than 760 billion yuan ($112.54 billion), according to the ministry.

During the 14th Five-Year Plan period (2021-25), deaths from geological disasters fell by 52 percent and direct economic losses dropped by 38 percent compared with the previous five-year period. The country also made significant advances in disaster prevention technology by deploying more than 75,000 automated monitoring and early warning devices and piloting comprehensive remote-sensing identification of geological disasters.

However, China's diverse terrain, complex geological conditions and active tectonic and seismic activity, combined with varied climate types, frequent extreme weather and intensive engineering activities, make geological disasters frequent and recurrent, said Yang Xudong, a senior engineer at the ministry's geological disaster technical guidance center.

Geological disasters are also difficult to predict because of their concealed nature, tendency to recur and sudden onset, Yang said, adding that prevention remains the key to reducing disaster risks.

Yang said China's geological disaster prevention has entered a third stage.

"The previous two stages — whether relying on traditional community-based monitoring and professional surveys or on large-scale, high-precision remote sensing and widespread monitoring instruments — focused on hazard points with visible deformation signs," Yang said.

"The new stage directly addresses mass shallow landslides and debris flows triggered by extreme rainfall, which often show no warning signs and typically occur during the heaviest rainfall. Traditional methods have difficulty identifying and predicting such disasters," he said.

To address the new challenges, the plan outlines seven major tasks for the next five years, including dynamic surveys, monitoring upgrades and comprehensive governance. It calls for more than 4,200 engineering treatment projects, over 6,100 hazard elimination projects and the relocation of 50,000 households.

Dual management of both hazard points and risk zones will be implemented in 1,206 key counties, cities and districts across 17 priority provinces, with management lists and accountability systems established for each area.

The plan also designates 21 key prevention zones, up from 16 during the 14th Five-Year Plan period. The zones cover about 2.97 million square kilometers for landslides, rockfalls, debris flows and ground subsidence, as well as 280,000 sq km for ground settlement and earth fissures.

Newly designated prevention zones include the lower reaches of the Yarlung Tsangpo River hydropower project area, high-altitude long-distance disaster chain regions and the Yanshan-Taihang Mountain region. The plan also further refines traditional high-susceptibility areas, including the southeastern hilly regions and the southwestern mountainous regions.

The plan emphasizes improving the precision and intelligence of geological disaster prevention. It calls for detailed surveys at a 1:10,000 scale in key towns located in extremely high- and high-risk areas and promotes the application of technologies such as artificial intelligence and digital twins to improve hazard identification and early warning.

"These changes represent a major upgrade in prevention thinking," Yang said. "The shift reflects the scientific recognition that under extreme conditions, some disasters remain beyond prevention with existing technology."

He said future disaster prevention will rely more on scientific risk assessment, precise early warning and broad public participation to enhance disaster prevention awareness across society.

Seminar stresses intl cooperation to fight terrorism

By FANG AIQING in Yining, Xinjiang and **MAO WEIHUA** in Urumqi

The International Seminar on Counter-Terrorism 2026 opened on Tuesday in Yining, Xinjiang Uygur autonomous region, drawing about 100 officials and scholars from 24 countries and regional organizations, including the United Arab Emirates, Egypt, Russia and the African Union.

Under the theme "Addressing New Challenges of Terrorism: Strengthening State Responsibilities and Fostering International Synergy", the event highlighted the need for shared commitment, state responsibility and international cooperation.

Supported by the Ministry of Foreign Affairs and the Xinjiang regional government, the seminar was organized by the region's foreign affairs office, the Institute of Chinese Borderland Studies at the Chinese Academy of Social Sciences and the World Muslim Communities Council.

Zhai Jun, the special envoy of the Chinese government on the Middle East issue, said global terrorist activities have resurged, with attacks becoming more complex, diverse, technology-driven and organized. The Middle East, Africa and South Asia have been among the regions most severely affected, while countries in the Global South are facing mounting pressure, he said.

Zhai said counterterrorism efforts should be integrated with conflict reduction, poverty alleviation, bridging civilizational divides and promoting political dialogue, with the United Nations playing a central coordinating role. He added that China has provided — and will continue to provide — public goods to strengthen international counterterrorism capacity-building. He also called for stronger governance of emerging technologies to prevent their misuse by terrorist groups.

Ali Rashid Al Nuaimi, chairman of the Defense Affairs, Interior and Foreign Affairs Committee of the UAE Federal National Council and chairman of the World Muslim Communities Council, described terrorism as a common enemy of humanity and said no country can confront the challenge alone. Defeating terrorism requires unity and a comprehensive approach that combines financial, political, military, educational and ideological measures.

Al Nuaimi said both China and the UAE have made significant progress in addressing the root causes of terrorism, offering a prevention-oriented and holistic approach that respects international law. He emphasized the importance of education in promoting coexistence, peace and national identity.

Drawing on his visits to Xinjiang, he said all levels of government and local communities have actively participated in countering extremism, safeguarding security and promoting prosperity.

Xu Guixiang, secretary of the leading Communist Party of China members group of Xinjiang's foreign affairs office, said the region once experienced multiple terrorist attacks and violent incidents but has not seen such cases for nearly a decade after years of sustained efforts.

He said that terrorist forces abroad continue to infiltrate through online and cross-border activities, and that social stability remains a top priority. Xu reiterated Xinjiang's resolve to crush any terrorist plots in accordance with the law, while adjusting tactics as appropriate to balance public convenience with stability.

Xu added that Xinjiang will deepen cooperation under the frameworks of the Shanghai Cooperation Organization, BRICS and the China-Central Asia mechanism in areas including risk assessment, cyberspace governance, joint exercises and coordinated operations.

Chinese silk went westward 4,000 years ago: Study

By LI MENGHAN
limenghan@chinadaily.com.cn

An international research team has discovered that China's domesticated silkworms reached Central Asia nearly 4,000 years ago — almost two millennia before the Silk Road — challenging the conventional narrative of how silk spread across the ancient world and reshaping our understanding of early globalization across Eurasia.

The findings are based on three dried silkworm cocoons and mulberry wood remains excavated at Sapalli Tepe, a Bronze Age site in southern Uzbekistan, by Chinese and Uzbek researchers during fieldwork between 2017 and 2019. The study, conducted by scientists from six institutions in China, Uzbekistan, Germany and the United States, was published in the journal Science Advances on July 23.

Silkworm domestication and silk production technologies originated in ancient China, with genomic and archaeological evidence tracing their origins to between 8,500 and 5,000 years ago. However, when and how Chinese silk first spread beyond the country's borders has long been debated. Many scholars have assumed that its westward transmission could not have begun before the Han Dynasty, the era during which the Silk Road was established.

The new study challenges that long-held view.

"Through protein analysis, we identified the three cocoons as belonging to the domesticated silkworm species Bombyx mori, which cannot survive without human care and mulberry leaves, and dated them to roughly 4,000 years ago," said Xia Qingyou, the study's corresponding author and a professor at Southwest University in Chongqing.

Zhou Xinying, a researcher at the Institute of Vertebrate Paleontology and Paleoanthropology of the Chinese Academy of Sciences who led the study, said the team discovered not only silkworm cocoons but also evidence of mulberry cultivation.

"This means that communities in Central Asia had begun producing silk long before the opening of the Silk Road, demonstrating that this uniquely Chinese invention spread far beyond its homeland," Zhou said.

Soil samples from Sapalli Tepe yielded the three cocoons alongside thousands of plant remains. Scanning electron microscopy revealed fiber structures consistent with Bombyx mori cocoons. The ancient fibers were notably finer than those of modern domesticated or wild silkworms, suggesting they represented an earlier stage of domestication.

Shen Hui, an associate researcher at the Institute of Vertebrate Paleontology and Paleoanthropology, said mulberry charcoal was found at all three sites the researchers excavated — Sapalli Tepe, Djarkutan and Molleli in Uzbekistan.

"The proportion of mulberry charcoal increased from 10 percent at Sapalli Tepe to 60 percent at Molleli, indicating that mulberry cultivation expanded over time," Shen said.

The team also identified citrus wood, a plant native to the southeastern Himalayas, further supporting links between Central Asia and South Asia, Shen added.

By compiling archaeological records of mulberry across Asia, the researchers proposed that China's sericulture tradition spread along the southern slopes of the Himalayas before reaching Central Asia, rather than through the better-known northern Silk Road corridors.

"This discovery places sericulture within a broader wave of early globalization alongside the spread of millet, wheat, livestock and metallurgy between China, Central Asia and South Asia during the third and second millennia BC," Zhou said.

"It shows that nearly 4,000 years ago, communities across Eurasia were already connected through networks of shared knowledge and technologies — far earlier than previously believed," he added.

The researchers said the findings also raise new questions about whether diverse forms of sericulture existed across Bronze Age Asia.
