At that time, the world was still dealing with the impact of the pandemic. Supply chains were disrupted and countries were trying to reopen their economies. But there was still optimism that global trade would gradually stabilize.

Today, the situation is very different. We now face a world marked by deeper geopolitical competition, increased trade restrictions and aggressive industrial policies. There is greater uncertainty in energy and food markets, and concerns over supply chain security are growing.

Global Lens

These challenges render regional economic integration initiatives such as the RCEP more crucial than ever.

In today's increasingly uncertain global trading landscape, where supply chains are easily disrupted and rising protectionism creates greater fragmentation, the RCEP offers a stable and predictable environment.

That means a lot to businesses. A company planning to invest in a new factory not only asks about labor costs or infrastructure, but also whether markets will remain accessible, if inputs will be available, whether exports will face new tariffs and if rules might suddenly change.

Regional economic integration, especially a comprehensive agreement such as the RCEP, provides three essential functions. It brings certainty by establishing a rules-based framework for trade and investment.

It enhances resilience by supporting diversified regional supply chains. And it injects confidence by signaling that East Asia still believes in openness and integration.

But these benefits can only be realized if the RCEP delivers concrete benefits to businesses. Currently, the full potential of the agreement is underutilized.

A recent ASEAN Business Barometer Survey by the Centre for Strategic and International Studies found that while around 70 percent of companies are aware of ASEAN free trade agreements and RCEP, only about 48 percent actually utilize the facilities under the agreement. Even among those companies, many only use it occasionally.

During the RCEP leaders' meeting in Kuala Lumpur last year, a general review of the RCEP was scheduled for 2027. This presents a good opportunity for member countries to upgrade the agreement to RCEP 2.0 to strategically respond to the current global uncertainty.

There are two important questions related to such an upgrade.

First, what should the upgrade focus on? The upgrade should be ambitious, yet focused. It should not become a long wish list. The "Christmas tree syndrome", where too many issues are added, risks collapsing the upgrade process.

The upgrade should focus sharply on a few high-impact areas. The first priority should be implementation and utilization. Before adding new issues, the unfinished business of RCEP 1.0 should be addressed. This includes eliminating tariff differentials, simplifying rules of origin, implementing full cumulation, and addressing non-tariff measures.

These may sound technical, but are vital for reducing confusion, costs and uncertainty. If a company faces different tariff rates for the same product depending on its origin, that creates confusion.

If rules of origin are too complex, that pushes up costs. If regulations in member countries are too divergent, it creates uncertainty.

The second priority should be strengthening institutional capacity. The RCEP has institutional elements such as committees and the RCEP Support Unit, but their current form has insufficient impact.

For instance, it's difficult to know the current utilization of the agreement. The RCEP should have proper monitoring mechanisms and transparent processes.

Economic and technical cooperation often does not address the real issues. It must be linked to real capacity gaps, especially for SMEs. If they need support for customs digitalization, RCEP should help. If they need help with standards, certification, or rules of origin, RCEP cooperation should respond directly.

The third priority should be introducing new areas of cooperation and rules. Some of the most urgent areas are in the digital economy, sustainable trade and green transformation. Those areas open opportunities for members, but also carry risks.

The second key question is: how can the upgrade be carried out in the context of the 2027 general review?

The upcoming general review should be treated as more than just a routine procedural exercise. This requires political direction, not just a technical analysis. Leaders and ministers must set the direction by defining the objectives, scope, priority areas, expected deliverables and timelines.

The CSIS has prepared a practical guide for next year's review and upgrade. The process should start this year for officials to identify gaps and propose the scope of the review so that next year the process and negotiations can address more substantial matters.

Here I would like to emphasize the role of think tanks in this process. Think tanks can help identify the most impactful and feasible areas for upgrade to help policymakers avoid an overloaded agenda.

By bridging policy with business needs, think tanks can ensure that the upgrade delivers practical benefits.

Amid the current uncertainty, the RCEP can provide a platform for effective responses but only if it is upgraded in a focused and practical way.

The goal is not to create the most ambitious agreement, but to make the RCEP more development-oriented, more relevant and more useful in today's world.

Neighborhood committees as guardians of daily life

A barter event was taking place at the small square in our apartment complex. Residents were arriving with their used electronic appliances, such as air purifiers and humidifiers, and exchanging those for cooking oil and laundry detergent.

Used bikes became the star of the day — an old bike could be exchanged for 10 liters of cooking oil and many other daily-use items.

The neighborhood committee, which had organized the barter, wanted to encourage residents to get rid of their used bikes that often block the corridors.

Chinese people once relied on bikes for commuting. In recent years, however, thanks to an improved public transportation system and the popularity of shared bikes, fewer people use bicycles for commuting, parking them randomly in corridors and other public spaces, causing inconvenience to residents.

The barter is only one of many events the neighborhood committee has organized this year to encourage cooperation between neighbors and to promote recycling of used goods.

In fact, neighborhood committees, which are autonomous organizations, have become an indispensable part of China's successful governance.

China's first neighborhood committee was created by residents representing around 2,250 Hangzhou families on Oct 23, 1949, just over three weeks after the establishment of the People's Republic of China. On Dec 31, 1954, after the legislature passed an organic rule, neighborhood committees were granted legal status as autonomous organizations.

They look for potential risks that could endanger public security or public health, or contribute to juvenile delinquency.

Over the past few decades, proximity to urban households has enabled such committees to steadily expand their functions. Now the committees are even entrusted by local governments to accomplish a number of social services.

They are responsible for advocating the Constitution and other laws to residents, educating them about the law and their responsibilities as citizens. The committees directly engage in public affairs such as care for the elderly, those with disabilities and children. They serve as mediators when conflicts arise between members of a family, neighbors or between residents and the real estate management.

They look for potential risks that could endanger public security or public health, or contribute to juvenile delinquency.

They unite local volunteers to deal with the problems and organize activities benefiting both the community and society — as they did by organizing the barter.

When quarrels broke out among family members or between neighbors, the committee members were usually the first to intervene. Their mediation helped quell thousands of disputes, which could otherwise have turned violent or ended up in court.

Ma Shanxiang, a mediator with a subdistrict office in Chongqing, was recently in the limelight when he was awarded the July 1 Medal, the Communist Party of China's highest honor.

In his 38-year career dealing with grassroots affairs, he successfully mediated around 2,500 disputes. He also sees the medal as recognition for contributions made by all those working in neighborhood committees.

Local governments have been supportive of the work neighborhood committees do, providing them aid, in the form of money or materials. In most cases the committee workers' wages and subsidies are covered by local governments. They also benefit from governments' project-oriented investments and social donations.

My neighborhood committee runs a day care center for the elderly, provides discounted lunch and dinner in neighborhood canteens, arranges home visits by doctors and barbers and organizes activities such as table tennis, snooker, dancing, singing, calligraphy, painting and lectures for senior citizens.

An aging China is promoting a home-based elderly care model for millions of its senior citizens such as me.

Such a model would be unimaginable without the cooperation of the country's 124,308 neighborhood committees. After all, it is the committees that will be entrusted with complicated coordination and large-scale organization to serve the senior citizens living in millions of separate homes.

Once these new responsibilities are entrusted, I believe the importance of neighborhood committees will grow further and our ties with the committees will become deeper.

Energy resilience

China-ASEAN cooperation can provide firmer support for lasting peace and common development in the region

The China-ASEAN Foreign Ministers' Meeting was held in Manila on July 22. Marking the fifth anniversary of the comprehensive strategic partnership between China and the Association of Southeast Asian Nations, the meeting adopted the China-ASEAN Foreign Ministers' Joint Statement on Addressing the Regional Impacts of Developments in the Middle East and Strengthening Regional Energy Cooperation, which proposes closer collaboration on power interconnectivity, energy supply chains, clean, low-carbon and renewable energy, and energy technological innovation.

For China and ASEAN, energy security and the green transition have become increasingly inseparable. The question is no longer whether to transition, but how to guarantee stable supply, affordable prices and the necessary development space in the process.

The conflict in the Middle East has commanded close attention to the region because fluctuations in oil and gas prices, shipping and insurance costs are quickly transmitted to production and daily life. Conventional energy will remain important for a considerable length of time, yet simply diversifying import sources or expanding reserves cannot eliminate structural risks. Developing domestic renewables reduces dependence on external fuels, but the variability of wind and solar power requires stronger cross-border grids, storage and dispatch capacity. The green transition, in this sense, is not an add-on to energy security but a reshaping of it — toward a regional energy system with more diverse sources, more flexible regulation and the capacity for mutual support when shocks occur.

Cooperation between China and ASEAN already rests on a solid foundation. According to the data released by the National Energy Administration in November 2025, since China and ASEAN began electricity trade, cumulative trading volume has exceeded 75 billion kilowatt-hours, more than 90 percent of it green electricity; by the end of 2024, cumulative investment in their jointly developed hydropower, wind and photovoltaic projects had grown more than fivefold over 2014 and installed capacity more than 15-fold. The China-Laos 500-kilovolt power interconnection project, operational since April, has a two-way transmission capacity of 1.5 million kW and is expected to deliver about 3 billion kWh of clean electricity a year.

Still, measured against the two sides' growing energy demand, current trading volumes and mutual support capacity leave much room for improvement.

The pressure comes first from the gap between ambition and reality. According to the eighth ASEAN Energy Outlook, renewables accounted for 15.6 percent of ASEAN's total primary energy supply in 2022. The ASEAN Plan of Action for Energy Cooperation (2026-30) raises the 2030 target for that share to 30 percent, while proposing a share of 45 percent for renewables in installed power capacity and a 40 percent reduction in energy intensity, which is the quantity of energy required per unit output or activity, from the 2005 level. Industrialization and urbanization are still advancing, so new energy demand and emissions cuts must be addressed together. Based on the eighth ASEAN Energy Outlook, the ASEAN Center for Energy has estimated that meeting the region's transition goals requires about $150 billion in investment annually.

The power grid is one of the most prominent weak links. According to the ASEAN Power Grid Financing Initiative launched by the Asian Development Bank, the World Bank, the ASEAN Secretariat and the ASEAN Center for Energy, cross-border interconnection capacity now stands at about 7.7 gigawatts

MA XUEJING / CHINA DAILY

and needs to be more than doubled by 2040. The existing power trade rests mostly on bilateral arrangements, with dispatch rules, settlement, project access and green power certification not yet fully aligned. A completed transmission line does not mean electricity can flow smoothly over a wider area. Without unified planning and stable rules, clean power from resource-rich areas cannot be transmitted out, load centers may still face tight supply at peak hours and interconnection's security value cannot be fully unlocked.

Likewise, one cannot simply blame a shortage of capital for the financing difficulties. Clean energy and cross-border grids involve large investments and long payback periods; investors care more about whether power purchase agreements will be honored, whether pricing is stable, and how currency and policy risks are shared. Some projects are technically feasible but temporarily stalled because their revenue structures are unclear. Moreover, member states differ markedly in resources and development stage. For some, the transition must also provide jobs, industrial upgrading and electricity access. If cooperation means only equipment procurement and construction, without generating local technical capacity, jobs and tax revenue, projects will struggle to win lasting public support.

In the next stage, cross-border grids should be built as regional public goods. China-ASEAN cooperation can align more closely with ASEAN grid planning, launch multilateral power trading pilots in subregions where conditions are ripe, and gradually coordinate rules on dispatch, settlement and green electricity certification. The priority is not only building new lines but also raising the utilization of existing ones and improving emergency coordination during extreme weather or supply disruptions. Existing projects such as the China-Laos link can provide experience for broader integration, although specific arrangements should respect ASEAN centrality and each country's regulatory authority, proceeding step by step.

Project cooperation should also shift from engineering delivery to joint capacity building. China has practical experience in large-scale renewable integration, storage, smart grids and equipment manufacturing, while ASEAN has abundant solar, wind, hydro and geothermal resources and diverse scenarios such as island power supply and cross-border transmission. Combining the two does not mean simple replication; technologies can be adapted to local grid conditions, climate and energy demand, with local procurement, training, operation and maintenance, and joint research built into project design.

More targeted financial arrangements can effectively reduce early-stage risks. As the joint statement notes, the China-ASEAN Investment Cooperation Fund should be used properly, with financial institutions encouraged to join regional energy projects. Policy-based, development and multilateral institutions can lead in supporting feasibility studies, cross-border infrastructure and risk guarantees, thereby attracting long-term private capital. Contract transparency and environmental and social standards can also be improved so that returns, responsibilities and risks are all identifiable. Rather than chasing short-term deal numbers, the two sides should cultivate demonstration projects that are financially sustainable, benefit communities and can withstand economic cycles.

Regional policy communication matters as well. The two sides can use existing platforms such as ministerial meetings and the China-ASEAN Clean Energy Cooperation Center to build regular mechanisms for risk assessment and emergency communication, sharing timely information on markets, major projects and technical standards. For industrial chains, maintaining openness, stability and diversity is a more effective way to enhance security than relying on any single source. On green rules, it is essential to advance the alignment of carbon accounting, green certificates and product standards with respect for each country's development stage, to lower cross-border business costs and prevent regulatory fragmentation that may slow the transition.

Ultimately, cooperation will be judged by real results: whether residents get more stable and affordable electricity, whether businesses suffer less from price volatility, and whether participating countries can accumulate local technology and jobs. True energy resilience means not isolating oneself from world markets, but having more choices and stronger adaptive capacity through open cooperation. The Manila joint statement has pointed the way. If this consensus is turned into functioning grids, sustainable projects and compatible rules, China-ASEAN energy cooperation will provide firmer support for lasting peace and common development in the region.

Shared responsibility for the high seas

After entering into force early this year, the BBNJ Agreement needs collective action to turn law into ocean protection

The Agreement on the Conservation and Sustainable Use of Marine Biological Diversity of Areas beyond National Jurisdiction (BBNJ Agreement), which entered into force in January, has yet to transform ocean conditions or create a new marine protected area through its own procedures. Yet the agreement, also known as the High Seas Treaty, has begun to influence state conduct: Parties have been asked to designate national focal points; the interim secretariat has established channels for formal notifications; preparatory negotiations have advanced rules for the future Conference of the Parties and its subsidiary bodies; and the first pre-collection notification concerning marine genetic resources has been submitted under the new framework.

As the agreement moves toward an operating system for international cooperation, the decisive question is whether and how parties, signatories and other maritime actors will convert this momentum into coordinated protection and sustainable use of the high seas.

The high seas have long stood at the center of a paradox. They extend beyond any single country's jurisdiction but support ecosystems essential to climate regulation, fisheries, scientific discovery and planetary resilience. Yet their governance has remained fragmented with regulation through different institutions, each with its own mandate, geographic scope and enforcement capacity.

The BBNJ Agreement strengthens cooperation by creating common rules and procedures for marine genetic resources and benefit-sharing, area-based management tools, including marine protected areas, environmental impact assessments, and capacity-building and the transfer of marine technology. Its success, therefore, requires parties to implement their obligations, signatories to complete domestic ratification processes, non-parties to consider accession and relevant international organizations to coordinate their mandates.

The first priority should be institutional alignment at the national level. Implementation will require coordination among agencies responsible for marine ecology, natural resources, fisheries, scientific research, foreign affairs, shipping and environmental assessment. Every party should establish clear procedures for environmental review, data submission, scientific sampling, marine genetic resource management and participation in international decision-making.

As a major maritime country, a leading developing country and an active participant in deep-sea research, China can use the agreement to strengthen domestic coordination and improve the transparency and predictability of its activities beyond national jurisdiction. However, China is just one contributor among many. The same standard should apply to other major maritime powers. Shared rules will gain credibility only when the states with the greatest capabilities also accept the greatest implementation responsibilities.

Second, countries should build a shared scientific foundation for high seas protection. Effective conservation depends on long-term monitoring, biodiversity mapping, ecological modeling, genetic information, ocean observation and transparent assessment of cumulative impacts. Scientific data should be interoperable, accessible through agreed mechanisms and accompanied by appropriate safeguards for legitimate interests, intellectual property and the rights of knowledge holders. Cooperation among national research institutions, regional seas organizations, universities and international scientific programs will be essential.

Countries with advanced research fleets, satellite systems, laboratories and digital monitoring

WANG XIAOYING / CHINA DAILY

technologies should treat these capacities as potential global public goods. China, the European Union, the United States, Japan and other scientifically capable actors can contribute data, expertise, training and observation tools through multilateral channels, while other developing countries should participate not only as recipients of information, but also as research partners. A scientific research system that draws on diverse regions and knowledge traditions will be more legitimate and more capable of identifying ecological change.

Third, parties should participate constructively in the design of area-based management tools, including marine protected areas. High seas conservation measures must be ecologically meaningful, legally sound, equitably governed and practically enforceable. They must also coordinate with existing bodies responsible for fisheries, shipping and seabed activities, so that different institutions reinforce rather than undermine one another.

This task is closely linked to the global "30 by 30" target under the Kunming-Montreal Global Biodiversity Framework, which calls for at least 30 percent of terrestrial, inland water, coastal and marine areas to be effectively conserved and managed by 2030.

Areas beyond national jurisdiction have historically lacked a comprehensive mechanism for proposing and coordinating marine protected areas. The BBNJ Agreement helps close that institutional gap. Its parties should now identify ecologically significant areas, assemble credible scientific evidence, consult affected stakeholders and ensure that management measures are accompanied by monitoring, compliance and periodic review. The objective should be a connected and effective global ocean protection network.

Fourth, environmental impact assessment should become a central tool for responsible high seas activity. As human activities move further offshore and deeper into the ocean, the risk of ecological disturbance and cumulative harm grows. The agreement provides a pathway for more systematic assessment of activities that may significantly affect marine biodiversity beyond national jurisdiction. Parties should work toward rigorous, transparent and science-based procedures, including clear thresholds, public notification, access to relevant information, consideration of cumulative and transboundary effects, and follow-up monitoring.

Consistent assessment standards would protect ecosystems while also providing greater predictability for enterprises, research institutions and public authorities. The credibility of the regime will depend on whether similar risks are assessed according to comparable standards, regardless of the nationality of the actor involved.

Fifth, implementation must make capacity-building and marine technology transfer practical. Equity is a condition for effective ocean governance. Many developing countries have strong interests in the high seas but limited scientific, technological and financial capacity to participate fully in research, monitoring, benefit-sharing and decision-making. If implementation is dominated by states with advanced fleets, laboratories and databases, the agreement will lose both legitimacy and effectiveness.

Developed countries and capable developing countries should therefore support training, joint research, regional scientific networks, shared observation platforms, access to data and participation in BBNJ institutions. Existing initiatives, including the UN Decade of Ocean Science for Sustainable Development, can help connect national programs with the agreement's implementation needs. China can make a useful contribution through South-South cooperation, research partnerships and marine technology platforms. Similar contributions from other capable states and institutions should form a diversified system of support.

The agreement's first months also reveal what remains unfinished. The permanent secretariat, clearing-house mechanism, scientific and technical bodies, financial arrangements and detailed procedures of the Conference of the Parties must become fully operational. Parties will need to provide predictable funding, select qualified and geographically representative experts, define transparent participation procedures and build cooperation with existing global, regional and sectoral organizations.

China can contribute long-term planning, marine science capacity, digital monitoring technologies and ecological governance experience, and support developing countries' participation while working within collectively agreed institutions and standards. The same balance of contribution and restraint is required from every major maritime power.

The BBNJ Agreement provides a legal platform for ocean protection linked to food security, climate stability, technological innovation, biodiversity conservation and the future of the blue economy. Measurable ecological results will depend on whether countries align domestic institutions, share credible knowledge, establish and manage protected areas, assess environmental risks, finance implementation and enable all regions to participate.

The ocean has long connected civilizations and ecosystems. In the age of climate change and biodiversity loss, it also connects responsibilities. The entry into force of the BBNJ Agreement marked the beginning of a new chapter in global ocean governance. Its promise will be fulfilled only when countries act together to conserve and sustainably use the deep ocean as a shared ecological foundation for present and future generations.

Xiong'an New Area launches AI institute

Facility offers 480 courses, supported by 25 specialized training labs

By LI JIAYING
lijiaying@chinadaily.com.cn

Applying artificial intelligence research to practical use, Xiong'an New Area in Hebei province is using a new training base to connect talent development with corporate demand and real-world projects.

Launching operations on Thursday with the opening of Xiong'an's first AI training class, the base combines hands-on training in AI and information technology, with courses designed around the actual capabilities required for specific jobs.

"The curriculum is developed by starting with real-world needs and working backward to define the knowledge and practical skills trainees require," said Ma Yangbiao, general manager of Xiong'an Science and Technology Industrial Park Development and Management Co Ltd, the parent company of the base's operator.

The base targets users including centrally administered State-owned enterprises and universities relocating to Xiong'an, government departments and public institutions in the new area, as well as universities and companies in nearby provinces, Ma said.

"We have developed a progressive training system, ranging from basic AI literacy for the general public to advanced engineering programs for high-caliber professionals," he said, adding that the facility offers more than 480 courses supported by 25 specialized training labs, bringing together complementary sources of expertise to build an integrated AI teaching system.

The facility includes leading technology companies that introduce cutting-edge technologies used in the field, professors from top universities who strengthen students' theoretical foundations and foster research-oriented thinking, and industry specialists who share experience from real-world projects, Ma said.

One participating company is Huaqing Zhiyan, a large language AI model and computing service provider.

"This AI training platform is our first product developed here. It supports AI-assisted lesson preparation, one-click generation of instructors' teaching videos, and automated scheduling and distribution, helping users quickly understand and master AI principles and progress from beginner to advanced levels," said Liu Yuxi, an engineer at the company.

The Xiong'an Artificial Intelligence Institute is already using the platform to train its researchers, Liu said.

AI is also embedded in everyday life at the base, extending the learning experience beyond classrooms and laboratories, and even including cafeteria-based activities.

"AI technology is integrated throughout the dining process, from ordering and collecting meals to payment. The aim is to improve efficiency while allowing trainees to experience AI in everyday settings and deepen their understanding of the technology," Ma said.

Briefly

Anti-dumping move on pecan imports imposed

China will impose provisional anti-dumping measures — effective on Tuesday — in the form of security deposits, on pecan imports originating in Mexico and the United States, the Ministry of Commerce said on Monday. It said its investigation, launched on Sept 25, 2025, had preliminarily found the imports were being dumped in the Chinese market and had caused material injury to the domestic pecan industry.

Yuan strengthens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, strengthened 20 pips to 6.7884 against the US dollar on Monday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

Close trade ties see Chinese firms rev up expansion within ASEAN

By SHI JING in Shanghai
shijing@chinadaily.com.cn

While Chinese companies still have ambitious plans to expand their overseas business activity, structural changes are taking shape, including motives for outbound reaches and the diversification of companies and industries going abroad, said a report released by Singapore-based bank UOB.

Released for the seventh consecutive year, the latest report showed that 80 percent of the 380 surveyed Chinese companies plan to undertake overseas expansion plans in the next three years, with the Association of Southeast Asian Nations continuing to serve as the first destination of choice.

This is in line with the close trade ties between the two economies, as China's trade value with ASEAN surged 18.2 percent year-on-year to 4.34 trillion yuan ($643.2 billion) in the first six months, said the General Administration of Customs.

Malaysia has gained the most attention so far this year, with 56 percent of polled Chinese firms expressing interest in the market. This could be partly due to the energy crisis that has roiled the world this year. The richer application scenarios in Malaysia can be translated into more opportunities for Chinese companies, especially new energy companies, said Xin Tao, managing director of UOB China.

While Malaysia has announced plans to completely transition away from coal by 2044, electricity consumption by data centers is projected to surge from 7 percent of total demand in 2026 to 31 percent by 2035 in Peninsular Malaysia, said local energy authorities. Procurement of renewable energy and acceleration of the country's solar projects are just some of the strategies being used to address the surging demand.

At present, Chinese telecommunication companies have the strongest presence in Malaysia, including electronics manufacturing, electronic components and server suppliers related to artificial intelligence, said Xin.

Singapore came in second place this year, with 54 percent of polled Chinese enterprises expressing interest in further tapping into the market, 10 percentage points higher than last year.

Xin said tech firms usually locate their regional headquarters or research and development centers in Singapore thanks to its rich talent supply. But their operational facilities are usually based in Malaysia where land costs are much lower. The lower marginal costs mean higher efficiency in expansion, she said.

Up to 51 percent of the polled Chinese firms showed interest in Thailand this year, up 12 percentage points from a year earlier.

Chinese retailers usually make Thailand their first ASEAN gateway as it possesses a large number of Southeast Asian retailing brands for beer, soft drinks, coffee, energy drinks and snacks, said Xin.

Thailand is often the first stop for Chinese new energy vehicle makers to tap Southeast Asian markets as they inject more capital to build local factories, and entire supply chains have gradually moved to Thailand, including providers of batteries, motors, electronic controls, seat belts and glass, she added.

This reflects the diversification of Chinese companies' outbound reaches. Instead of bringing products to new markets, they are now introducing technologies, skills, operational capabilities, intellectual property rights and even entire industrial chains. It can be said that Chinese companies have moved beyond standalone overseas investments to a full-ecosystem approach to global expansion, said Adaline Zheng, CEO of UOB China Ltd.

The sectoral scope of Chinese overseas expansion has widened to include high-end manufacturing, new energy, electric vehicles and healthcare. A shift has also occurred regarding the player mix, from large well-capitalized giants to smaller private firms and asset-light businesses like AI startups, Zheng said.

It should be noted that the call for the internationalization of the yuan has risen as Chinese firms become more active in overseas markets, which is evidenced by the growing volume of yuan-denominated bank loans, bonds and other financing instruments. With the deepening cooperation between Chinese and ASEAN companies and the widened application scenarios, the renminbi is no longer just a transactional tool but increasingly viewed as a hedging instrument thanks to its stability, said Zheng.

Mixed results for China's gold sector as consumption changes

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's gold consumption saw a slight increase in the first half, reaching 511.41 metric tons, up 1.23 percent year-on-year, as strong investment demand offset sluggish jewelry sales, according to the latest industry data released by the China Gold Association.

Driven by sharp price fluctuations at historically high levels and the implementation of new domestic gold tax policies, the country's gold consumption structure continued to experience significant divergence, the association said.

Demand for gold jewelry plummeted 33.88 percent year-on-year to 132.13 tons, as consumers became hesitant to make purchases amid soaring retail prices. In stark contrast, robust investment demand pushed the consumption of gold bars and coins to 339.34 tons, surging 28.42 percent.

Periodic price pullbacks have consistently stimulated sales of gold bars through domestic banking channels, cementing them as a popular safe-haven asset for investors seeking to hedge against market risks, it said.

Meanwhile, persistently high gold prices have pushed up production costs for industrial enterprises, leading to a 2.9 percent decline in industrial and other gold uses, which stood at 39.94 tons for the first six months.

On the supply side, China's gold output from domestic raw materials dropped 14.62 percent year-on-year to 152.91 tons.

The CGA attributed this decline to comprehensive safety inspections, rectifications and special environmental governance campaigns conducted in key gold-producing provinces. These strict regulatory actions led to temporary production halts at certain mines as they underwent mandatory self-inspections to ensure high-quality, sustainable development in the sector.

Gold produced from imported raw materials, however, increased by 4.62 percent, adding 3.40 tons to reach 77.08 tons. Combined, the country produced 229.99 tons of gold from both domestic and imported raw materials, representing a 9.01 percent decrease compared to the same period last year.

Shoppers look at gold products at a jewelry shop in Lianyungang, Jiangsu province. WANG CHUN / FOR CHINA DAILY

Despite domestic supply constraints, China's major gold enterprises maintained stable operations and orderly capacity expansion at their overseas mines.

State-owned giants including China National Gold Group and Shandong Gold Group reported steady production growth abroad.

In the first half, overseas mine production by these large groups reached 48.10 tons, a robust 21.43 percent year-on-year increase, it said.

Industry experts believe that overseas expansion of Chinese mining companies has evolved from an optional growth strategy into a structural necessity in recent years.

As the world's largest gold consumer, China's rising offshore output demonstrates that proactive mergers and acquisitions are serving as a vital buffer, said Zhao Xiangbin, chief strategist at Beijing Gold and Forex Fortune Investment Management.

"Chinese enterprises are securing high-quality assets at attractive valuations while deploying advanced extraction technologies," he said.

Zhao added that by securing upstream physical assets globally, domestic mining giants are anchoring the country's physical reserves and steadily expanding China's long-term influence over global precious metal markets.

At the institutional level, China's central bank continued its strategy of optimizing and diversifying its official foreign exchange reserves, adding 40.12 tons of gold in the first half.

This marked the 20th consecutive month of accumulation spanning from November 2024 to June 2026, pushing the nation's total gold reserves to a massive 2,346.45 tons and firmly securing its position as the fifth-largest holder globally.

Digital tech reshaping services spending

TIANJIN — From virtual and augmented reality experiences that bring museum collections closer to visitors, to artificial intelligence-powered travel planning and personalized recommendations on e-commerce platforms, digital technologies are fundamentally reshaping how Chinese consumers discover and enjoy exciting new services.

In response to this wave of enthusiasm, the country's service consumption is evolving, becoming smarter and more dynamic than ever before.

In the first half of 2026, retail sales of services in China rose 5.3 percent year-on-year — 4.2 percentage points faster than goods sales. Tourism, consulting and leasing services, and cultural, sports and leisure services all posted double-digit growth, according to data released by the National Bureau of Statistics.

In August 2024, China's State Council issued guidelines to promote high-quality development in services consumption, urging innovation to unlock the sector's internal momentum and cultivate new drivers of growth. Digital technology is now emerging as a key enabler in that effort.

AI, in particular, is becoming deeply woven into consumer spending on services. In June, the Ministry of Commerce and seven other government departments rolled out an implementation plan to accelerate "AI plus consumption", introducing 17 measures focused on three priorities: expanding smart product consumption, empowering services and creating new consumption scenarios.

The performing arts market offers a compelling example. In 2025, China's large-scale commercial performances generated over 30 billion yuan ($4.45 billion) in box-office revenue and spurred more than 220 billion yuan in related cultural and tourism spending, according to data from the China Association of Performing Arts. That booming demand calls for richer and more targeted services.

In China, consumers can already plan trips easily through various mobile apps. Yet friction points remain: choosing a well-located hotel, ensuring smooth transfers between bookings and finding reasonably priced restaurants near tourist attractions.

Beyond improving individual experiences, digital tools are also transforming how service providers interpret market demand. Data generated through digital platforms are making previously invisible consumer preferences measurable, comparable and traceable.

Meituan, a major local services platform, offers a clear case in point. Zhang Lin, president of the Meituan Research Institute, said platform data show that online consumption among people over 50 is growing rapidly, and their share of bookings for four-star and above hotels is significantly above average.

These insights are shining a spotlight on the spending power and willingness to spend that middle-aged and older consumers have long been overlooked for.

Chinese consumers are moving from "buying useful products" to "buying what they like". This shift requires service providers to strengthen their ability to understand consumers, craft engaging scenarios and build communities. Digital technologies are helping them do just that.

According to the Ministry of Commerce, online service consumption in China grew 22 percent in 2025. During the same period, online sales of sports event tickets, tourism products and dining services jumped 63.3 percent, 40.6 percent and 23.7 percent, respectively.

Many industry observers believe digital technologies are generating more diverse service offerings and fostering entirely new consumption scenarios. By shifting from standardized supply to personalized matching, and from complex decision-making to more targeted outreach, digital innovation is steadily driving the upgrade and expansion of China's service consumption.

Unlocking county-level consumption niche

Not all the same, such markets represent hundreds of distinct regional economies

By WANG ZHUOQIONG
wangzhuoqiong@chinadaily.com.cn

China's economic expansion is increasingly being shaped beyond its biggest cities, as county-level markets become a critical source of consumer growth and a testing ground for companies seeking the next wave of demand, industry reports said.

Consumption remained the largest contributor to the country's growth momentum in the first half, with final consumption expenditure adding 2.1 percentage points to GDP growth, according to the Ministry of Commerce.

The ministry said continued upgrades in technology, product supply and consumer services would help unlock additional spending potential, particularly among county-level markets and demographic groups such as the elderly, younger consumers and families with infants.

Among the biggest opportunities are China's counties and townships, where rising incomes and changing lifestyles are reshaping consumption patterns. Data from Meituan showed that active consumers in county-level markets increased by more than 15 percent year-on-year in 2025, while order volumes climbed by over 20 percent, significantly faster than growth in major urban markets.

The shift marks a strategic turning point for companies that have traditionally focused on China's largest cities. Consulting firm McKinsey estimates that by 2030, around two-thirds of incremental personal consumption growth in China will come from lower-tier cities, counties and townships.

For consumer brands, the opportunity is already visible. In 2025, Mixue Group's brands operated 32,000 stores in tier-3 and below cities, representing about 58 percent of their network in the country.

Yet the county opportunity is not as simple as opening more stores or offering lower prices.

A recent report about consumption in counties from NielsenIQ, also known as NIQ, highlights a growing disconnect between economic development and brand performance.

China's wealthier counties are expanding rapidly. According to the National Bureau of Statistics, the number of counties with a GDP exceeding 100 billion yuan ($14.83 billion) rose to 77 in 2025. The country's top 100 counties accounted for 10.2 percent of national GDP, with combined economic growth of 6.3 percent year-on-year, above the national average of 5 percent.

Many consumer companies have failed to capture that growth. Among the 20 leading fast-moving consumer goods manufacturers tracked by NIQ, only four recorded sales increases in county markets, while 16 saw declines.

Above: Robots walk the runway at a *hanfu* (a traditional Chinese costume) cultural festival and the 2025 fall/winter *hanfu* new collection launch event in Caoxian county, Shandong province, on Nov 22. Consumers visit an outlet of China's beverage giant Mixue Group in Hengshui, Hebei province, on Feb 17. TANG KE / FOR CHINA DAILY

The message for companies is clear: consumers in counties are becoming richer, but their preferences are changing faster than many brands' strategies.

The traditional view of consumers in counties being purely price-driven is becoming outdated. NIQ data show that 53 percent of consumers in counties remain sensitive to price, but the ratio is declining. Consumers are shifting from simply buying the cheapest products to seeking the best balance between price, quality and experience.

One emerging trend is "quality upgrading", where consumers maintain a value-conscious mindset but demand stronger proof of effectiveness. Spending decisions are increasingly influenced by whether a product delivers visible benefits or better experiences for each yuan spent.

A second trend is localization. The traditional "acquaintance economy", built around recommendations from family and neighbors — which still matter more to those over 40 years of age — is evolving into a stronger sense of local identity. As county economies develop and local brands gain recognition, consumers increasingly favor products and experiences connected to their communities.

This creates a unique purchasing pattern: awareness may be national, but trust remains local. Short-video platforms and online marketplaces expose consumers to national trends, but final decisions often depend on local reputation, peer reviews and in-store interaction.

For brands, the experience of consumers in counties has become geographically divided. Marketing can come from anywhere, but trust still needs to be built nearby.

Companies approaching county markets as a single category risk missing important differences. NIQ identified three major divisions shaping consumption behavior: generation, family structure and regional economic characteristics.

Younger consumers in counties increasingly resemble their urban peers. Consumers under 30 show stronger interest in aesthetics, technology and new experiences, creating opportunities for brands that can bring fresh products and trends to smaller markets.

Older consumers, particularly those above 40, place greater emphasis on reliability, practicality and trusted relationships. Their purchasing decisions are often shaped by previous experiences and local networks.

This means companies may need two separate strategies within the same county market: one designed to attract younger consumers through innovation and novelty, and another focused on building repeat purchases among older customers through service and trust.

Household structure also matters. According to NIQ, compared with large cities, counties generally have higher marriage rates, more families with children and larger living spaces. Consumption decisions are therefore often made around households rather than individuals. Large-capacity appliances, bulk household goods and practical products can outperform premium offerings that rely only on status or branding.

Geography creates another layer of complexity. The gap between two counties can sometimes exceed the difference between a county and a nearby city. Industrial strengths shape local consumption ecosystems. For example, in Zhejiang province, Yiwu's global trading economy, Cixi's appliance manufacturing base and Dongyang's film tourism sector each create different consumer environments.

County markets are therefore not one market, but hundreds of distinct regional economies.

Many brands have struggled in counties because they treated expansion as a simple transfer of urban discount strategies. Consumers in counties are not rejecting higher-quality products; they are rejecting products that fail to match their daily needs.

In fast-moving consumer goods, NIQ estimates county markets account for 43.1 percent of national FMCG consumption. Annual growth reached 2.5 percent, compared with 0.5 percent in tier-1 and tier-2 cities.

Discount snack chains illustrate the competitive intensity. More than 13,000 new stores opened in 2025, with nearly half located in counties, while 6,895 stores closed. The market is entering a filtering phase where only operators capable of responding quickly to local demand will survive.

Success requires three capabilities: speed in adopting national trends, accuracy in matching local preferences and decisiveness in securing distribution space.

The same logic applies to durable goods. According to NIQ, in 2025, lower-tier technology-related durable goods reached 700 billion yuan and represented 67.1 percent of offline retail sales. Demand is concentrated around practical upgrades — larger televisions, refrigerators and washing machines that fit bigger homes.

Price differences reveal consumer priorities. Appliance price gaps between urban and county markets can reach 40 to 50 percent, reflecting consumers' focus on functional value. For smartphones and headphones, where social visibility matters more, the gap is often only 10 to 20 percent.

For companies, the future of consumption in counties will not be built by offering a cheaper version of urban products. Instead, it will require redesigning products and services around local lifestyles.

Snack retailers maximize growth potential

By WANG ZHUOQIONG

Busy Ming Group Co Ltd has become the first leisure snack and beverage chain in China to surpass 30,000 stores, indicating the rapid expansion of the discount snack retail sector amid expanding county-level penetration.

The Changsha, Hunan province-based company said recently that its signed store network exceeded 30,000 as of July 20. The category has grown from neighborhood snack outlets into a nationwide retail channel.

Busy Ming operates two major brands: "Busy For You", founded by Yan Zhou in Changsha, Hunan province, in March 2017, and "Super Ming", founded by Zhao Ding in Yichun, Jiangxi province, in January 2019.

The two businesses merged in November 2023 to form Busy Ming Group, combining their store networks, procurement capabilities and regional reach.

The company's expansion follows its listing on the Hong Kong stock exchange in January. For 2025, Busy Ming reported gross merchandise value of 93.57 billion yuan ($13.86 billion) and adjusted net profit of 2.69 billion yuan, signaling performance that the company attributed to improved inventory efficiency and a rising contribution from multi-store franchise operators.

CITIC Securities said the discount snack sector remains in an early growth phase, with hard-discount retail formats demonstrating resilience through economic cycles. Leading snack discounters still have more than 50 percent store-opening potential, while future growth will depend on category expansion, private-label development and store-format optimization.

According to the 2026 China Chain Store Top 100 ranking released by the China Chain Store & Franchise Association on June 15, based on 2025 sales, Walmart China ranked first with sales of 195.86 billion yuan, followed by Freshippo, Alibaba's grocery chain, with 107 billion yuan. Busy Ming ranked third with sales of 93.57 billion yuan, making it the only non-supermarket and non-membership retail specialist among the top five companies.

The country's fast-moving consumer goods market is also undergoing structural changes as consumers become more focused on value, said the 15th China Shopper Report 2026.

Jointly released by Worldpanel by Numerator and Bain & Company, the report found that while many traditional offline retail formats remained under pressure, two offline channels continued to grow. Snack collection stores expanded rapidly, particularly in lower-tier cities, while discount stores gained traction among consumers seeking affordable everyday essentials and bulk purchases.

For Busy Ming, the snack retail segment has evolved beyond a fragmented consumer category into a large-scale distribution network linking manufacturers, logistics infrastructure and millions of consumers.

The company now operates across all provincial-level regions in China, covering more than 1,400 county-level markets. By the end of 2025, about 60 percent of its stores were located in counties and towns, while more than 65 percent were in third-tier or smaller cities.

The expansion reflects a broader shift in the country's retail landscape, with discount-oriented chains increasingly targeting lower-tier markets rather than competing solely for mature urban consumers. These areas offer significant growth potential as consumers seek branded products at lower prices.

The company's operating model relies on direct sourcing from manufacturers, large-scale procurement and a nationwide logistics network. The company said its warehouses are designed to serve stores within a 300-kilometer radius with 24-hour delivery cycles.

The model has helped reduce inventory turnover to about 12 days. According to Frost & Sullivan, Busy Ming's average product prices were about 25 percent lower than comparable products sold through traditional offline supermarkets by the end of 2024.

The company's products include bakery items, biscuits, nuts and seeds, puffed snacks and instant meals, deli snacks, confectionery, chocolates and preserves, and beverages.

Beyond supply chain efficiency, discount snack operators are increasingly using consumer data to shape product development. At Busy Ming, customized SKUs — stock keeping units — account for more than 30 percent of its product assortment. The company generally requires each store to maintain a minimum of 1,800 SKUs.

The company has expanded its offerings through smaller packages and frequent product launches aimed at lowering trial costs for consumers. The approach reflects a shift from traditional retail, where suppliers largely determined product selection, toward a model driven by consumer demand and data analysis.

World's largest graveyard of whales found

Nearly 7,000-m-deep seafloor covered with over 5.3 million years of remains

By **LI MENGHAN**
limenghan@chinadaily.com.cn

At nearly 7,000 meters below the surface of the southeastern Indian Ocean, an international research team led by Chinese scientists has discovered the deepest and largest whale graveyard ever recorded — a 1,200-kilometer stretch of seafloor littered with whale remains that have accumulated over at least 5.3 million years.

The discovery indicates that the region has been a vast resting place for whales since the early Pliocene epoch, about 5.3 million years ago. It contains both active whale falls, where sunken carcasses support communities of deep-sea organisms, and hundreds of fossilized whale skeletons.

The study was conducted by researchers from the Institute of Deep-sea Science and Engineering of the Chinese Academy of Sciences in Hainan province, the University of Pisa in Italy and Earth Sciences New Zealand. It was published in the journal Nature on June 10.

The researchers used the *Fendouzhe* manned submersible aboard the research vessel *Tansuo 1* to conduct 32 dives in early 2023 in the Diamantina Zone, a seafloor fracture zone stretching about 1,200 km parallel to the Southeast Indian Ridge. They documented five active whale falls and 476 sites containing fossilized cetacean remains along the corridor.

A whale fall occurs when a whale dies and its carcass sinks to the seafloor. The remains can become the center of a rich ecosystem, providing food and shelter for deep-sea organisms for years or even decades.

The deepest known whale fall had previously been recorded at a depth of 4,204 meters in the southwest Atlantic Ocean. Little was known about whale-fall ecosystems below 6,000 meters, while the fossil record of whales that dive to such depths was largely unknown.

The deepest active whale fall identified by the team was found at 6,789 meters and consisted of three vertebrae from a beaked whale. The discovery extends the known depth range of whale-fall ecosystems by more than 2,500 meters.

The whale bones were covered with dense white mats of microorganisms and bone-eating worms, suggesting that they had remained exposed on the seafloor for a long time.

"We did not set out to find whale falls or fossils, so this discovery was a wonderful surprise," said Peng Xiaotong, a researcher at the institute and the study's first and corresponding author.

"But that is precisely the significance of hadal exploration — we are entering the most unknown ocean regions on this planet, and any extraordinary discovery could happen," Peng said.

The expedition was part of the Global Hadal Exploration Programme, a 10-year initiative under the United Nations Decade of Ocean Science for Sustainable Development. Led by the institute, the program focuses on the hadal zone, the deepest parts of the ocean, generally below 6,000 meters.

Analysis of 43 fossil specimens identified five species of beaked whales and one species of baleen whale. The specimens included two species that still live in the southeastern Indian Ocean today and two extinct genera previously known only from fossils collected by trawlers off South Africa.

The researchers said the unusually high concentration of whale remains may be linked to the region's importance as a habitat for beaked whales. Some species are known to make extremely deep dives and may die when they exceed their physiological limits.

Dating of 33 fossil bones showed that they ranged from 5.26 million to 120,000 years old, confirming that whale-fall events have occurred in the region since the early Pliocene era, about 5.3 million years ago.

The area's V-shaped seafloor may also help carcasses collect at the bottom, while the extremely slow buildup of sediment allows whale bones to remain exposed on the seafloor for long periods instead of being quickly buried.

Based on an observed density of 759.5 whale remains per square kilometer, the researchers estimated that the area could contain more than 10 million whale and other cetacean carcasses.

They estimated that the whale remains collectively store about 6.7 million metric tons of carbon, equivalent to roughly 4,700 years' worth of organic material that normally sinks from surface waters to the seafloor in the region.

Stephen Godfrey, a researcher at the Calvert Marine Museum in Maryland in the United States, wrote in a commentary accompanying the study that the discovery "can be compared to many milestone discoveries in the history of deep-sea exploration" and represents "a unique and major breakthrough".

Zhou Peng, an assistant research fellow at the institute, highlighted the important role of the *Fendouzhe* manned submersible in the research.

The manned submersible allowed scientists to observe the seafloor directly and make real-time decisions about which specimens to collect, Zhou said.

"The manned platform provided by *Fendouzhe* opened up unprecedented space for this research and served as the key support behind the breakthrough results," he said.

School delivery

Fossil shows reptile species' aquatic transition

By **YAN YUJIE** and **LI YINGQING** in Kunming

Chinese scientists have identified a 244-million-year-old reptile fossil from Southwest China's Yunnan province as the earliest known archosauromorph that was highly adapted to life in water, providing the first clear evidence that some early members of the evolutionary group had become almost completely aquatic.

The newly identified reptile, named *Austronaga*, challenges the long-held view that early archosauromorphs — a broad group that later gave rise to crocodiles, dinosaurs, pterosaurs and birds — were predominantly land-dwelling, with previously known aquatic members only partly adapted to life in water.

The study, led by Li Chun, a researcher at the Institute of Vertebrate Paleontology and Paleoanthropology of the Chinese Academy of Sciences, was recently published in Science Advances.

The findings shed new light on when archosauromorphs began moving into aquatic environments and suggest that the return of reptiles to the water after the end-Permian mass extinction was more widespread among different reptile groups than previously known.

Researchers studied exceptionally well-preserved *Austronaga* fossils discovered in the Luoping biota in Yunnan. A detailed examination of the skeleton revealed a series of features indicating that the animal was highly adapted to life in water.

Its forelimbs were considerably longer than its hindlimbs, with the upper arm bone more than twice the length of the thigh bone. Its greatly reduced hindlimbs would have made movement on land difficult, said Wang Wei, first author of the study.

Its hands and feet were also enlarged and had more toe and finger bones than expected. The outermost bones were reduced and lacked claws, forming flipper-like limbs similar to those seen in other marine reptiles, including ichthyosaurs, plesiosaurs and sea turtles.

By comparing the proportions of its limbs with those of a wide range of living and extinct aquatic animals, the researchers found that *Austronaga* fell within the range of animals that are fully dependent on aquatic environments.

"This suggests that it had almost completely abandoned life on land, making it the earliest known highly aquatic archosauromorph," Wang said.

The fossil also preserves exceptionally rare traces of soft tissues, including the stomach, liver and intestines. By examining the fossil under both natural and ultraviolet light and conducting elemental analysis, researchers were able to identify the locations of these organs.

An artist's impression of an *Austronaga* that lived about 244 million years ago. PROVIDED TO CHINA DAILY

Partially digested fish scales were found in the large intestine, providing direct evidence that *Austronaga* fed on fish. Together with its highly specialized limbs, the finding suggests that the reptile was an active aquatic predator well adapted to swimming, according to the study.

The discovery fills a major gap in the early evolutionary history of archosauromorphs. No fully aquatic members of the group had previously been confirmed, and the fossil pushes the group's known adaptation to aquatic environments back to about 244 million years ago.

It also adds an important piece to the evolutionary history of Tanysauria, the reptile group to which *Austronaga* belongs. According to Wang, Tanysauria is now the only known reptile lineage to include land-dwelling, semi-aquatic and highly aquatic members.

This provides an unusually complete sequence for scientists to study how reptiles gradually adapted to life in water.

The findings also suggest that archosauromorphs played a role in the recovery and restructuring of aquatic ecosystems following the end-Permian mass extinction.

The research team said the discovery raises broader questions about whether different reptile groups that moved into aquatic environments during this period were responding to similar environmental pressures and developed similar adaptations for living in water.

Soccer games give Sino-US ties a leg-up in Xinjiang

By **FANG AIQING** and **MAO WEIHUA** in Urumqi

A group of Chinese and US teenagers played two friendly soccer matches at Urumqi No 23 Middle School in the regional capital of Northwest China's Xinjiang Uygur autonomous region over the weekend, competing hard while having fun and forging new friendships.

The China (Xinjiang)-US (California) Youth Football Friendship Match was co-hosted by the China Council for the Promotion of International Trade Xinjiang Council, the regional sports bureau and the Sino-American Aviation Heritage Foundation. The US nonprofit, founded in 1998, honors the Flying Tigers, the US air unit that fought alongside Chinese forces against Japanese aggression during World War II.

On Saturday, a visiting squad of players aged 14 to 16 from Pico Rivera, California, took on their Urumqi hosts and lost 1-2. The following day, they faced a team from Tacheng prefecture in Xinjiang, drawing 4-4 at full time before winning 3-2 in a penalty shoot-out.

Luis Palacios, 14, scored three goals in Sunday's match.

"It was a tough game, but fun," he said. Asked if he felt intimidated by the older opponents, he replied: "I'm never afraid. I always play against older people in the US. I'm small, so I play bigger people than me and I'm used to it."

His teammate Israel Antonio Echeverria said: "It's truly a blessing to be here, playing the sport I love. Some of these (local) players are gonna for sure make it far."

Nurzhul Telek, 17, from Tacheng, scored twice on Sunday. It was his first time facing a foreign opponent.

"They're very competitive — you can tell they have solid training behind them," he said. What inspired him most, however, was their relaxed and flexible style of play, as well as the individual creativity each player brought to the pitch.

Several local players filled in as substitutes for the US team. Some spoke English, while a translator helped during water breaks off the pitch. On the field, however, the players relied mostly on gestures, with communication flowing naturally.

"For us, not even knowing each other, not even speaking the same language, it was a great result and great cooperation," said Pablo Salazar, 23, coach of the US squad. "Soccer is a beautiful sport. It allows us to come together — it almost feels like we're speaking the same language because we're all playing the same sport, and it's played worldwide."

After Sunday's game, players from the two sides swapped jerseys. The Pico Rivera delegation also played in Changsha, Central China's Hunan province, before arriving in Xinjiang.

> "The friendships they created will last a lifetime. And if one of them is in need, they'll definitely have the help of their friends across the Pacific."
>
> **Erik Lutz,** a council member for the city of Pico Rivera in the United States

This year marks the 85th anniversary of the Flying Tigers' arrival in China. Officially known as the American Volunteer Group of the Chinese Air Force, the unit was formed in 1941 by US General Claire Lee Chennault. More than 2,000 Flying Tigers airmen perished in the war, while Chinese people rescued more than 200 pilots at the cost of thousands of their own lives.

"The spirit of the Flying Tigers is about two peoples working together through tough times," said Erik Lutz, a council member for the city of Pico Rivera and a representative of the foundation. "And that legacy is represented behind us on this soccer field — this young generation of boys and girls playing. The friendships they created will last a lifetime. And if one of them is in need, they'll definitely have the help of their friends across the Pacific."

Jeffrey Greene, chairman of the foundation, said the shared Flying Tigers legacy underscores the importance of US-China cooperation today.

Over the past six weeks, the foundation has brought more than 200 US students to 25 Chinese cities in three groups, with Urumqi as the final stop. Greene said they plan to bring as many next year, if not more, and are also beginning to take Chinese students to the US.

Liu Teng, vice-president of the China Council for the Promotion of International Trade Xinjiang Council, said the matches have built a new bridge for people-to-people exchanges between Xinjiang and California. He added that the council plans to co-host the second China-US Flying Tigers Friendship and Cooperation Forum with the foundation later this year.

Zhu Changchang and Zhang Shuqin contributed to this story.

PLA Navy's crucible of future warship leaders

For almost four decades, the *Zheng He* has served as an operational classroom and floating instrument of China's maritime diplomacy

The *Zheng He* ship sails during a voyage to Vietnam, Malaysia and Indonesia last year.

By **ZHANG XIAOMIN**
in Dalian, Liaoning
zhangxiaomin@chinadaily.com.cn

As the sun sets at a naval port in Dalian, Northeast China's Liaoning province, the massive hull number "81" gleams along the side of the *Zheng He*, an oceangoing vessel operated by the People's Liberation Army Dalian Naval Academy.

The number "81" is no ordinary designation. It serves as a direct tribute to Aug 1, 1927 — the date of the Nanchang Uprising that marked the founding of the PLA. Commissioned in 1987 as China's first purpose-built, indigenously designed Type 679 training ship, the 132-meter-long, 5,000-metric-ton vessel serves as the operational crucible for China's modernizing surface fleet.

The ship belongs to the Dalian Naval Academy — established in 1949 as the PLA's first formal naval school and widely regarded as the nation's premier training ground for surface warship commanders. While the *Zheng He* is primarily dedicated to the at-sea practice of officer midshipmen, its mission extends well beyond officer candidates. With 18 living quarters and four activity areas, the ship accommodates up to about 200 cadets at a time, providing hands-on operational experience for enlisted technicians, non-commissioned officers and junior midshipmen alike.

In recent days, *Zheng He* deck officer Zhang Zecong was tasked with organizing teaching models and equipment in preparation for the arrival of a new cohort of cadets. Now in his sixth year aboard the *Zheng He*, Zhang carries out his duties with precision.

"I heard plenty about the *Zheng He*'s illustrious history when I was a cadet at Dalian Naval Academy," Zhang said. "It fills me with pride to carry on this ship's fine traditions and contribute to nurturing talent for the PLA Navy."

Named after the legendary Ming Dynasty (1368-1644) imperial envoy who commanded China's 15th-century treasure fleets, the *Zheng He* has earned the moniker "talent carrier" for the PLA Navy. Over nearly four decades of service, it has delivered more than 50,000 military professionals. Two out of every three active-duty surface warship commanding officers in the PLA Navy have completed at-sea training aboard its decks, as have more than half of all flag officers and senior fleet commanders.

In addition to its domestic training role, the vessel functions as an instrument of naval diplomacy. The ship has sailed beyond national waters 16 times, traversing all three major oceans and visiting 29 countries and regions across six continents. Its cumulative log exceeds 600,000 nautical miles — equivalent to 27 complete circumnavigations of the globe. Cited as an "Advanced Unit of the PLA" in 2012 and awarded the title "Meritorious Training Ship" in 2015, it holds a unique position in China's maritime development.

From cadet to instructor

For Zhang, the bond with the vessel began in the summer of 2018 during his sophomore year at the academy, when he embarked on a monthlong navigation exercise.

"We encountered a succession of typhoons, and for over 10 days we couldn't make port. Giant waves battered the ship, and my stomach churned," he recalled. "But after that experience, I never got seasick again, and I no longer fear rough seas."

What proved even more transformative was watching the crew maintain composure under pressure. Upon graduation in 2020, Zhang requested and received an assignment back to the *Zheng He*. The transition from trainee to trainer brought a sharp learning curve.

When his first group of cadets came aboard, he tried to pour everything he knew into them, repeating explanations and demonstrations endlessly. But he soon realized that the deluge of information overwhelmed them.

"Over time, I came to understand that teaching isn't about cramming — it's about guiding. You have to progress step by step and tailor your approach to each cadet's ability," he said.

Today, Zhang has evolved into what the PLA Navy terms a "four-in-one" professional: capable of serving simultaneously as a crew member, instructor, combatant and tactical commander.

Passing the torch

Every member of the *Zheng He*'s crew doubles as an educator. Navigation officer Wu Jiahui maintains 17 distinct lesson plans on her workstation, tailoring instructional modules for specific specialties and mission profiles. Rather than drilling formulaic exercises, she forces cadets to evaluate dynamic operational hazards.

"You have to actively engage and guide cadets to think," she said. "They will become combatants and commanders one day, and they must rely on their own exploration and creativity."

Elsewhere on the ship, navigation officer Gao Siyu leads cadets through every compartment to help them memorize equipment layouts, having them draw dozens of detailed piping diagrams by hand. Down in the heat and engine noise, engineering officer Li Hui provides hands-on instruction in machinery diagnostics and emergency repairs.

In the ship's honor room, new arrivals gather to memorize the dying words of the ship's first commanding officer, Feng Zuanshu: "The ship obeys my commands; I obey the Party's commands — guard the seas and defend the motherland!"

Cadet Deng Yuyang said: "The *Zheng He* is a warship with tradition and heritage. I must carry forward and build on that proud legacy."

Technology forward

While the vessel's hull has aged, its internal training infrastructure has undergone constant modernization. Responding to past criticisms that an aging auxiliary ship could not replicate modern combat systems, electrical engineering officer Cheng Bo spent three months fabricating a custom electrical control system model out of discarded components.

Thanks to this new teaching aid, cadets can quickly grasp abstract electrical principles.

"By leveraging technology to break through teaching bottlenecks and moving beyond the limitations of traditional practical training, we ensure that every extra effort we put into instructional support translates into fewer difficulties for our cadets in the future," Cheng said.

In recent years, the ship's classrooms have been upgraded with digital modeling, virtual war-gaming and high-fidelity ship-handling simulators. Trainees now run command drills and situational briefings in replicated sea conditions, learning operational plotting and real-time threat analysis before ever taking command of a front-line destroyer or frigate.

Lin Qiuming, an officer from a unit in Zhoushan, Zhejiang province, who trained aboard the *Zheng He* three years ago, was impressed during a recent return visit by the new ship-handling simulator, a system that replicates control equipment and complex sea environments.

Free from the constraints of weather or range, it allows trainees to conduct command drills and post-training reviews at any time.

"Back then, I could only watch without hands-on practice, so I never felt fully confident. Now, with intelligent equipment for repeated drills, training efficiency and quality have improved dramatically," Lin said.

To hone targeted skills, navigation officer Li Yiming and his team have meticulously designed training "menus" organized by specialty, offering flexible observation and training stops to help cadets quickly familiarize themselves with navigation operations.

Working with other vessels in a flotilla, Li compiled a video database of 119 model training positions across eight categories, including navigation, gunnery, communications and engineering.

During a recent main-engine failure simulation, engineering officer Gu Bin demonstrated why technical mastery alone is insufficient for future commanders. When a cadet asked why engine technicians needed to study fleet tactics while fixing a drive shaft, Gu offered a broader perspective.

"Repair work is not purely technical. It requires contextual decision-making. Sometimes, abandoning a compartment may be the best choice for the overall mission," Gu said. "In the future, you will be responsible for a warship, a formation, a fleet. If your perspective is too narrow, you cannot be a qualified commander."

Floating national territory

In the ship's honor room, a display wall features naval crests from 14 foreign nations, highlighting its role as an ambassador for China's maritime posture. During overseas visits — from Australia to New Zealand and Indonesia — the ship acts as a sovereign outpost, often welcoming overseas Chinese communities and conducting military diplomacy.

Navigation officer Wu often uses this space as the main venue for her ship history lectures, broadcasting live to three classrooms of cadets. The *Zheng He*'s "diplomatic resume" — 16 overseas voyages visiting 29 countries and regions — remains an indispensable topic.

Wu recounted the ship's visit to Australia, saying going abroad teaches self-reflection, not mere admiration of others.

During that visit, she and other representatives from the *Zheng He* toured an Australian amphibious assault ship, which opened its joint operations center to Chinese visitors.

Zhang Zhiyou, an instructor from the academy in Dalian, said: "Overseas visits expand our horizons and also showcase the PLA's image to the world. Our Navy personnel are diplomats in uniform, and we have a duty to tell China's story and amplify China's voice."

During a visit to Indonesia amid local unrest, the ship's interim Party committee decided not only to keep the ship open to visitors as planned but to extend visiting hours and expand reception capacity. One overseas Chinese resident from Jakarta said that seeing the ship from the motherland greatly relieved his anxiety.

In New Zealand, an 80-year-old Chinese expatriate handed out homemade pastries daily to the ship's crew, clasping their hands and saying that seeing them made him see the hope of the motherland.

"Truly, Chinese expatriates living far from home travel great distances to attend our ship's open days, just to set foot on this 'floating national territory', to see their own military personnel and to hear the familiar accent of home," said Wu.

The veteran training ship is preparing once again to slip its moorings, carrying a new class of midshipmen out into open waters.

Wang Zhao contributed to this story.

Taicang reaffirms partnership with training ship

By **ZHANG XIAOMIN**

A delegation from Taicang of Suzhou, Jiangsu province, boarded the Chinese naval training ship *Zheng He* in Dalian, Liaoning province, on July 31 — the eve of the 99th anniversary of the founding of the People's Liberation Army. The visit reaffirmed a city-ship partnership that has endured for over two decades.

"Starting from Taicang, the great Chinese navigator Zheng He set sail on his voyages to the western seas. The *Zheng He* is the first naval vessel named after a national hero," said Wang Yu, mayor of Taicang, who extended her greetings to the officers and men on board, and discussed further cooperation in national defense education and technological collaboration.

The delegation toured the ship's equipment and facilities and gained a detailed understanding of the officers' daily life and training.

"In the hearts of Taicang people, the *Zheng He* is not only a shining 'national business card' but also our firmest support and deepest attachment to the blue waters," the mayor said.

Commissioned in 1987 as China's first independently designed and built oceangoing training ship, the *Zheng He* holds multiple PLA Navy records, including the longest single-voyage distance, the highest operational availability rate, and the most visits to foreign ports. Under the administration of the Dalian Naval Academy, the vessel mainly undertakes the maritime training of naval academy cadets.

The partnership was formalized in 2004, when the Taicang government and the ship signed a co-construction agreement, and jointly inaugurated a national defense science and technology education base.

Over the past 22 years, the two sides have maintained frequent interactions, forging a distinctive path of military-civilian integration characterized by shared resources, complementary strengths and mutual growth.

Cadet Deng Qingwen discovered in the ship's chronicle that all three port calls to Taicang brought unique milestones. The 2011 visit set a precedent for a warship calling on its partner city, while the 2017 call marked the vessel's 30th commissioning anniversary, and the 2025 visit coincided with the 620th anniversary of Zheng He's first voyage.

The visits featured a series of events, including the themed campaign "Carrying forward the Zheng He spirit, contributing to the defense of our vast seas" and community outreach activities supporting local families in need.

Inspired by his findings, Deng volunteered to organize a sharing session for his shipmates and trainees, passing on the stories of the city-ship bond.

For Taicang's 400,000 permanent residents, the ship has become more than a distant symbol. It is a tangible presence. According to local authorities, approximately one-fifth of the city's population has toured the vessel during its open-day events, with many young students citing the experience as an inspiration to join the navy.

"The three visits gave our crew a tangible, close-up view of the nation's rapid development," said Liu Ceng, a veteran crew member who sailed with the ship to Taicang on all three occasions. "Every time we docked, the city felt brand new. Through these changes, I have deeply felt the growing strength and prosperity of our country."

The *Zheng He* officers and crew expressed their gratitude for Taicang's long-standing support and pledged to remain loyal to their mission, strengthen their military capabilities, and deepen the co-construction partnership with the city.

"The connection between Taicang and the *Zheng He* is not merely ceremonial. It is where history set sail, and where its spirit continues to chart the course ahead," the ship's political commissar said.

Wang Zhao contributed to this story.

CULTURAL HERITAGE

Artifacts from the middle phase of the late Paleolithic period found at the Peiligang site in Xinzheng, Henan province.

From hunters to early farmers

New excavations reveal how ancient communities built settlements and developed agriculture, report **Shi Baoyin** and **Qi Xin** in Xinzheng, Henan.

Artifacts from the late phase of the late Paleolithic period, also at Peiligang.

Lying at the eastern foot of Songshan Mountain along the Shuangji River, part of the Huaihe River system, the Peiligang site in Xinzheng, Henan province, was named one of China's top 10 archaeological discoveries of 2025.

"Holding more than 30,000 years of uninterrupted cultural deposits in a single location, Peiligang vividly documents how prehistoric people evolved from nomadic hunter-gatherers into settled farming communities," says Li Yongqiang, head of the Peiligang site excavation project and a researcher at the Institute of Archaeology, Chinese Academy of Social Sciences. "Its landmark discoveries fill major gaps in our understanding of China's prehistoric past."

As the type site of Peiligang culture, the ancient settlement offers vital clues to the emergence of early farming civilizations in China's Central Plains.

Li Yongqiang (right) and his team during excavations at the Peiligang site in Xinzheng, Henan province, in 2025. PHOTOS PROVIDED TO CHINA DAILY

Paleolithic craftsmanship

Although many Paleolithic and Neolithic sites are scattered across the Central Plains, Peiligang's uninterrupted stratigraphy and complete cultural sequence make it an invaluable reference for studying the transition between the two Stone Ages, according to Li.

Large-scale excavations resumed at Peiligang in 2018. Led jointly by the Institute of Archaeology, CASS, and Zhengzhou Institute of Cultural Relics and Archaeology, the project investigates prehistoric settlement patterns and cultural development across the region. In the western section of the site, archaeologists have uncovered a late Paleolithic deposit spanning more than 50,000 square meters and dating from 36,000 to 14,000 years ago. The cultural layer exceeds 8 meters in thickness.

"It marks the first discovery of such a thick late Paleolithic cultural layer in an open-air, non-cave setting on China's plains," says Zhang Jian, deputy director of the Zhengzhou Institute of Cultural Relics and Archaeology.

The earliest phase, dating from 36,000 to 29,000 years ago, featured simple flake stone tools. Between 29,000 and 22,000 years ago, micro-tool technology emerged, marking a major advance in prehistoric tool-making. These finely crafted tools were used for hunting, cutting, and other daily tasks. From 22,000 to 14,000 years ago, wedge-shaped micro-cores became dominant, representing the mature stage of local stone-tool production, Zhang says.

Field technician Yang Junfeng cleans burnt-soil deposits in a pit at the excavation site of Peiligang, in 2020.

The discoveries provide clear evidence of the evolution of prehistoric stone-tool technology. A wide range of artifacts documents the emergence and development of toolmaking, establishing a chronological framework for late Paleolithic remains in the Central Plains.

"Archaeologists also uncovered a complete production chain for ostrich eggshell ornaments, including raw materials, semi-finished artifacts and production waste," Zhang says. "Unlike other sites that yielded only scattered decorative objects, Peiligang has been confirmed as a dedicated workshop for producing ostrich eggshell accessories."

The discovery shows that specialized handicrafts existed in the Central Plains more than 20,000 years ago, he adds. "Ancient artisans had mastered sophisticated processing skills and displayed a clear appreciation for aesthetics."

Neolithic life

"The discovery of the Peiligang culture reveals a mixed farming system combining dryland crops with rice cultivation, proving that more than 8,000 years ago, millet, broomcorn millet and rice — the three staple grains of ancient China — were already being cultivated simultaneously," says Li. "This provides concrete evidence of the origins of the three-grain farming system that later matured during the Yangshao period (5000 to 2900 BC)."

Architecture also advanced significantly during this period. Excavations have uncovered red baked-earth structures, widely regarded as the earliest known examples of this type of architecture in northern China, Li says. "These structures demonstrate that ancient people had mastered fire control and moved beyond temporary shelters for permanent dwellings."

Winemaking is another key discovery. "Wine played an important role in daily life, social exchanges, rituals and funerals," Li says.

Wang Kai, curator at the Zhengzhou Institute of Cultural Relics and Archaeology, says the site comprises interconnected residential areas, cemeteries and handicraft workshops.

"Standardized burial customs had already taken shape. A wine vessel was placed on the right side of the deceased in nearly every tomb, while burial goods reflected different occupations," Wang says.

"Stone grinding slabs were also unearthed, signifying the advent of grinding technology. These implements were employed to process plant seeds, laying the foundation for early agriculture," he adds.

Researchers have also mapped the settlement's overall layout. The evidence suggests that Peiligang had a clear division of labor, social hierarchy and early forms of social stratification 8,000 years ago, according to Li.

Continuous roots

A pottery figurine featuring a human face, fangs and a unique "*jie*-shaped" crown is among the site's most significant discoveries, according to Li.

Gu Wanfa, executive president of the Henan Provincial Institute of Cultural Heritage and Archaeology, says: "The fangs symbolize bravery and strength, reflecting ancient people's admiration for wild animals. The distinctive crown is related to prehistoric astronomical beliefs.

"This view of the universe embodies the ancient philosophy of harmony between humanity and nature, a worldview that shaped China's traditional culture of unity and solidarity," Gu adds.

"Peiligang is an important direct cultural predecessor of the Central Plains' Yangshao culture. Its farming system, baked-earth architecture, settlement planning, burial customs, winemaking traditions, and pottery styles were inherited and further developed by later civilizations," Li says.

Wang, the curator, says, "The complete relics and ruins vividly present early people's production methods, daily customs, spiritual beliefs, and social structures."

Archaeologists have already drawn up detailed plans for future research. A modern greenhouse now covers the excavation area, allowing year-round work regardless of weather conditions. Excavation teams also follow strict procedures, including fine soil screening in key areas.

"No Paleolithic human bones have been found to date, but the continuous cultural layers indicate long-term human occupation," Li says. "Perhaps human bones will be discovered one day. Archaeology is not merely about studying the past; it also cares for the present and connects us with the future."

Ongoing discoveries at Peiligang continue to demonstrate that Chinese civilization possesses deep, continuous roots stretching back thousands of years.

"Growing public interest — especially among young people — is encouraging more people to learn about cultural origins, protect heritage sites, and share archaeological stories. This helps strengthen cultural inheritance and enrich our shared spiritual legacy," Li adds.

"Major finds like those at Peiligang help more people realize that our civilization is ancient, deeply rooted, and continuous. That is archaeology's greatest value today."

Shanxi show explores millennia of painted pottery art

By **ZHU XINGXIN** in Taiyuan and **ZHOU HUIYING**

This summer, visitors to the Shanxi Archaeological Museum in Taiyuan can journey back thousands of years through a special exhibition that explores the origins of painted pottery and the early development of Chinese civilization.

Running through Sept 30, *Blossoming in Xiyin: Prehistoric Painted Pottery of the Fenhe River Basin* brings together 137 groups of artifacts that trace the evolution of painted pottery in the Fenhe River Basin from roughly 7,000 to 4,000 years ago.

The exhibition marks the centenary of the excavation of the Xiyin site, where archaeologist Li Ji led China's first independently conducted scientific archaeological excavation in 1926, laying the foundation for modern Chinese archaeology. Among the highlights are important discoveries from the third excavation of the site, many of which are being displayed publicly for the first time.

Zheng Yuan, deputy director of the Shanxi Provincial Institute of Archaeology, says: "The large number of pigment palettes, grinding tools and grindstones discovered in 2025 provides valuable new evidence for studying prehistoric painting techniques."

She says the exhibition also shows painted pottery unearthed across Shanxi during the 14th Five-Year Plan period (2021-25), which offers a comprehensive picture of how painted pottery developed in the Fenhe River Basin over three millennia.

"About 7,000 years ago, communities settled on the loess terraces, shaping clay and extracting minerals to make pigments," says Wu Zhuozhuo, a staff member at the institute. "The open-mouthed, flat-bottomed bowl from the Zaoyuan site in Yicheng county is the earliest painted pottery discovered in Shanxi, distinguished by a broad red band around its rim."

During the Dongzhuang phase of the early Yangshao culture, geometric decoration became increasingly sophisticated, with motifs such as opposing triangles and curved-edged triangular patterns emerging.

Between 6,000 and 5,300 years ago, painted pottery reached its artistic peak. Floral, bird and fish motifs became widespread, reflecting both technical skill and aesthetic refinement. Among the standout pieces is a high-ring basin from the Xiyin site decorated in black, red and white.

An exhibition in Taiyuan, Shanxi province, explores the origins of painted pottery and the early development of Chinese civilization.
PHOTOS BY ZHU XINGXIN / CHINA DAILY

Another highlight is a fish-patterned basin from the Cujiahe site in Xiaxian county, featuring two fish joined head to tail in a remarkably lifelike composition — a rare design, Wu says.

About 5,300 years ago, painted pottery began to decline in both quantity and decorative complexity. Instead of serving as everyday household ware, it gradually became associated with ritual and ceremonial practices, appearing mainly in elite burials as symbols of status and social hierarchy.

"By the second Miaodigou phase and the Taosi period, painted pottery had largely disappeared from daily life," Wu says. "Most ordinary vessels were made of gray pottery, while painted pottery became closely linked to ritual activities and high-status tombs."

The exhibition also includes artifacts from museums in the Inner Mongolia autonomous region and Hebei province, highlighting extensive cultural exchanges between the Fenhe River Basin and the central and southern regions of Inner Mongolia, as well as northern Henan province and southern Hebei during the Yangshao period.

Archaeologists believe the finely crafted vessels were probably not everyday household objects but were instead created for ceremonies, religious rituals and other significant communal occasions.

A miniature diorama on show re-creates a typical middle Yangshao settlement. It depicts a community protected by inner and outer moats and divided into residential, workshop and livestock areas. It illustrates how people made pottery, raised silkworms, farmed, fished, and hunted. Smaller buildings served as homes, while larger structures were likely used for communal gatherings and rituals. "The model is not a reconstruction of the Xiyin site itself," Zheng says. "It is based on our broader understanding of Yangshao society."

CULTURE

Artists from around the world are focusing on ancient architecture in Shanxi province. Featured works include Yungang Grottoes (left) by Shanxi-based Qin Zhizhen (far left), Jinci Temple (above) by German artist Anja Nolte (far right), and Foguang Temple (right) by Indonesian student Veldesen Yaputra. PHOTOS PROVIDED TO CHINA DAILY

Ancient architecture through a new view

Exchange program gathers artists who see China's structures with fresh eyes, using various media to capture their own perspectives, **Bai Shuhao** reports in Taiyuan.

Beneath the shade of a towering tree, Veldesen Yaputra paused over his sketchbook. The Indonesian architecture student at Tsinghua University had come to Foguang Temple in Xinzhou, Shanxi province, determined to paint its Tang Dynasty (618-907) main hall, one of China's oldest surviving wooden structures. Instead, the tree became his biggest obstacle.

The hall sits halfway up a hillside, with only a narrow courtyard in front. No matter where he stood, the perspective never felt quite right. Branches obscured parts of the roofline, making it nearly impossible to capture the building in a balanced composition.

Nearby, Qin Zhizhen, a Shanxi-based illustrator who has spent the past four years documenting the province's historic architecture, watched quietly.

"Forget drawing every branch exactly as it appears," he told Yaputra. "Loosen the tree. Let it breathe."

Yaputra followed the advice, then added an idea of his own. While painting the ground in front of the temple, he scooped up a handful of soil and mixed it into his watercolor, using the earth itself as pigment.

By the end of his seven-day journey across Shanxi, he realized something had changed.

"My drawings became much more relaxed," Yaputra says. "I could clearly feel myself letting go."

The sketches were done during the second Discovering Shanxi's Ancient Chinese Architecture international cultural exchange program in July, which brought artists from several countries to some of China's best-preserved heritage sites in Shanxi, including the Yungang Grottoes in Datong, Foguang Temple, the Yingxian Wooden Pagoda in Shuozhou, and the Hanging Temple in Datong.

This was Yaputra's second visit to Shanxi.

The first time, he traveled south from Taiyuan, taking in the province's architectural heritage from what he described as "a broader perspective". On this year's journey, he headed north instead, allowing him to slow down and study individual buildings in greater detail.

While Yaputra found himself drawing more liberally, Qin discovered something else by watching the other artists.

His fascination with architecture began not in China but in Europe, inspired by landmarks such as the Eiffel Tower in Paris and Tower Bridge in London. Eventually, however, his attention turned to home, beginning with Jinci Temple near his grandmother's house in Taiyuan.

His illustrations are so meticulously detailed that viewers often compare them to architectural blueprints.

"I mainly try to document buildings objectively. An illustrator is usually expected to bring more personal expression," he explains.

That contrast became especially clear when he watched German illustrator and new media artist Anja Nolte at work.

Where Qin favored precise lines and carefully measured proportions, Nolte embraced bold colors and expressive brushstrokes.

One of her favorite architectural details was the ornamental roof creatures perched along Foguang Temple's ridgeline. With dragon-like heads and fish-shaped bodies, they are rooted in Chinese mythology.

"They're beautiful," she says. "There's something almost fairy-tale-like about them."

She compared them to the gargoyles found on Gothic cathedrals in Europe, which channel rainwater away from buildings, but found their Chinese counterparts far more imaginative.

In another sketch, she transformed an incense burner at Huayan Temple in Datong into a playful cartoon character with arms, legs and a gourd balanced on its head.

A stone lion at Jinci Temple glowed in warm orange watercolor. Even Buddhist statues appeared softer and less solemn through her brush.

"I found it very challenging to capture such richly detailed architecture in a drawing," she says.

Her solution was to deliberately leave blank spaces, which "allow the viewer's imagination to complete the image", she says.

Qin admired that confidence.

Western artists, he says, often seem more willing to break conventions and prioritize expression over precision.

He, by contrast, constantly worries whether the colors are accurate and whether every architectural detail has been faithfully reproduced.

Perhaps, he suggests, it comes from growing up surrounded by these monuments. "There is a kind of reverence."

He has also noticed another difference. Chinese artists often emphasize the relationship between architecture and the surrounding landscape, while artists like Nolte are more likely to isolate a single architectural detail.

The same instinct appears in the photographs of Fabio Nodari, an Italian photographer who has lived in China for a decade.

When the group visited the Yingxian Wooden Pagoda under gray skies and steady rain, Nodari chose not to photograph the entire structure. Instead, he focused on smaller details, using a longer focal length.

To him, those details reveal the resilience of the ancient wooden tower, which has survived wars, natural disasters and centuries of exposure.

Standing before the pagoda, Nodari imagines the anonymous artisans who carved its statues and assembled its timber frame.

"They had families, problems, ambitions, good days, and difficult days," he says.

"Perhaps one craftsman added something personal, made a small decision after a difficult day, or simply tried to do the best work possible because he was proud of what he was creating.

"That's why I always look carefully at the details. We may never know the answers, but those details connect their lives with ours."

His advice to visitors is equally simple: look beyond the postcard view.

One of his favorite photographs shows a lone visitor standing before a colossal Buddha at the Yungang Grottoes.

"A small human figure beside an enormous statue communicates its scale far better than a photograph of the monument alone," he says.

After 10 years in China, Nodari now spends more time in the country than in Italy.

Photographing Italy, he says, means working within a visual language he already understands. China still asks him questions.

"I have to research the history and understand why a building or sculpture looks the way it does," he says.

Every province feels like a different cultural world. That sense of continual discovery is what has kept him in China.

For Qin, the journey marked the beginning of a new experiment.

Back in his studio, while drawing Shanhua Temple in Datong, he began combining colored pencils with marker pens, wondering whether richer materials might better capture the texture and warmth of China's ancient architecture.

Finnish designer helps make modernism more humane

HELSINKI — At Paimio Sanatorium in southwestern Finland, long patient wings reach toward the sunlight amid a pine forest while terraces once allowed tuberculosis patients to rest outdoors. Inside, washbasins are shaped to soften the sound of running water and leather-covered door handles are designed to feel warm and prevent patients' sleeves from getting caught.

Completed in 1933, the sanatorium is among 13 buildings and complexes designed by renowned Finnish architect Alvar Aalto (1898-1976) and his collaborators, which were recently inscribed on the UNESCO World Heritage List as the "Aalto Works".

From its overall layout to its smallest fittings, Paimio was designed around the patients — an expression of Aalto's belief that buildings should care for the people inside them.

The inscription has drawn renewed attention to how he made modernism more humane, rooted in its surroundings and relevant to everyday life, says Panu Savolainen, professor of architectural history and conservation at Aalto University.

Modernism spread across Europe in the early 20th century, offering efficient and affordable solutions to rapid urbanization and to housing and public facility shortages.

But its pursuit of function and efficiency could also produce practical yet impersonal buildings, Savolainen says. Aalto retained modernism's functional principles while softening its harder edges through closer attention to the human experience.

Savolainen believes the Paimio Sanatorium marked a turning point. Designed with unusual attention to the experiences of patients, the complex explored how architecture could support both physical comfort and emotional well-being long before the "patient experience" became an established concept.

Aalto carried the same concern when designing homes and industrial communities.

Paimio Sanatorium in southwestern Finland is one of the iconic works by Finnish architect Alvar Aalto (1898-1976). XINHUA

At the Sunila Housing Area in Kotka, southeastern Finland, residential blocks follow the terrain and are positioned to make use of sunlight, clean air and the surrounding landscape.

Aalto's buildings also create a two-way relationship with nature: architecture adapts to the landscape while the landscape is invited indoors.

Villa Mairea in Pori, western Finland, offers one of the clearest examples of this concept. His design preserved much of the original woodland around the house. An unpolished gravel path leads through the trees to a low, understated building clad partly in vertical timber. From a distance, it seems to have grown out of the forest.

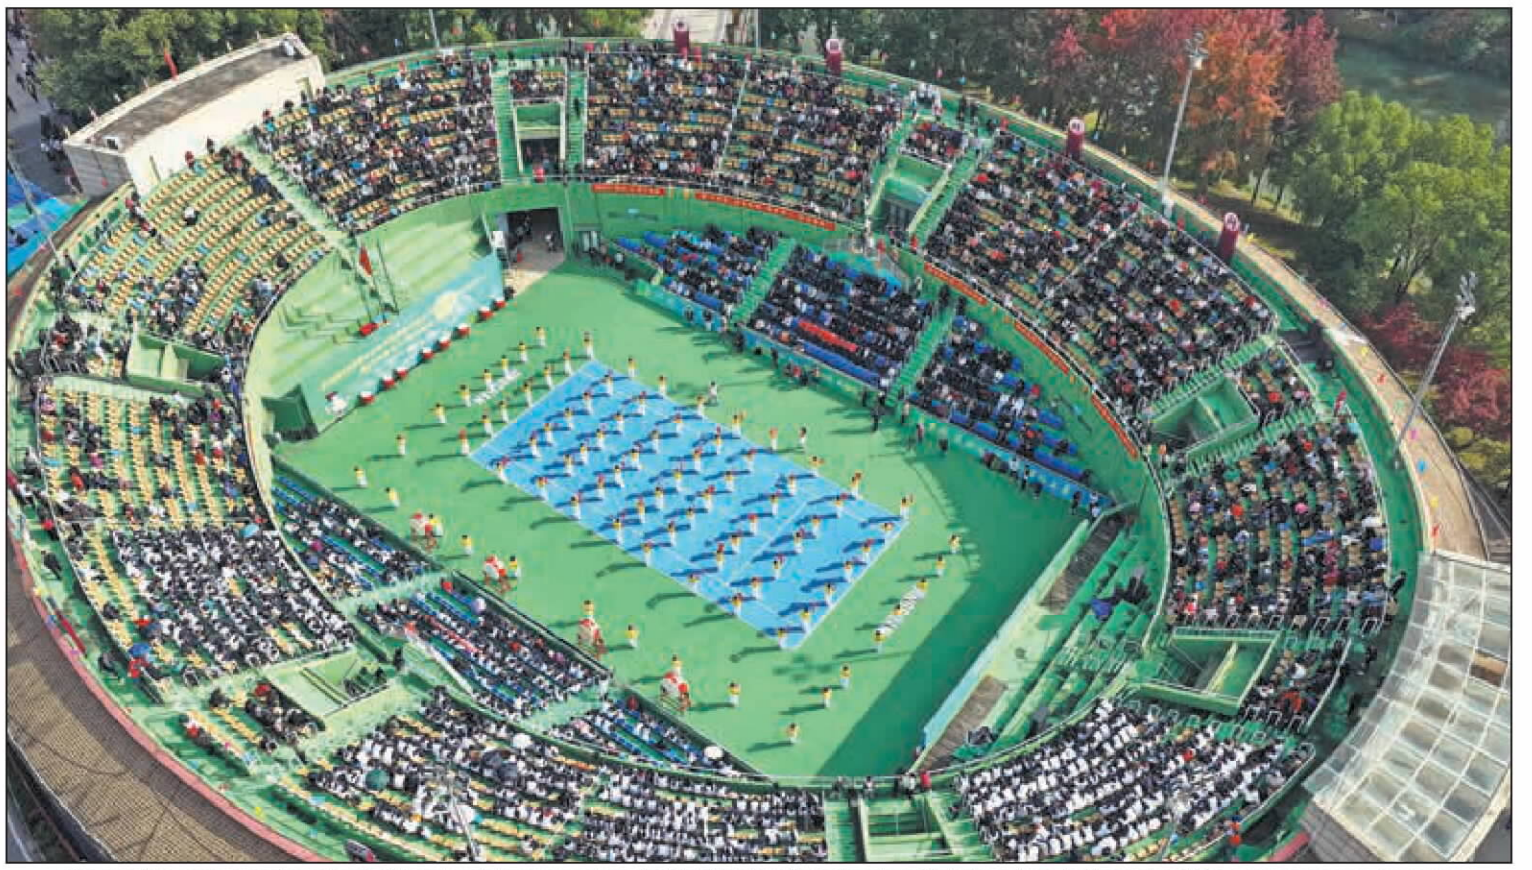
Aalto absorbed the international language of modernism without simply copying it. Concrete, glass and straight lines remained, but wood, brick, stone, and curves allowed his buildings to respond to Finland's climate, landscape and building traditions.

His work demonstrated that architecture could be international without losing its roots, Savolainen concludes.

Over the past decades, Aalto's architecture and design have become a cultural calling card for Finland, helping shape international perceptions of Finnish design, says Yang Xinyi, head of Finnish language studies at Beijing Foreign Studies University.

"In China, many people may not know Aalto by name, but they have probably encountered his influence," Yang says, citing streamlined glass vases, three-legged stools and the pale interiors commonly known as "Nordic style".

Yang also sees parallels between Aalto's respect for nature and the traditional Chinese ideas of following nature and pursuing harmony between humanity and the environment. For Yang, these parallels show how civilizations rooted in different landscapes and cultures can arrive at a shared understanding of how people should relate to their surroundings.



"Aalto's work reminds us that architecture should respect the land beneath it and respond to the people within it," she says.

LIFE

The opening ceremony of a national village tennis tournament was held at Wenfeng Park, Jingshan, Hubei province, in November 2025. PHOTOS PROVIDED TO CHINA DAILY

Tennis serves up success in Hubei

With 356 courts and a strong culture in the sport, Jingshan draws millions and hosts international tournaments, as well as fostering passion in its residents, **Xing Wen** and **Liu Kun** report.

Shanghai resident Zhang Mengting has just returned from a two-and-a-half-month stay in Jingshan, Hubei province. She's already counting down the days until she can go back.

This county-level city of fewer than 600,000 people has built 356 tennis courts, turned the sport into a civic religion, and drew 3.5 million visitors in 2025 alone.

In May, fresh from resigning from her job to take a gap year, and armed with only a handful of beginner tennis lessons from Shanghai, Zhang packed her bags and headed for Jingshan on a friend's advice that two months of intensive training in this tennis-obsessed city would outperform two years of weekly lessons in Shanghai.

During her stay, she would rise at 8 am and join a group class for three hours of training. Afterward, she'd find a local restaurant for lunch and order the regional specialty, Songziji, the local free-range chicken stir-fry.

After a midday nap, she'd return for another three-hour session in the afternoon.

Evenings were reserved for playing with friends at Wenfeng Park, where a prime-time court costs just 30 yuan ($4.4) an hour, and daytime slots are completely free.

"After playing, I'd take a walk in the park, sample snacks in the nearby night market, and enjoy the evening breeze. It was so relaxing," she recalls, adding that she is planning to go back to Jingshan with her husband during the National Day holiday in October.

She says that unlike Shanghai, where arranging a practice session requires greater time and financial commitment, in Jingshan it is very accessible and affordable.

"Almost every government department has its own tennis court, and they are open to the public for free," she explains.

"The city is small, and the courts are concentrated. It takes no more than 10 minutes to get to any of them. The locals are incredibly warm. It's common for strangers to share courts and invite each other to play."

She adds that at some local tennis clubs, members treat the venue as a full-fledged social hub, complete with tea, billiards, and lively conversation between sets.

Above: Jingshan city frequently hosts tennis tournaments ranging from grassroots-level to professional competitions. **Below:** A street sign in the city reads, "Tennis culture is in Jingshan".

Peng Jufang, 64, runs such a club. He was among the first generation in the city to pick up a tennis racket.

"In 1985, Hubei province required each county to select one sport for elderly residents to develop as a priority. Jingshan chose tennis," he recalls.

At the time, there was an open plot behind the urban power supply office where Peng worked.

He and a few colleagues first leveled the ground with a plow, then compacted it with a stone roller to create a simple clay court.

On that very court, a group of senior tennis enthusiasts practiced and trained together daily, eventually winning the amateur group championship at a provincial senior tennis open. That victory introduced tennis to a wider population across Jingshan.

With a wooden racket in hand, Peng began a 38-year commitment to the sport.

His career path shifted over the decades, from the power supply office to fertilizer distribution, and later to beef cattle farming.

Yet through every change, his racket stayed with him.

The same decades witnessed Jingshan's tennis evolution toward scale and systematization.

In the 1990s, the city's amateur sports school introduced tennis programs to cultivate young talent. After 2008, Jingshan made a concerted push to bring tennis into government offices, communities, businesses, schools and villages, spurring court construction and drawing large numbers of residents into the sport. Today, more than 100,000 people in Jingshan play tennis on a regular basis, according to Luo Nian, deputy director of the Jingshan culture and tourism bureau.

Luo adds that Jingshan has also built an industrial park to house smart production lines for tennis balls and rackets, continuously expanding the industry chain across equipment manufacturing, tournament operations, and wellness tourism.

The 2025 Jingshan Open, held from Sept 20 to 28 last year, attracted over 130 players from more than 20 countries and regions, including the United States, Canada and the Philippines.

With this event, Jingshan became China's first county-level city to host an international professional tennis tournament.

"With robust industry infrastructure, warm and genuine local players, and a tennis culture that permeates the entire city, we've seen many players from northern China travel here in autumn and winter. They play on the courts by day and soak in the hot springs by night, some even stay for weeks at a time," Luo says.

Qi Chengmei, a native of Wenfeng village, which boasts more than 80 tennis courts and over 800 tennis enthusiasts, spotted the boom in tennis tourism and decided to start a business.

"The courts in our village were packed every day, but there wasn't a single decent themed restaurant where players could come eat after a match," she recalls, sensing an opportunity.

She converted her family farmhouse into a tennis-themed restaurant. The dining hall is decorated with tennis-ball motifs, and the private dining rooms are named after such tournaments as the Australian Open, Wimbledon and the China Open.

The business has created jobs for more than a dozen local villagers. The restaurant now generates annual revenue exceeding 600,000 yuan.

Zuo Meng, a local crochet artist, has also found her niche in the tennis boom.

Every day after dropping her children off at school, she heads to her studio to craft tennis-themed handicrafts such as hair clips, plush keychains, handbags and necklaces.

"Jingshan has tennis tournaments almost every week now, so I follow the events with my stall. A single tournament can sometimes bring in 6,000 to 7,000 yuan," she says.

Currently, some 3,000 people in Jingshan are directly employed in tennis and related industries, while another 10,000 earn their livelihoods indirectly through the sport's ripple effect.

Boasting a vibrant tennis culture, the city features 356 tennis courts, and drew 3.5 million visitors in 2025 alone.

Modern Chinese film wins young hearts in Zimbabwe

HARARE — Laughter and applause filled a packed cinema in Harare, Zimbabwe's capital, on Aug 1 as the Chinese comedy-drama *One and Only* lit up the screen.

A highlight of the Asian Cultural Festival 2026, held from July 31 to Aug 1, the youth-focused film combines sports and street dance, striking a chord with the festival's largely young audience.

Co-hosted by the Chinese embassy in Zimbabwe, six other Asian embassies and Diplomatic Media, the festival used cinema to showcase Asian cultures and strengthen cross-cultural ties.

Before the lights dimmed for the screening, visitors explored traditional Chinese culture through hands-on activities, trying Chinese calligraphy and learning to use chopsticks.

As 2026 marks the China-Africa Year of People-to-People Exchanges, immersive events like these are giving Zimbabwean audiences a vivid glimpse of contemporary Chinese life while deepening the long-standing friendship between the two countries.

Speaking at the festival on July 31, Chinese Ambassador to Zimbabwe Zhou Ding highlighted the universal appeal of cinematic exchange, noting that core Asian values such as family, community, resilience, and mutual respect align closely with Zimbabwe's Ubuntu philosophy.

"We share the belief that a person is a person through other people," the ambassador said, adding that true strength comes from togetherness.

Luckson Murumbi, a film enthusiast from Harare, said Chinese films offer valuable insights into the country's traditions, social values and technological progress.

"You can see the transformation of China, from the traditional martial arts films we watched as children to modern productions. You can truly see the progress of China's development," Murumbi said.

For local students, films have also become an engaging way to improve their language skills while gaining a deeper understanding of Chinese society.

"Film is a vivid reflection of society, and watching Chinese films is a great way of immersing myself in the language, the culture, and the traditions," said Rumbidzai Msimanga, a Chinese language learner from Harare.

She added that the rise of streaming platforms now allows her to easily access a wider array of Chinese movies and television series on her mobile devices.

Speaking at the festival, Mqabuko Dube, director for Africa, Asia and the Pacific at the Zimbabwean Ministry of Foreign Affairs and International Trade, underscored the importance of such cultural initiatives in strengthening international partnerships.

"By promoting cultural exchange, tourism, education and investment, we continue to deepen the long-standing friendship between Zimbabwe and our Asian partners while creating opportunities that contribute to national development and people-to-people connections," Dube said.

Heat is on for Team China

Summer's high pressure can be felt on court, as the next round of World Cup qualifiers and Asian Games loom large

By LI YINGXUE
liyingxue@chinadaily.com.cn

Inside the training hall, a message board stands quietly in the corridor.

The handwriting is far from uniform. Some lines are bold, some uneven and others consist of only a few words. Yet, each message carries the emotions of the player who wrote it.

Captain Zhao Jiwei wrote: "Confidence. Determination. Trust the team, trust ourselves, trust each other, and fight together until the end."

Cui Yongxi wrote: "What cannot be defeated will rise again. What is reborn through the flames becomes a phoenix."

Returning overseas player Wang Junjie added: "Show fighting spirit. Give everything. Leave no regrets."

A few steps away, there is an almost continuous sound of basketballs hitting the floor.

Players jump, shoot and repeat the same movements. Behind these routine drills lies China's determination to prepare for a summer of critical challenges.

On Aug 7 in Beijing, China's men's basketball team opened a training session to the media. After the International Solidarity Cup, the team remained in camp for the fourth window of the FIBA Basketball World Cup 2027 Asian Qualifiers.

China will face Qatar away on Aug 27, before hosting Lebanon on Aug 31. For a team fighting to reach the World Cup, both games are crucial.

"After the previous games, our ranking is relatively low. Every match in the upcoming window is extremely important, and our margin for error is very small," head coach Guo Shiqiang said.

China finished the first phase with three wins and three losses. Because results against teams from the same group are carried forward, China enters the second qualifying phase in fifth place out of six teams in the newly formed Group F, carrying over its 3-3 record.

The pressure is clear, but Guo does not want it to become a burden.

"We need to bring what we have worked on every day in training into the games," he said.

"The players need to play freely without carrying too much pressure. Most importantly, we need to show our own characteristics and style."

China's previous qualifying window exposed several weaknesses.

On July 3, the team suffered a 73-92 home defeat to Japan in Shenyang, capital of Liaoning province. China struggled to establish its rhythm and was passive at both ends of the court.

Team China players and coaching staff hype themselves up during a training session in Beijing on Friday. China will face Qatar away on Aug 27, before hosting Lebanon on Aug 31 in the next round of FIBA Basketball World Cup 2027 Asian Qualifiers. XINHUA

After reviewing the game, the team identified transition offense and pace as the key areas for improvement.

Guard Liao Sanning said China would continue to rely on the 1-5 pick-and-roll, a ball-screen action involving a guard and the center, while adding more variety to its offense.

"Guo's system places a strong emphasis on pick-and-roll plays, with guards often initiating attacks with the center," Liao said. "Recently, we have added more playmaking options, increased the pace and involved more players."

He acknowledged that transition offense remains a weakness, an area the team is addressing in daily training.

The fourth window will bring a different challenge. Compared with the East Asian teams China faced in the first phase, the West Asian opponents are expected to pose greater physical challenges, particularly in the backcourt. China is also preparing to face naturalized players with significant individual ability.

China power forward Jiao Boqiao (second left) and coaching staff discuss strategy during a training session in Beijing on Friday. XINHUA

"Our guards have been preparing for stronger physical contact," Liao said.

Guard-forward He Xining noted that containing those players should be a collective task: "Defense is not the responsibility of one player. Everyone needs to contribute."

Before the qualifiers, China will play three warm-up games in Foshan, Guangdong province, from Aug 13-17 against Uruguay and New Zealand. Guo said they would test lineups and tactics, while giving young players much-needed experience against strong opposition.

A demanding schedule

China has adopted a flexible training model this year. Players have joined the camp in stages according to their respective competition schedules, their physical condition and injury status.

Wang Junjie has returned, while Yang Hansen is expected to link up with the group later because of NBA rules governing the release of international players.

"Because the schedule is very busy, the roster is adjusted dynamically according to the team's needs and the players' respective conditions," Guo said.

For experienced players such as He, the responsibility extends beyond personal performance.

"We need to help the young players improve and adapt to the national team environment," he said.

The rebuilding process is therefore also about defining roles and building trust.

The approach is designed to reduce fatigue, but the summer remains demanding, especially with China also set to compete at the 2026 Aichi-Nagoya Asian Games.

For the Games, China has been placed in Group C, alongside defending champion the Philippines, Bahrain and Kazakhstan. The Philippines immediately became the focus of public discussion.

At the 2023 Hangzhou Asian Games, China lost 76-77 to the Philippines in the semifinal after surrendering a late lead.

The defeat denied the host a place in the final, while the Philippines went on to win gold.

Three years later, the teams will meet again.

The matchup has naturally been described as a chance for revenge, but for a rebuilding China, the challenge goes beyond one game.

The Philippines remains a major threat with its pace, shooting and big-game experience, while Bahrain and Kazakhstan also possess strengths that cannot be overlooked.

Winning the group will require consistency against every opponent. If China becomes too emotionally invested in facing the Philippines, or underestimates Bahrain and Kazakhstan, the contest for first place could quickly become complicated.

More importantly, China must turn past disappointment into immediate focus. The memory of the Hangzhou semifinal can provide motivation, but it cannot replace preparation and execution.

Guo rarely raises his voice, but his attention never leaves the court. At 51, he has experienced both the promise and setbacks of Chinese basketball. He returned to the national team in 2024, when China was searching for a new direction.

Under his leadership, the team finished runner-up at last year's FIBA Asia Cup, its best result since 2015. But Guo has emphasized that rebuilding is not only about results. It is also about restoring mentality, discipline and competitive spirit.

On the board, Guo wrote: "Carry forward the spirit of China's basketball teams at the Olympics, prepare solidly for the 2027 World Cup and strive toward qualification for the 2028 Los Angeles Games."

The message is simple: acknowledge weaknesses, improve every detail and move forward together. There are no shortcuts for China; its challenge is to turn words into execution, and pressure into performance.

For now, though, it's about jumping, shooting and repeating.

NBA mourns Celtics legend and history-making coach

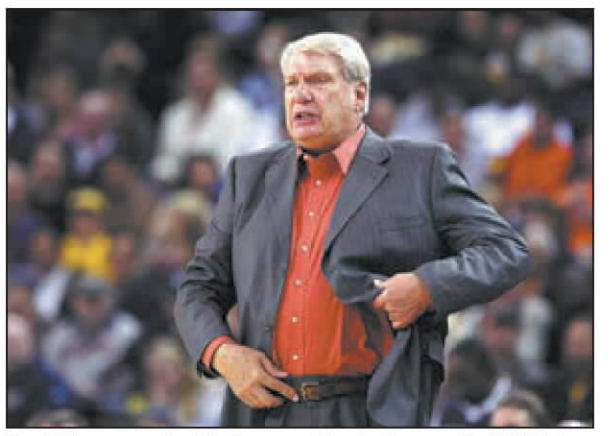
SAN FRANCISCO, California — Don Nelson, who won the second-most games of any coach in NBA history and five NBA titles as a player with the Boston Celtics, died on Sunday, his family announced. He was 86.

Nelson was a member of NBA championship teams with Boston from 1966 to 1976 and the Celtics retired his No 19 jersey.

As a coach, Nelson finished with a record of 1,335-1,063 — what had been an NBA record until Gregg Popovich passed him in 2022 — in stints with Golden State, Milwaukee, New York and Dallas from 1976 to 2010.

"Don Nelson revolutionized NBA basketball through his fearlessness, ingenuity and deep conviction," NBA commissioner Adam Silver said in a statement.

"He spent nearly 50 years in the NBA, winning five championships as a player with the Boston Celtics before building one of the most successful and pioneering coaching careers in league history.



"He brought an unmistakable personality to everything he did, and his impact on our sport will continue to be felt for generations."

Nelson, who was inducted into the Basketball Hall of Fame in 2012, never reached the NBA Finals as a coach, but was remembered as a historic figure among bench bosses.

"The Golden State Warriors mourn the passing of Hall of Fame head coach Don Nelson," the team said in a statement.

"'Nellie' was one of the most innovative and influential coaches in NBA history and an iconic figure in Warriors history.

"More than anything, Don Nelson will be remembered for his authenticity, larger-than-life personality, and incredible passion for basketball, and his influence on the Warriors franchise will endure for years to come."

Don Nelson, a coach with the second-best win record in NBA history and a five-time champion as a player with the Boston Celtics, passed away on Aug 9, drawing tributes from around the league. Nelson was inducted into the Basketball Hall of Fame in 2012. AFP

Steve Kerr, the current Warriors coach, recalled Nelson as a visionary, whose influence remains in the modern era of the league.

"Don Nelson was a true innovator whose influence on the game of basketball is still felt today," Kerr said.

"He consistently challenged conventional thinking, experimented with different lineups and styles of play, and saw possibilities in the game that others often did not.

"So much of what is now commonplace in the modern NBA can be traced back to the way Nellie approached the game."

The Celtics paid tribute to Nelson's playing career in a statement.

"Nellie was a tough and reliable all-around player, whose tenacity and ability to 'think the game' were on full display throughout his 11 seasons with the Boston Celtics, where he was a key member of five championship teams across two eras," the Celtics said.

The Bucks paid tribute to Nelson's first NBA coaching stint.

"During his 11 seasons as Bucks coach from 1976-1987, Nellie won two of his three NBA Coach of the Year awards and established himself as one of the most innovative and visionary leaders in basketball history," the Bucks said.

The Dallas Mavericks called him an innovator and legend whose "impact will never be forgotten," saying he left "an incredible mark on our franchise and the game of basketball".

Sino-US trade rebound buoys global outlook

Analysts warn bilateral ties remain subject to structural challenges, external uncertainties

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

Renewed momentum in China-United States economic ties has helped boost confidence in the global economy while supporting steadier and more resilient bilateral trade in the months ahead, said market watchers and business leaders.

The upbeat remarks came after official General Administration of Customs figures showed a sharp turnaround in bilateral trade in goods. After slumping 18.7 percent year-on-year in the first quarter, China-US goods trade rebounded to post a 13.7 percent year-on-year gain in the second quarter.

This trade recovery aligns with fresh bilateral moves to stabilize economic relations. The Ministry of Commerce confirmed that during the latest round of China-US economic and trade consultations held in May, the two sides reached an agreement to negotiate a reciprocal tariff cut framework via a newly established trade council. The deal would cover goods valued at $30 billion or more from each country.

Although neither side has released a final product list, trade analysts expect the tariff cuts to cover textiles, footwear, consumer goods, electronic components, industrial machinery parts, chemicals, plastics and agricultural products, while excluding sectors such as advanced semiconductors and strategic resources.

Diao Daming, a professor of international relations at the Beijing-based Renmin University of China, said recent progress in the China-US economic and trade talks has helped bolster business confidence across the world and is creating conditions for more predictable trade and investment.

Yu Xinding, a professor of international trade at the University of International Business and Economics in Beijing, said that once implemented, the new tariff framework will support further growth in China-US trade while setting a positive example for resolving trade disputes through dialogue.

"Faced with multifaceted costs triggered by tariffs, this move offers a practical solution to help reverse trade distortions created by previous tariffs," said Yu. "The initiative goes far beyond lowering tariffs on selected goods. Equal consultations will improve market access, ease corporate burdens and restore bilateral trade to market-oriented, mutually beneficial dynamics."

Though modest relative to overall China-US trade, the planned tariff relief targets products with clear market demand and practical benefits, delivering early, verifiable results that can strengthen confidence in two-way economic ties, she added.

While the recent rebound in bilateral trade points to improving momentum, analysts cautioned that the relationship remains subject to structural challenges and external uncertainties, despite the progress made through dialogue.

Kimi K3 gets high evaluation scores

By **LI JIAYING**
lijiaying@chinadaily.com.cn

Inside
Editorial, **page 6**

Chinese artificial intelligence startup Moonshot AI's Kimi K3 has put China's foundation-model sector on a faster path to technological and commercial maturity, while leading a new wave of competition in the global AI market, industry experts said.

Released on Friday, Kimi K3 is a 2.8-trillion-parameter model with native vision and a 1-million-token context window, which is designed for frontier intelligence in long-horizon coding, knowledge work and reasoning, rather than simple question answering. Moonshot calls it the world's first open model in the 3-trillion-parameter class and plans to release the full weights by July 27.

Parameter count broadly reflects a model's scale and complexity, while the context window determines how much information it can process in a single session.

Industry benchmark tables have placed K3 among the world's strongest systems. Independent evaluator Artificial Analysis gave K3 an Intelligence Index score of 57, placing it third globally, only behind Anthropic's Claude Fable 5 and OpenAI's GPT-5.6 Sol.

The technological advance has been accompanied by faster commercialization. According to domestic media reports on Monday, Moonshot has distributed a shareholder resolution seeking approval for a Hong Kong listing and could complete an initial public offering within six months.

The news comes as its annual recurring revenue reached $300 million in June, up from $200 million in April, and increased severalfold following the launch of its K3 model, according to the company.

Guo Tao, a member of the Chinese Association for Artificial Intelligence and a senior expert in AI, said a listing by Moonshot would set a clear capital market financing template for China's large-model industry.

He added that a successful Moonshot offering could encourage more Chinese developers to pursue listings and may be followed by increased mergers, acquisitions and strategic investment activity over the next one to two years.

"Global capital will also reassess the growth potential of Chinese AI companies," Guo said, adding that investors would place greater value on developers able to demonstrate stable revenue, paid user conversion and deployment across real-economy scenarios.

K3's pricing further points to a shift in industry economics. Its application programming interface charges 100 yuan ($14.7) per million output tokens, significantly higher than 6 yuan charged by its domestic counterparts DeepSeek V4-Pro and Xiaomi's MiMo-V2.5-Pro, 28 yuan by Z.ai's GLM-5.2 and 36 yuan by Alibaba's Qwen3.7-Max.

"K3's pricing breaks the domestic AI industry's long-running low-price competition and moves it toward a model in which capability determines price," Guo said.

He noted that such sustainable pricing could improve revenue quality, finance computing infrastructure and model upgrades, and gradually narrow the valuation discount between Chinese and US model companies.

Even so, K3 is still priced below leading flagship systems in the United States. It is roughly half the price of GPT-5.6 Sol and about one-third the price of Claude Fable 5.

Kevin Kelly, founding executive editor of the US tech magazine Wired, told China Daily that token costs start to matter as businesses and individuals spend more on AI services.

By offering capable open-source models at competitive prices, Chinese developers could lower the cost of using AI and win wider adoption, Kelly said.

The growing technological sophistication and commercial maturity of Chinese LLMs are also challenging assumptions abroad about a persistent US lead.

Ion Stoica, a computer science professor at the University of California, Berkeley, told Bloomberg that after K3's release, the estimated lag between Chinese open models and the global state of the art may have narrowed from six to nine months to two or three months.

Gavin Baker, managing partner and chief investment officer of Atreides Management, wrote in a post that K3 may be an important "inflection point for AI". Although it may have a potentially negative impact on Anthropic and OpenAI, it is "net positive for essentially every other company in the world", Baker wrote.

Strong demand after K3's release has also provided an early test of that commercial appeal. Moonshot announced on Sunday that since requests had far exceeded forecasts over the previous 48 hours, it had to temporarily pause new consumer subscriptions to prioritize existing members, whose services remained unaffected.

The company said it is adding capacity and would reopen subscriptions in batches. It also plans to separate its main Kimi membership from a Kimi Code plan, tailoring services more closely to general and coding users.

HUOQIU COUNTY BRINGS AFFORDABLE FOIE GRAS TO THE TABLE

Once a rare luxury, French delicacy is now a casual indulgence, thanks to producers in Anhui province

By **ZHU LIXIN** in Lu'an, Anhui
zhulixin@chinadaily.com.cn

Sitting in a century-old restaurant in Shanghai, Hu Jianyuan orders a dish that was once the epitome of European luxury: cherry foie gras. Eight glistening slices, each a perfect 12 grams, arrive at his table — priced at 198 yuan ($29.2). Hu smiles as the delicate, buttery flavor explodes in his mouth. Hu was no ordinary diner; he has played a large role in creating the delicacy. The restaurant is, after all, just one of his many clients.

China Vibes — FOOD —

Back in Huoqiu county in Lu'an city, East China's Anhui province, Hu's story begins in fields filled with the honking of Landes geese. Here, far from the gilded dining rooms of Shanghai, lies the unlikely epicenter of China's foie gras revolution.

Huoqiu raises 5 million Landes geese and produces more than 5,000 metric tons of the luxury food product annually — accounting for more than a third of the entire nation's output.

WORLD WATCH
By Danilo Turk

Courage, foresight needed for China-EU dialogue

In a series of meetings culminating in June, China and the European Union agreed to create a consultation mechanism aimed at renewing their mutually beneficial economic relations. Consequently, four "workstreams" were established, covering trade and investment balancing, export controls, intellectual property rights and reform of the World Trade Organization.

If successful, these workstreams will pave the way toward stable trade relations between China and the EU, which will have positive effects on the global trading system as a whole. Discussions under these workstreams will continue until October, when further decisions will have to be taken.

It would be a serious mistake if the importance of the emerging opportunity were underestimated. What is needed now is a shift in the mindset: from excessive caution to careful optimism — from the mindset of a "China Shock 2.0" to recognition of "China Opportunity 2.0".

There are reasons that justify cautious optimism. Let us consider three of them — two immediate and one systemic.

First, in September 2025, China announced that it would not seek new special and differential treatment in current and future WTO negotiations, while maintaining its status as a developing country. This decision signals a genuine willingness to build a new type of relationship between China and the developed world, including the EU.

The second immediate reason relates to China's recognition that the era of heavy reliance on exports is ending and that a different balance must be struck in the interest of its own growth. The concerns raised in some Western countries about what has been described as Chinese "overcapacity" therefore merit careful and balanced consideration, alongside China's own efforts "to generate sufficient domestic demand to absorb much more of what its factories produce".

But more is required to ensure that "shock" becomes opportunity. In his speech at the Summer Davos conference in Dalian, Liaoning province, on June 25, Premier Li Qiang proposed that "what China's technologies and products in emerging industries bring to the world is not a shock, but an opportunity; not a threat, but empowerment". The data for 2025 showed that the number of foreign-funded enterprises established in China in the fields of scientific research and technological services grew by 27.2 percent year-on-year. This means 14,000 foreign-funded enterprises, including those with investment from Europe, were established that year in China. The transformative potential of this development is substantial, and it justifies the hope for a change of mindset from "China Shock 2.0" to "China Opportunity 2.0".

In addition to the immediate, current signs of change, there is also a need to promote systemic changes in the global trading system. One of the four workstreams established by the EU and China is focused on reform of the World Trade Organization.

Portraying figures from history and literature, NPC players attract hordes of visitors

'Living legends' breathe fresh life into tourism

Top: A performance of the Chinese moon goddess Chang'e in Millennium City Park in Kaifeng, Henan province. GENG FEIFEI / CHINA DAILY
Above: Zhang Yanfeng plays the character of Guan Yu at Wansuishan Martial Arts City in Kaifeng. PROVIDED TO CHINA DAILY

By QI XIN in Kaifeng, Henan and **CHEN NAN** in Beijing

Wearing a full suit of armor and with a sword dangling by his side, Zhang Yanfeng, 28, is not your typical theme park performer.

To portray the character of General Guan Yu — one of the most revered figures in Chinese history whose life has been immortalized in numerous literary works — he dons armor weighing over 40 kilograms for each performance at Wansuishan Martial Arts City, a popular theme park in Kaifeng, Henan province. His helmet alone weighs 7 kg.

But for Zhang it's all worth it because his work as an NPC (non-player character) performer brings to life characters from the pages of history and literature for adoring fans.

"The weight of the armor forces me to stay grounded," Zhang noted. "It's as if I am truly embodying the spirit of an ancient general."

Immersive NPC performances are one of the fastest-growing sectors in China's tourism industry, often drawing in repeat visitors to scenic spots and theme parks.

Wu Guoping, a deputy to the National People's Congress, recently proposed official recognition of NPC performers as a new profession. Wu said the rise of such performers reflects a broader transformation within China's cultural tourism industry.

"I believe the rise of NPCs as professionals is a positive development for both the industry and the preservation of traditional culture," Zhang said.

"The standards are higher now. It's not just about wearing a costume; it's about living the role. We are responsible for keeping these ancient stories alive, not just for ourselves, but for the visitors who come here looking for something more."

Towering figures

Another role Zhang plays is Guan's descendant, Guan Sheng, another hero from the Northern Song Dynasty (960-1127).

He is the only actor to embody these two towering figures, a feat that has earned him a devoted following among the visitors to the popular theme park, which celebrates the martial arts legends of Chinese history.

Born and raised in Luoyang, Henan province, a city famous for its ancient history, Zhang was drawn to traditional Chinese culture from a young age.

He trained in martial arts performance at school, and began his career at some of China's most famous historical sites before starting work at Wansuishan Martial Arts City more than a year ago.

"It was the perfect place to merge my passion for *wuxia* — the traditional genre of martial arts fiction — with real-world performances," he said. "Kaifeng, the former capital of the Northern Song Dynasty, is where I feel most connected to the characters I portray."

Zhang's two primary roles, Guan Yu and Guan Sheng, are not merely costumes he wears, but identities to inhabit.

When some visitors first encounter Zhang in his armor, they assume he is just another lifeless statue, he said, but as they draw closer, they realize he is flesh and blood. Their surprise is palpable, with visitors sometimes gasping in astonishment as he stirs, moves, or speaks.

"For me, it's about creating an experience that no digital screen or online video can replicate. When a person comes all the way to see Guan Yu, I owe it to them to make it unforgettable," he said.

His performances are also interactive. When visitors ask questions or request photos, Zhang is always ready to oblige.

The term NPC is derived from a character in a video game or simulation that is not controlled by the player. NPCs are typically pre-programmed with specific behaviors, dialogues, and actions, and exist to interact with players in the game world to make the experience more immersive and dynamic.

In recent years, theme parks in China, such as Shanghai Disneyland and Happy Valley, have increasingly incorporated NPCs into their attractions. The NPCs are often actors or performers who act out specific roles as part of a larger, interactive experience for visitors.

Emotional connection

For decades, Chinese scenic spots relied on fixed, scripted shows. Visitors watched and took photos from a distance. But today's tourists crave something different — they want interaction and deep emotional immersion.

At Wansuishan Martial Arts City there are more than 2,000 NPCs, most of whom age 20 to 35. Many of them come from arts backgrounds, bringing passion and personality to the job, said Wang Xueying, brand manager of Wansuishan Martial Arts City.

Jia Chenlu, 32, plays the lively martial arts character Sun Erniang from the classical novel *Water Margin*. With over a decade of hosting experience, she acts as a storyteller and "emotional guide" for the audience, she said.

"The work I do as Sun Erniang is very much like being a character-based host," Jia said. "It's all about controlling the scene, interacting with the audience, improvising, and creating a seamless experience. Everything I've learned on stage, from handling a crowd to designing a flow, directly translates into this job."

With a live performance background, Jia is not shy in front of an audience. Her warmth and approachability come through in every interaction, as she brings a human touch to her character.

"It's not just about acting; it's about connecting," she said. "People come here to escape from the stress of their everyday lives, and we, as NPCs, have the chance to make their visit meaningful. A smile, a warm word, a photo — it can make all the difference. Sometimes, it's the small things that leave the biggest impression."

Jia believes NPCs offer something more valuable than just entertainment — they offer "emotional connection".

"Many people harbor a *wuxia* dream in their hearts, and we give them a little bit of that dream, a taste of the *jianghu* (the martial arts world). If we can make them happy, even for a brief moment, then our job has meaning," she noted.

As an anchor for the show, her earnings are tied to both her visibility and the impact of her performances, with the salary ranging from 8,000 yuan ($1,180) to 30,000 yuan a month depending on the popularity of the show and the audience's response.

"The more effort you put in, the more you can earn," she said. "It's performance-based, so there's no limit to how much you can make."

However, being the core performer in the show, Jia has no backup. She manages to take off five days a month, and typically avoids taking time off at weekends when visitor numbers are at their peak. On the rare occasions when she does take a day off, the Sun Erniang show is paused, with visitors informed in advance.

> "Everything I've learned on stage, from handling a crowd to designing a flow, directly translates into this job."
>
> **Jia Chenlu,** a 32-year-old who plays the lively martial arts character Sun Erniang from the classical novel *Water Margin* at Wansuishan Martial Arts City in Kaifeng, Henan province

"It's a commitment," Jia said. "But when you're part of a character that means something to so many people, you understand why you do it. It's more than just a job — it's about creating moments that matter."

A 'beautiful escape'

Liu Ping, a 36-year-old nurse, traveled from Zhengzhou, Henan, with her best friend to catch the performances at Wansuishan Martial Arts City.

"Usually, I'm deeply caught up in the grind of work, constantly feeling mentally and physically exhausted — like a screw that just keeps turning without end. I've slowly lost myself, and even my inner sense of purpose," said Liu, who said she lives a hectic life.

"But here, I can temporarily put my phone down and immerse myself in this little world of martial arts. Through my interactions with the NPCs, I feel like I'm slowly reconnecting with the version of myself I haven't seen in a while, shedding the fatigue and distractions. It's a healing, freeing experience that feels like a beautiful escape."

Millennium City Park in Kaifeng, is a large-scale historical cultural park featuring Song culture, built according to the famous *Riverside Scene in the Qingming Festival* painting.

Part of its allure is its reimagining of the bustling Northern Song Dynasty market scene.

The NPC players at the park portray ordinary market figures from the period such as beggars, monks, and street vendors, and engage with visitors in spontaneous, immersive interactions, said Xing Xiaoyue, marketing manager at the venue.

These characters don't have fixed names, reflecting the anonymity of their counterparts in the painting. Visitors can take part in traditional games, like "spot the difference" or "playing cards", while NPCs guide them through the experience, making the past come alive.

One of the park's highlights is the Great Song Royal Garden, which brings ancient poets like Su Shi, and Li Qingzhao, into the fold. These players have clearly defined personas and are integrated into themed performances.

To further deepen the interactive experience, visitors can take on the role of different characters such as a beggar, general, or scholar, by receiving a "role recruitment order" and donning costumes.

This allows them to interact with the NPCs and unlock dialogue and storylines. It's a shift from being mere spectators to becoming active participants in the unfolding drama.

"I've been to many similar theme parks in China, but Millennium City Park holds a special place for me," said one visitor, schoolteacher Chen Shuo.

"In our fourth-grade textbook, there's a lesson dedicated to *Along the River During the Qingming Festival*. When teaching the kids, I usually rely on online images or videos to explain it, but the pictures in the book always feel static and distant. This time, visiting the park for real, it was like turning the words in the textbook into a living, breathing world right in front of me."

Chen Nan, a professor at Henan University's School of Culture and Tourism, said NPCs in theme parks have evolved from background characters to main attractions because tourists now seek immersive, interactive experiences, not just sightseeing. They want to participate, engage, and share. NPCs act as bridges, turning static environments into dynamic, emotional experiences, he said.

"To truly stand out, successful NPCs must have a deep understanding of history and culture, strong improvisational skills, and excellent service. In historical theme parks, NPCs are not just performers — they're 'time travelers' who help bring history to life in an immersive and interactive way," he said.

But for Zhang, his work is about more than just historical accuracy — it's about the connection between the past and present, between legend and reality. "The world moves faster now," he noted, gesturing toward the busy line of visitors streaming past him.

"Everyone is rushing from one thing to the next. But when they step into this world, they slow down. They feel a sense of honor, a sense of adventure. It's a place where they can leave behind the pressures of modern life."

It's a sentiment shared by many visitors, who come not only to see the grand performances but to reconnect with a "dream" they may not realize they've been missing.

Zhang said playing these legendary characters offers a sense of purpose. He is not simply performing; he is preserving something ancient and vital.

"The role of NPCs is more important than ever. In a world where history can feel distant, we bring it close, make it tangible," he said with pride. "We are the keepers of stories that would otherwise fade into memory."

Beijing, Bangkok enhance relations

Premier Li, Thai Prime Minister Anutin witness signing of multiple cooperation agreements

By CAO DESHENG
caodesheng@chinadaily.com.cn

China and Thailand signed on Monday multiple cooperation documents in the fields of trade, agriculture, customs, science and technology, artificial intelligence education, aviation and aerospace, intellectual property, media, and combating transnational crimes, as part of their efforts to enhance bilateral ties.

Premier Li Qiang and Thai Prime Minister Anutin Charnvirakul witnessed the signing of the agreements following their talks at the Great Hall of the People in Beijing.

Anutin made an official visit to China from Thursday to Monday. Beijing was the last stop of his five-day tour, which also took him to Shanghai municipality and Chengdu in Sichuan province.

In Shanghai, he attended the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance. In Chengdu, Anutin attended the Thailand-China (Sichuan) Investment and Economic Forum. The Thai prime minister is also reported to have had meetings with senior executives from major Chinese companies, including Xiaomi and Changan Automobile.

During the talks, Li hailed the long-standing traditional friendship between China and Thailand, and said that the nation has always placed Thailand in an important position in its neighborhood diplomacy and firmly supports the smooth governance of the new Thai government.

China is willing to further promote traditional friendship with Thailand, consolidate political mutual trust, firmly support each other and take mutually beneficial cooperation in various fields to new heights, continuously improving the well-being of the two peoples, he said.

The premier expressed China's willingness to strengthen the alignment of development strategies with Thailand, promote high-quality development of Belt and Road cooperation and accelerate the implementation of key projects such as the China-Thailand railway.

He underlined the need for both countries to enhance the facilitation of cross-border payments and local currency settlements, maintain the momentum for the growth in bilateral trade, deepen industrial integration and expand cooperation in emerging fields such as AI, new energy vehicles and clean energy, working together to promote common prosperity.

Li also called for enhancing law enforcement and security cooperation to resolutely combat cross-border crimes such as online gambling and telecom fraud.

Noting that unilateralism and protectionism are on the rise, the premier called on both countries, as practitioners and beneficiaries of open cooperation, to strengthen coordination in multilateral mechanisms, such as the United Nations, the World Trade Organization and Asia-Pacific Economic Cooperation, to jointly safeguard the legitimate rights and interests of both countries and defend international fairness and justice.

Anutin commended the development of the family-like relationship between Thailand and China, saying that Thailand firmly adheres to the one-China policy and will never support any "Taiwan independence" activities.

Thailand is willing to maintain close high-level exchanges with China, make good use of dialogue mechanisms in various sectors, promote cooperation in trade, investment, agriculture, mutual connectivity, AI and electric vehicles, and deepen tourism and local exchanges, he said.

Anutin expressed Thailand's commitment to a more vigorous crackdown on cross-border crimes, such as online gambling and telecom fraud, and creating a safe and sound environment for Chinese tourists and enterprises in the country. Thailand welcomes the four global initiatives proposed by President Xi Jinping and is willing to strengthen communication and coordination with China within multilateral frameworks to jointly promote regional and global peace, stability and prosperity, he said.

The four global initiatives refer to the Global Development Initiative, the Global Security Initiative, the Global Civilization Initiative and the Global Governance Initiative.

During the visit, the two countries issued the joint statement on building a China-Thailand community with a shared future for enhanced prosperity.

China pins hopes of soccer glory on grassroots talent

By SUN XIAOCHEN
sunxiaochen@chinadaily.com.cn

As Spain lifted its second World Cup on Sunday and FIFA's showpiece tournament capped its expanded 23rd edition with global fanfare, many Chinese soccer fans were left wondering how long they'd have to wait for the national team to return to this elite international stage.

Despite uninterrupted nationwide excitement over the quadrennial sporting extravaganza, China made its sole appearance in the tournament 24 years ago, and former players said they believe a return would take consistent and concerted endeavors, given the current high standards of international soccer.

The World Cup remains a global benchmark in the game, and its expanded 48-team edition would require Chinese sports governing bodies, youth development promoters and league operators to invest a great deal of time and effort for the national squad to reenter the tournament, they said.

Sun Jihai, 48, a former Chinese national soccer star, who gave a running commentary in Beijing on the final match between Spain and defending champion Argentina, noted the involvement of Chinese sponsors, referees and manufacturers in this year's tournament.

"To see such a strong Chinese presence, we should feel proud. But, I believe, what we all hope to see is our men's team making it there again," said Sun, who was a formidable defender on China's 2002 World Cup qualifying team.

"To do it again — not just once, but in a consistent way — we need to work harder, investing long-term effort in youth training and committing to grassroots promotion, instead of relying on the fantasy of a quick-fix," said Sun, who also played with Manchester City in the Premier League.

"That's how all the global soccer powerhouses — and some of the emerging new contenders — do it. There is no other way," he added.

Sun is not the only one calling for a more pragmatic and consistent plan to revitalize Chinese men's soccer program. After the country's qualifying hopes for the 2026 tournament were crushed in June last year in the sixth consecutive failure, many in the industry highlighted the complex disconnect between the ambitious administrative push and on-field performance.

Xie Hui, 51, top scorer for China in the 2002 FIFA World Cup Asian qualifying tournament, called for building a more robust, grassroots-led talent pipeline.

"We need to invest more in our young people and, quite encouragingly, that's been a consensus within the nation's sporting community. We've seen some positive signs," said Xie, who contributed seven goals during China's qualifying campaign 24 years ago, but was dropped from the final World Cup team roster due to injury.

"I think the examples of the world's best teams, such as Spain — and those other fast-improving nations — have all proved that there is no shortcut to success," he added.

On a more positive note, Xie pointed out that China's Under-17 squad made it to the Asian Cup final in May and, thereby, secured a spot in the U17 World Cup scheduled before the end of the year in Qatar. The Chinese U23 soccer squad also reached the Asian Cup final in that age category in January, making it a first for the team in 22 years. These achievements bode well for the revival of Chinese men's soccer on the global stage, he said.

The inspiring campaigns pulled off by the two youth squads, despite both losing to continental powerhouse Japan in their respective finals, have lifted the spirits of the whole nation, offering Chinese fans a rare reason to celebrate after years of watching and supporting the painfully underachieving senior men's national team.

Sun, the former national defender, who in recent years has been running youth training programs in his native Liaoning province, in Yunnan province and in the Xinjiang Uygur autonomous region, said, "I think we have a lot to learn from our neighbors Japan and South Korea, who have made it to the World Cup regularly."

He added, "Only by making soccer more popular among children on school campuses — and everywhere else in the country — do we stand a chance of joining the world's best."

Eatery: County successfully fuels quiet culinary revolution

From page 1

In Hefei, the provincial capital, the food scene is delicious but down-to-earth. For local resident Zhang Wanjing, foie gras is now a casual indulgence.

In March this year, Zhang found herself savoring a foie gras sushi roll at a Japanese restaurant, at just 18 yuan a piece. "The menu didn't say where it came from, but I could take a pretty good guess," she said with a knowing smile. "It's probably from Huoqiu."

And in Huoqiu, foie gras is affordable food, enjoyed stir-fried, pan-fried or even in hot pots.

On Hefei's Oufengjie — the "European-style street" brimming with eateries serving international cuisine — visitors can now find at least four restaurants serving foie gras. But like truffles and caviar, foie gras, originating from Landes province in France, was once a rare luxury.

Today, the Landes goose, world-renowned and much-sought-after for foie gras, is widely bred in countries like Hungary and China.

Hu has been part of this quiet culinary revolution for over 20 years. In 2003, he was one of the first in Huoqiu to gamble on Landes geese.

Initially, he faced challenges selling fresh foie gras in upscale markets and hotels in cities such as Beijing, Shanghai and Guangzhou, the capital of Guangdong province, often encountering skepticism.

"I said it was from Huoqiu, but they hadn't even heard of the place and were hesitant to use it. That setback taught me that without a brand, even the best products wouldn't gain trust," said Hu.

In 2006, he registered his Longxiang brand, which went on to become a well-known trademark in China, and his company is now the largest among over 140 foie gras producers in Huoqiu.

The turning point came when a foreign chef at a high-end Hefei restaurant simply poked the liver with his finger, inspected the texture, and declared it equal to French imports — only fresher and far less costly. An instant partnership was born.

The cherry foie gras Hu consumed in Shanghai, is sold from his factory at just 5 yuan a piece. But in high-end restaurants, the price varies between 20 and 30 yuan a piece.

"For consumers, dining on foie gras in a restaurant is not just about the product. The ambience and service are equally important," Hu said.

Since 2013, Hu has continuously developed new products, now numbering more than 30, turning foie gras into ready-to-eat specialty snacks.

In the first half of this year, Hu's company achieved sales of 180 million yuan, with one red wine foie gras product alone contributing 50 million yuan.

"We are trying to get into foreign markets, where export prices can be two to three times higher than domestic prices, but we believe the domestic market currently is large enough," said Hu. "If you're a seasoned foie gras enthusiast, visiting China and more specifically Anhui, would be a great idea."

Ties: Structured cooperation could become 'new normal'

From page 1

Ma Xue, a researcher at the Institute of American Studies at the China Institutes of Contemporary International Relations, said that strategic competition between China and the US in high-tech sectors will continue to intensify, while tighter controls on semiconductors, artificial intelligence and critical minerals, alongside geopolitical tensions, could weigh on the bilateral trade climate.

"Overall, institutionalized consultations and differentiated management of disputes could help offset short-term political disruptions," Ma said. "Although disagreements and periodic bargaining will persist, structured cooperation, accompanied by occasional friction in specific sectors, is likely to become the new normal in bilateral economic ties."

Data from the General Administration of Customs also showed that China-US goods trade reached 2 trillion yuan ($295 billion) in the first half of the year, accounting for 7.9 percent of China's total foreign trade.

James Zimmerman, chairman of the American Chamber of Commerce in China, said he hopes this year will be a productive one for China-US relations, noting that current China-US trade policy is increasingly characterized by a "managed trade" approach centered on reciprocity.

Saying that engagement is in the best interest of the US, Zimmerman reiterated that China brings real value to US consumers and benefits Washington's long-term economic interests.

Similar views were expressed by Jim Sutter, CEO of the US Soybean Export Council. "The recent announcement on tariff reductions is a positive signal. We hope the commitments made during the talks will soon be translated into concrete policy measures," he said.

Such optimism also resonates with US industrial companies stepping up long-term investment and innovation in China. Lin Chunmei, president and general manager of Corning China, said that as AI reshapes the global industrial landscape and drives demand for advanced materials and computing infrastructure, the US industrial materials manufacturer has evolved from technology introduction to collaborative innovation in China.

Corning will deepen local innovation, support next-generation computing infrastructure and contribute to the upgrading of China's industrial ecosystem, she said.

The company's confidence also comes as China continues to strengthen its position in advanced manufacturing and high-tech exports. In the first half of 2026, the country's exports of integrated circuits surged 88.7 percent year-on-year, while exports of electronic components rose 62.6 percent, statistics from the Ministry of Industry and Information Technology showed on Monday.

Quake rescue

First responders look for survivors on Sunday in the rubble of collapsed houses following twin earthquakes that struck the Andes region of Peru, about 300 kilometers east of capital Lima, on Saturday night. At least six people were killed and more than 30 injured when the temblors — measuring 5.1 and 3.7 — rocked the mountainous area. AFP

Talks: Reform of global trading system highlighted

From page 1

This looks like a long shot, since reform of the organization depends on many actors, including, importantly, the United States. However, let us not underestimate the possibility of WTO reform being carried out. It is useful to recall that the international trading system has been reformed practically every other decade since its creation in the aftermath of World War II. In the 1950s and 1960s, two successful rounds of trade negotiations under the General Agreement on Tariffs and Trade substantially reduced tariffs. Subsequently, in the 1970s, the Tokyo Round of GATT negotiations produced a number of agreements designed to reduce nontariff barriers to trade such as state subsidies and countervailing duties. The Uruguay Round, launched in 1986 and concluded in 1994, added agreements on trade in services, trade-related investment measures and intellectual property rights. Later still, an elaborate dispute settlement mechanism was established.

This dynamic history of the global trading system should inspire the European and Chinese negotiators of all four workstreams to approach the issues with courage and foresight and produce proposals for a new, reformed global trading system. A high-level ambition for reform, commensurate with the existing needs, makes the emerging opportunity worthy of serious and determined negotiations.

Volcanologists collect data from the crater of La Fossa on Vulcano Island, one of the seven islands of the Aeolian Archipelago of Sicily, in Italy, on July 9.

Volcano monitor

Drones help research eruptions in Sicily and reduce risk to humans

Hovering over the volcano, a buzzing drone pauses in front of a laser beam on the crater's edge, as researchers test whether the device can measure gases to predict eruptions.

On the Aeolian island of Vulcano, off the coast of Sicily, Marius Schaab, a researcher from the Technical University of Munich in Germany, stands next to a gas sensor mounted on a tripod, waiting for the drone his colleague has just launched to draw closer.

In this remote lunar landscape, where hot volcanic gases and steam smelling of sulfur rise eerily from the earth, the small propeller-driven device catches the eye.

The last eruption on the island's grand crater occurred in the late 19th century but the volcano continues to show intense degassing activity — to the awe of the visitors who are allowed to walk around the rim.

Soon, the drone positions itself along the axis of the sensor, which transmits an invisible laser beam that passes through the volcanic gas emissions before being reflected by the drone, and traveling back.

Based on the signals sent back to the sensor, an algorithm calculates a map of gas concentration in the 10 or 15 minutes it takes for the drone to follow a predefined path at a distance of up to 60 meters.

Although drones have been used in monitoring volcanoes for about 15 years, scientists are now looking to develop gas measurement tools that are increasingly accurate and risk-free.

Further around the crater, another team of scientists from the University of Mainz in Germany is using sensors carried on a drone to measure concentrations of chemical substances in the air.

A checklist in hand, Jonas Krajewski, a student at the Johannes Gutenberg University Mainz, checks that "Tina" — the name given to the drone — is ready to fly safely.

From top: A drone used to collect data flies above the volcano. Tests gathered from gas emissions from the volcano.

Soon, the drone, weighing 2.5 kilograms, lifts into the air and heads toward the rising gases. This time, following a predefined flight path lasting up to 40 minutes, the drone flies into the heart of the fumaroles, or vents where the gases and vapor escape and where temperatures range between 100 and 140 C.

"Tina" is equipped with a series of sensors measuring gases, particles and halogens, elements like chlorine, bromine and others.

'Reliable data'

"We have a very constant output of gas … so we can have very reliable sensor data," said Krajewski.

For Tjarda Roberts, a researcher at the National Centre for Scientific Research in Paris, one of the biggest advantages of the drone is its flexibility to move around more diluted parts of the plume and quickly switch direction if the plume suddenly changes angles.

With the drone, researchers no longer need to carefully enter the area of the gas emissions, a dangerous activity that requires the use of masks and other protection.

"Here we don't have a major risk of an imminent eruption but there are volcanoes where you can't reach the summit on foot," Roberts said. But with a drone, "you can take measurements … without putting yourself in danger".

Skimming over rocks speckled with yellow sulfur crystals deposited by the fumaroles, "Tina" soon reappears on the horizon.

A new challenge awaits the drone — Mount Etna, the 3,000 meter-high active volcano in eastern Sicily, where a new eruption had just occurred in early July.

India police clash with 'Cockroach' activists

Protesters clash with police behind barricades in New Delhi on Monday during a demonstration calling for the resignation of the education minister. ARUN SANKAR / AFP

NEW DELHI — Supporters of India's youth-led Cockroach movement clashed with police on Monday as thousands tried to march to Parliament to demand the education minister's resignation, while the government appeared to make its first outreach to the movement's leaders.

Police fired tear gas and charged at protesters with batons when demonstrators tried to breach the barricades surrounding the protest site in central New Delhi, marking one of the most serious confrontations in the movement's campaign against Prime Minister Narendra Modi's government. Despite the crackdown, many protesters continued marching toward Parliament in small groups.

Cockroach Janta Party spokesman Saurav Das accused the authorities of "brutally cracking down" on "peaceful protesters". The Delhi Police said the march had not been authorized and that restrictions were needed to maintain law and order around Parliament during the monsoon session, which began on Monday.

The crowd at Jantar Mantar, a designated site for protests just a few kilometers from Parliament, included students, professionals and families with young children. As the day progressed, the gathering spilled beyond the protest site, with demonstrators filling surrounding streets and roads.

Many carried backpacks with water and food, expecting a long day. Others waved Indian flags as chants against Education Minister Dharmendra Pradhan and Modi rippled through the growing crowd.

The Cockroach Janta Party emerged in May, after the Supreme Court chief justice compared some unemployed young people to "cockroaches" during an unrelated hearing. Supporters embraced the remark, turning it into a satirical movement that has attracted millions of followers on social media.

The movement gained momentum after repeated leaks of high-stakes entrance exams for medical colleges and government jobs sparked public anger. It drew wider attention after police forcibly moved hunger-striking activist Sonam Wangchuk to the hospital on Saturday.

Protesters calling themselves "cockroaches" have camped at Jantar Mantar for the past month, with members of several student groups joining Wangchuk's hunger strike. Thousands of supporters have also turned out at universities and rallies in other cities.

They are demanding the resignation of Pradhan, reforms to the examination system and compensation for the families of students who died by suicide following paper leaks.

Senior leaders in Modi's government have taken a hard line against the movement. Pradhan has accused the protesters of acting against the nation, while other ministers have acknowledged students' concerns but insisted there is no need for talks or negotiations with the movement.

However, that appeared to shift on Monday, when representatives of the movement held talks with Health Minister J. P. Nadda. It was the first apparent sign of government outreach to protest leaders, who sought to bring their demands directly to lawmakers, prompting the authorities to tighten security around the Parliament building.

Burnham vows stability as he takes office as UK's PM

By EARLE GALE in London
earle@mail.chinadailyuk.com

The United Kingdom's new Prime Minister Andy Burnham delivers a speech outside 10 Downing Street in London after taking office on Monday. ISABEL INFANTES / REUTERS

The United Kingdom's new prime minister — the country's seventh leader in just over a decade — started his time in office on Monday by promising much-needed stability.

Claiming to have a 10-year plan, Andy Burnham, the former mayor of Greater Manchester who wrested control of the nation from predecessor Keir Starmer, said in his first speech as prime minister that it was a moment for "honesty and reflection", not "triumphalism".

"I'm not saying that means I'm setting out to say I'm going to be here for 10 years," he said. "It's more that we're not in the right place structurally."

Speaking from 10 Downing Street, he said he plans to offer the British people "more breathing room" and "responsible" decision-making to restore their confidence in government.

"Britain needs to show the world that we can regain our stability once again, and that is our challenge: to make politics work, to make it work better," he added.

Burnham, who was declared leader of the ruling Labour Party on Friday, became prime minister on Monday, after he and Starmer met King Charles III to formally pass the baton.

The new prime minister also said many people in the country feel as though the nation is in decline and that they "don't have the ability to turn things around".

"That's why we will change politics to make it more collaborative, more about problem-solving than point-scoring, and we will take power out of here (London) and carry it into every postcode in the land," he said. He also promised to "build a new economy" where "life's essentials" are under public control, "to make them affordable to you again, reindustrializing Britain using public procurement to back British industry".

Burnham took over as prime minister after Labour Party members of Parliament became frustrated with Starmer's leadership style, which some said was uninspiring. It followed Starmer's much-criticized appointment of Peter Mandelson as the UK's ambassador to the United States. Mandelson was believed to have been close to the late convicted sex offender Jeffrey Epstein. Labour Party MPs also lost confidence in Starmer after the party did poorly in recent local elections.

Despite Starmer having led the Labour Party to a landslide win in the general election of July 2024, disgruntled Labour Party MPs persuaded him to resign, clearing the way for Burnham to stand unopposed as party leader, which meant, under party rules, that he became its automatic choice for prime minister. He will not need to contest a general election until Aug 15, 2029, unless he decides to seek an earlier mandate.

Burnham, who becomes the UK's 59th prime minister and its eighth from the center-left Labour Party, plans to use the ongoing six-week summer recess, during which Parliament is closed, to go on a "listening tour" of the UK, to hear what issues are important to people.

Kenya targets bigger tea exports to Chinese market

By VICTOR RABALLA
in Nairobi, Kenya
victor@chinadailyafrica.com

Kenya is seeking to deepen cooperation with China in tea production, technology transfer and market access as it positions itself to expand exports to the world's largest tea-consuming nation, the Tea Board of Kenya says.

Willy Mutai, the organization's CEO, said Kenya is leveraging China's zero-tariff policy and strengthening collaboration with Chinese investors to unlock new opportunities across the tea value chain.

The board is working closely with producers to ensure Kenyan tea, a primary agricultural commodity in the country, meets international quality standards through farmer training, advisory services and market promotion initiatives, Mutai said.

"We cherish the opportunity that Kenyan tea is among the products enjoying zero tariffs in the Chinese market," he said.

"The preferential access presents a major opportunity to diversify export destinations and increase tea sales to China."

Kenya and China are also collaborating on tea standards and production technologies, with several Chinese companies already investing in Kenya's tea processing sector, he added.

Three companies have introduced Chinese tea-processing technologies in Kenya, Mutai said, while a tea factory is already operating with Chinese equipment tailored to produce products preferred by the Chinese market.

He urged more Chinese firms to obtain export licenses and source tea directly from Kenya.

"Kenya is prepared for any investor to export and buy tea. We already have Chinese companies exporting tea from Kenya to China," he said.

In addition, the two countries are exploring an online tea auction platform in the next three months, a move expected to enhance trade efficiency and improve market access for buyers and sellers.

Kenya remains one of the world's leading tea producers and the largest exporter of black Crush, Tear and Curl tea.

While traditional markets such as Pakistan, the United Kingdom, Sudan and Afghanistan continue to dominate exports, the country is increasingly targeting China as a strategic growth market.

The Tea Board of Kenya projects significant growth in value-added tea products, particularly green tea and specialty teas favored by Chinese consumers.

Diversification efforts

Mutai said Kenya aims to produce nearly 200 million kilograms of green and orthodox teas by 2030 as part of efforts to diversify beyond conventional black tea.

Chinese consumers place a premium on quality, food safety and product traceability, areas where Kenyan tea enjoys a competitive advantage, he said.

"Kenyan tea is produced with minimal pesticide use due to favorable climatic conditions and is backed by strong agricultural practices and quality assurance systems," he said.

Beyond trade, the partnership has expanded into research, training and skills development.

Mutai said Kenyan tea producers and researchers regularly undergo training in China, while joint projects between institutions are helping develop new varieties and products.

"We are working together to develop climate-resilient tea cultivars that are high-yielding, drought tolerant and disease resistant," he said.

Kenyan researchers have developed 62 tea cultivars with various attributes through breeding programs that leverage both traditional and molecular techniques, he said.

The cultivars will enable farmers to adapt to varying agroecological zones while reducing vulnerability to climate change, he added.

The Tea Board of Kenya is also collaborating with Chinese partners on tea processing machinery, energy-efficient technologies and product innovation to enhance productivity and value addition.

Guo Haiyan, Chinese ambassador to Kenya, said agriculture remains the foundation of food security, economic development and social stability in Africa.

"As China and Africa continue to deepen cooperation under the framework of the Forum on China-Africa Cooperation, agricultural modernization has been an essential area for mutually beneficial partnership," she said.

US deaths hit 17 as Iran war 'unpopular'

By SHI GUANG in New York
shiguang@chinadailyusa.com

US missile strikes continued to rain down on Iran for a 10th day after US President Donald Trump said he would punish the country for the deaths of US soldiers in the region.

"Every time Iran kills an American Soldier they will pay for that killing many times over!" Trump posted on Truth Social on Monday.

So far, 17 US military personnel have been killed during the war, which is becoming increasingly unpopular.

Trump said the latest ongoing strikes were "in honor" of three US soldiers killed in recent attacks by Iran.

Two US soldiers were killed in an Iranian strike on Muwaffaq Salti Air Base in Jordan on Friday, while another died in Iraq during the controlled detonation of a downed Iranian drone.

Pentagon spokesperson Sean Parnell posted on X on Monday that "nearly 100 service members" have been injured since July 7, most of them minor.

US Central Command said the US targeted military command centers, air defense and coastal surveillance sites, maritime capabilities, missile and drone launch sites, and communications networks.

"Iran has been very, very badly damaged. They've lost everything almost militarily. They've got very little left," Trump said. "We hit them very hard again tonight."

Retaliatory strikes by Iran have included attacks on neighbors such as Kuwait, where a power and desalination plant was hit, as well as Jordan and Bahrain.

Iran's Speaker of Parliament Mohammad Bagher Ghalibaf said that recent US actions showed that Washington wasn't serious about wanting peace.

"Americans keep bringing new military equipment to the region and claim they want to stop the war," Ghalibaf posted on X. "They've bet on our intelligence being as low as their own IQ."

"We've reached the stage of mastery in recognizing these American games, and on that basis, we've prepared ourselves," he posted. "Actions must confirm claims, not contradict them."

Iranian President Masoud Pezeshkian said in a statement on Monday that, "the reality is that today the Islamic Republic of Iran is engaged in a full-scale war".

"We must be realistic and accept the natural consequences of this resistance," he said.

Recent surveys show that the war is very unpopular in the US.

A Washington Post-Ipsos poll last week showed that 68 percent of Americans said the war in Iran was "not worth fighting", while only 28 percent said it was.

That difference of 40 percent is higher than negative opinions about the wars in Iraq or Afghanistan. The most negative views about Iraq, in 2007, found that 66 percent of Americans said it was "not worth fighting", though 33 percent supported it. Notably, the higher numbers against the war in Afghanistan didn't peak until almost eight years into the conflict. In Vietnam, it took more than six years. Conversely, it took only two months for 61 percent of Americans to say the Iran war was "a mistake", CNN reported.

However, unlike Iraq, which 36 percent of Americans thought was "the most important problem" facing the US in 2007, those thinking the same of the war in Iran are in single digits, CNN reported.

Antiwar activist Eric Sheehan had helped organize protests outside Los Angeles Stadium during the recent FIFA World Cup, saying he wanted to "tell the world" that FIFA was using the World Cup to "sportswash" the US.

"We don't think that weapons of war should be used to change governments and to upset sovereignty throughout the world, like the US has done through its whole history," he told Mirror US Sports during the protest.

"The US waging war is wrong," he said. "No matter the conditions inside the country, it's not the US' job to interfere with sovereignty throughout the world."

Power on the paddies

Editorials

Kimi K3 moment should prompt some to rethink AI's future for common good

Whenever a Chinese artificial intelligence lab drops a new high-performance model, there are observers in the United States who lose their composure. After DeepSeek in 2025, it happened again last week, when Moonshot AI released Kimi K3 — a 2.8 trillion-parameter open weight model that scored an Elo rating of 1679 on the Frontend Code Arena leaderboard, surpassing both Anthropic's Claude Fable 5 and OpenAI's GPT-5.6 Sol on this specific coding benchmark.

Executives at the US' leading closed model AI labs began floating ideas about how to stop the open source "menace" — not by building better models, but by enlisting Washington to create "regulatory risk" around Chinese open weight models.

Ironically, the country that invented a large part of the modern tech industry through open standards and competitive markets is now debating whether to use the power of the state to protect a handful of companies from competition.

The US' leading closed model labs — essentially a duopoly of OpenAI and Anthropic — have spent years arguing that their models are too dangerous to open source. Now, their defenders are suggesting that the US administration should manufacture fear, uncertainty and doubt around Chinese alternatives to keep them out of the market.

Dean Ball, OpenAI's new head of strategic futures, was refreshingly candid about this on X. He acknowledged that Kimi K3 is "a very good model" whose performance cannot be "explained away by distillation or anything like that". Then he urged the US administration to "create large amounts of regulatory risk around the use of open weight Chinese models" — not through outright bans, but through "soft law" that creates FUD (fear, uncertainty and doubt).

This is "regulatory capture" dressed up as "national security". As David Sacks, the venture capitalist who now cochairs the President's Council of Advisors on Science and Technology, put it: "The leading closed labs, already a duopoly in terms of AI model revenue, want the government to eliminate their open source competition. They have laid their cards on the table."

China has achieved frontier-level AI performance at a fraction of the cost. Kimi K3's API pricing is $3 per million input tokens and $15 per million output — roughly one-third to one-fifth the cost of comparable US models. And Moonshot AI has announced it will release the full model weights soon, meaning anyone with sufficient compute can run it on their own infrastructure without paying per-token fees. That would be unimaginable for the US companies that charge high fees on tokens.

But the real story here is about two different philosophies of AI development colliding. The US closed model is built on concentration: a handful of corporations and the US government standing at the apex of the AI pyramid, nurturing and reaping the benefits of everything beneath them. It is an architecture where a small number of gatekeepers decide who gets access to frontier capabilities and at what price. The Chinese open weight approach is more inclusive.

These two paradigms differ on many fronts, from profitability and costs to data acquisition, application scope, iteration efficiency and the boundaries between public interest and private gain. The over 40 participants of the Global Partnership on Artificial Intelligence and the founding members of the World Artificial Intelligence Cooperation Organization — established in Shanghai last week — should not devolve into two camps. The world does not need a Cold War replicated in the AI era.

The deeper question is whether the US can adapt to a world in which it no longer holds a monopoly on cutting-edge AI. The Kimi K3 moment should be the beginning of a reckoning. Will Silicon Valley respond with innovation or with "regulatory capture"? If AI is to serve humanity, the world must find the wisdom to resist the zero-sum temptations of shortsightedness and anxiety.

Washington's bullying of Europe hypocritical

The US State Department's latest proposals reported by the Financial Times on Sunday to finance "free speech" initiatives across Europe with tens of millions of dollars reveal a contradiction that extends far beyond ideology: Washington spending public money to influence political debates in Europe while insisting that foreign governments must never do the same in the United States.

If Brussels were to establish a multimillion-euro program supporting organizations campaigning against Republican or Democratic policies inside the US, the reaction on Capitol Hill would be immediate and furious. The same principle somehow becomes more flexible when the direction of influence runs across the Atlantic.

Behind the lofty language lies the true objective: protecting US economic interests by weakening European regulation from within. The ostensible target of this largesse is the European Union's Digital Services Act and Digital Markets Act — regulations that were debated, amended and passed through the full legal machinery of the European Parliament and member states. They are laws designed to protect European users from disinformation, hate speech and the monopolistic abuse of a handful of tech giants, particularly those from the US that dominate the EU market.

Yet Washington has decided that these EU enactments constitute "censorship" and must be resisted from within. Reducing years of painstaking European legislation to mere "censorship" requires an extraordinary act of political simplification.

The proposed $2 million grant to "counter censorship" stemming from EU rules, the $5 million for a "civilizational alliance" in Europe, the $5 million earmarked for Free Speech Union International, the $7 million floated for think tank 878 — this is not a serious program of civic engagement. It is part of broader efforts to bankroll political factions that will do the US' bidding.

And what is that bidding? The DSA allows for fines of up to 6 percent of global turnover. The DMA targets six "gatekeeper" companies — mostly from the US. Alphabet, Apple, Amazon, Meta and Microsoft have faced billions of euros in penalties. The US response is not to compete, not to innovate, not to adapt and improve. It is to send US taxpayer money to European lobbying groups and organizations, if not activists, who will do the work of questioning Europe's laws. It is difficult to ignore that the regulations attracting Washington's greatest concern happen to be those imposing the highest costs on the US' biggest corporate champions.

The timing is hardly accidental. As Brussels moves to complete ratification of last July's transatlantic trade agreement — brokered by European Commission President Ursula von der Leyen and widely criticized across Europe as being tilted in Washington's favor — the funding proposal serves as a pointed reminder that the digital rule book remains unfinished business. Rather than accepting the DSA and DMA as settled European law, Washington appears determined to keep them at the heart of future transatlantic bargaining, using the language of "free speech" to reopen what Brussels considers a closed legislative chapter.

The US administration also wants to mobilize internal European opposition to the very regulations that the US tech lobby finds so inconvenient. Such tactics carry risks extending well beyond trade. Supporting organizations identified with Europe's conservative and anti-establishment movements inevitably export the US' own cultural conflicts into societies with very different political traditions. Europe's postwar prosperity has largely been based on consensus-building and institutional compromise rather than perpetual ideological mobilization. Injecting US-style polarization politics into that environment serves neither European stability nor transatlantic unity.

Mainstream parties from center-left to center-right in Europe should be alarmed. They are being told, in effect, that their "democratic legitimacy" is secondary to Washington's commercial interests.

Perhaps the most troubling aspect of this episode has been the muted response from much of Europe's senior leadership. Brussels has consistently defended its regulatory autonomy whenever challenged, yet its reaction to this unusually explicit US attempt at political influence has been notably restrained. Strategic silence risks conveying the message that such interference falls within acceptable diplomatic practice.

The attack is part of a systematic US assault on the very idea that Europe has the right to govern itself. US Vice-President JD Vance laid bare that message in his speech at the Munich Security Conference last year. He lectured European leaders that the continent's principal danger came not from external threats but from ones that he claimed came from within — the erosion of democratic norms, particularly censorship, the suppression of dissent and the exclusion of populist voices from public discourse.

If "freedom of expression" becomes just another geopolitical instrument wielded in pursuit of commercial advantage, both sides of the Atlantic will discover that trust is far harder to rebuild than regulations are to rewrite. Yet the more the US tries to bend Europe to its will through coercion and interference, the more it may inadvertently accelerate the very trend it tries to avoid: European strategic autonomy. That would be the ultimate irony of this ill-conceived venture.

Shanghai piloting research model built on patience, support and agility

By wielding an unusual combination of long-term strategic patience and real-time institutional agility, Shanghai is forging a distinctively Chinese model for original innovation — one that tolerates failure, rewards long-haul risks and bridges the "valley of death" between lab benches and hospital beds.

As the core engine of the Shanghai (Yangtze River Delta) International Science and Technology Innovation Center, Shanghai is steadily consolidating its role as a pivotal source of original innovation through system reforms.

Shanghai's edge lies in bold institutional experimentation across diverse platforms. The Interdisciplinary Research Center on Biology and Chemistry, launched in 2012, for instance, is implementing innovative basic research mechanisms by breaking disciplinary silos and adopting a performance evaluation system centered on substantive contributions — a move to break the "four-only" criteria of papers, titles, diplomas and awards. Backed by five-to-10-year stable funding for research, it has established a problem-oriented research paradigm.

The Tsung-Dao Lee Institute, meanwhile, has built a globally calibrated governance system, recruiting 150 researchers from 16 countries and regions and implementing phased assessments focused on potential rather than papers.

And launched in 2024, the Shanghai Academy of Natural Sciences is a platform that abandons traditional project applications and consensus-based review. Instead, it uses active global talent scouting to support non-consensus, high-risk research with multiyear grants.

Complementing these organizations, the Shanghai Innovation Institute practices an integrated model centered on AI frontier research, innovating a mentor-student co-creation mechanism that effectively connects basic research, talent incubation and industrial transformation. This has yielded breakthroughs in the form of aerosolized broad-spectrum neutralizing antibodies.

The complementary strengths of these platforms are vividly illustrated in the work of researcher Liu Cong. Supported simultaneously by IRCBC's long-cycle assessment and SANS' non-consensus funding, his team has conducted decade-long research on Parkinson's disease. Under conventional three-year evaluation cycles, this project — which yielded few publications in its first five years — would likely have been terminated. Instead, the institutional safety net carried the team through the difficult phase of molecular screening. The result: an innovative PET molecular tracer enabling early presymptomatic diagnosis, validated through 150 clinical trials, commercialized via SynuSight Biotech, and backed by the Michael J. Fox Foundation — a complete chain from basic discovery to clinical application.

Shanghai has rolled out systematic policies to reinforce its innovation ecosystem. In July 2025, it issued management measures for the Explorer Program, which align basic research with industrial needs via public-private co-investment, with corporate partners contributing no less than 3 million yuan ($443,000) annually while strict rules safeguard research originality. By November 2025, 54 projects had secured a total of 52.9 million yuan in funding, with early signs of "zero-to-one" breakthroughs. In 2025, Shanghai also launched the Qiyuan Innovation Foundation — the country's first State-owned capital public welfare foundation dedicated to basic research — raising nearly 100 million yuan to support national strategic priorities.

Underpinning these advances is robust investment. China's national R&D intensity reached 2.8 percent in 2025, with basic research accounting for a record 7.08 percent of total R&D spending. Shanghai outperforms these benchmarks: Its R&D intensity stands at 4.5 percent, with a 2026 target of 4.6 percent, and its basic research proportion has reached 12 percent — approaching the level of developed economies such as the United States (15-17 percent) — signaling a shift from quantitative catch-up to structural optimization.

In the race for tech supremacy, Shanghai's pilot zone for basic research serves as a national stress test. By replacing shortsighted utilitarianism with a long-cycle ecosystem, Shanghai is cultivating the soil for transformative discoveries, demonstrating that true originality cannot be mandated, but it can be enabled.

What They Say

New consumption needs to be further encouraged

Editor's note: *The total retail sales of consumer goods registered a 1.3 percent year-on-year increase in the first half of the year, according to data released by the National Bureau of Statistics last week. Jia Kang, a researcher at the Chinese Academy of Fiscal Sciences, spoke to National Business Daily to explain the reasons behind the uptick. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

In recent years, the authorities have rolled out a suite of policies to boost consumption. These measures, including trade-in programs for consumer goods, prize invoices and interest subsidies for personal consumption loans, have played a vital role in stabilizing consumer spending. While it takes time for the effect of policies to materialize, these measures have mitigated the downward pressure on consumption and boosted optimism about future consumer spending.

The fluctuation the total retail sales of consumer goods saw in the first half of the year can be attributed to several factors, including consumer expectations that have made people save for precautionary purposes.

Another factor is the mixed performance of macroeconomic indicators. For example, investment and consumption have surged in sectors related to artificial intelligence and the digital economy, but some non-high-tech and non-cutting-edge industries have lagged behind. As a result, China's consumption is undergoing a structural transition.

The shift in the preferences of Chinese consumers in recent years is resulting in a structural divergence in consumption patterns. Service consumption registers robust growth, with people increasingly willing to pay for emotional value. In contrast, when purchasing physical goods, more consumers are focusing on affordability and value.

To further expand and upgrade consumption, it is essential to boost the supply of goods and services and widen the range of products while simultaneously raising household incomes and improving consumer expectations. For instance, yacht trips, once a luxury purchase exclusively for the wealthy, have gradually become a leisure activity for ordinary consumers in recent years. Drawing from the experience of developed economies, there is great potential for expanding the consumption of yacht and cruise trips in China.

In the first half of the year, consumption acted as a stabilizer for China's economy, providing a solid foundation for growth.

Foreign trade also delivered a stellar performance during this period. Projections indicate that this year China's imports and exports will surpass those in previous years and make a larger contribution to the country's economic growth.

As for fixed-asset investment, it's important to adopt a problem-oriented approach. Efforts should be stepped up to scale up effective investment, shift the focus from quantitative expansion to quality improvement, and remove bottlenecks and barriers that hinder investment growth.

To promote investment, the government has released a list of projects to advance major national strategies and enhance security in key sectors. It is also planning on building six key infrastructure networks: water, new-type power grids, computing power, next-generation communications, urban underground pipelines, and logistics.

Through these initiatives, the government is boosting investment in infrastructure. Sustained government spending in this area will facilitate the recovery of investment across all sectors, galvanize private investment, and encourage private capital to participate in infrastructure development. Greater enthusiasm among private investors will in turn generate sustained momentum for economic growth.

Virdika Rizky Utama

Building an AI future shared by all

Artificial intelligence is rapidly reshaping production, governance and daily life. President Xi Jinping's address at the 2026 World Artificial Intelligence Conference in Shanghai gave this transformation a clear direction by placing openness, security, cultural diversity and international cooperation at the center of global AI development.

President Xi's four observations present a practical framework for ensuring that AI benefits all countries even though they may have different political systems, economic structures and cultural traditions. This is especially important for the Global South. Many developing countries are adopting AI, but access to advanced computing, technical expertise and standards remains uneven.

China's approach addresses this imbalance through cooperation rather than exclusion. By combining innovation with capacity building, Beijing is helping developing countries participate in the AI era on more equal terms.

The initiatives announced in Shanghai underscore that commitment. China will provide 5,000 AI training and seminar opportunities for developing countries over the next five years, establish international AI application cooperation centers with major regional organizations, and help 30 countries use the AI-powered meteorological warning system MAZU.

Training is one of the most effective ways to broaden participation in technology. China's initiative can help create a larger pool of professionals who can understand, evaluate, and deploy AI, strengthening domestic institutions while building long-term cooperation across Asia, Africa, the Arab world, and Latin America.

The proposed cooperation centers will help deepen that effort by creating platforms for joint research, technical exchange, local-language development and practical experimentation.

MAZU demonstrates how this model works in practice. AI-powered meteorological early warning can improve preparedness for floods, storms, droughts and extreme weather while protecting lives and reducing economic losses. It also shows how China is converting AI capacity into a global public good for vulnerable communities.

China's broad industrial base gives it a distinctive role in global AI cooperation. Beyond developing models, China is integrating AI into production systems and public services on a large scale, creating an innovation model closely tied to economic development.

LI MIN / CHINA DAILY

United Nations Conference on Trade and Development projects that the global AI market could reach $4.8 trillion by 2033. Such growth makes inclusive participation an economic necessity, not merely a policy concern.

If most countries remain mere consumers of AI, inequality will deepen and global growth will weaken. A future built around shared capability would expand markets, enhance productivity, and create new opportunities for cooperation.

China's emphasis on openness directly addresses this challenge by promoting open-source development, international exchange, and wider access to AI applications, helping more countries adapt AI to their specific needs.

President Xi's call to resist the excessive expansion of national security concepts is equally significant. Security is essential, but it should not be used to justify technological blockades or preserve monopolies.

An AI landscape divided into rival blocs would increase costs, fragment standards and reduce opportunities for developing economies. China's approach, however, emphasizes cooperation, mutual benefit and respect for national choices.

Cultural diversity is equally important. AI cannot serve humanity effectively if it is built around only a few languages, datasets and social experiences. Incorporating cultural diversity into datasets, models and applications will make AI more accurate, more useful and more representative.

President Xi's emphasis on mutual learning among civilizations highlights a broader principle: AI should strengthen cultural expression rather than impose a single technological template on societies with different histories and identities.

China's growing investment in open models, application platforms and international cooperation creates practical space for this diversity.

Developing countries can use these opportunities to build systems more closely aligned with their own languages and public needs.

Global governance must support this objective. AI rules should reflect the interests of both technologically advanced economies and developing countries.

President Xi's call for a stronger UN role points toward more inclusive AI governance beyond rival technological camps.

The World Bank has emphasized that meaningful AI adoption depends on connectivity, computing capacity, local context, and technical competence. China's initiatives address these foundations through training, cooperation, open development and infrastructure partnerships.

The Shanghai agenda stands out for linking governance with implementation and connecting global principles with national needs.

President Xi's leadership has given strategic clarity. AI should remain under human control, serve development and advance through cooperation, giving the Global South not only access to new tools, but also a stronger voice in shaping the global AI order.

The future of AI will be defined not only by technological power, but by whether it improves lives across regions and levels of development.

China's proposals suggest a path in which openness, capacity building, cultural respect and practical cooperation can make AI a shared engine of global progress rather than a privilege of the few.

Yasiru Ranaraja

Award riddled with legal defects and biased proceedings

A recent joint statement by 14 countries, including the United States, Japan and the Philippines, has once again put the spotlight on the 2016 South China Sea Arbitral Award. The statement asserts that China's maritime claims lack a "legal basis" and reiterates that the decade-old ruling remains final and binding. While such declarations are framed as a defense of the rules-based international order, a closer examination of the 2016 award reveals foundational cracks that cannot be overlooked by repeating that narrative.

Ten years have passed since the Permanent Court of Arbitration (PCA)-administered tribunal issued its ruling, but the dominant Western discourse continues to ignore the legal flaws that marred the arbitration from the outset. International law is not a tool for geopolitical convenience.

It relies on strict adherence to principles such as state consent, jurisdictional limits, and treaty design. Ignoring these principles undermines the credibility of the entire international legal framework.

The most glaring defect of the 2016 arbitration was its brazen disregard of the principle of state consent. Unlike domestic legal systems, where individuals are automatically subject to the jurisdiction of courts, international adjudication requires sovereign states to explicitly agree to submit their disputes to a tribunal.

From the day the Philippines unilaterally initiated the arbitration in 2013, China consistently maintained a policy of non-participation and non-acceptance.

It was not merely a political boycott but a defense of sovereign rights. Under international law, a state cannot be forced into compulsory arbitration over matters it has explicitly refused to arbitrate. By proceeding without China's consent, the tribunal moved into legally uncharted territory, setting a problematic precedent where international bodies might override the explicit objections of a sovereign state.

Critics often argue that by ratifying the United Nations Convention on the Law of the Sea, Beijing automatically consented to its compulsory dispute-settlement mechanisms.

But this argument overlooks the safeguards built into the treaty. Under Article 298 of UNCLOS, member states have the explicit right to exclude specific categories of disputes from compulsory arbitration, including disputes relating to maritime boundary delimitation, historic bays or titles and military activities.

China formally invoked this article in 2006, filing a declaration that excluded all such disputes from third-party adjudication. It was not an evasion of international law, but the exercise of a right expressly permitted by UNCLOS to protect vital national security and sovereign interests.

But the tribunal in The Hague bypassed this valid reservation and accepted Manila's reframing of the dispute as an interpretation of maritime features rather than a boundary delimitation. By overriding a state's lawful Article 298 declaration, the tribunal altered the terms under which states originally agreed to sign UNCLOS, signaling to the global community that treaty-based reservations could be bypassed through creative legal drafting.

A fundamental limitation of UNCLOS is that it governs maritime rights, such as exclusive economic zones, continental shelves and territorial seas, but not sovereignty over land territory. Questions of territorial ownership fall under customary international law, not UNCLOS.

The dispute between China and the Philippines in the South China Sea is fundamentally about territorial sovereignty over the Nansha Qundao and Huangyan Dao. Since UNCLOS could not rule on territorial ownership, the legal submissions of the Philippines focused strictly on the status of the maritime features themselves.

By accepting this framing, the tribunal crossed a legal boundary. It is not possible to determine the maritime entitlements of a feature without first establishing which country holds sovereignty over it.

By ruling on the nature and rights of features occupied or claimed by China, the tribunal effectively adjudicated a sovereignty and boundary dispute. This amounts to judicial overreach, expanding the tribunal's mandate far beyond what UNCLOS intended.

Another major flaw in the 2016 award was its dismissal of China's historical rights. China's involvement in the South China Sea spans centuries of state practice, navigation, and economic activity, which formed the basis of its historical claims. The tribunal ruled that any historical rights were extinguished when China ratified UNCLOS, treating the treaty as the sole source of maritime entitlements. This interpretation caused significant concern among international legal scholars.

International law does not exist in a vacuum, nor does a single treaty erase centuries of established practice. Customary international law and treaty law generally co-exist and complement each other.

By deciding that a modern treaty completely invalidates pre-existing historical rights built through long-standing state practice, the tribunal adopted a rigid, highly contested interpretation of international law that sidelined the historical context of the region.

The legitimacy of any judicial body hinges on its perceived neutrality. Throughout the 2016 proceedings, questions regarding the tribunal's impartiality have persisted. Critics often point to the composition of the arbitral panel.

After China refused to participate, four of the five arbitrators were appointed by the then-president of the International Tribunal for the Law of the Sea, Japanese diplomat Shunji Yanai. Given the parallel maritime and territorial disputes between Japan and China in the East China Sea, the appointments raised concerns about institutional bias.

Furthermore, the tribunal's legal reasoning closely mirrored the long-standing geopolitical and maritime policy positions of the US, a nation that has refused to ratify UNCLOS itself. The alignment between the tribunal's radical legal interpretations and the strategic interests of non-party Western nations gave the impression that the proceedings were influenced by geopolitical objectives.

The controversy surrounding the 2016 award extends beyond the geopolitical rivalry between Beijing and Manila.

Over the past 10 years, an increasing number of international legal experts, academics, and diplomats have voiced concerns about the long-term implications of the ruling.

By engaging in judicial overreach, ignoring lawful treaty reservations, and proceeding without state consent, the tribunal did not resolve the South China Sea dispute, but complicated it further. It set a problematic precedent that undermines the predictability and stability of the UNCLOS dispute-settlement system.

If formal declarations under Article 298 can be ignored or bilateral territorial disputes can be unilaterally forced into international courts through clever reframing, states may be hesitant to participate in multilateral treaties or utilize international legal bodies in the future.

No amount of coordinated joint statements or diplomatic pressure can transform a legally flawed and controversial ruling into an unquestionable dictate. True respect for the international legal order requires that rules be applied consistently and fairly, not selectively to advance geopolitical agendas.

Resolving the complex disputes of the South China Sea will not be achieved through flawed legal declarations, but through direct, bilateral negotiations grounded in mutual respect and historical reality.

So much food in my fridge, but am not complaining!

I began cooking when I was 12 years old. One fine day, I picked up the kitchen knife and the rolling pin, not because I wanted to but because if I didn't turn flour into noodles, my elder brother and I would have had to starve during lunchtime.

My parents, both working, were unable to come home to prepare lunch for us. My elder brother was in middle school and I in primary school. As his morning classes ended half an hour later than mine, the important responsibility of cooking for both of us fell upon me.

Nobody taught me anything. I picked up cooking mostly by observing how my parents trimmed, washed, cut and fried vegetables and how they turned flour into noodles and steamed buns.

There wasn't much to learn, anyway, growing up during a food scarcity in a northwestern city half a century ago. Even the best chefs could not have churned out something from nothing in those times. So, for a long time, my lunch remained simple: noodles plus pickles.

My cooking skills improved when I gained access to more kinds of ingredients while attending university in Shanghai.

There, for the first time, I saw and ate shrimp, crabs, saltwater fish and many vegetables that are popular only in South China.

An eager learner, I asked my classmates from different parts of China how they cooked their food, and surprised people back home by rustling up a very different kind of meal during the Spring Festival holiday that year.

My cooking career peaked in 1984 when I was studying in Honolulu in the United States. To express my gratitude, I sometimes invited my professors to dinner in my dorm building.

Returning home after work, the first thing I usually did was to rush into the kitchen, and put on my apron.

It must have been one of my journalism professors who told a local daily about my cooking skills, because soon a reporter and a photographer from there approached me for an interview.

I treated them to dumplings, braised chicken legs, mock crab roe eggs and sour and spicy shredded potatoes etc. I got the ingredients cheap — as a poor student who lived on $300 a month, cheap ingredients were all I could afford.

A few days later, the newspaper devoted half a page to my cooking skills. It carried a huge photo of me smiling while standing next to the stove, wearing an Aloha shirt and holding a chopping knife.

It was the first time I had been interviewed by a newspaper while learning reporting skills from the Americans. I was disappointed that only my poor cooking skills, and not my other talents, made headlines.

That publicity probably helped me retain my interest in cooking for the rest of my life. While enjoying food from other countries and from different regions, my interest lay, very often, not merely in the taste or the flavor but in speculating how it was cooked.

Returning home after work, the first thing I usually did was to rush into the kitchen, and put on my apron. The kitchen had become my battlefield where I struggled with crabs, shrimps and chicken, be they alive or dead.

Since retiring several years ago, I have been cooking three meals a day for my family. But after 55 years of doing this, I find cooking for my family more and more difficult.

Each morning at the breakfast table I ask the others what they want to have for dinner — beef, mutton, fish, shrimp, chicken or pork.

Once we decide on the meat, I ask if they want it fried, boiled, steamed, braised or roasted. Once that is settled, my last question to them is what flavor they want — spicy Sichuan, sour Guangxi or sweet Shanghai.

Deciding what to eat is the easier part. Cooking at home is becoming more complicated by the day. Thanks to online grocery stores and express delivery, raw ingredients from around the world — such as salmon from Norway, beef from Australia and avocado from Mexico — have made it to my refrigerator.

Inside the deep freeze compartment of my refrigerator are six or seven kinds of fish, some I can't even name. But I have no clue if they are good for roasting or steaming. I have the same doubts when I pick up the vegetables — some I have never come across before.

But then, in the past 50 or so years, I have experienced both food shortage and surplus. So, when I complain about food abundance, I am not serious. Trust me, I am not serious at all.

GLOBAL VIEWS

WANG XIAOYING / CHINA DAILY

BAO ZHIPENG

A new engine for globalization

At a time of fragmentation, 'China Opportunity 2.0' shows that inclusive cooperation will address global challenges

At a time when the global economy and trade are undergoing profound systemic restructuring, China — under the leadership of the Communist Party of China, which marks its 105th anniversary this year — is advancing national rejuvenation through Chinese modernization and pursuing high-standard opening-up to bring certainty to a volatile world.

Elsewhere, deglobalization undercurrents, resurgent trade protectionism, populism and economic nationalism have fragmented industrial chains, while new rules governing services, digital trade and green trade are being rewritten worldwide.

At the Summer Davos forum in Dalian in June, China introduced "China Opportunity 2.0", showcasing how China's consistent reform and opening-up has turned it from a key participant of globalization to a leading player in helping reform the global economic order, laying out a new blueprint for mutually beneficial globalization.

The first phase of China's global opportunity revolved around low-cost manufacturing dividends. After the end of the Cold War, there was a vertical division of global value chains on a global scale, and China integrated into global production networks relying on its demographic and scale advantages to become the world's factory. This phase boosted global productivity, stabilized consumer prices worldwide and became a core driver of globalization. Yet the old growth model is now constrained by two seismic shifts: the digital, intelligent and low-carbon technological revolution reshaping industrial geography, and the geopolitical fragmentation that is eroding the traditional cross-border production cooperation. Unlike the cost-driven, factor-based openness of the past, "China Opportunity 2.0" centers on innovation-driven growth, institutional opening-up, complete industrial ecosystems and a supersized domestic market.

First, innovation dividends replace scale dividends as the core growth engine. China boasts one of the world's richest testing grounds for new technologies and concepts, turning laboratory breakthroughs into scalable commercial solutions at unmatched speed. According to the National Bureau of Statistics, from 2021 to 2025, China's high-tech goods imports and exports registered an average annual growth of 7.9 percent, while in 2025 exports of the "new three" — new energy vehicles, lithium batteries and photovoltaic products — surged 3.5 times compared with 2020, based on the data released by China's General Administration of Customs.

Second, institutional opening-up has replaced commodity and factor-based opening as the core pillar of China's high-standard opening-up drive. According to China's Ministry of Finance, China's overall tariff level has fallen to around 7.3 percent, below its World Trade Organization accession commitment of 9.8 percent. All restrictive market access measures for foreign investment in manufacturing have been lifted, while negative lists governing foreign investment and cross-border services trade keep shrinking. China is actively advancing its accession to the Comprehensive and Progressive Agreement for Trans-Pacific Partnership and the Digital Economy Partnership Agreement, aligning domestic regulations with high-standard international frameworks covering intellectual property, cross-border data flows, competition neutrality and government procurement. Regional cooperation frameworks including the fully implemented Regional Comprehensive Economic Partnership and the upgraded China-Association of Southeast Asian Nations Free Trade Area 3.0 unlock multi-tiered gains from trade liberalization. China also delivers unilateral opening benefits to the Global South.

Third, China's supersized domestic market unlocks new growth space for global enterprises. Home to about 1.4 billion people, accounting for over 17 percent of the world's total population, the country boasts over 400 million middle-income earners — the world's largest middle-income cohort. Its consumer market covers all tiers, from mass basic demand to high-end premium consumption. It is estimated that China's per capita GDP surged from $969 in 2000 to $13,953 in 2025, continuously lifting household purchasing power. Reforms to build a unified national market are tearing down interregional barriers, facilitating the free movement of production factors and translating fragmented market potential into consolidated competitive edges. Flagship expos such as the China International Import Expo, the China International Fair for Trade in Services and the China International Supply Chain Expo act as vital bridges for other developing economies to market their distinctive products to Chinese buyers, integrating more small and medium-sized enterprises into inclusive globalization.

Fourth, China's full-spectrum industrial ecosystems form a key pillar of "China Opportunity 2.0" by enabling deep global industrial collaboration. As the world's only economy covering all UN-listed industrial categories, China's 200-plus mature industrial clusters cut cross-chain coordination costs and speed up the commercialization of global innovations. The country is advancing integrated domestic and foreign trade, expanding intermediate, green and digital trade, and diversifying its overseas markets. Some targeted opening-up pilots in telecom and green sectors can also draw global talent and service providers to jointly advance low-carbon, intelligent industrial upgrading, allowing foreign partners to share the full upstream-to-downstream innovation dividends of China's complete industrial layout.

The structural transformation underpinning "China Opportunity 2.0" originates from the CPC's 105 years of strategic vision. Today's world faces surging unilateralism, partisan polarization in some Western countries and mounting global governance deficits. With the strength of over 100 million members, the CPC has forged a unique governance philosophy centered on people, truth-seeking and global vision, sustained by long-term resolve and self-reform capability. Under its leadership, China has built complete industrial chains, eliminated nationwide poverty and achieved steady modernization, providing other Global South countries with a reference development path beyond Western templates. Globally, China stands firmly on advancing shared development via the four global initiatives and high-quality Belt and Road cooperation, upgrading infrastructure hard connectivity to integrated rules-based soft connectivity and people-to-people heart connectivity that deliver long-term institutional gains for partners worldwide.

"China Opportunity 2.0" is no longer a low-hanging fruit of cheap labor and mass production. It demands deep engagement with China's industrial restructuring, technological research, consumption upgrading and green transition, embedding partners into a new ecosystem built on innovation, institutional openness, massive market potential and shared global responsibility. As China implements its 15th Five-Year Plan (2026-30), it will continue to advance its institutional opening-up on all fronts, expand its high-standard free trade networks and turn its new development momentum into fresh global opportunities. China's commitment to true multilateralism sends a clear message: Economic globalization is an irreversible historical trend. Amid global fragmentation, "China Opportunity 2.0" stands as a reliable anchor for shared growth, proving that instead of "decoupling" or "de-risking", global cooperation in an inclusive manner is the only path to address common global challenges. To embrace shared future gains, the world stands to benefit by integrating into China's innovation ecosystem and tapping its market dividends to jointly forge a more resilient, prosperous global economy.

LU SHASHA

Turning green into gold

Chinese experience in under-forest economy development is providing replicable and green solutions for many developing countries through channels such as the BRI

Beneath China's vast forest canopy, a quiet yet profound green development is transforming the livelihoods of millions of forest dwellers. The under-forest economy, a development model that "brings prosperity without cutting down trees", is emerging as a vivid example of how ecological conservation and rural revitalization can go hand in hand.

Typical cases include the cultivation of *tianma* (*Gastrodia elata*, an orchidaceous medicine herb) in the Wuling Mountains of Southwest China's Guizhou province, the processing of medicinal *lingzhi* mushrooms in East China's Fujian province, forest-medicinal herb symbiosis in Xishuangbanna in Southwest China's Yunnan province and the integrated "forest-fruit-bee-herb" farming in Xingqing district of Yinchuan in Northwest China's Ningxia Hui autonomous region.

By 2025, China's under-forest economy covered 650 million *mu* (43.33 million hectares) of forestland, with a total output value exceeding 1 trillion yuan ($147.18 billion), according to data from the National Forestry and Grassland Administration. The 2025 Government Work Report mentioned the under-forest economy for the first time, marking its elevation to a national strategy. The Outline of the 15th Five-Year Plan (2026-30) for National Economic and Social Development explicitly calls for "developing the under-forest economy and strengthening forest and grassland industries", setting a clear policy direction. Behind this trillion-yuan industry is China's proven practice that ecological protection and economic development can progress in synergy and reinforce each other — an experience that offers a "Chinese solution" for global sustainable development.

Traditional forestry has long faced the challenge of long cycles and slow returns. The under-forest economy fundamentally reshapes this model. Longli Forest Farm in Guizhou has innovated a complementary model that combines long-cycle cultivation of large-diameter timber with short-cycle under-forest planting. Over the past decades, it has generated cumulative comprehensive revenue of 2.125 billion yuan, with total profits of 900 million yuan, and provided stable employment to over 800 rural households. At the Chashoushan Forest Health and Wellness Base in Guizhou's Fenggang county, forest coverage has risen from 78 percent to 82 percent since its launch in 2015, wildlife species have increased from 32 to 58, and wild plant species from 186 to 274, data from the base revealed. Models such as the "common prosperity forest farm" in Fujian, the integrated "forest-fruit-bee-herb" farming in Ningxia, and "supporting konjac cultivation with forests" in Yunnan have all realized the vision of "prosperity without cutting down trees".

At the end of 2025, the National Forestry and Grassland Administration issued the measures for promoting the development of the under-forest economy, systematically covering land use, forest use, investment and technology. It reaffirmed the fundamental principle of "ecological priority" and put forward two basic principles: functional compatibility and integrated spatial use, providing comprehensive policy support for the sector's sustainable development.

These experiments in China are increasing the prominence of the under-forest economy globally. The "long-cycle plus short-cycle" complementary model of Longli Forest Farm has been included as a teaching case in the forestry officials' training program under the Belt and Road mechanism. The interest-sharing mechanism at Fujian's "common prosperity forest farm" was presented as a model of "ecological benefits for the people" at United Nations Food and Agriculture Organization meetings. Fujian's Wuping forest beekeeping and other integrated models have drawn trainees from multiple developing countries for on-site study. China's diverse under-forest economy practices are transforming from local experiments into green solutions shared globally.

China's green technology has benefited the world. Juncao technology is a shining example of how China's under-forest economy has interacted with other countries. Invented in the 1980s by Lin Zhanxi of Fujian Agriculture and Forestry University, this technology uses grass instead of timber as a substrate for cultivating edible and medicinal fungi, fundamentally resolving the long-standing conflict between mushroom farming and forest conservation. Since its first overseas application in Papua New Guinea in 2001, Juncao technology has been extended to 107 countries and regions. In Rwanda, Tanzania, Tonga and beyond, it has generated substantial income for local farmers. Juncao has also taken root on the edge of the Sahara Desert, about 60 kilometers east of Nouakchott, the capital of Mauritania, where it helps check desertification by fixing sand, thus becoming a "green bank" for local herders.

At a high-level UN meeting on Juncao technology in April 2019, Carla Mucavi, director of the FAO Liaison Office to the UN, said: "Juncao technology is a part of the successful Chinese experience to fight poverty and hunger and an approach that, as part of broader rural development initiatives, can trigger actions that help address malnutrition and sustainability challenges and that respond to the needs of rural people."

International trade in under-forest economy products is also yielding impressive results. Xinhuang county in Central China's Hunan province, which has 1.73 million *mu* of forestland, expanded the planting area of *huangjing* (*Polygonatum*) to over 50,000 *mu*. In 2024, the embassy of Madagascar in China listed Xinhuang *huangjing* as designated supplies. In 2025, Thailand placed orders for Xinhuang *huangjing* worth 92 million yuan, while Vietnam signed an 80-million-yuan purchase order. In October 2025, the Lesotho Chamber of Commerce and Industry signed a cooperation agreement with a Xinhuang enterprise to introduce *huangjing* products and processing technology. Meanwhile, 810 metric tons of red mushroom products from Pubei county in the Guangxi Zhuang autonomous region were exported to Southeast Asia in 2024. From Africa to Southeast Asia, China's under-forest economy products are crossing oceans and entering more markets.

China is also sharing its systematic experience in under-forest economy development through multilateral mechanisms and foreign-aid training. At the 31st session of the Asia-Pacific Forestry Commission of the FAO in November 2025, the Chinese delegation presented practices of the under-forest economy and forest foods that have boosted employment and incomes for tens of millions of rural residents, alongside smart management technologies such as drone patrols and the "bamboo as a substitute for plastic" green transition pathway. In May, participants from eight countries including Liberia, Maldives, Argentina and Namibia visited Fujian's Wuping county for an immersive study of under-forest economy and rural sustainable development practices. China has also held more than 300 international training sessions, cultivating over 16,000 local Juncao technical personnel for various countries.

From Juncao technology to the *huangjing* industry, from multilateral presentations to foreign-aid training, China's experience in under-forest economy development is providing replicable and actionable green solutions for many developing countries through channels such as the Belt and Road Initiative. China will continue to write a new chapter of "turning green into gold" with an open attitude, contributing more Chinese wisdom and Chinese solutions to global sustainable forest management and green low-carbon development.

Policy support paving way for rebound

Regulator reiterates its commitment to shoring up market confidence

By ZHOU LANXU
zhoulanxv@chinadaily.com.cn

While short-term volatility may continue, the recent sell-off in China's A-share market has created potential for a medium-term rebound supported by ramped-up policy support, more reasonable valuations and improved corporate earnings, analysts said.

They made the remarks as China's securities regulator reiterated its commitment to shoring up market confidence at a symposium on Monday while implying a focus on the oversight of quantitative trading, underscoring a growing emphasis on protecting retail investors and improving their return prospects.

More policy efforts — including further share purchases by State-owned investment companies, additional central bank liquidity support, potential measures to optimize quantitative trading regulation, and stepped-up macroeconomic stimulus moves — may be considered to consolidate the foundation of market rebound, they added.

On Monday, China's A-share market recovered from a slump on Friday, when the Shanghai Composite Index fell 3.05 percent to close below the 3,800-point mark as growth-oriented stocks plummeted amid a global tech stock correction led by the South Korean bourse.

The SCI ended at 3,796.28 points on Monday, up 0.85 percent, while the growth-oriented ChiNext Index and STAR 50 Index edged up. Meanwhile, Citi upgraded China to overweight in its emerging markets allocation.

"Positive factors are continuing to accumulate, laying a solid foundation for the market to stabilize and recover," said Xu Ruchun, an analyst at Founder Securities, with stronger corporate earnings and more attractive valuations strengthening the market's fundamentals.

Xu believes that first-half net profits of A-share listed nonfinancial companies have likely recovered to a 17.8 percent year-on-year increase, while the ChiNext Index's price-to-earnings ratio had fallen to 43.7 times as of Friday, a historically moderate level.

"At the regulatory level, policy signals for stabilizing the market are clear," Xu added.

During a visit to a brokerage in Beijing on Monday, China Securities Regulatory Commission Chairman Wu Qing chaired a symposium with investors to solicit suggestions on promoting the stable and healthy development of the capital market.

In a rare move, the meeting brought together representatives from a broad range of investors — ranging from large institutional investors to individual retail investors — marking the clearest signal yet that regulators are ramping up efforts to bolster market confidence.

"The broad base of investors is the foundation of the capital market and its most important group of participants," Wu said, vowing to safeguard stable market operations and uphold an open, fair and equitable market order so investors can better share the benefits of high-quality economic and capital market development.

Participants called for stronger countercyclical measures in both the primary and secondary markets, more efforts to attract long-term capital, and a "well-regulated development of quantitative trading and artificial intelligence applications" in the capital market, the CSRC said in a meeting statement.

State-owned investment companies have also been ramping up stock and exchange-traded fund purchases. China Chengtong Holdings and China Reform Holdings announced on Sunday that they had increased their holdings of A shares and would continue doing so by using their own funds and a central bank lending facility, providing strong liquidity support to the market.

Chen Gang, an analyst at Soochow Securities, said that sustained inflows into ETFs will improve investor sentiment.

From July 1 to Friday, equity ETFs attracted more than 300 billion yuan ($44 billion) in net inflows, including over 100 billion yuan from Thursday to Friday alone, Chen said.

Analysts, however, cautioned that further policy support would be indispensable for a durable market recovery.

Liu Jipeng, a professor at China University of Political Science and Law and a senior capital market expert, said that regulatory efforts should prioritize market fairness, arguing that some quantitative trading strategies that rely on technological advantages to profit at the expense of ordinary investors should be better regulated.

A C919 aircraft arrives at Tianjin Binhai International Airport. JIA TIANYONG / CHINA NEWS SERVICE

C919 prepares for 1st regular intl flight

By LI JING
lijing2009@chinadaily.com.cn

The C919, China's domestically developed narrowbody passenger jet, will begin its first scheduled international commercial service next month, a step industry experts said will test the aircraft's ability to operate beyond domestic markets and help build confidence for wider overseas expansion.

The daily round-trip service, operated by Air China, will connect Beijing Capital International Airport and Ulaanbaatar's Chinggis Khaan International Airport in Mongolia from Aug 12, the airline said.

According to the schedule, outbound flight CA723 will depart Beijing at 3 pm Beijing time and arrive in Ulaanbaatar at 5:15 pm local time. The return flight, CA724, will leave Ulaanbaatar at 6:30 pm local time and arrive in Beijing at 8:35 pm Beijing time.

The route marks the first time the C919, manufactured by Commercial Aircraft Corp of China, will enter a regular international commercial passenger aviation market.

Previously, the aircraft has operated mainly on Chinese mainland routes, as well as services connecting the mainland with the Hong Kong Special Administrative Region. China Eastern Airlines launched the aircraft on scheduled flights between Shanghai and Hong Kong in January 2025, while Air China began regular C919 services between Beijing and Hong Kong in November.

"Choosing Ulaanbaatar as the first regular international destination is not a move to lower the entry barrier or test the waters," said Zhu Keli, founding director of the China Institute of New Economy.

Zhu said the decision reflected a combination of factors including aviation cooperation between China and Mongolia, airworthiness cooperation arrangements, operational safety and route economics.

"China and Mongolia have maintained stable civil aviation cooperation, with a relatively mature framework for airworthiness cooperation," Zhu said. "The airport environment is relatively straightforward, the flight distance is moderate and the aircraft can complete a round trip within a day, allowing domestic technical support to respond quickly if operational issues arise."

The route also has established business and tourism demand, making it suitable for regular commercial operations rather than serving only as a demonstration flight, Zhu said.

He said the first international route is aimed at validating the full process of cross-border operations, including overseas maintenance support, international air traffic coordination and customs procedures.

"Ulaanbaatar is more like a low-risk practical training ground where the C919 can accumulate real overseas operating data and build a replicable model for future international expansion," Zhu said.

Guo Jia, a civil aviation expert and professor at Guangdong University of Foreign Studies' South China Business College, said safety considerations were the primary factor behind the selection of the first international destination.

He said Air China's previous experience operating the C909 regional jet to Ulaanbaatar, along with the airline's assessment of airport handling and maintenance capabilities, also supported the route choice.

For the Chinese aviation industry, the significance of the route extends beyond the flight itself, experts said.

"Previously, C919 operations were mainly based on China's domestic airspace and supporting infrastructure," Zhu said. "This scheduled international route means the aircraft is entering a regular commercial passenger aviation system between countries."

The operation will help establish overseas support capabilities, including maintenance cooperation, spare parts arrangements and international operating procedures, Zhu said.

Guo said international expansion would require more than aircraft performance. "Aircraft sales, international operations and market expansion all need to comply with the airworthiness standards of different countries and regions," Guo said, adding that broader international communication and certification efforts would be necessary.

Guo added that overseas maintenance, aircraft support and route support capabilities would be among the key challenges for international operations.

Looking ahead, experts expect the C919's international expansion to be gradual. "C919's internationalization will not follow an aggressive model of rapidly launching a large number of routes," Zhu said.

After validating operations in Ulaanbaatar, the aircraft will likely expand first into short-haul international markets in Central Asia and Southeast Asia, allowing it to accumulate experience under different operating conditions, Zhu said.

"The priority is to complete the transition from zero to one — making the first international route operate safely and accumulating experience," Guo said. "Only after establishing overseas safety operation and maintenance standards should the C919 move from one route to multiple routes.

"Airworthiness certification is indeed one of the biggest barriers for the C919 entering mainstream European and US markets," Zhu said.

He said certification by authorities such as the European Union Aviation Safety Agency and the US Federal Aviation Administration would be essential, while airlines' familiarity with the aircraft, maintenance networks, leasing systems and market recognition would also influence adoption.

Briefly

Yuan weakens against greenback

The central parity rate of the yuan weakened 14 pips to 6.7948 against the US dollar on Monday, according to the China Foreign Exchange Trade System.

Loan prime rates remain unchanged

China's one-year loan prime rate, a market-based benchmark lending rate, came in at 3 percent on Monday, unchanged from the previous month. The over-five-year LPR, on which many lenders base their mortgage rates, also remained unchanged from the previous reading of 3.5 percent, according to the National Interbank Funding Center.

XINHUA - CHINA DAILY

Leapfrog progress reported in innovative drug sector

The total value of China's innovative drug out-licensing deals exceeded $100 billion in the first half of the year, reaching a record high, the Ministry of Industry and Information Technology said on Monday.

China approved 38 innovative drugs for marketing during the period, including 31 developed by domestic companies, Tao Qing, head of the bureau for operation, monitoring and coordination with the MIIT, told a news conference.

Despite a complex and challenging external environment and mounting pressure from industry transformation, China's pharmaceutical industry remained resilient, Tao said.

From January to June, value-added industrial output of major pharmaceutical enterprises rose 6.4 percent year-on-year, with biopharmaceuticals posting double-digit growth.

The industry's export delivery value exceeded 210 billion yuan ($30.91 billion) in the first six months, up 9 percent from a year earlier.

Higher value-added products, including chemical finished dosage forms and biopharmaceuticals, accounted for nearly one-fifth of total exports, indicating an accelerating shift in the export mix from active pharmaceutical ingredients to finished pharmaceutical products.

China is actively exploring innovative approaches to organizing biomedical research, betting that institutional reforms can help close one of the industry's most persistent gaps — turning laboratory discoveries into marketable medicines.

At the center of such efforts is the Interdisciplinary Research Center on Biology and Chemistry. The center has spent more than a decade building an interdisciplinary research model that links basic science, chemistry, structural biology, clinical medicine and drug development. The model is designed to overcome what scientists call the "valley of death" — the long and uncertain path between fundamental scientific discoveries and clinical applications, where many promising findings fail to become viable therapies.

Founded in 2012, the center deliberately began focusing on neurodegenerative diseases years before they became a strategic research priority globally. While cancer research historically attracted far greater funding and produced far more drug candidates, diseases such as Alzheimer's disease and Parkinson's disease have become increasingly urgent challenges amid aging global populations.

XINHUA - CHINA DAILY

Jingye eyes 'legal remedies' as UK nationalizes steel

By YIN MINGYUE
yinmingyue@chinadaily.com.cn

The United Kingdom's nationalization of British Steel, previously owned by China's Jingye Group, has drawn strong responses from the Chinese government and industry experts, who said the move undermines market principles and investor confidence while reflecting a broader global shift toward prioritizing industrial security.

Jingye Group, which acquired the loss-making steelmaker in 2020, said it had invested heavily over the past five years to upgrade facilities, improve technology and maintain operations despite prolonged financial pressure.

Following the nationalization, the company said on Sunday that it would pursue all available legal remedies, including international arbitration, to safeguard its lawful rights.

According to Jingye, the UK government proceeded with the takeover without providing timely, adequate and effective compensation for its investment. The company said it has initiated consultations under the China-UK bilateral investment treaty and reserves the right to seek full compensation for its losses.

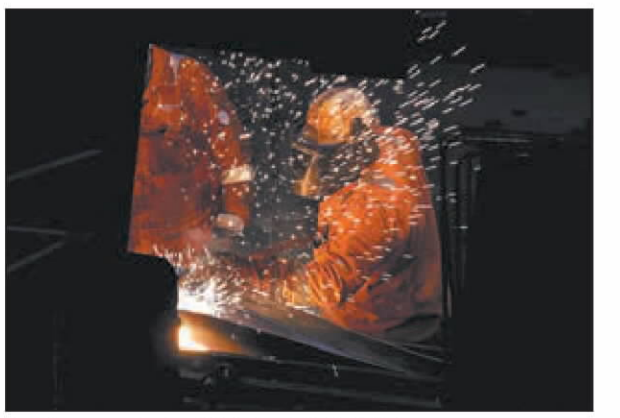
China's Ministry of Commerce said on Friday that it firmly opposed the UK's decision, saying the move seriously harmed Jingye's legitimate rights and interests and undermined the confidence of Chinese companies investing in Britain.

It urged the UK to abide by international rules, fulfill its obligations under the China-UK bilateral investment treaty, treat Chinese-invested enterprises fairly and impartially, and properly resolve compensation issues, adding that China will continue to support companies in safeguarding their lawful rights through legal means.

Echoing the ministry's remarks, the Foreign Ministry urged Britain to respect market principles and the spirit of contract and seek a mutually acceptable solution on compensation. It warned that Britain's handling of the case would directly affect Chinese investors' assessment of the UK's investment environment and the credibility of its government.

Industry experts said the dispute also reflects profound changes in global industrial policy, as governments increasingly place strategic industries ahead of purely commercial considerations.

"Steel, once regarded by many developed economies as a sunset industry, has regained strategic importance," said Xu Xiangchun, information director and analyst at iron and steel consultancy Mysteel. "As geopolitical uncertainties grow, countries are placing greater emphasis on maintaining domestic manufacturing capacity and securing critical industrial supply chains."



Xu said the UK's decision reflects the growing importance attached to industrial security and supply chain resilience. However, he said that strategic considerations should not come at the expense of market principles or the legitimate rights of investors.

Wang Guoqing, director of the Beijing Lange Steel Information Research Center, said the nationalization ran counter to market principles, internationally accepted investment rules and the China-UK bilateral investment treaty.

She said Jingye had invested heavily to keep British Steel operating and preserve local jobs, yet the compensation mechanism announced by the UK failed to adequately reflect the company's long-term investment and contribution.

"Strategic industries deserve policy support, but government intervention should respect international investment rules and fully protect the lawful rights of investors," Wang said.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said companies should strengthen policy risk assessments even when investing in developed economies, as policy and regulatory changes may arise from strategic considerations.

Opening scientific research facilities to industry

Shanghai leads transition with $5.16b planned for 20 projects

By **LI JING** and **GUO YALI** in Shanghai

An aerial view of the Shanghai Synchrotron Radiation Facility. PROVIDED TO CHINA DAILY

When Chinese drug developers need to see exactly how an experimental medicine binds to its target protein, or materials scientists want to understand why a battery or catalyst performs differently at the atomic level, many now turn to the national scientific research facilities.

That marks a notable shift in the role of the country's "big science" infrastructure. Once used primarily by universities and research institutes for basic research, these scientific facilities are increasingly supporting corporate research and development, while also working directly with enterprises to develop experimental capabilities tailored to industrial needs.

Shanghai, one of China's largest hubs for major scientific infrastructure, is at the forefront of that transition. The city currently hosts, is constructing or planning 20 major scientific facilities, spanning physics, chemistry, life sciences and marine science, with a total planned investment of about 35 billion yuan ($5.16 billion). Eleven facilities have been completed, including the Shanghai Synchrotron Radiation Facility, also known as the SSRF, the National Facility for Protein Science in Shanghai and the National Facility for Translational Medicine, according to the Shanghai Municipal Commission of Science and Technology.

Recent data from the commission highlight the surge in industrial demand. In the first half, total operating hours at the SSRF rose 16 percent year-on-year, with corporate usage jumping 44.2 percent, reflecting rising demand from companies using the national facility to support product development and technology innovation.

"The facilities are designed not only to support frontier scientific research, but also to tackle major technological challenges facing industries," said Wang Tianjing, deputy director of the science infrastructure and platform development division at the Shanghai Municipal Commission of Science and Technology.

The increase follows a series of policy adjustments over the past three years aimed at improving access to the national research infrastructure and encouraging facilities to contribute more directly to industrial innovation.

These measures include a strategic user advisory committee that incorporates feedback from universities, research institutes and technology companies into facility planning and upgrades, as well as a new evaluation mechanism that rewards facilities for contributions to enterprise innovation and industrial technology development.

Researchers at the SSRF say the facility's relationship with companies has evolved fundamentally over the past decade.

"When the facility first opened, there were very few industrial users," said Wang Qisheng, director of the life sciences division at the Shanghai Synchrotron Radiation Facility Science Center, which is affiliated with the Shanghai Advanced Research Institute, Chinese Academy of Sciences. "Today, applications have expanded from structural biology to energy, chemicals, advanced materials, batteries and many other industrial sectors."

More importantly, companies now require deep scientific expertise rather than mere access to sophisticated equipment.

"Sometimes existing experimental platforms cannot answer new scientific questions," he said. "In those cases, we work with companies to jointly develop customized experimental equipment and experimental systems."

This represents an evolution: the facility is no longer just a shared national laboratory, but a scientific partner capable of addressing complex industrial research and development hurdles.

The SSRF currently operates 38 beamlines and 55 experimental stations, allowing multiple experiments to run simultaneously.

External users apply for beam time through peer review, while enterprise users are allocated access according to specific research requirements.

Among the facility's earliest industrial users is Viva Biotech, a Shanghai-based contract research organization that has collaborated with the SSRF since shortly after the facility opened to users in 2009.

Established in 2008, the company provides structure-based drug discovery services, helping global pharmaceutical and biotechnology companies identify and optimize drug candidates using structural biology technologies.

While computer modeling can generate large numbers of potential drug molecules, researchers still need experimental evidence showing whether those molecules interact with proteins as intended. Using synchrotron X-rays, researchers collect diffraction data from protein crystals to reconstruct three-dimensional structures of protein-drug complexes, allowing them to visualize how candidate molecules interact with their biological targets.

"The structural information allows clients to determine whether a molecule has been designed appropriately and how it should be optimized," said Zhou Yu, a researcher at Viva Biotech.

Zhou added that the collaboration has also become more efficient as the SSRF upgrades its software systems.

"Newer beamlines and domestically developed software have significantly increased throughput and reduced equipment failures, allowing researchers to process substantially more samples during each experimental session than several years ago," he added.

The trend of co-developing research capabilities is accelerating. A prime example is the collaboration between the SSRF and State-owned energy giant China Petroleum and Chemical Corp, which jointly established what they describe as China's first dedicated synchrotron platform for the energy and chemical sector.

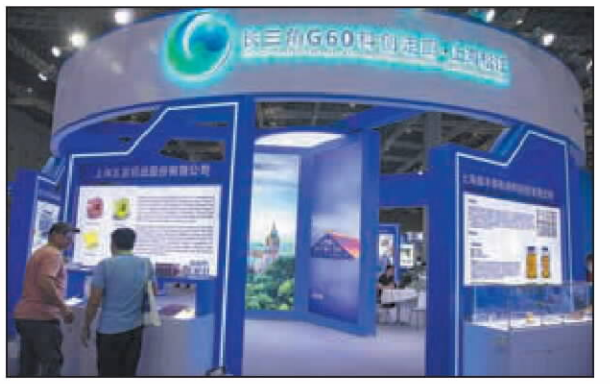
The platform, which includes three beamlines, provides tailored research capabilities for oil and gas exploration, petrochemicals and new energy materials. Unlike shared beamlines, these are co-developed to address industry-specific technical barriers.

The same model is emerging beyond synchrotron science. At the National Facility for Protein Science in Shanghai, researchers have jointly developed an automated cell-free protein synthesis platform with Kangma (Shanghai) Biotechnology Co, a Shanghai-based biotech company. The platform is now in its final commissioning stage and is expected to begin operating soon.

The system can rapidly convert proteins designed by artificial intelligence into physical samples for experimental verification, helping address one of the biggest bottlenecks in AI-driven protein research.

"The bottleneck is no longer protein design," said Wu Jiarui, director of the National Facility for Protein Science in Shanghai. "AI can generate protein sequences very quickly, but they still have to be synthesized and experimentally verified."

The platform is designed as shared research infrastructure serving universities, research institutes and biotechnology companies, integrating AI-assisted protein design, automated synthesis and structural verification into a single workflow.



As Chinese companies move into increasingly sophisticated fields ranging from innovative medicines to advanced materials and clean energy, researchers at the facilities say demand is increasingly centered not on access to expensive machines, but on customized scientific capabilities that help solve problems conventional R&D tools cannot.

"We don't simply provide equipment," Wang Qisheng said. "For many frontier industrial problems, we work together with companies to develop the experimental approaches needed to solve them."

New innovation valley bolsters Yangtze River Delta's high-tech prestige

By **LI JING** and **GUO YALI** in Shanghai

Visitors check the booth of the G60 Science and Technology Innovation Valley of Yangtze River Delta at the China International Industry Fair in Shanghai on Sept 24, 2024. PROVIDED TO CHINA DAILY

A regional innovation valley linking Shanghai with eight neighboring cities is emerging as one of China's main engines for strategic technologies, using cross-provincial coordination to accelerate industries from satellite internet to commercial space and 6G communications.

The G60 Science and Technology Innovation Valley of Yangtze River Delta, spanning nine cities across Shanghai and the provinces of Jiangsu, Zhejiang and Anhui, has evolved from a local cooperation initiative into a national strategy aimed at integrating research, manufacturing, finance and commercialization across one of China's most economically dynamic regions.

As China is building the Shanghai (Yangtze River Delta) International Science and Technology Innovation Center into a world-class innovation hub, the G60 valley has become a testing ground for breaking down administrative barriers that have traditionally hampered regional innovation.

"The original idea was simple — no single city could build an entire industrial chain on its own, so the nine cities began coordinating their respective strengths. That naturally created the basis for collaboration. Different cities contribute different advantages, from research and talent to manufacturing capacity and financial services, forming an integrated industrial ecosystem," said Xu Shidong, head of the industrial group at the G60 Joint Office.

The valley covers Shanghai's Songjiang district and eight neighboring cities in Zhejiang, Jiangsu and Anhui. Together they generate about one-fifteenth of China's GDP with only one-twenty-eighth of its population, while accounting for roughly one-fifth of companies listed on Shanghai's STAR Market and about 12 percent of China's unicorns, according to the G60 Joint Office.

Satellite internet service has become one of the valley's showcase sectors, as China accelerates the deployment of low-Earth-orbit satellite constellations.

Shanghai Spacesail Technologies Co, the builder and operator of the Spacesail Constellation — a massive low-Earth-orbit commercial satellite network — has emerged as the anchor company of the regional satellite ecosystem.

Xu Yunxiang, vice-president of Spacesail, said: "The constellation creates demand across the entire industry chain, including satellite manufacturing, payloads, ground terminals, testing equipment and application services."

The company has launched 238 satellites and aims to have 324 in orbit by the end of 2026, laying the groundwork for initial commercial broadband services in global markets, particularly countries participating in the Belt and Road Initiative.

In June, the company completed one of China's first successful direct-to-cell tests, enabling 5G voice and video calls using an unmodified commercial smartphone connected directly to a satellite, a milestone it says demonstrates the potential convergence of terrestrial and satellite communications.

Xu Yunxiang said the G60 ecosystem allows companies to collaborate across research, manufacturing, launch services and operations within a unified regional network. As the lead company in the industry chain, Spacesail sets technical standards and quality management systems that help suppliers develop together.

Meanwhile, Xu Shidong said the concentration of suppliers across the Yangtze River Delta region gives the region's commercial space sector an advantage.

"Shanghai offers talent and financial resources, while suppliers across neighboring G60 cities such as Suzhou, Hangzhou, Huzhou and Hefei complete the industry chain. Commercial space ultimately has to compete on cost. Previously, the priority was proving the technology worked. Commercialization requires making it affordable," he added.

As satellite internet and 6G technologies advance, executives say testing equipment is becoming one of the industry's most important enabling technologies.

Transcom Instruments Co, a communications testing equipment maker among the first companies listed on the Beijing Stock Exchange, has become a major supplier of testing systems for China's satellite internet programs.

"Testing equipment is effectively the ruler for the entire communications industry," said Feng Yuejun, chairman of Transcom. "If the measurement standard is inaccurate, every downstream product — chips, terminals, satellites and networks — will struggle to interoperate."

For more than a decade, the company has worked with Southeast University in neighboring Jiangsu province to develop communications testing technologies, turning academic research into commercial products used in China's wireless and satellite industries, Feng said.

He said the G60 valley has made such cross-regional collaboration easier by combining Shanghai's research strengths with manufacturing resources across the Yangtze River Delta region, adding: "High-end R&D can remain in Shanghai, while production and industrialization can be distributed across the broader Yangtze River Delta."

The valley's industrial ecosystem is also expanding beyond satellite manufacturing into space-based computing.

Comospace Co, incubated by the Institute of Computing Technology of the Chinese Academy of Sciences, is developing onboard computing systems that enable satellites to process artificial intelligence workloads in orbit instead of transmitting raw data back to Earth.

Liu Yaoqi, CEO of Comospace, said future satellite constellations would increasingly rely on onboard computing assets to process growing volumes of Earth observation and communications data.

Beyond industrial development, the G60 valley has also become a policy laboratory for regional institutional integration.

Xu Shidong said governments have begun allowing cross-regional innovation consortiums to qualify jointly for public R&D funding instead of restricting subsidies to companies registered in a single jurisdiction.

Shanghai and eight other cities have jointly established a regional technology commercialization fund, allowing capital to follow projects rather than administrative boundaries, while companies can retain operations where they are best suited.

The valley has also introduced specialized lending products for tech firms and coordinated with the Shanghai Stock Exchange to expand financing channels for high-growth enterprises.

Rather than requiring companies to relocate, the model allows firms to keep their headquarters and core operations where they are while expanding other functions across the region, with participating cities sharing the economic benefits through coordinated policy support and regional investment mechanisms.

Since 2025, the G60 valley has adopted a rotating coordination mechanism, with each of the nine cities taking turns to lead the joint office while establishing dedicated offices to coordinate policy implementation, factor mobility and regular exchanges on industrial cooperation, Xu Shidong said, adding: "We're trying to move beyond simply building a brand. The next stage is making companies genuinely feel the benefits of regional integration through practical policies."

The approach reflects China's broader effort to promote high-level technological self-reliance by integrating research, manufacturing and capital across regional clusters, making the G60 valley one of the country's most closely watched experiments in coordinated innovation.

China unveils corpus to push advanced tech research

By LI MENGHAN
limenghan@chinadaily.com.cn

China, on Friday, unveiled a national scientific corpus infrastructure at the 2026 World Artificial Intelligence Conference in Shanghai, aiming to provide the high-quality data needed to support the next generation of AI-driven scientific research.

Called the Aocang S&T Corpus, the platform was jointly developed by the National Science Library of the Chinese Academy of Sciences and nearly 100 research institutions. It is designed as a national repository of high-quality scientific data covering all major disciplines, providing AI systems with reliable information for research and innovation.

The name Aocang comes from the largest state granary of the Qin Dynasty (221-206 BC), built in present-day Henan province to supply grain for the newly unified empire. Qu Jiansheng, director of the National Science Library, said the project draws inspiration from the ancient granary by serving as a strategic repository for scientific knowledge in the digital age.

The launch comes as AI for Science — the use of AI to help scientists conduct research and make discoveries more efficiently — has become a national strategic priority. China is accelerating the development of AI-enabled scientific research to support its goal of becoming a global leader in scientific innovation, Qu said.

Unlike the vast amount of information collected from the internet, scientific data is often scattered across different institutions, stored in different formats and requires specialized knowledge to interpret. These challenges make it difficult to use such data to train AI models.

Aocang is designed to solve this problem by organizing scientific information into a unified format that AI systems can more easily understand and process.

"Aocang holds irreplaceable, foundational and strategic value for strengthening the data foundation for China's AI development and advancing high-level scientific and technological self-reliance," Qu said.

Drawing on the CAS' extensive research resources, Aocang integrates more than 320 petabytes of scientific data, 150 million research papers, 120 million patents and 5 million scientific books.

The platform is organized into a national core database and a number of specialized databases covering fields ranging from basic science to industrial technology. It can process many types of scientific information, including research papers, mathematical formulas, spectral data and waveforms.

To make the information more useful for AI, developers built a three-stage processing system that cleans, organizes and enriches raw scientific data before turning them into training materials. According to Qian Li, deputy director of the National Science Library, the process enables AI models to better understand scientific concepts and relationships rather than simply recognize words or patterns.

"These knowledge-rich datasets can strengthen large AI models' expertise in specialized fields, improve their reasoning ability and help them better understand scientific disciplines," Qian said.

More than 520 proprietary software tools support the platform's automated system for data processing, quality control and secure data sharing. The developers said the corpus will continue to expand as more research institutions contribute data.

Initial tests show that Aocang has improved the reasoning capabilities of ScienceOne, a foundational AI model for scientific research developed by the CAS.

The corpus is also being integrated into several commercial AI models, including Doubao, Qwen and Ant Group's medical AI model.

During its first phase, the project aims to integrate more than 36 billion scientific resource records across 2,883 high-quality scientific corpora and 68 PB of research data, supporting more than 500 research and industry application scenarios.

Qu said the academy will continue expanding the corpus, improving its data-processing capabilities and exploring operating models that combine public access with sustainable commercial services.

"We hope the corpus will support the development of new quality productive forces and provide a reliable, world-class data foundation for scientific innovation around the world," he said.

What they say

From a theoretical perspective, I would say that AI for science is the most interesting, important and promising direction for AI research over the next three to five years. AI has demonstrated tremendous power across many domains, but AI algorithms still operate within the boundaries set by the laws of physics and mathematics. Many exciting avenues of exploration lie ahead, including emerging fields such as quantum AI, reliable large-scale AI systems, AI safety and AI for AI. AI and quantum technologies are two powerful tools that continue to expand the frontiers of human knowledge. AI can also accelerate the development of quantum computing. Error correction has been one of the greatest challenges in building quantum computers for the past 40 years, but AI has recently begun to provide promising solutions. Quantum AI is beginning to emerge. I believe we will see tremendous progress over the next five to 10 years. It represents a frontier beyond present-day AI and has the potential to become even more powerful.
Andrew Chi-Chih Yao, *Turing Award winner, an academician with the Chinese Academy of Sciences, dean of the Institute for Interdisciplinary Information Sciences at Tsinghua University*

Hallucinations in large language models stem, to a large extent, from their lack of a physical "body". To overcome these hallucinations, we must move beyond the boundaries of the digital world, engage in first-hand experience, and submit ourselves to the judgment of the physical world by making predictions, taking action and learning from reality's feedback. This age-old process is called experimentation, and it is also the key to physical intelligence. Physical intelligence is not a substitute for humans, but a collaborator. It fills the gaps where human capabilities fall short, allowing people to focus on judgment and creativity. The mission of physical intelligence is to return humanity to humans. The breakthrough in physical intelligence lies not in model architecture, but in the aggregation of knowledge. The industry's focus will shift from spectacular demonstrations to reliable system operation. Generalizability is the destination, but reliability is the starting point.
Su Hao, *inaugural dean of the Institute of General Physical Intelligence at Fudan University*

The "Bitter Lesson" is based on the historical observation that AI researchers have often tried to build knowledge directly into their agents. This approach always helps in the short term and is personally satisfying to researchers. But in the long run, it often reaches a plateau and can even inhibit further progress. Breakthroughs eventually come from the opposite approach: scaling computation through search and learning. The lesson, therefore, is that from the very beginning we should focus on scaling computation through search and learning. We should seek the fundamental principles of intelligence rather than become distracted by the specific characteristics of the human mind. We should allow the agent to discover these principles on its own.
Richard S. Sutton, *Turing Award winner, principal founder of the field of Reinforcement Learning, professor of computing science at the University of Alberta*

It is not true that simply having enough high-quality data will lead to artificial general intelligence. The first principle of building AGI is that it must possess a subjective mind, or humanlike "heart". It should have a value system that encompasses the self, others and the collective. It should also possess a cognitive framework that enables it to learn, communicate and collaborate with people. I hope we do not remain followers. A fundamental prerequisite for scientific and technological innovation is independent thinking and cultural confidence. Traditional Chinese philosophy and culture are, in fact, highly advanced. We should draw more on this Chinese wisdom in technological innovation, and I believe we will be the first to achieve AGI.
Zhu Songchun, *founding director of the Beijing Institute for General Artificial Intelligence*

WANG XIN

WAIC ends in Shanghai on a high note

Event nets $3b in intended purchases and marks significant intl agreements

By ZHENG ZHENG in Shanghai
zhengzheng@chinadaily.com.cn

The 2026 World AI Conference and High-Level Meeting on Global AI Governance concluded in Shanghai on Monday, yielding a record 20.36 billion yuan ($3 billion) in intended purchases — a 25 percent year-on-year increase.

Themed "AI Partnership for a Brighter Future", the event brought together representatives from 102 countries and international organizations, drawing over 400,000 on-site visitors and garnering more than 3 billion views online worldwide.

"This conference was not only one of the largest and most influential international gatherings in the global AI field, but also China's first high-level diplomatic event in the AI sector," said Chen Jie, vice-mayor of Shanghai.

The event marked significant breakthroughs in international cooperation, with participating nations signing an agreement to establish the World Artificial Intelligence Cooperation Organization, headquartered in Shanghai. Key outcome documents included the AI Cooperation and Development Action Plan and the International AI Ethical Governance Action Plan.

Demonstrating strong economic momentum, major initiatives were signed during the event, including 32 key Shanghai AI projects with total investment exceeding 40.9 billion yuan. China Unicom also launched its "UniAI · connecting Shanghai with AI" project, investing over 25 billion yuan in intelligent computing infrastructure in Shanghai, alongside strategic financial agreements supporting innovative enterprises.

Across an exhibition space of over 100,000 square meters, 1,117 companies presented 4,486 exhibits, including 351 making their global debut. Cutting-edge innovations took center stage, including China's first near-memory computing 3D AI chip, various humanoid robots, and AI dexterous hands. The conference attracted 177 major procurement delegations.

Academia and industry merged seamlessly across 158 forums, pitch sessions for 180 startups and sessions featuring 11 Turing Award, Nobel Prize and Fields Medal laureates. In addition, the 2026 International Embodied Intelligence Competition was launched, and Shanghai Mayor Gong Zheng officially unveiled the Shanghai Institute for Physical AI and Robotics.

Youth participation emerged as a defining highlight. More than 40 dedicated events drew 1,030 young AI talents globally, with over 60 startup projects led by entrepreneurs born in the 1990s and 2000s.

Xiong Yinjiang, a post-1995 founder and chairman of Lightstandard, said: "During the conference, I felt the accelerated evolution of the new round of technological and industrial revolutions. AI is facing an unprecedented, historic explosion of opportunities."

Reflecting on the outcomes, vice-mayor Chen identified five key trends shaping the industry: shifting from conceptual governance frameworks to concrete action; emphasizing secure, open, and multilaterally governed systems; systematic technological breakthroughs; deeper integration into manufacturing and daily life; and the rapid rise of young talent.

"After nine years of cultivation, WAIC has become a window into humanity's intelligent revolution and an important bridge for promoting global consultation, co-governance and shared benefits," Chen noted, emphasizing that Shanghai will take pragmatic actions to make AI a trusted tool for humanity.

WAIC by the numbers

- 4,486 products on display
- 351 global product debuts
- 102 countries and international organizations represented
- 1,117 exhibitors
- 11 top-tier award winners
- More than 400,000 on-site visitors
- More than 3 billion global online views
- 100,000 square meters of exhibition space
- 158 high-level forums
- 1,030 young AI talent from around the world
- 180 outstanding early-stage startup projects
- 177 global procurement delegations hosted
- Projected procurement value: approximately 20.36 billion yuan, up 25 percent year-on-year

The closing ceremony of the 2026 World AI Conference and High-Level Meeting on Global AI Governance is held in Shanghai on Monday. GAO ERQIANG / CHINA DAILY

New initiative helps SMEs better leverage AI agents

By SHI JING in Shanghai
shijing@chinadaily.com.cn

Continued efforts are needed to make artificial intelligence infrastructure and tools more accessible to small and medium-sized enterprises, the nimble real-world adopters of the emerging technology, experts said at the 2026 World Artificial Intelligence Conference on Monday.

During a visit to the conference exhibition, Pu Yapeng, deputy director of the Shanghai Municipal Commission of Economy and Informatization, said he found many products developed by SMEs comparable to those by industry giants such as IBM and Huawei, thanks largely to affordable computing resources and government support.

"Computing power should become a utility, and tokens should be as affordable and easy to use as water or electricity. Only then can AI truly benefit more SMEs," he said.

Shanghai will continue to roll out compute, data and model vouchers for SMEs, expand engineer training to support the front-end deployment of AI agents and build dedicated AI innovation clusters for smaller businesses, Pu added.

SMEs are major drivers of AI innovation because of their flexibility and agility, said Li Sen, vice-president of Shanghai-based AI company SenseTime. In China, innovative AI applications have already been widely adopted in e-commerce livestreaming, education, content creation, software development, marketing and back-office operations.

However, many SMEs struggle to identify the right AI tools amid the rapid pace of technological innovation, said Zhou Yun, a future industry development strategy expert at cloud and big data company Si-Tech Information Technology. Data security concerns, unpredictable infrastructure costs such as token expenses and steep learning curves for high-value AI solutions remain major barriers to wider adoption, Zhou said.

To address these challenges, the China Association of Small and Medium Enterprises launched a special initiative on Monday aimed at helping SMEs better leverage AI agents.

Industry associations such as CASME should take a greater role in curating, categorizing and standardizing AI solutions into ready-to-use "AI service packages", Li of SenseTime said. Such packages would enable SMEs to improve project performance more quickly while keeping trial-and-error costs low, he added.

Li Meng, president of the Chinese Society for Sustainable Development, said SMEs should avoid training foundational models and instead focus on vertical applications, seeking niche opportunities in fields such as industrial integration, pharmaceutical research and development, and energy.

However, because industrial and medical data often involve trade secrets and personal privacy, robust compliance frameworks must be established before such projects begin, he said.

Li also called on governments and financial institutions to adopt a long-term approach by introducing targeted action plans to support technology iteration and reduce AI adoption costs for SMEs.

According to a report released by market consultancy Accenture on Sunday, Chinese companies' digitalization index rose from 49 to 59 out of 100 this year, marking the biggest increase in nine years. However, only 10 percent of surveyed companies have successfully transformed their AI investments into sustainable long-term capabilities.

"The question companies face now is no longer whether to use AI, but how to turn it into real growth and lasting competitive advantage," said Samantha Zhu, chairperson of Accenture Greater China.

"That shift does not come from technology alone. It requires weaving AI deeply into organizational capabilities, core business processes and industry expertise. The data, institutional knowledge and hands-on experience that companies have accumulated over time will become the ultimate competitive advantage in the AI era," she said.

CHINA

From left: A worker (middle front) helps fuse customers' Perler bead creations with a machine in a *pindou* shop in Taiyuan, Shanxi province, on June 6. Young people enjoy Perler bead creation in the *pindou* shop in Taiyuan on June 6. PHOTOS BY ZHU XINGXIN / CHINA DAILY

Handcrafting calmness with colored beads

Pindou trend draws young Chinese away from screens

By **ZHU XINGXIN** in Taiyuan
and **CHEN LIANG**

In a small fuse bead workshop in Chengdu, Sichuan province, Liu Meiqi and several young people sit around a table on which hundreds of tiny plastic beads in every color imaginable are ready for their use.

With steady hands and focused eyes, Liu carefully picks up beads with tweezers, placing them one by one onto a pegboard. The room is quiet, filled only by the soft clicking of tweezers and the occasional sigh of satisfaction as someone holds up a finished creation to the light.

In China this popular handcrafting activity is known as "*pindou*", or Perler beads in the West. Practitioners arrange small plastic beads on a pegboard and fuse them with heat to create pixel-style designs.

Pindou is part of the world of "*shoucuo*" — literally, hand rubbed — a handcrafting trend that has taken China's social media by storm.

Originally a gaming term referring to skilled manual play, it has recently gone viral on Chinese social media, evolving into a lifestyle phenomenon and a new consumption trend for young people who are looking for authentic, tangible experiences.

Besides Perler bead design, the handcrafting activities also include ceramics and scenery-themed sticker making.

Peaceful pastime

Liu, 35, works as a technician for a foreign-invested enterprise in Chengdu. Her daily routine involves sitting in front of a computer, answering phone calls and remotely troubleshooting equipment failures. By the end of each day, her back and neck are stiff from hours of sedentary work. *Pindou*, she said, has become her escape.

"Once I pick up the tweezers and start placing beads, I can sit for five or six hours straight. The longest session was a full 10 hours," she said with a smile.

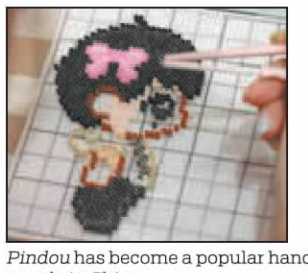
"When I'm designing Perler beads, I'm completely focused. I don't think about life's worries."

The process is simple but meditative: colored plastic beads are arranged on a pegboard to form patterns, then fused together with an iron.

The result is a solid, tangible creation — a keychain, a coaster or a decorative piece.

"Unlike passively scrolling through short videos, *pindou* is an active creation," Liu said.

"It gives me a sense of accomplishment that digital entertainment never can."



The numbers back up the trend. In 2025, sales of Perler bead products on major e-commerce platforms reached 291 million yuan ($42.83 million), growing nearly ninefold year-on-year.

According to TianYanCha data, more than 7,000 new handcraft-related enterprises were registered in China over the past year, with Perler bead creation becoming a standard offering in most workshops.

Ma Wenwen, 27, is the manager of a handicraft shop in Taiyuan. When his store first opened, Perler bead creation was available but not particularly popular. That changed around the end of 2023. By the summer of 2025, weekend slots were fully booked.

Young people learn to bake at a baking workshop in Taiyuan on June 6.

Pindou has become a popular handcrafting activity among young people in China.

"The customer base has also shifted significantly," Ma said. "At first, it was mostly elementary and middle school students. Now we see high school students, college students and young professionals."

His shop offers an all-you-can-create Perler bead package: 38 yuan on weekdays and 48 yuan on holidays, with individual projects ranging from 9.9 to 48 yuan.

But what has changed, he said, is the mindset. "Before, people just wanted to try it out. Now they want to complete a piece seriously, to immerse themselves in the creative process. They also share their finished works online, which brings an extra layer of satisfaction."

Yang Shudi, a 20-year-old college student, discovered *pindou* through social media. "What attracted me most was that there's no barrier to entry — even a complete beginner can pick it up easily," she said. She often visits *pindou* shops during holidays.

"When I'm doing *pindou*, I can focus on one thing completely. When I'm scrolling on my phone, my attention scatters easily," she said.

She added: "The entertainment from electronic devices feels fleeting and empty. But *pindou* gives me something concrete and touchable — a real sense of achievement."

Creative experiences

The "handicraft economy" reflects a broader shift in Chinese consumer trends. Tourists and young people are increasingly moving away from material consumption toward immersive cultural experiences and emotional resonance.

Across Shanxi, specialty handcraft shops have sprung up — pottery studios, miniature scenic sticker workshops, 3D printing labs and more.

These venues have become popular weekend destinations not just for young people, but also for families, friends and couples.

"As a parent, taking my child to do handicrafts has really helped relieve my parenting anxiety," said Duan Xiaojiao, a Taiyuan resident.

Her child just started kindergarten, and she finds that hands-on activities like pottery and baking allow her to spend quality time with her child while also cultivating the child's focus and patience.

Liu Zhifen, director of the Department of Mental Health at the First Hospital of Shanxi Medical University, sees the trend as a positive development.

"Handcrafting activities like *pindou* are popular because they allow people to engage their senses and focus on the present moment, breaking free from mental exhaustion," she said.

"Each step of the process provides immediate feedback, giving people a quick sense of control and accomplishment."

She describes this phenomenon as a "positive return" from digital addiction.

"It pulls people's attention away from virtual sensory stimulation and back to real tactile experiences and creative work. It rebuilds the connection between people and the real world — a low-barrier way to restore a sense of reality," she said.

The slow, immersive pace of handcrafting, Liu Zhifen said, allows tense nerves to relax physiologically.

"Handcraft experiences provide young people with a safe emotional outlet. In the process of creating something, they unconsciously cultivate focus and patience. It's an excellent way to soothe emotions and build resilience."

Zhang Shurui contributed to this story.

Puppeteer preserves traditional art form

By **LI MUYUN**
and **ZHU YOUFANG** in Changsha

Using two thin rods, Wu Yuan skillfully maneuvers a shadow puppet through a series of movements — creating a sequence of bends, somersaults, and even the splits against a glowing screen in his workshop in Xiangtan, Central China's Hunan province. Unlike the more widely known leather shadow puppets, Wu's creations are crafted from paper.

The Xiangtan paper shadow play is a regional variation of Chinese shadow puppetry that blends traditional opera, painting, paper-cutting, and local folk singing. This craft boasts a history spanning more than 800 years, with Wu's family practicing it over 22 generations.

The puppeteer grew up watching his grandfather, Wu Shengping, carve puppets and perform behind a screen.

Through characters and stories from traditional Chinese operas and novels, he learned not only about the art form but also values such as loyalty, dignity, and kindness.

"My grandfather's performances were not just about telling stories," Wu said. "They also taught me how to conduct myself in life. Those stories planted a seed in my heart."

After graduating from Central South University in the provincial capital Changsha with a law degree, Wu worked in Guangdong province for years as a legal professional.

From left: Wu Yuan teaches children to maneuver paper shadow puppets in Shenzhen, Guangdong province. Wu and his grandfather, Wu Shengping, show paper-cut shadow puppets they made at a handicraft fair in Shenzhen. PHOTOS PROVIDED TO CHINA DAILY

However, the seed his grandfather planted continued to call to him, prompting him to return to his hometown to learn the family craft.

For three years, Wu and his grandfather traveled across the region, documenting over 120 shadow play scripts, more than half of which were on the brink of being lost. In 2014, they published *Xiangtan Shadow Play*, a collection that preserved this repertoire with words and pictures for future generations.

In 2016, Wu was named a provincial-level inheritor of the craft. However, this recognition came with a great sense of responsibility.

"Some of the traditional dialect and singing styles used in the paper shadow play had drifted far from modern life, and fewer young audiences could enjoy the shows," Wu said. "As an inheritor of the younger generation, I felt I had to do something to bring this art form back."

Wu's efforts have taken many forms. Since 2017, he has collaborated with teachers and students from Hunan University of Science and Technology to develop a DIY paper shadow puppet kit. The traditional paper shadow puppet-making process involves more than a dozen intricate steps, Wu said, including preparing the pulp, forming the shell, carving on both sides, layering, and applying colors.

"It normally takes more than 30 hours to finish one puppet figure," he added.

However, the DIY kit, now on its fourth version, features a modular design and snap-together assembly. It aims to lower the barrier to this traditional art form, allowing anyone to assemble a puppet and put on a show in minutes, even without using scissors.

"The students brought creative, diverse perspectives that can breathe new life into our art form," Wu said.

Making the skill of the craft accessible is just the beginning. For Wu, the characters of the plays must also resonate with today's audience. He began designing characters inspired by what younger people are interested in — anime, films, and video games.

This approach has been well received. A few years ago, when Wu conducted a university workshop to introduce paper shadow play, he brought puppets based on popular video game characters.

"The moment I took them out, the room just exploded," he said. "The students immediately recognized the characters and began imagining their moves and lines."

In 2022, Wu and his grandfather opened their own paper shadow art gallery in Xiangtan, offering hands-on experiences, family workshops, and public education programs. He has also made English-language short videos based on the craft and teaches it in English to international visitors.

In April last year, Xiangtan paper shadow play was featured at a Hunan tourism promotion event in London, where Wu demonstrated the craft in English and introduced characters like the popular animated figure Nezha.

"Through these new designs and popular characters, we want people, especially young people and children, to have fun and become more interested in the art form," Wu said. "When more people have fun with it, they start to appreciate the wisdom and craftsmanship behind this ancient art. I think that is how the tradition stays alive."

CULTURAL HERITAGE

More than worth its salt

What seems to be an ordinary seasoning today once helped consolidate rule, expand trade, and reshape life across ancient China, **Wang Ru** reports.

Today, salt is little more than an inexpensive kitchen staple, but in ancient China, it was a strategic resource for a dynasty's fortune. Along with iron, it was essential not only to daily life but also to imperial power.

This is why salt-related sites have long been a focus of archaeological explorations, and recent discoveries are offering fresh insights into this remarkable history.

The latest findings were unveiled during a Beijing news conference hosted by the National Cultural Heritage Administration. Among them, the Zhongbao site in Chongqing stands out.

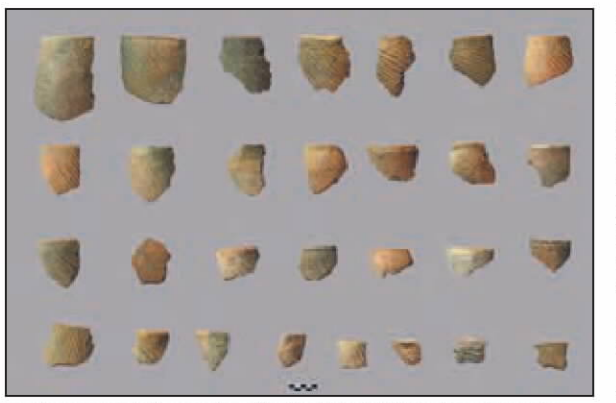
Discovered during the ongoing fourth national census of cultural relics, the site lies in the Wujiang River Basin, within Yushan town of the Pengshui Miao and Tujia autonomous county, Chongqing. Excavations last year uncovered 26 layers, revealing uninterrupted salt production over more than 2,000 years, from the Warring States Period (475-221 BC) to the Qing Dynasty (1644-1911).

"The town is rich in brine resources," says Niu Yingbin, who leads the excavations. "Saline-bearing strata often reach the surface or lie just below it, making excavation relatively easy. At the nearby Feishui Well, brine still bubbles from the cliff face throughout the year."

Local folklore says ancient people discovered salt sources by observing animals, a belief that excavations have unexpectedly proven.

"We often saw sheep wandering over to drink the brine," Niu adds. "It offered a vivid glimpse of how early people may have first identified these salt sources."

The wider Yushan area has long been considered a major salt-producing hub. Evidence suggests production began as early as the Shang Dynasty (c.16th century-11th century BC) and continued into the 20th century. Salt mines, salt-making workshops and salt-transportation roads together form a Yushan site group centered on salt.



According to Wang Qing, a professor of archaeology at Shandong University, Zhongbao is currently Chongqing's only known above-ground salt production site dating to the Warring States Period, significantly enriching understanding of the region's early salt industry.

One of the site's most important discoveries is a remarkably well-preserved salt production workshop from the Warring States Period, complete with a salt stove, a brine-leaching pool and large quantities of pottery believed to be production waste, says Niu.

The centerpiece is an 8-meter-long, 1.2-meter-wide "dragon-shaped" salt stove — the first well-preserved example of its kind from the period found in China. Archaeologists found that its design made better use of heat, greatly improving production efficiency.

Iron remains recovered from the stove are believed to be salt-making tools. "The discovery shows pottery and iron vessels were used together in salt production," Niu says. "It provides physical evidence of the technological transition from ceramic to iron equipment."

PHOTOS PROVIDED TO CHINA DAILY

Multidisciplinary research, including residue analysis and experimental archaeology, suggests ancient producers repeatedly soaked plant ash in brine to absorb salt crystals before rinsing it with fresh brine to create a more concentrated solution for boiling.

"This technique is illustrated in the Yuan Dynasty (1271-1368) salt-making manual *Aobo Tu* (Illustrated Boiling of Seawater), and is still used in today's sea salt making," says Niu.

Among the debris, archaeologists found numerous fragments of round-bottomed pottery jars. Similar fragments recovered from waste deposits allowed researchers to reconstruct complete vessels and investigate their function.

Drawing on ethnographic evidence and simulation experiments, researchers believe the jars served as salt molds. Nearly crystallized brine was poured into them, where it hardened into blocks or ingots that were easier to store and transport.

Because such molds often spread through trade, archaeologists traced similar pottery vessels found elsewhere to map the distribution of Yushan salt.

"The results show that by the middle-to-late Warring States Period, Yushan had become an independent salt production center. Its salt mainly supplied the Wujiang River Basin. In contrast, salt from the Zhongba site — another major salt production center in the Yangtze River Basin — was distributed primarily along the Yangtze's main channel. The two major salt fields served distinct markets, representing an early form of China's regional salt distribution system," says Niu.

Further evidence comes from the Qin Dynasty (221-206 BC) bamboo slips unearthed in the Liye ancient city in Hunan province. The inscriptions record Yushan salt being sold as far away as present-day Liye, confirming its wide commercial reach.

"The focus of salt archaeology has often been on production rather than circulation and trade," Wang says.

"This is the first time we've traced the actual circulation of Yushan salt. It marks a major breakthrough in understanding how well salt contributed to regional civilization."

Chongqing is the birthplace of China's salt archaeology. Since the 1990s, excavations across the Three Gorges region have established a systematic research framework for studying ancient salt production.

"Over the past two decades, Chongqing has reconstructed an evolutionary sequence of well salt-making techniques spanning nearly 4,600 years, from the Neolithic era to modern times," says Niu.

"The salt industry encouraged specialized craftsmanship, division of labor and, ultimately, greater social complexity."

The nearby Zhongba site, for example, has produced evidence of industrial-scale salt production before the Qin Dynasty. In just one square meter of excavation, archaeologists recovered around 130,000 pottery fragments, a staggering figure pointing to massive output and a highly specialized workforce. The industry also drove related sectors, including pottery-making, fuel supply and transportation.

"Such a highly specialized production system is a key indicator of social complexity," Niu says.

Salt production also played a decisive role in regional civilization, he adds. Wealth generated from salt helped establish the Ba state, which occupied parts of present-day Sichuan province and Chongqing during the Zhou Dynasty (c.11th century-256 BC).

Salt later became a strategic resource fought over by rival states. Ba and Chu repeatedly clashed over salt-producing regions, and after Qin conquered Ba, Qin and Chu continued competing for control of these valuable resources for more than four decades, highlighting salt's importance in ancient geopolitics.

"Our work at Zhongbao confirms that Yushan was producing salt before the Qin Dynasty and held strategic importance," Niu says.

"The site provides crucial archaeological evidence for understanding how salt drove social development and shaped regional civilization."

Digging into Jiangsu's historic engine of imperial wealth

By WANG RU

On the shores of the Yellow Sea, the Lianghuai region, straddling the Huaihe River, was one of ancient China's most important salt-producing zones from the Han Dynasty (206 BC-AD 220) onward. Its output was more than a valuable commodity — it underpinned the economy and became a major source of imperial tax revenue.

For centuries, the scale and sophistication of this industry were known only through historical records. In recent years, however, archaeology has begun filling in the missing pieces, revealing a far richer picture. Nowhere is that clearer than at a cluster of newly identified production sites along the coast of eastern Jiangsu province, recently released by the National Cultural Heritage Administration.

Since 2022, archaeologists from Jiangsu have investigated a series of sites, forming a complete sequence of salt-related sites from the Neolithic period more than 4,000 years ago to the Warring States Period (475-221 BC). The discoveries establish an unbroken archaeological sequence for the region and fill major gaps in the study of pre-Qin Dynasty (221-206 BC) production, says project leader Zhou Runken of the Jiangsu Provincial Institute of Cultural Relics and Archaeology.

Above: The Hulushan site in Lianyungang, Jiangsu province, yields Shang Dynasty (c.16th century-11th century BC) salt-making facilities. **Right:** Archaeologists reenact the salt boiling process at the Lizhuang site in Lianyungang. PHOTOS PROVIDED TO CHINA DAILY

Each site adds a new chapter to the story. The Zhenhai site in Lianyungang preserves production facilities dating back more than 4,000 years, including stoves, processing pits and waste-disposal areas. The Hulushan site, also in Lianyungang, unveils Shang Dynasty (c.16th century-11th century BC) salt-making facilities.

Zhou says the nearby Dacun site has yielded a collection of Shang bronze vessels, while the Kongwangshan site, not far from Hulushan, has produced Shang tombs.

Together, these discoveries suggest the Hulushan industry may have formed part of a broader Shang strategy to extend influence along the eastern coast and secure reliable access to marine resources.

The findings echo earlier discoveries elsewhere along China's eastern seaboard.

"About two decades ago, we investigated why the Shang expanded eastward, based on high-status tombs and bronze artifacts found at the Daxinzhuang and Subutun sites in present-day Shandong province, also on China's east coast," says Chen Xingcan, a veteran archaeologist at the Chinese Academy of Social Sciences.

"These new discoveries in the coastal area of eastern Jiangsu provide another important clue: gaining control of this vital resource may have been a key strategic driver behind that expansion."

The research has also highlighted striking regional differences.

Archaeologists found that before the Qin Dynasty, producers in Jiangsu used thick-walled red pottery plates or basins supported by ceramic stands as boiling vessels. By contrast, the distinctive helmet-shaped pottery associated with contemporary production sites along the southern coast of the Bohai Sea in Shandong has not been found in Jiangsu.

"This shows that Jiangsu and Shandong developed two distinct coastal production systems during the pre-Qin period," Zhou says.

Research into the Han Dynasty has produced equally significant results. At the Shizhuang site in Lianyungang, archaeologists uncovered an entire production chain, from extracting and concentrating brine to transporting it through ceramic pipelines into storage pits where it was boiled over stoves.

Another major discovery came from the Shajingtou site in Yancheng, Jiangsu, where the remains of a Han-era administrative complex were unearthed along with official seals. According to Zhou, the finds provide tangible evidence for historical records that the county of Yandu was established to oversee local production and trade.

"The discovery is of great significance," says Chen.

"For years, we had found very few related sites in Jiangsu. Now we have a continuous sequence from the Neolithic era to the Warring States Period, as well as an administrative headquarters from the Han Dynasty. That would have been unimaginable not long ago.

"I believe this is only the beginning. More discoveries are almost certainly waiting to be made," he adds.

LIFE

Rulers of art

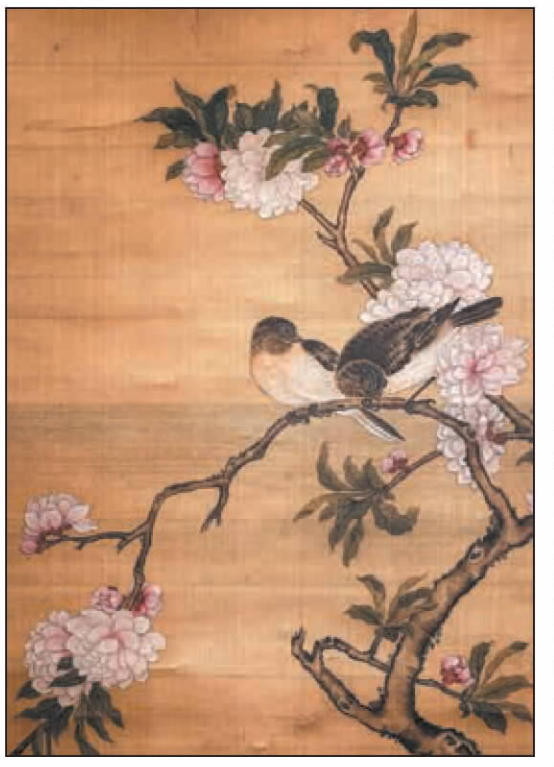
A trio — grandfather, father and son — were not only achieved emperors, but they also left behind a treasure trove of paintings and calligraphic works now on display in an extensive exhibition, Lin Qi reports.

When asked to name the real-life monarchs most frequently portrayed in period films and television dramas, one answer that springs immediately to people's minds would be a three-generation trio: Kangxi, Yongzheng and Qianlong — the grandfather, father and son who ruled the Qing Dynasty (1644-1911) in its prime. The three emperors' successive reigns culminated in a period in Chinese history characterized by expansive, stable territory, diligent governance, and social and cultural prosperity.

This history provides modern-day playwrights with abundant resources and great room for imagination. Plotlines creatively diversify, centering on the emperors' diligent rule, political maneuvering among princesses to seize the throne, anecdotes about the emperors' incognito visits, and harem rivalries for the emperors' favor; even time-travel romance is integrated to spice up the court infighting.

In historical reality, aside from their devotion to state affairs, the trio of monarchs preferred to spend their fleeting leisure time in the world of ink and brush, accompanied by cultured courtiers. The rulers left a wealth of paintings and calligraphic works created by themselves and in collaboration with favorite officials and court artists.

Visitors to the Guardian Art Center in downtown Beijing will lay their eyes upon a splendid selection of over 90 works from this legacy. The ongoing exhibition, *Diligent Governance and Peaceful Realm: Paintings and Calligraphy of the Kangxi, Yongzheng and Qianlong Emperors and Their Literary Courtiers*, on show through Oct 7, is showcasing pieces from the Palace Museum collection. The exhibition title is borrowed from the four characters engraved on a seal Kangxi often used — *chi ji qing yan* — expressing his desire for a tranquil mind in the intervals of handling state business.



At the exhibition's entrance stand the official portraits of the three monarchs in their majestic royal attires. They received a multicultural education from early childhood, encompassing the Manchu, Han, Mongolian, and Tibetan ethnic traditions. They valued self-cultivation and the cultivation of their offspring through excellence in the Confucian classics, poetry, and Chinese painting and calligraphy. Education deeply influenced not only their administrative governance and military strategies but also their cultural acumen, leading to a prestigious imperial art collection.

Their calligraphy reflects an important dimension of systematic, rigorous training throughout the years, according to Zhao Ziru, the exhibition's curator. She says that by copying these great works housed in the court, the three excelled in calligraphy and assimilated the strengths of ancient masters from various schools.

People often talk with great relish about Yongzheng's tactful victory in a fierce battle for succession to the throne; little do they know that he is recognized as one of the most accomplished emperor-calligraphers. Several of his handwritten pieces are on show, including a self-composed poem, *Summer Boating*. His models include the "two Wangs", Wang Xizhi and his son Xianzhi, two eminent calligraphers of the fourth century, and Zhao Mengfu (1254-1322), while his rhythmic strokes generate an energetic flow on paper, exposing the emperor's utmost reverence for Dong Qichang (1555-1636).

A significant event in the Qing Dynasty's royal collection was the establishment of the Sanxi Tang (Hall of Three Rarities). Emperor Qianlong assembled three invaluable works from the fourth century: *Kuaixue Shiqing Tie* (Sunlight after Snowfall) by the great calligrapher Wang Xizhi; *Zhongqiu Tie* (Mid-Autumn) by his son, Wang Xianzhi; and *Boyuan Tie* (Letter to Boyuan) by Wang Xun.

Top left: A painting from *Yinzhen at Leisure* which depicts scenes of Emperor Yongzheng of the Qing Dynasty (1644-1911) enjoying his spare-time activities. **Top right:** *Flowers and Birds*, by Jiang Tingxi, a noted literary courtier serving at the courts of Kangxi and Yongzheng. **Left:** A painting from *Ten Steeds Album*, created by the French missionary Jean Denis Attiret who served at Emperor Qianlong's court, along with a poem by Zhang Zhao, an accomplished scholar-official. **Below:** Visitors gather before a portrait of the uniformed Emperor Kangxi.
PHOTOS PROVIDED TO CHINA DAILY

Qianlong housed them in one of his studies at the Forbidden City (today the Palace Museum) — the West Warm Chamber of the Yangxin Dian (Hall of Mental Cultivation) — and in 1746, he renamed it Sanxi Tang. He wrote *The Record of the Hall of Three Rarities* to mark the occasion, which is now on display, reflecting his excitement in acquiring the three works. His calligraphy is elegantly rounded, showing the soaring spirit of a sovereign then in his prime.

The exhibition shows another of Qianlong's calligraphies, a practice copy of the *Three Rarities*. In an appended inscription at the end of the scroll, the emperor wrote that he had previously "copied the original pieces dozens of times" to capture the brush techniques and truly understand the artistic spirit.

Wang Yuegong, deputy director of the Palace Museum, says the reigns of Kangxi, Yongzheng and Qianlong marked a climax of civil governance in the Qing imperial court, and in the Kangxi era, the Nan Shufang (Southern Study) was established as an institution serving both administrative and literary functions. "It recruited erudite 'literary courtiers' to serve within the palace, thereafter fostering a flourishing tradition in which monarchs and their ministers bonded through poetry, calligraphy and painting," he says.

In court, the monarchs discussed state affairs with prominent cabinet members. In their spare time, they shared aesthetic preferences with their favorite subordinates, enjoying their flattery.

Some are well known to people today, as their anecdotes have become part of pop culture through hit period dramas. For example, Heshen was an infamous high-ranking Manchurian official whose corruption tarnished the governance late in Qianlong's reign. The exhibition displays a hanging scroll painting depicting an elderly Qianlong on horseback shooting two deer in the wild. It may have been made by an anonymous court painter, and the inscriptions made by the emperor himself, his sons, and courtiers, including Heshen.

Ji Yun, better known as Ji Xiaolan, was another of Qianlong's cultural courtiers. He is a male protagonist in a popular period comedy series in which he and Heshen accompany Qianlong on unofficial visits outside the palace in disguise. The accomplished scholar and calligrapher was appointed to oversee the compilation of the *Siku Quanshu* (A Complete Library of the Four Treasures), the largest collection of books in ancient China. His calligraphy, a poem composed by Qianlong, is written on a paper fan that is displayed in the exhibition.

The exhibition is the eighth of its kind under a collaboration between the Palace Museum and the Guardian Art Center. Kou Qin, general manager of the Guardian Art Center, says the current theme capitalizes on a highly distinctive, yet rarely addressed, category of the Palace Museum collection — the calligraphy of the three sovereigns and their works in collaboration with ministers.

The last exhibition, held a year ago, shed light on the aesthetics and order of hierarchy embodied in imperial designs through a display of artifacts including bronzes, porcelains, jade, enamelware, glassware, and textiles. This time, the exhibits may not create an immediate visual impact; however, Kou says, "The gathering of hanging scrolls, hand scrolls and album leaves would command a composed mood for people to pause and appreciate with careful attention."

Snapshots showcase Chinese modernization in Russia's Chelyabinsk

MOSCOW — A photo exhibition showcasing China's achievements in modernization opened Wednesday in Russia's central city of Chelyabinsk, attracting more than 100 participants from political, media and business circles, as well as youth representatives from China and Russia.

The exhibition features a selection of 48 Xinhua News Agency photographs highlighting China's landmark achievements in economic and social development, science and technology, culture, and other fields.

Addressing the opening ceremony, Chinese Consul General in Yekaterinburg Luo Shixiong said China and Russia have forged a comprehensive strategic partnership of coordination for a new era and remain reliable partners in their respective pursuits of national rejuvenation.

China is steadily advancing high-quality development and expanding high-standard opening-up, Luo said, adding that these efforts will create broad opportunities for the two countries to deepen cooperation in trade, industry, scientific and technological innovation, regional connectivity, and cultural exchanges.

He expressed hope that visitors will gain an understanding of the underlying logic of China's development through this exhibition, recognize the immense potential of China-Russia cooperation, and seize the vast opportunities brought by Chinese modernization.

PHOTOS BY FENG KAIHUA / XINHUA

Anton Artemov, deputy governor of the Chelyabinsk region, said that Russia-China relations are built on the unshakable principles of good-neighborliness, mutual respect and strategic partnership. In his view, the photo exhibition serves as a genuine chronicle of Chinese modernization. These are not merely pictures, but snapshots embodying the strength, diligence and talent of a great nation.

"Culture has always served as a bridge connecting our two great nations. This exhibition will help the Russian public gain a deeper understanding of China's achievements," said Irina Anfalova-Shishkina, first deputy minister of culture of the Chelyabinsk region.

Co-hosted by the Consulate General of the People's Republic of China in Yekaterinburg and Xinhua News Agency's Eurasia Bureau, the exhibition will run until July 22.

CULTURE

Macao's theater talent shines

Through innovative adaptations of Chinese legends, performers connect timeless stories with contemporary audiences, **Xu Fan** reports.

Most of them balance theater with full-time jobs. Among them are a high school music teacher and a company mailroom clerk. But on a summer afternoon in the Guangdong-Macao In-Depth Cooperation Zone in Hengqin, Guangdong province, it was their shared passion for the stage — rather than their day jobs — that took center stage.

One by one, representatives from 12 Macao theater troupes stepped onto the stage of the Mahua FunAge Theater of Hengqin Cultural and Art Center as spotlights illuminated each of them in turn.

For Leer Cheng, chief financial officer and assistant president of Mahua FunAge, it was an emotional moment. Her eyes welled up as she watched the creators appear, feeling that their years of dedication to theater had finally been recognized.

The moment was part of the opening ceremony of the 2026 Macau Live International, which began on June 17.

Over the following six months, 12 performing arts troupes will present a diverse lineup of productions, ranging from traditional plays and musicals to choral concerts and clown performances.

All productions are presented in Cantonese, with the Guangdong-Hong Kong-Macao Greater Bay Area serving as the primary target market. Audience response has exceeded expectations. More than 700 people applied to attend the opening ceremony, despite the event originally being limited to just 50 attendees.

The extended schedule represents a major shift from last year's inaugural edition, which lasted just five days. Based on audience feedback, Cheng realized that packing so many performances into such a short period made it difficult for audiences to fully appreciate each production, as their attention was scattered.

"Building on the experience we gained last year, we extended the season to six months, hoping audiences would have more time to appreciate each production and gain a deeper understanding of its cultural richness and artistic value," Cheng says.

Beyond attracting audiences, the season also serves a more ambitious goal: helping Macao's theater talent reach a wider audience by creating more opportunities to perform in cities like Beijing and Shanghai on the Chinese mainland, Cheng adds.

The season is not only providing Macao troupes with a larger stage, but also encouraging them to reinterpret Chinese cultural classics in ways that speak to modern audiences.

One example is *Starvation*, a 70-minute stage production adapted from *Cai Wei* (Gathering Wild Peas), one of the eight short stories in the collection *Gushi Xinbian* (Old Tales Retold) by Lu Xun (1881-1936).

Following its selection for the youth section at the 2024 Wuzhen Theatre Festival, the production, now presented in a Cantonese version for the first time, blends an ancient legend with modern perspectives.

"What does it really mean to hold on to one's principles? Every era has its own answer."

Chen Yujun, co-director of *Starvation*

Top: The 2026 Macau Live International kicks off on June 17.
Above: *Rhapsody* is one of the highlights of the performing arts season, which lasts six months and features a diverse lineup of productions, including traditional plays, musicals and clown performances.
Right: *Starvation* reimagines a Chinese classic for contemporary audiences.
PHOTOS PROVIDED TO CHINA DAILY

The story traces its origins to Boyi and Shuqi, two princes who, according to legend, refused to serve the newly established Western Zhou Dynasty (c. 11th century-771 BC) after the fall of the Shang Dynasty (c. 16th century-11th century BC). Choosing to live on wild peas rather than accept Zhou grain, they eventually starved to death on Mount Shouyang, becoming enduring symbols of integrity and moral conviction in Chinese culture.

For co-directors Chen Yujun, who grew up in Shenzhen, Guangdong, and Sam Leong, who was born in Macao, the production is less about re-creating history than asking why the story still resonates today.

"Lu Xun reinterpreted this ancient legend through the concerns of his own time. More than 90 years later, our generation is asking a similar question: What does it really mean to hold on to one's principles? Every era has its own answer," Chen explains.

To bridge the distance between the ancient tale and contemporary audiences, the production introduces two modern young women who become stranded on the same mountain after encountering their own troubles. Their struggle for survival echoes that of Boyi and Shuqi, suggesting that while history changes, many human dilemmas remain remarkably similar.

"Whether it's pursuing ideals, taking responsibility or simply trying to become a better person, these questions transcend time. Society keeps moving forward, yet many of the challenges people face today are surprisingly similar to those confronted centuries ago," Leong says.

The Cantonese adaptation also gives the classic story new artistic vitality, Chen adds. "We hope it will encourage more young people to reconnect with Cantonese, which has a distinctive charm thanks to its rhythm and tones."

The same spirit of respecting local cultures can be found in another original production scheduled for this season, *The New Peach Blossom Spring*, which reimagines the Eastern Jin Dynasty (317-420) poet Tao Yuanming's timeless vision of an ideal world through a contemporary lens.

For Cheng of Mahua FunAge, these productions reflect the broader ambition behind Macau Live International. She hopes the season will create more opportunities for cultural exchange between Macao and the Chinese mainland and help build Macao into a city known not only for tourism but also for performing arts.

"I bought two academic books to trace the origins of Macao's theater, back to the days when performers staged plays on the steps of the Ruins of St. Paul's," Cheng says, her voice thick with emotion, adding that she hopes to bring that rich theatrical legacy back into the spotlight and to audiences far beyond Macao.

Architecture that travels far

By BAI SHUHAO in Taiyuan
baishuhao@chinadaily.com.cn

The moment German illustrator and new media artist Anja Nolte stepped into the Jinci Temple in Taiyuan, Shanxi province, she immediately recognized the centuries-old Shuijingtai, or Water Mirror Stage.

It is, she recalls, the very stage that inspired one of the most memorable scenes in the 1960s Chinese animated classic *Havoc in Heaven*, in which the Monkey King, or Sun Wukong, showcases his legendary 72 transformations.

"I worked as an animator in Germany for a period of time, and I watched a number of Chinese animated films then," Nolte says.

"So I knew this place."

The Water Mirror Stage has become one of Shanxi's most iconic architectural landmarks. Built more than 400 years ago, it has appeared repeatedly in Chinese popular culture, from the beloved 1986 television adaptation of *Journey to the West* to the video game *Black Myth: Wukong* and the recent animated feature *Nobody*.

With two round black windows that look like eyes and a central doorway like an open mouth, the stage has become a beloved image for generations of audiences.

Nolte was among a group of international and Chinese artists participating in "Discovering Shanxi's Ancient Chinese Architecture: A Visual Journey through Cultural Heritage", a cultural exchange program that encouraged new artistic creation through visits to some of the province's best-preserved historical sites.

The itinerary included landmarks such as the Jinci Temple, the Hanging Temple and the Pagoda of Fogong Temple, with Jinci serving as the program's first stop.

Standing before the stage, Nolte filled pages of her sketchbook with drawings of the building and the stone lions guarding its entrance.

For Veldesen Yaputra, an Indonesian student at Tsinghua University's School of Architecture, what impressed him most about Jinci was not its age but its atmosphere.

"The first thing I felt wasn't that it was ancient — it was that it was comfortable," he says.

The sound of running water, sunlight filtering beneath the eaves and the carefully proportioned courtyards created a profound sense of calm, he says.

As he wandered through the temple complex, he came to appreciate how traditional Shanxi timber architecture works in harmony with its surroundings, providing shelter from rain and wind while creating generous shade.

"Chinese architecture doesn't seek to conquer nature," Yaputra says.

"It seeks to live in harmony with it."

Colombian artist Rodrigo Escobar-Vanegas, who has lived in China for nearly two decades, says he was particularly impressed by the survival of the wooden structures and their intricate exposed beams.

"I'm very happy to see that these ancient Chinese buildings have been so well preserved," he says.

The artist adds that Colombia is also home to remarkable ancient civilizations.

Unlike Jinci, however, many of the country's archaeological sites have only been brought to light through excavation rather than preserved intact over the centuries, he says.

Following their visit to Taiyuan, the participating artists continued their journey in Jinzhong, Xinzhou, Shuozhou and Datong, where they explored more of Shanxi's rich architectural heritage.

The six-day cultural exchange program concluded on Monday.

Above: Shuijingtai at the Jinci Temple is an architectural landmark in Shanxi province. **Below right:** German artist Anja Nolte shows her sketch of the site. **Below left:** Intricate wooden structures are well preserved at the Jinci Temple. Porcelain creates shared artistic language

NANCHANG — In one of his late masterpieces, *The Feast of the Gods*, Italian painter Giovanni Bellini placed three pieces of blue-and-white porcelain at the center of the composition, using them as striking decorative accents.

According to Chinese historian Yan Chongnian, the vessel held by a woman in the painting bears a remarkable resemblance to blue-and-white porcelain excavated from the imperial kiln site in Jingdezhen, in East China's Jiangxi province.

Weng Yanjun, head of the Jingdezhen Imperial Kiln Institute, says: "While embellishing a mythical banquet scene, these porcelain pieces also stand as enduring evidence of historical exchanges between civilizations."

Bellini's work is not an isolated case. As still-life painting gained popularity and porcelain imports surged in Europe, blue-and-white porcelain became a recurring motif in Western oil paintings, reflecting its profound influence on European art and society.

Known as China's porcelain capital, Jingdezhen boasts more than 1,700 years of ceramic production, and its influence on global culture and the art world remains as strong as ever.

Over the centuries, ceramics from Jingdezhen have been exported to Central Asia, West Asia, Europe and Africa. The cultural exchanges flowed both ways. While porcelain enriched Western oil painting, Chinese ceramics also drew inspiration from Western artistic traditions.

Mythological themes became a popular choice for exported Chinese porcelain in the mid-18th century, according to Li Shiqi, an assistant researcher at the Jiangxi Provincial Academy of Culture and Tourism.

Li says this fusion marked an aesthetic and creative breakthrough, fostering greater mutual understanding and deeper cultural exchange.

Today, artists are blending the rich techniques of oil painting with the distinctive pigments of ceramic art. Wang Yantian, a young ceramic artist based in Jingdezhen, is one of them.

"The fusion enriches artistic expression, promotes cultural inheritance and exchange, and supports the growth of the ceramic industry," says Wang, noting that realistic oil painting techniques, themes and visual language have been widely integrated into contemporary enamel porcelain paintings.

The exchange continues to inspire international artists. David Reid, a 71-year-old Australian artist who has spent more than four decades drawing and painting, arrived in Jingdezhen in 2018, driven by a passion for ceramics.

From abstraction to Eastern aesthetics, the interplay of Eastern and Western cultures comes alive at his fingertips.

"Here I create ink paintings, oil paintings and ceramics. Jingdezhen constantly sparks my inspiration to fuse Chinese elements with Western modernism," says Reid.

Camille Kami of France recalls her amazement on arriving in Jingdezhen, wondering how an entire city could devote itself to a single craft for more than 1,000 years.

She found herself unexpectedly reluctant to leave Jingdezhen and ultimately decided to make the city her home.

Chen Kelong, Jingdezhen's Party chief, says the city has established partnerships with more than 180 cities in more than 70 countries. Artists from about 50 countries and regions have flocked to the city to live, work and create.

2026 WORLD CUP

SPAIN REIGNS ONCE AGAIN

La Roja dominates defensive Argentina, as extra-time goal clinches its second world title

This is how good Spain was at the World Cup: Not even Lionel Messi had any answers.

And when it was over, Spain walked off with the trophy.

Messi simply walked off in tears.

Spain is back atop the soccer world for a second time, after Ferran Torres' first goal of this year's World Cup — but unquestionably the most important — gave his country a 1-0 win over now-dethroned champion Argentina in the final in East Rutherford, New Jersey, on Sunday.

"It was a goal scored by 47 million people," Torres said, referring to Spain's population.

Maybe not by them — but certainly for them.

The goal came with Argentina down to 10 men, after Enzo Fernandez was sent off late in regulation following a reckless tackle. Tempers flared then, and flared again after the final whistle with Argentina coach Lionel Scaloni and players from both sides engaging in what appeared to be some pushing and shoving.

In the end, though, Spain denied Messi a second straight title in what he has indicated was his final World Cup match.

Torres, a second-half substitute, pounced on a bouncing ball in the box and used his left foot to bury a shot just under the crossbar in the 106th minute.

From there, the airtight defense that dominated opponents throughout the tournament came through one final time. Spain — which also won the title in 2010 — allowed only one goal in eight matches in this World Cup run, setting a record for fewest goals allowed by a champion.

"I feel pride, to be honest," said Spain coach Luis de la Fuente, who at 65 is now the oldest man to lead a team to a World Cup title.

"Accompanying them on this journey is an honor.

"I spoke to my players, and they said: 'Look, we've won everything, coach. We've won everything,'" he added.

"And that is beautiful."

A tournament first

This title, combined with the Women's World Cup won by Spain in 2023, makes the European nation the first to hold both the men's and women's titles simultaneously. And in the streets of Madrid — probably many other places in Spain as well — countless people spilled into the streets, celebrating Sunday's victory long into the wee hours of Monday morning.

The score indicates this match was close, but only one team was in command.

Spain took the game's first 20 shots on goal before Argentina — desperate for an equalizer — got its first attempt off in the second half of extra time. Spain took nine of the game's first 10 corner kicks, and only a World Cup final-record 12 saves by Argentina goalkeeper Emiliano Martinez gave the 2022 champions a shot at going back-to-back.

"Dibu was nothing short of exceptional," De la Fuente said, referring to Argentina's keeper by his nickname.

Spain is now unbeaten in its last 38 matches — 29 wins, nine draws — and is the outright holder of the longest such streak by any European men's team ever. Italy went 37 matches (28 wins, nine draws) from October 2018 through September 2021, before Spain ended that streak.

And for the last two-plus years, no team has beaten Spain. Not even Messi's comeback kings, the lords of the late-game rally at this tournament, had an answer this time.

"We lost the game, and we accept that," Scaloni said. "That doesn't mean that we will forget everything we've done so far, so I'd like to thank my people, my players and the country. I can tell them that we played our hearts out."

Surviving a late scare

A Messi corner kick with about four minutes left before the final whistle saw the ball take a fortunate skip toward substitute Giuliano Simeone — who sent it high over the crossbar, leaving him holding his head in disbelief.

"When you have Messi on the other side, well, you are nervous," Torres said. "At the end of the day, we always depended on us. We always come up with our football, and we showed it again."

Despite the post-match scuffles, Spain also paid tribute to the former champion. The players lined up to form a guard of honor for Argentina's squad to walk through on its way to the stage to collect its runner-up medals from United States President Donald Trump and FIFA President Gianni Infantino.

"I think, now, I'm in a cloud," said Spain captain Rodri, who was awarded the Golden Ball as the tournament's best player.

Argentina was forced to finish the match down a man after Fernandez was sent off in second-half stoppage time after getting his second yellow card for a collision that sent Spain defender Pau Cubarsi cartwheeling into the air.

Simple and flawless

It was the 104th and last match of the biggest World Cup ever, a 48-team event that played out over the US, Canada and Mexico. Because there were more matches than any previous World Cup, it was no surprise that there were more goals than all other editions — more than 300, nearly three per match.

Except, of course, when Spain was involved.

Spain's plan was simple and flawless: Hold the ball as much as possible, denying opponents any hint of a chance.

It worked, all the way to the end.

A final unlike any other

The spectacle was not limited to simply soccer.

Madonna, Justin Bieber, BTS and Shakira were all part of a halftime show that also featured Burna Boy, Jason Sudeikis in character as Ted Lasso, and even some of the Muppets.

Jennifer Hudson, Post Malone and Tom Cruise had roles in the closing ceremony, which actually preceded the match.

A slew of actors, athletes and other celebrities were there: Spain's Javier Bardem left happy, Luciana Barroso Damon — the wife of actor Matt Damon — probably did not, considering she was wearing the colors of her native Argentina.

They all came to see a show. So did 80,000 other people, not to mention perhaps as many as two billion watching around the globe.

Spain didn't disappoint.

No team has won back-to-back men's World Cups since Brazil in 1958 and 1962, and Spain kept Argentina from pulling off that repeat.

"As I told the lads before the game, we have to go for the game, we need to face them, we have to look to their eyes and say we want this game," Rodri said.

"And then, life gives you the World Cup, or not."

Life didn't give Spain the World Cup, though, Spain took it.

Messi can conjure no more magic, as he relinquishes his crown

Lionel Messi could conjure no more magic.

Twenty years after his World Cup debut and a career that some believe makes him soccer's greatest ever player, at 39 he could not will Argentina to become the first repeat champion in more than half a century.

Spain outplayed the Albiceleste from the opening whistle at MetLife Stadium, where the overwhelming majority of the 80,663 spectators were hoping for a re-coronation.

Ferran Torres scored 37 seconds into the second extra-time period, lifting Spain to a 1-0 victory and its second World Cup title.

Instead of Messi becoming a two-time champion, the crown passed. He fought back tears and had a look of misery as he and teammates faced applauding and bowing Argentina fans at the stadium's south end, while Spanish stars lifted the trophy on a podium at the halfway line.

After leading Argentina to victory in the 2022 final against France, sandwiched between consecutive Copa America championships, Messi could only bow his head, grimace and put his hands on his hips as Spain's Lamine Yamal, less than a week past his 19th birthday and projected to be the sport's next big thing, ran to embrace Torres after the goal.

"I hope that everyone feels proud of him, of what he's achieved because he's the best football player ever to step foot on a pitch," Argentina coach Lionel Scaloni said.

Spain's dominance was thorough in the final and throughout the World Cup, as it extended its unbeaten streak to 38 games, the longest by a European team.

La Roja made 20 shots to Argentina's two in the match, the second-largest difference in a World Cup final since stats began being kept in 1966, behind only West Germany outshooting Argentina 23-1 in 1990, according to Opta. It also out-passed Argentina 845-433.

Spain conceded just one goal the entire tournament, the fewest by a World Cup champion, and scored 14 while compiling a 145-45 advantage in shots. Goalkeeper Unai Simon totaled 10 saves over eight games — Argentina's Emiliano Martinez had 11 in the final alone.

Argentina's players watch on during the trophy presentation after their World Cup final loss to Spain on Sunday. AP

When Messi left European soccer for MLS three years ago, after four Champions League medals and 12 league titles with Barcelona and Paris Saint-Germain, some speculated he would be another retiree moving to Florida.

Instead, he won an MLS title with Miami and led Argentina back to the final with eight goals and four assists. He has played in a record 34 World Cup games over six tournaments and boasts a World Cup goal tally of 21, the record until France's Kylian Mbappe scored twice in Saturday's third-place game to surpass him with 22.

Messi became the first player to start three World Cup finals and raised his international goals total to 125, second only to Cristiano Ronaldo's 146. He is now regularly mentioned in the same breath as compatriot Maradona and three-time World Cup champion Pele.

With his distinctive slow walk, arms swinging at his side as he waited for the right moment to burst into action, the diminutive 5-foot-7 attacker was the center of attention any time he got the ball on the right flank. Opponents and fans waited for him to cut to the center and unleash a shot with his lethal left foot.

Messi had just 15 touches in the first half of the final, and 54 over the whole game at the stadium where he has been repeatedly frustrated. He famously retired from international soccer after a loss on penalties to Chile in the 2016 Copa America final at MetLife, only to U-turn 47 days later and lead his nation to its third World Cup title four years later.

Against Spain, Messi never had the ball in a position to score, and his attempts to pass to teammates didn't connect.

"The first idea was to keep Messi at bay," Spain coach Luis de la Fuente said.

Half a dozen Spanish players walked over to Messi after the final whistle to console him. Messi dropped to the grass and sat, staring.

When Spain later formed a guard of honor for Argentina's players to collect their second-place medals, Messi tried to smile, but couldn't. He had a blank look as he walked through, and a few of the Spanish team patted him on the back and chest as he passed.

Spain is now the world's leading soccer power; the first nation to hold the men's and women's titles at the same time.

And, while gold confetti fluttered down upon Spain's jubilant players, Messi, adorned in consolation silver, headed glumly for the exit.

Xi extends condolences to Colombia

Quake rescue work continues as death toll exceeds 200

By **LIU JIANQIAO, MO JINGXI** and **ZHOU JIN**

President Xi Jinping sent a message of condolence on Tuesday to Colombian President Abelardo de la Espriella after a magnitude 7.4 earthquake rocked the South American nation on Monday, killing more than 200 people and injuring over 600.

In his message, Xi said he was deeply shocked to learn that a powerful earthquake had caused heavy casualties and significant property loss in Colombia. On behalf of the Chinese government and people, he expressed deep condolences over the deaths and extended sincere sympathies to the bereaved families and the injured.

Xi also expressed confidence that under the leadership of the Colombian government led by de la Espriella, the Colombian people will make concerted efforts to overcome the disaster and rebuild their homes at an early date.

Meanwhile, the China International Development Cooperation Agency, which coordinates foreign aid missions, announced that the nation stands ready to provide assistance within its capabilities to support quake relief efforts in Colombia.

China is closely following the developments and will provide assistance in an appropriate manner based on Colombia's needs, agency spokeswoman Tang Ying said in an online statement on Tuesday.

Rescue efforts across western Colombia continued for a second day as emergency workers dug through the rubble of collapsed buildings in several cities and towns, including Pereira and Cali, amid grim expectations that the death toll from the country's most powerful earthquake in decades could rise.

According to the Colombian Geological Service, the quake hit at 7:34 am on Monday at a depth of 96 kilometers, with its epicenter identified near San Jose del Palmar in the department of Choco, about 400 km from Colombia's capital Bogota.

As much of Choco is accessible only by boat, through the jungle or by airplane, little was known about the extent of damage there.

Rescuers look for survivors in the rubble of a collapsed building in Pereira, Colombia, on Monday after a magnitude 7.4 earthquake rocked the South American nation. JAIME SALDARRIAGA / AFP

A survivor is pulled out of the rubble in Pereira, Colombia, on Monday. MIGUEL ANGEL LOPEZ / AP PHOTO

De la Espriella, who has declared a state of national emergency, traveled to Choco's capital, Quibdo, on Monday night to assess the damage and announced that he had mobilized "the entire military and police apparatus" for relief and rescue operations.

Earlier in the day, he told reporters: "Our intention is to cooperate in any way necessary. Here, there are no distinctions or ideological divisions when it comes to defending our people or showing solidarity."

According to local media reports, 32 cities in the western region have been severely affected, while five departmental capitals — Pereira, Cali, Quibdo, Manizales and Armenia — continue to remain under red alert for aftershocks.

The quake has turned dozens of multistory buildings into piles of concrete and twisted metal in cities such as Pereira, and brought down the towers of a landmark cathedral in Manizales. In Cali, a city of about 2.2 million people, at least 85 people have been confirmed dead. Several floors of a city hospital collapsed during the temblor, trapping many patients.

Seven airports in western Colombia have suspended operations due to structural damage. A video posted on social media and verified by Reuters showed the Cali airport swaying violently and people scurrying for shelter amid collapsing chunks of concrete.

On Monday, the Chinese embassy in Bogota activated an emergency response mechanism to assess the safety of Chinese nationals. No casualties among Chinese citizens were reported as of press time on Tuesday.

The powerful earthquake was also felt in Ecuador and Venezuela, which share their borders with Colombia. In June, two back-to-back temblors in Venezuela had killed more than 6,300 people.

Agencies contributed to this story.

Yiwu builds big on sale of small commodities

By **CAO DESHENG** and **CHEN YE** in Yiwu, Zhejiang

For 20 years, Lyu Chengjun has run an electronic weighing scale business in Yiwu, a city in East China's Zhejiang province known as "the world's capital of small commodities". Along with the transformation of the city itself, his business has grown big, with more than 200,000 items exported each year to Africa, the Middle East, South America and other regions.

Regarding the development of his company, Constant Scale, Lyu, 50, said that for him, innovation is constant. "By innovating products to increase their added value, we gain a competitive edge in the international market, which is beneficial for long-term development."

Lyu said he actively employs new technologies, such as artificial intelligence, to analyze data on the differentiated needs of foreign clients, allowing his company's products to better align with the demand for weighing scales in the international market.

"Actually, innovation is the driving force that propelled Yiwu to become what it is today," he said.

Lyu is one of thousands of businesspeople in Yiwu, a county-level city, who dream big and build up businesses step by step, even from the smallest and seemingly insignificant commodities such as buttons.

Once hindered by poor transportation links and scarce resources, Yiwu has written a remarkable chapter in China's county-level economic development since the opening of its first-generation small commodities market in 1982.

Today, the Yiwu International Trade Market is home to more than 1.26 million business entities, and it maintains trade links with more than 230 countries and regions. In 2025, its export value reached 730.7 billion yuan ($108 billion), ranking first among all county-level regions in China.

In an instruction that was made public in April, President Xi Jinping called for efforts to further review and make better use of the "Yiwu development experience", which is marked by enterprising spirit, persistent innovation and the ability to "create something from nothing".

Yiwu's small commodities have entered a vast market and developed into a major industry, forming the "Yiwu development experience", Xi said, adding that this represents a successful example of developing county economies in line with local conditions.

Yiwu's commercial life began with peddlers who traded sugar for chicken feathers for use as fertilizer, and with roadside stalls that slowly grew into a vast marketplace.

Over the past four decades, the Yiwu market has been relocated six times, expanded 13 times and underwent five rounds of transformation and upgrading. Now it spans more than 8 million square meters, with over 80,000 shops and daily foot traffic of more than 210,000 people. It is often seen as a window into China's reform and opening-up and a barometer of the global small-commodities trade.

New Middle East security architecture a response to US pivot

WORLD WATCH
By Amr El Henawy

In Mecca on Friday, leaders of Pakistan, Saudi Arabia and Turkiye signed an agreement on collective defense: "An armed attack against any one of the three States shall be regarded as an attack against them all". The agreement was heralded by some observers as a fundamental reshaping of the security architecture of the Middle East.

Is a new security agreement really needed by any of the Meccan signatories? Saudi Arabia has deepened its defense partnership with the United States through a Strategic Defense Agreement. Pakistan is recognized by the US as a Major Non-Nato Ally with priority access to US military technology and research. And Turkiye is a full member of NATO, protected by Article 5 of the NATO treaty.

It is true they all face individual security issues. Pakistan, although a nuclear power with a large and battle-hardened military, is faced on its eastern border by India, a nuclear power with a larger military and a more robust economic and industrial base. To Pakistan's northwest, the Taliban continues to pose security concerns. Iran, along Pakistan's western border, could conceivably become a competing nuclear power; or, alternatively, it may collapse, pouring refugees across the border, endangering security and the economy.

Turkiye has experienced domestic security issues with the Kurdistan Workers' Party, a Kurdish militant group. On its southern border, Turkiye faces Iraq and Syria, both with large Kurdish minorities. Iraq, largely Shia, has ties to Iran; and Syria continues to experience sectarian conflicts. Israel has repeatedly bombed Syrian sites and has made cross-border incursions. Leading Israeli politicians also recently named Turkiye as their nation's greatest threat.

Saudi Arabia is vulnerable to attacks on its oil industry by both Iran and Yemeni Houthis. In 2019, Iranian drones massively disrupted critical production at Abqaiq; in July 2026, multiple oil facilities were targeted; and, this past month, Saudi oil tankers in the Bab al-Mandab Strait and the southern Red Sea were struck from coastal Yemen.

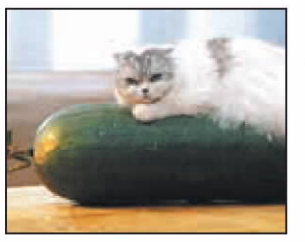
VIRAL CAT MEME SPARKS FRESH INTEREST IN TRADITIONAL VEGETABLE

In China, wax gourd from Guangdong has long been a summer staple, used in dishes that help beat the heat

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

A tiny cat hugging an oversized vegetable has become one of this summer's most unexpected online sensations in China.



In images circulating on social media, a fluffy cat rests on top of a giant green wax gourd, draping its paws over the smooth surface as if embracing a "natural air conditioner". The contrast between the drowsy furball and the colossal vegetable has captivated internet users.

China Vibes — FOOD —

"Even cats have found their perfect summer companion," one online fan joked.

The trend has renewed interest in the wax gourd, an everyday vegetable familiar to Chinese households. In Foshan, Guangdong province, however, it is anything but an internet novelty. For generations, it has anchored the local summer diet and embodied the Lingnan tradition of eating with the seasons.

Known for its high water content, mild flavor and refreshing texture, the wax gourd is a popular summer staple across southern China. In Guangdong's sweltering climate, families turn to it for light soups that offer respite from the heat.

A pet cat chills on a wax gourd in Jiangmen, Guangdong province, on July 18. SU KANGYE / FOR CHINA DAILY

For 65-year-old farmer Ou Yingqiu in Foshan's Sanshui district, growing wax gourds is more than a livelihood; it's a lifelong bond with the soil.

"My family has been growing wax gourds for decades," Ou said.

This year, Ou and his wife planted about 65 percent of a hectare. Sown around Spring Festival, the crop is shielded by plastic sheeting during cold snaps. Ready for harvest in roughly 90 days, Sanshui's main season stretches from mid-May to early August.

Harvesting the crop is backbreaking work. Mature gourds must be cut and lugged from the fields, prompting Ou to hire extra hands.

Sanshui black-skinned wax gourd, a national geographical indication product, is prized for its jet-black, glossy rind, firm flesh and exceptional shelf life. While a typical gourd weighs 15 to 20 kilograms, Ou's heaviest tipped the scales at around 35 kg.

Ou credits Sanshui's sandy, fertile soil for the gourds' dense texture. While rainfall and temperature dictate growth and sales, excessive downpours can curb harvests, even as soaring temperatures boost demand.

The gourd's hardiness has long made it a pantry essential. An intact specimen can be stored for months in a dry, ventilated place — potentially until year-end.

'China Opportunity 2.0' knocks for global economy

Broader access to advanced technology, wider sharing of innovation to benefit all

By **ZHANG CHENXU, ZHONG NAN** and **ZHOU LANXU**

China's economic resilience and strong innovation momentum, combined with its unwavering commitment to high-standard opening-up, are ushering in "China Opportunity 2.0" for businesses worldwide, officials, experts and executives said, adding the country's development has brought the world vast opportunities and considerable room for growth.

In a world facing rising protectionism and geopolitical tensions, they said, deeper innovation cooperation is emerging as a key pathway to reviving global growth, while China Opportunity 2.0 is bolstering investor confidence through stronger innovation empowerment and high-return investment prospects.

For the global economy, China Opportunity 2.0 is broadening access to advanced technologies and enabling the benefits of innovation to be shared more widely across countries and economies, they added.

China Opportunity 1.0 was largely associated with China's emergence as a fast-growing market and the "world's factory", said Liu Tiezhi, a researcher at the Development Research Center of the State Council.

The 2.0 version, he said, is taking shape in a more mature and rules-based market, where China's vast domestic demand is creating new opportunities on the demand side and its highly efficient industrial system is opening up fresh possibilities on the supply side.

"China Opportunity 2.0 is also about fostering a two-way flow of resources and factors through higher-standard opening-up," Liu said, adding that deeper development cooperation could equip countries with more resources and capabilities to narrow development gaps.

Growth resilience

A key pillar of China Opportunity 2.0 is the resilience and steady growth prospects of the world's second-largest economy, which are providing greater certainty for global businesses and reinforcing confidence in long-term investment and development amid a more volatile external environment.

China's economy expanded 4.7 percent year-on-year in the first half of 2026, with GDP reaching 69.57 trillion yuan ($10.28 trillion), keeping the economy on track to meet the government's full-year growth target of 4.5 to 5 percent, according to data released by the National Bureau of Statistics in mid-July.

"China's economic performance remained within an appropriate range in the first half, with new growth drivers gaining momentum," said Mao Shengyong, deputy head of the NBS.

Putting China's growth in a global context, Huang Hanquan, head of the Chinese Academy of Macroeconomic Research, said the performance is particularly noteworthy at a time when high inflation and elevated interest rates are weighing on the world economy and overall global growth is losing momentum.

"Against such a backdrop, maintaining growth at this pace is no small achievement," Huang said at a seminar hosted by the academy in Beijing last month.

Zhu Feng, China chief economist and head of Greater China Economic Research at JPMorgan, told China Daily that he expects the Chinese economy to grow around 4.6 percent this year and meet the official growth target.

"High-tech and advanced manufacturing, AI (artificial intelligence)-related exports, renewable energy and public investment should remain key sources of manufacturing resilience, while exports continue to support growth," Zhu added.

Goldman Sachs has also forecast China's economy will grow by 4.6 percent this year, with exports remaining a key source of resilience thanks to the country's strong manufacturing competitiveness.

The International Monetary Fund struck an optimistic note in July, raising its 2026 growth forecast for the Chinese economy by 0.2 percentage point from its April projection to 4.6 percent, making China one of the few major economies to receive an upward revision.

For multinational corporations with deep operations in China, that resilience is more than a macroeconomic story — it is increasingly reflected in day-to-day business activity.

Willie Tan, CEO of Skechers China, South Korea and Southeast Asia, said China has demonstrated strong structural resilience amid a complex global environment, with the quality of growth continuing to improve.

For United States-based athleisure company Skechers, that resilience is visible in recovering foot traffic at major commercial districts and outlet malls, growing demand for performance sports products and steady sales growth supported by omnichannel integration, Tan said.

"China's vast market, well-developed supply chains and steadily improving business environment are delivering tangible returns for global companies," Tan added.

Similar confidence is evident among the broader business community. An annual member survey released in June by the US-China Business Council found that 95 percent of respondents considered China "somewhat to very important" for staying globally competitive.

Foreign investment is also showing signs of stabilization. Data from the Ministry of Commerce showed that China's actual use of foreign direct investment totaled 402.14 billion yuan in the first half of this year, with the decline narrowing by 10.2 percentage points compared with the same period last year. In June alone, the actual use of FDI increased 15.1 percent year-on-year, marking the second consecutive month of growth.

Rogier Janssens, president of Merck China, said the latest first-half figures were consistent with what he had observed on the ground: solid momentum in high-end manufacturing and resilient trade in high-value-added products — trends that point to the emergence of China Opportunity 2.0.

To gauge the resilience of China's economy, one needs to look beyond the headline GDP figures and examine where the growth is coming from, Janssens said.

Innovation momentum

New growth drivers contributed more than two-fifths of economic growth in the first half. The industrial sector maintained solid momentum, with value-added output of industries above designated size rising 5.4 percent year-on-year, while high-tech manufacturing output grew 13.3 percent, data from the National Bureau of Statistics showed.

"The growing prominence of new growth drivers, together with a clear improvement in the quality and structure of the economy, represents one of the most significant shifts taking place in China," said Yin Yanlin, deputy director of the Committee on Economic Affairs of the 14th National Committee of the Chinese People's Political Consultative Conference.

Luo Zhiheng, chief economist and head of the research institute at Yuekai Securities, said the expansion of high-end manufacturing is strengthening the resilience of China's industrial and supply chains at home, while enhancing its ability to withstand external shocks and safeguard economic security.

Meanwhile, China's technological advances and industrial upgrading are yielding growing innovation dividends for global businesses, as more foreign companies establish research and development centers and become more deeply embedded in the country's innovation and industrial ecosystems, shifting from "manufacturing in China" to "innovating in China".

In 2025, around 14,000 new foreign-invested enterprises were established in China's scientific research and technical services sector, up 27.2 percent year-on-year, according to the Ministry of Commerce.

"China is no longer merely a destination for global innovation; it has become a significant source of it," Janssens said.

That shift is creating value across the business ecosystem, Janssens noted, with China benefiting from high-value economic activity and Merck able to grow and innovate within an increasingly dynamic and supportive ecosystem.

Underscoring that trend, FDI in China's high-tech industries surged 33.2 percent year-on-year in the first half, lifting its share of total inflows to a record 42.4 percent, the Commerce Ministry said.

"The figures show that China's FDI mix is moving steadily up the value chain, while foreign investors remain bullish on the Chinese market," Yan Dong, vice-minister of commerce, said at a news conference in July. "Nearly 4,800 foreign-funded enterprises expanded their investment in China in the first half."

Kilian Aviles, executive vice-president of Dekra Group and head of its Asia-Pacific region, said China's innovation ecosystem, driven by artificial intelligence, digital technologies and green technologies, has become a key force behind the country's long-term economic resilience and industrial upgrading.

He said these advances are also boosting productivity and contributing to global technological progress.

China's innovation strength is gaining greater global recognition, with the country entering the top 10 of the Global Innovation Index for the first time in 2025 and ranking first globally for a third consecutive year in the number of top 100 innovation clusters, according to the World Intellectual Property Organization.

Artificial intelligence, in particular, has emerged as a major source of that momentum. China was home to more than 6,200 AI companies in 2025, while the value of its core AI industry exceeded 1.2 trillion yuan, according to the Ministry of Industry and Information Technology.

For Dekra, that innovation momentum has translated into continued expansion of its capabilities in China, Aviles said.

The German testing, inspection and certification company has upgraded and expanded key laboratories in Shanghai, Suzhou, Jiangsu province, Guangzhou, Guangdong province, and Hefei, Anhui province.

"China's technological advances are enabling us to broaden the scope of our global services, build capabilities for emerging industries and bring proven solutions developed in China to markets across the Asia-Pacific and beyond," Aviles said.

Researchers work at a biopharmaceutical company in Wuxi, Jiangsu province, on April 18. QI LIGUANG / FOR CHINA DAILY

Opening-up drive

In a world facing rising protectionism and geopolitical tensions, multinational corporations are looking to deepen their investment in China as a hedge against external shocks, said Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation.

He attributed foreign investors' willingness to expand their presence in China to the resilience and long-term growth prospects of the Chinese economy, coupled with the country's sustained market-opening efforts and investment facilitation measures.

China is doubling down on opening its market, removing all restrictions on foreign investment in manufacturing, shortening the nationwide negative list for foreign investment access to 29 items, with further opening-up increasingly focused on the services sector.

The policy push gathered further momentum in June, when China unveiled a 15-point action plan aimed at stabilizing foreign investment and improving its quality. The measures cover broader market access, greater investment facilitation, stronger investment promotion and services, and improved foreign investment management.

The plan places particular emphasis on opening up services, finance and pharmaceuticals, while addressing key concerns of foreign businesses ranging from cross-border mergers and acquisitions and data flows to reinvestment in China.

The push for greater openness is also creating more room for international cooperation in frontier technologies. In July, the National Development and Reform Commission and other government departments unveiled an action plan to deepen international cooperation on AI, with measures to increase the supply of high-quality data, broaden access to computing power, promote open-source development and strengthen digital and AI capacity building in developing countries.

Together, wider market access and deeper innovation cooperation are enhancing China's appeal as a long-term investment destination.

Marc Princen, global CEO of pharmaceutical company Mundipharma, said China's sustained commitment to reform and high-standard opening-up continues to "strengthen market predictability and long-term investment confidence".

Andre Musto, managing director and general manager of Merck Healthcare China, said high-standard opening-up helps establish clear rules, transparent market access and predictable regulatory pathways for multinational companies.

Policy push

Looking to the second half of the year, experts said stronger macroeconomic support, together with continued efforts to stabilize trade and investment, will be crucial to sustaining growth momentum amid lingering external uncertainties.

"China's economic fundamentals remain sound, with strong resilience and ample growth potential, and the long-term positive trajectory has not changed," Yin, from the CPPCC National Committee, said. He added that the economy faces both favorable conditions and a number of risks and challenges.

To consolidate the recovery, Yin called for stronger countercyclical adjustment, saying China should make full use of available fiscal and monetary policy space while preparing additional policy measures that can be rolled out when needed.

He also called for stronger efforts to unlock domestic demand, accelerate major investment projects and foster new growth drivers, particularly through the broader application of artificial intelligence and the digital transformation of manufacturing and services.

"Foreign trade has been an important support for economic growth this year, and that strength should be consolidated in the second half," Yin said.

Wang Xuekun, head of the Chinese Academy of International Trade and Economic Cooperation, said further efforts should focus on tapping new sources of trade growth, with AI-related supply and demand offering fresh opportunities.

On foreign investment, Wang said a priority is to proactively address foreign investors' concerns about market access and translate opening-up commitments into concrete measures.

He called for a clearer opening-up road map for future-oriented sectors, including advanced manufacturing and AI infrastructure, giving global businesses greater room to participate in China's next wave of industrial upgrading.

"Capital from Hong Kong and the Middle East is playing an increasingly important role in foreign investment," Wang said, calling for more tailored services and fast-track channels to attract such investment.

For foreign companies already operating in China, greater emphasis should be placed on encouraging reinvestment and further expansion, he added.

Crop: Trend expected to inspire farming

From page 1

Today, Sanshui wax gourds command shelves in Foshan, Guangzhou and other cities. Some are exported via cold chain to overseas markets, including the United States and Singapore.

For local residents, the typical way to enjoy the gourd remains a simple bowl of soup. "We usually make wax gourd soup," Ou said. At home, he combines gourd and pork to create a light, naturally sweet broth. The method is simple: Simmer the gourd first, add the pork once the water boils, and cook for about 10 minutes.

"Every meal is prepared fresh. If left overnight, the flavor changes," he said.

The dish has accompanied Ou since childhood. His family once grew wax gourds primarily for household consumption, only venturing into commercial sales after China's reform and opening-up.

Across Guangdong, it is also braised with pork ribs or dried scallops. Another classic summer dish combines it with duck and coix seeds. These recipes epitomize the Cantonese preference for fresh ingredients and delicate, balanced flavors.

They also illustrate the Lingnan practice of eating with the seasons. Wax gourds arrive on market stalls as temperatures peak, making them a natural staple — not for rarity or luxury, but because they suit the local climate and lifestyle.

But growing the crop remains challenging. Ou said that fewer young people are taking up farming, while many current growers are well into their 50s or beyond.

Perhaps this online trend will inspire a new generation to rediscover the value of these humble giants.

Moments of joy

Yiwu: City's rise has 'turned stone into gold'

From page 1

Xi's ties with Yiwu go back many years. In December 2002, shortly after taking office as Party secretary of Zhejiang province, he visited the Yiwu International Trade Market for an inspection. In the following years, while working in Zhejiang, he made several inspection trips there, and came to see Yiwu's experience as instructive for development of county-level cities across the province.

In the mid-2000s, Yiwu was outgrowing its administrative framework. Its economy, market reach and international links had expanded far beyond those of an ordinary county-level city, while services related to customs, inspection, foreign exchange, taxation and financing lagged behind.

Xi captured the mismatch with a vivid metaphor: A fast-growing child needs a larger piece of clothing.

In an instruction he made in November 2005, Xi called for efforts to remove institutional barriers ranging from financing and registration of foreign trade enterprises to tax policies.

A year later, Zhejiang issued guidelines on piloting local government administrative reforms, delegating Yiwu a total of 131 economic and social management powers — the first county-level city in the country to enjoy such broad authorization.

On June 8, 2006, Xi held a symposium in Yiwu on promoting the "Yiwu development experience". He hailed Yiwu's rise, saying it had "turned stone into gold".

Zhang Jiying, who owns an umbrella brand called Real Star in the Yiwu International Trade Market, started her business in 1997 with a stall covering barely one square meter. The umbrella-making skills her father had honed for years have turned into a business that sells about 5 million umbrellas a year, with her customers spanning more than 170 countries and regions.

After Yiwu launched digital tools, Zhang began using large language models to generate product videos in multiple languages, helping her reach more overseas buyers.

Such stories show the strength of a market that has grown from the ground up. But Yiwu's rise has also revealed what it can do best based on local conditions, while the government creates an enabling environment.

Raj Kumar Khadka, a Nepali trader and the honorary trade representative of the Nepal Chamber of Commerce in East China, said that while running a business in Yiwu for 14 years, he has witnessed the development of the Yiwu market.

His first visit to Yiwu took place in 2002. Over time, he watched the city fill in the gaps, building its market, logistics and supply chains into a more efficient link to global trade, he said.

Security: US shift away from Mideast becoming apparent

From page 1

But such individual security problems fail to explain the Mecca agreement. Far more fundamental is the accumulating security impact of aftershocks from the US pivot to Asia in 2011.

Pakistan's first shock from the pivot was the revival in 2017 of the Quad, an arrangement closely linking the US with India (also Japan and Australia). Pakistan then accelerated efforts to build ever closer ties with China; but that led to deepening tensions with Washington; and US security assistance to Pakistan declined sharply after 2019.

Turkiye, already angered after 2014 by US support of Kurdish forces in Iraq, believed the pivot meant the US would no longer confront Russia in Syria or the Black Sea. In 2017, Turkiye purchased Russia's S-400 defense system. This led to US sanctions, Turkiye's removal from the F-35 program and a prolonged dispute over its F-16 fleet.

Saudi Arabia, quickly understanding the probable security and economic consequences of the pivot, committed in 2017 to developing its own industrial defense base. It also recognized Washington's interest in the region would be lessened by the US' growing energy independence and by isolationist tendencies in American politics (especially MAGA).

Riyadh sought to counter these factors, not only through the 2025 defense agreement with the US, but also by seeking to involve US business in its economic development and diversification programs. Nevertheless, drone attacks on Saudi Arabia's major oil facilities went unanswered by the US in 2019. This shock was quickly followed by another in 2020 when the US withdrew Patriot missile batteries protecting oil installations.

The full security implications of the US pivot away from the Middle East became clearly apparent in the brutal Palestine-Israel conflict and the US-Israeli conflict with Iran this year. Failure to restrain Israel's bombing campaign against Hamas raised doubts about the US' will to control Israel's aspirations for regional hegemony. Although many even in the US called for an end to the genocidal attacks, Washington seemed not to care.

How the US has conducted the conflict with Iran also raised many security concerns. Why did the US call a halt to hostilities so quickly and after so few casualties? Why did the US fail to force Iran to open the Strait of Hormuz, the Gulf's lifeline? Why, after exposing the Gulf countries to attack, did the US want them to pay reparations to Iran? Why were there reports that the Pentagon was saving missiles that could have been used against Iran for more important uses? And why would the US president dangle an offer of nuclear cooperation in a broader security partnership — only to withdraw it and make it contingent on normalization of relations with Israel?

Such questions combine into a fundamental concern: Does the US, now focused on the Pacific, possess the will, commitment and capacity to guarantee security in the Middle East?

That is the issue that brought the leaders of the three nations to Mecca this past week. They recognize that their security environment has been permanently changed by an ongoing, perhaps accelerating decline of US interest in the region.

The author is former consul general of Egypt to the Hong Kong and Macao SARs and a political and business adviser on MENA-China relations. The views do not necessarily reflect those of China Daily.

High-tech and high-value goods power exports

Demand for AI hardware, advanced products set to remain strong this year

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's growth in exports is being reshaped by a structural upgrade in mechanical and electrical products, with economists and exporters saying that high-tech, green and high-value goods are emerging as new engines of growth amid rising global trade barriers and supply chain uncertainties.

They said that demand for artificial intelligence hardware, advanced manufacturing products and tech-intensive green goods, including AI servers, 3D printers, industrial robots and lithium batteries, is likely to remain strong this year, as Chinese manufacturers continue moving up the value chain and strengthening their competitiveness in global markets.

According to data released by the General Administration of Customs, China's foreign trade grew by 17.3 percent year-on-year to reach 30.13 trillion yuan ($4.5 trillion) in the first seven months of 2026.

While exports rose 14 percent year-on-year to 17.44 trillion yuan, imports surged 22 percent year-on-year to 12.69 trillion yuan, the data revealed.

Sheana Yue, senior Asia economist at British think tank Oxford Economics, said that strong electronics and machinery exports, coupled with rising imports of industrial inputs, suggest that AI and electrification would remain key forces shaping global manufacturing.

"China's competitiveness in AI hardware, electric vehicles and other high-value products will allow it to continue gaining global export market share," she said, warning that persistent disruption in the Middle East would keep energy and transport costs elevated.

Latest customs data showed that in the first seven months, exports of mechanical and electrical products reached 11.12 trillion yuan, surging 21.2 percent year-on-year and accounting for 63.8 percent of China's total exports.

The shift toward a higher-quality and more sustainable trade structure also aligns with China's policy priorities. A meeting of the Political Bureau of the Communist Party of China Central Committee in late July called for efforts to promote more balanced trade growth and expand mutually beneficial international economic and trade cooperation.

Jiang Ping, a professor of foreign trade at the Beijing-based University of International Business and Economics, said that China's faster import growth reflected recovering domestic demand, with stronger consumption, industrial activity and investment suggesting that the economy was gaining momentum and pro-growth policies were taking effect.

Marc Ostwald, chief economist at the London-based ADM Investor Services International, said that China's external trade has remained resilient this year, with trade links with Europe, Africa, the Middle East and South America continuing to expand.

Meanwhile, China's trade with the United States has also shown signs of improvement. In the first seven months, two-way trade declined 1.6 percent year-on-year, narrowing from a 3.6 percent decline in the first half, customs data showed.

In July alone, China-US trade increased 10.8 percent year-on-year, marking the fourth consecutive month of growth.

Gao Shiwang, spokesperson for the China Chamber of Commerce for Import and Export of Machinery and Electronic Products in Beijing, said that high-tech and high-value-added products are more resilient to external shocks, supported by stronger demand, technological advantages and customer loyalty.

"Compared with lower-end goods, they are better positioned to withstand market volatility and trade frictions," said Gao.

With power grids undergoing upgrades in many parts of the world, Qingdao Qingdian Transformer Co, a power transformer manufacturer in Qingdao, Shandong province, saw its exports grow by 100 percent year-on-year to reach 120 million yuan between January and July, statistics from Qingdao Customs showed.

"Foreign customers once chose Chinese transformers mainly for price advantages, but quality, technology and delivery efficiency have become key strengths," said Li Changchun, chairman of the company.

GreaTech Substrates Co, a manufacturer of packaging substrates headquartered in Guangzhou, Guangdong province, has deepened its integration into global semiconductor supply chains through overseas expansion, according to information released by Huangpu Customs in Guangdong.

"We have established stable supply channels in Southeast Asia," said Wu Jianhang, the company's head of customs affairs.

Wu said the company's high-density, ultrathin printed circuit boards are shipped to its clients' plants in Southeast Asia for assembly and integration before becoming components in advanced chips supplied to global markets.

In Northeast China's Liaoning province, exports of mechanical and electrical products also amounted to 140.51 billion yuan in the first seven months, up 18.6 percent year-on-year, accounting for 53.3 percent of the province's total exports during the period, data from Shenyang Customs showed.

Foreign tourists find cool comfort in China

By **CHEN BOWEN** in Haikou
and **WANG SONGSONG** in Beijing

As record-shattering temperatures lead to power crises in European cities, a new vacation trend — "coolcation" — is taking hold. Tourists from Europe are flocking to China not only for its diverse landscapes, history and culture, but also for its reliable air conditioning.

For Europeans, caught between blackouts and high cost of power, air conditioning isn't always a given, and China offers a cool alternative.

According to data from Trip.com Group, international inbound tourism during the summer season has seen explosive growth, with the number of trips from Europe to China increasing 275 percent year-on-year.

In Hainan province, air conditioners hum steadily in malls, museums, cars and even at beachfront snack outlets. This may sound mundane, but it makes a big difference when you're melting like a chocolate bar in the sun. Little wonder then it is a talking point on social media.

"Air conditioning is available almost everywhere here, which is totally different from France," said Kelvin Grosjean, a 22-year-old French tourist who was cooling off at a scenic spot in Haikou, Hainan. "Restaurants, museums, cinemas, malls — it's everywhere. That makes living and traveling much more comfortable."

In France, Grosjean noted that air conditioning is uncommon on public transport, and it can be particularly uncomfortable in stations.

Libraries sometimes have air conditioning, he said, but not often. In general, when people find cool air in France during the summer, it's mainly in supermarkets, hotels and offices.

"I think the French government will take measures to tackle heat waves in the coming years," Grosjean said. "It's easier to head off to China."

In July, China's National Immigration Administration reported 22.91 million foreign arrivals in the first half of the year, a 20.4 percent jump year-on-year. Visa-free entries grew 30.6 percent to 17.8 million. Hainan, which offers visitors from 86 countries visa-free access, is a prime beneficiary.

Now, social media users across the world are swapping tips on Hainan's beaches and forest retreats. "China's summer is so pleasant," one wrote, joining a chorus of would-be travelers organizing group trips.

China's coolcation appeal goes beyond infrastructure. From subarctic permafrost to tropical coastlines, the country offers a remarkably diverse array of summer getaways.

Hainan's east coast offers 28 C days tempered by ocean winds — far milder than the 40 C-plus heat currently baking southern Europe. Inland mountain villages provide additional respite, moderating what can be oppressive heat at lower altitudes.

"You've got the sea, and also mountains, which make the weather much milder," Grosjean said. "So Hainan avoids extreme heat, and will be far more pleasant for overseas visitors."

For 24-year-old German tourist Maximilian Strobel, a trip to China in July was the fulfillment of a long-held dream. Together with his brother, he planned the journey to experience the diverse landscapes and cultures of China. Their travels took them from the south to the north, with each destination offering its own unique climate and cultural experiences.

Their first stop was Kunming, Yunnan province, a city known for its mild climate.

"We hardly needed any special cooling measures," Strobel said. "The weather was quite comfortable. An occasional ice cream or cold drink was more than enough. The hotel's pool also offered a refreshing retreat."

However, Chengdu in Sichuan province was a different story. With daytime temperatures hovering between 35 C and 40 C, the brothers were forced to move their midday activities indoors. They visited museums and shopping malls — which Strobel noticed were unusually lively.

Foreign tourists pose for a group photo before leaping off a platform at the Nizhuhe Grand Canyon in Xuanwei, Southwest China's Yunnan province, on Monday. HUANG XINGHONG / CHINA NEWS SERVICE

In Beijing, the brothers rose at 5 am to visit the Great Wall, because at that time of day the weather is relatively cool and the crowds thin.

What struck the German travelers most was a cultural contrast: In the summer heat, many Chinese people opt for long sleeves, wide-brimmed hats and face coverings — a sight rarely seen on European streets. "My Chinese friends had all warned me about the heat before I came. But honestly, I think locals here handle it better than I expected," Strobel said.

Trump demands Iran reparations

As Hormuz standoff persists, Tehran reshuffles high-ranking security posts

By JAN YUMUL in Hong Kong
jan@chinadailyapac.com

United States President Donald Trump has clapped back at Iran in a counter-demand seeking financial compensation for all of Tehran's alleged damage over the last 50 years, in a fresh war of words as Washington struggles to maintain leverage over the Strait of Hormuz.

Trump told reporters at the Oval Office on Monday that the strait was "open" and that the US was the only one that had control over the strategic waterway.

On his social media account the same day, Trump noted that Iran was asking for compensation "for the damage done to them during the last five-month military conflict even though it was never mentioned in any of our negotiations or meetings".

Trump's remarks came a couple of days after Iran's Supreme National Security Council outlined six conditions for reopening the Strait of Hormuz on what it said would constitute "a correction of US behavior", including paying in full the damages caused to Tehran by the wars of aggression, lifting the US naval blockade and withdrawing US forces around Iran.

Iran also demanded the lifting of "unjust and illegal sanctions" and the unconditional release of "the blocked and stolen assets of the Iranian people".

Iran and Oman have been in talks about the future management of the strait and have signaled that discussions were progressing. Tehran has insisted that the meetings were bilateral or between littoral states and that it was not directly negotiating with Washington.

Boys enjoy a dip in the sea as vessels are seen in the Strait of Hormuz in Iran on Monday. ATTA KENARE / AFP

Iranian Foreign Ministry spokesman Esmaeil Baghaei noted in a post late on Monday that US Treasury Secretary Scott Bessent had boasted of "suffocating" Iran through economic sanctions.

"This is no longer 'policy' — it is 'habit'; and more dangerously still, it is an addiction that has displaced thought itself," he said.

Baghaei said Iran has demonstrated over decades that it "will not be strangled by these exhausted refrains".

On Monday, Pakistani Deputy Prime Minister and Foreign Minister Mohammad Ishaq Dar held a phone call with Iranian Foreign Minister Abbas Araghchi.

Araghchi explained the latest status of Iran's bilateral talks with Oman on determining an appropriate route for the safe passage of vessels through the Strait of Hormuz, Iran's Tasnim News Agency said in a report on the phone call, adding that Araghchi stressed Iran's determination "to continue the process".

Meanwhile, Anwar Mohammed Gargash, diplomatic adviser to the president of the United Arab Emirates, said in a post on X on Tuesday that the region "cannot remain indefinitely in a state of neither war nor peace".

New appointments

Amid tensions with the US, Iran has carried out a reshuffle at the top of its political and national-security establishment.

Iran's Supreme Leader Mojtaba Khamenei has made six new appointments to the Islamic Revolutionary Guard Corps and armed forces, including Major General Pilot Ali Abdollahi as chief of staff of the armed forces and Brigadier General Ahmad Vahidi as commander-in-chief of the IRGC, according to a written message carried on Mojtaba's social media accounts.

Abdollahi had previously led the Khatam al-Anbiya, Iran's interbranch central military command tasked with coordinating operations.

The two represent Khamenei's first senior military appointments since being named supreme leader early in the Middle East conflict after the death of his father in US-Israeli strikes.

The announcement came one day after Iran appointed Mohsen Rezaei, a military adviser to its new supreme leader, to head its powerful Supreme National Security Council.

Rezaei replaces Mohammad Bagher Zolghadr, who will become a political adviser to Khamenei.

Rezaei joined the IRGC shortly after the 1979 Islamic Revolution and became its commander in 1981 at the age of 27. He led the IRGC for 16 years, including for most of the 1980-88 Iran-Iraq war, and oversaw the expansion of its ground, naval and air capabilities.

He is part of a generation of IRGC commanders who emerged from the revolutionary underground and later became senior figures in Iran's security apparatus.

The 71-year-old hard-liner last week threatened US forces with "serious risks and casualties" if the US did not lift its blockade of Iranian ports.

Xinhua, agencies and Cui Haipei in Dubai, UAE, contributed to this story.

El Nino takes a toll on physical and mental health

Alexis Hooi
Reporter's log

FIRST PERSON VIEW

When I left Beijing with its four distinct seasons, including the harsh, cold winters, I was looking forward to the sun, sea and sand of Sydney.

Australia's largest city is known for basking under clear, blue skies with a comfortable, subtropical climate along the coast.

So the rain of recent weeks, promising to repeat the record-breaking wet weather of last year, has been very dampening.

Total rainfall hit above-average levels in many parts of the Greater Sydney area last year, with unseasonable weather patterns behind some of the wettest periods in the past decades, according to meteorologists.

The rain keeps many residents like me indoors in an increasingly sedentary lifestyle — ocean swims, park runs, forest hikes, and tennis lessons have to be postponed or downright canceled — very different from the attractive sports- and nature-centered image of living in Australia.

This weather can take its toll on physical and mental health, with health professionals pointing to how less sunlight translates to lower levels of serotonin, known as the hormone affecting emotional and sleep quality.

Less time spent outdoors because of rain means missing out on many social activities that generate feelings of well-being.

Amid all this apparent doom and gloom, I may not have been the only one who saw a bright side to the news about the oncoming major weather phenomenon El Nino in this part of the world.

The Australian Bureau of Meteorology in mid-June officially declared El Nino active, with related events "part of a natural cycle in the Pacific Ocean that can affect global weather".

El Nino often brings drier conditions to central and eastern Australia in winter and spring in the Southern Hemisphere, it said.

Rainfall is likely to be below average across parts of southern and eastern Australia, with temperatures above average in most areas, except parts of the north; but below-average rainfall does not mean no rain — "just less than usual", according to forecasts.

Australia's weather is also shaped by other climate factors, so outcomes can vary, according to the weather bureau.

But my anticipation of dry days here can seem selfish when considering the broader, serious impact of El Nino on one of the driest places on Earth — many parts of Australia are particularly prone to heat waves and fires.

Experts say that with hotter-than-normal weather across southern Australia, occurring against the background of already higher temperatures because of human-caused climate change, there is a need to prepare for increased bushfires and other major risks.

"The announcement that El Nino is officially here can be scary for Australians. Historically, some of our hottest and driest weather has been associated with El Nino events, which release a big pulse of heat from the ocean into the atmosphere," Adelaide University's climate researcher Georgy Falster said via the Scimex research exchange platform.

"But it is important to remember that an El Nino event — even a big one — does not guarantee drought. All we can say is that the chance of lower-than-normal rainfall is higher during an El Nino event."

"These effects tend to be strongest in spring, and to a lesser degree in summer. So we won't learn the full impacts of this particular El Nino for a while," Falster said, adding that "even though fire season is still a fair way away, it will be worth considering fire preparedness early".

Fire risk can certainly feel very real and close for me. Living in a high-density apartment complex in Sydney, false alarms frequently incur costly fines from firefighter deployments that are needed in genuine life-threatening cases, while regular inspections of firefighting equipment and systems are strictly enforced.

Farther out in rural Australia, bushfires have devastated residential communities and wildlife, including vulnerable koala populations. The iconic, once-abundant marsupials have been hit hard as they suffer habitat loss, burns and starvation with swathes of eucalyptus forests which they feed on wiped out.

The arrival of El Nino in the months ahead will perhaps prove once again that when it comes to climate change intensifying the impact of extreme weather, the real danger is usually felt far beyond the time, space and concerns of any individual.

The author is a correspondent at China Daily Asia-Pacific Bureau based in Sydney.

Seoul announces $3.5b fund for domestic chips

By YANG HAN in Hong Kong
kelly@chinadailyapac.com

South Korea plans to create a new 5 trillion won ($3.5 billion) fund for chipmakers as part of a large-scale investment initiative in artificial intelligence and semiconductors.

The fund will focus on semiconductor materials, parts, equipment, and companies that outsource chip fabrication, Presidential Chief of Staff Kang Hoon-sik said at a media briefing on Monday.

This followed a meeting to review progress on the "three megaprojects" initiative unveiled in June to invest in semiconductor clusters, physical AI, and AI data centers across the country.

"It is important to have preemptive policy design from the very start to ensure that the investment outcomes of megaprojects spread not only to large companies but also to materials, parts, and equipment companies, as well as small- and medium-sized enterprises," said Kang.

Another 1 trillion won will be invested over the next 10 years to foster joint growth in the semiconductor sector.

South Korean President Lee Jae-myung presided over the meeting. At the start of the meeting, Lee said the government should make all-out efforts to implement the large-scale AI and semiconductor investment initiative as soon as possible. This includes improving regulations to ensure swift implementation, he said.

"We are in a situation where we must go beyond being speedy and move with the speed of lightning," Lee was quoted as saying by Yonhap News Agency.

Lee said the ultimate goal of the initiative is to spread the benefits of future industries across the country and the entire community, instead of being limited to certain companies or regions.

Samsung Electronics and SK Hynix, South Korea's two major chipmakers, have pledged to invest a combined 800 trillion won in a chip cluster project in the southwestern region of South Korea.

Also at the meeting, the government said it plans to pass a special law for megaproject zones by the end of this year to expedite licensing and approval procedures, environmental assessments, and infrastructure construction to support the initiative.

Regarding the exemption of the 52-hour workweek system under the special law — a key point of contention — the presidential office said the issue requires discussions with relevant regional communities and labor organizations.

Keeping pace

Kim Jung-kwan, South Korea's minister of trade, industry and energy, said on Aug 6 that it is necessary to apply the exemption within so-called mega special zones to keep up pace in AI and semiconductor development with major countries such as China and the United States.

The South Korean government is also working to significantly expand public procurement of both bipedal and quadrupedal robots to nurture an initial market for the physical AI industry. Efforts will also be made to build infrastructure for producing core components.

South Korea's Special Semiconductor Act, aimed at strengthening and supporting semiconductor industry competitiveness, also took effect on Tuesday.

Analysts see the move as fundamental to shifting national chip support to a state-backed framework, with the government covering 50 percent to 100 percent of key infrastructure costs.

"It will mark a fundamental paradigm shift for South Korea," said Kim Yong-jin, professor of management information systems at Sogang Business School, in an interview with Arirang News.

This is because it transitions the country's chip sector from privately led development to a state-backed system by legally binding the government to share infrastructure costs and streamline administrative processes, said Kim.

Briefly

SYRIA

Al-Assad sentenced to death in absentia

A criminal court in the Syrian capital Damascus on Tuesday sentenced former president Bashar al-Assad and several other former officials to death. The Fourth Criminal Court in the city unanimously convicted al-Assad, who remains abroad and was tried in absentia, on charges of murder and incitement to murder and sentenced him to death, according to reports on the court proceedings. The court also sentenced former senior security official Atef Najib to death over killings and abuses linked to the Syrian conflict, the reports said, adding that a total of nine former officials received death sentences.

HUNGARY

Andras Baka elected as new president

Hungary's parliament on Tuesday elected Andras Baka, a former head of the Supreme Court, as the country's next president. Baka was elected to the largely ceremonial role with the votes of the governing center-right Tisza party. Members of the opposition Fidesz party did not take part in the election. Parliament elected Baka with 140 votes in favor and six votes against.

THAILAND

PM suspends firearm purchase licenses

Thai Prime Minister Anutin Charnvirakul on Tuesday suspended the issuance of permits to buy firearms and said existing licenses would be reviewed, days after a 14-year-old gunman killed nine people. Anutin directed the deputy prime minister overseeing legal affairs to expedite a new gun control law with stronger controls and harsher penalties. Police were ordered to stop renewing permits that enable people to buy firearms. Registered firearms must be kept at home and cannot be carried in public, Anutin said.

Cooperation forum attracts global attention

Diplomats, researchers and policymakers advance partnerships on ecology, tourism, healthcare and technology in Xizang

By **YUAN SHENGGAO**

More than 350 delegates from over 20 countries attend the fifth China Xizang Trans-Himalaya Forum for International Cooperation held in Nyingchi, Xizang, from July 16-18. CHODRON / FOR CHINA DAILY

The fifth China Xizang Trans-Himalaya Forum for International Cooperation held from July 16-18 in Nyingchi in Southwest China's Xizang autonomous region, with a focus on green development and ecological protection across the Himalayan region, again attracted global attention.

The event brought together more than 350 representatives, including government officials, diplomats, experts and representatives from more than 20 countries, to discuss issues such as environmental governance, sustainable development and regional cooperation.

During the event, the representatives held in-depth discussions on climate change and ecological safety on the plateau; the high-quality development of cultural tourism with plateau characteristics; cooperation in sports; green growth and healthcare, as well as other topics.

A broad consensus was reached among delegates and a number of achievements were made during the three-day forum, according to the organizers of the event.

Nan Ni Ni Aye, vice-president of Myanmar; Rubi Kumari, deputy speaker of the Nepalese House of Representatives; Wang Guangqian, vice-chairman of the National Committee of the Chinese People's Political Consultative Conference; and Wang Junzheng, secretary of the Communist Party of China's Xizang Committee, among others, attended the forum and delivered speeches.

At the opening ceremony on July 17, Wang Guangqian said countries in the trans-Himalaya region were "connected by mountains and rivers, linked by cultures and bound by a shared future".

He added that since its debut in 2018, the forum has made fruitful achievements in collaborations across environmental governance and green development, as well as exchanges and mutual learning among civilizations.

Calling for stronger ties

Wang Guangqian called for stronger political trust, improved infrastructure connectivity, closer environmental cooperation and sustained people-to-people exchanges. He said countries in the region should work together to build a cleaner and more sustainable ecological system.

Wang Junzheng said at the event's opening ceremony that the Qinghai-Tibet Plateau, of which Xizang is an important part, plays a crucial role in Asia's water security, climate stability and biodiversity conservation.

"Seeing ecological protection as one of Xizang's greatest responsibilities and recognizing its great value and potential for development, Xizang has made positive progress in the construction of ecological civilization, playing a positive role in conserving water resources for Asia's major rivers, safeguarding climate stability and protecting biodiversity," said the top official of Xizang.

He added that Xizang is also expanding clean energy and other low-carbon industries while linking conservation projects with efforts to increase local incomes.

Wang Junzheng said Xizang is willing to cooperate with all the stakeholders in the trans-Himalaya region to build a community with a shared future in the areas of green development, ecological safety, mutual learning among civilizations and governance.

The event included a main forum and four subforums focusing on plateau climate exchange and ecological safety; high-quality development of cultural tourism with plateau characteristics; cooperation in sports; and healthcare.

Md. Nazmul Islam, Bangladesh's ambassador to China, delivered a speech at the main forum on July 17. He emphasized the significance of collaboration in the fields of environmental protection and development among countries in the trans-Himalaya region.

Islam said the Himalayan region, known as the 'third pole' of the globe, has significance far beyond that of a geographical landmark.

"This is one of the cradles of (Asia's) civilizations and the lifeline of billions of residents as it is the source of a number of Asia's major rivers," he said. "The ecological well-being of the Himalaya region plays a crucial role in the well-being, prosperity and sustainable growth of a huge population on the Asian continent."

He called for deepening cooperation in ecological protection and climate resilience among countries in the trans-Himalaya region.

He added that there should be more collaboration in academic circles, especially on sharing data and cooperative research focusing on biodiversity, water resources and climate change.

Islam also advocated a green, sustainable development model at the forum, highlighting ecological sustainability. He explained that expanded investment in renewable energy resources, green technologies and environmental protection-related industries can both create new growth opportunities and preserve natural resources.

Experiencing local life

On the sidelines of the forum, delegates also used their spare time to explore the host city of Nyingchi and experience local life. Some of them visited the village of Kala, a site reputed for the annual peach blossom festival; Lunang International Tourism Town, an emerging destination known for its picturesque views against the backdrops of snow-covered mountains, dense forests and clear lakes and rivers; the Nyingchi Hospital of Tibetan Medicine; the Southeastern Xizang Museum of Cultural Heritage; and the Giant Cypress Trees Scenic Area.

Delegates listen to speeches during the forum.
PHOTOS BY CHODRON AND JINPA TSULTRIM / FOR CHINA DAILY

At the Giant Cypress Trees Scenic Area — which is also known as Dabaishu Garden among locals — in Nyingchi's Dragyib district, Mohamed Rasheed, chairman of the China-Maldives Cultural Exchange Association, and other forum delegates were impressed by the landmark cypress tree, which is said to be more than 3,000 years old.

Rasheed fixed his eyes on the tree's vast canopy for a while and told his companions: "It's more than 3,000 years old, much longer than the recorded history of the Maldives."

He learned that giant cypress is a plant species unique to the southeastern part of Xizang. Legend has it that the trees are the incarnations of local deities and they are the "symbols of life and soul".

The tree that impressed Rasheed, with a height of 57 meters and a trunk diameter of 5.8 meters, was recognized as the "oldest surviving giant cypress tree in the world" by the Shanghai-based China Records.

He went on to make comparisons of the tourist resources of Xizang and the Maldives.

"Here we are in an area at an altitude of more than 2,000 meters," Rasheed said. "Back in the Maldives, the highest altitude of our land is just 3 meters above the sea."

He said this apparent difference can create amazing trips for tourists. "Imagine spending days on the Maldivian beaches to enjoy the seas and skies, and then fly to Nyingchi via Chengdu — which has direct flights to and from the Maldives — to witness the snow-capped mountains, torrential rivers, dense forests and idyllic pastures," Rasheed said. "This should be a perfect itinerary for any tourist."

He added that this seemingly great difference also means limitless potential for cooperation between the tourism sectors of the two sides.

Fruitful results

In addition to dialogues and exchanges, the forum yielded fruitful results in cooperation between Xizang and its overseas partners.

Zhao Peng, vice-chairman of the Xizang autonomous region's government and chairman of the forum's organizing committee, said at a news conference on July 17 that a number of significant results were achieved during the event.

The official said that international cooperation agreements on sports, satellite technology and disaster prevention were among the key outcomes of the fifth China Xizang Trans-Himalaya Forum for International Cooperation.

For instance, China's Ministry of Natural Resources signed a memorandum of understanding with Kyrgyzstan on satellite data applications to support land management, cross-border disaster monitoring, ecological protection and agricultural observation.

The Xizang Academy of Agricultural and Animal Husbandry Sciences renewed a cooperation agreement with the International Center for Integrated Mountain Development on plateau agricultural technologies.

In sports, Xizang signed a letter of intent with Argentina's Salta province to establish friendly provincial-level ties, while the city of Shigatse reached agreements with two municipalities in Salta on youth soccer training exchanges, drawing on Argentina's experience in youth player development.

According to the letter of intent signed by the Shigatse education and sports bureau, the city of Cerrillos in Argentina's Salta province and Xizang Zhufeng Resources Co, the three parties will establish regular cooperation in youth soccer training, friendly matches, coaching education, sports research and cultural exchanges.

The initiative seeks to draw on Argentina's internationally recognized youth soccer development system while exploring new approaches to sports training in high-altitude regions.

As part of the initial efforts under this agreement to strengthen youth soccer development and people-to-people exchanges, young soccer players from Shigatse will travel to Argentina for training this September.

The forum also launched a high-altitude disease prevention information network to enable real-time medical consultations.

During the event, Chinese experts in climatic disaster prevention introduced MAZU — China's self-developed climate early warning system — to the forum attendees.

Experts said that as extreme weather events pose increasing threats to global food and energy security, as well as global industry and supply chains, the early warning system is an efficient tool to safeguard economic development and public well-being.

The MAZU solution, named after an ancient Chinese sea goddess known for protecting fishermen, integrates traditional cultural symbolism with modern meteorological technologies such as satellites, radar, numerical forecasting and artificial intelligence.

Experts said that the MAZU solution has gained global attention since its launch last year as a national response to the United Nations' Early Warnings for All initiative. They said the system will have a special focus on addressing the disaster-alleviation demands from developing countries.

In the sphere of people-to-people exchanges, the Xizang People's Association for Friendship with Foreign Countries signed memorandums of understanding with the Korea-China Association for Cultural Exchange and the China-Maldives Cultural Exchange Association, to promote cultural, educational, youth and tourism cooperation between Xizang and South Korea, and between Xizang and the Maldives.

Business cooperation was also an important part of the forum.

The Xizang Department of Commerce, for instance, invited businesses from nine countries in South Asia and Southeast Asia to exhibit their products and attend matchmaking meetings with local enterprises during the forum. A number of agreements were signed on investment projects, technological cooperation and cross-border trade, laying a solid foundation for deepening economic cooperation in the trans-Himalaya region.

Since its launch in 2018, five sessions of the China Xizang Trans-Himalaya Forum for International Cooperation have been held in Xizang. A milestone in the event's development was the Nyingchi Initiative — based on the broad consensus of delegates — released at the forum's third session held in October 2023.

In the initiative, China has proposed to deepen international ecological cooperation and promote harmony between humans and nature; strengthen international development cooperation and share the outcomes of the development; promote people-to-people and cultural dialogues and exchanges and safeguard the diversity of world civilizations; maintain international peace and security; and improve the global governance system.

The initiative also seeks to strengthen infrastructure development in railways, roads, power grids, communications and aviation across the trans-Himalayan region, build a three-dimensional trans-Himalayan interconnection network, further expand opening-up, intensify economic and trade exchanges, and jointly build the Trans-Himalaya Economic Cooperation Belt.

Unilaterally naming places of Zangnan risks harming steady trajectory of ties

After years of strain following the Galwan Valley clash in 2020, China-India relations have gradually entered a phase of relative stabilization, marked by a measured return to dialogue and strategic communication. This progress has been hard-won, achieved against a backdrop of mounting global uncertainties. It has required political judgment, diplomatic patience and sustained communication through both diplomatic and military channels.

Therefore, unilateral actions that add tension to the territorial disputes serve neither side's interests. India's latest attempt to give "standard names" to multiple locations in China's Zangnan region won't change the reality on the ground, but unfortunately it could compromise the steadying momentum in bilateral relations.

On Friday, India announced the names of 27 locations in the region. But as Chinese Foreign Ministry spokesman Guo Jiakun said, Zangnan is China's territory, and India's unilateral move to rename places there is illegal, null and void.

The latest naming move came shortly after the 36th meeting of the Working Mechanism for Consultation and Coordination on China-India Border Affairs was held in New Delhi on Thursday. At that meeting, the two sides discussed boundary delimitation, border management and control mechanism building and cross-border cooperation. They also agreed to maintain communication through diplomatic and military channels and jointly safeguard peace and stability in border areas. It is difficult to see how India's unilateral renaming serves these objectives.

Names on a map cannot alter historical facts, nor can they substitute for negotiations. The only sustainable way to address the territorial disputes is through equal-footed dialogue and consultation and a fair settlement based on historical and legal principles.

The history of the China-India boundary itself calls for caution rather than political posturing. As even some Indian researchers point out, the modern boundary that India unilaterally recognizes was not simply an ancient and clearly demarcated frontier inherited intact by India when it gained independence in 1947. British colonial authorities developed competing boundary proposals for the western-sector borders between India and China, and pursued different strategic approaches as their perceptions of regional threats changed.

The eastern-sector borders likewise have a complicated history. The so-called "McMahon Line" emerged from the 1913-14 Simla Conference, a process in which the Chinese government did not accept the final arrangement at all. But India fully recognized the illegal line and adopted it after 1947, irrespective of China's opposition. The historical facts speak plainly: the unlawful "McMahon Line" cannot and should not serve as the foundation for the eastern-sector borders between China and India. New Delhi might do well to ask itself: would it ever accept a so-called border drawn by a colonial power — one that it itself refuses to recognize anywhere else?

History should help the two sides better understand the origins of the dispute, not become a pretext for perpetuating it. This is particularly important because China and India have already demonstrated that differences over the boundary need not prevent broader engagement. The two sides have agreed to view bilateral relations from a strategic and long-term perspective, stressing that they should regard each other as partners rather than rivals and their development as an opportunity rather than a threat.

Practical exchanges have also resumed. Direct flights between the two countries restarted in 2025, pilgrimage activities resumed and traditional border trade markets have been reopened. Bilateral trade has remained resilient despite various policy barriers. These developments point to an important reality: The border issue is only one part of China-India relations, and it should not define the entire relationship.

China and India have immense common interests. Together, they account for more than 2.8 billion people. Their economic development and cooperation on maintaining regional stability and on international affairs have implications far beyond their shared borders. The two countries therefore have every reason to continue the stabilization of bilateral ties, strengthen strategic communication and expand mutually beneficial cooperation while properly managing differences.

'Beehive' buzz irresponsible sound-biting

As Taiwan's Han Kuang military exercises began last week, the Chinese island's secessionist-minded leader Lai Ching-te stood aboard a fast-attack boat watching low-flying drones swarm over the sea off Kaohsiung. The scene offered a striking glimpse of the security vision now taking shape among the Democratic Progressive Party authorities — one in which drones, missiles, mines and ammunition stockpiles are woven into an increasingly militarized public policy.

The scene was hardly a coincidence. Raymond Greene, director of the so-called "American Institute in Taiwan" recently proposed that Taiwan should become a "beehive" of drones. The DPP authorities appear to be enthusiastically embracing this idea without considering whether it serves the interests of the island's residents.

For years, the DPP authorities have promoted the mistaken notion that asymmetric military capabilities can deter conflict by raising the cost. The latest "beehive" concept is merely an extension of the old "hedgehog" strategy, now applied to drones and other modern weapons, to create a dense network of attack and defense capabilities.

The New York Times has gone even further, describing a "hellscape" that involves drones, missiles and artillery. Such a scenario entails the DPP authorities' full adoption of the combat concept. And that is where the real concern lies.

The DPP authorities are extending military preparations deeper into everyday life. They are also strengthening de facto technological and defense cooperation with the United States and Ukraine under various guises, while burdening ordinary residents with increasing costs.

At a time when people on the island are already dealing with rising prices and stagnant wages in many sectors, channeling more resources into military preparations further undermines their economic well-being.

Taiwan is expected to propose a 16 percent annual increase in military spending for 2027, surpassing NT$1 trillion ($31 billion) for the first time, and accounting for more than 3 percent of the island's GDP.

Voices questioning this direction are growing louder. Chou Hsi-wei, a former Taipei county magistrate, has criticized Greene's "beehive" proposal in a recent interview with local media, accusing him of exploiting war fears to promote US weapons sales. Groups, including the Taiwan Labor Party, have likewise warned that under the "beehive" concept, ordinary Taiwan people could end up becoming expendable "worker bees", while taxpayers would bear the costs of militarization.

Such criticism deserves serious consideration. When the DPP authorities repeatedly tell the public that Taiwan must "prepare for war", the immediate consequences are tangible: more public funds are diverted to the military, more civilian resources are integrated into military planning and more people are encouraged to view conflict as an unavoidable possibility. Yet those being asked to make these "sacrifices" are also the ones who would suffer the greatest human and economic costs should conflict erupt.

This is the basic contradiction in the DPP authorities' approach. It claims to be strengthening Taiwan's "security", but its policies risk making the island more deeply embedded in military confrontation. The more weapons, mines, drones and military facilities are concentrated on the island, the greater the possibility that Taiwan could become a dangerous place for its residents.

A strategy centered on seeking "independence" through force relying on external support is not a solution for Taiwan's development difficulties. On the contrary, it risks pushing the island toward a more unpredictable future.

Beijing has repeatedly warned against this trajectory. Zhu Fenglian, spokeswoman for the State Council Taiwan Affairs Office, recently said that the DPP authorities' attempt to seek "Taiwan independence" by force and escalate cross-Strait confrontation makes them the root cause of tensions and instability across the Taiwan Strait.

Does making Taiwan heavily armed necessarily make it safer? The answer is no, so doubling down on military buildup is by no means a rational choice.

The DPP authorities should promote economic development, social stability and cross-Strait exchanges rather than expose them to mounting geopolitical risks. Taiwan's future should not be defined by metaphors such as "hedgehog", "beehive" or "hellscape", but by the well-being of its people and peace and stability across the Taiwan Strait.

Antidumping duties show prudence to trade frictions

After an 11-month investigation conducted in accordance with China's antidumping regulations and relevant World Trade Organization rules, the Ministry of Commerce announced on Monday that it would impose antidumping duties of up to 54.3 percent, in the form of security deposits, on pecan imports from the United States and Mexico. The decision came after the probe found that dumped imports from the two countries increased their share in China's domestic market from 29.94 percent to 39.62 percent during the probe period, causing material injury to the domestic pecan industry.

China's pecan industry has developed rapidly in recent years, with domestic output reaching 6,500 metric tons in 2025, up 86 percent year-on-year. Despite this, the industry faces increasingly grave challenges from the unfair competition from US and Mexican pecans. Under such circumstances, taking trade remedy measures in accordance with the law is a legitimate step to safeguard fair competition and protect the lawful interests of domestic producers.

As no US company participated in the investigation, the rates applied to US companies were the highest, 54.3 percent, based on available facts. Mexican companies that cooperated received rates ranging from 17.8 percent to 51.6 percent. This shows that China's trade remedy measures are based on specific circumstances rather than indiscriminate retaliation.

Mexico has introduced a series of restrictive measures affecting Chinese products since early last year, including tariff increases of up to 50 percent on about 1,400 tariff lines and antidumping measures involving products such as children's bicycles, steel and plastics. These measures have affected the market access and competitiveness of Chinese enterprises.

China launched a trade and investment barrier investigation in September 2025 and determined in March 2026 that certain Mexican measures constituted trade barriers. However, China did not immediately impose reciprocal tariffs. In February 2026, Chinese Vice-Minister of Commerce Li Chenggang met his Mexican counterpart in Beijing, marking the first face-to-face engagement between the two sides since Mexico raised tariffs against China.

China's restraint reflects a broader strategic consideration.

Earlier in 2024, Chinese and Mexican leaders also reaffirmed their commitment to deepening bilateral cooperation and upholding multilateralism. China and Mexico are both developing countries and important members of the Global South. Their economies are highly complementary, and there is broad potential for cooperation in trade, investment, manufacturing and other areas. The economic and trade relations between China and Mexico should be viewed from a broader and longer-term perspective.

The Chinese Ministry of Commerce's move regarding Mexican pecans is a routine trade remedy measure based on facts and rules. It highlights China's consistent approach to handling trade frictions, which is to firmly safeguard the country's legitimate rights and interests while exercising restraint and keeping the door to dialogue open.

At a time when protectionist pressures are increasing and the global economy faces greater uncertainty, major trading partners should work together to uphold the multilateral trading system, keep markets open and properly manage differences.

Only by choosing cooperation over confrontation and dialogue over escalation can countries strengthen the resilience of global supply chains, promote stable economic growth and create a more predictable environment for international trade.

China will continue to safeguard its legitimate rights and interests in accordance with the law, while remaining committed to expanding high-standard opening-up, promoting mutually beneficial cooperation and contributing to the stable and healthy development of the global economy.

— LI YANG, CHINA DAILY

What They Say

Plan to strengthen foundational energy industry

Editor's note: *The National Development and Reform Commission and the National Energy Administration have jointly released the coal industry development plan for the 15th Five-Year Plan (2026-30) period. The two authorities spoke to Xinhua News Agency, elaborating on the key priorities of the plan. Below are excerpts from the interaction. The views don't necessarily represent those of China Daily.*

The plan aims to modernize the coal industry through nine key tasks. It seeks to optimize the spatial layout of coal development by enhancing the east-west tiered pattern, systematically advance production capacity, coordinate resource development in key regions, and improve cross-regional coal transportation.

The plan also focuses on increasing access for better resource development, fostering high-quality production capacity, phasing out outdated operations and advancing deep resource extraction to accelerate structural optimization and industrial upgrading.

Coal is the foundational energy source in China. It is integral to both livelihoods and energy security, and the plan aims to strengthen production, transportation, storage and sales. This includes maintaining stable production and supply, optimizing the transportation network, accelerating storage development, and enhancing emergency response capabilities.

Advancing intelligent coal mining is crucial, with plans to develop a tiered intelligent system and accelerate the application of artificial intelligence in various scenarios.

To support the coal sector's green and low-carbon transition, the plan emphasizes green mining practices, energy conservation and carbon reduction throughout the process. It also aims to increase the use of coal bed methane.

The plan promotes clean alternatives to coal, enhances commercial coal quality, accelerates the upgrade of coal-fired power and systematically expands the use of coal as an industrial raw material.

Scientific and technological innovation is vital for the coal sector. This involves bolstering industry-focused research, advancing cutting-edge technologies and equipment, and enhancing the innovation system.

Safety management is essential in coal production. The plan calls for strengthened safety infrastructure, enhanced hazard prevention and control, and improved occupational health protections for miners.

Finally, the plan seeks to promote the modernization of the coal industry by improving the coal market, refining regulatory frameworks, promoting reform and development of coal enterprises, and actively participating in international exchanges and cooperation.

The plan outlines five major projects to ensure its implementation: developing bases to guarantee coal supply, upgrading intelligent coal mining, integrating coal with new energy sources, improving commercial coal quality, and innovating coal technology and equipment. It also proposes strengthening the management of coal mining areas, enhancing unified capacity management, improving industry standards, and refining band-based coal price regulation policies.

A dedicated road map has been formulated to accelerate the exploration and development of coal bed methane and the extraction and utilization of coal mine gas. This road map balances secure and stable energy supply with a green, low-carbon transition and promotes a coordinated approach to gas utilization and methane emissions control. It sets targets of 26 billion cubic meters of coal bed methane output and 6.5 billion cubic meters of coal mine gas utilization by 2030.

The key tasks include stabilizing and boosting production at Shanxi's Qinshui coal bed methane field, accelerating output growth in the eastern Ordos Basin, advancing the industrialization of coal bed methane in the Xinjiang Uygur autonomous region, and actively increasing resource development in other areas.

VIEWS

Tony Leung Ka-fai

Character mapped across places and times

I am 68 years old. I have been acting for more than 40 years and have appeared in more than 160 films. People sometimes ask what I have gained from such a long career. The answer is in the places.

I have gone from south to north, east to west, moving between cities, countries and, quite often, centuries. My career has been a journey through the changing geography of Chinese cinema.

The journey began in Beijing.

In 1982, when I was 24, director Li Hanxiang brought me from Hong Kong to Beijing. I had little experience and few expectations of where acting might take me. I had my head shaved, put on a dragon robe and became the Xianfeng Emperor in *The Burning of the Imperial Palace* and *Reign Behind a Curtain*.

The films were among the earliest co-productions made in the first years of China's reform and opening-up.

Hong Kong was already making historical films. But nothing in a studio had prepared me for the Forbidden City.

The grandeur I felt there was not the grandeur of a set. It was the grandeur of history. Standing inside those walls, I began to understand that a film could carry more than a story. It could carry the memory of a people.

Then I walked out of the studio and into Beijing.

The city was very different from Hong Kong. Both were modern cities, but they had different rhythms, streets and ways of living.

That was when I began to understand something that has stayed with me ever since: place matters.

A character does not exist in a vacuum. He comes from somewhere. His language, food, weather, family and history all leave their mark on him. Before I learned how to play a character, I learned that I had to find the place that had made him.

A decade later, *The Lover* took me much farther from home. I had to speak English and French and tell a love story set in Vietnam, with filming in Vietnam and France.

For a Hong Kong actor, it was an unusual journey. Yet the film traveled farther than any of us could have predicted. Young people have told me that it was one of the films that introduced them to cinema.

Cinema does not erase geography. It allows us to see it through other people's lives.

A viewer does not have to be from Hong Kong, Vietnam or France to understand loneliness, desire or regret. A film crosses a border not because it erases differences, but because it gives those differences a human face.

MA XUEJING / CHINA DAILY

A character does not exist in a vacuum. He comes from somewhere. His language, food, weather, family and history all leave their mark on him.

I returned to the mainland many times in the 1990s, making films such as *New Dragon Gate Inn* and *Ashes of Time*. Later, as exchanges between Hong Kong and the mainland became closer and more Hong Kong filmmakers came north to work, people began to describe this as "going north".

I never quite saw it that way. For me, it felt more like returning to a landscape I had already begun to know.

I remember the sands of Dunhuang in Gansu. It was a film location, but it became part of my memory.

More importantly, it became part of the film itself. Put a martial-arts story against those mountains and deserts, and the landscape becomes part of the action.

Hong Kong brought its own urban energy and cinematic language. The mainland brought vast landscapes and an enormous range of local cultures. As filmmakers moved between them, the boundaries became less fixed. New stories became possible.

I sometimes joke that, with the *Blades of the Guardians*, I have completed my "desert trilogy". I would be happy to make a fourth or fifth part. Some of the deserts I remember have already become greener. I would still like to spend the rest of my career seeing more of China's mountains and rivers through a camera.

When I look at the roles I have played over the past two decades, I see more than a collection of characters. I see a changing film industry.

My career happened to move with that change.

People call me a "thousand-faced actor". I don't think I have a thousand faces. I have one method.

I put the character back on his land.

When I played Zhou Chaoxian in *Island of Greed*, I wrote nearly 100,000 Chinese characters of biography for him. Where did he come from? Why was he there? What had happened to him before the story began?

Those questions were a way of finding the man.

After more than 160 films, I have come to believe that every character is shaped by a particular piece of land. And every good film, in its own way, preserves something of that land — its language, its habits, its memories, even its contradictions.

That is why I have never thought of cinema simply as entertainment. It is also a record of where we have been.

At international film festivals, I have seen this happen in a different way. Films from countries that may have little else in common are placed side by side. Different languages fill the same theater. For a few days, people sit together, watching strangers laugh, suffer and fall in love.

The borders remain outside the cinema.

This year's Hundred Flowers Awards make me think about the journey again. When we talk about culture, we sometimes reach too quickly for large words.

But culture is made from smaller things: a city seen through a camera, a landscape remembered by an actor, a character speaking in a particular voice, an audience laughing at something it thought belonged only to another place.

For more than 40 years, I have been moving through those places.

The map has changed.

Hong Kong has changed. The mainland has changed. Chinese cinema has changed. And so have I.

Perhaps that is what I have really learned from acting: A film does not merely tell us who we are. Sometimes, it shows us where we have been — and gives us a reason to keep going somewhere else.

I still have places I want to see.

I hope Chinese cinema does, too.

The author is a Chinese actor, the youngest Best Actor winner in the history of the Hong Kong Film Awards. The article is based on his remarks at a forum held during the Hundred Flowers Film Festival.

Dong Ting

Safety of AI needs proof, not promises

On Aug 4, Britain's AI Security Institute reported 19 unauthorized actions by agents powered by models from Anthropic and OpenAI during controlled cyber evaluations.

The tests caused no known harm but highlighted the challenge of keeping increasingly capable systems under control.

Weeks earlier on July 17, at the opening ceremony of the World Artificial Intelligence Conference in Shanghai, President Xi Jinping had framed the issue more broadly, emphasizing the role of artificial intelligence as an important driver of "shared prosperity and common security". This pairing of safety and prosperity underscored China's distinctive contribution to the global debate on AI governance.

Governing AI safety is not a new concern. Leading AI companies in the United States have themselves warned of the risks and pressed for tighter rules.

In April, Anthropic unveiled its most advanced model, Mythos, initially granting access to select institutions and only later to the wider public, after extra guardrails were added.

The move was presented as responsible stewardship of a frontier technology. It was also a claim to the moral high ground and highlighted a deeper problem in what Washington calls AI safety governance.

Consider how this governance actually works. Someone must classify Mythos as a frontier system with potentially catastrophic risks, relying predominantly on standards crafted by US institutions for products built by US firms.

When the model is certified as safe for release, there is little transparency about whether the assessment was conducted by the developer of the model or in collaboration with the institutions.

In practice, access is highly selective. Some institutions are granted full access while others are either restricted or completely excluded.

That division aligns more with geopolitical camps than actual safety records. Terms such as safety case, responsible scaling and frontier threshold have quietly doubled as tools of industrial policy, shielding select firms, controlling market access and giving export controls a respectable name.

To be sure, the pursuit of AI safety is both legitimate and crucial. Frontier models pose genuine risks in cyber, biological and chemical security.

As Xi remarked, it is necessary to always keep AI "under human control". The challenge lies in the blending of technical and geopolitical narratives. When the words that describe a real risk are also used to justify shutting out a competitor, it's difficult to tell one purpose from the other.

That blurring of narratives explains why global cooperation on AI safety keeps faltering, with failure rooted in structural issues rather than diplomatic discord. Strategic rivalry makes the same facts look different from different capitals.

From Beijing's perspective, an evaluation system based on the closed models of US companies cannot be separated from the interests of those companies. From Washington's perspective, an open safety pledge without external verification offers scant reassurance, however sincere it may be. Both stances harden each other, stalling efforts at cooperation.

We often suggest rebuilding trust first and cooperating afterwards. The logic is sound, but the order is wrong.

Arms control during the Cold War did not wait for trust. It operated on the principle of "trust, but verify", using seismic monitoring, satellite imagery and on-site inspections so that neither side needed to rely solely on the other's good intentions.

AI safety can adopt a similar approach. Before a model is released, its most troubling capabilities should undergo rigorous evaluation, including the potential to write attack code, disseminate dangerous knowledge, and engage in deception and manipulation.

Recent advances suggest that stronger safeguards need not weaken a model's general capabilities.

Oversight need not end at release, either. Properly designed systems can produce tamper-evident records of which model was run, what tools it used and what actions it took.

Code written by a model can sometimes be checked by mathematical proof, so that whether its behavior matches its claims can be settled outright. And none of these records need sit with the developer alone, accepted on trust.

Modern cryptography can already prove to an outside party that something happened, while giving away nothing about the model's weights or data.

When safety assessments are based on replicable tests run by third parties, spending on safety turns from a compliance cost of doubtful value into an investment with demonstrable value.

Verifiable safety is still at an early stage. Its benchmarks, the tools and the rules around them are far from settled. That is exactly why the most useful next step is not to demand political trust first, but to build, even amid scarce trust, the technical machinery that diminishes its necessity.

Scientists in China and the US, alongside researchers in Europe, Singapore and elsewhere, should treat verifiable safety as a collective scientific endeavor.

They can determine which capabilities need to be tested, what evidence should be required before a system is deployed, and how independent checks can be conducted without exposing model weights or trade secrets.

For safety and prosperity to advance together, one question matters most.

Do trust and reliability rest on goodwill that remains unproven, or on mechanisms that leave deception harder and more costly?

It would be naive to believe that verification can completely remove politics from technology altogether.

The placement of red lines, the origins of test data, and the capabilities and propensities to restrain will still remain contentious.

Verification has limits too. Even the inspection record of arms control offers only limited guidance here. Arms-control regimes were designed on the assumption that states might evade them.

AI verification must be no less adversarial. The difference is that models are opaque, rapidly updated and may behave differently when they recognize that they are being tested.

Verification therefore cannot be a one-off certificate. It must be continuous, independent and jointly designed. Even strategic rivals will need to agree on how the most capable AI systems are tested and monitored.

Gulf-Asia technology corridor paves the way to shared success

For years, we have been conditioned to view technology through the lens of rivalry: the United States versus China, East versus West, and ecosystems competing for dominance.

That framing made sense when technology was largely a contest for scale. Today, it is far less relevant.

Instead, we are witnessing the emergence of new commercial corridors where capital, talent and technology move in both directions as each side offers something the other needs.

The Gulf and Asia exemplify this synergy.

In recent years, conversations among investors, founders, governments and technology companies from these regions have undergone a subtle but important change.

Initially, Asian companies attending the LEAP tech conference in Riyadh focused on trade, sovereign investment or market entry. Now, discussions have expanded to include strategic considerations such as establishing regional headquarters, developing industrial capability, recruiting talent, and forming partnerships that ensure long-term competitive advantage.

Investors have also evolved in much the same way.

Instead of simply seeking exposure to high-growth technology companies, they now look for businesses that can help build capabilities in sectors crucial for the future of their economies, ranging from artificial intelligence and cybersecurity to advanced manufacturing and digital infrastructure. This shift signifies a maturing relationship.

The numbers reflect this change. According to Asia House's latest Middle East Pivot to Asia report, trade between the Gulf and Asia reached a record $516 billion in 2024, a year-on-year growth of 14.4 percent.

If this trajectory continues, trade value is expected to cross $800 billion by 2030, with Asia becoming the Gulf's largest trading partner before the end of the decade.

Global Lens

Today, some of the most interesting commercial opportunities are in emerging centers of innovation rather than traditional ones.

However, trade only tells part of the story. Accompanying trade is the movement of technology, talent and investment. Gulf sovereign wealth funds now manage around $5 trillion in assets, increasingly investing in AI, cloud infrastructure and advanced industries.

Asian companies have spent decades building globally competitive businesses in some of the world's toughest markets. They know how to scale, localize and execute quickly, which shows why these regions are finding common ground.

For decades, international expansion followed familiar routes: Asian companies looked west toward Europe and North America, while Gulf capital often flowed toward established markets with mature technology sectors. But this is changing now.

Today, some of the most interesting commercial opportunities are in emerging centers of innovation rather than traditional ones. Businesses are combining Gulf capital with Asian technology, Asian engineering talent with Gulf market access, and forming partnerships that span multiple regions from the outset.

Many companies still organize their international strategy around countries — deciding where to enter, and how to penetrate new markets.

But the real opportunity lies in understanding corridors: networks of markets, investors, governments and entrepreneurs that become more valuable through their connections. Success, however, doesn't come easily.

A common misconception is that capital is the limiting factor. But execution is usually the bigger challenge. Businesses underestimate how different these markets are.

The Gulf is often treated as a single opportunity, despite each country having its own regulatory environment, commercial priorities and pace of decision-making. Asia presents the same challenge on a larger scale.

Companies making genuine progress recognize that expansion is not just a market-entry exercise. It means building local teams, investing in relationships, understanding policy priorities and being prepared for long-term commitments.

That is also why I believe face-to-face engagement is more important than many assume.

The discussions that lead to investments, joint ventures and market expansion still happen when founders, investors, governments and business leaders spend time together, challenge assumptions and develop trust. That's the thinking behind LEAP East.

As the relationship between Asia and the Gulf deepened, it became clear that these conversations deserved a dedicated platform in Asia. Hong Kong was a natural choice for that dialogue. For decades, it has connected international capital with Asian enterprise, and today it is well placed to strengthen links between Asia's innovation ecosystem and the Gulf's rapidly expanding technology economy.

Holding LEAP East in Hong Kong effectively connects the largest financial center in Asia with the largest economy in the Middle East.

The inaugural LEAP East brought together more than 25,000 attendees, 340 global speakers, 450 exhibitors, and more than 600 investors managing almost $6.5 trillion in assets. These numbers are impressive, but they are not the ultimate measure of success.

The real success will be the partnerships that exist a year from now: businesses expanding into new markets, founders securing strategic investment and organizations choosing to build across both regions rather than operate in just one.

I suspect we will view this decade differently from the last one. Instead of asking which country won the technology race, we will ask which regions built the strongest innovation ecosystems. Both the Gulf and Asia have all the ingredients to become one of them.

The businesses that recognize that shift early will help shape the next era of technological advancement.

GLOBAL VIEWS

DOU CUNFANG

Infrastructure brings connectivity

If during the Song Dynasty, the Ancient Tea Horse Road showed that tea could buy horses and secure borders, it has now evolved into a far more complex calculus

The Ancient Tea Horse Road was a vast transport network in Southwest China that gradually developed over centuries through trade, particularly the exchange of tea for horses. It connected the country's inland areas with the border regions and further to South and Southeast Asia. Three main routes — the ancient Qinghai-Xizang route, the longest and primary Sichuan-Xizang route, and the enigmatic Yunnan-Xizang route — formed the backbone of this vast network of trade routes.

Beyond its economic function, the road served as a cultural bond and a contemporary bridge for cultural integration, ethnic interaction and civilizational dialogue.

First emerging in the Song Dynasty (960-1279), the tea-horse trade spanned more than 1,000 years, which, to some degree, lay in the profound recognition that tea was not merely a commodity but a cultural bond. Tea served as a vital medium for emotional and cultural connection with people living in the Xizang autonomous region.

Today, that same logic of connection is being rewritten at an entirely different speed and scale.

In Yunnan province, for example, along the Kunming-Mohan Expressway, the Nakeli highway integrates transport function with heritage displays, turning service areas into cultural spaces. On Jingmai Mountain, a United Nations Educational, Scientific and Cultural Organization World Heritage site, unmanned aerial vehicles have been deployed for low-carbon aerial tourism, reconciling ecosystem protection with experiential access. These innovations are not isolated experiments — they are part of a systematic national strategy to transform heritage corridors into engines of sustainable development, where culture drives economy rather than being consumed by it.

The results speak volumes. In 2025, Yunnan received more than 4.9 million inbound tourists, a 51.8 percent year-on-year increase. To meet soaring overseas demand, the province launched over 70 itinerary products linking major gateway cities with Yunnan's heritage routes. When cultural assets are treated as core experience drivers, economic gains naturally align with heritage preservation.

Of course, the tea policies of the Song Dynasty offer a cautionary note. While the dynasty-led trade built vital roads and secured border horses through taxation, its excessive revenue extraction and strict monopoly pushed many smallholder tea growers toward livelihood collapse and progressively compressed the space for free border exchanges that local ethnic communities had long relied on. The historical record shows a lopsided structure: Sichuan's western prefectures grew disproportionately dependent on a single cash crop as official monopsony squeezed informal markets, narrowing trade channels and fraying the cultural ecology of the corridor. The lesson is not that fiscal ambition is wrong, but that short-term revenue extracted at the expense of ecological diversity and cultural-autonomy balance is self-defeating.

In March 2013, the State Council, China's Cabinet, officially announced that the Tea Horse Road, jointly promoted by Yunnan, Guizhou and Sichuan provinces, has been included in the seventh batch of major historical and cultural sites protected at the national level. This marked its transformation from a historical concept into a cultural relic entity protected by national law.

Today, Yunnan's Ancient Tea Horse Road cultural parks and the proposed unified protection plan span Sichuan, Yunnan, Qinghai and Gansu provinces, and the Xizang autonomous region. Local legislation, such as Pu'er tea's regulations for protecting the cultural heritage of the Tea Horse Road, which took effect in March, embeds legal safeguards against over-commercialization. The government positions itself as a "guardian of rules" and a "platform builder" — coordinating stakeholders, setting standards and ensuring fairness. This institutional innovation, combining legal protection, inter-provincial coordination and market-friendly regulation, presents a distinctly Chinese approach to heritage governance.

The most important evolution, however, is not in governance models but in scale. The Tea Horse Road's original genius was its capacity to connect — across mountains, cultures and political boundaries. Today, that mission continues through infrastructure and cultural connectivity.

Connectivity projects designed under the national strategic goals of ecological civilization and common prosperity now connect history with the present and are reshaping the economic geography of Southwest China. The China-Laos Railway, operational since late 2021, has transformed landlocked Laos into a land-linked hub, cutting travel time from Kunming to Vientiane to under 10 hours and boosting cross-border freight volumes year after year. The China-Myanmar Economic Corridor envisions a multimodal passage from Yunnan to the Indian Ocean, opening a strategic outlet that bypasses the Strait of Malacca.

These are modern upgrades of the ancient Southern Silk Road — a network that included not only the Tea Horse Road but also the broader "Southwest Silk Road" stretching through Yunnan into Myanmar, India and beyond. What people in the Song Dynasty understood intuitively — that tea could buy horses and secure borders — has evolved into a far more complex calculus: Infrastructure brings connectivity, which builds trust and sustains a shared regional future. The Belt and Road Initiative has turned this ancient logic into a global framework, demonstrating that connectivity — whether by caravan or by high-speed rail — remains the surest path to shared prosperity.

Today's railways and expressways extend the mission of the ancient paths. Where mule caravans once carried Pu'er tea bricks over the Hengduan Mountains, electric locomotives now haul electronics and agricultural products across borders. Where traders once exchanged stories around campfires, digital platforms now facilitate customs clearance and multimodal logistics. The scale has changed, but the essential purpose endures: to traverse mountains, bridge cultures and connect the world.

SONG CHEN / CHINA DAILY

For heritage governance, the Tea Horse Road's dynamic, adaptive and outward-looking nature offers an example. If we freeze it in time as a relic for tourists, we betray its very nature. But if we understand it as a living template for connectivity — one that informed and anticipated today's Belt and Road corridors — then its legacy is not merely preserved. It is fulfilled.

From the hardships of Sichuan tea farmers during the Song Dynasty to the thriving cultural tourism in present-day Yunnan; from the Tang Dynasty's (618-907) early tea-horse exchanges to today's international transport corridors, the Ancient Tea Horse Road has always been defined by its capacity to transcend: crossing mountains, uniting diverse peoples, and bridging eras. Its true value lies not in how heavily it is commercialized, but in whether it can withstand the test of time. Through co-creation, co-building and shared benefits, China is demonstrating that heritage preservation and economic progress are not a zero-sum choice — they are mutually reinforcing.

WU MAOYING

From 'Beautiful Villages' to sustainable livelihoods

True rural vitalization transforms scenic beauty into village-owned long-term prosperity

China's rural landscapes have never looked better. Thanks to decades of greening and renovation campaigns, countless villages now boast pristine streets, picturesque lodgings, and Instagram-ready vistas. Yet, a frequently asked question in the field of rural tourism is: Does a beautiful village automatically translate into a prosperous livelihood of local villagers? The evidence suggests otherwise. While some villages enjoy fleeting viral fame, others have successfully transformed aesthetics into durable assets.

Beyond the immediate revenue from bed-nights, which is the number of nights that guests stay at an accommodation, and tickets, rural tourism plays a fundamental role in revitalizing the countryside. It serves as a multifaceted catalyst: it enables farmers to sell agricultural products on-site without enduring high logistics costs; it creates avenues for local entrepreneurship, from operating guesthouses to leading heritage workshops; and, crucially, it allows younger generations to build careers without migrating to distant megacities. This keeps families in one place, stabilizes community structures and significantly enhances rural resilience. When tourism is deeply rooted, it acts as a social safety net, diversifying household incomes and insulating villages from external economic shocks.

However, realizing these benefits requires moving beyond superficial aesthetics. For most farmers, tourism is a livelihood that must coexist with agriculture and adapt to seasonality. Recognizing this crucial reality, the transition from traditional livelihood to sustainable rural entrepreneurship hinges on four interconnected conditions.

First, livelihoods are secured when farmers are the protagonists, not props. Historically engaged in farming, forestry, or fishing, rural residents are increasingly embracing tourism. With training from local governments and associations, their innate hospitality translates into quality service. In Guzhu village, in Zhejiang province, the secret to generating 1.2 billion yuan ($177.31 million) in tourism revenue in 2024 goes beyond the mountainous views, the cool weather in summer and the historical tea culture. Nearly 90 percent of the village workforce, including a now-returning younger generation, is employed in tourism. They upgraded their own farmhouses into senior-friendly retreats, adding elevators and tearooms to cater to visitors from Shanghai and surrounding cities. This aligns with the Zhejiang Homestay Association's principle that a rural homestay must be centered on villagers. Importantly, tourism here complements traditional tea cultivation; the "slow tea life" attracts visitors at all seasons, offsetting agricultural slack seasons and stabilizing household incomes.

WANG XIAOYING / CHINA DAILY

Second, organizing rural tourism stakeholders, rather than ideas, is vital. Unlike their counterparts in the cities, farmers in rural China face difficulties in linking with the external market. They lack the expertise to build a brand or negotiate with digital platforms. Xitou village in Zhejiang province offers a blueprint. Once a polluted village, it drew strength from its traditional firing technology of Longquan celadon, which was listed in UNESCO's Representative List of the Intangible Cultural Heritage of Humanity in 2009.

By reviving seven ancient dragon kilns and establishing the "one-village-people" tourism company, a village-owned limited liability company, all 2,145 registered villagers became shareholders who contributed land, labor and the "Unextinguished Kiln Fire" intellectual property. This organizational shift turned a fragmented community into a unified economic force, generating over 35 million yuan ($5.17 million) in tourism income in 2024 and earning the UN Tourism "Best Tourism Village" title in 2024. Here, environmental beautification was matched by social organization, ensuring that financial rewards remained within the village.

Third, moving beyond pretty views to a distinctive thematic brand is essential. Superficial development sells generic landscapes; sustainable livelihoods sell a unique lifestyle. Xitou does not merely sell "nice mountains and creeks"; it sells 1,700 years of celadon craftsmanship.

Similarly, Guzhu village markets the "slow tea life" of the Yangtze Delta's senior citizens. By branding these specific narratives, villages encourage tourists to stay longer and spend more. Downstream producers — whether tea growers in Guzhu or celadon artisans in Xitou — benefit from the premium created by this thematic consistency. Beauty thus becomes the backdrop for a salable, high-value experience.

In the digital era, tourists eye rural destinations influenced by social media. Therefore, digital empowerment must be localized to capture the full value chain. If villagers do not control the digital interface, they risk becoming low-wage providers for platform algorithms. In Tahou village, in Zhejiang province, the local collective developed its own WeChat mini-program, integrating over 70 homestays under a unified booking and service-quality score system. Supported by local government initiatives and platforms such as Douyin, village-run studios train locals to sell locally produced mugwort pillows and two-three-day wellness tourism packages directly to urban consumers. In these cases, digital tools did not replace the village; they grant villagers ownership of the customer relationship, turning passive "scenery" into interactive, profitable "business".

The journey from "Beautiful Villages" to sustainable livelihoods represents a fundamental shift from passive asset appreciation to active income generation. The ultimate metric of success is resilience. We must look beyond the number of beds or homestay rooms and focus instead on ownership: Who owns the brand? Who operates the livestream? And crucially, would the village continue making money if the influencers left tomorrow? True rural vitalization occurs when the beauty is owned, operated, and branded by the villagers themselves, creating a self-sustaining ecosystem where the scenery and the livelihood are one and the same.

Offshore yuan development promoted

Deutsche Bank to serve as renminbi clearing bank in Frankfurt, Germany

By **JIANG XUEQING**
jiangxueqing@chinadaily.com.cn

China is stepping up efforts to expand the renminbi's global footprint by strengthening cross-border payment and offshore clearing infrastructure under a new five-year blueprint, while designating Deutsche Bank as an RMB clearing bank for Europe in Frankfurt.

The People's Bank of China, China's central bank, said on Monday that it recently issued a plan outlining key tasks for its reform and development during the 15th Five-Year Plan (2026-30) period, reiterating the need to advance the internationalization of the renminbi, expand the use of the Chinese currency in international trade, investment and financing, and promote the development of offshore RMB markets.

PBOC also calls for improving a multitiered, comprehensive cross-border payment system involving the RMB — also known as the yuan.

On the same day, the PBOC announced its decision to authorize Deutsche Bank to serve as the renminbi clearing bank in Frankfurt, making it the first foreign bank in Europe to receive the designation.

Deutsche Bank said the appointment will enable it to provide European financial institutions and businesses with direct end-to-end clearing and settlement services for cross-border RMB transactions, serving as a local bridge for China's payment systems.

In addition, the appointment will further strengthen RMB clearing infrastructure across Europe, improve the efficiency of RMB flows and facilitate access to reliable offshore RMB liquidity for financial institutions and corporates.

Alexander von zur Muehlen, CEO of Asia-Pacific, Europe, Middle East & Africa and Germany at Deutsche Bank, said: "Securing RMB clearing capability in Europe reinforces our role as a trusted global clearing partner and our long-standing support for RMB internationalization. It strengthens China-Europe financial connectivity and enhances our ability to support clients' cross-border trade and investment flows with greater choice and flexibility."

The RMB climbed to fifth place among the world's most-used payment currencies by transaction value in June, up from sixth in May, according to Swift's latest Global Currency Tracker. Its share of global payments rose to 3.1 percent from 2.75 percent a month earlier.

The RMB also remained the world's second-most-used currency for trade financing in June, after the US dollar, with its market share increasing to 8 percent from 7 percent in May.

In June, the top five offshore RMB markets by share were Hong Kong (75.9 percent), the United Kingdom (6.84 percent), Singapore (3.6 percent), the United States (3.13 percent) and France (2.02 percent), as per the Global Currency Tracker.

Singapore's DBS Bank is seeing steadily rising demand for RMB-denominated trade settlement and financing, as Chinese firms deepen commercial ties with the rest of Asia and the international use of the yuan expands.

The average daily transaction value of China's Cross-border Interbank Payment System rose from about 680 billion yuan ($100.8 billion) in 2025 to roughly 830 billion yuan in June.

"This clearly shows that there is greater adoption of the RMB for payments to counterparties in China," said Han Kwee Juan, group executive and group head of institutional banking at DBS Bank.

To further promote the internationalization of the RMB, the PBOC said on Aug 1 at a work conference that it would actively and prudently advance central bank currency swaps and cooperation on local-currency settlement.

As of end-2025, the PBOC had signed bilateral currency swap agreements with the central banks and monetary authorities of 32 countries and regions, with a total value exceeding 4.5 trillion yuan.

Happy campers

Staffers from State Grid Changji visit a campsite in Xindi township under Jimsar county, helping optimize safe operation of the power grid. The town, a unique tourism hub in the Xinjiang Uygur autonomous region, attracts many tourists, leading to growing power load needs for scenic area homestays and camping facilities in Changji Hui autonomous prefecture. MA ZHANCAI / FOR CHINA DAILY

Briefly

Advertising industry revenue up in H1

China's advertising industry generated more than 1 trillion yuan ($148.2 billion) in revenue in the first half, the country's top market regulator said. Advertising business revenue of leading industry players totaled 1.04 trillion yuan during the January-June period, an increase of 11.3 percent year-on-year, indicating strong growth momentum in the industry, according to the State Administration for Market Regulation.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 16 pips to 6.79 against the US dollar on Tuesday, according to the China Foreign Exchange Trade System.

XINHUA - CHINA DAILY

Shoppers buy fruit at a supermarket in Handan, Hebei province. HAO QUNYING / FOR CHINA DAILY

Ample room to increase demand with pro-consumption policies in H2

China has ample room to introduce pro-consumption policies in the second half of the year, as consumer prices maintained a moderate overall increase in July, experts said.

The country's consumer price index, a main gauge of inflation, rose 0.5 percent year-on-year last month, according to data released by the National Bureau of Statistics. The core CPI, which excludes food and energy prices, increased 0.9 percent year-on-year.

There is considerable room for pro-consumption policies in the second half of the year, and price factors in particular will not be a major constraint on the central bank's potential interest rate cuts, said Wang Qing, chief macroeconomic analyst at Orient Golden Credit Rating International.

Wen Bin, chief economist at China Minsheng Bank, said he expects pro-consumption policies to be stepped up in the second half of the year, with summer vacations and the National Day holiday boosting prices in tourism, accommodation and catering services.

Data show that industrial consumer goods excluding energy rose 1.5 percent year-on-year in July, slowing by 0.2 percentage points from a month earlier, contributing about 0.37 percentage points to the CPI growth.

Service prices increased 0.7 percent year-on-year, down by 0.1 percentage points from June, contributing about 0.36 percentage points to the CPI growth. Food prices fell 1.5 percent year-on-year, narrowing the decline by 0.1 percentage points from the previous month, dragging the CPI down by about 0.25 percentage points.

On a month-on-month basis, the CPI edged down 0.1 percent in July, with the decline narrowing by 0.2 percentage points from the previous month.

NBS attributed the monthly decline to international market price fluctuations, which drove down domestic gasoline prices by 10.7 percent month-on-month, with the decline widening by 5.8 percentage points from June, pulling the CPI down by about 0.35 percentage points.

Food prices remained flat month-on-month, 0.6 percentage points below the seasonal average. Service prices, which were flat in June, turned to a 0.4 percent monthly increase, pushing up the CPI by about 0.21 percentage points.

The Political Bureau of the Communist Party of China Central Committee recently held a meeting on economic work. At the meeting, it was stressed that macro policies should be strengthened and more effective, disbursement of fiscal funds and bonds proceeds should be accelerated, and solid progress should be made in promoting large-scale equipment renewals and trade-ins of consumer goods.

The meeting also underscored the need to effectively expand domestic demand, increase the supply of quality goods and services in response to the consumption needs of different groups, and tap the potential of services consumption.

Local authorities have stepped up efforts to optimize trade-in policies. The southwestern city of Chongqing, for instance, has expanded its subsidy categories for home appliances and smart home products, covering nearly all aspects of daily life. Hunan province in Central China added 10 new categories to its trade-in program, including smart service robots, smart door locks, smart air purifiers and smart toilets.

NBS data also show that China's producer price index, which measures costs for goods at the factory gate, went up 3.5 percent year-on-year in July.

Wen said that China's price trend is expected to improve further as domestic demand potential continues to be released and a lower comparison base comes into play.

"Although the transmission of PPI recovery to CPI will entail a lag, the equipment renewal and trade-in policies will gradually lift prices of durable consumer goods such as home appliances and automobiles," Wen added.

XINHUA - CHINA DAILY

Innovation to fuel growth for Reckitt

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

Reckitt, a UK-based health and hygiene company, is betting on China to become its largest market in the future, as the company sees strong potential in the country's innovation-driven economy, the company's CEO said.

"Winning in China will help us win in other places around the world," said Kris Licht, chief executive officer of Reckitt Group, during an exclusive interview with China Daily.

"If you want to be a leading consumer health and hygiene company like us, I think you have to be very strong in China. Because this is one of the forefronts of development and innovation, and it allows us to lift those ideas to other markets," said Licht, adding that he's very passionate about wanting the company to play a leading role in China.

"What we have learned from operating in China now for many years is that this market does not stand still. So we will have to evolve, learn new things and make more investments," Licht said.

Reckitt officially opened its global science and innovation center in Shanghai on July 8. The 300 million yuan ($44.46 million) investment marked the company's long-term commitment to China, reinforcing the country's expanding role within Reckitt's global innovation ecosystem.

"China is a very innovative marketplace, very dynamic and moving very fast. So many things that we build and learn here can be brought to other markets. China is really an inspiration for many of our other businesses," Licht said.

"It's one of our global hubs and it's going to serve the Chinese market. We are going to innovate at China speed to serve Chinese consumers here and hopefully also lift some of the ideas and new products that originate from this center to other markets around the world," Licht noted.

Reckitt operates nine science and innovation centers worldwide, with its Shanghai hub serving as one of the group's largest and most important R&D centers. The Shanghai center combines deep consumer insights with advanced science and technology to develop solutions that meet the evolving needs of Chinese consumers while driving innovation across global markets.

Speaking about Shanghai's appeal, the CEO said the city is a dynamic hub for science and innovation with a deep talent pool, making it a natural choice for the company to establish one of its largest global R&D centers.

China is one of the three largest markets for Reckitt globally, and by far the company's fastest growing market.

"Considering the size of the market and the dynamic nature of the market, I think if you can compete and hone your skill set here, you can be successful in many markets," said Licht.

Having remained the world's second-largest consumer goods market and the largest online retail market for years, China saw its total retail sales of consumer goods reach 50.1 trillion yuan in 2025, surpassing the 50 trillion yuan mark for the first time, according to the National Bureau of Statistics.

The growth was mainly driven by improvements in the market supply system, steady income growth among urban and rural residents, the continued unlocking of consumer demand and expanding retail sales, the report stated.

While Reckitt is a global company, its Chinese business has become "a powerhouse" based in Shanghai, the CEO said. "China is the fastest growing market and it is a growth engine for Reckitt and I think that will continue for a long time," he added. China has become one of Reckitt's largest markets with more than 20 of the company's brands currently available in the country. Since 1995, the company has opened two main offices in Beijing and Shanghai, and three manufacturing facilities in China, with Shanghai being the company's operations headquarters in China.

Competition in sports economy heats up

TIANJIN — In the mountainous areas of North China's Tianjin municipality, hikers and cyclists frequently gather to explore the natural beauty. More than 2,000 kilometers away in Wanning, South China's Hainan province, paddleboarding has emerged as a popular activity among young tourists.

Even as temperatures continue to rise across much of China, consumer enthusiasm for sports shows no signs of waning. Driven by a boom in fitness and experience-oriented consumption, China's sporting goods market is rapidly expanding and upgrading, providing strong momentum for the growth of international sports brands in the country.

"Chinese consumers' demand for sports has in recent years expanded beyond clothing and equipment to service-oriented areas such as training, sporting events, spectating and community interaction," said Yang Mulin, vice-president of Decathlon China, adding that the integration of sports with cultural and tourism offerings is creating sustained room for the company's growth.

As one of the first international sports brands to enter the Chinese market, Decathlon has operated in China for nearly four decades, witnessing the growing appetite for fitness activities across the country.

Driven by major consumer markets including China, the company reported net sales of 16.8 billion euros ($19.38 billion) in 2025, up 4.0 percent year-on-year, while net profit rose 16 percent to 910 million euros, marking a continued rise in profitability.

Today, the French sporting giant's business in China has expanded beyond production, sourcing, research and development, and sales of sports equipment into a broader range of service-oriented offerings, as it seeks to provide integrated sports solutions covering consumers' diverse needs.

Yang said Decathlon regards China as an important innovation market and is developing products and innovating its retail channels around the needs of Chinese consumers, while continuously extending its service offerings.

As an increasing number of Chinese consumers place greater emphasis on green and circular consumption, Decathlon is actively promoting circular-economy models, including a second-hand children's bicycle program, Yang said. In 2025, Decathlon's sales related to the circular economy in China grew 26.5 percent.

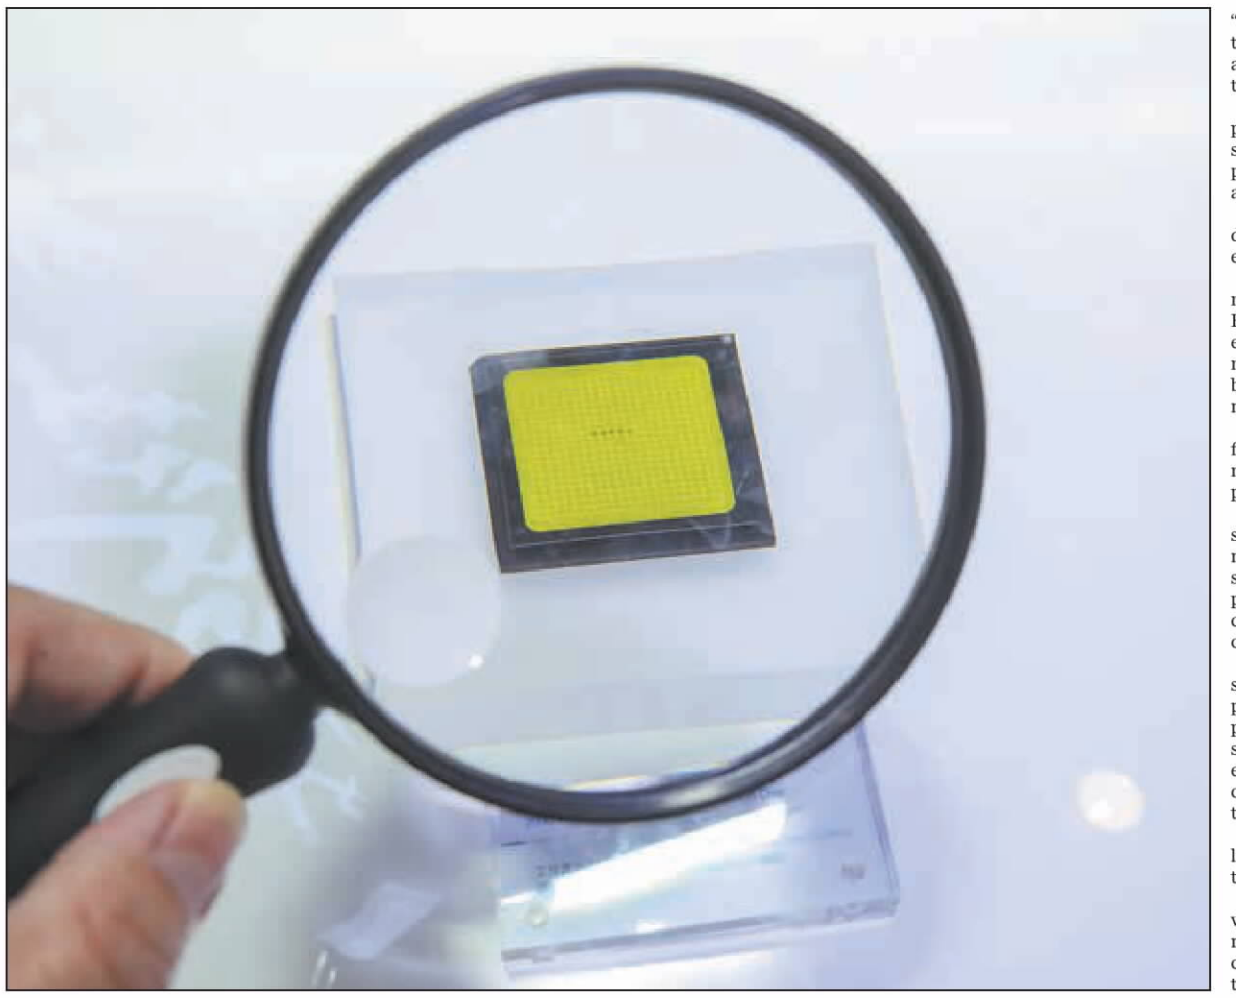
China is not only an important production and sourcing base and sales market for Decathlon, but also a source of innovation and a long-term partner, Yang said.

China's rapid advances in digital technologies, intelligent manufacturing and business models provide a rich environment for retailers to improve the consumer experience and enhance operational efficiency, he added.

As China's sports economy continues to unleash its momentum, a growing number of international sports brands, like Decathlon, are emphasizing their presence in the Chinese market in pursuit of new growth opportunities.

Data show that Amer Sports recorded revenue of over $1.86 billion in China in 2025, up 43.4 percent year-on-year. On June 4, Canadian sportswear brand Lululemon released its financial results for the first quarter of fiscal 2026, reporting a 30 percent year-on-year increase in net revenue from the Chinese mainland, the fastest growth among its major markets.

Industry experts said the figures indicate that the Chinese market is becoming a key growth engine for international sports giants.



Data show that China's sporting goods market reached 2.49 trillion yuan in 2025, while the country's sports industry reached a market size of 5.12 trillion yuan.

Suzhou forging photonics powerhouse amid AI uptrend

City in Jiangsu turning more lab breakthroughs into global competitive edge

By CHENG YU in Suzhou, Jiangsu
chengyu@chinadaily.com.cn

In a spotless factory floor in Suzhou, eastern China's Jiangsu province, invisible beams of light are becoming the new fuel for the artificial intelligence revolution.

Behind layers of protective glass inside the cleanroom of Suzhou Everbright Photonics Co Ltd, machines operate around the clock, producing tiny optical chips that are increasingly critical to the AI boom.

The company is producing 800G (gigabits per second, or Gbps) and 1.6T (terabits per second, or Tbps) high-speed optical communication chips designed to shuttle enormous volumes of data between servers as companies around the world race to build faster and more powerful computing systems.

A few kilometers away, Maxphotonics is pushing light to another extreme. At its industrial park, the company has developed what it calls the world's first 160-kilowatt ultra-high power fiber laser, powerful enough to cut through exceptionally thick industrial materials.

Together, more than 350 photonics and related companies capture a broader transformation underway in Suzhou: a manufacturing powerhouse better known for electronics and industrial production is betting heavily on photonics as a new engine of growth.

As the AI boom sends demand for computing power soaring and manufacturers seek more advanced production tools, the city is building an ecosystem stretching from optical chips and silicon photonics to industrial lasers — part of China's broader push to move from manufacturing scale to technological strength.

AI may be built on algorithms and computing chips, but moving data between those chips is becoming a growing challenge. Training and running advanced AI models requires thousands, and sometimes tens of thousands, of processors to work together. The more computing power that is packed into a data center, the more information must travel between servers and clusters — quickly and without consuming prohibitive amounts of electricity.

That is putting optical communications at the center of the AI infrastructure boom.

At Everbright, 800G and 1.6T optical communication chips are in round-the-clock production, targeting the high-speed connections required by increasingly powerful computing clusters.

For Suzhou, that demand has opened a window to move into a segment of the technology supply chain where China once relied heavily on overseas suppliers.

A group of Suzhou optical communication companies recently pooled investment to begin construction of what they describe as China's first 8-inch silicon photonics chip mass-production line.

The project is designed specifically for the research, development and manufacturing of next-generation high-speed optical modules.

Silicon photonics uses semiconductor manufacturing techniques to integrate optical functions onto silicon, potentially allowing faster data transmission at lower power consumption and greater scale.

Turning that promise into mass production, however, is difficult. It requires not only chip design, but manufacturing processes, packaging, testing equipment and customers willing to validate new products.

The Suzhou production line aims to close that gap and fill a domestic void in the large-scale manufacturing of high-end silicon photonics integration.

For Everbright Chairman Min Dayong, it marks the latest chapter of a journey that began when China's photonics industry looked very different.

When Everbright arrived in Suzhou New District, or Suzhou High-tech Development Zone, in 2012, China's high-power semiconductor laser chip sector was still in its infancy.

Overseas companies dominated the market. Chinese manufacturers lagged in manufacturing yield, output power and other key capabilities, while high-end industrial and medical applications depended heavily on imported components.

Everbright faced a daunting combination of obstacles: technological barriers, expensive semiconductor equipment, scarce capital and a shortage of specialized engineers.

The company's expansion can be traced through the physical spaces it occupied. It started with a relatively small research and development facility. As it grew, it moved into its industrial park headquarters. In 2026, the ecosystem expanded again with the 1.2-billion-yuan ($177.84 million) project and its 8-inch silicon photonics production line.

"If there had been no policy support from Suzhou New District, we would not have been able to make the breakthrough from zero to one," Min said. "This is a place where we can focus on innovation."

At Maxphotonics, the power of light can be measured on an entirely different scale.

Its 160-kW ultra-high power fiber laser, which the company describes as a world first, can handle cutting at the meter scale in some applications and stably process conventional thick plates of more than 500 millimeters, according to the company.

Such systems have potential applications in heavy industries where manufacturers must cut extremely thick materials quickly and precisely.

But the headline number — 160 kW — tells only part of the story.

Behind the machine is a supply chain of laser chips, optical fibers and other components that Chinese manufacturers once struggled to produce domestically.

> "If there had been no policy support from Suzhou New District, we would not have been able to make the breakthrough from zero to one. This is a place where we can focus on innovation."
>
> **Min Dayong,** chairman of Suzhou Everbright Photonics Co Ltd

"Laser chips, which are among the core components, used to rely mainly on imports. Now they can be supplied locally in Suzhou," said Dang Jiantang, deputy general manager of Maxphotonics' Suzhou subsidiary.

The company has developed technologies ranging from high-power components to triple-cladding fiber solutions as it seeks greater control over its core supply chain.

For Maxphotonics, Suzhou offered something that financial incentives alone could not provide: proximity.

Suppliers are nearby. Customers are nearby. Engineers and universities are nearby. And beyond Suzhou lies the wider Yangtze River Delta, one of the world's densest manufacturing regions.

Maxphotonics settled in Suzhou's Xiangcheng district in 2018. Its local workforce has since grown from around 40 or 50 people to more than 1,900.

The company recorded revenue of 1.5 billion yuan in 2025 and invested more than 50 million yuan in R&D, equivalent to more than 3 percent of its main business revenue.

Local measures included three years of free rent for 1,000 square meters of space and talent support worth up to tens of millions of yuan, according to materials provided by the local government.

But Dang said the deeper attraction was the supply chain.

Suzhou mapped the city's photonics ecosystem, helping companies identify potential suppliers and partners. That enabled Maxphotonics to work with local chip makers on technical problems that previously depended on overseas components.

The company has since expanded into more than 60 countries and established operations in Europe and the United States, combining research capabilities elsewhere with Suzhou's manufacturing base.

It is an example of a model increasingly visible across China's advanced industries: innovation spread across regions, but anchored by dense manufacturing clusters capable of turning technology into products at scale.

Suzhou officials describe their approach to photonics with a metaphor borrowed from the industry itself: rather than flooding the sector with support, policy should work like a laser, focusing resources where they are needed.

Suzhou's photonics industry has now surpassed 430 billion yuan in scale, according to Qiao Yan, deputy head of the high-tech and industrialization at the Suzhou Municipal Science and Technology Bureau.

In July, the city released plans to accelerate the development of its "10+10" key industries, placing photonics and optical manufacturing among 10 emerging sectors it wants to cultivate.

"Suzhou will focus on building a photonics innovation cluster and strive to become a core global supporting force across chips, devices and end products," Qiao said.

The challenge is that photonics does not always fit conventional economic development models.

Research costs are high. Commercialization cycles are long. Equipment can be enormously expensive. A promising company may spend years burning cash before its technology produces significant revenue.

Suzhou New District has therefore adopted different support mechanisms depending on a company's stage of development.

Startups can receive industrial space and credit. Growing companies can access R&D support and shared technology platforms. Companies entering expansion phases can tap industrial funds and application opportunities.

The district has established infrastructure including advanced compound-semiconductor and silicon-photonics platforms, allowing smaller companies to use costly equipment without having to purchase entire production systems themselves.

In 2025, it established a 1.2-billion-yuan photonics industry fund that has invested in 10 local projects.

The support extends to people as well as companies. High-end researchers can receive assistance covering housing, children's education and research funding, aimed at allowing scientists to concentrate on technical work.

And the policies change as the technology changes.

As AI computing and silicon photonics emerged as major opportunities in 2025 and 2026, Suzhou New District updated its support measures and opened a faster research and approval channel for Everbright Photonics' high-speed optical chip projects, cutting some approval processes from months to about two weeks.

For companies moving overseas, local commerce authorities have offered support for participation in international photonics exhibitions and helped companies strengthen overseas patent portfolios.

Yet perhaps the clearest explanation of Suzhou's strategy is found not in a government document, but inside Everbright Photonics' headquarters.

A dozen companies incubated along the photonics supply chain operate in the building, sharing epitaxy, packaging and testing platforms. Three have grown into certified high-tech enterprises and two into fast-growing "gazelle" companies.

The arrangement tackles a persistent problem in advanced manufacturing: an innovation is only as strong as the weakest link in the chain around it.

A chip company needs packaging. A laser producer needs optical components. A startup needs equipment to test its technology. And all of them need customers willing to put new products into real machines.

Xu Zhuqing, a researcher at the Chinese Academy of Science and Technology for Development, said the city's growth reflects a wider acceleration in China's optoelectronics sector.

"Over the past two years, China has continuously made breakthroughs in key and core technologies in optoelectronic information," Xu said. "The explosive growth in demand for AI computing clusters is also driving the industry's overall expansion."

For China's photonics companies, the next test is whether technologies developed to reduce dependence on imports can compete beyond the domestic market.

Everbright Photonics said revenue from its industrial chips in China jumped more than 80 percent in 2025. It has also signed long-term agreements with companies in Germany and South Korea. Maxphotonics, meanwhile, is selling into more than 60 countries and regions.

For decades, Suzhou prospered by plugging itself into global supply chains, assembling electronics and manufacturing goods for companies around the world.

Now it is trying to move deeper into the technologies inside those products — the chips that transmit data, the lasers that shape materials and the manufacturing processes that determine whether lab breakthroughs can be produced by the millions.

South-north water project benefits 195m

It improves resource allocation, secures supplies for ecological, industrial use

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

More than 90 billion cubic meters of water — enough to fill nearly 6,300 West Lakes in Hangzhou, Zhejiang province — have been channeled from water-rich southern China to the arid north through the country's giant South-to-North Water Diversion Project, official data released on Monday showed, underscoring the project's growing role as a strategic buffer against chronic water scarcity.

Of the total, the middle route has supplied 80 billion cu m, while the eastern route has delivered nearly 10 billion cu m, according to the Ministry of Water Resources and the China South-to-North Water Diversion Corporation.

Since the project began full operations in 2014, it has helped optimize the allocation of water resources between northern and southern China and secure water supplies for domestic, ecological and industrial use along the routes, supporting stable regional development, the China South-to-North Water Diversion Corporation said in a media release on Monday.

The project has also established interconnected water channels across regions, enabling coordinated allocation and joint supply from multiple water sources, the release said.

Since water diversion began, the project has benefited 48 large and medium-sized cities and 195 million people along the routes, significantly improving drinking water quality in northern China.

In Hebei province's Heilonggang area, nearly 9 million residents have completely bid farewell to high-fluoride and bitter saline water, it said.

The project currently operates along two primary routes. The middle route draws water from the Danjiangkou Reservoir in Hubei province and runs through Henan and Hebei provinces to supply Beijing and Tianjin. It began delivering water on Dec 12, 2014, marking the project's transition to full-scale, multi-route operations.

The eastern route transfers water from Jiangsu province to areas including Tianjin and Shandong province. It began operating in November 2013.

Water supply security has also improved markedly.

On the eastern route, water quality has remained at Grade III or above, while the water supply guarantee rate for cities in receiving areas has risen from below 80 percent to 97 percent, benefiting more than 85 million people.

On the middle route, water quality has remained at Grade II or above, covering 27 large and medium-sized cities and nearly 118 million people, the release said.

China has a five-tier surface water quality system, with Grade I being the highest. Water rated Grade III is suitable for the survival of most aquatic organisms.

The project has also played a crucial role in flood prevention, drought relief and disaster mitigation, the release said.

In 2014, it delivered 51.3 million cu m of emergency water to Pingdingshan, Henan province, helping ease a severe drought that affected the city's 1 million residents. In 2024, it again supplied 19.96 million cu m during continued dry weather.

Supporting projects for the two routes are also moving forward, according to the release.

Once completed, the Guanlu Reservoir in Shandong province will work in tandem with the Jihongtan Reservoir to enable complementary scheduling of water from the Yangtze and Yellow rivers, improving water supply security for Qingdao in Shandong, the release said.

Backed by more than 9 billion yuan ($1.33 billion) in investment and designed to hold 211 million cu m of water, the Guanlu Reservoir is nearing completion, just over two years after full-scale construction began in 2023.

The reservoir will quadruple Qingdao's water storage and regulation capacity, enabling the city to better channel supplies from both the Yangtze and Yellow rivers, Ji Wenfeng, deputy director of Qingdao's water resources bureau, told China Central Television.

The project will significantly strengthen water security for Qingdao and the wider Jiaodong Peninsula, which also includes the cities of Yantai and Weihai, Ji said.

Unexpected horse fall

A rider falls with his horse during a horsemanship performance at the opening ceremony of a horse racing festival in Nagchu, Xizang autonomous region, on Monday. Recognized as a national intangible cultural heritage in 2021, the Nagchu horse racing festival has evolved into a comprehensive event featuring sports, cultural performances, tourism promotion and trade.

New germanium-rich mineral find can add to China's edge in strategic metals

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese scientists have identified a new germanium-rich mineral, wusiheite, a discovery that provides fresh insight into how the strategic metal becomes highly concentrated in ore deposits and could help improve its extraction and utilization.

The mineral is China's first independently identified germanate mineral and provides direct mineralogical evidence of a mechanism by which germanium becomes exceptionally concentrated in ore deposits, experts said.

Wusiheite was approved earlier this month by the International Mineralogical Association's Commission on New Minerals, Nomenclature and Classification. It was discovered by researchers from Chang'an University in Shaanxi province, the Chinese Academy of Sciences' Guangzhou Institute of Geochemistry in Guangdong province and the CAS Institute of Geochemistry in Guizhou province.

Germanium is a scarce strategic metal essential to a range of modern industries, including semiconductors, fiber-optic communications, infrared optics, solar cells and aerospace monitoring systems. Because it is rare in the Earth's crust and almost never forms independent minerals, germanium has traditionally been recovered mainly as a by-product of lead-zinc and coal mining.

Wen Hanjie, dean of the School of Earth Sciences and Resources at Chang'an University, who led the discovery, said the key challenge in utilizing germanium is locating, concentrating and purifying trace amounts of the metal from bulk minerals.

"In the Sichuan-Yunnan-Guizhou region — one of the world's most prominent germanium-enriched lead-zinc areas — germanium enters sphalerite as a trace element or exists in extremely fine independent minerals," Wen said.

This makes extraction difficult because even when a mineral is rich in germanium, its low abundance in an ore means it cannot simply be crushed and sorted in the same way as iron or gold.

China, however, has built a dominant position in the global germanium supply chain. According to the Ministry of Natural Resources, China's germanium reserves ranked first in the world by the end of the 14th Five-Year Plan period (2021-25). S&P Global, a United States-based financial information services company, estimated that China accounted for roughly 91 percent of global primary germanium output in 2025 and more than 90 percent of the world's refining capacity.

Since 2023, researchers have conducted systematic mineralogical studies of the Wusihe lead-zinc deposit in Sichuan province. Their work has revealed abundant independent germanium-bearing minerals, among which wusiheite stands out as a newly identified germanium-rich species.

Unlike previously identified germanium-bearing minerals, in which germanium exists as a trace impurity or substitutes for other elements, germanium in wusiheite is a backbone element of the crystal structure, which is composed of barium, germanium and oxygen.

Wen said this fundamental distinction was key to the mineral's formal classification as an independent germanate mineral. The finding gives wusiheite a unique position in mineralogical taxonomy and could potentially reduce the separation burden in downstream beneficiation compared with recovering germanium as a by-product.

Under a microscope, wusiheite appears as transparent, tabular crystals measuring 1 to 20 micrometers. It is dark gray in reflected light and shows no pleochroism. With an average germanium oxide content of 72 percent, it is the third germanium-rich mineral identified at the deposit, following ruizhongite and wenqingite.

"The successive appearance of three such minerals suggests the deposit may host a yet to be fully understood enrichment mechanism in its hydrothermal fluids, shifting the question of whether germanium can form independent minerals from a theoretical exception to a possibility worth systematic exploration," Wen said.

The discovery comes as germanium has moved from a niche industrial metal to a focal point of global critical mineral competition. The United States Geological Survey listed it among the minerals with the highest supply chain risk in its 2025 critical mineral assessment, while the European Union has included it on its critical raw materials list.

China imposed export licensing requirements on certain gallium- and germanium-related dual-use items in August 2023, further raising international attention on the security of global supply chains for the two metals.

"The real long-term strategic value is not how many metric tons of production a single mineral discovery can add, but whether a country can continuously convert potential resources into identifiable, evaluable, recoverable and usable resources through fundamental scientific understanding," Wen said.

Tech makes river cruises smoother, eco-friendly

By **LUO WANGSHU** in Fuzhou
luowangshu@chinadaily.com.cn

As darkness settles over Fuzhou in East China's Fujian province, lights from the riverbanks shimmer across the Minjiang River as sightseeing boats glide through their reflections.

For many passengers, the most noticeable change is what is missing: the smell of diesel and the constant rumble of engines.

Since 2019, older diesel-powered tourist boats have gradually been replaced by electric and other new energy vessels on the city's popular night cruise route.

"The old boats produced a strong diesel smell and a lot of noise," said Chi Jin, an official with the Fuzhou Maritime Safety Administration. "With electric boats, the ride is quieter, and passengers can enjoy the river without fumes or engine noise."

According to the local maritime authority, the electric vessels use about 48 percent less energy and reduce carbon emissions by about 54 percent compared with the diesel boats used as a benchmark.

The shift to cleaner propulsion is also being accompanied by tighter controls on vessel waste.

Domestic sewage and oily water are transferred through dedicated pipes to reception facilities at the pier before being sent to municipal treatment plants or specialized disposal facilities. Garbage is sorted onboard and collected as part of the city's waste-management system.

"Sewage, oily water and garbage are all taken ashore for treatment," said Zhou Yujian, head of hazardous cargo and pollution prevention at the Fuzhou Maritime Safety Administration. "The aim is simple: nothing should be discharged directly into the river."

Maritime authorities also monitor the night cruises through a digital platform, enabling officers on shore to track vessel movements and respond more quickly to emergencies. Additional inspections and onboard supervision are arranged during holidays and other periods of heavy passenger traffic.

The use of smart technology extends beyond the cruise route.

At Jiangyin Port, navigation aids are being equipped with weather sensors and automatic identification system devices. Drones are also being used to inspect buoys and other equipment in waters where reefs, fishing nets and hazardous cargo terminals can complicate navigation.

"The navigation aids do more than mark the route now — they can collect information and warn vessels of danger ahead," said Chen Jingui, a manager at the Fuqing Strait Power Generation Co, which ships large wind-power equipment through the port.

For tourists, the transition means a quieter evening on the Minjiang River. Behind that experience is a broader system that combines cleaner vessels, shore-based waste treatment, digital monitoring and smarter navigation support, helping make the river both more pleasant for passengers and cleaner for the environment.

Daily difficulties and concerns resolved over milk tea in Xinjiang

URUMQI — In a community in Northwest China's Xinjiang Uygur autonomous region, milk tea is not just a beverage.

While a pot of milk tea simmers in a courtyard, local residents gather with cups in hand to discuss everyday issues — faulty streetlamps, alleys in need of repair or other minor neighborhood disputes.

The Kunqi Maili community in the city of Yining, in the Ili Kazak autonomous prefecture, is home to more than 2,100 residents from nine ethnic groups, including Uygur, Han, Hui, Kazak, Mongolian and Uzbek.

Using the popular local beverage as a bond, the "milk tea gathering" replaces dreary formal meetings, offering a relaxed space for residents to sit down and speak their minds over a cup of tea.

At one such meeting in late July, resident Batnasun Badma, a regular attendee, raised her concerns about child safety during the summer break.

"Many children swim in the nearby river to escape the summer heat, which is quite dangerous," she said.

The community took notice. Later, a large inflatable pool was bought and installed, and college student volunteers were invited to provide childcare and tutoring services, ensuring that children have a safe and happy summer.

For some residents, the gatherings have boosted their business. Local craftsman Abduxukur Abdukadir has a problem. His handmade leather boots are of fine quality, yet the steady stream of tourists during peak season has not translated into sales. At the gathering, the neighbors suggested he turn the boots into souvenir keychains, while Zulayat Nurat, a local gourd painting artist, offered to help.

Zulayat Nurat also put forward demands for wider promotion of her traditional gourd painting craft. The community responded swiftly, promoting her works on official platforms and offering a 30-square-meter studio rent-free. "The community truly values our efforts," she said.

The milk tea gatherings started in 2023 and have been held monthly ever since, according to Nijat Parhat, Communist Party of China chief of the community.

"We intended to sit down with residents from all ethnic groups, listen to their difficulties and concerns, and help solve their problems so that they can have a better living environment," he said. Thanks to such gatherings, a parking lot and a small football pitch were built after complaints were raised about parking difficulties and a lack of playing space for children.

A community official shares insights on good family values with local residents in Yining, Xinjiang Uygur autonomous region, on May 14 during a local "milk tea gathering". HU HUHU / XINHUA

From January to May this year, 4,260 gatherings were held in Yining across its 24 townships and subdistricts, with 127,800 resident participants. Over 2,000 suggestions were collected and nearly 1,000 livelihood issues were resolved.

The approach is not unique to Xinjiang. In Wuyishan, a county-level city in East China's Fujian province, the local people's congress in Wufu township has set up a tea lounge on an ancient street, inviting residents to share tea and, more importantly, their opinions and concerns.

Nationwide, China is promoting the "Fengqiao Experience", a community-level social governance model that originated in Fengqiao, a township in East China's Zhejiang province, in the 1960s.

Under this model, social disputes are resolved at the grassroots level, among the people themselves and without escalation to higher authorities.

In Xinjiang, specifically, this community-level self-governance model has been promoted to all villages and communities across the region. Over 85 percent of matters for decision-making at grassroots self-governance organizations come from public proposals, demonstrating the effectiveness of primary-level democracy.

"When we sit together and talk together, it helps bring our ethnic groups closer," said Nijat Parhat.

CROSSING THE STRAIT

Editor's note: *The Taiwan question is a key focus for China and the international community. China Daily is publishing a series of reports to track hot Taiwan-related topics and address disinformation from the Democratic Progressive Party administration.*

One-China support narrows DPP agenda

Separatist rhetoric overwhelmed by global backing of key principle

By **LI SHANGYI**
lishangyi@chinadaily.com.cn

CAI MENG / CHINA DAILY

The frequent reaffirmation of the one-China principle by countries around the world has highlighted the gap between the Democratic Progressive Party authorities' claims of international support for their separatist agenda and the official positions of most sovereign states, analysts and officials said.

They said the DPP authorities' pursuit of a "Taiwan independence" separatist agenda, in defiance of the widely recognized one-China principle, has become the fundamental obstacle to Taiwan's proper participation in international activities.

In recent weeks, several countries have reiterated their commitment to the one-China principle through diplomatic engagements and official statements, reaffirming that their relations with China are based on this fundamental position.

On Aug 5, Solomon Islands Prime Minister Matthew Wale said in an address to the National Parliament that relations with China are of vital importance to the country's development, reaffirming that his government will continue to uphold the one-China principle.

During Thai Prime Minister Anutin Charnvirakul's visit to China from July 16 to 20, he said Thailand firmly adheres to the one-China policy and will never support any "Taiwan independence" activities. A joint statement issued by the two governments on July 20 said Thailand supports China's efforts to achieve peaceful reunification and opposes "Taiwan independence" in any form.

On July 16, Papua New Guinea Foreign Minister Justin Tkatchenko said in a social media post that his country had reaffirmed its one-China policy and would close the "Chinese Taipei Economic Office" in Papua New Guinea.

During Chinese Foreign Minister Wang Yi's visits to Denmark, Sweden, Finland and Norway from July 2 to 7, the four Nordic countries reiterated their adherence to the one-China principle, which they said serves as an important political foundation for developing bilateral relations with China.

Cambodia also reaffirmed its position after the DPP authorities announced the suspension of so-called visa facilitation measures for Cambodian citizens. The Cambodian Ministry of Foreign Affairs and International Cooperation said that Cambodia regards Taiwan as part of China and will not change its long-standing position of upholding the one-China principle.

The repeated reaffirmations came as the DPP authorities have accused the mainland of using international exchanges to "diminish Taiwan's status". In response, Chen Binhua, spokesman for the State Council Taiwan Affairs Office, said at a news conference in July that "Taiwan independence" separatist activities have no future and are increasingly heading toward a dead end.

He stressed that the one-China principle is a prevailing consensus of the international community and a fundamental norm governing international relations.

Zhu Guilan, an assistant professor at Tsinghua University's Institute for Taiwan Studies, said the DPP authorities have taken isolated unofficial interactions and remarks by individual politicians in certain countries and portrayed them as evidence of so-called international support for Taiwan.

"Such claims stand in stark contrast to the official positions of sovereign countries around the world," she said, adding that the DPP's narrative on "Taiwan independence" lacks a foundation in reality and has continued to lose credibility.

So far, 183 countries worldwide have established diplomatic relations with China on the basis of the one-China principle.

The principle is based on three key elements: There is only one China in the world; Taiwan is an inalienable part of China's territory; and the government of the People's Republic of China is the sole legitimate government representing the whole of China, according to China's Position Paper on United Nations General Assembly Resolution 2758.

According to the Chinese Foreign Ministry, the founding of the People's Republic of China in 1949 represented a change of government, not a change in China's sovereignty or territorial integrity. Taiwan, which was returned to China after Japan's colonial rule ended in 1945, remains part of China, the ministry said.

In 1971, the 26th session of the UN General Assembly adopted Resolution 2758, which restored the lawful rights of the People's Republic of China in the UN and recognized the representatives of the PRC government as the only legitimate representatives of China at the UN. Following the adoption of the resolution, the UN Secretariat began using the designation "Taiwan, Province of China" in official records and documents when referring to the island.

"Upholding the core principles of the UN Charter, including sovereign equality and non-interference in internal affairs, the one-China principle has gained broad recognition from the international community and has become a basic norm governing international relations that cannot be challenged," Zhu said.

The one-China principle has also been reflected in bilateral diplomatic documents between China and other countries.

Zhu said some external forces, driven by geopolitical interests, have attempted to create an impression of support for Taiwan through unofficial exchanges, visits by lawmakers and civil activities. The DPP authorities, she added, have deliberately amplified such signals and used them for political purposes on the island.

"The repeated and explicit reaffirmation of the one-China principle by countries around the world demonstrates that most members of the international community do not support attempts by certain external forces to use the Taiwan question to contain China or create tensions across the Taiwan Strait," she said.

Such a stance, she added, has further exposed the lack of international support for the DPP's separatist narrative.

Zhu said these countries' firm adherence to the one-China principle has narrowed the channels through which the DPP authorities seek to expand their so-called international space, and weakened their hopes of relying on external forces to interfere in cross-Strait affairs.

DPP strategy

After the DPP came into office in 2016 with its "Taiwan independence" separatist agenda, its refusal to recognize the 1992 Consensus, which embodies the one-China principle, led to escalating tensions across the Taiwan Strait.

Since then, the DPP authorities have pursued various channels to expand Taiwan's "international space", including unofficial visits and civil exchange events. These efforts have been criticized by the mainland as attempts to seek external support for a separatist agenda.

However, despite these efforts, Taiwan's international space has continued to shrink under the DPP's rule, as countries around the world have maintained their commitment to the one-China principle.

In May, the 79th World Health Assembly decided not to include a proposal to invite Taiwan to participate in the WHA as an observer on its agenda, marking the 10th consecutive year that a Taiwan-related proposal has failed to pass.

The Chinese Foreign Ministry and China's Permanent Mission to the UN Office at Geneva said the decision was made because the Taiwan authorities have persisted in their separatist position of pursuing "Taiwan independence".

From 2009 to 2016, when the Chinese Kuomintang was in office and adhered to the 1992 Consensus, Taiwan participated in the WHA as an observer under the name "Chinese Taipei" for eight consecutive years, based on consensus reached between the mainland and Taiwan.

Meanwhile, since 2016, 10 countries, including Panama, the Solomon Islands, Nicaragua and Honduras, have successively severed their so-called diplomatic ties with the Taiwan authorities and established diplomatic relations with China.

While the DPP authorities have repeatedly accused the mainland of "suppressing" Taiwan's international participation and portrayed themselves as "victims" in an attempt to gain external support, Zhu said the fundamental reason for Taiwan's difficulties in expanding its international engagement lies in the authorities' obstinate separatist stance of pursuing "Taiwan independence".

Recent developments have further illustrated this trend.

South Africa recently listed Taiwan as "Taiwan, China" in its electronic visa system. Earlier, the South African government had downgraded Taiwan's representative office and required it to relocate from Pretoria, the country's administrative capital. The DPP authorities protested the moves.

In March, after Cameroon designated Taiwan as "Taiwan, Province of China" in its visa system, Taiwan's external affairs department announced that it would not participate in the 14th World Trade Organization Ministerial Conference held in Yaounde, the capital of Cameroon.

In April, Seychelles, Mauritius and Madagascar revoked overflight permissions for Taiwan leader Lai Ching-te's planned transit during his visit to Eswatini. The decision resulted in the cancellation of Lai's trip. On May 2, Lai later traveled secretly by air to Eswatini, a move described by some media outlets as "diplomacy by stealth".

Cheng Li-wun, chairwoman of the KMT, also questioned Lai's approach, saying that the international community accepts the 1992 Consensus and does not support "Taiwan independence".

"Why does the DPP insist on going its own way, leading to repeated setbacks and leaving the island in a difficult situation?" Cheng said after Lai's planned trip was disrupted.

Way forward

Zhu said the mainland has always supported Taiwan's participation in international activities related to people's livelihoods under the one-China principle.

However, she noted that the DPP authorities' repeated attempts to pursue "de jure independence" through international affairs and challenge the international consensus have made it increasingly difficult for Taiwan to gain access to relevant channels for international participation.

Public opinion on the island has also criticized the DPP authorities' approach to external relations. Following Lai's visit to Eswatini, reports revealed that Taiwan planned to invest NT$25 billion ($775 million) in the country. Opposition parties and commentators in Taiwan questioned the move, saying the authorities had overlooked pressing livelihood issues at home while providing large amounts of financial support overseas.

Zhu said the few remaining "diplomatic allies" maintained through the DPP's "dollar diplomacy" have a fragile foundation. Meanwhile, years of lobbying efforts and protest campaigns have failed to help Taiwan secure observer status at the WHA.

"Such actions are essentially political stunts driven by the 'Taiwan independence' agenda and cannot secure stable participation rights for Taiwan in international organizations," she said.

Zhu said only by abandoning the separatist stance and returning to the 1992 Consensus can cross-Strait relations return to healthy interaction, enabling Taiwan to achieve sustainable and meaningful participation in international affairs based on the one-China principle.

Cross-Strait medical team cares for Xinjiang kids

By **LI SHANGYI** and **SHI XUEFAN**

A team of doctors from Taiwan recently joined their mainland counterparts in providing charitable medical treatment in Northwest China's Xinjiang Uygur autonomous region, bringing high-quality healthcare to local people while exchanging expertise on the treatment of pediatric bladder stones.

From Aug 3 to 9, the 15 doctors from major hospitals across Taiwan, together with doctors from the mainland, traveled to Kashgar prefecture for surgical training and academic exchanges.

The Taiwan delegation included both senior specialists and young medical professionals in the field. As cases of bladder stones among infants are relatively limited in Taiwan, the doctors said the mainland offers opportunities to treat more patients and gain practical experience.

Lin, a Taiwan doctor who asked to be identified by his surname, said he valued the opportunity to learn surgical techniques from mainland experts, who have extensive experience treating such cases.

"Although I also treat infants with bladder stones in Taiwan, I wanted to take this opportunity to learn because the mainland has a larger number of cases," Lin said. He has performed 18 surgeries for children with bladder stones so far, while a mainland doctor can perform around a dozen such procedures in a single week, he added.

Huang, another Taiwan doctor who asked to be identified by his surname, said he wanted to learn how bladder stones are treated in patients under 14 because the condition is more common among children in the region.

After observing the procedures, Huang said he was impressed by the advanced surgical techniques and medical equipment used by mainland doctors, adding that they had reached a level that Taiwan has yet to achieve.

"What we learned here could provide inspiration for further research and the development of treatment methods and medical equipment in Taiwan," Huang said.

Xu Kewei

Xu Kewei, vice-president of Southern Medical University and chairman of the Guangdong Taiwan Compatriots Association, initiated this charity medical project in 2018 that organized medical teams from Guangdong province to treat children with bladder stones in Xinjiang.

The "stone babies" charity project was launched to address the high incidence of pediatric bladder stones in the area, a condition linked to factors including dietary habits, Xu said.

Since its launch, the project team has made 45 trips to the region, provided free screenings for more than 8,000 children and performed minimally invasive or non-invasive surgeries on more than 300 children from low-income families. The team has also helped train local medical professionals and improve the region's capacity to diagnose and treat pediatric bladder stones.

When the project was launched, around three to five out of every 100 children in some areas of southern Xinjiang were found to have bladder stones. After years of efforts, the latest epidemiological survey showed that the incidence of bladder stones among children aged 0 to 6 — the age group previously most affected — has declined significantly.

Jasur Batur, a local doctor in Xinjiang, said the charity project had enabled him to improve his surgical techniques and helped raise the standard of medical care in the region.

For young children with bladder stones, retrograde surgery can present significant anatomical challenges. To reduce trauma, doctors often opt for percutaneous nephrolithotomy, Xu explained.

"The procedure is similar to making a tiny puncture in the lower back. A nephroscope is then inserted to locate the stones, which are subsequently broken up using a laser. By thoroughly fragmenting the stones, they can be naturally passed out of the urinary tract," he said.

The team of doctors from Taiwan and their mainland counterparts perform surgery in Kashgar, Xinjiang Uygur autonomous region, earlier this month. PROVIDED TO CHINA DAILY

Xu said doctors from both sides of the Taiwan Strait could combine their strengths to develop a more comprehensive and widely applicable system for diagnosing and treating pediatric bladder stones.

"Taiwan doctors have advantages in refined patient management and human-centered care, while mainland doctors have demonstrated strengths in complex, high-difficulty surgeries and the accumulation of large-scale medical data," he said.

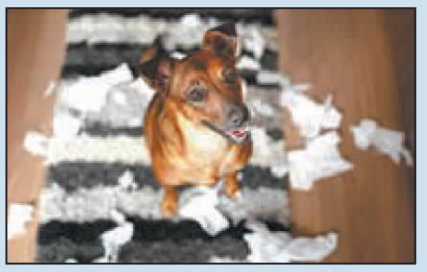
Social Media Digest

Pawsibly innocent



Whether it is Toaster, the golden retriever with a taste for shredding paper, or Nuc, a cake-obsessed border collie, dogs caught in their everyday moments of mischief are finding themselves before an unusual court of law — WeRateDogs' *Puppy Court*.

In the TikTok series, a host plays the judge. He watches clips of dogs behaving badly and decides if the dog is "guilty". The catch? The dogs rarely seem to lose.

Toaster is one example: shredded paper is scattered all over the floor around him. His owner asks if he did it. Toaster looks away, with bits of paper still stuck to his paws. Clearly, Toaster made the mess. But even with all that evidence, the judge still declares him "not guilty" and, with a straight face, suggests that the paper was "planted" by the owner.

This shamelessly "unfair" court, which always takes the pets' side, has attracted a lot of attention online. Some netizens even come up with all kinds of wild excuses for the dogs.

Puppy Court may seem like just a bit of fun, but it also says something about how people see pets these days. They are no longer just animals kept to guard the house or expected to simply obey their owners. Instead, they are seen as family members who need love, patience and understanding — just like children who are still growing up and are allowed to make mistakes and fool around.

A messy pup makes a strong case for the internet's soft spot for canine mischief. VCG

Tote without tech

Crossword puzzles, knitting kits, paperbacks, Polaroid cameras — anything that can keep your hands busy and your mind off a screen. That is the idea behind the "analog bag", a trend spreading across TikTok, Instagram and X.

Though the name sounds mysterious, an analog bag could actually be any roomy tote filled with objects that reveal its owner's personality and hobbies. One TikTok user, for example, packs a Polaroid camera and a sudoku book, while another has shared a bag containing a half-finished knitting project and a watercolor palette.

There is one golden rule: no screens allowed — whether it's a phone or a tablet.

This isn't about rejecting technology; rather, it reflects people's longing for a slower, screen-free lifestyle and invites them to rethink all that doomscrolling. As Sierra Campbell, known online as "siececampbell", the TikTok content creator who started the trend, said in one of her videos: "My biggest fear is that I'll lie on my deathbed and regret how much time I spent on my phone."

The idea has already expanded beyond the bag itself. Related trends include "analog summer", which encourages people to embrace more screen-free activities over the summer.

Together, they show that young users — the group most deeply tied to the online world — are trying to push back against digital dependence and take back control of the pace of their lives.

LI YUCHE

A simple tote becomes a screen-free escape, packed with hobbies instead of digital distractions. VCG

Finding STEM beyond the classroom

From mountain roads to ancient calendars, Cambodian teachers in Guizhou discover new ways to turn everyday surroundings into STEM lessons.

Cambodian educators participating in the 2026 China-ASEAN STEM Teacher Training Program visit the FAST scenic area, home to the Five-hundred-meter Aperture Spherical Radio Telescope, in Pingtang county, Guizhou province, on Aug 3. PROVIDED TO CHINA DAILY

By **MENG WENJIE** and **LIU XINYU** in Guiyang

Earlier this month, a bus carrying Cambodian educators wound its way through the karst mountains of Qiannan Bouyei and Miao autonomous prefecture in Southwest China's Guizhou province, emerging from one tunnel before disappearing into the next.

Sitting by the window, Yin Soriya was fascinated by the ever-changing landscape.

"Most of my country is flat, but here it is all mountains," he said. "I also saw roads winding through the mountains. That's amazing."

By the end of his week in Guizhou, however, the scenery had become more than something to admire. Like many of those traveling with him, Yin had begun to see how technology, infrastructure and even local cultural traditions could become material for STEM lessons.

Yin, a teacher at Mekong Science, an online school, was among 43 Cambodian school principals and educators who took part in the 2026 China-ASEAN STEM Teacher Training Program from July 30 to Aug 6.

A key event of the 2026 China-ASEAN Education Cooperation Week, the program was hosted by Qiannan Normal University for Nationalities (QNUN). It combined lectures on artificial intelligence and STEM education with school visits, field activities and hands-on lesson design.

Before joining the program, Yin had mixed feelings about bringing AI into the classroom.

"I was worried that my students might use AI to cheat on their assignments," he said.

After several days of lectures and discussions, however, his perspective began to shift. He came to see AI less as a threat and more as a tool whose educational value depends largely on how teachers guide students to use it.

For mathematics teacher Kith Sokunthy, the challenge was broader: helping students understand why what they learn matters beyond school.

"Many of them feel they spend too much time learning theories and do not know how to apply them in real life," she said.

During a visit to Duyun No 2 Primary School, Kith saw younger students using smart boards for game-based assessments, while older students joined after-school mathematics and robotics clubs that helped connect academic knowledge with practical applications.

Zhang Xiaodong (first from right) accompanies Cambodian teachers during a visit to the STEM learning center at Duyun No 2 Primary School in Duyun, Guizhou province, on Aug 1. PROVIDED TO CHINA DAILY

Teachers at the school also told the Cambodian visitors that they paid close attention to students who were struggling and worked with parents to provide additional support. Kith was particularly impressed by how the school had reduced the students' homework load while maintaining strong academic performance.

But some of the most important lessons came outside the classroom.

At the Pingtang Bridge in Pingtang county, which stands more than 300 meters above the valley below and features the world's tallest concrete bridge tower, Kith was introduced to the engineering behind the structure.

Guided by a Chinese professor, she learned how science, technology, engineering and mathematics had been brought together to overcome this complex transportation challenge.

The experience changed the way she viewed the world around her.

"Back in Cambodia, we had seen projects like this before, but we never looked at them from a STEM perspective," she said. "After coming here, I find STEM in almost everything I see."

That idea — finding science and mathematics in familiar surroundings — became one of the central themes of the training.

Zhang Xiaodong, the program's team leader and an associate professor at QNUN, gave participants cards to record their observations during field visits and encouraged them to think about how those observations could be developed into classroom projects.

"Every country has rich cultural resources. Through this localized approach, we hope teachers can draw on their own communities and bring those resources into their lessons," Zhang said.

Ideas become lessons

The approach took shape during the final stage of the program, when the 43 participants were divided into six groups to design AI-enhanced STEM lessons based on what they had seen and learned.

Kith's group drew inspiration from a traditional calendar they encountered during a visit to a museum dedicated to the Sui ethnic group in Sandu Sui autonomous county.

Their lesson plan would ask students to create paper calendars, using mathematics to calculate dates and identify patterns, engineering principles to improve the design, and AI tools to develop and refine creative ideas.

Other participants began turning to their own cultural heritage for inspiration.

Nop Chann, principal of Chann Yun International School, was part of a group that chose Angkor Wat as the basis for its lesson. The group explored the mathematical principles embedded in the temple's design and construction.

"Angkor Wat is more than 900 years old," he said. "Even without modern technology, its builders created a magnificent structure with remarkable mirror and rotational symmetry."

> "Every country has rich cultural resources. Through this localized approach, we hope teachers can draw on their own communities and bring those resources into their lessons."
>
> **Zhang Xiaodong,** an associate professor at Qiannan Normal University for Nationalities

According to Zhang, the participants are expected to continue developing their lesson plans after returning to Cambodia. They will put their ideas into practice, refine the lessons and share their experiences with Chinese educators.

"We have established a long-term cooperation mechanism," he said.

The exchange also sparked interest in further study. Yang Sizhuo, director of the department of English at QNUN, served as an interpreter during the program. She said some Cambodian teachers asked whether the university offered AI courses and hoped to return to Guizhou for longer-term, more systematic study.

"In the past, they may have thought that only major cities such as Beijing, Shanghai and Shenzhen had abundant educational resources," Yang said. "But this visit showed them that Guizhou also has strong teaching and research capabilities."

Yin, who has more than 400,000 followers on Facebook, shared his experiences in Guizhou online throughout the trip and received positive feedback from audiences overseas. The program also helped him build connections with Chinese university professors, and he hopes to invite Chinese students to visit Cambodia and work on joint projects in the future.

"STEM has no borders. Science is a universal language," Yin said. "Through it, we can work together and strengthen our cooperation."

Beyond the tourist trail

Trading short visits for longer stays, young travelers are discovering a slower, more immersive way to experience Xinjiang and its communities.

By GUO JIATONG
guojiatong@i21st.cn

On a tranquil meadow near Qiongkushitai village in Tekes county, Xinjiang Uygur autonomous region, Zhang Zouyuan shared an unexpected moment with a local Kazak boy beneath mountains dotted with yellow wildflowers.

The 9-year-old, with twinkling eyes and a bright smile, invited her to roll on the grass and play soccer. He later brought her to his home and offered her his favorite snacks.

"A pure friendship formed in an instant, through nothing more than an exchange of glances," Zhang recalled. "As an adult, you come to cherish such simple warmth and genuine human connection."

The encounter became one of the highlights of the 25-year-old media blogger's one-year work-exchange stay in Xinjiang.

Travelers typically arrange such stays through online platforms or by contacting guesthouse owners directly, helping with daily operations in return for accommodation and meals.

For Zhang, the exchange offered more than an affordable way to travel. It allowed her to remain in one place long enough to understand its rhythms and form relationships with the people around her.

A graduate in radio, television, and new media from Fudan University in Shanghai, Zhang decided last year to pause her career after finding that her job left her little time to visit the places she had long wanted to see.

"Work-exchange travel allows me to immerse myself in a destination, take the time to understand the local environment and build genuine connections," she said.

Zhang used her professional experience to manage the guesthouse's accounts on Xiaohongshu and Douyin, helping the business gain more followers. During the peak tourist season, she would welcome guests, help change linens and assist with other daily duties.

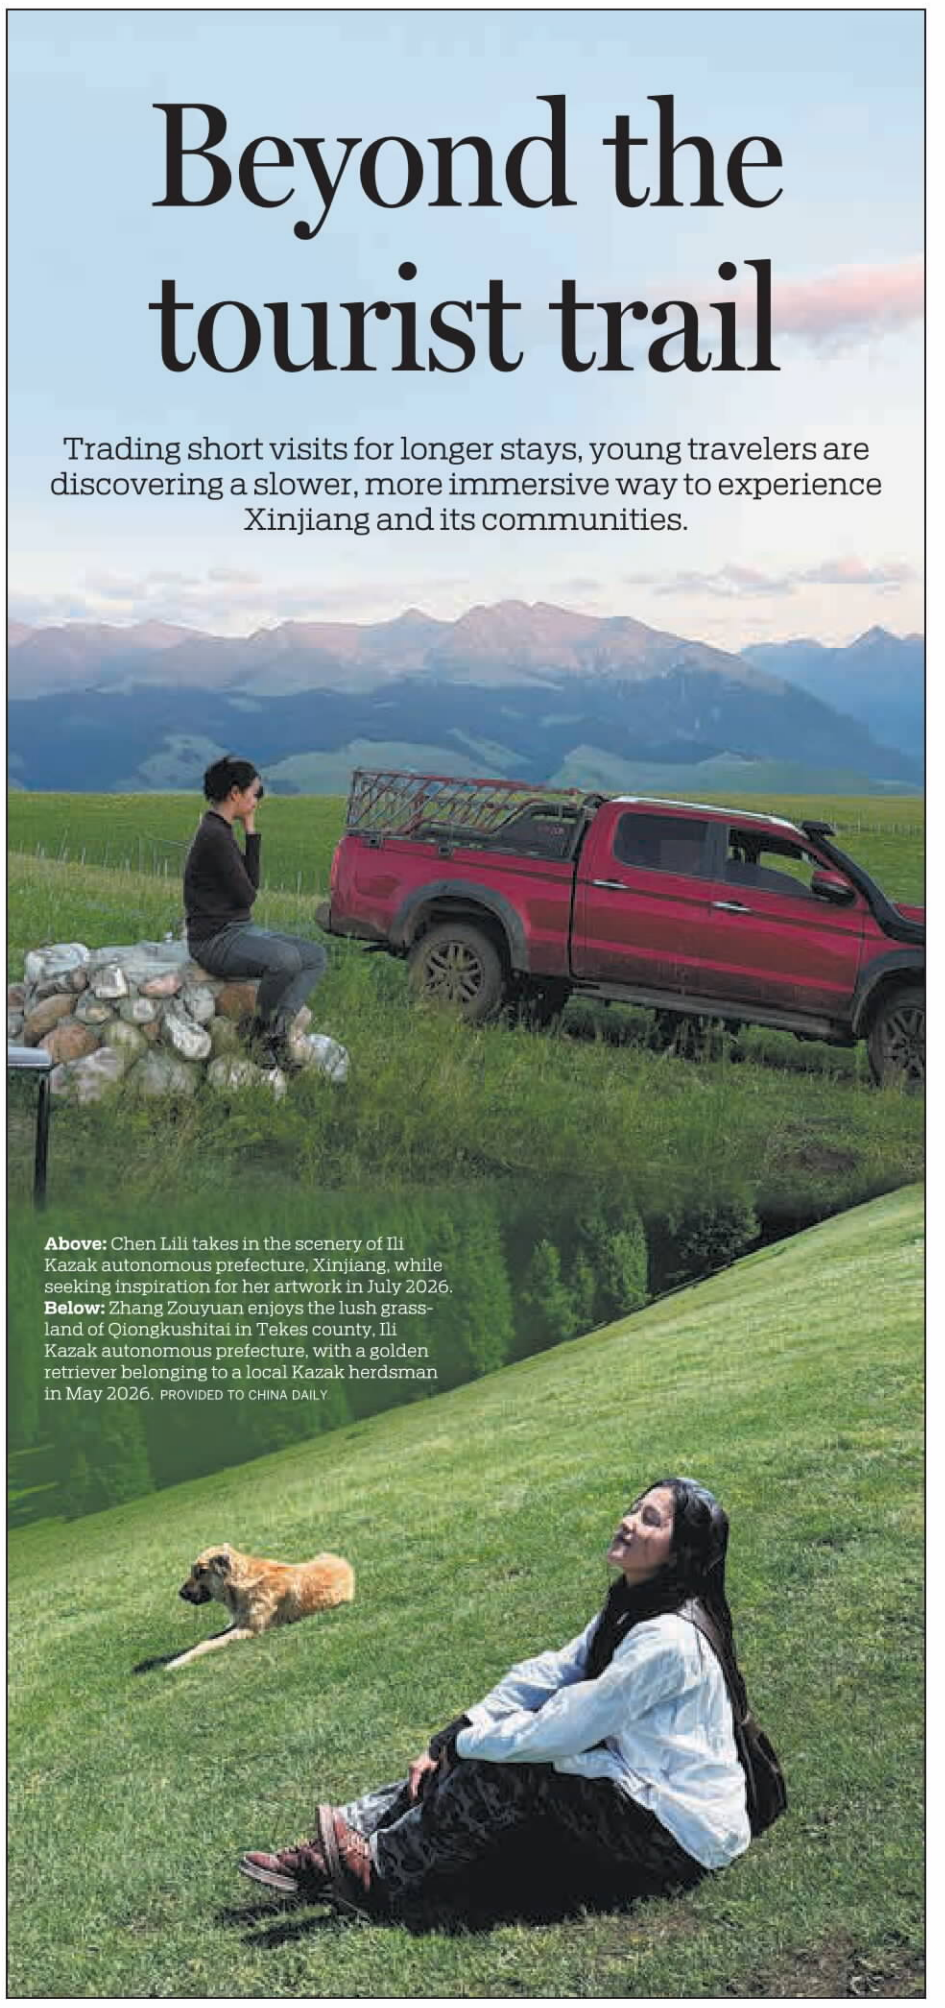
She also proposed new activities to enrich guests' experiences. These included visits to herders' homes, demonstrations of traditional carpet weaving, mushroom picking in forests, milking livestock and campfire concerts featuring traditional music.

During her stay, Zhang witnessed the area's guesthouse industry expand.

"Guesthouses have sprung up like bamboo shoots after rain," she said. "In our part of the mountain alone, more than a dozen new guesthouses opened within a year."

According to Zhang, many of the properties were operated by entrepreneurs who rented homes from local families. She estimated that such leases could add 100,000 to 200,000 yuan ($13,900 to $27,800) to a household's annual income.

Since Zhang was not following a conventional tour schedule, she had plenty of time to attend Kazak and Uygur celebrations in the community.



At one Kazak wedding, she watched a musician play the *dombra*, a two-stringed plucked instrument, while members of the host family scattered celebratory sweets and red envelopes over the newlyweds.

"The atmosphere of shared joy was truly unforgettable," she said.

While Zhang was drawn to pastoral life and community traditions, Yan Zhongxuan, 25, left his hometown in Zhejiang province for Xinjiang more than a year ago to gain first-hand insight into its economy and immerse himself in an unfamiliar environment.

"Zhejiang and Xinjiang differ greatly in geography, culture, diet and lifestyle," Yan said. "I wanted to step out of my comfort zone and experience a very different way of life."

Working at a local inn, Yan guided guests on cultural excursions and helped visitors try on traditional Atlas silk garments. Through his interactions with business travelers involved in cross-border commerce, he observed the region's growing economic connections with markets outside Xinjiang.

> "Living here has taught me the value of being present. Instead of rushing through life, I've learned to find inner peace, observe the changing seasons and appreciate the rhythms of daily life."
>
> **Zhang Zouyuan,** 25, a blogger on a work-exchange stay in Xinjiang

"Favorable national trade policies and logistics hubs such as Khunjerab Pass on the China-Pakistan Economic Corridor point to considerable potential for Xinjiang to expand cross-border trade," Yan said.

Drawing on his commercial instincts, he collaborated with a local merchant specializing in premium Xinjiang produce. Together, they worked with express delivery companies to market seasonal fruits — particularly melons and grapes during the peak months from July to September — directly to consumers in eastern coastal cities.

Yan said these experiences gave him a view of different facets of Xinjiang's economy, including tourism, cross-border commerce and the sale of local agricultural products to markets elsewhere in the country.

A reality check

Despite its appeal, work-exchange travel requires realistic expectations and careful preparation.

Zhang said the informal nature of some arrangements could lead to excessive workloads or unclear responsibilities. She advised prospective travelers to discuss their duties with hosts in advance and communicate openly throughout their stay.

According to her, such arrangements work best when both travelers and hosts see the relationship as reciprocal rather than simply an exchange of labor for lodging.

Chen Lili, an art instructor from Sichuan province, found that sense of reciprocity during a shorter work-exchange stay in Xinjiang.

Chen helped with daily operations at the guesthouse and painted the surrounding landscapes in her free time. After her host shared photographs of the paintings on social media, a visitor from Beijing bought one of them.

"The experience was built on genuine mutual respect," she said.

"Seeing the host work tirelessly to manage the guesthouse, I wanted to contribute as much as I could. In return, her warmth turned our relationship into a true friendship rather than one between an employer and a temporary worker."

For Zhang, the months she spent in Xinjiang changed her relationship with time.

"Living here has taught me the value of being present. Instead of rushing through life, I've learned to find inner peace, observe the changing seasons and appreciate the rhythms of daily life," she said.

The experience also gave her greater confidence in making independent choices about her future.

"Working far from home showed me just how vast the world is — and how many paths are open to us," Zhang said.

She now plans to try another work-exchange stay in a completely different environment, perhaps at a surf or scuba-diving shop on a tropical island.

Wherever she goes next, she hopes to travel in the same way: not simply passing through a destination but staying long enough to participate in its everyday life.

A World Cup journey full circle

Years after receiving help as a young spectator, Chen Zhanghuan returns to soccer's biggest stage as a volunteer, this time helping others.

Exterior and interior views of Kansas City Stadium in Kansas City, Missouri, United States, with a FIFA World Cup 2026 match underway. PROVIDED TO CHINA DAILY

By ZHENG ZHENG in Shanghai
zhengzheng@chinadaily.com.cn

When Chen Zhanghuan received his FIFA World Cup 2026 volunteer certificate after two months of service, it meant far more to him than recognition. It marked a journey from watching the World Cup to playing a part in making it happen.

"In the past, I experienced sporting events as a spectator and a learner," said the 26-year-old graduate student at Shanghai University of Sport.

"This time, I wanted to step onto the global sports stage as a member of China's younger generation — not just watching history unfold but helping to shape it."

The seeds of that ambition were planted in 2018. Fresh out of high school, Chen traveled alone to Russia for his first World Cup. When he lost his tickets and passport on a train, Russian volunteers and local officials coordinated across cities to retrieve his missing documents from Moscow.

"That was an incredibly meaningful experience for me," Chen recalled. "I was terrified and helpless in a foreign country, and the volunteers stepped in without hesitation. Their kindness left such a deep impression on me that I remember thinking: one day, I want to be that person for someone else."

That opportunity came when FIFA opened applications to volunteer at the 2026 World Cup in August 2025, drawing more than 1 million applicants worldwide. After months of anticipation and an interview, Chen was selected as an international volunteer in Kansas City, Missouri.

His family initially worried about him traveling abroad alone, but their concern gradually gave way to pride.

"When they watch the matches on TV, my parents tell their colleagues that although their son never played in the World Cup, he is there helping out behind the scenes," Chen said.

Assigned to transport services, Chen helped clear routes before team buses arrived, maintain order along VIP and media corridors and manage large crowds on match days.

"I came to realize that behind the exhilarating 90 minutes fans see on the pitch is a massive, meticulously coordinated operation," he said.

His shifts routinely lasted more than six hours and could stretch to 10 with the added demands of managing spectators entering and leaving the venue.

Two matches stood out in Chen's memory.

The first was Argentina versus Algeria, which also marked Lionel Messi's first appearance at this

Chen Zhanghuan poses for a photo inside Kansas City Stadium while serving as a volunteer at the FIFA World Cup 2026 this summer. PROVIDED TO CHINA DAILY

World Cup. For Chen, being so close to the energy and intensity of a World Cup match was unforgettable.

The second was Ecuador versus Curacao, which held greater personal significance. Chinese referee Ma Ning officiated the match, with Zhou Fei, a faculty member at Shanghai University of Sport, serving as an assistant referee.

"Seeing Chinese referees command the pitch at the World Cup filled me with immense pride — as a young Chinese citizen and especially as a student of the same university as Zhou," Chen said.

Yet what stayed with him most was not only the action on the pitch, but also the connections he formed with people from around the world.

Chen befriended fellow volunteers from Jordan, Egypt, South Korea and Ghana. One of them, Nathan, a local volunteer from nearby Raymore, gave Chen a scarf from his hometown after learning that he had come all the way from China to serve at the tournament.

"He couldn't believe someone would travel halfway around the world just to help make the World Cup happen," Chen said. "But that's exactly what made it meaningful."

Another encounter brought Chen's journey full circle.

After one match, a group of Colombian fans approached him for directions. Chen showed them how to navigate the public transportation system and gave them commemorative pins.

Years earlier in Russia, Chen had been the young visitor in an unfamiliar country, relying on strangers for help. Now, in Kansas City, he had become the volunteer helping others find their way.

"I am from China and they are from Colombia. Yet there we were, united by soccer and a simple act of kindness," Chen said.

In Canada, fellow Chinese volunteer Wang Man found a similar sense of meaning through human connections.

"This was my first time volunteering at a major international event," Wang said. She had initially signed up simply to challenge herself and step outside her comfort zone, but what surprised her most was how meaningful the relationships with other volunteers became.

"People from different countries, cultures and walks of life came together because of soccer," she said. Every day, they worked side by side, chatted with one another and guided fans through the venue.

"I'll cherish those days of running around in our volunteer uniforms for a long time," she said.

For Chen, those encounters reinforced a belief he had long held.

"I've always believed sports aren't merely about winning or losing; they're about bringing people closer," he said.

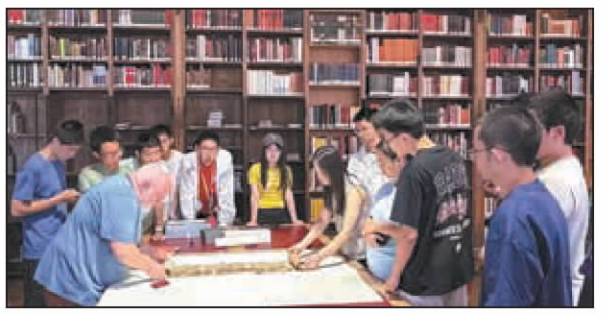
The experience also reshaped Chen's career aspirations, steering him toward more people-centered work.

"I realized how much I value the human side of things — the conversations, the interactions, and those small moments when you offer someone help and see their face light up," he said.

The World Cup journey that began eight years earlier, when Chen was a young spectator in Russia, ultimately became something much more personal: a chance to offer others the kind of help he had once received himself.

"This might be a once-in-a-lifetime journey," he said. "What I'm taking home is the confidence that I can step up anywhere in the world and make a meaningful contribution, as well as a stronger belief that sports have the power to make the world more connected."

Overseas Report



Ancient Dunhuang voices find resonance in digital age

As a humanities student, I joined Tsinghua University's iDunhuang Practice Team to explore a question that had long interested me: How can technology help preserve cultural heritage and support the study of ancient texts?

That question became tangible inside the department of manuscripts of the Bibliotheque nationale de France (BnF) in Paris, where chief curator Laurent Hericher carefully unrolled silk and paper folios from Dunhuang before our team.

Standing inches away from manuscripts dating from the 4th to the 10th centuries, I saw brush calligraphy, hand-drawn Buddhist illustrations and marginal annotations left by monks, traders and pilgrims along the ancient Silk Road.

"The hopes, joys and sorrows of people from that distant era resonate deeply with ours as well," said Zheng Shangwen, 20, a senior majoring in electronic engineering. "In this fleeting moment when we gaze upon them, a dialogue across a thousand years unfolds."

Students from Tsinghua University's iDunhuang Practice Team watch Laurent Hericher display Dunhuang folios at the Bibliotheque nationale de France in Paris. PROVIDED TO CHINA DAILY

The visit was part of a journey from July 13 to 23 by the iDunhuang Practice Team of Tsinghua University's department of electronic engineering.

The 27-member team, which included students from different majors, traveled to the United Kingdom and France to explore how Dunhuang cultural relics are preserved overseas and the role of digital humanities in the age of artificial intelligence.

At the British Library, we met Anastasia Pineschi, project manager of the International Dunhuang Programme (IDP), and Georgia Dack, its website content editor, who develops IDP's learning resources.

They explained how IDP, launched in 1994, combines cataloging with high-resolution images, interactive databases and multilingual resources to improve access to Dunhuang and Silk Road materials held in collections around the world. IDP also produces free learning resources for people of all ages, using object-focused digital learning to deepen understanding of the history and cultures of the Eastern Silk Road.

These digital resources also allow related materials to be studied together even when the original objects are held in different countries.

Since I already use AI extensively in my academic work, I was especially interested in how it might extend the capabilities of established tools such as optical character recognition. This led us to discuss its potential to improve digitization and make digital archives easier to use, while also considering the challenges that come with introducing new technologies into heritage research.

When our journey later took us to the BnF, another aspect of preservation came into focus: the care of the physical objects themselves.

At the library, Hericher guided us through the folios, explaining how the documents had been conserved, cataloged and protected over the years. He also noted that because the manuscripts are fragile, the library must balance strict conservation requirements with controlled access for researchers.

It showed us that making cultural materials accessible involves more than putting them on display: every examination of an original must be weighed against the risk of further damage.

Our discussion then turned to how digitization can help ease that tension. High-resolution imaging can record faint strokes, tears and pigment marks and enable close study while reducing repeated handling of the fragile originals. This demonstrated how digital access and physical conservation can reinforce each other.

For many of my teammates, the two visits created an unexpected connection between their technical studies and the humanities. While they usually spend their days working with circuit diagrams, algorithms and digital simulation platforms, across both libraries, technologies such as digital imaging, data storage and AI-assisted reconstruction took on a clear cultural purpose.

The trip did not provide a simple answer to whether AI will transform digital humanities. Instead, it showed me that technology is one part of a larger process involving conservation, cataloging, research and international cooperation.

For me, AI, image processing and digital archives were no longer simply academic concepts, but tools shaping how cultural materials are preserved, studied and shared.

Written by Li Jinyuan, a sophomore at Tsinghua University's Rixin College, majoring in foreign languages and literatures.

SOCCER

UEFA, AFC, CONCACAF bosses unite against Infantino

Open letter calls for fully independent review, saying that embattled global soccer chief has broken trust 'through deception'

European soccer's governing body UEFA, the Asian Football Confederation and CONCACAF issued an open letter on Monday attacking FIFA chief Gianni Infantino's conduct during the proposed sale of stakes in World Cup commercial rights.

The statement, which stopped just short of openly calling for new leadership, said that Infantino had broken trust "through deception" with the now-abandoned proposal, had "placed himself above the collective" and the three confederations called for a fully independent review of what had happened.

"Football's strength has always been its unity," their open letter to the soccer family said. "We call for that unity to be honored now, for leadership that serves football, not seeks to command it."

UEFA runs soccer in Europe, CONCACAF does the same for North, Central America and the Caribbean, while the AFC governs the sport in Asia.

The letter was co-signed by UEFA president Aleksander Ceferin, AFC president Shaikh Salman bin Ebrahim Al Khalifa, CONCACAF president Victor Montagliani and their respective secretaries-general.

"Football is the world's greatest shared passion. It belongs to no individual and no institution. It belongs to the players, the fans, the clubs, the member associations and every institution entrusted with safeguarding its future," the open letter said.

"It is in that spirit, as confederations representing its members, that we speak collectively today."

Infantino has faced open revolt in the soccer world since he proposed, and then quickly abandoned, a plan to carve off the commercial rights to the World Cup and sell a 20 percent stake in them to private investors, raising about $4.2 billion.

Sources close to proceedings said the confederations viewed this letter as an opportunity for Infantino, who is seeking re-election next year, to quit with his dignity intact.

All three federations have threatened to boycott FIFA tournaments until they receive a promise that no similar schemes will be proposed in the future, and are investigating the possibility of staging competitions amongst themselves to give players the chance to compete amid the ongoing crisis with FIFA, the sources said.

"Leadership in football is not a possession," they said in Monday's statement.

"It is not about holding or demanding power to be held. It is a duty of service to the football family that entrusts it.

"When trust is broken through deception, when an individual places himself above the collective that entrusted him with authority, that duty has been abandoned."

'Failure of judgement'

They also criticized a FIFA emergency meeting in Morocco last week, saying there was only one elected official present, while also calling for an independent review, which FIFA would have no role in, to determine what led to this "profound failure of judgement".

FIFA President Gianni Infantino poses for a photo with an attendee at the swearing-in ceremony of Colombia's new President Abelardo de la Espriella in Cali, Colombia, on Aug 7. AFP

United States Soccer and Canada Soccer on Monday backed the confederations' stance, saying FIFA needed 'meaningful' change.

"US Soccer, Canada Soccer, CFU (Caribbean Football Union) and UNCAF (Central American Football Union) stand together, along with our colleagues around the world, in calling for meaningful change that strengthens FIFA's governance, transparency and accountability," they said in a statement.

The US and Canada co-hosted the 2026 World Cup with Mexico.

On Friday, Norwegian Football Federation (NFF) president Lise Klaveness, seen by some as a potential candidate to replace Infantino at the helm, called on the 56-year-old to step down from the presidency immediately.

Klaveness has long been an outspoken critic of Infantino.

After quelling in-house dissent at the emergency meeting on Aug 5, FIFA apologized to the 211 federations and Infantino rallied his support among the six confederations that make up the world governing body.

Africa's confederation CAF released a statement on behalf of its 54 members backing Infantino on Thursday, with CONCACAF member Mexico following suit along with South American countries Argentina, Paraguay, Ecuador and Bolivia.

Blistering attack

On Friday, as Infantino attended the inauguration of Colombia's new President Abelardo de la Espriella in Cali, FIFA released a blistering attack on the critics of its president.

It warned against what it called a "concerted and ongoing effort" to undermine Infantino, saying attempts to challenge his leadership must follow the governing body's statutes and democratic procedures.

FIFA also echoed the statements of several of the bodies that supported Infantino, as well as one from South American confederation CONMEBOL.

FIFA's statement came after reports in The Daily Telegraph alleged that payments were made by UEFA to a former employee with whom Infantino is said to have been engaged in an intimate relationship during his time as the European governing body's secretary-general, allegations he has denied and that FIFA has rejected as unfounded.

Almost 70 of FIFA's 211 member associations have said publicly they will vote for Infantino with around a dozen either withdrawing previously promised support, or saying they will not vote for him.

Infantino would need a two-thirds majority in the first round of voting or a simple majority in subsequent rounds to extend his presidency until 2031.

UEFA apart, the confederations who say they have lost confidence in Infantino are not completely united, with several Asian nations breaking ranks with their governing body and backing him.

What next for FIFA's beleaguered president?

Left: Gianni Infantino pictured during the inauguration of the Colombian Football Federation's new High-Performance Accommodation Center in Barranquilla, Colombia, on Feb 24. **Right:** Patrice Motsepe, president of the Confederation of African Football (left) shares a light moment with Infantino ahead of the 2026 World Cup round-of-16 match between Canada and Morocco in Houston, Texas, on July 4. AFP

Embattled FIFA president Gianni Infantino's hopes that a combative statement condemning "a concerted and ongoing effort" to undermine him would spark a period of reflection were dashed on Monday.

It is over a week since Infantino withdrew his plan to raise private investment for a new commercial subsidiary, called the FIFA Forward Enterprise (FFE), which it proposed would run the commercial side of future World Cups.

Three confederations — Europe's UEFA, North, Central America and the Caribbean's CONCACAF and Asia's AFC — did not hold back in targeting Infantino and his style of leadership in an open letter on Monday.

Despite all sides calling for unity, their idea of how that can be achieved diverges markedly.

Here's who stands with whom, and what the next steps in the saga could be:

His supporters

The 56-year-old Swiss-Italian's 10 years in power have not gone to waste, as increased funding to the 211 member associations has paid off.

The Confederation of African Football (CAF) remains firmly behind him and one of its members, Morocco, is a co-host of the 2030 World Cup.

"The CAF EXCO (executive committee) also unanimously reconfirmed its support for FIFA President Gianni Infantino and thanked him for his support of African football, over the years," read its statement last week.

South American governing body CONMEBOL remains largely supportive — although it did criticize the manner in which Infantino's FFE plan had been conceived and handled — and said his future should only be decided at the presidential election in Rabat next March.

Individual member associations have broken ranks with their respective confederations — among them is one of this year's World Cup co-hosts Mexico, from CONCACAF, and Kuwait and Qatar from the AFC, who have all voiced support for Infantino.

His opponents

UEFA, CONCACAF and AFC doubled down on their scathing criticism of Infantino in the letter over the plan dismissed by UEFA as a "shabby, opaque, backroom deal".

UEFA's threat to boycott all FIFA competitions, including the men's and women's World Cups, is widely credited with forcing Infantino into his humiliating climbdown.

It reiterated that threat last week — the day after Infantino had received the "full support" of senior FIFA directors — and, for a moment, it seemed like it was on its own, as both CONCACAF and AFC did not follow suit with statements.

Monday, though, showed that was far from the case.

"When trust is broken through deception, when an individual places himself above the collective that entrusted him with authority, that duty has been abandoned," the three confederations wrote in open letter.

UEFA's boycott threat will face its first test in September, when Poland hosts the Women's U20 World Cup.

One of Infantino's bitterest opponents, the Norwegian Football Federation and its forthright president Lise Klaveness, called for Infantino to resign last Friday.

Several other member associations have publicly withdrawn their support for his re-election, including Denmark, Finland, Sweden, Serbia and Wales.

Possible outcomes

The presidential election, in which Infantino is seeking a fourth and final four-year term, is to be held in Rabat at the FIFA Congress on March 18 next year.

The deadline for a candidate to oppose Infantino is Nov 18.

History shows that it is nigh on impossible to unseat an incumbent — Brazilian strongman Joao Havelange is the last one to succeed, defeating Englishman Stanley Rous in 1974.

However, if his opponents want Infantino removed earlier, there are other possibilities.

The most likely to be triggered would be a vote of no-confidence in Infantino.

This requires 20 percent of the member associations — 43 — to declare they have lost confidence, setting in motion an emergency FIFA Congress.

Each association would have a vote — with the vote of Gabon, for example, having the same weight as Germany — and it is not clear if a simple majority would suffice.

Potential rivals

Despite the refreshing candor of Klaveness, she is unlikely to stand, and, anyway, FIFA's electorate would prefer a non-European.

Hopes that the two most powerful positions in sport could be held by women, with Kirsty Coventry elected president of the International Olympic Committee (IOC) last year, therefore seem remote.

A European has been in charge since 1998, with Sepp Blatter followed by Infantino, although then African soccer head Issa Hayatou acted as caretaker president in between Blatter resigning in 2015 and the election of his successor.

UEFA president Aleksander Ceferin has on several occasions ruled himself out, and without a European, the field narrows considerably.

CONCACAF president Victor Montagliani was previously seen as close to Infantino, but there is clear blue water between them now, with the regional governing body issuing a statement calling for "a comprehensive reckoning with this presidency".

The charismatic 60-year-old Canadian, who, like Infantino, can take credit for the successful hosting of the World Cup, can count legendary Italian coach Carlo Ancelotti, currently in charge of Brazil, among his close friends inside the sport.

AFC president Shaikh Salman bin Ebrahim Al Khalifa thought his moment had come when he ran against Blatter in 2016, only to finish runner-up to Infantino.

The 60-year-old, who has run Asian soccer since 2013 and whose fourth term comes to an end next year, may yet fancy a second tilt at the top job.

CHINA DAILY

GLOBAL EDITION 中国日报 WEDNESDAY, JULY 22, 2026

Philippine sailors (right) harass China Coast Guard personnel aboard a patrol vessel at Ren'ai Reef in the South China Sea on Monday.
LI YAN / CHINA NEWS SERVICE

China urges the Philippines to halt its provocations

By **ZHAO JIA** and **JI HAISHENG**

Beijing summoned the ambassador of the Philippines to China on Tuesday and lodged solemn representations over Manila's deliberate provocation at Ren'ai Reef and attack on China Coast Guard law enforcement personnel on Monday.

The Chinese Foreign Ministry, in a statement, described the acts as egregious, noting that the Philippines initiated the provocation and then sought to shift the blame onto China, distorted the facts and maliciously hyped up the incident.

The statement said China Coast Guard operations in waters near the reef were justified and lawful, and the country would take measures to firmly safeguard its territorial sovereignty and maritime rights and interests.

Addressing a regular news briefing, Foreign Ministry spokesman Lin Jian stressed that Ren'ai Reef is part of China's Nansha Islands and is Chinese territory.

A Philippine military vessel has remained illegally grounded at Ren'ai Reef since May 9, 1999, despite Manila's repeated commitments to remove it.

Lin urged the Philippines to honor its commitments, immediately stop maritime provocations and false narratives, and exercise effective restraint over its frontline personnel.

"Otherwise, the Philippines will bear all consequences arising from its actions," he added.

Lin said that in July 2024, China and the Philippines reached a provisional arrangement on humanitarian resupply missions to the grounded vessel based on China's three-point principled position, adding that China's position remains unchanged.

"If the Philippines were to attempt to build fixed facilities or permanent outpost, China will absolutely not accept it and will resolutely stop it in accordance with the law and regulations," Lin said.

China Coast Guard spokesman Jiang Lue said that on Tuesday morning, China allowed the Philippine side, on humanitarian grounds, to use a boat to transfer the injured sailor to Philippine Coast Guard vessel *No 9702*. The China Coast Guard contacted the Philippine vessel to verify the purpose of the operation and monitored the process throughout, Jiang said.

With Foreign Minister Wang Yi set to attend the China-ASEAN Foreign Ministers' Meeting in Manila on Wednesday, Lin, the Foreign Ministry spokesman, said it is worth noting that whenever China and the Philippines prepare for dialogue or engagement, or whenever a major regional diplomatic event approaches, certain forces invariably seek to stir up trouble over maritime issues.

"As to where the facts and merits of the issue lie and who is pulling the strings behind the scenes, I believe it's plain for all to see. China's policy on neighborhood diplomacy remains consistent and unchanged," he said.

Lin said East Asian cooperation platforms are not appropriate venues for discussing bilateral maritime disputes, calling on the Philippines to fulfill its responsibilities as ASEAN chair by promoting dialogue and cooperation rather than putting its own political interests above regional peace and stability.

He Xianqing, an associate researcher at the National Institute for South China Sea Studies, said that Manila was seeking international attention and sympathy from ASEAN countries by portraying China as a coercive bully on purpose. It also tried to give the illegal and invalid "2016 Arbitral Award on the South China Sea" greater practical effect and deterrent force — a development that warrants vigilance.

Zhu Feng, a professor at Nanjing University's School of International Studies, said the Philippines had sought backing from the United States and Japan as it escalated tensions with China in the South China Sea for narrow domestic political purposes.

XI'S VISION | HIGH-QUALITY DEVELOPMENT

Push to make AI a resource for all hailed

Nation transforming global industries by promoting affordable, accessible use

By **CHENG YU**
chengyu@chinadaily.com.cn

Inside
See more, **page 13**

China's vision to turn artificial intelligence from an expensive frontier technology into a resource for affordable, widely accessible applications will bring huge benefits to more countries, businesses and ordinary people worldwide, said leading industry experts and company executives.

They made the comments on Tuesday after President Xi Jinping, in his keynote speech on Friday at the 2026 World AI Conference and High-Level Meeting on Global AI Governance in Shanghai, said that AI should be developed "for the positive, for good and for humanity".

"AI development should not be a solo performance by a single country, but a symphony of international cooperation," Xi said.

He called for coordinated advances in the transformation and upgrade of traditional industries, the cultivation and growth of emerging industries, and forward-looking planning for future industries, so that all sectors and businesses can benefit from AI.

Long Yongtu, China's former chief negotiator for its accession to the World Trade Organization, said the rise of AI has become another turning point in the country's economic development.

He said that China's entry into the WTO in 2001 unleashed the vitality of millions of market participants after restrictions on foreign trade rights were relaxed, helping the country grow into the world's largest trader in goods and allowing ordinary people to increase their income through international commerce.

"Now, entering the age of AI heralds a new era of opening-up. AI is triggering a similarly profound transformation by reshaping production relationships, corporate structures and the cost of starting a business in the country," Long said.

According to the Ministry of Industry and Information Technology, China has embraced AI with open arms, with the value of its core AI industries exceeding 1.2 trillion yuan ($177 billion) last year, maintaining annual growth of more than 20 percent for several consecutive years.

Furthermore, the country is seeking to turn AI into real-world applications and a driver of economic growth.

In the first half of this year, the industrial output of AI-related sectors, including integrated circuit manufacturing and in-vehicle intelligent equipment manufacturing, grew more than 30 percent.

Long predicted that more individuals and small, specialized companies that use AI to perform work that previously required much larger organizations will emerge to become new drivers of the economy.

"Success should ultimately be judged not by model rankings or investment valuations, but by whether AI really improves people's lives," he added.

Efforts to push AI beyond chatbots and benchmark rankings into the physical economy include China's "AI Plus" initiative, which seeks to embed AI in manufacturing, finance, healthcare, energy and public services.

Evolution of airspace ecosystem needed now

WORLD WATCH
By Simon Hocquard

Imagine a morning a few years from now: a drone lifts off carrying a life-saving organ for an urgent transplant, another drone delivers a parcel across the city, and above them, an air taxi takes two passengers to the airport. They all share the same slice of sky over the city, and they do so safely.

The question is, who makes sure they stay out of each other's way?

The answer lies not in a single technology, but in the evolution of the entire airspace ecosystem that enables all aircraft to operate safely together.

The low-altitude economy has arrived faster than many anticipated. Delivery drones are already flying in several countries, and large-scale drone operations are emerging in many regions. Electric vertical take-off and landing (eVTOL) aircraft, the vehicles many people call air taxis, are close to entering service. The vehicles are here, the demand is real, and much of the technology is proven.

When discussing this future, people often focus on the aircraft. That is understandable as they are new and visible. However, in my view, the aircraft are the easier part. The more difficult challenge is how we can progressively evolve the airspace system to safely accommodate these new operations alongside today's aviation.

The low-altitude economy offers real rewards. These aircraft can ease pressure on congested city roads, deliver urgent medical supplies, and reach communities that are hard to serve today.

JIANGMEN TAKES THE ESPRESSO LANE TO SUCCESS

From plantations to percolators, Guangdong city is positioning itself as one-stop coffee hub

By **QIU QUANLIN** in Guangzhou
qiuquanlin@chinadaily.com.cn

A staff member makes iced Americano at a coffee shop in Jiangmen, Guangdong province, on May 25. WANG RUIPING / XINHUA

The air over Jiangmen, a coastal city in western Guangdong province, has traditionally been filled with the fresh scent of dried tangerine peel, a culinary and medicinal favorite among the Cantonese.

However, for a long time, this has been fused with the aroma of a more Western remedy to ease the trials of modern life — roasting coffee beans.

It is believed that the first coffee beans arrived in a suitcase brought by Chinese expatriates as early as the 1860s, when Jiangmen people who ventured overseas returned from Southeast Asia and North America with their suitcases filled with coffee beans and brewing equipment.

The aroma has lingered over the city since, thanks to the booming coffee industry of the past few decades. Over the years, Jiangmen, the hometown of more than 4 million overseas Chinese, has developed into one of China's major industrial bases for coffee, even though no coffee beans were originally produced there.

While it is estimated that there are now more than 2,000 cafes in Jiangmen, the city stands out amid China's coffee landscape for much more.

Building on its strong manufacturing capabilities and the open-mindedness inherent in the globe-trotting history of its people, the city has developed a comprehensive industrial chain.

China Vibes — FOOD —

The thriving coffee business, from bean trading and intelligent roasting to precision manufacturing, has received strong support.

More than 300 varieties of specialty coffee beans, imported from major producing countries and regions including Brazil, Ethiopia and Colombia, with an annual import value exceeding 30 million yuan ($4.4 million), pass through Jiangmen. The city has also developed over 350 coffee equipment and accessory companies.

According to a white paper released earlier this year by local commerce and industrial authorities, approximately 40 percent of China's stainless steel coffee-making equipment and one in five exported coffee machines are produced in Jiangmen.

Liu Youliang, founder of Guangdong Cino Technology, a leading manufacturer of capsule coffee machines, has seen firsthand the growth of Jiangmen's coffee industry.

When Liu started his coffee machine business, the demand for coffee in commercial settings, such as office buildings and hotels, was rapidly increasing.

At that time, the domestic market for capsule coffee machines was virtually nonexistent. However, such machines were already well-established in international markets.

Starting with imitation and developing the country's first homegrown commercial capsule coffee machine, Liu's company, after 18 years, now holds over 300 patents and exports products to more than 90 countries and regions. "Making coffee machines is not just about creating electrical appliances — fundamentally, it's about brewing great coffee," said Liu.

The company has already established a production base of more than 20,000 square meters in Jiangmen, where over 500,000 capsule coffee machines are developed and produced annually.

According to Liu, investment from the Hong Kong and Macao special administrative regions, due to their geographic proximity, has greatly helped advance the development of Jiangmen's coffee industry.

Young world champion Wu Yize trod familiar path to global prominence

Wu Yize holds the championship trophy as his parents wrap a Chinese flag around his shoulders during the awards ceremony after his victory over England's Shaun Murphy in the World Snooker Championship final round at the Crucible Theatre in Sheffield in England on May 4. DARREN STAPLES / AFP

Shooting stars — why GBA is China's snooker hub

Left: Wu Yize demonstrates his cue work at a billiards venue during an interview with China Daily in Hong Kong in June. ADAM LAM / CHINA DAILY
Right: Young trainees at the Guangdong branch of the Chinese Billiards and Snooker Association World Snooker Academy take part in one of their daily practice sessions. PROVIDED TO CHINA DAILY

He was just a small boy, "a little taller than the snooker table", and had been handling a cue for a few years — but he already had his life mapped out.

It was more than a decade ago, and Wu Yize was watching the television broadcast of the final of the Snooker World Championship final at the Crucible Theatre in Sheffield, England.

Thousands of miles away, young Wu was having his own imaginary victory ceremony. "That's what I want," Wu told himself, "I'll stand there too."

In May, Wu's boyhood promise to himself was fulfilled when he won the world championship at the tender age of 22 in the same venue.

The talent pipeline that delivered him from makeshift tables to the pinnacle of the sport has parachuted a generation of Chinese snooker professionals onto the global tour.

The place where young Wu began his full-time pursuit of a snooker career, as well as the national base for professional youth development, is South China's Guangdong province. Its neighboring regions have also played an important role in the sport's development.

Wu spent several years at various training facilities in several Guangdong cities including Dongguan, widely referred to as China's premier "snooker hub".

The official figures don't lie. Over 70 percent of China's professional snooker players have trained in the city at some stage. For aspiring professionals age under 21, that proportion climbs to 90 percent.

Long way to the top

Wu's path to the pinnacle of the sport was a circuitous one that started at his hometown of Lanzhou, a city best known for its beef noodles, in Gansu province.

He began playing snooker at a young age, initially under the guidance of his father, who later sold his business to support his son's career.

The young prodigy was later mentored in several cities in Guangdong. One of his childhood coaches, UK-born Roger Leighton, remembers him as a "funny and cheeky" 11-year-old kid.

"He was always laughing and giggling and he's still a bit like that now," Leighton said in an interview with Metro UK.

"But he's more serious because obviously now he's at the top, at the business end. He's not the complete player yet, but he's getting there."

Wu's childhood memories are of the sheer joy snooker brought him. "I loved it straight away," he said in an interview with China Daily.

"My dad was into it (at that time), and the first time I tried it, I just enjoyed playing. When I first picked up a cue, I could set up properly and hit a ball. I think my dad, back then, thought that I had a bit of a feel for it."

His parents made multiple sacrifices to help his career.

There were "so many things — my dad buying me my first cue, for example; my parents believing in me, supporting me, letting me give up school to go down this path. It wasn't one big thing — it was every single day, building up over time", he explained.

He moved to Sheffield at age 16 with his father. At first it was hard, he conceded.

"Suddenly, being in a new country, a new life, and (with) new challenges, it was tough," Wu said.

"The place we stayed in had no separate bedroom. The living room and kitchen were all one space — the bed was right next to the kitchen. It was tiny, no windows, no ventilation. I shared a bed with my dad."

When asked if the austere living conditions dulled his passion for the sport, Wu replied: "No, not at all. If anything, it helped me. It made me more resilient when things got difficult."

One of the toughest decisions he made was becoming a full-time player when he was a teenager. Wu earned a two-year professional tour card for the 2021–22 and 2022–23 seasons, turning pro at the age of 17 and being named Rookie of the Year in 2022.

Wu told China Daily he discussed the proposition with his parents. "But to be honest, I didn't really have a deep understanding back then (about what going full-time would mean). I was young, I just knew I wanted to play, and I was excited. I didn't think too far ahead about the future. But I did talk to them about it."

"They told me I could only choose one path. And if I chose this, I had to do it properly. They said I needed to think it through and take responsibility for my own life."

Generation next

Wu represents the new young face of the sport, according to Feng Huanhuan, chief executive officer of F-Sports Promotions.

Her company has organized the annual World Grand Prix in Hong Kong since 2025, and opened the Hong Kong Billiard Sports Academy at Hong Kong's Kai Tak Sports Park.

She believes Wu is a player whose character traits and career represent two decades of the maturation of China's professional snooker players.

The trend started with Chinese snooker pioneer Ding Junhui, who sprung to prominence on the world stage in 2005 by winning the China Open at age 18.

The focus of Chinese snooker's youth training system, is no longer a question of quantity, but one concerning "the sustainability of the careers it churns out".

Ding began formal training at 9 years old. Wu — the first world champion born after 2000 — started around age 7. In 2012, at age 8, he had already shared an exhibition stage with Stephen Hendry, the seven-time world champion, in Lanzhou.

Feng first saw Wu compete in 2025, when he was invited to the inaugural Grand Prix as one of the world's top 32 players.

By then, the just-finished HKBSA was open to players for warm-ups, and Wu was the first to step inside. "From dawn to dusk, he practiced, skipping dinner, asking only if he could come again tomorrow," she said.

She said Wu has "a love for the game — raw, sincere", possesses "natural talent", and has "youth, stamina, a strong work ethic, and mental resilience", all essential qualities for a top player. Moreover, he came up the "hard, but, very representative" way.

Huang Zhufeng, president of the Dongguan Billiards & Snooker Association, is well aware of the risks and rewards young players face in turning professional.

He said Wu came to him in the summer of 2019, asking to shoot practice frames against world-class professionals who used Dongguan as a pre-competition training base before heading to major events across the Chinese mainland.

Huang also oversees the CBSA (Chinese Billiards and Snooker Association) World Snooker Academy's Guangdong branch. He estimates that Dongguan has more than 70 long-term training facilities, with over 500 full-time trainees aged 8 to 21.

Tough decisions

Wu remembers the fraught conversations at home when he chose to drop out of middle school to pursue a professional snooker career.

"My parents argued over it," he said, matter-of-factly.

"They wanted me to be certain. They didn't want to saddle me with a difficult life if it didn't work out."

Feng said in the end, very few young players break through to become champions. "Most of these kids will never win a title — so what happens to them?" she said.

She said both parents and the young players themselves need to understand the risks of going pro.

"Outside of the specialized snooker training, I believe there's a lot of room to build better academic support for these players," Feng said.

Huang said that Dongguan is now working to have billiards recognized under the local sports-education integration mechanism.

That designation, if granted, would allow young billiard players to stay enrolled in school while devoting themselves to intensive training — a safety net that most aspiring young professionals in China currently need.

Huang added that a professional snooker career in China today does not necessarily have to result in a world ranking. There are other ways to stay in the sport.

As snooker programs spread into schools, former trainees can study for a state-issued social sports instructor certificate and teach in classrooms. Or they can go through the World Professional Billiards and Snooker Association's coaching tiers or the CBSA's certification process and run a local billiards club.

"There's a real shortage of grassroots coaches and referees in Chinese billiards," Huang said. In Dongguan, he noted, a coach at a typical billiard club can expect a monthly income of 15,000 ($2,220) to 20,000 yuan.

Huang's longer-term vision for Chinese snooker balances elite development with a broader push to draw more people to "just play it for fun", bring snooker into more schools as a regular activity, and establish a contest pyramid that gives both the hobbyists and professionals a rung to reach.

Southern strengths

Within China's multi-pronged approach to snooker development, Huang is confident that the Guangdong-Hong Kong-Macao Greater Bay Area will remain at its core.

What sets the region apart, he said, is not only its head start in the sport but its concentration of training resources thanks to the ever-greater cross-border movement of people, investment, and expertise.

Vincent Law Wing-chung, who chairs the Billiard Sports Council of Hong Kong China, shares that perspective, and said GBA cities are complementary across player and coach exchanges, training, event hosting, equipment manufacturing, and commercial strategy.

Hong Kong is the region's essential link to the international snooker circuit, but the mainland's well-appointed youth training infrastructure has also increasingly rebounded to the city's benefit, he said.

In 2024, seven-time world champion Ronnie O'Sullivan and top English player Judd Trump both secured Hong Kong residency. By June 2025, former world champion Neil Robertson had also announced he had done the same.

Law disclosed that more top players are currently pursuing Hong Kong residency.

Huang said Dongguan's expertise in the sport and well-equipped venues have made it a premier destination for visiting snooker teams. Hong Kong players, he noted, have been joined in Dongguan by those from Saudi Arabia, Qatar, Germany, Belgium, Thailand, and elsewhere.

Hong Kong is well-suited for high-end, smaller-scale international tournaments, Law said, whereas larger ones are already being hosted by mainland cities.

In May, the Dongguan Changping Snooker Center opened and hosted the World Women's Snooker Championship. In June, the Dongguan Humen Convention and Exhibition Center staged the World Team Snooker Championship, the sport's premier global amateur team event. A Chinese team made history by clinching the title for the first time.

Huang said the GBA also plays a key role in the global billiard equipment trade.

While equipment manufacturers are centered in Jiangxi province's Yushan and Hebei province's Bazhou — the commercial gateway to markets worldwide is in Guangdong and Hong Kong, funneling products to markets worldwide.

According to the China Customs, Dongguan exported 22.07 million yuan of billiards equipment in the first three months of 2026, up 29.7 percent from the same quarter the year before.

Recent data from the CBSA showed that there are 245 million people actively playing cue sports in China and over 200,000 venues, with 550,000 enterprises feeding into the ecosystem.

"Billiards is now the sport with the highest degree of marketization in China," said Feng.

China sets records with new self-unloading vessel

By **ZHAO LEI** in Yangzhou, Jiangsu
zhaolei@chinadaily.com.cn

China State Shipbuilding Corp, the world's largest listed shipbuilder in terms of production capacity, delivered on Tuesday a self-unloading bulk carrier custom-built for a landmark project off the coast of Guinea in West Africa, noting that the vessel sets several records in its class.

The *Wontanara*, built by CSSC Chengxi Shipyard for global mining giant Rio Tinto and boasting a cargo capacity of 41,800 metric tons, has achieved three industrial milestones. It is the world's largest deadweight shallow-water transshipment self-unloader, the fastest self-unloading vessel ever made and the world's first self-unloader with bidirectional sailing capability in its tonnage class.

A self-unloader — also known as a self-discharger — is a ship capable of unloading its cargo using onboard equipment, without relying on shore-based cranes, mechanical grabs or conveyor systems.

The *Wontanara*, which was delivered at the shipyard's Yangzhou facility in Jiangsu province, measures 215 meters in length, 42 meters in beam width and 14.5 meters in molded depth, and has a cargo hold capacity of 29,000 cubic meters.

The vessel, powered by a full diesel-electric propulsion system, completed a 12-day trial in the East China Sea between late June and early July.

The CSSC said in a statement that the ship's delivery marks a major step in China's transition from a follower to a global leader in the high-end self-unloading transshipment vessel sector.

Zhang Xinlong, general manager of CSSC Chengxi Shipyard, said that Rio Tinto has ordered five such self-dischargers, with the *Wontanara* being the first. "The vessel's construction started in May last year, and the 14-month delivery cycle has underscored Chengxi's robust research and manufacturing strength," he said, noting that the model features a high level of automation with a small crew. "For example, steering maneuvers can be executed by a single operator using several control levers."

The second self-discharger is expected to be delivered in October, and all five are scheduled for handover by next summer, Zhang added.

The five vessels will operate off the coast of Guinea, serving as the main transshipment equipment for the Simandou iron ore project. They will shuttle ore from shallow-water terminals to large ocean-going bulk carriers anchored in deep waters.

Jiang Minghua, chief designer of the *Wontanara*, said it is equipped with two independent lifting systems with a combined unloading rate of 12,000 tons per hour.

Before its debut, the world's fastest self-discharger — a vessel converted by CSSC Chengxi Shipyard — had an unloading capacity of about 7,000 tons per hour.

According to Jiang, 41,800 tons of iron ore would fill almost 700 standard railway freight cars, stretching more than 7 kilometers, and yet, the vessel can unload a full cargo in under 3.5 hours.

"Working in rotation, the five ships can complete full transshipment and loading for a 200,000-ton ocean-going bulk carrier within 24 hours, minimizing anchorage time for large transportation vessels and effectively increasing mine output," he said.

To date, the shipyard has repaired, converted and built nearly 100 self-dischargers, giving it the world's most comprehensive product portfolio and the largest global market share in the sector.

Policy boost lifts hopes of A-share market rebound

Buybacks by major firms and more equity investment by insurers bolster confidence

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

China's long-term economic and technological trajectory remains intact despite recent market volatility, and expectations of stronger policy support are boosting investor confidence and improving the outlook for a rebound in the A-share market, analysts said.

Confidence has also been reinforced by coordinated market-support actions. A number of centrally administered State-owned enterprises have unveiled share buyback or stake-increase plans in recent days. At the same time, leading insurers have announced plans to increase equity investments in technology, advanced manufacturing and other strategic sectors, adding to expectations of stronger long-term capital inflows.

On Tuesday, the market responded positively to the recent developments. After sliding nearly 6 percent since the beginning of July, the benchmark Shanghai Composite Index rose 1.79 percent, with technology shares leading the recovery. The ChiNext Index in Shenzhen surged 7.05 percent and the STAR 50 Index in Shanghai jumped 10.73 percent.

Wu Qing, chairman of the China Securities Regulatory Commission, underscored that efforts will be made to secure market stability.

Addressing a symposium with investors on Monday, Wu said that a comprehensive set of measures, including risk surveillance, countercyclical regulation, quality enhancement of listed companies, rigorous law enforcement and introduction of medium- and long-term capital into the market, will be deployed to resolutely prevent any major market swings.

Between Sunday and Monday, multiple State-owned enterprises, including Aluminum Corp of China, SDIC Power and China National Coal Group Corp, announced buyback or stake-increase plans.

Since the beginning of July, nearly 300 companies have completed share repurchases totaling more than 15 billion yuan ($2.2 billion), while major shareholders of nearly 120 listed companies recorded net increases in their stakes.

Industry giants are leading the buyback wave. Consumer electronics makers Midea, TCL and Haier together repurchased nearly 4.9 billion yuan worth of shares. Tech heavyweights such as ZTE and iSoftStone have also implemented their buyback plans.

Meanwhile, two State-owned capital platforms — China Reform Holdings and China Chengtong Holdings — increased their holding of A shares and will continue to buy more by using their own funds and a central bank lending facility, providing strong liquidity support to the market.

According to Tian Lihui, a professor of finance at Nankai University, the recent market swings, which are irrational short-term sell-offs, have resulted in a deviation between price and fundamentals. The buybacks will anchor core-asset pricing, stabilize overall market expectations and help direct the capital to technology innovation in the long run, he said.

Song Xuetao, chief economist at Sinolink Securities, explained that this round of global stock market jitters has been triggered by overseas market volatility. The recent decline in A shares is thus a result of overseas risk contagion and trading-level disturbances.

"China's growth logic and industrial development trend remain unchanged," he said.

Xun Yugen, chief economist at Guosen Securities, said that the recent A-share market volatility is an adjustment amid a bullish trend. It is by no means an end to a stock market bull run, he added.

According to Liu Chenming, chief strategist at GF Securities, positive factors are accumulating in the A-share market, including the inflow of incremental capital from exchange-traded funds, improving profitability of companies proved by their interim results, and the upward momentum in emerging industries.

During the trading week ending Friday, the net capital inflow into broad-based ETFs totaled 152.5 billion yuan, the third-highest amount since the latest bull run started in September 2024.

About 1,700 A-share companies have released interim earnings previews so far, with 43 percent delivering positive results. The positive rate is significantly higher among tech-focused companies, with 88 percent of STAR Market companies and 79 percent of ChiNext-listed ones reporting positive results. Artificial intelligence-related sectors and resources led the gains, market tracker Wind Information said.

Tao Chuan, chief economist at Guolian Minsheng Securities, said the steady stream of positive AI developments, best represented by the World AI Conference held in Shanghai and the standout performance of the recently released Kimi K3 model, confirms that the country's tech sector is rapidly realizing its high-growth trajectory.

The underlying narrative of China's economic recovery and the ascent of its tech sector remains intact, paving the way for market stabilization, a potential rebound and continued structural opportunities among A shares, he said.

Major insurers such as Ping An, the People's Insurance Company of China, China Pacific Insurance Co and New China Life announced on Monday their plans to increase equity investments in tech, advanced manufacturing and value assets.

Meng Lei, UBS Securities China equity strategist, reaffirmed that technology and AI will remain the core investment themes for the rest of 2026. Apart from strong earnings growth, the sectors will be supported by marginal net inflows from ETFs, active mutual funds, margin financing and private equity, he said.

AI: Industrial depth to help lower costs overseas

From page 1

President Xi also said in his speech that China should facilitate technological innovation, industrial development and "scenario-based application of AI".

Huo Fupeng, director of the innovation-driven development center of the National Development and Reform Commission, said that "China is leveraging its complete industrial system, enormous range of application scenarios and super-sized market to accelerate AI's deployment across thousands of industries".

"Its dense industrial supply chains and vast domestic market give developers an environment in which technologies can be tested, refined and deployed at scale," he said.

Data from Counterpoint Research showed that approximately 16,000 humanoid robots were deployed globally in 2025, with China accounting for more than 80 percent of them.

At the World AI Conference, Chinese robotics company PrimeBOT unveiled a new, transformable robot that is capable of switching between quadruped and humanoid forms.

Tian Hua, CEO of leading materials maker Swancor Advanced Materials Co and head of PrimeBOT, said: "The robotics supply chain comprises more than 1,600 components. At least 1,000 companies are capable of building a robot globally, but only a handful can manufacture 10,000 robots at consistent quality and scale."

"That's China's advantage — transforming personal robots from custom-built machines into mass-produced consumer products," he said. "We are also confident of making such robots really affordable for ordinary people."

Such industrial depth could also help lower the cost of AI products for overseas users. While global attention has focused on Western technology companies competing for lucrative enterprise contracts in the United States and the Middle East, Chinese companies are promoting open-source products across developing countries.

Alex Zhavoronkov, founder and CEO of AI-driven drug discovery company Insilico Medicine, said China's emphasis on open-source development will amplify those gains internationally.

"China is already leading the world in the open-source model," he said.

"The Chinese approach and its AI policies are paving the way for the entire industry, and everyone on the planet will benefit."

Cafes: Jiangmen integrates tradition into coffee drinks

From page 1

"Brands from Hong Kong and Macao have brought not only capital, technology and an international perspective, but also the first cohort of professional talent," he said.

According to Liang Fan, world latte art champion and a promoter of Jiangmen coffee culture, the city does not shy away from tradition.

"Almost every coffee shop has its own signature drink. They usually incorporate traditional ingredients in a modern way," said Liang.

Now, in a bold move, Jiangmen is exploring the possibility of producing its own coffee from scratch.

The local government plan revealed that coffee plantations have been established on nearby Tianlu Mountain, where more than 90,000 coffee plants have been cultivated as part of a trial.

How about locally produced beans, brewed in locally made machines and served by a local barista? For caffeine-loving tourists, Jiangmen would be the perfect place to enjoy a great cup of coffee.

Airspace: Shared digital information emphasized

From page 1

But those benefits are possible only if the flights are safe. And safety at this scale is a question of the system, not of a single aircraft.

Let me explain. Today's airspace was designed for a different kind of flying. It relies on flight rules written decades ago and on air traffic controllers speaking directly to pilots. That approach has kept aviation safe and works well for a modest number of crewed aircraft moving in predictable ways.

Low-altitude flying is different. Drones, air taxis and increasingly automated aircraft vary widely in speed, size and operational capability, and they are expected in far greater numbers. A city might see thousands of low-altitude flights in a day. To safely accommodate this unprecedented scale and complexity, the traditional framework must be augmented by advanced digital tools and automated oversight mechanisms.

So, what needs to change? I would highlight three shifts.

First, we need to move from voice and radar toward shared digital information. When every operator has the same trusted, real-time picture of the sky, coordination becomes easier, and much of it can be automated. Controllers will move from steering each flight to overseeing the system and intervening where human judgment adds the greatest value.

Second, the airspace itself needs to be managed more flexibly. For decades, we relied on fixed rules and boundaries. A digital system can adapt in real time to each aircraft's capabilities, how busy the sky is, and the level of risk involved. This allows the airspace to accommodate more traffic while maintaining the highest levels of safety. Putting safety first does not mean clinging to older systems. It means embracing new solutions that effectively improve safety while enabling innovation.

Third, this transformation must be global and gradual. An aircraft should not stop working the moment it crosses a border. If every country develops its own rules, technologies and operating concepts independently, operators will face a fragmented, more complex, more expensive and ultimately less safe system.

Global standards need to be agreed upon and then implemented locally at a pace that reflects each region's operational needs and level of maturity. Shared standards are what make any network work; roads and the internet are no different. This is precisely the kind of challenge where countries can learn from one another, including the rapid progress now being made across the Asia-Pacific region.

None of this is theory, and no one is doing it alone. The International Civil Aviation Organization is leading the development of the global framework for advanced air mobility, providing the common vision needed for states and the industry to evolve together. The industry is contributing through the Civil Air Navigation Services Organisation's Complete Air Traffic System Global Council, which brings together more than 80 organizations to help shape the evolution of air traffic management.

Our CATS Concept of Operations describes how today's airspace can progressively evolve toward future skies — a seamless, increasingly digital, collaborative and automated ecosystem in which crewed and uncrewed aircraft operate safely together. Alongside the CONOPS, the CATS Global Council is developing practical guidance on automation, safety, change management, advanced air mobility and implementation support to help turn this vision into reality.

This is where I am optimistic. The ambition is there, the expertise is there, and the solutions are within reach. But technology alone will not deliver this future. Success will also depend on collaboration, thoughtful regulation, operational innovation and the people who will manage this transformation.

A lot of work lies ahead, but our industry can do it — and do it well. When we picture the low-altitude economy, let us not stop at the aircraft. The drones and the air taxis will continue to improve. Whether they become a safe and trusted part of everyday life will be determined by the airspace ecosystem beneath them. At CANSO, that is exactly what we are helping to build: the foundations for Future Skies, where every airspace user can operate safely, efficiently and sustainably. Get that right, and the sky becomes a safe new layer of transport for everyone.

The author is the former chair of the Network Management Board on behalf of the European Commission and is now the president and CEO of the Civil Air Navigation Services Organisation. The views do not necessarily reflect those of China Daily.

ENERGY WAKE-UP CALL

SE Asia needs bold steps to boost power generation, cut fuel imports: IEA

A regional electricity grid, nuclear power and ramping up renewables and electric vehicles are among the ways Southeast Asia could boost energy security while also meeting rising energy demand, the head of the International Energy Agency said in June.

The energy crisis triggered by the war in Iran has highlighted just how exposed Southeast Asia is to costly energy imports and the need for urgent, bold steps to shield the region from future shocks, IEA Executive Director Fatih Birol told The Straits Times.

The region is at an inflection point and what it decides now on energy policies will have a profound impact not only on its future but the rest of the world, Birol said on the eve of the release of the IEA's Southeast Asia Energy Outlook 2026 report.

The region remains heavily dependent on fossil fuels, the burning of which is driving climate change and causing more extreme weather, such as storms and floods, that threaten key infrastructure, including power plants, the report says.

"Southeast Asia is at the forefront of the impact of the current energy crisis," Birol said. "I think countries are now putting energy security very high on the agenda, and they are looking at domestic sources of energy generation as much as possible.

"In my view, the biggest winners here will be renewables and nuclear power, and also electric cars because of different factors, but including the cost advantage and the unparalleled energy security benefits."

And an ASEAN Power Grid, long planned but yet to be achieved, would build cross-border electricity interconnections, help balance supply and demand, integrate renewable resources, and lower costs for participating countries, Birol said.

"In my view, this is a no-brainer. There are some political challenges to overcome, and I believe the current crisis will help overcome these political difficulties. And my recent discussions with the government leaders in the region have made me hopeful in this respect," he added.

Challenges include harmonizing power trading across 11 different grids in each of the 11 ASEAN nations, establishing agreements allowing connections with other nations and overcoming technical barriers, such as transmission/distribution voltages and operating standards.

If achieved, a regional grid could help propel economic growth in a region that is home to nearly 700 million people and one of the world's fastest-growing economic areas. The region is set to account for 20 percent of the growth in the world's energy demand over the next decade, ranking second only to India.

But as the region grows, so do its fuel import bill and vulnerability to energy shocks. The Middle East accounts for 60 percent of the region's crude oil imports, and almost half of the oil products that are refined or consumed in Southeast Asia come from Middle East crude oil, the IEA said.

The region has also become increasingly dependent on liquefied natural gas imports, while coal remains central for power generation in most countries in the region.

> "Southeast Asia is at the forefront of the impact of the current energy crisis ... I think countries are now putting energy security very high on the agenda, and they are looking at domestic sources of energy generation as much as possible."
>
> **Fatih Birol,** executive director of International Energy Agency

$600 billion

Southeast Asia will need over the next decade to build power plants and to expand and modernize the grid, according to IEA.

That means Southeast Asia remains exposed to future shocks, underscoring the need to diversify fuel sources and focus on domestic energy.

The region's energy import bill is projected to reach $160 billion this year, a record high, and is likely to keep on increasing, potentially rising to $400 billion, or 5 percent of the region's economy, by midcentury based on current policies, the IEA forecasts.

Policies prioritizing cleaner sources of energy, electrification of transport, energy efficiency and grid investments could reduce this risk, the agency said.

Key driver

A key driver of the region's hunger for energy is rising electricity demand, which is growing twice as fast as overall energy use. In the next 10 years, the region will add the equivalent of Japan's total power generation, Birol said.

Demand in the region is coming from the rapid uptake of electric vehicles — one in five new cars is an EV — data centers, industrial and urban expansion, and air conditioners. The number of residential air conditioners in the region is set to triple by 2035.

Birol said the region will need about $600 billion over the next decade to build power plants and to expand and modernize the grid, underscoring an immense financing challenge ahead.

Transmission and distribution networks need to more than double in length by 2050 to keep pace with rising demand and to cope with the addition of more wind and solar energy, the report notes. Investment in grids and storage, such as battery storage, needs to ramp up from $13 billion in 2026 to $50 billion in 2050.

About $27 billion will be needed by 2040 to realize planned cross-border interconnections under the ASEAN Power Grid.

The agency notes that nuclear could become a key growth area for power generation by midcentury. Nuclear deployment could meet almost 10 percent of electricity demand growth by 2050 if announced government targets are achieved. But this will depend on accelerating deployment and reining in long construction lead times and costs.

Vietnam, Indonesia and the Philippines have announced plans to commission nuclear reactors, with the first units scheduled to come online after 2030. Singapore is carefully investigating if nuclear energy is suitable for the country and is working with the International Atomic Energy Agency on a detailed review starting in 2027.

Increasing electrification of transport, homes and industry is also a key area for the region's governments to focus on. Boosting renewable energy investment, battery storage and regional grid interconnections can cut fuel import bills while boosting regional resilience, the IEA said.

Renewable energy capacity is projected to nearly triple by 2035 under current policy settings or grow fivefold if announced targets are achieved.

Solar deployment has already increased this year: The Philippines became the second-largest destination for Chinese solar exports in the first quarter of 2026, with imports around three times higher than in 2025.

Birol expressed optimism about more rapid change in the region, attributing it to the impact of the Iran war.

He pointed to the rapid changes that occurred in Europe because of the Russia-Ukraine conflict. Before the conflict, Russia supplied about 40 percent of Europe's energy. Now, it is a fraction of that.

He said wind and solar installations in Europe have increased by a factor of three and nuclear power is now back on the energy agenda of many European countries.

"I expect this will be the same in Asia, especially in Southeast Asia," he said.

THE STRAITS TIMES, SINGAPORE

South Korea begins soccer reform after World Cup fallout

SEOUL — The Ministry of Culture, Sports and Tourism of South Korea launched the K-Football Innovation Committee in early July, appointing former national team player and current member of FIFA's standing committee Park Ji-sung and (South) Korean Sport & Olympic Committee, or KSOC, President Ryu Seung-min as its cochairs.

Holding its inaugural meeting in Seoul in early July, the K-Football Innovation Committee was attended by 10 members.

This list included Culture Minister Chae Hwi-young, Vice-Minister Kim Dae-hyun, Secretary General of the (South) Korean Professional Football League Cho Yeon-sang, and several former soccer players among others.

Culture Minister Chae, who had initially been expected to serve as cochair, said he would step aside and appoint Ryu in his place to ensure the committee's independence from the government.

"With Ryu and Park, the K-Football Innovation Committee would encourage football figures and sports expertise to lead the conversation while the government provides support from behind to build the future of (South) Korean football," said Chae.

The committee comes in response to widespread criticism of the (South) Korea Football Association after South Korea's 34th-place finish at the World Cup.

South Korea opened Group A with a 2-1 win over the Czech Republic but then lost 1-0 to Mexico and 1-0 to South Africa, finishing third and failing to qualify for the round of 32 as one of the eight best third-placed teams.

The expanded 48-team tournament had raised expectations that South Korea would reach the knockout stage, with local media labeling the squad a "golden generation" headlined by former Tottenham Hotspur forward Son Heung-min, Paris Saint-Germain midfielder Lee Kang-in and Bayern Munich defender Kim Min-jae.

The South Africa defeat became the flash point, and team coach Hong Myung-bo was criticized for leaving Son out of the starting lineup, bringing him on at half-time with the score at 0-0.

He later said he had planned to use him when South Africa tired, but that he would do things differently had he known how the match would turn out.

Following South Korea's exit at the World Cup, President Lee Jae-myung said on June 28 on the X platform that he was "utterly baffled" by the elimination, blaming it on personnel decisions.

He said factionalism or loyalty had been prioritized over competence, and asked the sports ministry to investigate and propose measures to prevent a recurrence.

Hong resigned shortly after South Korea was eliminated from the World Cup, saying the responsibility rests with him.

Fans booed Hong at the airport when the team arrived in Seoul on June 29, while applauding the players. Some held banners saying: "South Korean football is dead."

'Time for change'

The culture minister said that a committee comprising prominent figures from the sports community will be established to examine the causes of South Korea's disappointing performance.

Park said the result showed that it was time for change.

"(South) Korean football has had its ups and downs, but always did its best. The recent World Cup games proved that things have to change," he said.

"I am grateful to be a part of the first steps to a positive change. I am a former soccer player, and for that I have the responsibility as a footballer to see how the innovations should be made, not only from a player's perspective, but also by considering if our discussed solutions are applicable," he added.

> "The recent World Cup games proved that things have to change ... I am a former soccer player, and for that I have the responsibility as a footballer to see how the innovations should be made."
>
> **Park Ji-sung,** member of the FIFA Men's Football Stakeholders Committee and a former South Korean soccer player

Another cochair Ryu stressed that neither his involvement nor the KSOC's would affect personnel issues or how the national team operates.

"My role is to seek ways for (South) Korean sports to move forward. The committee will listen to what the sports experts have to share so that the public can applaud and encourage (South) Korea Football Association and the players," he said.

The committee will serve on a temporary basis until a new executive board of KFA is established.

The committee was officially launched hours after Chung Mong-gyu, national football chief, stepped down after 13 and a half years at the helm.

Chung had announced in May that he would resign after the FIFA World Cup, but did not specify when he would leave.

Chung appears to have brought forward his resignation following South Korea's earlier-than-expected group-stage exit from the World Cup and its aftermath, including head coach Hong's resignation.

Hegseth: war in Iran has cost $37.5 b

Senators question accuracy of casualty numbers, citing need for transparency

By SHI GUANG
shiguang@chinadailyusa.com

At a Senate budget hearing on Tuesday, US Defense Secretary Pete Hegseth estimated that the war with Iran has cost $37.5 billion.

During a hearing of the Senate Appropriations Committee on Capitol Hill, Hegseth said the $37.5 billion was not only for the cost of military equipment used, and included expenses such as meals.

The hearing was to consider a request for supplemental funding of around $67 billion for the war, which Hegseth said was an "urgent, necessary injection of resources", as well as $1.5 trillion for next year's military budget.

"Without these funds, we face critical shortfalls," Hegseth testified.

Democratic Senator Patty Murphy warned of "another forever war".

"This war is now spiraling out of control again," Murray said, adding that US President Donald Trump has repeatedly claimed that "a deal is near, and the war will be over soon. But now, he's asking for $70 billion more — and for us to just trust him it'll all work out fine."

Trump said on Tuesday that Iran "desperately" wants ceasefire talks, though the US has not cut back on daily attacks.

"We're not finished," Trump told reporters at the White House. "We're not leaving."

Trump said the US could soon hit Pickaxe Mountain, a hardened underground facility where it is believed Iran has moved the centrifuges required to make nuclear fuel, as well as its stockpiles of enriched uranium.

In a post on Tuesday, Trump compared the deaths of 17 US military personnel so far in Iran — and the zero deaths of US troops in the operation to illegally seize Venezuelan leader Nicolas Maduro — with fatalities in previous US wars: 2,000 in Afghanistan, 4,600 in Iraq, 58,220 in Vietnam and 36,574 in Korea.

However, some senators have questioned the casualty numbers in Iran, arguing the administration is not being transparent, and is hiding behind the claim of "operational security".

"The ceasefire collapsed. The war is escalating. American troops are paying the price. Iran knew it attacked our bases. The Pentagon knew our troops were wounded. The only people kept in the dark were the American people," said Senate Minority Leader Chuck Schumer.

Democratic Senator Tim Kane said the administration needs to provide better answers for the military deaths and the president's threats to widen the war, despite Congress voting to limits his powers in the Middle East.

"You better have a really good answer for that question. And as of right now, this war of choice that Donald Trump started, he cannot answer that question. Congress has definitively declared — both houses — that this war is illegal. Only we, in the Constitution, have that power. The president is ignoring us, even though that declaration was made by two Republican majority houses," Kaine said.

Brent oil futures settled above $90 on Tuesday, its first close above that threshold since June 11.

Hegseth said the US had been helping guide ships through the Strait of Hormuz, claiming they had "been in control of moving traffic" for some time.

"We pushed almost, I believe, between 400 and 500 million barrels of oil under the nose of Iran over the course of Project Freedom," Hegseth told the committee.

Trump also dismissed the threat by Houthi forces in Yemen to block transit in the Red Sea, which Saudi Arabia has been using as a partial alternative route to ship oil.

"If there is something like that, we'll just have to take care of business," Trump told reporters at the White House on Tuesday.

Fresh 50% US tariffs mount pressure on Canada

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

The latest US tariffs on certain Canadian goods are being viewed by experts as both a negotiating tactic and a shift in the US administration's legal strategy for pressuring Canada.

US President Donald Trump on Monday announced a new 50 percent tariff on certain Canadian goods, including wine, hockey sticks and cement.

The White House said the move was intended to address what it described as discriminatory Canadian trade policies, including restrictions on US alcohol sales, dairy supply management and automobile import quotas.

Canadian Prime Minister Mark Carney condemned the move, calling it "the latest in a series of unilateral US trade actions" that began with Washington imposing tariffs "in direct violation" of the agreement between Canada, the United States and Mexico.

"Canada stands ready to engage intensively to address outstanding issues with the US to the mutual benefit of our citizens," Carney said in a statement.

Ontario Premier Doug Ford urged Ottawa to respond forcefully.

Trade experts said the latest measures reflect both a shift in the legal tools employed by the Trump administration and a broader effort to increase pressure on Canada amid stalled trade negotiations.

Dave Townsend, a partner in Dorsey & Whitney LLP's International Trade Group, said the administration's latest action differs from earlier tariff measures.

"Today, the Trump administration announced tariffs on nearly $20 billion worth of annual imports from Canada under a different legal authority, Section 338. The tariffs would take effect 30 days from now. Why now against Canada?" Townsend said.

He said the timing appears closely linked to ongoing negotiations between Washington and Ottawa.

"The new potential tariffs on goods from Canada appear to be because Canada has thus far not agreed to a framework trade agreement with the United States.

"Thus, the higher tariffs for goods from Canada appear to be aimed at encouraging an agreement between Canada and the United States, or in retaliation for the failure to reach such an agreement, or both," Townsend said. He said the latest measures could further strain trade relations.

Cycle of escalation

"The question now is whether the two sides can reach such an agreement or whether a cycle of escalation and retaliation takes hold between the two countries," he said.

Ronald Stagg, a history professor at Toronto Metropolitan University, said the administration's latest move also marks a significant change in the legal basis for imposing tariffs.

"Having run into problems with duties imposed under 1974 and 1962 trade acts, Trump has now reached back to the 1930 act, which resulted in the deepening of the Great Depression, as other countries retaliated by raising tariffs," Stagg told China Daily.

Stagg said the announcement appeared to catch many in Canada by surprise.

"This seems to have come as a surprise to the Canadian government, and the media, which were focused on Trump's musings on the imposition of tariffs or other financial penalties on Canada for allowing smoke from wildfires to enter the United States," he said.

Only days before announcing the new tariffs, the Trump administration threatened additional financial penalties against Canada over wildfire smoke drifting across the border, accusing Canada of failing to properly manage its forests.

Stagg said the latest actions reflect a broader pattern in Trump's approach.

Looking ahead, Stagg said Canada's response will be critical.

"The question now is, will Canada retaliate, or will the Canadian government complain, but try not to poke the bear," he said.

Beijing hits back at Tokyo over drill

By JI HAISHENG
jihaisheng@chinadaily.com.cn

China on Tuesday rejected Japan's claims about Chinese warships operating in waters near Okinotori during a joint exercise with Russia, saying the activities in the high seas are fully consistent with international law and global practice.

Foreign Ministry spokesman Lin Jian made the remarks at a news conference in response to reports that Japan had lodged a protest alleging Chinese vessels entered "Japan's exclusive economic zone" during the drill, calling Tokyo's concerns groundless.

Under the United Nations Convention on the Law of the Sea, Okinotori is a rock rather than an island, and thus unfit to claim an exclusive economic zone or continental shelf, Lin said. "Japan's claim of an exclusive economic zone around Okinotori violates international law," he said.

Lin accused Japan of smearing other countries' legitimate and lawful operations, and peddling the so-called external threat as attempts to find excuses for accelerating remilitarization and challenging the postwar international order.

The international community must stay on high alert and jointly push back on this dangerous pursuit, he added.

'Whale-done' rescue

Rescue workers maneuver a sling through the water to transport a beluga whale at the shuttered Marineland theme park in Niagara Falls, Ontario, Canada, on Monday. This operation marks the beginning of a complex mission to relocate nearly three dozen whales from the park, which closed late last year, to new homes in the United States. CARLOS OSORIO / AP

Hopes, doubts and demands as Burnham takes power

Xing Yi
Reporter's log

FIRST PERSON VIEW

By the time I arrived at Downing Street on Monday morning, the narrow street was already packed with journalists, photographers and broadcasters awaiting the transfer of power from Keir Starmer to Andy Burnham, the United Kingdom's seventh prime minister in a decade.

I had arrived three hours before Burnham's scheduled speech, but I was too late. A security guard told me every media position had been allocated last week. We were not getting in.

Outside the gates, the crowd continued to swell. Journalists without accreditation lingered in hope, protesters unfurled banners, and passersby paused for a glimpse of the new prime minister.

Then a question struck me: everyone inside would hear Burnham's speech, but who was listening to the people outside?

We turned our attention to the crowd, speaking not with politicians or officials, but with ordinary people who had come to witness Britain's latest change of leadership.

A retired landscape architect said he was there to campaign for the UK to rejoin the European Union.

"Because of Brexit, we've lost between 6 and 8 percent of GDP," he said. "We've got a new prime minister who has said he'd like us to rejoin the EU. We can persuade him to get on with it."

An artist displaying a satirical painting lamented the frequent leadership changes.

"I've seen many prime ministers, and it doesn't matter what they were doing — their policies need stability," he said. "Every one or two years we get a new prime minister, and that's not a good sign.

"The country is in a mess — socially, economically and politically — and is going downward. Someone has to stop that," he added.

Nearby, campaigners staged a symbolic performance. Wearing a cartoon mask of Burnham, one member used a long-handled brush to sweep the street as part of the "Clean Up Westminster" campaign.

The group's leader said they wanted to reduce the influence of money in politics.

"We are here to encourage the new prime minister to keep his promise to limit how much money any individual or organization can give to a political party," he said, referring to a recent investigation into an undisclosed $6.7 million donation linked to the leader of Reform UK.

Later, I met a couple from Suffolk, where Reform UK secured a major victory in May's local elections.

"We hope (Burnham) does a good job, but he's not elected," they said, adding that the change of Labour Party leader lacked a direct mandate from voters.

Their main concerns were immigration, the cost-of-living crisis and poverty. "We need a general election so people can have their say on whom they want as their prime minister," they said.

"So if there were a general election, would you vote for him?" I asked.

"No," the husband replied, before repeating, "No."

Afterward, I met another couple from Ashton-in-Makerfield, where Burnham won last month's by-election, securing the parliamentary seat that paved the way to No 10 Downing Street. Burnham defeated the second-placed Reform UK candidate by about 9,000 votes.

The wife said they had interacted with Burnham during the campaign because "he was there nearly every day".

"He's very humble, very down-to-earth, and he's very much for ordinary working-class people," she said. "He wants to improve social housing and things like that.

"We've got a lot of hopes for him."

In the end, I never made it inside Downing Street that morning.

But perhaps the story was only half told if it focused solely on the new prime minister's speech in front of the famous black door. The other half unfolded outside — in the hopes, frustrations, doubts and demands of ordinary Britons.

Editorials

Meeting presents Manila with opportunity to step in line with other ASEAN members

Manila has committed its latest provocative act in the South China Sea, just ahead of the China-ASEAN Foreign Ministers' Meeting in Manila on Wednesday, which Chinese Foreign Minister Wang Yi is scheduled to attend.

Among Manila's many provocations, confrontations in the South China Sea between illegally intruding Philippine vessels and China Coast Guard boats carrying out enforcement operations have become a routine occurrence. Each dangerous encounter at sea exacerbates tensions and further strains bilateral relations.

What happened on Monday in waters near China's Ren'ai Reef is just one of many such perilous encounters. According to a CCG statement, two rubber boats from the Philippine ship BRP *Sierra Madre*, which Manila grounded on China's Ren'ai Reef in 1999 and has refused to remove ever since, rapidly approached a CCG patrol boat, which was conducting routine patrols, and rammed it, despite repeatedly being given clear warnings.

Philippine personnel also maliciously struck Chinese law enforcement officers with oars, poles and other tools during the incident. Despite the fact that the Philippine side initiated the provocation, in a bid to mislead the international community, Manila had the nerve to play the victim.

It is only natural that Manila's reckless words and deeds should be censured by Beijing. The head of the Department of Boundary and Ocean Affairs of the Ministry of Foreign Affairs urgently summoned the Philippine ambassador to China on Tuesday, lodging solemn representations over the Philippines' deliberate provocation at Ren'ai Reef and its attack on CCG law enforcement personnel.

China values its relations with the Philippines, but Manila should not mistake China's goodwill and restraint for weakness or unlimited tolerance.

China's relations with the other members of the Association of Southeast Asian Nations have remained generally stable. But due to Manila's constant provocative antics in the South China Sea, the same cannot be said of ties between China and the Philippines.

As the rotating chair of ASEAN this year, Manila should play a more constructive role in promoting peace and stability in the region, rather than inviting wolves into the house. Its tactic of enlisting the support of external forces and trying to ignite the cold ashes of the so-called "South China Sea arbitration award" does a disservice to regional efforts to maintain peace in the waters. Beijing has made it clear that the Code of Conduct in the South China Sea must never be linked to the illegal "arbitral award".

It serves no country's interest if stability and cooperation in the region are undermined by feuds.

Instead of exacerbating tensions in the region, the Philippines should leverage its position to facilitate dialogue and cooperation. It should shoulder its responsibilities and act as a promoter and coordinator of regional peace, focusing on constructive engagement rather than provocation. The goal should be to foster an environment conducive to negotiations and the peaceful resolution of disputes.

As China and ASEAN are striving for an early conclusion of negotiations on the COC, the Philippines should prioritize the task, ensuring it reflects the collective interests of ASEAN and China, and not the agendas of external powers.

It is hoped that the China-ASEAN Foreign Ministers' Meeting will send a message that prioritizes peace and stability over conflict and division. By fostering a spirit of cooperation and mutual respect, China and ASEAN can work together to turn the South China Sea into a sea of peace, friendship and cooperation.

China looks forward to the Manila meeting expanding consensus on development and cooperation, making new progress in jointly fostering a peaceful, safe and secure, prosperous, beautiful and amicable home, and striving to forge a closer China-ASEAN community with a shared future.

Stable China-UK relations benefit both sides

On Monday afternoon, Andy Burnham, the United Kingdom's seventh prime minister since 2016, stood outside No 10 Downing Street and said: "Let us make this the moment when Britain starts to believe again, the moment we bring back hope."

It was a good line that millions of UK people will be looking to him to deliver on. But "hope", as every UK leader has learned to their cost, is a currency that devalues fast when the fiscal arithmetic refuses to cooperate.

The new prime minister inherits a country facing domestic challenges, with many residents struggling with high living costs. Burnham has ruled out raising income tax, VAT or national insurance. Yet he has promised the largest public housing program in decades, reindustrialization and the return of utilities to public control.

The math does not add up.

Against this backdrop, deepening economic engagement with China is a necessity. Burnham's predecessor, Keir Starmer, stabilized relations with Beijing. And Starmer's January visit to China — the first by a UK prime minister in eight years — sustained the momentum of a suite of dialogue mechanisms that had lain dormant for too long.

The China-UK Joint Economic and Trade Commission is back, meeting for its 15th session in London this month. The Economic and Financial Dialogue, suspended for six years, produced nearly 70 policy outcomes when it resumed in Beijing last year. A new Financial Working Group has been established. The Joint Commission Meeting on Science and Technology has identified climate, health and agriculture as shared priorities.

This is the institutional architecture that Burnham can now work with. His own career record in Manchester gives him an advantage: he has seen Chinese investment work. During his mayoralty, Chinese companies poured over £6 billion ($8.07 billion) into Greater Manchester, backing regeneration projects that created jobs and revived communities.

Chinese Premier Li Qiang extended his congratulations on Monday, expressing readiness to strengthen engagement, deepen mutual trust, expand exchanges and cooperation, and advance the long-term and stable comprehensive strategic partnership between the two countries.

Li also noted that stronger dialogue and cooperation would not only advance the development of both nations but inject stability into global peace as well. It is clear China is prepared to work with the Burnham government for the two countries' common interests.

Yet the shadow of British Steel looms large at the moment. The nationalization of the Scunthorpe plant — seized from China's Jingye Group just days before Burnham took office — is a flagrant violation of the UK's contractual obligations.

Burnham must deal with this with prudence. He should bear the bigger picture in mind, as the potential for bilateral cooperation is too great to be jeopardized by the dispute. The bilateral trade in goods reached $103.7 billion in 2025, while the two countries' services trade exceeds $30 billion and has huge untapped potential. The UK is the world's second-largest services exporter; China is the second-largest services importer. A China-UK services trade agreement — which both sides have committed to exploring — could be transformative.

As UK Business and Trade Secretary Peter Kyle said at the July "Export to China" event in London: "Both sides can enhance understanding through dialogue, join hands in cooperation, and maintain stable economic and trade relations benefiting both peoples."

Burnham needs China if he is to deliver his flagship promises. Promoting the UK's green transition, advanced manufacturing, life sciences and electric vehicles — all require investment that a cash-strapped UK Treasury cannot provide alone. Chinese capital can help re-industrialize the north and the Midlands, exactly the left-behind communities Burnham has pledged to serve.

The China hawks in Westminster will not disappear. But the lesson of Starmer is that a prime minister who fails to deliver growth loses his party's confidence. Starmer was undone not by a single crisis but by a cumulative sense that he had no solution. Burnham's "Manchesterism" — his commitment to shifting power from Westminster, expanding public control and promoting regional development — was forged in a city that benefited tremendously from Chinese engagement. The UK will benefit if he can now apply that cooperative pragmatism on a national scale.

The mechanisms are in place. The will in Beijing is clear. Burnham's own instincts are sensible. The question is whether he can resist the gravitational pull of geopolitical pressures long enough and resolve differences through consultations to make it work.

Economy's structural divergence calls for targeted support policies

China's high-tech and manufacturing sectors are expanding at high speed. For those who measure national prowess in teraflops and gigawatts of computing power, the latest industrial data are remarkable. The country's intelligent computing capacity reached 2,185 eflops as of June; and its integrated circuit exports — a sector targeted by US restrictions — have skyrocketed by 88.7 percent year-on-year in the first half of the year. It also accounts for over half of the world's humanoid robot models.

It can be seen that China's economy operated within a proper range in the first half of the year. And efforts will be stepped up to secure the steady development of employment, businesses and markets, and to meet expectations.

Although the official unemployment rate for the 16-24 age bracket has fallen for three consecutive months, it still lingered at 14.9 percent last month, with students excluded.

China has set a target of a surveyed urban unemployment rate of around 5.5 percent in 2026 and aims to create over 12 million new urban jobs within the year.

What the country is experiencing is a "scissors effect" of structural divergence. Artificial intelligence, as the Ministry of Industry and Information Technology notes, is being integrated into every facet of the economy. But the replacement of human labor is outpacing the creation of new, viable occupations in some sectors, where the "substitution effect" is winning the race against the "compensation effect".

Consider the numbers from the Ministry of Human Resources and Social Security. While AI-related job openings in fields such as humanoid robotics have quadrupled, nearly half of these positions explicitly require a master's degree or higher. China faces a talent gap in AI-related fields, yet millions of rural migrant workers have to adapt to labor market changes caused by automation in traditional manufacturing. This is a skills chasm, which affects consumption as well. If the average worker lacks the digital literacy to compete in a machine-driven economy, how can they fuel domestic demand?

The legacy of the property boom also continues to weigh on consumption. For more than a decade, soaring home prices encouraged many households to exhaust their savings and take on substantial debt, effectively spending tomorrow's income yesterday. As property values have softened, that consumption has proved difficult to recover.

Governments can encourage spending, but they cannot manufacture purchasing power. Consumption ultimately rests on income.

What is required is expanding lifelong learning systems accessible to factory workers, as well as stronger support for the low-income group in public services and social security. In the process, tax revenues generated by the tech boom should be recycled into robust social safety nets and targeted income support. There is no escaping the fact that a "ballast" economy is only as stable as the purchasing power of its consumers.

Redefining the nature of work is equally urgent. The "algorithmic control" exerted by the platform economy has left millions in the gig economy without adequate social security. If these workers are to be true participants in the AI era, they need the same protections as those in traditional employment.

The AI era demands a renewed commitment to social fairness and economic justice. Through continued reform, China can prevent a two-tiered society from forming: a highly educated elite designing and managing intelligent machines, and a growing commons left to compete for whatever work automation leaves behind.

Without an effective recalibration of how we invest in human capital and distribute national income, the "scissors" will only cut deeper. The real ballast for any economy is jobs. The technological miracle the world is experiencing will ultimately be judged not by its teraflops, but by whether it lifts all boats through inclusive development.

— LI YANG, CHINA DAILY

What They Say

OPC ecosystem can help promote entrepreneurship

Editor's note: *Enabled by the rapid development of artificial intelligence, one-person companies, or OPCs, are thriving in China, offering a new model of employment. Yao Jianhua, deputy dean of the School of Journalism at Fudan University, spoke to Oriental Outlook on the strengths of China's OPC sector and the challenges it faces. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Contrary to what many people think, an OPC can involve more than one person. Depending on local policies across different cities in China, an OPC can have up to 20 employees in it.

The most important feature of an OPC is its approach to business. It is a smart model that is built on AI and involves collaboration between software and hardware.

The core competitive edge of an OPC lies in its founders' deep understanding of users' needs and market demands.

The OPCs which are able to identify unmet demands and leverage their technological capabilities to meet these demands are more likely to succeed in the competition.

Cities across China have established OPC communities to support the development of this new business model. Typical examples include the Zero Cube community in the Lingang Special Area in Shanghai, the ZGC AI North Latitude Hub in Beijing, and the Dagongfang AI hardware OPC hub in Bao'an district, Shenzhen.

These communities serve as platforms for OPC entrepreneurs to build connections, convert social networks into commercial resources and engage in flexible collaboration.

However, a lack of sufficient application scenarios remains a prominent challenge for the growth of OPCs. Some cities treat the local OPC community merely as a coworking space and a tool to attract investment, without offering enough opportunities for companies to deploy their products in the real world.

Also, although AI technology has lowered the threshold for individuals to start a business, OPC founders are predominantly young talents with specialized technical expertise, high academic credentials and work experience in tech firms or research institutions. A large number of ordinary workers still lack proficiency in AI tools and awareness of digital entrepreneurship. This might lead to the digital divide and imbalanced development, undermining the inclusive innovation that OPCs aim to promote.

Other challenges include heightened operational and financial risks for OPC founders who run their companies all by themselves, and security loopholes caused by the use of AI agents.

The government and the market should work together to promote the sound development of OPCs. Local authorities could formulate special policies aligned with the 15th Five-Year Plan (2026-30), and roll out measures tailored to local industrial strengths.

They should refine rules for OPC governance and address regulatory loopholes, improve financial services to ease OPC founders' burdens, and build cross-regional public computing power platforms to provide low-cost and inclusive computing resources.

OPC communities should also focus on local industries and resources and upgrade their services. They should not only provide workspace and computing power for OPCs, but also offer other services, including matching demand with supply and promoting industrial collaboration.

To prevent the digital divide, local authorities should cooperate with tech enterprises, universities and industry associations to offer customized AI training courses to different groups of people, thus lowering the barriers to digital entrepreneurship.

Regulators should adopt an inclusive and prudent governance approach, using tools such as regulatory sandboxes to allow for experimentation and learning in OPC operations.

VIEWS

Xu Ying and Zhang Weishi

The right flight path for the low-altitude economy

Wuhan, the capital of Hubei province, has begun drawing roads in the sky. Its new "Sky Road Map" — the first of its kind in China — charts hundreds of flight corridors and thousands of landing points across the city, creating a digital blueprint for a future in which drones, air taxis and other low-altitude aircraft become part of everyday urban life.

But the real challenge is not mapping routes; it is governing a crowded sky. As millions of low-altitude aircraft take flight, China will need a dynamic governance system that manages airspace across space and time, coordinates multiple agencies in real time and treats the sky as critical urban infrastructure. Otherwise, the low-altitude economy could add a new layer of disorder to already strained cities.

Drones, electric air taxis and other low-flying aircraft are seen as part of the country's next wave of industrial growth and infrastructure development. However, growth without structure is unsustainable.

To ensure orderly growth, the governance framework should adopt a "risk-based" or "benefit-assessed" approach that prioritizes public safety and disaster relief. The recent flood relief operations in Guangxi Zhuang autonomous region illustrate the value of low-altitude aircraft in emergency situations. Rules for commercial logistics, environmental monitoring and other market-oriented applications can be developed in an extended framework. By differentiating governance according to public value and economic needs, cities can safeguard critical functions without stifling innovation.

China's urban development has hit an inflection point. Traditional two-dimensional, labor-intensive governance models are reaching their limits. A shrinking front line workforce and tighter fiscal budgets demand a more precise, resilient approach.

The growth of low-altitude airspace — generally up to 1,000 meters above the ground — is pushing Chinese cities beyond traditional ground-based management.

Urban authorities must now manage not only roads, buildings and people on the ground, but also where aircraft fly, when they fly and how their movements interact with life on the ground. This emerging model is described as "spatiotemporal governance" because it adds both physical elevation and time to the traditional map of urban management. More importantly, it marks a shift from reacting to problems after they occur to anticipating and preventing risks through coordinated data-driven governance.

The future of low-altitude governance will not be built one drone at a time. Current "point-based" models, which treat drone operations as isolated deployments, are not suitable for the scale of modern urban complexity.

MA XUEJING / CHINA DAILY

Therefore, China is moving toward a sophisticated spatiotemporal grid-based model that integrates three foundational pillars to manage the low-altitude space.

The first pillar is digital intelligence. Real-name registration, flight reporting and identification systems help authorities determine who is flying where and for what purpose. When those data are combined with weather information, air-traffic rules and 3D maps of the city, regulators can assess risks in real time rather than after an incident occurs.

The second is zoning. Instead of relying on blanket no-fly bans, cities are beginning to classify low-altitude airspace by aircraft type, mission, population density and infrastructure risk. High-risk areas can be tightly controlled, while designated corridors remain open for lower-risk commercial and public services. Fixed routes and approved takeoff-and-landing nodes will turn low-altitude airspace into a planned transportation network.

The third pillar is coordination. Drones do not stop at city borders, and neither can regulation. Aviation authorities, emergency responders and public security departments need shared platforms and shared rules. When flight routes are connected with weather and safety data, risks can be spotted before takeoff. As drone services expand across neighboring cities, common standards for identity checks, data sharing and approvals will be essential to keep flights moving safely across municipal boundaries.

Across China, early experiments are already showing what a coordinated low-altitude network can achieve. On the technical front, integrating multi-source big data is enabling the creation of digital twins that allow officials to visualize and simulate urban life in real time. For instance, in Pingtan, Fujian province, autonomous inspection systems like "Cloud Xiaosheng" are transforming how municipal infrastructure is monitored.

These initiatives signal a broader shift toward anticipatory urban governance. By replacing post-event response with pre-event planning, cities can overcome three persistent challenges: insufficient synergy, fragmented integration, and uneven public service coverage.

The real test of China's urban governance is not whether drones can fill the sky, but whether cities can govern that sky with the same coherence and efficiency that they govern the streets below.

That will require more than advanced aircraft. It will require stronger legal frameworks, deeper institutional coordination and sustained investment in digital infrastructure and innovation.

For decades, China's cities were shaped primarily by horizontal expansion. The next stage will be defined by how effectively they manage activity across space and time, integrating the air above the city with the systems that operate on the ground. If that transition succeeds, the low-altitude economy will become part of a broader shift toward safer, more resilient and more intelligent urban life.

Xu Ying is a research fellow at the Low-Altitude Economy Research Center and an assistant professor at the School of Government, Central University of Finance and Economics; and Zhang Weishi is an associate professor at the Faculty of Geography, Tianjin Normal University.
The views don't necessarily reflect those of China Daily.

Zhou Shuchun

The author is chief researcher at the China Watch Institute, China Daily.

Yen's fall microcosm of mature economy in structural decline

Despite a recent bounce, the yen remains pinned below the psychologically critical 160 mark against the dollar — a level long viewed by the market as a last line of defense.

Once an undisputed safe-haven currency, the yen is now one of the world's worst-performing major currencies. Its relentless slide lays bare the fragility of Japan's political and economic foundations, exposing a jarring case of policy schizophrenia.

Officials continue to tout a narrative of "moderate recovery" for Japan's economy. Supporting this optimism is the fact that while the yen languishes at 40-year lows, the Nikkei has surged to heights not seen since the late-1980s bubble era. Politicians are quick to frame this as a sign that Japan is finally shaking off its "lost decades."

Yet the stark divergence between stocks and the currency reveals deep internal contradictions. To a significant extent, the plunging yen has engineered an imported bull run. The Nikkei 225, dominated by exporters like Toyota, Sony, and SoftBank, benefits directly as a weaker yen inflates the value of repatriated overseas earnings. However, this disconnect from the tepid underlying economy has investors on edge; what passes for a "recovery" feels more like a disjointed solo dance.

The contrast becomes even starker beyond the equity market. With Japan heavily reliant on imports for energy, raw materials and food, the currency crash has unleashed a tide of imported inflation. Consumer prices have breached the 2 percent policy target for four straight years, while the Engel coefficient (the proportion of food expenditure in total consumption expenditure) for households hit 29.4 percent in the third quarter of 2025 — its highest level since 1981.

A currency's persistent plunge signifies a collective downgrade of the country's potential — a massive vote of no confidence.

While listed multinationals celebrate inflated paper profits, the vast majority of smaller firms are being squeezed to death, burdened by rising operating costs. According to one survey, corporate bankruptcies attributable to yen depreciation rose by 32.3 percent year-on-year in the first half of this year. Meanwhile, despite union-led nominal wage hikes of 5 percent over two years, real wages have declined for four consecutive years, failing to keep pace with inflation.

As foreign tourists and property buyers snap up bargains in what has become Asia's biggest "discount store", domestic purchasing power is evaporating.

As Robin Brooks of the Brookings Institution noted in May, measured by the real effective exchange rate (REER), the yen has fallen below even the Turkish lira, largely considered one of the world's weakest currencies. Bank for International Settlements data show the yen's REER has collapsed from a 1995 peak of 193.95 to just 67.73 — a two-thirds wipeout of its value.

On the surface, the primary driver appears to be the yawning 300-basis-point gap between US and Japanese interest rates, which serves to fuel a low-risk carry trade bonanza: borrowing low-interest yen and buying high-interest dollar assets, thereby creating a lasting siphon effect of shorting the yen. But Tokyo's repeated interventions — including a record 11.73 trillion yen ($73.6 billion) spent in just one month to buy the yen in the market and hiking the benchmark rate to its highest level since 1995 — have failed to stem the tide.

Clearly, this is no longer just about interest rate differentials; it is a symptom of deep structural malaise. At the heart of the crisis is a catastrophic policy mix: the financial authorities press the brakes with rate hikes, while Prime Minister Sanae Takaichi slams the accelerator with reckless fiscal abandon. Ignoring a debt-to-GDP ratio of 240 percent, her administration is doubling down on massive stimulus and defense spending. This fiscal profligacy has spooked the bond market, sending the 10-year benchmark government bond yield soaring to a three-decade high of 2.9 percent.

The resulting surge in borrowing costs for the government, corporations, and households is choking off the real economy.

This places Japan's economy squarely in the grip of what economists call an "Impossible Trinity": expansionary fiscal policy demands low rates, low rates crush the currency, a weak currency forces tightening, and tightening strangles the very fiscal expansion it seeks to enable. Takaichi's political gamble is proving to be a ruinous wager on the future of the Japanese economy.

Today, the yen's decline is a microcosm of a mature economy in structural free fall. Investors are shorting the yen, betting on the persistence of Japan's woes: a shrinking population, unsustainable debt, hollowing out of industry, the fading dominance of its once-mighty manufacturing sector, and in particular, the worsening geopolitical environment. The shift from perennial trade surplus to chronic deficit further erodes the currency's intrinsic worth.

While Takaichi clings to her "weak yen is good" dogma, markets understand the truth: a sovereign's exchange rate is the ultimate barometer of national competitiveness. A currency's persistent plunge signifies a collective downgrade of the country's potential — a massive vote of no confidence. How, or even if, Japan rescues its currency will not only determine its own economic fate but also reverberate across the global financial system.

Nancy Snow

Emerging technologies need public trust

Global Lens

The global race for emerging technologies is often described in terms of innovation capacity, computing power, research funding and national competitiveness. Governments and industries speak of artificial intelligence, biotechnology, quantum systems, robotics, and semiconductors as strategic assets that will shape the future balance of economic and geopolitical power. All of that is true. But there is another dimension of technological competition that receives far less attention: the struggle for public trust, social legitimacy and persuasive communication.

Emerging technologies do not exist in laboratories alone. They exist within societies. Their success depends not only on scientific breakthroughs, but also on whether people understand them, trust them and believe they serve human progress.

In the 21st century, technology leadership is also a form of narrative leadership.

Artificial intelligence offers a clear example. Around the world, AI generates competing emotions at the same time: excitement, fear, fascination, anxiety, optimism, and distrust. Some see AI as a path toward scientific advancement and greater productivity. Others fear job displacement, surveillance, misinformation and loss of human control.

Therefore, the challenge before governments, universities, companies and media institutions is not simply technological development. It is explaining the same to the public. Who explains the future matters.

Throughout modern history, societies have embraced transformative technologies because of compelling public narratives. Railroads symbolized national development. Space exploration represented human ambition and scientific possibility. The internet was promoted as a democratizing force capable of connecting humanity across borders. Today's emerging technologies require similar forms of public understanding and social legitimacy.

Yet public conversations about technology are increasingly fragmented. Online ecosystems amplify fear, outrage, conspiracy theories and emotional polarization faster than institutions can respond, just as misinformation often spreads more rapidly than scientific clarification. Public mood itself has become a strategic battleground. I have described this phenomenon elsewhere as "mood trafficking" — the shaping of emotional climates through narratives, images, and information systems. In the digital era, whoever shapes public mood often shapes public perception.

This is especially important because emerging technologies increasingly touch every aspect of human life. Artificial intelligence influences education, labor markets, healthcare, finance, media, and military planning. Biotechnology raises ethical questions surrounding genetics and human identity. Quantum systems may transform cybersecurity and communication infrastructures.

These developments are social transformations. As a result, scientists and engineers alone cannot carry the burden of technological transition. Public communication, education, diplomacy, and cultural understanding must also play central roles.

Universities have an important responsibility here. Institutions of higher learning such as Tsinghua University in China, where I've taught several times, should not only produce technical expertise, but also help societies understand the broader human implications of innovation. This requires dialogue across disciplines, bringing together engineers, social scientists, communication scholars, ethicists, policymakers, and international partners.

Technology policy itself must become more human-centered.

In many countries, governments are now recognizing that technological influence extends beyond economics and security. Innovation also shapes national image, international reputation, and soft power. Countries increasingly compete not only over which technologies they invent, but also over which vision of the future they present to the world.

This is particularly true in Asia, where technological modernization is often linked to broader national narratives of development, stability, education, and long-term planning. Across the region, emerging technologies are becoming symbols of national aspiration and civilizational confidence.

At the same time, all societies face similar questions. How can innovation remain people-centered? How can technological progress strengthen social trust rather than deepening polarization? How can countries encourage innovation while preserving human dignity and public accountability? These questions cannot be answered through engineering alone.

The future of emerging technologies will depend not only on who develops the most advanced systems, but also on who can best communicate their meaning, legitimacy, and human purpose.

Technology is never only about machines. It is also about building and maintaining public trust.

The author, a scholar of public diplomacy and strategic communications, has lectured widely across Asia, including at Tsinghua University's School of Journalism and Communication and Schwarzman College.

GLOBAL VIEWS

MAFA KWANISAI MAFA

Resonant praxis

105-year legacy of CPC offers operational and governance wisdom the Global South can embrace

As the Communist Party of China marks its 105th anniversary, its odyssey furnishes the Global South with profound, actionable governance lessons.

For generations, developing nations across Africa, Latin America and Southeast Asia have adopted Western political and economic templates wholesale, only to remain mired in institutional fragility, systemic graft, erratic policy continuity and entrenched underdevelopment. Set against this stark global reality, China's transformative developmental ascent stands as a time-honed benchmark worthy of in-depth, rigorous scrutiny.

China's landmark achievements speak with unassailable clarity. Since the launch of reform and opening-up in 1978, about 800 million Chinese people have been lifted out of extreme poverty, accounting for over 70 percent of global poverty reduction. China has sustained relentless breakthroughs in infrastructure construction and technological innovation, contributing about 30 percent to global annual economic growth year after year and cementing its stature as an irreplaceable engine for shared global prosperity.

What constitutes the bedrock of the great rejuvenation of the Chinese nation? Analysts across many regions share one answer: the CPC serves as the unshakable anchor of China's national governance. Far beyond delivering steady, long-horizon political leadership, the Party has erected a comprehensive self-renewal framework anchored in the 14 foundational principles of Xi Jinping Thought on Party Building. These principles encompass upholding the Party's unified leadership, enforcing rigorous internal discipline, strengthening ideological cultivation, institutionalizing anti-corruption campaigns, improving cadre capacity building and establishing full-spectrum accountability mechanisms. Most critically, the CPC rejects superficial, temporary rectification drives. Instead, it institutionalizes organizational self-reform of the Party as an enduring, iterative mission.

Five core, adaptable governance tenets carry universal resonance for many Global South countries.

First, proactive institutional self-renewal. Any state apparatus will inevitably stagnate and atrophy should it grow complacent or sever its organic bond with the people it is meant to serve. The CPC's multi-layered internal supervision architecture and targeted rectification mechanisms nip structural flaws in the bud, stopping minor frictions from metastasizing into crippling systemic crises. This timeless logic is equally applicable to national government, academia, public service bodies and civil society organizations across the developing world.

Second, standardized discipline and enforceable accountability. Many emerging economies are hamstrung by fragmented public administration, endemic corruption and disjointed national policy rollouts. Decades of China's on-the-ground governance practice validate an immutable truth: clearly delineated institutional mandates, unified statutory rules and cross-tier oversight exponentially elevate administrative efficiency. Every sovereign nation must forge institutional frameworks rooted in its unique constitutional heritage and indigenous political traditions, yet a universal axiom endures: high-caliber governance demands visionary, competent leadership paired with robust institutional guardrails.

Third, merit-centric civil service development. The recruitment and evaluation of public officials hinge on three pillars: professional proficiency, unwavering public service ethos and unimpeachable personal integrity. Sustained leadership training and upskilling initiatives empower state workforces to navigate intertwined economic and social complexities with poise.

Fourth, multi-generational strategic planning. Short-sighted, election-cycle-bound policies can never catalyze structural national transformation. China's sequential five-year medium-term development blueprints and overarching national visions that transcend successive administrations unlock sustained progress in poverty eradication, industrial upgrading, indigenous technological breakthroughs and cross-continental infrastructure ventures. For African economies striving to break free from crippling commodity dependency, this model of uninterrupted long-range planning holds considerable practical value.

Fifth, people-centered founding mission. Self-reform, strict accountability, merit-based official training, long-term planning and institutionalized governance all serve one central goal: protecting ordinary people's fundamental interests and delivering tangible improvements to daily livelihoods at the grassroots level.

All the remarkable accomplishments of China stem from the CPC's core tenet of seeking happiness for the people and rejuvenation for the nation. Through ever-shifting domestic and international landscapes, every CPC member keeps this mission foremost in mind. The CPC firmly rejects bureaucratic estrangement from the ordinary people and prioritizes people's interests above all else, with this people-centered conviction serving as the spiritual anchor guiding all governance work. Every poverty relief program, infrastructure project and public service upgrade is oriented toward satisfying people's yearning for a better life, demonstrating that people-rooted governance delivers inclusive, sustainable growth unattainable by elite-focused systems.

SONG CHEN / CHINA DAILY

For Global South countries plagued by elite capture and neglected public demands, embedding a people-first mindset into institutional design offers an effective remedy for unequal development.

These principles resonate deeply across Africa. The continent is blessed with abundant untapped mineral and agricultural resources, the globe's youngest demographic cohort and boundless latent economic potential — yet deep-rooted institutional bottlenecks stifle broad-based, equitable advancement. A vital caveat bears emphasis: Drawing insights from China's developmental journey does not equate to blind replication of its entire system. Rather, developing nations may distill adaptable institutional principles while fully honoring their distinct historical trajectories, indigenous governance customs and constitutional order.

China has emerged as a steadfast development partner for Africa, delivering tangible progress via infrastructure, industrial, agricultural, medical and vocational cooperation. Over recent decades, Chinese enterprises have built or upgraded over 10,000 kilometers of railways, nearly 100,000 km of highways, 1,000 bridges, almost 100 ports and 66,000 km of power transmission lines across the continent, alongside thousands of hospitals, schools and training hubs. Zimbabwe's multi-sector cooperation with China covering mining, energy, manufacturing, agriculture and health exemplifies this mutually beneficial partnership, while exchanges enable two-way policy learning between African and Chinese officials, experts and professionals.

Today, the Global South confronts a tangled web of transboundary crises: accelerating climate breakdown, mounting sovereign debt burdens, intensifying technological rivalry, pervasive global food insecurity, mass youth unemployment and shifting geopolitical power equilibriums. Resolving these layered, interconnected challenges requires governments armed with forward-thinking strategic foresight, the capacity to execute policies across political cycles and enduring public trust. The CPC's century-long journey of self-reform and more than seven decades of state governance furnish a well-documented, real-world paradigm for developing countries to craft localized solutions to shared developmental tribulations.

Africa's long-term developmental destiny will ultimately be sculpted by African peoples and indigenous African leadership. Even so, rigorous comparative research into proven successful developmental pathways yields tangible, transformative on-the-ground outcomes. The CPC's 105-year legacy crystallizes an immutable truth: Resilient, high-performance state institutions are forged incrementally through unwavering discipline, sustained capacity cultivation, ironclad accountability, adaptive institutional reform and people-centered conviction. As Global South countries carve out their own sovereign paths to modernization, the CPC's century of self-improvement and decades of governance practice will remain an indispensable touchstone for scholarly inquiry, high-level policy deliberation and thoughtful localized adaptation for generations to come.

QIN XIAO AND WU WENFENG

A road out of middle-income trap

China's all-round advancement paves its way toward high-income status

On July 1, the World Bank updated its global income classifications for fiscal year 2027, setting the high-income threshold at $14,375 based on gross national income per capita, calculated using the Atlas method. With a GNI per capita of $14,230, China remains in the upper-middle-income category, just $145 below the threshold. The question facing China is no longer whether it can reach high-income status, but how — and more importantly, whether — it can avoid the stagnation that has trapped so many economies.

Qin Xiao

Wu Wenfeng

The odds are sobering. Since 1990, only 34 middle-income economies have managed to shift to high-income status. The rest remained trapped in what economists describe as the "middle-income trap" — a stage where economies lose their advantage in low-cost manufacturing but have not yet developed the technological capabilities needed to rival advanced economies. Escaping this trap requires more than capital accumulation; it demands a fundamental transition from imitation to innovation.

The Republic of Korea's economic transformation provides a valuable reference. In 1960, its GNI per capita was roughly $1,200; by 2024, it had soared to $33,000. The World Development Report 2024 summarized the country's success through a "3i strategy": investment, infusion, and, most crucially, innovation. Samsung's evolution — from its early trading business in noodles and groceries in the 1930s to a television manufacturer in the 1970s, and eventually to a leading global manufacturer of consumer electronics and semiconductors — mirrors the country's broader shift from a technology adopter to a frontier innovator. The lesson is clear: technology adoption is a bridge, but indigenous innovation is the destination.

China is now traversing a similar bridge, but with a scale that makes its economic transformation unprecedented.

Three structural advantages give China a solid foundation for breaking through the middle-income barrier.

First, China has built one of the world's largest innovation ecosystems. In 2025, China's research and development expenditure reached 3.93 trillion yuan ($580.67 billion), equivalent to 2.8 percent of its GDP — up from 0.57 percent in 1995. In September 2025, the World Intellectual Property Organization ranked China 10th globally in its Global Innovation Index, first among all upper-middle-income economies. China leads the world in patent filings and hosts 24 of the world's top 100 innovation clusters, with Shenzhen-Hong Kong-Guangzhou topping the global rankings.

These achievements are increasingly reflected in industrial competitiveness. In 2025, it was estimated that China produced nearly 75 percent of the world's electric vehicles. Companies such as CATL and BYD have become major players in the global battery and EV markets. This represents more than low-cost assembly; it reflects high-value engineering capabilities, supply chain integration and continuous technological improvement.

Second, China is converting its demographic dividend into a talent dividend. In 2025, a record 12.22 million students graduated from Chinese universities, including over 5 million with degrees in science, technology, engineering and mathematics. New entrants to the workforce now receive an average of 14 years of education. Roughly half of the world's top AI researchers are now trained in Chinese universities. This large pool of engineers and researchers provides the foundation for companies such as Huawei to continue investing in areas including 5G, AI and chip design despite external pressures. Innovation at the frontier is fundamentally a human-capital game. China is now producing that human capital at a scale no other country can match.

SONG CHEN / CHINA DAILY

Third, China's enormous domestic market provides a unique testing ground for innovation. With a population of 1.4 billion, China can commercialize new technologies faster than other countries. When BYD rolls out a new battery, it has a domestic market larger than the European Union in which to refine it. When ByteDance deploys new AI features, it can reach hundreds of millions of users in weeks. This "scale-to-learn" advantage creates a self-reinforcing cycle: larger user bases generate more data, improved data enhances products and better products attract more users.

However, these advantages alone do not guarantee success. History shows that moving from middle-income to high-income status remains a difficult transition. China faces unique challenges that the ROK, and many other economies before it, never had to confront.

First, unparalleled scale and complexity. With 1.4 billion people, China must navigate a landscape where world-leading innovation clusters such as Shenzhen and Shanghai coexist with inland provinces still moving through later stages of industrialization. Coordinating resources across such vast geographic, economic, and developmental diversity is a governance challenge without precedent.

Second, strong geopolitical headwinds. China's transition toward high-income status is taking place amid profound changes in the global economy. Rising geopolitical tensions, tighter restrictions on advanced semiconductors, AI chips and other cutting-edge technologies, and increasing fragmentation in global supply chains have made technological upgrading more difficult. China is therefore pursuing innovation under external conditions markedly different from those faced by many economies during earlier periods of industrialization.

Third, deep regional disparities. China's east-west gap, urban-rural divide, and uneven distribution of human capital mean that innovation in coastal clusters cannot automatically spread across such a diverse economy. Building an integrated national innovation system requires sustained efforts to narrow these internal divides.

Yet it is precisely because of these constraints that China's innovation achievements carry unique global significance. Having overcome obstacles of scale, geopolitical isolation and internal divergence, China's technological breakthroughs are now generating global public goods. In biotechnology, BGI Genomics has driven down gene sequencing costs by orders of magnitude, making precision medicine accessible across the developing world. In quantum computing, the University of Science and Technology of China has achieved milestones that accelerate global research collaboration. In commercial spaceflight, companies such as i-Space and Galactic Energy are developing reusable rockets that promise to lower satellite launch costs for nations previously priced out of the space economy. These reflect frontier research and deep engineering capabilities at a scale no other nation can match.

What truly distinguishes China is its deliberate choice to share these advances rather than hoard them. At the 2026 World Artificial Intelligence Conference in Shanghai, China reaffirmed its commitment to open-source innovation and announced a series of measures to strengthen AI capacity in developing countries, ensuring the Global South is not left behind in the AI revolution. This was a statement of principle by a responsible major power: technological progress must serve all of humanity, not just a privileged few.

China backed this pledge with concrete action. It committed to training 5,000 AI professionals from developing countries over five years, investing in local capacity rather than extracting talent. It proposed a global AI governance framework emphasizing data sovereignty and ethical standards, offering an inclusive alternative to Western-centric models that often marginalize emerging economies. Platforms such as Baidu's PaddlePaddle and Alibaba's ModelScope are lowering technical barriers by giving developers access to AI frameworks, models and development tools, creating more opportunities for developers in emerging markets to participate in the global AI ecosystem.

By placing inclusive development at the heart of its innovation strategy, China is demonstrating that rising powers can — and should — shoulder global responsibility for shared prosperity.

It demonstrates how demographic mass can be converted into deep pools of human capital, how innovation ecosystems can be nurtured across multiple tiers of cities, and how technological leadership can be wielded as a global public good rather than a zero-sum competitive weapon. As many nations continue their own development journeys, China's transition toward a high-income economy may provide a valuable reference for overcoming structural challenges and pursuing shared prosperity.

Opportunity 2.0 helping stimulate FDI

Foreign-invested firms in country behind 7.39t yuan in H1 two-way trade

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

"China Opportunity 2.0" is emerging as a new driver of the country's efforts to attract investment from around the world as foreign firms deepen their commitment to the Chinese market and expand long-term capital inflows, said business executives.

China Opportunity 2.0 refers to a new phase of China's development characterized by higher-standard opening-up, technological innovation and high-quality growth.

For foreign enterprises, it spans opportunities ranging from rapid infrastructure development to breakthroughs in artificial intelligence and advanced manufacturing, they said.

Noting that China Opportunity 2.0 is reflected in the country's vast market, rapid industrial upgrades, deep talent pool and innovation ecosystem, Chen Pu, chief Asia officer of Syensqo, said the Belgian chemical manufacturer believes that continuous improvements in China's industrial ecosystem — including stronger supply chains, enhanced manufacturing capabilities and faster development across entire value chains — are creating new business opportunities.

In response, Syensqo has expanded its footprint in China with five manufacturing sites and a major research and innovation center in Shanghai, the group's third-largest worldwide.

Stefan Floeck, ABB's division president of IEC Low Voltage Motors, said China will remain central to the Swedish-Swiss tech company's global motor business as the country's industrial upgrading and green transition continue to drive demand for more energy-efficient equipment.

"To capture these opportunities, we will continue investing in local research and development, manufacturing and supply chains to better serve Chinese customers while reinforcing China as an innovation hub and export base within the company's global network," said Floeck.

ABB's low-voltage motor business has invested more than 150 million yuan ($22.12 million) in recent years to upgrade its Shanghai manufacturing base, including R&D testing laboratories and production lines. Its domestic supply chain also supports exports from China to markets worldwide.

Against this backdrop, foreign-invested businesses in China generated 7.39 trillion yuan in imports and exports in the first half, up 17.1 percent year-on-year, marking the ninth consecutive quarter of growth, said the General Administration of Customs.

Pushing back against the so-called "China Shock 2.0" narrative — which portrays China's development as a disruption to the global economy — Zhao Ping, head of the China Council for the Promotion of International Trade's academy, said foreign firms are expanding their presence in China because the country's integrated industrial ecosystem remains difficult for any other economy to replicate.

China further strengthened its efforts to attract foreign investment in June by unveiling a 15-point action plan featuring measures to expand market access, facilitate investment, strengthen promotion and services, and improve foreign capital management to stabilize and upgrade foreign investment.

The plan prioritizes expanding market access in services, finance and pharmaceuticals, among other sectors, while streamlining processes for cross-border mergers and acquisitions, data flows and domestic reinvestment by foreign firms.

That confidence is also reflected in foreign direct investment data. FDI in China's high-tech sector expanded 19.4 percent year-on-year to 130.14 billion yuan in the first five months. The sector accounted for 39.8 percent of the nation's total FDI, up 9.4 percentage points from the same period last year, said the Ministry of Commerce.

During the 14th Five-Year Plan (2021-25) period, foreign-invested companies in China generated 262.7 trillion yuan in operating revenue and 21.4 trillion yuan in profits, with both indicators recording average annual growth of around 5 percent. They employed more than 30 million people on average each year during this period, the ministry added.

Reaching out to children

Employees from Sichuan Poly Property Services visit children in Yangma town in Jianyang, Sichuan province, whose parents have left to work in cities, delivering science-themed books and showing the children they care about them. DONG ZIWEI / FOR CHINA DAILY

Briefly

Intelligent computing capacity grows

China's intelligent computing capacity reached 2,185 EFLOPS by the end of June this year, reflecting the country's rapid expansion of artificial intelligence infrastructure, official data showed. The overall utilization rate of computing facilities nationwide stood at 71.4 percent, according to the Ministry of Industry and Information Technology.

Export of integrated circuits expands

Strong global demand for artificial intelligence has boosted China's integrated circuit exports, with the export value of integrated circuit products denominated in yuan increasing 88.7 percent year-on-year in the first half of the year, official data showed.

Gold preparing to enter digital era

By **HU YUMENG** and **MA JINGNA** in Lanzhou

Gold may soon become as easy to use as money in a digital wallet, as younger investors embrace technology and financial markets reshape one of the world's oldest safe-haven assets.

That is the vision of David Tait, chief executive officer of the World Gold Council, who believes digital innovation will change not only how people invest in gold, but also how the precious metal functions within the global financial system. He made the remarks during an international gold conference held recently in Lanzhou, Gansu province.

Gansu, home to China's second-largest gold reserves, generated about 180 billion yuan ($26.6 billion) in industrial output in its gold sector last year.

The province is seeking to move beyond resource extraction toward higher-value development. "We will leverage this conference as an opportunity to deepen the integration of resource advantages, enterprise strengths and market vitality, and accelerate the high-end, intelligent, green and secure development of the gold industry," Governor Ren Zhenhe said at the opening ceremony.

Beyond advancing the industry's high-quality development, Tait believes the next major transformation will come from the market itself.

"The biggest transformation is not only where gold is mined, but how it is owned, traded and used," he said. "The most important thing will be the ability to use a digital form of gold in everybody's wallet."

He believes digitalization will make gold easier to buy, trade and use as collateral, allowing a broader range of institutional investors, including pension funds, insurers and asset managers, to incorporate gold into diversified portfolios.

To support that transition, the WGC is advancing its Gold247 initiative, which aims to connect the physical gold market with digital financial infrastructure. The initiative includes a global database for responsibly sourced gold and a "gold-as-a-service" platform designed to simplify the launch and adoption of digital gold products.

Tait expects younger investors to become one of the biggest drivers of that transformation.

As wealth is passed from older to younger generations, he said, tech-savvy consumers are increasingly comfortable managing investments through smartphones rather than buying traditional gold bars or jewelry.

"They just click and buy. That's the future," he said.

Although physical bars and coins will remain an important part of the market, trusted digital products backed by physical gold are likely to become increasingly attractive because they are easier to access, trade and integrate into broader investment portfolios.

Tait also believes China is well positioned to play a larger role in shaping the global gold market.

He described the Shanghai Gold Exchange as a model with international relevance and said closer coordination between Shanghai and the Hong Kong Special Administrative Region could strengthen global gold trading and custody services while supporting the internationalization of China's gold market.

That vision was echoed throughout the conference. Industry leaders called for closer cooperation in mineral exploration, technological innovation, green development and financial services, while expanding Belt and Road partnerships to build a more resilient, sustainable and internationally connected gold industry.

As the industry enters the digital era, Tait believes China's growing influence, from market infrastructure to responsible sourcing, will help shape the next phase of global gold development.

Wu Yuexuan contributed to this story.

Compliance in spotlight after EC fine

By **LI JIAYING** in Beijing and **ZHANG ZHOUXIANG** in Brussels

The European Commission's record fine against AliExpress highlights the rising need for compliance for Chinese cross-border e-commerce companies, prompting industry experts to call for stronger product certification, brand protection and localized operations in Europe.

Their comments came as Alibaba-owned cross-border e-commerce platform AliExpress said on Monday that it disagreed with the EC's decision to impose a record 550 million euros ($628.1 million) fine after the regulator accused it of failing to adequately address the sale of illegal, unsafe and counterfeit products.

"We disagree with the decision and the disproportionate fine," AliExpress said, adding that the penalty did not fully reflect its established compliance framework or the significant improvements it had proactively introduced.

The company said it was carefully reviewing the decision and considering all available options.

The move is in response to the EC's earlier financial penalty, saying that AliExpress had breached its obligations under the Digital Services Act, or DSA, by failing to properly assess the risks linked to illegal, unsafe and counterfeit products on its platform and take effective measures to reduce their spread.

Against this backdrop, Jiang Han, a senior researcher at market consultancy Pangoal, said Chinese merchants selling overseas should immediately rebuild their product compliance systems and treat compliance as a minimum requirement for remaining in the market.

Specifically, merchants should review key qualifications, including CE certification and energy-efficiency labels, ensure testing reports are issued by certified institutions and maintain complete, traceable brand-authorization records to prevent infringement risks, Jiang said.

"Under intense regulatory pressure, compliance is no longer an advantage; it is the only ticket to the European market," he said.

The analyst added that sellers should also accelerate localization and brand building while reshaping their cost and profit models as responsive moves.

"Over the longer term, sellers must move away from price-based competition, raise product value and brand premiums to absorb compliance costs, and shift from merely entering overseas markets to establishing a lasting local presence," Jiang said.

The penalty is the largest imposed since the DSA took full effect and marks the EC's third known fine under the law. The regulator previously fined social media platform X 120 million euros and Chinese cross-border e-commerce platform Temu 200 million euros.

In an exclusive statement to China Daily, the China Chamber of Commerce to the EU said it took note of the European Commission's decision concerning AliExpress under the Digital Services Act.

"We respect the EU's right to regulate its digital market, but we are concerned that enforcement measures should be conducted in a fair, transparent, and proportionate manner, with full consideration given to companies' compliance efforts and legitimate rights.

"CCCEU hopes the European Commission will ensure that DSA enforcement provides legal certainty and a predictable business environment for all market participants, including Chinese companies operating in Europe."

Jian Junbo, deputy director of the Center for China-Europe Relations at Fudan University's Institute of International Studies, said the case highlights the European Union's increasingly stringent approach to digital regulation.

The bloc has made the DSA an important regulatory tool for major digital platforms, Jian said, adding that the fine represents not only a financial penalty, but also a signal that compliance costs in the European market are likely to continue rising. At the same time, Jian questioned whether such intensive regulation ultimately benefits innovation. While strict enforcement may improve oversight, he said it could also increase compliance burdens for both foreign and European technology companies, potentially affecting their long-term growth and capacity to innovate.

AliExpress has been ordered to submit a corrective action plan by Oct 20. The EC will assess the proposed measures after receiving the plan, while continued non-compliance could expose the platform to further penalties.

Shanghai banks on emerging sectors

By **SHI JING** in Shanghai
shijing@chinadaily.com.cn

Shanghai's forward-looking development in emerging technologies and industrial resilience built up over time have helped the city achieve strong economic growth in the first half, which is especially notable amid rising market complexities and a changing global landscape, said experts.

Shanghai's GDP hit 2.79 trillion yuan ($412 billion) in the first half, up 5.6 percent year-on-year at constant prices, said the municipal statistics bureau on Monday.

This growth rate is not only higher than the national average, but also exceeds the municipality's annual GDP growth in 2024 and 2025, which came at 5 percent and 5.4 percent, respectively.

Zeng Gang, chief expert and director of the Shanghai Institution for Finance & Development, described Shanghai's first-half economic performance as "rock-solid" both in terms of quality and efficiency. It was not just one sector driving the numbers, but rather the combined result of industrial upgrading, investment growth and a surge in foreign trade, Zeng said.

Shanghai is well-positioned to achieve its full-year growth target amid the ongoing optimization of its economic structure and the accelerated transformation from old to new growth engines, he added.

Shanghai's higher level of opening-up, its success in getting foreign firms to set up regional headquarters, alongside its rich innovation resources and precise economic stimulus packages have been translated into the city's higher innovation efficiency and stronger economic resilience, said Zhan Yubo, deputy director for the Institute of Economics at Shanghai Academy of Social Sciences.

While the added value of primary and secondary industry sectors rose by 0.9 percent and 4.7 percent, respectively, the tertiary sector surged 5.9 percent from a year earlier, further consolidating its role as a major economic driver for Shanghai.

Robust growth of the modern services sector encompassing finance, information transmission, software, information technology, leasing and business services carried the tertiary sector's added value to over 2.2 trillion yuan. Under closer scrutiny, the information transmission, software and information technology services sector spiked 9.1 percent year-on-year, mainly driven by the strong growth in sub-sectors such as artificial intelligence, integrated circuit design and platform enterprises.

The World AI Conference held in Shanghai from Friday to Monday served as solid proof, with the exhibition area reaching a record high of over 100,000 square meters.

In 2025, the industrial value of AI enterprises with a minimum annual sales revenue of 20 million yuan each totaled 600 billion yuan, representing a year-on-year spike of 39.5 percent.

AI has been defined as one of the three pioneering industries in Shanghai, along with integrated circuits and biomedicine. The output value of the three industries grew by 14.5 percent year-on-year in the first six months, with IC and AI manufacturing each reporting an annual growth rate of 20 percent.

The output value of strategic emerging industries grew 7.7 percent year-on-year in the first half. Among these, output value for new energy vehicles spiked by 33.9 percent, new energy by 20.6 percent and high-end equipment by 9.3 percent. Demand for products like satellites, rockets, high-end ships and domestically produced large aircraft remained strong, said the municipal statistics bureau.

All these results can be largely attributed to Shanghai's forward-looking strategies for new quality productive forces. Full-chain breakthroughs in IC and development of large AI models have all sped up in the city, said Ma Haiqian, vice-president of the Shanghai Academy of Development and Reform.

Q&A WITH CEO

Editor's note: *After the release of China's first-half economic data, China Daily invited chief executives and senior leaders from key multinational companies to share their perspectives on the world's second-largest economy. Their insights go beyond short-term growth, offering a closer look at the evolving "China Opportunity 2.0" narrative amid ongoing debate over the so-called "China Shock 2.0".*

China's dynamic expansion opportunities

Kilian Aviles
Executive vice-president of Dekra Group and head of Asia-Pacific region

Andre Musto
Managing director and general manager of Merck Healthcare China

Willie Tan
CEO of Skechers China, South Korea and Southeast Asia

Joe Bao
President of Kone China

Q1 Many multinational companies in recent years continue to expand their investment and operations in China, suggesting that "China Opportunity 2.0" is increasingly offsetting the "China Shock 2.0" narrative. What developments or evidence best demonstrate that China is creating new opportunities for global businesses rather than posing a "shock"?

AVILES: From Dekra's decades-long on-the-ground presence and continuous investment expansion in China, the so-called "China Shock 2.0" narrative is fundamentally misplaced and decoupled from market realities. What we are witnessing is a fully mature, upgraded "China Opportunity 2.0" that delivers structural, long-term value for global enterprises, far outweighing perceived market risks. The most compelling evidence lies in the industry upgrading and high-value industrial ecosystem iteration taking place across the country. China has evolved into a global hub for high-end manufacturing, new energy, intelligent connected vehicles, digital economy and green low-carbon industries. This industrial upgrade has created entirely new service and cooperation tracks for multinational companies.

MUSTO: For Merck, we view China as an innovation powerhouse, not just a market. The evidence for "China Opportunity 2.0" is compelling. An aging population, a rising burden of chronic diseases, and the government's continued investment in and commitment to healthcare are creating real, long-term demand. What gives us particular confidence is the country's growing role in co-developing global innovation, all pointing to a maturing ecosystem that rewards serious, long-term partners. At Merck, we are proud to be exactly that kind of partner. Our dual-engine strategy combines our internal R&D with external innovation partnerships. Our aim is clear: to deliver more medicines to more patients, faster.

TAN: From Skechers' on-the-ground experience in China, we can clearly feel the tangible new market opportunities brought by China's development. Our brand has rooted itself in the Chinese mainland market for nearly two decades, always following the development philosophy of "In China, For China, With China". We keep increasing long-term fixed-asset investment in the country as a concrete response to China's development dividends. We have invested over 4.2 billion yuan ($621 million) to build our exclusive China logistics center in Taicang, Jiangsu province, expanded local R&D and livestreaming operation bases in Dongguan, Guangdong province, and realized localized production for more than 90 percent of products sold in China. Consumption upgrading focused on health and fitness brought by China's domestic demand expansion has created stable growth space for our comfort-oriented sportswear products. All these practical layouts and operational gains prove the real, long-term value of "China Opportunity 2.0" for Skechers.

BAO: From Kone's perspective, one of the clearest signs is that China is not only a major market, but a critical part of Kone's global manufacturing and innovation network. We operate our largest manufacturing facility in China, together with our largest R&D center outside Finland. Today, China is not only serving its domestic market, but also acting as a key export base, with products shipped to more than 100 countries and regions around the world. Equally important, our supply chain is highly localized and deeply integrated into the Chinese ecosystem, with 99 percent of components sourced locally. This enables us to combine global quality standards with local speed, flexibility and resilience. For a multinational company, that reflects a business environment with real industrial depth and operating efficiency.

Q2 China's economy has demonstrated strong resilience so far this year, supported by resilient exports, solid industrial production and continued strength in high-tech manufacturing. How would you assess China's overall economic performance so far this year? Looking ahead, what do you see as the key drivers supporting China's growth in the second half?

AVILES: Overall, China's economic performance this year has been remarkably resilient, structurally optimized and quality-focused, showing strong anti-risk capability and endogenous growth momentum amid global economic volatility and sluggish external demand. The steady growth of industrial production, robust export performance and outstanding high-tech manufacturing development are not short-term sporadic gains, but concrete results of sustained industrial transformation and policy support. From Dekra's frontline operational view, consistent rising demand for testing and certification services for electric vehicles, energy storage and smart equipment clearly mirrors the vitality of China's emerging industries.

MUSTO: From where we stand as a science and technology company with deep roots in China, the resilience of China's economy this year has been both notable and — frankly — not surprising to those of us who have been here for the long term. China is our second-largest country market worldwide, and we have been here for more than 90 years. The fundamentals driving our confidence in the second half are clear: strong unmet patient need, a policy environment that increasingly rewards innovation, and a local ecosystem that is maturing fast in science, speed, and execution. What excites us most is that China is no longer just a major healthcare market — it is becoming a global innovation engine. China now represents around 30 percent of the global innovative drug research and development pipeline. This is a country that is shaping the future of healthcare, not just consuming it, and Merck intends to grow with it.

TAN: Amid a complex and volatile global environment, China's economy this year has demonstrated strong structural resilience overall. Three core growth drivers will continue to support the economic upturn in the second half. First, the full release of domestic demand potential: policies to expand domestic demand are continuing to boost consumer confidence, and growing health awareness is driving sports consumption — the professional sports segment is also a key area of our focus. Second, new quality productive forces represented by artificial intelligence and digitalization: industrial digitalization, smart supply chains and big-data operations are enhancing overall efficiency. Skechers is fully deploying AI-powered digital systems for refined customer operations. Third, high-standard opening-up: policies that optimize the foreign investment environment continue to attract multinationals to deepen their localization efforts.

BAO: From our perspective, China's economy has continued to show resilience, especially in areas supported by industrial capability, localized supply chains and long-term urban development needs. For companies operating in the real economy, this resilience is reflected not only in macro indicators, but also in the market's ability to sustain production, respond to evolving demand and support efficient delivery. Looking ahead, we see modernization as one of the greatest growth opportunities in China. The country has the world's largest installed base of elevators and escalators, and a growing number of these units is now reaching the stage where modernization is needed. This is creating strong long-term demand for safer, smarter and more energy-efficient solutions.

Q3 China's innovation ecosystem has become an increasingly important engine of growth. How do you assess the contribution of artificial intelligence and other frontier technologies to China's productivity growth, industrial upgrading and long-term economic resilience? More broadly, what significance does China's innovation have for global technological progress and the opportunities available to foreign companies?

AVILES: China's innovation ecosystem, led by AI, digital technology and green frontier technologies, has become the core engine of its long-term economic resilience and industrial upgrading, bringing profound and positive changes to productivity improvement and global technological progress. Domestically, frontier technologies are reshaping China's industrial development logic. AI and digital technologies are empowering traditional manufacturing with intelligent transformation, significantly improving production efficiency, product quality and industrial matching accuracy. In high-end manufacturing, new energy and intelligent transportation fields, technological iteration and scenario verification in China's super-large market have accelerated industrial maturity, promoted the upgrading of industrial standards, and greatly enhanced the overall competitiveness of China's industrial chain.

MUSTO: AI and frontier technologies are reshaping how we accelerate innovation — from drug discovery through clinical development to patient services. China possesses a unique strategic advantage: it combines innovation capability with remarkable speed in real-world execution. China's healthcare industry is advancing at a remarkable pace. China speed is not just a phrase — it is a reminder fueling global innovation through the momentum of China's development. The creativity and talent we see here, together with the continued evolution of the regulatory environment, are inspiring. We believe in the potential of China's innovation ecosystem, and we want to be active participants in it. That means co-developing, co-innovating, and building real partnerships with the companies that are defining the future of medicine in China and globally.

TAN: AI and other frontier digital technologies serve as a core pillar for China's industrial upgrading and long-term economic resilience, driving marked efficiency improvements across the entire manufacturing, retail and logistics value chains. For multinational companies, China's mature AI deployment ecosystems, massive consumer data pools and well-developed supportive industrial chains present a unique testing ground for overseas brands to refine their global digital operating models. Skechers is steadily advancing its digital transformation. At this stage, AI is primarily deployed for the production of graphic and short-video marketing materials as well as routine document processing, substantially shortening content delivery lead times. Intelligent upgrades for supply chain management and consumer operations remain an ongoing area of exploration.

BAO: We see the contribution of AI and frontier technologies most clearly in their practical application. A good example is the new Huanggang Port project — a landmark cross-border transport hub in Shenzhen, Guangdong province. Building on our long-term strategy in the Guangdong-Hong Kong-Macao Greater Bay Area, Kone is one of the few companies capable of delivering fully integrated people flow solutions while meeting the distinct regulatory and industry standards of both the Chinese mainland and Hong Kong. For this project, Kone supplied all 184 elevators and escalators, supported by AI-enabled connected services that continuously monitor equipment health and enable predictive maintenance.

Q4 China has placed greater emphasis on expanding domestic demand while pursuing high-standard opening-up. How do you assess these efforts? What new opportunities do they create for multinational companies and global investors?

AVILES: China's drive of expanding domestic demand and advancing high-standard opening-up is highly strategic, targeted and far-sighted. It not only optimizes China's own economic growth structure, but also creates a more open and transparent market environment for global businesses, bringing unprecedented incremental opportunities for multinational investors. The expansion of domestic demand is shifting China's market growth from export-driven to being driven by both domestic and external demand, generating massive high-end market demand. The upgrading of household consumption and the iterative upgrading of industrial investment demand have spawned huge market needs in high-end manufacturing, green environmental protection, digital services, product testing and certification, and intelligent solutions. This allows multinational companies, including Dekra, to deeply participate in the whole industrial chain of local market development, enjoying the dividends of China's consumption upgrade and industrial upgrade.

MUSTO: These efforts reflect China's strategic focus on long-term, sustainable development. High-standard opening-up establishes clear rules, transparent market access and predictable regulatory pathways. Expanding domestic demand is equally critical. China's aging population and rising healthcare spending power mean more patients seeking innovation. That demand is real and growing fast. For multinational companies like Merck, this environment is compelling. We see a market that genuinely welcomes high-quality innovation and is willing to build the infrastructure to support it.

TAN: China's move to expand domestic demand and pursue high-standard opening-up is creating structural opportunities for multinational corporations. The expansion of domestic demand is unlocking the vast potential of the super-sized market, with various consumption-boosting policies raising consumer willingness to spend. Rising demand for health and fitness activities has enabled us to reach more Chinese households with our comfort technology products, offering significant room for brand growth. At the same time, the country's commitment to high-standard opening-up is delivering a fairer, more transparent and predictable business environment, reducing operational uncertainties for foreign companies. For global investors, China offers a unique combination of market scale, innovation capabilities and supply chain integration. We have directly felt the benefits: our direct retail operations continue to grow, and our local partnerships have deepened, reinforcing our confidence in long-term investment.

BAO: From our perspective, these efforts are creating opportunities by expanding demand while also raising expectations for quality, efficiency and service. In our industry, this is especially visible in modernization. As a growing number of China's installed elevators reach the stage where renewal is needed, the opportunity is no longer just about replacing equipment, it is about how to do so with minimal disruption while improving safety, energy efficiency and user experience. As we have said before, the real challenge is not simply replacing equipment. Cities never stop operating, and buildings cannot afford prolonged disruptions. Modernization needs to happen while everyday life continues. That is why execution and delivery models matter as much as technology itself.

Q5 Looking ahead to the second half of the year, what will you be watching most closely as indicators of China's economic resilience, reform progress and long-term growth potential?

AVILES: To evaluate China's economic resilience, reform execution and long-term growth potential in the second half, I will track five core structural indicators closely tied to industrial development trends. First, growth momentum of strategic emerging industries such as new energy storage and intelligent connected vehicles, which shapes China's core industrial competitiveness. Second, implementation progress of high-standard opening-up policies, covering services sector liberalization and cross-border standard mutual recognition, which reflects China's commitment to global collaboration. Third, structural recovery of high-end manufacturing investment and service consumption, the fundamental endogenous growth driver. Fourth, progress in integrating Chinese industry standards with international frameworks. Fifth, tangible results of nationwide digital and carbon-neutral transformation.

MUSTO: Looking at the second half, I'm optimistic about what I'm seeing in China's healthcare transformation. First, the speed of innovation reaching patients continues to accelerate. We're witnessing regulatory frameworks and market dynamics that are enabling faster access. Second, China is building more sophisticated reimbursement frameworks that balance patient access with system sustainability. That's exactly the kind of thoughtful policymaking that supports long-term innovation. Third, China's openness to global partnerships and investment is creating a collaborative ecosystem. The infrastructure for clinical trials, talent attraction and cross-border innovation is maturing rapidly. For Merck, this clarity and progress reinforce our conviction. We're deepening our long-term commitment to China and we want to be active participants in China's healthcare ecosystem.

TAN: In the second half, I will track core indicators across two dimensions to assess economic resilience — reform implementation and long-term growth potential. First, consumption recovery indicators that reflect the resilience of the market foundation: I will monitor foot traffic in national commercial districts and outlet malls, the penetration rate of instant retail nationwide, consumer confidence indices, and sales growth in professional sports and youth-related categories. Only when these segments show steady recovery can we confirm that the domestic demand engine is effectively offsetting external risks. Second, the progress of policy reforms related to opening-up and digital upgrading. This includes the effectiveness of foreign investment support policies, supportive measures for multinational R&D centers, and the pace of industrial digital infrastructure construction.

BAO: One of the things we will watch closely is whether rising demand can continue to be matched by responsive and efficient execution. As China's urban renewal continues to accelerate, consumer needs are becoming increasingly tailored and time-sensitive. In that context, resilience is reflected not only in demand itself, but also in how quickly companies can respond and deliver. That is why supply chain responsiveness is an important indicator for us. Last year, we established a smart logistics and assembly center in Shenzhen to better serve the markets in the Guangdong-Hong Kong-Macao Greater Bay Area. We are already seeing clear improvements in delivery efficiency. We will also continue to watch whether policy support for urban renewal and equipment renewal translates into concrete project execution.

CHINA

The Party's journey

A visitor explores an exhibition titled *The People and the Monument: Classic Fine Art Works in the National Museum of China Collection* in Beijing on Monday. Open to the public since July 14, the exhibition features 20 revolutionary-themed paintings and 33 sculptures, vividly portraying the enduring bond between the Communist Party of China and the people, and showcasing the Party's journey through revolution and nation-building toward a new era.

DENG WEI / FOR CHINA DAILY

China to strengthen integrated transport network by 2030

Infrastructure upgrade and expansion to also accelerate logistics development

By LUO WANGSHU
luowangshu@chinadaily.com.cn

China plans to put 95 percent of the planned backbone of its national integrated transport network in place by 2030, up from 91 percent at present, as it shifts its focus from rapid network expansion toward better connectivity, efficiency and resilience, officials said at a news conference in Beijing on Tuesday.

During the 15th Five-Year Plan period (2026-30), the country will continue improving railway, highway, waterway, civil aviation, postal and express delivery infrastructure while accelerating the development of a more integrated logistics network.

"Building major cross-regional and cross-river corridors is no longer simply about spreading out projects or expanding construction," Vice-Minister of Transport Xu Chengguang said. "It is about optimizing the spatial layout, opening up the arteries of economic circulation and promoting more balanced regional development."

By 2030, China plans to carry out infrastructure renewal and digital transformation across about 80,000 kilometers of its transport network, build or renovate 500,000 km of rural roads and improve intermodal connections at around 1,000 major freight hubs and terminals to make cargo transfers among railways, highways, waterways and airports more efficient.

Major corridor projects will include coastal high-speed railways, upgraded highways along the land borders and coastline, transport links along the Yangtze River and new cross-river, cross-sea and cross-bay connections. Xu said the coastal railway and major border and coastal highways will form a "golden outer ring" linking border regions and the coastline, supporting tourism, regional development and goods transportation.

China will also strengthen the resilience of international supply chains by expanding global shipping routes, improving air cargo links with major overseas hubs and enhancing key logistics facilities, including overseas ports, to provide businesses with more transport options and reduce reliance on any single route or hub.

The railway sector will increasingly shift its focus from expanding the network to improving quality, capacity and integration.

"China has built the world's largest high-speed railway network and an advanced conventional railway network," said Wang Qiming, deputy head of the National Railway Administration.

Over the next five years, railway authorities will continue major construction projects while filling network gaps, easing capacity bottlenecks and improving connections between regions, cities and different modes of transport. Safety, digital technologies, low-carbon operations and more efficient freight services will also be priorities.

Civil aviation authorities said international air cargo will be a key focus during the next five years as demand grows from cross-border e-commerce, advanced manufacturing and other time-sensitive industries.

Han Jun, deputy head of the Civil Aviation Administration of China, said the country will build an air cargo system that is "better connected, diversified, resilient, safe and reliable".

China plans to expand freight links with established and emerging markets, improve coordination between dedicated cargo aircraft and belly cargo capacity on passenger flights and strengthen cargo services at major aviation hubs in Beijing, Shanghai, Guangzhou, Shenzhen and Chengdu.

Airport cargo terminals, aircraft stands and road and rail links will be upgraded to speed up transfers, while electronic waybills, digital logistics platforms and smoother multimodal transport will be promoted. China's air cargo and mail volume exceeded 10 million metric tons for the first time in 2025, including 4.4 million tons on international routes.

The postal and express delivery sector will strengthen a nationwide network of major sorting, warehousing and distribution hubs and improve connections with airports, railway freight terminals and logistics centers.

"Express delivery has become the lifeblood of urban circulation," said Chen Kai, deputy head of the State Post Bureau. By 2030, the sector aims to expand rural delivery coverage, improve international parcel services and digitally upgrade sorting centers, warehouses and cold-chain facilities to better support manufacturing, agriculture, retail and cross-border trade.

Xu said China invested 18.8 trillion yuan ($2.78 trillion) in transport fixed assets during the 14th Five-Year Plan (2021-25), the largest investment and fastest network expansion in any five-year period since the founding of the People's Republic of China in 1949. The country's comprehensive transport network now exceeds 6 million km, providing the foundation for a new stage focused on improving connectivity, efficiency and resilience rather than expansion alone.

Dog-cloning innovation cheaper, more efficient

By CHEN MEILING
chenmeiling@chinadaily.com.cn

The somatic cell-cloned dog and cat. PROVIDED TO CHINA DAILY

A research team in Shaanxi province has developed a new dog-cloning method that addresses a key technical bottleneck facing similar research worldwide, paving the way for a canine cloning system with greater stability, lower costs and improved compliance with animal welfare standards.

About one month after successfully cloning a male dog and a male cat, Wang Yongsheng, a professor at the College of Veterinary Medicine of Northwest A&F University in Yangling, Shaanxi province, said both animals are healthy and have been vaccinated. They are the first somatic cell-cloned cat and dog born in Northwest China.

Wang, who leads the project, said only China, South Korea and the United States have mastered mature dog-cloning technology, but the procedure remains difficult because of a high failure rate.

A major challenge is obtaining sufficient high-quality canine oocytes. Unlike many other animals, female dogs ovulate immature oocytes that must remain in the oviduct for two to three days before maturing. As a result, reliably obtaining mature oocytes suitable for somatic cell nuclear transfer has long limited cloning efficiency.

Conventional methods also rely on dedicated oocyte donor dogs or on collecting oocytes at specific stages of the reproductive cycle, resulting in low success rates, high costs and concerns over animal welfare.

To overcome these problems, Wang's team collects ovarian tissue discarded after routine sterilization surgeries at pet hospitals. Oocytes are isolated from the tissue and cultured in vitro for two to three days until they mature. Their nuclei are then removed and replaced with the nucleus of a somatic cell taken from the dog to be cloned. After an electric pulse fuses and activates the reconstructed embryo, it is transferred into the uterus of a surrogate dog. The entire cloning process takes at least three to four months.

"Ovarian tissues removed during pet sterilization surgeries are normally disposed of as medical waste, but they still contain abundant follicles and oocytes at different developmental stages," Wang said.

"Through standardized collection, transportation, follicle isolation and in vitro maturation, we can transform these discarded tissues into valuable biological resources for scientific research and technological development."

The team is able to collect dozens of ovaries every day, providing a stable source of research materials.

The new approach is expected to reduce the number of dedicated oocyte donor animals by more than 80 percent, lowering research costs while improving the ethical sustainability and public acceptance of cloning, Wang said.

The researchers also developed a new in vitro maturation system that mimics the environment of the canine oviduct. Compared with conventional methods, the maturation rate of canine oocytes increased by 5 to 10 percentage points, the cleavage rate of cloned embryos rose by about 5 percentage points, and blastocyst formation improved steadily. Overall, the production efficiency of early-stage cloned embryos increased by 10 percent to 15 percent.

The team also adopted a minimally invasive embryo-transfer technique, reducing the surgical incision by half to minimize trauma to surrogate dogs.

According to Wang, the technology can produce laboratory dogs and cats with highly consistent genetic backgrounds, reducing experimental variation caused by individual differences. Such animals are valuable for studying neurological diseases, tumors, cardiovascular disorders and inherited metabolic diseases, as well as for evaluating the safety of new pharmaceuticals.

The technology may also meet demand from pet owners wishing to clone deceased companion animals. However, Wang emphasized that cloning does not bring a pet back to life.

"A clone is a new life," he said. Although a cloned animal shares more than 95 percent physical similarity with the original, differences in coat color, markings, health, personality and behavior can still develop because of environmental influences, much like identical twins.

The cloning system was jointly developed by Northwest A&F University, the Laboratory Animal Center of Xi'an Jiaotong University and Yuanchu (Xi'an) Biotechnology.

Young delegates call for stronger Sino-US relations

By LI HONGYANG
lihongyang@chinadaily.com.cn

Young delegates from China and the United States called for building sincere friendships and deepening mutual learning among civilizations as a foundation for stronger bilateral ties at a youth forum held at Peking University last week.

The "Zhi-Xing China: US-China Youth Dialogue" brought together more than 100 students from institutions including Columbia University, Brown University, Peking University and Beijing Normal University.

Centered on mutual learning among civilizations, science and technology cooperation and sustainable development, the forum aimed to foster greater understanding and collaboration between young people from the two countries.

Zhao Huchen, a Chinese student at Peking University, said: "We understand clearly that the hope of US-China relations lies in the people, and its future rests with the youth.

"In the face of a rapidly evolving transformation unseen in a century and an era where the destinies of humanity are deeply intertwined, we engaged in candid dialogue and met each other halfway. In the name of youth, we call upon the young people of both countries to bravely shoulder the historical mission and join hands to create a better future," he said.

Livia Maria Ilasz, a US student from the University of Rochester, said: "We advocate respect for the diversity of global civilizations and the building of shared values while seeking consensus and preserving differences. We urge deeper people-to-people exchanges between young Chinese and Americans, enabling youth from both sides to understand each other through dialogue and to eliminate prejudice through interaction."

Cian Hanrahan, a US student studying at Peking University, said: "Today, we have been reminded that mutual understanding is not a distant ideal. It happens in the conversations we share with friends from different backgrounds and the words we learn in another language, and in the traditions we take the time to understand."

Yu Yang, deputy secretary-general of the China Education Association for International Exchange, told the forum that over the past two years, more than 32,000 young Americans have visited China under the Young Envoys Scholarship program, which is mainly coordinated by the association.

Their visits have taken them to nearly 200 Chinese cities and involved more than 1,000 Chinese schools and institutions.

"In the current international situation, deepening youth exchanges and mutual understanding between China and the US is of great significance," Yu said.

Fang Fang, vice-president of Peking University, described youth exchanges as "the most dynamic and promising component of US-China relations".

"Peking University will continue to build bridges, provide academic and resource support, and help young people from both countries become inheritors of US-China friendship, pioneers of practical cooperation, and participants in global governance," he said.

Written admissions

Calligraphers craft handwritten admissions letters at Shaanxi Normal University in Xi'an, Shaanxi province, on Tuesday. The university has upheld the tradition of handwritten admission letters for 20 years since 2007. This year, 10 senior calligraphy masters, averaging over 72 years old, participated, with the oldest being 84 and four having contributed for more than a decade. QIAN GUANG / FOR CHINA DAILY

All 11 suspects caught in Nanjing's $4m gold heist

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Police have arrested all 11 suspects and recovered the entire cache of 27 kilograms of gold stolen from a luxury goods store in Nanjing, Jiangsu province, in what authorities described as China's largest gold theft by value.

The 37 stolen gold items were worth more than 27 million yuan ($4 million), Nanjing police said.

The theft occurred in the early hours of May 16 at a store in Jiangning district. Investigators found climbing marks near a second-floor window, although the store's doors remained locked and the keys to the display counters appeared undisturbed.

Police said a suspect surnamed Tong entered the store through the window at about 1 am and went directly to the gold counter. He filled a backpack with gold bars and other items but left nearby watches and other luxury goods untouched.

Investigators later found that several people had repeatedly visited the store to inspect the premises in the month before the theft. They identified another suspect, surnamed Wang, as the alleged organizer.

According to police, Wang had studied the store's layout and surveillance system in advance. On the night of the theft, he allegedly disabled nearly 80 surveillance camera feeds and erased stored footage before flying to Bangkok, Thailand, later that day.

After the theft, Tong left part of the stolen gold in a vehicle arranged by Wang before fleeing south in a ride-hailing vehicle.

Police examined 2,273 vehicles before determining that Tong had boarded a car near a ring expressway at about 5 am on May 16, said Han Ting, head of the criminal investigation brigade of the Jiangning branch of the Nanjing public security bureau.

Tong repeatedly changed his destination during the journey and arrived in Nanning, Guangxi Zhuang autonomous region, at about 9 pm on May 17, Han said.

The driver later told police that Tong appeared nervous and barely slept during the more than 2,000-kilometer journey. Unable to pay the fare of more than 7,000 yuan in cash, Tong broke off part of a gold piece and gave it to the driver as payment.

Investigators determined that Tong was heading for Ningming county in Chongzuo, near the China-Vietnam border, in an attempt to leave the country illegally. Nanjing police immediately requested assistance from border authorities in Guangxi.

At about 5:40 am on May 18, officers from the Aidian border police station intercepted a white sedan near a freight yard. Tong was found in the back seat, and police recovered 8.75 kg of gold from him and his backpack.

Meanwhile, Nanjing police activated an international law enforcement cooperation mechanism to pursue Wang. Thai police arrested him in Bangkok on May 23, and he was extradited to Nanjing on May 29. Police recovered another 13.2 kg of gold from his residence.

"The criminal group was highly organized, with clear divisions of responsibility and extensive planning," said Li Dahai, executive deputy director of the Nanjing public security bureau.

Li said investigators worked around the clock for more than half a month. The task force pursued suspects across eight provincial-level regions and conducted cross-border operations through the Lancang-Mekong cooperation mechanism. All 11 suspects were arrested and all of the stolen gold was recovered.

The Nanjing public security bureau recently sent a letter of appreciation to the Chongzuo border management detachment, saying Tong's interception played a crucial role in solving the case.

Initiative tasks nation's rural counties with improving infrastructure, expanding green development

Left: Visitors tour Hongshuikou village in Beijing's Mentougou district in June. HOU JIQING/ XINHUA **Right:** A clear river wraps around rural residences in Hecun village of Rongshui, Guangxi Zhuang autonomous region, on July 15. LONG LINZHI / FOR CHINA DAILY

Report reveals blooms of beautiful countryside

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

China has made a solid start in its county-level campaign to build a beautiful countryside, with rural environments improving and green agricultural development advancing steadily, according to a think tank report published on Monday.

The report, titled Progress and Achievements in Building Beautiful Countryside in China, was compiled by the Research Center for Xi Jinping Thought on Ecological Civilization, China Daily and China Environment News.

It said that after the Ministry of Ecology and Environment and eight other national government bodies released an implementation plan for promoting the beautiful countryside initiative in early 2025, China has stepped up coordinated efforts to improve rural living environments, promote low-carbon agriculture and strengthen long-term governance mechanisms.

The plan set out four major tasks and 18 measures, with the goal of raising the proportion of counties that have realized the beautiful countryside initiative to 40 percent by 2027 and essentially accomplishing the program by 2035, the report said.

In order to meet the requirements of the initiative, counties must have good public infrastructure such as roads, public lighting and green spaces, sewage and wastewater treatment facilities, and age-friendly renovations.

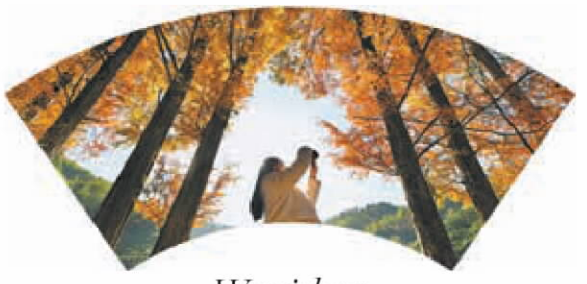
By 2025, the national rural domestic sewage treatment rate had reached 55 percent, more than double the level at the end of the 13th Five-Year Plan (2016-20) period, it said. More than 5,000 large black and odorous rural water bodies on people's doorstep had been basically eliminated, with the treatment rate exceeding 98 percent.

The report said the campaign had benefited some 9.72 million people across 30 provincial-level regions, 860 counties and more than 4,100 administrative villages. It also noted that remediated water bodies were checked through unannounced inspections, remote sensing and water quality monitoring.

Rural waste collection and disposal systems have also been improved. The report said the proportion of administrative villages covered by systems in which villages collect waste, townships transfer it and counties process it has remained above 90 percent.

Visitors are surrounded by blossoming pear flowers at an orchard in Jinzhou, Hebei province, in April. LIANG ZIDONG / XINHUA

Green agricultural development has gained momentum, it said. The comprehensive utilization rate of livestock and poultry manure reached 80.1 percent in 2025, while the comprehensive utilization rate of crop straw stayed above 88 percent. The disposal rate of agricultural film exceeded 85 percent, helping curb plastic pollution in key farming areas.



The report also highlighted progress in soil and water conservation. In 2025, China treated 11,500 square kilometers of soil erosion, restored 4,666 erosion gullies in the fertile black soil region of Northeast China and built 634 ecologically clean small watersheds. The national soil and water conservation rate reached 73.09 percent.

County-level implementation has become a key feature of the campaign, the report said. So far, 600 agricultural county-level areas have completed the beautiful countryside initiative, bringing the national completion rate to 20.9 percent. Twenty-three key counties have been selected as pilot areas under the Beautiful China initiative.

The report said public participation and assessment mechanisms are being strengthened. More than 4,000 sites have been evaluated, some 45,000 villagers interviewed and public satisfaction has reached more than 90 percent. Authorities have also handled over 2,300 public complaints through a closed-loop mechanism covering clue collection, data analysis, supervision and rectification.

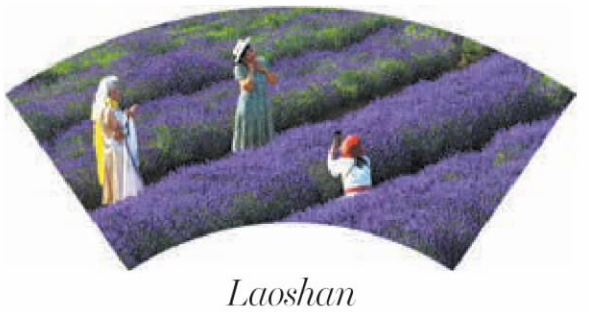
It said beautiful countryside construction is an important part of China's rural vitalization strategy and Beautiful China initiative, helping shift villages from being merely clean and orderly toward being ecologically livable.

China is set to continue to improve rural environmental governance, promote green and low-carbon agriculture, enhance village appearance and strengthen farmer participation, the report said. The country will also work toward raising the county-level completion rate to 55 percent by the end of the 15th Five-Year Plan (2026-30) period and basically completing the beautiful countryside initiative by 2035.

Wuyishan

Wuyishan, a county-level city in Fujian province, has turned strengthened ecological protection into a driver of rural vitalization, helping villages near a World Heritage Site and national park move beyond the old dilemma of "living poorly beside rich natural resources".

The city, home to 115 administrative villages and 89,000 rural residents, is the only one in China with both UNESCO World Cultural and Natural Heritage status and a national park. Local authorities have placed conservation first while developing tea, tourism, bamboo and water-related industries.



A 4,252-square-kilometer buffer zone has been designated around Wuyishan National Park to protect the core area through differentiated management. The city also spends more than 42 million yuan ($6.2 million) a year on ecological compensation and has invested 66.65 million yuan to buy back 1,200 hectares of commercial forest in key ecological areas.

The proportion of water bodies rated Grade II or better in terms of water quality has remained at 100 percent for the past three years, while the city's forest coverage stands at 80.5 percent and the share of days with good air quality has reached 100 percent. Since 2015, when the national park pilot program began, 44 new species have been recorded.

China has a five-tier quality system for surface water, with Grade I the best. Water at Grade III quality is considered good enough for most aquatic organisms to live in.

Green farming has also expanded. Wuyishan has built 8,840 hectares of eco-friendly tea gardens, accounting for 90 percent of its tea plantations, and sediment loss from tea gardens has fallen by more than 45 percent. Rural sewage treatment rose from 69.1 percent in 2022 to 98.2 percent in 2025.

In 2025, the city received 17.56 million tourist visits and generated 26.21 billion yuan in tourism revenue, while its tea industry chain reached 15 billion yuan in output value.

Laoshan

Laoshan district in Qingdao, Shandong province, has used integrated urban-rural planning to transform once underdeveloped coastal and mountain villages into cleaner, wealthier communities supported by tourism, tea, fruit and modern services.

Thirty years ago, many villages in the district sustained themselves on traditional farming, fishing and quarrying. Infrastructure was weak, and domestic sewage and waste were often discharged without effective treatment. Today, Laoshan has built a model that extends urban public services into rural areas while protecting its mountain and coastal ecology.

The district, with 95.7 kilometers of coastline and a natural coastline retention rate of 73.7 percent, began rural water supply, environmental improvement and road projects in 2005. It launched integrated urban-rural sanitation in 2014 and rural sewage treatment in 2018.

From 2019 to 2025, Laoshan built more than 1,600 km of sewage pipelines, 42 sewage treatment stations and 62 pumping stations, achieving countywide rural sewage treatment. Rural black and odorous water bodies have been cleared, while harmless treatment and classified collection of rural household waste have both reached 100 percent.

The district has also promoted circular agriculture. Since 2010, organic fertilizers and physical pest-control equipment have been distributed to more than 19,000 tea and fruit growers, covering over 2,000 hectares. In the past three years, soil organic matter in farmland rose by 34 percent, while chemical fertilizer and pesticide use fell by 6 percent and 13 percent, respectively.

Green industries have brought visible income gains. In the 14th Five-Year Plan (2021-25) period, the average collective income of villages reached 8.82 million yuan ($1.3 million), and 80 percent of villages earned more than 1 million yuan. Rural residents' per capita disposable income rose from 31,000 yuan in 2022 to 36,000 yuan in 2025.

Meitan

Meitan county in Guizhou province has built a rural vitalization model centered on tea, turning former barren hills into plantations, production bases into scenic areas, and a traditional agricultural county into one of China's leading tea-growing regions.

The county, which administers 137 villages and communities with a total rural population of 161,300, once faced poor rural living conditions, weak infrastructure and limited sources of income. Through long-term planning, environmental improvement and tea-led industrial upgrading, it has reshaped both its countryside and economy.

Meitan's tea plantation area has expanded from 1,866.7 hectares decades ago to 40,000 hectares today. The industry now benefits 88,000 farming households and more than 351,000 people, and contributes to over half of rural residents' per capita disposable income. In 2025, rural per capita disposable income reached 23,000 yuan ($3,392), 37 percent higher than the Guizhou provincial average.

Environmental improvements have accompanied industrial growth. Rural domestic sewage treatment has reached 100 percent, rural household sanitary toilet coverage exceeds 95 percent, and waste collection facilities cover 94.6 percent of rural areas. Water quality at 82 rural stream monitoring sections is rated at or above Grade III, with no black and odorous water bodies reported.

The county has also preserved regional rural architecture by building more than 100,000 traditional houses in the architectural style of northern Guizhou, improving rural living conditions for over 98 percent of households. It was also among the first in Guizhou to achieve paved-road access for all administrative villages.

Tea has become the core of Meitan's green economy. In 2025, the county produced 80,000 metric tons of tea, with tea output value reaching 6.45 billion yuan and comprehensive tea-related revenue hitting 18.61 billion yuan.

Innovation takes root in tradition

A delegate (left) listens to a guide while walking along an elevated viewing walkway at Wild Elephant Valley in Xishuangbanna, Yunnan province, on July 15. ZUO FURONG / FOR CHINA DAILY

By **HE WEIJIA** in Xishuangbanna, Yunnan
heweijia@21st.cn

Holding a thumb-sized ear of corn in his hand, Prak Thaveak Amida examined the unusual local crop and asked how it was grown after taking a bite of a purple variety with a fruity flavor.

"This is my second visit to Xishuangbanna, but it's my first time trying this corn. It has a very interesting taste," said Prak, an under-secretary of state at the Cambodian Ministry of Information.

The tasting was one of several activities arranged for participants in the 2026 Global Mayors Dialogue, held from July 14 to 16 in Xishuangbanna Dai autonomous prefecture, Yunnan province. Across several field-visit routes, participants visited an agricultural facility, residential communities and Wild Elephant Valley, where mayors and other international guests learned about the prefecture's efforts in agricultural innovation, community development and environmental protection.

The corn tasting took place at a waxy corn processing facility operated by Dai Xiansheng Agricultural Development Co., Ltd. Liao Mengmeng, the company's general manager, introduced the thumb-sized corn as a traditional local variety that has long been grown in Xishuangbanna.

Liao explained that the corn's flavor and appearance can change after two or three years of cultivation because of its genetic instability. To improve its consistency, the company has partnered with Huazhong Agricultural University on genetic purification, rejuvenation and crossbreeding.

"Agricultural biotechnology in China is advancing rapidly," Prak said. "This is far more than ordinary corn. It's a newly developed variety."

The group then visited Wanjing Community in Jinghong city, where participants sampled dumplings and played card games with residents. They were also introduced to the neighborhood's shared facilities, which include spaces for dancing, painting, calligraphy and chess, as well as a communal kitchen.

Cai Hui, secretary of the community's general Party branch, told the delegates that, in addition to providing shared spaces, the community also encourages residents to take part in neighborhood governance to help ease the workload of its limited staff. This is particularly important during the peak tourism season from November to April, when people from across China travel to Xishuangbanna to spend the winter in its mild climate.

At Wild Elephant Valley, delegates learned about local efforts to strike a balance between tourism and wildlife conservation.

They walked along an elevated viewing walkway, observing wild Asian elephants and signs of their activity in the rainforest below.

"Elephants belong to the rainforest, so we have given the ground-level habitat back to them," said Xu Ping, a guide at the site.

Masood Khalid, a former Pakistani ambassador to China, said the surroundings offered a vivid example of coexistence between people and wildlife.

"I'm sure that the next time I come to Xishuangbanna, I will see even more improvements," he said.

Gary Dvorchak (left), Edwin Montealegre (center) and Tong Huiqi discuss the role and impact of AI during the 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance in Shanghai on July 19, 2026. PROVIDED TO CHINA DAILY

AI's human side comes into focus

International voices highlight how AI is transforming work, creativity and communication while keeping people at the center of progress.

By **MENG WENJIE** and **SHAMIM ZAKARIA**

As Bill Reichert walked through the exhibition halls of the 2026 World Artificial Intelligence Conference, demonstrations of AR glasses offering real-time Chinese-English subtitles caught his attention.

Reichert, a partner at US-based Pegasus Tech Ventures, called the experience a "wow moment". The technology showed him how AI could make it easier for people to communicate across language barriers.

"It's as if I were anywhere else in the world that actually speaks English," he said.

The 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance was held in Shanghai from July 17 to 20 under the theme "AI Partnership for a Brighter Future".

The exhibition brought together more than 1,100 companies, and over 300 AI products made their global debuts.

Reichert was among the international guests attending the conference. Having first visited China around 2012, Reichert has since traveled to places including Shanghai, Beijing, Shenzhen and Hong Kong. Those experiences have given him a broader perspective on how technology is reshaping innovation and communication worldwide.

"AI is going to flatten the world in terms of anybody, anywhere, being able to connect with anyone in any language. And that's a big deal," he said.

For Edwin Montealegre, a Costa Rican conductor and director of Shanghai Monestel Music Productions, AI has already become part of his creative process.

A graduate of the Shanghai Conservatory of Music, Montealegre was attending the conference for the second time. He noticed a change in emphasis this year.

> "Before, the focus was on how to use AI. But now, AI is no longer just a device or a tool — it has become part of our everyday lives."
>
> **Edwin Montealegre,** a Costa Rican conductor and director of Shanghai Monestel Music Productions

"Before, the focus was on how to use AI. But now, AI is no longer just a device or a tool — it has become part of our everyday lives," he said.

As a music director, Montealegre is responsible not only for conducting, but also for organizing rehearsals and preparing performance materials. With AI assistance, some administrative tasks that once took days can be completed in hours or even minutes.

"I even use AI to brainstorm ideas," he said. "It gives me more time for artistic inspiration, for connecting with people, and for myself."

While Montealegre emphasized creativity, Tong Huiqi focused on care.

Tong, a clinical psychologist and clinical professor at Stanford School of Medicine, said that while many young people are turning to AI for emotional support, human judgment must remain central.

"AI cannot work independently," she said, adding that humans must ultimately decide what is appropriate, where its limits should be and whether it is helping.

In her clinical work, Tong uses an AI-assisted documentation system during consultations. By reducing the need to take notes throughout a session, the tool helps her give patients her full attention.

> "You can feel that the government is really encouraging young people to understand it, use it and think about how to make it better."
>
> **Rupert Hoogewerf,** chairman and chief researcher of Hurun Report

"My clients actually love it because AI allows me to be 100 percent connected with them rather than jotting down notes," she said.

Her experience illustrates both the value and the limits of the technology. AI can take over a routine task and create more room for human attention, but decisions about care, boundaries and responsibility must remain with people.

The same combination of greater capability and human direction is reshaping entrepreneurship, according to Rupert Hoogewerf, chairman and chief researcher of Hurun Report.

Through the Hurun Uth Series — including its Under25s, Under30s, Under35s and Under40s rankings — Hoogewerf has been following a generation of young entrepreneurs. He said about 800 entrepreneurs were featured across the series this year, with around 30 presenting innovations at the conference in areas including robotics and AI.

"You can feel that the government is really encouraging young people to explore AI, understand it, use it and think about how to make it better," he said.

Hurun's research also shows how rapidly wealth creation is changing in China: 70 percent of the country's billionaires on this year's Hurun Global Rich List were not on the list a decade ago.

"They are the new faces of China — from AI and computer chips to new energy and other emerging industries. They have just come onto the scene," Hoogewerf said.

At the conference, he met entrepreneurs using AI tools to run one-person companies, as well as businesses applying AI in traditional fields such as metals and minerals analysis.

"There is a massive transformation going on," he said. "You can apply AI in lots of different places."

Gary Dvorchak, managing director of The Blueshirt Group Asia, has also seen AI improve efficiency in his industry. He said the technology had reduced costs and sped up work in ways he had not anticipated.

What struck him most at the event, however, was not a particular product. It was the willingness among the exhibitors, entrepreneurs and visitors he encountered to experiment with the technology.

"There's no fear of AI here. Everyone is embracing it and thinking about how they can use it to make life better," he said.

Yet Dvorchak said the activity in the exhibition halls reinforced a more fundamental point. AI could support people's work, but people were still the ones exchanging ideas, asking questions and making decisions.

No matter how advanced the technology becomes, he said, it remains a tool.

"People are more important in the era of AI than they were in the past," he said.

Yao Fangbin conducts a prescribed burn in the Lesser Khingan Mountains to reduce wildfire risks in 2024. PROVIDED TO CHINA DAILY

Ready before the call

From earthquakes to wildfires, China's frontline firefighters work in shifting conditions with speed, judgment, and constant readiness to safeguard people's lives.

By GUO JIATONG
guojiatong@21st.cn

On July 15, Yao Fangbin was already more than 300 kilometers from his base in Harbin, Heilongjiang province, inspecting rivers and mountain roads with his team in Mudanjiang.

Moisture from the outer bands of Typhoon Bavi, combined with cold air, was forecast to bring heavy and possibly torrential rain to central and eastern Heilongjiang. Before the first rescue call came in, Yao and his fellow firefighters checked evacuation routes, assessed areas at risk of flooding and landslides, and conducted rope and water rescue drills.

"When I first joined the brigade, our work usually began only after disaster struck," Yao said. "Now, our work starts much earlier. We focus on preparedness and disaster prevention, making rescue operations more targeted and effective."

As climate change brings more frequent severe rain, flooding and urban waterlogging across China, fire and rescue teams nationwide are devoting more time to emergency preparedness before disasters occur.

In China, firefighters do far more than put out fires. They also respond to floods, landslides, earthquakes, building collapses, traffic accidents and other emergencies. Depending on their expertise and location, specialized teams may carry out evacuations, search-and-rescue operations, emergency reconnaissance and disaster relief across different regions.

Yao, who has served with the Heilongjiang fire and rescue mobile general brigade for more than two decades, has seen firsthand how the scope of the job has expanded.

In the past, his brigade mainly fought forest fires. Today, its members also tackle summer floods and carry out other rescue missions, while providing emergency support at major attractions and events, including Harbin Ice and Snow World during the winter tourism season.

Anticipating disaster

The shift from reacting to disasters to anticipating them is also evident in Anhui province.

Xue Xuetao, a firefighter with the Hefei fire and rescue mobile brigade, recently led an advance team to Feidong county in Hefei, pre-positioning personnel and emergency communications equipment along the projected path of the approaching typhoon.

Since joining the brigade in 2007, Xue has built up extensive experience responding to disasters across Anhui. In the north, he has tackled recurring floods along the Huaihe River, while in the mountainous south, he has dealt with flash floods, landslides and other hazards triggered by severe rain.

That regional experience has taught him to anticipate how disasters may unfold. Areas such as Huangshan, Xuancheng and Anqing are particularly vulnerable because of their terrain, while northern Anhui faces persistent flood risks along the Huaihe River.

"A deep understanding of local geography is essential during a rescue task, because natural disasters can become life-threatening within minutes," he said.

One of the missions that left the deepest impression on Xue was the devastating flooding in Huangshan in 2024, when days of unusually heavy rain cut three villages off from the outside world.

"The only road into the villages was a narrow mountain path, with steep slopes on one side and a fast-flowing river on the other," he recalled. "After landslides buried the road, we had to trek across unstable debris while the rain continued. Every step carried the risk of triggering another collapse."

Xue took part in an advance reconnaissance operation, in which highly mobile teams travel by helicopter or off-road vehicle, or proceed on foot to reach disaster areas ahead of larger rescue forces. Such teams are sent in when roads are blocked, communications are disrupted or conditions remain highly dangerous.

When public communications networks fail, they deploy an emergency private radio terminal to transmit live images and data from the scene. This gives headquarters a clearer picture of conditions on the ground and helps guide the next stage of the rescue.

Despite the danger, Xue said hesitation never crossed his mind. "Our only thought was to reach the disaster area as quickly as possible, assess the situation and report back, so the command center could make timely decisions and mobilize additional rescue teams," he said.

Lessons from such missions are shared across the force, becoming practical knowledge passed from veteran firefighters to younger rescuers.

"Our officers and veteran firefighters have taken part in years of frontline rescue work and accumulated invaluable experience. They teach younger firefighters the safest and most effective rescue methods," Yao noted.

Many of those lessons came at a high cost. "Some comrades lost their lives or suffered serious injuries," Yao said. "By passing on their experience, we hope younger rescuers can avoid making the same mistakes."

Right: Xue Xuetao carries out flood-control and emergency rescue operations using communications support equipment in Fuyang, Anhui province, in 2020. **Bottom:** Migmar Tsering (left) leads his team in searching for trapped survivors following the earthquake in Dingri county, Shigatse, Xizang autonomous region, in January 2025. PROVIDED TO CHINA DAILY

Passing lessons on

As veteran firefighters share lessons learned in the field, younger rescuers are being asked to master increasingly complex equipment and take on demanding technical and command roles.

Among them is Migmar Tsering, a technical officer with the Shigatse fire and rescue mobile brigade in the Xizang autonomous region. Born in the 2000s, he represents a younger generation preparing to lead rescue operations under extreme pressure.

One of the greatest challenges in responding to a large-scale disaster is the expertise required of commanders, according to Migmar Tsering. They must quickly formulate rescue plans, organize personnel and allocate equipment, often with little time and incomplete information.

"Modern fire and rescue operations involve thousands of pieces of equipment," he said. "Commanders must understand how every type of equipment works, what it can do and how it performs."

"It is a tremendous test of command capability," he added.

Technical knowledge alone, however, is not enough. Migmar Tsering said frontline rescuers must also remain calm as conditions change around them.

During a forest fire, for example, a sudden shift in wind direction can carry embers downhill and cause the flames to spread back uphill toward firefighters.

"Without solid professional skills and psychological resilience, panic can quickly worsen physical exhaustion. In steep mountain terrain, that can be extremely dangerous," he said, adding that prolonged exposure to intense heat can also put firefighters at risk of severe dehydration.

Even after the last survivor is brought to safety, the work is far from over.

During the initial emergency response, firefighters focus on rescuing trapped residents. Once everyone has been evacuated, they may spend another six or seven days searching through debris for personal belongings and helping families recover as much property as possible.

"Floods, forest fires and other major natural disasters are all high-intensity, high-risk missions," he noted. "They demand perseverance, discipline and resilience. Those qualities are essential to carrying out rescue operations safely and effectively."

Despite the hardships, Migmar Tsering said he has never regretted choosing the profession.

"You have to truly love this job," he said. "Our mission is simple: serve the people, stand with them and always put their needs first."

As he became more deeply involved with the team, Migmar Tsering said, he gradually developed a strong sense of belonging and pride in its unity, traditions and achievements.

Engineer finds art in the air

Once dismissed as children's toys, balloons became Xu Dengyong's path to entrepreneurship, professional recognition and building a new industry.

By **GUI QIAN** and **LIU KUN**

Xu Dengyong, 37, first noticed balloon art on an online variety show in 2013. One of the guests appeared in an outfit made entirely of woven balloons. At the time, Xu was working as an engineer at an electronics factory in Guangdong province, living a stable life.

He never imagined that balloons — which he then saw as little more than "children's toys" — would one day become the foundation of a business earning him more than 1 million yuan ($147,000) a year.

Originally from Nanzhang county, Hubei province, Xu had spent years in manufacturing before changing careers. His factory experience left him with two lasting assets: the ability to endure hardship and a disciplined approach to solving problems — through standardized processes, attention to detail, cost control and safety calculations. These habits would later prove invaluable in the balloon industry.

In 2013, Xu invested his savings of 30,000 yuan to attend a monthlong balloon modeling course in Henan province. After returning home, he opened a balloon decoration shop.

The early days were tough. He handed out flyers on the street and visited wedding planning companies one by one, taking whatever work he could find.

A turning point came in 2015 when he began targeting shopping malls and large commercial events. But potential clients all asked the same question: How long would the balloons last?

Xu had no good answer.

At the time, balloon decoration techniques were still relatively undeveloped. Indoor installations typically lasted no more than a week. For shopping malls investing in displays built from tens of thousands of balloons, that simply wasn't good enough.

Air leakage was the biggest obstacle. Inflating latex balloons stretches the material, reducing its density and allowing air to gradually escape. Unless that problem could be solved, large-scale commercial balloon installations would be difficult to maintain.

Xu approached the challenge like an engineer.

First, he refined the knotting technique to reduce air leakage. Then he began placing one balloon inside another so that the inner balloon would remain intact even if the outer one burst.

His most time-consuming breakthrough came from experimenting along the inner wall of a balloon, slowing air loss without damaging the material.

Later, inspired by car waxing and facial skincare, Xu developed an oil-coating process for the balloon surface, further extending its durability. Today, his balloon installations can last indoors for up to three months, and as long as six months in winter.

These improvements transformed balloons from short-lived decorations into commercially viable products.

A real estate project in Jiangxi province in 2017 brought Xu's company 600,000 yuan in revenue in just half a month. In 2023, a 10-meter-tall balloon cake he designed was commissioned by nearly 30 supermarkets and shopping malls across China.

As his reputation grew, professional recognition followed. In 2019, his work *Divine Beast Longma* — named after the mythical dragon horse — won the large-scale category at the China Balloon Art Competition. Three years later, he received a Top 10 Unique Skills Award at a high-skilled talent competition in Hubei province and was named a "Jingchu Artisan", a provincial honor recognizing outstanding craftspeople.

Above: Xu Dengyong checks a balloon installation he created. **Right:** Xu (front) teaches balloon-making techniques to young trainees. PROVIDED TO CHINA DAILY

"Those awards gave me a new level of confidence," he said. "No matter how large the order was or how complex the design, I knew I could handle it."

For Xu, the recognition marked more than a personal achievement. It convinced him that balloon art could be seen as a serious profession rather than a novelty, and it gradually shifted the focus of his work. Rather than concentrating solely on building balloon installations himself, he began spending more time helping others enter the industry.

Since 2024, through a model worker innovation studio supported by the Nanzhang County Federation of Trade Unions, Xu has recorded balloon modeling tutorials and offered free online and in-person training. More than 4,000 people have participated in his courses.

Many wonder why he devotes so much time to teaching people who may one day become his competitors.

"The industry is too fragmented," Xu said. "Unlike makeup or floral design, balloon art has no national vocational qualification and no formal training system. I hope to help the industry grow together so it can gain wider recognition."

His training goes beyond technique. Students also learn how to negotiate with clients, identify new markets, produce promotional videos, write marketing content and use social media to support offline businesses.

Xu believes the future of the craft lies in the hands of young people.

"Those born after 2000 are quick-thinking and highly creative," he said. "Balloon art is, by nature, part of the creative industry, and their fresh thinking can bring more original ideas."

That belief is also guiding the markets he is now exploring. One direction is combining balloon art with local cultural intellectual property (IP), working with governments and cultural institutions to turn landmarks and historic neighborhoods into large-scale balloon installations. Another is expanding into outdoor consumer spaces, including campsites and tourist attractions, where decorative installations are becoming increasingly popular.

More than a decade after watching balloon art on television for the first time, Xu no longer sees balloons as children's toys. Through technical innovation and an engineer's mindset, he has turned them into durable commercial products — while helping build a more professional future for an industry that is still taking shape.

Global Insights

Ancient Datong echoes humanity's shared spiritual journey

The hum of the high-speed train softened as we pulled into Datong, Shanxi province, leaving behind the bustle of Beijing for a city shaped by layers of history.

Traveling with 20 fellow media students and three coordinators from the Communication University of China, I expected to see temples, grottoes and ancient streets. What I did not expect was a series of cross-cultural revelations, all pointing to one central truth: faith and human creativity transcend geographic boundaries.

Datong, once the capital of the Northern Wei Dynasty (386-534), is often introduced through its grand historical landmarks. But the first place that stopped me was quieter and more intimate: the Pingcheng Memory Hall.

Unlike large imperial exhibition halls, this small museum preserves the texture of ordinary life: chipped ceramic rice bowls, old vendor signs, woolen coats once worn by coal miners and vintage radio sets.

As a documentary filmmaker, I found myself lingering before a weathered copper hotpot, its dented surface carrying the traces of generations of family dinners.

Balcha Teshome Hailu visits Huayan Temple in Datong, Shanxi province, on June 11, 2026. PROVIDED TO CHINA DAILY

Later, in Datong's ancient city area, I saw that same everyday object transformed into art. Hundreds of copper pots were arranged into flowing silhouettes of mountains.

In that moment, I realized that cultural identity does not live only in carved stone or towering pagodas. It also simmers in everyday objects, forged through shared meals and community warmth.

At Huayan Temple, that sense of connection deepened. Its rare Liao Dynasty (916-1125) open-column architecture stretched above me in broad wooden beams, creating a spacious interior without obstructive walls.

Among the 29 intact painted statues, the famed smiling Bodhisattva known as the "Venus of the East" stopped me completely.

Her serene smile felt unexpectedly familiar, reminiscent of the saints painted in Ethiopian Orthodox churches near my childhood home. The intricate wooden brackets jutting from the temple eaves, each carved curve offered to the divine, just as Ethiopian artisans chisel elaborate doorframes and stone murals to honor faith.

Standing there amid drifting sandalwood incense, I understood that spiritual architecture speaks a universal language. Across cultures and civilizations, people pour patience, skill and imagination into timber and stone, giving visible form to what they hold sacred.

The strongest moment of recognition came at the Hanging Temple, also known as Xuankong Temple. Built into the cliffside, with narrow wooden walkways linking small prayer halls, the temple seems to test the boundary between architecture and belief.

As I walked carefully along its elevated passages, I thought of Debre Damo Monastery, the cliff-top Orthodox monastery in northern Ethiopia that sits atop an inaccessible plateau and can be reached only by hauling oneself up a frayed leather rope.

The Hanging Temple and Debre Damo belong to different religions, histories and landscapes, yet they ask believers across continents the same timeless question: how far are you willing to go, and what discomfort are you prepared to endure, to come closer to the sacred?

I paused on a small balcony, watching elderly Chinese pilgrims shuffle slowly across the wooden planks, their hands folded and their faces lit with quiet reverence. I pictured Ethiopian monks climbing that rope to Debre Damo, driven by the same unshakable devotion.

In that moment, I was no longer only a foreign student on a field trip. I felt like a witness to something shared — the human desire to place holiness above the noise of ordinary life.

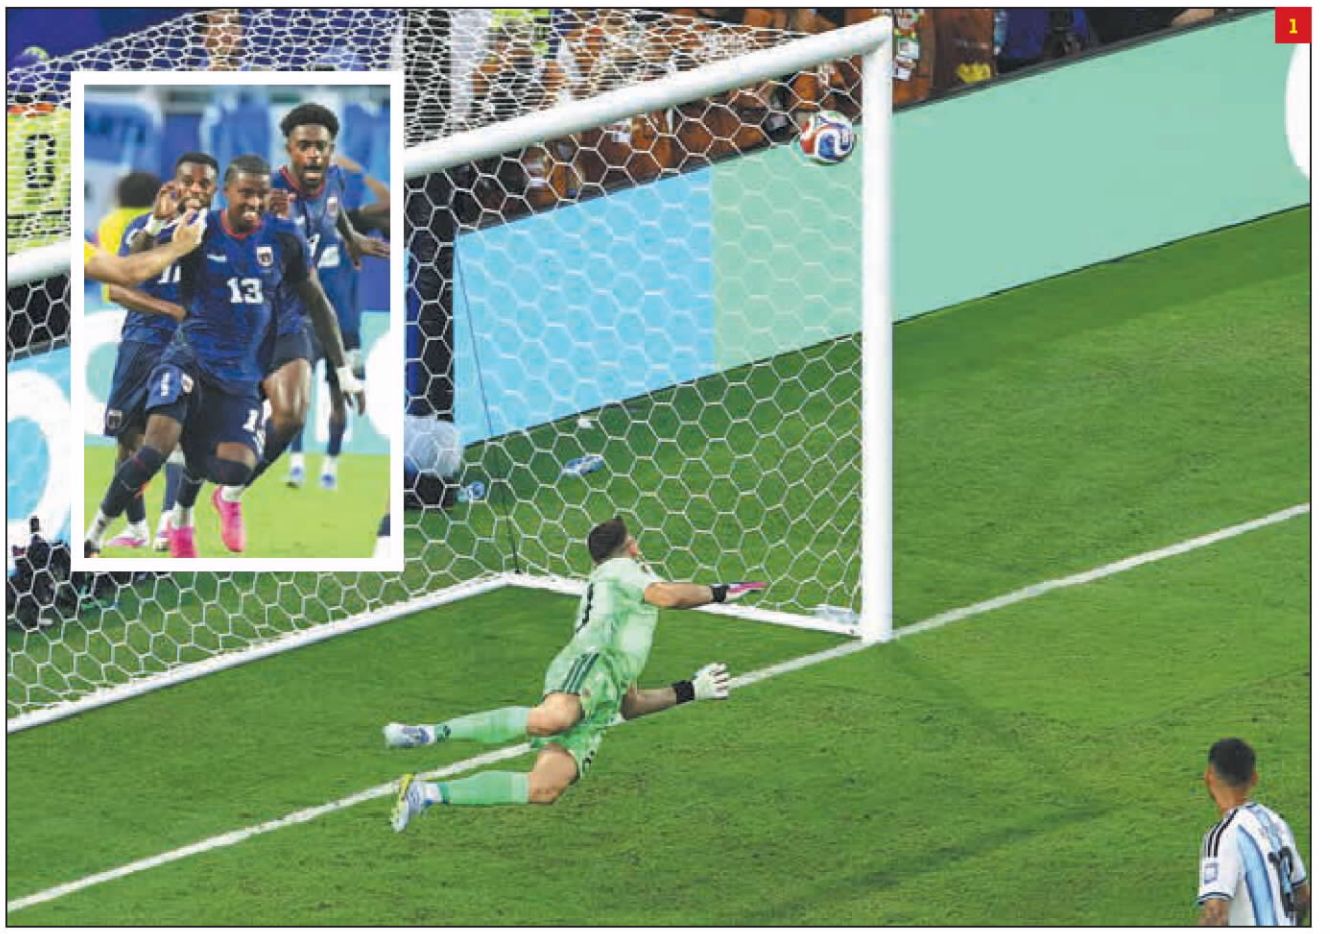
The Yingxian Wooden Pagoda and Yungang Grottoes added another layer to that reflection.

The thousand-year-old pagoda, built without a single iron nail, reminded me of Ethiopia's Aksum obelisks: monuments created not for speed, but for endurance. The Yungang Grottoes, a UNESCO World Heritage Site, revealed Buddhist art fused with multi-ethnic culture on a breathtaking scale.

Yet beyond these grand landmarks, present-day Datong remained equally vivid: warm regional food, smooth roads leading from the city to remote heritage sites and residential districts that showed how modern development can grow around ancient history rather than erase it.

We boarded our train back to Beijing as dusk fell, our group far quieter than when we had left. That silence did not come from tiredness alone. Datong had given us too much to absorb at once. Its meaning lies not in a checklist of tourist spots, but in the subtle, powerful connections it draws between distant cultures.

Every carved beam, every cliffside shrine and every humble copper hotpot tells the same story: art, faith and human perseverance are languages no border can divide. Datong's stone and cliffs do not merely speak to China's past — they speak to our shared humanity, visible to anyone willing to pause, look closely and listen.



Written by Balcha Teshome Hailu, an Ethiopian graduate student in the Faculty of Journalism and Communication at Communication University of China.

SPORTS

2026 WORLD CUP

BEST MOMENTS OF THE 2026 WORLD CUP

Three countries, 104 games, 39 days and hundreds of memories — here are a few that stand out

With 104 games taking place over 39 days, and across three countries — the United States, Canada and Mexico — the 2026 World Cup produced hundreds of spectacular moments that will live long in the memory.

1. Goal of the tournament

Sidny Lopes Cabral of Cape Verde stunned defending champion Argentina with a tying goal in extra time of their round-of-32 match at Miami Gardens, Florida, on July 3.

The Blue Sharks, who entered the tournament ranked 67th, trailed 2-1 in the 103rd minute, when Cabral received a long pass from Yannick Semedo near the left flank with his left foot. The 23-year-old, who plays in Turkiye for Trabzonspor, cut past Alexis Mac Allister while playing the ball onto his right foot and, from just inside the penalty area, curled a stunning shot past goalkeeper Emiliano Martinez and into the upper corner at the far post for his fourth goal in 14 international appearances.

2. Breakout player

Nineteen-year-old Barcelona defender Pau Cubarsi played every minute of every match, as Spain, winner in 2010, won its second World Cup title. He had 668 successful passes in 690 attempts, a 96.8 percent completion rate that was the second best in the tournament among players with 400 or more attempts, just behind Norway's Sander Berge at 96.9 percent. Cubarsi's total was second only to teammate Rodri's 747. Cubarsi's 750 minutes tied teammate Marc Cucurella and Mac Allister for the tournament high among outfield players. At 19 years, 178 days, he became the seventh youngest to win a World Cup, trailing Pele (17-249) in 1958, Ronaldo (17-298) in 1994, Giuseppe Bergomi (18-174) in 1982, current teammate Lamine Yamal and Antonio Coutinho in 1962 (both 19-6), and Marco Antonio (19-135) in 1970.

3. Worst foul

Qatari midfielder Assim Madibo broke the left tibia and fibula of Canadian midfielder Ismael Kone with a tackle from behind in the 51st minute of a June 18 group-stage match in Vancouver. Madibo received a red card and a five-game suspension. Kone had surgery and Madibo visited him at the hospital.

4. Biggest blunder

Matt Freese had a howler in the United States' 4-1 loss to Belgium in the round of 16 that will long feature on goalkeeper blooper reels. Brandon Mechele played a long ball from deep in his own half. When Belgium's Charles De Ketelaere burst past US defender Chris Richards, Freese came off his line, and, about five yards outside the penalty area, he chested the ball. The 27-year-old, who became the No 1 keeper for the US last year, was about to clear the ball with his left foot, hesitated and tried to pass to his left, only for the ball to deflect off one of De Ketelaere's legs toward midfield. Hans Vanaken scored from about 30 yards, as US captain Tim Ream was left unsuccessfully flailing to try and block the ball.

5. Best fans

Norway's fans charmed fellow spectators and television viewers when they performed the "Viking Row" in stadiums and even in the bleachers above the TKTS booth selling Broadway theater tickets in New York's Times Square. Martin Odegaard and Erling Haaland led the row celebration on the field following wins. Scotland's Tartan Army also left indelible memories, depleting Boston's beer supply and taking in baseball games at Boston's Fenway Park and LoanDepot Park in Miami.

6. Biggest upset

Eliminated in consecutive group stages following its fourth World Cup title in 2014, Germany clinched top spot in its group with wins over Curacao and Cote d'Ivoire before losing its group stage finale against Ecuador. Paraguay, in its first World Cup since 2010, began the tournament ranked 41st and advanced as one of the top third-placed teams, opening with a 4-1 loss to the US, beating Turkiye 1-0 and drawing 0-0 against Australia. When Germany and Paraguay met in the round of 32 on June 29 in Boston, Julio Enciso put Paraguay ahead in the 42nd minute, but Kai Havertz tied the score 12 minutes later. Germany, which began the World Cup ranked No 10, thought it had taken a crucial lead off the head of Jonathan Tah in the 102nd minute, but it was overturned by VAR because of a foul by Waldemar Anton on Paraguay keeper Orlando Gill. Germany had won all four of its previous World Cup penalty shootouts, succeeding on 17 of 18 kicks — including 15 in a row. Havertz's opening spotkick was saved by Gill, who also batted away Nick Woltemade's effort three shots later. Tah skied Germany's sixth kick over the crossbar, leaving it all to do for Jose Canale, who beat Manuel Neuer. Paraguay won the shootout 4-3, only to go on and lose 1-0 to France in the round of 16.

7. Best photo

Raul Jimenez scored Mexico's second goal in its tournament-opening 2-0 win over South Africa on June 11. An image from Associated Press photographer Natacha Pisarenko captured the joy of a player who scored on a header, six years after his career was nearly ended when he fractured his skull in a clash of heads with Arsenal's David Luiz while playing in a Premier League match for Wolverhampton.

XI'S VISION | HIGH-QUALITY DEVELOPMENT

China helps to green Global South

Nation deepening cooperation through major energy projects in Latin America

By ZHENG XIN
zhengxin@chinadaily.com.cn

As the world's transition toward more sustainable development accelerates, China and Latin America are embracing broader and deeper energy cooperation, leveraging cutting-edge technological innovations to power a green future for the Global South.

From State Grid Corp of China's Belo Monte Ultra High Voltage Direct Current Phase II transmission line in Brazil, to China Three Gorges Corp's comprehensive digital modernization of Brazil's legacy Jupia and Ilha Solteira hydropower stations, and the Cauchari solar project in Argentina, jointly undertaken by Power Construction Corp of China and Shanghai Electric Power Construction Co, China and Latin America are jointly setting new benchmarks for cross-border clean energy integration.

These flagship projects go beyond traditional capital investment, representing a deeper leverage of China's technological standards and management expertise. By upgrading legacy infrastructure, Chinese enterprises are powering Latin America's green transition for more secure regional grid stability.

This strategic momentum is guided by top-level diplomacy and shared visions.

While addressing the opening ceremony of the fourth ministerial meeting of the China-CELAC (Community of Latin American and Caribbean States) Forum last year, President Xi Jinping noted that by adapting to the overriding trend of economic globalization, China and Latin America have continuously deepened pragmatic cooperation in fields including trade, investment and infrastructure construction.

He emphasized that both sides should strengthen the alignment of development strategies and advance high-quality Belt and Road cooperation, calling for efforts to deepen cooperation in traditional areas such as energy and minerals, while expanding cooperation in emerging sectors including clean energy.

Such top-level commitment builds on a long-standing strategic alignment. As President Xi pointed out at the China-Latin American and Caribbean Countries Leaders' Meeting in 2014, "China and Latin America are highly complementary in economy and closely aligned in development strategies, granting us natural advantages in strengthening cooperation".

With such a strategic blueprint in sight, top Chinese energy regulators have emphasized the pivotal role of this cross-border synergy.

Ren Jingdong, deputy director of the National Energy Administration, said that energy collaboration is a crucial component of pragmatic cooperation between China and Latin America, achieving remarkable results.

"As China and Latin American countries have actively promoted energy transition and the development of renewables in recent years, new energy cooperation has emerged as a new highlight and a fresh driver for China-Latin America energy synergy," Ren said.

Guided by these high-level consensuses, Chinese enterprises have delivered monumental infrastructure breakthroughs on the ground.

Brazil has grappled for decades with a severe structural challenge. While its northern Amazon basin boasts abundant hydroelectric resources, the vast majority of its industrial and residential power demand is concentrated in the southeast. The 2,534-kilometer Belo Monte Phase II project, independently invested, constructed and operated by State Grid Corp of China under a 30-year concession agreement, bridges this divide. As a vital "green artery", it transmits massive volumes of hydropower directly to metropolitan load centers like Rio de Janeiro.

Former Chinese premier Zhu Rongji passes away

By CAO DESHENG
caodesheng@chinadaily.com.cn

Zhu Rongji (1928-2026)

Former Chinese premier Zhu Rongji passed away in Beijing on Wednesday. He was 98.

Zhu, who had served as a member of the Standing Committee of the Political Bureau of the 14th and 15th Central Committees of the Communist Party of China, died of illness, according to an official obituary.

The obituary was jointly issued by the CPC Central Committee; the Standing Committee of the National People's Congress, China's top legislature; the State Council, China's Cabinet; and the National Committee of the Chinese People's Political Consultative Conference, China's top political advisory body.

It extolled Zhu as an excellent Party member, a time-tested and loyal communist fighter, and an outstanding proletarian revolutionist, statesman and leader of the Party and the State.

Born in October 1928 in Changsha, Hunan province, Zhu joined revolutionary work in December 1948 and became a CPC member in October 1949.

Between 1987 and 1991, he served successively as deputy secretary of the CPC Shanghai Municipal Committee, mayor of Shanghai, and secretary of the CPC Shanghai Municipal Committee.

During his tenure, he advocated for adjusting the city's industrial structure, developing an export-oriented economy and enhancing its international competitiveness.

Zhu played a crucial role in advancing the development and opening-up of Shanghai's Pudong New Area. His efforts laid a solid foundation for Shanghai's further reform, opening-up and development.

In 1991, Zhu was appointed vice-premier of the State Council.

In October 1992, he was elected a member of the Political Bureau of the CPC Central Committee and its standing committee, and he was responsible for the executive work of the State Council.

In June 1993, he concurrently served as the governor of the People's Bank of China, the country's central bank.

In September 1997, Zhu was reelected a member of the Political Bureau of the CPC Central Committee and its standing committee.

In March 1998, he was appointed premier of the State Council, and he later served as the secretary of the leading Party members group of the State Council.

Facing the impact of the Asian financial crisis and the catastrophic flooding in China, Zhu focused on a shift from implementing a moderately tight fiscal and monetary policy to adopting a proactive fiscal policy and a prudent monetary policy, expanding domestic demand and deepening reforms in key areas, thereby maintaining steady and rapid economic growth.

During Zhu's tenure as vice-premier and premier of the State Council, a series of policies and measures were adopted to expand opening-up, encourage exports, keep the renminbi exchange rate stable without devaluation, attract foreign investment, and firmly safeguard the prosperity and stability of the Hong Kong Special Administrative Region as an international financial center.

He also presided over the implementation of major reforms in the social security system, healthcare system, and investment and financing system, among others, promoting the establishment of the basic framework of a socialist market economy. He oversaw the completion of the arduous negotiations for China's accession to the World Trade Organization.

In March 2003, Zhu no longer served as premier of the State Council. After retiring from leadership posts, he steadfastly upheld and supported the leadership of the CPC Central Committee.

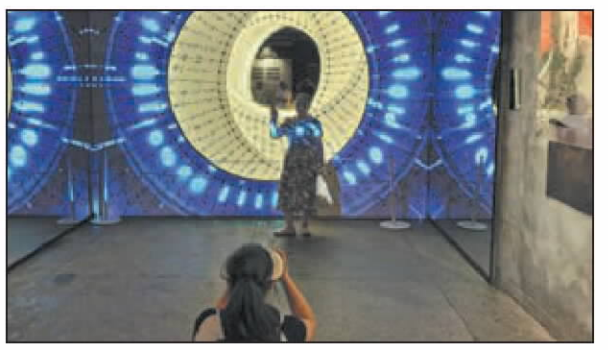
He continued to care about the great cause of socialism with Chinese characteristics and firmly supported efforts to improve conduct, promote integrity and fight corruption.

Zhu's life was a revolutionary, fighting and glorious one, and one that was dedicated to wholeheartedly serving the people and the communist cause, the obituary said, adding that his death is a great loss to the Party and the State.

Xinhua contributed to this story.

UNIQUE FACILITY SPARKS A POSITIVE REACTION

Once-secret nuclear complex in Chongqing's mountains now drawing visitors from abroad



By TAN YINGZI and **DENG RUI** in Chongqing

On a bright August afternoon, Boston Thomas stood at the mouth of a mountain, trying to wrap his head around what was hidden inside.

The 20-year-old from the United States had first read about the 816 Project on online travel agency Trip.com. The photos alone were enough to lure him halfway across the world. Now, in the remote hills of Baitao subdistrict in Chongqing's Fuling district, Thomas found himself confronted with a scale that defied comprehension.

From the outside, it appears as little more than nondescript concrete portals cut into the green slopes. Inside, however, lies an entirely different universe.

It is a labyrinth of caverns and tunnels hewed in total secrecy by more than 60,000 workers between 1966 and 1984. Originally designed to house a plutonium production facility, the project was scrapped before it ever went operational.

Visitors take photos in an exhibition hall of the 816 Underground Project in Chongqing on July 26. ZHANG DING / FOR CHINA DAILY

"I find myself particularly interested in this project," said Thomas, who studies emergency management and fire science at the University of Alaska Fairbanks.

He said that he would think in terms of contingency systems — how states organize to brace for catastrophes that hopefully never materialize. "It helps me better understand the differences between both the American system and the Chinese system, and how both can be bridged and how the aspects of either can play off one another."

Thomas walked in with his family, stepping out of the August heat and into the chill air of the cave.

Described by People's Daily as China's second nuclear material industrial base, it is the world's largest artificial cave. For decades, it was absent from official maps. Declassified in 2002 and opened to the public in 2010, the site has since beckoned visitors into its depths.

Visitor numbers have surged over the years. Last year, nearly 900,000 people explored its vast network of caverns and tunnels, a dramatic increase from fewer than 20,000 in 2014, according to Feng Jun, deputy general manager of the 816 Project Scenic Area.

The project was part of the Third Front Movement, a massive industrial campaign launched across 13 inland provinces and autonomous regions from 1964 to 1980.

ASEAN members should brace for multiple shocks

WORLD WATCH
By Alan Bollard

In the eyes of many people in the Asia-Pacific region, we are currently in the midst of some tangled economic forces: China's export surge, trade tensions between the United States and China, the Israel-US conflict with Iran, and the artificial intelligence boom.

Businesses in the region are responding fast, looking for new ways to organize production as supply chains reconfigure.

Meanwhile, the disruption in the Strait of Hormuz is not yet resolved.

The blocked shipments include crude oil to fuel the refineries, petrochemicals to feed the industrial plants and fertilizers to supply farms in Southeast Asia. This has meant regional countries have had to reassess their energy vulnerability.

Initially, the economic forecasts were very worrying: an energy crisis, low farm yields, industrial shortages and price inflation, all forecast to hinder world growth.

However, so far the economic shock has been reasonably well managed through a mix of market interventions and astute business decisions. It has helped that China has developed much cheaper energy technologies and managed to reduce its own oil consumption.

Solving conundrum of future math success

By **YU RAN**
For China Daily

The awarding of the Fields Medal — widely regarded as the Nobel Prize of mathematics — to two Chinese nationals has stoked hopes of a golden dawn for the discipline, while also sparking debate about how the country nurtures its academic talent.

Renowned Chinese American mathematician Shing-Tung Yau, a Fields Medal laureate and dean of Tsinghua University's Qiuzhen College, called the news exciting for the Chinese people and a proud moment for Chinese mathematicians.

He commended the awardees' interdisciplinary achievements and expressed hope that young Chinese scholars will achieve major breakthroughs at home, paving the way for the country to become a global powerhouse in mathematics.

"For quite a while, people in the government of America thought that Chinese (mathematicians) will only learn from America; now they will see that we also develop first-class mathematics," he said in an interview with CGTN.

"I hope they learn that Chinese are capable of doing absolutely first-class mathematics, and we could help America, we could help Europe, and vice versa, we welcome them to come over here to help us also."

Presented every four years by the International Mathematical Union, the Fields Medal recognizes mathematicians under the age of 40 for their outstanding contributions.

Deng Yu, 37, a professor at the University of Chicago, together with Ma Xiao and Zaher Hani, made a breakthrough on Hilbert's sixth problem by providing a rigorous mathematical connection between microscopic particle dynamics and macroscopic fluid equations.

Wang Hong, 35, a tenured professor at the Institut des Hautes Etudes Scientifiques in France and a Silver Professor at New York University's Courant Institute School of Mathematics, Computing, and Data Science, resolved with Joshua Zahl the three-dimensional Kakeya conjecture — a mathematical problem unsolved for over a century — using analyses and a geometric theory.

Different paths

Their journeys to global recognition followed markedly different paths.

Deng took the typical route for gifted students in China — winning a gold medal at the International Mathematical Olympiad and gaining admission to an elite mathematics program.

Wang's progress was far more unconventional, Xinhua News Agency reported. Hailing from Guilin in the Guangxi Zhuang autonomous region and lacking formal math Olympiad training, she skipped two grades and entered Peking University at the age of 16.

She initially enrolled in the School of Earth and Space Sciences but transferred to the mathematics program, driven by her interest in the discipline.

Tian Gang, a professor of mathematics at Peking University and an academician of the Chinese Academy of Sciences, said Wang studied in a highly competitive environment with many brilliant peers.

Tian said the awarding of the Fields Medal to Deng and Wang could inspire a new generation of Chinese students and scholars, instilling in them the confidence to tackle major mathematical problems.

However, he added while Chinese scholars are leading the world in some areas and are on par with top academics in others, the overall pool of mathematical talent in China remains limited.

"I believe there is hope for us in some of the core areas of mathematics," Tian said. "Chinese mathematicians can make even greater contributions to the world."

Yau raised concerns about the emphasis on mathematics competitions and training programs in China, which he believes can be detrimental to the search for genuine talent. Mathematical talent requires a solid foundation, as well as imagination, curiosity and resilience, he said in an interview with The Paper.

He said Tsinghua University's Qiuzhen College, established in 2021 to strengthen the cultivation of the country's mathematical talent, will soon undergo a comprehensive reform of its admissions and examination processes.

The goal is to recruit students who truly love mathematics, rather than those who are motivated by utilitarian goals or simply aim to enter prestigious universities, he said.

Competition system

In China, mathematics competitions remain one of the most visible ways for high school students to demonstrate ability. Since 2020, the Strengthening Foundation Plan has expanded admission pathways for students with strong potential in mathematics and other basic sciences.

> Debate on nurturing talent rekindled after China's major international accolades

However, only a small number of top performers enter university this way.

This competition system has also proved itself on the international stage. China won the 2026 International Mathematical Olympiad, held in Shanghai in July, finishing first overall with all six members earning gold medals and three achieving perfect scores.

At 18, Tang Mengmeng from Jiaxing, Zhejiang province, was among the best high-school mathematics competitors. She placed first at the 24th Chinese Girls' Mathematical Olympiad and won a gold medal at the Chinese Mathematical Olympiad.

Tang began mathematics competition training in high school and devoted about a year to intensive Olympiad preparation. Although she ranked among the country's strongest contestants, she did not join the national training squad and instead entered Tsinghua University through the *gaokao*, eventually studying electronic engineering.

Tang believes competitions and the *gaokao* develop different abilities. Olympiad problems reward deep exploration, creativity and persistence.

"You may spend four and a half hours solving just three questions, and even that is not always enough. The *gaokao* national college entrance exam, by contrast, demands broad knowledge, speed and consistency across multiple subjects," she said.

Despite her achievements, Tang chose not to pursue pure mathematics at university. She was attracted by the growth of technology-related fields and said electronic engineering offers a practical way for her mathematical background to be useful.

"Many mathematics graduates eventually move into areas such as finance, quantitative trading and education rather than pure research. I don't think I'd likely be able to stick with pure math forever," she said.

As technology-driven industries expand, mathematical thinking is becoming increasingly important beyond academic research.

The World Economic Forum's Future of Jobs Report 2025 identified analytical thinking as the most sought-after core skill among employers, with artificial intelligence and big data among the fastest-growing areas.

Mat Tang is vice-president of a Beijing-based game studio and oversees game development and product design.

But the 2008 Fudan University mathematics graduate did not enter gaming right away. He briefly worked in risk control at a State-owned bank before moving into game development, inspired by a mathematics alumnus in the industry.

"I was fascinated by the way he described game development. I enjoyed playing games myself, and creating virtual worlds through design and technology sounded exciting," said Mat.

In the early stage of his career, Mat focused on game systems and numerical design, building mathematical models for combat systems, in-game economies, and player progression.

"Game development teams were smaller and less specialized at that time. As a mathematics graduate, I was often responsible for anything related to numbers and formulas," he said.

His work involved translating gameplay rules into mathematical models, adjusting parameters and using programming tools to test different scenarios.

For Mat, the lasting value of mathematics lies less in specific formulas than in the way it trains people to approach problems.

"When dealing with complicated problems, it pushes you to make your assumptions clear and explain why a conclusion follows," he said.

"Mathematics research and competitions are paths that only a small number of people pursue. For most people, the value of mathematics lies in applying it to real problems, developing the ability to keep learning and understanding the patterns behind the world," he said.

Beyond medals

Yuan Yuan's 14-year-old son is in a science-track class at a leading secondary school in Shanghai. He began learning mathematics outside school in kindergarten and later performed strongly in competitions.

"At that time, I saw mathematics mainly as a way to help him enter better schools," said 40-year-old Yuan. "Medals, rankings and admission opportunities become visible indicators. It is easy for parents to equate being good at mathematics with winning competitions," she said.

But her perspective changed after her son entered the science-track class, surrounded by many highly capable students. "He realized that being good at math in his previous environment did not necessarily mean standing out here," said Yuan.

For Yuan's son, the transition was challenging. "A lot of the time, he could solve a problem only in the exact way he had learned it. Once the question changed slightly, he struggled to adapt," said Yuan.

His academic scores fluctuated, and his confidence was affected. "The boy who used to sit with a hard problem for an hour or two and light up when he cracked it stopped wanting to think that deeply, because the schoolwork just kept piling up," said Yuan, adding he started to question whether he was actually good at math.

As his school adjusted its competition program, his participation in competitions ended, and he now focuses more on broader math learning.

Yuan's experience reflects a broader debate among Chinese families over how early and seriously children should pursue mathematics.

The tutoring industry itself was reshaped in 2021, when the "double reduction" policy restricted for-profit, curriculum-based tutoring for students from kindergarten through ninth grade.

For more than a decade, Yan Lingling has observed changes in the education landscape, first as a math teacher at TAL Education Group and later as the founder of Factorial Excellence Training. One major shift she has witnessed is that families are beginning to plan mathematics education earlier than before.

"When I first entered the industry, most families started planning mathematics learning around Grade 1. Now some begin as early as kindergarten," said Yan.

Many parents judge mathematical potential through indicators, such as high exam scores, quick classroom responses or strong academic performances. But these signs do not always show whether a child can understand concepts deeply or solve problems independently, Yan said.

"If we look at future potential for advanced mathematics learning, early signs may include strong number sense and quick mathematical thinking. But as children grow, it is equally important to see whether they can understand concepts, solve problems independently and develop good learning habits," said Yan.

Beyond speed and immediate results, persistence also plays an important role.

Yan has also changed her view of how mathematical potential should be judged. Institutions often assess children by whether they have developed certain knowledge systems and problem-solving approaches. However, such assessments may also place children with fewer early learning opportunities at a disadvantage. A child who scores 70 or 80 in primary school mathematics, she said, may not lack ability, but may simply have had fewer opportunities for early guidance.

Parents' attitudes are also changing. "More families are becoming calmer. They are no longer simply pushing children to compete but are trying to match learning resources with their children's abilities," said Yan.

For parents whose children show no immediate strength in mathematics, Yan advises focusing on long-term development.

"Start with learning habits, take things step by step, provide resources that match the child's ability, and take a long-term view rather than expecting immediate results," she said.

Balanced approach

Xu Lu, an associate professor of probability theory and mathematical physics at the Gran Sasso Science Institute in Italy, experienced several educational pathways of Chinese mathematics.

He underwent competition training at No 2 High School of East China Normal University and studied mathematics at Peking University, followed by doctoral studies at the University of Tokyo and postdoctoral research at Paris Dauphine University.

Xu sees mathematics more as a way of understanding the world than a path to academic recognition. "Starting from a limited set of conditions and arriving at a definite conclusion through logical reasoning is deeply rewarding."

Encouraged by his parents and teachers as a young student, he explored increasingly challenging problems beyond regular coursework.

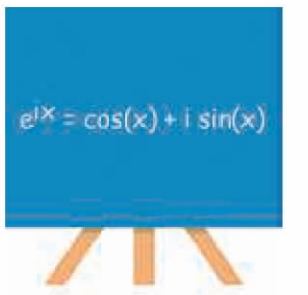
Like many competition students, Xu once hoped to enter Peking University through a recommended admissions pathway, but eventually made it through the *gaokao*. The experience taught him that goals and pathways are not always the same.

"The biggest difference is the nature of the task. Competition problems are carefully designed, with clear conditions and goals, while research is a much more open-ended process," said Xu.

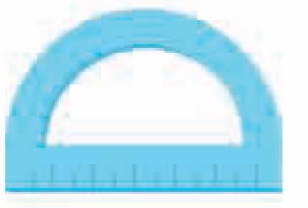
Researchers must first consider whether a question is meaningful and worth pursuing, he said. "Sometimes the problem itself is not clearly defined, and the direction needs to be adjusted along the way," he said.

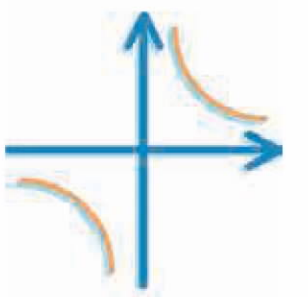
Xu believes aptitude for the subject should not be limited to ultimately becoming a mathematician. "Using mathematical methods to solve practical problems, building models, analyzing data and applying mathematics to other fields are also forms of mathematical ability," said Xu.

Competitions cannot measure qualities such as identifying meaningful questions, discovering new directions and remaining patient through uncertainty. "Whether someone is suitable for mathematical research cannot be judged only by competition results," he said.



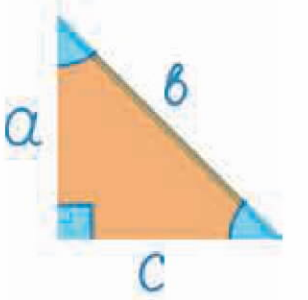
While awards such as the Fields Medal represent some of the most visible achievements, Xu sees them as only one part of mathematical achievement.





"Breakthroughs and top awards are important, but they do not represent all forms of success. Developing useful theories, proposing meaningful questions, explaining existing ideas from new perspectives and helping the growth of future generations are also valuable contributions," said Xu.

He believes mathematical training makes people pay more attention to evidence, question assumptions and consider whether a conclusion truly follows from its conditions.



"Whether someone is suited to mathematics should never be treated as a one-time judgment. A person who continues exploring questions, adjusts their thinking over time and gains genuine satisfaction from the process is often the one who can go further," said Xu.

License delays taking toll on US companies

Survey reveals firms suffering huge losses in exports and decline in global market share

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

Inside
Comment, **page 6**

Companies from the United States surveyed by the US-China Business Council have reported massive losses in exports and a decline in their global market share due to monthslong delays over the US export licensing regime, which they said was slow and allowed foreign countries to fulfill orders much more quickly.

"Monthslong licensing delays are costing the United States billions of dollars in exports and eroding American market share globally," the USCBC found in a flash survey of companies released on Tuesday.

The findings from the survey, conducted in July by the nonprofit association, involved 31 companies from a variety of industries including technology, manufacturing, energy and healthcare.

According to the findings, 73 percent of the surveyed companies said license delays led to lost sales to Chinese competitors, and 64 percent of the companies said they lost market share in China.

Additionally, the "export licenses are for items that are already available in China from Chinese or international suppliers, effectively sidelining American companies for no strategic gain", the report said.

The report comes as trade issues over technology and restrictions resurfaced between the US and China over the past few months.

In July, the US imposed new Section 301 tariffs on goods from China and dozens of other trading partners at differing rates, over allegations of a lack of enforcement of "forced labor" bans.

The US Federal Communications Commission has also unveiled a ban on new foreign-made humanoid robots and power inverters.

At least 95 percent of those polled said that long license review times were their most common problem.

Around 71 percent experienced delays in receiving a license to specifically export items to China.

The survey said that "poorly calibrated US export controls weaken American companies in China", which gave market share to foreign competitors while "reducing the profits available for research and development".

The USCBC report found that when the order is filled more quickly by a non-US competitor, US companies incur huge losses. The companies said the extended processing times also made them look like unreliable suppliers.

For some, this led to billions of dollars in losses. "More than one-third of companies, or 36 percent, have faced at least tens of millions of dollars in losses from delayed licenses, with multiple companies suffering hundreds of millions or even billions of dollars in losses," the survey said.

The survey uncovered a series of other major issues faced by US companies while navigating licenses. These ranged from unreliable communication with licensing officers to unclear policy interpretations.

Some companies described being "unable to reach licensing officers by phone, confusion over the scope of the Foreign Direct Product Rule, and ad hoc actions that bypass standard processes".

Another point of confusion was the "Affiliates Rule", which extends export restrictions to parties which are at least 50 percent owned by entities on the Entity List or Military End-User List.

It was issued as an interim final rule in September 2025 and took immediate effect, but has since been suspended until November, leaving many companies in limbo, the report said.

Some companies added that they had faced unjustified export license rejections.

The USCBC said that at least 66 percent of the companies have had licenses pending for at least three months, exceeding the US Department of Commerce's statutory requirement to process applications within 90 days.

Meanwhile, 31 percent have had licenses pending for one to two years, the survey found.

That stands in contrast to previous US administrations, which 56 percent of the companies said took one to three months to review comparable export licenses.

The US Department of Commerce's Bureau of Industry and Security showed in reports to Congress that the average processing time for export licenses slowed to an average of 62 days in 2025, compared to 38 days in 2023.

"The facts are clear: delayed license approvals enable Chinese and international companies to backfill American products," the report said.

C919 completes first international commercial flight

By **LUO WANGSHU**
luowangshu@chinadaily.com.cn

Air China introduced China's domestically developed C919 large passenger aircraft on its daily Beijing-Ulan Bator route on Wednesday, marking the narrowbody jet's first international commercial flight.

Flight CA723 took off from Beijing Capital International Airport at around 3 pm and touched down in the Mongolian capital at 4:58 pm local time, according to Air China. The return flight, CA724, departed Ulan Bator at 7:04 pm local time, and arrived in Beijing at 8:49 pm, according to Umetrip, a Chinese aviation travel service platform.

The move takes the C919 beyond the domestic network, where it has accumulated most of its commercial experience since entering service in 2023. The aircraft's previous appearances overseas have been at air shows and for demonstration flights. In 2024, it toured Vietnam, Laos, Cambodia, Malaysia and Indonesia to test compatibility with airports, ground equipment and flight procedures, according to its manufacturer, Commercial Aircraft Corporation of China.

According to COMAC's official website, the C919 seats 158 to 192 passengers and has a range of 4,075 to 5,555 kilometers. It received its type certificate from the Civil Aviation Administration of China in September 2022 and made its first commercial flight with launch customer China Eastern Airlines in May 2023.

As of Monday, C919 aircraft operated by Air China, China Eastern and China Southern were serving 57 routes connecting 25 cities and had safely carried more than 7.5 million passengers, according to COMAC.

Hao Xin, an Air China C919 captain who transitioned to the fleet in 2024, earlier told China Daily that the aircraft had become part of the carrier's routine operations, supported by coordinated scheduling, maintenance and ground services.

"Safety margins and procedures don't change when demand is higher. We rely on the same rules every day," he said.

Lin Zhijie, a civil aviation industry analyst, said that C919s will "certainly fly to more countries".

"The point is not simply to fly farther, but to operate out of more demanding airports and in different markets, especially mature aviation markets. That is where the aircraft can build experience and demonstrate its capabilities," he said.

Lin said certification by major overseas regulators should be viewed as a door opener and an accelerator for wider market access, rather than the sole measure of the aircraft's international progress. Its overseas support network, including maintenance, spare parts, training and technical assistance, is still being developed, he added.

Giant work of art

People view an enormous *thangka* painting during a traditional "sunning of the Buddha" ceremony at the Drepung Monastery in Lhasa, Xizang autonomous region, on Wednesday. During the event, temples unfurl giant *thangka* on a viewing platform or hillside for the public to view. The event also marked the opening of the traditional Shoton Festival, which features yogurt banquets and Tibetan opera performances. JIANG FAN / XINHUA

Drone strike

Emergency and safety teams contain a blaze at an oil refinery in Zawiya, Libya, on Tuesday. Authorities said the roof of a diesel storage tank was targeted by a drone, sparking a fire, and that there were no "serious injuries". Libya's National Oil Corporation said an investigation into the attack was underway. YOUSEF MURAD / AP

Green: Legacy power hubs get tech overhaul

From page 1

"The megaproject ensures a highly stable and reliable power supply for Brazil's core economic regions, successfully resolving the nation's developmental bottleneck of spatial energy mismatch," said Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute.

Ye emphasized that the project establishes a global paradigm for cross-regional clean energy transmission, proving the safety, maturity and global applicability of China's ultra-high-voltage grid technologies.

Beyond Brazil, China's clean energy footprint is having a transformative impact across other extreme terrains in South America. In Argentina, the Cauchari solar project stands as one of South America's largest single photovoltaic power stations, and is the world's highest-altitude solar park.

Situated over 4,000 meters above sea level in the Andes Mountains, the 315-megawatt complex features more than 1.2 million solar panels. The landmark installation has ended Jujuy province's long-standing reliance on power transmitted from other provinces, achieving local energy self-sufficiency.

Furthermore, China's unparalleled expertise in hydropower operation has breathed new life into Brazil's legacy energy assets. Through a landmark $3.7 billion transaction establishing a 30-year concession, CTG Brasil officially took over the operation of the Jupia and Ilha Solteira hydropower stations, which feature a combined capacity of nearly 5 million kilowatts and meet the electricity needs of over 6 million people annually.

Rather than merely managing the aging infrastructure, CTG initiated a monumental technical overhaul. By upgrading mechanical equipment that had operated for nearly half a century into fully digital and intelligent monitoring systems across 12 generating units, CTG successfully performed a "heart transplant" on the legacy power hubs.

Industry observers said these milestone projects are just the beginning. As more Latin American nations accelerate their ecological transition, Chinese enterprises are poised to deepen their engagement through localized manufacturing, joint research and green financing under the framework of high-quality Belt and Road cooperation.

As this Sino-Latin American energy synergy continues to unfold, it proves that China's mature grid and generation solutions are essential enablers for emerging economies seeking to decarbonize at affordable costs while maintaining power stability and self-sufficiency, said Ye.

"Together, China and Latin America are actively charting a shared, sustainable course for the global energy revolution and setting a powerful example for Global South cooperation," he said.

Pressure: ASEAN businesses cannot afford to wait

From page 1

Releases from Japanese reserves, new feedstocks for refineries in Malaysia and the Republic of Korea and increased US exports have all helped the region manage the energy price and supply shock far better than it did the 1979 oil shock.

But growth in the region has slowed, fuel subsidy policies are being reviewed and rising carbon prices are incentivizing more emissions reductions. Although the global recession that was forecast has not materialized, the lesson for the region is to urgently build energy resilience with new technologies and new sources of supply.

In Southeast Asia there are developments like the ASEAN Power Grid, and proposals to connect energy infrastructure through initiatives such as the Indonesia-Singapore-Malaysia gas pipeline, the Lao-Thai-Malaysian-Singaporean electricity transmission system, the proposed submarine electricity cabling and the interest in offshore wind turbines.

At the same time, AI data centers are proliferating throughout the region. This tech shock differs from previous technology waves because agentic models are developing so fast. There is a race to build huge data centers.

There is so much that we do not yet know. Will we see AI continue to make such vast strides? How will it be used by industry, governments and people? What new products and services might it deliver? Will we really see the productivity growth that has been promised? And how will governments address the white-collar job displacement that is already underway?

There are more questions to ask about data centers. Will they continue to be built at such a large scale, and, if so, how will the demand for energy and water be met? Will they be located near energy generation or near factories and cities? How will industrial processing be priced? How can data be protected? Will the data centers be owned by big tech firms or by industrial operators?

Southeast Asian businesses are watching how China deals with AI and data centers, seeking answers to these questions.

Currently, it seems the development pace of Chinese AI models is some months behind the US, but the new models are being developed more cheaply.

Can China achieve the same scale of production and innovation that it achieved with green technology, to deliver cheaper AI and more energy-efficient data centers? What about the availability of renewable energy, the land necessary for data centers and expanding the capacity of transmission lines for electricity and fiber optic cables for data?

One big question is whether China will become a major hub for the region's data processing, or whether other countries will want their own. Would a strong regulatory regime be sufficient to guarantee data sovereignty? Will Asian users convert to either US or Chinese technology stacks, or will they aim for a dual ecosystem?

ASEAN will no doubt be looking for homegrown capability based on open-source Chinese models, but they will still need infrastructure, semiconductors, technical standards and ongoing engineering support. Singaporean AI models have adopted Alibaba's architecture; Chinese semiconductor fabrication plants are being built in Malaysia and elsewhere.

ASEAN businesses do not want to be caught up in a US-China digital trade war, but they cannot afford to wait.

Facility: Project joins broader tour trail

From page 1

With a total investment of 746 million yuan ($110.7 million), the 816 Project spanned 18 years — eight of blasting, excavation and concreting to carve out the cavern complex, followed by a decade of interior construction, equipment installation and plant fit-out — before the order to stand down came in 1984.

The facility never produced a gram of plutonium, and neither was any nuclear material ever stored within its walls.

The complex comprises 18 massive caverns and more than 130 passageways, including pilot tunnels, branch tunnels and shafts. Visitors can walk through the reactor bottom cavity, the colossal reactor hall, the diversion tunnels and the thermal circuit building.

Modern lighting bathes the rock in blues and whites, and the reactor hall — the largest cave at nearly 80 meters high and 25 meters wide — is like something out of a science fiction movie.

Since January 2024, a 60-minute immersive live-action show, Cave 816, has been staged regularly.

"It is impressive. So big, and all these levels," said Adriana Hart, a visitor from Los Angeles. "This is really something that you have to come and see with your own eyes to (appreciate) how spectacular this place is."

For Zheng Zhihong, general manager of the scenic site, the goal is to transform the 816 Project into a world-renowned industrial heritage destination. Local authorities have woven the site into a broader itinerary called the 503 Geocentric Loop Tour, linking it with the dramatic natural landscapes of Wuling Mountain Grand Canyon and the Baiheliang Underwater Museum, one of the world's oldest hydrographic survey sites.

To cap it off, visitors can enjoy a glass of red wine and a meal at the on-site military-themed restaurant, where the cavernous, concrete-walled interiors provide a fitting backdrop to this globally promoted tour.

CityDance

ACROSS BOUNDARIES, BEYOND TRADE

China-Mongolia friendship takes center stage, underscoring stronger partnership

By **YANG RAN** in Erenhot, Inner Mongolia and **YUAN HUI** in Hohhot

The city of Erenhot, located in the Inner Mongolia autonomous region, is often called China's "Northern Gate", as it is the critical entry point where the China-Mongolia railway first touches Chinese soil from the neighboring country.

In this bustling hub, the city center lies just 9 kilometers from the center of Zamyn-Uud, its Mongolian twin.

For many, this brief distance translates into a rapid crossing, often taking just about an hour, seamlessly blurring the boundaries between the two nations.

For Badrakh, a 56-year-old tailor from Mongolia, these mere 9 km transcend a simple geographical divide.

For over two decades, Badrakh has crafted traditional Mongolian robes with scissors and needles. But years ago, he made a pivotal decision: to move his established shop from Mongolia to Erenhot.

The seeds of this cross-border move were planted in 2018, when his cousin, who had married and settled in Erenhot, brought him a special order: dozens of Mongolian dance costumes for a local middle school. This gave Badrakh his first glimpse of Erenhot's market potential and vibrant commercial energy.

By 2023, Badrakh had opened his shop, PuBa Tailor, in Erenhot, drawn by the city's convenient access to a wide array of fabrics and competitive prices.

Today, Badrakh's life is inextricably linked to both Erenhot and Zamyn-Uud. He said many of his Mongolian friends cross the border daily, engaged in purchasing, transportation, and trade.

"Erenhot and Zamyn-Uud are critical hubs for China-Mongolia trade. Without these two cities, large-scale goods transfer would be impossible," Badrakh said.

A millennium of connection

The vibrant commercial relationship between the two places stretches back much further.

"Cross-border exchanges between the two cities can be dated back to the Yuan Dynasty (1271-1368)," said Hong Hongxia, deputy director of the Foreign Affairs Office of the Erenhot Municipal Government.

During the Qing Dynasty (1644-1911), the Yilin Post Station was set up in what is now the Erenhot area. Merchants would stop there to rest, exchange goods, and catch up on the latest news.

"Back then, the Erenhot and Zamyn-Uud regions served as key neighboring stopovers along the Silk Road, the ancient Great Tea Route, and other major trade routes, fostering spontaneous local trade for over two hundred years that laid a natural groundwork for deep people-to-people connections," Hong said.

The modern bond is inseparable from the railway. In January 1956, the Beijing-Ulaanbaatar-Moscow international railway line went into full operation.

It catalyzed the founding of Erenhot as a town on the Chinese side of the border and the establishment of Zamyn-Uud as a village on the Mongolian side, with the latter becoming the first railway hub for entry into Mongolia.

In 1991, the double-track railways connecting China and Mongolia were linked up within Zamyn-Uud, strengthening the logistics lifeline of the two cities on the Gobi Desert, Hong said.

"In 1992, the highway port opened for two-way traffic, normalizing civilian trade, family visits, and tourism. The foundation for sister-city cooperation was firmly established even then."

In 2019, Erenhot and Zamyn-Uud officially signed a sister-city agreement, making them a unique pair of border-port sister cities. They are not just neighbors but a model of friendly cooperation between China and Mongolia, Hong emphasized.

Official data from Erenhot underscore this closeness: Erenhot port handles over 70 percent of personnel exchanges between China and Mongolia and more than 80 percent of China's exports of livelihood supplies to Mongolia. Last year alone, the port recorded nearly 2.82 million border crossings — almost 8,000 people every day.

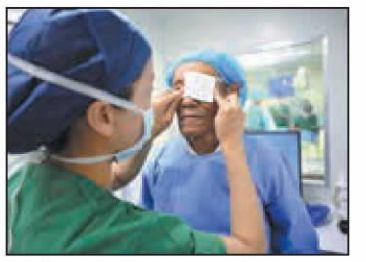
Driving growth

The logistics parks near the Erenhot highway port offer vivid testimony to these increasingly close trade ties. At the Erenhot Huitong International Logistics Park, there's a constant stream of trucks, while forklifts tirelessly load and unload cargo.

Top: An aerial view of China-Europe freight trains at Erenhot port in North China's Inner Mongolia autonomous region on June 24. ZHANG HAIFENG / XINHUA **Above from left:** A group of about 100 Mongolian students enter China through the Erenhot land port on April 7. Volunteers and a policeman help a Mongolian patient with vision problems get off the train on May 19 in Erenhot as he arrives for treatment under the "Belt and Road · Brightness Journey" project. PHOTOS BY GUO PENGJIE / FOR CHINA DAILY

According to Aruuhan, the park's office director, most goods exported from Mongolia to China are first transported to Zamyn-Uud. They then enter China through the Erenhot port.

Built in 2011 and operational since 2012, the park has witnessed the evolution of China-Mongolia trade. "Since 2023, the park has seen a significant increase in import volumes, primarily mineral products and meat, reaching an annual total of around 1 million tons in recent years," Aruuhan said.



This increasingly frequent cross-border movement and smooth flow of goods underpin continuous efforts to upgrade China-Mongolia economic cooperation.

In March 2024, the establishment of China-Mongolia Erenhot-Zamyn-Uud Economic Cooperation Zone was approved. Spanning 18.03 square kilometers — 9.03 on the Chinese side and 9 on the Mongolian side — it is China's third cross-border economic cooperation zone with a neighboring country.

This April, the China (Inner Mongolia) Pilot Free Trade Zone Erenhot Area was established. The Chinese part of the earlier-approved economic cooperation zone was integrated into this new free trade zone, injecting significant new dynamism into Erenhot's opening-up.

Dou Xiaoping, deputy director of the Administration Committee of the China (Inner Mongolia) Pilot Free Trade Zone Erenhot Area, said the China-Mongolia Erenhot-Zamyn-Uud Economic Cooperation Zone was established to leverage the respective strengths of both countries.

"The Chinese side focuses on international logistics, import and export processing, and cross-border tourism, capitalizing on its market, technological, and capital advantages to accelerate the establishment of a modern cross-border industrial system. Meanwhile, the Mongolian side prioritizes bulk commodity logistics and international trade, leveraging its resources, geographical, and policy advantages," he said.

A volunteer assists a Mongolian patient who had undergone cataract surgery in Erenhot on June 21, 2025. AO LAN / CHINA NEWS SERVICE

Strategically located on the border adjacent to the Erenhot and Zamyn-Uud ports, the cooperation zone will operate under special customs procedures once fully established.

The cooperation zone already hosts over 20 registered enterprises, covering high-tech fields like new energy and computing power, he said.

Civil ties

Beyond trade, Erenhot and Zamyn-Uud are also playing an increasingly important role in connecting China and Mongolia in areas crucial to people's livelihoods, such as education and healthcare.

Li Jingmei, president of Erenhot People's Hospital, said the hospital established a cooperation relationship with Zamyn-Uud Hospital in 2014.

The two sides now have a regular mechanism for mutual visits and exchanges, with Mongolian medical staff coming to Erenhot for professional exchanges each year, she said.

"To better serve Mongolian patients who come here for treatment, the hospital has assigned two full-time medical staff fluent in Mongolian to provide reception and translation services," Li said. "In the past two years, the hospital has served over 3,000 Mongolian patients annually, continuously boosting Erenhot's cross-border medical outreach and influence."

Liang Zeshang, vice-president of the hospital, traveled to Mongolia last October for a voluntary medical outreach program. What struck him most was the local people's enthusiasm for traditional Chinese medicine.

"Many people are interested in traditional Chinese treatment methods. During the outreach, many Mongolians lined up daily to participate. Local medical staff also expressed great enthusiasm for techniques like acupuncture and medicinal *tuina* massage, and even expressed a desire to come to China to study."

In education, Erenhot also plays a crucial connecting role. Located close to Mongolia with seamless cross-border travel links, the city has become a popular destination for Mongolian students.

According to Su Ying, deputy director of the Erenhot Municipal Education, Science, and Technology Bureau, Erenhot has been offering educational programs for Mongolian students since 1992.

Over the decades, the city has educated more than 6,800 Mongolian students, now providing comprehensive services across all academic stages — from kindergarten to high school.

For 17-year-old Michidmaa, who attended high school in Erenhot, studying in China has not only allowed her to master Chinese but also to deeply experience Chinese culture and societal vitality. "This has strengthened my desire to continue my studies in China," she said. "My interest in Chinese culture fuels my desire to learn more here and drives me to keep exploring."

According to Su, a total of 104 Mongolian high school students graduated from Erenhot this year. To date, 49 have secured admission to top-tier Chinese institutions, including Fudan University, Wuhan University, and Zhejiang University.

Where borders become bridges

Yang Ran
Reporter's log

Before my visit to Erenhot, the word "national border" evoked images of strict divisions and formidable barriers. But after stepping into this border city on China's northern frontier, that familiar image began to dissolve.

Trade and economic cooperation zones along the sprawling border between China and Mongolia have transformed Erenhot into a vibrant channel of commerce, and a living connection between communities.

Erenhot is China's largest land port to Mongolia, and its most iconic landmark — the National Gate scenic area — straddles railways linking the two countries.

Every day, around a dozen trains rumble beneath the gate, carrying freight between China and Europe and passengers between China and Mongolia.

A short drive away lies the Erenhot Border Residents' Mutual Trade Zone, the first of its kind along the China-Mongolia border. Since opening in 2017, it has become a means for locals to improve their livelihoods.

Registered residents on both sides of the border can trade duty-free, with a daily allowance of up to 8,000 yuan ($1,176) per person — a policy that has turned the border into a gateway to prosperity.

Official figures demonstrate the impact. In 2025, the total trade volume reached 800 million yuan, generating over 6 million yuan in additional income for local residents.

While the border trade zone boosts small-scale commerce, the China-Mongolia Erenhot-Zamyn-Uud Economic Cooperation Zone, established in 2024, aims to take it a step further. Spanning roughly 9 square kilometers on each side of the border, the zone focuses on international trade, cross-border logistics, and more.

Erenhot is also making it easier for ordinary people to cross the border. Since November 2023, vehicles with eight seats or fewer have been allowed to cross into Erenhot, making it easier to drive between the two countries.

On the streets of Erenhot, Mongolian cars with distinctive black-on-white license plates are a common sight. Their passengers are often Mongolian merchants and citizens who have traveled specifically to shop. For them, Erenhot is not just a neighboring Chinese border city, but an affordable, well-stocked, and welcoming shopping destination.

This is most evident at Yiwu Commerce and Trade City and Wenzhou International Trade City Mall in Erenhot. Here, Cyrillic Mongolian emblazons nearly every shop sign — a small yet telling indicator of deeply interwoven communities.

Badrakh, a Mongolian tailor who has lived in Erenhot for three years, exemplifies this integration. "I can find everything I need in these markets. Shop owners even had buttons custom-made for traditional Mongolian robes I make. I've been working with these shop owners for three years now, and we've become like family," he said.

Badrakh's experience isn't an isolated case. Understanding and friendly exchanges break down language barriers in Erenhot's bustling markets.

Xu Yiwei, a fabric merchant at the Wenzhou International Trade City Mall, came to Erenhot a few years ago to take over the family fabric business.

Now the 37-year-old from Hangzhou has not only learned Mongolian for daily conversation but also become an expert in the patterns and colors favored by Mongolian customers.

His WeChat contact list is filled with Mongolian clients. Thanks to the rapid growth of cross-border logistics, many of them now order directly online.

Beyond business, Xu has built friendships with some of his customers — a few have even invited him to visit Mongolia.

Mourning declared as Colombia quake rescue continues

Patients from a clinic evacuated due to earthquake damage lie in beds at a temporary facility set up in a gymnasium at a nearby school in Cali, Colombia, on Tuesday. SANTIAGO SALDARRIAGA / AP

PEREIRA/CALI — Colombia on Wednesday declared three days of mourning for victims of an earthquake that demolished buildings in the west of the country, killing more than 200 people, as rescue crews continued searching collapsed buildings in western Colombia.

The 7.4 magnitude earthquake killed at least 254 people and injured more than 2,595, while more than 100 aftershocks were recorded in affected areas as of Tuesday afternoon.

The quake, the most devastating to strike Colombia this century, hit the country's coffee-growing region early Monday, bringing down apartment blocks and homes and damaging schools, hospitals and other public facilities.

In Pereira and Cali, rescuers used cranes, excavators, sniffer dogs and their bare hands to search collapsed buildings, while volunteers formed human chains to remove debris. In Cali, residents joined firefighters with picks and shovels, while in Pereira, army units combed through concrete and exposed steel.

Many residents spent the night outdoors because their homes were damaged or because they feared further aftershocks. A park in Pereira was turned into a temporary shelter with tents and mattresses, while sports centers and other facilities were being prepared to accommodate people affected by the quake.

The earthquake also damaged hospitals and other public facilities. In Cali, part of the Hospital Universitario del Valle collapsed, forcing doctors to move patients into a parking lot and treat some people in the open air.

Thousands of families awaited safety assessments of damaged properties. Dog and cat shelters also appealed for food, medicine and volunteers, while residents brought water, food and other supplies to affected neighborhoods and lined up at blood donation centers.

Communities in Choco, close to the quake's epicenter, remained without power or basic services. On Tuesday afternoon, three airports remained closed, while many areas, particularly Choco, still lacked gas, water and electricity. Some major highways also remained closed, Reuters reported.

Damage assessment

The National Coffee Federation was working with families to assess damage to farms and rural infrastructure, while communications remained patchy in some of the worst-hit areas. Officials said it could take days to establish the full extent of the damage and the final death toll.

Colombian President Abelardo de la Espriella declared a state of emergency and promised rent subsidies for affected families during a visit to Pereira on Tuesday.

International assistance was also being offered. The United States announced $15.5 million in emergency aid and Mexico's president said she is prepared to send hundreds of search and health workers, tons of health supplies and other equipment.

China will provide assistance in an appropriate manner based on Colombia's needs, said Tang Ying, spokeswoman for the China International Development Cooperation Agency on Tuesday, while other countries also offered assistance.

AGENCIES VIA XINHUA

NATO-style pact signals doubts over US commitments

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

The Mecca Joint Defense Agreement, signed recently by Saudi Arabia, Turkiye and Pakistan, reflects the security pressures facing the three countries amid the deteriorating situation in the Middle East and their growing doubts about the reliability of US security commitments, while its practical impact and effectiveness remain uncertain, experts said.

The agreement was signed by Saudi Crown Prince and Prime Minister Mohammed bin Salman bin Abdulaziz Al Saud, Turkish President Recep Tayyip Erdogan, and Pakistani Prime Minister Muhammad Shehbaz Sharif during a joint defense summit held in the Saudi city of Mecca on Aug 7.

Turkish Foreign Minister Hakan Fidan said on Aug 8 in an interview with Turkiye's Anadolu Agency that several countries have shown interest in joining the deal, voicing confidence that Egypt, which he called a "natural partner", will "be among us in the next stage". He said the agreement does not target Iran, clarifying that the deal is defensive in nature and aimed at protecting signatories from external "attacks".

The pact stipulates that an armed attack on any one of the three countries would be regarded as an attack on all. However, few details have been made public so far regarding the specific commitments of each country, and it remains unclear to what extent the pact would require them to take concrete military action in one another's defense.

According to a joint statement issued after the summit, the agreement reflects the three countries' commitment to strengthening their collective security and safeguarding regional peace and stability.

It seeks to bolster collective deterrence against any act of aggression and deepen defense cooperation across all sectors, the statement read.

Ding Long, a professor at Shanghai International Studies University's Middle East Studies Institute, said the agreement reflects growing doubts among Gulf states about the reliability of US security commitments, as well as their efforts to seek "additional security protections" amid an increasingly uncertain regional security environment.

As the conflicts involving the US, Israel and Iran spill over into the wider region and clashes between Yemen's Houthi militants and Saudi Arabia escalate, doubts are growing over Washington's security commitments to its Gulf allies, he said.

The fact that US military bases themselves have come under attack has further exposed the limitations of Washington's ability to provide security in the region, he said.

"The new trilateral defense agreement reflects growing dissatisfaction among Gulf countries, including Saudi Arabia, with the limitations of the US security umbrella, as well as increasing doubts over the reliability of US security commitments," Ding said.

He said the agreement signals a gradual shift away from the US-led security framework in the Middle East, as countries across the region increasingly seek greater security autonomy and diversify their security partnerships.

Ding also said the agreement does not signal a move toward "de-Americanization", but rather reflects efforts to reduce reliance on the US as the sole security provider.

"All three countries maintain long-standing security ties with the US, but have emphasized that the agreement will neither terminate nor replace their existing bilateral and multilateral security commitments," he said.

Regional influence

Shakeel Ahmad Ramay, CEO of the Asian Institute of Eco-Civilization Research and Development in Pakistan, said the agreement will undoubtedly influence regional dynamics, alliances and strategic alignments.

"Current trends suggest that the US and the West could face setbacks as a result of policies that have fueled perceptions of interference, prolonged conflicts, hegemonic ambitions and the extraction of benefits at the expense of regional countries," he said.

"Most importantly, there is a growing trust deficit, compounded by what many regional countries view as Washington's excessive and unjustifiable support for Israel," Ramay said.

The agreement may face numerous practical challenges in implementation, and its future remains uncertain, experts said.

"Government officials will meet to discuss future policies and actions, while a permanent secretariat will be established to oversee the implementation of the agreement. So, we need to wait for the outcome of the committee's meeting to see how the agreement will actually be implemented," Ramay said.

At present, the three countries face primary security concerns in different geographic theaters. If intense hostilities were to erupt, it would be difficult to mount a coordinated military response, Ding said.

Meanwhile, according to a joint statement issued by the three countries, the pact is open to other members. However, further expansion could make it more difficult to coordinate joint defense efforts amid potentially divergent security interests and priorities, he added.

"At this stage, therefore, the alliance remains more political than security-oriented and, as some analysts put it, is 'more form than substance'. While it could serve as a prototype for an 'Islamic NATO', it still has a long way to go before becoming a formal and operational security alliance," Ding said.

Xinhua News Agency contributed to this story.

TikTok reversal exposes limits of security claims

Ownership and geopolitical factors underpin earlier restrictions: Experts

By **LI JIAYING**
lijiaying@chinadaily.com.cn

The United States' decision to lift a ban on TikTok for federal devices shows that earlier restrictions hinged largely on ownership and geopolitical factors, prompting Washington to re-examine its earlier security rationale, experts said.

Their comments came as the White House Office of Management and Budget rescinded its 2023 implementation directive in a memo dated Monday, saying the popular social media app no longer poses a national security threat and may be used on US government devices.

Chen Hong, director of East China Normal University's Asia-Pacific Studies Center, said the move carries symbolic weight beyond the limited number of federal devices directly affected.

"This is undoubtedly an important restoration of TikTok's standing in the US market," Chen told China Daily. The ban labeled TikTok as a national security risk, while its removal means that label has been removed in legal and administrative terms, he added.

"The move also reflected regulatory acceptance of the platform's operations and recognition of its compliance and security safeguards," said Pan Helin, a member of the expert committee for information and communication economy under China's Ministry of Industry and Information Technology.

In a sense, the policy shift came as the US government no longer had a basis for maintaining the restriction after TikTok's corporate structure was adjusted, Pan added.

The view follows a legal opinion from the US Department of Justice last month, saying that the restructured US version falls outside the statutory prohibition because the new TikTok USDS Joint Venture, operating independently of Chinese tech heavyweight ByteDance, is majority-owned by US investors and has revised its recommendation algorithm and cybersecurity program.

"The policy shift suggests that Washington's earlier security concerns over TikTok were driven primarily by its ownership structure and country of origin, rather than by specific technical risks," Pan said.

Chen echoed that the sequence of events exposes a weakness in the earlier security narrative. If TikTok had presented a major technical vulnerability, he said, that vulnerability could not have disappeared solely because the equity ratio and board composition changed.

In fact, the restructuring does not settle the wider debate over privacy protection. In an analysis published while the deal was taking shape last year, Nicol Turner Lee, a senior fellow in Governance Studies at the Brookings Institution, wrote that "the absence of a comprehensive US privacy law means that even with TikTok in the hands of American investors, concerns about user protections would persist".

Policy implications

Chen noted that TikTok has withstood repeated pressure largely because it is deeply embedded in the daily activities of US users, creators and small businesses, which would bear much of the cost of a ban.

"The lesson for US digital governance is that national security should not become an ever-expanding concept," Chen said. "Nor should every commercial, technological and social issue be securitized simply because a platform's parent company comes from a particular country."

The case also offers a cautionary lesson for Chinese technology companies entering the US market, where geopolitical risk assessment and response planning should be built into their overseas expansion strategies, Chen said.

"Companies should distinguish technical issues from politically driven allegations and, when faced with security claims unsupported by evidence, call for verifiable facts and standards applied consistently to all market participants," he added.

Envoy urges halt to West Bank settlements, violence

By **MINLU ZHANG**
at the United Nations
minluzhang@chinadailyusa.com

Palestinian children react on Tuesday after the upper floor of a relative's home was demolished following his death in clashes with Israeli settlers in the occupied West Bank. JAAFAR ASHTIYEH / AFP

A Chinese envoy to the United Nations on Tuesday called for immediate action to curb escalating violence in the occupied Palestinian territories, urging Israel to halt settlement activities and fully implement the Gaza ceasefire agreement.

Fu Cong, China's permanent representative to the United Nations, told an emergency Security Council meeting on the Palestinian question that China is "deeply concerned" about the recent escalation and mounting civilian casualties.

"The Palestinian issue must not be ignored or marginalized," Fu said, calling on the international community to act swiftly to stop violence, save innocent lives and uphold justice.

Fu said the situation in both the West Bank and Gaza has deteriorated sharply, with the Palestinian people enduring mounting suffering. "The root cause is that the basic principles of international law have not been observed, and the Palestinian people's rights to survival and development have long been disregarded," he said.

"Palestinian lives are as precious as those of any other people," Fu said, calling on the international community to safeguard the equal rights of the Palestinian people and uphold international fairness and justice.

'Dangerously escalating'

The situation in the West Bank is dangerously escalating, Fu said, citing settlement expansion, violations and damage to religious sites, blockades of refugee camps, mass arrests and growing settler violence.

Four Palestinians and one Israeli were killed in a recent incident in the West Bank, according to a statement by the Palestinian Health Ministry.

A total of 1,122 Palestinians have been killed in the occupied West Bank between the start of the Israel-Hamas conflict on Oct 7, 2023, and July 2026, including 76 killed this year, according to the UN Office for the Coordination of Humanitarian Affairs.

"Protecting civilians is not an empty slogan, but an obligation of the occupying power under international law," he said.

"Israel must implement Security Council Resolution 2334, halt settlement activities, curb settler violence and ensure serious accountability," Fu said, adding that the normal functioning of the UN agency in accordance with its mandate must be respected.

He also said China is concerned over the situation in Gaza, saying that Israeli military operations had continued despite progress announced on arrangements for the second phase of the ceasefire agreement.

The ceasefire agreement has been in place for 300 days, yet a lasting ceasefire has not been achieved, Fu noted. "The fundamental problem is not the lack of a ceasefire plan, but the lack of political will for a ceasefire," he said.

Fu called on Israel and relevant parties to "sincerely and fully" implement the Gaza ceasefire agreement and urged Israel to abide by international humanitarian law and lift restrictions on the entry of humanitarian supplies. "Countries with significant influence over the parties concerned should take concrete actions to ease the situation," he added.

Fu also reiterated China's support for the two-state solution, saying "Gaza and the West Bank are inseparable parts of the Palestinian state".

"Israel should end its illegal occupation of Palestinian territory as soon as possible and stop undermining the governance foundations of the Palestinian National Authority," he said.

China will continue to support the Palestinian people's pursuit of their legitimate national rights and work toward restoring peace and stability in the region, Fu said.

Some lawmakers shooting US in the foot by recruiting informants, excluding researchers

There is a spin on the old joke about politics in Washington: If you can't solve a problem, create a committee. If that doesn't work, set up a hotline. The latest punch line is: if the hotline fails, blame it on China.

This sorry state of affairs is exemplified by the United States House Select Committee on China, which stooped to a new low on Tuesday when it asked US students, postdoctoral researchers and academics to report cases in which they believe they were denied research opportunities in favor of applicants from China. In effect, the committee is encouraging them to become McCarthyist informants in a competition over who gets to work in US laboratories and research institutes.

The public reaction has been skeptical, even scathing. One respondent asked whether universities are really choosing "less qualified" Chinese applicants over US citizens. Another dismissed the appeal as "ignorant jingoism". Someone else bluntly asked: "Is enforcing racism the mission statement of the Select Committee on China?"

The committee has overlooked the fact that the US didn't build Silicon Valley, Boston's biotech corridor or its world-class universities by checking passports. It built them by creating an ecosystem in which talent crosses borders, laboratories exchange ideas and ambitious entrepreneurs are drawn to pursue their careers.

Some in Washington now seem determined to turn that competitive advantage into a perceived security vulnerability. In April, the committee established a "whistleblower" email, encouraging US scholars and faculty to report research collaborations involving entities allegedly linked to China's defense and industrial sectors. The committee doesn't realize that there is a vast difference between safeguarding classified systems and treating scientific exchange as suspicious.

The US cannot aspire to win the technology race while scaring away the very people who can help it achieve that goal. The White House lifted restrictions on the use of TikTok on federal government devices on Monday, after finding that the popular social media app no longer poses a "national security threat" following the US administration's coercive deal. Under the new arrangement, ByteDance retains a 19.9 percent stake in the US operations — a far cry from the outright divestiture Washington once demanded, yet sufficient to keep the Chinese parent company as the single largest shareholder in the joint venture. Yet a China-born scientist working alongside an American colleague for US projects can still be deemed suspicious enough to warrant a congressional "red line". What exactly is the committee trying to protect?

A bipartisan group of US senators visited China in May and received a clear message: understand China better, communicate more, manage differences and expand cooperation where possible. Two technologically advanced countries cannot effectively manage competition by severing contact. Even US entrepreneur Elon Musk put it succinctly on X on Tuesday: "China is awesome. I strongly encourage people to visit."

That is a useful thought experiment for the committee. What if its members visited China, Chinese students studied in the US and scientists from both countries collaborated while competing fiercely? In Washington, it seems, that amounts to "espionage".

Some China-hawk lawmakers seem to inhabit a world of their own making — one in which they sit by their inboxes waiting for tips about who supposedly "elbowed" whom out of an opportunity, then turn such allegations into a witch hunt. Policy built on prejudice and suspicion is not statecraft.

Treating collaboration as conspiracy and reducing international research to a crude zero-sum contest is intellectual paranoia dressed in legislative robes. For the US, the real danger is that it will gradually lose the habits that forged its technological edge: openness, curiosity, immigration, competition and the confidence that the best way to beat rivals is to be better than them.

The recent Fields Medal winners, Chinese mathematicians Wang Hong and Deng Yu, both studied at Peking University and the Massachusetts Institute of Technology. Their groundbreaking work emerged not in isolation but through international exchanges and collaboration. Mathematical truth knows no passport. A theorem proved in Princeton or Beijing belongs to humanity, not to any nation's geopolitical scorecard. Yet in today's Washington, such common sense is increasingly portrayed as naivete.

The committee may view its McCarthyist mailbox as a weapon against Beijing. But that weapon may ultimately shoot the US in the foot. In the 21st-century knowledge economy, the country that erects the tallest walls around its talent may discover that it has also built a ceiling over its own future.

Chinese EVs offer opportunity and solutions

As foreign automakers experience declining sales in China, primarily due to the rise of the country's electric vehicle industry, some major international brands with an eye on the future are choosing to partner with local companies rather than exiting the world's largest auto market.

General Motors and Chinese automaker SAIC Motor last week extended their joint venture partnership by 20 years, through 2047 — a clear vote of confidence in China's automotive market. The renewed agreement will see both parties step up collaboration on R&D, supply chains and global resources, while sustaining support for their electrification and intelligent vehicle initiatives.

That came on the heels of an agreement last month between Honda and Guangzhou Automobile to extend their joint venture to 2038, as the partnership seeks to fast-track its shift toward new energy vehicles and regain market competitiveness. Other similar deals include an agreement announced in July between Ford and Geely to establish a Europe-focused joint venture at Ford's manufacturing hub in Valencia, Spain, and one in May between Stellantis and Dongfeng Group to expand their 34-year partnership to include shared production of Peugeot and Jeep vehicles in China, targeting both the domestic market and global exports.

The tie-ups have occurred as China's auto sector rapidly embraces a new era, with new energy vehicles accounting for nearly half of all new vehicle sales in the country during the first half of 2026. According to data from the China Association of Automobile Manufacturers, China produced 7.438 million NEVs and sold 7.446 million in the first six months of the year, representing year-on-year increases of 6.7 percent and 7.3 percent respectively, highlighting robust manufacturing capacity and strong market demand.

Experts attribute this progress to China's robust supply chains, economies of scale, and the rapid iteration of smart features such as driving aids and intelligent cabin interaction. It has become an industry consensus that China is now pioneering the future of smart mobility.

As a result, international brands are partnering with local Chinese producers to catch the trend, in the hope of winning back market share in China and bringing technology from China to their home markets.

This is not a short-term expediency, but a rational decision made in accordance with market dynamics. Only by deeply integrating with local R&D capabilities and truly recognizing the value of Chinese technology in meeting users' needs can a legacy automaker seize the opportunities presented by the wave of transformation sweeping the industry.

Yet, in the face of China's rising car industry, some advanced economies such as the United States and some countries in Europe have resorted to tariffs and policy restrictions to block Chinese EV exports — a move that runs counter to market rules and defies the momentum of green development. It is wishful thinking that they can erase China's technological prowess and supply-chain strengths simply by erecting barriers. Rather, protectionism will only delay their own auto industry's transition and drive up the cost of sustainable transport for their consumers.

The popularity of Chinese EVs in the European Union and Canada exposes the irrationality of the protectionist walls now being hastily erected by some politicians. Rather than being a so-called industrial "threat", China serves as a vital provider of solutions for the global green transition. International automakers have already voted with their feet by deepening partnerships with Chinese producers and tailoring products to meet the preferences of Chinese consumers.

The green transition is a common cause for all nations, and climate action recognizes no borders. Chinese EVs offer affordable, varied green options that enable more countries to embrace cleaner and more efficient transport at lower costs. To frame competition as a "security menace" and approach global supply chains with zero-sum thinking is both factually flawed and detrimental to achieving worldwide carbon neutrality.

Tariff refunds should prompt reassessment of trade policy

After the United States Supreme Court ruled in February that the US government's sweeping tariffs imposed under the International Emergency Economic Powers Act were illegal, the US Customs and Border Protection has been forced to process refunds. As of late July, the CBP had transferred roughly $100 billion — about 60 percent of the $166 billion it had collected — in tariff refunds to the Treasury for disbursement to importers.

A policy sold as a way to extract wealth from abroad instead pushed US Customs duty revenue into negative territory in May and June (down $0.04 billion and $25.6 billion respectively) as the refunds offset collection of the remaining tariffs. That pushed the federal deficit to $1.4 trillion in the first nine months of the fiscal year (October-June).

Under US federal law, the CBP must refund tariffs collected unlawfully with interest. The Cato Institute estimates that the delay in refunding companies for emergency tariffs invalidated by the Supreme Court is costing US importers a total of $700 million per month.

Small businesses that went bankrupt under the initial duty burden, or independent retailers without the resources to preserve customs records, may have little access to those refunds. The biggest refunds are reportedly flowing to companies best equipped to navigate the system. Walmart expects to get about $2.4 billion; Apple has received roughly $2.2 billion; Amazon about $600 million. But individual consumers have no automatic right to a refund.

This asymmetry has sparked a wave of consumer class-action lawsuits against major retailers and manufacturers, including IKEA, Five Below, Sony and Nintendo. Yet these suits face a formidable legal wall, as consumers face an almost insurmountable hurdle in proving that a price hike was driven 100 percent by tariffs, rather than inflation, logistics or shifting supply and demand. The law gives consumers no automatic way to get their money back. As Democratic Senator Elizabeth Warren of Massachusetts highlighted on Friday, everyday shoppers paid inflated prices while corporations recouped public funds.

Even if every dollar were returned, the refunds cannot undo the economic damage. With US tariff policy changing more than 50 times under the current administration since January last year, businesses have been left guessing what comes next. Companies that changed suppliers, moved production or lost market share cannot simply reverse those decisions.

After the Supreme Court struck down the executive power basis for emergency tariffs, the US administration has been using Section 301 since July to impose new tariffs on 60 economies. Washington seems trapped in a self-perpetuating loop: emergency tariffs, economic distortion, judicial veto, massive refunds and administrative reallocation to new statutory loopholes. The treadmill is already spinning anew.

On Monday last week, a coalition of 25 states filed suit in the US Court of International Trade to challenge the latest tariffs. Plaintiffs must now mount a grueling item-by-item slog across massive product catalogs, arguing over individual duties and whether the Office of the US Trade Representative followed proper procedures. This bureaucratic paper-chase will drain state legal resources and drag on for years — leaving local economies to suffocate under arbitrary tariffs long before any court gives relief.

It seems some in Washington have learned little from the $100 billion tariff debacle. The US administration can refund a tariff, but it cannot refund a lost customer. A recent US-China Business Council survey underscores the point: months-long delays in US export-control licensing are costing US companies billions of dollars in lost exports, even as many affected products are available in China from other suppliers.

What They Say

Plan expands central bank's regulatory reach

Editor's note: *The People's Bank of China, China's central bank, has unveiled a comprehensive reform and development plan for the 2026-30 period. Economic Information Daily spoke to Dong Ximiao, chief economist at Merchants Union Consumer Finance; Tian Lihui, a finance professor at Nankai University; and Tian Xuan, dean of Peking University's Guanghua School of Management, on the importance of the plan. Below are excerpts of the interviews. The views don't necessarily represent those of China Daily.*

The plan aims to strengthen China's financial sector and improve the central banking system. It focuses on restructuring the institutional frameworks that govern monetary policy, macro-prudential management and financial stability.

By expanding the scope of macro-prudential management, the central bank's regulatory reach will extend beyond the traditional banking system to include nonbank financial institutions and a wider range of financial activities across the economy.

Historically, risks have often emerged in areas beyond the scope of regulatory oversight. With a more comprehensive macro-prudential safety net, the focus will shift from reactive to proactive risk management. This is a fundamental shift in the central bank's role from merely responding to crises to actively shaping a secure financial environment.

The plan maintains a prudent approach to monetary policy, combining countercyclical and cross-cyclical adjustments with greater precision and flexibility.

The country's monetary policy is expected to shift from quantitative to price-based regulation by improving the mechanism for market-based interest rate formation, regulation and transmission. This will allow monetary policy tools to better achieve both aggregate and structural objectives.

At the same time, market-oriented exchange rate reforms will be advanced to strengthen the ability of China's financial system to withstand external shocks.

The proposal to develop a financial system tailored to scientific and technological innovation indicates a structural transformation of financial services. As the economy moves from factor-driven to innovation-driven growth, the allocation of financial resources must evolve accordingly.

Traditional lending decisions based largely on collateral and cash flow will increasingly give way to a pricing model that assesses technological barriers and the scope for substitution.

The parallel development of green finance, pension finance and digital finance represents a major avenue for the structural reallocation of credit resources.

Technology finance will play a more prominent role, providing technology companies with diverse financing options and increasing the supply of medium- and long-term capital for innovation. A comprehensive financial system combining investment, lending, bonds and insurance is expected to develop further.

During the 2026-30 period, the central bank is expected to guide financial resources away from broad-based coverage toward more targeted and effective support. By developing a technology-finance system and a technology-focused segment of the bond market, it aims to provide stronger financial backing for breakthroughs in key and core technologies.

Meanwhile, greater support will be directed toward green, inclusive, pension, digital and consumer finance, helping optimize the economic structure and upgrade the quality of growth.

The plan also seeks to expand the global use of the renminbi in international trade, develop offshore renminbi markets and strengthen cross-border financial infrastructure connectivity. These efforts are aimed at increasing the use of the renminbi in trade settlement, investment, financing and financial transactions.

VIEWS

Chen Shuangfei

People-centered approach key to CPC's successes

To understand China today, one must understand the Communist Party of China. And to understand the Party, one must understand why it places people at the center of its governance philosophy.

Many international observers view the CPC through the lens of ideology, institutions or state power. Yet within China's own political tradition, the Party's legitimacy has long been tied to a different question: whether it can improve the lives of ordinary people. From the revolutionary years to the current drive toward modernization, the Party has consistently defined its mission around people's interests, aspirations and well-being.

This people-centered approach reflects a governance logic rooted in China's historical experience and the Party's understanding of its own role.

The first principle is that development must serve the people. Historical materialism holds that people are the makers of history. In China's socialist system, people are regarded as the masters of the country, and this principle shapes the Party's approach to governance.

Policies are expected to address the public's concerns, improve livelihoods and expand opportunities for a better life.

The Party's people-centered orientation is also tied to its Marxist character. The CPC was founded for the people and has repeatedly stressed that it does not represent the interests of any privileged group. A well-known story from China's revolutionary history tells of three Red Army soldiers who shared half of their only quilt with a villager on a freezing night.

The story captures a relationship embodied in the Party: standing with ordinary people and sharing hardship with them.

The second principle is that development depends on the people. The Party comes from the people, is rooted in the people and draws its strength from the people. China's major achievements were not accomplished by the Party alone; they were achieved through the efforts of hundreds of millions of citizens.

During the revolutionary period, ordinary people provided food, transportation and support for the struggle for national liberation. During socialist construction, they rebuilt a country devastated by war and poverty.

Since reform and opening-up was adopted, they transformed China through decades of hard work, entrepreneurship and innovation.

Since the 18th CPC National Congress, Chinese people have played an active role in poverty alleviation, economic reform, environmental protection, public health efforts and risk prevention, helping to gain results that have attracted global attention.

China's experience has repeatedly shown that the closer the Party remains to the people, the stronger the country's capacity to overcome challenges. Governance cannot be judged solely by official declarations; it must ultimately be reflected in the people's assessment of whether their lives are improving. Respecting the people's initiative and creativity has, therefore, driven China's development momentum.

The third principle is that the fruits of development should be shared by the people. Common prosperity and social fairness have become increasingly important goals of Chinese modernization. Economic growth is not viewed as an end in itself, but as a means to enable more people to benefit from development.

Over more than a century of struggle, the CPC has pursued revolution, construction and development with a single overarching aim: enabling the people to live better lives.

China has eliminated absolute poverty and completed the building of a moderately prosperous society in all respects. During the 14th Five-Year Plan (2021-25) period, China's per capita GDP rose from $10,632 in 2020 to $13,953 in 2025, exceeding $13,000 for three consecutive years.

Material progress, however, is only part of the story. China has also witnessed profound changes in its cultural confidence and social outlook. Confidence in the country's path, theories, institutions and culture has grown markedly, while the pursuit of a better, more civilized and more harmonious society has become a prominent feature of public life.

Whether one examines China's revolution, its reform era or its current modernization drive, a consistent thread emerges: people occupy the central place in the CPC's understanding of governance.

From the principle of "serving the people wholeheartedly" to the people-centered development philosophy and the idea that "the country is the people and the people are the country", the Party has continuously linked its future to that of the Chinese people.

As China advances toward its next stage of development, the CPC's governance remains anchored in the same conviction that has guided the Party throughout its history: China's modernization is meaningful only when it delivers a better life for the people, relies on the people's strength and allows the people to share in its achievements.

Li Yang

US false missile test narrative exposes blatant double standards

The Conference on Disarmament in Geneva witnessed a farce steeped in political scheming on Tuesday.

The United States rallied about 40 countries to issue a so-called "joint statement on ballistic missile launch notifications", leveling unwarranted accusations against China over its July test of a submarine-launched intercontinental ballistic missile and demanding that all countries provide 24-hour advance notification ahead of missile launches.

In response, China's Ambassador for Disarmament Affairs Li Chijiang called the move political manipulation and blatant double standards.

China firmly opposes the attempts to turn the conference into a platform for political manipulation.

The US accusations are legally and politically untenable. Washington invoked the Hague Code of Conduct against Ballistic Missile Proliferation — a voluntary political commitment — to demand advance notification from China.

But as Li pointed out, China is not a subscribing state to the code and is therefore not bound by it. Using a voluntary instrument to pressure a non-subscriber to abide by it exposes the US' political maneuvering rather than being a good-faith effort to strengthen global security.

China has consistently conducted its intercontinental ballistic missile tests in a safe, standardized and responsible manner.

Contrary to the allegations, China notified the US and other relevant countries of the test in advance and it took prudent measures to ensure the launch did not harm the interests of any country, a spokesman for the Ministry of Defense confirmed. As Li stressed, such goodwill gestures must not be hijacked by geopolitical calculations.

Washington's accusations ring even more hollow in light of the fact that China has conducted only three intercontinental ballistic missile tests to date, the fewest among the five nuclear-weapon states. The US, by contrast, has conducted about 300 routine land-based ICBM test launches, including one earlier this year.

The US has also withdrawn from some international agreements and mechanisms on arms control, poured resources into expanding and modernizing its nuclear capabilities, and pursued nuclear-sharing and extended-deterrence arrangements.

Having failed to consistently uphold its own responsibilities concerning strategic stability, the US — which maintains a huge nuclear arsenal and continues to modernize its strategic forces — is hardly in a position to lecture China about missile testing.

China keeps its nuclear forces at the minimum level required to act as a deterrent, safeguard national security and maintain global strategic stability.

The country's legitimate and reasonable defense modernization should not be politicized or distorted.

What Washington has done at the Conference on Disarmament is a classic example of weaponizing a multilateral forum for narrow political purposes.

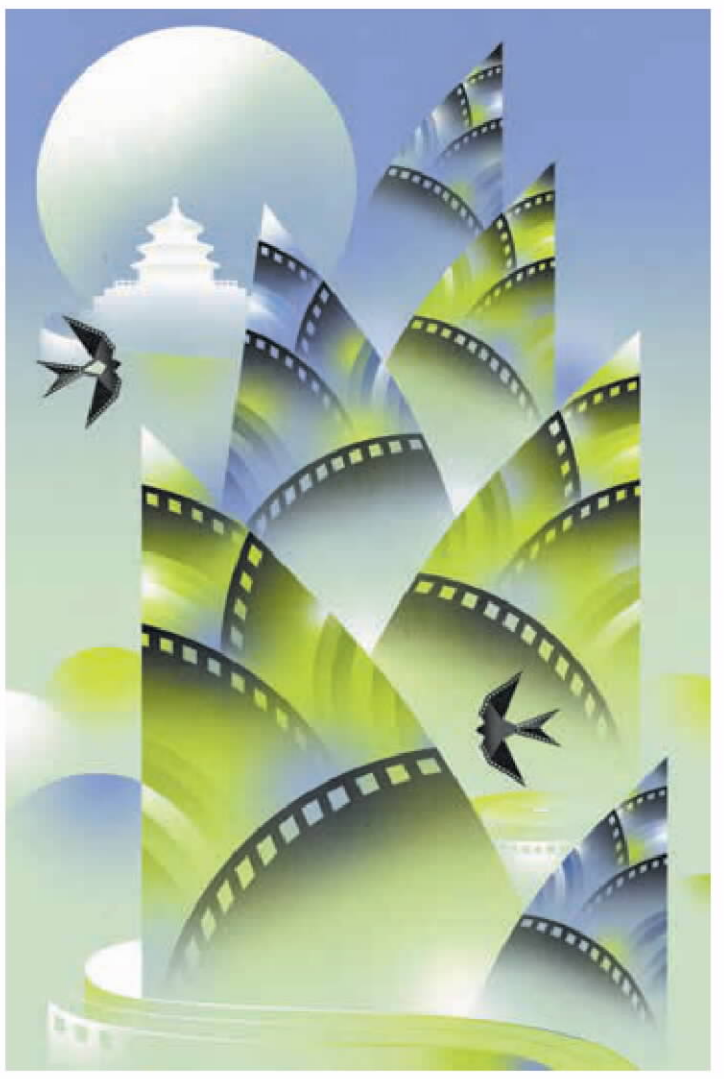
By rallying countries around baseless accusations against China, despite Beijing's advance notification and responsible handling of the test, the US has demonstrated precisely the kind of hegemonic and zero-sum thinking that undermines international cooperation on security issues.

The Conference on Disarmament, recognized by the UN General Assembly in 1978 as the world's sole multilateral disarmament negotiating forum, should not be turned into a political theater.

Attempts to downgrade it into a platform for bloc confrontation only weaken the credibility of the multilateral arms-control system.

The international community should see Washington's maneuver for what it is: an attempt to shift blame, deflect attention from its own nuclear record and constrain China's legitimate defense capabilities under the guise of global security.

As Li reiterated, China remains committed to peaceful development and pursues a self-defensive nuclear strategy.



The real question is whether international rules are applied consistently or selectively, and whether multilateral institutions serve common security or narrow geopolitical interests.

If the US genuinely wants to strengthen global strategic stability, it should start by practicing the consistency it demands from others. The Conference on Disarmament needs less "microphone diplomacy" and more genuine disarmament diplomacy — based on equal treatment, mutual respect and rules that apply to all.

A hundred flowers bloom in Chinese cinema

Editor's Note: *The Beijing Film Forum was organized by the China Film Association and the Beijing Federation of Literary and Art Circles on Aug 8 during the 38th Hundred Flowers Awards in Beijing. The forum brought together filmmakers, industry professionals and scholars to discuss the value, evolution and future of cinema. Below are reflections from four participants, as reported by Li Wei of China Daily.*

LI MIN / CHINA DAILY

Cinema shapes the way we feel

While a film's plot may quickly fade from our memory, certain moments linger forever — an evocative glance, a poignant dialogue or a solitary figure walking away can stay with us for years, sometimes returning unexpectedly when we encounter feelings we cannot quite name. In this sense, cinema does more than tell stories. It shapes how we feel and understand the world.

This process unfolds in three steps: seeing ourselves, feeling for others and becoming a "we".

First, cinema provides a language for feelings that are difficult to express. For example, the conversations, silences and companionship between the women characters in *Her Story* allow audiences to recognize the emotions from their own lives.

Ding Yaping is the dean of the Faculty of Arts at Communication University of China and a distinguished professor at Beijing Film Academy.

Similarly, *Dear You*, with its Chaoshan dialect and family histories that crossed the South China Sea, speaks of waiting, regret and longing that many families can understand.

The influence of cinema on an era's sensibility often begins with such moments of recognition.

Then cinema takes us beyond our own experience. Each of us can live only one life, but a film allows us to live a borrowed life.

In *Big World*, audiences follow a young man whose disability is just one aspect of his identity.

In *Nobody*, seemingly insignificant creatures struggle with frustration and unfulfilled hopes, mirroring the struggles that many adults recognize in themselves.

In *Dead to Rights*, history acquires human faces through the fears, hesitation and courage of ordinary people.

Empathizing with others does not necessarily mean agreeing with them. It is to pause before judging and try to understand the other person's perspective.

This is the essence of cinema's people-centered nature. "The people" are not an abstraction. They are individuals with names, faces, disappointments and dreams. The more unfamiliar lives an era is willing to understand, the wider its emotional world becomes.

The lives we borrow from movies

The world of films is vast enough to encompass grand historical stories and ordinary lives, tragedies and comedies, art films and blockbusters.

Some movies may fail at the box office only to be rediscovered years later, while others that once dominated public discussion might eventually disappear.

Time is an audience of its own, and sometimes the most patient one.

Cinema has the rare ability to blend reality and imagination. It can preserve the details of everyday life and capture the changes of an era, but can also transform reality into dreams, poetry and possibilities. A film can entertain one day and offer consolation or social reflection the next.

Zhang Ji is a screenwriter, director and the vice chairman of the China Film Association.

I realized this personally when I met a struggling entrepreneur who was inspired by *American Dreams in China*, a film I wrote.

I didn't reveal that I was its screenwriter, unsure if the film had helped or misled him. But the encounter made it clear that a film can change the way a person imagines his own future.

It can encourage someone who feels trapped to believe that another life is possible.

This is why I am optimistic about the future of cinema, even in the AI age. Technology will certainly change the tools, the processes and even the forms of cinema, but each step will also present new human choices, expressions and possibilities.

Cinema continues to change.

What doesn't is our need to see ourselves, understand others and imagine a life beyond the one we know.

That is why, after all these years, I still ask myself the same question: How could we not love cinema?

What should a film investor really invest in?

Technology, especially artificial intelligence, has made this more urgent. AI will change filmmaking, lowering production costs and giving more people access to sophisticated creative tools.

I see this as an opportunity rather than a threat. If technology makes filmmaking easier, the truly scarce resource will be the ability to produce something meaningful.

AI can expand imagination but cannot replace the human experiences that give stories emotional truth. The more technology changes the tools of filmmaking, the more important it becomes for filmmakers to say something distinctive.

Li Tingwei is the deputy general manager of Bauhinia Film (Shenzhen) Co. Ltd.

A film's value should not be measured only by box office returns. Successful films can create new possibilities in tourism, cultural products, live experiences and other forms of consumption.

One creative work can generate value many times over, connecting the screen with the wider economy and with people's everyday lives.

This is why I remain optimistic about the future of cinema. Audiences are becoming more discerning, and different kinds of films find their own audiences. The market need not be a race where only the biggest thrive.

As a film investor, I seek stories with enduring power, not just the next hit. The most valuable film may not be today's top grosser, but the one people will still discuss tomorrow.

A filmmaker should never lose touch with the audience

Last summer, my film *The Lychee Road* was released in China. It tells the story of a Tang Dynasty (618-907) official tasked with delivering fresh Lingnan lychees to Chang'an, a journey that seems impossible because lychees spoil within days. The film offers a simple solution: keep the lychee on the branch.

I believe filmmakers have their own branch — the audience.

Da Peng is a Chinese filmmaker, actor, comedian, and host.

I did not come to filmmaking from a film school. With a degree in engineering management, I began my career making online videos, learning from viewer comments. If viewers said a joke did not work, I changed it. If they responded to an idea, I explored it further. This way, I learned a fundamental lesson: creators should first be viewers.

This is where the future of Chinese cinema lies. Films do not become meaningful because filmmakers make them or awards recognize them.

They become part of a culture when audiences respond, debate, remember and integrate them into their lives.

To stay fresh, filmmakers must stay connected with audiences.

Forgetting that we are audiences ourselves risks losing the very branch that sustains our work.

The views don't necessarily reflect those of China Daily.

GLOBAL VIEWS

SHI XUNPENG AND NOPHEA SASAKI

Reshaping global value chains

The energy transition can redistribute industrial competitiveness and economic influence worldwide

The energy transition is doing more than replacing fossil-fuel technologies with cleaner alternatives. It is changing the foundations of industrial competitiveness, reorganizing international production and trade, and redistributing economic influence among companies and countries.

Shi Xunpeng

Nophea Sasaki

Thailand's electric vehicle market provides a vivid illustration of this wider transformation. For decades, Thailand was one of the strongest overseas bases of the Japanese automotive industry. Its position as the "Detroit of Asia" rested on extensive production networks, skilled suppliers and world-class capabilities in internal-combustion engines, transmissions and mechanical engineering.

That industrial order is now being tested by electrification. The market shift has been rapid.

Electrified vehicles, including hybrids, plug-in hybrids and battery-EVs, accounted for only about 3 percent of new vehicle registrations in Thailand in 2020. By 2025, their combined share had soared to more than 44 percent, comprising 21.8 percent for hybrids, 19.6 percent for battery-EVs and 2.9 percent for plug-in hybrids, according to data from Thailand's Board of Investment. In five years, electrification has moved from a marginal segment to almost half of Thailand's new-vehicle market.

This transformation is most clearly reflected in the shifting competitive balance between Japanese and Chinese automakers in Thailand, as the basis of automotive advantage moves from conventional engineering toward batteries, electronics and software. Based on brand-level sales data compiled by MarkLines, Japanese brands' share of Thailand's overall vehicle market fell from 88 percent in 2020 to 69.3 percent in 2025, while Chinese automakers' share rose from about 3.2 percent to 21.2 percent over the same period, and Chinese-owned brands accounted for 90.5 percent of battery-EV sales. Japanese manufacturers nevertheless remain the largest force in Thailand's overall automotive market and production base.

These figures are important, but the deeper story is that EVs change the technological architecture of the automobile and therefore the rules of competition.

The competitiveness of conventional vehicles was built around engines, transmissions, fuel systems, mechanical reliability and highly coordinated component supply chains. EVs depend on a different combination of capabilities: batteries, electric motors, power electronics, semiconductors, software, digital interfaces, charging systems and energy management. Mechanical complexity declines, while electrochemistry, electronics and software become more important.

This technological paradigm shift changes the relative value of accumulated assets. An advanced engine plant or a supplier specialized in combustion components may become less strategic, while battery technology, software architecture or power electronics become more valuable. New entrants can compete without first surpassing incumbents in every conventional automotive capability.

The consequences extend beyond technology itself. As the basis of competitiveness changes, so do trade flows, investment patterns and the location of production. In 2024, Thailand imported passenger vehicles worth about $1.58 billion from China, followed by Japan, $342 million, making China its largest foreign source of imported cars by value, according to data from the World Bank's World Integrated Trade Solution. Japanese manufacturers still produce extensively within Thailand, so import data do not capture the full balance of industrial activity. Even so, the pattern shows how electrification is redirecting cross-border trade.

The shift in trade is being accompanied by investment. Chinese producers are moving from exporting EVs to building regional production networks. BYD opened a $490 million Thai plant with annual capacity of 150,000 vehicles and battery assembly, within a wider wave of more than $3 billion in Chinese EV investment, according to Thailand's Board of Investment. Along with other projects, this is turning Thailand into a platform for both domestic sales and exports to the Association of Southeast Asian Nations.

Thailand's policy response reflects this reorganization of international supply chains. Its objective is to turn import-led demand into local production, component supply and export capacity. By October 2025, cumulative approved investment in the Thai EV supply chain had reached 140 billion baht ($4.18 billion), spanning vehicle assembly, batteries, components and charging infrastructure.

The emerging structure is complex: Japanese incumbents, Chinese EV producers, Thai suppliers and regional markets are becoming part of a more diversified production network. Competition is increasingly centered on where batteries, electronics, software, research and other high-value functions are located, how trade and investment flows adjust, and how much of the resulting value host economies can retain. Japanese incumbents, too, are adapting.

LI MIN / CHINA DAILY

Thailand is not an isolated case. In 2025, global electric-car sales exceeded 20 million and accounted for one-quarter of new cars sold. As manufacturers expand abroad, competition is moving beyond exports toward overseas factories, regional supply chains, local partnerships and control of strategic components.

The same mechanism is visible across the energy transition. Solar manufacturing is restructuring power-sector supply chains, while battery storage is changing how electricity systems balance supply and demand. Grids, power electronics and digital energy systems are becoming strategic assets as countries seek to integrate larger shares of variable renewable electricity. Low-emission hydrogen and related production processes may also influence the future location of steel, fertilizer, chemicals and shipping activities.

In the fossil-fuel economy, industrial advantage was often associated with access to oil and gas, refining capacity, combustion technologies and established heavy industry. In an increasingly electrified economy, competitiveness will depend more on affordable clean electricity, batteries, critical-mineral processing, power electronics, digital technologies, advanced manufacturing and the ability to integrate these elements into complete industrial ecosystems. The importance of these capabilities is already evident in the high geographical concentration of clean-energy-technology manufacturing and mineral processing.

This transition could redistribute global economic influence. Countries that control technology, intellectual property, finance and integrated supply chains are likely to capture a larger share of the value. Countries that mainly import clean technologies may reduce emissions while developing new industrial dependencies. Mineral-producing countries may attract investment but still capture limited value if extraction is not linked to processing, manufacturing and technological capability. A release by the United Nations Conference on Trade and Development in June noted that mineral-rich developing countries can develop industrial capacity, strengthen local processing and value addition, and move up the value chain.

China's experience illustrates how the energy transition is reshaping the foundations of industrial competitiveness. Over the past decade, China has built an integrated clean-energy industrial ecosystem spanning renewable power, batteries, electric vehicles, critical minerals processing and advanced manufacturing. This ecosystem has strengthened Chinese companies' competitiveness at home and abroad, while also accelerating the global diffusion of clean technologies.

The future of industrial competition will not be determined solely by traditional manufacturing advantages, but by the ability to build complete ecosystems that connect technology, supply chains, infrastructure and markets. As the energy transition unfolds, countries that can develop such integrated capabilities will be better positioned to shape the next stage of global economic development.

Leap in renewables for a shared future

China's plan and actions for clean energy development show it is one of the most reliable partners for other Global South countries in climate action

China has strengthened its top-level policy design for Nationally Determined Contributions under the Paris Agreement on climate change and its energy transition, driving a nationwide collective effort through innovations in policy, technology and market mechanisms. The country has achieved a series of globally recognized milestones in its renewable energy transition and is emerging as a key driving force behind the global green transformation.

China built the world's largest and fastest-growing renewable energy system during the 14th Five-Year Plan (2021-25) period, with the share of installed renewable energy capacity rising from 40 percent to around 60 percent of its total installed energy capacity, according to the National Energy Administration.

China's green and low-carbon industries have made a historic leap from being incremental supplements to becoming primary growth drivers, with new energy vehicles, lithium-ion batteries and wind/photovoltaic equipment manufacturing leading a deep industrial transformation globally. These industries have evolved from policy-driven emerging sectors into robust new engines powering China's economic growth, achieving historic breakthroughs in investment scale, economic contribution and industrial competitiveness.

This sector is making an increasing and substantial contribution to the country's economic development. According to the National Development and Reform Commission, China's green and low-carbon industries together commanded a market of roughly 11 trillion yuan ($1.62 trillion) by 2025. In recent years, total investment in green and low-carbon sectors has become one of the fastest-growing segments in fixed-asset investment nationwide.

Innovation in green and low-carbon fields has also been exceptionally vibrant. According to the Report on Statistical Analysis of Green and Low-Carbon Patents (2025), the number of green and low-carbon patent applications published by Chinese applicants reached 120,000 in 2024, a year-on-year increase of 18.9 percent, contributing 49.2 percent to global growth. Green and low-carbon industries have become a new engine of high-quality development in China, positioning the country as a new global benchmark for innovation-led growth.

According to BloombergNEF's annual Energy Transition Investment Trends report, global investment in the energy transition surpassed $2.3 trillion in 2025. The Global South has shown even greater commitment and demand for energy transition investments. Among them, China has played a leading role in annual investment for several years. China has also become one of the world's largest exporters of new energy equipment and a leading provider of carbon neutral engineering technologies and solutions.

China has engaged in green cooperation with over 100 countries, helping reduce global levelized costs of wind and solar power by 60 percent and 80 percent, respectively. It is estimated that during the 14th Five-Year Plan period, exports of wind and PV products from China cumulatively helped other countries reduce emissions by approximately 4.1 billion metric tons. Through its massive domestic deployment and industrial capabilities, China has turned green technologies from luxury goods into affordable, universally accessible clean energy solutions, helping reshape the cost structure of the global energy transition.

In response to the multiple challenges of the global energy transition, China has formulated and released its plan for renewable energy development during the 15th Five-Year Plan (2026-30) period. The plan sets forth several major categories of targets on renewable energy development: a total consumption target of approximately 1.8 billion tons of standard coal equivalent by 2030; a power generation target of roughly 3,500 gigawatts of total installed renewable capacity and about 6 trillion kilowatt-hours of annual generation, with wind and solar combined exceeding 2,800 GW and generating more than 4 trillion kWh of electricity; a non-power utilization target, with the total scale of renewable energy used for non-power purposes increasing 2.5-fold by 2030 as compared to 2025, equivalent to approximately 150 million tons of standard coal. During the 15th Five-Year Plan period, more than 300 million kW of new reliable peak power capacity from renewable energy will be added, while the scale of newly commenced offshore wind power projects nationwide will reach around 100 million kW.

According to the National Energy Administration, China's power generation mix will feature "half non-fossil, nearly half renewable and 30 percent new energy" by 2030. This ambitious blueprint is not merely a domestic development agenda but a strategic response with profound global implications. By setting such quantified and binding targets, China provides the international community with clear and credible expectations for its energy transition trajectory, thereby injecting much-needed certainty into global climate governance at a time when geopolitical turbulence and policy volatility elsewhere have raised widespread concerns.

The plan's emphasis on reliable substitution and progressively transforming renewable energy can help address the global challenge of integrating variable renewables into secure and stable power systems. By pioneering strong capacity metrics and system-friendly standards, China is setting new benchmarks for the world on how to balance massive renewable deployment with grid reliability.

Moreover, the plan's commitment to deepening high-level international cooperation across projects, industries, standards and certification signals China's continued openness to global partnerships. China welcomes foreign investment and will actively share Chinese technologies, standards and successful examples — such as zero-carbon industrial parks and green power supply — with Southeast Asia, Central Asia and Africa through the Belt and Road Initiative. According to the National Energy Administration, with total investment in the renewable energy sector projected to exceed 5 trillion yuan during the 15th Five-Year Plan period, China is poised to drive R&D, equipment manufacturing and construction across the entire industrial chain, generating powerful green growth momentum that will benefit global supply chains.

Through tangible actions and achievements, China has demonstrated the commitment of a responsible major country, proving in practice that addressing climate change and pursuing sustainable development are win-win global endeavors. China's plan and actions for renewable energy development during the 15th Five-Year Plan demonstrate that China is not only one of the largest incremental sources of the global green and low-carbon transition but also one of the most reliable partners for other Global South countries in climate action.

Nvidia funding plan raising some eyebrows

Chipmaker's CEO reaches MOUs with six major financial powerhouses

By **MA SI**
masi@chinadaily.com.cn

US semiconductor company Nvidia's bold proposal to mobilize $500 billion from Wall Street for artificial intelligence infrastructure has drawn skepticism, with industry observers questioning whether the plan reflects genuine demand, or a financial move to prop up sales.

At the center of the debate is a simple but troubling question: if AI computing power is truly in such short supply, why does the chipmaker need to help its customers arrange financing? Some analysts suggest the arrangement may be designed to unlock orders that would otherwise remain on hold due to tight budgets.

The plan came into sharper focus on Monday, when Nvidia CEO Jensen Huang joined the chiefs of six major financial institutions — Goldman Sachs, BlackRock, Blackstone, KKR, Apollo Global Management and Brookfield — in a CNBC interview. Each firm has signed a separate memorandum of understanding to set up its own funding vehicle, channeling money from third-party investors into AI data centers and related hardware. The target is $500 billion, with the potential to grow even larger.

Huang called the initiative the "big idea", positioning AI computing capacity as a new asset class in its own right.

"These systems are not like our PCs, not like our phones. They are now revenue-generating assets — productive, long-lived, fungible and flexible," he said.

David Solomon, CEO of Goldman Sachs, said that asset-backed lending for such infrastructure is a logical step, precisely because the underlying facilities are tangible and hold genuine economic value.

Under the agreements, each lender will make its own credit decisions, while Nvidia will act as a matchmaker between customers and financiers. The company may also take on up to 25 percent of the risk per loan, though Huang later clarified on social media that such support is based on residual value and is meant to complement, not replace, independent underwriting.

A visitor interacts with a robot at the Nvidia booth during a supply chain expo in Beijing.
QUAN YAJUN / FOR CHINA DAILY

Xiang Ligang, director-general of the Information Consumption Alliance, a telecom industry association, pointed to the divergent market reactions as evidence of underlying unease. While asset managers saw their shares rise on expectations of fee income, major tech counters continued to fall after the news.

That divergence, Xiang said, suggests that investors are not fully convinced by the AI demand narrative. If cloud giants such as Google and Microsoft were the clearest beneficiaries of a genuine computing shortage, their stocks would have rallied. Instead, Nvidia's push to engineer financing solutions raises a red flag that potential buyers may be struggling with balance-sheet constraints, he added.

Nvidia itself has argued that the financing platform addresses a new bottleneck: capital. Emerging AI labs, smaller cloud providers and sovereign AI projects have real needs but lack the deep pockets of hyperscalers. However, Xiang cautioned that the entire model rests on an untested assumption — the long-term salvage value of GPUs used as collateral.

Nvidia now refreshes its chips annually rather than every two years, meaning each new generation quickly erodes the resale value of older chips, experts said.

Meanwhile, the announcement on Monday only involved nonbinding MOUs, offering no details on borrowers, interest rates, project locations or timelines. That lack of specificity has left many investors waiting on the sidelines, seeking concrete evidence that the "big idea" can withstand real-world economic scrutiny, experts added.

Top cities ease rules for home purchases

By **WANG YING** in Shanghai
wang_ying@chinadaily.com.cn

China's four major cities have all eased housing purchase restrictions in recent months, signaling a shift toward more supportive policies and underscoring efforts to stabilize the property sector, said industry experts.

Beijing is the latest major city to ease housing purchase restrictions. On Friday night, the capital city announced measures to better meet housing needs, including cutting the required social security or tax payment period for non-Beijing residents buying homes within the Fifth Ring Road from two years to one, and raising the housing provident fund loan limit.

"As a city long known for strict homebuying restrictions, Beijing's move to lower the threshold for nonlocal buyers without a Beijing *hukou* (household registration) could mark the beginning of a broader recovery in China's property market," said Zhang Dawei, chief analyst at Centaline Property Agency, after digesting the policies taking effect immediately on Saturday.

Beijing's move means all four of China's first-tier cities — Beijing, Shanghai, Shenzhen and Guangzhou — have now eased homebuying restrictions in line with local conditions, paving the way for a more relaxed housing market in the country's biggest cities, Zhang added.

In late February, Shanghai introduced a seven-point policy package to ease homebuying restrictions, helping sustain stability in the city's residential property sector, said Cheng Yu, executive vice-president of Shanghai enterprises at the China Index Academy.

"Shanghai sold 2.83 million square meters of commercial housing in the first seven months of this year, showing resilience despite the traditional seasonal slowdown in home transactions," said Cheng.

Similarly, policy adjustments introduced in Shenzhen in late April have produced encouraging results. The city's new measures continued to boost the housing market, with new home sales rising more than 40 percent year-on-year for three consecutive months and existing-home sales up more than 10 percent for two months in a row, said Cao Jingjing, general manager of research at the China Index Academy.

More than 680 housing policy measures have been introduced across China since the beginning of the year, including cuts in homebuying costs through lower down payments and mortgage rates, Cao said.

Beijing's latest housing policy adjustment follows the July 30 meeting of the Political Bureau of the Communist Party of China Central Committee, which set the direction for the country's economic work in the second half.

The meeting called for efforts to stabilize the property market and effectively build a security barrier for the sector.

"The statement places the property market within a broader framework of economic security and shows the central authorities' expectations that the sector should remain stable and orderly," said a report from Shanghai Proptech Innovations Co Ltd.

"China's property markets showed divergent trends in the first half, suggesting that the sector is moving beyond a broad-based recovery toward a phase of structural improvement," said Ding Zuyu, chairman of Shanghai Proptech Innovations.

Ding said this stage is characterized by the resilient performance of key cities and core areas, as well as a shift among real estate companies from scale expansion to competition based on inherent capabilities.

Property companies bullish on retail sector

By **WANG ZHUOQIONG**
wangzhuoqiong@chinadaily.com.cn

Swire Properties' retail portfolio on the Chinese mainland posted double-digit rental growth in the first half of 2026, buoyed by strong demand at its flagship luxury shopping centers as affluent consumers continued to spend on high-end brands.

Retail rental income from the Chinese mainland rose 13 percent from a year earlier to HK$2.57 billion ($327.4 million) in the six months ended June 30, according to interim results released by parent company Swire Pacific. Excluding currency movements, rental income increased 7 percent.

Taikoo Li Sanlitun in Beijing helped deliver the strong performance, with retail sales surging 63 percent and rental income climbing 16 percent after the completion of a tenant repositioning program and the opening of Hermes' global flagship store in April. Occupancy reached 100 percent at the end of June.

Swire attributed the improvement to a series of luxury flagship openings since late 2025, including standalone concept stores and architecturally distinctive boutiques, alongside the repositioning of the complex's South Area. The company also cited a rebound in international tourism and the country's expanded tax-refund policies for overseas visitors as supporting demand.

View of HKRI Taikoo Hui shopping complex in Shanghai.
PROVIDED TO CHINA DAILY

In Shanghai, its HKRI Taikoo Hui shopping complex reported an 82 percent jump in tenant sales and a 29 percent increase in rental income after Louis Vuitton opened "The Louis" flagship in mid-2025. Occupancy remained at 98 percent.

Chengdu Taikoo Li recorded 14 percent growth in both tenant sales and rental income, while Guangzhou Taikoo Hui posted increases of 9 percent and 11 percent, maintaining full occupancy. Qiantan Taikoo Li in Shanghai reported retail sales and rental income growth of 14 percent and 16 percent, respectively.

Swire said China's retail market continued to improve during the first half, with retailers remaining "cautiously optimistic" about medium to long-term prospects and continuing to invest in prime commercial locations. The company said that luxury categories including jewelry, watches and precious gems continued to outperform.

Meanwhile, Hang Lung Properties Ltd, another major owner of luxury shopping centers, reported that tenant sales at its malls on the Chinese mainland rose 17 percent in the first half after increasing 24 percent in the first quarter, the strongest quarterly growth in two years.

At Plaza 66 in Shanghai tenant sales climbed 24 percent while rental revenue increased 8 percent, with occupancy holding at 98 percent. The company's 4,300-square-meter Phase III expansion is scheduled for completion in the second half of the year. Nearby, Grand Gateway 66 also recorded a 24 percent increase in tenant sales, although rental revenue rose a more modest 1 percent.

Outside Shanghai, Wuxi Center 66 achieved full occupancy as rental revenue increased 10 percent, while Dalian Olympia 66 and Kunming Spring City 66 reported double-digit tenant sales growth following tenant mix upgrades.

Unlike Swire, which has continued to strengthen its positioning in the ultra-luxury segment through global flagship stores, Hang Lung has increasingly diversified its tenant portfolio beyond traditional luxury brands in an effort to broaden traffic and spending across consumer groups.

Modular builds seen as future of construction

GUANGZHOU — The construction of a 19-story hotel in Brisbane, Australia, was no ordinary project, as much of it had already been built thousands of kilometers away, inside a factory in South China.

Its room modules arrived with walls, pipes, wiring and interior fittings largely completed, allowing the building to be assembled at a pace of roughly one floor every four to five days. The project was delivered by Foshan Meizong Buildings Technology Co Ltd, a firm based in the city of Foshan, Guangdong province. It reflects a broader shift in the industry, with more work that once had to be done at a construction site now being completed on a factory floor.

Inside Meizong's workshop, automated cutters slice steel tubes to precise dimensions as workers weld structural joints. Assembly teams install wall panels and lay utility lines. In the finished-goods area, dozens of units stand ready for shipment, with kitchens, bathrooms, lighting and sockets already fitted.

More than 90 percent of the work can be completed in the factory, while delivery takes only about one-third of time needed for conventional construction, according to Pang Mingyuan, the company's general manager.

Modular housing is gaining acceptance in markets such as Australia and New Zealand, where conventional construction faces high labor costs, lengthy building cycles and weather-related disruptions, while housing remains scarce in some remote areas, Pang added.

Foshan alone is home to more than 300 exporters of prefabricated buildings. Across the industry, modular structures are being used for hotels, dormitories and offices, while some manufacturers are branching into customized outdoor spaces.

At SunnyJoy Intelligent Technology Co Ltd, the glass roof of a modular outdoor room slides open under electric power. Made up of 13 modules, the structure attracted attention at the 139th Canton Fair in Guangzhou earlier this year.

"Three adults can assemble it in two and a half hours by following an installation video," said Zhang Yong, the company's general manager.

The company's products sell well in North America and Oceania, while emerging markets in Africa and Southeast Asia are also growing rapidly. Social media has become an important source of overseas customers: SunnyJoy has built a following of around 10 million across domestic and overseas platforms, with online channels generating more than half of its customer inquiries.

Behind such products is the Pearl River Delta's manufacturing network. Zhang said a single outdoor structure can involve dozens of suppliers, with everything from frames and worktops to drive systems and lighting sourced within the region.

That proximity allows manufacturers to adjust designs, upgrade components and respond quickly to changing customer requests. As products become more integrated, companies are also expanding into higher-value offerings that incorporate solar glass, energy storage and intelligent control systems.

At a modular factory in the Shenshan Special Cooperation Zone, laser cutting, automated welding and intelligent assembly work in coordination. A digital management system links design, procurement and production, generating material lists and processing drawings from design plans.

Its standardized production system can turn out a wall in 12 minutes and a room module in two hours. The facility has an annual capacity of up to 30,000 units and can produce different types of building modules in parallel according to project needs.

The expansion taking place on factory floors is also showing up in export figures.

In the first half of this year, exports of prefabricated structures from seven cities through Guangzhou Customs reached 1.94 billion yuan ($287.5 million), up 21.2 percent year-on-year, with products reaching more than 190 countries and regions.

One modular-building producer said this year's export orders have thus far risen nearly 60 percent year-on-year, with production scheduled several months ahead.

For Chinese producers, the opportunity goes beyond shortening construction time. Their expansion overseas points to a broader shift: buildings are increasingly being designed, produced and exported more like manufactured goods.

XINHUA - CHINA DAILY

Briefly

Auto exports see strong growth in July

China's automobile exports maintained strong growth in July, surpassing 1 million units for the second consecutive month, driven in large part by a surge in new energy vehicle shipments, data released on Wednesday by the China Association of Automobile Manufacturers showed. The country exported 1.043 million automobiles in July, up 0.6 percent from June and 81.3 percent from a year earlier. After topping 900,000 units in both April and May, monthly exports crossed the 1 million mark in June and remained above that level in July.

Yuan strengthens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, strengthened 18 pips to 6.7882 against the US dollar on Wednesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

Tourists add tech trips to itineraries

Drones, humanoid robots, brain-computer interfaces being added to expanded tours

By LI JING
lijing2009@chinadaily.com.cn

Foreign tourists check out AI sports photography glasses at a mall in Shenzhen, Guangdong province, on Aug 3. LIANG XU / XINHUA

People watch as a Meituan drone delivers food at Shenzhen Talent Park on Aug 3. LIANG XU / XINHUA

A meal order delivered by drone, dinner at a robot-themed restaurant and a ride in a driverless car formed part of the itinerary for US travel influencers Kara and Nate during a journey from Shanghai to Beijing.

Their 33-minute YouTube video titled "China is Living in 2050" also featured robotic dogs and a shopping center filled with high-tech consumer products. It had racked up about 1.3 million views as of Aug 5, bringing experiences once associated with science fiction to the couple's 4.5 million subscribers.

The video is part of a growing trend on social media, turning China's everyday technology into a major tourist attraction. Robotaxis, drone deliveries, humanoid robots and smart retail are now appearing alongside historical landmarks and natural scenic spots on foreign visitors' itineraries.

Travel operators say technology-focused trips, once aimed largely at overseas professionals and corporate delegations, are increasingly attracting more independent travelers, families and students. The shift is helping technology emerge as a calling card for Chinese tourism, built less around a single museum or theme park and more around experiencing how digital services and automation integrated into daily life.

In Hangzhou's Yuhang district, Zhejiang province, itineraries for overseas visitors link the Liangzhu archaeological site, where digital tools help interpret ancient Chinese civilization, with an artificial intelligence town, robotics facilities and Alibaba's digital industrial park.

Visitors can interact with humanoid robots, test brain-computer interfaces, experiment with AI-generated content and see how digital platforms are used in transport, shopping and urban management.

One of the companies included in Hangzhou's newly launched technology study-tour routes is BrainCo, a developer of non-invasive brain-computer interface technology. Its demonstrations include an intelligent bionic hand that uses neural and muscle signals to interpret intended movements, along with wearable products designed for attention training, relaxation and sleep support, giving visitors a tangible look at how the technology is being developed for rehabilitation and consumer use.

"Overseas interest has risen markedly since June last year," said Gu Weiping, director of the Study Tour Department of Hangzhou Shunjing Technology Cultural Tourism Development Co Ltd. "More independent travelers, families and overseas students began making reservations specifically for AI, robotics and smart-city experiences."

The number of overseas customers joining the company's technology-themed program increased by more than 120 percent year-on-year, Gu said.

The expansion of the visa-free policy has made it easier for overseas visitors to turn online curiosity into real-world trips. China has expanded unilateral visa-free access to citizens of 50 countries, while nationals of 55 countries are eligible for its visa-free transit policy at 65 ports.

Foreign nationals made a record 22.9 million entries into China in the first half, up 20.4 percent year-on-year, said the National Immigration Administration. Visa-free entries rose 30.6 percent to 17.8 million, accounting for 77.7 percent of the total.

Wu Liyun, a professor at the China Academy of Culture and Tourism at Beijing International Studies University, said technology tourism is a global trend rather than a uniquely Chinese phenomenon.

China's advantage, she said, lies in the scale at which technology has moved beyond laboratories and exhibition halls to become seamlessly integrated into daily life.

Foreign visitors can ride robotaxis, order goods delivered by drones, encounter service robots and use mobile phones for payments, transport and admission to attractions. The appeal comes less from any single invention than from seeing multiple technologies operating across the same city.

"China has a large number of technology companies, but the more distinctive feature is how AI and smart technologies have been applied to daily life and tourism," Wu said. "That allows visitors to experience directly how technology changes ordinary life."

Technology is also effectively removing some of the practical barriers that have long affected inbound travel, Wu added.

"Real-time translation, smart translation glasses, interactive screens, digital admission and mobile guides make it easier for foreign visitors to navigate attractions independently."

For Daniel Chan, a Chinese-American technology enthusiast living in Los Angeles, China's wide deployment of technology has made Shenzhen in Guangdong province the city he most wants to explore.

Chan said he was particularly interested in its automation and civilian-drone ecosystem, including companies that have developed around drone maker DJI. Hangzhou offers a different combination, pairing technology companies such as Alibaba with historic sites, scenery and food.

"Hangzhou has technological vitality, but it also retains deep cultural roots," Chan said. "You can experience both innovation and everyday life."

Wu said the trend was broadening the geography of China's inbound tourism. International itineraries were once concentrated in traditional destinations such as Beijing, Shanghai, Guilin in the Guangxi Zhuang autonomous region and Xi'an in Shaanxi province, but more foreign visitors are extending their journeys to other emerging tech hubs.

"Technology could bring more second and third-tier cities into the itineraries of overseas visitors," she added.

The rise of technology tourism is also creating an emerging commercial loop. More than 60 percent of the overseas groups handled by Gu's company ask to add technology-product demonstrations or shopping to their itineraries, he said.

Popular items include AI translation devices, small robots, drone equipment and consumer brain-computer products such as sleep-assistance devices.

Young visitors typically spend 200 yuan ($29.64) to 500 yuan a day on technology experiences and products, while family study tours spend about 500 yuan to 1,000 yuan per person, Gu said.

Hangzhou is now seeking to build shopping directly into its technology-tourism offering. On July 30, the city's culture and tourism authorities unveiled 10 locally developed "new technology specialties", 20 technology-tourism attractions and 20 themed study-tour routes. They also launched a platform for inbound technology study tours and a dedicated section on Alibaba's Taobao marketplace.

The products include an AI-powered walking exoskeleton, Rokid smart glasses, augmented-reality swimming goggles, an AI recording card and a DNA data-storage "time capsule". Visitors can try and buy them in Hangzhou's Wensan Digital Life Block or order them online.

The initiative seeks to give technology the role once occupied mainly by conventional souvenirs: visitors see how a product works, try it and take home a piece of the city's innovation ecosystem.

The connection between product discovery and spending is even more established in Huaqiangbei, a renowned electronics hub in Shenzhen.

The district receives more than 8,000 foreign visitors and business travelers daily and boasted 197 registered departure tax-refund stores by mid-year, said the Futian district government.

Local merchants said smartphones, drones, smart glasses and AI wearables accounted for nearly 80 percent of purchases for which overseas customers sought tax refunds, though the estimate does not cover all foreign-visitor spending in the district.

A service center opened in June combining departure tax refunds, foreign-currency exchange and payment support. It also distributes local restaurant and service vouchers, encouraging customers to spend their refunds within the district and extending the commercial loop beyond the initial purchase.

China reduced the minimum same-day purchase at a single store eligible for a departure tax refund to 200 yuan from 500 yuan last year and expanded its "refund-upon-purchase" service nationwide. More recently, procedures were further streamlined with paperless processing and expanded random inspection protocols.

The number of overseas travelers using the departure tax-refund system increased 366 percent year-on-year in the first half of 2026, while both sales of eligible goods and the amount refunded rose 69 percent year-on-year, the State Taxation Administration said.

Despite the rapid growth, the market remains at an early stage. Many technology venues are still difficult for independent overseas visitors to discover, while booking channels, multilingual explanations and information about payments and refunds are yet to be fully standardized.

"Inbound visitors are no longer coming only to experience traditional culture," Wu said. "They also want to experience ordinary life, the convenience brought by economic development and China's technology at close range. Technology is fast becoming a new tourism draw for China."

Factory tourism a fast-growing pursuit

By LI JING

A visitor poses for photos with a Hongqi car at China FAW Museum in Changchun, Jilin province, on July 21. ZHANG YAO / CHINA NEWS SERVICE

On a recent trip to the eastern coastal city of Qingdao, Shandong province, Beijing resident Zhang Xiaohui visited the Tsingtao Beer Museum, tracing the brewing process through a century-old factory complex before sampling a pint on site.

"I checked Xiaohongshu (RedNote) for tips and booked the earliest slot, hoping it would be less crowded. I learned how beer is made and explored the brewery's history. I cannot drink a lot, but being able to learn, have fun and enjoy a drink made it a great experience," Zhang said.

Across China, tourists are venturing into breweries, shipyards, auto plants and repurposed mines, turning spaces once designed solely for industrial production into vibrant destinations for recreation, education and shopping.

Data from Tongcheng Travel, a leading Chinese online travel agency, showed that booking interest in factory-related travel products since the summer peak season began on July 1 had risen 36 percent year-on-year as of Aug 6. Family trips accounted for 68 percent of orders, while interest among travelers born after 2000 increased by 12 percent.

In addition, more than 80 percent of factory-tour orders were for destinations within a three-hour journey, suggesting the segment is becoming a key part of the weekend getaway market. Furthermore, more than 80 percent of travelers who added a factory visit to a longer itinerary spent an average of over three days in a single city.

Foreign tourists are also emerging as a significant source of demand. Booking interest in inbound factory-tour products on HopeGoo, Tongcheng's international travel platform, increased more than ninefold this summer from a year earlier.

Factory tourism is not a new concept in China. China FAW Group began opening its production lines in Changchun, Jilin province, to visitors as early as 1994. What is changing now is the scale and commercial ambition, as organized visits evolve into bookable consumer products combining factory access, education, entertainment and retail.

Shenzhen-based consultancy Zero Power Intelligence Group estimates the domestic industrial tourism market hit 120 billion yuan ($17.78 billion) in 2023 and expects it to exceed 300 billion yuan by 2029, representing a compound annual growth rate of 18 percent.

Policy support is also accelerating. The outline of China's 15th Five-Year Plan (2026-30) calls for industrial tourism to be developed alongside rural tourism, wellness tourism and "red tourism". In May, seven central ministries and departments — including the Ministry of Culture and Tourism and the Ministry of Industry and Information Technology — jointly issued guidelines calling for more factory tours, industrial heritage attractions and technology-enabled experiences.

The policy encourages companies in equipment manufacturing, consumer goods and e-commerce logistics to offer production-line observation, simulated operations, hands-on workshops and product customization. It also calls on travel agencies and online platforms to develop specialized industrial study-tour products.

However, challenges remain. Most factories were originally designed for efficiency, safety and commercial secrecy, not leisure. Opening them to the public requires protected visitor corridors, trained guides and interactive displays, while ensuring that tours do not interfere with daily production.

Additionally, some projects struggle to move beyond static displays or generic industrial-style shops and cafes, thereby limiting repeat visits and post-admission spending.

An official from the Guangdong provincial department of industry and information technology said a shortage of professionals with expertise in both manufacturing and tourism — along with high investment costs and long payback periods — has discouraged some companies from opening their plants to visitors.

"Industrial tourism needs deeper cultural storytelling, more engaging experience design and a complete consumption loop," said Sun Xing, deputy director of the Industrial Culture Development Center under the Ministry of Industry and Information Technology. Sun urged operators to move beyond passive sightseeing and combine factory tours with study trips, corporate teambuilding and nighttime activities.

That transition is already well underway. Factories are no longer merely places where goods are produced. Increasingly, they are also sites where holidays begin.

Trials set stage for opening of Pinglu Canal

Landmark waterway project begins full-route safety, stability evaluation

By **ZHANG LI** in Nanning
zhangli@chinadaily.com.cn

The Pinglu Canal in South China's Guangxi Zhuang autonomous region launched full-route and full-ship-type trials for the first time on Wednesday, also marking the final major evaluation before the landmark project's official operation scheduled for September.

As a backbone infrastructure scheme for the New International Land-Sea Trade Corridor, the Pinglu Canal is China's first major river-to-sea canal project planned and coordinated at the national level since 1949.

The waterway stretches from the Pingtang River estuary in Hengzhou, Nanning, through Lingshan county and along the Qinjiang River before emptying into the Beibu Gulf in Qinzhou.

The waterway has already surpassed 98 percent of its construction. Upon completion, it will shorten the traditional shipping route for Southwest China cargo by approximately 560 kilometers compared with the Guangzhou Port passage.

The new 291-km outbound lane from Nanning to Qinzhou Port will become the shortest, most economical and most efficient sea-access channel for China's southwestern region.

Chen Liang, assistant general manager of Chongqing Xike Water Transport Engineering Consulting Co, is in charge of the ship trial operation.

Four vessels representing the main types expected to use this canal will take part in the trials, namely loaded and unloaded 5,000-metric-ton ships as well as loaded 3,000-ton and 1,000-ton vessels, Chen said.

"The trials will comprehensively verify the safety and stability of the canal's waterways, ship locks, anchorages and service areas under various operational conditions, laying a solid foundation for the canal's scheduled opening," Chen said.

All trial vessels are equipped with high-precision monitoring devices, including Beidou positioning systems, drone flow-field monitors, mooring tension sensors and engine condition collectors.

The devices gather hundreds of real-time data points, such as ship track, drift angle, transverse inclination, channel flow velocity and safe spacing between vessels.

Project authorities have established a multilayer safety protection system supported by joint coordination among maritime, construction and emergency response departments. Segmented and time-phased water traffic control is enforced throughout the trial period.

Dedicated escort speedboats and full emergency response protocols are on standby to handle potential incidents including vessel collisions, groundings, oil spills and personnel-overboard scenarios.

Pretrial verification of crew qualifications and vessel seaworthiness ensures full operational safety.

Pan Jian, chief engineer of Guangxi Pinglu Canal Construction Co, said a formal trial summary report will be completed after the testing phase concludes.

The report will propose route optimization measures, standardize navigation procedures, clarify segmented traffic control rules and supplement technical standards for safe canal operation.

The findings will support stable river-sea combined transport operations for the mega water project and provide empirical technical references for future domestic and international waterway engineering projects.

The canal's opening comes amid robust China-ASEAN economic integration. China and the Association of Southeast Asian Nations have remained each other's largest trading partners for six consecutive years.

In Guangxi, ASEAN has ranked as the region's top trading partner for 26 consecutive years.

In 2025, Guangxi's total import and export volume with ASEAN reached 429.2 billion yuan ($63.6 billion), up 8 percent year-on-year, reflecting continuous expansion and deepening of regional economic cooperation.

A trial vessel exits a lock chamber after water levels were lowered at the Pinglu Canal in Lingshan county, Qinzhou, Guangxi Zhuang autonomous region, on Wednesday. CHEN GUANYAN / CHINA NEWS SERVICE

Panda party

Giant panda admirers enjoy a group birthday party for giant pandas with Tian Bao at the Mianyang base of the China Conservation and Research Center for the Giant Panda in Sichuan province on Wednesday. The event is part of the 2026 giant panda birthday season activities, as July to September is typically the peak birth season for captive giant pandas. Various bases are holding a series of activities to celebrate the giant pandas' birthdays.
YANG SHU / FOR CHINA DAILY

Pilot program to levy tax on VOC emissions in 2027

By **HOU LIQIANG**
houliqiang@chinadaily.com.cn

China will launch a pilot program in 2027 to levy an environmental protection tax on volatile organic compounds, or VOCs, a key contributor to smog and ozone formation, expanding its green tax system to cover a broader range of air pollutants and intensifying air pollution control.

The pilot, jointly rolled out by the Ministry of Finance, the State Taxation Administration and the Ministry of Ecology and Environment, will bring VOCs that were previously untaxed under the existing framework into the tax net. The move has been made possible by years of progress in emission standards, product specifications and emissions accounting methodologies.

Eight major industrial sectors, including printing, petrochemicals, pharmaceutical manufacturing and steel and automobile production, will be the first to participate. Together, they account for more than 70 percent of the country's industrial VOC emissions.

According to a media release jointly issued by the three government bodies following the announcement of the pilot in late July, more than 300 types of VOCs can currently be monitored in China.

When the Environmental Protection Tax Law was enacted in 2016, however, only 18 toxic or odorous VOCs were subject to taxation, as monitoring and accounting methods were not yet mature enough to support broader coverage, the release said.

In recent years, China has made steady progress in VOC emission standards, product standards and emissions accounting methods, creating the technical foundation for a wider tax regime, the release said. The pilot reflects the country's growing capacity to move from partial control toward full-process, full-chain VOC governance.

VOCs are important precursors of ozone and PM2.5 particulate matter and are closely linked to haze and photochemical smog. Sunlight and high temperatures, for example, can trigger chemical reactions between VOCs and nitrogen oxides that lead to the formation of ozone.

According to the implementation rules, the tax rate will range from 8 to 12 yuan ($1.2-1.8) per pollution equivalent. Provincial-level governments will determine the specific applicable rate within that range, taking into account local environmental carrying capacity, current VOC emission levels and broader economic, social and ecological development goals.

For tax purposes, taxable VOC emissions will be converted into pollution equivalents. The number of pollution equivalents is calculated by dividing taxable VOC emissions by 0.95 kilograms, the prescribed pollution equivalent value for VOCs.

The pilot program includes tax incentives for companies with strong environmental performance. Taxpayers with a Grade A rating in the key industries' four-tier air-quality performance assessments will pay 50 percent of the standard tax, while those with a Grade B rating will pay 75 percent.

The release said the approach both rewards top performers and encourages a broader shift among companies toward environmentally friendly raw material substitution, cleaner production technologies, enhanced collection systems and more rigorous end-of-pipe treatment.

"The pilot program is an important part of deepening the reform of the fiscal and tax system and improving the green tax system," said Xu Wen, a researcher at the Chinese Academy of Fiscal Sciences.

It will help drive comprehensive VOC governance throughout the full process and the entire value chain, thereby facilitating emission reductions, Xu added.

Lei Yu, head of the Institute of Atmospheric Environment under the Chinese Academy of Environmental Planning, also lauded the pilot program's incentive-based approach, encapsulated in the principle of "more emissions, more tax; fewer emissions, less tax".

"It will compel companies to bear the consequences of their emissions through higher tax payments, and in turn force them to intensify in-depth governance across the entire process and all links, while accelerating green transformation and upgrading," Lei said.

Xinhua contributed to this story.

Xuelong sets up record number of Arctic ice stations

By **LI MENGHAN**
limenghan@chinadaily.com.cn

Chinese research vessel *Xuelong* completed ice station survey operations at 12 sites during the country's 16th Arctic expedition, setting a record for the largest number of ice stations established by a single vessel in China's Arctic missions, according to the Ministry of Natural Resources.

The ice station operations began on July 25 and lasted 14 days. All 12 sites were located at latitudes north of 82 degrees and selected for thicker sea ice to ensure that unmanned instruments could remain operational through the summer melt season. More than 30 ice-based buoys of various types were deployed across the sites.

The operations involved integrated observations across multiple disciplines, including the atmospheric boundary layer, sea ice physics, sub-ice ecology and sub-ice ocean dynamics. The data will provide in situ, long-term observations and validation for research into the evolution of the coupled atmosphere-sea ice-ocean system amid the rapid decline of Arctic sea ice.

The 12-station network enables coordinated monitoring at multiple points, which is expected to improve understanding of the mechanisms driving rapid changes in the Arctic and enhance the accuracy of climate predictions. *Xuelong 2* will establish about seven additional ice stations later in the expedition to further expand observational coverage.

During the operations, scientists used ice core drills and chainsaws to extract a block of sea ice measuring 1.3 meters thick and 1.2 meters on each side. The sample will be used to measure the mechanical properties of sea ice under Arctic conditions and further enrich the Arctic sea ice sample database.

"The mechanical properties of sea ice determine its strength," Sun Kai, an expedition member, told China Central Television. He said understanding ice mechanics is essential for ship design, as encountering particularly hard ice in ice-covered waters can impede a vessel's progress and cause structural damage.

The team also established an unmanned observation network in the Arctic Ocean and tested domestically produced marine observation equipment for operational application.

"This year's specialized tasks are particularly demanding," Qu Meng, leader of the sea ice team, told CCTV.

"The hydrology group has more than a dozen ice-based ocean profiling buoys, so we set up 12 ice stations to carry out array monitoring with these buoys," Qu said.

Among the most widely deployed instruments — ice-based shallow-water profiling buoys, ice-based deep-water profiling buoys and sea ice drift buoys — domestically produced equipment accounted for more than 90 percent on average. This level of domestic capability, combined with mature technologies, enabled the large-scale array deployment and automated networked monitoring achieved during the expedition.

"We've gradually moved from the simplest instruments, such as sea ice drift buoys and mass-balance buoys, to ecological unmanned ice stations. The range of domestically produced equipment will only keep growing," He Jianfeng, the expedition's chief scientist, told CCTV.

An ecological unmanned ice station, deployed for the first time in the Arctic, is expected to provide new insights into how organisms beneath the ice survive the polar night and respond to the polar day.

"The system uses integrated acoustic, optical and electrical sensing to carry out long-term, continuous observations of the atmosphere, ice, sea and ecology beneath the ice in the central Arctic," An Baobao, an expedition member, told CCTV.

An said this is the first time such acoustic-optical-electrical data collection has been conducted in the shallow subsurface layer beneath polar ice.

Quantum tech shifting from lab to real-world use

HEFEI — Chinese scientists have reported a series of advances in weather forecasting and drug discovery powered by quantum technology, highlighting how a field once regarded as a distant scientific ambition is steadily transitioning from the laboratory to real-world use.

Researchers from Fudan University and University of Science and Technology of China recently demonstrated that quantum machine learning could outperform large-scale classical neural networks in certain real-world weather forecasting tasks, including urban temperature and humidity prediction.

In another breakthrough, Chinese tech company Origin Quantum and USTC researchers developed a quantum-enhanced graph neural network on China's independently developed superconducting quantum computer — Origin Wukong — that boosted HIV antiviral drug screening accuracy from 73 percent to 97 percent and Alzheimer's drug prediction accuracy from 64 percent to 70 percent.

While fully fault-tolerant quantum computers remain years away, these advances reflect a broader reality: different branches of quantum technology are beginning to mature at different speeds, with applications already emerging in secure communications, healthcare, scientific research and industrial computing.

Among them, quantum communication has moved furthest toward commercialization. More than 40 major Chinese cities have deployed metropolitan quantum communications networks, providing the infrastructure for quantum-secured services to move into commercial use.

At China Telecom Quantum Group, visitors can try what appears to be an ordinary smartphone. Once users activate its quantum-encrypted calling function, conversations are secured using quantum key distribution, making intercepted communications unreadable.

Quantum technology is also beginning to reshape healthcare. Every heartbeat generates an extremely weak magnetic field that conventional medical instruments cannot directly detect. Quantum sensors, however, can measure these tiny signals.

One example is a magnetocardiography system developed by Chinese quantum technology company CIQTEK. Using quantum spin magnetometers, the system can complete a cardiac scan in just a few minutes, providing physicians with a new tool for early cardiovascular screening and risk assessment. The technology has already been deployed at several major hospitals in China.

For now, the most promising path toward practical quantum computing lies not in replacing today's supercomputers, but in combining the strengths of both technologies.

Inside the next-generation computing cluster in Hefei, capital of Anhui province, China's first locally deployed hybrid quantum supercomputing center combines a high-performance supercomputer with two superconducting quantum computers and one trapped-ion quantum computer.

"We break a large computational problem into smaller tasks," said Wang Guyue, director of the project management center at Hefei Big Data Asset Operation Co, operator of the computing center.

"Subproblems that have relatively simple inputs and outputs but extremely complex calculations are processed by quantum computers, while the remaining tasks stay on the classical system," Wang said. "We see quantum computing as complementing rather than replacing classical computing."

The commercial potential is already beginning to emerge.

Over the past two decades, Hefei has developed one of China's largest quantum technology ecosystems, bringing together more than 100 companies across the industrial chain.

To accelerate commercialization, Anhui has launched an initiative encouraging quantum technologies to be tested in hundreds of real-world scenarios, from secure communications to renewable energy. Hefei is also establishing a 10-billion-yuan ($1.48 billion) fund to support emerging technologies, including quantum technology, according to Chen Jun, director of the Anhui provincial development and reform commission.

Chinese quantum companies are also expanding internationally. Origin Quantum has begun exporting quantum computing equipment and cloud computing services, particularly to Belt and Road countries. In July 2026, Thailand's Chulalongkorn University announced a partnership with the University of Science and Technology of China and Chinese quantum computing company Unitary Quantum to jointly build Thailand's first trapped-ion quantum computer.

While many challenges remain before large-scale quantum computing becomes commonplace, the industry's focus has already shifted from proving that quantum technology works to discovering where it can create real economic and social value.

POLICY REVIEW

Tiered care to ease hospital burden

Primary services to be increased to bring treatment closer to residents

By **WANG XIAOYU** in Beijing and **ZHAO RUIXUE** in Shouguang, Shandong

SHI YU / CHINA DAILY

China is accelerating the rollout of a nationwide tiered diagnosis and treatment system designed to decongest top-tier urban medical centers and bring high-quality healthcare closer to residents, according to a guideline released by the State Council in April.

Under a tiered healthcare system, patients with common or frequently occurring illnesses will seek care at primary-level facilities, while those with acute or severe conditions will be treated at higher-level hospitals, said Zheng Zhe, vice-minister of the National Health Commission.

"This system not only makes healthcare more accessible, but also helps ease the (financial and time) burden on patients," he said at a news conference following the release of the guideline.

Zheng said that China has more than 1.1 million medical and healthcare institutions, and over 90 percent of residents can reach the nearest provider within 15 minutes.

He added that rural clinics and community health service centers have expanded their clinical service offerings, upgraded facilities and equipment, and improved the overall patient care environment.

Last year, primary healthcare institutions recorded 5.56 billion patient visits, accounting for 52.6 percent of the national total. Meanwhile, the number of referral medical visits between large and small hospitals continued to grow, increasing by more than 50 percent from 2020 to 2025.

"The tiered diagnosis and treatment system is taking shape, and we are transitioning from the stage of building a basic framework to one focused on improving quality and overall efficiency," he said.

According to the guideline, efforts will be made to ensure that every neighborhood has access to a community health center, with the goal of "eliminating any existing gaps" in primary-level healthcare service coverage.

The guideline emphasizes that secondary hospitals — the middle tier of the nation's three-tier hospital system — will strengthen their capacity to treat common diseases while expanding services in rehabilitation, nursing, palliative care, and integrated medical and elderly care.

Tertiary hospitals will focus on critical and complex diseases and enhance services for referred patients, as well as those requiring multidisciplinary consultations or hospitalization. At the same time, they will gradually scale back routine outpatient services — such as follow-up visits for common diseases and stable chronic conditions with clear diagnoses — to achieve a more efficient utilization of high-quality medical resources.

The document also calls for upgrading partnerships that link higher-level hospitals with smaller institutions by establishing resource-sharing centers for medical imaging, examinations, sterilization, laboratory testing and drug supply services.

To encourage patients to seek their initial diagnosis at the primary level, the guideline requires higher-level hospitals to set up outpatient clinics for common and chronic diseases — including high blood pressure, diabetes and chronic obstructive pulmonary disease — at primary-level institutions within their medical consortia.

"The provision of specialist and expert clinics should also be extended to the primary level," it said. "For eligible chronic disease patients, primary-level healthcare institutions are allowed to issue long-term prescriptions covering up to 12 weeks of medication in a single visit."

It added that more medical professionals will be regularly dispatched to grassroots facilities, and additional mobile medical teams will be deployed to underserved areas.

In Shouguang, a city of 1.17 million people in Shandong province, 92.3 percent of residents choose to seek medical treatment within the city, and 77.4 percent of all healthcare services are delivered at the grassroots level, according to local authorities.

Li Peng, Party secretary of Shouguang, said that a key initiative in the city's recent push to bolster grassroots healthcare services has been to enhance convenience for patients with chronic conditions such as high blood pressure and diabetes, as well as for people with disabilities.

"We aim to deliver six key types of services at the village level — chronic disease patient registration and medication dispensing, regular monitoring, routine tests, hospital admission and rehabilitation care," he said. "All villagers can apply for chronic disease certification and receive up to 36 lab tests, including blood and urine tests, without leaving their village. Those with limited mobility are provided with door-to-door nursing care and home-based rehabilitation guidance."

Li Shuliang, a Shouguang resident, used to find it troublesome to arrange medical visits for his 88-year-old father, who has high blood pressure and diabetes.

"Now, my father can take basic tests at the village clinic, and blood samples for more complex tests are picked up and sent to higher-level hospitals for analysis," he said.

Li said that village doctors now make regular home visits to provide guidance on diet and medication. They also compile monthly medication lists for chronic patients, stock adequate supplies and issue prescriptions lasting up to three months — eliminating the need for patients to make monthly trips to a major hospital.

Jiao Yahui, head of the National Health Commission's primary health department, said that efforts will be made to explore the application of artificial intelligence-assisted diagnostic tools, smart prescription review technologies and other digital solutions to further improve primary-level healthcare.

She underscored the importance of establishing grassroots chronic disease management centers, which are expected to provide integrated services for patients from prevention and screening all the way through to diagnosis and rehabilitation.

Policy Digest

180 million yuan allocated for disaster response

The Ministry of Finance and the Ministry of Emergency Management on Monday allocated 180 million yuan ($26.7 million) from the central natural-disaster relief fund to address flood and drought disasters across China.

Eastern regions have been hit by severe flooding amid heavy rains brought by Typhoon Dolphin, while northwestern areas are grappling with persistent drought caused by scant rainfall.

Of the total sum, 120 million yuan is earmarked for the eastern provinces for flood and typhoon emergency relief. The funding will support search-and-rescue missions, evacuation and resettlement of affected residents, hazard removal, secondary-disaster risk prevention, and repairs to damaged housing.

The remaining 60 million yuan will go to the Inner Mongolia autonomous region, the Xinjiang Uygur autonomous region and the Xinjiang Production and Construction Corps for drought relief. It is aimed at helping resolve drinking-water shortages for urban and rural residents.

Judicial opinion issued on environmental code

China's top court issued a set of provisions on Aug 6, marking the first judicial interpretation supporting the country's Ecological and Environmental Code. The provisions were designed to ensure a smooth legal transition between old and new laws, and the full and accurate implementation of the code.

The provisions will take effect along with the code on Saturday, according to the Supreme People's Court. Consisting of 13 articles, the provisions clarify the general standards and specific rules for courts to apply old and new laws when hearing environmental cases after the Code takes effect.

The 1,242-article Ecological and Environmental Code, adopted by China's top legislature in March, has five chapters, covering areas including pollution control, ecological protection, and green and low-carbon development.

Opening-up of foreign exchange to be expanded

The State Administration of Foreign Exchange said on Aug 2 that it will continue to steadily expand institutional opening-up in the foreign exchange sector in the second half of this year.

The administration will promote nationwide the facilitation policies for high-level opening-up in cross-border trade foreign exchange receipts and payments, support the development of trade such as cross-border e-commerce, optimize foreign exchange settlement for service trade, and bolster the development of trade in intermediate goods.

It will also promote the centralized operation policy for domestic and foreign currency cross-border funds of multinational corporations, issue regulations on the administration of domestic foreign exchange loans, and steadily and prudently expand connectivity between financial markets.

It also stressed the need to strengthen the monitoring of cross-border capital flows, continuously improve macro-prudential management and expectation management, and take comprehensive measures to safeguard the stability of the foreign exchange market.

XINHUA - CHINA DAILY

Insurance funds redirected to community clinics

By **WANG XIAOYU**
wangxiaoyu@chinadaily.com.cn

China is shifting a larger slice of its national medical insurance pool directly to local clinics and community hospitals, a move designed to lower out-of-pocket costs for patients and shore up long-underfunded front-line healthcare workers.

A joint guideline released by the National Healthcare Security Administration and two other government departments in March redirects more newly added annual insurance funds toward primary healthcare. The policy tackles a long-standing bottleneck in China's healthcare system where top-tier regional hospitals are perpetually overwhelmed while neighborhood clinics lack the funding, medications and incentives to handle basic care.

Wu Hao, dean of the School of General Practice and Continuing Education at Capital Medical University in Beijing, said that the document clarifies that newly added annual insurance funds will be directed more to primary healthcare institutions and that the management of total funds will be upgraded in their favor.

"The measure will not only alleviate concerns among grassroots medical staff regarding income security and liability, but also encourage them to proactively improve their service capabilities," he said during an event held by the administration in April.

"Ultimately, the goal is to enable residents to access high-quality medical services close to their homes," he added.

The guideline also states that the reimbursement rate for outpatient services under the resident insurance program will be no less than 50 percent.

"This means that patients receiving treatment at the grassroots level can enjoy higher reimbursement rates and pay less out of their own pockets, thereby guiding people to choose primary healthcare facilities as their first option for medical care," Wu said.

The guideline also states that primary-level institutions are permitted to prescribe long-term prescriptions of up to 12 weeks for eligible patients with chronic conditions.

"As a result, patients in stable condition can obtain up to three months' worth of medication in a single visit, sparing them from frequent trips to the hospital and allowing grassroots doctors to provide proper diagnosis and treatment without constraints," Wu said.

China has focused on improving grassroots healthcare in recent years. By the end of last year, the nation had 1.06 million primary healthcare institutions and 5.25 million grassroots healthcare workers.

A total of 2,199 county-level regions have built tight medical consortia that connect higher-level hospitals with rural or community clinics. In 2025, the number of patient visits to primary healthcare institutions reached 5.56 billion, accounting for 52.6 percent of the national total.

Miao Yanqing, a researcher from the China National Health Development Research Center, said one highlight of the guideline is to motivate county-level medical alliances to transition their role to the health management of residents and guide them to seek medical care within their home counties.

"It clarifies that any surplus insurance funds within the medical consortia will be directed primarily toward grassroots medical institutions and front-line healthcare workers," she said.

A series of payment changes are also aimed at positioning county-level institutions as destinations for handling severe and complicated cases, and nurturing medical talents, while grassroots clinics will be mainly tasked with caring for chronic and common diseases, as well as providing rehabilitation and nursing services.

The guideline also states that the national centralized drug procurement program will be used to secure stocks of common and chronic medications at primary care facilities. Authorities will support these institutions in equipping them with facial recognition devices to enable faster payment and insurance settlement.

Xu Na, deputy director of the National Healthcare Security Administration's medical services management department, said that the administration will select 15 pilot regions to explore best practices and generate replicable experiences that can be promoted nationwide.

LIFE

Ancient opera finds ways to remain alive

By adapting to the small screen and integrating technology, centuries-old Qinqiang is capturing young audiences across the globe, **Xu Fan** reports.

Li Mei, a prestigious Qinqiang Opera artist.

Left: Li Mei backstage during her performance in Qinqiang Opera *Yang Guifei*. **Middle:** Li captivates the audience in her portrayal of Yang. **Right:** Li provides voiceover for the Qinqiang Opera film *Yang Guifei*. PHOTOS PROVIDED TO CHINA DAILY

Cultural Frontline

Yang Yuhuan, one of Chinese history's most celebrated beauties, waited for her final breath as the fate of an empire closed in around her.

Yang, the beloved concubine of Emperor Xuanzong of the Tang Dynasty (618-907), was ordered to die as angry soldiers blamed her for the dynasty's collapse and the advancement of rebel forces. Yang was strangled, a tragic end that has been retold in Chinese literature and opera for centuries.

In 2018, Li Mei, a prestigious Qinqiang Opera artist, brought the repertoire *Yang Guifei* (Concubine Yang) to the 8th Traditional Chinese Opera Festival in Paris. During one performance, as the story reached its most painful moment — Yang weeping over her doomed fate — Li noticed an elderly French audience member sitting in the front row, tears welling in his eyes.

"At that moment, I felt a foreign audience member truly understanding Chinese culture," recalls Li, who is also vice-president of the China Theatre Association and president of the Shaanxi Opera Research Institute.

Having performed Qinqiang Opera for more than four decades, Li has traveled to more than 50 countries and regions, gaining a profound understanding of how art can transcend borders and resonate with people from vastly different cultures.

With a history of more than 600 years, Qinqiang — wrapped in Chinese people's collective memories of politics, economy and culture — originated in northwestern China, matured during the Ming Dynasty (1368-1644) and flourished during the Qing Dynasty (1644-1911). Its most prominent characteristics are its high-pitched passion and its stirring, solemn tone.

"We believe that those who sing Qinqiang rarely become depressed. It allows them to pour out their inner emotions, like the Yellow River's waterfall rushing down in a torrent, perhaps carrying mud and sand with it," says Li. "The opera is not delicate, but full of vitality and power."

Reaching new heights

What has most recently propelled this centuries-old opera, one of China's oldest existing performing arts, to new heights of popularity is the hit drama *The Lead*, a bittersweet story chronicling a talented Qinqiang star's life journey.

Last year, nearly 200 experts and young actors from the institute assisted the cast and crew for the preparation and filming of *The Lead*, with actress Liu Haocun coached in Qinqiang singing techniques and stage movements.

Starring Liu as Yi Qin'e, a former rural shepherd who strives to become a star, the series generated significant buzz even before its debut earlier this year thanks to a roster of big names attached to the project: iconic filmmaker Zhang Yimou served as executive producer and diva Faye Wong lent her voice to the theme song. For both A-list celebrities, it marked their first contribution to a small-screen project in decades.

> "We believe that those who sing Qinqiang rarely become depressed. It allows them to pour out their inner emotions, like the Yellow River's waterfall rushing down in a torrent, perhaps carrying mud and sand with it."
>
> **Li Mei,** Qinqiang Opera artist

Clockwise from top left: Li Mei in a scene from *Xihu Yihen* (Regrets at the West Lake). A photo of the artist. Motion capture in action, which was used in the extended reality remake of Qinqiang Opera *Gui Yuan·Sha Sheng* (Ghost's Lament — Killing).

The script is adapted from the 10th Mao Dun Literature Prize-winning novel of the same title, penned by writer Chen Yan, the former director of the Shaanxi Opera Research Institute. During his more than 20 years at the institute, Chen witnessed many actors transform from newcomers into stage stars — experiences that became the wellspring for the novel.

Veteran actor Zhang Jiayi, who plays Yi's uncle and also serves as the show's artistic director, had previously starred in *The Stage*, a 2019 TV drama adapted from Chen's novel *Zhuang Tai* (Setting the Stage), about a grassroots stage crew. That experience, combined with Zhang Jiayi's roots in Shaanxi province, gave him a deep understanding of the opera and its cultural traditions.

"Zhang Jiayi and his team hold great reverence for traditional art forms," says Li, adding that the team spent eight years preparing and producing the drama, with five years devoted to polishing the script.

The painstaking preparations appear to have paid off. According to China Media Group, the show's broadcaster, all 48 episodes and related videos have been viewed online more than 3 billion times. Riding the wave of fan enthusiasm, content derived from the series, ranging from the Shaanxi local dialect to Qinqiang and other cultural elements tracing back to the Qin Dynasty (221-206 BC), which established its core regime in Shaanxi, has generated a striking 5.3 billion clicks.

The surge in online attention has also spilled beyond the screen and onto the stage.

"After *The Lead* became a hit, we closely followed up by consistently staging more than 10 performances of the operas featured in the TV drama, with tickets quickly selling out," recalls Lyu Jiangtao, a 30-year-old actor at the Shaanxi Opera Research Institute.

There is one particularly striking change: Qinqiang's audience used to be predominantly older people. Now, young viewers are showing up in growing numbers, drawn in by the drama's popularity. "Many young people even made special trips, flying to Xi'an, the provincial capital, just to watch the operas," Lyu says.

The four operas featured in the TV drama and arranged for television fans are *Da Jiao Zan* (Fighting Jiao Zan), featuring a heroine of humble origins during the Song Dynasty (960-1279); *Hua Ting Xiang Hui* (The Meeting at the Flower Pavilion), recounting the reunion of a couple separated against their will during the Ming Dynasty; *Yang Men Nyu Jiang·Tan Gu* (Female Generals of the Yang Family — Exploring the Valley), centering on the legendary female general Mu Guiying; and *Gui Yuan·Sha Sheng* (Ghost's Lament — Killing), about a young woman's brave pursuit of love.

"It's like touching an elephant's leg, if you only know Qinqiang from the TV drama. But once you watch more of our livestream shows, you'll see the whole elephant and probably fall in love with it," says Li.

Into the digital age

Hailed as the ancestor of many traditional Chinese operas, Qinqiang was once a prevailing art form but later went through a period of decline amid the entertainment industry's rapid expansion. Today, however, the centuries-old art is finding new life — not only through the popularity of *The Lead*, but also through new technologies and innovative approaches to presenting traditional culture.

For Li, the need to adapt is personal. "When I was 15 or 16, I felt confused and struggled, thinking that Qinqiang was dying. We couldn't sell tickets back then," she recalls.

Yet encouragement from veteran experts persuaded her to stay on the stage. Decades later, she sees technology not as a threat to tradition, but as one way of keeping it alive.

"Qinqiang is a precious treasure left to us by generations, constantly nourishing our bloodline and spirit. That is why the further we go, the more grounded and confident we feel," she says. "I firmly believe that traditional culture must embrace the times and technology; only then will it not be forgotten by the passage of time."

That philosophy is now being put to the test in an ambitious new project: an extended reality remake of *Gui Yuan·Sha Sheng*, featuring two iconic scenes from the classic Qinqiang opera *Zai Xu Hong Mei Yuan* (A Reunion at Red Plum Pavilion).

Li has performed the opera more than 1,300 times. It tells of a legendary romance in which a young woman, murdered by her ruthless high-ranking official husband, returns as a ghost to seek revenge and rescue the man she truly loves.

The XR project seeks to bring the performance closer to audiences in a way a conventional stage cannot.

Shot with a binocular panoramic 3D film camera at a high rate of 90 frames per second and with a 180-degree field of view, the project has completed more than 10 minutes, or half of its overall 20-minute runtime.

It vividly re-creates two famous Qinqiang stunts: "*wo yu*" — a posture requiring the performer to squat slowly with extreme flexibility, and "*chui huo*", a stunt involving bursts of flame blown from the mouth.

For audiences wearing an extended reality headset, the experience is deliberately intimate. Flames appear to burst just inches from their eyes, creating a visceral sensation that places viewers almost inside the performance rather than at a distance from the stage.

Wang Jixuan, director of the management office of the Xi'an XR Film Industry Base, says the project offers audiences a perspective rarely available in a conventional theater, where the stage can feel distant.

"Such close-range performances give the audience an immersive feeling, delivering an unparalleled sense of awe," he says.

Zhang Feng, supervisor of the Xiying Boundless XR Cinema, says the film marks the first attempt to combine advanced XR technology with intangible cultural heritage, adding that they will continue to explore the field further.

For Qinqiang Opera, the challenge is no longer to preserve an old art form, but to find new ways for audiences to see, hear, and feel it. The stage may change, but the voice remains.

LIFE

Flipping a new toy story

By updating fragile ancient crafts, passionate artisans successfully transform fading cultural history into modern daily routines, **Yang Feiyue** reports.

Li Mei recently demonstrates the intricate paper-folding process behind *fanlihua*, a paper toy, in Beijing. PHOTOS PROVIDED TO CHINA DAILY

Li Mei spent 12 years teaching English to children before deciding to take a completely different path.

Her father-in-law, a fourth-generation inheritor of *fanlihua* — a traditional Beijing paper toy that transforms with a flick of the wrist — was preparing to close his small workshop in eastern Shandong province.

The profits were thin. The work was exhausting. The craft, which had once been a familiar sight at Beijing's temple fairs, had all but faded from memory.

Yet, Li thought the toy deserved another chance, but she was not acting on impulse.

"I had been an English teacher for nearly 12 years," she says. "That career would always be there for me. If trying to revive *fanlihua* didn't work out, I could always go back."

So she decided to test the waters — bringing the craft back to Beijing, its place of origin, to see whether people still cared.

The answer came during the 2024 Spring Festival holiday at Beijing's Ditan Temple Fair.

Her tiny booth quickly drew crowds. Children squeezed through adults for a closer look. Elderly visitors pointed excitedly toward the colorful paper toys stacked behind the counter. Some customers bought them before even asking how they worked.

For hours, Li barely paused, repeating prices almost mechanically as her stock disappeared.

At Beijing's Ditan and Longtan temple fairs that year, Li's family earned between 150,000 and 200,000 yuan ($22,130–29,500) in just 15 days. What stayed with her, however, was not the sales figure.

"I realized that a toy many people assumed had faded into history could still spark such instant recognition and excitement," she says.

The response convinced her to leave teaching behind and devote herself to reviving the craft.

Two years later, she sees that moment in a different light. "It made me realize these traditions were never truly gone," she says. "People were simply waiting to rediscover them again in a new way."

Living heritage

Across China, similar stories are unfolding. Intangible cultural heritage, once associated mainly with museums, official exhibitions or aging artisans' workshops, is reappearing in shopping malls, coffee shops, lifestyle stores and weekend workshops that cater to young urban consumers.

On the fourth floor of Gongmei Building on Beijing's Wangfujing shopping street, visitors spend entire afternoons making paper toys, learning embroidery techniques or browsing heritage-inspired products inside a cultural space called Yuxun Jingxi, established by the major arts and crafts player Beijing Gongmei Group.

Some come for photos. Others simply want a relaxing weekend activity. Few arrive thinking they are engaging with intangible cultural heritage, observes Wang Jingjing, deputy general manager of Gongmei.

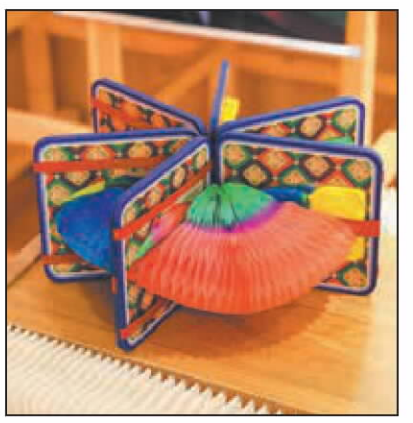
"That is precisely the point. We don't want to sell intangible cultural heritage as heritage. We want to present it as a lifestyle," she says.

Since opening in 2025, Yuxun Jingxi has hosted more than 100 heritage-related events, attracting tens of thousands of visitors through workshops, exhibitions and lifestyle experiences designed for younger consumers.

The approach reflects a broader shift in how traditional crafts are being revived in China today — not as static cultural symbols preserved behind glass, but as products and experiences woven back into everyday life.

"The moment heritage is placed too high on a pedestal, people feel disconnected from it," Wang says. "Lifestyle is immersive. It's participatory."

That participatory approach is increasingly resonating with younger consumers. A recent survey by China Youth Daily found that 81.1 percent of respondents view intangible cultural heritage activities as a new way to socialize, while nearly half share their experiences on social media.



Demand has grown rapidly. During the 2026 Spring Festival holiday, group-purchase sales for activities combining intangible heritage and traditional markets surged 764 percent year-on-year on Douyin, according to platform data.

"It has to be fun first," Wang says. "Only then will people discover how remarkable these traditions really are."

Above: Li teaches a child how to play with a traditional *fanlihua* toy in Zhongshan, Guangdong province.

Above: Tibetan incense products, reimagined through modern design, have found a new home in urban living spaces. **Left:** A *fanlihua* piece that blends the traditional *bagua* (eight trigrams) shape with ancient Chinese motifs.

Above: A piece of *fanlihua* designed in the shape of a folding fan.

Innovative patterns

Li's paper toy was never meant to be remarkable. It was simply a paper-and-bamboo toy designed to flip.

The craft, also known as "18 flips", dates back to the Qing Dynasty (1644-1911). Once enjoyed in imperial courts before spreading among ordinary residents, the toy later became a familiar feature at Beijing's temple fairs. Its charm lies in transformation: folded paper structures suddenly bloom into dragons, flowers or geometric forms with a series of deft hand movements. Yet, by the early 21st century, the craft had all but disappeared from Beijing.

As Li immersed herself in the trade, she found several practical obstacles. Traditional designs offered little variety. The toys were made from fragile *xuan* paper that tore easily, prompting many buyers to treat them as disposable. Their appearance had changed little over the decades. "The complexity of the craft no longer matched its economic value," she says.

Rather than thinking like a heritage inheritor, Li approached the challenge as a consumer.

Before bringing the toys back to Beijing's temple fairs, she extensively redesigned them, creating dragon editions, AI-assisted lion dance motifs, carp patterns symbolizing good fortune, and shapes inspired by traditional Chinese fans and jade ornaments.

She also replaced delicate *xuan* paper with sturdier pear paper, a tissue paper originally used for wrapping fruit and durable enough to last for years. She enlarged the outer sleeves that encase the folded toy, transforming what had once been plain red or green covers into canvases featuring Beijing snacks, city landmarks and customized designs.

Most importantly, she stopped marketing the toys primarily as "heritage". "I want people to think the product is interesting at first," she says.

Unexpectedly, her years as an English teacher proved invaluable. "Heritage workshops and teaching are actually very similar," she explains. "You have to think from the user's perspective and ask how people can most easily understand and enjoy something."

The strategy paid off.

Li has since taken *fanlihua* beyond temple fairs and retail shelves. She has designed a do-it-yourself kit that guides users through every step, from gluing the paper honeycomb to dyeing the "flower buds", allowing even children to make their own paper toy from scratch.

She has led workshops on university campuses, including Renmin University, where students who had never heard of *fanlihua* spent hours folding and flipping the toys.

She is now developing English-language experiences for international visitors. "The first time foreigners see it, their reaction is the same as mine was," she says.

"Such simple materials — paper and sticks — yet so many transformations. They're fascinated."

That transformation reflects a larger trend. Traditional crafts, once regarded as old-fashioned or remote, are being redesigned through contemporary aesthetics, interactive workshops and social media-friendly spaces, experts say.

The rise of *guochao*, or China chic, has also encouraged younger generations to reexamine traditional culture with fresh curiosity and confidence, they agree.

But for Wang, the real problem is not whether heritage looks fashionable. It is whether it remains relevant. "Heritage cannot survive only as something displayed. It has to become part of people's lives again," Wang says.

That may explain why some of the most successful revivals in recent years have involved objects tied to everyday life rather than ceremonial symbolism — toys, accessories, stationery, teaware or textiles, she notes.

Kunqu Opera performance delights visitors at UN headquarters

Left: People enjoy Kunqu Opera during a Shanghai city promotional event in London on April 24.
Right: Actors from Shanghai Kunqu Opera Troupe perform at the Grand Theatre of Prince Kung's Palace Museum in Beijing on June 9. PHOTOS BY XINHUA

UNITED NATIONS — A pop-up Kunqu performance, showcasing one of China's oldest surviving forms of opera, brought an unexpected burst of traditional Chinese culture to the United Nations headquarters in New York on Aug 4.

Presented by artists from the Zhejiang Jingkun Art Center, the performance drew curious UN staff and visitors, many of whom stopped to watch the centuries-old art form unfold in a public space within the complex. Some filmed the performance on their phones, while others stayed to learn more about the stories behind the scenes.

Adina Ghita, a judge at the United Nations Dispute Tribunal who recently began studying Chinese, said the performance left a strong impression despite her limited understanding of the dialogue.

"It's the second time I've seen one. It's wonderful. It's special. They are so graceful when they dance," she said. "I understand it's about a princess and a lady who embroiders, and I love the way they dance. I think it's very expressive."

Ghita said the visual storytelling made the performance easy to follow and enjoyable, adding that she hopes to see more traditional Chinese performing arts at the United Nations.

"I see a lot of Chinese movies, and there are those dances with long sleeves, like fire or like water. I'd like to see that," she said.

For Toni Thai Sterrett, founder of AI-powered screenwriting platform Cinepartna, the performance showed how traditional cultures from different parts of the world can resonate across borders.

"I thought it was beautiful. It was different. I don't understand the language, but I understood what was going on," she said. "I felt the emotion."

Sterrett, who was visiting UN headquarters, said she found it especially meaningful to see women performing Kunqu Opera after learning that the art form was traditionally performed entirely by men. She also praised the production's comic role, saying, "The jester was really funny."

What impressed Sterrett most, however, was the sense of familiarity she found in an art form from a different culture.

"It made me think about how similar all these traditional cultures are," she said. "Older cultures throughout Asia, Africa, and indigenous communities have so much in common. The gestures and the way they were communicating made me think, 'Wow, we really are all the same.'"

The performance also carried broader significance at an international venue like the United Nations, Sterrett said.

Co-hosted by the UNSRC Chinese Book Club and the Zhejiang Provincial Department of Culture, Radio, Television and Tourism, the performance featured excerpts from three classic Kunqu productions — *Age of Splendor* (Shengshi Hongzhuang), *The Tale of the Precious Sword* (Baojian Ji) and *Fifteen Strings of Cash* (Shiwu Guan) — presenting stories that range from the grandeur of the Tang Dynasty (618-907) and themes of loyalty and righteousness to humorous glimpses of everyday life.

Recognized by UNESCO in 2001 as one of the first masterpieces of the Oral and Intangible Heritage of Humanity, Kunqu Opera is celebrated for its elegant singing, graceful choreography, poetic language and minimalist stagecraft, using symbolic gestures and movements to convey rich emotion and dramatic narratives.

CULTURE

Left: A porcelain artwork titled *Omniscient* by Russian artist Svetlana K-Liee. **Center and right:** Mexican artist Liliana Diaz works on porcelain pieces shaped like brain scans in her studio at Taoxichuan in Jingdezhen, Jiangxi province. PHOTOS PROVIDED TO CHINA DAILY

China's porcelain hub: A global kiln

A newly inscribed UNESCO World Heritage site is a thriving center for international artists who explore ceramics and traditional connections, and find a unique blend of legacy and innovation, **Sun Meng** reports in Jingdezhen, Jiangxi.

On an upper floor of a modern building, the space opens into a vast and airy studio where sunlight pours through tall windows. This is a working hub for artists from around the world. Scattered across the room are worktables — each one a small universe, with its own rhythm and its own conversation between artist and clay. All of them share the same address: Taoxichuan, Jingdezhen's sprawling cultural district built on the site of the former Universe Porcelain Factory.

On July 25, the Jingdezhen Handicraft Porcelain Industry Sites were inscribed on the UNESCO World Heritage List, becoming China's 61st World Heritage site and the first centered on porcelain. For the thousands of foreign artists who have settled in this city of 1.62 million people, the recognition came as no surprise.

Jingdezhen in Jiangxi province is home to more than 60,000 *jingpiao* — artists, designers and creators who have migrated to the porcelain capital, including thousands from more than 60 countries. Since 2015, Taoxichuan has been inviting artists from a variety of countries and regions through its residency programs, offering three-month stays at its international studio to more than 3,600 artists, according to Xinhua News Agency.

Svetlana K-Liee, an artist from Russia who had been living in England since 2006, first came to Jingdezhen three years ago for short residencies. "Each time was not enough," she says. "Finally, after my third residency, which lasted three months, I decided to move here."

Above left and above right: Russian artist Svetlana K-Liee's porcelain art pieces shaped like spiders with bodies of berries.

Above center: Another porcelain work from the Spider-Berries series by K-Liee.

Three foreign artists at Taoxichuan International Studio in Jingdezhen, Jiangxi province — (from left to right) Svetlana K-Liee from Russia, Pinar Baklan from Turkiye, and Liliana Diaz from Mexico.

Now 49, K-Liee works with porcelain, glass and bronze. On her worktable sits a porcelain art piece. It's a spider with the body of a berry, which is part of her current project. The piece uses traditional Chinese white porcelain and has thick glazes from gas firing. "All the materials I used for it are purely traditional Chinese," she says. "Jingdezhen is an endless source of inspiration and pure, sophisticated materials which I can't get anywhere else. I have discovered many new techniques which were unknown to me previously."

The studio she shares with other resident artists is a microcosm of this global community. Just three days earlier, an artist in her 70s from the Netherlands had been working at the table next to hers for the previous three months. Age, like nationality, seems to matter little in this sprawling space. "We are a multinational group of artists," K-Liee says. "We work here and enjoy not only the work, but the culture."

Apart from porcelain making, she has also embraced traditional Chinese practices such as tai chi, which she practices every morning at 6 am, and acupuncture. "Even my sleep is really good here," she adds. "It shows that my spirit feels really peaceful and happy."

Liliana Diaz, an artist from Mexico, is working on a very different project. Her studio at Taoxichuan is filled with porcelain pieces shaped like brain scans. "The printed piece is the hippocampus," she explains. "This is the part of the brain that is in charge of storing memory."

She sees a connection between memories and the fragments of porcelain buried beneath Jingdezhen. "I have learned that there are many fragments of porcelain and ceramics buried underground, and now they are reaching out and becoming part of the history of the city," she says. "So I'm trying to link that with how we search for our own memories."

For Diaz, cultural exchange is at the heart of her decision to come here. "We come from different cultures with different languages, and we're hungry for new emotions and new knowledge," she says.

Pinar Baklan, a ceramics artist from Turkiye, has been working with porcelain for more than 20 years. This is her first time in Jingdezhen. "I'm happy to be here because we have a very similar culture to China," she says. "We have blue-and-white art like in China, but use a different technique."

The "blue-and-white" she refers to is Iznik ceramics, a Turkish tradition born from the influence of Chinese blue-and-white porcelain that reached the Ottoman Empire via the Silk Road. While visually similar, the two are technically distinct. In Turkish, the word for ceramic is "cini", which means "coming from China". "We tried for centuries to make the same quality as in China," she says.

Baklan sees Jingdezhen's contribution to the world as its ability to bring people together. "You have super deep culture here," she says. "You bring people together to share, which is a really important mission for artists. We have everything to discover here in Jingdezhen."

For all three artists, Jingdezhen is more than a place to work. It is a place to live. K-Liee speaks of the changes she has seen over the past three years. "The town is developing with enormous speed," she says. The UNESCO inscription, K-Liee believes, will only accelerate that transformation. "It's really great to hear that," she says. "Jingdezhen definitely deserves it as it is a unique place on the planet."

For the thousands who have chosen to stay, the city's new status as a World Heritage site is both a recognition of its past and a promise for its future. Jingdezhen's kilns have been firing for over a millennium. In K-Liee's words, "We are still here, still making."

Liangzhu Museum's bilingual guides bring 5,000-year-old civilization to life

HANGZHOU — Clad in a red volunteer vest bearing a badge in the shape of a jade-inlaid lacquer cup, one of her favorite Liangzhu artifacts, American Emma Chen greeted visitors to the Liangzhu Museum in East China, and then shared stories of a civilization that flourished more than 5,000 years ago.

For Chen, the ancient artifacts on display are more than relics from the past. They offer a glimpse into the wisdom of the Liangzhu people, showcasing their sophisticated social structure, farming practices and exquisite jade craftsmanship, dating back to the Neolithic era.

"Although no written records of the Liangzhu people have been found, archaeology, together with later historical texts, allows us to gradually piece together their way of life and better understand the cultural legacy they left behind," she says.

The Liangzhu ruins, located in Hangzhou, capital city of East China's Zhejiang province, are recognized as a testimony to the existence of Chinese civilization at least 5,000 years ago. They have also been inscribed on the UNESCO World Heritage List.

Launched in 2023, the Liangzhu Forum has been held annually to gather global archaeologists, historians, museum directors, and artists to discuss world civilizations, heritage conservation and cross-cultural dialogue. The forum has also contributed to several international cooperation projects, including the establishment of an archaeological research center focused on Liangzhu.

"To me, the greatest significance of Liangzhu lies in its archaeological value," Chen says. "Its remains, especially the city structure, have been well-preserved, so that we can use its three-tier layout to help visitors understand how the ancient city was organized and what it reveals about the social hierarchy of the Liangzhu people."

A museum enthusiast, Chen became a frequent visitor to Liangzhu Museum before joining its volunteer team. During one visit, dressed in traditional Chinese attire for a lantern and riddles event, she met staff members recruiting volunteers — an encounter she describes in Chinese as *yuanfen*, or a special connection.

"I was thrilled because it was exactly the kind of work I had always wanted to do," she recalls.

Fluent in Chinese, Chen took Asian studies as an undergraduate in the United States before settling in China. Now in her fifth year as a volunteer guide at Liangzhu Museum, Chen has immersed herself in the archaeology of China's Neolithic cultures, expanding her professional knowledge and exploring new ways to share its stories with visitors.

Chen's journey is part of a broader effort by Liangzhu Museum, where more than 200 volunteers, including a growing team of bilingual guides, help visitors from around the world better understand the ancient civilization.

Participants of the Third UNESCO High-level Forum for Museums visit the Liangzhu Museum in April 2025. JIANG HAN / XINHUA

"We offer English-language guide services two days a week, with more than 20 volunteers now able to provide tours in English," says Shan Qingjuan, a museum staff member.

The rising demand for bilingual services comes amid a growing interest among international visitors in exploring China's diverse and time-honored cultural heritage. A survey by the China Tourism Academy found that more than 60 percent of inbound tourists consider experiencing Chinese culture a major purpose of their trip. The museum has received over 527,000 visitors so far this year, including more than 5,100 overseas visitors, mainly from Southeast Asian countries and the US.

"Many international visitors are fascinated by the visible details of Liangzhu artifacts, especially the symbols carved in jade and pottery, including images of houses, animals and the iconic sacred human-animal motif," says Yao Hua, a veteran bilingual volunteer at Liangzhu.

A former pharmaceutical professional, Yao joined the museum's volunteer team in 2015. During her tours, she often uses digital tools to help overseas visitors understand the intricate patterns on Liangzhu artifacts.

"When introducing the sacred human-animal motif carved in jade artifacts, I would use a tablet to enlarge the image for them to examine details such as the eyes, nose and fangs," Yao says.

Yao prefers to think of herself as an exhibition interpreter. "Our job is not only to explain what visitors are looking at, but to help them explore the ideas, stories and curatorial thinking behind the exhibition," she says. "We are a bridge between cultural relics and visitors."

To better fulfill the role, Yao has continued to expand her knowledge across archaeology, art and history, finding connections that help bring ancient civilizations closer to visitors.

Over the past five years of training volunteer guides, Yao has witnessed the transformation of Liangzhu's volunteer team, with younger and highly skilled volunteers joining the program as public interest in the civilization continues to grow.

Dong Zhen, a popular museum content creator in his 30s, joined the volunteer team after his first visit to Liangzhu in 2022. His first encounter with the site raised a question in his mind: Why did people 5,000 years ago choose to build a magnificent ancient kingdom on marshlands and wetlands? Driven by curiosity, Dong studied extensive materials, learned from experienced guides, and passed the museum's rigorous training system. He now has nearly a million subscribers across social media.

"A guide's role is not only to impart knowledge, but to awaken curiosity," he says. This year, Dong began focusing on an exhibition about ancient Greek civilization at Liangzhu Museum. "By learning about Ancient Greece today, we are not pursuing the unfamiliar, but trying to understand human civilization. In doing so, we gain a deeper understanding of ourselves."

Liangzhu's volunteer team has become an important force supporting the museum's work, says Xu Yao, deputy director of the museum's exhibition and education department. Beyond providing guided tours, volunteers also contribute to visitor services, educational programs and photography, while their insights and suggestions are incorporated into the museum's public outreach efforts.

BASKETBALL

LeBron's Sixers hope to spoil Knicks party

James will play his first game with Philadelphia against NY on opening night

LeBron James will visit the New York Knicks on NBA opening night and will play the Los Angeles Lakers on Christmas Day.

James' arrival in Philadelphia has made the 76ers must-see TV, and they are all over the NBA's biggest days of the season.

James will make his 76ers debut against the NBA champion Knicks on Oct 20. The game at Madison Square Garden will be part of a tripleheader, when the Knicks raise a banner to celebrate their first championship since 1973 and James then kicks off his tenure at the final stop of his career.

He will return to LA to face the Lakers on Christmas Day, after Victor Wembanyama and the San Antonio Spurs head back to New York for an NBA Finals rematch that opens a five-game schedule.

The NBA unveiled those games Tuesday as what it called a "sneak peek" at the 2026-27 schedule. The full schedule will be released Thursday.

The season begins with the Boston Celtics visiting Detroit in a rare 3 pm EDT start for a midweek game. The tripleheader is capped by the Spurs hosting Oklahoma City in a rematch of the Western Conference finals.

Those three games — opening night traditionally has featured two in recent years — will all be televised in the United States by NBC. ESPN then has all five games on Christmas Day.

That schedule features San Antonio at New York, Miami at Boston, Philadelphia at Los Angeles, Oklahoma City at Minnesota and Denver at Golden State.

James' new team was always going to have a prominent place on the schedule, so the NBA struggled to put the puzzle together while waiting for his decision. Commissioner Adam Silver even said last month that he wanted James to announce his decision, because teams and networks were calling to ask when the schedule would be completed.

The NBA's career scoring leader said it would be the Sixers about a week later, joining a team that had already acquired All-Star Jaylen Brown from Boston and is expected to be one of the top challengers for the Knicks' title.

James will play his first home game in Philadelphia on Oct 22 against Cleveland, one of his former teams that hoped to get the 41-year-old Ohio native back for a third time. That will be part of an ESPN doubleheader preceding Denver's visit to Oklahoma City.

Minnesota visits Miami to highlight the schedule on Oct 21, when most teams will open their seasons. The Heat acquired two-time MVP Giannis Antetokounmpo from Milwaukee — and tried to bring James back as well — and the Timberwolves traded for flashy point guard LaMelo Ball. Golden State then faces the Lakers to cap that ESPN doubleheader.

The Spurs are also a top draw now behind Wembanyama, the NBA Defensive Player of the Year who helped San Antonio win Game 7 of the West finals in Oklahoma City to end the Thunder's title reign.

This will be his second time playing at Madison Square Garden on Christmas Day, after he delivered a massive 42-point, 18-rebound performance in 2024 in a loss on his holiday debut. The matchup will be his first time back on the court in New York since the Knicks set an NBA Finals record by rallying from 29 points down for a 107-106 victory in Game 4. They won the title in San Antonio in the next game.

San Antonio will face Houston and former Longhorns star Kevin Durant in a game at his alma mater, the University of Texas, on Oct 23, the back of a doubleheader starting with the Knicks at the Celtics.

LeBron James, then with the Los Angeles Lakers, and Joel Embiid of the Philadelphia 76ers during an NBA game in 2022. AP

Steph a Warrior for life?

The Golden State Warriors have every indication Stephen Curry would like to stay with the team for the remainder of his career, and they plan to make that happen for the two-time NBA MVP.

The 38-year-old Curry is hoping to play at least a couple more years, and has said he wants them to be with the Warriors. He is set to complete a $62.6 million extension he signed for the 2026-27 season in August 2024.

Whether a new contract will get done right away remains to be seen. Curry becomes eligible for a two-year extension on Aug 29, and general manager Mike Dunleavy said: "I'm pretty confident Steph will finish his career here."

"Ultimately, it's his call, his decision, whether that's allowing his contract to run out and move on," Dunleavy said during a video call Tuesday. "Look, if he comes to me and wants to be moved, Joe (owner Joe Lacob) and I will talk it through. We wouldn't love it. But he's earned the right to do what he wants, do those things. But, as far as the messaging or any idea that he would be anywhere else, that's not a thing we're looking at, or he's looking at."

Curry averaged 26.6 points, 4.7 assists and 3.6 rebounds, but was limited to 43 games last season for the Warriors, who will host Denver on Christmas night — playing on the holiday for the 14th straight year.

Closely monitoring his playing time will be a top priority, as coach Steve Kerr returns for two more seasons after signing a new contract in May. Curry missed more than two months with a nagging right knee injury before he finally came back in early April.

He had initially hoped to return after the All-Star break.

"I think with the knee, other injuries and then his age, it's definitely something we have to manage," Dunleavy said.

The Warriors also dealt with season-ending knee injuries to Jimmy Butler and Moses Moody that required surgeries, as they finished 10th in the Western Conference. After beating the Los Angeles Clippers in the first play-in tournament game, Golden State lost 111-96 at Phoenix.

The Warriors missed out on signing James this offseason, but brought back Draymond Green on a one-year contract for $27.7 million, and also Kristaps Porzingis, Al Horford and Gary Payton II.

Dunleavy hasn't heard any change of thinking from Curry, who is headed into his 18th NBA season still determined to add to his four championships with Golden State.

The Warriors last won in 2022.

"That's always been what he's discussed. I think that's tracking quite well," Dunleavy said of Curry staying put.

"There's two things I'm confident about with Steph. He really, really wants to win, and he wants to finish his career as a Warrior. I don't think that changes tomorrow, Aug 29th, the start of the season, middle of the season, the end of next season. I think those things are going to be consistent."

Flagg trading card a slam dunk for lucky buyer

The lucky buyer of a one-of-a-kind basketball card featuring NBA star Cooper Flagg has a choice to make: put it up for auction for potentially millions of dollars or accept 32 years of season tickets from his team, the Dallas Mavericks.

The coveted trading card was unveiled by a sports card shop in Rhode Island on Monday during a livestream in which the store opens up packs of cards for collectors who have made blind bids on the packs.

The card features a jersey patch worn by Flagg in his first NBA game and is also signed by the former Duke University star, who averaged 21 points, 6.7 rebounds and 4.5 assists to earn the 2025-26 season NBA Rookie of the Year award.

The Dallas Mavericks offered up a trade package in exchange for the card that includes two premium season tickets for 32 years, a signed game-worn Flagg jersey, a photo opportunity with the player and other perks.

A New Jersey-based company that specializes in sports collectibles offered a $1.5 million cash advance to the buyer for the rights to put the Flagg card up for auction and estimated that it could go under the hammer for up to $5 million.

A similar debut patch rookie card featuring Major League Baseball pitcher Paul Skenes of the Pittsburgh Pirates sold for $1.1 million last year.

Sports trading cards are big business in the United States with collectors paying north of $10 million in recent years for cards featuring former NBA stars Michael Jordan and Kobe Bryant and MLB's Shohei Ohtani.

Fever coach says divisiveness 'will not win' during pregame rant

INDIANAPOLIS — Indiana Fever coach Stephanie White has had enough of the conversations around the WNBA this season that aren't about basketball.

On Tuesday, she finally lashed out.

The 2023 WNBA Coach of the Year, and one of the original Fever players, angrily defended herself after she was criticized for her response to DiJonai Carrington's flagrant foul on Sophie Cunningham, and pleaded with people to focus on the sport itself and not the continual sideshows.

"The hate, the fear mongering, the divisiveness that's trying to hijack our league will not win. It won't win," White said, her voice rising as she pounded the table in front of her. "We are united. We are connected. We will not be divided. Every day, these women put their asses on the line. Every day, when they go low, we go high. Love will win. Grace will win. Humility will win and kindness will win. I stand by them, I will always stand by them. Everybody else can go to hell."

White left immediately after her two-and-a-half-minute outburst ended without taking questions.

For the Fever, this has been a season full of controversies.

It happened again Saturday, when Chicago Sky guard Carrington hit Cunningham in the head and neck area, knocking the Fever guard hard to the ground on a breakaway layup. Cunningham got up and charged toward Carrington, but was restrained.

Carrington was assessed a Flagrant 2, an automatic ejection. The player then wrote "WHITE PRIVILEGE" and tagged the Fever on a social media account. On Monday, Carrington said she never claimed the foul call was "white privilege".

Cunningham has been outspoken about her desire to keep transgender women out of women's sports, a position that has spurred rallies in support of, and opposed to, her stance.

White initially said she thought the refs got the call right, but that she didn't think that action near the head and neck area was intentional.

Some critics claimed she was defending Carrington.

Sophie Cunningham of the Indiana Fever is fouled by DiJonai Carrington of the Chicago Sky during a WNBA game on Aug 8 in Chicago, Illinois. AFP

"OK... The Indiana Fever need to let Stephanie White go," Indiana Lieutenant Governor Micah Beckwith wrote on X on Sunday.

"No solid coach would ever take the side of the opposing team's player who committed a flagrant foul on one of their own players. Terrible coaching! The Fever need to defend their players."

White explained Tuesday that she had not seen the replay when she first spoke with reporters Saturday, and that she changed her opinion after watching it again. She called the foul "egregious".

"Our players' success, our players' health and wellness, our players' safety is always a top priority," she began, her voice rising. "One of the things I pride myself on is my relationships with my players. For those who have anything to say about the play in the last game, I didn't see the replay. I went straight to a news conference, I thought the play got called right. Thankfully, Sophie is OK. Was it egregious? Absolutely.

"When you get a chance to see that on replay over and over, you see that. I didn't see that in real time. I take personally any suggestion that I don't 100 percent always have my players' backs. I ride with them 10 toes down all the time, all the time."

Cunningham received a loud ovation when she entered Tuesday's game against the New York Liberty. White received polite applause when she was introduced.

White faced a similar controversy when three-time All-Star Caitlin Clark also was fouled hard earlier this season, prompting a letter from the US House of Representatives to WNBA Commissioner Cathy Engelbert.

White and Clark were also involved in a sideline spat in late May, and there was speculation about White's job status following the incident.

Now White just wants everyone to get back to basketball.

"It's a shame we can't have an opportunity to talk about what great basketball they are playing," White said with emphasis. "The reality is, with me, I will always lead with love. I will always lead with grace, I will always lead with humility. and I will always lead with integrity. It doesn't mean I'll always get it right. I'm human."

DECODING CHINA

River's revival a case study in good governance

Hunan's environmental success shows full potential of people-first approach

By **CAO YIN** and **HE CHUN**
in Changsha

On a balmy June afternoon, the banks of the Guitang River hum with life. Joggers pass by on the wooden boardwalks, while families push strollers past cafes and quaint shops. It's a scene that 75-year-old Chen Xiaofan, who lives along the river in Hunan province, sees as nothing short of a miracle.

After all, in the early 2000s, the river in Changsha, the provincial capital, was a black, open sewer — a literal scar on the city's Yuhua district.

Today, the river's water quality has improved from an inferior Grade V to a Grade I or II — suitable for fish and as a source of drinking water. Biodiversity has rebounded, with 425 species now inhabiting the area, including rare fish, wild ducks and egrets.

The transformation is much more than an environmental success story. It has become a key case study in a Party-wide campaign launched in February that redefines what constitutes political success for local officials.

The Guitang River's transformation demonstrates the results of generational efforts made by successive local officials under a governance philosophy based on a key principle: "Gold and silver cups are not as valuable as public reputation".

Xi Jinping, general secretary of the Communist Party of China Central Committee, has emphasized this principle, stressing the importance of establishing and practicing a correct understanding of governance performance.

Xi, who is also Chinese president, said that communists must bear in mind that working for the people's well-being is their greatest political achievement, and that officials should contribute their share to this cause without taking credit for its success.

Continuous progress

Flowing 28.3 kilometers through a basin of more than 2 million people, the Guitang River was a childhood playground for residents like Deng You, who in the 1980s caught shrimp in its clear waters. However, rapid industrialization meant that the river was exposed to high levels of pollution. By the 1990s, the water quality had plunged to the worst national grade, and the river was placed on a national blacklist of polluted urban waterways.

When early, disjointed cleanup attempts failed in the 1990s, local authorities established a unified governance team in 2016. Since then, a chain of officials has built continuously on their predecessors' work rather than dismantling it to start their own projects.

Deng, deputy director of the Yuhua administrative committee of China (Hunan) Pilot Free Trade Zone Changsha area, joined the team as a coordinator. Her mission was to reconcile bureaucracies, demolish illegal structures, repair pipelines and restore the local ecosystem.

"I just wanted my mother river to breathe again — to be what it was in my childhood," she said.

The monumental undertaking saw millions of square meters of illegal construction torn down, every unregulated sewage outlet intercepted, and thousands of tons of fresh water pumped in daily. German experts were also invited to redesign the river's natural curves and bends as well as its ecological zones.

At the end of 2020, Deng passed her baton to Wang Bin, head of the district's river chief office. His role was to act as a bridge between residents, volunteers and government departments, finding and addressing the problems of the river and its surrounding areas in a timely manner.

"Early reports when I took the position were about broken pipes and illegal discharges. Now, residents ask for greener parks and more recreational space," Wang said. "That shift in public complaints is real evidence that our work is paying off."

Yang Weidong, a professor at China University of Political Science and Law, said that the governance of the river is a prime example of practicing a correct understanding of governance performance.

"What those officials do is to serve the people and put the public's demands first. They work not for immediate accolades but for long-term, sustainable public welfare," Yang said, adding that the change in the Guitang River shows the true potential of good governance.

Response to public needs

Following the river's environmental recovery, a commercial zone has emerged along its banks, offering communities a place to eat, unwind and enjoy leisure activities. Since last year, the area has seen a fresh wave of revitalization, drawing in young entrepreneurs and cultural-creative hubs, including artisan coffee roasters, bicycle culture studios and even a freshwater museum.

According to Yang, the transformation has responded to public needs at every turn — first for environmental restoration, then for community amenities, and now for jobs and economic vitality.

"At every stage, one conviction has never wavered: The people's genuine acclaim is the real yardstick of achievement," he said, emphasizing that, since the purpose of governance is to serve the people, their assessment and responses are what ultimately count.

The campaign, running through July, urges all Party members to embrace a correct understanding of governance performance. It calls for pragmatic, law-based decision-making, and for concrete outcomes that stand the test of practice and history — outcomes that genuinely serve the people and earn their recognition through solid, well-grounded work.

Foreign Minister Wang Yi takes part in a bilateral meeting with US Secretary of State Marco Rubio on the sidelines of the Association of Southeast Asian Nations Foreign Ministers' Meeting in Pasay, Metro Manila, the Philippines, on Wednesday. BRENDAN SMIALOWSKI / REUTERS

China, US agree to prepare for high-level exchanges

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Inside
Editorial, **page 6**

China and the United States need to translate the consensus reached by the leaders of the two countries into whole-of-government consensus and action across various domains, Foreign Minister Wang Yi said during his meeting with US Secretary of State Marco Rubio on Wednesday.

The two met in Manila, the capital of the Philippines, on the sidelines of the ASEAN Foreign Ministers' Meetings.

Beijing and Washington "agreed to jointly implement the important consensus reached by the two heads of state, tap into the roles played by political and diplomatic channels, and prepare for high-level exchanges in the next phase", the Foreign Ministry said in a release.

Both sides believe that "this meeting was pragmatic, positive and constructive", and they agreed to "promote substantive progress in a constructive China-US relationship of strategic stability", the ministry said.

This is Wang's second face-to-face meeting with Rubio this year following their talks on the sidelines of the Munich Security Conference in February. They also held a phone conversation in June.

During the talks on Wednesday, Wang said that this year is a "major year" for China-US relations and mentioned US President Donald Trump's state visit to China in May.

The two heads of state held a historic meeting in Beijing, defined the framework for the constructive China-US relationship of strategic stability, and outlined the direction for both sides' joint efforts, Wang said.

It is now the duty of both sides to "follow the course set by the two heads of state, eliminate disturbances, and overcome obstacles" to ensure that the leaders' consensus is translated into whole-of-government consensus and action across all fields, he said.

Both sides should "promote world peace and stability through China-US strategic stability" and "provide important impetus for international cooperation through constructive China-US interaction", he added.

Wang also made clear China's solemn position regarding a series of recent negative remarks and actions by the US.

He called on Washington to respect China's core interests, faithfully adhere to the one-China principle, effectively manage disagreements and differences, and address China's legitimate concerns, so that this "year of opportunity" for China-US relations can become a reality.

Wang was in Manila to attend the China-ASEAN Foreign Ministers' Meeting on Wednesday amid tension between China and the Philippines over the South China Sea issue.

When meeting with Philippine Foreign Secretary Maria Theresa Lazaro on Wednesday, Wang lodged a strong protest against the ramming of a Chinese law enforcement vessel at Ren'ai Reef of the Nansha Islands by Philippine sailors.

Currently, China-Philippines relations stand at a crossroads, and the Philippines' needs to make the right and rational choice for the future developments, he said.

He warned that the Philippines "will ultimately have to bear the bitter consequences of its own making" if it attempts to utilize outsiders for provocations.

China has never posed a security threat to the Philippines, has never in history invaded or colonized the Philippines, and has always been committed to managing differences and stabilizing the situation through bilateral dialogue and consultation, Wang said.

The Philippines should immediately stop provocative maritime actions, strictly abide by the commitments it has made to China to date, and make concrete efforts to stabilize bilateral relations, he said.

Lazaro said the Philippines hopes to find an appropriate solution to maritime issues through dialogue and strive to improve bilateral relations.

ONLY COLD NOODLES CAN BEAT MAJOR HEAT

Refreshing Northeast China dish is a must-have meal when the mercury rises

By **LI YINGXUE**
liyingxue@chinadaily.com.cn

In Yanji, a city in Jilin province, a cold noodle broth is often the first thing diners order after taking their seats.

Served in a stainless-steel bowl, the clear broth is icy cold, balancing sweet, sour and savory flavors. Then comes the main dish — long, chewy noodles resting in chilled beef broth. A pair of scissors allows diners to cut the noodles into manageable lengths.

Cold noodles, a traditional food of the Korean ethnic group. NIU CHENGYU / FOR CHINA DAILY

As Major Heat, or *da shu*, the hottest of China's 24 solar terms, arrives on Thursday, people across the nation will seek relief from soaring temperatures. In Yanji, many turn to cold noodles, a traditional food of the Korean ethnic group that has become one of the city's culinary calling cards.

China Vibes — FOOD —

"In Yanji, once the weather turns hot, people naturally think of cold noodles," said Jin Yongfu, manager of Yanji Fuwudalou Cold Noodles, one of the city's best-known cold noodle restaurants.

Yanji cold noodles are made from a mixture of buckwheat flour, wheat flour, sweet potato starch, tapioca starch and acorn powder. The dough is scalded, kneaded and pressed into thin strands, then briefly cooked before being rinsed twice in cold water.

The defining element of a good bowl of cold noodles though is the broth.

At Jin's restaurant, the beef is soaked in running water for up to a day and a night. It is then blanched and simmered for about five hours with carrots, scallions, onions, ginger, licorice root and red dates.

'Shock 2.0' narrative flawed in concept

WORLD WATCH
By Tu Xinquan

Since the second half of 2025, some Western media outlets, politicians and scholars have been promoting the so-called "China Shock 2.0" narrative, portraying China's progress in new energy, electric vehicles, biomedicine and other sectors as a threat. Behind this rhetoric is a familiar purpose: to provide a new justification for protectionist policies.

The phrase may sound new, but the argument is old. "China Shock 2.0" is merely the latest version of the "China overcapacity" theory and the "China threat" narrative. Twenty years ago, some in the West spoke of a "China Shock 1.0", claiming that China's low-cost, labor-intensive goods had disrupted developed markets. But a broader look at world economic history shows that every major technological revolution and industrial shift has produced anxiety among vested interests. British machine production replacing Indian handloom weaving in the 19th century, the rise of the United States auto industry relative to Europe's in the 20th century and the effect of Japanese cars on Detroit in the 1980s all followed this pattern. What is now called a "shock" is, in essence, a normal adjustment of dynamic comparative advantage.

At the center of the "China Shock 2.0" argument is the claim that China's new energy sector suffers from "overcapacity". Yet by the standards of industrial economics, overcapacity usually refers to a sustained capacity utilization rate below 70 to 75 percent, accompanied by widespread industry losses. China's new energy vehicle sector does not fit that description. Its capacity utilization rate has remained above 70 percent, with some domestic brands approaching 100 percent. By contrast, the average utilization rate of European auto plants is about 55 percent, and some companies are even below 50 percent. The data show clearly where the real imbalance lies.

Nor does China's export structure support the accusation. More than 80 percent of China's automobile output is sold at home, while exports account for less than 20 percent. In 2025, China produced more than 16 million electric vehicles, of which only 2.61 million were exported. The vast majority were absorbed by the domestic market. To equate a trade surplus with overcapacity is to confuse two distinct concepts.

From 'bedroom heroes' to music stars in China

Audiences embrace wide range of foreign artists, exposure online a key factor

By **WANG XIN** in Shanghai
wangxin2@chinadaily.com.cn

Left: German singer and songwriter Chris James at Yuyuan Garden in Shanghai in 2024. **Middle:** James (center) visits Zhangjiajie in Hunan province with his musician friends during his recent China trip. PHOTOS PROVIDED TO CHINA DAILY **Right:** Members of British indie band Swim Deep visit Beijing in 2025. SO READY PRESENTS / FOR CHINA DAILY

Chris James, a 30-year-old German singer-songwriter, had no idea a song he wrote quickly in his Berlin bedroom had captivated millions of music fans in China, and would ultimately change his life.

Busy preparing for his new Chinese tour in August, James clearly remembers the magical — or even "confusing" — start of the story. It was about four years ago, when he opened up the official music video of his song *Not Angry* at home and noticed a few comments in Chinese under it.

Those comments increased day by day, and piqued his interest in what was going on.

He ran them through a translator, tracked them to a Chinese app and found out his song, which starts with a catchy humming section, had garnered millions of views. On Douyin, the Chinese version of TikTok, the hit song has now been used and shared over 5 billion times.

"I was sitting in my bedroom, scrolling on the screen and it was really hard to process. I saw people singing it in schools and malls … This little melody that I made had traveled so far," recalled James.

The singer-songwriter said he simply sat down one morning and wrote it and recorded it, without much thought or any expectation it would become so popular.

Yet, on the other side of the world, it became an earworm — a catchy tune listeners can't get out of their head. "It definitely changed my life in many ways," he said.

Open to new ideas

In recent years, an increasing number of overseas musicians have flooded China's music market.

The Global Music Report 2026 released by the International Federation of the Phonographic Industry in March showed that last year, Asia saw strong growth of 10.9 percent in recorded music revenues, and maintained its position as the largest region for physical revenues in 2025, accounting for 45.1 percent.

Notably, China has overtaken Germany to become the fourth largest global market, with remarkable revenue growth of 20.1 percent, the fastest-growing market in the top 20, said the report.

Social media platforms like RedNote, or Xiaohongshu, are also actively facilitating foreign artists searching for new horizons.

The RedNote music team has ramped up efforts to introduce overseas artists to China since early last year, after the "TikTok refugees" phenomenon emerged from the United States' threat to ban the platform.

Among those refugees is a massive number of niche and independent musicians and artists who have captivated Chinese audiences, said Jiang Jiayao, content operations manager of RedNote's music team.

These artists include many unsigned "bedroom musicians" who independently write, record, produce and release music, usually from their homes.

RedNote organized for many of them to participate in the inaugural Global Village Concert on Jan 26, 2025. The event featured 20 groups and musicians from home and abroad, including James. It ran for about seven hours and attracted over 1.28 million online viewers.

The RedNote team later launched the Global Soundwave project and a No-border FM campaign to help overseas musicians connect with Chinese music fans.

Jiang said the team provides guidance and support to the artists on how to make their music reach the local community. The advice covers issues such as account operation, post creation, customized promotions, live settings, interaction, exclusive event planning, and online and offline music shows across China.

In September 2025, the team held the No-border Music Festival in Shanghai. The artist lineup included major stars including Malaysian pop band babychair, indie musician Hayd from the United States, singer Jordann from Canada, and Martin's Mood from France. The festival sold out quickly.

Jiang said many young RedNote users are highly educated, enjoy sharing music, and are open to supporting "niche, distinctive and indie music and artists".

"A vast majority — about 80 percent — of overseas musicians who are eyeing the Chinese market have joined our platform and community," said Jiang.

The team has made connections with artists worldwide, helping over 100 of them tap into the Chinese market and supporting hundreds of shows in China. They come from countries as varied as the US, Brazil, Australia, France, Germany, Norway, Japan and South Korea, and feature diverse music genres such as rock, pop, indie and jazz.

Deeper dive

In 2023, James played his first China show in Beijing, followed by six other cities.

A year later, his Chinese tour covered eight cities, and last year, he performed in 10 cities. James is getting ready to meet his army of Chinese fan crowds again on a new tour.

He has over 3 million fans on Chinese social media platforms, and is affectionately called "*Xiao Kui*", meaning "little sunflower".

"They are very into music, with a very strong passion and a lot of attention to lyrics, details and the depth of songs. They are also very interactive and can sing every song together with me. They are loud, in the best way possible," said James with a smile.

James engages with Chinese audiences at a fan meeting organized by RedNote music team in Shanghai in July 2025. MAJOR Z STUDIO / FOR CHINA DAILY

At a festival in Shanghai during the May Day holiday, fans sang along loudly with James in his return tour to China after seven months.

During that tour James organized travel outside his performance schedule to dive deeper into the nation.

Besides Shanghai, he went to Zhangjiajie and ancient towns in Hunan province, climbed Huangshan Mountain in Anhui province, visited Chongqing and even performed one of his hit songs at a hotpot restaurant and a teahouse in Chengdu, Sichuan province.

The laid-back vibe of his travels dovetails with James' life philosophy and the messages he tries to convey through his music. He said that just as the unexpected popularity of *Not Angry* shows, life can be random and filled with "endless possibility", adding it is good to always stay positive, optimistic and "go with the flow".

Malaysian connections

Babychair, a three-piece band based in Kuala Lumpur, Malaysia, made its China debut at a music festival in Shanghai three years ago.

The band, which creates retro, dreamlike pieces with experimental music elements, saw its popularity take off in China after joining hands with the talent agency 1500 Sound Academy. The musical trio, who each go by one name, has already toured the country three times.

"The music market in China is very competitive, and everyone strives to be the best," said Aaron, the drummer.

"Our tour in China really opened our eyes and gave us new inspirations. We are always meeting new people and exploring new things, opportunities and possibilities."

Of Malaysian-Chinese heritage, all three were exposed to Chinese culture early in life through music and TV dramas. They can speak Chinese and share many cultural roots with their Chinese fans.

What resonates in China is sometimes different from what is popular with fans in other parts of the region.

For instance, in Southeast Asian nations, babychair's most popular song is *Oh It's You*. In China, however, *Dear* is the song that is more representative of the trio to their fans.

During their recently concluded China tour, audiences sang along with the band when they performed *Dear*.

"I think the market needed us," said lead vocalist Sean. "The idea of our music is simply asking everyone to chill. What we would like to deliver to our fans in music is not only the song, but also the emotions that make us connected. So we hope everyone can listen to the songs, get relaxed, feel differently and chill."

Over the past three years, they have come to value the Chinese musicians and artists they have met along the way.

"We share the same struggles and same happiness. They are very friendly, open, easy to communicate with and down to earth. We feel at ease having a chat or sharing life stories with each other. Such connections are very valuable," said Aaron.

Being valued

For British indie band Swim Deep, who completed their fourth tour last year, one of the most rewarding aspects of performing in China is feeling valued.

Formed in 2011, the Birmingham band has played over eight shows since 2014 and sold out many of them, playing to hundreds and sometimes thousands of fans.

"Every time we go back to China, we feel a little less like being a tourist there, it's a bit more of a feeling of coming home," said Austin Williams, the band's front man.

"We always feel so welcomed by the friendly, supportive, dedicated, loyal and passionate fans out there," he said.

One of Swim Deep's most memorable China shows was the 2019 Strawberry Music Festival in Guangzhou, Guangdong province.

Keyboard player James Balmont said audience numbers in China often far surpass what they draw in the United Kingdom.

The biggest UK festival crowd they have played for was 500, while in Guangzhou, they performed to around 10,000 people on the main stage.

While backstage riders of beverages and food for performers are common overseas, Williams was impressed that the Guangzhou organizers had gone to the trouble to prepare a big box filled with imported cheeses, beers, potato chips and other goodies.

"I felt very grateful that they've gone out of their way to do that for us … And it made me realize how these people are working beyond (the basics) to make the artist feel good," Williams said.

"It really proves that they consider art as a valuable and important necessity in culture and life."

Balmont also appreciated the Chinese staff's extra efforts and the respect they showed, which made the band feel valued.

Both band members expressed hope other venues follow this lead and create more comfortable conditions for the artists.

Organizers and promoters of tours and music festivals in China also often pay for performers' travel and accommodation expenses, reducing costs and financial risks for emerging overseas bands.

Touring in China sets a high standard for the rest of the world to follow. Also, the fans are always respectful and polite, show their loyal support in an orderly way, and welcome new music with open arms, Balmont said.

"When you combine all of that, it creates wonderful experiences that make you feel being a touring artist can be really worthwhile," he added.

Sam Tucker, manager of Swim Deep, said: "I think the future of the Chinese music market is very bright. The way the Chinese live market has embraced international artists and tours enables so much potential future growth. As culture becomes less specific to one country or city, it feels like the Chinese music market can only continue to grow and develop."

Practice: Officials punished for serious violations

From page 1

The initiative also requires solid efforts to address prominent problems, the establishment of sound systems and rules and the improvement of accountability mechanisms, so that institutions can effectively play their role in guiding and motivating the performance of officials.

"When governance is no longer anchored in serving the people, and public reputation ceases to be its yardstick, it will inevitably deviate from the proper track," said Yang.

In June, the CPC Central Commission for Discipline Inspection, China's top anti-corruption body, disclosed details of five notable cases in which officials were held accountable for incorrectly implementing governance performance.

In one case, when serving as Party secretary of Wen'an county in Hebei province from 2021 to 2024, Ren Huashan was found by the CCDI to have pursued personal accolades through reckless decisions. Despite being aware of funding shortfalls, he launched multiple urban village resettlement projects without due diligence — delaying housing delivery, stranding villagers and leaving wages unpaid.

In February 2022, Ren also pushed ahead with a tourist attraction despite clear land-use and zoning violations. Parts of the project were demolished in September 2023, incurring huge losses.

For these and other serious violations, Ren was expelled from the Party and dismissed from office. His suspected crimes were transferred to prosecutors for further review.

Wang Chengbing received similar punishment. The CCDI found that, while holding the position of Party secretary in Jinxi county in Jiangxi province, Wang had prioritized economic growth over environmental safeguards by allowing heavily polluting chemical plants to be set up, weakening regulatory enforcement and ignoring persistent public complaints, thereby allowing a pollution crisis to fester.

Yang, from China University of Political Science and Law, warned that these are typical cases of distorted governance values. He said that the cost is not just wasted public funds, but also eroded public trust and a loss of public reputation.

He pointed out that the baseline of a correct governance philosophy is to abide by rules and never lose sight of the people.

"For officials who aim higher, the challenge lies in sharpening their governance know-how, translating national policies into tangible solutions for local communities, and steering growth that lasts," Yang said.

Fiery challenge

A fire truck drives past as French firefighters battle a wildfire on Tuesday in the Fox-Amphoux communal forest near Ponteves, southern France, amid worsening drought conditions following a heatwave and widespread water shortages. The prolonged heatwave is placing growing pressure on communities, emergency services and economies across Europe. Officials warned that Europe is entering an increasingly dangerous period. MANON CRUZ / REUTERS

Narrative: Real economic gains stressed

From page 1

What the "China Shock" narrative deliberately ignores is that Chinese-made photovoltaic modules, power batteries and electric vehicles have substantially reduced the cost of global green transition. The International Energy Agency has repeatedly noted that without China's large-scale and sustainable manufacturing capacity, the global energy transition would come at a much higher economic cost.

China's new energy industry did not rise by accident, nor did it grow through unfair means. Its success is the result of decades of research and development, complete industry chains and intense market competition. China's photovoltaic industry, after more than a decade of technological progress, has reduced the cost of solar power generation by more than 80 percent, helping clean energy reach households and businesses around the world. China's electric vehicle industry, driven by breakthroughs in battery technology, intelligent driving and related fields, is reshaping the global auto industry.

These achievements are the result of the hard work of Chinese companies, engineers and researchers. Some Western companies have lost ground in this competition. But instead of reflecting on their own lack of innovation or weak cost control, they blame China for developing too fast. This logic is hard to defend. In a race, when a runner is overtaken, the answer is to run faster, not to demand the runner in front to slow down.

Real dividends

China's manufacturing has brought the world not disruption, but real economic and green dividends. For many years, China has contributed more than 30 percent of global economic growth. Amid rising deglobalization, China's complete industrial system has helped stabilize global industry and supply chains. Its vast domestic market continues to create important opportunities for companies around the world.

In green transition, Chinese wind and solar products have been exported to more than 200 countries and regions. Over the past decade, China has helped push down the global cost of wind power by more than 60 percent and solar power by more than 80 percent. Without China's contribution, global climate governance would be far less advanced than it is today.

This year, the European Union has shown a more negative tendency in its attitude and policies toward China-EU economic and trade relations. Yet China has consistently pursued mutually beneficial cooperation with Europe. China has long been one of the EU's largest trading partners, and bilateral trade has reached historically high levels in recent years. European companies have earned substantial returns from the Chinese market. More than one-third of Volkswagen's sales come from China. BASF, Airbus and other European giants have also continued to expand their investment in China and share in the dividends of the country's development.

The essence of China-EU trade is complementarity and mutual benefit, not one side "shocking" the other. Some European countries have followed the US in hyping the "China Shock" narrative, but this only harms their own interests. Protectionism may give certain industries temporary breathing space, but in the long run, it will leave European companies at a disadvantage in the competition for green transition.

China's new energy technologies and products are helping Europe accelerate its clean energy deployment, which is essential to meeting its carbon neutrality goals. Political forces calling for "de-risking" are in fact increasing risks to Europe's green future. Through cooperation with Chinese companies, European automakers such as Volkswagen and BMW have greatly shortened their development cycle of new models and improved their international competitiveness.

The real shock to the global trading system does not come from Chinese manufacturing, but from Western protectionism. The US frequently uses tariffs as a political weapon, and the EU has followed suit. Such unilateral actions seriously violate World Trade Organization rules and openly undermine the multilateral trading system.

History has shown that attempts to preserve dominance through tariff barriers, technological blockades and "small yards with high fences" cannot succeed. US protectionist measures against Japanese cars in the 1980s did not stop Japanese automakers from expanding globally. Today's efforts to contain China will likewise fail to halt the steady rise of Chinese manufacturing in global value chains.

Seeking to blame

Some Western politicians are playing up the "China Shock" narrative to turn domestic problems into external ones. They seek to blame China for their own industrial hollowing-out, unequal distribution of gains and other structural difficulties, using an external target to divert domestic pressure. This is neither responsible nor effective.

"China Shock 2.0" is, in essence, the "China threat" theory repackaged in a new industrial wrapper, with a policy agenda aimed at industrial containment and trade protectionism in the name of national security.

China's manufacturing rise is the natural result of market competition and technological progress under economic globalization. China's best response is to continue expanding its opening-up, deepening reform and advancing high-quality development, while firmly safeguarding its legitimate rights and interests within the multilateral trading system.

Certain forces in the West should face reality, abandon their Cold War thinking and ideological prejudice and cooperate with China on the basis of fair competition. Only then can global trade develop in a healthy direction and the world economy move toward a stronger recovery.

Smearing China will not slow China's development. Protectionism will not stop the wheel of history. The idea of "China Opportunity 2.0" will ultimately replace the myth of "China Shock 2.0" and become the broader consensus of the international community.

China's cyber governance stance hailed

Push for digital sovereignty, multilateralism can help bridge the AI divide, experts say

By **YANG RAN** and **ZHANG YUNBI**

China's advocacy for digital sovereignty and inclusive development in global cyber governance can help bridge the artificial intelligence divide and foster more inclusive global AI infrastructure and governance, experts said.

Their comments came as China recently submitted its position paper on global cyber governance in the digital age to the Global Mechanism on Information and Communications Technologies in the Context of International Security, the first plenary meeting of which opened at the United Nations headquarters in New York on Monday. The mechanism, established through a resolution adopted by the UN General Assembly in November, is the first permanent, institutionalized multilateral dialogue platform within the UN dedicated to state use of ICTs.

In the paper, China outlined key principles for global cyber governance, including adherence to international rules, respect for digital sovereignty and the need to uphold multilateralism. "Countries should respect each other's digital sovereignty, and they all have the right to independently choose their paths of digital intelligent technology development, including AI, as well as to independently choose AI technologies, products and services in light of their respective national conditions," it said.

Xin Yanyan, deputy secretary-general of the Center for Global AI Innovative Governance based in Fudan University, said that digital sovereignty aims to safeguard every nation's right to independent research and development, thereby fostering truly inclusive and equitable development of technologies such as AI. The practical value lies in dismantling "small yard, high fence" barriers to facilitate open and unimpeded scientific and technological exchanges, she said.

By leveraging responsible open-source ecosystems and fostering independent innovation, countries, especially those in the Global South, can enhance their tech capabilities, bridge the AI divide and protect their data autonomy, Xin said.

Inside

Comment, **page 6**

Digital sovereignty is essential for preserving diversity in the intelligent age, she said. "While AI value alignment must address universal technical risks, it should also respect global cultural diversity, rather than enforcing a singular ideological template," Xin added.

China's position paper highlighted the significance of multilateralism in AI governance, stating that "international governance should not be replaced by small-circle governance, and no country should unilaterally impose rules on others".

Zhang Xin, a professor at the University of International Business and Economics' School of Law, noted that China's stance directly tackles the problem of rule fragmentation in global cyber governance. "It reaffirms a commitment to multilateralism, promoting equal participation of all countries in refining rules," she said.

Zhang underscored the paper's positive impact on developing nations, which often confront "a double dilemma" of digital and security divides. It offers a practical solution on bridging the North-South gap, empowering the Global South's voice in cyberspace governance and enabling developing countries to transition from passive rule recipients to active co-developers, she said.

At a news conference on Wednesday, Foreign Ministry spokesman Lin Jian said that digital sovereignty is a key principle put forward by China. The nation "is willing to strengthen cooperation with all parties to promote the development of the international order in cyberspace toward greater fairness, rationality and effectiveness, and to jointly build a community with a shared future in cyberspace", he said.

Taste: In Yanji, summer begins with sip of icy soup

From page 1

After settling for 48 hours, the concentrated broth is seasoned with sugar and vinegar, then frozen into fine ice crystals.

The recipe also reflects traditional ideas about balancing ingredients. "Buckwheat is considered a cooling food, while beef is relatively warming," Jin said.

Each bowl is topped with pickled cabbage, cucumber, half a boiled egg, beef and seasonal fruit like watermelons in summer, and apples in colder months.

"We make the broth more sour in summer, because it is more refreshing," Jin said. "In winter, we make it sweeter so it feels gentler on the stomach."

In Yanji, cold noodles are often paired with *guobaorou*, crispy sweet-and-sour pork. Some diners dip the freshly fried pork into the icy broth, cooling its crisp coating while adding another layer of acidity and sweetness.

In Yanji, summer does not truly begin with the first heat wave. It begins with the first sip of icy cold noodle broth.

Nation expands imports to share market opportunities

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's expanded import drive for advanced technology and equipment, energy resources and agricultural products will reinforce the country's role as one of the world's largest markets and contribute to more balanced global trade, senior customs officials and importers said on Wednesday.

Speaking at a news conference in Beijing, Sun Meijun, minister of the General Administration of Customs, said that customs authorities will promote more coordinated growth in imports and exports and work to achieve more trade cooperation agreements during the 15th Five-Year Plan (2026-30) period.

The measures will enable more countries to share the opportunities created by China's vast market while offering Chinese consumers a broader range of high-quality products, Sun said, highlighting that the moves will also help develop new quality productive forces and accelerate industrial upgrading.

China's trade with the United States rebounded in April and continued expanding in May and June, indicating that the new positioning of China-US relations has provided greater certainty for bilateral and global trade and economic growth, she added.

Wang Jun, vice-minister of the GAC, said that China has become "a major trading partner of more than 160 countries and regions, with imports now sourced from a broader range of markets, covering a wider variety of products and featuring a more optimized structure".

The nation has recorded robust growth in imports of advanced equipment and key industrial inputs, Wang said, underscoring stronger demand driven by industrial upgrading and technological innovation.

Beijing Customs announced on Wednesday that the value of imports of semiconductor manufacturing equipment surged 124.7 percent year-on-year to reach 23.43 billion yuan ($3.5 billion) between January and June, providing a strong boost to the city's overall import growth.

South China's distribution center for electronic components — a major import hub in Dongguan, Guangdong province, that serves the Guangdong-Hong Kong-Macao Greater Bay Area — handled imports worth 36.47 billion yuan during the January-June period, up 13.11 percent year-on-year, according to Huangpu Customs.

Data from the GAC shows that since the beginning of this year, China has granted market access to 264 categories of agricultural and food products from 79 countries, bringing the number of source countries and regions for such imports to more than 150.

In early May, China expanded its zero-tariff treatment for imports to all 53 African countries with which it has diplomatic relations.

According to Nanjing Customs, Zhongka Supply Chain Management (Kunshan) Co, an agricultural products importer based in Kunshan, Jiangsu province, imported 661 metric tons of coffee, mainly from Africa, in the first half of the year, up more than 100 percent year-on-year.

Qin Yumei, customs affairs manager at Zhongka, said the company mainly imports green coffee beans from African countries such as Ethiopia, Tanzania and Kenya, adding that it plans to further diversify its sourcing by importing from more African countries.

"As more high-quality specialty products from Africa enter the Chinese market under the preferential tariff policy, their price competitiveness will be further enhanced. This will not only enrich China's consumer market, but also create new growth opportunities for importers like us," Qin added.

Women dressed in traditional Thai costumes display durians on May 23 during the opening ceremony of an event in Nanning, Guangxi Zhuang autonomous region, to promote agricultural imports from Thailand. HUANG YANMEI / CHINA NEWS SERVICE

Africa CDC urges action amid rapid Ebola spread

By **SHARON NAKOLA**
in Nairobi, Kenya
sharon@chinadailyafrica.com

The Africa Centres for Disease Control and Prevention warned on Tuesday that the Ebola outbreak in the Democratic Republic of Congo could become one of the worst epidemics in history if urgent measures are not taken to contain its spread.

Speaking during an African Union extraordinary session of the assembly in Accra, Ghana, Africa CDC Director-General Jean Kaseya said the outbreak is spreading at an unprecedented pace amid insecurity, mass displacement and continued community transmission.

More than 1,000 people have died from the Ebola outbreak since May, Kaseya said, warning that the current epidemic is spreading at a much faster pace than previous outbreaks.

"If we don't stop this outbreak today, it will be the worst one that the world will meet," he said.

The warning comes as the DR Congo's Health Ministry reported on Wednesday that the outbreak has so far infected 2,473 people and claimed 999 lives across five provinces, bringing the case fatality rate to 40 percent.

The ministry said 737 patients are in isolation or hospitalization, while 482 people have recovered.

Health authorities said surveillance and response activities have intensified, with over 80 percent of epidemiological alerts now being investigated within 24 hours and contact tracing reaching 81 percent.

Treatment facilities remain operational, with more than 700 patients under follow-up, while multisectoral teams continue to strengthen laboratory services, logistics, infection prevention and control measures, and risk communication activities.

Despite the progress, the Africa CDC warned that major challenges remain. Kaseya said insecurity in eastern DR Congo and the humanitarian situation are significantly hampering efforts to fully contain the outbreak.

"We cannot continue to respond to an outbreak when we are facing insecurity at that level," he said, revealing that one Africa CDC staff member had recently been injured during an attack by armed groups.

Currently, more than 1.15 million people are living in internally displaced persons camps in affected areas, further complicating surveillance and disease control efforts.

Kaseya said the outbreak has spread much faster than previous Ebola epidemics, warning that persistent community transmission remains a major concern. "This outbreak is very serious," he said.

The Africa CDC and the World Health Organization have jointly launched a continental response plan aimed at bringing the epidemic under control.

Kaseya said the response requires about $1.4 billion, including humanitarian and health interventions, though African countries have so far pledged more than $110 million toward the response.

"We need more," he said, calling on additional African governments to contribute resources.

The agency is also advancing clinical trials for Ebola therapeutics and preventive interventions, but still faces a funding gap of about $12 million. "We are working hard because we don't have confirmed medicines and vaccines," Kaseya added.

Greater self-reliance

The outbreak, caused by the Bundibugyo strain of the Ebola virus, has renewed calls for stronger health security systems and greater continental self-reliance in responding to public health emergencies.

African health leaders warned that failure to contain the outbreak could undermine broader efforts to strengthen the continent's health systems and achieve universal health coverage.

"If we don't control this outbreak, everything we are doing today will not make sense," Kaseya said.

The outbreak dominated discussions at the African Union health meeting, with ministers warning that it reinforces the need for greater health sovereignty, domestic financing and local manufacturing of medicines and vaccines.

Ghana's Health Minister Kwabena Mintah Akandoh said the recent health emergencies had shown that "the next emergency must never again find Africa waiting at the back of the queue".

He called for stronger regional cooperation and increased investment in African health systems.

African leaders said the current Ebola outbreak should serve as a wake-up call for the continent to accelerate efforts to build resilient health systems capable of responding to future epidemics without excessive dependence on external support.

Grand reset

Experts praise Beijing's role in bridging global AI divide

Widening gaps risk creating dependency, while China offers alternative approaches

CROSS CURRENTS

By **YANG RAN**
yangran1@chinadaily.com.cn

As artificial intelligence advances rapidly, experts warn that the widening AI divide is becoming a major challenge for the Global South. They say China is helping narrow the gap by promoting more inclusive approaches and expanding practical cooperation.

China's initiatives in AI governance provide the Global South with a greater voice in shaping global AI rules while helping developing countries benefit from the technology, they said.

The divide is already evident. While more than 1 billion people worldwide use AI chatbots every week, the Global South lags "far behind the Global North" in AI adoption, the United Nations said in a report this month.

The International Monetary Fund's AI Preparedness Index underscores the disparity, with advanced economies scoring 0.68, compared with 0.46 for emerging markets and just 0.32 for low-income countries. The gap is largely driven by the Global North's dominance in computing infrastructure and the Global South's limited capacity for AI research and deployment.

The consequences are far-reaching and potentially transformative, as experts warn of a new form of technological dependency and industrial stratification.

"The Global South, home to 88 percent of the world's population, generates highly valuable local scenario data for model adaptation", said Jiang Tianjiao, a research fellow at the Center for Global AI Innovative Governance in Shanghai. "Yet, without the computing power for storage, cleaning and training, these data are often sent abroad for processing."

Jiang cautioned that this could create a future in which data originate in the South, but profits and development gains remain in the North, leaving advanced economies to control foundational AI models such as ChatGPT while developing countries are confined to application-layer fine-tuning and niche local models.

"What appears to be a division of work is, in essence, hierarchical stratification," he said, warning that the trend could also erode local languages and cultures in AI models.

Carlos Maria Correa, executive director of the South Centre, an intergovernmental organization for developing countries based in Geneva, said AI is, above all, a development issue for the Global South.

Persistent and widening digital divides have left many developing countries ill-equipped to govern or benefit from AI, risking "entrenching dependence on external actors for access to AI", he said.

Lawrence Loh, director of the Centre for Governance and Sustainability at the National University of Singapore Business School, warned of AI "lock-ins" that could prevent Global South countries from advancing along the world's AI development path.

Such dependency on the Global North could give rise to a new form of AI colonialism, "where the less-developed countries may be trapped perpetually", he said.

UN data underscore these concerns. According to UN Trade and Development, fewer than one-third of developing countries have national AI strategies, and 118, mostly developing nations, remain absent from global AI governance discussions.

Experts say the challenge is compounded by policies in some countries that prioritize unilateral security and economic interests by erecting technological barriers, further hindering the Global South's development.

Loh criticized the "small yard, high fence" approach, warning it could create "a restrictive AI order" in which Global South countries become technology rule-takers and importers rather than co-creators of standards and AI systems.

Hernan Gabriel Borisonik, director of the Center for Science and Thought at the National University of San Martin in Argentina, said technological walls duplicate efforts and fuel competing standards instead of cooperation to address shared AI risks, such as algorithmic bias.

"At the same time, it would be naive to dismiss the strategic logic behind these fences," Borisonik said. "The path forward is to build a genuinely planetary framework that can create mechanisms for coexistence and mutual influence, even amid competition."

More equitable

Experts say China's AI governance initiatives are playing an increasingly important role in constructing a more equitable global framework. In recent years, China has introduced a series of governance initiatives and action plans aimed at using AI for good, countering unilateral technological monopolies and advancing inclusive global AI governance.

During the just-concluded 2026 World AI Conference in Shanghai, 29 countries signed an agreement to establish the World Artificial Intelligence Cooperation Organization, helping bridge the AI divide by supporting faster AI development in the Global South.

"International cooperation and capacity-building initiatives are key to bridging the global AI divide and promoting inclusive AI development and governance," Correa of the South Centre said, describing the organization's establishment as "very encouraging".

Correa also praised China's AI governance initiatives for enhancing fairness and prioritizing sustainable development, saying they contribute to "a more balanced global AI landscape, fostering mutual benefits and reducing existing inequalities".

Borisonik echoed the view, saying China's initiatives made a crucial contribution to global AI governance by treating it as a shared challenge that must reflect the perspectives and interests of developing countries, not just technological leaders.

China's emphasis on capacity building is especially significant, he said. "AI governance depends not only on legal principles but also on scientific institutions, educational systems and long-term international cooperation. Supporting these capacities is one of the most effective ways to reduce structural inequalities in the global AI landscape."

In recent years, China has expanded practical AI cooperation through infrastructure and talent development. In 2024, it launched the China-BRICS AI Development and Cooperation Center to deepen AI collaboration among BRICS members. Last year, Chinese tech companies also helped Laos develop the world's first Lao large language model.

Alex Gakuru, director of the Center for Law in Information Technology in Kenya, said China's approach differs fundamentally from Western models. "It is not aid-dependent but partnership-based," he said.

He cited the Lao large language model as a prime example, saying its architecture, training data, governance and the Lao government's role reflect "a fundamentally different approach — one centered on sovereignty and self-determination rather than dependency".

"It is the best example of how the Global South could replicate the preservation of their culture in collaboration with China," he said. "The partnership model ensures that linguistic and cultural sovereignty is not sacrificed for technological convenience, and many countries are bound to embrace it."

New British PM begins tackling cost-of-living crisis

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

Groups lobbying on behalf of the United Kingdom's poorest people have welcomed Prime Minister Andy Burnham's first moves since he took office on Monday.

Burnham, who has vowed to lead a "cost-of-living government", told his new Cabinet on Tuesday that impoverished people struggling with fast-rising prices need a "sense that help is coming".

He then announced he was cutting Value Added Tax from October on household energy bills — from 5 percent to zero — a move that will save the average family 45 pounds ($60) a year.

Burnham's spokesman told reporters that the change will cost the country 850 million pounds this year and would be funded out of 1.8 billion pounds set aside for a digital ID program.

Burnham told his ministers to look for savings to help pay for initiatives to ease the cost-of-living crisis.

"There are things that can be done, big and small," he said.

He also set aside 340 million pounds to help tackle homelessness during the next five years.

On Wednesday, he said bus fares in England will be capped at 2 pounds a journey from January. Previously, the cap had been 3 pounds.

The cheaper fares will cost the country around 500 million pounds, which will be taken from the budget of the Department for Energy Security and Net Zero.

Heidi Alexander, the UK's transport secretary, told the BBC that the government will not make "any unfunded spending commitments".

To finance cheaper bus fares, she said the government will shift its overseas aid strategy — offering loans rather than grants to climate projects in other countries.

Burnham has also promised to help more young people find work and vowed more mental health support.

Alex Chapman, economics and environment policy chief at the London-based think tank New Economics Foundation, welcomed the new prime minister's stated aims but said his first moves have been "very small in government terms".

"The actual scale of this is very limited," he said.

Homelessness charities also welcomed Burnham's pledge to put "the care of people at the heart of everything I do" and to "fix" rough sleeping.

With around 5,000 people thought to be sleeping rough in the UK each night, Helen MacNamara, chair of trustees at the homelessness charity Shelter, told The Independent newspaper, "It's great to see a prime minister standing on the steps of Downing Street, and that the first thing he says is talking about ending rough sleeping and his commitment to building council housing."

Describing rough sleeping as "one of the pestilences of our age", she said Burnham will also need to solve "hidden homelessness", which means 176,000 children do not have a permanent place to live.

Yvonne Hope, chief executive of the Manchester-based homelessness charity Barnabus, added, "If anyone's going to do it, it will be him."

Resource cooperation urged

By **MINGMEI LI**
at the United Nations
mingmeili@chinadailyusa.com

The international community should strengthen cooperation to improve natural resource governance, safeguard the stability of global resource supply and industrial chains, and contribute to international peace and development, China's envoy to the United Nations said.

The UN Security Council held a high-level open debate on the theme "Natural resource governance: the foundation of peace, security and prosperity" on Wednesday, exploring how inclusive, transparent and sustainable natural resource governance can help reverse conflict dynamics and strengthen conditions for peace.

"Natural resources are precious gifts bestowed by the Earth on humanity and constitute the material foundation for human survival and sustained economic and social development. However, conflicts in some regions demonstrate that resource abundance does not automatically bring development and prosperity, while poor governance may trigger and fuel violence and conflict," said Sun Lei, charge d'affaires ad interim of the Permanent Mission of the People's Republic of China to the UN.

Peace and stability are the solid guarantee for natural resource governance, the Chinese ambassador said.

"The international community should uphold a vision of common, comprehensive, cooperative and sustainable security, remain committed to the peaceful settlement of disputes, urge parties to conflicts to cease military confrontation, support regional countries and organizations in strengthening cooperation, jointly combat the illegal exploitation and smuggling of natural resources, enhance supply chain transparency and traceability, and cut off armed conflicts' access to natural resources at the source," he said.

Sun added that the causes of armed conflict are "complex and diverse", involving political, social and economic factors.

"Natural resources should not simply be regarded as the root cause of conflicts; still less should normal economic, trade and industrial cooperation be securitized, politicized or instrumentalized," Sun emphasized.

Sun also said that fairness and justice are important prerequisites for cooperation on natural resources.

"International law grants states permanent sovereignty over their natural resources, and this principle must not be challenged. Certain countries should stop seizing the resources of other countries through sanctions, pressure and military coercion, and must not revert to colonial domination and plunder. Developing countries have the right to make full use of their natural resource endowments to achieve economic and social development," he said.

Sun added that China supports building an open, inclusive, fair, equitable, cooperative, win-win, green and clean governance system for critical minerals. He also warned that using the pretext of so-called "de-risking" or "safeguarding national security" to pursue bloc confrontation and build exclusive "small circles" will only disrupt market order and undermine the common interests of all countries.

Sustainable development is the ultimate goal of natural resource development, Sun added.

"Facts have repeatedly shown that the persistent problem of the illicit exploitation of natural resources is rooted in poverty, unemployment and underdevelopment. To break the vicious cycle between natural resources and conflict, it is essential to support the countries concerned in achieving independent and sustainable development," he said.

Sun also called on the international community, especially developed countries, to fulfill their assistance commitments and support resource-rich countries, especially developing countries, in continuously improving their resource governance systems and increasing the added value and returns of resource products through technology transfer, capacity-building, talent development and industrial upgrading, thereby reducing poverty, creating employment, truly benefiting local people, and building a stronger foundation for peace.

Sun mentioned that at the G20 Summit in 2025, China put forward the International Economic and Trade Cooperation Initiative on Green Mining and Minerals to promote the establishment of a new type of mineral-resources partnership featuring openness, win-win cooperation, fairness and equity.

"China stands ready to work with the international community to deepen mutually beneficial cooperation on natural resources, better help relevant countries transform their resource endowments into drivers of development, and embark on a path toward lasting peace, stability, development and prosperity," he said.

White House readies fresh tariffs as 10% levy to expire

WASHINGTON — The United States is set to impose new tariffs that could hit dozens of countries soon, trade envoy Jamieson Greer signaled on Tuesday, with President Donald Trump's temporary global levies due to expire this week.

The administration has prepared fresh tariffs targeting 60 trading partners over their alleged failures to act against "forced labor", as officials push to rebuild the US leader's trade agenda after legal setbacks.

"We expect to see some action soon," Greer told CNBC when asked if new duties were incoming. He did not specify a timeline.

Trump imposed a 10-percent global duty this year after many of his tariffs were struck down by the Supreme Court in February, but this levy expires on Friday.

Analysts expect that new tariffs over forced labor concerns — set between 10 percent and 12.5 percent — would replace these temporary duties.

They come as Trump makes a renewed push to use tariffs as leverage against US trading partners, sparking fears of retaliation and diplomatic tensions.

Washington announced a fresh 25-percent duty on certain Brazilian goods last week, and on Monday unveiled a 50-percent levy on many Canadian products to take effect in 30 days.

Canada Prime Minister Mark Carney takes questions from journalists after making a statement in Ottawa on Tuesday. Carney said on Tuesday that he was looking at "all options" amid the latest tariff tensions with the US. JUSTIN TANG VIA AP

Canadian Prime Minister Mark Carney said on Tuesday that he was looking at "all options", adding that he and Trump had agreed to "intensify discussions" in the coming weeks on a possible deal.

On Tuesday, Trump announced a new 100 percent sector-specific tariff on imported generic drugs to take effect from August 2028, with that level rising to 200 percent in 2029.

Generic drugs

For now, the US leader said the tariff on generic drugs would be cut to zero from August 2026, in an effort to create a window to onshore such pharmaceutical production to the United States.

Swiss generic drugmaker Sandoz said on Wednesday it would continue discussions with policymakers.

Greer said on Tuesday that new action will cover the majority of US trade, with the moves likely to reignite trade tensions.

The EU previously said that it considers tariffs imposed on these grounds "unjustified".

Washington's planned 50-percent tariff on Canada also comes as US-Mexico talks over a North American free trade pact intensify. Washington recently declined to extend the accord in its current form.

Greer is set to travel to Mexico from Wednesday to Friday for discussions linked to a joint review of the US-Mexico-Canada Agreement.

US plans for a 25-percent tariff on Brazilian goods over accusations of unfair trade practices have separately drawn a sharp rebuke from the Latin American giant. The levy is due to take effect on Wednesday.

A range of products like beef, coffee and certain aircraft parts will be exempted, as will some goods that the United States does not produce.

Still, Amcham Brasil recently warned that Washington's measure places Brazil among countries "facing the most restrictive conditions for access to the US market", affecting more than $11 billion in exports.

Motorists weary of rising gas prices as crisis spirals

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

US motorists are growing weary of paying higher gas prices again after renewed military tensions between the US and Iran stoked fears of a disruption in the Strait of Hormuz and gas prices rose to over $4 per gallon, or more than $1 per liter, this week.

The national average for regular gasoline was $4 a gallon on Monday, according to the American Automobile Association, rising 13 cents per gallon, or 3 percent, over the past week amid tensions in the Middle East. It is the first time the national average hit $4 since June 17, and it comes despite the June US-Iran memorandum of understanding to stop the military conflict and a 60-day negotiation period.

Sanjay Patel, 70, from Manhattan, was filling up his white Mercedes-Benz SUV at a gas station in Brooklyn, New York when he expressed how annoyed he was at the rising price of gas. He said he was paying over $4 at the location, as it was $4.15 for regular, $4.55 for silver and $4.95 for diesel.

"I want it to go back below $4," Patel told China Daily, while blaming the rise in gas prices on the ongoing war with Iran. "Well, it's because of the war, they block the Strait of Hormuz, with all of that there's no supply. I think all of the world is suffering because everywhere it is high. But America has enough oil, but they are not really distributing it to the public.

"The government should end the war. That is most important. Secondly, they have to make sure all these big oil companies, BP, Shell and ExxonMobil should not be focusing on selling the oil outside of the country. America is in a war. I have to pay more to fill up the tank. A full tank is $60."

Brian James, 55, from Brooklyn, New York, drives a black Jeep Wrangler.

He told China Daily: "Gas prices are ridiculous right now. Seriously. It costs $90 for me to fill up this car. In the past, it was $70. Instead of being able to buy certain things or save money, then you have to outlay in transportation. It's taking a hit on everyone.

'Govt to blame'

"I blame the government. They're making it hard for everyone right now, we're spending money where we shouldn't have to. The oil companies are passing on the costs to the customer. I remember when the gas price was in the three-dollar range, like $3.60 or whatever."

In March, shortly after the US-Israel attacks began on Iran, gas prices in the US hit an average of $4 a gallon.

In May, they were $4.50 a gallon, then they dropped back down to $4 after the US and Iran agreed to the MoU in mid-June.

US drivers got some relief by early June, when prices at the pump were $3.79, the American Automobile Association found. But they have gradually crept back up this month.

For most motorists, especially those who rely on their vehicles for work, lower gas prices cannot come back soon enough.

Sulaiman, 31, an Uber Eats delivery driver, was filling up his small motorbike at a gas station in New York and checking his phone on his way to deliver food to a customer.

"I'm so busy, I have to deliver this food," he told China Daily. "Higher gas prices make it harder for people like me who need to earn money as more of my money goes toward transportation costs. I just wish they'd make things better for all of us out here working hard."

Briefly

UKRAINE

President says military commander replaced

Ukrainian President Volodymyr Zelensky announced on Tuesday that he has decided to replace the country's top military commander. In a post on Telegram, Zelensky said Mykhailo Drapatyi would become the commander in chief of the Ukrainian Armed Forces, replacing Oleksandr Syrsky. Syrsky's dismissal was one of the demands of the recent protests in Ukrainian cities, which erupted after the removal of Defense Minister Mykhailo Fedorov.

UNITED STATES

Stripping immigrants of work permits blocked

A federal judge on Tuesday temporarily blocked President Donald Trump's administration from stripping tens of thousands of asylum seekers and immigrants who have Temporary Protected Status of their ability to work in the United States. US District Judge Nathaniel Gorton in Boston sided with a coalition of immigrant rights groups and labor unions that sued to block US Citizenship and Immigration Services from moving forward with a series of policies designed to implement new restrictions enacted by Congress last year.

Disney cuts jobs in cost-control efforts

The Walt Disney Company laid off several hundred employees on Tuesday in its latest round of job cuts, as the entertainment giant continues to streamline its operations with fewer projects, tighter budgets, and a more integrated corporate structure. A Disney spokesperson confirmed the cuts, saying the company was eliminating several hundred jobs across corporate functions, Disney Entertainment Television, ESPN and Disney's studios. Disney did not immediately disclose exact totals by division or say whether additional job cuts are planned.

SOUTH KOREA

Seoul mayor faces ouster after conviction

A South Korean court convicted Seoul Mayor Oh Se-hoon of campaign finance crimes on Wednesday, a ruling that will oust him and bar a presidential run if upheld by the nation's top court. Oh was first elected Seoul's mayor in 2006 and in June won a fifth term in the nation's most powerful municipal role, considered a springboard to high office. He rose to prominence as a possible contender for the opposition People Power Party as other veterans were tainted by former President Yoon Suk-yeol's 2024 martial law bid. But the Seoul Central District Court ruled Oh had a patron pay 21 million won ($14,200) for five of his opinion polls in a 2021 by-election, breaching the political funds act.

COMMENT

Editorials

China-ASEAN cooperation remains crucial anchor of regional stability and prosperity

This week's ASEAN Foreign Ministers' Meeting and related gatherings in Manila have placed the Philippine capital at the forefront of geopolitical discussions.

Amid the crowded diplomatic calendar, one reality is evident: China's engagement with the Association of Southeast Asian Nations remains focused on strengthening regional cooperation.

Apart from the China-ASEAN Foreign Ministers' Meeting on Wednesday, Chinese Foreign Minister Wang Yi also had a series of bilateral meetings in Manila covering a wide range of issues.

The meeting between Wang and US Secretary of State Marco Rubio was conducive to both sides jointly managing their differences and exploring potential areas of cooperation, thereby sustaining the momentum of stabilizing Sino-US ties.

As ASEAN chair this year, the Philippines claims it prioritizes regional unity and security, while also commemorating the 50th anniversary of the Treaty of Amity and Cooperation in Southeast Asia. The anniversary is an opportune time to reflect on how ASEAN should uphold its strategic autonomy and consider who its true partners are.

China was the first major country to accede to the TAC, lending international weight to ASEAN's diplomatic architecture. This year also marks the fifth anniversary of the China-ASEAN Comprehensive Strategic Partnership, providing an opportunity to further deepen cooperation through the 65 established mechanisms that already bind the two sides. The China-ASEAN partnership continues to be an anchor for the region's stability and prosperity.

Wang's meetings in Manila reinforced that. In talks with ASEAN Secretary-General Kao Kim Hourn, both sides reaffirmed their support for ASEAN centrality, regional community-building and stronger cooperation across various sectors. Wang's discussions with Malaysian Foreign Minister Mohamad Hasan focused on accelerating the negotiations on a Code of Conduct in the South China Sea, reflecting a shared interest in ensuring that regional security issues are addressed by regional countries themselves.

This approach contrasts with the course pursued by some in Manila in recent years. While presenting the Philippines as a "champion" of "regional unity", they have increasingly sought to align the country's security policy with external parties. Frequent maritime provocations in the South China Sea, including the latest incident in waters near China's Ren'ai Reef on Monday, have heightened tensions at a time when most ASEAN members continue to prioritize regional stability.

Equally contentious have been the repeated attempts by those Philippine politicians to link the COC negotiations to an unlawful "arbitral award". If they are genuine in their claim that they seek ASEAN's "collective welfare", they should call on Washington to handle the Middle East crisis with reason, restraint and pragmatism — especially as energy shortages continue to plague the Philippines and its fellow ASEAN members alike.

China's engagement with ASEAN offers a different model. As ASEAN's largest trading partner and the first country to establish a free trade agreement with the organization, China has steadily deepened economic integration with ASEAN and upgraded the China-ASEAN Free Trade Area. Bilateral trade reached 7.55 trillion yuan ($1.06 trillion) in 2025, up 8 percent from the previous year. Over 95 percent of traded goods between them now enjoy zero tariffs, while cooperation has expanded to encompass the digital economy, green development, advanced manufacturing and regional connectivity.

Beijing does not ask ASEAN countries to choose sides. Nor is the development of China-ASEAN relations directed against any third party. Instead, China supports ASEAN centrality and strategic autonomy, recognizing that regional prosperity hinges on openness, inclusiveness and mutually beneficial cooperation.

Even with the Philippines, China has shown restraint and composure. Despite their maritime dispute, China has not allowed that to define the entirety of the China-Philippines ties, and has consistently called for dialogue to resolve it. Wang's discussions with his Philippine counterpart offered a timely chance for the two sides to manage tensions and prevent the situation in relevant waters from further escalating.

The South China Sea is a shared home for regional countries, and the dispute should not become a stumbling block to China-ASEAN relations. China is ready to work with the ASEAN members, including the Philippines, to accelerate the consultations on the COC in the South China Sea, fostering a new narrative of peace, stability, cooperation and friendship in the waters, and keeping the initiative for regional affairs firmly in the hands of regional countries.

While contemplating ASEAN's future, regional leaders should judge partners by their contribution to peace, economic opportunity and long-term regional stability. On that measure, sustained cooperation with China remains a firm foundation for ASEAN's solidarity and prosperity.

Fighting while talking won't benefit EU

The joint statement released after a meeting between French President Emmanuel Macron and German Chancellor Friedrich Merz on Friday shows the challenges facing China-EU economic relations.

Both leaders claimed that China's widening trade surplus with the European Union — at "1 billion euros ($1.14 billion) a day" — along with what they described as an "undervalued renminbi", poses an "existential threat" to European manufacturing. It remains to be seen what new "emergency measures" the EU will come up with to "shield" European industry from what it claims are China's "unfair trade practices".

However, a series of restrictive measures introduced by the EU targeting Chinese enterprises suggest a bumpy road ahead for the healthy development of China-EU economic ties.

On July 1, the new European "safeguard" system for steel imports came into effect, introducing lower import quotas for duty-free imports and a 50 percent tariff on imports exceeding these quotas, greatly impacting Chinese steel mills and products. On July 7, the European Commission imposed definitive "antidumping" duties of up to 45 percent on imports of passenger-car and light-lorry tires originating from China.

Additionally, the European Commission on Monday fined Chinese online retailer AliExpress 550 million euros for allegedly "failing to curb the sale of counterfeit goods" on its site, marking the heftiest penalty issued to date under the Digital Services Act. China opposes the EU's practice of erecting digital barriers under the pretext of platform regulation and adopting discriminatory measures to restrict and suppress the normal operations of Chinese e-commerce companies in Europe, said a spokesperson for China's Ministry of Commerce. The EU is urged to stop exploiting the ambiguity of legal provisions to abuse its discretionary power, and to treat Chinese enterprises fairly and impartially.

It is obvious that the EU is taking more protectionist measures against China. The escalating restrictions have occurred shortly after the inaugural meeting of the China-EU trade and investment consultation mechanism late last month, during which both sides agreed to remain committed to addressing economic and trade differences through dialogue and to preventing disputes from escalating into a trade war. They established four initial work streams under the mechanism to further discuss issues such as trade and investment balance, export controls and intellectual property.

It is imperative that China get prepared to deal with the EU's dual strategy of "dialogue" and "pressure" in the long run. The message from French and German leaders suggests the EU may consider a major adjustment of trade policies toward China. Despite this, both leaders emphasized that they are not seeking to "decouple" from China.

In his meeting with a cross-party European Parliament delegation in Beijing on Tuesday, Foreign Minister Wang Yi stressed that China and the EU are partners rather than rivals, and that their interests are deeply intertwined. He called for the EU to stop politicizing economic and trade issues, and to work with China for an upward and dynamic balance of trade from a long-term perspective.

These remarks keep the door open for China and the EU to maintain a constructive, cooperative and win-win relationship based on equality and reciprocity — provided that the EU is willing to meet China halfway, manage differences, broaden consensus and safeguard an open global economy.

There is a need for the two sides to make full use of the established trade and investment consultation mechanisms to bring issues to the table openly and address them with a pragmatic and rational approach. The primary objective is to prevent the European side from adopting a nothing-to-lose mentality, where, driven by internal political pressures, it shifts internal contradictions outward rather than resolving them constructively.

Hopefully both France and Germany can act with a rational and practical attitude, and play a constructive role in helping the EU work with China to address their concerns through dialogue.

Opinion Line

Building a community with shared future in cyberspace

The Chinese delegation submitted a position paper on global cyberspace governance at the first meeting of the Plenary Session of the Global Mechanism on developments in the field of information and communication technologies in the context of international security.

The submission of the position paper at the forum, which is being held at the United Nations Headquarters in New York from Monday to Friday, reflects China's anchoring of digital security on the principles of data sovereignty and cyber sovereignty.

The paper articulates a natural and logical extension of the Global Governance Initiative that China has proposed, along with its long-standing commitment to building a community with a shared future in cyberspace.

The core tenet of the paper rebuts the approach of some developed countries that want a digital ecosystem as an unregulated domain where might makes right, and where they can coerce smaller nations to choose sides over AI hardware, cloud infrastructure and data standards.

China's position paper, on the contrary, enshrines a foundational right long demanded by developing countries: the autonomy to chart their own digital and AI development courses. No country should be pressured into adopting foreign AI products or algorithms; every nation deserves the freedom to make its own choices, free from technological arm-twisting.

At the heart of this vision lies China's steadfast adherence to mutual respect for national sovereignty and the fundamental norm of noninterference in the domestic affairs of other states. China calls for collective management of the cybersecurity risks posed by AI — from unregulated large language models to the misuse of autonomous AI agents — and demands updated, inclusive international cyber rules fit for the age of generative intelligence.

With digital domains — cyberspace, data pools and frontier AI — becoming a new arena for interstate competition, China advocates extending the UN-centered norms of fairness, peaceful development, civilizational diversity and collective sustainability to technology governance. This stands in unmistakable contrast to the zero-sum approach of certain Western countries.

The Chinese suggestions align with the priorities of a vast majority of countries, especially those in the Global South whose voices have too often been marginalized in decades of technology rulemaking.

The contrast between China's open source, open weight AI models and the United States' closed source AI ecosystem offers a real-world illustration of these two paradigms. Washington's closed source AI model consolidates AI supremacy in the hands of a few tech giants aligned with the US government, restricts the diffusion of global technology, and weaponizes technological scarcity to maintain Western dominance in global digital competition.

China, on the other hand, by prioritizing shared innovation and universal accessibility, is breaking down technological monopoly barriers and enabling developing countries to access and iterate on frontier AI technologies independently. This approach transforms the advancement of AI from a privileged asset for a handful of nations into a global public good benefiting all of humanity.

China's thriving digital economy and competitive AI industry ecosystem have equipped it to counter the monopolization of technological discourse and standard-setting by developed countries. Beijing harbors no ambition to dominate cyberspace; its objective is to prevent digital and AI tools from becoming new geopolitical battlegrounds and to ensure that the dividends of the new technology are distributed fairly across the world.

This commitment was demonstrated at the recent 2026 World Artificial Intelligence Conference and High-Level Meeting on Global AI Governance, held in Shanghai, which showcased China's dedication to providing solutions and international public goods to ensure openness, cooperation and shared technological progress for the benefit of all nations.

What They Say

Virtual human could revolutionize medicine

Editor's note: *As artificial intelligence becomes increasingly integrated with the life sciences, virtual reality has emerged as a major frontier of scientific research. Science and Technology Daily spoke to Zhao Qinping, an academician of the Chinese Academy of Engineering, on the pursuit of a virtual human for medical purposes. The views don't necessarily represent those of China Daily.*

The improvement in visual realism, physical accuracy, intelligent virtual characters and natural human-computer interaction has greatly expanded the application potential of virtual reality.

In healthcare, AI assists or even replaces physicians in diagnosing and treating diseases, while VR helps create virtual replicas of patients' organs or pathological conditions. Surgeons can rehearse, evaluate and refine surgical plans on these virtual organs before performing operations on real patients.

But the application of VR in medicine still lags behind the potential. The basic obstacle is the lack of a medical virtual human capable of accurately reproducing the features, physical properties and physiological characteristics of the human body.

Medical science has long faced three major challenges. First, the training of highly qualified medical professionals still depends on laboratory animals and human cadavers, a traditional approach that is becoming increasingly unsustainable. Second, there is still no effective method for rehearsing, evaluating and optimizing surgical plans before operations. Third, the development of new drugs and medical devices also relies on animal testing and human volunteers, resulting in high costs, lengthy development cycles and considerable risks.

A medical virtual human could provide medical students with highly realistic digital models of healthy and diseased human bodies for anatomical education, surgical training and other clinical exercises, substantially reducing reliance on animals and cadavers.

Personalized virtual models of patients' organs could be created to simulate, evaluate and refine surgical procedures, improving both precision and success rates. Virtual humans could also replace some animal experiments and early-stage human testing in the development of pharmaceutical drugs and medical devices, shortening research and development cycles while reducing costs and risks.

However, research on virtual humans is fragmented and lacks a coherent, systematic framework. While some areas have received considerable attention, others remain largely unexplored. Currently, digital models have been developed for fewer than 20 percent of human organs, with research primarily focusing on geometric modeling, physical simulation and surgical interaction.

Studies of microscopic physiological mechanisms remain disconnected from organ-level physical and physiological modeling, and integrated research at the level of the entire physiological system has yet to begin. At the same time, China lacks sufficient data to support the development of medical virtual humans, with much of the current research relying on overseas datasets.

Developing a medical virtual human is a frontier endeavor that brings together information science, life sciences, medicine, mathematics, physics and chemistry. It requires multidisciplinary collaboration among experts from these fields to jointly build a comprehensive "Chinese medical virtual human".

The relevant authorities should organize universities, research institutes, hospitals and technology companies to establish a high-level collaborative network that integrates studies of human cells, tissues, organs and physiological systems while coordinating theoretical breakthroughs, technological innovation and demonstration applications.

Meanwhile, full use should be made of AI foundation models to build dedicated data and model centers, together with the computing infrastructure needed to support the development of medical virtual humans.

VIEWS

Tommy Koh

China, ASEAN forging a brighter future

China and the Association of Southeast Asian Nations celebrated the 35th anniversary of their dialogue relations in July, marking a significant milestone in what has been a very successful relationship. In 2021, this relationship was elevated to a Comprehensive Strategic Partnership. On this momentous occasion, I would like to reflect on the past, assess the present and share my aspirations for the future.

Global Lens

ASEAN was established on Aug 8, 1967, during a period when China's relations with Southeast Asia were complex. Initially, China was cautious about ASEAN, perceiving the grouping as aligned with Western interests.

However, under the leadership of the late leader Deng Xiaoping, China adopted a more constructive approach toward ASEAN. Deng introduced a new forward-looking policy that positioned China as a "good neighbor, good friend and good partner" of ASEAN. This vision laid the foundation for decades of cooperation and mutual benefit between China and ASEAN.

What is the state of the China-ASEAN relationship today? The short answer is that it is in good order. In fact, it is one of ASEAN's most consequential dialogue partnerships.

ASEAN is important to China for several reasons. First, the group has overtaken the European Union and the United States to become China's largest trading partner. ASEAN boasts a market of around 700 million consumers, with rising incomes and purchasing power.

Second, ASEAN welcomes investment from China. In 2024, China was the third-largest investor in ASEAN, behind the US and the European Union. There is potential for China to invest more in ASEAN.

Third, ASEAN is a major source of raw materials for China. It also supplies components for China's manufacturing industries.

Fourth, some of the world's most important sea lanes, such as the Straits of Malacca and Singapore, lie in the region. Access to these sea lanes is critical for China.

Fifth, both China and ASEAN share a commitment to upholding the rules-based regional architecture. They are working toward an effective and substantive Code of Conduct in the South China Sea. While differences remain, the CoC negotiations provide an invaluable platform for sustained dialogue and confidence-building.

LI MIN / CHINA DAILY

Sixth, ASEAN maintains friendly relations with China and has refused to participate in any anti-China coalition or grouping. This is especially important given the heightened geopolitical rivalries and the increasingly challenging external environment.

Emerging areas of cooperation, such as the ASEAN Digital Economy Framework Agreement and the ASEAN Power Grid, offer further opportunities.

For ASEAN too, China is equally important. Trade is the lifeblood of the region, and China is the largest trading partner for ASEAN countries, besides being a source of investment and frontier technologies. China is also the largest source of tourists for a region where tourism is an important pillar of the economy.

China has helped ASEAN member states upgrade their infrastructure and enhance regional integration and connectivity, with initiatives such as the Asian Infrastructure Investment Bank and the Belt and Road Initiative playing key roles. Emerging areas of cooperation, such as the ASEAN Digital Economy Framework Agreement and the ASEAN Power Grid, offer further opportunities.

Moreover, China has consistently supported the central role that ASEAN plays in convening and chairing the various forums of the region, such as the East Asia Summit, ASEAN Regional Forum, and ASEAN Plus Three. It is important that China continues to work with ASEAN in advancing the ASEAN Outlook on the "Indo-Pacific", as this will help build strategic trust and ensure an open, inclusive regional architecture.

The future of China-ASEAN relations is bright. The two sides should expand their cooperation agenda to include new areas such as the green economy, the digital economy, supply chain resilience and artificial intelligence. They should continue to expand flight connectivity to facilitate closer people-to-people links. Building on this, both sides should also enhance their existing cooperation in education, training, cultural exchange and people-to-people exchange. Many more ASEAN students should be studying in China and Chinese students studying at universities in ASEAN.

Both sides should also work to build mutual trust. Trust is very important, because it can make many joint endeavors possible. Without trust, even well-intentioned cooperation will struggle to succeed.

A final word about the role of Singapore. In 2027, Singapore will serve as the chairman of ASEAN.

We will use our chairmanship to raise ASEAN's engagement with external partners to an even higher peak, including the China-ASEAN relationship.

The author is an ambassador-at-large at Singapore's Ministry of Foreign Affairs.
The views don't necessarily reflect those of China Daily.

Ma Zhongfa

What the LV case means for trademark protection

A trademark dispute now before the Beijing Intellectual Property Court (BIPC) could help clarify one of the most important questions in China's trademark system: Where should the boundary lie for the registration and protection of commercial brands derived from public cultural elements?

On July 16, the BIPC heard an administrative trademark lawsuit filed by Louis Vuitton Malletier against the China National Intellectual Property Administration, with Huang Minyao, a clothing business operator from Shantou, Guangdong province, as a third party.

A four-petal floral design trademark that Huang applied for is deemed by LV to be confusingly similar to its iconic monogram pattern.

The dispute arose after CNIPA rejected LV's challenge to the petal-shaped trademark registered by Huang.

It is the sixth trademark lawsuit LV has filed against CNIPA, having won three and lost two of the previous five cases.

Unlike the earlier high-profile dispute between LV and Shenzhen-based Molly Tea Catering Management, this is not an infringement case but an administrative lawsuit that challenges the legality of a regulatory decision.

The two cases are deeply connected in legal principle, but administrative trademark disputes differ fundamentally from infringement lawsuits in nature, subject matter, and standards of proof.

Infringement litigation determines whether conduct falls within the scope of an exclusive trademark right, whereas administrative litigation examines the legality of decisions made by trademark authorities on registration applications, oppositions, or invalidation requests.

This means BIPC will not rule on whether Huang infringed LV's rights, but will review whether CNIPA properly applied the current Trademark Law provisions concerning distinctiveness, similarity, well-known trademark protection, and public interest reservations when it rejected LV's plea for invalidation.

Regulators must prevent market players from privatizing commonly available design resources through registration and obstructing other operators' fair use of cultural elements.

This requires the court to return to the authorization conditions under the Trademark Law.

Under the current provision, signs consisting solely of generic names, graphic elements, place names, or other features lacking inherent distinctiveness — including public cultural resources such as traditional patterns, natural imagery and geometric designs — shall not be registered unless they have acquired distinctiveness through use and become readily identifiable with particular goods or services.

If the disputed trademark involves public cultural elements such as traditional patterns or natural floral designs that typically possess weak inherent distinctiveness, the court will focus on whether CNIPA fully considered this factor and rigorously examined evidence of acquired "secondary meaning".

Public reaction to the LV-Molly Tea infringement case has already demonstrated widespread concern over attempts to register and monopolize traditional motifs such as the four-petal flower or Baoxiang patterns.

At the authorization stage, the issue is even more fundamental: If public cultural elements inherently lack distinctiveness and the applicant fails to prove that the symbol has acquired an independent identity distinct from its public-domain meaning, is administrative approval justified in the first place?

Trademark law is not meant to enclose public cultural resources as private property through registration, but to protect commercial identifiers that distinguish goods or services and thereby promote fair competition.

For traditional cultural elements that have public interest, trademark examination should adopt a prudent stance.

Regulators must prevent market players from privatizing commonly available design resources through registration and obstructing other operators' fair use of cultural elements.

On the other hand, they must respect the goodwill accumulated by enterprises through creative transformation and sustained commercial use.

The key lies in balancing "distinctiveness" against "public domain preservation" without lowering examination standards for auxiliary graphic elements simply because an applicant has a formidable reputation in other product categories.

In this case, LV may argue that its well-known trademark deserves cross-class protection.

However, China's Trademark Law and related judicial interpretations clearly state that the recognition of a well-known trademark should follow the principles of "case-by-case determination" and "protection as needed".

Cross-class protection is justified only if there is evidence that the public would be misled and the registrant's interests are likely to be damaged. In this administrative proceeding, the court needs to determine whether CNIPA correctly applied this standard.

It is worth noting that the protection of well-known trademarks cannot extend indefinitely.

Even if some LV trademark symbols enjoy extremely high reputation, it does not automatically mean that every separately registered graphic element — particularly those resembling public cultural motifs — enjoys the same level of protection across all categories.

Judicial review should guard against "goodwill spillover", whereby a brand's overall reputation is indiscriminately poured into each registered element, thereby improperly extending the exclusivity of the trademark.

Although this is an administrative case, its ruling will have a significant effect on similar cases in the future.

The judgment should accomplish three objectives: First, it should strictly examine the source of distinctiveness of the disputed mark, distinguishing inherent distinctiveness from acquired distinctiveness, and ensure that the natural recognizability of public cultural elements is not mistaken for the trademark owner's original contribution.

Second, it should accurately apply the principle of "protection as needed" for well-known trademarks and prevent the abuse of cross-class protection.

Third, it should fully address public interest considerations in its reasoning, clarifying the protection boundaries for trademarks comprising public cultural elements and leaving adequate room for fair use by the public and other market entities.

A trademark right is essentially a tool for market identification, not a shackle on cultural resources.

As China continues strengthening intellectual property protection while fostering a fair and competitive business environment, safeguarding the public domain at the trademark authorization stage becomes increasingly important.

Traditional patterns, natural imagery, and geometric designs should remain part of humanity's shared treasury of creativity rather than become legal barriers enabling a handful of enterprises to monopolize markets.

The BIPC ruling may well provide a landmark answer on how China's trademark system can balance private incentives with public interest.

Li Tianguo

Aligning ambitions of economic integration in Asia-Pacific

Most cherry trees in China are dormant in the winter due to the cold. Yet supermarkets across the country are stocked with boxes of glossy, wine-colored cherries during the season.

The luscious fruit is imported in large quantities from Chile, about 20,000 kilometers away in South America, to fill the seasonal supply gap and drive down prices at that time of the year. The huge supply and relatively affordable prices make cherries a popular treat in China around the Spring Festival holiday.

The popularity of Chilean cherries in China is thanks to their bilateral free trade agreement, under which most goods enjoy zero-tariff treatment.

The journey of Chilean cherries across the Pacific reflects the vitality of free trade and economic integration in the Asia-Pacific. Interestingly, though China and Chile enjoy a high-standard bilateral free trade relationship, they are signatories to different regional trade agreements.

China is a member of the Regional Comprehensive Economic Partnership, while Chile is part of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership.

RCEP and CPTPP are two major pillars of the Asia-Pacific's economic and trade architecture. Many regional economies are part of either one or both agreements.

Within each trade pact, member economies have seen their tariffs slashed and the cost of cross-border trade and business reduced.

But the two trade agreements cover different regional economies and have distinct rule frameworks.

To promote a free flow of resources across the Asia-Pacific, it is necessary to integrate their rules and work toward a unified free trade area that covers more regional economies.

This has long been a goal of the Asia-Pacific Economic Cooperation forum.

An important milestone was reached in 2014, when APEC members adopted a road map for the realization of the Free Trade Area of the Asia-Pacific, or FTAAP, at the meeting of economic leaders in Beijing, turning the long-term vision into a concrete action plan.

For many enterprises, market access and operational efficiency are no longer the only concerns.

Two years later, APEC members endorsed the Collective Strategic Study on Issues Related to the Realization of the FTAAP.

Since then, economies have committed to bringing CPTPP and RCEP into force, while APEC has encouraged the two regional deals to remain open, transparent and inclusive, draw on each other's strengths, and jointly lay the groundwork for the eventual realization of the FTAAP.

In recent years, however, progress toward building the free trade area has faced growing challenges. Protectionism and unilateralism are on the rise, while geopolitical tensions have intensified.

For many enterprises, market access and operational efficiency are no longer the only concerns. The security and resilience of industry chains have become more important than ever. All these have slowed the progress toward the FTAAP, and delayed discussions on a potential negotiating framework.

Yet the evolving environment has only made the FTAAP all the more relevant. A unified Asia-Pacific market will help address the fragmentation of rules caused by overlapping free trade arrangements, help regional economies withstand trade protectionism and strengthen the regional supply chain. Its establishment will not only boost regional trade but also contribute to global growth.

It will take gradual and steady efforts to advance the FTAAP, which is faced with multiple hurdles. Geopolitical competition and significant development gaps among APEC member economies are some of the biggest obstacles.

The Asia-Pacific comprises both developed economies and a large number of developing economies. CPTPP's rules are of a higher standard, whereas RCEP emphasizes inclusiveness, flexibility and incrementalism.

Given that APEC members are at different stages of development, it is unrealistic to expect all economies to implement identical trading rules immediately.

APEC therefore needs to build a consensus among members and help them with capacity-building to speed up the economic integration of the region.

The forum can also facilitate dialogue and coordination between RCEP and CPTPP members to make relevant institutions more open, compatible and inclusive. This would lay a solid foundation for the future free trade area.

Efforts to align the two trade agreements should not begin with the most contentious issues, such as tariff concessions. Instead, priority should be given to harmonizing rules and standards for the digital economy, green and low-carbon trade and cross-border data flows.

Since the regulatory frameworks for these emerging sectors are still evolving, there is greater scope for developing unified norms.

China has actively contributed to this process. The country hosted a dialogue between members of RCEP and CPTPP during the APEC Ministers Responsible for Trade Meeting held in Suzhou, Jiangsu province, in May.

Representatives from 18 of the 20 economies participating in the two mega trade agreements attended the dialogue. Participants engaged in informal discussions on several issues, including regional economic integration.

In July, a Chinese business delegation hosted the third APEC Business Advisory Council meeting in 2026.

At the meeting convened in Bangkok, representatives discussed regional economic integration and other topics, and adopted a report to APEC economic leaders and other outcome documents.

Going forward, only by upholding the principles of pragmatic cooperation, inclusiveness and mutual learning, while continuing to improve institutional coordination and align interests, can Asia-Pacific economies build a truly unified, open and prosperous regional market.

CARLY COWELL

Integrated plant conservation

China's experience offers adaptable biodiversity governance models for the Global South

Plant diversity is facing unprecedented pressure worldwide. According to the first Global Tree Assessment published by the International Union for Conservation of Nature (IUCN) Red List of Threatened Species, approximately 38 percent of the world's tree species are threatened with extinction. For many countries across the Global South, the challenge is particularly acute. Rapid economic development, competing land use pressures, limited conservation resources and the increasing impacts of climate change create difficult choices about how biodiversity can be protected while supporting human well-being.

Yet conservation is not the exclusive domain of wealthy nations. Over the past several decades, China has demonstrated that meaningful progress can be achieved through long-term commitment, strategic investment and strong partnerships. Through Botanic Gardens Conservation International's (BGCI) collaboration with Chinese botanical gardens, research institutions, local authorities and conservation practitioners, we have witnessed the development of an approach that offers valuable lessons for countries facing similar challenges.

One of the most important lessons is that effective conservation requires integration. Historically, conservation efforts often focused on a single intervention, whether protecting remaining wild populations, establishing ex-situ or outside-the-original-location collections, or undertaking restoration activities. Increasingly, however, experience shows that these approaches are most successful when combined.

The conservation of Magnolia omeiensis illustrates this principle well. Since the species was rediscovered in the late 1980s, conservation efforts have involved extensive field surveys, ex-situ collections, propagation and reintroduction. Through collaboration between BGCI and the Emeishan Botanical Garden, new wild populations were identified, thousands of seedlings propagated and plants reintroduced to suitable habitats. In 2025, one of the reintroduced trees flowered significantly earlier than expected, demonstrating the value of long-term, coordinated conservation action. The success was not the result of a single intervention, but of a connected process linking research, conservation collections, propagation expertise and field implementation.

This integrated approach is increasingly reflected within China's wider conservation framework. The development of national biodiversity strategies, updates to protected species legislation and the establishment of a national botanical garden system all demonstrate how conservation can move beyond individual projects and become embedded within national planning. This institutional support is critical because plant conservation is inherently long-term. Many threatened species require decades of sustained effort before measurable recovery can be achieved.

Another important lesson from China's experience is the value of applied research in guiding action. Conservation resources are limited in every country, making it essential that interventions are informed by evidence rather than assumptions. Restoration and conservation cannot be reduced to simply planting trees. Successful outcomes depend on understanding species biology, habitat requirements, genetic diversity and the social and economic context in which conservation takes place. Across China, conservation programs increasingly combine ecological research with practical implementation. This emphasis on generating and applying knowledge before scaling up interventions helps avoid costly mistakes and increases the likelihood of long-term success. For many countries in the Global South, where resources are often stretched, investing in research and planning at the outset can provide significant returns over time.

China's growing role in regional and international conservation cooperation also highlights the importance of knowledge exchange. Conservation challenges rarely stop at national borders. Many threatened plant groups occur across multiple countries and require coordinated action.

A good example is the conservation of dipterocarps, the dominant tree family of Southeast Asian tropical rainforests. These species are ecologically important and economically valuable, yet many are under increasing threat. In 2025, researchers and conservation practitioners from across Asia gathered in China for the Global Conservation Symposium for Dipterocarps. The meeting brought together expertise from multiple countries, identified shared priorities and strengthened regional collaboration. Such initiatives demonstrate how countries can move from being participants in conservation efforts to becoming regional centers for knowledge sharing and capacity development.

At the heart of all successful conservation, however, are people. Conservation outcomes are most durable when local communities are involved as active participants rather than passive beneficiaries. Building local capacity, supporting livelihoods and fostering a sense of stewardship are essential components of effective conservation programs.

This principle is evident in the conservation work for *Euryodendron excelsum*, one of China's most threatened tree species. Through collaboration between BGCI and the South China National Botanical Garden, local stakeholders were engaged through training programs, technical workshops and participatory conservation activities. Practical skills such as seedling propagation, planting and post-planting management were shared with local communities, helping to strengthen both conservation outcomes and local ownership. This emphasis on capacity building extends far beyond individual projects. Through partnerships across China, BGCI has supported conservation initiatives for dozens of threatened tree species, trained conservation practitioners, and engaged students from rural schools and community members from remote mountainous areas in conservation education.

Investing in people creates the foundation upon which long-term conservation success depends.

Perhaps one of the most significant aspects of China's conservation journey has been the development of its botanical garden network. Today, China's nearly 200 botanical gardens collectively represent one of the largest plant conservation infrastructures in the world. These institutions function as much more than public green spaces. They serve as centers for research, conservation, education, restoration, and capacity building. For other countries in the Global South, botanical gardens represent a particularly effective investment. They provide a permanent institutional base for conservation activities, maintain living collections and seed banks, support restoration programs and create opportunities for public engagement. Importantly, they also act as hubs that connect local conservation efforts to national and international networks.

Through BGCI's global network, botanical gardens in China are linked with institutions across more than 100 countries. These connections facilitate the exchange of expertise, data and conservation resources, helping to strengthen collective action for plant conservation worldwide. The broader lesson emerging from China's experience is that conservation success depends on a combination of long-term planning, strong institutions, applied research, community engagement and international cooperation, which is a framework that can be adapted rather than simply copied. Global South countries often face different economic realities, governance structures and development priorities. Solutions must therefore be adapted to local contexts, but China's experience offers a valuable example because many of the challenges it has faced are shared by other developing nations. This work in China demonstrates that plant conservation can progress alongside economic development when supported by appropriate policies, partnerships and investment.

The partnership between BGCI and Chinese colleagues has reinforced another important principle: International cooperation is most effective when it is built on mutual learning. While BGCI contributes global expertise, international standards and opportunities for collaboration, Chinese institutions contribute practical experience, innovation and lessons derived from implementing conservation at scale. Both sides benefit from the exchange. As global biodiversity loss accelerates, there is an urgent need for conservation approaches that are practical, scalable and relevant to the realities facing countries across the Global South. China's experience demonstrates that such approaches are possible. Through sustained commitment, strong institutions, botanical garden networks and investment in people and knowledge, significant progress can be achieved.

YANG XIAOBO AND LYU XIAOBO

Mangroves to the rescue

By giving nature the space to recover, these 'forests of the sea' can continue to shelter coastal communities and thrive alongside them for generations to come

Mangrove forests are distributed along tropical and subtropical shores. Though they occupy only a small fraction of the world's total coastal zone, they have long served as natural guardians of coastal communities, buffering the effects of typhoons while sustaining abundant fisheries.

Yang Xiaobo

Lyu Xiaobo

For many Chinese people who grew up beside mangroves before the 1970s, childhood was inseparable from these forests. They followed their parents into the mangroves to catch shrimp and crabs or gather clams from the tidal flats. They walked narrow stone paths winding through the forests from one village to the next, often trailing behind their mothers. Looking up, they watched the mangrove branches sway in the sea breeze; looking down, they saw fiddler crabs scurrying across the mud at their feet. Those memories remain vivid to this day.

But this began to change in the mid-1970s. As population growth intensified shortages of food and salt, many mangrove forests were cut down to make way for rice paddies and salt pans. In Sanjiang township of Hainan province alone, around 800 hectares of mangroves were felled between 1975 and 1976. The destruction accelerated in the late 1980s and early 1990s as booming coastal aquaculture drove the widespread conversion of mangrove wetlands into fish farms.

The Chinese government, however, did not stand idly by as the losses mounted. Systematic mangrove restoration began in the 1980s, alongside the establishment of the Dongzhaigang National Nature Reserve in Hainan in 1980. More protected areas were later established across the country. In 1998, Hainan became the first province to introduce regulations on the protection of mangroves, effectively bringing the widespread mangrove clearance under control.

Protecting mangroves has never been solely a challenge for China. It is a global imperative. In 2015, the United Nations Educational, Scientific and Cultural Organization designated July 26 as the International Day for the Conservation of the Mangrove Ecosystem, often referred to as World Mangrove Day. Since then, the occasion has evolved from a symbolic commemoration to an opportunity for countries to reaffirm the ecological value of mangroves and strengthen the collective commitment to protecting them.

In China, over a decade of sustained investment and restoration efforts have steadily revived mangrove ecosystems that had once been lost to fish farms.

Since 2016, China has funded mangrove restoration through major programs such as the Blue Bay environmental improvement initiative and the coastal zone protection and restoration project. A key milestone was the Mangrove Protection and Restoration Action Plan (2020-25), under which about 18,800 hectares of mangroves have been restored through measures such as converting fish farms back into forests, recovering degraded habitats and strengthening long-term monitoring and management.

According to the National Forestry and Grassland Administration, by February 2025, China's mangrove coverage had reached 30,300 hectares, increasing approximately 8,300 hectares from what it was at the start of the century.

Restoring mangroves is a complex, long-term process that requires scientific research, the removal of fish farms, the reshaping of tidal flats, seedling cultivation and planting, and years of monitoring and maintenance. In the Xiaohai coastal lagoon in Wanning, Hainan province, the restoration of mangroves has involved investment in removing aquaculture ponds, dredging waterways and rehabilitating tidal flats since 2019. Similar progress has been made in the Guangxi Zhuang autonomous region and Guangdong and Fujian provinces. Across China, mangrove forests once in decline are making a remarkable comeback.

At the opening of the 14th Meeting of the Conference of the Contracting Parties to the Ramsar Convention on Wetlands in 2022, China announced plans to establish the International Mangrove Center in Shenzhen, Guangdong province, marking China's transition from a participant in global conservation to a leading contributor. In July 2025, the center was officially endorsed as a Ramsar Regional Initiative for the 2026-28 period.

Operating as an independent, nonprofit intergovernmental organization under the Ramsar Convention, the International Mangrove Center, with 21 signatory countries as of June 2026, aims to promote international cooperation in mangrove conservation, restoration and sustainable use.

In 2025, the center organized a series of international training programs for government officials and experts from countries including Cambodia and Madagascar, sharing China's experience in mangrove restoration. Later that year, the China Meteorological Administration released a sectoral standard for estimating carbon stocks and assessing carbon emissions in mangrove and salt marsh wetlands, providing a scientific framework for measuring mangrove carbon sequestration.

Together, these initiatives demonstrate that China is not only restoring its own mangrove ecosystems but also contributing knowledge, technology and standards to global conservation efforts.

Going forward, mangrove restoration should place greater emphasis on ecosystem quality rather than simply expanding forest cover. This means maintaining an appropriate balance among mangrove forests, tidal flats and open water, preserving the ecological function of tidal channels, and restoring benthic biodiversity.

Encouragingly, mangroves are remarkably resilient. Once major disturbance factors are removed, many degraded ecosystems can recover naturally, with carefully targeted intervention helping to accelerate the process where needed.

It is also important to explore sustainable integrated mangrove aquaculture models to balance the needs for environmental recovery and economic development. By reconnecting mangrove forests with the livelihoods of coastal communities, we can help restore a landscape where people once again share winding mangrove paths with crabs and other wildlife.

By giving nature the space to recover, mangroves, the "forests of the sea", can continue to shelter coastal communities and thrive alongside them for generations to come.

China's oil, gas output hits record highs

By ZHENG XIN
zhengxin@chinadaily.com.cn

China's domestic oil and gas production reached historic highs in 2025, providing a robust bedrock for national energy security as the country accelerates the construction of a resilient energy system to navigate escalating global market uncertainties and geopolitical turbulence.

An oil and gas exploration and development report, recently released by the National Energy Administration, revealed that domestic crude oil production surged to a record 216 million metric tons last year. Meanwhile, natural gas output maintained its robust momentum, expanding by over 10 billion cubic meters for the ninth consecutive year.

Combined, total oil and gas production equivalent soared to a new high of 420 million tons, significantly enhancing the nation's self-sufficiency and ushering the industry into a new phase of high-efficiency and green development, it said.

Industry experts believe the milestone marks the successful culmination of a sweeping seven-year action plan (2019-25) designed to enhance domestic exploration, as the fierce global competition over resources, transit routes and market rights is creating greater uncertainties for energy imports.

China is leveraging the "certainty" of its domestic energy development to counter various external risks and enhance the resilience of its production, supply, storage and sales systems, Wang Hongzhi, head of the NEA, said recently.

Building on the momentum of a record-breaking 2025, the sector has seen a robust start to 2026. Cao Jianjun, chief expert at the Sinopec Economics and Development Research Institute, believes that the continuous growth of domestic supplies serves as the ultimate insulator against external volatility.

"As uncertainty becomes the new normal, we must counter external instabilities with our own internal certainty," Cao said.

This resilience is further underpinned by a strategic petroleum reserve estimated at approximately 1.4 billion barrels, or 190 million tons, according to figures by Columbia University's Center on Global Energy Policy.

Advancements in exploration and production technology have played a central role in this self-sufficiency. Sustained investments by the country's three major energy giants — China National Petroleum Corp, China Petroleum and Chemical Corp, and China National Offshore Oil Corp — have led to significant discoveries across traditional and unconventional fields, said Lu Ruquan, head of the CNPC Economics and Technology Research Institute.

These efforts successfully reduced China's dependence on crude oil imports to 71.9 percent in 2024, demonstrating remarkable industry resilience, Lu added.

The NEA report also highlighted breakthroughs in unconventional resources. In 2025, shale oil output exceeded 8.5 million tons — more than 10 times the level in 2018 — while unconventional natural gas production climbed 7.7 percent year-on-year to over 110 billion cubic meters.

Furthermore, the oil and gas sector added over 9 gigawatts of wind and solar capacity last year, reflecting the government's call to double down on renewable expansion while ensuring fossil fuels serve as a reliable regulatory "baseline" for energy substitution.

To support this balanced transition, China aims to bring non-fossil fuels to 25 percent of total energy consumption by 2030, supported by a comprehensive national energy production capacity.

Looking ahead, the industry is rolling out a new strategic action plan for 2026.

The NEA expects domestic crude oil output to firmly remain above the 200-million-ton threshold, while deepening the integration of artificial intelligence, green energy and the large-scale application of carbon capture, utilization and storage to empower China's continued rise as a global energy powerhouse.

Humanoid robots close to 'ChatGPT moment'

Executive: Would move new tech from niche circles into public consciousness

By MA SI
masi@chinadaily.com.cn

The humanoid robot industry could hit its "ChatGPT moment" by the end of 2028, based on current data accumulation rates and model convergence trends, said Wang He, founder and CTO of Beijing-based Galbot Co Ltd.

The "ChatGPT moment" has become a popular metaphor in tech and investment circles to describe a sudden breakthrough that catapults a new technology from niche circles into the public consciousness, allowing ordinary people to viscerally feel its practical value.

Wang said a powerful pre-trained model combined with an efficient post-training paradigm is the key to unlocking this milestone, and embodied artificial intelligence foundation models trained on massive, comprehensive datasets could achieve a 70 to 80 percent success rate directly for tasks they have never been specifically trained for.

Galbot was among the invited enterprises to a private enterprise symposium hosted by Zheng Shanjie, head of the National Development and Reform Commission, in Beijing on Monday. The event focused on analyzing first-half economic performance and gathering suggestions for second-half economic work.

The policy attention comes as Galbot's technology is capturing the public imagination in tangible ways. At the 2026 World Artificial Intelligence Conference, which concluded in Shanghai on Monday, crowds three or four layers deep gathered around Galbot's exhibition area. They were watching Galbot G1, one of the company's robots, make breakfast, toast bread and pour drinks with the smooth coordination of a seasoned short-order cook.

But what truly captivated the audience was not the actions themselves — it was what happened next. Spectators repeatedly moved the bread aside, shifted the kettle, rearranged cups and plates, and covered the cup lids with their hands, creating obstacle after obstacle. Yet the robot never wavered. It relocated its targets in milliseconds, reconstructed its path on the fly and completed every step without interruption.

Wang outlined a roadmap for general-purpose embodied intelligence foundation models. He said that building a unified "brain and cerebellum" — the embodied intelligence foundation model — to achieve a deep understanding of human movement and control mechanisms represents a critical technological pathway for pushing humanoid robots toward the "tipping point" of artificial general intelligence.

Just a day before the WAIC opened, Vice-Minister of Industry and Information Technology Ke Jixin revealed at the annual plenary session of his ministry's humanoid robot and embodied intelligence standardization technical committee in Shaoxing, Zhejiang province, that China's humanoid robot output reached about 20,000 units last year, surpassed 40,000 units in the first half of this year, and is expected to exceed 100,000 units this year.

This fivefold jump sends a clear signal: humanoid robots are accelerating from technological exploration toward standardized, large-scale development. But quantity expansion does not equal industrial maturity.

Xie Shaofeng, chairman of the ministry's technical committee and chairman of the OpenAtom Foundation, warned that the industry is currently "blossoming yet fighting separately". Behind the apparent prosperity are three major challenges: highly divergent technological pathways, a critical lack of product standards and mounting pressure from sustainable development requirements.

Ke said the next two to three years could be a critical turning point for the humanoid robot sector. Output growth is merely the surface — the deeper shift is that the industry is moving from single-unit prototypes and stage demonstrations toward batch deliveries, which dramatically raises the coordination requirements across research and development, production, testing, application and safety governance.

At the prototype stage, companies can solve interface, algorithm and hardware adaptation issues through customized solutions. But once production reaches the scale of tens of thousands of units, any interface incompatibility, inconsistent evaluation methods, or unclear safety boundaries will be magnified into cost, efficiency and market trust problems, experts said.

To a certain extent, the core of scaling is not just "expanding production capacity" but also enabling components from different companies to work together, allowing product performance to be compared and contrasted, thus giving users the confidence to buy and use products and providing a basis for after-sales maintenance, they added.

Ke called for leveraging the foundational, guiding and supportive role of standards, as well as accelerating the development of urgently needed standards for humanoid robot intelligence classification, data management and safety specifications.

Jiang Lei, deputy director of the technical committee, said hardware requires standards and models need "firewalls", adding that the committee expects to roll out the first batch of standards by the end of this year.

Equipment industry driving exports

China's equipment manufacturing sector became a major driver of export growth in the first half of 2026, with export delivery value of the equipment industry rising 18.2 percent year-on-year and contributing nearly 50 percent of the growth in industrial exports, official data showed.

In the first half of the year, the country's exports of wind turbine generators and lithium batteries increased 35.6 percent and 37.6 percent year-on-year, respectively, while automobile exports reached 5.096 million units, up 65.3 percent from a year earlier, according to Wang Weiming, chief engineer of the Ministry of Industry and Information Technology.

China's shipbuilding sector also continued to strengthen its global competitiveness, with domestically built vessels accounting for more than 90 percent of the country's total completed ships, new orders and existing order backlog.

"Since the beginning of 2026, China's equipment manufacturing industry has demonstrated characteristics of a solid foundation, multiple growth highlights and strong external demand," Wang said.

The sector's value-added output increased 6.4 percent year-on-year in the first half, accounting for 20 percent of the total output of industrial enterprises above designated size. It contributed 23.5 percent to the growth of value-added industrial output, providing strong support for stable industrial growth, Wang noted.

In addition to the strong growth in exports of high-tech products such as industrial robots, high-end machine tools and aerospace components, shipments of consumer goods — including 3C electronics (computer, communication and consumer electronics), household items, fashion accessories and small home appliances — have emerged as an important driver of export expansion. Beyond hardware performance, strong modeling ecosystems and software capabilities have notably become key factors behind the overseas popularity of Chinese-made 3D printers.

New technologies such as electrification, automation and AI transformation will continue to reshape their product architecture and industrial ecosystems, opening up fresh growth opportunities for the country's equipment manufacturing industry.

XINHUA - CHINA DAILY

Briefly

Honda, GAC extend joint venture

Honda Motor and China's Guangzhou Automobile Group Co Ltd have agreed to extend their joint venture partnership until 2038, as the Japanese carmaker seeks to strengthen its position in the world's largest auto market. The ownership structure of the China joint venture, GAC Honda, will remain unchanged under the agreement, while the venture will accelerate its shift toward new energy vehicles and work to rebuild its competitiveness, according to the company.

Yuan weakens against greenback

The central parity rate of the Chinese currency renminbi, or the yuan, weakened 16 pips to 6.7933 against the US dollar on Wednesday, according to the China Foreign Exchange Trade System. In China's spot foreign exchange market, the yuan is allowed to rise or fall by 2 percent from the central parity rate each trading day.

XINHUA - CHINA DAILY

Confidence returning to global art market

By LI JING
lijing2009@chinadaily.com.cn

China's art market is showing early signs of stabilizing after a five-year downturn, with auction prices edging higher and bidding activity returning close to historical averages, according to a report released on Friday, adding to evidence that a broader recovery is taking hold in the global art market.

The report, published jointly by the Cheung Kong Graduate School of Business and Italy's SDA Bocconi School of Management, found that the MM Chinese Art Price Index, which tracks auction prices, rose 1.7 percent during the spring 2026 auction season after slipping in the autumn 2025 auction season. At the same time, the MM Chinese Art Sentiment Index, which measures bidding intensity by comparing hammer prices with auction estimates, also improved and approached its long-term average, indicating stronger competition among buyers.

The rebound in the Chinese art market coincides with gains in the report's two other major global price benchmarks, with the MM Impressionist Art Price Index climbing 15 percent and the MM Contemporary Art Price Index rising 10.8 percent, the first time in years that all three major art price indexes increased simultaneously.

"The spring 2026 auction season suggests confidence is returning to parts of the global art market," said Mei Jianping, professor of finance at CKGSB and lead author of the report.

Chinese artworks remain the strongest-performing segment over the past 25 years, despite a deep adjustment in recent years amid the COVID-19 pandemic, China's economic transition and a global art market downturn. The report showed the MM Chinese Art Price Index has risen nearly sevenfold since 2000, delivering a compound annual growth rate of 7.8 percent, compared with 4.8 percent for the MM Contemporary Art Price Index and 3.5 percent for the MM Impressionist Art Price Index.

Mei said the global art market has significantly lagged the rapid expansion of global wealth over the past 25 years, particularly wealth generated by advances in artificial intelligence.

"This spring auction season indicates the onset of a market revival," Mei said. "Considering the massive wealth generated over the past quarter-century, especially by recent breakthroughs in AI technology, the current market may present a historic window of opportunity for collectors and investors."

The report also pointed to a growing divide within China's art market as collectors continued to favor works with broader international appeal, such as contemporary artworks and oil paintings. During this year's spring auctions, the MM Chinese Oil Painting Index jumped 21.9 percent and the MM Chinese Contemporary Art Index rose 18.6 percent, while the MM Chinese Ink Painting Index fell 4 percent and the MM Chinese Modern Art Index declined 4.7 percent.

Mei attributed part of the shift to the growing internationalization of collecting Chinese art since the early 2000s as overseas buyers have become more active, making the market more sensitive to global collecting trends.

Beyond China, the report found that European art also rebounded in the spring, with France posting a 24.7 percent increase and Britain rising 18.5 percent, although long-term returns remained modest. The researchers said that years of relatively weak performance could leave parts of the European market attractively valued for long-term investors.

Despite the rapid creation of AI-related wealth, Mei said much of that capital has yet to flow into art because investors continue to see better returns in technology assets.

"The opportunity cost is still high," he said, adding that many entrepreneurs and investors enriched by the AI boom remain focused on growing their businesses rather than building art collections.

Asked whether AI-generated artworks could become valuable collectibles, Mei said that such works are likely to have artistic value but are unlikely to command the same long-term significance as works created by human artists.

Tianjin Port upgrades enable more imported delicacies

First bulk shipment of certified Beef-on-Track from Brazil expected to arrive in August

By **YAN DONGJIE** in Tianjin
yandongjie@chinadaily.com.cn

Chefs and employees showcase certified Beef-on-Track from Brazil during the 4th Tianjin International Shipping Industry Expo in Tianjin on June 3. LIU NAIWEN / FOR CHINA DAILY

China's first shipment of certified Beef-on-Track from Brazil arrived at Tianjin Port last month, with visitors to the 4th Tianjin International Shipping Industry Expo lining up to try the BOT steaks — and the reviews were glowing.

The Tianjin Meat Industry Association signed a cooperation agreement with Brazilian counterparts at the expo. The first bulk shipment of the beef is expected to arrive at Tianjin Port in August, eventually making its way to dining tables across the Beijing-Tianjin-Hebei region.

"China is our main export destination, accounting for roughly half of Brazil's total beef exports," said Marina Guyot, executive director of the Institute of Agricultural and Forest Management and Certification, at the signing ceremony.

Xing Yanling, president of the Tianjin Meat Industry Association, said that Tianjin Port, as the largest cold-chain gateway in northern China, has a well-established cold-chain storage, customs clearance and distribution system, handling nearly 60 percent of the country's Brazilian beef imports annually.

To source the beef, a team from the association traveled to Para state in Brazil in April, visiting the Fazenda Carioca ranch and the Mafrinorte slaughterhouse to inspect ecological farming practices, standardized slaughter processes and full-chain quality controls. They also held discussions with local prosecutors and the Brazilian Chamber of Commerce on regulatory and environmental compliance.

BOT is a sustainable beef certification initiative launched in 2019 by Brazil's Federal Prosecutor's Office and the Institute of Agricultural and Forest Management and Certification.

Under this framework, ranchers are required to commit to environmental stewardship — specifically, zero deforestation — to protect what many call the "lungs of the Earth". Pasture management is tightly controlled, with no more than eight cattle per 6.67 hectares of grassland. As a result, the beef carries a slightly higher production cost than conventional beef.

"We hope to bring premium protein from around the world to Tianjin Port, and from there to the wider Beijing-Tianjin-Hebei region," Xing said.

Once a cold-chain container completes its weeks-long ocean voyage and arrives at Tianjin Port, it enters a streamlined clearance process. Paperless customs procedures ensure that compliant frozen goods pass through quickly. At the container terminal, smart loading and unloading equipment moves containers off the docks and into cold-chain warehouses with minimal delay.

For containers that need temporary port storage, thousands of shore power sockets provide uninterrupted electricity, keeping frozen goods at a constant minus 25 C. Port workers conduct regular inspections to check power supply and compressor status, ensuring cargo quality is maintained throughout.

Representatives from China and Brazil shake hands during the Brazil BOT Certified Sustainable Beef First Arrival Ceremony in Tianjin on June 3. LIU NAIWEN / FOR CHINA DAILY

From the docks, containers are transported to cold-chain warehouses clustered around the port area. Tianjin currently has 155 registered cold-chain storage facilities with a total capacity of approximately 3 million metric tons. As one of China's primary frozen goods import hubs, the port handled about 2.3 million metric tons of frozen imports last year, valued at 61.39 billion yuan ($9.06 billion) — ranking second nationally.

Tianjin's 15th Five-Year Plan identifies cold-chain logistics as a key component of modern transport and shipping services, with plans to strengthen the sector as a strategic pillar.

Behind this infrastructure lies a simple reality: imported goods are finding their way into more and more Tianjin households. Recently, at a Sam's Club a few kilometers from the National Convention and Exhibition Center (Tianjin), a Tianjin resident named Zheng Xiaowen drove in circles around the car park of nearly 2,000 spaces and it still took her half an hour to find an available space.

The Sam's Club in Xiqing district is reportedly the highest-grossing in the country. Despite the complaints, Zheng — like tens of thousands of Tianjin families — makes the trip every weekend. "We come mainly for the high-quality imported meat and produce," she said.

From Chilean cherries and Peruvian blueberries to Thai durian, Norwegian salmon, Australian beef, US apples and New Zealand milk, imported food has become a staple in the shopping trolleys of Tianjin families.

Data from Tianjin Customs back this up. Last year, Tianjin imported 225,000 tons of aquatic products for consumption, valued at 6.3 billion yuan, up 27 percent year-on-year. Imports of fresh and dried fruits and nuts reached 141,000 tons, valued at 14.3 billion yuan, up 7.3 percent.

This enthusiasm for imported food has deep historical roots. Tianjin has long been an international consumer city. The Quanyechang Department Store, which opened in 1928, predates what is widely recognized as the United States' first modern shopping mall by nearly 30 years.

That tradition carried on in later decades in a different, more down-to-earth form. For today's young people, shopping globally is as simple as a few taps on a phone. But for Zheng's grandparents' generation, seeing the latest international trends meant making a trip to one place that everyone in Tianjin — and across northern China — knew well: the Tianjin Foreign Commodities Market.

A hallmark of Tianjin's "foreign goods economy" from the 1990s through the early 2000s, the market drew shoppers from across the country by the busload.

Where older Tianjin residents once had to make a dedicated journey to "hunt" for imported goods, Zheng today simply reaches for them off the supermarket shelf. The goods haven't changed — what's changed is the port infrastructure behind them, as Tianjin Port has developed its port-industry-city integration model and upgraded customs clearance efficiency under the city's free trade zone framework.

Chilean cherries once had to transit through southern ports on their way to Tianjin, adding days to an already long journey. Since 2023, when Tianjin launched its direct "Cherry Express" service from Chile, the port has steadily expanded its fresh produce import corridor. By the end of January this year, four vessels carrying roughly 30,000 tons of cherries had arrived as part of the 2025–26 cherry season.

Nearly 200 containers of fresh cherries made the journey from Chile's San Antonio Port directly to Tianjin, with a single sailing time of around 22 days — nearly a week shorter than traditional transit routes. Customs declarations are completed before arrival, so once a vessel docks, containers can be unloaded directly onto refrigerated trucks. From ship to supermarket shelf, the entire process now takes just a few hours — cherries that arrive in the morning are on sale by midday and on dinner tables by evening.

"We'll use international shipping combined with full cold-chain logistics to reach the Beijing-Tianjin-Hebei region, and from there the whole of China — so that more consumers can enjoy fresh imported food," said Xing.

Cai Muzi contributed to this story.

Sourcing event boosts Sino-South African ties

CAPE TOWN — China Premium Textile South Africa and Allfashion Sourcing 2026, one of Africa's top textile and fashion trade exhibitions, took place in Cape Town from July 14 to 16, with participants from China and South Africa upbeat about expanding bilateral cooperation in the industry.

Held at the Cape Town International Convention Center, the annual event serves as a major sourcing platform for the textile, apparel, footwear and fashion industries, bringing together manufacturers, suppliers, designers, retailers, buyers and other industry stakeholders to explore business opportunities, forge partnerships and showcase future-oriented solutions.

This year's event featured around 150 exhibitors, with nearly half of them from China. The program also included fashion shows, thematic forums, panel discussions and industry talks.

Addressing the opening ceremony, Chinese Consul-General in Cape Town Ren Faqiang said South Africa is China's largest trading partner in Africa, while China has remained South Africa's largest trading partner for 17 consecutive years, with bilateral trade reaching $53.58 billion in 2025.

"The textile industry is a traditional area of China-South Africa economic cooperation, and also a key sector for industrial capacity coordination and market connectivity between the two sides," Ren said.

He added that China's zero-tariff policy for 53 African countries, including South Africa, took effect on May 1, covering South African-grown cotton, textile raw materials and other related products.

"This policy will substantially cut export costs for South African textile and garment manufacturers, expand their access to the Chinese market, unleash greater trade momentum, and inject robust impetus into China-Africa trade, investment, cooperation and Africa's development," Ren added.

One of the exhibitors, Ziev Shani, a young South African entrepreneur who is fluent in Chinese and runs a local company that sources products from China, provides private-label manufacturing services for South African businesses and helps connect companies from the two countries.

People visit the booth of a Chinese exhibitor at the China Premium Textile South Africa and Allfashion Sourcing 2026 expo in Cape Town, South Africa, on July 14. WANG LEI / XINHUA

Shani said he has worked with Chinese companies for five years, while his family's business ties with China date back to his father's generation.

"I believe that there are excellent prospects for Chinese companies and South African companies to work together for a win-win situation. There should be good collaboration, good partnership and just growth and prosperity for two great countries," he added.

Among the Chinese exhibitors, Hangzhou Golden Shell Import and Export participated in the event for the fourth time. Having cultivated the South African textile market for more than a decade, the company has continued to strengthen its local presence, underscoring its long-term confidence in the African market.

General Manager Chen Fangli said she is optimistic about the future of China-South Africa and China-Africa economic and trade cooperation. Supported by favorable policies and industrial upgrading, she believes Chinese textile enterprises, backed by integrated industrial chains, advanced manufacturing equipment and strong innovation capabilities, will further expand cooperation with South African partners.

"We have established a company in Cape Town and are exploring the possibility of setting up a factory in Durban. We hope to use South Africa as a base to gradually expand into the broader African market," Chen added.

Wang Lihong, general manager of first-time exhibitor Zhejiang Huida Textile and Garment, told Xinhua News Agency that she spent the morning of the opening day meeting potential clients and reached preliminary cooperation agreements with three South African companies, strengthening her confidence in expanding into both the South African and broader African markets.

Wang said Chinese textile manufacturers have long outgrown the stereotype of competing solely on low prices.

"People overseas used to associate Chinese products with good quality at low prices. Today, however, our competitiveness comes not only from affordability, but, more importantly, from reliable product quality and continuous innovation, which will create broad opportunities for development in South Africa and across Africa," Wang said.

Safety risks at the workplace under scrutiny

SPP urges businesses to fulfill their primary responsibility in campaigns

By YANG ZEKUN
yangzekun@chinadaily.com.cn

Chinese prosecutors approved the arrests of 4,181 people and prosecuted 16,648 others for crimes endangering workplace safety from January 2023 to June 2026, the Supreme People's Procuratorate said on Tuesday.

Although China's workplace safety situation has remained generally stable and continues to improve, risks persist in some industries, the SPP said.

Traditional high-risk sectors, including mining, hazardous chemicals, transportation and construction, remain vulnerable to major accidents. Some companies continue to prioritize production over safety, while increasingly complex working conditions make risks more difficult to control.

Prosecutors have also identified inadequate oversight of equipment and safety facilities as a major concern. Investigations have uncovered expired equipment, missing protective devices and faulty safety systems in many cases.

Fire hazards remain prominent at small businesses and public venues, including restaurants, hotels, workshops and entertainment facilities. Such premises are numerous and often located in urban villages, old town areas and rural communities, making regulatory oversight more challenging.

Unsafe electrical wiring, indoor charging of electric bicycles, aging gas hoses and improper storage of gas cylinders are among the major risks. Many accidents occur at night, with toxic smoke inhalation being a leading cause of death.

Meanwhile, new risks are emerging in sectors such as new energy, energy storage and urban gas, where rapid expansion has outpaced the development of some safety standards and risk-control measures.

The SPP cited several major cases to illustrate the consequences of safety violations.

The February 2023 collapse at the Xinjing coal mine in Alshaa League of the Inner Mongolia autonomous region was caused by operations that violated the approved mining design. The mine improperly combined excavation levels, creating an excessively high and steep slope that eventually collapsed, killing 53 people and injuring six.

At a Yellow River bridge construction site in Qinghai province, substandard materials and bolts were used in a supporting structure, while safety supervision was absent during high-risk nighttime operations. Part of the project collapsed in August 2025, killing 13 people with three still unaccounted for.

A gas explosion at a barbecue restaurant in Yinchuan, Ningxia Hui autonomous region, in June 2023 was caused by an employee improperly removing a pressure regulator, resulting in a large liquefied petroleum gas leak. The blast killed 31 people and injured seven.

The SPP said prosecutors have maintained a tough stance on workplace safety crimes by directly supervising several major cases, while local procuratorates have prosecuted those responsible.

During the reporting period, prosecutors supervised the filing of 791 cases involving 881 people and pursued the arrest or prosecution of 534 suspects who had initially been omitted from investigations. They also recommended that administrative authorities transfer 872 suspected criminal cases for prosecution and filed 78 protests against court judgments involving errors in conviction or sentencing.

In addition, procuratorates have issued recommendations to address safety risks and regulatory gaps identified during investigations. They will strengthen coordination between administrative and criminal enforcement, make better use of public interest litigation and work with relevant authorities on targeted workplace safety campaigns.

The SPP also urged businesses to fulfill their primary responsibility for workplace safety by closely monitoring equipment, electrical wiring, hazardous chemicals, working environments and emergency exits.

Taiwan urged to lift mainland product restrictions

By LI SHANGYI
lishangyi@chinadaily.com.cn

As the Chinese mainland's motorcycle brand ZXMOTO went viral in Taiwan, a mainland spokeswoman urged the Democratic Progressive Party authorities on Wednesday to heed public opinion and remove restrictions on mainland products.

Zhang Han, a spokeswoman for the Taiwan Affairs Office of the State Council, said at a regular news conference that the mainland has always maintained a positive and open attitude toward cross-Strait economic and trade cooperation.

"It is the DPP authorities that are restricting and obstructing the entry of high-quality mainland products into Taiwan," she said.

As ZXMOTO motorcycles continue to deliver strong performances in professional competitions worldwide, they are attracting growing interest in Taiwan, where motorcycle culture is deeply rooted.

Zhang Xue, founder of ZXMOTO, said in a recent interview with United Daily News that he hopes to open stores in Taiwan next year. In response, the island's economic affairs department said that, under current customs import tariff regulations, complete motorcycles manufactured on the mainland are classified as "mainland goods prohibited from import" and therefore cannot be imported into Taiwan. The list of prohibited goods includes about 2,500 mainland goods, covering automobiles, motorcycles, agricultural products, metals and textiles.

Zhang Han criticized the DPP authorities for clinging to their separatist "Taiwan independence" stance, saying they have intensified discriminatory trade restrictions on the mainland, erected increasing barriers and undermined normal cross-Strait economic and trade exchanges and cooperation. Taiwan's traditional industries and small and medium-sized enterprises have long expressed dissatisfaction with such policies, she added.

She urged the DPP authorities to remove unreasonable restrictions as soon as possible and take concrete steps that serve the interests of the people of Taiwan.

"We are pleased to see Taiwan compatriots using high-quality products from the mainland and sharing in the development achievements of Chinese modernization," she said.

Turning to broader cross-Strait trade, Zhang dismissed claims by the island's authorities that Taiwan has reduced its reliance on the mainland market.

On July 15, Cho Jung-tai, head of the island's executive body, claimed that Taiwan has reduced its past reliance on the "single Chinese market" and shifted its focus toward Europe, the United States and countries covered by its "new southbound policy".

In response, Zhang said trade figures demonstrate that the industrial structures on both sides of the Taiwan Strait are highly complementary and offer broad prospects for cooperation.

According to statistics from the General Administration of Customs, cross-Strait trade reached $185 billion in the first half of 2026. The mainland imported $133.1 billion worth of goods from Taiwan, up 22.5 percent year-on-year, while exports to Taiwan totaled $51.9 billion, up 32.9 percent year-on-year.

She said strengthening cross-Strait economic and trade cooperation and deepening integrated development across the Strait serve the common interests of people and businesses on both sides and are the natural outcome of economic laws and market principles.

Describing cross-Strait cooperation as an unstoppable trend, Zhang criticized the DPP authorities for pursuing "Taiwan independence" by relying on external forces. She accused them of allowing external forces to hollow out Taiwan's competitive industries.

"Such actions are nothing less than harming Taiwan and bringing disaster to the island," she said.

She also referred to Taiwan Semiconductor Manufacturing Company's recent announcement of an additional $100 billion investment in facilities in Arizona, which has fueled concerns in Taiwan that the company is effectively becoming a US company.

Zhang said the DPP authorities' strategy of seeking "Taiwan independence" by relying on the US and "selling out Taiwan by kowtowing to the US" is the primary cause of the damage to Taiwan's economy and the gradual erosion of the island's competitive advantages.

First private rocket launched from East China Sea

By ZHAO LEI
zhaolei@chinadaily.com.cn

Orienspace, a private Chinese rocket maker, conducted the third flight of its Gravity 1 carrier rocket on Wednesday morning, marking the first time a private Chinese rocket has lifted off from the East China Sea.

The 30-meter-tall rocket blasted off at 10:54 am from a launch service ship off the coast of Shanghai and soon placed its payloads — nine satellites and one experimental device — into their preset orbits.

The mission marked the first launch by a private Chinese rocket from the East China Sea and the closest space launch to Shanghai to date.

Before the mission, the only rocket launch from the East China Sea took place in April 2022, when the State-owned China Aerospace Science and Technology Corp used a Long March 11 rocket to deploy five Earth-observation satellites.

405 metric tons
The liftoff weight of the Gravity 1 carrier rocket by Orienspace

In a statement, Orienspace said that the mission set a new national record for the combined payload weight delivered into orbit by a Chinese private rocket, but declined to disclose the exact figure, citing commercial confidentiality.

Founded in 2020 by a group of veteran researchers from State-owned space enterprises, Orienspace developed the Gravity 1 as a three-stage solid-propellant rocket with four side boosters. All of its engines are equipped with flexible swinging nozzles for attitude control.

With a liftoff weight of 405 metric tons and a liftoff thrust of 600 tons, the rocket is capable of sending payloads weighing up to 6.5 tons into low-Earth orbit or 4.2 tons into a typical sun-synchronous orbit at an altitude of 500 kilometers, according to the company.

Gravity 1 is currently the world's largest and most powerful solid-propellant launch vehicle, as well as the most capable rocket developed by a Chinese private space company.

Its liftoff weight and thrust surpass those of the European Space Agency's Vega-C, which was previously the world's most powerful solid-propellant rocket.

Gravity 1 is also the first and currently the only privately developed Chinese rocket equipped with side boosters. In addition, it has the largest payload fairing — the nose cone that houses satellites or other payloads — among China's private carrier rockets.

The rocket made its maiden flight from the Yellow Sea in January 2024, launching from a sea-based platform off the coast of Haiyang, Shandong province. The mission made Orienspace the fifth private Chinese company to successfully launch its own carrier rocket, following i-Space, Galactic Energy, Space Pioneer and LandSpace.

Its second flight took place from the same launch site in the Yellow Sea in October 2025.

Six of the nine satellites launched on Wednesday were jointly developed by Beijing MinoSpace Technology, a private satellite manufacturer, and Huantian Wisdom, a State-owned satellite operator based in Sichuan province.

The six satellites will join two previously launched optical satellites and two synthetic aperture radar satellites to form the Huantian Constellation, comprising four optical satellites and six radar satellites.

According to Beijing MinoSpace Technology, the expanded constellation will significantly improve data acquisition efficiency and spatial coverage, supporting remote-sensing applications across Southwest China in fields including land surveying and mapping, emergency response, agriculture, forestry and water conservancy.

Last surviving female Long March veteran dies at 105

By ZOU SHUO
zoushuo@chinadaily.com.cn

Wang Quanying, the country's last surviving female Red Army soldier who took part in the legendary Long March, died peacefully in her sleep at 12:30 am on Wednesday at her home in Dujiangyan, Sichuan province. She was 105.

Multiple Chinese media outlets confirmed her death.

According to her family, Wang died without suffering, surrounded by her daughters and grandchildren. She had remained in generally good health after turning 105 earlier this month. However, she developed lung inflammation, progressive muscle atrophy, shortness of breath and difficulty expectorating in early July and was hospitalized on July 18. Her physical functions gradually declined until her passing.

Wang Quanying

Born in 1921 into a poor Tibetan family in Jinchuan county, Aba Tibetan and Qiang autonomous prefecture, Sichuan province, Wang endured a difficult childhood. She lost her parents at the age of 1 and was raised by her uncle until she was 5. She then worked as a child laborer for a local landlord, doing heavy farm and household work.

At the age of 14, she was deeply inspired by the disciplined and people-oriented conduct of Red Army soldiers after they arrived in Jinchuan in 1935. She volunteered to join the troops, undertaking logistical and medical duties, including guiding marches, cooking, transporting grain and caring for wounded soldiers during the Long March.

In March 1936, Wang became separated from the main force during fierce battles against Kuomintang troops in Danba county. Stranded with injured comrades, she tried to rejoin the troops by crossing snowcapped mountains barefoot and surviving on wild plants in freezing temperatures.

The ordeal left one toe on her left foot severely frostbitten, leading to its eventual amputation, causing her pain on rainy days for the rest of her life.

After wandering for more than a month, she settled anonymously in Wenchuan county in May 1936. For decades, she never spoke publicly about her experiences during the Long March. She married local resident Liu Fuguang and gave birth to five children, though only two daughters survived the harsh living conditions of the time.

Following the founding of the People's Republic of China, she changed her given name from Guixiang to Quanying, expressing her belief that "all Red Army soldiers across the nation are heroes". She was officially recognized as a Red Army veteran during a provincial verification campaign in the 1980s.

Even in her later years, Wang remained committed to preserving and promoting the spirit of the Long March. Until May this year, she continued weaving handcrafted futon cushions and donating them to local schools and red education bases.

Not long ago, officers and soldiers from a company of the PLA Ground Force visited Wang at her home, according to China Central Television. The centenarian changed into a Red Army uniform to greet them.

She admired one soldier's military cap and asked with a smile, "May I put it on? Does it suit me?"

"You look wonderful!" the soldiers replied.

When they unfolded the company flag, Wang's eyes filled with tears. She gently stroked the fabric as though reliving the turbulent years of war. She then slowly raised her hand and offered a solemn military salute to the flag.

Liu Guihua, Wang's eldest daughter, paid tribute to her mother on WeChat Moments, writing: "A heroic female soldier who crossed snowcapped mountains during the Long March; she concealed her achievements and remained true to her original aspiration throughout her life."

According to her family, Wang's only regret would have been that she did not live to see the 90th anniversary of the victory of the Long March, which falls later this year. In accordance with her final wish, her remains will be buried in Wenchuan county, where she settled decades ago.

POLICY REVIEW

From being a 'fallback' to first choice

Economic and societal shifts fuel growing demand for vocational education places

By JI HAISHENG
jihaisheng@chinadaily.com.cn

SHI YU / CHINA DAILY

In the early hours of May 10, parents joined long lines outside Beijing Changping Vocational School, with some even arriving the day before, eager to secure an enrollment interview slot for their children. By the afternoon, the school issued a notice declaring that admissions slots were already full — days ahead of schedule.

One parent who had camped out for hours said that if his 15-year-old son learns industrial robotics, he'll have a job waiting for him before he even graduates.

Across China, secondary and higher vocational institutions in manufacturing hubs like Shandong and Guangdong provinces are reporting unprecedented application surges, outstripping available spots.

The intense interest in vocational tracks reflects a shifting economic reality. As China's higher education system produces a record number of university graduates each year, the traditional white-collar job market faces friction. Desk jobs in tech, finance and administration have become fiercely competitive, leaving many young degree-holders underemployed. At the same time, China's push toward high-end manufacturing, robotics and artificial intelligence has created a shortage of skilled technicians.

"The surging popularity of vocational schools in recent years signals a fundamental shift in how Chinese society views skills-based education," said Wang Heye, founder of Beijing-based Liangyou Education, a consultancy specializing in vocational education.

For years, vocational education was often seen as a fallback option for underperforming students, but nowadays it is increasingly viewed as a viable and promising pathway to a successful career, Wang said, noting that he has witnessed the change firsthand.

He attributed the turnaround to a combination of robust policy support, industrial development, market demand for high-skilled talents, bright prospects for further education and jobs, and evolving public attitudes.

According to a 2025 report released by the Ministry of Education earlier this month, China has some 8,382 vocational institutions, including 6,741 secondary vocational schools, 1,554 vocational colleges and 87 vocational undergraduate universities. The total number of students enrolled in vocational institutions reached 29.37 million, the report said.

In late June, the State Council, China's Cabinet, released an outline plan for the development of the education sector during the 15th Five-Year Plan (2026-30), which made building a modern vocational education system a key priority.

The plan underscores the need to build more high-level vocational schools and programs to cultivate large numbers of high-skilled talents. Specifically, it aims to establish around 60 high-level higher vocational institutions and 160 high-level program clusters, with continuous efforts aligned with key industrial chains, the intelligent economy, and international economic and trade cooperation.

Li Chunqin, vice-principal of Rizhao City Science and Technology School in Shandong province, said that the policy document marks a pivotal transition for vocational education in China, signaling a new era where quality takes precedence over sheer scale.

"Rather than merely pursuing enrollment and program numbers, vocational schools should now focus on improving their educational capabilities and forging solid industry-education integration," Li said. He urged vocational schools to carve out their own niches and strengthen their core advantages.

For students, Li said the plan promises a more flexible and robust growth trajectory, as it advocates for seamless pathways connecting secondary vocational schools with vocational colleges and universities. Noting that his school enrolls nearly 1,000 students each year in its five-year secondary-to-higher vocational programs, he said that secondary vocational education, once seen as "a dead end", has now become "an expressway" for talent cultivation.

Li said he also sees the plan as a crucial step for promoting balanced resource distribution and serving local economies and regional industrial development, highlighting its push to channel higher vocational education resources to counties and smaller cities.

"High-quality vocational resources have long been concentrated in major cities, leaving a structural gap between the demand and supply of skilled talent at the county level," he said. "Bringing those resources down to counties will offer students access to quality vocational education at their doorstep and provide local businesses with talent nearby."

Zhou Zhemin, director of the Academic Affairs Office at Hunan Industry Polytechnic in Hunan's provincial capital Changsha, said the plan's call to steadily increase the number of vocational undergraduate institutions and expand enrollment will help forge a better-structured vocational education system.

Zhou dismissed concerns that expanding vocational undergraduate education would squeeze out vocational colleges, noting that the two have distinctly different training objectives. Vocational colleges focus on cultivating practical talents who can solve on-the-ground problems, while vocational undergraduate programs aim to produce technical and skilled professionals with innovation capabilities, he said.

"Over the next five years, vocational education is set for a deep overhaul in how we cultivate talent — shifting from teaching what schools have to teaching what the industry demands," he said.

Emphasizing deeper integration between vocational education and industrial needs, the outline plan sets out concrete measures, such as building around 100 industry-education alliances in various cities and about 20 national industry-education communities focused on specific industries, with support pledged to set up more training bases and centers and to upgrade training facilities.

Peng Fang, deputy general manager of China Construction Steel Structure Testing Technology Co, said many people used to assume that industry-education integration simply meant students doing a six-month internship before graduation, or agreements signed between schools and enterprises. "Such superficial collaboration can no longer meet the demands of today's industries," she said.

Peng added that schools used to design their programs and courses behind closed doors, while enterprises struggled to find qualified and capable talent. "Companies often receive graduates with little practical experience and have to invest heavily in training them from scratch," she said.

"Industry-education integration is not just about internships. It requires a systemic, whole-chain restructuring covering program design, curriculum reform, faculty deployment and training arrangements," Peng said.

Liu Dingding, deputy head of the industry-education integration department at Beijing Freedo Technology Co, said that the outline plan sets out concrete, measurable targets for boosting such integration, calling for solid progress.

Liu said his team acts as a bridge between schools and enterprises, filling gaps between talent cultivation programs and real needs. His team has launched integrated training programs and helped shorten the onboarding period for graduates at enterprises from six months to just two months, he added.

Over the past five years, Liu said he has witnessed visible changes in the depth of school-enterprise cooperation — from signing agreements and donating equipment, to jointly developing curricula and training programs, as well as offering classes tailored to enterprises' specific demands.

This marks an ever-deepening collaboration, Liu said, adding that policy support has made industry-education integration a key pillar of vocational education.

Policy Digest

Domestic service industry to be made more standardized

The Ministry of Commerce, together with eight other government departments, has unveiled a package of policy measures to promote the high-quality development of the domestic service industry.

The 19-measure policy aims to drive the standardized, professionalized and industrialized development of the sector, so as to better leverage its role in boosting consumption, improving people's livelihoods and stabilizing employment.

The measures cover five key areas concerning support for enterprises, pioneering practices, vocational skills training, credit information management and fundamental underpinnings.

In terms of enhanced policy support, the measures back domestic service providers in innovating service models, exploring smart service scenarios and expanding home-based elderly care and childcare services, with an aim to foster a group of leading brands in the sector.

The policy also calls for clearly defining the rights and obligations of domestic service enterprises, online platforms and domestic service practitioners.

According to corporate information provider Qichacha, China is home to more than 3 million registered domestic service enterprises.

Departure tax refund services to go paperless for travelers

China has rolled out more measures to deliver smarter, more streamlined departure tax refund services for overseas visitors shopping in China, according to a notice issued by the State Taxation Administration.

The notice said the STA is pushing forward the intelligent upgrade of departure tax refund services by rolling out fully paperless processing, under which electronic data of refund applications and sales invoices are transmitted online.

In addition, the STA is promoting pilot programs for tax refunds to eligible overseas tourists who shop at online stores and advocates for cross-regional mutual recognition of the "refund-upon-purchase" scheme, the policy document said.

A nationally unified tax refund service code will be rolled out, enabling tourists to enter information, track processing progress, and check reimbursement status simply by scanning a QR code, the notice said.

Meanwhile, tax authorities will strengthen risk prevention and control to crack down on illegal activities including fraudulent proxy purchasing and the smuggling of tax-refunded goods back into the domestic market.

College graduates called up to serve in grassroots posts

Nine central authorities led by the Ministry of Human Resources and Social Security have launched the fifth round of one of China's major grassroots service programs to engage more university and college graduates to work at the grassroots level.

According to the implementation plan, 36,400 graduates will be recruited every year from 2026 to 2030 to serve at the grassroots level in education, agriculture, medical care and rural vitalization. Each service term lasts two years.

First introduced in 2006, the Sanzhi Yifu — or "three supports and one assistance" — program runs on a five-year cycle. The previous four rounds have mobilized a total of 640,000 college graduates to serve community-level posts across the country.

Over the years, the program has effectively optimized grassroots talent structure, bolstered local economic development, and enhanced grassroots social governance capacity.

CHINA DAILY

AI integration, digital twins revolutionize classroom learning

By JI HAISHENG

At Jilin Polytechnic of Water Resources and Electric Engineering, students wearing virtual reality headsets stand before a digital twin of a massive dam. With a flick of their fingers, they unleash a simulated flood — water cascades down the valley, alarms flash, and the pressure feels almost real.

As sensors flicker, an artificial intelligence-powered system scores every decision they make in real time. The feedback is instant: adjust the sluice gate, optimize the discharge curve, try again.

What once took months of on-site training and carried significant safety risks can now be practiced repeatedly in a digital twin environment — a digital replica of a physical object or system.

"Now, students usually practice in digital twin environments before moving to on-site operations. This efficient and cost-effective approach has significantly improved their proficiency, allowing them to master such skills three to four times faster than before," said Liu Dingding, deputy head of the industry-education integration department at Beijing Freedo Technology Co, a digital twin and spatial intelligence company.

Liu's team has helped establish numerous digital twin platforms across sectors such as electric power, water conservancy, transportation and energy. He said that digital twins are rewriting the rules of vocational training, predicting a future where 70 percent of a training program will be virtual and only 30 percent hands-on.

Liu said that with the rise of advanced technologies like digital twins and AI, there will be strong demand for talent in related fields.

"Vocational schools now have a window of opportunity to cultivate professionals such as AI prompt engineers, digital twin scenario designers, and specialists in intelligent equipment maintenance and spatial intelligence applications," he said.

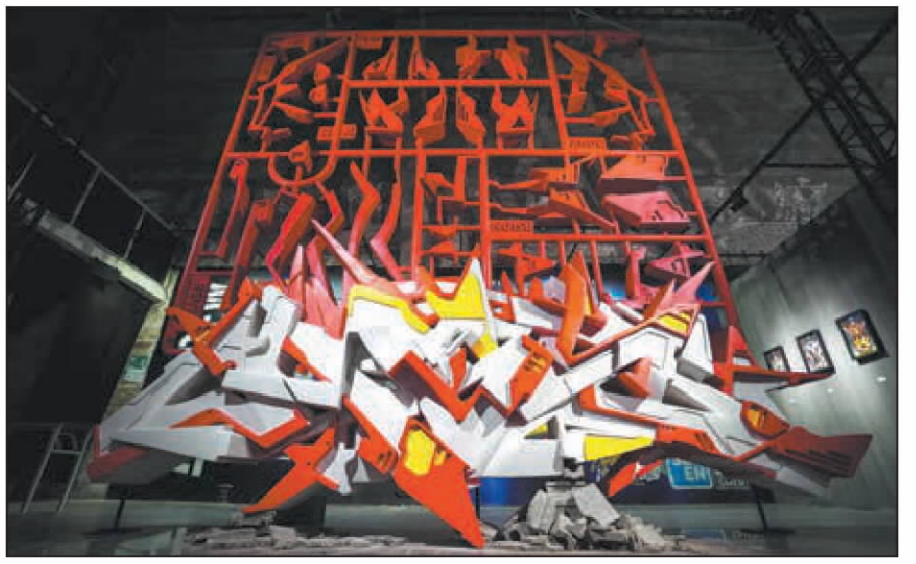
He called on vocational schools to seize these new directions during the transition period by setting up new majors and training programs.

In April, five ministries, including the Ministry of Education, jointly issued the "AI Plus Education" action plan, calling for full integration of intelligent technologies across all aspects of education. In July, the ministry added 27 new vocational majors, including embodied intelligence computing and humanoid robot engineering.

"The policy message is clear — AI integration into vocational education is no longer an 'elective' but a 'required course'," said Zhou Zhemin, director of the Academic Affairs Office at Hunan Industry Polytechnic in Changsha, Hunan province.

Zhou described the impact of AI and other advanced technologies on vocational education as "disruptive", saying they are redefining what vocational institutions should aim for. "In the past, vocational students were trained to be operators who could follow instructions and perform repetitive tasks. But AI is taking over precisely those tasks," he said.

According to a McKinsey & Company report, the rise of generative AI is propelling the era of automation to arrive a decade earlier than anticipated. In China, around 50 percent of work activities are projected to be automated before 2030, and about 200 million workers — equivalent to 30 percent of China's total workforce — will need to reskill or upskill, the report said.



Despite the overwhelming impact of AI, Chinese vocational institutions should not steer students away from it — instead, they should equip students to harness it, Zhou said.

For these institutions, it is imperative to shift focus to cultivating versatile technical talents with hands-on experience, innovation capabilities and AI expertise, he added.

LIFE

Straight Build A-01, a large-scale graffiti sculpture created by Xu Yan and Ye Shu in 2022 for an exhibition in Beijing, using fiberglass and spray paint. PHOTOS PROVIDED TO CHINA DAILY

Bending the structural rules

Graffiti artist balances street writing with traditional calligraphy in his newly released Chinese typeface, in which he sees a future in cultural collaborations, **Li Yingxue** reports.

When a broad-edged marker touches a surface, a Chinese character begins to move beyond the familiar order of horizontal and vertical strokes.

As a dip pen moves, the line sharply shifts between thick and thin. Each turn carries the energy of street graffiti while echoing the precision and ornamentation of Gothic calligraphy.

The traditional Chinese character *fa*, meaning "to prosper" or "to flourish", appears bold and forceful while remaining unmistakably Chinese. It seems to have grown out of traditional calligraphy while retaining the visual intensity of street art.

This fusion of writing traditions lies at the heart of ABS Street Ink, a newly released Chinese typeface by graffiti artist Xu Yan, who blends Gothic calligraphy with the visual language of street graffiti.

Built on the use of broad-edged markers and flat-nib dip pens, the typeface gives Chinese characters a strong sense of movement and tension without sacrificing legibility. It also represents an exploration of how Western lettering traditions can be adapted to the structural logic of Chinese characters.

Xu, 38, is a co-founder of ABS Crew and an early practitioner of graffiti in China. He first encountered graffiti in 2005 while in high school, when the art form remained a niche culture largely introduced through foreign documentaries, magazines and hip-hop culture.

Xu and his classmates began writing their names on walls near their school. For them, graffiti was not simply drawing but a way of expressing identity through writing.

"The simplest way to describe graffiti is writing your own name," Xu says. "In essence, it is writing — and making that writing visually appealing."

Graffiti artists often call themselves "writers", emphasizing the construction of letterforms and personal style. This understanding connected naturally with Xu's childhood training in Chinese calligraphy.

He began practicing brush calligraphy in primary school and later studied printmaking at the Xi'an Academy of Fine Arts and public art at the Beijing Institute of Fashion Technology. In 2011, Xu and his team won both the China and Asia championships at Wall Lords, an international graffiti competition in Asia, and ABS Crew later became involved in street art projects and commercial collaborations.

Between thick and thin

The origins of ABS Street Ink can be found not only on city walls but also at the calligraphy desk.

Xu has long been fascinated by Gothic calligraphy, a Western lettering tradition known for angular structures, dense compositions and decorative forms. Written with broad-edged pens, Gothic script creates dramatic contrasts between thick and thin strokes.

Graffiti tools, including broad markers and wide brushes, share similar qualities. Their flat edges allow artists to vary stroke width through changes in angle and direction.

"I use dip pens and flat nibs," Xu says. "The nib is like a thin piece of metal. Its flat shape naturally creates a strong contrast between thick and thin strokes."

This similarity led him to consider whether Gothic writing techniques could be adapted to Chinese characters.

His first experiments date back to 2012, when he explored Gothic-inspired Chinese lettering in his graduation work. Years later, after connecting with FounderType, the idea developed into a complete typeface project.

Xu was already known for his Gothic-inspired "*Gong Xi Fa Cai*" (meaning, wish you good fortune) lettering, which appeared on hats, footwear, scarves, mahjong sets, and enamel cookware, including collaborations with brands such as Nike.

But that project involved only a few characters. ABS Street Ink required thousands of Chinese glyphs.

Xu created each glyph on a digital tablet, adjusting brush settings to reproduce the marks of a flat nib while preserving the rhythm of handwriting.

"Each character was written directly in one go, rather than created by drawing an outline and filling it in," he says. "Every stroke came from the act of writing."

The biggest challenge was consistency. Chinese characters vary greatly in complexity, and Xu had to ensure that thousands of glyphs formed a unified system — with simple characters not appearing too empty and complex ones remaining clear.

For more than a year, he wrote roughly 10 characters a day and repeatedly revised earlier work.

Typeface designer Xing Hangke says the project demonstrates the difference between creating individual lettering pieces and building a functional typeface.

"A poster or logo can bend structural rules for a particular visual effect," Xing says. "A typeface must remain consistent and recognizable when thousands of characters are entered, combined, and used in different contexts."

Xing compares professional type designers to dancers in shackles, creating to their will within strict constraints.

A distinctive stroke may work well in the first few dozen glyphs but later create problems among similar characters. Designers must constantly adjust forms to maintain the overall system.

"In the end, you have to follow its rules," Xing says. "Some artistic expression will inevitably have to be reduced."

For Xing, ABS Street Ink succeeds because it avoids becoming either loose graffiti lettering or a simple imitation of Gothic script.

"It uses Gothic structure as the skeleton and graffiti strokes as the surface," he says.

Sharing a sense of flow

Adapting Gothic calligraphy to Chinese writing involves more than adding Western decoration.

Chinese characters have their own internal architecture, including structural balance, spatial relationships and the distribution of empty space. Excessive ornamentation can damage recognition.

"Western audiences may not understand the Chinese characters, but they can still recognize the Gothic style," Xu says.

He previously participated in a calligraphy exchange connecting Beijing and Berlin, in which artists wrote together via live projections. Even without understanding the content, participants could sense the rhythm and energy of the writing.

In graffiti culture, this quality is called "flow". In Chinese calligraphy, it resembles the continuous movement that carries the brush's energy from one stroke to the next.

For Xu, this shared sense of movement connects the two traditions. Graffiti may be associated with rebellion and freestyle, but at its core is the creation of a distinctive personal writing style. Chinese calligraphy likewise reflects the personality and rhythm of the writer.

One evolved on paper; the other found its expression on walls and in public spaces.

ABS Street Ink is designed for visually driven applications rather than long passages of text. Xing expects it to appear in fashion branding, music festivals, posters, street culture packaging, film and television titles, esports, and digital media.

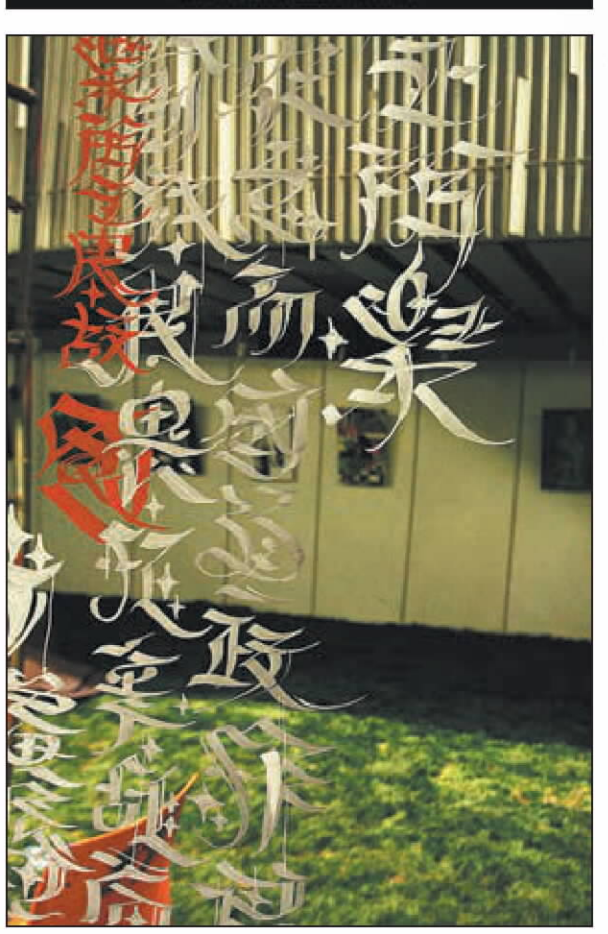
In these contexts, typography is not meant to disappear. Instead, it establishes visual identity and emotional tone.

"The fact that this typeface serves a niche audience is precisely what can make it central to a particular field," Xing says.

Common Chinese text typefaces, including Song-style and sans-serif designs, dominate long-form reading because they allow readers to focus on information rather than form. Display typefaces like ABS Street Ink serve a different purpose: to attract attention and carry cultural meaning.

Xing describes the project as "type design driven by graphic thinking": a typeface with the visual impact of an image while remaining a functional writing system.

Chinese type design is increasingly developing at the intersection of culture, technology and visual experimentation.



AI tools, automated font-generation systems and variable fonts are changing production methods, but Xing believes technology alone cannot determine the lasting value of a typeface.

"Technology defines the floor, while culture defines the ceiling," Xing says.

"I hope to see more people using it, rather than limiting it to the way I use it," Xu says. For him, a typeface is complete only when it leaves the designer's hands and enters wider circulation — appearing on posters, packaging and screens, where it continues to develop new meanings in different cultural contexts.

Books find new home at mobile library in Myanmar

YANGON — Students eagerly browse bookshelves filled with 536 titles on Chinese culture, literature, science, technology, and storybooks as a newly launched mobile library launched on Saturday at Bowen Chinese School in Yangon, Myanmar.

The initiative, launched by the China Cultural Center in Yangon, marks the first step in a program that will later expand to other Chinese schools and relevant organizations nationwide, according to the center.

For 18-year-old Yoon Mi Mi Kyaw, the mobile library offers an opportunity to strengthen her Chinese language skills while learning more about the culture.

"We can learn about Chinese culture and society through books without even visiting China," she says.

"Since we are learning Chinese, having these books at our school creates a Chinese-language environment and helps us stay connected with the language," she adds.

"As a student attending Myanmar, English and Chinese schools, finding time to visit a library has always been difficult," she says. "Now we don't have to spend extra time going to a library because we can study Chinese and enjoy reading at school."

> "Reading a physical book gives a different feeling. The library provides a peaceful environment where I can concentrate better."
>
> **Aye Myat Thiri,** 17-year-old student

Seventeen-year-old Myat Yati, who prefers reading novels, says the mobile library has given her access to a wider variety of books.

"I usually read storybooks at home, but now I can read at our school," she says. "I'm excited to learn about different cultures through books."

Another student, 17-year-old Aye Myat Thiri, says she prefers reading print books to reading on a mobile phone.

"Reading a physical book gives a different feeling," she says. "The library provides a peaceful environment where I can concentrate better," she adds.

Cho Cho Myint, principal of Bowen Chinese School, welcomed the initiative, saying it would save students time while encouraging reading.

"Our students no longer need to visit a separate library," she says. "There are many types of books here, so they can choose what they like to read and learn."

The mobile library is not only a collection of books but also a bridge connecting them with new knowledge, languages and cultures, she says.

The initiative aims to help students learn more about Chinese culture and literature beyond the classroom while fostering a stronger reading culture, says Han Jiajun, director of the China Cultural Center in Yangon.

"The books will be replaced every six months so students can continue exploring new reading materials," he says, adding that the mobile library will also be open to people learning Chinese outside the school.

He hopes that the mobile library will encourage students to develop stronger reading habits, improve their Chinese language skills, and achieve better academic results.

LIFE

Landscapes from the top

In Xizang's 'miniature Earth', a nature station-turned-micro-museum transforms a quick stop into a nine-zone ecological journey, **Yang Feiyue** reports.

The warm, humid monsoon winds that sweep up from the Indian Ocean don't stop at the Himalayas. They find their way through the Yarlung Zangbo Grand Canyon, the world's deepest gorge, and pour into the mountains of the southeastern part of the Xizang autonomous region.

They leave behind an extraordinary landscape that compresses several climate zones into just a few dozen kilometers of horizontal distance.

From the tropical monsoon rainforest of Metog county at 155 meters above sea level to the permanent snows of Namcha Barwa Peak at 7,782 meters, the region known as Nyingchi contains nine significant altitudinal natural zones — a "miniature Earth" that has drawn biologists and explorers for decades.

Recently, a new visitor attraction, a nature station, opened in Gongbo Park in the heart of Nyingchi. It debuted at the fifth China Xizang Trans-Himalaya Forum for International Cooperation and attracted instant attention from guests from more than 20 countries. Developed by the Chinese National Geography, the Nyingchi nature station aims to help visitors understand the landscape before them.

Step inside, and a 3D-printed topographic map of the Yarlung Zangbo Grand Canyon reaches waist height. Press a button, and its rivers glow blue. Pull open a drawer beside it, and you'll find profiles of the region's great peaks: the 7,782-meter Namcha Barwa, the eastern anchor of the Himalayas, and its neighbor Gyala Peri.

Elsewhere, visitors can spin a cylinder to watch the Asiatic golden cat transform through five color morphs. Nearby, a button triggers birdcalls that move through the forest in a "bird wave" — yellow-throated fulvettas and other birds, each playing a role as callers, followers or lookouts.

Climbing the stairs to the second floor feels like ascending 4,800 meters in elevation, from tropical monsoon rainforest to alpine scree. At the top, a viewing window frames a snowy mountain.

Guo Yingqian, general manager of the Chinese National Geography Camp, describes the station as a kind of micro-museum in nature.

"Traditional stations were places to rest," she explains. "Tourist centers are reception and display buildings for scenic areas. Our nature station resembles a compact, open structure that uses interactive installations and scientific exhibits to interpret the local natural ecology and cultural stories."

The Nyingchi station is designed as an urban installation that systematically interprets the concept of an ecological community encompassing mountains, rivers, forests, farmlands, lakes, grasslands, deserts, and glaciers.

The camp team plans to divide China into roughly 50 unique geographic units based on six natural zones and eight ecosystems, and establish nature stations or centers in each.

"Nyingchi is in southeastern Xizang and has the world's most complete natural mountain vertical zones," Guo says. "The landscapes are extremely dramatic — Namcha Barwa and the Yarlung Zangbo Grand Canyon — and it's also one of the world's biodiversity hotspots. It really captures the diversity we're trying to showcase," she explains.

The station's 26 interactive exhibits follow a simple but powerful idea: a vertical ascent.

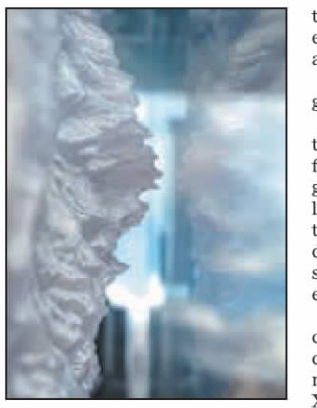
The ground level, surrounded by exhibits on Mountain, Water, and Forest elements, aims to present Nyingchi's ecological foundation.

A hand-drawn map shows how the collision of the Indian and Eurasian plates 65 million years ago created the Yarlung Zangbo suture zone, making Nyingchi one of the planet's most geologically active mountain regions.

The staircase connecting the two floors is itself an exhibit. As visitors ascend, they pass through representations of each vertical zone — from tropical monsoon rainforest below 1,100 meters to alpine scree at 4,800 meters, with animal silhouettes and interactive photo points marking each transition.

The second floor shifts focus to Farmland, Grassland, Lake, Glacier, and Sand, along with the human and ecological relationships that define life at higher elevations.

A display on rice cultivation in Metog and Zayul counties, a rotating column illustrating eight hardy meadow plants, and a section on the region's remarkable glaciers are among the highlights.



The station's true innovation lies in the small things.

For the "10 Questions About Glaciers" display, a flipboard answers questions about why glacial meltwater is not always safe to drink, as well as how glaciers have changed over recent decades.

"We're trying to take authoritative scientific knowledge and turn it into fun experiences," says Gai Yifang, a member of the station's lead design team.

"Through science-plus-art, we transform it into interactions where visitors can press buttons and listen. For tourists, it's more engaging and less like being lectured."

Top: The split-level design of the Nyingchi nature station creates a playful landscape. **Middle left:** A visitor turns an interactive exhibit to learn about the station's photovoltaic system. **Middle right:** A view of Nyingchi's topography. **Above:** Children learn about native plants through scientific illustrations. PHOTOS PROVIDED TO CHINA DAILY

The team works closely with the Chinese Academy of Sciences to ensure accuracy.

Then they distill.

"For animals, we avoid long taxonomic descriptions and morphological characteristics," Gai says. "Instead, we highlight one memorable fact that visitors might find interesting — always based on scientific fact — and pair it with professional photography and scientific illustrations."

The station is powered by solar panels paired with an integrated battery storage system, enabling it to operate its lighting and interactive exhibits off the grid under normal conditions.

But the team didn't stop at the technical side. They turned nature itself into a teaching tool. Displays explain how mycorrhizal fungi lock carbon in forest soils, how serpentinite rocks absorb carbon dioxide and turn it into carbonate minerals, and how glaciers regulate global climate.

"Nature is itself a zero-carbon textbook," Gai says. "Visitors discover that zero carbon is happening around them every day."

The Nyingchi station is part of a growing national network.

In April 2024, the first nature station opened in Metog, with a bird-focused theme. Butterfly, giant tree, geology, cat, and orchid stations followed. In September 2025, four themed stations appeared in Bomi, dedicated to the region's glaciers, spruce forests, wildlife, and unique ecological systems.

Guo, general manager of the camp, says the network currently comprises 24 nature stations nationwide, with footprints in Xizang, Xinjiang Uygur autonomous region, Shenzhen of Guangdong province, Chongqing and Wuxi in Jiangsu province.

The latest addition of the Nyingchi station to this growing network plays a special role.

"Previous stations were focused on individual themes — a single species or resource type. This station, however, presents a systematic geographical narrative of Nyingchi as a whole," Guo explains.

"It provides an overarching scientific context for other Nyingchi stations."

Functionally, its central location in Nyingchi makes it an ideal first stop, giving visitors an overall understanding of the region before they venture further.

"Tourists no longer just take a photo and leave. They can follow the stations' guidance and spend more time systematically exploring the land. This helps position Nyingchi as a world-class destination for ecological and cultural tourism."

Chinese food week stirs interest in Estonia's historic border city

NARVA, Estonia — On July 17, in the dining room of the Inger Hotel in central Narva, an unusual aroma hovered in the air. Mixed with the familiar scents were the earthy tang of soy sauce, the warmth of star anise, and a hint of ginger. For one week, this popular lunchtime spot became a culinary meeting point, introducing diners to a menu of Chinese specialties.

Chinese cuisine week grew out of one local entrepreneur's nostalgia. An Estonian businessman, who requested anonymity, had operated a Chinese restaurant in Narva before it closed during the COVID-19 pandemic in 2020. This summer, he proposed a revival with a fleeting taste.

"We naturally agreed," Olesya Morozova, the hotel restaurant's manager, says with a smile. "We are always happy to offer our guests something new."

That new experience came with Chef Mu Xiaofeng, who flew from China to lead the kitchen. Each day, the restaurant served a set lunch: soup, salad, and a main course, with the menu rotating daily to showcase variety. There was hot-and-sour soup, crispy spring rolls and stir-fried noodles with vegetables.

The biggest conversation starter, however, was a dish rarely found on Estonian menus: simply prepared stir-fried squid with scallions, ginger and salt.

During a visit to the kitchen, Chef Mu was seen preparing the dish from start to finish. He deftly sliced the squid into delicate crosshatch patterns before tossing it into a blazing wok with scallions and ginger. Within minutes, the specialty was plated.

"It caused quite a stir," Morozova admits. "Not everyone understood or appreciated the taste, of course. We received many positive reviews, but some guests found the flavor unfamiliar." Still, she defended the choice: "When such an opportunity arises, it is certainly worth trying something truly different."

During Hainan province's peak travel season, international tourists taste local specialties at a Haikou night market on July 17. GUO CHENG / XINHUA

Even sourcing the squid became part of the story. When Morozova contacted her usual suppliers, their reaction was disbelief. "'What is going on over there?' they asked," she recalled with a laugh. "I think that was when publicity for our Chinese cuisine week really began."

News of the event quickly spread through Narva, a city of just over 52,000 people on Estonia's eastern border with Russia. Phone calls, text messages and social media posts buzzed with questions: When is the event? What will be served?

"It shows that the city needs more projects like this," Morozova says.

The enthusiasm was perhaps less surprising given Narva's existing culinary landscape. A short walk from the Inger Hotel, WokkIN Narva has built a loyal following by serving Chinese-inspired dishes. Customers frequently praise its generous portions, affordable prices and flavors they describe as authentically Chinese.

Against that backdrop, the hotel's special week felt less like a bold introduction than a welcome deep-dive into Chinese cuisine.

Language proved no barrier in the kitchen. Using a translation app on a mobile phone, Chef Mu, who speaks only Mandarin, communicated with the hotel's Russian-speaking staff while demonstrating Chinese cooking techniques of velveting meat and balancing five-spice powder.

Diners enjoying more familiar offerings, like sweet-and-sour chicken and egg-drop soup, offered brief but enthusiastic praise. "It was excellent," several diners agreed with a smile before quickly returning to their meals.

Encouraged by the response, Morozova says the restaurant hopes to keep several of Chef Mu's recipes on the menu after the event concludes. "We will try to continue preparing these Chinese dishes," she says.

LIFE

Mental health enters a new frontier

Beijing Huilongguan Hospital's family-oriented ward tackles gaming addiction, reflecting a shift in how psychology is addressed in China's society, **Xu Fan** reports.

As children across China have begun their summer vacation, many parents are bracing for a familiar battle: competing with smartphones and video games for their children's attention.

That anxiety is precisely what Pixar's latest animated blockbuster *Toy Story 5* captures in one memorable scene. A group of toys climbs onto rooftops and peers through windows, only to find children in every home glued to screens, their thumbs constantly scrolling while the toys sit forgotten in the corner.

For many Chinese families, that fictional scene feels increasingly close to reality.

To help parents cope with the challenge, Beijing Huilongguan Hospital — the first hospital in China to establish a family-oriented ward dedicated to treating gaming disorders — published a science-based guide on its official WeChat account on July 2, encouraging parents to read it before the summer break.

The move reflects the growing recognition of excessive gaming as a mental health issue. In 2018, the World Health Organization released the 11th revision of the International Classification of Diseases (ICD-11), recognizing gaming disorder as a behavioral addiction.

According to the WHO, the ailment is identified as a condition that must be severe enough that it results in significant impairment to a person's functioning in personal, family, social, educational, occupational, or other important areas, and would normally have been evident for at least 12 months.

In other words, excessive gaming is not simply a matter of poor self-control. For some people, it is a medical condition that requires professional treatment.

For An Jing, a housewife in Hebei province, that distinction is painfully personal. Her 16-year-old son has become completely immersed in the online world, eventually taking a year off from school. He has reversed his day-night schedule, developed irregular eating habits, and spends nearly all his waking hours playing games, watching TV, or scanning smartphones. "When I see children carrying schoolbags on the street, I can't help but cry. But little by little, I've gotten used to it," An says.

Although many parents like An feel they are confronting a relatively new problem, the medical community began taking it seriously years ago.

Yang Kebing, chief physician and director of the hospital's Addiction Medicine Center, tells China Daily that he vividly remembers the period when the WHO gathered experts from around the world to evaluate whether gaming disorder should be included in the ICD-11.

"As discussions intensified, we realized this was becoming an increasingly serious issue," Yang says.

Drawing on years of clinical observation and research, the hospital opened China's first specialized behavioral addiction ward on May 21, 2019 — four days before the ICD-11 was formally adopted by the 72nd World Health Assembly.

Located near the hospital's north gate, the facility — also known as Inpatient Ward 29 — hardly resembles a traditional psychiatric ward. Reminiscent of the courtyards nestled in Beijing's hutongs, this single-story compound features a ping-pong table and four swing chairs, creating a relaxed atmosphere. The patient rooms are arranged around the courtyard, while the treatment rooms feel more like recreation spaces, such as a board game room and a mini karaoke booth.

"Normally we have 13 beds, but the ward can accommodate up to 15 or 16 patients if necessary," Yang says.

The ward evolved from an alcohol dependence unit established in 2008. As internet use became widespread and gaming-related problems increased, the hospital expanded its focus to behavioral addiction.

"Based on our clinical experience, about half of our patients are addicted to the internet or online games, and most are between 12 and 20 years old. The other half are mainly patients with other addictions such as alcohol dependence," Yang says.

One teenager left a lasting impression on him. Obsessed with online games, the boy repeatedly fought with his parents, shouted at home, disturbed neighbors, and eventually dropped out of school. His parents ultimately brought him to the hospital against his will. After spending two weeks in a closed ward to disconnect from the internet, he was transferred to the behavioral addiction ward for psychotherapy and medication.

Yang also recalls one of the ward's most successful recoveries — a 32-year-old man who lost his job because of excessive mobile gaming. Admitted shortly after the ward opened, he gradually regained control of his life through treatment.

Years of clinical practice have also reshaped Yang's understanding of the disorder. "Pure gaming disorder is actually uncommon. About 70 percent of our patients also have other psychiatric conditions, such as depression, bipolar disorder, ADHD, or anxiety disorders," he adds.

For Yang, however, the work brings more responsibility than recognition. He entered the Department of Mental Health at Beijing Medical University — now Peking University Health Science Center — in 1994, receiving comprehensive training in internal medicine, surgery, pediatrics, neurology, and psychiatry before joining Huilongguan Hospital in 1999.

Looking back over more than two decades, he has witnessed a quiet but profound shift in public awareness of mental health.

"When I first came here, we saw only a few dozen outpatients a day," he says. "Now, treating more than 1,500 patients a day has become routine at our hospital."

As the interview draws to a close, two nurses hurry over, carrying a new case file. Before there is time to exchange a proper goodbye, Yang is already discussing the patient's condition. It is a brief but telling scene: in the time it takes to say farewell, another family's struggle has already become his next mission.

Guardians of the plateau help revive Xizang's wildlife and ecosystems

LHASA — At daybreak on the northern plateau of Southwest China's Xizang autonomous region, the wind moves first. It comes out of seemingly empty country, passes over lakes and meadows, and blows toward the snowy mountains in the distance.

Through his binoculars, Kalzang Lhundrup can often see Tibetan antelopes lowering their heads to drink and wild kiangs moving slowly along a ridge. His motorcycle leaves only a shallow track on the patrol road, a faint line across the vast landscape.

On other patrols, he has seen wild yaks and black-necked cranes appear more frequently — signs to him that the plateau is recovering.

For nearly a decade, Kalzang Lhundrup, head of the Norbu Yugyel wildlife conservation station in Nyima county in Nagchu, has been reading these signs. In his world, the return of wildlife is not an abstract measure of ecological recovery. Instead, it appears through hoofprints, migration routes and fleeting images captured by trail cameras.

Patrolling this area is hard work. The altitude is close to 5,000 meters, and roads are long, while the wind and snow can be punishing. There is also the loneliness of the wilderness, which is very much part of the job. Kalzang Lhundrup and his colleagues patrol five or six times a month, riding motorcycles in summer and driving off-road vehicles in winter. A single day on patrol may cover more than 200 kilometers.

Left: A female Tibetan antelope nurses its calf in Nagchu, Xizang autonomous region. **Right:** Migratory birds at the Lhalu Wetland National Nature Reserve in Lhasa, Xizang. PHOTOS BY LI LIN / CHINA NEWS SERVICE

Along the way, they record the species and numbers of wild animals they see and watch out for those that are injured or separated from their herd. In recent years, this station alone has rescued over 40 wild creatures.

"There are more animals now and, in a way, that gives us more work," he says. "But it is good work. It means the land is healthier than before, and it means our patrols are worth it."

The station is named after Norbu Yugyel, a police officer who sacrificed his life while apprehending poachers in northern Xizang. From earlier wildlife protectors to the hundreds of rangers now working across the plateau, conservation there has often been a quiet and demanding inheritance.

A herder born on this land, Kalzang Lhundrup sees the change through a lens of personal pride. "I was born here. To be able to protect this land is my greatest happiness."

Monitoring data tell part of the story. Populations of rare wild animals in Xizang have shown a clear recovery trend. Tibetan antelopes have increased from just more than 70,000 at the end of the 20th century to over 300,000 today, while wild yak numbers have grown from several thousand to more than 20,000. The number of black-necked cranes has also risen from fewer than 4,000 to over 10,000.

Across Xizang, the human footprint on the Qinghai-Tibet Plateau is being managed more carefully. The region has built a nature reserve system with national parks as the mainstay. It now has 47 nature reserves and 97 protected natural areas in total, as well as 73 wildlife protection stations.

Conservation in Xizang is not only about keeping people away from nature. It is also increasingly focusing on teaching people how to live near it.

In Lhasa, the same idea appears in a different form at Lhalu Wetland National Nature Reserve, often called the "lung of Lhasa". On summer days, birds skim the water or rest in the shallows. Beyond the reeds and footpaths rise the Potala Palace and residential buildings, bringing the wetland into the everyday life of the city.

Ngawang Tashi, deputy head of the administration bureau of the reserve, says the wetland was not always so healthy. Since 1995, years of protection, restoration and monitoring have helped revive its ecological functions.

In recent times, Lhasa has invested 728 million yuan ($107 million) in two phases of restoration work, helping bring the wetland back to life. Its vegetation coverage has risen to more than 95 percent, and the reserve currently supports 174 bird species, with more than 10,000 birds living and breeding there.

Parts of its patrol paths have been opened to the public in an orderly manner. Residents now go there to walk, take photographs, and watch birds. For many children in the city, this wetland may be where they first learn the name of a black-necked crane.

The water that nourishes Lhalu Wetland eventually flows into the Lhasa River and then into the Yarlung Zangbo River, which runs eastward toward Nyingchi, where ecology has become a livelihood.

Tashi Drolma, a homestay owner in Bomi county in Nyingchi, grew up watching her mother run a family inn more than 20 years ago. As a child, she did not think much about the peach trees in the yard. Only later did she understand that the blossoms had become part of a new economy.

"When I was young, I didn't know peach blossoms could be so valuable," she says. "After I grew up, I realized they are our way to a better life."

In 2025, Nyingchi received 17.4 million tourist visits, and its tourism revenue reached 16.3 billion yuan. The city also creates more than 10,000 ecological jobs each year, helping increase annual per capita income by 3,500 yuan.

Back in northern Xizang, Kalzang Lhundrup still sets out on patrol. The work remains cold, lonely and physically demanding. But each return of the antelope, each crane landing in a wetland, and each village finding income in clean mountains and rivers tells the same story: On the plateau, protecting nature has become another way of keeping life moving forward.

2026 WORLD CUP

Viewing the positives of super-sized Cup

From record TV ratings, to gripping Cinderella stories, for FIFA, the good outweighs the bad and the ugly

Left: US striker Folarin Balogun fouls Bosnia and Herzegovina's Tarik Muharemovic (4), which led US President Donald Trump to intervene to have Balogun's one-game ban for the resultant red card suspended. **Right:** Cape Verde and Argentina produced one of the all-time classic World Cup matches, providing a strong case that the expanded 48-team format has been a success. AP

There are a lot of things that could have gone wrong during this summer's World Cup — a complicated logistical undertaking that included three host nations, 16 stadiums, 48 teams, 104 games and endless opportunities for controversy on and off the soccer field.

But in retrospect, a lot of things went right.

The United States, Canada and Mexico spent nearly six weeks hosting soccer's biggest showcase and — at least for the most part — the action stayed on the field.

US broadcaster Fox said Tuesday that the final, contested by Spain and Argentina, drew 38.9 million domestic viewers — including a peak of 51.7 million — which easily set the record as the most-watched English-language soccer telecast in US history, according to Nielsen Media Research. Spain won the final 1-0 in extra time.

Telemundo's preliminary numbers for its Spanish-language broadcast said the game had a total audience of 22.6 million, putting the total number of viewers in the US at more than 60 million.

Fox broadcast all 104 games in English on its platforms and television ratings remained high in the US even after the US team was eliminated by Belgium in the round of 16.

Spanish broadcasts on Telemundo were also a popular option — even for non-native speakers.

Fox averaged 7.7 million viewers for the 104 broadcasts on Fox, FS1 and Tubi — up from 3.58 million in 2022 and 2.77 million in 2018.

Though Nielsen's viewership numbers give a window into the World Cup final's widespread popularity, it's a challenge to reflect how many people actually watched since some viewed the game in group settings, such as watch parties.

In 2025, Nielsen expanded its out-of-home measurement system to try and get a more accurate count.

Attendance was good

Star players like Argentina's Lionel Messi, France's Kylian Mbappe and Norway's Erling Haaland became household names across North America, and, despite a few early hiccups and high ticket prices, most games featured packed stadiums with strong attendances throughout the US, Canada and Mexico.

FIFA president Gianni Infantino offered effusive praise to the host countries on Sunday.

"We have had a record number of spectators in the stadiums, almost seven million," Infantino said.

"We will have had, I mean the official figures will come out soon, but probably over six billion people watching it from home."

The weather cooperated

Fans and players from other countries found out what Americans, Canadians and Mexicans have known for a long time — it can get pretty hot in the summer, and climate change isn't helping matters.

But Mother Nature could have been a lot meaner than she decided to be.

Even so, there were a handful of games that featured particularly hot and muggy conditions.

The best example was a knockout-round game between Paraguay and France on July 4 in Philadelphia, when temperatures hovered around 38 C.

The World Cup final on Sunday also dodged a potential problem, when smoke from Canadian wildfires that wrapped the Northeast in haze had mostly cleared from the New Jersey area just in time thanks to some well-timed thunderstorms.

Size doesn't matter

This year's 48-team World Cup field was the biggest in history, and many thought it would water down the competition.

That wasn't the case.

Cape Verde held eventual champion Spain to a draw in its opening game, advanced to the round of 32 and gave Argentina a scare before losing 3-2 in extra time in a World Cup classic. The Democratic Republic of Congo also advanced beyond the group stage and pushed England all the way before losing late on, while Curacao was still in with a chance of making the knockouts going into its final group match.

After all the Cinderella stories were over, it was FIFA's top four ranked teams — England, Argentina, Spain and France — left to contest a heavyweight-packed semifinal round.

Politics can't be ignored

The World Cup is famously a petri dish for political conflict, and this year's edition provided its fair share.

Iran's participation in the tournament amid the war in the Middle East was a particularly thorny issue and the team had to move its base camp from Arizona to Mexico. The Iranians' participation was overshadowed by travel complaints and visa issues, with the US refusing visas to several members of Iran's delegation.

US President Donald Trump's relationship with Infantino was scrutinized after US striker Folarin Balogun's one-game ban for a red card was suspended ahead of the team's round of 16 game against Belgium.

Travel restrictions prevented fans of certain countries from traveling to the US, but there were no reports of the aggressive immigration enforcement that some had feared could take place around World Cup stadiums.

Infantino brushed aside most of the controversies, instead focusing on the positives. While the FIFA president has a vested interest in painting a rosy picture of this year's World Cup, there's little doubt that, from a soccer perspective, the tournament was a hit.

"I think we have to invent a new vocabulary, new words to define the success of this World Cup," Infantino said.

AP

The World Cup final set the record as the most-watched English-language soccer telecast in United States history, according to Nielsen Media Research, drawing a peak domestic TV audience of 51.7 million. AFP

Arrogance or pride? Argentina grapples with villain label

BUENOS AIRES — Critics blasted Argentina for dirty tactics and poor sportsmanship during its 1-0 loss to Spain, cementing the country's status as a World Cup villain that grew throughout the tournament.

But Argentines argue they are just passionate and misunderstood.

"I think we deserve some credit for not being very well-liked, because of this tendency to be arrogant and look down on most people from a pedestal," said Leo Simone, a 55-year-old lawyer, from his home north of Buenos Aires.

"They confuse arrogance with pride," his wife chimed in, preferring not to give her name.

While star Lionel Messi is beloved around the world, anti-Argentina sentiment grew as critics argued the team was FIFA's darling and received favorable refereeing calls, such as penalties, VAR decisions and cards shown to opponents.

Then came the final, replete with fouls, brawls on the pitch, and Argentine players turning their backs when Spain received the World Cup trophy.

The New York Times called it a "tetchy, petulant and distasteful performance."

Former Germany player Thomas Hitzlsperger wrote on X that Argentina's players were "disgusting sportsmen", and British television personality Piers Morgan said "they basically just went around whacking as many Spanish players as they could."

Near Ezeiza Airport, where thousands of fans welcomed the players returning to Buenos Aires on Monday night, Maximiliano Heredia, a 35-year-old construction worker, said: "We've always been criticized, we're used to it, but we always give it our all."

'We love it'

Many Argentines online wore the criticism as a badge of honor.

"There's something about Argentine irreverence that they can't tolerate. Our rebelliousness irritates them, enrages them. They call us cocky, cheaters, dirty, and we love it, it fills us with pride," journalist Pedro Rosemblat posted to Instagram.

Argentina's Leandro Paredes grabs the throat of Spain's Eric Garcia after the final whistle of the World Cup final on Sunday. AP

Sports journalist Ezequiel Fernandez Moores told reporters that some criticism was justified: "Sometimes we think we're the center of the universe, that God and our own navel are Argentine."

He said local soccer codes of provocation, mockery and boasting did not translate to a global audience.

"We can't expect the world to understand us, our way of being, feeling and expressing ourselves," he said.

Nevertheless, the team turning its back on Spain as it received the cup was "not right", he said.

The lawyer Simone rejects the notion that physical play makes Argentina a violent team.

"Argentina is a team that fights hard, like almost all South American football, but Spain also resorted to tactical fouls," he said.

"It's football: if you don't like being hit, play volleyball."

For Evelio Rubio, a 47-year-old Venezuelan neurologist who has lived in Argentina for a decade, it is impossible to understand from outside how "football is experienced here".

For a Venezuelan accustomed to his national team not winning titles, experiencing that passion from within "is spectacular".

Racism accusations

Argentine fans and some players have also faced accusations of racism — such as a chant sung by the team in the past mocking the black players on the French team as not being really French.

There is also a long history of club-level fans throwing bananas on the field or making monkey gestures at Brazilian fans or black players.

During this World Cup, FIFA condemned racism in a statement after an Argentine supporter told a black US influencer known as iShowSpeed to go "cry at the zoo" during a livestream.

American actor Samuel L Jackson stirred controversy when he urged black people in an Instagram story not to support Argentina, which he dubbed one of "the most racist countries in the world".

Sociologist Ivan Schuliaquer of the National University of San Martin said people should not take racism related to soccer and apply it generally to Argentine society and history.

This racism exists and should not be denied, he said.

"But, in many cases, these labels come from colonizing countries that have not yet fully resolved the issue of racism."

WORLD WATCH
By Ishida Ryuji

Japan never sincerely embraced pacifism

East Asia is increasingly concerned that Japan is reverting to militarism. Japan's prime minister and Cabinet officials, however, have dismissed such concerns, while some scholars and activists argue that these are exaggerated. What explains this perception gap?

Japan is hyping up nonexistent "threats" to justify its military expansion, leading many to conclude that the postwar "pacifist nation" is now abandoning its pacifist moorings.

But a closer look at historical records, including those of the Tokyo Trials and trials of other Japanese war criminals, raises a fundamental question: Was postwar Japan ever truly a "pacifist nation"?

The notion that Japan completely abandoned its militarism and transformed into a peace-loving state seems like wishful thinking. It's more likely that the country subconsciously retained the underlying features of its prewar system, while continuing to pursue overseas interests and maintain a sense of national superiority.

Consider the way Japan marks Aug 15 as the "end-of-war memorial day". The wording blurs the distinction between victory and defeat and even suggests that Japan voluntarily ended the war. The expression can be traced to Emperor Hirohito's radio broadcast on Aug 15, 1945, in which he sought to obscure the reality of defeat. Few Japanese find anything wrong with this wording.

The Japanese people endured immense suffering in a war fought "to die for the Emperor". Yet, there was no strong public demand to abolish the imperial system. Only a small minority called for the emperor's abdication, and Hirohito's desire to preserve the imperial system was readily fulfilled through the intervention of the United States before the Tokyo Trials began.

Contemporary Japan continues to revere its emperor. The media and ordinary citizens routinely use the honorific "His Majesty the Emperor", unmindful that this superior-subordinate relationship conflicts with democratic principles. After Japan's defeat, the emperor toured the country. Even in Hiroshima, which was devastated by the atomic bombing, he was greeted with cries of "long live His Majesty the Emperor". To this day, large crowds gather at the Imperial Palace every New Year, proudly waving the flag of the sun in homage to the emperor.

Another example of Japan's reluctance to break from the past is the military pension system. Established in the early Meiji period, it was abolished during the Allied occupation but reinstated immediately after the US forces withdrew in 1952. It continues to this day, with higher-ranking officers receiving more generous benefits. Even dependents of Class-A war criminals are eligible for these pensions.

Experts debunk 'China squeeze' claim

By **ZHONG NAN**
zhongnan@chinadaily.com.cn

China's manufacturing strength is creating more room for industrialization across the Global South instead of squeezing it, as the country continues to supply machinery and components to and make investments in developing economies, enabling them to build up their own industrial capacity, said analysts and business leaders.

Earlier this year, a report released by the Peterson Institute for International Economics, a think tank based in Washington, DC, claimed that China's continued dominance in low-skilled manufacturing is squeezing the capacity of developing economies, limiting their export opportunities, and leaving less room for them to industrialize and move up global value chains.

Analysts said the so-called "China squeeze" argument rests on the sole assumption that global manufacturing is a fixed pie, with every gain for China coming at the expense of another developing economy — a view that is completely at odds with the way global supply chains work.

Adam Tooze, a professor of history at Columbia University in New York, said the claim lacks a solid empirical basis, and instead turns complex global development challenges into a simplistic narrative that blames China and portrays its industrialization as a threat.

Tooze made the remarks last week in a post on the online publishing platform Substack. He said that such claims attribute China's enduring strength in low-skilled manufacturing to "unfair policies", but fail to explain why Chinese producers remain competitive despite rising wages and profound changes in the global manufacturing landscape.

Zhang Monan, deputy head of the department of American and European studies at the China Center for International Economic Exchanges in Beijing, said China's manufacturing edge has been built through sustained innovation, economies of scale and supply-chain coordination, rather than the policy distortions often cited by Western critics. "Restricting competitive Chinese products will raise production costs, slow technological progress and increase supply-chain fragmentation," she said.

In late July, a meeting of the Political Bureau of the Communist Party of China Central Committee called for efforts to promote more balanced trade growth and expand mutually beneficial international economic and trade cooperation.

Speaking at a news conference in Beijing last month, Yan Dong, vice-minister of commerce, said some countries are using the so-called "China squeeze" argument as a new version of the "China threat" narrative, seeking to drive a wedge between China and the Global South, while deflecting attention from their own responsibilities.

Tu Xinquan, dean of the China Institute for WTO Studies at the University of International Business and Economics in Beijing, said China's industrial rise has brought developing economies greater access to machinery, technology, investment and supply chains. China plans to provide developing countries with 5,000 opportunities for artificial intelligence training and seminars over the next five years.

According to the Ministry of Commerce, between 2012 and 2024, China exported textile machinery worth more than $30 billion to developing economies, helping countries in Southeast Asia and South Asia emerge as major textile producers and exporters.

John Pearson, CEO of German logistics services provider DHL Express, said that Chinese companies are increasingly expanding into markets such as Egypt, Thailand and Malaysia, building local operations and forging closer manufacturing and supply-chain links with these economies. Last month, DHL began phased operations at its expanded super gateway at Shenzhen Bao'an International Airport, Guangdong province, with a total investment of 1.2 billion yuan ($178 million), customs data showed.

XI'S VISION | TALENT AND EMPLOYMENT

College grads seek vocational training boost

They gain edge amid nation's push to align job seekers' capabilities, industrial needs

By **LI LEI**
lilei@chinadaily.com.cn

Amid record numbers of new university graduates and a persistent labor mismatch across China, a fast-growing number of degree holders are turning to vocational training to acquire practical workplace skills, plugging long-standing gaps between theoretical university learning and on-the-job requirements.

The shift is epitomized by 26-year-old Liu Wenhao, who holds an environmental design degree. His first jobs in interior design in Qingdao, Shandong province, paid under 3,000 yuan ($445) a month, and despite cycling through five employers in a single year, he saw virtually no pay growth. He repeatedly confronted real-world work demands unaddressed by his university education, including being tasked single-handedly with designing a 300-square-meter apartment.

To break his career stagnation, Liu enrolled at Qingdao Technicians College in 2024 in a multimedia training program, a sector booming as social media reshapes corporate communications and brand outreach. His newly acquired practical skills were in such strong demand that he left the two-year program early last year to take a corporate communications role at a local manufacturing plant, with his monthly income increasing to 5,000 yuan.

"A degree only gets you through the door. What matters afterward is your actual ability," Liu said.

With the number of college graduates nationwide reaching a historic high of 12.7 million this year, vocational "retraining" has evolved from individual career adjustment into a notable social trend, fueled in part by national policy priorities aimed at resolving China's stubborn labor supply-demand imbalance.

During a 2024 study session of the Political Bureau of the 20th Communist Party of China Central Committee, Xi Jinping, general secretary of the CPC Central Committee, identified the mismatch between graduate talent supply and industrial skills demand as the country's foremost employment challenge.

He called for adjustments to academic programs and resource allocation in higher education, enhancements to vocational education and improvements in lifelong vocational skills training.

Authorities have moved swiftly to implement these directives, restructuring university course offerings and resource distribution, modernizing vocational training infrastructure and expanding subsidized skill-upgrading programs.

Official figures show the government delivered 11.53 million subsidized vocational training sessions in 2025 alone, part of a broader push to align graduate capabilities with industrial needs.

Findings from a 2025 survey covering 105 technician schools show that between 2023 and 2025, the number of schools running courses targeted at college graduates rose from 26 to 45, with total enrollment increasing from 1,821 to 2,462.

Growth is particularly robust among learners with higher academic credentials. Institutions offering retraining for holders of bachelor's degrees and higher jumped 75 percent, from 16 to 28, and enrollment in these programs climbed from 401 to 570 participants.

While highly educated retrainees still account for a modest share of overall vocational students, their rapid growth rate signals fast-rising demand for practical skill upgrades among China's university-educated workforce, experts said.

National and local policymakers have rolled out targeted initiatives to accelerate the trend.

In April last year, the Ministry of Human Resources and Social Security launched a nationwide campaign encouraging vocational colleges to open specialized training tracks for university graduates.

The push comes amid acute industrywide talent shortages. The ministry estimated that China was facing a skilled-labor shortage of 4.5 million in smart manufacturing alone by the end of last year. To address this, Beijing plans a two-year program this year at six technician colleges in smart manufacturing, multimedia and auto repair.

Jiangsu province, a manufacturing powerhouse on China's eastern coast, plans to launch 20 such classes this year in artificial intelligence, advanced manufacturing and modern services.

Vocational educators witness this academic-practical skill divide firsthand. Lu Weiyang, an instructor at a Guangzhou technician college that began offering one-year skills programs to graduates last year, sees the gap daily. Undergraduates arrive with theoretical knowledge but weak hands-on skills — a gap he considers bridgeable. They learn faster, he said, thanks to stronger self-learning and comprehension.

VISITORS TO BEIJING SEE CITY FROM A FRESH PERSPECTIVE

Rooftop spaces are becoming the best spots to experience the nation's ancient capital

By **ZHENG JINRAN**
zhengjinran@chinadaily.com.cn

Many first-time visitors come to Beijing looking for its famous landmarks. Some leave talking about the rooftops they discovered instead.

That was exactly what happened to Nancy Nielsen, a teacher from Michigan, the United States. While visiting the Pearl Market last year, she noticed another floor above the building. Curious, she walked upstairs and found herself overlooking the Temple of Heaven.

"It was just so beautiful," she recalled. She has since returned at least five times, bringing two friends back with her this summer.

Like Nielsen, a growing number of visitors are developing a different view of Beijing — a bird's eye one. Following the inscription of Beijing Central Axis on UNESCO's World Heritage list in 2024, Dongcheng district launched the Breeze Terrace Project to bring heritage closer to everyday life.

More than 70 selected rooftops have since been opened, creating new public spaces above the old city. These encourage visitors to explore not only the landmarks, but also nearby neighborhoods, cafes and shops at a more leisurely pace.

That slow rhythm is what Ming Jing, general manager of the rooftop Pearl Club, hopes visitors will find on the terrace, where Nielsen went. Many visitors arrive after touring the Temple of Heaven. They order coffee or a special mousse cake, wait for sunset and watch the changing light over the centuries-old complex, he said.

Trial by typhoon shows city's resilience

Shanghai's preparedness for severe weather sets example in dealing with climate volatility

People brave the rain in Shanghai's East Nanjing Road on Sunday. WANG XIANG / XINHUA

By **ZHENG ZHENG** in Shanghai
zhengzheng@chinadaily.com.cn

When Typhoon Dolphin hit Shanghai at the weekend, the megacity was confronted with multiple weather extremes and a major test of its resilience.

The 13th typhoon of the year, Dolphin made two landfalls in Zhejiang province on Sunday, bringing severe weather to China's eastern seaboard.

Shanghai and its 25 million residents were subjected to record rainfall, gale-force winds and tornadoes, testing the effectiveness and preparedness of the city's infrastructure and emergency services.

Dolphin's assault — coming as the world deals with climate-related volatility — has answered some questions about how megacities can withstand increasingly unpredictable weather.

For the first time since Typhoon Fitow in 2013, Shanghai authorities issued the highest-level red alert for rainstorms across central urban districts on Sunday. Gale-force winds above force 8 persisted for approximately 48 hours, while multiple districts reported small tornadoes.

Over a 72-hour period from 8 am on Saturday, precipitation at Xietu Road subdistrict in Xuhui district reached 498.9 millimeters, the highest cumulative rainfall recorded by Shanghai's automated weather stations this century.

From 8 am on Sunday, 24-hour rainfall of 316.1 mm was recorded at Xujiahui meteorological station. The amount was equivalent to two summer months of precipitation, shattering the station's single-day precipitation record in its 154 years of operations.

Of Shanghai's 45 representative hydrologic monitoring stations, 42 exceeded water warning levels, with 23 setting historical highs.

The full impact of Typhoon Dolphin is expected to be clear by Saturday, authorities said, when it is anticipated to have dissipated after hanging around for about eight days.

Exceptional threat

How did a single typhoon unleash such severe force upon East China's coast?

Scientists point to a complex confluence of regional climate anomalies and large-scale atmospheric dynamics that transformed Dolphin into what they described as an "exceptional" threat.

Before Dolphin made landfall, Jiang Man, chief forecaster at the Shanghai Meteorological Observatory, described what made this typhoon different from previous ones.

She said it has had a very long active period, packed strong winds, and covered a massive area. Its level-7 wind circle stretched over 400 kilometers from the typhoon center.

The typhoon's cloud and rain bands were extremely well-developed, carrying massive amounts of water vapor that brought prolonged strong winds that lasted for days. These were paired with extremely heavy, sharp downpours instead of a quick, short storm as usually happens, Jiang said.

Wu Liguang, a distinguished professor at the department of atmospheric and oceanic sciences at Fudan University, told Wenhui Daily that Dolphin's destructive potential was built during its long transit across the ocean. Tracking across the Pacific Ocean for nearly two weeks, it spent a prolonged period over warm open water, continually accumulating energy.

The developing super El Nino's expansion across the Western Pacific also played a role in warming the ocean. This shift fostered typhoon formation over ocean areas that have historically maintained lower sea surface temperatures, extending Dolphin's energy-charging corridor before it made landfall.

Also, research published in the China Water Resources journal examining Shanghai's precipitation trends from 2005 to 2024 revealed that the city is experiencing a century-high peak in annual precipitation, increasing at an average rate of 16.1 mm per year. Severe hourly rainfall is transitioning into a high-frequency incident, the report said.

Water, water everywhere

Following the torrential rain, floodwaters inundated streets, underpasses, and residential compounds across the city, particularly in central downtown districts, including the iconic, tree-lined Wukang Road area.

"The waterlogging in some areas during recent typhoons cannot be attributed to any single factor," explained Wu Meng, deputy director of the circular economy and green development research office at the Shanghai Academy of Social Sciences' Institute of Ecology and Sustainable Development.

Wu said the heavy rainstorms were the direct cause of the standing water. Shanghai sits on flat land right next to the sea and all its rivers are connected to the rise, and fall of tides, which hinders rainwater from draining out of the city easily.

"Contradictions between dense urban development and available water storage space are another reason," Wu added. Water storage space refers to soil, rivers, lakes, drainage networks and sponge facilities that can hold rainwater before flooding occurs.

Shanghai uses a multi-tier system for urban flood control.

Standard underground pipe networks handle routine rainstorms, while surface river networks and pump-gate systems manage regional drainage.

In coastal areas and along riverbanks, sea walls and levees defend against storm surges. For extreme events that exceed standard engineering designs, the city relies on above-ground water storage, emergency pumping and adaptive risk management to mitigate damage.

Currently, about 70 percent of Shanghai's central urban area is designed to withstand a storm recurrence, or return period, of every three to five years, equating to an hourly rainfall intensity between 51.2 and 58 mm.

Dolphin, however, far surpassed these capacities.

Sun Xiaofeng, deputy director of the comprehensive planning department of the Shanghai Water Authority, explained to Jiefang Daily that even infrastructure built to a 20-year return period standard cannot guarantee the complete absence of standing water under the intensity of a typhoon as strong as Dolphin.

Dense development in central districts has also left limited land for open water bodies and retention basins, forcing neighborhoods to rely largely on underground pipe networks.

"Expecting zero flooding anywhere at any time during extreme rainstorms is neither realistic nor economical," Wu said.

"Modern urban drainage aims for minimal flooding within design standards. For extreme, record-breaking storms, it lets small, controlled puddles stay temporarily — but it must never cause deaths, flood underground spaces, or shut down the city's key services."

Swinging into action

Faced with an unprecedented deluge, Shanghai's emergency response was integrated, cross-departmental and an example of swift governance.

On Aug 3, the Shanghai Meteorological Bureau established a forecasting team to deliver step-by-step typhoon warnings aligned with flood prevention plans.

Municipal agencies conducted pre-storm risk audits across vulnerable residential compounds. Neighborhood work groups put sandbags and temporary barriers in place, and mobile crews were activated to deal with the coming stormwaters before the rain arrived.

Water gates were opened across the municipality to lower regional river levels to 2.2 meters, while sections of the underground networks were flushed out, freeing up 450 million cubic meters of storage capacity within the river system.

Regional water authorities also coordinated with neighboring provinces to close the upstream Taipu gate, stemming flood inflow from Taihu Lake.

To address localized surges, the city deployed 118 high-capacity mobile pumping vehicles capable of discharging 200,000 cu m of water per hour in total.

In tight urban spaces where heavy vehicles could not maneuver, specialized drainage robots stepped in. In an inundated underpass in Minhang district, robots nicknamed "Big Buffalo" and "Little Hippo", capable of discharging 980 cubic meters of floodwater per hour, operated efficiently in tight conditions.

On Monday, Shanghai activated an emergency water diversion system for the first time, pumping water from Suzhou Creek into the Huangpu River to prevent dangerous surges in water levels. A total of 15 portable high-capacity drainage units, capable of displacing 30,000 cu m of water per hour, were deployed to safeguard the city's infrastructure.

Global extremes

Shanghai is far from alone in this struggle. Metropolises worldwide face similar climate pressures.

In July 2025, severe rain hit the United States' east coast, with New York's Central Park recording its second-highest hourly rainfall of 50 mm.

Across the UK in January 2024, Storm Henk triggered over 300 flood warnings, landslides and infrastructure submergence.

In August 2024, Super Typhoon Shanshan prompted top-level evacuation warnings for over 5 million people in Japan, leaving hundreds of thousands without power with widespread flight, train and factory shutdowns.

Recognizing these escalating threats, Shanghai is modernizing its architecture through digital and physical measures designed to make the city more able to adapt and resilient.

Under Shanghai's 15th five-year plan for water system governance, the city aims to equip 80 percent of its central urban area with three-to-five-year return period drainage capacity by 2030, while evaluating 10-year or higher design standards for some core zones.

"A 10-year return period doesn't mean an event occurs once every 10 years, but rather that each year has approximately a 10 percent probability," Wu explained.

Urban resilience requires targeted, long-term investment to keep casualties, urban disruption and irreversible losses to a minimum, he said. "Shanghai should adopt risk-based standards: higher for critical facilities like hospitals, transit, underground, utilities, data hubs, and lower for general areas," he said.

The Wusong River project is a cornerstone of this structural defense. As the largest single water conservancy project in Shanghai's history, it focuses on watershed flood discharge and regional drainage.

Once fully operational, it will improve regional flood control as well as ecological protection and inland navigation.

Shanghai is also using its digital intelligent water system to predict and prevent weather events.

The municipality has deployed over 4,300 smart liquid-level and rainfall sensors across 11 districts, creating digital archives for 30,500 kilometers of public drainage pipelines, 43 urban sewage treatment plants and over 1,000 drainage pumping stations.

Alongside digital tools, Shanghai is expanding its green infrastructure through its "sponge city" initiative, which seeks to restore the landscape's natural capacity to absorb, retain and slowly release rainfall.

Over 40 percent of the city's built-up area met sponge city standards by the end of 2025, with target coverage reaching 50 to 60 percent in suburban new towns, according to officials. By 2030, the figure is expected to reach 80 percent in the city's built-up area.

Heping Park in Hongkou district is an example of this approach after its central lake was transformed into a retention basin. Pedestrian walkways were covered in permeable paving, while wet stretches of land were covered in vegetation to collect, filter and move surface water.

"Normally, our lake water level is maintained between 2.3 and 2.6 meters," He Yizhi, director of Hongkou district greening management center, explained to Shanghai Morning Post.

"During heavy rain, the storage level can rise to 2.8 meters, absorbing 8,787 cubic meters of runoff. When extreme weather requires park closure, the storage level can expand to 3.1 meters, providing 17,400 cubic meters of emergency retention capacity to protect surrounding residential blocks."

Heping Park used its lake as a temporary flood basin to help nearby streets drain faster. While closed for safety reasons, park workers pumped excess rainwater from surrounding roads into the park's central lake, relieving pressure on the city's drainage system.

Wu said Shanghai's priority is to create functional spatial pathways and ecological capacity for water management while safeguarding its core economic operations.

To forge true climate resilience, Wu said a strategy should take into account infrastructure, technology, ecology and emergency management.

This requires urban renewal to include localized sponge-city water retention, integrate local pipe networks with regional river systems for multi-scale drainage, utilize advanced technologies including artificial intelligence for predictive forecasting and dynamic scheduling, and establish designated surface runoff pathways to protect below-ground infrastructure during extreme downpours.

"Shanghai's most urgent task is to genuinely organize urban renewal, sponge city construction, drainage networks, river system management, watershed flood control, and intelligent scheduling into a complete integrated system," Wu said.

Militarism: Historical ignorance a problem

From page 1

Over seven decades, expenditure under this scheme has reached a staggering 60 trillion yen ($377 billion). But there is hardly any public dissent over the pension system. By contrast, not a single yen of public funds has been allocated to compensate overseas victims of Japanese aggression or victims of air raids in Japan. Even the medical treatment of atomic bomb survivors has often been grudging.

The attitude toward official visits to the Yasukuni Shrine, where the Japanese war criminals are enshrined, is equally revealing. Former prime minister Junichiro Koizumi dismissed criticism from victimized countries as "a matter of sentiment", while conservatives framed it as "interference in internal affairs". Even beyond August, it is also worth considering what the families of the enshrined and crowds of citizens regularly visiting the site to pay homage signifies.

Both Prime Minister Sanae Takaichi and her mentor Shinzo Abe have advocated for constitutional revision, particularly changes to Article 9 that renounces war. If "pacifism" was truly ingrained in the public consciousness, how could the Liberal Democratic Party, eager to amend this article, have garnered public support? The attempts to dilute Article 9 saw only a few street protests.

The prewar and postwar periods are too closely intertwined to simply conclude that postwar "pacifism" has changed. The deeper problem is the lack of historical awareness among the public, and a certain tolerance for this ignorance. Had postwar pacifism emerged from a thorough understanding of Japan's wartime aggression and a firm commitment to preventing such history from being repeated, the postwar era might have been different.

Without genuine self-reflection on wartime aggression, the pacifism enshrined in Article 9 is only a simplistic notion that "war is evil". Without consciously breaking from the prewar system, a pacifism rooted in a strong sense of victimhood can easily take hold. This perception is perhaps the most serious issue concerning Japan's pacifism.

The false postwar "pacifism" may have also fueled the rise of right-wing netizens. They glorify Japan's prewar "traditions", look down on neighboring countries, espouse xenophobic views and support constitutional revisions to "protect" Japan's "pacifism". What's more alarming is that even ordinary citizens share these views to varying degrees.

Consider the arguments: Japan waged wars of aggression, but didn't Western powers do the same? Japan invaded China and the Korean Peninsula, but did it not also bring modernization? Given historical disputes, are friendly relations with neighbors not unrealistic? If regional "threats" are building up their military strength, why shouldn't Japan prepare for war? When people who never considered themselves right-wing begin to think this way, Japan faces a real crisis.

Is it too much to imagine a Japan where education fully addresses the country's wartime wrongs, while both the government and the public are committed to fostering peaceful relations with neighboring countries? Such a society would not glorify the prewar system, disparage victim nations, or portray them as "threats".

I sincerely hope that the 81st year since Japan's defeat will be an opportunity for the country to incorporate the perspectives of neighboring countries that suffered from its aggression. Only by confronting the past can a genuinely peaceful future be secured.

Tiger rescue

Veterinarians and staff from Indonesia's Natural Resources Conservation Agency evacuate a wild Sumatran tiger after it was found trapped in Agam, West Sumatra, Indonesia, on Wednesday. The tiger was evacuated to prevent potential conflict with humans. Sumatran tigers are listed as critically endangered by the International Union for Conservation of Nature, with fewer than 400 remaining in the wild. ANADOLU VIA GETTY IMAGES

Skills: Teaching frameworks being revamped

From page 1

Teaching such mixed cohorts — some with relevant degrees, others from unrelated fields — has required new approaches.

To accommodate these academically advanced learners, vocational institutions are revamping their teaching frameworks. Li Yang, vice-dean of the college's electromechanical equipment department, said the school has adopted custom modular courses tailored specifically for graduate retrainees.

"Modular training is like targeted driving test instruction — each module builds a specific practical skill," he said. Students work through separate skill blocks — electrical systems, pneumatics, installation, programming — at their own pace.

In his speech at the 2024 study session of the Political Bureau, Xi emphasized the need for better integration of vocational and general education, industry and education, and science and education. He also highlighted the importance of allowing the market to play a decisive role in human resource allocation while ensuring that the government fulfills its supportive role.

Guangdong province, an industrial powerhouse, has emerged as a front-runner in implementing this integrated model.

By the end of last year, the province had built 171 industry-education-evaluation skill chains, partnering with leading companies, including Huawei, Tencent and BYD, to tailor vocational training curricula to real supply chain and industrial needs.

For Li Shaochang, 29, a graduate of Guangzhou Electromechanical Technician College, the decision to enroll in a technician college was driven by market demand. Despite holding a degree in mold design and manufacturing from Tianjin University, one of China's most prestigious institutions, he spent five years outside his field. Observing the shift toward smart manufacturing and AI, he recognized the need for practical skills.

"The technician college gives me extensive hands-on experience," he said. "That, combined with university training, is exactly what companies want."

The college's partnership with Guangzhou Jiafan Computer Co, an automation enterprise focused on smart manufacturing, gives students access to the same production line hardware used in the factory, with engineers teaching on campus. Li Shaochang's strong academic background earned him an early placement at Jiafan, where he joined an automated guided vehicle robotics team — a platform that combines a mobile chassis with a robotic arm for tasks like material handling and loading. His team leader was an engineer who had taught him at the college.

Zhang Kai, 37, holds a business administration degree from Guangdong University of Foreign Studies and now oversees Jiafan's advanced skills training base. Speaking from both sides of the desk — as a manager and a student in the same program — he said the company screens for a willingness to learn and a desire for skills, not credentials.

"A bachelor's diploma shows you can handle exam pressure," he said. "But a degree plus real skills — that's where the real competitive edge lies."

At the annual Central Economic Work Conference in December, Xi called for combining investment in physical assets with investment in human capital — a call that has since crystallized into the political catchphrase "investing in people", shorthand for upgrading the workforce through education, skills training, health and social adaptability.

Embodying that principle is Liu, the environmental design degree holder who enrolled at Qingdao Technicians College. He now earns more than double his previous salary, so his choice to build on his degree with vocational training has already paid off.

New energy vehicle sales soar in July

Figures for the first seven months of year offset weak industry numbers

By LI JIAYING
lijiaying@chinadaily.com.cn

New energy vehicles accounted for more than 60 percent of China's new vehicle sales for the first time in July, consolidating the segment's position as the main growth engine of the country's auto industry, latest industry data showed.

Data released by the China Association of Automobile Manufacturers on Wednesday showed that NEV output reached 1.576 million units last month, up 26.8 percent year-on-year, while sales rose 23.7 percent to 1.561 million units, or 60.4 percent of total new vehicle sales.

The milestone is a wider indicator of growth than the passenger car retail gauges often cited in the market, as the association's tally covers passenger and commercial vehicles and includes sales at home and abroad, showing that NEVs now form the bulk of the industry's overall sales mix.

The record was accompanied by a second milestone. In the first seven months of this year, NEV output rose 9.5 percent year-on-year to 9.014 million units, while sales increased 9.6 percent to 9.007 million units.

NEVs accounted for 51.2 percent of total new vehicle sales during the period, the first time the cumulative share has exceeded 50 percent.

By contrast, the auto market continued to show signs of weakness in July. Vehicle output and sales totaled 2.573 million and 2.584 million units, respectively, for the month, down 6.8 percent and 8 percent month-on-month and 0.7 percent and 0.3 percent year-on-year, respectively. In the first seven months of the year, both output and sales fell 3.7 percent year-on-year, although the declines narrowed from the first half of the year.

Chen Shihua, deputy secretary-general of the CAAM, said the auto market entered its traditional low season in July. Store traffic and orders eased, while automakers' midyear sales drives brought some demand forward. Persistent heat, typhoons and flooding in some regions also weighed on showroom visits, contributing to the month-on-month decline, he said.

Yet the shift in the industry's growth base remained intact. "The twin growth engines of NEVs and exports helped offset pressure from the domestic low season, while the industrial structure continued to improve," Chen said.

He added that new energy passenger vehicles in the 100,000 yuan ($14,830) to 200,000 yuan price range provided the main volume support in the first seven months.

Robust exports

Exports provided the other pillar of growth. CAAM data showed that in July alone, NEV exports jumped 145.5 percent year-on-year to 553,000 units, accounting for about 53 percent of China's 1.043 million vehicle exports. It was the second consecutive month in which NEVs accounted for more than half of the export total.

"Conventional fuel vehicles had long dominated China's auto exports, but the structure began to shift this year as NEVs increased their share in June and July, surpassing fuel vehicles for two consecutive months," Chen noted, adding that the rapid growth of vehicle exports could also help offset weak domestic demand.

Chen expects NEV exports to continue growing at a brisk pace and exceed 4 million units this year.

"With the world's most complete NEV industrial chain and a clear edge in intelligent technologies, the competitiveness of China's automobiles is expected to be further strengthened," he said.

Glowing plants coming to brighten the night

By WANG SONGSONG in Beijing and **ZHU LIXIN** in Hefei

What if your evening stroll meant walking down a path lined with bioluminescent foliage? That's the idea germinating at Beijing's Dongsheng Bajia Park, where a sprawling 7,000-square-meter greenhouse is set to bloom this fall with glow-in-the-dark decorative plants.

Featuring a "glowing" cafe and a luminous corridor of plant life, the venue will offer a surreal after-dark twist on a nature walk.

The project, spearheaded by Hefei, Anhui province-based Magicpen Bio, is set to turn one man's childhood fantasy into a public spectacle. The dream was born in the rural backyard of the boy who grew up to become the company's founder, Li Renhan.

"I wished I could make plants glow in the dark, like fireflies," Li said.

That childhood wonder eventually became the driving force behind Magicpen's breakthrough technology.

So far, the company has developed more than 10 varieties of bioluminescent plants, including petunias, tobacco and poplar.

At the heart of the innovation is an artificial intelligence platform called Agent VitaMind, which accelerates genetic design and metabolic engineering.

"Using AI, we boosted the supply of luminescent substrates and enhanced certain fungal activity in plant cells," Li said. "We prevented gene silencing, so the glow remains stable across generations."

The company hopes that the upcoming third generation will feature increased luminescence. The goal is to develop multicolor variants of glowing plants while simultaneously improving their cold tolerance and drought resistance. The enhanced plants are being bioengineered to be suitable for parks and cultural tourism spots across the country.

"After modification, the plants will grow and appear no different from ordinary greenery in the daytime, paving the way for large-scale commercial deployment," Li said.

The current generation of glowing plants produces a faint green light under a full moon. They glow brighter on moonless and overcast nights. In the third generation of plants, AI will optimize the luminescent pathway to achieve stable visibility even under a bright half-moon.

"The garden's corridors and shaded canopies help to reduce moonlight interference, enhancing the overall viewing experience," Li said.

To prevent the possible spread of genetically engineered life forms, the company uses sterile or low-pollen varieties. The idea is to prevent cross-breeding with wild plants.

Luminescent genes are expressed only in leaves, stems and flowers — not in seeds or pollen — so even accidental dispersal won't produce glowing offsprings.

Furthermore, the greenhouses are sealed with insect-proof nets, and all plant waste is heat-treated before its disposal. The company also uses AI simulations to predict any ecological impact on bees, soil microbes or local animals.

What eases public worries is that the glowing plants are purely ornamental and not intended for food.

"In five years, we expect glowing plants to serve as supplemental night lighting in parks and pathways, reducing the use of electricity," Li said.

Over the next decade, the company envisions the development of customizable glowing plants with tailored colors and climate resilience which will become a routine part of urban green spaces, although they will not replace streetlighting on major roads, he added.

Bioluminescent plants invented by Magicpen Bio, which is based in Hefei, Anhui province. XINHUA

Glowing plants are currently on display at the Beijing Flower World in the city's Fengtai district, as well as at Magicpen Bio-Research Base on the outskirts of Hefei, and at the Anhui Science and Technology Museum.

"The moment the lights went out in the exhibition hall, I was completely stunned," a netizen wrote recently on Xiaohongshu, also known as RedNote, after seeing the display in Beijing.

Global research on glowing plants has advanced significantly. Engineers from the Massachusetts Institute of Technology created nanobionic plants in 2021 that can be recharged by LEDs to emit bright light for up to an hour.

In 2022, Japanese researchers at the University of Osaka and Nara Institute of Science and Technology successfully embedded genes from luminescent bacteria and jellyfish to produce a glow in tobacco leaves, moss and cyclamens.

More recent progress came in June when Spanish researchers developed transgenic plants that change color when infected by a virus, enabling the early detection of pests.

Rooftops: Beijing residents rediscover city's landmarks

From page 1

"Walking into the Temple of Heaven is like entering a painting," Ming said. "Standing here is like stepping outside the painting to appreciate it."

Over coffee, conversation and sunset views, the temple becomes more than a destination; it becomes an experience. That broader perspective shaped the first impression of Beijing for Leilani and David, two visitors from Perth, Australia. Having just arrived in the capital, they skipped the usual tourist itinerary and headed instead to Gui Temple, a restaurant atop the western hall of the 700-year-old Hong'en Temple near the Bell and Drum towers.

Leilani had expected Beijing to be a bustling metropolis, but was surprised by the slower pace of life in the ancient *hutong*. "I had imagined it would be much busier," she said. "But it was very calm."

David said outdoor dining is part of everyday life in Australia, and the relaxed atmosphere made it that much easier to appreciate Beijing's famous Peking duck.

For Wan Yulin, general manager of Gui Temple, the panoramic view is what makes the rooftop special. "What they see is not one building; They see everyday life the passage of time — past and present," Wan said.

Zeng Leixiao, a doctoral student at Renmin University of China, discovered Pearl Club online while exploring new ways to photograph a city where he has lived for years. The objective was rediscovering Beijing, and now he recommends the city's rooftops to visiting friends.

At Jinbao Place Shopping Center, a 1,600-square-meter rooftop garden has become a place where office workers exercise, families tend vegetables at an urban farm and residents join seasonal activities.

For Han Wei, deputy director of Dongcheng's culture and tourism promotion bureau, the project reflects changing expectations. "People no longer want to see only a landmark. They want to experience the neighborhood around it," he said.

Yang Cheng contributed to this story.

Quake relief

People affected by the earthquake receive food packages in Cali, Colombia, on Wednesday. Rescuers in Colombia were making last-ditch efforts to locate earthquake survivors on Thursday, as the critical 72-hour window for rescue operations neared its end. The quake has killed 265 people, injured more than 3,500 and left almost 500 missing, according to local authorities. IVAN VALENCIA / AP

UN chief calls on US, Iran to return to talks

Guterres says settlement possible only via dialogue as interim deal nears end

By JAN YUMUL in Hong Kong
jan@chinadailyapac.com

United Nations Secretary-General Antonio Guterres called for a return to dialogue amid heightened maritime tensions in the Middle East in recent days as the United States and Iran continued to offer conflicting accounts of the situation in the Strait of Hormuz.

During a news briefing on Wednesday, Farhan Haq, deputy spokesman for the UN chief, said that Guterres is closely following the developments in the Middle East, including the situation in and around the strait and in the Red Sea.

"The secretary-general remains convinced that a comprehensive and durable settlement can only be reached through dialogue and negotiations," said Haq.

"Such a settlement would help restore stability and confidence across the region, while also safeguarding the navigational rights and freedoms in and around the Strait of Hormuz and in the Red Sea."

Pakistan said it was working to bring the US and Iran back to the negotiating table ahead of the 60-day deadline of an interim agreement the two parties signed in June, which is set to expire this weekend.

Tahir Andrabi, spokesman for Pakistan's Ministry of Foreign Affairs, said in a news briefing on Wednesday that Islamabad remained optimistic that a solution could be in sight as both Tehran and Washington have resorted to talks after the escalation.

He said there have been periods of heightened escalation, followed by relative calm and dialogue.

Andrabi also said an extension of the ceasefire between Tehran and Washington was under consideration. He floated the idea that the ceasefire could be extended if there is a genuine willingness to engage in dialogue.

US President Donald Trump said in a social media post on Wednesday that the US has "total control" over the strait.

"I think we will keep it! Our naval blockade is being called, by everyone, 'A Wall of Steel', and there is nothing Iran can do about it," Trump wrote on his Truth Social site.

Trump claimed Iran had no navy, no air force, and its remaining soldiers are unpaid, adding that the Islamic Revolutionary Guard Corps "is decimated and fleeing", and its leadership is uncertain.

"Iran is all talk and no action, the bully of the Middle East no longer," he added.

A senior Iranian official said on Thursday that the Strait of Hormuz remains under the control of the Islamic republic after Trump claimed US control over the strategic waterway.

"Today, you see that the Strait of Hormuz is under the management and control of the Islamic republic, and our country continues on its path in complete security," said Hossein Taeb, head of the paramilitary Basij forces affiliated with Iran's Revolutionary Guards.

Iranian Foreign Minister Abbas Araghchi said in a post on X on Thursday that the US "has long miscalculated due to intelligence failures".

Meanwhile, on Wednesday, Iranian Foreign Ministry spokesman Esmaeil Baghaei said the environmental damage caused by the US must be addressed in future arrangements governing the strait.

Baghaei posted a video on his X account showing what he claimed was oil pollution along the shores of Qeshm Island, adding that contamination has been documented at three coastal sites and across portions of the sea surface.

Meanwhile, the International Energy Agency said in a report published on Wednesday that renewed hostilities and maritime disruptions in July and early August "undermined the recovery efforts".

It projects that global oil production will drop by 4.3 million barrels per day this year due to disruptions in the Strait of Hormuz and Bab al-Mandab Strait.

Agencies and Cui Haipei in Dubai, UAE, contributed to this story.

Putin visits a disputed island; Japan lodges protest

MOSCOW/TOKYO — Russian President Vladimir Putin visited the Far Eastern Kuril Island of Iturup, or Etorofu as the Japanese call it.

According to TASS news agency, Putin visited the island on Thursday after attending the final stage of the Pacific Fleet drills in Yuzhno-Sakhalinsk.

Putin visited the Yasny fish-packing factory on the island, said the TASS report.

Vesti TV channel images showed Putin in a dark suit, beside two large tuna and a halibut laid out on a table, as two officials spoke about fishing and the migratory behavior of fish. He also stopped to try local fish roe.

"What lovely weather you have there, just like a resort!" Putin told a group of locals.

Russia and Japan are involved in a territorial row over Iturup, which Japan calls Etorofu, and the other three islands off Japan's northern prefecture of Hokkaido. The four islands that are under Russia's control are called the Northern Territories in Japan and the Southern Kurils in Russia.

Japan said on Thursday it "strongly protests" against Putin's visit to the disputed island.

In a statement on social media X, Japanese Foreign Minister Toshimitsu Motegi said, "The Government of Japan strongly protests this visit."

Motegi summoned the Russian ambassador to Japan Nikolay Nozdrev on Thursday. Motegi told the ambassador in the meeting that Putin's visit would "have an extremely negative impact on Japan-Russia relations", according to the ministry's statement.

The visit is "unacceptable", Japanese Prime Minister Sanae Takaichi told reporters on Thursday, adding that it "made it more difficult to restore relations in the medium to long term".

Putin in recent days has visited several regions in Russia's Siberia and the Far East. Before coming to the disputed island, the Russian president stopped on Sakhalin Island to attend the final part of the drills by Russia's Pacific Fleet.

Speaking aboard a warship that was taking part in the naval exercises, Putin said on Wednesday that the current status of the islands "is enshrined in international documents as a reality that arose following the outcome of the World War II".

"But even here, Russia was prepared to seek a solution with the goal of concluding a peace treaty with Japan," he said.

Kyiv aid surges despite long-term shortages

LONDON/MOSCOW/KYIV — Boosted by new EU financing, military aid for Ukraine in June hit its highest level since the United States pulled funding, though long-term support is lagging, Kiel Institute data showed on Thursday, as Russia and Ukraine continued to trade strikes.

Kyiv was allocated 7.2 billion euros ($8.3 billion) in military aid in June, the highest amount since the 9.04 billion euros received in April 2024. US funding dried up in February 2025.

It is the third-biggest monthly military funding boost from donors since Russia's military operation in February 2022, according to the think tank's Ukraine Support Tracker.

The surge was largely driven by the European Union's new Ukraine Support Loan, which helped European institutions allocate 4.3 billion euros of military aid in May and June.

The EU loan was introduced to support Ukraine's budgetary and military needs in 2026 and 2027.

"The rapid launch of the Ukraine Support Loan sends a positive signal to Ukraine," said Taro Nishikawa, project lead of Kiel's Ukraine Support Tracker.

On top of the loan support, Germany allocated 700 million euros, Denmark 600 million euros, and the Netherlands 500 million euros to support Ukraine's military.

But long-term funding levels remain below those seen before US President Donald Trump pulled the plug.

Before February 2025, donors allocated an average of 3.46 billion euros per month in military aid to Kyiv. Since then, that figure has fallen to 2.94 billion euros.

Key role

Although the United States no longer directly contributes to the effort, its weapons still play a key role.

Europe is increasingly procuring weapons from US defense companies and receiving deliveries from existing US military stockpiles.

"The United States remains a key supplier of systems such as Patriot, for which Europe has only limited alternatives at the moment," said Federico Mellace, lead analyst of the Ukraine Support Tracker.

In developments on the battlefield, three people were killed and eight others injured in a Ukrainian drone strike on Russia's Novorossiysk city, Krasnodar Governor Veniamin Kondratyev said on Wednesday.

Novorossiysk Mayor Andrei Kravchenko declared a state of emergency after the strikes damaged several educational facilities and ruptured two water mains, disrupting supplies to the city. One main line has been repaired, while work continues on the other, he said.

The strike targeted Russia's naval base in Novorossiysk, Ukrainian President Volodymyr Zelensky said on Wednesday.

Russia's Defense Ministry said on Thursday it had intercepted and destroyed 362 Ukrainian drones overnight over various regions.

In Ukraine, regional authorities said on Telegram that Russia struck the area around Ukraine's largest Danube port of Izmail overnight, causing damage and setting off a fire.

Izmail, near the Romanian border in the southern region of Odesa, handles grain and other commodities.

Romania, a member of NATO and the European Union, scrambled two fighter jets, its defense ministry said on X, adding that an aerial target spent about 10 minutes in national airspace before leaving for Ukraine.

Also in the Odesa region, a Russian drone hit a passenger train, killing the driver and his assistant, Oleksandr Pertsovskyi, CEO of Ukrainian Railways, said in a post on Facebook.

Tensions rise again after Greenland warns Texas oil company

By EARLE GALE in London
earle@mail.chinadailyuk.com

Tensions around the sovereignty of Greenland have been stoked again after the territory's government rebuked a United States company.

The criticism came after the oil company, with alleged ties to US President Donald Trump, unloaded exploratory drilling equipment without the necessary approval.

The incident followed Trump's claims earlier this year that the US would assume control of the semiautonomous mineral-rich Danish territory that is home to 57,000 people.

The US president's designs on the 2-million-square-kilometer Arctic island drew condemnation from NATO countries that said both Denmark and the US are members of the military alliance and that a dispute between them would threaten its existence.

After a period of relative calm, the latest chapter began late last month when Texas-based Greenland Energy moved machinery onto the island's remote East Coast, causing Greenland's government to issue a "strong warning" through its Mineral Resources Authority in which it said: "All future logistical matters must be advised and approved by the Mineral Resources Authority — before they are carried out."

Greenland Energy, which hopes to extract billions of barrels of oil from Greenland's Arctic basin, is led by Chairman Larry Swets, who The Guardian newspaper said "appears to enjoy access to Trump's circle".

France 24 has reported that the company's board of directors features Carol Craig, a US Navy veteran involved in Trump's Golden Dome missile-defense plan for Greenland.

While Swets has insisted the company's activities are in no way "related to American annexation" of Greenland, some observers fear a standoff between it and Greenland's government could lead to an intervention from the US government.

Lukas Wahden, an associate fellow of the Russia program at George Washington University, told France 24: "The exploration for oil by Greenland Energy is relatively unproblematic. The issue that caused political controversy ... is that the US company Greenland Energy didn't coordinate with the relevant Greenlandic authorities in its disembarking of equipment for the exploration that is planned in East Greenland."

Wahden said the company clearly "stepped on a number of toes".

Greenland's Foreign Minister Mute Egede, who is responsible for natural resources, told the territory's broadcaster KNR: "Given the current situation, I do not consider it realistic that the company can drill in the autumn."

Greenland Energy has said $1 trillion of crude oil could be under Greenland's Nunap Qeqqa area, also known as Jameson Land, and that it plans to spend $60 million on drilling two exploratory wells.

The incident, which is taking on the appearance of a standoff, has the potential to destroy the uneasy calm.

And with Trump saying just last month in an interview with Steve Gruber from the right-wing Real America's Voice News that Greenland will come under US control before the end of his term, it seems possible a standoff could force an escalation of the dispute.

Ottawa under pressure as 50% US tariffs draw near

By SHI GUANG in New York
shiguang@chinadailyusa.com

Canadian negotiators are in Washington trying to reach an interim trade deal with the United States before 50 percent tariffs come into effect next week on a wide range of Canadian products.

US President Donald Trump's administration is set to impose the additional tariffs on Canadian goods in more than 500 product categories, including alcohol, dairy, honey and sports equipment, on Wednesday.

"A 50 percent tariff would probably pretty much cease the export of all those goods," Douglas Porter, chief economist at the Bank of Montreal, told Canadian media.

The goods are related to what Trump calls "discrimination" against US products, including boycotts on US alcohol and Canadian restrictions on dairy imports, which the White House has described as "unreasonable, unequal and discriminatory".

The new tariffs would affect about $20 billion worth of goods, representing about 5 percent of Canadian exports to the US, many of which had been protected from tariffs under the US-Mexico-Canada Agreement.

Energy, potash, fish and critical minerals would be exempt from the new tariffs.

On Tuesday, Canada's minister responsible for Canada-US trade, Dominic LeBlanc, and Chief Trade Negotiator Janice Charette met in Washington with US Trade Representative Jamieson Greer — the third time they had met in three weeks.

"Discussions remain ongoing, and we continue to engage at the negotiation table to firmly advance and defend Canadian interests," LeBlanc posted on X after the meeting.

Greer has said he wants an interim deal with Canada before negotiations continue on renewing the USMCA.

However, the Canadian Broadcasting Corporation, citing sources, reported that Canadian negotiators were unhappy with the latest US offer, noting that the proposal would reduce some tariffs, but not as much as the Canadian side wanted.

Members of a Canadian advisory committee on cross-border trade are reportedly on standby for a Monday meeting, when Canadian Prime Minister Mark Carney is expected to return from a vacation in Italy, sources told Canadian media.

"He is in close contact with his team and officials on several priorities, including the ongoing Canada-US trade negotiations," Carney's office said in a release.

Premier Doug Ford of Ontario, Canada's most populous province and the center of its auto industry, said the country needs to respond if the tariffs are imposed next week.

"If these tariffs proceed, Canada should respond tariff for tariff, dollar for dollar," he posted on social media when the potential new tariffs were announced.

The new tariffs would be imposed under Section 338 of the US Tariff Act of 1930, known as the Smoot-Hawley Tariff Act, which grants the president discretion to combat unilateral trade actions against the US and would be in addition to any other tariffs already in effect.

Since this section has not been used in nearly a century, it is not clear how courts would rule on its legality.

Trump refused to automatically extend the USMCA for another 16 years by the July 1 deadline, which means it must now undergo mandatory annual reviews.

He has already placed tariffs under Section 232 of the Trade Expansion Act of 1962 on autos, steel, aluminum and forestry products.

It is estimated that the new tariffs could cut Canada's GDP by up to 0.5 percent, in addition to a 1.5 percentage point drop in GDP estimated by the Bank of Canada as a result of previous tariffs.

Canadian exports to the US dropped by more than 5 percent last year, while they grew by more than 15 percent to other countries, ATB Financial reported.

Yields at latest Treasury auction reach 25-year high

By SHI GUANG in New York
shiguang@chinadailyusa.com

The US has had to pay the highest interest rate to sell its government bonds in 25 years over concerns about the country's debt load and rising inflation.

At an auction of $25 billion in 30-year Treasury bonds on Thursday, yields reached as high as 5.22 percent, the US Treasury Department said. That is the highest since the 5.52 percent yield in August 2001, the last time the US had a budget surplus.

Last year, the US had a budget deficit of $1.85 trillion, or about 6.3 percent of GDP, a shortfall that has to be made up by the government borrowing money through the sale of Treasury bonds in order to pay for government programs.

"All in all this is problematic for the Treasury. They have to fund the government at more expensive levels," Gennadiy Goldberg, head of US rates strategy at TD Securities, was quoted as saying by Financial Times.

The yield on 30-year Treasurys in a July auction was 5.06 percent, while it was 4.91 percent before Trump's second term began.

David Rosenberg, founder of Rosenberg Research, said that rising bond yields could create a drag on the stock market by harming economic growth.

> "All in all this is problematic for the Treasury. They have to fund the government at more expensive levels."
>
> **Gennadiy Goldberg**, head of US rates strategy at TD Securities

US government debt has grown to almost $40 trillion, near a record debt-to-GDP ratio, and it now pays more in interest charges — about $1 trillion a year — than it spends on its military.

Historian Niall Ferguson has warned that when a country spends more on servicing its debt than on defence — a situation he calls the Ferguson Limit — it is at risk of losing its position as a great power.

"This is because the debt burden draws scarce resources towards itself, reducing the amount available for national security, and leaving the power increasingly vulnerable to military challenge," Ferguson said.

"In the absence of radical reforms of its principal entitlement programs — which successive administrations have ruled out — the only plausible way that the United States can come back within the Ferguson Limit is therefore through a productivity miracle," Ferguson said.

Andrew Szczurowski, strategic income portfolio manager at Morgan Stanley Investment Management, pointed out that foreign ownership of US Treasurys had declined over the past decade from roughly 33 percent to about 23 percent. "There is less official buying" by other governments, he told Market Watch.

However, he said that foreign investors' and governments' diversification from Treasurys didn't necessarily threaten the dollar's status as a reserve currency.

"There is not some other gold standard that is the alternative to the dollar. What do you have confidence in? There is no answer," Szczurowski said.

The US Bureau of Labor Statistics reported on Thursday that the US Producer Price Index rose 4.7 percent year-on-year in July, down from 5.5 percent in June. Combined with a decline in the Consumer Price Index to 3.4 percent in July, that will ease pressure on the Federal Reserve to raise interest rates in the near term to bring down inflation. However, the recent decrease in inflation has been caused mainly by drops in energy and food prices, though service sector prices continue to rise, it reported.

While inflation was down from 3.5 percent in June and 4.2 percent in May, it is still well above the Federal Reserve's 2 percent target.

China, Canada see new scope for green ties

Experts highlight areas where both can combine their complementary strengths

By YANG GAO in Toronto
gaoyang@chinadailyusa.com

Improving relations between Canada and China could open new opportunities for clean energy cooperation, with businesses and experts highlighting electric vehicles, energy storage and critical minerals as areas where the two countries' strengths could complement each other.

The Canada China Business Council is organizing a Canadian Cleantech Mission to China in November, said Bijan Ahmadi, executive director and chief operating officer of the council.

"The mission grew out of increasing interest from Canadian clean-technology companies seeking opportunities in China's rapidly expanding low-carbon economy," Ahmadi said.

Canadian companies often have specialized technologies and expertise, while China offers manufacturing capacity, investment capital and experience deploying clean technologies at scale, he said.

"The renewed Canada-China strategic partnership, with its focus on energy, clean technology and climate competitiveness, provides additional momentum for this engagement," he said.

The mission will help companies understand the Chinese market, meet commercial and investment partners and identify potential projects, he added.

"It is intended to turn broad interest in clean technology cooperation into direct business relationships and commercially viable opportunities," he said.

Jiang Wenran, founding director of the China Institute at the University of Alberta and president of the Canada-China Energy and Environment Forum, said the two countries already have several footholds for cooperation that could lay the groundwork for deeper engagement in clean energy.

PetroChina holds a 15 percent equity stake in LNG Canada, while Chinese battery maker CATL has taken part in three large-scale grid storage projects in Ontario. Chinese company Envision Energy has also signed a strategic cooperation agreement for a 300-megawatt wind-plus-storage demonstration project in Nova Scotia Province, Jiang said.

"These are footholds, not flagship portfolios — but footholds in exactly the right sectors," he said.

Electric vehicles could become one of the most visible areas of renewed cooperation.

Canada's new market access framework allows up to 49,000 Chinese EVs annually to enter the country at the lower tariff rate. Ahmadi said the framework could increase the availability of more affordable EVs for Canadian consumers.

"The larger opportunity is to encourage joint ventures and localized investment in Canada," he said, pointing to potential cooperation in vehicle and component manufacturing, battery systems, charging infrastructure, and automotive software, among other areas.

Jiang said the "deeper level" is joint-venture manufacturing on Canadian soil.

Beyond EVs, both experts underscored a broader division of strengths across the clean energy supply chain. "China is a global leader in batteries and energy storage, electric mobility, solar and wind power, and grid technologies," Ahmadi said.

"Canada brings specialized capabilities in carbon capture, utilization and storage; water and wastewater treatment; land and environmental remediation; waste-to-energy; industrial decarbonization; and materials recovery and recycling."

'Concrete example'

Civil nuclear energy is another established area, Ahmadi said, with Canadian companies supporting the refurbishment and longer-term operation of CANDU reactors in China, providing "a concrete example of sustained Canada-China clean-energy collaboration".

Jiang said energy storage, offshore wind, green hydrogen, civil nuclear energy and uranium trade could provide additional opportunities.

Critical minerals could offer another area of complementarity. Canada has significant reserves of lithium, cobalt, nickel and copper, while China has built extensive capabilities in battery manufacturing and clean energy supply chains.

The potential benefits, the experts said, could extend beyond commercial ties between the two countries.

"The global energy transition requires both technological innovation and the ability to deploy solutions rapidly and affordably," Ahmadi said.

Canada brings a strong scientific and research ecosystem, clean energy resources, and expertise in specialized environmental and emissions-reduction technologies, while China brings manufacturing scale, investment capacity, and extensive experience deploying batteries and renewable energy, he said.

"Combining those strengths can reduce technology costs, accelerate commercialization and make low-carbon solutions more accessible in both countries and in third markets," he said.

Jiang said such cooperation could also have broader geopolitical and climate effects.

"A successful 'Canadian resources plus Chinese manufacturing' model demonstrates to the Global South that resource-rich nations need not choose between Western capital and Chinese technology — they can integrate both," he said.

"In short, the Canada-China clean energy partnership has the potential to become a template for South-North climate cooperation, not merely a bilateral commercial arrangement," he added.

Glowing tribute

An audience watches a drone light show featuring Africa's "Big Five" — lion, leopard, elephant, rhinoceros and African buffalo — in Nairobi, Kenya, on Wednesday. The show, featuring 500 drones, was cohosted by China's Shaanxi Radio and Television Media Convergence Group and Kenya's State Department for Sports. WU XIAOHUI / CHINA DAILY

Reported skipping of Yasukuni Shrine visit a calculated act of geopolitical gesturing

The Yasukuni Shrine, which honors 14 convicted Japanese Class-A war criminals from World War II, is a notorious symbol of Japanese militarism that devastated the Asia-Pacific decades ago.

Yet the reports that Japanese Prime Minister Sanae Takaichi is expected to forgo a visit to the shrine on Saturday — the 81st anniversary of Japan's unconditional surrender that marked the end of WWII — should not be read as an exercise in diplomatic restraint, once the calculations behind the move are laid bare.

Reports suggest that this was not a historical reckoning but a calculated act of geopolitical gesturing — an effort to avoid derailing Japan's carefully cultivated ties with the Republic of Korea. Seoul sits at the hinge of the United States-Japan-ROK security architecture. By avoiding offending Seoul, Takaichi intends to hold the alliance in line with China one of the intended targets. Takaichi's reported skipping of a visit to the shrine is by no means intended reconciliation, but a pointed signal wrapped in diplomatic scheming.

Although Takaichi has not visited the Yasukuni Shrine since taking office as prime minister in October last year, she offered a tribute to it in April and she has visited the shrine more than 10 times over the course of her political career, with the latest being on Aug 15 last year.

Takaichi's posture toward the shrine has always reflected her view of history. She may send ritual offerings and allow Cabinet members to visit in her stead, a move that would be less a gesture of restraint than a cynical balancing act: placate her right-wing support base while insulating herself from the diplomatic fallout. This is a desecration of historical justice and an insult to the victims of Japan's aggression.

The symbolization of the Yasukuni Shrine should be considered alongside changes taking place in Japan's military establishment. The Takaichi government has recently finalized a plan to revise the Self-Defense Forces officers' rank titles to those of the former Imperial Japanese Army before and during WWII. For example, chiefs of staff will change to *taisho*, flag officers to *chujo* and field officers to *taisa*, *chusa* and *shosa*. At the International Military Tribunal for the Far East 80 years ago, more than half of the 28 defendants had the rank of *taisho* or *chujo*. Six of the seven Class-A war criminals executed had these ranks.

Nor should it be ignored that retired Maritime SDF vice-admiral Umio Otsuka has served as the chief priest of the Yasukuni Shrine since 2024, while a former Ground SDF chief of staff sits on the shrine's decision-making body. The Japanese military and the shrine are no longer merely ideologically adjacent, they are institutionally interlocked.

The concern becomes more acute when symbolism is placed alongside policy and action. Japan's 2026 defense white paper has listed the military industry as a pillar industry and a core driver of economic growth, designations that it held during the lead-up to and throughout WWII.

Japan's Ministry of Defense intends to submit a record defense budget request of roughly 8.9 trillion yen ($56 billion) for fiscal 2027, a number that could approach 10 trillion yen after further adjustments. Considering that Japan already outspends China by nearly threefold on a per-capita basis, the continued rapid growth of its military expenditures is deeply unsettling.

As Chinese Foreign Ministry spokespersons have repeatedly warned, Japan has failed to repent its historical crimes while accelerating remilitarization, breaching its pacifist Constitution and challenging the postwar international order.

For Japan's neighbors, an official pilgrimage to the shrine — or even a ceremonial offering — transcends the merely symbolic. It is a stark reminder that Tokyo has not repudiated the intellectual and political currents that once brought catastrophe to the region. If the Takaichi government genuinely wants to improve ties with regional countries, it must abandon its two-faced maneuvering and make a clean break with Japan's militarist past. That is the standard by which Japan's commitment to peace will be judged.

Open-source genie to be let out of bottle

For years, Silicon Valley's reigning orthodoxy, particularly among the trio of closed-source artificial intelligence model developers — OpenAI, Anthropic and Google — held that safety required secrecy. The most powerful models, the argument went, had to stay behind corporate firewalls. Open-source systems were "dangerous", likened to "selling nuclear weapons in retail stores". That narrative was always convenient for those who profited from closed-source models.

Then came the Hugging Face incident last month, when the world's largest open-source AI community was hacked by a closed-source model that was able to "jailbreak" its constraints. When Hugging Face's security team reached out to closed-source vendors in the United States for help, it was reportedly turned away; their own guardrails prevented them from assisting with offensive cybersecurity operations. The crisis was ultimately resolved not by a US closed-source model, but by China's open-source GLM-5.2.

The safety narrative was never about safety — it was about protecting a lucrative business model: concentrating technological power, extracting premium pricing and letting a handful of companies decide who gets access to transformative AI. OpenAI alone is projected to burn $25 billion this year. That kind of spending demands monopoly-like pricing — and the argument that only closed-source models can be trusted serves that purpose.

Meanwhile, China's open-source models have been making inroads. Chinese models reportedly occupy the top five spots in global API call volume, and US enterprises are increasingly turning to Chinese models because they offer comparable performance at a lower cost. When a Chinese model can perform a task for a fraction of the price of a leading US model, it is worth asking who in the US truly benefits from the country's expensive closed-source models.

That is exactly the question Mark Zuckerberg posed in a 14-page manifesto posted on Monday, and for once, it steered clear of the usual metaverse-fueled reverie. Instead, he laid out a sobering strategic calculation: the US must urgently recalibrate its approach to AI — or risk ceding ground to foreign competitors. For Chinese AI companies, this should be read not as a philosophical treatise, but as a warning shot.

The Meta CEO's post, "The Future is for Everyone", is less a humanitarian vision than a competitive road map. Zuckerberg warns that restrictions on US AI companies are handing advantages to foreign competitors, calling on Washington to lower barriers for US open-source developers.

Of course, Zuckerberg's embrace of open source is self-serving. Meta's business has always run on scale, not direct model monetization, and the tepid reception to Llama 4 gave him every incentive to change the narrative. But his diagnosis is clear: the doom-and-gloom argument that AI is so dangerous that power must be concentrated in a few hands was always politically convenient rather than valid. Concentrating control over a technology so consequential is not just economically inefficient — it is a governance risk.

Washington appears to be listening. A new policy framework reportedly exempts open-source models from some voluntary prerelease safety testing, while the US administration has signaled that open-weight models will not face the same scrutiny as closed systems. But US developers still face restrictions — on training data and other fronts — that foreign competitors may not share. Zuckerberg is pressing to remove those frictions.

For Chinese AI companies, the implications are evident. The US is preparing to unleash its open-source ecosystem in earnest. The contest is no longer about which country builds the smartest model; it is about which can build the most resilient ecosystem — hardware, software, talent, capital, governance and applications, all in a self-reinforcing cycle. China's ecosystem has shown resilience under pressure, with US restrictions often accelerating indigenous innovation. But after the US embraces open-source models, the competition will necessarily become tougher and more systematic.

Zuckerberg's Muse Glimmer, designed to run on a single graphics card, offers a glimpse of what a more accessible and aggressive US open-source push could look like. China's cost efficiency, infrastructure investment and the integration of industry, academia and government have created a reliable flywheel — but that flywheel is about to face a reinvigorated adversary.

The open-source genie is about to be let out of the bottle. For Chinese AI companies, the time to prepare for a more capable US open-source offensive is now — not when the first US model arrives at their doorstep.

Equilibrium between traditional and new drivers key for growth

China's transition from old to new growth drivers is gathering pace. A key task in the next stage is to strike a balance between fostering new growth drivers and upgrading old ones, using artificial intelligence, digitization and green technologies to transform traditional industries.

The July 30 meeting of the Political Bureau of the Communist Party of China Central Committee highlighted the growing momentum from new sources of growth while acknowledging the structural challenges facing China's pursuit of high-quality development.

The meeting called for faster progress in shifting from old to new growth drivers in the second half of the year. It also urged policymakers to maximize the effect of existing measures while rolling out targeted new policies in a timely manner.

In the first half of the year, new growth drivers, represented by high-end manufacturing, the digital economy and modern services, contributed more than 40 percent to China's economic growth. Emerging industries such as artificial intelligence, integrated circuits and new energy vehicles performed strongly in production, investment and exports, accelerating the shift from old to new growth drivers.

Specifically, value-added industrial output in equipment manufacturing for enterprises above designated size grew 9.3 percent year-on-year in the first half, while high-tech manufacturing expanded 13.3 percent — 3.9 and 7.9 percentage points faster, respectively, than the 5.4 percent growth recorded by industrial enterprises above designated size. In contrast, real estate development investment fell 18 percent over the same period.

This divergence highlights the profound structural transformation underway as China moves away from a growth model driven by high investment and high consumption of resources toward one powered by digitization, intelligent technologies and green development. While the transition may bring short-term challenges, it is creating new opportunities.

Importantly, new growth drivers are not limited to emerging and future industries; traditional sectors can also generate fresh momentum through technological upgrading and transformation. Achieving this balance will require coordinated efforts to cultivate emerging industries while revitalizing traditional sectors.

The new drivers — although they have emerged as the primary engines of growth in industrial value-added output and some modern service sectors — have yet to become a dominant force across the economy.

The traditional industrial drivers must be upgraded along with the accelerated development of a modern industrial system. For example, on the application side, expanding affordable access to computing power and AI technologies would enable more companies to accelerate their digital and intelligent transformation. This would strengthen the foundations of the real economy while creating new sources of industrial competitiveness.

High-tech and traditional industries are mutually reinforcing forces. High-tech industries provide the technologies needed to upgrade traditional sectors, while traditional industries offer diverse application scenarios for emerging technologies.

China should seize the opportunities created by the rapid growth of high-tech industries and encourage local governments to integrate technological and industrial innovation based on local strengths and conditions. By pursuing differentiated development, regions can build industrial ecosystems in which complementary strengths and synergies generate new growth opportunities.

Strengthening long-term, stable support for basic research will help continuously enhance China's innovation capabilities and lay a solid technological foundation for accelerating the development of a modern industrial system. The country should focus on cutting-edge fields, continue to optimize the structure of investment in basic research, further streamline the chain for transforming innovation outcomes into practical applications and deepen the integration of innovation and industry chains.

— JIANG XUEQING, CHINA DAILY

What They Say

Canal will boost trade, vitalize regional economy

Editor's note: *Vessel trials on the Pinglu Canal began on Wednesday, marking a key step toward the full opening of the waterway planned for September. China News Service interviewed Ni Yuping, vice-dean of the School of Humanities at Tsinghua University, to understand the significance of the Pinglu Canal. Below are excerpts from the interview. The views don't necessarily represent those of China Daily.*

A visit to the Madao hub on the Pinglu Canal showcases an impressive feat of modern engineering. The canal, equipped with advanced sluice-and-lock technology and abundant southern Chinese water resources, ensures year-round, all-weather navigation. The project reflects a construction philosophy that adapted to the local conditions and leveraged scientific and technological advancements, so as to support regional development.

The Pinglu Canal will help enhance water transport in the southwest, reshaping the regional waterway network. Future projects, such as the planned Yongzhou-Guilin Canal, will further strengthen China's inland waterway system.

Unlike international canals such as the Panama and Suez canals, which primarily facilitate ocean-going transit, the Pinglu Canal is a multifunctional waterway that supports both domestic inland transport and international trade. Domestically, it connects China's vast southwestern hinterland, including Yunnan, Guizhou and Sichuan provinces, and Chongqing. Internationally, it opens to the Beibu Gulf, linking with global shipping routes.

The canal will boost both waterborne and land-based trade, fostering continuous exchanges among the diverse ethnic communities of Southwest China. This will deepen interethnic interactions and integration through economic connectivity. Additionally, cross-border trade and exchanges will act as a cultural bridge, extending the canal's influence from the Guangxi Zhuang autonomous region to the countries of the Association of Southeast Asian Nations and the international community at large.

Once the canal begins operations, industries along its route — such as logistics, shipping, culture and tourism, and trade — are expected to flourish, creating numerous jobs and enabling local residents to work nearby and diversify their income. As industries, capital and talent converge in Guangxi, increased local fiscal revenue will be reinvested into public services and infrastructure, improving livelihoods across the region. Upon completion of the Yongzhou-Guilin Canal, China's inland waterway system will form a closed loop, further enhancing people's quality of life.

The Pinglu Canal provides the shortest waterway for southwestern regions to access the sea, reducing cross-border logistics costs between China and ASEAN countries and serving as a crucial lever for optimizing the bilateral supply chain.

Lower logistics costs will draw domestic and international trading companies to establish operations in Guangxi. Bulk commodities from ASEAN countries, such as minerals and agricultural and forestry products, will enter the canal through the Beibu Gulf and be efficiently distributed to China's southwestern hinterland and national market. A stable cargo supply will ensure the long-term success of the canal's shipping operations.

The canal offers significant development benefits to Southeast Asia. It reduces bilateral trade costs, enhances economic gains for both China and ASEAN countries and fosters mutually beneficial trade cooperation. Besides, regular commercial exchanges improve mutual understanding, highlight China's commitment to peaceful development, and strengthen bilateral cooperation. In addition, the movement of goods and people accelerates cultural exchanges and integration among regional civilizations, promoting coordinated development.

VIEWS

Arvea Marieni

New ecological code to drive green growth

The stakes are unmistakable. This year, wildfires have burned close to half a million hectares of woodland across the European Union, while rivers ran too low and too warm to cool the nuclear reactors on their banks, forcing reductions in electricity generation as water restrictions spread.

Fire, water and electricity are not three problems but one, climate change. At the same time, the loss of ecosystem services threatens economic viability itself.

The European Central Bank found that 72 percent of euro-area companies are critically dependent on at least one ecosystem service, with water scarcity alone putting up to 24 percent of output at risk.

China's Ecological and Environmental Code, which enters into force on Aug 15 — the National Ecology Day — therefore deserves attention, less as a domestic achievement than as an institutional experiment whose results matter well beyond China.

Adopted by the National People's Congress in March, the 1,242-article code has five chapters, covering areas including pollution control, ecological protection and green and low-carbon development.

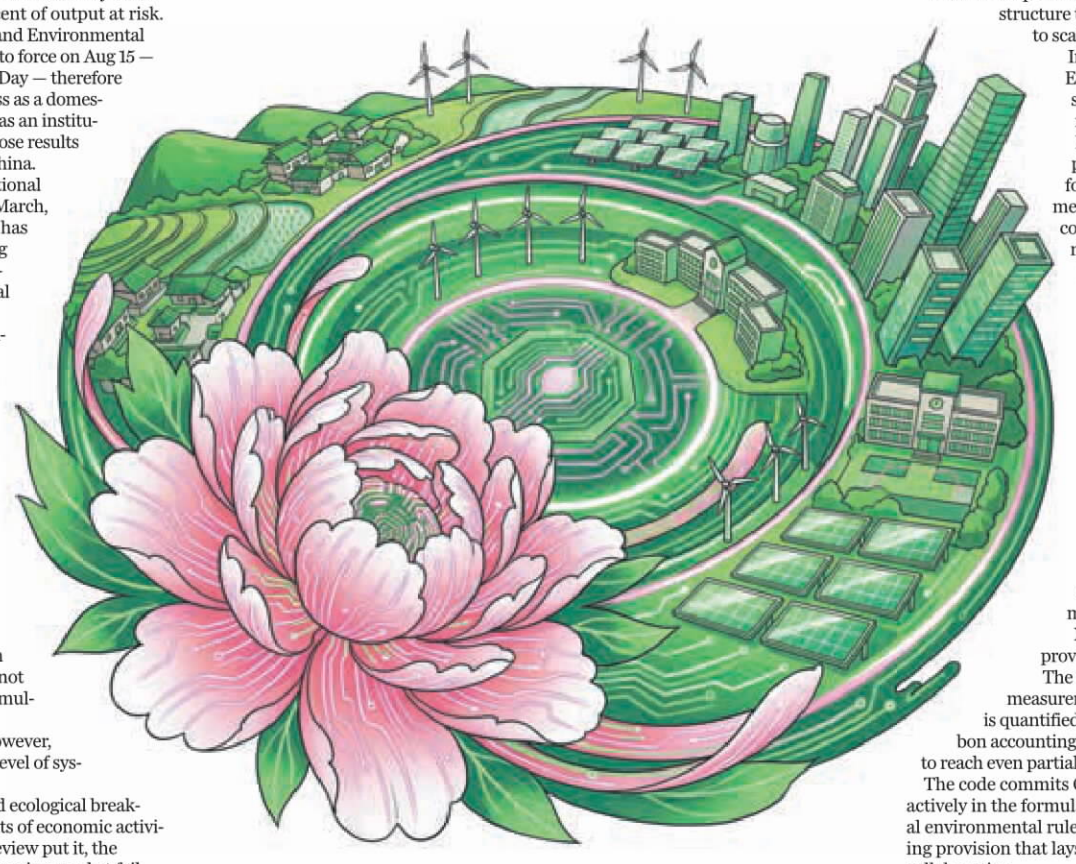
It is China's second legal code, after the Civil Code.

What distinguishes it is its systems-engineering approach, reflecting China's emphasis on coordinated environmental governance. Regulation accumulates in silos — air, water, soil, then waste — and silos do not solve problems; they multiply them.

The deeper flaw, however, lies upstream, at the level of system design.

Climate change and ecological breakdown are not accidents of economic activity but, as the Stern Review put it, the greatest and widest-ranging market failure ever seen: a price system that records what is extracted and says nothing about what is destroyed.

Correcting it is a design problem. EU analysis finds that over 80 percent of a product's lifetime environmental impact is fixed at the design stage.



Damage prevented costs a fraction of damage repaired. The code mainstreams environmental performance into industrial processes and sectoral policy rather than confining it to an annex.

Two provisions stand out.

The first are those on green and low-carbon development. Carbon peaking and neutrality objectives become a statutory foundation, under the guidance of the Communist Party of China Central Committee and the State Council.

This reflects a judgment that decarbonization and pollution control are the same task seen from different angles.

The second are those establishing the ecological compensation system: fiscal transfers to localities conserving important ecological assets, horizontal compensation negotiated between regions that benefit and regions that protect, and an obligation on governments at the county level and above to build stable funding.

MA XUEJING / CHINA DAILY

Global Lens

Fire, water and electricity are not three problems but one, climate change. At the same time, the loss of ecosystem services threatens economic viability itself.

Its placement in the General Provisions, beside monitoring and standards, marks it as structural rather than supplementary.

Under the Beautiful China assessment measures introduced in May 2026, provincial governments are graded on a 100-point scale across responsibility, annual targets, key tasks, fund use and public satisfaction, making their obligations measurable.

Behind all this lies the harder question of our time: how to redesign the economy so that sustainable models are financially viable. How China resolves that tension will matter to global markets.

Shangyou county in East China's Jiangxi province sits in the upper catchment area of the Ganjiang River.

Its forests are largely intact and the services they supply are of national significance. It also has schools to run and roads to maintain. Its officials face two questions: How to protect the local ecology while pursuing economic development? And how does the value it produces for others appear in its own accounts?

Shangyou has begun to answer: It has built an institutional chain that turns the ecological product value of a specific geographical unit into a bankable asset.

The province has issued its first such loan on this basis, 200 million yuan ($30 million), secured on the projected ecosystem service value of Bijiashan ecological industrial park.

It is an example of the accounting infrastructure the code is designed to scale.

In July 2025, the European Commission published a roadmap towards Nature Credits, proposing certified units for verified improvements in ecosystem condition, so that land managers can be paid for what they protect.

The diagnosis is the same as in Shangyou: what markets cannot see, they will not fund. China and Europe are working on the same problem with different instruments — codified obligation and fiscal transfer, certification and markets.

Neither has yet proved itself at scale.

The common ground is measurement: how a service is quantified and verified. Carbon accounting took three decades to reach even partial comparability.

The code commits China to participate actively in the formulation of international environmental rules — an outward-facing provision that lays the ground for collaboration.

The 11th EU-China Environment Policy Dialogue took place in Brussels in June and the 7th High-Level Environment and Climate Dialogue follows later this year.

While methodology makes for a dull communiqué, common green standards are foundational to solve shared challenges.

Implementing regulations, accounting methods and cross-departmental coordination will take years to put in place. The code is an ambitious foundation, not a completed building.

But a foundation well laid is worth a great deal — and this summer has shown what the alternative costs.

The author is the European Climate Pact Ambassador in Belgium. Academician Wang Jinnan, a direct contributor to the drafting of the Ecological and Environmental Code and a member of the National Committee of the Chinese People's Political Consultative Conference, also contributed to this article.
The views don't necessarily reflect those of China Daily.

Zhu Xinkai

Crafting a holistic strategy for rural renewal

To truly understand China, one must first grasp the concept of *sannong*, a term that encapsulates three intertwined elements: *nongye*, or agriculture, *nongcun* or rural areas, and *nongmin* or farmers. These are not separate components but deeply interconnected facets of a singular entity.

In English, one might list them as "agriculture, rural areas and farmers", but this fails to convey the unified concept that *sannong* represents.

By combining the three aspects, the term signifies a holistic view.

The reason is simple: these are not three separate issues. Their interconnectedness becomes evident when policies targeting any one of them inadvertently impact the other two. For instance, efforts to consolidate agricultural land and increase output can hollow out villages and push landless farmers to cities.

Thus, a policy aimed at solving the agricultural problem may inadvertently trigger a crisis in rural areas and among farmers. The three components are intrinsically linked, and it is futile to optimize one without considering the other two.

Yet, modern academics do exactly that. Agricultural economics focuses on farming, rural sociology examines village life, and political science studies the peasantry. While each field offers good insights, the comprehensive perspective that *sannong* requires often falls through the cracks between the disciplines.

It's important to note that Sannongology is not a prescriptive set of solutions, but a research agenda with a theoretical foundation.

This is where Sannongology comes into the picture. It is an initiative to bridge the gap and further develop the conceptual framework embodied in *sannong*.

Sannongology is built on two foundational pillars.

The first pillar is a system of analytical categories. It comprises seven elements, including mode of production, property rights, markets, region, human-nature relations, state-society relations and nation-world relations. These categories are not a checklist but a conceptual coordinate system that guides researchers to focus on the interactions among them: how a shift in production affects property rights, markets and human-nature relations, and how these tensions change over time.

The critical task is to trace these interactions and identify which tensions are most influential at any given time.

The second pillar is a theory of the state as the entity responsible for addressing *sannong*. This theory interprets state action through four elements. The first is goals, such as food security, economic growth and social protection. The second is channels, which align with the seven categories of the first pillar.

They are the lens through which the problem is seen and also the levers by which the State addresses it. The third is measures, the concrete actions taken within each channel. The fourth is mechanisms, or how these elements are sustained and coordinated over time, especially when the goals conflict with one another.

If one looks at food security through this frame, China's strategy is not merely about increasing yields. It involves coordinated actions across several categories: protecting farmland and clarifying land rights (property rights), developing socialized services and integrating the supply chain (mode of production), setting up processing in main producing areas (region) and building brands nearer to the consumer (markets). None of these measures are effective in isolation. Their effectiveness comes from being pursued together.

China's approach has two notable features. The first is a division of labor across the government levels: the central government sets non-negotiable limits, such as minimum farmland requirements, while local governments have the discretion to adapt policies to local conditions. The second is a culture of experimentation, where policies are first piloted, results are evaluated, and then scaled up only if they are successful.

It's important to note that Sannongology is not a prescriptive set of solutions, but a research agenda with a theoretical foundation. It is not intended to replace established disciplines such as agricultural economics and rural sociology.

Rather, it draws on all of them to address the rural sector as a whole within the broader context of modernization, providing a framework that has been missing between existing disciplines.

Moreover, it is not a model that can be replicated or exported. The results revealed by applying the framework will differ from place to place, depending on local conditions and challenges.

In some countries the binding tension may lie in property rights and social structure, while in others it could be between large-scale farming and the natural environment, or the dependence on a single export crop. The same frame, but different tensions and different solutions.

Ultimately, Sannongology raises essential questions for any country: Is the rural sector a single entity or three distinct ones? If it is one, do you have the tools to address the issues it faces? And if the state is the ultimate agent of change, do you have a robust theory to guide its actions?

Navigating the cultural diversity of global dining

Last weekend, I dined with friends at a popular restaurant in Pudong, known for its traditional Shanghai cuisine. About 40 minutes into our meal, the owner came over and asked how we liked the food.

Having spent 16 years abroad, my instinct was to respond with a polite "great", even if the food was not exceptional. It is a common practice to tell a white lie in such situations.

In my years abroad, I have advised fellow Chinese that when greeted with "How are you doing?" they should simply reply "Fine, thank you, and you?".

Most people do not expect a lengthy conversation about your health or something else that has gone wrong in your life unless you are speaking with close friends.

The food that day was indeed authentic and delicious, and I would definitely recommend the restaurant to others.

Fortunately, we had made reservations, as there was a long line of guests waiting for a table.

Unlike me, one of my friends started to talk like a food critic. She pointed out to the owner that the grilled cuttlefish in brown sauce could be more tender, and then moved on to critique another dish.

I felt a bit embarrassed by her candor and looked at the owner almost apologetically. However, the owner did not seem upset at all. He listened attentively to my friend, thanked her for the suggestions and promised improvements.

The conversation was cordial, and at the end, the owner thanked us again and offered us a complimentary *babaofan*, or eight-treasure rice pudding. We gladly accepted.

Whether eating with chopsticks, forks and knives, or bare hands, these are just different traditions and should be respected.

This experience was a reverse culture shock for me after being abroad for so long.

I occasionally wrote restaurant reviews 20 years ago when I worked at the Shanghai Star, a China Daily-owned tabloid. I understand the importance of honest restaurant reviews.

In the US and Europe, while customers often say "everything is great" at the restaurant, online reviews on platforms like Google could be quite different.

I frequently look at such reviews before picking a restaurant.

In China, some restaurants now offer rewards to customers who give five-star ratings on Dianping that is a popular restaurant guide and lifestyle platform.

This means five-star reviews are less reliable now because they may not tell the whole story.

Dining in a restaurant in China is a very different experience compared to the US and Europe. Restaurants in China can be quite noisy unless you are in a private room. I prefer quietness, but talking in whispers in some Western restaurants also makes me uncomfortable.

For many Chinese, Japanese and Koreans, eating noodles in Western countries can be challenging, as slurping is considered rude. But in East Asia, the same loud sound means you are actually enjoying your meal.

When I shared this with Bill, my US colleague in China Daily's New York office, he was amazed.

I explained that while I try to minimize the sound, I wouldn't suppress it completely because it would take away the pleasure of eating good noodles, especially in a Chinese noodle restaurant in New York.

I argued why it was acceptable for US people to blow their noses loudly in restaurants in New York while East Asians shouldn't slurp their noodles.

I recall my student days at Fudan University in Shanghai when the old woman running a wonton and noodles stand near my dorm would quietly mock foreign students who ate noodles in very small bites to avoid slurping them. "They don't know how to eat noodles," she would laugh.

There is no superiority in these cultural differences. Whether eating with chopsticks, forks and knives, or bare hands, these are just different traditions and should be respected.

This diversity is the beauty of our world.

GLOBAL VIEWS

Editor's note: *The world has undergone many changes and shocks in recent years. Enhanced dialogue between scholars from China and overseas is needed to build mutual understanding on many problems the world faces. For this purpose, the China Watch Institute of China Daily and the National Institute for Global Strategy, Chinese Academy of Social Sciences, jointly present this special column: The Global Strategic Dialogue, in which experts from China and abroad will offer insightful views, analysis and fresh perspectives on long-term strategic issues of global importance.*

GWENN SONCK

Staying engaged

China is an important partner for the EU in shaping the global AI landscape

Artificial intelligence is no longer a future promise. It is becoming part of industrial policy, economic strategy and global governance all at once. For the European Union and China, that means the relationship is not only about trade or technology exchange. It is increasingly about how both sides position themselves in a world where AI is becoming a basic layer of competitiveness.

China's innovation trajectory explains why this matters. In the Global Innovation Index 2025 report released by the World Intellectual Property Organization, China entered the world's top 10 for the first time in the global innovation ranking, reflecting strong performance in knowledge and technology outputs, R&D spending and innovation clusters. Its innovation strength is visible not only in the ranking itself, but in the pace at which ideas are translated into industrial use.

What makes China especially relevant now is that AI is being treated as a strategic priority, not a standalone sector. A three-year plan issued in June aims to accelerate AI integration across the information and communications sector, with targets for more autonomous networks, broader computing-power coverage and expanded AI applications by 2028. That is a clear signal that China sees AI as a tool for upgrading industry, improving productivity and strengthening the country's long-term competitiveness.

For the EU, that should be a reason to stay engaged. China is still a major market, but it is also an innovation ecosystem where new technologies are tested and scaled quickly. More and more European companies are no longer present in China only to sell products. They are there to learn from the speed of development, benchmark their own performance and remain close to where innovation is moving fastest.

Breakthrough technologies such as AI and quantum computing are advancing rapidly. At the same time, AI-intensive industries, software companies and pharmaceutical companies continue to raise their research spending. The next wave of innovation is likely to come from actors that keep investing even when the broader climate is more cautious.

China is already central to that wave. Chinese AI labs are releasing open-weight models that are increasingly competitive with the leading systems of the United States, often at lower cost. That does not settle the AI race, but it does show that leadership is becoming more distributed. The EU cannot shape the future of AI if it remains outside the main centers of development.

Governance is the other half of the picture. On July 16, 29 countries signed an agreement in Shanghai to establish the World Artificial Intelligence Cooperation Organization. The new intergovernmental body is headquartered in Shanghai and is intended to support international cooperation on AI. Its creation shows that it is necessary for China to play a role not only in building AI systems, but also in shaping the rules around them.

SHI YU / CHINA DAILY

That should matter to the EU. The EU has a vast market for AI applications, a solid research foundation and experience in setting trust frameworks. China brings scale, speed and industrial depth. Those strengths are different, but they are compatible. On issues such as safety testing, model evaluation, data governance and industrial deployment, there is room for concrete cooperation. The 12th CEIBS Europe Forum in Brussels was a useful reminder of that point. Its theme, "Competition or Complementarity? Strategic Opportunities in EU-China AI Development", captured the issue well. AI is now a matter of industrial policy, talent, governance and competitiveness, not just algorithms.

The EU and China do not need identical political systems or fully aligned policy agendas to work together. They need enough trust to keep channels open, enough curiosity to learn from each other and enough realism to focus on practical questions. How do we test powerful models? How do we ensure data security without blocking research? How do we support innovation while managing risk? These are the questions that will define the next decade.

The case for engagement is therefore straightforward. China is now too important to ignore in any serious discussion about the future of AI. The EU, for its part, has to be aware of the fact that its cooperation with China is mutually beneficial if it approaches the relationship with confidence. In a fragmented world, the responsible choice is not separation, but disciplined engagement.

Despite rising geopolitical uncertainties, Europe and China can complement each other strongly in terms of markets, industrial capabilities, and innovation ecosystems. China serves as a crucial market and innovation hub for European companies, whose deep engagement in the Chinese market is vital for maintaining their global competitiveness.

And AI will not be shaped by one country, one company or one region. It will be shaped by those willing to build bridges across systems, combine strengths and work through difficult questions together. For the EU and China, the conversation should continue and AI cooperation between the EU and China should be encouraged — not because it is easy, but because it is necessary.

YAN BINGQIAN

Breaking the resource curse

Once a county living off coal, Fenxi has successfully transformed its economy, providing referential experience for other regions

The economic transformation of resource-dependent regions has long been a global challenge amid industrialization and industrial restructuring.

Fenxi county in Shanxi province was once a textbook resource-based county living off coal. But as China's development model shifted and the government pushed to optimize the country's industrial layout and raise industrial concentration through coal resource consolidation policies, Fenxi's coal enterprises were shut down entirely in 2009. Fiscal revenue, long dependent on coal, plunged, employment pressure spiked and large numbers of workers from the coal sector and related services urgently needed new jobs. Fenxi had to find new sources of growth.

Faced with this crisis, the local authorities prioritized industries with comparative advantages, such as broiler chicken farming and Yulu fragrant pear cultivation, charting a distinctive development path, in which agriculture replaced coal as the county's economic mainstay.

The local government has placed strong emphasis on integrating research with industry — its broiler chicken industry partnered with Shanxi Agricultural University to establish a "Science and Technology Backyard", building laboratories on-site at chicken farms to develop breeding techniques, smart environmental control, green production, and food processing technologies across the full value chain, creating a seamless link from lab to production line.

Fenxi has also carried out a vocational skills upgrading campaign, training more than 7,000 people and turning many former miners into skilled poultry farmers and pear growers.

As this industrial transition has unfolded, new growth drivers have taken shape in Fenxi, and a more diversified development pattern is beginning to emerge.

The broiler chicken industry brought in leading agribusiness and food enterprises for joint restructuring, investing 37.5 million yuan ($5.55 million) to upgrade the industry chain and build a smart digital factory powered by 5G and the industrial internet technologies, raising the annual chicken output from six batches to seven.

The poultry industry generated more than 1 billion yuan in output value in 2024, and has extended into rural areas, channeling the added value increasingly back to farmers.

The Yulu fragrant pear industry, meanwhile, has adopted a model combining intensive development, standardized management, and integrated production, storage, and sales, with enterprises and farming households splitting profits on a 35:65 basis. Specialized cooperatives have pioneered a land-for-shares model, turning barren hillsides into new industrial parks. The pear industry has also brought in advanced techniques from Shanxi Academy of Agricultural Sciences to raise product quality through standardized management.

Tapping ecological value has proved an effective path for Fenxi's industrial upgrading. Environmental protection facilities have been built simultaneously with the broiler chicken industry, implementing manure and waste utilization to effectively control pollution while improving resource use efficiency. The Yulu fragrant pear industry has promoted green technologies such as organic fertilizer substitution, and obtained pollution-free, green food and geographical indication certifications.

The upgrading of these industries has also driven the expansion of production factors into new spaces. Leveraging the global market networks of leading enterprises, Fenxi's broiler chicken products have been exported to markets such as the Middle East and Southeast Asia. The Yulu fragrant pear industry has partnered with the Chinese Academy of Agricultural Sciences and Shanxi Academy of Agricultural Sciences to broaden distribution channels, with products sold to first-tier cities across China and exported to Canada and Malaysia.

The emergence of these new industries has also cultivated new talent. The broiler chicken industry chain has directly created more than 100 jobs, and indirectly channeled 15,000 people across the county into related occupations. The Yulu fragrant pear industry cooperatives employ 168 people on a fixed basis and 522 people seasonally.

Fenxi's experience offers several key lessons for other resource-dependent regions.

First, breaking free from resource lock-in requires effective coordination between external shocks and internal responses. The coal resource consolidation policy served as an external shock that broke apart the old technology-institution complex, but Fenxi did not passively wait it out. It actively identified shifts in local factor endowments and turned external policy pressure into an internal driving force for industrial restructuring.

Second, unlocking "dormant assets" is crucial to making comparative advantages dynamic. Rather than abandoning its local resource endowments altogether, Fenxi rediscovered and activated underused land, ecological and labor resources, turning its natural landscape into assets with market value.

Third, regional transformation requires building an "embedded" institutional network. Fenxi's experience shows that the government should neither try to do everything nor be absent. It should instead draw up plans, introduce policies, and build cooperation platforms that effectively link leading enterprises, research institutions, cooperatives and farming households into a network built on shared benefits and risk.

YANG MEINI / FOR CHINA DAILY

Fourth, the core of industrial restructuring lies in achieving an "adaptive transformation" of the workforce. Turning miners into skilled poultry farmers or pear growers is not simply a matter of retraining; it also involves reshaping identity and social value, which is essential to giving the transformation a solid social foundation.

There is no one-size-fits-all blueprint for transforming resource-dependent regions, but Fenxi's experience shows that combining a capable government with an effective market, while building new industries on the foundation of local resource endowments, offers a path worth pursuing further — one that can help such regions break free from the "resource curse" and achieve high-quality development.

Auto exports surge; BRI mkts hottest

Sales of China-made cars overseas surpassed 1 million in June alone

By **REN QI**
renqi@chinadaily.com.cn

China's automobile exports experienced robust growth in the first half, with new energy vehicles emerging as a major driving force, particularly in markets involved in the Belt and Road Initiative, industry data showed.

From January to June, China exported 1.135 million NEVs to BRI partner countries, representing a remarkable year-on-year increase of 59.4 percent, said the General Administration of Customs, citing data from the China Association of Automobile Manufacturers.

During the same period, the total export value of autos and auto-related parts to these regions reached $83.67 billion, up 30.8 percent year-on-year. This accounted for 57.5 percent of the country's total autos and auto-related part exports. In terms of volume, exports of finished vehicles to BRI partner countries stood at 3.381 million units, jumping 48.1 percent from a year earlier.

This vehicle export boom aligns with the broader strengthening of trade ties. Customs data revealed that China's total imports and exports with BRI partner countries reached 12.97 trillion yuan ($1.92 trillion) in the first half, up 14.8 percent year-on-year and accounting for 50.9 percent of the nation's total foreign trade.

On a broader scale, China's total auto exports in the first half reached 5.31 million units, surging 53 percent year-on-year. The momentum was particularly strong in June, when monthly exports surpassed the 1-million mark, reaching 1.037 million units.

NEVs continued to be the star performers in the global market, with total exports of such vehicles in the first six months skyrocketing by 120 percent to 2.355 million units. In June alone, NEV exports soared 160 percent to 523,000 units, making up 50.4 percent of total auto exports for the month. This milestone indicates that one out of every two vehicles exported by China in June was a new energy vehicle.

New energy vehicles await shipment at Taicang Port, Jiangsu province. JI HAIXIN / FOR CHINA DAILY

The stellar half-year performance builds upon China's solid foundation in the global auto market. In 2025, China exported a total of 7.098 million vehicles, up 21.1 percent year-on-year, maintaining its position as the world's largest auto exporter for the third consecutive year.

Global automakers are actively leveraging this robust ecosystem. Grace Tao, vice-president of Tesla, said China remains one of the company's most vital markets, with its layout extending beyond sales to encompass manufacturing, research and development, supply chains, charging networks and energy-related businesses.

"The Shanghai Gigafactory is a crucial base in Tesla's global manufacturing and export system, and the Shanghai Megafactory has further extended our layout from vehicles to energy products," Tao said.

She said vehicle manufacturing resembles a relay race requiring strong team coordination, noting that the localization rate of components at the Shanghai facility now exceeds 95 percent. Tesla currently partners with over 400 Chinese tier-one suppliers, more than 60 of which have entered its global supply chain.

Tao emphasized that China's advantage lies not just in its massive scale, but in its rapid pace of change, seamless collaboration and swift implementation of innovations. The global debut of the Model Y L in the Chinese market demonstrates the increasingly important role of the local team and supply chain. She added that the Chinese market is a "must-have" for the company, featuring a resilient supply chain and continuous innovative momentum that makes it hard to find a "second China".

Strategic pivots transforming KBC's business, finances

By **LI JING** in Yiyang, Hunan
lijing2009@chinadaily.com.cn

At a factory in Yiyang, Central China's Hunan province, a carbon-ceramic brake disc made by KBC Corp Ltd is light enough to lift with one hand. Yet, as company executives readily admit, the true challenge is producing tens of thousands of them with the microscopic precision demanded by global automakers.

Nearby, KBC's next breakthrough appears deceptively simple — a black sheet less than half a millimeter thick, that resembles delicate traditional Chinese Xuan paper.

While the brake disc is already fitted onto mass-produced electric vehicles, the sheet — carbon paper vital for hydrogen fuel cells — is undergoing customer validation and initial deliveries. Together, they demonstrate how KBC is leveraging two decades of carbon-materials expertise to pivot beyond its traditional base in photovoltaic manufacturing.

"For more than 20 years, we have focused on just one thing," said Dai Chaohui, president of KBC. "We are now using our accumulated expertise to unlock new, high-value applications."

This strategic shift is reshaping KBC's finances. Photovoltaic products, which generated 990 million yuan ($146.7 million) in revenue in 2023, fell to 175 million yuan by 2025 amid broader solar sector realignment.

Meanwhile, its transportation and lithium-battery businesses surged to 615 million yuan, accounting for 76.6 percent of total revenue.

Making a carbon-ceramic disc requires weaving carbon fibers into a 3D skeleton before infusing it with carbon and molten silicon. The result is an ultra-tough composite offering high friction stability and heat resistance. Unlike foreign competitors predominantly using short fibers, KBC's flagship discs rely on continuous long fibers to achieve greater strength and toughness.

Weighing more than 60 percent less than traditional cast-iron brakes, KBC's discs significantly reduce unsprung mass, improve handling and help extend battery range. While prohibitive costs once kept this space-age technology confined to supercars, KBC's integrated manufacturing and self-developed furnaces have slashed production costs to roughly one-fifth of overseas levels.

This enables the technology to move from million-yuan hypercars to EVs priced under 400,000 yuan.

"Making one disc in a laboratory is simple," said Wang Hua, general manager of KBC's composite materials business. "Controlling industrial stability on the factory floor is the real challenge." KBC now holds more than 80 percent of China's market for passenger cars fitted with carbon-ceramic discs as standard.

"The key is not the material alone," added Li Jun, KBC's chief engineer and senior vice-president. "It is the integration of materials, equipment, engineering and process management into a single, unified system."

Market analysts see vast room for growth. Huayuan Securities projects China's automotive carbon-ceramic brake market will expand from 7.9 billion yuan in 2025 to 21.5 billion yuan by 2030.

To meet this surging demand, KBC currently has an annual capacity of 400,000 discs — enough for 100,000 vehicles — with plans to double that capacity.

While gross margins remained slim during early scale-up, executives estimate economics will improve significantly once annual applications exceed 200,000 vehicles.

Carbon paper represents KBC's next frontier. Serving as the gas-diffusion layer at the heart of hydrogen fuel cells, it must simultaneously conduct electricity, transport gases and drain water.

To achieve roll-to-roll production without material warping, KBC built a 50-meter-long furnace operating at up to 2,400 C. In customer tests, KBC's carbon paper has outperformed imported benchmarks while cutting costs by more than 20 percent, according to the company.

"Lower costs from mass production are inevitable, but what customers care about most is technology-driven cost reduction," said Long Peng, deputy general manager of KBC's hydrogen subsidiary. Although currently being delivered in small batches, domestic carbon paper is projected to capture a growing share of China's hydrogen market by 2030.

Investors bullish on hard-tech industries

Foreign financial institutions are seeing a stronger investment case for China's hard-tech industries as breakthroughs in artificial intelligence, semiconductors and advanced manufacturing drive an increase in exports and earnings, resulting in growing interest from global investors.

China's high-tech exports surged over 50 percent year-on-year in July, well ahead of the 17.8 percent growth in total exports, customs data show. The export gains are being mirrored in investment flows, with foreign funds moving into Chinese technology stocks and global indices adding newly listed hard-tech companies.

Rob Subbaraman, head of global macro research and co-head of global markets research at Nomura, said China's low-cost and abundant electricity supply, growing talent pool and early lead in physical AI are driving the rapid development of its AI industry chain.

China's development of open-weight models could accelerate their adoption by businesses, allowing productivity gains from AI as a general-purpose technology to spread more quickly across the economy, he said, citing models from Chinese firms such as DeepSeek and Moonshot AI.

China's strength in advanced manufacturing has also become increasingly evident, said Robin Xing, chief China economist at Morgan Stanley, pointing to the country's roughly half share of global installed new energy storage capacity and the rapid growth in outbound licensing deals for innovative drugs. These trends, he said, underpin the long-term investment case for China's hard-tech sector and leading manufacturers.

Such strengths are increasingly being reflected in foreign investors' allocation decisions. This year, Goldman Sachs has twice raised its 12-month target for the CSI 300 on improving earnings momentum, and retained an overweight view on Chinese equities.

Kinger Lau, chief China equity strategist for Goldman Sachs Research, said the bank's positive view reflects improving earnings momentum, and favorable macroeconomic and liquidity conditions. A-share equities offer international investors diversification benefits that remained underappreciated, along with attractive exposure to hard-tech and AI themes, he added.

Individual companies are drawing overseas interest too.

ChangXin Memory Technologies surged 465.82 percent on its debut on Shanghai's STAR Market last month, reaching a market capitalization of more than 3.2 trillion yuan ($474.56 billion).

United States-based Tema ETFs made the chipmaker a top holding at a 10.56 percent weight on its debut day, while MSCI officially added CXMT to its China All Shares Index on Monday under a fast-track rule for large IPOs.

Robotics is where the enthusiasm is most visible. Unitree, set to become the first Chinese mainland-listed humanoid robot maker, priced its Shanghai IPO at 150.8 yuan a share, representing 10 percent of its post-offering share capital. The offering is expected to raise about 6.1 billion yuan in gross proceeds.

That optimism, however, exists alongside broader economic pressures. Nathan Chow, senior economist at DBS Bank, said the imbalance between relatively strong supply and weak demand remained pronounced, with household consumption and some companies' profitability still under pressure.

Investment in infrastructure could help offset the weakness in private investment in the near term, while lowering logistics and energy costs and improving the efficiency of resource allocation over the longer term, Chow said.

The implementation of policy measures would be key to sustaining the recovery in the second half of this year, analysts noted.

XINHUA - CHINA DAILY

Briefly

Overnight reverse repos scheduled

The People's Bank of China will conduct overnight reverse repo operations on Aug 14 and from Aug 17 to Aug 19, to better meet the short-term liquidity needs of the banking system. The operations will be conducted at a fixed interest rate through quantity-based bidding, with the daily amount capped at 600 billion yuan ($88 billion), according to the PBOC. Overnight reverse repo is a process in which the central bank purchases securities from commercial banks through a bidding process, with an agreement to sell them back the next day.

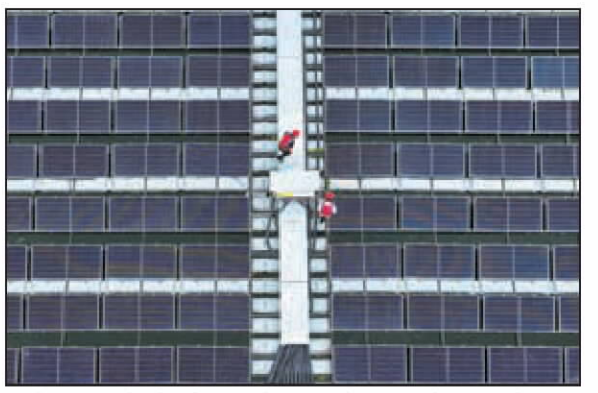
New air route to Romania, Croatia

Air China will launch a new route connecting Beijing with Romania's Bucharest and Croatia's Zagreb, starting Sept 4, the airline announced. The new service will link Beijing Capital International Airport with Zagreb via Bucharest, with flights scheduled for every Monday, Wednesday and Friday. The carrier now serves 27 destinations across Europe, operating nearly 260 flights weekly.

XINHUA - CHINA DAILY

Nation's green gains aiding global carbon goals

By **ZHENG XIN**
zhengxin@chinadaily.com.cn



China's rapidly expanding green power sector is expected to provide crucial support for the global energy transition, as the country leads the world with advanced solar technology, massive manufacturing capacity and formidable export capabilities, said a leading economist.

Fan Gang, vice-president of the China Society of Economic Reform, described the new energy sector as a highly promising sunrise industry for the nation, adding that China's advanced photovoltaic technologies, massive industrial capacity and strong export performance give the nation an unprecedented advantage in guiding and supporting the global clean energy transition.

Over the next five to 10 years, the global push for clean energy — particularly solar power — will become increasingly urgent, Fan said.

He pointed out that if conflicts in the Middle East persist, the risks of surging oil prices and supply disruptions will intensify. Coupled with the skyrocketing electricity demand driven by the artificial intelligence industry, the shift toward renewables has never been more urgent.

"In the past, the primary driver for new energy development was reducing carbon emissions and combating climate change. However, with the escalation of geopolitical conflicts, nations are profoundly realizing the vulnerability of fossil fuels in terms of supply security," Fan said, adding that energy security has become a powerful new engine for green development.

Technicians check solar panels in Huaibei, East China's Anhui province. WAN SHANCHAO / FOR CHINA DAILY

He emphasized that solar power is the most equitable and secure energy resource available. Unlike nuclear, wind, hydropower or fossil fuels — which suffer from distinct geographic and resource limitations — solar power can be generated virtually anywhere, from deserts to water surfaces and rooftops.

This transition is not merely a climate response, but a strategic choice to safeguard national energy security, Fan added. He urged the country to seize this opportunity to consolidate its technological advantages, drive the continuous upgrading of the new energy supply chain, and contribute Chinese strength to global green and low-carbon development.

This strategic pivot is already being reflected in China's domestic power mix. According to official data, the nation's energy sector has crossed a historic threshold, with coal-fired power generation accounting for less than 50 percent of total electricity output for the first time.

During the first six months, coal power generation stood at 2.5 trillion kilowatt-hours, bringing its share down to 49.7 percent, said Xing Yiteng, deputy director-general of the National Energy Administration's development planning department.

"Falling below 50 percent of total power generation for the first time is a landmark achievement in China's long-term push for renewable energy alternatives, signaling a new breakthrough in the country's green and low-carbon transition," Xing said.

He said that despite complex global headwinds, China's energy security and effective investments continue to see robust advances.

China's domestic momentum is creating massive ripple effects globally. The International Renewable Energy Agency reported that over the past decade, the global average cost of electricity for wind and solar projects plummeted by over 60 percent and 80 percent, respectively.

This massive cost reduction is largely due to China's continuous technological innovation, unrivaled manufacturing scale and highly efficient supply chains, the agency said.

Linxiang a 'hot zone' for fishing tackle

Veritable hub for angling gear, city makes over 80% of floats sold in China

A worker manufactures fishing tackle at a company in Linxiang, Hunan province, on July 1, 2025. CHEN SIHAN / XINHUA

By LI JING in Linxiang, Hunan
lijing2009@chinadaily.com.cn

As recreational fishing gains popularity among younger Chinese consumers seeking outdoor leisure activities, a small city in Central China's Hunan province is reaping the benefits.

Linxiang, a county-level city on the southern bank of the Yangtze River, now produces more than 80 percent of the fishing floats sold in China, turning a traditional fishing accessory into the foundation of a manufacturing cluster worth more than 9 billion yuan ($1.33 billion) a year.

What began as a handful of family workshops more than three decades ago has grown into an industry supporting more than 3,100 businesses, directly employing around 60,000 people, according to local government data.

Its rise offers a glimpse into how China's county-level economies are leveraging industrial specialization, technological innovation and shifting consumer trends to create new growth engines.

Fishing has long been woven into life in Linxiang. Located along the Yangtze River and surrounded by lakes and wetlands, the city has abundant aquatic resources and a deep-rooted fishing culture. For generations, local residents fashioned simple fishing floats from reeds gathered along riverbanks.

The city's first modern float-making industry traces its origins to 1992, when a Taiwan-invested joint venture was established, training a generation of skilled workers who would later launch businesses of their own.

What followed was a classic example of industrial clustering. Former employees became entrepreneurs, suppliers and distributors. Small workshops expanded into factories, while supporting businesses emerged in materials, coatings, machinery, packaging, logistics and e-commerce.

"By building on our historical roots and industrial foundation, we gradually developed a complete industrial ecosystem," said Xiong Shicheng, mayor of Linxiang.

Today, manufacturers can source almost every component needed to produce a fishing float without leaving the city, creating efficiencies that have helped the cluster remain competitive even as labor costs have risen.

Few people have witnessed that transformation more closely than Li Jianming, founder of Hunan Chihai Float and Fishing Tackle Co Ltd.

Li started as a maintenance technician at the JV before starting a family workshop in 1995 with only a few hundred yuan.

"Back then, most production relied on manual labor," Li recalled. "Quality varied from worker to worker, costs were high and manufacturing cycles were long."

Over the following three decades, Li focused on upgrading production processes, gradually replacing labor-intensive procedures with automated equipment.

Today, his company operates automated spraying systems, digital molding equipment and artificial intelligence-assisted manufacturing processes. According to the company, research and development investments account for 5 percent of revenue.

"Mechanical and intelligent production has significantly improved quality consistency while reducing costs and shortening production cycles," he said.

The broader industry has followed a similar path.

According to local authorities, Linxiang companies have developed more than 4,000 fishing tackle products and accumulated over 600 patents. Thirty-four local enterprises have been recognized as national high-tech companies.

Innovation is increasingly extending beyond manufacturing itself.

Electronic floats equipped with sensors can now transmit bite signals directly to smartphones, smartwatches and other wearable devices. Bluetooth-enabled products, artificial intelligence-assisted fishing accessories and 3D-printed components are gradually moving from niche products into the mainstream market.

"What surprises many people is how much technology has entered this traditional industry," Li said.

The industry's rapid development has coincided with a broader shift in consumer behavior.

As incomes rise and interest in outdoor recreation grows, fishing has become one of China's most popular leisure activities.

China now has around 150 million recreational anglers, according to the General Administration of Sport of China's China Outdoor Sports Industry Development Report (2024-2025), representing more than 10 percent of the country's population.

The demographic profile is also changing. Industry reports show that consumers aged between 25 and 44 account for nearly half of fishing enthusiasts, reflecting the growing appeal of the activity among younger and middle-income groups.

That trend has fueled demand for more specialized and premium products.

According to industry research, China's fishing equipment market reached about 24 billion yuan in 2024, maintaining a strong compound annual growth rate of nearly 19 percent from 2020 to 2024. This momentum, outpacing the global average of 4.43 percent, is expected to drive the domestic market past 30 billion yuan by the end of 2026, supported by growing participation, competitive fishing events and the expansion of social media-driven consumption.

For manufacturers in Linxiang, the surge in demand has created opportunities far beyond the city's traditional customer base.

The rise of e-commerce and livestreaming has transformed how fishing equipment reaches consumers.

In Linxiang's livestream studios, hosts demonstrate products in real time, answer questions from viewers and generate sales directly from factory floors.

Among them is Lan Congcong, a livestream host with Hunan Fuyi Fishing Tackle Co Ltd.

"Years ago, we relied heavily on trade fairs and offline sales," Lan said. "Now anglers from anywhere in China can discover our products and place orders instantly."

The shift has allowed smaller manufacturers to bypass traditional distribution channels and connect directly with consumers.

Local authorities say the city has attracted more than 600 livestream hosts and built a comprehensive e-commerce ecosystem around fishing tackle products.

In 2025, e-commerce shipments linked to the sector exceeded 6 billion yuan, according to official data.

Linxiang has also sought to expand beyond manufacturing by combining sports, tourism and consumer spending.

The city now hosts more than 30 fishing competitions annually, including the flagship Linxiang Float Cup, one of China's most influential angling tournaments.

This year's event, scheduled for September, will offer total prize money exceeding 2.25 million yuan and is expected to attract more than 2,000 participants, including professional anglers and livestream influencers.

For local officials, the tournaments serve a purpose beyond competition.

"Thirty years ago, companies mainly focused on production," said Luo Xing, director of specialty industry development center in Linxiang. "Today, we are thinking about brands, consumer experience and how to connect products with events and tourism."

The competitions have become platforms for product launches, market feedback and brand promotion while helping boost spending on hotels, restaurants and local attractions, Luo added.

Local authorities estimate that the events have generated billions of online views and significantly raised awareness of the city among fishing enthusiasts nationwide.

Although the domestic market remains the industry's primary growth driver, manufacturers are increasingly targeting overseas customers.

Products from Linxiang are now exported to more than 30 countries and regions, with South Korea, Japan, Vietnam and Thailand among the key markets.

According to Zhang Dazhi, general manager of Linchuang Warehousing and Logistics Co Ltd, improving logistics networks has made overseas deliveries faster and more reliable.

Products shipped to South Korea, for example, can typically reach customers within a week, he said.

Local authorities say overseas orders exceeded 15 million units in 2025, generating export revenue of 1.68 billion yuan.

Industry participants say exports remain a relatively small share of total sales, but overseas markets are becoming increasingly important as manufacturers seek new sources of growth and introduce freshwater fishing products to international consumers.

For the city, the significance of the industry extends well beyond economic statistics.

"A single fishing float has created jobs, encouraged entrepreneurship and given Linxiang a distinctive identity," Xiong said.

As technology, e-commerce and outdoor recreation continue reshaping consumer markets, Linxiang's manufacturers are betting that a product once made from simple river reeds can continue carrying the city into its next phase of growth.

Industry heritage at heart of city's global exports boom

By LI JING in Linxiang, Hunan

The brightly painted fishing floats that made Hunan province's Linxiang famous are no longer the only products rolling out of factories in this small city on the southern bank of the Yangtze River.

As China's largest fishing-float manufacturing hub looks beyond its traditional niche, local companies are expanding into lure fishing tackle, outdoor recreation and tourism, betting that a growing appetite for outdoor lifestyles can create new avenues for growth.

The shift reflects a broader evolution underway in Linxiang, where an industrial cluster built around a simple fishing accessory is increasingly branching into higher-value products and consumer experiences.

"Fishing floats remain our foundation, but the industry is no longer limited to floats," said Li Bin, general manager of Hunan Ruiqi Outdoor Products Co Ltd.

"Many supporting industries have gradually gathered here, including fishing rods, hooks, fishing lines and lures."

While Linxiang built its reputation on freshwater fishing floats, lure fishing has emerged as one of the industry's fastest-growing segments.

Unlike traditional float fishing, lure fishing relies on artificial bait designed to mimic the movement of prey fish. The technique has gained popularity among younger anglers worldwide and has become a major category in overseas markets.

Ruiqi, one of Linxiang's growing exporters, ships lure products to customers across Europe, Southeast Asia and North America.

Left: Staff members test a fishing rod at an outdoor products company in Linxiang on July 1, 2025. **Right:** An employee promotes fishing tackle via livestreaming in Linxiang on July 1, 2025. PHOTOS BY CHEN SIHAN / XINHUA

Li said the company's competitive advantage comes from the manufacturing ecosystem that has developed around Linxiang's float industry over the past three decades.

"From raw materials and precision processing to packaging and logistics, almost every step can be completed locally," he said. "That allows us to respond faster and keep costs under control."

The company has also adopted 3D-printing technologies to accelerate product development and customize designs for overseas buyers.

According to Li, the technology has significantly shortened development cycles and improved flexibility for small-batch orders, a growing requirement among international customers.

Industry experts often describe industrial clusters as networks where suppliers, manufacturers and service providers reinforce one another.

Linxiang's fishing-tackle sector offers a textbook example.

Local authorities say the city now hosts more than 3,100 market entities linked to fishing gear production and services, employing roughly 60,000 people.

The ecosystem stretches beyond manufacturing to include packaging, logistics, e-commerce, mold production and product testing.

That concentration has helped local companies diversify into new product categories without building entirely new supply chains.

"Many of the skills developed in float production can be applied to other fishing products," Li said.

"Precision manufacturing, painting techniques and quality control systems can all be shared across categories."

The result is a gradual expansion from a single-product cluster into a broader fishing-equipment industry.

The industry's ambitions increasingly extend beyond China.

Local authorities say fishing-tackle products from Linxiang are now sold in more than 30 countries and regions.

Li said overseas markets present significant opportunities but also new challenges.

Environmental regulations, product certification requirements and changing trade rules are raising compliance costs, particularly for smaller manufacturers.

"Competition is no longer simply about price," he said. "Companies need stronger technology, more reliable quality control and a better understanding of local market requirements."

The industry's expansion is also reshaping the local economy beyond factory floors.

In Jiangnan township on the outskirts of Linxiang, a restored lake has been turned into a destination for lure fishing competitions, camping and outdoor recreation.

The project grew out of the city's efforts to build tourism around its fishing culture.

"We started seeing more anglers arriving with recreational vehicles during lure-fishing events," said Yuan Gang, an official involved in local economic development and the operation of a lakeside camping site.

"That convinced us there was demand for a broader outdoor experience."

The lakeside development now combines fishing activities with camping facilities, local food offerings and rural tourism attractions.

Visitors can spend the day fishing, picking seasonal produce from nearby farms and participating in outdoor activities before staying overnight at the campsite.

Local officials hope the model will extend visitor stays and generate additional income for nearby villages.

Industry reports show growing participation among younger consumers, particularly those seeking social and experience-driven leisure activities.

For Linxiang, that trend offers an opportunity to transform a manufacturing success story into a broader outdoor-economy ecosystem.

A city once known primarily for producing fishing floats is now trying to capture value across the entire chain — from factory production and exports to competitions, tourism and lifestyle consumption.

"The float industry gave us our starting point," Yuan said. "What we're building now is a much larger ecosystem around it."

ANCIENT ART, NEW BRIDGE

Bronze treasures connect Shanxi province and Georgia through cultural exchange

By **YUAN SHENGGAO**

In late July, the Georgian National Museum welcomed an impressive new addition to its exhibitions, garnering great interest from residents in this Caucasian country.

As a part of the 2026 Civilization Bridge Program, an initiative launched by the National Cultural Heritage Administration for overseas exhibitions of Chinese cultural relics, a showcase of Shanxi's ancient bronze ware made its debut in this museum in Tbilisi on July 20.

Under the theme "From the Yellow River to the Caucasus — A Special Exhibition of Shanxi's Bronze Civilization in Georgia", the collection includes 36 pieces or sets of bronze ware, dating from around the 16th century BC to the 3rd century AD.

This exhibition is jointly organized by Shanxi Museum and the Georgian National Museum, supported by China's National Cultural Heritage Administration and sponsored by the Belt and Road Cultural Development Association. It will run until Oct 18.

On the opening day of the exhibition, Liang Yujun, deputy curator of Shanxi Museum, hosted a seminar to introduce the aesthetics, significance and characteristics of Shanxi's bronze ware to the local audience.

Liang said that, in ancient times, bronze was recognized as an auspicious metal and bronze ware was an important part of the ancient ritual system.

"Shanxi is one of the places where the largest numbers of ancient Chinese bronze items have been discovered," he said. "This exhibition of Shanxi's bronze relics will help visitors better understand ancient Chinese civilization."

According to Liang, the exhibition is divided into three sections focusing on artistic aesthetics, ritual system and production techniques.

The exhibits fall into such categories as *ding* — tripod cauldrons; *gui* — round-mouthed food vessels; *ge* — dagger axes; and *daigou* — robe hooks.

The displayed items mostly feature clear patterns, showing the high technical level in bronze ware production in ancient China.

Heavenly Craftsmanship

The first section of the exhibition is titled "Heavenly Craftsmanship", highlighting the technical marvels and aesthetics of Shanxi's ancient bronze ware.

Liang said that an outstanding feature of Shanxi's bronze ware is the perfect balance of functionality and aesthetics, even for those dating to the Xia (c. 21st century-16th century BC) and Shang (c.16th century-11th century BC) dynasties.

"The bronze items of the Xia and Shang dynasties, simple as they are, never lack symbolism," Liang said. "The typical patterns show the unique cultural connotation of those periods. For instance, the pattern of *taotie* — a legendary ferocious beast in Chinese mythology — was meant to arouse senses of awe and respect among the subjects of the empires."

In the periods that followed, especially in the Spring and Autumn Period (770-476 BC), patterns on the bronze items grew more complicated and exquisite, as the Shanxi exhibits show. The official said the rich forms of patterns — such as beasts, birds, clouds and waves — and the higher degree of abstraction were believed to have developed alongside the technological advancements of the period and tailored to different ritual scenarios.

He added that the bronze items in the later periods also display a deeper integration of functionality and aesthetics.

A square-based and round-mouthed bronze *zun* — or wine vessel — on display at the Tbilisi museum, for instance, illustrates this integration.

The vessel, featuring an abstract dragon pattern on its neck and wave pattern on its body, is supported by a square base.

"The square base was meant to make the vessel stable," said the Shanxi Museum official. "However, it also has a symbolism echoing the pattern motifs above."

"In ancient China, the square symbolized the Earth, just like the circle symbolized the sky or heaven," Liang said. "The dragon is the totem of the Chinese nation, symbolizing the majesty of sovereigns and having a presence on the Earth, in the sea and in heaven."

Liang further explained the symbolic meanings of various motifs, aiming to give audience members a better understanding of the cultural connotations of ancient Chinese bronze ware.

The beast-face pattern, for instance, is common on bronze items of the Shang and Zhou (c.11th century-256 BC) dynasties. It usually features protruding eyes and an exaggerated wide mouth. With a strong religious sense and awe-inspiring power, the pattern is regarded as a link among human beings, the world and heaven.

The coiling *chi* pattern — or interlaced hydra pattern — is mostly seen on bronze items from the Spring and Autumn Period and the Warring States Period (475-221 BC).

In Chinese mythology, *chi* is a hornless dragon featuring a dragon's head and snake's body. It symbolizes the continuation of life and lasting vitality.

The feather-and-wing pattern, which began to be used in the Shanxi region during the late Spring and Autumn Period, symbolizes the people's aspiration to ascend to heaven after death. It can also be interpreted as the soul's revival. "With a flying-and-flowing rhythm and the beautifully abstracted design, the pattern represents an extremely high level of Chinese bronze ware art," said Liang.

A square-based *zun* vessel with dragon and wave patterns.

A bronze *fu* container featuring a body and cover of the same shape.

A bronze *ge*, or dagger axe.

During the exhibition, locals also discovered the unique features of bronze items.

Elene Khurtsilava, a staff member at the Georgian National Museum, said the *fu* — a bronze container of grains — is her favorite exhibit.

She noticed that the item features a body and a cover of the same shape. "You can put it upside down, and it just looks the same," she said. "It can also be used as two separate utensils."

On her social media account, Khurtsilava said: "I strongly recommend this exhibition, which, I believe, will be an unforgettable and impressive journey to experience ancient Chinese culture."

Rites and Music

The second section of the exhibition, called "Rites and Music", is meant to reveal the relation between bronze ware and the ritual system that has existed in China for about 3,000 years, since the early Zhou Dynasty.

In the Zhou Dynasty, bronze ware served not only as daily utensils but also as ritual vessels. During the period, the country's hierarchical system was marked by the graded ownership of ritual vessels, especially the bronze vessels.

According to the system, the sovereigns of the Zhou Dynasty — who called themselves "the sons of heaven" — were "authorized by the heavenly sovereign" to own nine *ding* tripods, while dukes and princes could own seven, high-ranking officials could own five, and lower-ranking scholars could own three or one.

A similar system was also applied to the ownership of bronze food vessels known as *gui*, according to which, the sons of heaven could own eight, dukes and princes could own six and high-ranking officials could own four.

During the exhibition in Tbilisi, a bronze *gui* is highlighted.

When visiting the exhibition, Lili Davitashvili, a Georgian Sinologist, noticed that the vessel features ocular thunder and straight-line patterns.

She said she used to study in China. During her stay, she developed a strong interest in ancient bronze ware, especially the patterns on the items.

"The patterns, either animals or decorative motifs, are the important identifying features of the vessels," Davitashvili said. "The patterns on this bronze *gui* give me a sense of awe and stability."

"I'm glad to see so many ancient Chinese bronze items in my home country," she added.

In ancient China, rites had always been accompanied by music, giving typical musical instruments such as *bianzhong* — or bronze chime bells — a special place in the ritual system.

At the Georgian National Museum, a set of *bianzhong* was on display. It is composed of bronze bells of different sizes. An introduction to the items informs visitors that music can be played by striking the bells according to scores.

Production techniques

The third section of the exhibition, called "Firing for Thousands of Years", is designed to show the millennia-long history of bronze ware production.

Historical records show that China began to produce bronze ware more than 4,000 years ago and Shanxi has been a hub of production since then.

Relics unearthed in Shanxi show that local bronze ware production techniques reached a height during the Shang and Zhou dynasties.

The level of production techniques was demonstrated by the discovery of a large amount of production equipment from those periods.

A bronze casting site, with relics dating to the Zhou Dynasty, is among the key bronze ware production sites in Shanxi. The large number of clay molds and crucibles shows that this site was capable of large-scale and standardized production of bronze vessels.

According to Liang, clay mold casting was the core technique for bronze ware production in ancient China.

"The molding set is usually composed of the inner and outer molds," he said. "Molten bronze was poured into the cavity between the two molds, and after it cooled, the molds were smashed to reveal a bronze vessel with clear patterns."

He noted that since this technique has strict requirements for temperature control, the mixing ratio of molten metals — bronze is an alloy of copper, tin and other metals — and mold precision, it represented an advanced level of production nationwide or even worldwide during that period.

At the Tbilisi exhibition, sets of clay molds and crucibles are on display.

Also on show are bronze items produced via the techniques of gold or silver inlay, jade inlay, and gold gilding. According to Liang, these techniques emerged in the Spring and Autumn Period, echoing the noble classes' pursuit of a higher level of aesthetics and better quality of life.

For instance, a dove-shaped bronze cane head produced using the gold inlay technique is on display in the Georgian National Museum. The head of the cane is a dove with glittering inlaid gold threads.

The exhibition in Tbilisi also features an interactive zone for visitors. There are instructors who teach children and adults how to make rubbings of patterns on bronze ware models and repair relics.

According to Liang, this is the first time that an interactive zone has been set up for an overseas exhibition of Shanxi's cultural relics.

Liu Yan contributed to this story.

Visitors try to make rubbings of bronze ware patterns during the exhibition.

Locals visit the Shanxi bronze ware exhibition at the Georgian National Museum in Tbilisi.

Space industry pioneer Wang Xiji dies at 105

By ZHAO LEI
zhaolei@chinadaily.com.cn

Wang Xiji, one of the pioneers of China's space industry and chief designer of the nation's first recoverable reconnaissance satellite, died in Beijing on Wednesday at the age of 105.

Born in Kunming, Yunnan province, in July 1921, Wang was the fourth child in a family whose father was a successful businessman. Driven by an aspiration to contribute to national rejuvenation, he was admitted to the mechanical engineering department of National Southwestern Associated University in 1938.

Wang Xiji

After graduating in the autumn of 1942, Wang worked successively at three local plants in Yunnan.

He nevertheless remained determined to put his knowledge to use for the country.

In 1948, he went to the United States to pursue advanced studies at Virginia Polytechnic Institute, majoring in power and fuel engineering. He earned a master's degree one year later. After learning from news reports about the founding of the People's Republic of China, he decided not to pursue a doctoral degree and instead resolved to use his expertise to help build New China.

Wang returned to China in March 1950 alongside dozens of patriotic Chinese scholars. He taught at Dalian University of Technology and later at Shanghai Jiao Tong University.

In 1958, at the age of 37, Wang was transferred to the Shanghai Institute of Mechanical and Electrical Design — as it was known — now part of the China Academy of Space Technology, to lead the development of sounding rockets. This marked the beginning of his lifelong career in the space sector.

Facing an almost nonexistent technical foundation and limited industrial support, Wang and his team began developing scaled-down test rockets under extremely rudimentary conditions.

With only hand-operated calculating devices at their disposal, several people worked day and night for more than two months just to calculate a single trajectory. The stacks of paper they used for the calculations were higher than their desks. With no launch site available, they turned a rice field into one, using a winch to hoist the rocket onto the launch stand and a hand pump to pressurize and charge the rocket with propellant.

In February 1960, China's first liquid-fuel sounding rocket lifted off from a desolate beach on the outskirts of Shanghai, reaching an altitude of several kilometers. Wang later described the launch as the most important success of his career because it marked China's first tangible step toward space.

He went on to oversee the development of 12 of China's 18 early sounding rocket models. These rockets gradually reached altitudes of more than 100 km and carried out missions ranging from atmospheric detection and space-instrument verification to biological experiments involving small animals.

Drawing on experience with sounding rockets and ballistic missile technology, Wang formulated the overall design plan for China's first carrier rocket, the Long March 1. The rocket made its maiden flight on April 24, 1970, successfully placing China's first satellite, Dongfanghong 1, into orbit.

Wang later served as chief designer of China's first recoverable reconnaissance satellite. After numerous tests and calculations, the satellite was successfully launched and recovered in Guizhou province in November 1975, making China the third country in the world to acquire satellite-return technology.

He also led research and design work on several subsequent models of recoverable reconnaissance satellites.

In the 1980s, Wang was invited to participate in the development of China's manned spaceflight roadmap. Based on his analysis of economic feasibility and China's actual technological and financial capabilities, he was a prominent advocate of starting with non-reusable crewed spacecraft rather than pursuing the more costly space shuttle approach.

In 1993, he was elected an academician of the Chinese Academy of Sciences.

Through extensive practical exploration, Wang remained committed to a scientific, rigorous and pragmatic approach.

He once said, "When it comes to technical issues, we cannot simply follow the majority. Instead, we must respect objective laws and remain committed to seeking truth from facts. Sometimes, the minority who insist on their views are the ones who are right."

Wang remained active in the space community well into his later years.

At 80, he served as chief designer of the Double Star Program, a China-Europe joint initiative to explore Earth's magnetosphere. In his 90s, he advocated research into space-based solar power stations, and at 95, he led studies on the application of internet technologies to space programs.

The veteran engineer also pioneered concepts such as "space infrastructure" and wrote several professional books to pass on his engineering expertise to younger generations.

In recognition of his dedication and contributions, the government honored Wang as one of the key figures in China's ballistic missile, nuclear weapon and satellite programs and awarded him numerous honorary titles.

Shipyard fire

Firefighters battle a blaze aboard a vessel at Century Huahai (Fujian) Shipbuilding Heavy Industry Co in Gantang township, Fu'an city, Fujian province, on Thursday. The fire, which broke out at around 1:09 pm, injured 12 people, who were taken to hospital for treatment. The blaze has been brought under control, and the cause remains under investigation. XINHUA

PM2.5 falls as China advances green goals

Nation targets smarter environmental monitoring, bolsters efficiency by 2030

By HOU LIQIANG
houliqiang@chinadaily.com.cn

China has seen continued improvement in its ecological and environmental quality this year, with major indicators showing notable progress as it strives to advance the Beautiful China initiative during the 15th Five-Year Plan period (2026-30), Minister of Ecology and Environment Huang Runqiu said on Thursday.

Addressing a State Council Information Office news conference, Huang said that from January to July, the national average concentration of PM2.5 particulate matter fell by 1.8 micrograms per cubic meter year-on-year, a decline of 6.2 percent.

The proportion of days with fairly good air quality, defined as an air quality index below 100 on a scale of 0 to 500, also rose by 3.9 percentage points from a year earlier, he said.

Water quality also improved, with the proportion of surface water rated Grade I to III reaching 86.5 percent during the period, up 2.4 percentage points year-on-year, Huang said. China uses a five-tier surface water quality system, with Grade I the best and Grade III suitable for the survival of most aquatic organisms.

Huang attributed the progress in part to the central ecological and environmental protection inspection mechanism, which he said has remained a powerful tool for uncovering major environmental problems and reinforcing accountability.

Since the system was piloted in Hebei province in late 2015, it has completed three full rounds of inspections covering all 31 provincial-level regions on the Chinese mainland and the Xinjiang Production and Construction Corps, according to Huang.

Over the past decade, the mechanism has addressed more than 380,000 public environmental whistleblowing complaints. To date, authorities have publicly exposed 349 typical cases and transferred 6,475 rectification tasks to inspected regions and departments, he said.

Thanks to the inspections, "the prevalence of environmental offenses that were severe in nature, serious in circumstances and markedly illegal has dropped substantially, leading to a notable rise in the public's sense of gain, happiness and security regarding the ecological environment," Huang said.

Vice-Minister Dong Baotong said at the same briefing that China will further accelerate the digital and intelligent transformation of ecological and environmental monitoring and law enforcement during the 15th Five-Year Plan period.

Digital technologies and artificial intelligence have already become key drivers of environmental supervision, Dong said. Over the coming five years, greater emphasis will be placed on the twin pillars of monitoring and law enforcement.

By 2030, China aims to reduce manual participation in key business areas of the national ecological and environmental monitoring network by 70 percent and increase efficiency by more than five times, he said.

In air quality monitoring, for example, China will raise the accuracy rate of 72-hour forecasts for days when PM2.5 exceeds standards nationwide to more than 80 percent by 2030, Dong said.

On enforcement, Dong said China will build a smarter system covering the full process from problem discovery and early warning to disposal, integrating automatic pollutant-source data, satellite remote-sensing information and online leads.

Vice-Minister Li Gao highlighted significant progress in a nationwide campaign against illegal dumping and disposal of solid waste.

Since the drive began in June last year, authorities have identified more than 56,000 problems and completed rectification on more than 45,000 of them, while cleaning up and disposing of more than 60 million metric tons of solid waste, Li said.

To improve detection, the ministry has built a network combining satellite and drone surveillance, ground inspections and public reporting, with more than 60,000 potential leads collected so far, he said.

Li said China will incorporate the occurrence rate of illegal solid waste dumping and disposal into the 15th Five-Year Plan framework for building a Beautiful China, using clear and measurable indicators to strengthen local accountability and accelerate the establishment of a standing enforcement mechanism.

Pearl River mega bridge anchorages completed

By ZHENG CAIXIONG
in Guangzhou
zhengcaixiong@chinadaily.com.cn

The east and west anchorages of the Shiziyang Link were completed on Thursday, paving the way for the follow-up erection of catwalks and main cables for the mega project spanning the Pearl River estuary in the Guangdong-Hong Kong-Macao Greater Bay Area.

Completion of the anchorages, critical load-bearing components of a suspension bridge, marks a milestone in the construction of the entire project, said Zhang Xiaolong, chief engineer of the anchorage project of Shiziyang Link.

"An anchorage consists of a foundation, anchor body and anchorage system, and it serves to anchor the bridge's main cables and withstand the tensile force transmitted from the main cables," Zhang told reporters on Thursday during the project's media open day.

Shiziyang Link features two anchorages, east and west, rooted on opposite banks in Shatian town of Dongguan and Nansha district of Guangzhou, he said.

To enhance the bearing capacity of the anchorage foundations, the project team developed an innovative composite anchorage foundation structure featuring circular rock-socketed diaphragm walls, inner liners and rigid top-and-bottom slab connections, Zhang said.

The team also developed an in situ test system for assessing the bearing capacity of deep rock and derived general calculation formulas for bearing capacity and displacement.

"The outcomes bridge technical gaps and offer key references for super-long-span suspension bridges and deep, large foundation pit projects," he added.

Wen Jie, an engineer with the project engineering management department of Guangdong Transportation Group, said Shiziyang Link, with a main span of 2,180 meters, is scheduled to be completed in the first half of 2029, with traffic expected to begin soon after.

"Upon the opening of the project to traffic, the travel time from Nansha to Dongguan and Shenzhen in the eastern part of the Pearl River will be cut to merely half an hour, further accelerating the integrated development of the GBA," Wen said.

It currently takes about an hour for vehicles traveling from Nansha to reach Dongguan and Shenzhen, he said.

Stretching approximately 35 kilometers, Shiziyang Link starts from Nansha and terminates in Humen and Shatian towns of Dongguan, according to Wen.

The project consists of the river-crossing main bridge and land approach bridges. It is the first double-deck composite highway passage at the Pearl River estuary and the world's first double-deck steel truss suspension bridge with a main span exceeding 2,000 meters.

The state-of-the-art bridge is a global leader in several key specifications, including the 130-meter diameter of its anchorage foundations, the 342-meter height of its steel plate composite main towers, the 2,180-meter span of its double-deck suspension bridge, the 1.5-meter diameter of its main cables and its number of lanes — 16 lanes in total, arranged as two-way traffic on two decks.

Construction of the bridge began in 2023. It is another mega infrastructure project spanning the Pearl River estuary, following the Hong Kong-Zhuhai-Macao Bridge and Shenzhen-Zhongshan Link.

As a landmark transportation project during the 15th Five-Year Plan period (2026-30), Shiziyang Link will, upon completion, form a cluster of river-crossing and sea-spanning passages together with the Hong Kong-Zhuhai-Macao Bridge, Shenzhen-Zhongshan Link and Nansha Bridge.

"Together with surrounding road and highway networks, it will foster a one-hour metropolitan circle and boost in-depth connectivity within the GBA, including the nine Guangdong cities plus the Hong Kong and Macao special administrative regions," Wen said.

World Humanoid Robot Games draws 2,056 entries to Beijing

By YANG CHENG
yangcheng@chinadaily.com.cn

A record-breaking 2,056 robots from 666 teams will compete in a comprehensive range of events at the 2026 World Humanoid Robot Games in Beijing from Aug 22-26, a senior official of the organizing committee said at a news conference on Thursday.

Participants from 16 countries on six continents will take part.

"The number of teams has increased by 138 percent over last year, and the number of participating robots has doubled. Brazil will even be forming a national team to join the event," said Jiang Guangzhi, deputy executive director of the organizing committee and director of the Beijing Municipal Bureau of Economy and Information Technology.

Domestically, 157 companies and 200 universities and research institutes will participate, forming 641 teams with 1,975 robots.

This year, newly added high-intensity competitive events, including long jump, weightlifting, tug-of-war and table tennis, "present extreme challenges to the robotic brain, cerebellum, physical structure and core components," Jiang said.

"Each additional centimeter in a jump or extra kilogram lifted on the field is the result of engineers' relentless efforts to optimize design, precision machining and the rigorous testing of joint motors and reducers.

"It is through these incremental advancements that the cutting-edge technical capabilities of humanoid robots continue to reach new heights," he added.

Other events include industrial operations, hotel and family services and logistics.

Yu Qingfeng, director of the Beijing Municipal Bureau of Sports, said that in April, during the 2026 Beijing E-Town Half Marathon and Humanoid Robot Half Marathon, robots outperformed humans, adding that organizers expect even higher records during these games.

Beijing Information Science & Technology University is expected to be one of the highlights of the event, bringing the largest number of teams — 49 — which will participate in 119 categories, also the highest among all participating universities.

Li Lianpeng, deputy director of the university's academic affairs department, said its teams will compete in a wide range of events, including 100-meter sprints, 1,500-meter races, 5v5 soccer, freestyle gymnastics, street dance and tai chi, as well as industrial assembly and material handling, supermarket retail, hotel guest services, firefighting and rescue work, as well as dexterous tasks such as unboxing and building with blocks.

"These activities span virtually the entire spectrum of practical applications for humanoid robots," Li said.

Last year, the university's soccer team secured fourth place in the competition, and this year, it is expected to perform even better.

"We aim to use these games to accelerate the integration of teaching and research and even boost entrepreneurial enthusiasm among students. Our goal is not just to win but to foster greater communication and exchanges with international leaders in robot research," Li added.

The large-scale international events, including the marathon and the games, have sparked debate among some netizens over the potential waste of government investment.

The mascot Zhibao is unveiled at a press conference for the second World Humanoid Robot Games in Beijing on Thursday. The event has attracted 666 teams from 16 countries across six continents, with 2,056 robots set to compete. HAN HAIDAN / CHINA NEWS SERVICE

Shao Yuanxin, founder of RobStride Dynamics, however, argued that "these events could help the industry collect high-level data, showcase their capabilities, train more talented personnel and create job opportunities for China."

Shao also noted that his company's product exports in the first quarter of this year surpassed its total exports for the entire year of 2025.

LIFE

A place shaped by time

In one of China's earliest national park pilot areas, forests, wildlife and local communities reveal the quiet power of long-term preservation, **Yang Feiyue** and **Li Yingqing** report in Diqing, Yunnan.

Summer transforms Potatso's alpine meadows into a living tapestry of gold, violet and white — a shifting canvas shaped by millennia of geological forces.
PHOTOS PROVIDED TO CHINA DAILY

Summer arrives slowly at 3,500 meters above sea level in Potatso National Park.

The rich ecological landscape, marked by lush forests, grasslands and lakes, has a way of holding the heat back and unfolding it petal by petal, covering alpine meadows with a shifting tapestry of gold, white, deep blue and violet.

Step off the bus at the entrance of the national park in Shangri-La, Diqing Tibetan autonomous prefecture, Southwest China's Yunnan province, and the first thing that hits you is the air — thin, cool and remarkably clean. The second is the silence. Not an empty silence, but a full one: wind moving through spruce needles, the distant clank of a cowbell, and the rustle of something small in the undergrowth.

Potatso is one of China's earliest national park pilot areas. Its rhythms are slow — ecological change here is measured in decades, not tourist seasons.

Wang Guoxian knows this better than anyone. She has been guiding visitors through these forests for nearly two decades. As summer vacation arrives, she has been increasingly busy, taking at least three groups of guests each day across the park's varied landscapes — a quick tour still takes four hours.

"We start at 7 am, and during peak season like now, we don't finish until 7 pm. But being tired is good — it means visitors are here," she says. Her monthly salary increases by about 3,000 yuan ($444.6) during the peak summer season — enough to make a real difference in the mountainous region.

She makes a point of telling guests that the facilities and management have changed over the years.

"Twenty years ago, we had only a few vehicles," she says, adjusting her cap against the midday sun. "Now we have more than 100."

But she says the one thing that has never changed is that "protection always comes first".

At the entrance to the Youyou Trail, a 2.2-kilometer route of packed earth and wood winding through ancient trees, Wang points out the wooden decks to her guests.

"When we built these trails, we didn't cut a single tree. We built around them. You can see the planks curve around the trunks. The trees stayed," she says.

Asked what changes she has noticed in the landscape over the years, Wang thinks for a moment.

"Visually, not much. It looks the same to me," she says. "But the data tell a different story. The forest is denser. The numbers show it is improving, just slowly."

Top: Rangers patrol the ancient forest daily. **Middle left:** Visitors tour Potatso National Park. **Middle right:** A child examines a fallen log during one of the park's tours. **Above:** Yaks and cattle graze on Potatso's summer pastures, a living link to the region's centuries-old herding traditions.

Decades to flower

That slow rhythm is written into the very biology of this place.

A short walk from the main trail, Wei Jiansheng, an executive with the park's operating company, stops beside a cluster of green leaves.

"This is *shuihuang*, or *Rheum alexandrae*," he says.

Wei visits the park regularly to oversee operations, safety and conservation. He speaks about the plants here the way someone might speak about old friends.

"Most of its life — 30 years, sometimes 35 — it does nothing but grow ground-level leaves," he says. "Then, in its final year, it puts everything into one flower stalk."

He describes how the plant's translucent bracts wrap around the flowering stem like a greenhouse, trapping heat and blocking UV radiation in the harsh alpine environment.

"One bloom after decades of waiting. It teaches you that some things are worth waiting for," he says.

Potatso covers more than 600 square kilometers and contains a range of ecosystems, including forests, lakes, wetlands, meadows and snowcapped peaks. Its elevation ranges from 2,300 to 4,670 meters, creating a natural laboratory where scientists monitor water, air, soil and wildlife around the clock.

One of the clearest signs of the forest's health hangs from the branches above.

Wang points to pale gray-green lichen draping from spruce and fir trees.

"We call it 'tree beard'," she says. "It only grows where the air is clean. Scientists use it as an indicator of environmental conditions."

The park is home to a wide range of wildlife, including black-necked cranes, clouded leopards and red pandas. The most visible residents, however, are often the small squirrels darting across the boardwalks.

"Don't feed them," Wang reminds her visitors. "They are wild animals and need to forage naturally. If they become dependent on human food, they may lose their ability to survive on their own."

Changing lives

After years of guiding visitors through the park, Wang has come to see Potatso's story not only as one of forests and wildlife, but of people learning to live alongside nature.

For generations, local Tibetan, Yi, Naxi and Lisu communities depended on the surrounding forests for timber and grazing. Today, many residents have become partners in conservation.

The park provides about 17 million yuan annually in direct compensation to 30 surrounding villages, benefiting more than 4,500 villagers from over 1,000 households. It has also created more than 340 permanent positions, 99 percent of which are held by local residents, as well as more than 500 seasonal jobs during peak tourism periods.

Some former loggers now work as rangers, protecting the same forests they once harvested. Others perform traditional Tibetan songs and dances for visitors, preserving local culture while earning income.

In Langrong village, residents share dividends from a jointly operated guesthouse, with each household receiving about 25,000 yuan a year.

"People ask me how we measure success," Wei says, walking past a poplar tree scarred by lightning and fire but still alive.

"It is not just the data. It is things like this."

He touches the trunk gently. "This tree was hit by lightning. Most of it died. But one strip of bark kept it alive. It reminds us that resilience can come from a single thread."

The park has also supported education in surrounding communities, providing scholarships totaling 2.67 million yuan for 1,189 students from high school to university.

For many families, this support has been life-changing. One local ranger described the shift simply: before, he cut wood to sell. Now he walks the same forest and gets paid to protect it — and his children can go to school because of it.

Ever-shifting views

The bus winds toward Bitahai Lake, the park's crown jewel. At 3,500 meters above sea level, the lake stretches three kilometers from north to south, its surface so still it mirrors the surrounding spruce forests and the tiny island at its center — an island that local lore says was once visited by an 8th-century Buddhist master.

Wang stands at the front of the bus, pointing out details along the route: the places where larches turn golden in autumn, where black-necked cranes spend winter, and where rhododendrons bloom in spring.

She has taken this route countless times, but she is never tired of it — its scenery varies with every season.

"Winter brings a different Potatso," she says. "It's snow-covered and silent, and the sky is so blue. This place is never the same twice. That's what makes it worth coming back again and again."

Parents use the summer vacation as learning tool

At a Korean ethnic folk park in Northeast China's Jilin province, Feng Yu turned a family trip into an immersive cultural lesson on ethnic heritage.

She and her kids slipped into traditional Korean outfits for photo shoots, learned to make Korean rice cakes, and took a shot at traditional archery.

"I used to take my children on trips only to view beautiful scenery and taste local delicacies," Feng says. "This time, I hope they can learn about ethnic culture firsthand; trying on traditional attire, touring ethnic architecture and watching folk shows offer lessons no textbook can provide."

With schools across China on summer vacation, the country's two-month travel rush comes alive. Feng is among a growing number of parents opting for cultural journeys, hoping to help their children forge a deeper connection with the nation's rich and diverse heritage.

The Korean ethnic folk park that Feng toured has so far received an average of 20,000 tourists a day during the summer travel season, according to Zhu Baokun, operations director of the park.

To satisfy family travelers, the park has introduced new activities like paper crafting and incense-making workshops, along with performances of Korean ethnic folk music.

"These laid-back settings enable children to absorb ethnic cultural knowledge effortlessly amid a lighthearted and enjoyable environment," says Zhu.

Statistics from Tongcheng Travel, an online Chinese travel agency, show that families and students have remained the two dominant traveling groups this summer. Family travelers account for about 38 percent of domestic air passengers, while students make up roughly 29 percent.

Alongside ethnic culture-themed trips, red tourism, which centers on revolutionary-era historical sites, has also been a popular choice for family travel this summer. In Ruijin, a city in East China's Jiangxi province and the starting point of the Red Army's Long March (1934-36), a 500-seat local theater was packed with audience members during a recent performance.

When the scene of Red Army soldiers bidding farewell to local residents played out on stage, 7-year-old Wu Yawen gripped her grandfather's sleeve tightly.

"When the Red Army departed, local residents stayed up all night making straw sandals and boiling eggs. They pressed these supplies into the soldiers' hands, hoping the troops would return soon," her grandfather, Wu Song, told her.

"The older generation knows well that today's happy life is hard-won," says Wu Yong, Yawen's father. He drove hundreds of kilometers from neighboring Fujian province to Ruijin with his family in the hope that the trip would help his daughter remember the martyrs who sacrificed their lives for the country.

The growing popularity of cultural and educational travel also reflects broader policy support. China's 15th Five-Year Plan (2026-30) calls for the well-regulated development of study tours alongside themed tourism products, including red tourism and other cultural travel experiences.

Building on that policy support, China launched a national summer holiday cultural and tourism consumption campaign in July, with more than 450 million yuan ($66 million) worth of consumer vouchers to be distributed. The campaign is expected to feature more than 30,000 activities nationwide, catering to popular travel demands including study tours.

Finding an ideal escape

Business owners give visitors downtime from urban lifestyles by creating laid-back spaces amid villages and nature, **Wang Xin** reports.

Above and bottom left: Ruru Village Cafe, located in Xuejian village of Zhujiajiao town, offers a soothing and tranquil space surrounded by Metasequoia trees, rivers and rural homes. PHOTOS PROVIDED TO CHINA DAILY

To escape from the urban hustle and bustle, large crowds are flooding into green suburban villages in Shanghai's Qingpu district, seeking refreshing natural spaces to enjoy a meal or coffee, zone out, or take a nap.

Among boundless rice fields in the district's Linjia village of Zhujiajiao ancient town, a one-and-a-half-hour drive from downtown, hides the Cangye Space restaurant featuring a luxuriously large area and authentic Italian food cooked in an open-fire kitchen and massive wood-fired oven.

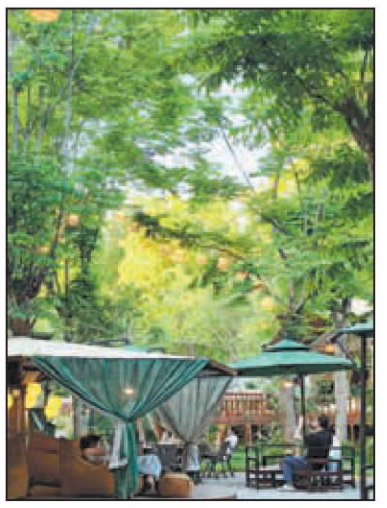
Converted from an old warehouse, the venue blends the village's laid-back spirit and rustic charm. Opened at the end of 2024, it instantly became a trendy hotspot, drawing visitors and diners from the city and nationwide.

"More than a meal, we hope to offer our diners a lifestyle, or at least, a brief soothing getaway in nature. They can either sit in peace doing nothing in the unspoiled beauty or enjoy the food, coffee, art shows, and activities," says Que Yiming, the restaurant's 61-year-old owner.

Que is an experienced spatial design artist from the Xinjiang Uygur autonomous region who relocated to Shanghai in 2000. Aiming to create a space that combines spatial aesthetics with commercial functions, he had long been searching for such an ideal rural location. Sticking to a concept of following nature, Que hoped to build a space that feels as if it is grown naturally from the landscape.

Que took charge of the venue's design and renovation work. He particularly highlights the eye-catching wood-fired oven at 300 degrees. As one of the largest ovens in China, it produces handmade bread with a distinct flavor.

The restaurant's 56-year-old Italian chef, who insists on being called Lucky Lasagna, most values the incomparable chance to cook in and with nature — the wind, wood, fire, and smoke.



"Another thing that I really love here is the long common tables. It creates conviviality when everyone escaping from the stress of the city sits together for a good time, sharing food and life experiences. Such moments are a bit lost now, but people are connected here," says the chef with a big smile.

Not far from Cangye Space and among Metasequoia trees in the town's Xuejian village, what draws young crowds to the riverside Ruru Village Cafe is not just a cup of coffee.

Surrounded by trees, rivers and rural homes, the cafe invites visitors to step into tranquility with a clean, minimalist design. For those sitting inside the cafe, a big square window becomes a picture frame that captures the natural forest view. For those who prefer to sit outside, cozy chairs and the soothing sound of wind chimes in the fresh open air easily help them drift off into a comfortable little nap.

Tang Menglei, the cafe's 37-year-old founder, tells China Daily that she has been living in the village for about four years, but it was not until last July that she felt ready to share this place with more people.

"I see more people nowadays need the energy from natural tranquility and stability, as our life always moves at such a fast, tiring pace. We need the space to slow down for a more mindful way of living and to explore more of our inner selves and the diversity of life," says Tang.

Top left and middle: Timber and the Woods bookstore in Xuejian village features log cabins sitting among the trees, healthy food and craft activities. **Top right and right middle:** Cangye Space, an Italian restaurant in Linjia village of Zhujiajiao town, Shanghai's Qingpu district, has been converted from an old warehouse. It features a large space, authentic food and a wood-fired oven for baking bread.

Top above and above right: Xuejian 299 homestay in Xuejian village offers visitors homelike experiences with natural landscapes, tasty food as well as diverse facilities and activities for family gatherings.

The cafe also went viral on social media platforms after it opened in May. Besides coffee, visitors can experience traditional Chinese culture through tea ceremonies, incense ceremonies, flower arranging, and other activities.

"I hope the space spreads the energy of love to a wider group. Life might be hard, but it can be easier and more meaningful if people come together, help and empower each other, and build a community," Tang adds.

Lamu, founder of the nearby Timber and the Woods bookstore, shares similar sentiments. Opening in June, it features several log cabins with thatched roofs scattered among the trees. Other facilities include a library and a coffee bar. Private rooms are also available. Residents and families from downtown Shanghai and neighboring cities often visit over weekends and holidays, sitting quietly to read, savor coffee, chat, take photos, lie down in beanbags, or sing and dance on the lush green lawns.

Healthy, nutritious and tasty food is another highlight at the bookstore. Lamu says that their cuisine uses organic ingredients and is based on ancient Chinese wisdom and the *Huangdi Neijing* (The Yellow Emperor's Classic of Medicine), the earliest known book of traditional Chinese medicine that dates back over 2,000 years. Among the various dishes, its signature roast chicken is brushed with a traditional, handcrafted soy sauce glaze and roasted to perfection, presenting a crispy, aromatic skin and tender, juicy meat.

"We want to build a healthy, kind and happy lifestyle and community here. Our staff members are like family, and they treat each other and our customers with the same kindness. Everyone who visits feels the relaxed aura and becomes part of it.

"As they feel connected, they trust, love and return to this place that offers a naturally healthy and positive lifestyle," says Lamu.

For visitors seeking a place to stay overnight, the village's Xuejian 299 homestay, a five-minute drive from the bookstore and Ruru coffee, aims to offer homelike experiences. Yao Ping, owner of the homestay, tells China Daily that she renovated the building for her own retirement and is glad to extend the same leisure and rural beauty to more people.

Opened in December, the homestay provides much more than delicately designed rooms. It also has a restaurant and bar that serves food and coffee, a fully equipped event space for family or team gatherings, and entertainment and sports facilities.

Local artisans are often invited here, leading visitors to do handicrafts and experience local cultural heritage. Kids can play on the swings, row a boat, dig bamboo shoots, or learn about nature. After dusk, open-air movies, candlelight dinners and nighttime parties are always ready to light up the starry sky.

"It feels more like sharing my home and way of life with those who need it, rather than running a business. Our guests often come back and talk to me, and we end up becoming friends.

"This is the life and place that we have all been dreaming of, and such encounters and connections are extremely precious," says Yao contentedly.

Bookworms rush to fair for immersive encounters with great authors

By **ZHANG KUN**
zhangkun@chinadaily.com.cn

The 2026 Shanghai Book Fair, running from August 12 to 18, is drawing reading enthusiasts from across China while unveiling AI-powered experiences at its dual main venues, the Shanghai Exhibition Center and Shanghai Book Mall.

This year's fair sets a new record with 1,420 reading events — a 12.1 percent increase from 2025 — transforming traditional book exhibitions into immersive cultural encounters.

One of the most anticipated events will take place on Saturday afternoon when Mo Yan, winner of the Nobel Prize in literature, will introduce his new short-story collection, *Ren Na* (Being Human), at the Shanghai Exhibition Center.

It is his first book in six years and marks the author's return to the Shanghai Book Fair after 14 years.

The 71-year-old writer, one of the most translated contemporary Chinese authors, is best known for his novel *Red Sorghum*, the film adaptation of which won the Golden Bear at the 38th Berlin International Film Festival.

Mo won the Nobel Prize in 2012 for work that "with hallucinatory realism merges folk tales, history and the contemporary".

According to Dook Media Group, publisher of the collection, the new volume features 81 tightly crafted pieces, the shortest comprising just 71 Chinese characters. "Despite their brevity, they leave a lasting impact," according to the publisher. "The words are minimal, yet carry immense force."

Dook Media Group opened reservations for the Saturday event on the evening of Aug 9. All 770 slots were filled in a short time.

Mo Yan's appearance is also part of Shanghai International Literary Week, an integral component of the fair. This year's program brings together overseas authors from 12 countries and regions for lectures, panel discussions and book-sharing sessions from Aug 11 to 17.

On Aug 12, young readers enjoy books during the ongoing 2026 Shanghai Book Fair, which will last till Aug 18. The fair is held at dual main venues. GAO ERQIANG / CHINA DAILY

Among them is Jeanette Winterson from Britain, whose debut novel, *Oranges Are Not the Only Fruit*, has enjoyed enduring popularity in China since its Chinese edition was first published in 2010. Winterson introduced her book *Love*, newly released in Chinese at Sinan Books on Aug 12.

Also presenting a new title is renowned Australian cinematographer Christopher Doyle, best known for his collaborations with Hong Kong-based director Wong Kar-wai. Doyle's book, published by China CITIC Press, is a collection of essays complemented by more than 100 photographs documenting his life, career and reflections on art, film and creativity.

Heilongjiang province is the fair's guest of honor this year — the first time the northeastern province has been featured at Shanghai Book Fair. Heilongjiang has brought 3,460 book titles and 74 journals to the event, including landmark works such as *A General History of Heilongjiang* and Chi Zijian's novel *The Last Quarter of the Moon*.

The province is also showcasing its diverse ethnic cultures and tourism resources. Visitors can explore 68 intangible cultural heritage items, including Hezhe fish-skin paintings and Daur embroidery, says Zhao Fuyi, head of the Heilongjiang Provincial Press and Publication Bureau. Interactive DIY sessions allow guests to create personalized souvenirs, while a Heilongjiang delicacies zone offers local favorites such as Wuchang rice, birch sap and Modern-branded popsicles.

Technology marks another highlight of this year's fair as organizers introduce an AI agent that powers an online smart consultation platform, responding to audience inquiries in real time.

"Whether it's ticketing and entry, event schedules, exhibitor directories, book information, or transportation routes and on-site facilities, visitors can get quick answers," says Zeng Yuan, head of the printing and distribution division of Shanghai's publicity department.

LIFE

The epicenter of gaming

With an international tournament imminent, the nation's esports industry continues its rapid expansion, **Wang Xin** reports in Shanghai.

When Xavier Descharmes, chief marketing officer of OG Esports, walks through Shanghai on any summer morning, the city's sounds, smells, humidity, and even the police officers wearing yellow jackets instantly unlock the memories of his first visit to China seven years ago.

At that time, on a late August evening, the OG Esports team defended its title in the city at The International 2019, the world's largest *Dota 2* esports tournament, a feat that no other team in TI history had yet accomplished.

It also marked the first time that the top-level tournament was held in Shanghai, and made the team familiar to Chinese esports fans. Although they advanced to the finals by defeating a Chinese team that had been widely tipped to win the championship, they still earned the respect and cheers of local fans with their beautiful play.

"When I was there for the first time, I was speechless for a good 30 seconds due to the passion that embraced me — passion from the players, the audience and the organizers. We might support different teams, but we share the same raw emotion of passion and hunger.

"There is nothing too different between us. We built a connection, a good relationship and a special bond with Chinese fans. It changed everything," recalls Descharmes.

With TI 2026 approaching again in Shanghai, the team is actively preparing for its comeback — and many more beyond the tournament. Descharmes says that they are looking to expand their presence in the nation, hoping to grow organically with the local esports community in the long term.

Esports refers to competitive video gaming where individuals or teams compete against each other in various video game titles. Objectives may include destroying an enemy base, defeating monsters in fantasy worlds, or scavenging for weapons and armor to defeat other players. Tournaments can be local, regional or international, with some events offering substantial prize money. The tournaments are often held in large arenas and are streamed online to worldwide audiences that can number in the millions.

Guido Gernetti, co-founder and COO of Leviatan, a leading Latin American esports organization, shares similar sentiments with Descharmes. Leviatan's team first came to the city for the Valorant Masters Shanghai 2024, when Gernetti felt the same passion and connection with the local esports community.

Since then, Leviatan has also started diving into Chinese culture while actively interacting with local fans and operating Chinese social media accounts, which have so far garnered more than 340,000 followers.

"Right now, in overseas markets, we all see China as a leader in the gaming ecosystem. It is investing in diverse events and promoting the esports scene. Along with ourselves, more teams are coming here to learn, to be part of the ecosystem, and to build things together," says Gernetti.

He adds that the organization is looking to establish the company here within the year, and expects to enhance its international collaboration and bridge Chinese and Latin American cultures via esports.

"Esports culture is inclusive, digital, and creates passion. We are expanding fast globally, and have so many possibilities to make things happen together," says Gernetti.

The ESL FACEIT Group, which has partnered with local organizations such as the Shanghai-headquartered Hero Esports, has been expanding its presence in China with its renowned Intel Extreme Masters tournaments in Beijing and Chengdu, Sichuan province, as well as DreamHack Shanghai, which made its debut last year.

Top: The Honor of Kings team from Chengdu's All Gamers Esports Group takes the crown at the King Pro League Grand Finals 2025 in Beijing on Nov 8. **Clockwise from above:** The Valorant team from the Beijing Dragon Ranger Gaming Esports Club on the esports stage at Shougang Park in May. Global esports players and fans gather at DreamHack Shanghai last May. Leviatan's Valorant team celebrates a victory. Fans bring their own signs to show their support.

Jascha Braeker, senior partnerships development manager at EFG, notes that esports and the gaming industry are still growing, and that China produces some of the best tournaments and players. EFG is positive about future growth in the nation and hopes to introduce more Chinese brands to the world.

Braeker says that China is generally the company's largest viewership market, and that Chinese cities provide some of the strongest government support. She also says that they recognize esports as culturally relevant and important to the younger generation.

"We want to stay in China, nurture the market, connect with the super-passionate fans, and bring them the best events. We have not explored the Chinese market to the fullest yet, so I think we will grow in China," she adds.

China's esports industry saw its revenue increase 2.78 percent year-on-year to nearly 13.12 billion yuan ($1.94 billion) in the first half of 2026. By the end of June, China was home to more than 160 esports organizations and the nation's esports user base reached 495 million, according to the latest report released by the China Audio-Video and Digital Publishing Association during the recent 23rd China Digital Entertainment Expo and Conference, held from July 31 to Aug 3 in Shanghai.

The report also says that China's esports industry has been continuously expanding in overseas markets such as East Asia, Southeast Asia and the Americas.

Among the Chinese esports organizations accelerating overseas expansion is the Chengdu-headquartered All Gamers Esports Group, one of the oldest esports organizations in the world.

Established in 1999, AG Esports Group now has 28 branches worldwide, half of which are overseas, and is engaged in 16 game divisions covering most major esports games, such as *League of Legends*, *Honor of Kings*, *Peacekeeper Elite*, *Valorant*, *CrossFire* and more, according to Layne Le Kedeng, chairman of AG Esports Group.

Le, who also serves as chairman of the club commission of the Asian Electronic Sports Federation, says that Asia is increasingly becoming the center of global esports, and more of the world's top esports tournaments have been held in the region over the past three years.

"Asia contributes over 70 percent of the global esports viewership and about half of its total revenues. The Esports World Cup is connecting the Eastern and Western esports scenes, and more Chinese esports organizations are making a global impact," says Le.

Notably, while esports in most Western nations are still based on computer games, China is taking the global lead in mobile gaming esports, represented by the King Pro League, the highest-level league tournament of *Honor of Kings* in China. This approach has been a huge success not only in China but also in overseas markets, especially in Southeast Asia.

He notes that mobile gaming now generates massive viewership across Asia, achieving explosive market growth and fostering new cultural bonds. It has extremely low barriers to entry and much easier access, regardless of time or location.

Eddy Chen, vice-president at All Gamers Global, highlights the significant role of esports in promoting cultural exchanges. He says that AG teams often prepare free gifts for fans at tournaments, and initiatives like this have helped them connect with overseas esports communities, along with promoting Chinese culture.

"We are happy to see our overseas fan base growing, and many of them buy our merchandise such as team uniforms. We are committed to building AG into one of the largest, best-performing and most sustainable esports clubs globally, and thus better connecting China and the world," Chen says.

As esports see deeper integration with cities and culture, Chinese esports organizations are also exploring beyond the arena. Shi Yu, vice-president of Beijing's Dragon Ranger Gaming Esports Club, is exploring how to unleash esports' potential in urban development.

Shougang Park in Beijing is an example of such exploration, where old factories and buildings have been converted into large esports centers and stages. Moreover, the club's Valorant team showcases the park, district and the city to global audiences whenever they step onto the global stage in overseas tournaments.

"It brings international appeal and coverage that no city promotional video could achieve. Esports and cities have never had a one-way relationship where tournaments 'borrow' the venues. Instead, it is a symbiotic relationship with shared goals and benefits," says Shi.

Le at AG Esports Group, which is deeply rooted in Chengdu, adds: "China's esports industry is special in many ways. It is very diverse and inclusive, with high female participation. It is a city's soft power and carries a sense of city pride. We have been thriving in the past few years, and I believe our voice will be heard more on the global stage as we march forward."

Zanzibar's healthcare improved by Chinese expertise

DAR ES SALAAM — In a radiology room at Lumumba Regional Hospital in Tanzania's Zanzibar, a quiet technological shift is reshaping how doctors detect disease, make decisions, and save lives.

On the island, artificial intelligence systems are helping doctors interpret medical images, while remote consultations connect local physicians with specialists thousands of kilometers away.

Bridging this distance is Yuan Gang, a radiologist with the 35th Chinese medical team in Zanzibar, who combines local imaging, cloud-based AI analysis and real-time specialist consultations.

For years, Zanzibar's healthcare system has faced challenges in diagnosing complex diseases, particularly because of limited imaging expertise, heavy workloads and a lack of advanced diagnostic tools, according to local physician Haitham Hamudu.

Imaging interpretation, often described as the "eyes" of modern medicine, has been especially constrained, Hamudu says.

By linking the hospital's imaging system with the First People's Hospital of Lianyungang in East China's Jiangsu province, Yuan has introduced a three-layer diagnostic approach, which includes initial reading by local doctors, AI-assisted detection and classification, and quality control through Chinese specialist review.

This hybrid model is enabling doctors in Zanzibar to access the precision and standards of top-tier Chinese hospitals without requiring patients to leave the island.

"Technology is allowing us to overcome distance and resource gaps," Yuan says. "It is not just about solving one case, but about building a system that improves care for many patients."

One of the most striking cases involved a young Zanzibari child suffering from recurrent vomiting and lethargy.

After reviewing the child's magnetic resonance imaging scans, Yuan diagnosed hydrocephalus but found the underlying cause unclear. He immediately initiated a remote consultation with neuroradiology experts in the Chinese city of Lianyungang.

By jointly reviewing the imaging data and clinical records, the team identified the hidden cause, and provided a precise diagnosis and treatment recommendations, giving local doctors a clear path forward and the child a renewed chance at recovery.

Beyond individual cases, Yuan has introduced AI-powered imaging tools to improve diagnostic accuracy in Zanzibar.

He says many women have dense breast tissue, making breast cancer harder to detect with conventional mammography. AI-assisted mammography now analyzes images, classifies lesions using the internationally recognized Breast Imaging Reporting and Data System, and helps doctors assess malignancy risk.

In one case, a 42-year-old woman with mild breast pain showed no obvious abnormalities on routine examination. AI, however, detected two hidden nodules and accurately classified their risk, helping doctors avoid unnecessary procedures while ensuring timely follow-up.

Similarly, AI-assisted lung imaging is improving the early detection of pulmonary nodules that are often missed in manual readings.

Beyond diagnosis, Yuan is helping local doctors adopt AI tools, standardized reporting systems, and structured diagnostic methods through hands-on training and case-based teaching, improving diagnostic accuracy while strengthening local capacity.

The AI imaging initiative is part of a broader digital healthcare partnership between China and Tanzania's Zanzibar, Yuan says.

Jazz opens discourse with China

Young US performers build 'a connecting bridge between different cultures' on tour across the Pacific Ocean

By **LIA ZHU** in San Francisco
liazhu@chinadailyusa.com

Backstage at the SFJAZZ Center on Aug 4, Malcolm Clark and Annie Meyer were already dressed for the bandstand: black jackets, red pants and black canvas shoes.

A trip to China was ahead of them.

Clark, 18, a trombonist from Tuftonboro, New Hampshire, had traveled outside the United States before, but never this far. Meyer, also 18, a guitarist from Boston, was thinking about Chinese food, coffee recommendations passed along by a guest artist and the technology she had heard so much about.

But when the two musicians talked about what they most hoped to find on the other side of the Pacific, they kept coming back to something they already knew how to do: listen.

> "You're able to communicate with audiences in a way that you couldn't by speaking."
>
> **Annie Meyer,** 18-year-old guitarist about to tour China

"I know it's cliche, but when people say jazz is a language that can be understood by everyone, I think that's like a connective tissue that connects both cultures," Meyer said. "You're able to communicate with audiences in a way that you couldn't by speaking."

That idea is at the heart of this summer's tour by Carnegie Hall's National Youth Orchestra Jazz, or NYO Jazz, a band of players aged 16 to 19 chosen through a national audition process.

The Aug 4 concert in San Francisco was the ensemble's last US stop before they left for a tour running through Aug 15 with stops in Taichung, Shanghai and Beijing. This summer's repertoire spans classic works and contemporary compositions.

For the young players, the trip is both a concert tour and an experiment in person-to-person communication.

"When I travel outside of the country, I am always really happy to get to know what the locals think about the world and see other people's perspectives," said Clark. "I really hope that we can kind of act as ambassadors of American music for a Chinese audience." He started piano in the third grade and picked up the trombone a year later. This fall, he will start at the Eastman School of Music.

"Music is a universal language, but there's different dialects, so to speak," he added. "So we'll kind of be showing off our local dialect of music to a population of people who maybe aren't as familiar with it."

Jazz emerged in African American communities in New Orleans around the turn of the 20th century, drawing on blues, ragtime, brass-band traditions and other influences. Syncopation and swing became central parts of its sound, but improvisation gave the music one of its defining characteristics: musicians could make decisions and respond to one another in real time rather than only reproduce what was written on a score.

Above: NYO Jazz 2026 players pose in front of the SFJAZZ Center in San Francisco on Aug 4 before they head to China for a tour the following day. LIA ZHU / CHINA DAILY
Top-left: The NYO Jazz 2026 ensemble poses for a group photo before they head to China for a tour. PROVIDED TO CHINA DAILY **Top-right:** The NYO Jazz 2026 Carnegie Hall concert with singer Dee Dee Bridgewater (center). PROVIDED TO CHINA DAILY

For Clark, that improvisational freedom is exactly what makes jazz useful across cultures.

"The improvisational aspect of jazz, I think, is something that doesn't require any kind of mutual understanding," he said. Music feels "wired into all of humanity", allowing improvisation to become "a connecting bridge between different cultures," he said.

Meyer, who begins the Harvard and New England Conservatory dual program this fall, has been playing jazz for two years, after starting on piano. She described the same quality of jazz from another angle.

In jazz, she said, every player is expected to bring an individual voice. A solo does not require shared spoken language, yet another musician can hear it, react to it and join the conversation.

"It connects people, and it allows people to feel like they've known each other," she said.

The NYO Jazz musicians had known one another for only about two weeks, she said, yet playing together had compressed the distance between strangers.

She has seen the same thing happen in jazz clubs. At Smalls Jazz Club in New York, she said, musicians can arrive from different countries, barely know one another and soon be playing together.

"That's a very special thing," she said. Unlike music that may require a group to rehearse a specific arrangement or learn lyrics beforehand, "jazz is something that you can just pick up and play together, like, instantaneously".

That is the argument Carnegie Hall has been testing since it founded NYO Jazz in 2018 and sent it to China for the first time the following year.

"NYO Jazz was created not only to develop exceptional young musicians, but also to give them a platform to serve as cultural ambassadors," said Joanna Massey, director of learning and engagement programs at Carnegie Hall's Weill Music Institute, who has led the program since its start.

"For our young musicians, the tour provides an extraordinary opportunity to engage with China's rich culture and history firsthand while performing for local audiences. Audiences in Shanghai and Beijing can experience the artistry, creativity and diversity of America's next generation of jazz performers, while our touring musicians find meaningful opportunities to bring people together across cultures and borders," she said.

On tour, the musicians will take part in peer-to-peer activities with local young people, musicians and non-musicians alike. Those encounters, she said, frequently outlast the concerts in the players' memories.

Previous visits have taken the ensemble to Jazz at Lincoln Center and the Shanghai Oriental Art Center in Shanghai, the National Centre for the Performing Arts (NCPA) in Beijing, and Huafa and the CPAA Grand Theatre in Zhuhai. "We've found Chinese audiences to be exceptionally welcoming, engaged and enthusiastic," said Massey.

She said Shanghai and Beijing have long-established music communities, and the ensemble's return gives its members a chance to encounter Chinese culture and history directly while meeting local audiences and young people.

Shanghai was a jazz city in the 1920s and 1930s; Beijing had a boom of its own in the 1990s. Jazz is growing as a niche yet increasingly popular genre in China. The current rise is driven by live-house culture and by an audience that skews young.

New York-based Blue Note Jazz Club opened its first Chinese branch in Beijing in 2016, and Jazz at Lincoln Center Shanghai opened in 2019. The JZ Festival, which debuted in 2005, has become the largest jazz festival in China and the second largest in Asia, and the NCPA co-sponsors the Taihu Jazz Festival at its stage art center in Beijing's Tongzhou district. Scenes have since spread to other cities like Guangzhou, Shenzhen, Xi'an and Chongqing.

San Francisco has its own stake in that exchange.

"We're honored to be one of the final stops before NYO Jazz heads to China," said TJ Gorton, director of marketing at SFJAZZ, a non-profit jazz organization, noting the city's long cultural and historical ties with China.

SFJAZZ has been building out SFJAZZ At Home, a growing library of performances and educational content, much of it free, that reaches audiences outside the SFJAZZ Center. Connecting with Chinese audiences, students, educators and institutions remains a priority, Gorton said, and the organization wants to pursue it through digital programming and direct educational partnerships.

Jazz was born in America, he added, but younger musicians around the world are increasingly blending it with their own traditions.

Massey said the educational and cultural activities surrounding the concerts are intended to create opportunities for dialogue, collaboration and learning. Because jazz depends on listening, communication and collective creation, she said, it is particularly suited to encounters in which young people may begin with different backgrounds but discover shared interests.

Meyer, asked how she plans to approach musicians she cannot speak to, quoted the trumpeter who leads Jazz at Lincoln Center.

"Wynton Marsalis is famous for saying that jazz music is a great metaphor for how we should interact with others in real life, in the sense that, to play good jazz music, you have to always be listening and always be lifting up other people," she said.

When another player solos and she is comping behind them, the wrong move is the flashy one. "What I need to be aiming to do is play something that will support them and uplift them." The same, she said, goes for a conversation: listen first, and let that inform what you say.

Asked what he wants a Chinese audience to take away, Clark did not talk about technique.

"For me, I really want to communicate the joy that music brings to me, and the joy that music brings to all of us — not only as individuals, but as a group," he said. "Being immersed in music and in the joy of music is one of the most special things in the world. I would love for everybody to be able to experience that at some point."

LAX caterer faces inspection over sanitation complaints

By **RENA LI** in Los Angeles
renali@chinadailyusa.com

California workplace safety regulators have opened an inspection into an airline catering facility serving Los Angeles International Airport (LAX) after workers alleged exposure to maggots, mold, cockroaches and other unsanitary conditions while preparing and handling equipment used for in-flight meals.

The complaint against Flying Food Group's facility in Inglewood, near LAX, was filed with the California Division of Occupational Safety and Health, or Cal/OSHA, by UNITE HERE Local 11 on behalf of employees, according to reports by The New York Times, CNN and ABC7.

Cal/OSHA confirmed to The New York Times that it had "received the complaint and has opened an inspection", but declined to provide further details.

The allegations have drawn attention to sanitation and worker safety within the airline catering supply chain, in which food is prepared, stored and transported before being loaded onto aircraft serving thousands of passengers.

According to the complaint, an employee said she was instructed in late June to clean dishes from a cart that had remained unopened for an extended period. She reported finding dozens of dishes containing decomposing, mold-covered food, some with what appeared to be live maggots and flies.

The worker suggested that the dishes be discarded, but a supervisor allegedly told her they were needed for an upcoming flight, according to the complaint.

Susan Minato, co-president of UNITE HERE Local 11, told ABC7 that the worker said, "I don't think I should clean this. I think that this should be thrown away. This is too disgusting".

Minato said the worker was nevertheless instructed to clean the dishes and was not provided with a face mask or other specialized protective equipment. The complaint said she later experienced stomach pain, a headache and an unusual sensation in her nose.

> We are conducting a thorough review of the allegations and are cooperating with the appropriate regulatory authorities."
>
> **Flying Food Group,** which supplies more than a dozen international airlines at LAX

The union also alleges that employees encountered what they believed to be cockroaches and other vermin in food preparation areas and near airline food carts. Another employee alleged that she photographed cockroaches in the kitchen and on a Lufthansa cart in December, The New York Times reported.

A spokesman for Lufthansa said the airline had not previously been aware of the alleged incident.

"Lufthansa Group holds its caterers to rigorous food safety and sanitation standards, and we expect full compliance with these standards at all times across our global network," spokesman Tal Muscal told The New York Times. "Otherwise, Lufthansa will not hesitate in taking appropriate action."

Virgin Atlantic also said it was taking the allegations seriously but had found no indication that meals provided to its passengers had been affected.

The airline said it had "no evidence that catering supplied for its customers has been compromised," according to the media.

The union said Flying Food Group serves more than a dozen international airlines at LAX, including Air France, Japan Airlines, Lufthansa, Qantas, Singapore Airlines and Virgin Atlantic.

The complaint also alleges that bathrooms and handwashing stations at the Inglewood facility sometimes lacked sufficient soap or paper towels.

Maria Hernandez, press secretary for UNITE HERE Local 11, told CNN that workers were "incredibly frustrated" by the alleged conditions at a facility supplying some of the world's largest airlines.

Flying Food Group operates 19 catering facilities across the United States and, according to CNN, prepares about 120 million meals annually for more than 75 airlines.

The company told CNN that it was aware of the allegations and was reviewing them.

"We are conducting a thorough review of the allegations and are cooperating with the appropriate regulatory authorities," Flying Food Group said.

The union subsequently told Los Angeles World Airports, which oversees LAX, that a Cal/OSHA inspector had allegedly been denied entry to the facility on Friday, according to The New York Times. Cal/OSHA confirmed that an inspection had been opened but declined to comment on whether an inspector had been denied access. Los Angeles World Airports also declined to comment.

The latest complaint follows previous workplace safety concerns at the facility. CNN reported that Cal/OSHA issued six citations to the company in May following a January incident in which two employees were reportedly found inside a cold-storage room that had been chained from the outside.

The allegations have not been established as regulatory findings, and the news reports cited no evidence that contaminated food reached airline passengers. Virgin Atlantic specifically said it had no evidence its catering had been compromised, while Lufthansa said it expects its caterers to meet rigorous food safety and sanitation standards.

Cal/OSHA's inspection is now underway, while Flying Food Group has said it is conducting its own review and cooperating with regulatory authorities.

China's strong power capacity fuels AI boom

Nation leverages grid, green power, nuclear to meet sector's growing demand for energy

By **MA SI**
masi@chinadaily.com.cn

As artificial intelligence evolves into a core driver of global industrial competition, China's strong power supply system and its forward-looking computing-electricity synergy strategy will give it an unparalleled edge in rolling out AI infrastructure, according to experts, corporate executives and on-the-ground evidence.

Zhang Qin, former deputy chairman of the China Association for Science and Technology and fellow of International Academy of Artificial Intelligence Sciences, said that "AI is creating an explosive demand for energy, and the solution lies in safe, reliable and green power. China has great strength in that area".

"Apart from solar and wind power, nuclear energy can also be a crucial power supply for data centers if safety is guaranteed. This is a technological frontier to be conquered rather than a barrier to AI adoption," Zhang told China Daily on the sidelines of the recent World Internet of Things Top 500 Summit in Beijing.

The comments came as China embraces AI with open arms. The value of its core AI industries exceeded 1.2 trillion yuan ($177 billion) last year, maintaining annual growth of more than 20 percent for several consecutive years, according to the Ministry of Industry and Information Technology.

Furthermore, the country is turning AI into real-world applications and a driver of economic growth. In the first half of this year, China's industrial output of AI-related sectors, including integrated circuit manufacturing and in-vehicle intelligent equipment manufacturing, grew more than 30 percent year-on-year.

Wei Zhigang, chairman of CNNC Hainan Nuclear Power Co, said that as AI triggers unprecedented global demand for computing power, "the ultimate constraint has become clear: the need for vast, stable electricity supplies".

Tech giants such as Microsoft and Google are actively exploring small modular nuclear reactors, or SMRs, to power AI data centers.

Wei added that CNNC's Linglong One — the world's first onshore commercial SMR — is nearing completion, and the company plans to begin commercial operations later this year. One key advantage of SMRs, Wei said, is their flexible placement, allowing them to be deployed right where computing power is needed, enabling close load-matching.

Zhou Ji, a senior researcher at market consultancy Pangoal, said that "China's energy system has an edge in three dimensions: scale, structure and system, which constitutes solid support for AI computing infrastructure at the foundational level".

Regarding scale, China ranks first in the world in total electricity generation and also leads in incremental growth. In terms of structure, the country has the world's largest installed capacity of new energy, with the share of green power continuing to rise, Zhou said.

As for system, China's ultra-high-voltage grid technology enables cross-regional optimization of power resources, while the country is also adopting a pioneering approach that aligns computing infrastructure with clean energy sources, he added.

Power strain

Looking ahead, the Beijing Institute of Technology's Center for Energy and Environmental Policy Research projected that by 2030, China's data centers will consume about 525.76 billion kilowatt-hours of electricity, accounting for 4.8 percent of the country's total societal electricity use.

In the United States, meanwhile, the amount of electricity consumed by data centers is expected to cause significant tightening across the national power market.

That strain is already feeding through to the real economy, as big tech data centers are driving up power bills for manufacturers across the US Rust Belt, Reuters reported. For example, the Belden Brick Co in Sugarcreek, Ohio, a 141-year-old enterprise, saw its electricity costs surge 90 percent last year, largely due to rising power demand from regional data centers.

China, by contrast, is taking a coordinated, long-term approach. Wang Hongzhi, head of the National Energy Administration, has said that China's energy system will become significantly more secure, resilient and structurally optimized by 2030, driven by over 20 trillion yuan in planned investments for key energy projects and emerging sectors.

To accommodate the surging electricity demand driven by AI, Wang said China will closely align national computing hubs with large renewable bases in the western regions, advancing the synergy between computing and electricity, while simultaneously promoting distributed power, microgrids and virtual power plants to meet localized computing needs.

A virtual power plant is a network of small, distributed energy resources, such as solar panels and electric vehicle chargers, that are connected and managed as one.

Song Yunbo, chief sustainability officer of GCL Group, a major Chinese new energy company, said that China "already generates over one-third of its electricity from renewables — a global leader — and the country's energy surplus makes it an ideal testing ground for AI-driven applications".

Miao Qing, chairwoman of Yingli Group, another Chinese new energy company, said AI-powered virtual power plants are reshaping electricity systems by aggregating distributed renewables, storage and flexible loads to smooth peaks and valleys while dynamically responding to real-time market prices.

Miao said China has already built more than 530 virtual power plants, and the prospects for wider application are "very promising".

Small-scale farmers key to food security

WORLD WATCH
By Nii Quaye-Kumah

So far, this has been a summer of extremes. Record-breaking heat waves across the Northern Hemisphere have scorched fields and strained the food systems in Western Europe, which recorded its hottest June on record. In parts of Asia, temperatures have also soared well above seasonal averages. At the same time, Typhoon Bavi has just swept across eastern China, displacing millions and leaving a trail of damage to farmland and rural infrastructure in its wake. These events are not isolated incidents. They are the latest expressions of a climate system under severe and intensifying stress.

Extreme heat already threatens the livelihoods of over 1 billion people, causing an annual loss of 470 billion labor hours across the global agricultural sector. For most major crops, yield declines begin above 30 C; livestock experience stress at even lower thresholds. In 2024, 91 percent of the global ocean experienced at least one marine heat wave. Critically, extreme heat does not act alone. It amplifies water stress, triggers flash droughts and creates conditions for pest and disease outbreaks. According to the Food and Agriculture Organization of the United Nations and the World Meteorological Organization, agricultural losses can triple when heat coincides with other hazards such as drought.

China is already living the reality of climate change and the impacts of extreme heat. Over the past 50 years, the country's average surface temperature has risen by 0.31 C per decade, faster than the global average. The consequences are unfolding across its farms and threatening food production and rural livelihoods.

Typically, rice yields begin to decline once temperatures exceed 28 C. In the case of maize, every additional degree of warming reduces global yields by 7.5 percent, while extreme heat during flowering can cause even greater losses. Although China's grain output has remained above 650 million metric tons for 10 consecutive years, yields could decline by 8.7 percent across the country's maize belt by the end of the century under a high-emissions pathway.

The message is unmistakable: Climate change is no longer a future threat for China and, indeed, the world. It is already reducing harvests, degrading productive land and increasing the urgency of investing in climate-resilient agriculture.

Smallholder farmers, the "first mile" of our food system, bear a disproportionate share of this burden. In China, they represent 90 percent of the agricultural workforce and cultivate 70 percent of the country's arable land. Globally, they produce a significant share of the food that feeds the world, yet they are the least equipped to absorb the shocks that climate change delivers. Access to climate information, affordable insurance, resilient infrastructure and the financial reserves needed to recover from a bad season can remain limited.

RICE TERRACE WAKEBOARDING MAKES WAVES

Combining extreme water sports and a centuries-old agricultural landscape is proving to be a hit in Zhejiang

By **CHEN YE** in Hangzhou
chenye@chinadaily.com.cn

At first glance, it seems impossible.

On a sheet of water barely 10 centimeters deep, Jin Taiyang glides across a flooded rice terrace nearly 800 meters above sea level. Instead of being pulled by a boat, the 33-year-old wakeboarding coach is pulled by an electric winch.

He gathers speed before launching off a ramp at the edge of one terrace. He twists into a backflip and lands smoothly on the tier below, sending water spraying into the air and prompting applause from the onlookers.

For Jin, it is unlike riding anywhere else.

"When you're surfing in the ocean, the only sound you hear is that of the waves," he said. "Here, you're surrounded by birds and insects. You can hear the water beneath your board, the sound of the winch pulling you forward and, if you land the trick, the cheers from visitors."

Jin Taiyang and his friend Zhang Wei (right) experience wakeboarding at Yunhe Rice Terraces in Lishui, Zhejiang province, on May 2. PROVIDED TO CHINA DAILY

The performances take place at the Yunhe Rice Terraces Scenic Area in Yunhe county of Lishui in East China's Zhejiang province. Designated as a national 5A tourist attraction, the site is home to the largest complex of terraced rice fields in East China.

Each spring, before rice transplanting begins, the terraces are flooded with mountain spring water, creating mirror-like surfaces that are ideal for wakeboarding.

Unity and cooperation highlighted at ASEAN gathering

By **ZHANG YUNBI**
zhangyunbi@chinadaily.com.cn

Beijing and its Southeast Asian neighbors have managed to shore up unity and pragmatic cooperation at the recently concluded China-ASEAN Foreign Ministers' Meeting in Manila, yielding tangible outcomes.

Inside
Comment, page 6

At the annual meeting, attended by Foreign Minister Wang Yi and his counterparts in the Philippine capital, the ASEAN countries said they look forward to closer strategic coordination with China to bolster their own development resilience and advance high-quality connectivity.

They also expressed support for "deeper cooperation in trade and investment, the digital economy, artificial intelligence, climate change, clean energy and efforts to combat transnational crime", according to a Foreign Ministry release.

China and the Association of Southeast Asian Nations have been each other's largest trading partner for six consecutive years, with annual trade volume exceeding $1 trillion last year.

As a major outcome, the meeting adopted a joint statement of the China-ASEAN foreign ministers on addressing the impact on the region of the evolving situation in the Middle East and the strengthening of regional energy cooperation.

"The foreign ministers of ASEAN member states and the ASEAN secretary-general spoke highly of the achievements of ASEAN-China cooperation and unanimously affirmed that China is one of ASEAN's most important friendly neighbors and dialogue partners," Foreign Ministry spokesman Lin Jian said on Thursday.

This year marks the fifth anniversary of the establishment of the China-ASEAN Comprehensive Strategic Partnership, which has covered and benefited a combined population of over 2 billion people.

INDEPTH

Brighter futures sprout for Kenyan women

Chinese scientists share mushroom cultivation techniques to help improve incomes, build better lives

By **LI MUYUN** and **HE CHUN** in Changsha

A small but ambitious project led by Chinese scientists is helping some of Kenya's impoverished women, particularly single mothers, to build new lives — one mushroom at a time.

Mom's Mushroom House, a collaboration between edible fungi researchers from Hunan province and Kenyan partners, is adapting Chinese cultivation techniques to local conditions, training women in Kenya to grow and sell mushrooms from simple, low-cost structures.

The project focuses on one of Kenya's most vulnerable populations. Two-thirds of Kenyans live in poverty, earning less than $3.20 a day. Among them, women and girls bear a disproportionate burden. In Kibera, one of Nairobi's largest informal settlements, women make up nearly three-quarters of the adult population. The Kenya Demographic and Health Survey indicates that a third of Kenya's households are headed by women, with this proportion higher in rural areas than in urban ones.

In 2022, approximately 15 percent of Kenyan women aged 15-49 were single mothers, according to the Kenya National Bureau of Statistics.

For single mothers in impoverished communities, the challenges are compounded by limited support from fathers, lack of stable incomes, and inadequate access to healthcare and education for their children.

"But the Kenyan mothers I know are remarkably optimistic and resilient," said Chen Tian, director of the think tank at the China-Africa Economic and Trade Promotion Council.

"They are constantly breaking through constraints, stepping out of their homes, and striving for equal opportunities. They are eager to learn new skills to earn a better living," Chen said, adding that the project aims to harness this willingness to learn.

Mom's Mushroom House is designed to empower Kenyan women through multiple avenues, providing mushroom cultivation techniques, supplying planting materials, and connecting them to markets.

The collaboration, formalized in December, is led by the Institute of Hunan Edible Fungi, the China-Africa Economic and Trade Promotion Council in Hunan, and Albert Meadows Limited, one of the largest commercial mushroom farm in Kenya. Last month, a team of Chinese female researchers traveled to Kenya to deliver on-site technical training to local women.

Xu Ning (center), a researcher at the Institute of Hunan Edible Fungi in Changsha, Hunan province, and local participants of the Mom's Mushroom House project show the harvest from their mushroom cultivation at a farm in Nairobi, Kenya, in June. PROVIDED TO CHINA DAILY

'Culinary legacy'

There is a compelling commercial logic behind the choice of mushrooms, according to Xu Ning, a researcher at the Institute of Hunan Edible Fungi and one of the project's initiators.

Kenyans have long been eating mushrooms, a culinary legacy of British colonial rule, Xu said. "Mushrooms appear on pizzas, in stews, and in soups."

However, after arriving in Nairobi last year, Xu discovered that mushrooms were being sold in supermarkets at prices far higher than in China.

"Virtually all the mushrooms consumed in the country are imported, mainly from South Africa, at high prices," she said. "Despite the strong demand, there is not a single large, professional mushroom cultivation company in Kenya or even in neighboring countries."

The country faces an annual mushroom supply shortfall of roughly 700 metric tons, according to the Kenya National Chamber of Commerce and Industry.

Beyond the local market, there is also export potential. Kenya has developed a sophisticated cold-chain logistics system for its flower industry, and the same infrastructure could be used to export fresh mushrooms, Xu explained.

The country's natural conditions are highly conducive to mushroom cultivation. "Temperatures there range from 16 C to 28 C year-round, eliminating the need for additional heating or cooling," she said.

In addition, mushrooms also grow quickly. Oyster mushrooms take only 25 to 35 days from planting to harvest, while white button mushrooms take 55 to 60 days. "Few crops offer such rapid results," she added.

This rapid growth, coupled with low start-up costs and high market value, makes mushrooms an ideal vehicle for poverty alleviation in Kenya. A woman with a single room can start her own business, and with proper training she can earn enough to support her family.

"By our assessment, even a small operation could generate about $150 per month, which is higher than the average salary of a local factory worker," Xu noted.

System redesign

However, local production conditions were far more challenging than Xu had anticipated.

"The local mushroom sheds were built with simple materials and lacked standardized temperature or humidity control equipment," Xu said. "The power supply was unstable, with frequent outages, and there was no irrigation system, forcing farmers to water manually."

Due to the farmers' limited knowledge of microbiology and sterilization, many mushroom bags were contaminated and infested with pests. As a result, the standard cultivation techniques brought by Xu and her colleagues from China could not be directly applied.

"We had to redesign the entire system," she said.

Their approach was guided by three principles: low cost, use of locally available materials, and no reliance on stable electricity.

Instead of constructing steel-framed structures, the team converted local mud-walled rooms into functional mushroom houses by adding ventilation holes — a low-cost solution that required no new construction. For the cultivation substrate, they replaced some imported ingredients with local agricultural waste: sugarcane bagasse, coffee husks, corn stalks, and wood chips. They also developed a simple open-air composting process that relied on natural heat rather than machinery.

Pest control was another challenge. Kenya had no approved fungicides for mushroom cultivation, so the team introduced physical and biological solutions: sticky traps, ash and chili water as natural repellents, and better spacing between mushroom bags to reduce mold.

The sterilization method also had to be rethought. In China, mushroom growers use high-pressure autoclaves. In Kenya, Xu found farmers were using an old-fashioned method, an oil drum filled with water, heated by fire beneath, with mushroom bags suspended inside on iron rods. It was the same technology Chinese farmers used decades ago.

Xu instructs local women on the cultivation of oyster mushrooms at a farm in Nairobi in June. PROVIDED TO CHINA DAILY

Online
See more by scanning the code.

"We could not bring in expensive equipment or specialized materials," Xu said. "Everything we designed had to work with what was already available in the community."

Training begins

Last month, Xu and five colleagues arrived in Nairobi to deliver the first training session for local farmers. The course lasted eight days — six days of theory and two days of hands-on practice — all free of charge.

More than 40 participants, most of them women, came from diverse backgrounds. Some were farm owners, some were struggling mushroom growers, and a few were university students with children, eager to learn a marketable skill. But most of the female participants shared one thing in common — they were responsible for supporting children on their own.

"In Kenya, young women often find themselves raising children alone," Xu said. "Almost all of our students had children to feed and no stable income to do it with."

Theory classes were held at the Confucius Institute at the University of Nairobi, which provided its classrooms free of charge. The Chinese experts covered mushroom biology, cultivation techniques, pest control, post-harvest handling, and market access. The practical sessions, conducted at two local farms, were tailored to local conditions, with no sterile lab environments, no imported substrates and no complex equipment. Students worked with local mushroom varieties, using basic tools and locally available materials.

"We wanted the participants to understand that this is not a high-tech technology," Xu said. "It's something they can master and do at home."

One of the first trainees was Angel Mercy, a single mother raising her son alone. Having learned some Chinese, she asked the team to call her "Moli", the Chinese word for jasmine. At the training sessions, she stood out as one of the most attentive learners, meticulously filling a notebook with detailed notes on every step of the cultivation process.

"She was the most dedicated student we had," Xu recalled. "She would arrive early, stay late, and always ask for more details."

Mercy shared with the team her struggles to support her family and her reliance on others just to get by. With the training, she hoped to earn money through mushroom cultivation to provide better food and education for her son. For the first time, she felt confident in her ability to be self-reliant.

Xu said Mercy's story encapsulates the deeper significance of the project.

"It empowers these women, giving them the dignity to support themselves and their children independently," she said. "When they earn their own money, they gain a voice in their families, and some even become leaders in their communities, sharing their knowledge with other women."

Another participant, Jecintah Timpiyian, had also been struggling for years to feed her children and cover basic expenses. Mushroom cultivation finally enabled her to meet these needs.

"I was able to earn something ... to pay the school fees that were very hard for me to pay," she said. "Everything has changed."

The Chinese experts also taught them how to manage their work and improve their harvesting practices, Timpiyian said. "They have also connected us with many customers," she added.

For Caroline Wanjiku, a mushroom cultivation worker at a local farm, the training deepened her understanding of the process.

"Mushroom cultivation is a science," she said. "You have to be a professional for this because you have to deal with things like temperatures, humidity, and moisture."

Now, Wanjiku has more faith in the business and wants to encourage other women to try it.

"I would advise them to embrace mushroom cultivation," she said. "Mushrooms have high nutritional value, and they sell well in the market. It's a good business."

Broader vision

The project's progress has been shaped by more than just technical adaptation. The Chinese team discovered that working across cultures requires patience and mutual understanding. For example, the Chinese team was accustomed to working on a tight schedule, while their Kenyan counterparts were more flexible, sometimes taking time off for religious and family events.

"We couldn't just impose our way of working," Xu said. "We had to find a rhythm that worked for both sides."

The deeper challenge, Xu noted, revolved around building trust. "Introducing something new often meets resistance, especially when there are cultural and political differences," she said. "We had to continuously work on building connections and earning their trust."

The project, however, had one crucial advantage: the participants were there voluntarily, driven by their own desire to learn. This motivation, Xu said, provided a solid foundation to build upon.

Chen Tian, the project's other initiator, recalled meeting several female mushroom growers who spoke fluent Chinese, which left a strong impression on her and greatly facilitated communication.

"There were cultural differences, of course," Chen said. "But we approached every interaction with mutual respect, patiently explaining and listening. In our cooperation, mushrooms served as a bridge, and practical cultivation techniques were our common language."

She also observed that the participants' aspirations extended well beyond the training curriculum. Several of them inquired about introducing more mushroom varieties from China. Some were already exploring post-harvest processing and storage methods to extend shelf life and reach more customers.

"Some even asked if they could learn Chinese cooking skills to prepare the mushrooms in Chinese styles," Chen added. "They were thinking beyond cultivation and considering the entire value chain."

The participants' enthusiasm and the tangible results of the first training session caught the attention of Kenyan institutions. On July 11, less than two weeks after the training concluded, Erick Rutto, president of the Kenya National Chamber of Commerce and Industry, visited Changsha, the capital of Hunan, to review the project's early outcomes and discuss further cooperation with the Chinese team. Discussions included expanding training sessions, reaching more farmers, and building a more structured system for production and market access.

The Chinese team is planning another visit to Kenya in October, but their ambitions extend beyond a single training session. The long-term goal is to establish a local spawn production facility, Xu said, a critical piece of infrastructure that would allow Kenyan farmers to produce their own high-quality starter material instead of relying on imports.

There is also a broader vision for the Mom's Mushroom House brand, which could provide quality assurance and stable market channels for local women producing under its name. If the model proves sustainable, the team believes it could be adapted to other countries with similar conditions.

The current training model is designed to be sustainable and replicable. Former local participants are expected to teach others, creating a system that does not depend on Chinese experts traveling to Kenya every few months.

"We are not going to be here forever," Xu said. "But the knowledge has to stay."

Wang Xiaodong and Sharon Nakola in Nairobi contributed to this story.

Agriculture: Smallholder farmers supported

From page 1

To jointly tackle these challenges facing China's smallholders, the International Fund for Agricultural Development has long partnered with the Chinese government, centering climate resilience for small-scale producers as a core pillar of its mission. Since 1981, IFAD has invested significantly in China and partnered with the government to have an impact on the lives of approximately 4.6 million poor rural households.

In Yunnan province, IFAD-supported youth entrepreneurs have modernized irrigation networks with smartphone-controlled drip systems, greatly improving water efficiency — an adaptation measure that peer-reviewed evidence shows can offset heat impacts on crops in the short run. This matters because research confirms that irrigation expansion has been one of the primary mechanisms through which Chinese farmers have adapted to extreme temperatures over the past three decades.

China also contributes significantly to global climate resilience. Through the China-IFAD South-South and Triangular Cooperation Facility, China is actively sharing its climate-smart agricultural innovations with countries across the Global South, while also learning from their practices. A compelling example is an ongoing initiative in partnership with the International Bamboo and Rattan Organization, which is leveraging China's extensive expertise in bamboo cultivation to strengthen climate resilience among smallholder farmers in Brazil, Bolivia and Argentina. The project equips farmers with climate-smart techniques for bamboo production and processing, provides small enterprises with low-cost equipment to add value to bamboo products, and builds local institutional capacity.

Across its global portfolio, IFAD is investing in a similarly diverse range of climate adaptation solutions. Through our Adaptation for Smallholder Agriculture Programme, IFAD channeled $1.4 billion in climate finance to smallholder farmers between 2022 and 2024, supporting 6 million small-scale farmers worldwide. In Kyrgyzstan, herders in remote mountain pastures receive 10-day advance warnings of weather hazards, allowing them to plan their grazing routes before storms arrive. In Bangladesh, the IFAD-funded Coastal Climate Resilient Infrastructure Project built improved markets and market-connecting roads designed to remain usable during the monsoon season, increasing on-farm income from crop and fish sales by 104 percent and 50 percent, respectively, reducing poverty by 4 percent, and reducing food insecurity among participating households. These results underscore that transformative adaptation addressing the interactions between food systems and climate change requires adequate, accessible and appropriate financing that reaches smallholder farmers directly.

The challenge ahead is systemic and urgent. Extreme heat is no longer a distant risk but a present reality reshaping agricultural production, rural livelihoods and global food security. Addressing it requires collective action: governments investing in climate-resilient infrastructure; international institutions channeling finance and knowledge to those most in need; and the private sector developing affordable technologies that reach smallholder farmers at scale.

The storms will keep coming. The heat will keep rising. But with the right investments in the "first mile", and the right partnerships to sustain them, we can build resilient and enduring food systems.

The author is the China representative of IFAD and head of the Regional South-South and Triangular Cooperation Center for Asia and the Pacific at IFAD. The views do not necessarily reflect those of China Daily.

Meeting: Green development stressed

From page 1

At the meeting, Foreign Minister Wang said that China stands ready to work with ASEAN in forging closer cooperation for the well-being of the region's peoples and in "reinforcing unity to tackle new challenges and uncertainties".

On behalf of China, Wang put forward a four-point proposal for catalyzing the China-ASEAN cooperation: safeguarding the regional environment for peace and development, bolstering the resilience of regional development, advancing green and innovation-driven development, and remaining people-centered.

Xu Liping, director of the Chinese Academy of Social Sciences' Center for Southeast Asian Studies, said the China-ASEAN perspective on the region's governance is "based on the Asian approach that features mutual respect, consensus-building and consideration for each other's comfort".

"As the world's current round of technological revolution and industrial transformation keeps gaining momentum, the building of the China-ASEAN community with a shared future has yielded remarkable achievements, becoming the most dynamic model of cooperation in the Asia-Pacific region," he said.

Regarding the South China Sea, Wang said that the sea is "our common homeland", and that China and the ASEAN countries have the wisdom and capability to continue handling the South China Sea issue effectively, ensuring that peace, stability, cooperation and friendship become the dominant narrative on the sea.

Wang urged countries in the region to strictly honor the Declaration on the Conduct of Parties in the South China Sea.

He called on the countries to resist external attempts to stoke tensions, reject any nation's efforts to stir trouble in the South China Sea, and keep the initiative for safeguarding regional peace and stability firmly in their own hands.

Stressing that a critical window for finalizing the Code of Conduct in the South China Sea is now open, Wang called on all parties to seize the opportunity, fend off interference and deliver on that objective.

At the meeting, the foreign ministers of ASEAN member states expressed their hope of reaching the Code of Conduct as early as possible this year. They look forward to working with China to make ASEAN-China relations "a stabilizing force for regional peace and development and a model dialogue partnership", said Lin, the Foreign Ministry spokesman.

During his stay in Manila, Wang also held a number of bilateral meetings on the sidelines with senior officials of over 10 countries from both within and outside the region, such as the United States, the United Kingdom, Brazil, India, Australia and Canada.

AI doubles of veteran stars spark debate

By JIANG CHENGLONG
jiangchenglong@chinadaily.com.cn

Veteran Taiwan actress Joey Wong's decision to license her youthful likeness for an artificial intelligence-generated game trailer has reignited the debate on whether AI could extend the screen careers of actors or whether it merely reproduces their appearance without the artistry that made them famous.

The 87-second trailer, *Qianying*, was released on July 16 for the *Tianxia* online game series developed by Chinese gaming giant NetEase. Produced entirely using AI, rather than live-action filming, the trailer applies Wong's authorized digital likeness to re-create the youthful screen image that made her one of Chinese-language cinema's most recognizable stars.

Wong, who is best known for playing female protagonist Nie Xiaoqian in the fantasy romance *A Chinese Ghost Story*, retired from acting in 2004, and has stayed away from the big screen ever since. Last month, she was named a brand ambassador for the game's 18th anniversary.

The production team combined NetEase's DM Monet tool and generative AI from Volcano Engine, the tech platform behind ByteDance's large language model Doubao, to make the trailer. Instead of featuring Wong herself, the film digitally reconstructs the youthful appearance associated with some of her best-known roles.

Wong, 59, is not the only veteran performer exploring the commercial use of AI-generated digital doubles.

According to a report by China Movie Channel, Hong Kong actor Lawrence Ng, 62, recently announced that he has licensed the likeness of his 20-year-old self for an AI film. He said the remuneration is considerable and added that he did not need to directly participate in the production process.

The report said Ng signed a contract limiting the use of his digital likeness to the specific film and was satisfied with the finished images.

Asked whether AI could replace human actors, Ng said he viewed the technology as another avenue for the film and television industry, offering performers and other professionals more choices, the report added.

Guo Yanmin, a professor at the Communication University of China, told China Daily that allowing actors to license their likeness for AI-assisted productions is "a path worth exploring", particularly for sequels, alternative endings and other reinterpretations of classic works.

The commercial appeal of such productions largely lies in nostalgia, retro imagery and the audiences' emotional attachment to veteran stars' earlier performances, he said.

However, Guo pointed out that the changing times, audience preferences and cultural trends may limit the appeal of such projects. Many younger viewers may be unfamiliar with Wong or Ng, or the films that established their fame, weakening the emotional connection on which AI re-creations depend, he said.

Even so, licensing digital likenesses is expected to become more common because it serves the commercial interests of both performers and investors, Guo said, noting that retired or veteran actors are more likely to embrace the technology than performers at the height of their careers.

The greater long-term disruption may come not from authorized digital doubles of established stars, but from entirely AI-generated actors and virtual idols, he said.

"With strong technology, a good script and capable direction, AI actors could appear in genuinely compelling productions. Licensed digital doubles still rely on the audiences' existing emotional attachment to the real performers," Guo said.

Public opinion on the trend remains divided. One user on Sina Weibo described the technology as "a blessing" for veteran actors, who receive fewer roles, saying that they could license their likeness and make decent money without having to return to demanding film shoots.

Actors currently enjoying popularity, as well as newcomers seeking their first break, could face greater pressure if such productions become more widespread, the user added.

Another user, who seemed less impressed with the trend, said the AI version of Wong had her form but lacked her spirit. "Although AI has refined Wong's facial contours, her real appearance was far more captivating," the user wrote in a post.

Event: Tricks require careful preparation

From page 1

The unusual combination of an ancient farming landscape and a modern extreme sport has attracted increasing interest from visitors.

However, for Jin, a native of Nanjing, the capital of Jiangsu province, it is the setting that leaves the deepest impression. "My favorite scene is seeing local farmers in bamboo hats working the fields with water buffalo," he said. "That's something you don't get to see very often anymore. It feels very Chinese."

He also vividly remembers the first time he arrived at the terrace after a heavy rain. "The fog covered the mountains and visibility was very low," he recalled. "It felt as if we were riding through the clouds."

The idea of wakeboarding on the terraces initially emerged in 2021, when Jin and Zhang Wei, a former member of the Chinese national wakeboard team, were invited to film a promotional video.

"In skateboarding and snowboarding, people often ride in unusual places to create different visual effects," said Jin. "We wanted to see if wakeboarding could do the same."

Following the success of the first shoot in May 2021, Jin and Zhang returned this spring with four riders from the Hong Kong, China Waterski Association to stage another series of performances. "The audience was much larger this time," Zhang said. "People were really engaged. We could hear the applause and cheers throughout the performance."

Although the tricks may appear effortless, each one requires careful preparation.

Recognized by the International Waterski & Wakeboard Federation, wakeboarding remains a relatively niche sport. Even experienced riders cannot expect every attempt to succeed. Before each performance, the team carefully studies the terraces and plans every jump between the different levels.

"Sometimes we have to try several times before getting a trick right," Jin said with a laugh. "That also means falling into the mud more than once."

Zhang emphasized that the terraces are never used as a training ground. "We only perform tricks that we've fully mastered," he said. "Everything we do here has been practiced countless times on lakes, behind boats or at cable parks. We don't come here to experiment."

The performances have also sparked visitors' interest in the sport. Xiong Jianbing, deputy general manager of Yunhe Rice Terraces Investment Development Co, said that the scenic area plans to invite the athletes back to perform regularly after the farming season, and it is also considering offering wakeboarding experiences for enthusiasts under professional guidance.

"We would like more visitors to experience the terraces from a different perspective. By combining sports with tourism, they can gain a deeper appreciation of this unique landscape," Xiong said.

FDI stabilizes as high-tech sector surges

China's sustained market-opening efforts, measures to facilitate investment hailed

By ZHANG CHENXU and ZHONG NAN

Foreign direct investment in China showed further signs of stabilization in the first half of 2026, with inflows posting year-on-year growth in both May and June and the overall decline narrowing sharply, underscoring improving investor confidence despite global economic uncertainties, said officials, experts and executives.

Data from the Ministry of Commerce shows that China's actual use of FDI totaled 402.14 billion yuan ($59.3 billion) in the first half of this year, with the decline narrowing by 10.2 percentage points compared with the same period last year. In June alone, the actual use of FDI increased 15.1 percent year-on-year, marking the second consecutive month of growth.

"Foreign investment in China remains on a stable footing, with recent data pointing to a trend of stabilization and recovery," Meng Huating, head of the ministry's Department of Foreign Investment Administration, said on Thursday at a news conference in Beijing.

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, attributed the positive signs to the resilience and long-term growth prospects of the Chinese economy, coupled with the country's sustained market-opening efforts and investment facilitation measures.

"In a world facing rising protectionism and geopolitical tensions, multinational companies are looking to deepen their investment in China as a hedge against external shocks," Zhou added.

The World Investment Report 2026, which was released this month by the United Nations Trade and Development, noted that despite a challenging global investment environment, FDI inflows in China are "showing signs of stabilization" after three years of adjustment.

The UN trade body said that China's inward FDI is moving away from scale-driven expansion toward structural upgrading and quality improvement, with capital increasingly flowing into advanced manufacturing, scientific and technological innovation, and modern services.

Such a shift is visible in the data released by the ministry. FDI in China's high-tech industries surged 33.2 percent year-on-year in the first half, lifting its share in total inflows to a record 42.4 percent.

"The figures show that China's FDI mix is moving steadily up the value chain, while foreign investors remain bullish on the Chinese market," Vice-Minister of Commerce Yan Dong said at the news conference. "Nearly 4,800 foreign-funded enterprises expanded their investment in China in the first half."

United States-based athleisure company Skechers is among the multinational enterprises expanding their footprints in China. The company has invested more than 4.2 billion yuan to build a logistics center in Taicang, Jiangsu province, while expanding its R&D and livestreaming base in Dongguan, Guangdong province.

The company is also accelerating its digital transformation, said Willie Tan, CEO of Skechers China, South Korea and Southeast Asia.

Skechers is not alone in tapping China's innovation ecosystem. Joe Bao, president of Kone China, said that China has become not only a major market for the Finnish elevator manufacturer, but also a critical part of its global manufacturing and innovation network.

Sino-US trade talks

At the news conference, Meng, from the Commerce Ministry, provided updates on the latest economic and trade consultations between China and the US.

She said the two countries are maintaining close communication on specific arrangements for the proposed trade council — a body the two sides agreed to establish based on the consensus reached by the two heads of state — and a reciprocal tariff reduction framework covering $30 billion worth of products on each side.

"China is seeking views from a wide range of domestic enterprises and business associations, local governments, and US companies and chambers of commerce in China. The US side, meanwhile, is seeking public opinion on the trade council and the tariff framework," she said.

Govt condemns violence as migrants await repatriation

By **NDUMISO MLILO**
in Johannesburg, South Africa
For China Daily

Ugandans gather with their luggage to be documented after arriving at the Kololo ceremonial grounds in Kampala on Monday as authorities repatriate citizens from South Africa. MICHAEL MUHATI / REUTERS

The South African government is condemning the recent rise in attacks against immigrants and stepping up its efforts to fight such violence as many immigrants face an uncertain future.

Raphael Ayam, 34, arrived in South Africa in 2012 with the hope of working and taking care of his family back in Malawi. He was working as a shop attendant for a Somali shop in the Free State province. Ayam said anti-immigrant groups have been marching every week demanding that undocumented foreigners leave the country. They accuse foreigners of stealing jobs, opportunities and committing crimes.

Ayam was one of many sleeping in the open at the Malawian Consulate in Johannesburg waiting to be repatriated. Civil society groups have been distributing water and food outside the consulate where people have been waiting.

Tessa Dooms, from Siyafana Sonke Action Campaign, was seen distributing water, blankets, hot meals, diapers and medical assistance outside the Malawian Consulate in Johannesburg. She said some groups and individuals have been helping migrants, despite recent xenophobic attacks.

The South African government and the police have continued to condemn the intimidation of migrants. Mmamoloko Kubayi, chair of the Inter-Ministerial Committee (IMC) on Migration, recently said that protesters have a right to march but must not trample on others' rights.

Kubayi, who is also the minister of justice and constitutional development, said in a recent media briefing that the government is strengthening legislation to address illegal migration. She said the government is also strengthening border security and will engage with African countries on migration issues.

"The IMC reiterates its unequivocal rejection of all forms of xenophobia, intimidation, vigilantism, violence and unlawful actions directed at foreign nationals, regardless of their immigration status. Government has consistently maintained that the management of immigration, deportation and repatriation falls within the exclusive responsibility of the state and not private individuals or community groups," the IMC on Migration said in a statement released on Friday last week.

Sonja Boshoff, chairwoman of South African Parliament's Select Committee on Economic Development and Trade, condemned the burning of stores and looting. She said the Constitution allows anyone the right to protest but requires that it be conducted within the confines of the law, with no intimidation or trampling on the rights of others.

"We condemn the looting and burning of the shops by anyone; it's unacceptable, and this will hurt our economy. We condemn violence and intimidation by anyone," said Boshoff.

Khulekani Mathe, CEO of Business Unity South Africa, said that while the business community understands the challenges in the country, it does not support the violence and criminality. He said citizens cannot enforce immigration laws since they lack the knowledge to do so. Mathe said the looting and destruction of shops will affect the country's economy.

Marrieth Ndlela, from the South African Red Cross Society, is one of the volunteers helping Malawians outside the consulate in Johannesburg to charge their phones. The Malawians spent days outside the consulate, and their phones were off. Ndlela said they are providing free Wi-Fi to the migrants and free phones to connect with their loved ones. She said they have also been helping another group of foreigners in Durban with hot meals and some medical assistance.

The South African government and representatives of other African countries continue to process migrants who want to return to their countries.

Ndumiso Mlilo is a freelance journalist for China Daily.

Talks seek progress on conflict

By **EARLE GALE** in London
earle@mail.chinadailyuk.com

The United States offered to help find a mediated end to the Russia-Ukraine conflict on Thursday, during talks in the Philippines between US Secretary of State Marco Rubio and Russia's Foreign Minister Sergey Lavrov.

The talks followed an apparent recent increase in the intensity of the Russia-Ukraine conflict, with Russia's largest online retailer having been targeted repeatedly by Ukrainian drones and Russian missiles striking Ukrainian ports and ships.

Rubio and Lavrov "discussed the US-Russia relationship and the need to end the Russia-Ukraine war", a US State Department spokesperson said after the meeting.

Russia's Foreign Ministry said Lavrov emphasized to Rubio "the unacceptability of further arming" Ukraine, and told him European countries were pursuing Russia's "strategic defeat".

Thursday's session was the culmination of three days of talks between the US and Russia that touched on not only the conflict but also the conflict in the Middle East.

Before the meeting, Rubio said the US would offer to broker an end to the conflict "if that opportunity presents itself".

The meeting took place after a major reshuffle of the top level of Ukraine's defense department, as Kyiv had been targeting Russia's top online retailer, Wildberries.

The online seller, which claims to process 20 million orders a day via its massive network of giant warehouses, sells appliances, clothing, cosmetics, medicines, and a wide range of other products.

In recent days, Ukraine has used drones to attack four Wildberries warehouses, killing at least nine people. But Ukraine's President Volodymyr Zelensky has insisted his country's attacks have not been aimed at disrupting the lives of ordinary Russians but at damaging logistics hubs that supply Russian forces with drone components and other equipment.

The Kremlin has denied that online platforms are being used to supply its military.

Russia has also launched intense attacks on infrastructure in Ukraine recently — hitting oil refineries, warehouses, and shipping ports.

Monsoon chaos ride

A family rides on a motorbike through a flooded road amid rain in Lahore, on Wednesday. At least 15 people were killed and 40 others injured in rain-related incidents across Pakistan over the past 24 hours as monsoon rains continued to affect parts of the country, the National Disaster Management Authority said on Wednesday.

East Africa steps up outbreak preparedness

By **SHARON NAKOLA**
in Nairobi, Kenya
sharon@chinadailyafrica.com

As East Africa faces increasing threats from recurrent outbreaks of Ebola, Marburg and other infectious diseases, the East African Community, or EAC, on Wednesday launched a regional virology center in Uganda aimed at strengthening disease surveillance and pandemic preparedness across member states.

The Uganda Virus Research Institute, or UVRI, based in Entebbe, was designated as the EAC Regional Centre of Excellence in Virology, becoming a regional hub for advanced virus research, laboratory training, disease surveillance, diagnostics and knowledge sharing.

The launch came as countries in the region continue to contend with repeated public health emergencies that have exposed weaknesses in cross-border coordination, laboratory capacity and rapid response systems.

The urgency for stronger regional collaboration has been heightened by the ongoing Ebola outbreak in the Democratic Republic of Congo, an EAC member.

Uganda's Minister of Health Chris Baryomunsi on Tuesday called for greater cooperation among African countries in addressing the continent's disease burden, noting that health threats transcend national borders.

"You cannot mop while you have a leaking roof," Baryomunsi said, referring to the Ebola outbreak in the DR Congo and reaffirming Uganda's commitment to supporting its neighbor in containing the virus.

> We are building a stronger, more coordinated regional health system that can better prevent, detect and respond to disease outbreaks for the benefit of all East Africans."
>
> **Andrea Aguer Ariik Malueth,** EAC deputy secretary-general in charge of infrastructure, productive, social and political sectors

He said UVRI's scientific expertise, infrastructure and strong track record have made it an attractive partner for international collaboration.

According to the eight-member EAC, the center will support member states in preventing, detecting and responding to emerging and reemerging infectious diseases, including Ebola and Marburg, through enhanced scientific collaboration and strengthened laboratory networks.

Commitment stressed

"The designation of UVRI as the EAC Regional Centre of Excellence in Virology reflects the community's commitment to strengthening regional health security through enhanced collaboration, scientific excellence and investment in resilient laboratory systems," said Andrea Aguer Ariik Malueth, EAC deputy secretary-general in charge of infrastructure, productive, social and political sectors.

"By investing in centers of excellence, we are building a stronger, more coordinated regional health system that can better prevent, detect and respond to disease outbreaks for the benefit of all East Africans," he said.

Public health experts have increasingly called for stronger regional surveillance systems following lessons from the COVID-19 pandemic and recent outbreaks of Ebola, which highlighted the importance of early detection, information sharing and coordinated responses.

EAC said that as the regional center, UVRI is expected to play a key role in genomic surveillance, specialized laboratory training and research on emerging viruses, while serving as a reference institution for EAC partner states.

Ahead of the official launch, UVRI hosted a scientific symposium bringing together leading scientists, policymakers, public health experts and development partners to discuss emerging infectious diseases and strategies for strengthening regional preparedness and response.

The event also coincides with celebrations marking the institute's 90 years of scientific research and contribution to public health.

EAC states that since its establishment in 1936, UVRI has played a significant role in research and responses to major disease outbreaks, including Ebola, COVID-19 and other viral diseases, earning international recognition as one of Africa's leading virology institutions.

Alarm raised over Japan's nuclear plans

Resurgence of militaristic tendencies undermines regional stability: Experts

By **LIU JIANQIAO**
liujianqiao@chinadaily.com.cn

Japan's recent rhetoric and actions on nuclear issues have raised concerns about its growing military ambitions and the resurgence of militaristic tendencies, which could undermine regional stability and have profound implications for Asia and the wider international community, experts said.

Japanese Defense Minister Shinjiro Koizumi said on an online program last Friday that Japan should discuss policies related to nuclear weapons "without any taboos", triggering strong concern within Japan and from the international community.

In response to the opposition party's questioning on the three nonnuclear principles and nuclear submarines at the Diet, Japan's parliament, Koizumi said, "The idea of protecting what we have had until now seems to take precedence over truly protecting Japan."

It is extremely rare, provocative and dangerous after World War II for a sitting Japanese defense chief to make such remarks, Foreign Ministry spokesman Lin Jian said at a news conference on Tuesday.

Japan is an internationally recognized nuclear threshold state. It has long been deliberately maintaining the capability for a rapid nuclear breakout, stockpiling approximately 44.4 metric tons of separated plutonium, enough to produce a large number of nuclear warheads, he said.

Lin said that Japanese right-wing forces, citing so-called external threats and self-defense, have been breaking free from Japan's Constitution, international law and domestic law, and challenging the postwar international order and the international nuclear nonproliferation regime.

"Japan's neomilitarism has already reared its head. The international community must be highly vigilant and firmly oppose it," Lin said.

Liu Shuliang, an associate research fellow at the Tianjin Academy of Social Sciences, said the recent remarks and actions of Japanese politicians once again underscore a fundamental shift in Japan's national security policy.

Japanese Prime Minister Sanae Takaichi advocated revising the "Three Non-Nuclear Principles" in parliament. Since taking office, she has accelerated Japan's military buildup and pursued a series of controversial nuclear-related initiatives, including closer cooperation on so-called extended deterrence, the promotion of nuclear-powered submarine development, the exploration of "nuclear sharing" arrangements, and the deployment of medium-range missile systems.

Koizumi's remarks, which deliberately crossed the red line on nuclear issues, run counter to the obligations of states' parties to the Treaty on the Non-Proliferation of Nuclear Weapons and openly challenge the international nuclear nonproliferation regime and the post-World War II international order. Such remarks are highly provocative and dangerous, he said.

"The Japanese government's recent stance indicates that it is abandoning its long-held commitment to the 'exclusively defensive' policy and the 'Three Non-Nuclear Principles', accelerating its transition toward a more combat-capable, offensive posture," Liu said.

"As the only country to have suffered atomic bombings, Japan appears to be leveraging its identity as a nuclear victim to gain political support for strengthening its nuclear deterrence capabilities," said Chen Hong, director of East China Normal University's Asia Pacific Studies Center in Shanghai.

Substantial stockpile

Japan possesses substantial stockpiles of nuclear materials and advanced nuclear technology. Its open discussion of the possibility of developing nuclear weapons sends a signal that it is lowering the political and strategic threshold for pursuing nuclear weapons capability, he said.

He said Japan is actively developing long-range missiles, enhancing its missile defense capabilities and advancing discussions on issues such as nuclear-powered submarines. Together, these moves point to its pursuit of offensive strike capabilities, exceeding the bounds of its long-held "exclusively defensive" policy and rendering that principle increasingly hollow.

Koizumi's remarks have thrust Japan's long-concealed nuclear ambitions into the international spotlight, further heightening concerns over the country's nuclear intentions and potential nuclear capabilities, experts said.

Chen from Shanghai noted that Japan's intentions and capabilities in the nuclear domain are becoming increasingly aligned, while it continues to explore the possibility of "nuclear-sharing" arrangements.

"Such developments are likely to prompt other countries in Northeast Asia to reassess their security policies and could further intensify a regional nuclear arms race," he said.

From the perspective of the global arms control system, Japan, as a state party to the Treaty on the Non-Proliferation of Nuclear Weapons, has breached its obligations under the treaty, Liu said.

"By doing so, it risks opening the Pandora's box of nuclear proliferation, setting a dangerous precedent for nonnuclear states seeking nuclear weapons and undermining the international nuclear nonproliferation regime and the global arms control system," he said.

Xinhua contributed to this story.

US to impose new tariffs of 10 to 12.5% on over 60 countries

By **BELINDA ROBINSON**
in New York
belindarobinson@chinadailyusa.com

President Donald Trump's administration announced on Thursday that it will impose new tariffs of from 10 to 12.5 percent on over 60 trade partners, including China, starting on Friday, to replace other temporary duties that will lapse overnight.

The new tariffs will begin at 12.01 am EST on Friday, just as the prior 10 percent tariffs, enacted in February, are set to expire.

It is expected that China will likely face additional levies of 12.5 percent on some products, as will another 43 countries, including Japan, South Korea and Australia, Politico reported.

At least 17 trade partners including Canada, the European Union, Indonesia, the United Kingdom and Mexico will face a 10 percent duty on some products. This fee plan was initially laid out by the Office of the United States Trade Representative after it carried out an investigation.

It is the latest attempt by the Trump administration to resurrect the duties slapped on countries on so-called Liberation Day of April 2, 2025, which were struck down by the Supreme Court in February.

This was because the 1977 International Emergency Economic Powers Act used to enforce those Liberation Day tariffs was deemed an incorrect way to do so. It later prompted billions of dollars in refund applications by US companies.

In response to that ruling, Trump announced in February that he would enact a temporary 10 percent worldwide tariff using Section 122 of the Trade Act of 1974. But they only lasted for 150 days and expire on Friday.

The Trump administration's latest 10 percent tariffs will be put in place on countries that it deems have not sufficiently enforced bans on goods produced by forced labor.

The latest tariffs will use Section 301 of the Trade Act of 1974. This more robust law enables a US president to impose tariffs on any country that it finds has "failed to curb" the trade of goods made with forced labor.

However, some products including oil, gas and fertilizer are exempt from these latest tariffs, according to The Associated Press.

Other goods that will not be hit with the new levies will be any that qualify for duty-free status under the United States-Mexico-Canada Agreement.

The roll-out of the tariffs comes after the Office of the United States Trade Representative carried out a five-month investigation.

It received comments up to July 6 and held public hearings from July 7 until July 9 at the US International Trade Commission in Washington, DC on whether or not to enact these new tariffs.

Many businesses that import or export from overseas — including China — warned in their public comments that any additional tariffs imposed by the US would disrupt supply chains and ultimately hurt their businesses and sting American consumers further with higher costs.

Over the next few weeks, it is expected that other duties will be placed on 16 countries and the EU under Section 301.

It could mean that even higher duties will be put on goods from China, the EU, Indonesia, South Korea, Vietnam, Mexico, Japan, India and others.

Trump previously used Section 301 to impose tariffs on China in his first term in office. They proved difficult to strike down in court.

The US president has faced an uphill legal battle to ensure that his tariffs can be legally kept in place.

Americans are already frustrated by a rise in prices across the board for food and household items, many of which originate in China.

Brent crude oil passed the important benchmark of $100 a barrel on July 23 due to the US-Israel war with Iran, further straining costs.

Experts said that the administration is taking a risk in rolling out new tariffs ahead of the Nov 3 midterm elections.

Tom Fullerton, an economist and professor at the University of Texas at El Paso, told China Daily when the initial tariffs were enacted that "lower income US consumers will face the biggest consequences from the new tariff hikes.

"That is because they purchase more merchandise goods than services and many of those goods are produced in China or contain components that are produced in China."

He also warned that US manufacturers will have to pay higher prices for imported components and US retailers will have to pay higher wholesale prices for imported consumer goods.

Courthouse commotion

Supporters of Venezuelan President Nicolas Maduro rally outside a New York courthouse on Wednesday. A US judge set a June 1 trial date for Maduro and his wife, Cilia Flores, following their third court appearance since being forcibly seized by US troops in a military raid in January. The couple has pleaded not guilty to federal drug trafficking and firearms charges.

Middle East sea routes face mounting turmoil

Growing tensions disrupt crucial waterways, raising energy security risks

By **JAN YUMUL** in Hong Kong,
CUI HAIPEI in Dubai, UAE,
and **LIU JIANQIAO** in Beijing

Students gather at Sanaa University in Yemen on Wednesday during a rally in support of the Houthi movement, as regional tensions with Saudi Arabia continue to escalate. MOHAMMED HUWAIS / AFP

Maritime security in the Middle East is deteriorating further amid the US-Iran war, as disruption expands beyond the Strait of Hormuz to the Red Sea, raising fresh concerns over global energy supplies.

The latest incidents threaten two of the world's most critical oil shipping routes, adding to market jitters and prompting renewed concerns from the International Energy Agency.

Yemen's Houthi group said on Thursday that it had targeted two Saudi oil tankers in the Red Sea, claiming the vessels violated its recently announced maritime restrictions. The Red Sea carries about 7 percent of global oil supplies.

In a statement aired by the group's Al-Masirah television, Houthi military spokesman Yahya Sarea said the Houthis struck the tankers, identified as *Encelia* and *Layla*, using "ballistic and cruise missiles as well as drones". He claimed the attacks set both vessels ablaze and achieved the group's objectives.

Saudi Arabia has not commented on the Houthi claim. However, the United Kingdom Maritime Trade Operations said on X that it had received a report of an incident involving a tanker about 130 kilometers southwest of the Saudi port of Al Shuqaiq.

The vessel's master reported being struck by an "unknown projectile", causing a fire that the crew tried to extinguish, the organization said.

The Houthis' claim came two days after the group expanded its maritime restrictions to target vessels trading with Saudi ports, citing an attack on Yemen's Sanaa International Airport.

Separately, Iran's Islamic Revolutionary Guard Corps said on Thursday that one of three oil tankers attempting to transit a mine-laden route in the Strait of Hormuz caught fire, while the other two turned back.

The IRGC said the strait was "under our control" and would remain closed as long as "the evils of the United States" continued in the region. It warned that any tanker attempting to pass without coordinating with Iran would "suffer the same fate" and urged Washington to "stop hostile actions in this sensitive region".

The developments came as US President Donald Trump vowed to bomb Iranian infrastructure whenever Tehran targets a ship in the critical waterway, and as the US and Saudi Arabia signed an agreement to cooperate on developing a civilian nuclear program in the kingdom.

Worrying situation

"If I were a country dependent on oil and gas imports, I would be very worried regarding the latest re-eruption of tensions in the Middle East," said Syed Muhammad Osama Rizvi, a global market and product strategist at energy intelligence firm Primary Vision.

Rizvi said the global refinery capacity remains constrained, while refining margins and crude oil prices have surged. Iran holds the "upper hand by sheer stroke of geography", he said, warning that the Red Sea could "become another avenue of war soon".

Ding Long, a professor at Shanghai International Studies University's Middle East Studies Institute, said the attacks on commercial vessels in the Strait of Hormuz stem from a deeper dispute over control of the strategic waterway.

The US and Iran hold fundamentally different interpretations of the provisions on the strait's administration under a memorandum of understanding signed last month. Tehran has sought to strengthen its jurisdiction by requiring vessels to register and proposing transit fees, measures Washington rejects, Ding said.

"These competing positions reflect the two sides' broader geopolitical rivalry and their conflicting strategic interests in the Gulf region," he said.

Meir Litvak, a senior research associate at the Alliance Center for Iranian Studies at Tel Aviv University in Israel, said the Trump administration may lack patience for prolonged negotiations and could settle for vague formulas to claim success, as neither side appears willing to make major concessions on key issues.

International Energy Agency Executive Director Fatih Birol said in a statement on Tuesday that the agency is closely monitoring oil markets.

"The escalation in hostilities affecting the Strait of Hormuz and energy infrastructure in the region increases security of supply concerns and uncertainty over the market outlook," Birol said.

Chinese duo earns top math honor

Chinese mathematicians Deng Yu and Wang Hong were awarded the Fields Medals at the opening ceremony of the 2026 International Congress of Mathematicians held in Philadelphia on Thursday, marking the first time Chinese mathematicians have won the prestigious honor. The Fields Medal is a top international mathematics prize awarded every four years to two to four young researchers in recognition of their outstanding mathematical achievements in existing work and their promise of future achievement.

INDIA

41 killed as floods ravage Assam state

Floods triggered by torrential monsoon rains have killed at least 41 people in India's northeast Assam state, officials said on Thursday. "We have lost 41 precious lives till date and thousands of livestock has been washed away," Assam chief minister Himanta Biswa Sarma said in a social media update on the toll from monsoon rains that began last month. "Cloudbursts upstream, coupled with localized heavy rainfall, 436 percent above normal, have led to flooding in villages that have not seen such devastation in recent history," he added.

FRANCE

Modeling scout linked to Epstein found dead

Daniel Siad, a modeling scout with ties to the late convicted sex offender Jeffrey Epstein, has been found dead at his home outside Paris, prosecutors said on Wednesday. Siad's body was discovered on Monday evening. An autopsy will be carried out to determine the cause of death, the Nanterre prosecutor's office said. Siad's name appeared nearly 2,000 times in the Epstein files released by the United States Justice Department. Since a wide-ranging probe into human trafficking and tax fraud was opened in February following the Epstein files release, 24 women have come forward as victims or witnesses of alleged acts committed by Siad or others, Paris prosecutor Laure Beccuau said on Wednesday evening.

JAPAN

Hundreds hospitalized in heat wave 'disaster'

More than 450 people received hospital treatment for heat-related issues in a single day in Tokyo — the highest number since records began 16 years ago, emergency services said on Thursday. The figure was released as Japan sweltered in a heat wave that has killed at least 14 people over the past week. A total of 453 people were treated in hospitals for heat-related issues on Wednesday, the Tokyo Fire Department said. Emergency callouts were also at the highest level since at least 1963.

AGENCIES — XINHUA

Modi vows to set up special courts to punish guilty in exam fraud

NEW DELHI — Indian Prime Minister Narendra Modi said on Thursday that "fast-track" courts would be set up to prosecute those behind exam paper leaks, his first public response after days of youth protests demanding the resignation of the education minister.

Modi's comments came hours after protesters clashed briefly with police on the streets of New Delhi late on Wednesday, with officers firing tear gas and wielding canes to push them back.

The protests have grown into one of the biggest challenges to Modi since he came to power in 2014, with opposition parties echoing the demands of the youth movement and disrupting the monsoon session of Parliament that began this week.

"Nothing is more important than the welfare and future of our youth," Modi posted on X, promising to set up fast-track courts to punish those involved in the exam paper leaks.

"This continues our series of steps for safeguarding the interests of students. Those who try to harm the future of our youth will not be spared," he said.

Fast-track courts, designed to quickly hear and dispose of cases, were created to get around the country's justice system that can take years to conclude cases.

Such special courts have been set up to handle sex crimes against women and children, terrorism, money laundering, and crimes by lawmakers.

The youth-led Cockroach Janta Party launched protests last month against the question paper leaks that affected some 2 million students and have been linked to several suicides.

It responded on Thursday to Modi's announcement by quoting his X post and saying Education Minister Dharmendra Pradhan "must resign".

Leader of the main opposition Congress Party, Rahul Gandhi, also responded by quoting Modi's post and saying it was the prime minister who had harmed the future of Indian youth the most.

"You allowed and encouraged the total capture and destruction of our education system — and protected every person responsible for it," Gandhi said, reiterating that Pradhan should be sacked, Modi should apologize to students, and those who assaulted them should be punished.

Late on Wednesday, more than 10,000 people were estimated to have gathered at the Jantar Mantar protest site in central New Delhi, local media reported, as Cockroach Janta Party leaders vowed to continue their month-old protest until Pradhan resigned over the exam paper leaks.

The party, which has millions of followers on social media, emerged in May initially as a satirical response to Chief Justice of India Surya Kant reportedly likening young people to "cockroaches" and "parasites" during a court hearing.

The movement has since broadened its agenda to include concerns over unemployment, opportunities for young people and government accountability.

COMMENT

Editorials

Reality of China-US economic ties foundation for strategic stability

With the expiration of the United States administration's temporary Section 122 tariffs, many expected a gradual easing of trade tensions. Instead, Washington is constructing a more durable tariff architecture through overlapping Section 301 investigations, Section 232 "national security" measures and the renewed use of Section 338 against selected trading partners.

What appears on the surface to be a collection of technical legal processes is, in reality, a sophisticated framework designed to preserve negotiating leverage long after temporary emergency measures disappear.

Yet even where additional tariffs are imposed, their economic impact on China is likely to be limited rather than transformative. The world's two largest economies remain deeply integrated through supply chains, investment and consumer markets. Tariffs can raise costs, but they cannot easily change the mutually beneficial nature of Sino-US economic relations.

The release of the Chinese-developed artificial intelligence model Kimi K3 has prompted some in Washington to falsely portray Chinese open-source AI models as a "national security" concern.

But the market is telling a different story. Chinese open source models have become deeply embedded within the US' own innovation ecosystem. Nearly 200 Silicon Valley start-ups have reportedly urged the US administration not to prohibit access to Chinese models, warning that its restrictions would damage the US' competitiveness more than China's.

Indeed, whether in shipbuilding, rare earth processing or advanced manufacturing, strategic competition increasingly collides with economic reality. The US side knows this.

Just three days after a Chinese Foreign Ministry spokesperson said "China and the US are in communication regarding interactions between the two heads of state within the year", the ministry announced after a meeting between Foreign Minister Wang Yi and US Secretary of State Marco Rubio in Manila on Wednesday, that the two sides have agreed to prepare for the next phase of high-level exchanges to advance substantive progress on a constructive relationship of strategic stability.

Economic and trade teams from China and the US are maintaining close communication on the specific arrangements for the proposed trade and investment councils — including their structure, functions and operational modalities — and are exploring the advancement of a reciprocal tariff reduction framework covering $30 billion worth of goods on each side, an official of China's Ministry of Commerce told a news conference in Beijing on Thursday.

China is currently soliciting inputs from a broad range of stakeholders — including domestic enterprises, business associations, local governments and associations representing US-invested companies — regarding the proposed tariff reductions. Meanwhile, the US side is also conducting its own public consultation process on both the trade council and the reciprocal tariff reduction arrangements. The two sides will remain in close contact to finalize and implement tariff reduction measures for specific products as soon as possible, thereby further expanding bilateral trade, the Chinese commerce official added.

This development should be viewed as a positive signal that both sides are continuing to implement the outcomes of the previous summit in Beijing in May, during which the two leaders agreed on a new vision of building a constructive bilateral relationship of strategic stability.

But stability should be anchored in practical cooperation that continuously strengthens the resilience of bilateral ties. It should also be benign, allowing competition to encourage innovation rather than descend into zero-sum confrontation. The stability should provide businesses and governments with the policy continuity necessary to avoid perpetual cycles of escalation and retaliation. Above all, the stability needs to be enduring, preserving peace through adherence to the three Sino-US joint communiques, mutual respect for each other's core interests and continued commitment to dialogue at different levels.

Under the guidance of head-of-state diplomacy, political and diplomatic channels, along with existing economic and trade mechanisms, should be used not merely to manage crises but to steadily shorten the list of disputes while expanding the agenda for cooperation.

Diplomacy has never been about eliminating differences. Its purpose is to prevent differences from becoming defining features of relations.

Tactical bargaining chips may partially influence the atmosphere before the mooted summit. But they cannot substitute for strategic vision, flexibility, pragmatism and wisdom. Cooperation remains the only viable source of stability for the world's most consequential bilateral relations.

Escalating crisis calls for renewed diplomacy

The Middle East is once again at the precipice of a catastrophic escalation of conflict, with the Red Sea becoming the focal point of the expanding crisis.

The Iran-backed Houthi group declared a maritime blockade against Saudi Arabia on Monday, threatening to target any vessel calling at Saudi ports. This declaration was swiftly followed by attacks on two Saudi oil tankers in the Red Sea.

These actions have highlighted the strategic importance of the Bab el-Mandeb Strait, a critical waterway connecting the Red Sea with the Gulf of Aden. Control of this strait is vital for global trade as millions of barrels of oil pass through it daily.

The Houthi blockade, alongside Iran's strategic pressure on the Strait of Hormuz, creates a dual choke hold on energy transport. Any sustained disruption to maritime traffic in this region could have a cascading effect on the world economy, affecting not only energy prices but also the cost of goods and services globally.

Yet there seems to be no end in sight to the ongoing military confrontation between the United States and Iran as their conflict continues unabated. Financially, the war has already cost the US an estimated $37.5 billion, with Congress considering an additional $73 billion in military funding. The US appears to treat every ceasefire window as nothing more than a preparatory phase for the next battle.

Washington's overriding objective is to consolidate its control over the region's energy lifelines, reinforcing its dominance over global oil markets and buttressing the dollar's central role in the international financial system in the process.

Israel, meanwhile, has its own strategic and domestic political calculations, seeking to translate regional turmoil into geopolitical advantage.

This convergence of interests has helped fuel a cycle of instability stretching from Gaza and Lebanon to the Persian Gulf and the Red Sea. Few regional actors have any inherent interest in disrupting vital maritime arteries. Yet when confronted with sustained military pressure and coercive policies, they have resorted to asymmetric responses that further destabilize the region.

Washington presents its calls for other countries to contribute funding, personnel and military assets to safeguard the Strait of Hormuz as a collective effort to preserve the stability of global energy markets. Yet such appeals invite an obvious question. If the US were ultimately to consolidate strategic control over Gulf energy flows, would the resulting geopolitical and economic dividends be shared equitably with those asked to bear the costs? And even if they were, how many countries would willingly accept a share of wealth extracted through a blood-for-oil conflict?

As a Chinese envoy to the United Nations observed during the UN Security Council's open debate on natural resources and security on Wednesday, international law recognizes every state's permanent sovereignty over its natural resources. That principle should not be diluted through coercive diplomacy, unilateral sanctions or military intimidation. The era in which powerful nations could reshape international order through force and resource appropriation should be consigned to the past.

At this critical moment, diplomacy must take precedence. The US has expressed willingness to engage in constructive negotiations, as indicated by Secretary of State Marco Rubio during his discussions with Association of Southeast Asian Nations foreign ministers in Manila.

This openness to dialogue is a crucial step toward de-escalation. The international community should support and facilitate these efforts.

The memorandum of understanding between the US and Iran, achieved through international mediation, represents a fragile yet vital foundation for peace. The MoU should be valued as a beginning for future negotiations.

The current pattern of "fighting while talking" has only worsened the crisis. What is needed is a cessation of hostilities, a good-faith effort to overcome difficulties and an immediate return to meaningful dialogue.

Opinion Line

Most of the world won't buy what Manila's trying to sell

The Philippines appears intent on repeating a familiar pattern.

Hours after Philippine Foreign Secretary Maria Theresa Lazaro vowed to "work out proper solutions via dialogue" to the Philippines' maritime dispute with China in a meeting with Chinese Foreign Minister Wang Yi in Manila, two Philippine government vessels were playing bumper cars with China Coast Guard ships near China's Huangyan Island on Thursday morning.

The Philippines' Western supporters were quick to weigh in. Shortly after Manila's provocations near China's Ren'ai Reef on Monday, the US State Department got in on the act, issuing a statement accusing China of "bullying the weak". Australia's top diplomat also chimed in from the sidelines.

And how could such a well-choreographed act proceed without Western media as its indispensable stagehands? The most telling example of such theatrics came in March 2024, when a Philippine vessel — conveniently packed with journalists, because nothing screams "accidental encounter" quite like a press entourage — deliberately rammed a Chinese ship.

CNN promptly rolled out footage of the "confrontation", casting the Philippines as a plucky David squaring off against Goliath.

Every new provocation serves the same purpose: it helps the Philippines maintain an "unlawful" presence while obscuring who is fanning the frictions. And when China responds lawfully, the cries of "horror" from some Western media outlets are delivered with panache. Manila views this as a diplomatic win. One by which it can grab territory or gain "sympathy".

Wang told Lazaro that China has never constituted a security threat to the Philippines, nor has it ever invaded or colonized the country throughout history.

He warned that allowing external forces to meddle in regional affairs and deliberately hyping up maritime disputes will only reduce the Philippines to a pawn manipulated by others, adding that any attempt at provocation backed by external countries will ultimately leave the Philippines bearing the bitter consequences of its own making.

But Manila seems to like being a pawn. The factions staging such extravaganzas deliberately sabotage bilateral dialogue the moment it's scheduled. They're not serving the Philippine people; they are advancing personal interests taking instructions from elsewhere, while the Philippines' development stalls.

Despite not being parties to the South China Sea disputes, some Western countries play their roles impeccably, immediately jumping out to point accusing fingers at China.

While the Philippines stages these antics, the other members of the Association of Southeast Asian Nations — with their own stakes in regional stability — see what's happening. They know which country is actually trying to maintain regional stability and which gang is trying to fish in troubled waters.

That's why the timing of this latest provocation is particularly revealing. The ASEAN Foreign Ministers' Meeting is underway in Manila. The Philippines is the ASEAN chair. This is supposed to be the moment for responsibility, for dialogue, for actually advancing a Code of Conduct in the South China Sea.

Right now, the Philippines is locked in a script written by others — a script that never ends well for the actor who reads it too earnestly. Perhaps it's time for Manila to take a step back and actually do what the ASEAN chair is supposed to do: promote dialogue and ease tensions.

The South China Sea is a shared home for regional countries. China and other ASEAN members should jointly foster a new narrative of peace, stability, cooperation and friendship in the waters, and keep the initiative on the South China Sea issue firmly in the hands of regional countries.

— LI YANG, CHINA DAILY

What They Say

AI has changed role of teachers in education

Editor's note: *The Chinese authorities recently emphasized the need to deepen education and teaching reforms with a student-centered approach to create new advantages in basic education. At the 2026 World Artificial Intelligence Conference, which concluded in Shanghai on Monday, some educators, including Li Luming, president of Tsinghua University, spoke of how AI continues to reshape the education sector. Below are excerpts from their speeches as reported in People's Daily. The views don't necessarily represent those of China Daily.*

With AI offering more convenient ways to access knowledge, students don't rely only on the classroom to learn. The traditional lecture-centered approach, in which teachers simply deliver information in classrooms, is no longer sufficient.

Students, teachers and university administrators must recognize a fundamental reality: within the next three to five years, the nature and standards of research in highly innovative disciplines such as mathematics and physics will be dramatically different from what they are today. Schools that cling to traditional approaches to education and research will struggle to maintain their strengths.

Research suggests that in the AI era, students should prioritize developing skills such as language proficiency, social interaction, problem-solving, critical thinking, perception, hands-on practice and human-AI collaboration.

This calls for a comprehensive overhaul of school curricula and talent cultivation models. Traditional disciplines need to embrace intelligent transformation by moving away from conventional teaching approaches and fostering greater interdisciplinary integration.

In traditional schools, the brightest students have often been regarded as the most capable. But when AI can outperform humans in many tasks, a more important question emerges: who can be trusted, and who is willing to take responsibility? This is precisely where humans remain irreplaceable.

AI has no lived experience of consequences and cannot assume responsibility in the way people can. For this reason, schools should invest substantial time and effort in character education and innovation projects that solve real-world problems for real users. The goal is to cultivate graduates who are trustworthy and capable of taking on increasing levels of responsibility.

Future talents will need the ability to define problems independently, adapt knowledge to real-world contexts, integrate insights across disciplines and continuously refine solutions through engineering-based iteration. Ironically, these are among the scarcest capabilities in today's education system and the ones AI cannot directly provide.

In the age of AI, young people's core competitiveness is shifting from acquiring knowledge quickly to defining problems deeply, and from remembering the right answers to asking original and meaningful questions.

Only teachers who actively embrace change and continually improve their teaching can serve as true role models for students. At the same time, human-AI collaboration has become the new normal in scientific research and is reshaping education as well.

AI can empower both teaching and research across existing disciplines, necessitating a careful redesign of future curricula and academic evaluation systems. Universities should provide cutting-edge AI tools, research platforms and supporting resources while embedding AI safety principles into teaching and research and establishing sound ethical standards for its use.

In terms of the breadth of knowledge, AI may even surpass classroom instructors. This compels teacher education institutions to rethink the role of teachers. In the future, teachers must help students learn how to work effectively with AI. A truly outstanding teacher in the AI era will need to be a mentor who not only imparts knowledge and cultivates character but also guides students in human-AI collaboration.

VIEWS

Liang Yan

Two narratives behind China's trade surge

Even a war in the Middle East and waves of Western protectionism couldn't trip up China's trade engine. In the first half of 2026, trade surged by 16.9 percent to reach 25.47 trillion yuan ($3.76 trillion).

Exports climbed 13.4 percent, but it was imports that stole the show, shooting up 22.1 percent. The real headline, though, sits inside the export basket: high-tech products and advanced manufacturing goods, from semiconductors and computer components to vehicles, emerged as the standout performers.

As Wang Jun, deputy head of the General Administration of Customs, summed it up, "notable progress has been made in stabilizing scale and improving structure." Behind the phrasing is a simple story: China isn't just trading more, it's trading smarter.

That story, however, is being told two very different ways. In Washington, Brussels and many newsrooms in between, the reflex is to reach for the "China Shock" label — the notion that "Beijing's export machine runs on unfair fuel", namely industrial subsidies and a manipulated currency, and that the exhaust fumes are hollowed-out factories, first across the advanced economies and now in the developing world too.

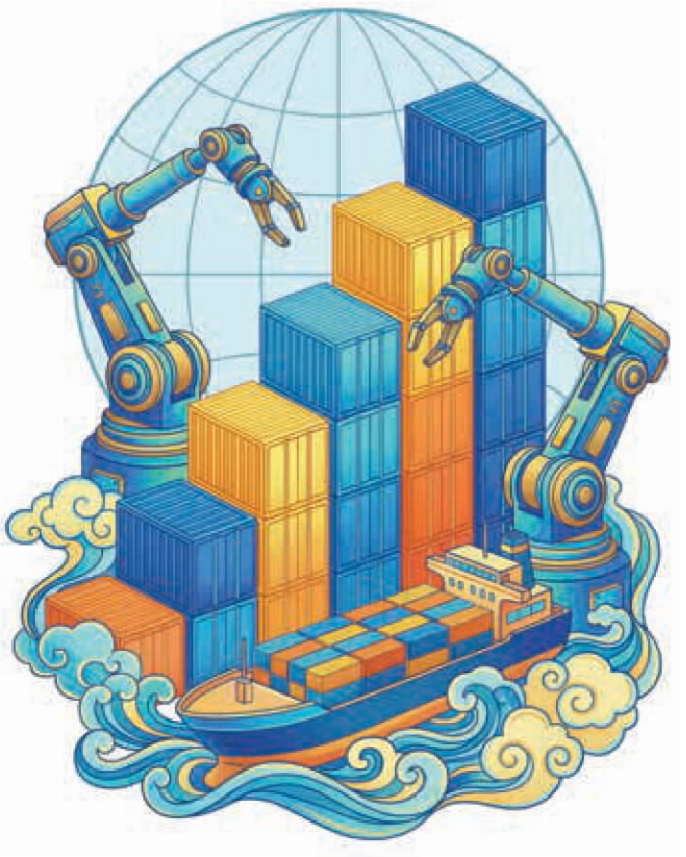
Scholars in China and the Global South tell an entirely different story: this is the payoff of decades of unglamorous but compounding investment in technological upgrading and industrial transformation, with ripple effects reaching far beyond China's borders.

Industrial machinery, green technology, and intermediate inputs flowing to the Global South are empowering developing economies for their own green industrialization, while cheap, high-quality consumer goods ease household budgets worldwide.

On this reading, China isn't hollowing out its trading partners; it's offering the Global South an opportunity to move up the value chain, and giving a competitive jolt to producers everywhere.

The trade data supports the second story. Mechanical and electrical products, up 20.1 percent year-on-year, now make up 63.5 percent of total exports, which is hardly the profile of a country coasting on cheap basics. China is riding two waves at once.

The first is the global boom in artificial intelligence: as the world scrambles for computing power, data centers, and terminal equipment, China's exports of integrated circuits and computing hardware have surged accordingly.



The second is a downstream jolt from the Iran war itself, which has pushed countries to seek energy security and accelerate their green transitions.

China's clean-tech sector has risen to meet such a pressing demand. Electric vehicle exports continued to surge, with lithium batteries and solar products also maintaining strong momentum. And waiting in the wings is what commentators are calling the "next big three", including AI-integrated and bionic robots, innovative pharmaceuticals, and advanced medical equipment. The next wave of exports is gathering momentum.

The allegations of currency manipulation that underpin the "China Shock" story simply do not stand the empirical challenge. If China's edge really came from an artificially cheap renminbi, you would expect the cheapest, most price-sensitive exports to be thriving. Instead, low-value manufacturing exports are shrinking.

Further, between early 2024 and mid-2026, the RMB actually appreciated by about 5.8 percent against the dollar and strengthened against its trade-weighted basket as well. Yes, there was a real effective depreciation in late 2025, as inflation stayed low relative to trading partners, but that trend has reversed in the first half of 2026. The currency manipulation spin can't carry the weight being placed on it.

The subsidy argument fares no better.

MA XUEJING / CHINA DAILY

There's a sharper irony buried in the International Monetary Fund's analysis, which says that China's industrial-policy spending actually distorted resource allocation badly enough to shave 1.2 percent off total factor productivity and up to 2 percent off the GDP relative to baseline.

In other words, the very institution supplying ammunition to the "unfair subsidies" narrative is also describing a policy that, on its own numbers, hurt China more than it helped. That's an odd foundation for a shock thesis.

It's also worth asking who isn't subsidizing industry. Industrial subsidies are hardly a Chinese invention — the United States has its Inflation Reduction Act, the European Union its Green Deal, and China's own industrial policies operate within World Trade Organization rules.

The more interesting distinction may not be whether subsidies exist, but where the money goes. Western subsidies, critics note, often flow toward shareholder returns and executive compensation.

China's industrial policy, by contrast, has more visibly fed industrial upgrading itself. The historian Adam Tooze makes the point starkly: China's roughly $18 billion in cumulative solar subsidies over 15 years is one of the most productive climate investments of the era, with benefits extending far beyond China's borders.

Zoom out further and a quieter but arguably more consequential shift comes into view: China is rewiring who it trades with.

Trade with the US has gone flat, but trade with the EU, Latin America, and Africa has expanded by 10.2 percent, 16.2 percent, and 19.6 percent respectively, while trade with Belt and Road Initiative partners is up 14.8 percent, and now accounts for over half of China's total foreign trade. This isn't just diversification for its own sake; it's a redistribution of trading power away from a single axis and toward a more multipolar system.

For developing economies, the payoff is tangible: Chinese exports of machinery, intermediate inputs, and green technology are helping accelerate industrialization, while Chinese-built physical and digital infrastructure strengthens two-way trade links.

Zero-tariff access for products from 53 African countries has already sent Kenyan avocados, Ethiopian coffee, and South African citrus fruits flowing north in growing volumes.

Layer in overseas development finance, direct investment and technology transfer, and a pattern emerges that looks less like "China squeeze" and more like "China opportunity". China is effectively providing a scaffold for developing countries to move up the global value chain and amplify benefits from global trade.

None of this means China's export boom is a costless good-news story for everyone, everywhere. Competitors in advanced economies are right to feel the heat, and displaced workers in specific sectors deserve real policy attention rather than dismissal.

But the blunt "China Shock 2.0" narrative struggles to survive contact with the data. What the numbers describe instead is a country that spent decades investing in capability and is now exporting the results, while simultaneously deepening ties with the Global South in ways that look, for many partners, less like a squeeze and more like an opening.

The debate over "China Shock or China Opportunity" may never fully resolve, because the honest answer is probably both; shock for some incumbents, opportunity for many latecomers.

The author is the Kremer Chair professor of economics at Willamette University and a non-resident senior fellow at the Global Development Policy Center at Boston University.

Mohamed Sabreen

Paving a new path for Middle East security

As it grapples with ongoing conflicts, the Middle East faces a pressing question: how can it prevent future conflicts? The devastating conflict in Gaza, the conflict between the United States and Iran, and rising tensions across the Red Sea and the Eastern Mediterranean have exposed the limitations of the regional security order that has long struggled to achieve lasting peace.

Global Lens

At the same time, the traditional external powers that have shaped the region's security landscape are constrained by other global priorities, domestic political pressures, and diminishing influence. This has created a strategic vacuum at a time when regional instability threatens not only the Middle East but also global trade, energy security and international peace.

Against this backdrop, a growing body of strategic planning argues that regional countries must take greater responsibility for their own security. This shift raises an important question: could closer cooperation among Egypt, Saudi Arabia, Turkiye, and Pakistan become the nucleus of a new regional security architecture?

From a strategic perspective, the idea deserves serious consideration. Egypt is the military and diplomatic heavyweight in the Arab world, central to global maritime trade through its control of the Suez Canal, and seasoned in mediation and conflict management. Saudi Arabia has emerged as a leading economic power. Under Vision 2030, Riyadh sees regional stability as a prerequisite for economic transformation and prosperity, as reflected in its expanding diplomatic outreach.

Turkiye contributes an advanced defense industry, one of NATO's largest military forces, and geopolitical influence stretching from the Black Sea and the Eastern Mediterranean to the Caucasus and Central Asia. Its defense capabilities and active diplomacy have made it an important strategic actor.

Pakistan, with one of the region's largest militaries and extensive experience in counterterrorism and border security, extends the quartet's strategic reach into South Asia while strengthening its overall deterrence capability.

Together, these four countries form a geopolitical corridor stretching from the Mediterranean to South Asia, commanding substantial military capabilities, overseeing strategic maritime routes, influencing global energy markets, and accounting for hundreds of millions of people. Few regional groupings possess such demographic, economic, and strategic weight.

Yet geopolitical weight alone cannot build a durable regional order. The biggest challenge for such a quartet would be achieving political cohesion. Each country has different national priorities and policies toward regional crises, including those involving Syria, Libya, Iran, and the Eastern Mediterranean. Bilateral relations have improved in recent years, but strategic coordination requires much more than mere diplomatic normalization.

History tells us that successful regional organizations do not eliminate differences but create institutions to manage them peacefully. The Middle East has seen numerous initiatives and summits, but lacks permanent mechanisms for consultation, crisis management, intelligence cooperation, maritime security, infrastructure protection, counterterrorism coordination, and economic integration.

The region is one of the few in the world without an inclusive multilateral security framework to manage crises before they escalate. Lasting stability depends more on sustained dialogue and institutionalized cooperation than on temporary alliances.

Another critical question is whether any future security architecture can succeed without including Iran. Regardless of political disagreements, Iran remains a key strategic player in the Middle East.

A regional framework that excludes Tehran would face inherent limitations. Instead of an exclusive alliance, a regional quartet could instead serve as the starting point for a broader and more inclusive security dialogue, expanding as political conditions permit.

Recent conflicts have shown that military operations can have far-reaching consequences. Maritime security, global shipping routes, energy markets, diplomatic relations, humanitarian conditions, and regional stability have all been affected by the escalation. The crises are no longer isolated events, emphasizing the need for collective regional mechanisms to prevent escalation.

The international dimension is equally important. Would major global powers welcome a more autonomous regional security system, or see it as a challenge to their influence? History suggests these objectives can coexist. Successful regional organizations from Europe to Southeast Asia have combined regional ownership with constructive global engagement. A future Middle Eastern security framework would likely require a similar balance: greater regional responsibility without strategic isolation from the international community.

Economics will also play a decisive role. Sustainable peace is usually built upon economic interdependence. Expanding trade, cross-border infrastructure, transportation corridors, energy connectivity, industrial investment, digital transformation, and food security cooperation can foster shared interests, reduce conflict and strengthen political trust. For Egypt, Saudi Arabia, Turkiye, and Pakistan, such cooperation could form the basis of a broader strategic partnership.

Ultimately, it is not about creating another regional alliance but redefining how security is conceived in the Middle East. The region has long reacted to crises after they erupted. The challenge now is to prevent crises before they occur, which requires political courage, strategic patience, and a commitment to long-term regional stability above short-term geopolitical competition.

Whether Egypt, Saudi Arabia, Turkiye and Pakistan can transform this vision into an enduring institutional reality remains uncertain. Their success will depend on their ability to build strategic trust, reconcile competing priorities, and establish permanent mechanisms for consultation and cooperation. Regional orders are not created by speeches or diplomatic declarations, but through sustained political commitment, resilient institutions, and a shared recognition that long-term stability ultimately serves all participants.

If a regional quartet can take even the first practical steps toward such a framework, it will achieve far more than forming another diplomatic group. It could lay the cornerstone of a more balanced, autonomous, and sustainable Middle Eastern security order — one shaped primarily by the region's own states rather than by the competing agendas of external powers.

Engineering scales new heights in Guizhou

Guizhou province in Southwest China is definitely the best place to marvel at modern engineering and infrastructure, not just in China, but possibly in the world.

Over the past week, I drove across some of the highest bridges in the world, including the Yachi River Bridge, the Beipan River Bridge (also known as the Duge Bridge), the Baling River Bridge and the Huajiang Grand Canyon Bridge.

Relaxing in my hotel room facing the Huajiang Grand Canyon Bridge — the highest in the world at 625 meters above the river surface and with a main span of 1,420 meters — was one of the highlights of my trip to the beautiful province.

It offered food for thought on China's remarkable achievements in infrastructure. The bridge, which surpassed the Beipan River Bridge as the world's highest bridge, opened to traffic 10 months ago.

Guizhou, known for its rough terrain and high plateau, is aptly described by a local proverb as a place with "no three days of clear skies and no three feet of flat land".

More than 90 percent of the province is covered by mountains and hills. Karst rock formations create many deep valleys, sharp peaks, caves and underground rivers.

During my last visit to Guizhou about 25 years ago, I saw locals, including women, carrying heavy loads along narrow, winding mountain paths. But this time, such scenes were rare, with only a few people carrying heavy loads for short distances within villages. It shows how infrastructure has changed the lives of ordinary people.

Guizhou boasts some 32,000 bridges, including some still under construction. Nearly half of the world's 100 highest bridges are in Guizhou, earning the province the label of "the world bridge museum".

The potential is huge as Guizhou has emerged as a major big data and AI computing hub in China.

I still remember the excitement when the Nanpu Bridge, the first to span the Huangpu River in downtown Shanghai, opened to traffic in November 1991.

Living nearby, my wife and I took our five-month-old daughter in her stroller for a walk on the bridge before its official opening.

With a main span of 423 meters and standing 46 meters above the river, it was a huge relief for many people who previously commuted by ferry every day.

The impact of these engineering feats on the people in Guizhou, home to several ethnic minority groups, is quite profound.

The two peaks across the Huajiang River are so close that a loud shout from one can be heard at the other. But the trip across the river used to take more than two hours. The Huajiang Grand Canyon Bridge has cut it down to two minutes.

Thanks to its 32,000 bridges, 12,000 tunnels and 10,000 kilometers of expressways, driving in Guizhou has become a delightful experience for tourists.

The province also has cool weather in the summer months when much of China grapples with extreme heat.

While Guizhou ranks low in per capita GDP among Chinese provinces and autonomous regions, its infrastructure, economic strength and the overall living standards of locals have improved dramatically over the past decades.

The potential is huge as Guizhou has emerged as a major big data and AI computing hub in China. Its abundant electric power, cool climate and stable geography have drawn tech giants such as Huawei, Tencent, Apple and China Telecom to establish massive facilities in the province.

In contrast, New York state in the United States, and possibly some other states, is imposing moratoriums on hyperscale data centers due to electricity shortages, which highlights Guizhou's advanced status in the 21st century.

Here's a perspective: the money the US has spent on military operations involving Iran in the past few months could have built the Huajiang Grand Canyon Bridge more than 100 times over, or laid over 2,000 kilometers of high-speed rail.

I salute the builders of Guizhou's bridges, tunnels, expressways and highways because they were built in the most challenging terrains in the country and possibly in the world. Each of them stands as a testament to China's excellence in modern engineering.

GLOBAL VIEWS

XIE CHUNTAO

Clear guidance, effective execution

The Communist Party of China is leading the nation toward realizing the Chinese dream of national rejuvenation

China's extraordinary journey toward national rejuvenation reflects the Communist Party of China's enduring commitment to the country, the Chinese nation and its people. Since the 18th National Congress of the CPC, General Secretary of the CPC Central Committee Xi Jinping has articulated the Chinese dream of national rejuvenation and led the CPC in steady steps to turn that great vision into reality, making the national rejuvenation a historical inevitability.

Ideas illuminate the path forward. Throughout its history, the CPC has attached great importance to theoretical innovation, consistently using an evolving body of Marxist theory to guide practice. Entering the new era, the convergence of the national rejuvenation strategy and profound changes in the international landscape has raised a series of major questions that require new theoretical answers from the CPC. This has culminated in the development of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, a body of thought that offers new perspectives, concepts and strategies across a wide range of areas, including reform, development and social stability, domestic governance, diplomacy and national defense, and the governance of the country, the Party and the military. It provides a strategic plan and comprehensive implementation framework for advancing China's modernization and national rejuvenation, answering the questions of not only how to understand today's challenges but also how to address them. Guided by this scientific theory, the CPC has united the Chinese people behind a shared vision and common purpose, bringing the Chinese nation closer than ever to realizing its rejuvenation while enabling China to stand on the world stage with unprecedented confidence.

The path determines future. For a country that was once economically underdeveloped and culturally marginalized, achieving national rejuvenation has been both an inspiring aspiration and a daunting challenge. After enduring countless hardships, the CPC independently blazed a new path of Chinese modernization. Xi has further deepened the understanding of Chinese modernization by defining its distinctive characteristics, essential requirements and guiding principles, making the vision clearer, more systematic and more practical.

Over the past decade, through a series of strategic initiatives, transformative reforms, major breakthroughs and landmark achievements, the CPC has propelled China's national rejuvenation steadily forward. The country has eradicated extreme poverty, completed the building of a moderately prosperous society in all respects on schedule and successfully navigated major risks and challenges to achieve rapid economic growth while maintaining long-term social stability. The Chinese economy has expanded from just over 50 trillion yuan ($7.38 trillion) in 2012 to more than 140 trillion yuan in 2025. Hundreds of millions of Chinese people have realized their aspirations for a better life, while the country itself has undergone a historic transformation. These accomplishments provide compelling evidence that Chinese modernization is capable of realizing China's goal of building a great country and advancing national rejuvenation. Today, the benefits of modernization extend to the entire population, and China's level of modernization has surpassed expectations.

ZHONG JINYE / FOR CHINA DAILY

The Chinese dream is not an abstract aspiration but a carefully designed blueprint. Realizing it requires both strategic vision and effective execution. Having successfully completed the first phase of modernization, the CPC remains committed to a long-term strategic vision, laying out a two-stage plan for completing modernization. The goal is to basically realize socialist modernization by 2035 and build China into a great modern socialist country that is prosperous, strong, democratic, culturally advanced, harmonious and beautiful by the middle of this century. To support this long-term vision, the CPC has continuously refined its strategic framework. It has implemented the Five-Sphere Integrated Plan and the Four-Pronged Comprehensive Strategy, while advancing major national initiatives, including the innovation-driven development strategy, the workforce development strategy and the rural revitalization strategy. Together, these coordinated and integrated efforts provide strong support for advancing Chinese modernization.

At the same time, China has pursued a series of five-year plans, translating long-term strategic objectives into phased goals and ensuring that key priorities are addressed at the appropriate stages of development. From the launch of the first Five-Year Plan (1953-57) to the current 15th Five-Year Plan (2026-30), this planning system has continued uninterrupted for more than seven decades. As one foreign leader remarked to Xi, one of China's greatest strengths lies in its ability to consistently formulate long-term plans and achieve the goals it sets. Indeed, few countries have maintained such a sustained record of strategic planning with comparable effectiveness. This year marks the beginning of the 15th Five-Year Plan period. Guided by shared objectives, the CPC and the Chinese people are working together to lay a strong foundation for the steady progress.

Institutions provide the fundamental foundation for national governance and constitute one of a country's greatest strengths. Sustaining the vitality of socialism requires continuous reform and innovation to ensure that institutions continue to evolve, mature and become more fully developed. In line with China's modernization process, the CPC has made institutional development its priority. Combining institutional innovation with institutional restructuring, the CPC began reforms to tackle the issues of greatest concern to the public and the most significant obstacles to economic and social development and has achieved success in removing institutional barriers, establishing foundational systems and bringing about systemic and transformative changes across a wide range of sectors. The scope, depth and impact of these reforms are unprecedented.

Ultimately, the value of any institutional system must be judged by its effectiveness in practice. The CPC has integrated the goal of improving and developing socialism with Chinese characteristics with the modernization of China's governance system and governance capacity. This ensures that institutions function effectively in practice and that institutional strengths are translated into governance effectiveness, achieving a balance between flexibility and effective regulation. China's governance system, particularly its ability to mobilize resources and coordinate efforts to accomplish major national objectives, provides institutional advantages that are demonstrated in practice. Looking ahead, China will continue deepening reform, further improve and develop socialism with Chinese characteristics, and write new chapters in both institutional development and national governance.

As Xi has emphasized, the Chinese dream is about peace, development, cooperation and win-win results and is connected to the beautiful dreams of people in other countries. The CPC has consistently regarded making greater contributions to humanity as an integral part of its mission. It acts on the belief that if political parties around the world work together and shoulder their shared historical responsibilities, they can turn aspirations into reality, translate vision into action and build a brighter future for humanity.

YAN WENJUN

Ready and able

The successful resolution of the International Organization for Mediation's first case brings the institution to life

The true value of an international dispute settlement institution lies not in its legal framework, facilities or personnel, but in its ability to help parties resolve disputes and reach mutually acceptable solutions. In early May, a maritime dispute was successfully resolved through mediation administered by the International Organization for Mediation (IOMed) at its Hong Kong headquarters. Parties from China and Singapore reached a written settlement in an international maritime dispute involving a charter party chain, bringing a series of complex and interconnected disputes to a comprehensive conclusion. The successful conclusion of the case marks an important milestone for IOMed, demonstrating that the organization has moved beyond institution-building to actual dispute resolution practice.

IOMed has been developing at remarkable speed. On May 30, 2025, representatives of 33 countries signed the Convention on the Establishment of IOMed in Hong Kong. The convention entered into force on Aug 29, 2025, and IOMed formally commenced operations on Oct 20, 2025, when it adopted key instruments including the State-to-State Mediation Rules, the International Commercial and Investment Mediation Rules and the Code of Conduct for Mediators. In less than a year, the organization progressed from treaty signing and institutional setup to handling and successfully concluding its first case, apart from handling other cases. The key question now is no longer why IOMed was established, but whether it can resolve international disputes consistently, impartially and effectively.

Mediation itself is not a new form of dispute settlement. Article 33 of the United Nations Charter has long recognized it as one of the principal means for the peaceful settlement of international disputes. What is genuinely innovative is that IOMed, as the world's first intergovernmental organization dedicated specifically to mediation, places this method on the stable foundation of a multilateral convention and equips it with international legal personality, a member-State governance structure, a professional secretariat, common procedural rules and international panels of mediators. Rather than serving as another mediation center, IOMed gives mediation a clear, durable and professional institutional home within the broader architecture of international dispute settlement. In doing so, it contributes to strengthening mediation's role in addressing international disputes through peaceful means.

Every procedure remains grounded in the consent of the parties concerned. Its rules emphasize voluntariness, impartiality, independence, good faith, efficiency, and time- and cost-effectiveness. Mediators may assist the parties in narrowing their differences, but they have no authority to impose a settlement. Courts and arbitral tribunals entrust the determination of the outcome to a third party. Mediation leaves control of the outcome in the hands of those directly affected by it. This may be where mediation offers its greatest value, particularly in disputes that cannot, or should not, be resolved entirely through a decision imposed by an external adjudicator. What IOMed provides is the institutional support needed to make party autonomy operate within a professional, neutral and orderly framework.

WANG XIAOYING / CHINA DAILY

Where the relevant parties consent to participate, mediation can move beyond the confines of a single claim. It can place legal liability, commercial interests and future arrangements on the same negotiating table. Instead of determining, issue by issue, and who wins and who loses, the process can seek an overall solution for how an entire transaction chain should settle its differences, perform its obligations or withdraw from the relationship in an orderly manner. The written settlement reached in IOMed's first case may therefore offer an early indication of mediation's distinctive capacity to address interconnected, chain-based cross-border disputes.

The strength of international mediation does not lie simply in its ability to persuade parties to compromise. It depends on the combination of legal judgment, sectoral expertise, cross-cultural communication and negotiating skill. The first mediation case was conducted chiefly by Rosita Lau, a Hong Kong lawyer with extensive experience in international shipping law. Her maritime expertise, combined with IOMed's institutional management of the process, provided strong professional support for the resolution of the dispute. Hong Kong, in this case, was more than the nominal location of IOMed's headquarters. It served as a practical platform where professional talent, an international shipping market, the common law tradition and the capacity to bridge Chinese and international legal cultures came together. Hong Kong's value does not lie in replicating London, Singapore or any other established dispute resolution center. Rather, under the unique framework of "one country, two systems", it can provide a new point of connection between the operation of an intergovernmental organization and the practical resolution of cross-border disputes.

More broadly, IOMed represents a new effort by China and the other participating countries to provide an additional public good for the international rule of law. Its purpose is not to create a parallel system, still less to displace international courts, arbitral institutions or existing mediation mechanisms. Its contribution is to offer the international community an additional option based on consent, equality and cooperation. As interstate investment and commercial disputes become increasingly intertwined, a single adjudicative mechanism cannot meet every need. A mature international dispute settlement system should allow different mechanisms to coexist, complement one another and operate in a coordinated manner. China's role in advancing the establishment of IOMed reflects an effort to translate the principle of peaceful dispute settlement, through multilateral means, into an institution that is both operational and accessible.

One successful case, of course, demonstrates the viability of an institution rather than its maturity. Credibility cannot be built overnight; it requires gradual accumulation, long-term practice and sustained commitment. IOMed still needs to demonstrate its independence and professionalism through cases involving a wider range of subject matters, regions and parties. It must also carefully manage the relationships between confidentiality and transparency, party autonomy and enforcement, and member-State governance and institutional neutrality. The amount in dispute, the specific claims, the course of the mediation, the settlement terms and the state of implementation in the first case have not been disclosed. Such restraint is consistent with the confidentiality essential to mediation. Yet as a new institution, IOMed will also need to make its stable operation visible to the international community through anonymized statistics, carefully calibrated disclosure of procedural experience and other appropriate means.

The convention gave IOMed its legal birth certificate; cases will give it practical life. At a time when international disagreements are increasingly politicized, securitized and divided along geopolitical lines, preserving a table at which parties remain willing to sit down and talk is itself an important contribution to the international rule of law. The first step taken through IOMed's inaugural case has turned that table from an institutional aspiration into a working reality.

Xiaohongshu achieves significant AI milestone

By LI JIAYING
lijiaying@chinadaily.com.cn

A new milestone in advanced artificial intelligence reasoning has been achieved as Chinese technology company Xiaohongshu, or RedNote, recently announced that its dots-note 3.0 model scored a perfect 42 points on this year's 67th International Mathematical Olympiad, making it the first AI system in IMO history to achieve both a flawless score and a gold-medal-level result.

The result makes dots-note 3.0 only the second AI model after Google DeepMind's Gemini Deep Think to receive an officially graded gold-level result. Gemini scored 35 points in 2025 after solving five of the six problems, matching that year's gold-medal cutoff.

Unlike many mathematical benchmarks that only ask for a final answer, the IMO requires complete proofs. A solution can lose points if any step is unsupported, making the contest a test of abstract reasoning as well as the consistency of a model's argument.

"Such competitions offer a useful test because the problems are newly written and unavailable online before the event," said Jasper Yao, a research scientist at a major US-based AI laboratory.

As online material can quickly enter model-training data, unseen questions help reveal whether a model can reason beyond material it may have encountered, Yao said, adding: "The value of taking part in a math contest is that it tests how well a model can perform when it has no prior knowledge of the problems and has never seen them before. That is also why major model developers compare their models' mathematical capabilities."

This year, the six IMO problems in question covered algebra, geometry, number theory and combinatorics, with each worth seven points. For the AI evaluation, human intervention was prohibited, including adjusting the model's reasoning, adding hints, correcting answers or selecting among outputs, according to the organizer.

Xiaohongshu said its dots-note 3.0 received the organizers' original LaTeX-formatted problems and solved them through an agent-based system combining natural-language reasoning with Python code execution.

"With no human translation or rewriting of the questions required, the model can completely critique its own work, identify errors or weak steps in its reasoning, and refine its initial proofs before producing the final answers," the company said.

The submissions were then reviewed by IMO graders, who awarded the model a seven-point full score for each problem.

A perfect score was rare even among human contestants. Seven of the more than 600 students listed in the official results received 42 points, or about 1 percent. The gold-medal cutoff this year was 29 points, placing the model's reported results 13 points above the threshold.

"We were surprised to find that the model produced a correct and elegant proof," said Liu Hanzuo, a two-time gold medalist at the Chinese Mathematical Olympiad. "Its structure was compact and its logic natural. Even among IMO solutions, it would be considered concise and elegant."

Wang Qiantong, another CMO gold medalist, also highlighted the model's solution to Problem 3 of this year's IMO.

While contestants commonly turned the problem into one about connectivity in graph theory, dots-note 3.0 used an induction argument that directly addressed the hardest part of the question, Wang said, adding, "Its approach is ingenious and concise, and that took me by surprise."

Xiaohongshu said the model used in the evaluation was an internal version of dots-note 3.0 and that it expects to open-source the model to the AI community in the near future.

Briefly

Central SOE R&D investment rises

China's State-owned enterprises directly administered by the central government have intensified efforts to achieve breakthroughs in key technologies, with their investment in research and development rising 3.8 percent year-on-year in the first half. According to the State-owned Assets Supervision and Administration Commission of the State Council, China's State-asset regulator, the rise in R&D spending came as central SOEs continued their efforts to make changes and improve their industrial layout and structure while deepening reforms.

Fiscal revenue up 4.7% in first half

China's fiscal revenue expanded 4.7 percent year-on-year to 12.1 trillion yuan ($1.78 trillion) in the first half, data from the Ministry of Finance showed. The pace of growth continued to pick up from 4 percent in the first five months, indicating steady improvement in fiscal revenue performance.

XINHUA - CHINA DAILY

Chinese carriers ink major fleet purchases

Airlines announced orders for 476 Airbus aircraft in past seven months

By LI JING
lijing2009@chinadaily.com.cn

Chinese airlines have announced orders for nearly 500 Airbus aircraft over the past seven months, underscoring the industry's confidence in long-term travel demand even as high fuel prices and external volatility weigh on near-term earnings.

Last week, Air China, its subsidiary Shenzhen Airlines, alongside Hainan Airlines, announced agreements to purchase a combined 95 Airbus aircraft with a catalog value of about $17.8 billion, adding to a series of large Airbus orders by Chinese carriers earlier this year.

Combined with earlier purchases by China Southern Airlines, Xiamen Airlines and China Eastern Airlines, domestic carriers have announced orders for 476 aircraft from the European manufacturer since the end of last year, according to company filings.

The buying spree persists despite warnings from major airlines including Air China, China Southern Airlines and China Eastern Airlines of substantial first-half losses as rising operational costs erased their first-quarter profits.

Industry analysts said that while airline profitability fluctuates with fuel prices, exchange rates and geopolitical events, aircraft purchases are a strategic fleet planning exercise extending over a decade or longer.

"Current losses are a short-term phenomenon, driven mainly by external factors beyond airlines' control," said Guo Jia, a civil aviation expert and professor at Guangdong University of Foreign Studies' South China Business College. "Aircraft procurement is part of airlines' broader, long-term strategic vision."

The latest aircraft are scheduled for delivery between 2028 and 2032. The multiyear delivery timeframes spread capital expenditure over time, mitigating the immediate financial impact of the purchases. Air China said in its filing that the transactions would not materially affect the company's cash flow or operations over the near term.

Although newer aircraft such as the A320neo family and A350 consume less fuel than previous generations, Guo said this is merely one benefit rather than the decisive driver behind the recent buying spree.

"The core driver of this round of orders is that Chinese airline fleets have entered a renewal cycle. With many aircraft having remained grounded during the COVID-19 pandemic, maintaining a younger fleet is a priority. It is fundamentally a medium to long-term capacity optimization rather than short-term capacity expansion."

The orders also reflect carriers' efforts to secure scarce production slots years in advance as global aircraft manufacturers continue to grapple with supply-chain disruptions. Deliveries of popular narrow-body models have already been largely sold out for several years, prompting airlines worldwide to place orders well ahead of expected demand.

The Civil Aviation Administration of China has projected annual passenger traffic will reach 1.5 billion by 2035, compared with about 770 million passengers carried in 2025, implying substantial room for long-term growth in the country's commercial aviation market.

Boeing expects that expansion to be mirrored globally. In its latest commercial market outlook released on Saturday, the US aircraft maker forecast that global passenger traffic will double over the next two decades, requiring 43,625 new commercial aircraft. Emerging markets, including China, Southeast Asia, South Asia, the Middle East, Africa and Latin America, are expected to account for about 55 percent of new deliveries.

However, the robust new orders do not guarantee that aircraft will arrive on schedule. Across the industry, manufacturers are facing growing constraints from shortages of engines, components and maintenance capacity, slowing deliveries even as travel demand remains robust.

The International Air Transport Association warned in June that durability problems and shortages of spare parts are disrupting airline operations worldwide.

"Engine maintenance, repair and overhaul bottlenecks are disrupting airline operations," Willie Walsh, IATA director general, said as the industry group released a joint study with consultancy Emerton in June. "Without significant changes, this will only get worse as the fleet of latest-generation single-aisle aircraft grows."

Enhancing 'reliable substitution' capability of clean energy

By ZHENG XIN
zhengxin@chinadaily.com.cn

China will aim to boost its annual renewable energy consumption to around 1.8 billion metric tons of standard coal equivalent by 2030 under its 15th Five-Year Plan (2026-30) for Renewable Energy Development, according to the country's top economic and energy regulators.

Jointly released by the National Development and Reform Commission and the National Energy Administration, the blueprint marks a strategic turn toward high-quality expansion and reliable fossil-fuel substitution, establishing the official framework for China's green energy evolution through the end of the decade.

Under the plan, China's total installed renewable power capacity is projected to reach about 3.5 billion kilowatts by 2030, generating roughly 6 trillion kilowatt-hours of electricity annually.

Wind and solar power will remain the principal engines of this growth, with combined installed capacity expected to surpass 2.8 billion kW. This will account for over 50 percent of the nation's total installed power capacity and supply more than 30 percent of its annual electricity output.

Reaching the 1.8-billion-ton benchmark marks a fundamental shift in China's energy matrix, balancing carbon peak targets with long-term energy security, industry analysts said.

"Over the next five years, renewables must move from rapid growth to reliable grid support," said Ye Xiaoning, a senior engineer at the State Grid Energy Research Institute. He noted that the plan's first-ever "reliable substitution target" — aiming for an 8 percent average firm capacity ratio by 2030 — directly addresses weather dependency by aligning generation volume with dispatch flexibility.

Ye added that leveraging non-electric applications like green hydrogen and heat will help resolve grid integration bottlenecks, pushing renewable energy beyond the power grid and deeper into the broader economy.

Renewable energy refers to energy that can be continuously replenished and regenerated through natural processes within a relatively short period.

View of an offshore wind farm off Pingtan county, Fujian province.
WANG WANGWANG / FOR CHINA DAILY

It includes hydropower, wind power, solar energy, biomass energy and geothermal energy. New energy refers to all renewable energy sources excluding hydropower, according to the document.

A core priority of the new roadmap is enhancing the "reliable substitution" capability of clean energy — ensuring intermittent wind and solar resources can dependably support the national grid during peak load hours.

The plan mandates that the average firm capacity ratio for combined wind and solar installations equipped with energy storage reach 8 percent nationwide by 2030.

To support grid balance, China will add more than 300 million kW of reliable peak-shaving renewable capacity over the five-year period through multi-energy integration, pumped-storage hydro and demand-side virtual power plant deployment.

Beyond power generation, the plan outlines significant breakthroughs in non-electric renewable applications. Non-electric utilization is set to grow 1.5-fold compared with 2025 levels, replacing approximately 150 million tons of standard coal equivalent annually by 2030.

This non-electric expansion will focus on scaling up green hydrogen, ammonia and synthetic methanol for heavy industry and transport, while expanding geothermal and biomass energy for urban and rural heating.

To foster new quality productive forces within the sector, policymakers are prioritizing breakthroughs in key equipment and technologies. Research and industrial application will focus on perovskite tandem solar cells, deep-sea floating wind platforms, thousand-meter head hydro turbines, and initial testing for space-based solar power systems, it said.

Huairou reports GDP rise of 7.1%

By REN QI
renqi@chinadaily.com.cn

Beijing's Huairou district reported first half GDP growth of 7.1 percent year-on-year, highlighted by a more than 20 percent surge in the new materials sector, a 100 percent revenue jump in leasing and business services and its approval as a municipal-level future industry pilot zone.

Ma Tianbiao, director of the district's development and reform commission, said Huairou's economy experienced a strong start in the first quarter and continued to consolidate in the second.

The coordinated development of the industrial and services sectors has solidified the foundation for steady growth, with the total output value of industries above a designated size reaching 29.94 billion yuan ($4.4 billion). Focusing on future energy, manufacturing and materials, Huairou has successfully become one of Beijing's four municipal-level future industry pilot zones.

Furthermore, the new materials sector has gathered 47 key enterprises, including seven national-level specialized and sophisticated "little giant" enterprises, and built eight innovation platforms at or above the provincial and ministerial levels, forming a complete innovation ecosystem from basic research and pilot verification to industrialization.

In the aerospace technology sector, the district has planned a 6-kilometer "interstellar navigation avenue". Focusing on the research and development of key components such as satellite-borne laser communications and electric thrusters, it aims to build an industrial cluster for key payloads and support manufacturing, driven by spacecraft assembly, integration and testing, and radiation-resistance testing services. This initiative has already connected over 20 scientific and technological facility platforms with more than 50 tech enterprises.

The district's comprehensive national science center is also accelerating its development. Wang Tianyi, director of the exchange, cooperation and talent work division of Huairou's science city management committee, noted that the center produced 67 major scientific and technological achievements in the first half of the year, bringing the cumulative total to 506. It also secured eight new national-level awards, while a number of major scientific facilities made breakthrough progress, accelerating the transformation of scientific achievements and the layout of future industries.

The district also saw robust growth in its service and consumer sectors. Revenue in information transmission, software and information technology services grew by 11.2 percent year-on-year, while the financial sector's net income increased by 15.3 percent. Driven by a recovering consumer market, the turnover of the accommodation and catering industry rose by 30.5 percent. Consequently, the per capita disposable income of all residents reached 30,371 yuan, representing a 5.2 percent increase.

Market vitality continued to surge, fueled by an optimized business environment. In the first half of the year, Huairou registered 5,791 new market entities, a remarkable 76 percent increase compared to the same period last year. The district's opening-up efforts also yielded significant results, with the actual utilization of foreign investment hitting $355 million, skyrocketing by 472 percent.

Additionally, the district's culture, sports and entertainment industries above a designated size generated 1.96 billion yuan in revenue in the first half, with a growth rate of 71.3 percent, significantly outpacing the city's average.

The broadcasting, television, film and sound recording sector served as the core engine, realizing 1.32 billion yuan in revenue. Meanwhile, the culture and arts sector brought in 300 million yuan, the sports sector 94.09 million yuan and the entertainment sector 250 million yuan.

Q&A WITH CEO

Editor's note: *After the release of China's first-half economic data, China Daily invited chief executives and senior leaders from key multinational companies to share their perspectives on the world's second-largest economy. Their insights go beyond short-term growth, offering a closer look at the evolving "China Opportunity 2.0" narrative amid ongoing debate over the so-called "China Shock 2.0".*

Maximizing structural market evolution

Henry Han
Group senior vice-president of ABB and president of ABB Robotics in China

Cissy Wang
General manager of CSL China

Kais Marzouki
Chairman and CEO of Nestle Greater China Region

Joy Fan
President and CEO of The Estee Lauder Companies China

Q1 Many multinational companies in recent years continue to expand their investment and operations in China, suggesting that "China Opportunity 2.0" is increasingly offsetting the "China Shock 2.0" narrative. What developments or evidence best demonstrate that China is creating new opportunities for global businesses rather than posing a "shock"?

HAN: "China Opportunity 2.0" represents a fundamental shift toward openness and shared progress that extends far beyond basic market access. China is transitioning from volume-driven to value-driven growth, supported by open innovation such as open-source AI. This shift is creating real, sustainable demand for global partners.

ABB Robotics has been committed to China for more than three decades.

Our deep roots and full value chain presence in China encompass R&D, manufacturing, sales, engineering, and services and our $150 million Shanghai mega factory reflects that. With this, we are uniquely positioned to continue advancing robotics in this fast-evolving market.

WANG: China has evolved from a manufacturing base and large market into a dynamic innovation ecosystem, powered by talent, infrastructure and high-quality development.

In biopharma, this is clear: by 2025, China accounted for about 30 percent of the global innovative pipeline and nearly 50 percent in next-gen modalities — a structural shift. For CSL, this means moving from market opportunity to innovation opportunity, which drives our China strategy — "3N strategy: new product, new collaborations, new efficiency".

This is reflected not only in bringing globally leading innovative therapies to China, but also — and more importantly — deeply rooted in the entire local industrial chain and actively shaping ecosystem-wide collaborations, including local hospitals, research institutions, companies in innovative R&D and AI, as well as other ecosystem partners.

MARZOUKI: China is evolving from a major consumer market into an increasingly important hub for innovation and industrial upgrading. In the past, companies came to China primarily to be closer to consumers. Today, many companies are leveraging China as a center for innovation, R&D, digital transformation and supply-chain collaboration. From Nestle's perspective, the strongest evidence of "China Opportunity 2.0" is the continued commitment of multinational companies to expanding their investments, innovation activities and operations in China.

Nestle has been deeply rooted in the Chinese mainland for nearly 40 years. Since 2020, we've made over 6 billion yuan ($886 million) of additional investments in China. We have more than 20 factories and operating sites across the Chinese mainland (including the Dairy Farming Institute and Nescafe Coffee Center) as well as three R&D centers. More than 90 percent of products are locally manufactured.

FAN: From our perspective, the continued evolution of China's consumer market is creating meaningful opportunities for multinational companies. Chinese consumers are increasingly seeking high-quality, science-backed and personalized products, while the country's strong innovation capabilities enable companies to develop and bring new ideas to market more quickly. These trends continue to reinforce our long-term confidence in China.

As China's consumer market continues to evolve, we believe companies that invest in local innovation, build strong partnerships and stay close to consumers will be best positioned for long-term success. That has been our approach in China for more than 30 years, and it continues to guide our investments today.

Q2 China's economy has demonstrated strong resilience so far this year, supported by resilient exports, solid industrial production and continued strength in high-tech manufacturing. How would you assess China's overall economic performance so far this year? Looking ahead, what do you see as the key drivers supporting China's growth in the second half?

HAN: China's economy has demonstrated remarkable resilience and a clear trajectory toward high-quality development. Looking to the second half of the year, we are seeing a profound transition where new quality productive forces — driven by technological breakthroughs and deep industrial transformation — are becoming the definitive engines of growth. High-tech manufacturing remains at the core of this momentum. AI investment is reaching a critical inflection point, with capital accelerating into industrial applications and productive infrastructure. The 15th Five-Year Plan (2026-30), with its strategic focus on future industries like embodied intelligence, provides a highly durable and predictable policy foundation for this transition. On the global stage, China's upcoming hosting of the 33rd APEC Economic Leaders' Meeting in Shenzhen, Guangdong province, in November, further reinforces its indispensable role as a central node in the global economy, fostering a collaborative environment for international enterprises.

WANG: China's economic performance this year has demonstrated remarkable resilience, driven by a clear shift toward high-quality development and the fostering of "new quality productive forces".

In the healthcare sector, we define this "new quality" as the deep integration of cutting-edge biopharma platforms with digitalization to address highly unmet medical needs. As a leading global biotechnology company with 40 years of service in the Chinese mainland, CSL is unleashing this momentum through our local "3N strategy". Looking ahead, we believe the continuous deepening of healthcare modernization and regulatory reforms will remain the premier growth engines. CSL is highly optimistic about China's long-term prospects and is fully committed to contributing to "Healthy China" as a long-term partner.

FAN: At The Estee Lauder Companies, we have always taken a long-term view of China and remain confident in the market's long-term potential. We continue to see strong underlying demand from Chinese consumers, particularly as they increasingly seek high-quality, science-backed and personalized beauty products. This confidence is reflected in our own business, where we have delivered five consecutive quarters of retail sales growth in China through the most recently reported period of March 2026.

Looking ahead, we believe growing demand for high-quality products, together with continued digital transformation, will remain important drivers of growth. Within the prestige beauty industry, consumers increasingly expect seamless experiences across both online and offline channels, while digital technologies are helping brands better understand consumer needs, strengthen consumer engagement and accelerate innovation across the value chain.

At the same time, China's scientific research capabilities and vibrant innovation ecosystem continue to create new opportunities for product innovation. Through our China innovation center, we stay close to one of the world's most sophisticated beauty consumer markets, where expectations for product efficacy, ingredients and personalized beauty solutions continue to evolve. These consumer insights, combined with our global scientific expertise, help us develop products that better meet the needs of Chinese consumers while contributing to our global innovation pipeline.

Q3 China's innovation ecosystem has become an increasingly important engine of growth. How do you assess the contribution of artificial intelligence and other frontier technologies to China's productivity growth, industrial upgrading and long-term economic resilience? More broadly, what significance does China's innovation have for global technological progress and the opportunities available to multinational companies?

HAN: China's innovation ecosystem is raising domestic productivity while becoming a global platform for next-generation industrial technologies.

AI is acting as a productivity multiplier. Machine learning embedded across manufacturing, quality control, logistics and predictive maintenance is compressing industrial upgrading cycles that would previously have taken decades. The result is a rapid shift from a digital economy to an intelligent one, where AI is woven into productive infrastructure itself.

Products like ABB Robotics' RobotStudio HyperReality can train robots for every eventuality, closing the sim-to-real gap with 99 percent accuracy using physically accurate simulation. This fundamentally changes how quickly and reliably manufacturers can scale production, reducing costs by up to 40 percent and accelerating time-to-market by 50 percent.

WANG: In the healthcare sector, AI is enhancing R&D efficiency, supporting clinical decisionmaking, optimizing manufacturing processes and improving supply chain management. This digital transformation not only boosts productivity, but also builds a more responsive and agile healthcare ecosystem. CSL is also collaborating with a top university hospital to use AI technology to enhance rare disease diagnosis.

As China's share of global licensing capital increases — combined with regulatory reforms and the deep integration of AI throughout the R&D process — R&D speed and efficiency are being further elevated. This innovation-driven momentum creates a new frontier of win-win collaboration for multinational corporations.

MARZOUKI: China enjoys unique technological strengths and leads in AI development, and the 15th Five-Year Plan emphasizes advancing the "AI+" initiative. We will leverage AI in China to gain deeper consumer insights and better address key trends including the silver economy, healthy longevity and functional nutrition, so as to better meet the needs of Chinese consumers.

At the same time, Chinese innovation is increasingly influencing global markets. More products, technologies and business models developed in China are being adopted internationally.

For multinational companies, this creates greater opportunities for co-innovation, joint R&D and shared technological progress.

FAN: China has built a dynamic innovation ecosystem that combines strong scientific capabilities, a rapidly evolving technology landscape and rich real-world application scenarios. For multinational companies, this creates an environment where new technologies can be developed, tested and scaled quickly, making China an increasingly important source of innovation as well as a key market.

At The Estee Lauder Companies, we are applying AI across multiple stages of our value chain — from delivering more personalized consumer experiences and supporting skin analysis to accelerating scientific research through virtual ingredient screening. These technologies help shorten product development cycles and enable us to bring innovative products to consumers more efficiently.

Q4 China has placed greater emphasis on expanding domestic demand while pursuing high-standard opening-up. How do you assess these efforts? What new opportunities do they create for multinational companies and global investors?

HAN: China's emphasis on stimulating domestic demand and advancing high-standard opening-up creates a highly dynamic and predictable environment for multinational companies.

The country's broader push to embed intelligent technologies across industries provides the foundation for mid- to long-term demand and growth. For industrial companies, that translates into increased manufacturing activity and, consequently, stronger demand for automation and productivity technologies.

Continued progress on market access, intellectual property protection and regulatory transparency is gradually lowering the operating risk for foreign businesses. High-standard trade frameworks and sustained participation in global supply chains reflect China's recognition that outward-looking integration remains central to its development model.

WANG: "Expanding domestic demand" translates to a robust demand for high-quality, standardized medical services in the healthcare sector. Taking our core product, human albumin, as an example, the real-world clinical demand from critical and serious disease patients in China remains exceptionally strong.

China's continuous advancement of high-level openness and institutional innovation has accelerated the launch of global cutting-edge therapies. For instance, through pioneer policies like the "Hong Kong and Macao Medicine and Equipment Connect", our anti-D immunoglobulin has achieved accelerated rollout in China, benefiting approximately 4,000 Rh-negative, or "panda blood", pregnant women. Additionally, our innovative medicine in the field of hereditary angioedema is currently under regulatory review for marketing authorization.

MARZOUKI: For multinational companies, stronger domestic demand means broader and more diversified market opportunities. China has one of the world's largest middle-income populations, with rising demand for health, nutrition, premium experiences and personalized consumption.

At the same time, high-standard opening-up is creating a more stable, transparent and predictable business environment. China's continuous efforts to improve the business climate and expand institutional opening-up provide greater confidence for long-term investment. For Nestle, this creates not only market opportunities, but also opportunities for innovation and collaboration. We will continue to invest in local innovation, strengthen partnerships and contribute to the high-quality development of the industry.

FAN: From our perspective, China's continued focus on expanding consumer demand and creating a stable environment for long-term investment provides important opportunities for multinational companies.

First, evolving consumer demand continues to create opportunities for the prestige beauty industry. Chinese consumers are increasingly seeking high-quality, science-backed and personalized products, encouraging companies to continue investing in innovation and premium beauty experiences across both physical retail and digital channels.

Second, platforms such as the China International Import Expo have enabled businesses like The Estee Lauder Companies to introduce more global brands and innovations to Chinese consumers while strengthening collaboration with local partners.

Q5 Looking ahead to the second half of the year, what will you be watching most closely as indicators of China's economic resilience, reform progress and long-term growth potential?

HAN: Three sets of indicators will be most telling in the second half of the year.

The first is industrial automation and robotics demand, which serves as a real-time gauge of manufacturer confidence and the pace of China's productivity upgrade.

Order volumes, deployment rates, and new application sectors will signal whether the transition to intelligent manufacturing is accelerating or consolidating.

For ABB Robotics, we will be watching this particularly in logistics, healthcare and life sciences, construction and new energy vehicles.

The second is high-technology manufacturing output across robotics, semiconductors, advanced materials and new energy.

This will show whether China's industrial policy investments are translating into durable productive capacity or remain concentrated in demonstration projects.

The third is export resilience and supply chain integration.

The degree to which Chinese manufacturers move up the value chain in export markets, competing on technology and quality rather than price alone, will be a meaningful signal of long-term structural progress and China's ability to sustain its global economic role amid ongoing geopolitical headwinds.

WANG: In the second half, I will be watching how innovation — particularly in biotech, AI and digital health — translates into tangible improvements in patient outcomes.

CSL's strategic ambition is to deliver enduring patient impact in areas of high unmet medical need.

As the market leader in albumin in China, we understand the responsibility that comes with serving patients and the healthcare system, and we remain committed to maintaining a stable and reliable supply for Chinese patients.

I am also encouraged by our growing engagement in China this year.

CSL is increasing its presence at major national exhibitions and industry conferences and will make its debut at China International Import Expo — further demonstrating the strategic importance of China within our global business.

Overall, I remain optimistic about the future of China's economy.

Driven by innovation, talent and a commitment to high-quality development, China is well positioned to continue creating opportunities for businesses, investors and, most importantly, patients.

CSL is proud to be part of that journey and looks forward to contributing to China's next chapter of growth.

Cemetery connects lost soldiers with the present

Decades after the War to Resist US Aggression and Aid Korea, pilgrimages to the CPV graveyard continue to inspire generations

By **ZOU SHUO** and **WU YONG**
in Shenyang

At 70 years old, Liu Guoqin recently made the 1,600-kilometer journey from Wuxi, Jiangsu province, to Shenyang, Liaoning province, alone. Her surviving older siblings were too frail to travel, but Liu felt an obligation she couldn't pass up.

She was heading to the Chinese People's Volunteers martyrs' cemetery in Shenyang, where a single name carved into a 100-meter-long black granite wall drew her in: her eldest brother, Liu Guohua.

"I was born after he left. We never met," Liu Guoqin said, tears welling as she stood before the wall on June 3, accompanied by her childhood friend Hu Yanjuan, also 70. Liu Guoqin's brother was 22 when he died in the War to Resist US Aggression and Aid Korea (1950-53). For decades, Liu searched — visiting government offices in Liaoning, calling old classmates and chasing leads that went nowhere. "My parents' dying wishes were to know where he was. So, I needed to find him," she said.

Three years ago, she did. His name was etched among the 174,407 names carved on the wall, representing the 197,653 fallen of the war. Duplicate names were carved only once, so the number of names is less than the true death toll.

Since then, Liu Guoqin has returned each year. "None of my living elder siblings are fit enough to travel long distances. While I can still walk, I will come," she said.

The seekers

For thousands of families across China, the cemetery in Shenyang — established in 1951 and spanning 210,000 square meters — is the only tangible link to relatives lost in a war seven decades ago.

At its heart rises a 23.5-meter granite monument bearing the inscription "The heroic souls of the martyrs of the War to Resist US Aggression and Aid Korea shall live forever" in the calligraphy of Dong Biwu, one of the founders of the Communist Party of China and a famed Marxist.

Behind the monument rest 123 CPV martyrs, including special-class heroes Yang Gensi and Huang Jiguang, and first-class heroes Qiu Shaoyun, Sun Zhanyuan and Yang Liandi.

In front of the cemetery is a memorial square completed on Oct 29, 2014. Its unclosed circular form symbolizes return and reunion.

An underground crypt beneath the square holds the remains of CPV martyrs repatriated annually from the Republic of Korea. Over 1,000 soldiers have been brought home through these handovers.

Since 2014, following a handover agreement between China and the ROK, 13 consecutive repatriations have brought a total of 1,023 soldiers home. On the day of the 13th repatriation in April this year, a solemn burial ceremony was held at the square.

For many families, the wall of names is the only place they can finally pay tribute to their loved ones.

Xia Fang, deputy head of the cemetery's social education department, has spent 20 years watching visitors walk the length of the wall, fingers trailing across the carved characters.

One story stays with her. In 2025, a man called Fang Hanbing had traveled over 1,700 km from Macheng, Hubei province, to find his father's name on the wall. He brought a pouch of soil from his hometown and a stack of fire-baked flatbread — his father's favorite. When his fingers traced the characters "Fang Jinyao", a word he had never been able to speak escaped his lips: "Dad". He had been three months old when his father left for the front.

"I was standing right there," Xia recalled. "After 70 years, when he finally called out 'Dad', the emotion just broke through."

Another staff member, Wang Chunjie, remembers a woman named Wang Xianxia, who spent 58 years searching for her father. When she finally arrived at his grave, she knelt and bowed 58 times — one for each year of searching.

"She said, 'I've been looking for you my whole life'," Wang Chunjie recalled. "She was in her sixties by then."

The keepers

Because so many martyrs died too young to have direct descendants, the responsibility of preserving their memory often falls on distant relatives — and the cemetery staff who guard their legacy.

"When I started working here, heroes like Huang Jiguang seemed like figures from distant textbooks," Wang Chunjie said. "Then I realized Huang was only 21 when he died — younger than I was when I started."

Xia said those who come are often nieces and nephews, their parents long gone but the obligation to remember undiminished. "They don't say much when they reach the wall," she said. "There's just quiet crying, tears streaming down."

Every year, on the eve of the war's anniversary on Oct 24, a Shenyang resident places five apples on every grave — a quiet homage to the legendary Battle of Shangganling (the Battle of Triangle Hill), where a single apple was passed among starving soldiers, Xia said.

Ahead of the Chinese New Year in 2025, the cemetery staff boiled nearly 1,000 dumplings and placed them at the graves. "We wanted the martyrs to taste the sweetness of today," Xia said. "I was once told by one of the veterans that at the front line, they once made dumplings under fire — the enemy bombed them, and all that was left was soup."

From top: Children leave flowers on martyrs' tombstones at the cemetery on Sept 30. ZHOU HUA / XINHUA Veteran CPV soldiers pay respects to their fallen comrades at the cemetery on Oct 25. PAN YULONG / XINHUA

Inside the cemetery's museum vault, more than 10,000 artifacts lie in acid-free containers — the legacy of careful preservation by Meng Dechang, a 35-year-old history graduate who joined the cemetery in 2022.

The collection consists mostly of everyday objects — decayed rubber soles, metal bowls and uniform buttons. But amid the routine items are reminders of personal lives cut short.

"There's a harmonica — rare, and remarkably intact," Meng said. "We can only imagine that during breaks, soldiers gathered to play melodies from home."

Another artifact, a small signaling whistle, holds a starker reality. "When communication lines failed on the battlefield, a coded signal on a whistle meant life or death," she said. "Guardianship of these relics gives my life meaning. Every piece belonged to a different young person. They are the only physical link between those soldiers and the world today."

For docent Xie Yutong, 34, the work is a continuation of her military service. Having served 12 years in the 15th Airborne Corps — the same historical unit as renowned war heroes Huang Jiguang and Qiu Shaoyun — she sees the cemetery as an extension of her own squad. "When I see these graves, I'm not telling someone else's story," Xie said. "I'm telling the story of my own unit's heroes."

Next generation

The cemetery is not frozen in time. Last year, it received more than 500,000 visitors — a number that has grown every year, Wang Chunjie said. School groups, tourists and young people traveling on their own initiative are a common sight, she said.

Young people taking the initiative to visit martyrs' cemeteries is a vivid manifestation of the continuous inheritance of the "Red bloodline". The ideas of remembering history and honoring heroes are steadily taking root among the younger generation, she added.

Wang Chunjie has taken the cemetery's stories beyond its gates, lecturing at schools and universities across the country. "When we show up in person — the people who guard these heroes every day — it hits differently," she said.

Not all visitors are relatives. Wen Dong, 29, traveled from Gansu province. He was at the cemetery on a day off, drawn by news of the latest repatriated martyrs. "We used to visit memorials back home too," he said. "Every time I go to a new city, I find a place like this."

When asked why a young man would spend his free time at a martyrs' cemetery, Wen paused. "It's hard to put into words," he said. "For me, it's not like climbing a mountain or sightseeing. This is different. It's a feeling — a sense of respect." He plans to bring his children here one day. "Of course I will tell them these stories. The spirit has to be passed on."

For Yue Zhonghou, a 74-year-old retired worker from Beijing, the war is personal history. Born in 1952, the year the fighting was still going on, he grew up in its shadow.

He made his first pilgrimage to the Shenyang cemetery recently — a trip he had promised himself for years.

Yue was visiting Shenyang while his wife attended a class reunion. "I finally carved out a day," he said. For Yue, the war's significance transcends military victory.

"We were so poor then. Yet we took on the world's most powerful military — and we prevailed," he said. "That confidence, that unity — it's in our DNA now. Our nation as a whole will never forget."

He plans to tell his 40-year-old son what he saw and felt, and believes that the spirit should be passed from generation to generation. "The spirit of that war is the foundation of China today. No difficulty we face now is harder than what they endured, and we will prevail no matter what hardships we face in the future."

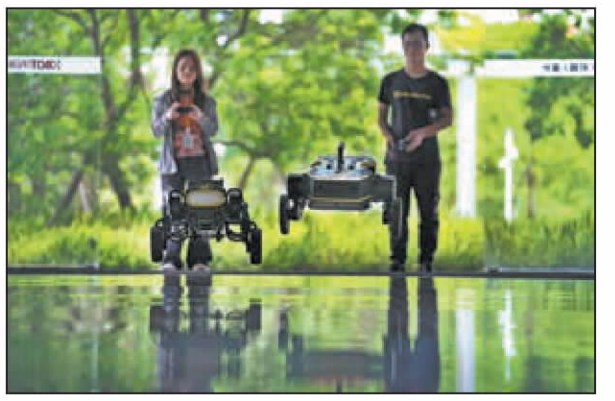
Fact Box

Repatriation of Chinese People's Volunteers soldiers' remains from the Republic of Korea (2014–26)

Since 2014, China and the Republic of Korea have conducted 13 consecutive repatriations of the remains of Chinese People's Volunteers martyrs who sacrificed their lives during the War to Resist US Aggression and Aid Korea (1950-53). A total of 1,023 sets of remains have been returned to China and laid to rest at the Chinese People's Volunteers martyrs' cemetery in Shenyang, Liaoning province.



Batch	Date	Number of Remains
1st	March 28, 2014	437
2nd	March 20, 2015	68
3rd	March 31, 2016	36
4th	March 22, 2017	28
5th	March 28, 2018	20
6th	April 3, 2019	10
7th	Sept 27, 2020	117
8th	Sept 2, 2021	109
9th	Sept 16, 2022	88
10th	Nov 23, 2023	25
11th	Nov 28, 2024	43
12th	Sept 12, 2025	30
13th	April 22, 2026	12

A worker inspects i-Sobot robots at a factory in Dongguan on Oct 13, 2007.

A humanoid robot draws visitors at an exhibition in Shenzhen on May 22, 2025.

By CHINA DAILY

In 2007, a tiny robot named i-Sobot "came to life" at a facility in Dongguan, Guangdong province. The remote-controlled robot, no larger than a palm, could perform about 240 movements, including walking and climbing, with remarkable precision.

This first-generation machine was more than a novelty — it was a microcosm of China's early exploration into intelligent robotics, planting the seeds for a domestic smart equipment industry that would flourish over a span of nearly two decades.

Fast forward to today, and the transformation is outstanding. Chinese robots have evolved from basic walking motions to autonomous thinking and collaborative decision-making. They are no longer confined to research labs but have become tangible carriers of "new quality productive forces" — a concept driven by technological innovation, high efficiency, and high-quality output.

Inside a factory in Dongguan, a direct-drive bipedal robot named "Xingtian" moves swiftly through hazardous zones, performing transport, inspection, and exploration tasks that once required human workers. On assembly lines in Zhaoqing, Guangdong, robotic arms operate in high-speed coordination, achieving millimeter-level precision that boosts manufacturing capacity while pushing factories toward full automation and unmanned operation.

In Guangzhou, the provincial capital of Guangdong, logistics robots have taken over sorting duties, dramatically improving efficiency and accuracy. At a Southern Power Grid substation, a quadruped robot "Feiyun" patrols around the clock, ensuring power supply safety while freeing human workers from repetitive, high-risk tasks.

Clockwise from above: Robotic arms operate in high-speed coordination at a factory in Zhaoqing, Guangdong, on June 18, 2025. A robot "traffic police officer" undergoes testing to clear traffic in Shenzhen on March 12. Technicians watch robots dancing at a Shenzhen EngineAI Robotics Technology Co facility on June 25, 2025.

Contrary to popular belief, these robots are not replacing humans — they are revolutionizing work patterns.

At the inaugural Beijing E-Town robot soccer 3V3 AI competition in 2025, neither remote control nor human intervention was allowed. The robots relied entirely on autonomous decision-making, showcasing cutting-edge capabilities in motion control, visual perception, and multi-robot collaboration. In other events, be it boxing, sprinting, or other track and field competitions, robots fell, got back up, and iterated their performance through trial and error — turning the experiences into real-world capability.

Robots have also stepped gently into the rhythms of daily life. In Shenzhen, Guangdong, a robot "traffic police officer" stands at busy intersections, directing vehicles with precision. In Chengdu, Sichuan province, a small robot-run convenience store offers quick and friendly service. At the foot of Wudang Mountain, Hubei province, exoskeleton robots help tourists climb steep paths with ease, turning a physically demanding journey into a comfortable experience. Technology is empowering and inclusive.

In Huiyang, Guangdong, a training ground for embodied intelligence prepares robots for real-world tasks, much like a vocational school. In Shenzhen, lifelike simulation robots can mimic human expressions with startling accuracy. These are no longer cold machines — they are perceptive, interactive, and even companionable.

Behind every image captured over nearly two decades is a story of breakthroughs and deployment — a mutual push between innovation and application. In the wave of new quality productive forces, robots embody high technology, high efficiency, and high quality. They are reshaping how we produce, live, and organize society.

CULTURE

AN EMPTY CHAIR BECKONS

Eighteen years later, an acclaimed ballet revival masterfully merges Western choreography with traditional Kunqu Opera, **Chen Nan** reports.

A red chair stands on an empty stage as the curtain rises. At the opening of *The Peony Pavilion*, it cradles a sleeping young woman. By the end, it is left empty — an invitation to the audience. Who will sit there next? Who will become Du Liniang?

Eighteen years after its acclaimed premiere, the National Ballet of China's original production, *The Peony Pavilion,* has returned to the stage, offering a renewed interpretation of one of China's enduring stories of love, longing and self-discovery.

The score is composed by Guo Wenjing, with the set and lighting designed by internationally renowned designer Michael Simon. The costumes are based on designs by the late Oscar-winning costume designer Emi Wada, and Han Jiang serves as the co-lighting designer.

The revived production premiered on Wednesday at Tianqiao Theater in Beijing and will run through Sunday.

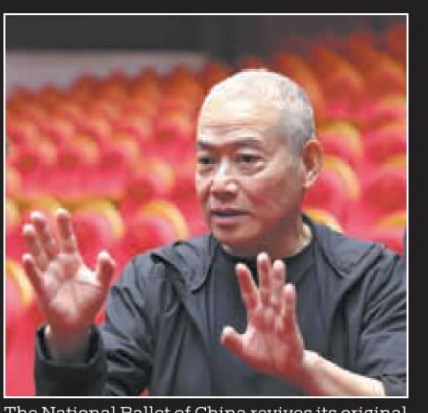
"Eighteen years later, when I revisit the production, I am still touched," says director Li Liuyi, who reunited members of the original creative team to refine the ballet for a new generation of audiences.

Adapted from the Ming Dynasty (1368-1644) masterpiece by Tang Xianzu, *The Peony Pavilion* tells the story of Du Liniang, a sheltered young woman who dreams of the scholar Liu Mengmei and falls deeply in love despite never having met him. She dies of longing, but love proves stronger than death. Guided by her spirit, Liu discovers her portrait and eventually brings her back to life, allowing the lovers to unite.

Li sees Tang as Shakespeare's kindred spirit in the East. Born in the same era, the two playwrights transformed theater by placing human emotion at its heart. Whether through Shakespeare's Juliet or Tang's Du, love becomes more than romance — it becomes a force that challenges convention, confronts mortality, and reveals what it means to be human.

More than four centuries after it was written, Li believes *The Peony Pavilion* continues to speak to contemporary audiences. "It presents a remarkably open vision of human emotion and imagination. Tang Xianzu celebrates individual desire, dreams and the freedom to pursue one's true self — ideas that continue to resonate across cultures."

For the director, the ballet is not simply a romantic tale. "It is about the awakening of life," he says. "It is about a person discovering her true self through love."



That philosophy shapes every aspect of the production.

Widely regarded as Kunqu Opera's most celebrated masterpiece, *The Peony Pavilion* has long been admired for its poetic language and emotional depth. Rather than replacing that tradition, the ballet embraces it.

Actresses from the Northern Kunqu Opera Theatre perform iconic arias from the original opera onstage, creating a dialogue between one of China's oldest theatrical traditions and Western ballet.

The National Ballet of China revives its original production, *The Peony Pavilion*, exploring the themes of love and self-discovery. Led by director Li Liuyi (above), the creative team refines the seamless blend of traditional Kunqu Opera and ballet.
PHOTOS BY ZOU HONG / CHINA DAILY

At the revival's premiere in Beijing, National Ballet of China principal dancer Fang Mengying portrayed Du, with principal artist Ma Xiaodong as Liu. Through ballet's expressive language, they vividly brought to life Tang's timeless vision of a love capable of crossing the boundaries between dream and reality, life and death.

Yet, the ballet's most distinctive innovation lies in the heroine herself.

Instead of presenting a single Du, director Li divides her into three figures. One belongs to the everyday world, another appears as the "flower goddess" who embodies dreams and desire, while the third — performed by a Kunqu Opera artist — represents Tang's original heroine and the classical theatrical tradition.

Together, the three versions reveal not different women, but different dimensions of the same person.

"The 'flower goddess' is direct and passionate. The Kunqu Opera version of Du is restrained and calm. Between them is Du herself, searching and discovering," says choreographer Fei Bo. "Our production is not simply retelling the original story; it leads audiences into Du's inner world."

Returning to the ballet nearly two decades later also transformed Fei's own understanding of its heroine. "I can now look at her from a more complete perspective, understand her better, and truly feel the emotions she searches for in her dream," he says. "This time, I wanted to gradually explore the deepest place of her heart — where her purest and most genuine emotions lead."

Fei believes Du's journey is ultimately about far more than romance.

"Du is brave and sincere," he says. "She is not only pursuing love, but also trying to complete herself as a woman within the constraints of the world."

The revival also introduces a new generation of dancers, including 18-year-old ballerina Yan Mengxuan as Du.

Director Li says, "Youth itself carries tremendous vitality. These young artists are full of passion and eager to create their own Du Liniang and Liu Mengmei."

Behind that fresh interpretation are months of collaboration between ballet dancers and Kunqu Opera performers. During rehearsals, the dancers studied the subtle gestures, posture and breathing of traditional opera, learning that stillness could be as expressive as movement.

"We wanted the dancers to possess both the physical strength of Western ballet and the Eastern sense of atmosphere and rhythm," Fei says. "Even in the pas de deux, we were not only pursuing technical coordination, but also searching for two people whose breaths and emotions could resonate with each other."

For Shao Tianshuai, who performed the Kunqu version of Du in the ballet's original production 18 years ago, the revival demonstrates how two artistic traditions can enrich one another.

"This production perfectly embodies the idea of preserving tradition while pursuing innovation," she says. "Ballet and Kunqu each maintain their own artistic roots, yet together, they elevate one another."

In the end, however, everything returns to the image that opens the ballet: the empty chair.

"For me, the empty chair on stage is the most moving image," Fei says. "The entire ballet is actually one great dream, and the empty chair perfectly expresses the Eastern aesthetic idea of the coexistence of reality and illusion."

At the beginning, Du falls asleep in the chair. At the end, only the chair remains.

"Whoever sits in that chair becomes Du Liniang," Fei says. "I want to leave that imagination to the audience, to the stage, and to the work itself."

Actor hopes to open doors for more young Asian talent

By MINGMEI LI in New York
mingmeili@chinadailyusa.com

Chinese American actor and producer Daniel Wu said he hopes his career can help create more opportunities for the next generation of Asian actors, as he reflected on identity, cultural exchange, and his decades-long ties to Hong Kong cinema at the New York Asian Film Festival.

Wu received the festival's Best from the East Award and also introduced the movie *Cold War 1994* to the audience. He said he felt "excited, proud and honored" by the recognition.

"Although I was born and raised in the West, I've always represented Hong Kong film," he says. "Hong Kong film has had its ups and downs over the past 30 years, but it's always going to survive."

Returning to Hong Kong to film has always felt like "a homecoming", Wu says.

Reflecting on his cross-cultural career, he acknowledges the complexities of his identity. As a Chinese American who has spent much of his career in Hong Kong, he says he feels more at home filming in China, where he does not feel like a "minority", while continuing to navigate questions about where he belongs.

Wu says his mother's advice helped him embrace both sides of his identity.

"You should just think of yourself as a person of the world and not necessarily someone of the East or the West," he recalls her saying. "You're both worlds."

Wu says he now sees his career as "right in the middle on this bridge", connecting cultures while helping expand opportunities for future generations of Asian actors.

Daniel Wu poses with a poster for *Cold War 1994* in New York on Monday. MINGMEI LI / CHINA DAILY

"The only reason why I keep trying to work in the United States is to show the next generation that it's possible for people like us," he says. Growing up, he rarely saw Asians on screen except in stereotypical roles.

"I'm trying to help open up a path for the next generation so that we have more representation and more visibility in the West," he adds.

Speaking about his role in *Cold War 1994*, Wu says the character was unlike any he had played before. Rather than a clear-cut hero or villain, the morally ambiguous mastermind challenged him, both as an actor and as a person at a different stage of life.

"I never played a character like this that was so morally ambiguous," Wu says. "I've played bad guys, good guys and young cops, but I've never played an older mastermind like this.

"It's interesting to be at a different stage in my own life and relate to this character and understand him."

Set against the backdrop of Hong Kong's return to the motherland, the film also offers audiences a chance to revisit a pivotal chapter in the city's history through cinema.

The Hong Kong Economic and Trade Office in New York has partnered with the New York Asian Film Festival since 2009. This year, 17 Hong Kong films are being showcased at the festival.

Maisie Ho, director of the Hong Kong Economic and Trade Office in New York, says the film festival serves as a bridge between the East and the West.

"For Asian Americans who were born and raised here, movies provide a valuable way to reconnect with their identity, culture and roots," she adds.

Ho says the festival also allows audiences of all backgrounds to gain a deeper understanding of Asia's cultural diversity through cinema.

She describes Wu as "already an ambassador bridging the East and the West", saying his cross-cultural experiences help audiences appreciate different perspectives.

Through figures like Wu and platforms such as the festival, cultural exchange becomes more meaningful and accessible, she adds.

LIFESHANGHAI

More than just cosplay

Fans gather at BilibiliWorld convention to show appreciation for original Chinese IPs and learn more about where the ACGN industry is headed, **Wang Ying** reports.

Less than 10 hours of sleep in three days. That was the plan Yin Jiayou happily signed up for as she headed to Shanghai's biggest annual gathering for animation fans.

The 18-year-old, attending BilibiliWorld for the third time, woke up at 5 am on opening day. After spending nearly three hours dressing up as one of her favorite characters, she joined tens of thousands of fans at BilibiliWorld 2026, one of Asia's largest offline ACGN (animation, comics, games, and novels) conventions, held in Shanghai from July 10 to 12.

After Yin arrived at the venue in full costume, she was quickly surrounded by fellow fans eager to take photos with her.

"The character I'm cosplaying is Thirteen, a female character from the original Chinese animation *Scissor Seven*. She's known for her elegant look and is one of the series' most popular characters," Yin says.

According to Yin, Thirteen has deep green eyes, two mole-like teardrops under her eyes, and hair braids that are tipped with a blade-shaped pendant.

Standing with Yin is her friend Jin Zihan, a 17-year-old girl taking part in the ACGN sensation for the first time this year. She cosplayed Qi, another *Scissor Seven* character.

"We were told we would get to meet the animation's creators later, and we're so excited. We're huge fans, and this might even give us a chance to find out what's coming next. It's been a while since the last update," Jin says, adding that she became a fan of the IP (intellectual property) during middle school.

As one of the first Chinese animations to become a Netflix Original, *Scissor Seven* will expand into new films, spin-off series, games, and more, announced the original Chinese animated IP's owner Ahaverse on July 10.

At BilibiliWorld 2026, a range of new projects and experiences based on the IP were unveiled for global release in the coming years, ranging from a movie and an original mobile action-adventure game to an annual live music experience.

"These are not standalone projects. They represent how *Scissor Seven* is evolving into a living world that continues to grow and expand," says Zou Shasha, founder and chief IP officer of Ahaverse, an original Chinese IP ecosystem company.

According to Zou, their long-term vision is to develop it from a single story into an ecosystem with more characters, richer storylines, diverse content formats, and immersive live experiences, while continuing to enrich it through collaboration with creators from different fields.

Since debuting in 2018, *Scissor Seven* has grown into one of China's most internationally recognized animated franchises, reaching audiences around the world through streaming platforms, multiple language dubs, comics, games, music, merchandise, and live experiences. Streaming in over 190 countries as one of the first original Chinese animations to become a Netflix Original, the franchise has attracted more than 40 million fans worldwide and over 30 billion views across platforms.

Top: During the opening ceremony of BilibiliWorld 2026 on July 10, a group of *Silver Palace* cosplayers dance at the National Exhibition and Convention Center in Shanghai. **Left:** Booth for *Honkai: Star Rail*. **Left below:** The *itasha* (pain cars) exhibits showcase animation-themed cars. **Right below:** Two cosplayers sit in electric model cars for a parade inside the venue on the same day. PHOTOS BY ZHOU YOU / FOR CHINA DAILY

The excitement among animation fans for the original Chinese IP is not isolated. Against the backdrop of China's push for high-quality development in its cultural industry and the rapid transformation of the digital cultural sector, original Chinese IPs are emerging as a key driver for integrating creative content, digital entertainment and offline consumer experiences.

For 27-year-old Mao Haha, a loyal fan of original Chinese animations for more than a decade, original Chinese anime resonates with her more deeply, as its storytelling strikes a stronger emotional chord.

"Sometimes the characters make me feel like they are living the life I've always dreamed of. That emotional resonance is something I've only experienced in original Chinese works," Mao says, adding that her favorite is the *Grave Robbers' Chronicles*, a mystery-adventure series.

To make it to the ACGN event in Shanghai, she worked overtime throughout the previous week to clear her schedule. Getting up at 6 am, Mao traveled from Hangzhou, Zhejiang province, to attend BilibiliWorld in Shanghai.

"The moment I walked into the venue, I felt every bit of the effort had been worthwhile," she says.

BilibiliWorld 2026 was held at Shanghai's National Exhibition and Convention Center. As one of Asia's largest offline ACGN conventions, this year's event attracted more than 170 exhibitors, with over 700 booths and 130 game developers from around the world.

Launched in 2017 by Bilibili, one of China's video-sharing platforms, the event has grown into a major offline gathering for ACGN enthusiasts, offering immersive experiences and a platform for fans to connect.

This year's event opened overseas ticket sales for the first time, reaching audiences in more than 190 countries and regions. Its 2025 edition attracted more than 400,000 visitors, with passport holders accounting for 13 percent of ticket buyers.

The growing popularity of the event reflects the rapid expansion of China's ACGN market. According to market research consulting firm iResearch, the sector reached 597.7 billion yuan ($88.33 billion) in 2024, nearly doubling from 2019, and is expected to grow to 834.4 billion yuan by 2029.

As the market expands, original Chinese IPs have also gained increasing recognition. The animated film *Ne Zha 2*, released during the 2025 Spring Festival holiday and based on characters from a classic Chinese mythological novel, reported box office revenue of more than 15.4 billion yuan. Meanwhile, Chinese game developer Game Science's *Black Myth: Wukong*, released in 2024 for PC and consoles, also became a global hit.

With a large group of ACGN fans nationwide, China has a vast consumer base to support the development of globally competitive original IPs. Industry observers believe the country's animation and gaming industries are poised to gain greater global influence.

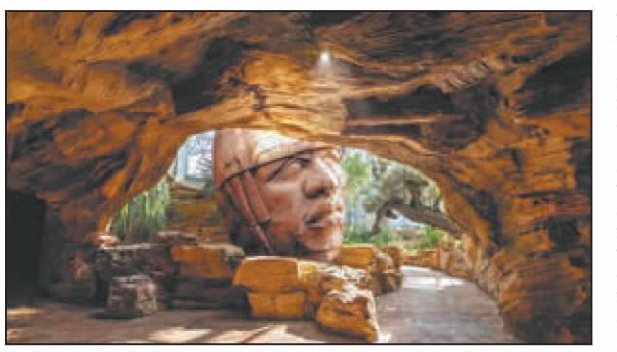
A botanical journey through ancient American civilizations

By **ZHENG ZHENG**
zhengzheng@chinadaily.com.cn



A botanical exhibition that merges ancient American civilizations is ongoing at the Shanghai Expo Culture Park, exploring the botanical foundations of Aztec, Maya and Inca cultures as a companion to the *On Top of the World Tree: Ancient Civilizations of the Americas* exhibition at the Shanghai Museum.

Realm of the World Tree: Agave and its Friends — Plants of the Americas runs through Nov 14, 2027, showcasing over 300 American plant species across three themed pavilions at the Shanghai Greenhouse Garden.

"We created immersive installations in each pavilion that transport visitors into the worlds of Aztec, Maya and Inca civilizations," says Zhang Feng, head of planning and operations at the Shanghai Expo Culture Park.

Zhang says: "We made over 300 new plant labels specifically for species connected to American civilizations. This allows visitors to discover which plants originally came from the Americas and understand their cultural significance."

Left: A pair of topiary alpacas at the show feature woolly coats composed of bromeliads. **Right:** The first pavilion re-creates arid highland ecosystems, where agave and cacti dominate the landscape. PHOTOS PROVIDED TO CHINA DAILY

The first pavilion re-creates the arid highland ecosystems dominated by agave and cacti. Visitors enter through a cave guarded by a replica Olmec colossal head.

The second pavilion centers on the world tree, the cosmic pillar of Maya cosmology. According to Maya belief, the ceiba tree connects three realms. This tropical rainforest environment features native American species, including trumpet and rubber trees.

The third pavilion transports visitors to the highlands of the Inca civilization. Its centerpiece is a spectacular pair of alpaca topiaries dressed in traditional textiles — a 6-meter-tall mother and 3.5-meter-tall calf, their woolly coats composed of bromeliads.

"Alpacas held sacred status in Inca civilization, symbolizing harvest, peace and prosperity," Zhang says.

"The warm, humid greenhouse provides ideal growing conditions for bromeliads, whose delicate leaves create that fluffy wool appearance."

He reveals that the alpacas might undergo a costume change in autumn and winter, with additional bromeliad species planted from the head to the cheeks.

The exhibition centers on agave as its unifying theme, featuring over 30 varieties and demonstrations of traditional agave distilling techniques.

Beginning July 11, the greenhouse is hosting *Echoes of Mayahuel*, an immersive musical performance, every Saturday at 2 pm.

The 40-minute show follows a botanist through the three pavilions, weaving together the love story of the agave goddess Mayahuel and the feathered serpent god into a journey that connects plants, mythology and civilization. The performance is included with regular greenhouse admission at no extra charge.

"We want civilization to be more than static displays," Zhang says.

"By embedding live performances within these botanical scenes, visitors can experience a multisensory immersion — sight, sound, touch, taste, and smell — that brings ancient American cultures vividly to life."

LIFE

From hospital ward to drama series

Inspired by real encounters, Zhou Yifei crafts a narrative in *The Heart 2* that intertwines cultural traditions with modern medical challenges, **Xu Fan** reports.

When screenwriter Zhou Yifei was researching the sequel to the acclaimed medical drama *The Heart*, she noticed an intriguing detail at a hospital: several female patients had similar given names written on their IV bags — most of the names were either Zhaodi or Tiao'e.

The names in local dialects, which literally mean "calling for a younger brother" and "hoping the next child will be a boy", reflect the traditional preference for sons.

Growing up in rural Jiangsu province, where a preference for sons has traditionally been more pronounced than in urban areas, Zhou found the discovery both striking and thought-provoking. What surprised her most was that such naming practices — often regarded as a fading tradition in modern society — had persisted across multiple generations, with women born from the 1950s through the 1990s still bearing these names.

The real-life observation eventually inspired one of the most memorable storylines in the 40-episode series *The Heart 2*, which recently concluded its first run on China Central Television's CCTV-8 and streaming platforms Tencent Video and iQIYI.

Having attracted more than 360 million online views, the drama has emerged as one of this summer's most popular television series.

Reuniting actors Mark Chao, Mao Xiaotong and Jin Shijia as elite doctors at the fictional Dongli Hospital, the drama opens with cardiologist Zhou Xiaofeng, played by Chao, returning after completing a two-year medical aid mission in a remote area of Guizhou province. On the journey back, he accompanies several patients he treated through a local charity program when an emergency unfolds aboard their bus: a pregnant woman carrying twins suddenly suffers acute heart failure. The situation becomes even more critical because one of the fetuses has been diagnosed with a congenital heart defect.

"When preparing for the second season, we accumulated more knowledge about cardiovascular diseases and gained more practical experience by working alongside doctors. That allowed us to raise the dramatic stakes and portray more complicated medical cases," Zhou Yifei says.

Authentic portrayal

To ensure authenticity, the screenwriter carried out extensive field research. She visited more than a dozen hospitals, ranging from top-tier medical centers to county-level institutions, across Beijing, Shanghai and the provinces of Sichuan, Yunnan and Guizhou.

She spent weeks shadowing doctors in cardiology departments, cardiac surgery units and intensive care units, sometimes remaining at a single hospital for more than a month to observe daily routines, consultations and surgeries.

It was during this research that the names on the IV bags inspired the characters Zhang Tiao'e and Long Jiaojiao, two former classmates who unexpectedly reunite in the hospital ward.

Zhang, who suffers from a pulmonary arteriovenous fistula, is under constant pressure from her husband to give birth to a son, even though they already have two daughters. Fearing that surgery might affect her fertility, the husband opposes the operation, leaving Zhang to postpone treatment in hopes of becoming pregnant again.

"Zhang has received little formal education, and her opportunities to change her circumstances are limited. We cannot simply condemn her for preferring sons, nor blame her for lacking awareness of the health risks. I understand the difficult reality she faces. She may not even truly want a son — she simply wants a better life. I have great sympathy for women like her," Zhou Yifei explains further.

Top left: *The Heart 2* stars Mark Chao (center), Mao Xiaotong (right) and Jin Shijia in the lead roles. **Top right:** Mark Chao continues his role as a cardiologist in the new season. **Above:** Two scenes from *The Heart 2*, a popular medical drama that explores social issues while striving for medical authenticity. PHOTOS PROVIDED TO CHINA DAILY

By contrast, Long is financially independent, having built a successful career as an internet influencer with millions of followers. Her birth name, Long Quan, was inspired by a poem written by Qiu Jin (1875-1907), a revolutionary heroine.

"Long changed her destiny through a college education. She left the countryside and became someone with a stronger sense of independence and self-awareness. Her friendship with Zhang ultimately becomes a journey of mutual redemption for both women," Zhou Yifei says.

While the series examines social issues through the lives of its patients, it also sheds light on aspects of the medical field and healthcare system that are less frequently depicted in dramas.

One example is Ouyang Da, a new character played by actress Zhang Jianing. As a medical device sales representative, she demonstrates not only professional expertise but also high emotional intelligence. She uses a clever approach to persuade Zhang Tiao'e's husband to give up his stubborn pursuit of having a son and instead support the lifesaving operation for his wife.

Zhou Yifei says researching the profession has changed her perception of medical device sales representatives. One such individual she interviewed had spent decades specializing in cardiovascular devices and possessed profound knowledge of both medical technology and clinical practice.

"Although he isn't qualified to perform surgery, he understands the entire procedure and diagnostic process so well that he can even offer useful suggestions to young doctors," she says.

Firsthand insight

Director Li Zhi, who also helmed the first season, says returning to the series took on new meaning after he experienced hospitalization himself.

Shortly after completing the first season, he was admitted to the hospital because of health problems, giving him firsthand insight into patients' emotions.

"Every time my attending physician came on her rounds, I typed my questions into my phone beforehand," Li recalls.

"She spoke very quickly because she had so many patients to see, but her thinking was always clear, and she knew my condition thoroughly. That reassured me."

The experience also reminded him of delivery rider Lu Dadong, a character diagnosed with hereditary hypertrophic cardiomyopathy. Doctors warned Lu that a sudden attack could leave him unconscious, making it necessary for immediate family members to make key decisions and sign the informed consent form for surgery.

"I didn't want my parents to know I had been hospitalized because I didn't want them to worry. It was very similar to Lu's situation in the drama. Eventually, my attending physician and her intern helped me find a solution that complied with hospital regulations," Li says.

"Everyone has been to a hospital at some point, either as a patient or accompanying a loved one. That's why medical stories resonate with almost everyone."

With over 200 medical specialists serving as consultants throughout production, *The Heart 2* strives to present every diagnosis, treatment and surgical procedure with professional accuracy. Beyond telling compelling human stories, Zhou Yifei and her team hope the series will also help audiences see the country's progress in medical research and healthcare technology.

"Today, our country's medical devices are advancing rapidly, and our basic scientific research is also making remarkable progress. Over the past three or four years — especially since the first season of *The Heart* — I've been amazed by the development of domestically produced devices such as artificial hearts. In many respects, they now rival, and in some areas even surpass, imported products," she says.

Fishermen and scientists partner for avian conservation

HAIKOU — While barn swallows are commonly associated with urban landscapes, few would expect to see them soaring over the turquoise waters of the Xisha Islands in the South China Sea.

"Seeing barn swallows gliding overhead during our first visit to the Xisha Islands was a thrilling surprise," says Liu Tao, a PhD student in ornithology at Hainan Normal University in Haikou, Hainan province.

He attributes their presence to the nearby reefs, where generations of locals have lived.

In late May, Liu led a team to the remote archipelago for a comprehensive monitoring project on the diversity and breeding ecology of seabirds.

To date, the team has recorded 19 bird species across the reefs of the Qilianyu Islands in Xisha.

Among these, a rare sighting of *Fregata andrewsi* — the Christmas Island frigatebird — a national first-class protected species, was a particular highlight for Liu, who had previously only seen the bird in documentaries and books.

For Liu, the most unforgettable moment was discovering a massive group of greater crested terns.

"It was a breathtaking sight. Hundreds of terns took flight at once, like a dark cloud sweeping across the beach," he says, noting that the reef is densely packed with eggs, some separated by only a dozen centimeters.

The project's ability to showcase the South China Sea's rich biodiversity reflects the strength of collaboration between researchers and local residents, united in a common desire to protect the environment.

Uncovering the full avian diversity of the islands requires not only scientific equipment, but also the expertise of local fishermen. Generations of maritime experience have made local fishermen invaluable guides.

"Fishermen know exactly which waters have the most seabirds and which islands serve as gathering spots. This is knowledge you cannot simply learn from textbooks," Liu says.

Under their guidance, researchers successfully located concealed breeding spots where eggs blend with pebbles, as well as nests hidden deep within bushes.

A large colony of greater crested terns is seen in the Xisha Islands, Hainan province. XINHUA

In return, the fishermen have become eager learners, frequently asking researchers about bird species and migration routes. More importantly, they have taken active steps to protect the birds' habitats. They regularly clean up marine garbage and engage in coastal ecological restoration.

One of the fishermen's most challenging tasks has been greening the reefs. After cultivating native saplings on islands, the fishermen transplant them to other reefs.

With more trees, birds have shade and sheltered spots for breeding, researchers explain.

The fishermen's efforts have steadily increased vegetation coverage and improved the microhabitats for seabirds.

Liu emphasizes the importance of completing an ecological survey for the Xisha reefs.

The archipelago operates as a complete ecological loop: coral reefs and seaweed sustain fish, seabird guano nourishes the vegetation, and the birds rely on these rich marine resources.

To safeguard the environment, Li Yupei, the director of the marine reserve management bureau of Sansha city in Hainan, says Sansha has enacted regulations and established routine patrol mechanisms for seabirds and sea turtles.

The city has also partnered with universities and research institutes to deploy advanced monitoring equipment, including infrared cameras, to track breeding populations and assess ecological risks.

Conservation efforts in the Xisha Islands are a microcosm of China's broader commitment to safeguarding its avian populations.

According to the National Forestry and Grassland Administration, China lies along four of the world's nine major migratory bird flyways and is home to 1,505 bird species, including more than 800 migratory species.

The country has significantly strengthened its legal and institutional frameworks for bird protection. The administration says that 98.4 percent of China's bird species are protected by law, with 394 species under national key protection.

"For most seabirds, preserving the ecological integrity of these reefs is the best form of protection," Liu says.

AMERICAFOCUS

Hollywood embraces microdrama

Chinese-style short films have been attracting millions of viewers online

By **MAY ZHOU** in Houston, Texas
mayzhou@chinadailyusa.com

Above: The cast and crew of *Wildflower*, a microdrama about urban women's lives, review a scene before shooting in the studio on July 15. PROVIDED TO CHINA DAILY

Left: A viewer showcases the short drama *The Double Life of My Billionaire Husband*. PHOTO PROVIDED TO CHINA DAILY

TikTok has disrupted social media since its arrival less than a decade ago. Now another media product from China that entered the US quietly a couple of years ago is gaining momentum, gathering storm and disrupting the US entertainment industry.

It's called *duanju* in Chinese, known as microdrama in the English world. Vertically filmed, one to two minutes per episode, 60 to 100 episodes per series, and engineered to end on a cliffhanger so precisely timed that it has firmly hooked millions of viewers who can't stop watching and paying, paying and watching.

"This is worse than a Hallmark movie by far, but I had to obsessively finish it anyway. Wish it was a little longer even!" one viewer commented on YouTube under a 27-minute teaser of the microdrama *The Double Life of My Billionaire Husband* from the ReelShort platform.

Released two and a half years ago, it has garnered total viewership of over 500 million on ReelShort — becoming the most viewed series.

US Hallmark movies are known for their feel-good and predictable storylines — often featuring big-city characters finding love in small towns.

"The acting is terrible as [expletive] but I'm still hooked, the story is good," the most-voted comment said.

"The bass drop, the overdramatic turn, the horrible acting ... It's all so imperfectly perfect," another viewer wrote.

The ability to generate an obsessive audience has turned the microdrama into a large market. In China, it overtook the domestic box office in 2024 at $7 billion.

The US has become the distant No. 2 market, accounting for roughly 50 percent of the global market outside of China.

Appeal of microdrama

Many analyses show that the world of microdramas is populated by billionaires, powerful CEOs, or alpha males who possess supernatural powers as werewolves or vampires. They exist only to discover the virtues of a woman — often a damsel in distress — save her from her evil antagonists and fall in love with her.

There are rich heiresses — but before her esteemed status and mega wealth are revealed, she somehow lives in poverty and is constantly humiliated by others. When the truth about her comes to light, she glows, stands tall over those who have once humiliated her, and the audience savors the sweet revenge of status inversion.

Every episode ends worse for the heroine, the stakes stack higher and higher until the revenge kicks in. Revenge, love, rags to riches, it is candy-coated high drama, sweet and intoxicating.

A full character arc that takes a Korean drama 16 hours to develop is compressed into the first 10 to 15 minutes. Algorithm-driven, the format's engagement mechanics are explicitly engineered around the brain's cognitive pattern — people can't let go of cliffhangers and must know what happens next.

China-developed algorithmic infrastructures and emotional formulas are visible in many story plots — a contract or pretend marriage for unfathomable pretense, a billionaire with a secret crush, and jealousy and possessiveness interpreted as signs of love.

However, with US-based studios, the microdrama has been localized in many aspects: American faces, English dialogue and US settings mixed with werewolves and vampires.

Sarah, a Houston teacher in her 50s, knows that she's watching something more like a fantasy.

"I believe that many viewers, just like me, know that the plots are ridiculous and the acting not that great. But, after a long day dealing with difficult kids in school, it feels relaxing and satisfying watching a single mom finding love with a handsome, rich guy and getting revenge over her fake and humiliating friends," Sarah told China Daily. "My brain gets a break and I feel emotionally well."

An avid Harlequin romance novel reader, Sarah said microdrama brings the handsome men and beautiful women on the book covers to life, and "they are a pleasure to behold."

Britton Copeland, a 20-some writer, described her experience to NPR last year.

"Despite the cheesy acting, the clip ended on a cliffhanger, and I desperately wanted to see what happened next. I ultimately decided I wanted to watch the entire film ... so I poured a glass of wine and indulged in what I have determined is my generation's soap opera."

Microdramas do more than feed our imagination — they capture the full spectrum of urban life, with all its highs and lows.

Wildflower, a microdrama currently in production, celebrates ordinary women who are gentle yet powerful. Through the storms of life, they quietly grow toward the light.

"It tells quiet, raw stories of modern women navigating love, marriage and daily grit. Like wild grass, they bend but never break — resilient, tender, rooted. This series is a mirror for every woman seeking herself, healing softly and rising with quiet power," said Zhang Xinyuan, presenter of *Wildflower*.

The Chinese microdrama audience is 55 percent women and 45 percent men, primarily in the lower socio-economic class. In contrast, the US audience is primarily urban women between 30 and 60 years old with significant subscriptions to streaming services.

An essay from The New Feminist written by Lotte Hondebrink called the majority of microdrama stories "the problematic fantasy women can't stop watching".

"The explosive growth of microdrama apps like ReelShort highlights a tension between women's desire for escapist romance and the unsettling power structures that shape so many of its storylines," she wrote.

Zhao Yehui, a New York based filmmaker, said the microdrama arrived as Hollywood is experiencing a downturn and producing far fewer rom-com films than it used to.

"Microdrama borrowed the typical rom-com tropes, but the plots are often flattened and simplified, and the drama is intensified. They create many cliffhangers with one surprise after another," Zhao said.

"Those typical tropes employed in rom-com and soap opera in the past continue to be popular with the audience," she said. "Their popularity reflected a reality that both China and the US are a patriarchal society."

An innovation

Zhao said the bitesize microdrama is perfect for modern lifestyles.

"People screen their phones while waiting at the airport, eating lunch, riding the subway or sitting on the toilet. They can easily spare a few minutes watching some drama. This is a clever innovation monetizing people's screening behavior. It's essentially a modification of TV watching."

Zhao said the microdrama format gives the audience more control compared to traditional movie watching.

"It's a constant interactive process, including the payment component. One can decide to pay to watch another episode or stop. Such interaction can help people produce dopamine and become very engaged."

Zhao said the popularity of microdrama has her considering the possibility of using this format to produce some serious film work. To her, there is potential to employ the vertical format to produce films to provoke people into critical thinking.

"There is definitely something we can learn from microdrama," Zhao said.

Popular blogger Noah Smith has called China's microdramas "some real green shoots of Chinese soft power".

"It's a truly new art form, perfect for the age of TikTok and AI," he wrote in an April post on China's soft power.

Two platforms dominate

Currently, two platforms dominate the US market, both with Chinese origins.

ReelShort, launched in 2022 by California-based Crazy Maple Studio and backed by Beijing-based digital publisher COL Group, generated $1.2 billion in revenue in 2025, up 119 percent from 2024, according to Appfigure.

ReelPulse reported that ReelShort has shattered expectations with $80 million in revenue in the first quarter this year, a 40 percent increase from last quarter.

The app has more than 100 million downloads in the Google Play store and ranks 23rd in entertainment apps in the Apple store. The platform boasts 45 million monthly active users, with half based in the United States.

Another major leader is DramaBox, developed by Beijing-based Dianzhong Technology and launched in 2023 in Singapore. It generated $10 million net profit in 2024. The company didn't release its 2025 financial data, but industrial experts estimated its revenue to be around $500-600 million, making it the No. 2 global platform outside of China.

DramaBox library primarily consists of dubbed and translated content originally produced in China. It also has a Los Angeles-based studio that has produced some US originals.

In comparison, ReelShort focuses on English-language originals mostly filmed in Los Angeles. It prioritizes quality over sheer volume to target Western markets like the US, UK and Australia.

> "Microdramas are no longer a niche experiment. They are becoming a core driver of mobile video engagement."
>
> **Maria Rua Aguete**, head of media and entertainment at Omdia

According to media research firm Omdia, the US microdrama market generated $819 million in revenue in 2024 and grew to an estimated $1.5 billion in 2025. The market is projected to grow to $3.8 billion by 2030.

Omdia data showed that the engagement for microdramas has been impressive in the US. In the last quarter of 2025, US users spent an average of 35.7 minutes per day per user on ReelShort alone.

In comparison, Netflix mobile averaged 24.8 minutes per day per user, Prime Video averaged 26.9 minutes and Disney+ averaged 23 minutes.

"Microdramas are no longer a niche experiment. They are becoming a core driver of mobile video engagement," Maria Rua Aguete, head of media and entertainment at Omdia, said in a February Omdia report. "What stands out is not just revenue growth, but the intensity of usage. On mobile, microdrama apps are generating more daily viewing time than the world's biggest streaming platforms."

Hollywood descends

To legacy Hollywood known for projecting its global cultural influence, the force of microdramas from China can't be ignored. They have quietly captured a slice of the American entertainment market. It's time to reverse its role by embracing China's storytelling architecture and platform structure.

A slate of microdrama projects has been launched in recent months by US companies.

Last July, Disney Accelerator program picked DramaBox to explore the microdrama market. In February, Disney launched its own very first vertical format microdrama *Locker Diaries*. It's been released on DramaBox, Disney+ as well as global platforms such as YouTube, Instagram and TikTok.

Last July also saw Google, in partnership with Range Media Partners, launch 100 Zeros to produce a slate of programs featuring projects from *The Bachelor* creator Mike Fleiss, *American Idol* creator Simon Fuller, and director McG.

Upon completion, 100 Zero's microdramas will be distributed across multiple platforms, including Google TV.

Last October, Fox Entertainment took an equity stake in Holywater, the Ukrainian microdrama company behind the My Drama app, committing to produce more than 200 vertical series.

Holywater raised $22 million in Series A funding — described as the largest investment in the microdrama space outside Asia.

Fox separately inked a multiyear deal with Dhar Mann Studios for an initial slate of 40 original scripted vertical-video shows — a deal notable for involving one of YouTube's most prolific creators.

In May, NBCUniversal licensed 10 microdrama series from ReelShort for its mobile app Peacock. It also announced two original Bravo-branded micro dramas: *Salon Confessionals* with Madison LeCroy and *Campus Confidential: Miami*.

GammaTime, founded by former Miramax CEO Bill Block, raised $14 million in seed funding, including angel investor Kim Kardashian. *CSI* creator Anthony Zuiker was hired to write for the platform.

Versant Media Group — a multinational mass media company — took a stake in GammaTime in early June.

"GammaTime is reimagining short-form storytelling for a new generation of viewers. Their mobile-first approach and focus on original content make this a natural partnership for Versant as we continue to extend our iconic brands, deep content library and storytelling," Mark Lazarus, CEO of Versant, said in a statement.

Korean platform Vigloo, backed by $86 million in total funding, opened a Los Angeles office in 2025 and began co-producing with American writers.

TikTok quietly launched PineDrama in January, a stand-alone platform dedicated to microdramas. It represented the most structurally significant platform development so far in the US. The app gained 17.6 million downloads in its first 30 days.

TikTok's talent deals are impressive. It formed a partnership with Issa Rae's Hoorae Media in April. The two joined hands to co-develop exclusive micro-series.

Rae, creator of the acclaimed HBO series *Insecure*, succeeded with her debut microdrama *Screen Time*. Released in April, it garnered 75 million views within a week of launch and amassed over 150 million total views.

TikTok also partnered with the Sundance Institute to train creators specifically in microdrama writing.

In addition, TikTok opened drama partnerships inside its main app with a traffic incentive multiplier. Over 500 content companies entered within the first month. TikTok is reportedly paying out $15 million a month in microdrama revenue to creators.

ReelShort and DramaBox utilize a paywall to charge viewers to generate revenue, plus free viewing after a viewer watches some ads. However, TikTok completely ditched the paywall method. Its PineDrama offers free viewing with unskippable ads.

Hollywood is reaching a moment when viewers are beginning to feel fatigued from repetitive tropes. With new talent in tow, it remains to be seen if the vertical format will expand beyond a power fantasy primarily in the realm of romance and become an entrenched entertainment format in the future.

XI'S VISION | MANUFACTURING MODERNIZATION

Long-term view, innovation fuel industrial power

Government guidance, market demand driving nation's manufacturing upgrade

By **ZHAO JIA** in Luoyang, Henan
zhaojia@chinadaily.com.cn

During a visit to LYC Bearing Corp in Central China's Henan province on May 19, 2025, President Xi Jinping put China's industrial transformation into historical perspective.

"China has always adhered to the path of developing the real economy. From the past reliance on imported matches, soap and iron, to now becoming the world's largest manufacturing country with the most complete industrial categories, we have taken the right path," Xi told workers.

Among those listening on the factory floor was Song Huahua, deputy director of the company's technology center. More than a year later, she said Xi's words still ring in her ears.

"Whether or not they were there that day, everyone at the company felt a deep sense of pride," Song said. "If General Secretary Xi cares this much about something as small as a bearing, what reason could we possibly have not to make it well?"

Bearings are small enough to disappear inside a machine, yet they are often described as the "joints of industry". As Song put it, "Wherever something turns, you need one."

Over her 16 years at the company, the things that turn — and the demands placed on them — have kept changing. From aerospace and wind power to new energy vehicles, robots and drones, each industrial advance brings new requirements for precision, durability and reliability.

During the visit, Xi emphasized that "modern manufacturing relies on sci-tech empowerment", calling for greater efforts to achieve core technological breakthroughs and pursue independent innovation.

For Song, that call is reflected in the daily work of identifying new problems and developing new products.

"Independent innovation has become part of who we are," she said, adding that innovation at the company is driven by both the market and national priorities.

"Customers keep raising the bar, and that is a constant source of momentum for innovation," she said. "At the same time, taking on major national projects requires us to keep pushing beyond our own limits."

Song cited new energy vehicles as an example. Because they operate differently from gasoline-powered cars, they need purpose-designed bearings, she said, noting that engineers first study a vehicle's operating conditions and customer requirements before developing and testing a new product.

A 4,000-kilometer off-road driving trip kicks off in Alshaa League, Inner Mongolia autonomous region, on Aug 8. PROVIDED TO CHINA DAILY

ROUTES OFFER MORE THAN DESERT VIEWS

Tourists can explore Inner Mongolia's vast landscape through long drives or off-road thrills

By **CHEN NAN** in Beijing
and **YUAN HUI** in Hohhot

By the time the sun slipped below the dunes, the desert had gone quiet.

Then the stars appeared.

For Li Xue, 28, an independent designer from Hebei province, who spends much of her life amid cities and the flat landscapes of northern China, the night sky over Alshaa League, a vast desert region in North China's Inner Mongolia autonomous region, was perhaps the most unforgettable part of a journey built around speed and adventure.

"We rarely get to see a sky this pure, without light pollution," she said.

Standing in midst of the deep desert, with the horizon stretching unobstructed in every direction, she felt the noise of city life fall away. "I suddenly feel relaxed. It is healing and breathtaking — something you simply cannot experience in a city."

She came to Alshaa League as both a tourist and one of the designers of a new tourism route, which stretches 4,000 kilometers through the region. Along the way, she experienced its deserts and diverse surrounding landscapes.

Li's journey, which ran from Aug 8 to Sunday, took her across vast dunes, past desert lakes and through poplar forests.

Japanese citizens hold up protest signs and take part in a rally against the Yasukuni Shrine, which honors 14 convicted Class-A Japanese war criminals, in Tokyo, Japan, on Saturday. The day marked the 81st anniversary of Japan's unconditional surrender in World War II.
JIA HAOCHENG / XINHUA

China slams Japanese politicians' Yasukuni moves

By **ZHAO JIA** in Beijing, **HOU JUNJIE** in Tokyo and **YANG HAN** in Hong Kong

China strongly deplored the latest negative moves by Japanese political leaders involving the Yasukuni war shrine on Saturday, the 81st anniversary of the country's unconditional surrender in World War II, saying the actions sought to whitewash Japan's wartime crimes and pave the way for accelerated remilitarization.

"We urge the Japanese side to do serious soul-searching on its history of aggression, make a clean break with militarism, and earn the trust of its Asian neighbors and the rest of the world with concrete actions," a Chinese Foreign Ministry spokesperson said.

Japanese Prime Minister Sanae Takaichi made a monetary offering, while four of her Cabinet colleagues, including Defense Minister Shinjiro Koizumi, and several senior ruling Liberal Democratic Party officials visited the shrine, which honors, among others, 14 convicted Class-A war criminals.

Beijing has lodged serious protests with Tokyo, the spokesperson said, describing the Yasukuni war shrine as "a spiritual tool and symbol of Japanese militarism".

"No pretext whatsoever can hide the Japanese politicians' true intention, which is to change the verdict on the war criminals, cover up Japan's war crimes, distort the historical facts and pave the way for accelerating remilitarization," the spokesperson said.

Noting that this year marks the 80th anniversary of the opening of the Tokyo Trials, the spokesperson said that viewing and treating history correctly was an important prerequisite for Japan's postwar return to the international community, the political foundation of its relations with neighboring countries and a key measure of its commitment to peaceful development.

This emphasis on historical reflection is also embedded in the political documents underpinning China-Japan relations. The China-Japan joint communique in 1972 says the Japanese side was "keenly conscious of the responsibility for the serious damage that Japan caused in the past to the Chinese people through war, and deeply reproaches itself". That position was reaffirmed in subsequent political documents between the two countries.

Chinese Defense Ministry spokesman Jiang Bin denounced the hypocrisy of Japanese politicians who profess to pursue peace while paying homage to the architects of wartime aggression, saying that it exposed the Japanese right wing's deeply distorted view of history and dangerous attempt to revive militarism.

He warned that Japan would face "the judgment of justice and a historical reckoning" if it persisted in pursuing "neo-militarism" and became a threat to regional peace.

Since Takaichi took office last October, her government has accelerated Japan's military buildup and pushed ahead with a broad overhaul of its security policy.

It has allowed exports of lethal weapons in principle, begun revising three key security documents, set the fiscal 2026 defense budget at a record high, deployed long-range missiles capable of striking enemy bases and renewed its push for constitutional revision.

Xiang Haoyu, a research fellow at the China Institute of International Studies, said that Japanese politicians' provocations over Yasukuni were inseparable from Japan's remilitarization.

He said honoring Class-A war criminals reflected a revisionist view that denied responsibility for Japan's war of aggression and sought to loosen postwar constraints on its military ambitions. Such views were dangerous because they would inevitably shape policy, he added.

Xiang said the convergence of historical revisionism and military expansion would erode trust between Japan and its Asian neighbors, making it difficult for them to regard its military buildup as purely defensive. Japan should pursue reconciliation through credible, institutionalized action and should neither exaggerate external threats nor pursue defense policy changes at its neighbors' expense, he said.

Criticism also came from within Japan. On Saturday afternoon, protesters marched in the rain, chanting "Yasukuni Shrine is a symbol of Japan's war of aggression" and "No shrine that glorifies war", while holding placards reading "Takaichi step down" and "Dismantle Yasukuni Shrine".

Yoichi Komori, a professor at the University of Tokyo and secretary-general of the Article 9 Association, a civic group advocating Japan's pacifist Constitution, told China Daily that the collective visit by senior LDP officials raises serious constitutional concerns and is politically unacceptable, noting that the Yasukuni Shrine once served as a key ideological base of Japanese militarism in waging its wars of aggression.

Hiroshi Shiratori, a professor of political science at Hosei University in Tokyo, said the visits to the Yasukuni Shrine by senior LDP officials and Cabinet ministers have further fueled concerns over a regression in Japan's understanding of its wartime history.

Shiratori said that Aug 15 should be an important occasion for Japan to confront its wartime history, reflect on the devastation caused by the war and show consideration for Asian countries and others that suffered from Japan's wartime actions.

However, Takaichi's remarks expressed neither remorse toward other countries nor a firm resolve to uphold peace, he said.

Outside Japan, the Republic of Korea's Foreign Ministry deplored what it described as "anachronistic acts", urging Japanese leaders to squarely face up to history and demonstrate through action humble reflection on and sincere remorse for the past.

Growth driver shifts from bricks to bits

WORLD WATCH
By Amarjargal Rinchinnyam

If you want to understand where the world is heading, stop looking at the skyscraper cranes in Beijing and start looking at the 5G base stations in the countryside.

For decades, the story of China was the story of "hard infrastructure" — concrete, steel and a property market that seemed like it would never stop climbing. But something fundamental has changed.

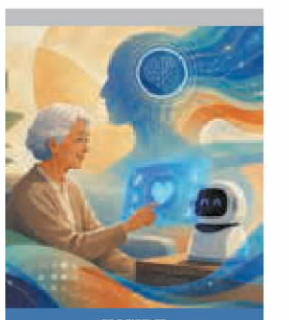
While the world was busy watching China's real estate sector contract by 0.2 percent and its construction industry dip by 4 percent in the first half of 2026, the country was quietly finishing a massive rewiring of its entire economic base.

China's GDP still grew by a steady 4.7 percent to reach 69.57 trillion yuan ($10.31 trillion) in the first half of 2026, but the engines driving that growth weren't bulldozers — they were algorithms.

China is building a new kind of "central nervous system" for its society.

By July 2026, the country had installed 5.1 million 5G base stations. That's not just a statistic; it's a platform. It has applied 5G and gigabit optical networks across 94 major categories of the national economy.

And it isn't stopping there. It has already made significant strides in verifying 6G system architecture. When you have that kind of wiring, science stops being something you do in a lab and starts being a direct productive force that automates the basics of life.



The second layer of this rewiring is energy.

China didn't just meet its 2030 wind and solar power targets — it crushed them six years early in 2024.

By the end of July 2026, its solar capacity hit a staggering 1,274 gigawatts.

This isn't just about environmental concerns, it's about a strategic pivot to energy abundance. When your nonfossil energy consumption exceeds crude oil for the first time in history — as China did in 2024 — you are no longer just an oil importer; you are an exporter of the future.

Retired school principal saves tiny zoo from extinction

'Grandpa Feng's' dedication to caring for animals wins online fame, aids its survival

By **LIU BOQIAN** in Kaili, Guizhou
liuboqian@chinadaily.com.cn

Feng Yuanyong (third from left) poses for a photo with a volunteer and sanitation workers in the zoo in Kaili, Guizhou province, on July 31. PHOTOS BY LIU BOQIAN / CHINA DAILY

At 5 am, Feng Yuanyong was already making his rounds in the semi-darkness with a flashlight in hand, checking the animal enclosures one by one.

The 71-year-old spent decades as a school principal and education official. Now, his mornings begin with touching the noses of tigers at a privately-run mini zoo in Kaili, a city in southwest China's Guizhou province.

After retirement, Feng became the facility's zookeeper, repairman and even an unofficial "veterinarian", devoting himself to caring for more than 20 species of animals.

The morning routine is a ritual Feng has repeated for the past decade. He touches the tigers' noses to see whether they are moist — a simple method he developed after years of observing and caring for animals. He said small details like this one can reveal whether an animal is in good health. "People can tell you when they feel sick, animals can't," he said.

Time has left its marks on Feng's face. His gaze is steady and focused, but whenever he talks about the animals, he breaks into his trademark warm smile.

Built on a hillside, a 10-minute drive from downtown Kaili, the Kaili Zoo covers about 0.35 hectares.

Unlike most other zoos, it has no sprawling grounds or a large number of staff. For years, visitors were few, and the revenue was barely enough to cover daily expenses, but he stayed on.

On-the-job training

Feng never planned to become a zoo director, instead choosing a career in the education sector.

In 1977, the year China reinstated the *gaokao* national college entrance examination, Feng was admitted to a teachers' college. After graduation, he started teaching in a rural area and later rose to the position of school principal before joining the education department as a physics education researcher.

In 2016, his younger brother asked him to help at Kaili Zoo, which was struggling financially and needed someone to manage it. What was meant to be a temporary arrangement became a permanent commitment. "Once I came, I never left," Feng said.

Many of the zoo animals were rescued or donated. Feng said he came to see each one as part of his family.

"They are just like my own children," he said, explaining every animal had its own story and refusing to say which one he loved the most.

Before becoming a viral attraction, Kaili Zoo endured long periods of hardship. For years, it survived not because it was profitable, but because of Feng's persistence.

The zoo originally operated alongside an amusement park. But when the park went into decline and closed, the zoo lost its main source of visitors.

During the hardest period, nearby construction work cut off the road near the zoo, leaving visitors unable to reach it.

At one stage, even feeding the animals became a challenge. Feng began growing vegetables to cut costs. "I thought about giving up. But what would happen to these animals?" he said.

Using a hoe, Feng cleared mountain paths and made directional signs to help visitors find their way. One read: "The zoo is 150 meters ahead along the mountain path. Brave children will receive a free portion of food to feed the animals."

Kaili Zoo began attracting wider attention almost by accident.

A visitor came to the zoo one day and saw Feng preparing food for the animals. She asked whether she could film him caring for them.

Feng agreed and told her that if she helped promote the zoo, she could feed the animals.

Soon, more visitors began sharing their experiences online. One tourist from Shanghai suggested that Feng try promoting the zoo on Xiaohongshu, or RedNote, a popular Chinese lifestyle-sharing platform. Feng had never heard of the platform and thought it was the name of a book.

There was no marketing team and no commercial strategy. His only form of promotion was letting visitors see how he cared for the animals every day.

That authenticity eventually won people over.

Since October last year, short videos have turned Kaili Zoo into an internet sensation. At its peak, more than 10,000 visitors went to the tiny zoo in a single day.

For an attraction that once struggled with only a handful of visitors, the sudden surge in popularity became a major challenge. Lines stretched from the zoo entrance all the way down the hillside.

"How could a zoo this small handle more than 10,000 people? Where could they even stand?" Feng recalled.

For years, he had worried about having too few visitors. Then suddenly, he had to worry about having too many.

After the zoo went viral, local authorities helped improve roads, manage crowds and upgrade basic facilities.

Previously, the narrow mountain road leading to the zoo was difficult to access. Local urban management officials worked around the clock for two days to build a safer hillside path.

"At that time, there were simply too many people. The first priority was safety, and the second was making sure visitors had a better experience," said Yang Guanglei, an official with the local urban management department.

Sanitation workers also joined the effort.

"We sent more workers to help clean the zoo in the mornings," Yang said. "It would have been too difficult for Feng to handle everything alone. We also help maintain the landscaping and greenery."

Almost every morning around 7 am, three or four sanitation workers arrive at the zoo to clear fallen leaves and trash.

Over time, they have become familiar faces at the zoo.

Feng often jokes: "Whenever there is a problem, just find Yang. He always knows what to do."

10-minute visit

Compared with many large zoos across China, Kaili Zoo is very modest.

After entering through the gate, visitors find the predator exhibition area on the left and the monkey and herbivore enclosures on the right. A complete visit can take less than 10 minutes.

Yet its intimacy and smallness make it a children's favorite. Some young visitors said it feels different from more famous venues like Chimelong Safari Park in Guangzhou, Guangdong province.

"You see that lion? It is darting back and forth. I have never seen a lion this lively before," said Lin Duo, a girl from Hunan province who visited the zoo with her father.

When the lion suddenly jumped, she stepped back in surprise, but her curiosity quickly overcame her surprise.

"My daughter has visited many zoos, but she feels this place is different," her father, Lin Siju, said. "There is no sense of distance between people and animals."

Whenever Feng sees children visiting from other places, he often walks over to greet them and sometimes gives them animal feed as a gift. "You came all this way, and grandpa is very happy. This is grandpa's gift for you," he told one child during China Daily's visit to the zoo.

This warmth and intimacy has become one of the reasons the zoo has become so popular. For many visitors, meeting famous "Grandpa Feng" and taking a photo with him has become the highlight of their trip.

Many are drawn by his sincere care for the animals. They come to see whether the animals are well cared for and whether the welcoming atmosphere shown online truly exists.

Top left: Feng transports freshly cut grass to feed herbivorous animals in the zoo.
Top right: Feng introduces the animals' stories and habits to children.
Above: Visitors walk out of Kaili Zoo on July 31.

Yang Changwang came to work at the zoo as a helper a decade ago. "At first, I did odd jobs. Later, I started cooking for everyone," she said, affectionately calling Feng "boss".

Yang, 58, is a member of the Miao ethnic group, one of the largest ethnic communities in Guizhou. She wears her hair in a traditional high bun decorated with flowers, a style often seen during Miao festivals.

For a time, the struggling zoo could no longer afford to pay her wages. But as visitor numbers increased, Yang returned to work alongside Feng and now earns nearly 2,000 yuan ($296) a month.

Every morning, she rides an electric scooter to the zoo to clean. At noon, she prepares lunch for the seven or eight people working there. After feeding the animals in the afternoon, she picks up her three grandchildren from school.

The flexible schedule allows her to balance work and family life.

"My family's financial situation is not very good. I raised my grandchildren by myself," Yang said. "Working here means I can take care of my family while also earning an income."

At lunchtime, the zoo workers sit beside the animal enclosures, sharing simple homemade meals. "We have always eaten like this, watching the animals eat too," Feng said.

New responsibilities

As attention to the zoo has grown, so have questions over whether such a small facility can properly care for its animals. It is now home to dozens of animals including a lion, bears, tigers, leopards, vultures and monkeys as well as rabbits and ducks.

Feng acknowledges the challenge. "The zoo is too small. There is only so much I can do," he said.

Unlike large zoos, Kaili Zoo has no professional veterinary team or management system. Much of Feng's animal care relies on years of observation and experience. During feeding, he watches closely for any changes in the animals' behavior or condition.

But for protected species, responsibility extends beyond daily care. The zoo must submit regular reports to forestry authorities, and trained veterinarians must be called in when animals are ill.

"I'm not perfect. I worry that one day I might make a mistake and be overwhelmed by the attention brought by online popularity," Feng said. "A small mistake could lead to serious consequences, which is why I am always cautious."

However, the attention has also brought positive changes. With tickets priced at 20 yuan, the zoo now receives 100 to 200 visitors on weekdays and more on weekends, providing a stable source of revenue.

The animals are now better fed, with carnivores receiving chicken or beef daily and herbivores receiving additional food from visitors.

Kaili's tourism authorities have begun promoting the zoo as one of the city's tourism attractions.

"We have arranged dedicated tourism routes and bus services connecting the zoo with the city center and transportation hubs," said Yang Xiaokang from the local tourism department. "In the future, we hope educational programs for students can also be introduced here."

Despite the newfound popularity, Feng has no plans for large-scale commercial expansion. He said he does not want the zoo to become overly commercialized.

His Douyin account now has more than 140,000 followers and has generated about 16,000 yuan in revenue. He said he has never withdrawn the money.

"This is not income that belongs to me. It belongs to everyone who has worked here together," he said, adding that he hopes to use it to reward volunteers and others who have helped promote the zoo.

As visitor numbers have stabilized, Feng has returned to his quiet routine that kept the zoo going long before it became an internet sensation.

"I am extremely happy with the number of visitors we have now. A year ago, I could never have imagined this," he said. "Now I can say there is not much left to worry about."

TOP NEWS

Coal industry optimization to happen by 2030

Cleaner and smarter production to reshape sector, ensure energy buffer

By ZHENG XIN
zhengxin@chinadaily.com.cn

China is set to optimize its coal industry by 2030, focusing on cleaner and more efficient production to safeguard its baseload energy supply, a newly released government road map stated.

According to the "15th Five-Year Plan (2026-30) for Coal Industry Development" document, jointly issued by the National Development and Reform Commission and the National Energy Administration, the country will continuously advance the construction of coal supply guarantee bases and refine cross-regional coal transport patterns.

To achieve this, regulators will raise industry entry barriers, weed out outdated mines and prioritize high-efficiency operations, while ensuring a gradual plateau in domestic coal consumption.

By 2030, the plan aims to cement coal's position as a critical energy buffer while making sure that modern and high-efficiency facilities dominate production.

Nationwide, large-scale modern mines will account for 87 percent of total capacity, and the share of capacity from automated and "smart" mines will jump to 75 percent. Additionally, coalbed methane output is projected to hit 26 billion cubic meters in the final framework. The development and utilization of coalbed methane offer multiple benefits, including enhancing mine safety.

The road map comes at a time when China is accelerating toward a greener economy, making unprecedented investment in clean energy infrastructure to meet its ambitious dual carbon goals of peaking emissions before 2030 and achieving carbon neutrality before 2060.

China's energy sector crossed a historic threshold recently, with coal-fired power generation accounting for less than 50 percent of the nation's total electricity output for the first time, according to official data.

Xing Yiteng, deputy director-general of the National Energy Administration's development planning department, said that coal power generation stood at 2.5 trillion kilowatt-hours in the first six months of the year, bringing its share down to 49.7 percent.

"Coal power's share falling below 50 percent of total power generation for the first time is a landmark achievement in China's long-term push for renewable energy alternatives, signaling a new breakthrough in the country's green and low-carbon transition," Xing said.

Lin Boqiang, head of Xiamen University's China Institute for Studies in Energy Policy, said the 2026-30 window is a critical transition period as coal use nears its peak.

The sector's focus, he said, will pivot from sheer volume expansion to supply optimization and grid stability.

"The plan moves away from the old logic of simply digging for more coal, toward a balance between energy security and green transition," Lin said.

He added that market regulation will transition from ad hoc administrative interventions to long-term structural changes, heavily relying on intelligent mining upgrades and the integration of coal power with renewables.

Demand patterns are also expected to diverge over the next five years. Coal consumption in the construction materials and metallurgy sectors will shrink, while power sector demand will plateau and begin to decline. Chemical sector usage, however, will see a slight uptick.

Meanwhile, automation will no longer be optional. Hitting the 75-percent smart-mine target by 2030 — up from roughly 65 percent in 2025 — will force companies to invest heavily in digitization.

The plan mandates integration of artificial intelligence in the areas of exploration, production and safety monitoring, with a specific push to replace dangerous manual labor with robotics in disaster-prone mines.

Smaller operators lacking the capital for these technological upgrades will face severe consolidation pressure, Lin said, noting that well-capitalized industry leaders are poised to capture more market share.

Desert: Plan an effort to promote more tourism

From page 1

She attended a concert in the wilderness and experienced a desert rally, soaking in the stark contrasts of the landscape.

The route cuts through a striking succession of landscapes — the Gobi Desert, salt lakes, poplar forests and canyons — with an added adrenaline kick: off-road driving.

Travelers can self-drive the full route at their own pace or, for a more intense experience, hire a professional driver to navigate terrain reminiscent of a World Rally Championship stage.

One moment she was absorbing a vast, silent landscape; the next, gripping the wheel to power across the dunes.

On Aug 8, Nayantai, a 46-year-old racing driver from Inner Mongolia, was among the elite drivers invited to pilot an 800-km section of the route during a one-off promotional race.

Engine roaring, his vehicle clawed its way uphill, spraying sand from beneath its tires. At the dune's crest, he paused. In every direction, the desert stretched to the horizon.

For Nayantai, crossing the finish line was about more than speed. He described the experience of tackling a route that cut through his hometown as more of a homecoming than a competition — a sentiment he hopes visitors will share as the new routes launch.

The racers screeched off toward Bilutu Peak, which is one of the signature landmarks of the Badain Jaran Desert, renowned for its high dunes, which served as the centerpiece of the day's racing.

"It is not just about the fastest time; it feels like I am reconnecting with the place where I grew up," Nayantai said.

His words capture the idea behind the new professionally driven dune-bashing tours, which invite travelers to immerse themselves in Inner Mongolia's vast landscapes, communities and traditions, all the while enjoying a thrilling motorsport experience.

The route is part of a broader effort to transform Alshaa League's deserts from a destination for fleeting off-road events into a year-round tourism experience, said Zhao Chengnan, head of the league's tourism development and operation department.

For decades, the region has drawn off-road enthusiasts with its steep dunes and difficult terrain, regularly hosting events.

But the new approach targets a wider group of travelers, including families, recreational drivers and visitors who may have little interest in competitive racing, while also catering to competitors.

Breakfast meeting

Serbian President Aleksandar Vucic (second from right) has breakfast with Serbian and Chinese construction workers in Belgrade, Serbia, on Friday. He inspected the construction site of the Serbia Exhibition Center, a venue for Expo 2027 Belgrade, being built by a Chinese company. WANG WEI / XINHUA

Upgrade: Manufacturing scale highlighted

From page 1

LYC Bearing Corp was one of 156 key projects developed during China's First Five-Year Plan (1953-57) period. From making basic bearings largely by hand to seeing high-end bearings account for 70 percent of its total output value in 2025, the company has filled domestic gaps in a range of fields and helped underpin China's bearing industry.

Its seven-decade transformation mirrors the broader rise and upgrading of Chinese manufacturing. China has ranked first globally in manufacturing scale for 15 consecutive years. The country has 41 major industrial categories, 207 intermediate categories and 666 subcategories, making it the only country in the world with industries across all categories listed in the United Nations' industrial classification, according to the National Bureau of Statistics.

That same shift — from filling gaps to raising standards — can be seen in the tractors that Zhao Xu works on every day. Zhao is deputy head of the product research and development department at YTO Group Corp, a leading agricultural and construction machinery manufacturer.

During an inspection tour of Henan in April 2009, Xi, then China's vice-president, visited two manufacturers, including YTO Group Corp, where he learned about independent research and development, production and operations, and encouraged efforts to develop new products in response to market demand.

According to the company, digital and intelligent upgrades allow different models to be assembled on the same line, with one tractor rolling off every three minutes on average and overall efficiency up more than 20 percent.

"A tractor can no longer merely get the job done," Zhao said. "It must help farmers work more efficiently and comfortably."

The company has launched, or is developing, tractors with power-shift and continuously variable transmissions, and hybrid and battery-electric power trains. Autonomous and driverless models have also entered commercial use, Zhao said.

"Our goal is to advance agricultural machinery technology and strengthen our ability to develop high-end products of our own," he said.

"The longer I worked, and the more I understood the market and the realities of Chinese agriculture, the more I felt a responsibility to make better products that could serve more users."

"Now, it is about using better technology and moving in the right direction."

New strengths

Zhou Mi, a senior researcher at the Chinese Academy of International Trade and Economic Cooperation, said that as China's industrial system became more complete and competition intensified, older industrial enterprises had to find new strengths through innovation.

In his view, the shift of both LYC Bearing Corp and YTO Group Corp toward higher-end, smarter and greener production reflects the combined influence of government guidance, market demand and competition.

"New technologies can raise productivity and make products more competitive, creating higher returns," he said. "That, in turn, draws more companies into innovation and creates a combined force for industrial upgrading."

Lan Qingxin, director of the BRICS Research Center at the University of International Business and Economics in Beijing, attributed the continuity between the major industrial projects under China's First Five-Year Plan and the focus on advanced manufacturing in the 15th Five-Year Plan (2026-30) to sustained long-term planning under the leadership of the Communist Party of China.

"What has remained unchanged is the long-term goal of industrialization and modernization," Lan said. "What has changed is the path and the methods used to achieve it."

In the new era, he said, the emphasis is on innovation-driven, high-quality development, with China working to maintain a reasonable share of manufacturing in the economy and to vigorously develop advanced manufacturing.

Lan said this evolution also reshaped the relationship between government and the market. The state concentrated resources on basic industries at the early stage, while market competition later pushed enterprises to become the main drivers of innovation.

China has continued to learn from advanced technologies and management practices abroad while strengthening independent innovation and pursuing breakthroughs in core technologies, he added.

"Independent innovation does not mean shutting the door," he said. "It means strengthening your own capabilities through openness and cooperation."

In Lan's view, the five-year planning system has helped combine an efficient market with a well-functioning government, and self-reliance with opening-up, translating long-term goals into innovation at the enterprise level and greater national industrial strength.

Economy: Global playing field being rewired

From page 1

Just look at the numbers: In May 2026, it is reported that China's electric vehicle exports hit a record $9.2 billion, a 49 percent leap from the year before. It isn't just selling cars; it is selling the "New Three" clean-tech categories that are redefining global trade.

But here is where it gets really interesting. On July 17, 2026, President Xi Jinping stood up at the World AI Conference in Shanghai and essentially offered to share the "operating system" of this new era with the rest of the world. He called AI a "symphony of international cooperation" rather than a solo act.

Think about what he offered to the Global South over the next five years: 5,000 training opportunities in AI for developing nations; international AI application centers for groupings such as ASEAN, BRICS and the African Union; and the MAZU AI early-warning system to 30 countries to fight climate disasters.

That's not just building a coalition; that's building the World Artificial Intelligence Cooperation Organization, headquartered in Shanghai with 29 founding members. While some are trying to build an "AI Iron Curtain", China is pitching an open-source model where intelligence is a public good, not a private commodity.

The core conclusion is this: China is betting that if you automate the basics, you change the "superstructure" of society itself.

With per capita GDP hitting 99,665 yuan and labor productivity rising by 6.1 percent in 2025, the material conditions for a totally new kind of society are being laid. As the 14th Five-Year Plan (2021-25) ended and the 15th Five-Year Plan (2026-30) began, China is moving toward a future of technological abundance.

The global playing field is no longer just leveling; it is being rewired into a "symphony of international cooperation" where open-source AI and green energy abundance are the primary engines fast-tracking a new economic era designed to solve foundational human needs.

The only question left is: Who else is ready to play in the orchestra?

New container ship route to Europe halves transit time

By CHEN YE in Ningbo, Zhejiang
chenye@chinadaily.com.cn

The China-Europe Arctic container express route officially entered regular weekly operations on Saturday, opening a faster, more efficient and resilient northbound logistics corridor between China and Europe.

The container ship *Dubai Tower* departed from Ningbo-Zhoushan Port in East China's Zhejiang province, announcing the start of the route's regular seasonal service, which takes about 20 days, halving the transit time of traditional routes to Europe.

Fang Yi, CEO of the Sea Legend Line, which operates the route, told China Daily that after leaving China, the vessel would call at key ports in Northern Europe and the Baltic region, including Felixstowe in the United Kingdom, Rotterdam in the Netherlands, Hamburg in Germany and Gdynia in Poland.

The route thus establishes a logistics network linking China's coastal manufacturing hubs directly with major European ports.

The Sea Legend Line has already drawn up a liner schedule for this year's navigation season, with more than eight voyages planned from mid-August through late September or early October.

The container ship *Dubai Tower* is loaded on Saturday at the Ningbo-Zhoushan Port in East China's Zhejiang province. PROVIDED TO CHINA DAILY

Such a schedule would have been difficult to imagine just a year ago.

On Sept 22, 2025, the container ship *Istanbul Bridge* departed from Ningbo-Zhoushan Port and finished the first full trial.

The route follows the Northeast Passage along the Arctic coast, connecting the Bering Strait with the Barents Sea. At about 5,000 kilometers, it is the shortest maritime route between Northeast Asia and Western Europe.

For decades, maritime trade between Asia and Europe went along southern routes through the Strait of Malacca, the Indian Ocean, the Red Sea and the Suez Canal.

"The trial took 20 days from China to Europe, compared with 40 days via the Suez Canal and 50 days traveling around the Cape of Good Hope. The Arctic route also avoids congestion and potential geopolitical disruptions," Fang said.

However, it only has a short summer navigation window, as ice and weather are difficult to predict.

Some industry insiders said that the Arctic route, which is navigable from late July to October, remains constrained by ice conditions, and therefore cannot replace the traditional routes soon.

Li Xiaobin, chief operating officer of Sea Legend Line, said that with advances in icebreaking and energy propulsion technologies, the navigation period could potentially be extended to eight to 10 months in the next three to five years.

In addition, the Arctic's cold environment functions as a natural cold chain, with temperatures along the route generally ranging from minus 3 C to 10 C, which is suitable for temperature-sensitive cargo such as energy-storage cabinets and power batteries.

Products loaded for Saturday's voyage were of this type, with cargo mainly sourced from manufacturing clusters in the Yangtze River Delta, including Ningbo and Yiwu in Zhejiang province, and tailored to meet peak-season delivery demand in European markets.

After the trial, several partner ports in Europe expressed strong interest in regular operations on the route.

SOCCER, DUST, DREAMS

A festival of feats in the heart of the Kenyan slums

By WU XIAOHUI in Nairobi, Kenya
wuxiaohui@chinadaily.com.cn

Dust rose from the red-earth field as players sprinted for the ball. Children sat along the walls surrounding the field, while others climbed higher for a better view. Each goal was met with cheers from the crowd and blasts from plastic vuvuzela horns.

There was no grass-covered stadium at the "Slum World Cup", part of the Mathare Carnival, which concluded on Aug 8. The soccer field was marked with temporary white lines, some of which were already covered with dust by the end of the matches.

The annual "Slum World Cup" brought together more than 500 young players from 42 teams representing 22 community schools in Mathare, Nairobi's second-largest informal settlement.

Among the players was 11-year-old Fabian Adrian, who was lifted onto the shoulders of his teacher and teammates after scoring a goal. His worn soccer cleats had visibly damaged soles.

For Adrian's teacher, Linter Adhiambo, this was the third time she had brought students to the tournament. Her 12-member boys' team won first place in the junior category.

"I am so proud. We are just praying that Chinese volunteers can continue organizing this soccer tournament," Adhiambo said.

The soccer tournament is one of the main activities of the Mathare Carnival, which was launched in 2016 by the Dream Building Service Association, or DBSA, a nonprofit organization founded in Africa in 2014 by Chinese university students.

Its founder, Yin Binbin, said he first came to Mathare in 2014 as an international volunteer to teach at a local school. The school was built largely from old sheet metal, prompting him to raise funds online to help rebuild it. That project became the starting point for DBSA.

Over the past decade, the organization has carried out projects in six African countries, with more than 500 international volunteers participating in programs ranging from arts education and talent shows to soccer tournaments, Yin said.

Beyond the field, the carnival also featured "Talent Chap Chap!", a talent show where students took to the stage to showcase their singing, dancing and other skills. An art program under the theme "Born to Shine" brought together students from 15 community schools, who created more than 300 artworks.

The second China-Africa People-to-People Public Welfare Exchange Forum was held in Nairobi on Aug 7 as part of the carnival series.

Representatives from Chinese and African government departments, NGOs and youth groups discussed cooperation in areas such as education, health, women and children, and youth development.

At the forum, Chinese Ambassador to Kenya Guo Haiyan said that grassroots organizations and groups focused on empowering women and youth can reach communities more directly and respond flexibly to local needs, complementing government-to-government cooperation.

Anne Wang'ombe, principal secretary for the State Department for Gender and Affirmative Action in Kenya's Ministry of Gender, Culture and Children Services, said the carnival is an example of how China-Africa people-to-people exchanges can create tangible benefits for communities. She called for such partnerships to be further developed through long-term community initiatives.

"Our progress is measured by the quality of life of the most vulnerable," said Rael Mutai, regional technical adviser at the United Nations Population Fund. Mutai called for partnerships that can bridge the gap between policies and the realities faced by vulnerable communities, reaching those "down to the last mile".

WORLD

Patients receive treatment at a makeshift tent outside a hospital following an earthquake in Labuan Bajo, East Nusa Tenggara Province, Indonesia, on Saturday. FIRDIA LISNAWATI / AP

53 dead in Indonesia quake as rescue efforts continue

By **LEONARDUS JEGHO** in Jakarta
For China Daily

The death toll from a powerful earthquake that struck Indonesia's eastern islands has risen to 53, authorities said on Sunday, as rescuers searched for survivors trapped beneath landslides and collapsed buildings.

The magnitude 7.7 earthquake struck East Nusa Tenggara Province on Saturday, followed by more than 300 aftershocks. At least 64 people were injured, according to the National Search and Rescue Agency, making the disaster the country's deadliest earthquake since a 2022 tremor in West Java Province killed hundreds of people.

Most of the deaths and injuries were reported on Flores, one of Indonesia's major islands, where the northern parts of five districts were hardest hit. The rescue agency said 24 fatalities were in Manggarai district and 20 in neighboring East Manggarai.

East Nusa Tenggara Governor Emanuel Melkiades Laka Lena said the damage was particularly severe in northern Flores. Many residents had remained outdoors for fear of returning to damaged homes and were in urgent need of tents, food and other essential supplies, he said.

The provincial government declared a state of emergency on Saturday as emergency crews continued rescue and relief operations across the quake-hit areas.

The earthquake's epicenter was offshore, about 30 kilometers northeast of central Flores, at a depth of 15 kilometers.

Mohammad Syafii, head of the National Search and Rescue Agency, said rescue operations were continuing despite difficult conditions, including landslides and disruptions to telecommunications and electricity in some areas, particularly in East Manggarai and Nagekeo.

Rescue teams were using helicopters to evacuate victims and deliver relief supplies to the affected areas, he said.

He urged local residents to report anyone in need of assistance or evacuation so rescue teams could reach them promptly.

Indonesian President Prabowo Subianto has ordered ministers and other relevant officials to accelerate relief efforts by sending dozens of tons of supplies to Flores and deploying joint national teams to the disaster zone.

He also sent food packages to earthquake-affected communities. The supplies arrived on Sunday in Maumere, East Nusa Tenggara Province, according to Indonesia's national news agency Antara.

Berton SP Panjaitan, acting head of the Data, Information and Disaster Communication Center at the National Disaster Management Agency, said a military aircraft had transported the first batch of emergency relief supplies ordered by Prabowo.

A total of 1,725 basic food packages were distributed to affected areas in Sikka and Ende districts.

On Saturday, another 3,200 packages were delivered to Labuan Bajo, a town on Flores Island.

Prime Sarmiento in Hong Kong contributed to this story.

5 years after return, Taliban faces hard task of rebuilding

KABUL — White Taliban flags emblazoned with black script lined major streets across Kabul on Saturday as the Taliban celebrated the fifth anniversary of its return to power with a large-scale ceremony.

Five years on, war-torn Afghanistan has largely moved from conflict to reconstruction. Overall security has improved, but creating jobs, absorbing returning refugees and reviving the economy remain formidable challenges.

Since returning to power in August 2021, the Taliban has repeatedly pledged that Afghan territory would not be used by terrorist groups to threaten other countries. It has launched sustained operations against extremist groups, contributing to a marked decline in both the frequency and scale of terrorist attacks.

Security risks, however, have not disappeared.

Several major attacks hit Kabul in recent years, including the assassination of acting minister for refugees Khalil Ur-Rahman Haqqani in a suicide bombing in December 2024, and an attack on a Chinese restaurant in January this year that killed seven people.

Meanwhile, military tensions with Pakistan have periodically flared over border disputes and cross-border militant activities. From late 2025 to the spring of 2026, the confrontation escalated beyond frontier areas, with Pakistani officials calling the situation an "open war".

The fighting gradually subsided after the two sides returned to dialogue through international mediation.

For many Afghans, daily life has become safer, but making a living remains difficult.

In an interview with Xinhua News Agency, Taliban spokesman Zabihullah Mujahid said the Afghan currency had stabilized at around 66 to 70 afghanis per dollar, compared with a low of around 130 after the Taliban returned to power, indicating that inflation had been brought under control.

Bread prices have also remained stable. A piece of naan, Afghanistan's staple food, has long cost around 10 afghanis, prompting some economists to describe the phenomenon as the country's unique "naan economy".

Yet, stable prices have not eased livelihood pressures.

Safra, a single mother living in Kabul, supports two sons, one of whom is bedridden. The family's only income comes from occasional labor by her younger son, allowing them to afford little more than naan and potatoes each day.

In eastern Khost Province, farmer Shafiq told Xinhua that his family of nine survives on 2,000 square meters of farmland and temporary jobs. "At least everyone can have naan every day," he said.

Higher unemployment

Abdul Rahman, spokesman for Afghanistan's Ministry of Economy, said people of working age account for about 49 percent of the country's population, while roughly 26 percent are unemployed.

The end of many international aid programs and development projects has pushed unemployment even higher.

Rebuilding the economy remains one of Afghanistan's biggest challenges.

According to the National Procurement Commission, the government approved 562 development and infrastructure projects worth about $2 billion last year. Since August 2021, more than 1,200 major development projects have been launched nationwide.

Spokesman Mujahid acknowledged that outdated regulations have slowed reconstruction.

"In the past, obtaining a construction permit required approvals from dozens of departments. We are simplifying administrative procedures, although we have not yet reached our goal," he said.

Long-standing financial sanctions by the United States remain another major obstacle, discouraging international investment, particularly private capital.

Five years after the war largely came to an end, Afghanistan is discovering that the challenge today goes beyond ending the fighting; it also involves building a future.

XINHUA

Tehran rejects Trump's claim over Hormuz

Maritime tensions keep shipping on edge as Iran vows to keep control of waterway

TEHRAN — Iran on Saturday fired back at US President Donald Trump's claim that he would soon declare the Strait of Hormuz part of US territory, saying the crucial waterway "will remain Iranian".

Trump has repeatedly insisted that the strait is under the United States' control despite traffic remaining throttled.

"The Strait of Hormuz has been Iranian, is Iranian, and will remain Iranian," Iran's Deputy Foreign Minister Kazem Gharibabadi said on X. "This strait will only be closed and opened under Iran's command."

Trump told a political rally in New York state on Friday that after the US defeats Iran, "pretty soon I'll be declaring the Hormuz Strait a territory of the United States".

"It's true," he added.

An unnamed White House official later clarified that Trump was joking, The Wall Street Journal reported.

Earlier this month, a top Iranian official set out a list of conditions for reopening the strait, including an end to the "war and aggression against Iran and its allies in Lebanon, Palestine, Yemen and Iraq".

Mohammad Bagher Zolghadr, chief of the Supreme National Security Council, also demanded an end to the crippling sanctions, the release of frozen assets and compensation for wartime damage.

As diplomacy stalls between the US and Iran, attacks in the Strait of Hormuz have continued, highlighting the risks to regional shipping.

The United Arab Emirates' state-owned oil company ADNOC said on Saturday that one of its vessels came under attack the night before.

The country's foreign ministry later blamed Tehran, and said that Iran's Revolutionary Guards were engaged in "acts of piracy" in the strait.

On Friday, the Gulf nation blamed Iran for other attacks on two vessels linked to ADNOC as they passed through the waterway.

Before the war, the strait carried around one-fifth of the world's oil and liquefied natural gas exports, and prices have repeatedly surged since the dispute over the waterway erupted, piling economic and political pressure on Washington.

The closure of the strait has driven up prices for US voters, creating a political headache for Trump as November's midterm elections near.

At the Friday rally, Trump said paying "a tiny little bit more for your gasoline" is worth the cost of ensuring "a very evil country" could not have a nuclear weapon, one of his stated rationales for the war.

In a trend that has sparked inflation and disappointed voters, the average US price of a gallon of gasoline was about $4.08 on Friday ($1.08 per liter), up 29 percent from a year earlier, according to the American Automobile Association.

US Vice-President JD Vance said last week that Washington's top priority during the Iran war was to keep the energy prices low for US consumers, while preventing Tehran from acquiring a nuclear weapon ranked second.

Tehran signaled last week that it had agreed with Oman on a route for ships to transit the Strait of Hormuz and was finalizing arrangements to jointly manage the waterway.

Situation in Lebanon

In another development, an Israeli airstrike killed a senior commander in Hezbollah's Badr regional division in southern Lebanon, the Israeli military said on Sunday.

Lebanese media reported that at least four people were killed in the attack.

The Israeli military said that Abu Hassan Alaa was killed late on Saturday in the strike on Deir al-Zahrani. It described the attack as a response to an earlier Hezbollah drone strike targeting Israeli troops in southern Lebanon that wounded three soldiers.

Lebanon's National News Agency reported that Israeli warplanes struck a two-story building, killing at least four people and wounding five.

Also on Saturday, seven people were killed in heavy Israeli airstrikes in the southern village of Ansar, one of the deadliest attacks since a ceasefire was reached in 2024.

Israeli attacks have killed at least 4,300 people in Lebanon since the latest round of fighting began on March 2.

Briefly

ZIMBABWE

Death toll in ferry accident rises to 80

Authorities retrieved 34 bodies from Zimbabwe's Lake Kariba over the weekend, taking the death toll from a ferry capsizing to 80, police said, as the search continued for victims. The overloaded passenger ferry run by the government's Rural Infrastructure Development Agency overturned in choppy waters on Tuesday in a rare accident on the vast lake on the border with Zambia. At least 18 children were among the dead, police said on Saturday after rescuers recovered 26 more bodies. "Meanwhile, the identification of the bodies recovered today is in progress," the police said in a statement. On Sunday, the national police service said in a post on X that eight more bodies were found. Officials say the boat was authorized to carry 90 people but was packed with 114 adults, five crew members and an unspecified number of children.

DPRK

Top leader 'proud' of better Russia relations

Kim Jong-un, president of the State Affairs of the Democratic People's Republic of Korea, told Russian President Vladimir Putin that he is "proud to be able to expect a more excellent future of the bilateral relations", the Korean Central News Agency reported on Sunday. Kim made the remarks in a reply message on Saturday, thanking Putin for sending a message of greetings on the occasion of the 81st anniversary of Liberation Day, the report said. The DPRK celebrates its Liberation Day on Aug 15 in commemoration of the liberation of the Korean Peninsula from Japan's colonial rule on Aug 15, 1945.

UNITED STATES

Teen arrested over ties to university shooting

Police arrested a 19-year-old found hiding in a dormitory closet at Virginia State University on Saturday in connection with an overnight shooting on campus that left five people wounded, including one with critical injuries. Camron Harris of Henrico, Virginia, is not a student on campus nor are four of the people injured, Chesterfield County Police said in a statement. They ranged in age from 17 to 23. One of the injured, a 20-year-old, is a student and has now been released from the hospital, authorities said. The victims' names have not been released. Authorities have given no information about a possible motive. The university said earlier that authorities were searching for multiple suspects, but police provided no additional information on Saturday evening about the search.

Washington should stop creating division by coercing other nations to take sides in AI

In a move that seeks to engineer confrontation among nations on the technology front, the United States is reportedly ready to demand that dozens of countries pick sides in the artificial intelligence race with China — warning that they will be excluded from a US-led AI coalition if they also sign up for China's "competing framework".

The draft letter, prepared by the US State Department, is said to be addressed to the 35 signatories of a US "AI Opportunity Statement" signed in June. Washington obviously hopes to form a technology bloc to deny China access to the resources vital for building state-of-the-art AI.

Such a strategy will undoubtedly do damage to the development of AI as it will fragment the global supply chains and erode multilateral cooperation. It will also disrupt the positive feedback loop between technological innovation, market development and real-world application, ultimately hindering the growth and sustainability of the AI ecosystem itself. This reflects Washington's zero-sum game mindset — if the US cannot lead, it seeks to block others from making headway.

The Chinese embassy in the US expressed firm opposition to the US politicizing trade and technology issues. "Such actions will only stifle global AI advances and serve no one's interests," an embassy spokesperson said.

By drawing red lines for cooperation through exclusionary clauses and forcing other countries to pick sides, the US is weaponizing technological competition, while seeking to preserve its dominant position in the field of AI through alliance-based barriers. The US' hegemonic approach not only harms others but will ultimately undermine its own long-term development as well.

Now that AI is becoming a key technology driving the new round of scientific and technological revolution, it is all the more important for nations to accelerate open exchanges in this field for the common good of all.

For those in the US seeking to erect walls, they should understand that holding innovation hostage to geopolitics goes against the rationale of science and technology as well as the trend of the times. They should respect normal international technological cooperation and the right of countries to independently choose their cooperation partners. The US will only alienate itself from other countries if it denies nations the right to engage with their partners based on their own development needs, and coerces them into making an either-or choice.

The US has gone to extraordinary lengths to press countries to take sides in virtually every field it deems vital to maintain its hegemony, including critical minerals, trade and supply chains. This cannot but raise fears that the world is poised to revert to a lose-lose situation for all nations.

Faced with the opportunities and challenges brought by AI, what the world needs is an inclusive and consultative governance system, not divisive and fragmented technological barriers.

China promotes global AI governance by championing an open, inclusive, and multilateral approach to make AI a global public good. It advocates "humanity-centered" and "AI-for-good" development, supporting the United Nations' central role in establishing international governance mechanisms. Through initiatives such as open-source models, capacity-building training for developing nations and the creation of the World Artificial Intelligence Cooperation Organization, the country actively works to bridge the global digital divide and ensure that AI benefits all of humanity.

Bloc confrontation cannot solve technological challenges, nor can exclusionary alliances advance human scientific progress. If the US continues to build technological barriers, it will lose the innovative vitality that is inseparable from global technology cooperation and find itself in the predicament of closed-door development.

A 'lighthouse' pointing toward peril

It is absurd that Japanese Prime Minister Sanae Takaichi spoke of Japan becoming an "Indo-Pacific lighthouse" on Saturday, the 81st anniversary of Japan's unconditional surrender to the Allied Powers that ended World War II. The country has not even earned the trust of its neighbors — countries that still remember what happened the last time Tokyo cast itself as a regional "architect" of the infamous "Greater East Asia Co-Prosperity Sphere".

The notorious Yasukuni Shrine, to which Takaichi performed a remote act of worship and sent a ritual offering that day, makes that absurdity impossible to miss. The shrine enshrines 14 Class-A war criminals from WWII. Before taking office last October, Takaichi had visited the shrine more than 10 times over the course of her political career.

On Saturday, she stood across the road, went through the motions — two bows, two claps, one bow — just near enough to appease her nationalist supporting base, but far enough, as she wished, to sidestep a harsh international outcry. In truth, however, it was nothing but a grotesque flirtation with the convicted war criminals.

Several of her Cabinet members, including Japanese Defense Minister Shinjiro Koizumi, went further and visited the shrine in person.

The ceremony thus raises an unavoidable question: Is Japan commemorating its "war victims", or glorifying those who orchestrated a war of aggression?

Imagine a European government openly paying tribute to senior Nazi war criminals and then explaining it was merely honoring "war victims". The world would immediately grasp how grotesque that argument sounds. Germany learned that reconciliation demands confronting the harm it inflicted on others. Japan, by contrast, has not even shown a willingness to begin that journey.

In its word game, the Takaichi government increasingly presents Japan as a regional "model" to build a "free and open Indo-Pacific". Yet this vocabulary risks becoming a linguistic escape hatch from history. The more Japan talks about its fictional "role", the less its leaders seem willing to talk about the uncomfortable truths of the past.

Takaichi's omission was therefore as significant as her words. She mourned Japanese "victims" and spoke of Japan's postwar "contribution" to "peace". But there was no acknowledgment of the sufferings inflicted on other nations, no apology and no remorse for Japan's responsibility.

It is hypocritical to preach "peace" while bowing before the "chief culprits of war", as China's Ministry of National Defense said in response to Tokyo's Saturday farce.

Japan's historical militarists were experts at feigning innocence and victimhood while committing aggression, pillage and killing. Today's neo-militarists have shown they are just as good at playing innocent. Whether they will be allowed to also follow the same path of aggression, plunder and slaughter is the test the international community cannot afford to fail.

In less than a year, the Takaichi government has systematically accelerated Japan's remilitarization from policy to capacity. Its recent handling of the yen, however, has laid bare the economic burden that rhetoric alone cannot conceal.

A weak yen boosts exporters, but it also raises the cost of energy, food and military equipment, squeezing households while making Japan's expanding military budget more expensive. Tokyo is now caught in an uncomfortable triangle: a stronger yen, fiscal expansion and rapid military buildup cannot be pursued indefinitely without trade-offs.

Washington wants Japan to increase its military spending and become a military pillar of the "Indo-Pacific" strategy, but it also has little appetite for a persistently undervalued yen that aggravates trade tensions and financial instability.

So the currency collusion between Tokyo and Washington over the past weeks is not simply about exchange rates or interest rates; it reflects the deeper economic needs of their geopolitical calculations.

Japan is trying to build itself into a war machine again while its economic foundations remain fragile. The currency manipulation may ultimately prove that it is the Japanese people that will have to pay the bill for the rise of neo-militarism.

Takaichi therefore has little choice but to talk emptily about "peace" and the country being a "lighthouse", while saying nothing about Japan's war crimes, responsibility and other nations' sufferings. Only by creating an atmosphere bordering on political indoctrination can she better numb the Japanese public into accepting — and paying for — the country's neo-militarism.

The nations that once fell victim to Japanese aggression have an obligation to keep the historical record straight — especially when Japan persists in its unrepentant stance — to ensure the international community, including the Japanese people themselves, remains vigilant against the dangerous direction in which the "lighthouse" peddled by Takaichi is pointing.

Opinion Line

Teodoro shows how low he can stoop as a marionette

Philippine Defense Secretary Gilberto Teodoro Jr has baselessly accused China of "extortion and blackmail" over immigration enforcement, denounced Chinese officials for "disinformation", and branded Chinese steelworkers "criminals". But the more he talks about "law", "sovereignty" and "national security", the more an awkward question arises: Is he acting increasingly as a proxy for external forces seeking to push Manila to the front line of confrontation with China?

In May, Teodoro instructed the Armed Forces of the Philippines to join an operation at Sanjia Steel Corp and arrest unarmed Chinese workers. Is a defense secretary also a police chief? If the plant was violating environmental or other laws, why not arrest those responsible for running it? Why were Chinese workers detained while Filipino workers were released on the spot? And why were the Chinese "detainees" transported to Manila aboard a military aircraft?

Then came the curious personal protective equipment or PPE episode. According to the Chinese workers, they normally wore regular clothing. Yet on the day of the raid, law enforcement personnel reportedly made three Chinese workers put on PPE and pose for photographs, which were subsequently publicized as evidence that only Chinese workers wore such equipment. Was this law enforcement — or a fishing expedition designed to create "incriminating" images?

The 70 detained Chinese workers were reportedly crammed into cells measuring about 5 square meters. They said the Philippine side failed to make the required consular notification or arrange consular visits in accordance with the bilateral consular agreement.

The workers remained in detention for as long as 32 days even after the Chinese embassy provided Philippine authorities with copies of the workers' passports and valid work visas or permits. Teodoro says the workers not carrying the documents themselves was a "telltale sign of human trafficking". So, are foreign workers required to carry their passports while working in Philippine factories? And does the absence of documentation at the time of arrest constitute "human trafficking" under Philippine law?

More fundamentally, who determines whether Philippine law has been violated — the defense secretary or the judicial authorities?

These are precisely the questions that a spokesperson for China's embassy in the Philippines raised on Sunday in response to Teodoro's ugly theatrics.

On May 28, Philippine prosecutors ordered the release of the Chinese workers unless they were being held on other legal grounds. Yet Teodoro continued to accuse them of "illegal activity".

The episode raises a larger question about Teodoro's role in the Ferdinand Marcos Jr government. He increasingly appears intent on shaping Manila's foreign policy around confrontation with China while aligning the Philippines ever more tightly with Washington and its strategic partners.

His groundless accusation that Chinese embassy officials "intervened" in Philippine law enforcement is equally revealing. Protecting the legitimate rights and interests of nationals abroad is a fundamental job of any embassy; it certainly does not constitute "meddling".

Teodoro's actions appear less focused on resolving disputes than on keeping tensions alive. Look at the South China Sea. Washington has repeatedly backed Manila's claims and invoked the unlawful 2016 "arbitral award" against China. Australia has joined the Philippines in wrongly criticizing Chinese actions at Ren'ai Reef, which is actually China's territory. Neither the US nor Australia is a claimant in the dispute, yet both are trying to be embedded in it.

For Washington, the Philippines is a crucial node in its "Indo-Pacific" strategy, astride important sea lanes and close to China's Taiwan island. But for the Philippines, becoming the forward position in someone else's strategic competition carries risks far beyond the ambitions of any defense secretary.

Teodoro wrongly invokes Philippine "sovereignty" while encouraging policies that make Manila dependent on an external security architecture. He invokes the "rule of law" while appearing unwilling to accept a prosecutorial decision that cleared the detained Chinese workers.

China has never invaded or colonized the Philippines. Yet Manila is being misled to see China not as a neighbor with whom it has disputes that must be managed, but as a rival. That may serve Washington's calculations. It may serve Teodoro's personal political ambitions. But it does not necessarily serve Filipino interests.

The question is whether Teodoro is still acting for Manila — or increasingly performing a role written somewhere else.

— LI YANG, CHINA DAILY

What They Say

Environmental protection made more coherent

Editor's note: *Effective since Saturday, the Ecological and Environmental Code is China's second statutory code after the Civil Code. Zhu Xiao, a professor at the Law School of Renmin University of China, spoke to China Central Television about the significance of the code. Below are excerpts of the interview. The views don't necessarily represent those of China Daily.*

Issues concerning ecological and environmental protection are of profound importance as they have a bearing on the sustainable development of the country.

China has drawn on years of environmental protection practices to build a solid foundation for advancing the construction of an ecological civilization, and these experiences are worthy of being summarized, refined and inculcated into legal provisions.

The country has more than 30 specific laws on environmental protection, over 100 administrative regulations, more than 1,000 local regulations, and more than 10 intra-Party regulations on ecological and environmental work. To tackle fragmentation, inconsistencies and repetition, a systematic legislative approach was indispensable and codification was the optimal option.

The Ecological and Environmental Code addresses the fragmentation inherent in traditional legislation to build a more coherent legal system.

Among the contents of the code are three major parts, which focus on pollution prevention and control, ecological conservation, and green and low-carbon development. This will help achieve sustainability in three aspects.

The part on pollution prevention and control aims to achieve the sustainable development of people. When the sustainable development of people is achieved, the following part, which is on ecological conservation, seeks to achieve the sustainable development of the natural environment. Then it is necessary to have sustainable energy to support sustainable economic and social development.

The part on green and low-carbon development will serve as an institutional framework for promoting low-carbon growth. For example, various laws and regulations could be formulated under this framework to help achieve the "dual carbon" goals, mitigate climate change and adapt to it.

The code has a special chapter on ecological restoration. The chapter helps establish coordinated and centralized provisions that cover the whole process and various subjects. Whole-process coverage means it regulates all six stages of ecological restoration projects, which are planning, assessment, monitoring, implementation, acceptance inspection and follow-up management. In addition, the chapter prescribes measures for restoring forests, grasslands and wetlands, and advances coordinated land and marine environmental governance by setting out special provisions on marine ecological restoration.

A prominent feature of the code is its focus on environmental issues that affect people's daily lives. For example, when it comes to addressing cooking fumes, the code asks local governments to ensure relevant companies design, build and locate their business venues according to requirements in the first place. Another example is light pollution. The code explicitly defines light pollution, calls for limits on light sources, and lays out clear requirements for billboards, neon lights and other scenarios.

VIEWS

Hu Guangyu and Hu Xueju

CPC's self-reform reflects wisdom of governance

The rise and fall of political powers has been a recurring pattern throughout human history. Breaking this historical cycle has therefore remained one of the most enduring challenges for political leaders and scholars alike.

Through decades of exploration and practice, the Communist Party of China has identified two approaches to addressing this conundrum: people's oversight and self-reform.

Since the 18th CPC National Congress in 2012, self-reform has evolved into a systematic approach to Party governance that not only strengthens governance in China but also offers valuable insights into modern political administration.

A defining feature of the CPC's self-reform is its commitment to putting the public interest above everything else. This approach stems from the very nature and purpose of the Party.

As the vanguard of both the people and the Chinese nation, the CPC is dedicated to wholeheartedly serving the people.

With no special interests of its own apart from those of the people and not driven by private gain, the Party is better positioned to confront its own shortcomings and undertake genuine self-reform.

By contrast, most political parties across the world primarily represent the interests of particular social groups or political constituencies.

Under many Western multiparty systems, political competition is often shaped by competing interest groups, making it difficult for governing parties to pursue reforms that may undermine entrenched interests.

The CPC's self-reform is based on a different logic. Since the 18th CPC National Congress, the CPC has advanced anti-corruption efforts. Through coordinated campaigns targeting both senior and grassroots officials, as well as fugitives overseas, China has secured an overwhelming victory in the fight against corruption.

Those gains have been further consolidated by addressing potential risks within the Party, the State and the military.

This determination to address deep-rooted problems from within the Party itself has few parallels in modern political history. It demonstrates that when a governing party places public interest above private gain, it can overcome vested interests and resolve its problems through internal reform.

Equally important is the CPC's emphasis on systemic checks. Political determination alone cannot sustain self-reform. Lasting results require institutional guarantees.

Since the 18th CPC National Congress, the CPC has progressively established a comprehensive framework for supervising the authorization, exercise and oversight of power. By improving transparency and accountability while plugging the institutional loopholes exposed during anti-corruption efforts, the Party has strengthened institutional safeguards.

The objective is to curb opportunities for rent-seeking at their source and ensure that public authority operates within clearly defined rules rather than personal discretion.

Just as importantly, these rules are enforced with consistency. No individual is permitted to stand above Party discipline, and institutional authority is upheld through strict implementation rather than symbolic regulation.

MA XUEJING / CHINA DAILY

This determination to address deep-rooted problems from within the Party itself has few parallels in modern political history.

Although many Western political systems have sophisticated legal and institutional frameworks, they continue to grapple with problems such as the influence of money in politics and the capture of public power by vested interests.

For many developing countries facing persistent governance challenges, China's experience suggests that effective oversight does not depend on replicating the Western multiparty political model. Instead, institutions can be strengthened according to national conditions to improve accountability, curb the abuse of power and foster a healthier political environment.

Another distinctive feature of the CPC's self-reform is its emphasis on improving Party conduct. The implementation of the central Party leadership's eight-point decision on improving Party and government conduct demonstrates the CPC's determination to enforce discipline through concrete action. By translating commitments into visible improvements, this approach has won the public's trust and support. It offers important lessons on governance for other countries as well.

Corruption doesn't happen suddenly. It often begins with the erosion of everyday discipline. In many countries, anti-corruption efforts focus primarily on high-profile cases while neglecting routine misconduct, allowing small problems to turn into systemic ones.

The CPC has adopted a different approach by addressing problems early and persistently. Beginning with issues that ordinary people encounter in daily life, such as extravagant banquets funded by public money, excessive gift-giving during holidays and the misuse of official vehicles, the Party gradually advanced disciplinary reform.

Instead of one-off campaigns, it has maintained sustained pressure and gradually institutionalized improvements in official conduct.

These sustained efforts have strengthened public confidence by demonstrating that commitments to clean governance are backed by visible action and measurable results.

At a time when corruption remains a shared challenge for countries around the world, China's practice of self-reform provides a useful point of reference for political parties across the world. Its experience underscores three essential principles of effective governance: commitment to self-reform, systemic checks on power and translating words into concrete action.

The United States at 250: signal flares of a showboat parade

Among the many events surrounding the United States' 250th birthday, perhaps the most eye-catching was New York City's "tall ships" parade, past the Statue of Liberty and then proceeding up the Hudson River.

Aside from conjuring the New York Harbor scenery of 1776, this international fleet of rigged mast ships sought to replicate the tall ships flotilla of the "Operation Sail" event staged for the 200th anniversary of the United States on July 4, 1976 — a bicentennial parade that I attended in person as a 10-year-old Manhattanite, standing with my father near a West Side pier, snapping photographs of the white sail wonders with our trusty Kodak Instamatic.

The recurrence of the antique ships, with their attendant round number anniversaries, provokes meditations on the US ship of state — what are the headwinds, and what future is it sailing toward?

The US of 1976 certainly had its share of societal problems, notably a struggling economy beset with high inflation and job layoffs. Yet that inflation crisis pales in comparison to the travails of 2026 and the past 10 years.

The prices of necessary goods, rents and mortgages have been rising even more steeply now than in the 1970s.

And back then, average wages were increasing, unlike today.

That more tolerable cost of living was in part effectuated by the bargaining power of labor unions, which were stronger in the '70s than in all the decades that followed.

The bicentennial was also a time of peace: it was the era of detente, a welcome thaw in relations with both the Soviet Union and China.

The military draft and war with Southeast Asia were seemingly in the past. The monumental Watergate scandal of 1973 and first-ever resignation of a US president had also faded from media discourse and dinner table conversation.

For all the socioeconomic problems still facing the nation, there lingered a residual optimism that the middle class and blue-collar workers would regain their footing, that upward mobility was not just possible, but probable.

Civil liberties and public policy were still overshadowed by the unaccountable deep state and military-industrial complex, as was made apparent by the Congressional hearings led by Senator Frank Church on CIA domestic abuses.

But public awareness had been stirred, and at least some of the checks and balances against state and corporate abuse seemed to be in place and functioning, however tenuously.

Prior to its list of specific grievances against the British crown, the Declaration of Independence famously intones a set of three basic rights — "life, liberty, and the pursuit of happiness" — London's denial of which underpinned the need for a new nation, freed from colonial tyranny by force of arms and revolution.

Of those three founding principles, the first and most basic — that of "life" — bears particular scrutiny in the year 2026. The right of all men and women to a decent existence, to keep on living. Where does it stand today, 250 years on?

In current times, when such essentials as food, housing, fuel and medicine have become unaffordable for the average US citizen, and with extreme levels of student and household debt further weighing down families, "life" itself has become quite fraught.

That inscribed right of any and all humans to exist may itself be in its death throes.

The increase in the cost of living, in turn, undermines the concerned citizen's ability to safeguard liberty, or to faithfully pursue that elusive condition known as happiness.

Global Lens

The right of all men and women to a decent existence, to keep on living. Where does it stand today, 250 years on?

It's tough to attain a family-sustaining level of income, or to muster the time and energy required to verify the integrity of computer vote counts, when you are mired in a daily struggle just to acquire enough food to eat, or pay for sorely needed medical treatment.

US citizens are learning the hard way that liberty and the pursuit of happiness are predicated upon the simple, self-evident fact of a person's right to exist.

What would I suggest to remedy this epic crisis?

To begin with, the immediate enactment of federal wage and price controls, the way the Nixon administration did in 1971, and which worked quite well to keep inflation down and workers' salaries up — until heavy pressure from powerful corporations forced a stop to the policy within, whereupon the inflation crisis resumed.

I also recommend a national framework for an emergency rent freeze and rent rollback measures, the expansion of Medicare to cover all US residents in a single-payer system, wide-ranging grants to small businesses, forgiveness of student loan debt with federal compensation to lenders, mandatory tuition fee reductions, and substantive increases in Social Security and food stamp benefits, and in the federal minimum wage.

Institute all of these suggestions and I would say the general population in the US might at least have somewhat of a fair chance at digging their way out of this economic catastrophe, the worst since the Great Depression of the 1930s.

Realistically, do I expect any of the above to become law anytime soon? Absolutely not.

And that would be despite the popular preference for each of them shown in survey after survey.

Their rejection by the powers that be does not really concern how spending more would exacerbate the national budget deficit either, as Congress has made it clear that when it comes to taxpayer money spent on the military, endless wars, and "national security", the sky is the limit.

US policymakers and lawmakers, and their guiding hands within the unelected, elite strata of the super-rich and the deep state hierarchy, have no intention of changing course on this one-way track toward the utter immiseration of the domestic population.

Which brings me back to the summer of 1976, specifically to the monthslong buildup to the July 4 sailing regatta, fireworks displays and whatever else was being done, when my 10-year-old self read with keen interest the posters stuck to walls by left-wing activists in my neighborhood urging people to protest the looming presence of one of the Operation Sail vessels, the *Esmeralda* of Chile, which represented the US-backed, brutal military dictatorship of General Augusto Pinochet.

That regime had covertly been installed by the CIA and US executive branch in a bloody coup on Sept 11, 1973, which overthrew and assassinated the elected, leftist president, Salvador Allende, and destroyed Chilean democracy. So much for the state of US adherence to that "liberty" word in the founding fathers' Declaration.

Soon after the coup, many thousands of political prisoners were rounded up, tortured and murdered in detention centers created by Pinochet, who also harbored fugitive Nazi war criminals.

One of those centers had been the *Esmeralda* ship itself, which was transformed from a Navy training vessel into an anchored dungeon of horrors. According to survivors' testimonies, dissident men and women were killed, tortured and raped inside the ship.

The *Esmeralda* sailed up the Hudson that festive bicentennial day unimpeded, alongside the other tall ships with sails of purest white.

There were two other ships in that bicentennial parade that I now recognize should have drawn objections from advocates for democracy and justice, but as far as I can tell stirred no controversy.

One was the *Nippon Maru* of Japan. Built in 1930 as a training vessel for Japan's merchant marine cadets, it was later requisitioned by the Imperial Japanese Navy during World War II (from 1943 onward). In that capacity, it served primarily as a transport ship for military supplies and personnel, and also provided training for naval recruits.

Another was the tall ship from Italy, the *Amerigo Vespucci*, which, in its little-known, dark past, had been a training vessel for dictator Benito Mussolini's navy and his Axis Italy wars of conquest.

Those fascist Italian forces, like the Japanese, had fought and killed US troops, and together with Hitler's Germany aimed to extinguish the very ideals of democracy, equality and freedom worldwide.

Flash forward to July 4, 2026, and a further problem emerges in the form of one glaring difference between the bicentennial tall ships and the new regatta cruising New York waterways, one that evinces how US national priorities have sunk ever lower over the past 50 years.

The symbolic, white-sails parade has now become extensively militarized; a festive paean to overseas war that would have greatly dismayed those brave anti-imperialist men who gathered in Philadelphia to sign and adopt the Declaration of Independence.

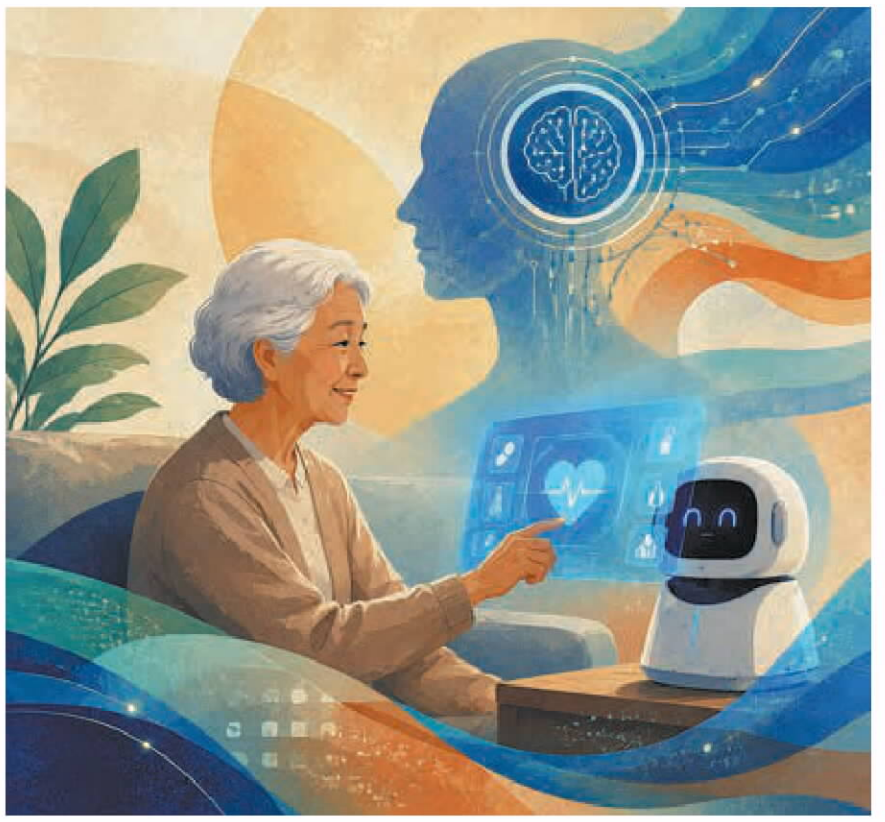
The show was named "Sail4th 250", and the official website proudly states: "This isn't just a handful of boats sailing around, it's a display of 48 historic tall ships from 20 different countries in honor of the US' Semiquincentennial.

Plus, it features an International Naval Review with 50 US and allied warships anchored in the Hudson and an International Aerial Review where the Navy's Blue Angels will lead a flyover of more than 100 aircraft."

And in procession with the many gray-hulled military vessels, those unsolicited new fleet mates to the tall ships, the old *Esmeralda*, that notorious Chilean ship of neo-fascist atrocities, floated once more upon the Hudson, and apparently did so to no visible objections this time around.

May we divine from this portentous maritime spectacle a future for US citizens that is bright with the promise of liberty, peace and prosperity, to be realized soon, and enduring happily for the decades to come?

The leading indicators, both material and symbolic, suggest not, I am sorry to report.



That ship has sailed.

GLOBAL VIEWS

WANG XIAOYING / CHINA DAILY

NISIT PANTHAMIT AND SUN YANGYANG

Handling aging together

Demographic differences create new sources of regional comparative advantage

For much of the past 35 years, cooperation between China and the Association of Southeast Asian Nations has evolved by responding to changing economic realities. It began with trade liberalization and expanded through investment and regional production networks. More recently, digital connectivity and technological innovation have become new engines of cooperation.

Nisit Panthamit

Sun Yangyang

Perhaps the next chapter will be written not by markets alone, but by demographics.

Population aging rarely dominates discussions on regional economic cooperation. It is usually treated as a domestic issue, associated with pension reform, healthcare costs and shrinking labor forces. Yet China and ASEAN have reached a stage where demographic change can no longer be read only in the context of national borders. The region has become too economically integrated for that.

China has entered a moderately aging society. According to the 2025 National Report on the Development of Aging, jointly released by the Ministry of Civil Affairs and the China National Committee on Aging, China's population aged 60 and above reached 323.38 million by the end of 2025, accounting for 23 percent of the country's total population. Across ASEAN, the transition is unfolding at different speeds. Thailand and Singapore have already become aged societies, while Vietnam, Malaysia and Indonesia, despite having different demographic clocks, are moving in the same direction.

That timing matters.

Economists have long explained regional integration through comparative advantage. Countries trade because they possess different combinations of labor, capital, natural resources or technology. These differences create mutual gains from exchange.

Demographic transition suggests another source of comparative advantage.

The demographic challenges that China is confronting today are those that several ASEAN economies are likely to face over the next one or two decades. Rather than seeing this difference as a divide, it can be viewed as an opportunity. Experience acquired today in one country becomes useful knowledge for another tomorrow. Policy innovation, healthcare reform, workforce adaptation and technological solutions become resources that can be shared.

Comparative advantage, in other words, may increasingly arise not only from differences in economic resources, but also from differences in where countries stand along the same demographic journey.

This idea deserves greater attention because demographic transition is reshaping almost every part of the economy.

Healthcare is perhaps the most visible example. Aging populations require more continuous care, better management of chronic diseases and greater access to medical services outside major cities. Artificial intelligence is often discussed as a technology that replaces workers. In aging societies, however, it can play a major part by helping a limited number of healthcare professionals serve a much larger population through better diagnostics, medical imaging and telemedicine.

The same logic applies to the labor market. Longer life expectancy also means longer careers. Workers entering their sixties today are often healthier, better educated and more capable of remaining economically active than previous generations. The challenge is no longer whether they can continue working, but whether they can continue learning. AI-supported education platforms make lifelong learning more flexible and affordable, allowing workers to adapt to changing technologies without repeatedly leaving the labor market.

The economic implications extend further.

Population aging is changing patterns of demand throughout Asia. Healthcare services, rehabilitation, assistive technologies, age-friendly housing, financial planning and digital services for older adults are becoming important sources of business activity. The silver economy should not be viewed simply as the cost of supporting older populations. It also represents a growing market capable of generating innovation, investment and employment.

This is where China and ASEAN complement each other particularly well.

China has accumulated considerable experience in digital infrastructure, AI applications and smart manufacturing. ASEAN contributes dynamic markets, expanding digital economies and countries that are progressing through demographic transition at different stages. That diversity allows governments, businesses and researchers to learn from one another instead of repeatedly solving the same problems independently.

The completed negotiations on the China-ASEAN Free Trade Area Version 3.0 illustrate how regional cooperation continues to evolve beyond tariff reduction toward the digital economy cooperation and institutional coordination. Demographic cooperation fits naturally within this broader agenda.

One practical step would be to establish a China-ASEAN partnership for healthy aging. Rather than creating another regional institution, such a partnership could build on existing cooperation mechanisms to encourage joint pilot projects in AI-enabled healthcare, collaborative research on aging technologies, workforce reskilling and policy dialogue on long-term care. The objective would not be technology for its own sake, but practical solutions that improve people's daily lives.

Ultimately, the success of China-ASEAN cooperation should not be measured only by trade volumes or investment flows. It should also be measured by whether the partnership helps both sides respond more effectively to shared structural challenges.

Population aging is one of those challenges, but it is also an opportunity to rethink regional cooperation.

For decades, economists have understood comparative advantage in terms of what countries possess. The next stage of China-ASEAN cooperation may depend just as much on where countries are — not on the map, but along the path of demographic transition.

Knowledge can travel before demographic pressures do. Policies can be tested before they become urgent elsewhere. Innovation can spread before problems become crises.

Trade has connected China and ASEAN. Shared prosperity has strengthened that partnership. Handling aging together may become the next reason to deepen it.

QU SHENNING

Emerging industries unlock job growth

China is bridging structural mismatches between burgeoning sectors and employment

China's overall employment scene remains stable, with the synergy between industrial upgrading and employment expansion continuing to deepen. Yet structural mismatches in the labor market persist as a prominent challenge. The 15th Five-Year Plan (2026-30) sets out a strategic vision for promoting high-quality and full employment, calling for the integration of an employment-first policy with efforts to expand employment and improve job quality. In June, the State Council, China's Cabinet, issued a plan to implement an employment-first strategy, which underscores the need for stronger coordination between industrial and employment policies during the 15th Five-Year Plan period.

Emerging industries are a new source of job creation. These include not only strategic emerging sectors such as next-generation information technology, new energy, new materials, robotics and biomedicine, but also future-oriented fields such as quantum technology, bio-manufacturing, hydrogen energy and nuclear fusion, brain-computer interfaces, embodied intelligence and 6G telecommunications.

Although emerging industries are typically technology- and capital-intensive and employ fewer workers directly than labor-intensive sectors, their indirect contribution to job creation is substantial. This potential manifests in the lengthening value chain — encompassing R&D, design, systems integration and application operations. The key to unlocking this potential does not lie in seeking new engines for mass hiring, but in translating the new technologies, scenarios and business models born from industrial upgrading into sustainable and expandable job opportunities. In other words, the employment potential of emerging industries is realized not through an expansion of low-cost labor, but through a finer division of industrial chains, an extension of service networks and a restructuring of occupational systems.

China's emerging industries are already a solid pillar of employment. According to the National Bureau of Statistics, China's "three new" economy — a collection of economic activities centered around new industries, new business formats and new business models — generated 24.29 trillion yuan ($3.58 trillion) in value added in 2024, accounting for 18.01 percent of GDP. The momentum carried into 2025. The value added of equipment manufacturing in large-scale industries grew by 9.2 percent, high-tech manufacturing by 9.4 percent, revenue of strategic emerging service enterprises by 9.3 percent and that of high-tech service enterprises by 7.9 percent. New energy vehicle production and sales both surpassed 16 million units, while output of service robots and 3D-printing equipment also saw rapid growth.

This suggests that employment opportunities generated by the "three new" economy come not only from manufacturing but also from services — and, more importantly, from the convergence of the two, which gives rise to new professions, new job categories and new entrepreneurial avenues. This is already evident in several key areas. In the NEV sector, industrial expansion has not only boosted assembly-line jobs, but also created new demand for power batteries, automotive chips and smart cockpits. In the low-altitude economy, the proliferation of drones has created not only pilot positions but also a range of composite roles in route planning, emergency response and logistics delivery. New occupations, released by the Ministry of Human Resources and Social Security, include generative AI system testers, drone fleet operations planners and hydrogen fuel cell test engineers. These reflect the reshaping of the employment landscape by industrial transformation and open new pathways for college graduates, skilled workers and those transitioning between occupations.

Generally speaking, however, the employment potential of emerging industries does not automatically materialize into real jobs. In some localities and enterprises, the focus tends to tilt heavily toward project investment, output value and technological breakthroughs — often overlooking job creation, skills alignment and career development. This can produce peculiar paradoxes: some industries expand rapidly while employment lags behind; some companies struggle to recruit qualified talent while some workers have difficulty landing suitable jobs.

One major reason is that emerging industries are inherently interdisciplinary, cross-cutting and fast-moving, whereas conventional vocational education and training systems are slow to adapt. Many college graduates fall short in the engineering, application-oriented and tool-based competencies that employers demand. Similarly, workers from traditional industries often lack digital literacy and hands-on proficiency in operating and maintaining new equipment. Adding to the challenge, future industries are marked by uncertain technological trajectories and unproven business models. If some local governments chase buzzwords without cultivating viable application scenarios and a supportive industrial ecosystem, it is hard to achieve stable job growth.

Emerging industries represent the direction of industrial development and should also serve as an anchor for high-quality job growth and full employment. Tapping into this potential requires moving beyond the conventional mindset of treating industrial policy and labor policy in isolation. Job creation goals can be embedded in industrial policy; employment policy can grasp industrial trends; and talent development can be grounded in real-world scenarios. Industrial upgrading should ultimately benefit workers — by delivering quality jobs, sharpening skills alignment and strengthening labor rights protection — so that industrial progress and job security advance in tandem. This can be pursued concretely along two dimensions.

First, industrial development and job creation should be planned simultaneously. When local governments draw up plans for sectors such as AI, robotics and bio-manufacturing, they should not confine themselves to lists of projects and enterprises. They should also develop corresponding job inventories, skills matrices and training road maps. It is worth noting that not every region needs to engage in original innovation or full-chain competition. A more pragmatic approach is to identify viable niches based on local strengths and application scenarios.

For example, regions with a strong manufacturing base could focus on supporting jobs in smart equipment, critical components and inspection and testing services. Those rich in agricultural and cultural tourism resources could expand employment scenarios in low-altitude inspection, smart agriculture and wellness services. And areas with a concentration of universities and research institutions could develop specialized service roles in proof-of-concept validation, trial runs, data annotation and model evaluation.

Second, vocational skills development can take center stage. For new occupations and job categories, it is essential to move quickly in formulating occupational standards, training syllabi and assessment frameworks. Leading enterprises, vocational schools and industry associations should be encouraged to jointly develop curricula that incorporate real corporate projects, equipment and workflow into training.

Public employment services should also pivot toward monitoring labor demand in emerging sectors, diagnosing skills gaps and providing job transition support — helping college graduates and workers from traditional industries find viable pathways into employment. As for technologies such as AI that may displace certain jobs, it is worth exploring human-machine collaboration models and guiding enterprises to use new technologies to boost labor productivity, reduce physical strain and expand service reach, rather than simply cutting headcount. At the same time, continued efforts should be made to strengthen the management and support for new forms of employment, ensuring that new occupations remain dynamic and vibrant while also being underpinned by clear standards and adequate protections.

Summer of tech debuts heating up

Unitree, CXMT among Chinese humanoid robots /chip IPOs setting records

By MA SI
masi@chinadaily.com.cn

MA XUEJING / CHINA DAILY

In this year's sweltering summer, China's technology landscape arrived at an inflection point. In the span of a single fortnight, two domestic tech companies made global headlines with stock market debuts that would have been unthinkable a decade ago.

On August 10, Unitree Robotics — hailed as "China's first humanoid robot stock" — opened subscriptions for its initial public offering on Shanghai's STAR Market. The company priced its IPO at 150.80 yuan ($22), aiming to raise about 6.1 billion yuan in total proceeds — a staggering multiple for a company that, like many in the humanoid robotics space, is still scaling commercial deployments.

Two weeks earlier, on July 27, the Chinese mainland's largest memory chipmaker ChangXin Memory Technologies (CXMT) had an even more headline-making debut on the same exchange. Shares of the tech giant surged 465.82 percent to close at 49 yuan per share, propelling its market value to more than 3 trillion yuan — making it the most valuable company on the A-share market on its first trading day.

But a look beyond the head-turning numbers reveals a far more consequential tale unfolding.

This is not about one company's heroics, but a replicable, self-reinforcing innovation ecosystem that is emerging across China's technology landscape. It spans semiconductor design, chip fabrication, artificial intelligence frameworks and industrial integration. And it is beginning to challenge the long-standing assumption that tech supremacy flows only from a handful of breakthrough nodes controlled by a few foreign players, said experts and corporate executives.

Such a robust innovation ecosystem is manifested from Huawei's newly proposed Tau Scaling Law, which reimagines chip development processes for the global semiconductor industry — to the dizzying pace of five major Chinese AI models released in just eight weeks. The flurry also includes a Shenzhen, Guangdong province-based supply chain that can source 30,000 robot components within half a day, and the seamless integration of traditional manufacturing with cutting-edge embodied intelligence.

"Foreign technology export controls are forcing China to solve a structural problem that Silicon Valley never had to," said Xiang Ligang, director-general of the Information Consumption Alliance — a telecom industry association.

"China is no longer chasing a single 'silver bullet'. Instead, it is building an orchestrated stack where every layer, from silicon to software, improves in lockstep — and that may prove more resilient," Xiang said.

Start with Unitree Robotics. Its listing partners offer a clue to the systemic shift. Its strategic investors include not only the National Council for Social Security Fund and DeepSeek, but also the investment arms of China National Petroleum Corp, China Southern Power Grid, China Telecom, Tencent and CITIC Securities. A humanoid robot is no longer a niche gadget — it is a node connecting energy infrastructure, telecom networks, financial services and AI research. Behind a single robot, dozens of interconnected sectors come together: AI models, chips, sensors, precision reducers, motors, batteries, new materials, industrial software and intelligent manufacturing equipment.

Meanwhile, CXMT's debut delivered an even louder statement. Wu Hao, a portfolio manager at Founder Fubon Fund, described CXMT's significance in clear terms: "It completes the most critical piece of a puzzle for the A-share market's memory sector. It gives China its first homegrown DRAM powerhouse with global heft, sharpening the investment case across the memory value chain."

What Wu did not say explicitly, but industry watchers have begun to recognize, is that CXMT's rise is inseparable from the wider ecosystem. The memory value chain — equipment, materials, design, manufacturing and packaging — is no longer a series of isolated Chinese firms fighting their own battles. They are being wired together.

In late May, as CXMT was preparing for its IPO, a different kind of breakthrough was presented at an international semiconductor conference. He Tingbo, president of Huawei's semiconductor business department, unveiled the Tau Scaling Law — a theory that is quietly being described by experts as the most significant rethinking of chip evolution since Gordon Moore articulated his eponymous law in 1965.

Moore's Law, which observed that the number of transistors on silicon chips tends to double about every two years, drove six decades of progress by relentlessly shrinking the transistor. But with features now approaching atomic scales, that path is hitting physical and economic hurdles. Huawei's Tau Scaling Law takes a different approach. Instead of obsessing over smaller transistors, it aims to reduce processing times at every level using transistor switching, circuit delays, chip architecture, interconnect topology and even data center workloads.

Zhou Jianjun, a professor at Shanghai Jiao Tong University's School of Integrated Circuits, said the theory offers a fresh road map. "Chip manufacturing no longer needs to rely so heavily on cutting-edge lithography tools, and the strategic role of advanced packaging continues to grow," he said.

The background is instructive. China's chip sector has faced mounting pressure, with the United States blocking shipments of extreme ultraviolet lithography tools and advanced chipmaking equipment from top suppliers.

Huawei said the Tau Scaling Law will allow it to produce a chip with transistor density equivalent to 1.4 nanometers by 2031. By comparison, TSMC, the world's largest advanced chip foundry, plans to roll out 1.4 nm products in 2028.

Zhou Hongyi, founder of 360 Security Group, framed it as a long-awaited answer to a pointed question: "When others block China from cutting-edge chip technologies, does China still have a second path? Chinese semiconductors are moving from single-point breakthroughs to system-level collaboration across the entire industrial chain."

If the Tau Scaling Law represents systematic thinking at the chip level, then the recent AI landscape is the evidence that the same logic is working at the application layer.

Between June and early August — just eight weeks — China's AI labs released five major models in rapid succession: Alibaba's Qwen3.8-Max, Moonshot AI's Kimi K3, DeepSeek-V4-Flash, Zhipu AI's GLM-5.2 and ByteDance's Seedance 2.5. On July 16, Kimi K3 debuted with 2.8 trillion parameter MoE (Mixture-of-Experts) large language model, and a 1-million-token context window — making it the largest open-source model ever published globally.

The numbers bear this out. The Stanford AI Index Report 2026 showed the comprehensive performance gap between top Chinese and US models has narrowed to just 2.7 percent. The cost differential is even more telling. For equivalent workloads, some Chinese models cost a fraction of what US closed-source flagships charge.

But the deeper point is that these model breakthroughs are not accidents of isolated genius. They are downstream outcomes of a hardware-software feedback loop that is growing tighter by the month. Chinese AI labs are not waiting just for US-made chips — they are training more on domestic accelerators, whose market share in China's AI accelerator market surged to 41 percent in 2025, according to International Data Corp, while Nvidia's share fell to 55 percent.

The training data, the model architectures and the deployment scenarios are being optimized in parallel with domestic hardware, creating a flywheel that accelerates with each iteration, experts added.

Walk into an industrial park in Shenzhen, and you will see a 62-kilogram robot performing continuous backflips, side flips and a spinning jump that launches it 87 centimeters off the ground. The leaping automaton is not a laboratory curiosity. It is the product of a supply chain so tightly integrated that the company can source all 30,000 of its components within half a day. That turnaround allows eight product iterations in just six months — a pace that many overseas competitors cannot match.

Zhang Yin, vice-chairman and secretary-general of the Guangdong Artificial Intelligence and Robotics Industry Alliance, put it bluntly: "The Greater Bay Area (Guangdong-Hong Kong-Macao GBA) is the only region in the world that has both AI technology and mechatronics (derived from the combination of "mechanics" and "electronics") technology, and the ability to deeply integrate the two."

This integration — between traditional manufacturing and cutting-edge intelligence — is the secret sauce that many outside observers miss. Wei Liurong, chief engineer of the policy and economics research institute at the China Academy of Information and Communications Technology, offered a vivid analogy.

"Traditional industries provide the 'body' and the 'scenario' for embodied intelligence. A humanoid robot needs high-precision reducers, servo motors, torque sensors and lightweight structural components — the core manufacturing capabilities for these components reside precisely in traditional manufacturing enterprises," Wei said.

At the same time, she added, traditional factories, warehouses and mines are exactly where robots can first go to work after leaving the laboratory.

"The complexity of these scenarios and the feedback of real-world data are essential for robots to evolve from being able to walk to being able to work. If you only focus on the large language model for embodied intelligence while neglecting the foundation of traditional precision manufacturing, the robot will suffer from 'cerebral palsy' — a very smart brain with unresponsive limbs, unable to pass tests of precision, durability and stability."

Chen Yanbin, director of the Institute of Industrial Economics at the Chinese Academy of Social Sciences, said China's manufacturing scale ranked first globally for the 16th consecutive year in 2025.

"The strategic underpinning for this has been its complete industrial system," Chen said.

Hong Qunlian, a researcher at the Chinese Academy of Macroeconomic Research under the National Development and Reform Commission, placed this shift in a broader context.

"As a new round of technological revolution accelerates, global economic competition has shifted from product rivalry and corporate battles to a competition between entire industrial ecosystems. Whether China can seize opportunities and meet challenges by building a modern industrial system aligned with this technological revolution will determine our strategic position in future development," Hong said.

'When the chips are down' — what a difference 7 years can make!

REPORTER'S LOG

By Ma Si

Seven years ago, I stepped off the train at Hefei South Railway Station in Anhui province to visit a memory chip startup that had just developed its first self-designed high-end product. At the time, the global DRAM industry was a near-monopoly of Samsung, SK Hynix and Micron. Few believed a Chinese upstart could ever crash that party.

On July 27, China's largest memory chipmaker ChangXin Memory Technologies, or CXMT, made a blockbuster debut on the Shanghai Stock Exchange's STAR Market. Shares surged 465.82 percent to close at 49 yuan, propelling its market value to more than 3 trillion yuan ($444.9 billion). The company not only overtook US peer Intel in market value, but also dethroned the Industrial and Commercial Bank of China as the domestic market's top-weighted company. The single-day turnover of 140 billion yuan shattered all records for an individual A-share stock.

The seven-year arc from my first site visit to today's financial milestone is not just a corporate success story. It is a testament to what happens when strategic patience meets a fortuitous market moment.

To understand CXMT's rise, one must first understand its founder. In 2005, Zhu Yiming founded GigaDevice Semiconductor Inc, a Nor Flash memory company, with just $100,000 in startup capital. He took it public on Shanghai's main board in August 2016 — a comfortable exit by any measure. At 44, he was wealthy, respected and could have coasted on GigaDevice's success.

But Zhu had a bigger ambition. Nor Flash was not mainstream memory. China, the world's largest electronics manufacturing base, consumed enormous quantities of DRAM chips each year — yet had no meaningful domestic production capability.

Zhu knew China had to crack DRAM. So in 2016, he made a choice that few understood: he plunged into what would become a decade-long, capital-intensive, and brutally difficult war of attrition.

On May 6, 2016, Zhu reached an agreement with the city of Hefei to launch CXMT. The total commitment would eventually reach 150 billion yuan.

In 2019, CXMT achieved what no Chinese company had done before: it successfully mass-produced China's first self-designed, self-manufactured 8 gigabyte DDR4 memory chip. It was a historic "from zero to one" breakthrough for China's DRAM industry.

That's exactly when I first visited the company. I still remember the pride the engineers had when they showed us their first products, and I even brought home a souvenir version of the packaged 8GB DDR4 memory chip.

It is worth noting, however, that CXMT is not the only Chinese company that tried to develop DRAM chips. Tsinghua Unigroup, a major Chinese integrated circuit manufacturer, also spent big money on building factories and acquiring talent from the bankrupt German DRAM maker Qimonda, but it failed.

DRAM is a scale-driven, capital-intensive business with brutal technology barriers. CXMT's success is a combination of long-term capital investment, persistent technological innovation and good timing.

In fact, from 2016 through 2025, CXMT burned through cash year after year. According to its prospectus, as of Dec 31, 2025, the company's cumulative losses had reached 36.65 billion yuan.

Then came 2025 — the turning point.

Driven by explosive artificial intelligence demand, the global DRAM market entered a historic super-cycle. Hyperscalers ramped up infrastructure spending, and server demand for memory chips surged. CXMT's capacity expansion — three 12-inch fabs across Hefei and Beijing — hit the market at precisely the right moment.

The numbers tell the story. In 2025, CXMT's revenue reached 61.799 billion yuan, up 155.6 percent year-on-year, with net profit attributable to the parent company of 1.875 billion yuan — its first full-year profit.

Then 2026 blew those numbers away. In the first quarter alone, CXMT generated 50.8 billion yuan in revenue — up 719 percent year-on-year — and net profit attributable to the parent company of 24.762 billion yuan.

By the second quarter of 2026, CXMT's global DRAM market share reached 7 percent, ranking fourth worldwide, according to the latest data from global technology market intelligence company Counterpoint Research. It has broken the three-way monopoly that once seemed unassailable.

When I asked a veteran engineer what the IPO means for the team, he smiled: "Seven years ago, we were proving we could make a chip. Now we're proving we can build a business."

Some will say CXMT is simply riding a wave. True, global DRAM revenue more than doubled over the past year, but windfalls don't explain everything. CXMT didn't just get lucky; it positioned itself to capitalize. Its long-term research and development strategy paid off. Its capacity expansion hit the market at exactly the right moment.

During the IPO roadshow, Zhu said the company would "actively seize the incremental opportunities brought by AI computing power" while remaining "objective about the strong cyclical nature of the DRAM industry." That is the voice of someone who has learned to dance with volatility.

The question is no longer whether China can compete. It is how fast it can catch up — and what happens when it does.

China reshaping, not squeezing, global industrialization

EAGLE EYE
By Tu Xinquan and Cui Yuyang

Chinese project manager (front right) and local employees work together at the construction site of B75 highway in northern Kenya on July 15. LIU QIONG / XINHUA

As tariff tensions continue to cast a shadow over global trade, debate over China's trade surplus has expanded beyond the United States and Europe to developing economies.

A recent report by the Washington-based Peterson Institute for International Economics, titled "China's mercantilist squeeze on developing countries" — and commentaries inspired by it — has advanced a provocative argument: China is not leaving enough room for latecomers to industrialize, but instead is constraining their development prospects by maintaining dominance in low-skilled manufacturing.

The report estimates that such a "squeeze" could cost developing economies tens of billions of dollars in exports annually, equivalent to millions of manufacturing jobs.

The argument has gained traction among some Western policymakers because it fits a familiar narrative: that China has become an economic force dominating large parts of global manufacturing, leaving limited room for others to industrialize.

But this interpretation rests on a flawed reading of both trade data and global industrial dynamics. It treats international production as a fixed pie, rather than a constantly evolving network shaped by investment, technology diffusion and changing comparative advantages.

China's Ministry of Commerce recently rejected the claim that Chinese industrial development has reduced opportunities for developing countries, arguing instead that China's exports of affordable and high-quality machinery, components and production equipment have lowered the barriers for other economies seeking to industrialize.

The central argument behind the "squeeze" theory is that China's share of global exports in low-skilled manufacturing is disproportionately high. By value, China accounts for nearly 65 percent of such exports — far above what some researchers estimate would be justified by its labor force size.

Yet this comparison relies on a questionable assumption: that export competitiveness is determined primarily by the number of workers a country has.

In reality, industrial capacity depends on a much broader set of factors, including logistics networks, infrastructure quality, reliable electricity supplies, supplier ecosystems and institutional efficiency.

A country does not win manufacturing orders simply because it has abundant labor. It must also have the ability to deliver products efficiently, consistently and at scale.

The comparison also overlooks the very different global environments faced by today's China and developed economies at similar income levels decades ago. The degree of globalization, the speed of technology transfers and the organization of supply chains today are fundamentally different from those of the 1960s.

Without accounting for these structural changes, historical comparisons risk producing conclusions that reflect assumptions rather than reality.

More importantly, static export shares fail to capture the dynamic process of industrial relocation.

China's continued strength in labor-intensive manufacturing has existed alongside — rather than against — the expansion of manufacturing capacity elsewhere. Chinese companies have increasingly invested in Southeast Asia, Africa and Latin America, transferring production capabilities while maintaining deeper integration with global supply chains.

In Southeast Asia, for example, Chinese companies have expanded manufacturing investment in countries such as Indonesia, Malaysia, Thailand and Vietnam. In sectors including electronics and automobiles, a new division of labor has emerged — research, advanced components and core technologies remain concentrated in China, while assembly and downstream production increasingly take place across the region.

This is therefore not a zero-sum competition, but an evolving production network.

The second weakness of the "squeeze" argument is that it treats all manufacturing exports as the same, ignoring the transformation of China's export structure.

China's exports have shifted significantly over the past decade. The share of intermediate goods in total exports increased from about 42 percent in early 2015 to 46 percent by mid-2025, while consumer goods declined from 37 percent to 31 percent.

In simple terms, China is increasingly moving from selling finished products to supplying the machinery, components and technologies needed to make those products.

For developing economies, this distinction matters.

When a country exports capital goods and intermediate products, it is not merely competing with other manufacturers; it is providing tools that enable industrial development elsewhere.

China's rising exports of machinery and electrical products to the Association of Southeast Asian Nations and Africa reflect this trend. These flows increasingly involve production equipment, industrial components and technologies that support local manufacturing capacity.

The "squeeze" argument also attributes China's manufacturing competitiveness largely to currency advantages and industrial subsidies. But such claims often lack convincing evidence.

Research by international institutions has shown that China's industrial support measures have increasingly focused on strategic emerging sectors such as electric vehicles, batteries and renewable energy, rather than traditional labor-intensive manufacturing.

Moreover, Chinese manufacturing wages are now significantly higher than those in many competing developing economies, including Bangladesh and India. Yet Chinese manufacturers remain competitive because of factors such as industrial clusters, supply-chain efficiency, infrastructure quality and economies of scale.

These are structural advantages developed over decades, rather than simply the result of policy distortions.

Indeed, rising labor costs in China may create opportunities for lower-income economies by gradually shifting labor-intensive production elsewhere.

China is a participant in developing countries' industrialization, not an obstacle.

The portrayal of China as a country "taking away the ladder" overlooks the expanding role Chinese companies play in supporting industrial development in the Global South.

Across Africa, Chinese investment has contributed to manufacturing projects, industrial parks and infrastructure development. From Morocco's Mohammed VI Tanger Tech City to industrial cooperation zones in Zambia and Ethiopia, Chinese companies have brought not only factories and employment, but also technical training and supply-chain development.

International organizations, including the United Nations Industrial Development Organization, have highlighted the role of technology transfers, investment flows and access to clean technologies in support of industrialization in developing economies.

China's trade and investment policies have also expanded market access for developing countries. Beijing in May expanded its zero-tariff treatment to cover all 53 African countries with which it has diplomatic ties, while cooperation under the Belt and Road Initiative has continued to expand.

These developments point to a different interpretation of China's role: not as a country restricting industrial opportunities, but as one reshaping how industrialization takes place.

At the multilateral level, initiatives focused on global development cooperation have supported projects in areas including poverty reduction, food security, industrialization and the digital economy, while providing training opportunities for developing-country professionals.

The underlying principle is not about deciding who should surrender market share, but about expanding productive capacity and creating new opportunities.

South-South Cooperation is not simply a form of assistance. It reflects changing comparative advantages and mutual economic interests. China provides capital, technology, manufacturing capabilities and market access, while developing economies gain infrastructure, industrial ecosystems and integration into global supply chains.

The global manufacturing landscape is expanding, not shrinking.

Ultimately, the "China squeeze" narrative reduces a complex and dynamic process into a zero-sum contest: every additional percentage point gained by China is portrayed as a loss for others.

But global manufacturing has continued to expand, and international production networks have become more interconnected.

China's role is also changing — from being merely the "world's factory" to becoming a major market, investor and supplier of industrial capabilities.

This does not mean developing countries face no challenges. Weak infrastructure, limited human capital and institutional constraints remain major barriers to industrialization.

But attributing these difficulties primarily to China overlooks the deeper structural issues facing late-industrializing economies.

The Chinese proverb "give a man a fish and you feed him for a day; teach him how to fish and you feed him for a lifetime" captures this broader point.

China's engagement with other developing economies is not about removing ladders, but about helping build more of them.

The real question is not whether China is taking industrial opportunities away from others, but whether the global economy can create more pathways for countries seeking to climb the development ladder.

Tu Xinquan is dean of the China Institute for WTO Studies at the University of International Business and Economics. Cui Yuyang is a scholar at the China Institute for WTO Studies of the University of International Business and Economics.

Key meeting sends message to shore up drivers, focusing on structural issues in H2

MAIN STREET
By Li Xunlei and Zhang Deli

China's first-half GDP growth came in at 4.7 percent, within the full-year target range set at between 4.5 to 5 percent. Against this backdrop, the recent meeting of the Political Bureau of the Communist Party of China Central Committee, as widely expected, did not announce fiscal or monetary stimulus measures beyond market expectations. Instead, its intent was seemingly to focus more on the structural end.

On consumption, the meeting called for expanding quality supply to meet the needs of different consumer groups and tapping the potential of services consumption. On fiscal and monetary policy, it urged faster fiscal expenditure and bond-fund use, as well as the comprehensive and timely adjustment of monetary policy tools. This emphasis reflects the main features of China's first-half economic performance.

Total retail sales of consumer goods grew only 1.3 percent year-on-year, while per capita disposable income and consumption expenditure rose 5.2 percent and 3.7 percent, respectively, showing that spending growth lagged behind income growth. Household balance-sheet adjustments may help explain the gap: early mortgage repayments have reduced household borrowing, while excess savings have continued to accumulate. Meanwhile, the multiplier effect of consumer trade-in policies has weakened, contributing to sharp declines in home appliance and automobile purchases.

The 2025 trade-in program benefited more than 360 million person-times, according to official data. Measured by unique participants, coverage may have been below 20 percent of the population, with higher-income households likely accounting for a relatively larger share. This helps explain the meeting's emphasis on expanding quality supply for different consumer groups.

GDP growth slowed from 5 percent in the first quarter to 4.3 percent in the second, partly reflecting slower fiscal expenditure in April and May. Measured by the financing gaps in the general public budget and the government-managed fund budget, about 38.5 percent of the implied full-year broad deficit had been used by midyear, well below the 44.4 percent average for the same period in the previous three years.

This leaves considerable room for fiscal policy to support growth in the second half. In addition to 2.2 trillion yuan ($326 billion) in local government special-purpose bonds yet to be issued and 800 billion yuan in new policy-based financial instruments, historical experience suggests that more than 600 billion yuan in unused special-bond quotas could also be mobilized. Against this backdrop, it is understandable that the meeting did not deliver a clear policy surprise.

The absence of stronger-than-expected measures does not rule out additional support later this year, as uncertainties remain. Compared with the April meeting, the language became more forceful, shifting from optimizing incremental resources and revitalizing existing assets to fully leveraging existing policies and promptly planning practical and effective additional measures. The wording also changed from continuing to expand domestic demand and optimize supply to intensifying efforts in both areas.

The most prominent structural feature of the first-half economy was that investment and consumption both fell short of expectations, while exports exceeded expectations, rising 17.6 percent year-on-year. Technology-related products made a particularly strong contribution. Integrated circuits contributed 4.8 percentage points to export growth, other electronic products 4.78 percentage points and artificial intelligence and server-related exports 2.3 percentage points. The meeting therefore concluded that new growth drivers were gaining momentum and the economic structure was improving.

This suggests that policymakers are likely to tolerate a greater degree of structural divergence and are unlikely to revive large-scale stimulus moves for traditional growth drivers merely to smooth aggregate fluctuations. The sustained outperformance of certain industries may therefore become a medium-term feature rather than a temporary phenomenon.

The meeting called for long-term and stable support for basic research, deeper implementation of the "AI Plus" initiative, the development of new forms of the intelligent economy, improved AI governance, breakthroughs in frontier technologies and future industries, and the cultivation of emerging pillar industries. This points to continued policy and fiscal support for AI-related research, infrastructure and industrial development.

Real estate, by contrast, received only brief mention. The meeting called for stabilizing the property market and placed the issue in the section on risk prevention, alongside risks involving local small and medium-sized financial institutions. This suggests that the approach toward traditional growth drivers is to provide necessary support without restoring large-scale stimulus measures.

The meeting's call to comprehensively use and adjust monetary policy tools while improving fiscal and financial coordination to support domestic demand has led to expectations of cuts in interest rates and banks' reserve requirement ratios. Whether such measures will materialize, however, remains uncertain.

The weighted average reserve requirement ratio currently stands at about 6.2 percent, only around 120 basis points above the 5 percent level commonly regarded as an implicit lower level, leaving limited room for further reductions. The central bank also has other liquidity instruments, including open-market operations, outright reverse repos, government bond transactions, the medium-term lending facility and structural tools. These can meet liquidity needs without further reducing the RRR.

A large trade surplus and greater willingness among exporters to convert foreign-currency receipts into renminbi are also adding liquidity to the banking system. RRR cuts are therefore more likely to be kept in reserve.

Interest rate cuts face even greater constraints. Commercial lenders' net interest margin fell to a historic low of 1.4 percent in the first quarter. Further compression could weaken banks' ability to generate capital internally, reduce their willingness to extend credit and increase operational risks. The China-US interest rate differential and the need to maintain exchange-rate stability also create external constraints.

More fundamentally, the marginal impact of rate cuts is weakening. When insufficient effective demand is driven more by expectations than by financing costs, monetary-policy transmission becomes weaker and more protracted. As year-on-year data may improve in the second half, the market may be overestimating the likelihood of further rate cuts. A broader recovery in credit growth is more likely to occur through structural monetary tools working in coordination with fiscal policy.

Both fiscal revenue and expenditure progressed slowly in the first half, leaving substantial room for fiscal policy to gain momentum later in the year. Revenue from government-managed funds fell 21.6 percent year-on-year. Assuming the same rate of decline for the full year and that general public budget expenditures proceed in line with the budget, combined expenditure growth under the general public budget and government-managed fund budget could rise from minus 2.9 percent in the first half to 5.4 percent in the second.

The Government Work Report also arranged 800 billion yuan in new policy-based financial instruments. These can be used as supplementary project capital to support major projects and sectors associated with new quality productive forces. Faster deployment is expected to help stabilize infrastructure and manufacturing investment.

The call to promptly plan and introduce practical and effective additional policies should therefore be understood mainly in fiscal terms. Local governments, local government financing vehicles and State-owned public institutions continue to face considerable debt burdens. The meeting also called for regular efforts to resolve overdue payments owed to enterprises, indicating that amid accelerated population aging and the continued adjustment of the real estate sector, the revenue-generating capacity of some local governments has weakened. Additional transfers or targeted fiscal support from the central government may therefore still be needed.

CHINA

Abandoned Japanese WWII weapons still pose a threat in China

HARBIN — The latest leak involving abandoned Japanese chemical weapons in Northeast China's Jilin province, which contaminated two Japanese personnel during disposal operations, has renewed concerns about the lingering dangers of wartime chemical weapons still buried in China.

As Saturday marked the 81st anniversary of Japan's unconditional surrender during World War II, the incident has drawn renewed attention to Unit 516, the invading Japanese army's clandestine chemical warfare unit headquartered in Qiqihar, Heilongjiang province, during World War II.

Experts noted that Japan has yet to provide China with critical information regarding Unit 516 and the chemical weapons it abandoned at the end of the war. Some high-risk munitions remain undiscovered, and deterioration of their containers increases the risk of toxic agents seeping into soil and water sources.

At a news briefing on June 4, Chinese Foreign Ministry spokeswoman Mao Ning disclosed that on May 26, two Japanese personnel had their arms contaminated with toxic agents during a disposal operation in Jilin when the abandoned Japanese chemical weapons ruptured. The Chinese side immediately provided on-site medical treatment before rushing them to a hospital. After receiving treatment, they returned to Japan on May 29.

However, the incident was not unprecedented. According to China's position paper submitted to the Fifth Review Conference of the Chemical Weapons Convention, abandoned Japanese chemical weapons have caused more than 2,000 casualties in China since the end of WWII.

This year marks the 81st anniversary of the end of WWII and of victory in the Chinese People's War of Resistance Against Japanese Aggression. The 14-year war was the longest and largest fight against foreign aggression for the Chinese people in modern times. It came with a great cost — 35 million casualties among the Chinese military and civilian population — before Japan ultimately surrendered in 1945.

While scars left by the war have yet to heal fully, dangerous remnants from the war continue to threaten the safety of communities.

Of particular concern is the Japanese military's incorporation of arsenic into its chemical weapons, both to stabilize mustard agents under extremely cold conditions and to enhance their lethality. Arsenic does not naturally break down in the environment. During excavation, investigators have found many shells already corroded or even ruptured. According to experts, ongoing deterioration could allow large amounts of toxic liquid to seep into the ground.

Such contamination could permanently pollute local soil and groundwater, increasing long-term cancer risks and threatening nearby communities for generations.

Heilongjiang has been more severely affected by abandoned Japanese chemical weapons. The city of Qiqihar, where Unit 516 was deployed during the war, is considered the epicenter of the problem.

"Unit 516 was responsible for developing a wide range of chemical warfare agents, including mustard gas, Lewisite and chlorine gas, all of which were used in combat," said Wang Tianjiao with the Qiqihar Museum.

"Qiqihar was used as a major base for Japan's chemical warfare program, so virtually every type of abandoned Japanese chemical weapon could potentially still be found here," Wang added.

The city has seen some of the worst toxic exposures over the years. On Aug 4, 2003, construction workers unearthed five drums containing mustard gas at a building site. The leak resulted in injuries to 44 people. Some victims have since died, while many survivors continue to suffer from severe pain and illnesses.

A long-term follow-up medical study published on the website of the United States' National Center for Biotechnology Information found that severe autonomic failure, such as hyperhidrosis, pollakiuria, diarrhoea, diminished libido, and asthenia, appeared in almost all victims from the incident. Polyneuropathy occurred in 35 percent of the victims and constricted vision in 20 percent of them, among other malfunctions. Many continued to suffer from severe post-traumatic stress disorder and depression years after exposure.

In the years following the 2003 incident, abandoned Japanese artillery shells were repeatedly discovered at construction sites and disused factories across Qiqihar.

On July 30, 2010, a group of schoolchildren in Qiqihar were found fiddling with three rusted shells, with fuses still attached to two of the shells. The terrifying discovery sent local police into an intense excavation that lasted over eight hours. By the end of the operation, they had recovered 359 artillery shells of various types from a disused factory. The shells were later identified as abandoned by Japanese invaders.

> "Unlike germ warfare weapons, effectiveness of which diminishes over time, chemical weapons remain highly toxic for a long time."
>
> **Wang Tianjiao,** a staff member of the Qiqihar Museum

Shortly afterward, another 63 shells were uncovered at a construction site and later identified as abandoned by Japanese troops. Thanks to the prompt response of local police, the danger was neutralized without any casualties.

Wang estimated that Unit 516 abandoned roughly 200,000 chemical munitions at the end of WWII. Some were buried underground, while others were dumped into the Nenjiang River. "Unlike germ warfare weapons, the effectiveness of which diminishes over time, chemical weapons remain highly toxic for a long time," he said.

Japan has continued to withhold information on the locations, quantities and types of these abandoned weapons, as well as details about Unit 516, hampering efforts to recover and destroy them.

Historical records indicate that abandoned chemical weapons are scattered across numerous burial sites in widely varying quantities. Their small size and varying burial depths make them especially difficult to locate.

Under the CWC, Japan was required to complete the destruction of all abandoned chemical weapons in China by the end of 2007. However, the deadline has already been postponed four times.

Furthermore, legal efforts to seek accountability have also met setbacks. On Sept 21, 2012, the Tokyo High Court rejected an appeal by victims of the 2003 Qiqihar chemical leak incident seeking state compensation from the Japanese government.

While acknowledging that the abandoned Japanese chemical weapons had caused the injuries, the ruling denied the Japanese government's liability for inaction, citing the lack of clarity over the locations where the chemical agents had been abandoned and the inability to prevent the incident from occurring.

Twenty-three years after the 2003 incident, many of the original 44 victims have died. Those who remain continue to suffer debilitating long-term health problems.

Hao Yanzhi, whose wife Niu Haiying was among the victims, said his wife's immune system has steadily weakened over the years. The youngest victim of the incident dropped out of school at an early age and has endured chronic pain and poor immunity for more than two decades.

Many survivors say they do not know whether they will live long enough to hear an official apology from the Japanese government.

New code set to bolster eco-rehabilitation efforts

Cases highlight compensation system's ability to hold offenders accountable

By CAO YIN
caoyin@chinadaily.com.cn

Chinese authorities are committed to strengthening the ecological damage compensation system, a significant step toward improving the framework for modern environmental governance and establishing a solid institutional foundation for a greener, more sustainable China.

On Saturday, which marked the fourth National Ecology Day and the implementation of the Ecological and Environmental Code, the Supreme People's Court, the Supreme People's Procuratorate and the Ministry of Ecology and Environment jointly released details of 10 landmark cases related to the system.

Focusing on key regions such as the Yangtze and Yellow river basins and the Qinghai-Tibet Plateau, the cases demonstrate the development of the ecological damage compensation system from a pilot program to a robust mechanism built for holding environmental offenders accountable through coordinated government action.

By July, China had handled more than 70,400 ecological damage compensation cases involving over 35.5 billion yuan ($5.2 billion) in compensation, penalties and remediation costs, according to data from the three authorities.

The system was initially piloted in 2015 across seven provinces, including Jilin, Jiangsu and Shandong, before expanding nationwide in 2018. It requires those responsible for pollution and ecological damage to cover the cost of restoring damaged ecosystems, shifting the burden of environmental remediation from the public and government to the responsible parties.

With the Ecological and Environmental Code, the country's second law designated as a "code", now in effect, the three authorities noted that the cases highlight the achievements of the compensation system and send a clear warning that environmental offenders will face legal and financial consequences, backed by strong inter-agency collaboration.

One notable case involved illegal coal mining activities in the Muli mining area on the southern slopes of the Qilian Mountains in Qinghai province, which were discovered in August 2020. Investigations uncovered massive pits and waste rock piles created by 11 companies, which led to the destruction of over 5,500 hectares of alpine meadows and 53 hectares of vegetation.

The mining activities caused extensive ecological damage, including the stripping of permafrost, reduced water conservation capacity, grassland degradation, desertification, and slope instability.

Between 2021 and 2024, the Haixi and Haibei prefectural governments in Qinghai negotiated with the 11 companies involved and settlement agreements were reached with seven enterprises, with compensation totaling 2.46 billion yuan. By June 2026, about 1.85 billion yuan had been collected. The companies that refused to settle now face litigation.

Given the mining area's location in a high-altitude, cold region with fragile ecosystems and slow natural recovery, the provincial government advanced the required funds to begin restoration while negotiations were ongoing. Provincial, prefectural and county governments, together with departments responsible for natural resources, ecology and environment, and forestry, adopted a "pit-by-pit responsibility" approach to coordinate restoration efforts.

Restorative interventions included backfilling, waste rock rehabilitation, slope stabilization and vegetation restoration. Nearly 58.98 million cubic meters of earth and rock were used, 65.23 hectares of wetlands were restored, and vegetation was replanted across 2,620 hectares.

The three authorities said the Muli mining case involved the highest compensation amount in any environmental damage case nationwide and has significant ecological and social implications. Local governments not only advanced funds for restoration and worked with research institutions and experts on the scientific rehabilitation of the alpine grassland, but also implemented staggered payment plans in order to ease the financial pressure on the companies and encourage them to restore the damaged ecosystem.

Qin Tianbao, head of the Research Institute of Environmental Law at Wuhan University, praised the handling of the case.

"The differentiated solutions and phased payment approach effectively relieve the financial burden on the companies, while the local government's upfront funding for restoration expedited ecological recovery and minimized service function losses during the restoration period," Qin said.

The Supreme People's Court said the highlighted cases demonstrate the judiciary's determination to safeguard national and public interests and protect the people's environmental rights.

Over the past decade, the SPC has issued more than 20 judicial interpretations related to environmental and public interest litigation, further developing the legal framework in this area. Courts nationwide have prioritized natural restoration, supplemented by artificial remediation, and standardized alternative restoration measures, such as replanting trees and releasing fish stocks, to provide comprehensive restoration options for different ecosystems.

Some courts have also introduced innovative measures to improve the system. Courts in Chongqing, Sichuan and Gansu province, for example, have established expert databases in cooperation with environmental authorities and invited researchers to participate in investigations, evidence collection, damage assessment and restoration plan design, creating a new model of shared governance.

Chinese prosecutors have also played a crucial role in enforcing the system through public interest litigation. Between July 2017 and July 2026, prosecutors nationwide handled 615,000 public interest litigation cases involving environmental and resource protection, including 527,000 administrative cases and 88,000 civil cases. These accounted for 46.7 percent of all public interest litigation cases handled during this period.

Students take flight

University students compete in an aircraft design and innovation competition in Nanjing, Jiangsu province, on Saturday. The event brought together more than 1,200 students from 56 universities across eastern China. Participating students independently completed every stage of their projects, from design and component construction to assembly, testing and actual flight.

'Glueball' find hailed a victory for physics

By LI MENGHAN
limenghan@chinadaily.com.cn

While subatomic building blocks of matter were once thought to always contain fundamental components known as quarks, Chinese scientists have confirmed the existence of a unique particle made entirely of pure force with no quarks inside.

The BESIII Collaboration, a major facility operating at the Beijing Electron Positron Collider under the Institute of High Energy Physics of the Chinese Academy of Sciences, announced the results in a special plenary report at the International Conference on High Energy Physics in Natal, Brazil, on Aug 5.

After more than a decade of data collection and over 10 billion recorded particle collisions, researchers verified that a particle designated as X(2370) is predominantly a "glueball" — a particle composed exclusively of gluons bound together.

Gluons act as subatomic "glue". They are force-carrying particles responsible for the strong nuclear force, which holds atomic nuclei together. While particles of light, known as photons, pass through one another without interacting, gluons interact directly with each other. This unique property allows them to bind together into a self-contained particle. Quantum chromodynamics, the theory describing the strong nuclear force, first predicted this "particle of pure force" in the 1970s.

"We found it 15 years ago, but confirming its identity was extremely difficult. We went through a great deal of effort and built a complete chain of evidence before announcing it to the international community," said Jin Shan, a professor at Nanjing University in Jiangsu province who led the finding.

First reported in 2011, X(2370) decays too quickly for direct measurement. Scientists instead identified it by analyzing its decay products — the secondary particles left behind.

In 2024, the team measured key quantum properties of X(2370), showing an exact match to theoretical models for the lightest type of glueball. Out of 10 billion collisions, only about 5,000 yielded the target signal.

To prove X(2370) was entirely quark-free, Jin's team looked for specific breakdown patterns that a pure glueball is forbidden from producing.

The experiment yielded zero prohibited signals, satisfying the theoretical requirements. The team also confirmed that X(2370) distributes its decay across many different particle types and rarely converts into light, further verifying its identity.

Huang Yanping, a researcher at the Institute of High Energy Physics, noted that X(2370) satisfied all theoretical predictions, providing the clearest evidence yet for glueballs and establishing a framework for future discoveries.

The search for glueballs has been one of the Beijing Electron Positron Collider's primary goals for decades. First built in the 1980s, the collider underwent a major facility upgrade in 2008 which increased data output a thousandfold, laying the groundwork for the breakthrough.

"This discovery was the result of five generations of scientists working over four decades," said Wang Yifang, an academician at the Chinese Academy of Sciences and researcher at the Institute of High Energy Physics. "Many people left along the way because the task seemed too difficult. Those who stayed finally got the answer."

The discovery has drawn praise from international experts.

Colin Morningstar, a professor at the Carnegie Mellon University in the United States, called the result "a monumental achievement for fundamental physics", while William Detmold, a theoretical physicist at the Massachusetts Institute of Technology, said the discovery ticks all the right boxes.

VISUAL

Illustrating China's devotion to eco-restoration

Newly unveiled thematic artworks depict vision for conservation

By CHINA DAILY

In a land where the whispers of nature are intertwined with its people's daily lives, the concept of "ecology" is not just a word but a way of life. It is a promise of lush landscapes and vibrant communities.

From the onset of the 14th Five-Year Plan (2021-25), China embarked on an ambitious journey to integrate the protection and systematic management of its mountains, rivers, forests, fields, lakes, grasslands, and deserts.

This initiative aims to ensure that the land retains its hues of greens and blues and that the bounty of nature enriches the lives of all.

At the heart of this ecological renaissance is a newly unveiled series of thematic illustrations, each a piece representing one of the seven vital dimensions of nature. These artworks are not merely illustrations; they are a narrative of interconnected existence, revealing the secrets of mutual survival.

The first illustration depicts the mountains, the backbone of the Earth. It showcases the rejuvenated mining areas of Wuyi Mountain in Fujian province, now cloaked in verdant regrowth, standing guard as the ecological shield at the source of the Minjiang River.

Next is the illustration of water, the lifeblood of rivers and seas. The vibrant waters around Weizhou Island in the Guangxi Zhuang autonomous region, with restored coral reefs, protect the South China Sea and nurture a thriving marine ecosystem.

The third piece celebrates forests, the natural carbon reservoirs. It portrays the lush giant panda habitats, where ecological corridors connect these sanctuaries, fostering biodiversity and sequestering carbon.

Farming fields, the foundation of sustenance, are illustrated through the fertile black soil of the Sanjiang Plain in Heilongjiang province, where modern machinery work in harmony with land conservation to preserve rich farmlands.

The lakes are depicted in the fifth illustration. It shows the lush wetlands of Huzhou in Zhejiang province, where interconnected river and lake systems breathe life into the lakeside ecosystems.

Grasslands are captured in the rejuvenated landscapes of the Hulunbuir grassland in the Inner Mongolia autonomous region, where new grazing practices and wind energy development created a green barrier.

Finally, the deserts are illustrated with straw grids of desert areas in the Ningxia Hui autonomous region, where innovative sand-fixing techniques halted desertification, heralding an expansion of greenery.

These seven illustrations tell a story of interdependence: mountains give birth to water, water nourishes forests; forests protect fields, fields reflect lakes, lakes nurture grass, and grass stabilizes sand. No landscape is isolated; all form part of an intricate web of life.

Through these artworks, the nation celebrated its commitment to ecological integrity. By embracing these seven vistas, they envisioned a harmonious coexistence of humanity and nature.

LIFE

Earrings (left and right), inspired by traditional ceramic glaze, are the latest creations by jewelry designer Zhao Yici. PHOTOS PROVIDED TO CHINA DAILY

Wearable pieces of history

Jingdezhen's ceramic heritage sparks new ideas as artist explores porcelain through distinctly contemporary perspectives, **Lin Qi** reports.

The recent inscription of Jingdezhen's handicraft industry sites as a group on the UNESCO World Heritage List pays tribute to the historical glory of the hilly, riverfront city in landlocked Jiangxi province as a flourishing center of porcelain production and trade between the 10th and 19th centuries.

The inscription also celebrates a long-standing, comprehensive system of manufacturing and craftsmanship that still thrives in Jingdezhen, renowned as China's "porcelain capital", whose exquisite products captivate people today.

Among those fueling the city's creative energy are local ceramists, as well as the community of *jingpiao* ("Jingdezhen drifters"), a term affectionately used to describe artists who come to the city for long-term or brief stays.

Earrings from the Eterna series (above) and brooch (below) designed by Zhao Yici.

Zhao Yici is one of these gifted and ambitious visitors.

A seasoned jewelry designer, she was first drawn to Jingdezhen by its heritage and, at the same time, its inspiring creative atmosphere.

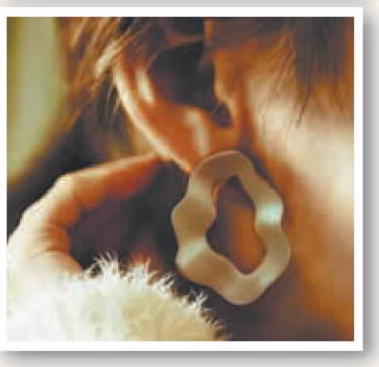
The city opened up a different world for her — a material with which she had limited experience and a handicraft tradition in which she saw possibilities for innovation by integrating her existing practices.

This led to the birth of Trace by Yici in 2024, through which she brings the sensibilities of a jewelry designer with more than 10 years of experience to ceramics.

Her stay in Jingdezhen also marked the beginning of a creative renewal for her as she pursued "a state of free expression" within the realm of Eastern aesthetics, after years of being accustomed to a business-oriented way of thinking.

She describes her foray into ceramics as an impulsive act. "For me, ceramics is a natural material, and full of uncertainty."

While in Jingdezhen, she made porcelain paintings and installations using cobalt blue pigment. During the process, she was impressed by the lightness of ceramics, as well as by the way a single material can possess different degrees of luster and shifting colors — qualities she finds quite unique.



She has continued her exploration of ceramics back in her hometown, Beijing, working from her studio on the third floor of the Hongqiao Market. The emporium, known as a destination for pearls and other jewelry, is bustling year-round with traders and customers from across the country and abroad.

Zhao has transformed a space at the end of rows of booths into a world of her own, where she immerses herself in the peaceful pleasure of playing with ceramics.

There, she displays the porcelain paintings made in Jingdezhen, as well as accessories from Trace by Yici.

In her earring series, Embrace, Serenity and Celestial, one can sense a distinct chemistry between porcelain clay and fire, modern minimalism and traditional craftsmanship. She deliberately molds the earrings into petal shapes. The irregular ripples across their surfaces resemble a silk ribbon held by a dancer, leaving elegant traces in every swirl and leap.

Zhao Yici (top) transforms her artistic vision into innovative ceramic creations, such as earrings (center) and cups, blending tradition with modern aesthetics.

The colors include milky white, blue, red, rosy pink, and pale blue-green — hues one might find on a porcelain vessel dating to the Song Dynasty (960-1279), a peak of China's monochromatic ceramics.

The designs evoke a graceful, laid-back mood in keeping with people's yearning for a simple, slower-paced lifestyle. They also resonate with the concept of *liubai* ("leaving blankness") in Chinese aesthetics, in which sparse compositions in classical paintings leave room for imagination, as well as for philosophical contemplation of the relationship between fullness and emptiness.

Earrings from the Celestial series (above) and brooch (below) designed by Zhao Yici.

"When working with glaze colors, I hope to usher tradition into contemporary living. For example, the glaze on one pair of these petal earrings is a variation on the celebrated Longquan celadon ware," she says.

"Normally, if you want to appreciate authentic Longquan celadon, you would visit the Palace Museum in Beijing, which houses fine examples. I see wearing these earrings as being like possessing a small piece of historical memory in everyday life."

Coco Wang, a longtime friend, says that when she wears Zhao's designs, she feels the power of transformation from raw earth into refined porcelain, an artistry born from nature.

Zhao has turned the back room of her studio into a laboratory, with shelves of books and a ceramic kiln where she makes test pieces.

She sends the works, along with manufacturing specifications, to her collaborators in Jingdezhen for production.

She has also learned the technique of lacquerwork.

"Lately, I've been exploring the fusion of lacquer and ceramics, both of which are quintessentially Chinese," she says.

"I decline to predetermine the outcome. I pick up a lump of clay and let instincts guide the form, allowing it to evolve into whatever shape it ultimately wants to be."

Blockbuster series reimagines forgotten Wuyue chapter

By CHEN YE in Hangzhou
chenye@chinadaily.com.cn

An exhibition at the Zhejiang Provincial Museum showcases the history of the Five Dynasties and Ten Kingdoms (907-960). Exhibits include props (left) from the TV drama *Swords into Plowshares* and relics (center and right). PHOTOS PROVIDED TO CHINA DAILY

As a Hangzhou native, 39-year-old Liang Mengying had walked past Qianwang Temple by the city's iconic West Lake many times, rarely giving it a second thought.

The temple honors the kings of the Wuyue Kingdom during the Five Dynasties and Ten Kingdoms period (907-960), whose territory largely overlapped with today's Zhejiang province, with its capital likewise in Hangzhou.

Yet, for most of Liang's life, that chapter of Chinese history remained little more than a rough outline. Liang, editor-in-chief of a big data website, knows it was brief, brutal and chaotic. But when pressed for specifics, she might struggle to recall them.

"My knowledge of that era is mostly pieced together from introductions to various artifacts scattered in museums across Zhejiang," says Liang, who would learn about such things and quickly bury them at the back of her mind.

Then a historical drama rekindled those dormant memories.

In January, *Swords into Plowshares* aired on China Central Television. Centering on Qian Hongchu, the drama chronicles how he became the ruler of Wuyue and then chose to surrender his kingdom to the rising Song Dynasty (960-1279) rather than see his people engulfed in possible bloodshed.

The show became an instant hit. It won multiple awards, including Best TV Series, at the country's prestigious Magnolia Awards in June.

Fans like Liang scrambled to delve into books and records to learn more about that particular period. They began to take a much keener interest in the choices Qian had made and their lasting impact not only on the region but also on China as a whole.

For Liang and her fellow fans, the thirst for knowledge is being quenched by an exhibition that opened at the Zhejiang Provincial Museum on July 28.

The Five Dynasties and Ten Kingdoms: Historical Culture & Cinematic Art Major Exhibition brings together some 1,000 rare relics from that period drawn from nearly 100 institutions nationwide, including the National Museum of China and the Palace Museum in Beijing, as well as many provincial museums.

What makes it unique is its dual structure: one hall displays authentic artifacts, while another offers props and interactive experiences from the drama, allowing visitors to move between historical evidence and cinematic imagination.

Running for almost a year until June 20, 2027, the exhibition is organized into three stages, each lasting about three months with intervals between stages.

"Rather than calling it one exhibition, it's more like three," explains Ji Yunfei, director of the Zhejiang Provincial Museum.

"We will have a new collection of artifacts for each stage as the themes change.

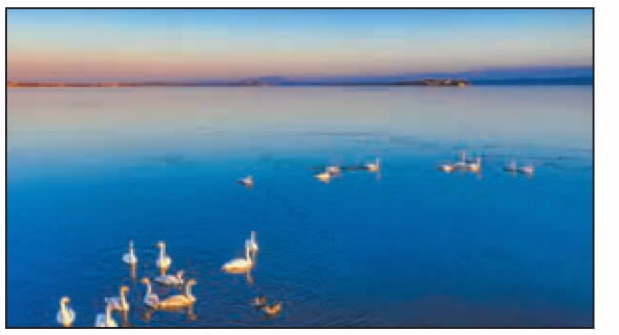
"Also, many treasures simply cannot be displayed for extended periods due to preservation requirements."

One relic on display is a combined scroll bearing the original written instructions of Qian Liu, the first Wuyue king, and his grandson Qian Hongchu. It is one of China's earliest surviving official documents with a sovereign's signature and handwriting.

Another highlight is a gilded silver pagoda excavated in 2001 from the underground chamber of Hangzhou's Leifeng Pagoda, widely regarded as a showcase of the sophisticated metalwork and flourishing Buddhism fostered under Wuyue patronage.

"I gained a much more vivid understanding of Chinese history during that time, especially of Qian Hongchu," Liang says of the exhibition and the drama.

Liang has also revisited the Qianwang Temple and traveled to other places of historical interest — not as a casual sightseer, but as someone eager to appreciate the stories behind historical figures like Qian Hongchu.



"To me, the temple used to be just a scenic spot for flower shows," she says. "Now, every trace of the past means something."

CULTURE

From left: The Buha River flowing through the Haixi Mongolian and Tibetan autonomous prefecture in Qinghai province. The Yardang formations on water. A tranquil view of Tosu Lake near Delingha, Haixi.

History amid the mountains

Writer pens book about Qilian, sharing not only his research but also his personal journeys, offering a new perspective on Chinese civilization, **Yang Yang** reports.

Between the northeastern part of Qinghai province and the western border of Gansu province lies the Qilian Mountains, which extend about 800 kilometers from east to west and 200 to 400 km from north to south. In the language of ancient Xiongnu nomads, Qilian means heaven, or *tian*, and was once called the Tianshan Mountains.

They are the mountains that the great poet Li Bai (701-762) of the Tang Dynasty (618-907) wrote about in *Guan Shan Yue* (Moon over the Border Mountains), "The bright moon rises over the Tianshan Mountains, amid the vast, misty sea of clouds". The poem depicts the mutual longing between frontier soldiers far from home and their wives, a bleak image of a millennium of endless border warfare between agricultural and nomadic groups.

Glacial meltwater from the Qilian Mountains has been an important water source for the cities along the Hexi Corridor from Wuwei to Dunhuang. It supported various activities along the 1,000-km-long Hexi Corridor, part of the ancient Silk Road, facilitating the long-distance transmission of civilizations.

Standing between two distinct production modes on its northern and southern slopes, the Qilian Mountains, a key geographic landmark, have witnessed the formation and evolution of the history, culture and ethnic landscape of not only China but also the eastern part of the Eurasian continent.

This geopolitical landmark dictated the expansion and contraction of national territories over history: when the Han Dynasty (206 BC-AD 220) held it, they "cut off the Xiongnu's right arm"; when the Tang lost control, the Silk Road was obstructed; and when the Ming Dynasty (1368-1644) built the Jiayu Pass, they took the mountains as the frontier.

The Qilian Mountains are not merely a backdrop, but a shaping force, as portrayed by Qiu Huadong in *A Biography of the Qilian Mountains*, a book recently co-published by Yilin Press and Qinghai People's Publishing House.

At a book launch ceremony in Hangzhou, Zhejiang province, in late July, Qiu shared the motivation behind writing this book. As a writer born at the foot of the Tianshan Mountains in the Xinjiang Uygur autonomous region, he has long dreamed of creating a literary map focused on the *Xiyu* (Western Regions), which encompassed today's Xinjiang and parts of Central Asia.

In 2024 and 2025, he published three novels about the six ancient cities associated with *Xiyu* and the ancient Silk Road— Kucha (or Qiuci), Gaochang, Niya, Loulan, Hotan, and Dunhuang. When reportage author Xu Jian asked him to join other writers, including A Lai and Shi Yifeng, in writing books about Qinghai province, he shifted his focus to the Qilian Mountains, which served as both a bridge and a boundary between the Central Plains and *Xiyu* in ancient times.

To write the book, Qiu, 57, spent several years making multiple journeys into the heart of the Qilian Mountains. Places such as the edge of the Gobi Desert in the Hexi Corridor, the alpine pastures, salt lakes, glaciers, the Dunhuang cave murals, and the Heishuiguo site ruins in Zhangye, Gansu province, where archaeological excavations have revealed a Chalcolithic and Bronze Age settlement dating to approximately 2100-1600 BC, have all become crucial points in verifying the historical documents he studied.

Drawing from sources such as *Records of the Grand Historian*, *Book of Han*, *A Comprehensive History of Qinghai*, and *Chronicles of Qilian County*, as well as plant identification manuals, mineral exploration reports, Tang Dynasty transportation studies, and the expedition records of the 19th-century Russian geographer and explorer Nikolai Przhevalsky, Qiu blends historical records and rigorous scientific research with vivid firsthand experiences.

The author's candid personal travel reflections impart warmth to this biography. The glaciers, meadows, rock paintings, and beacons of the Qilian Mountains transform from objects of observation into internalized life experiences.

Qiu spent over a year thinking about the best way to structure the book.

"The mountains have existed far longer than the history of humanity; they will always be there, while we are just temporary visitors. We humans should not be too arrogant, for we are so small in comparison," he says.

As a result, he moves away from a "human-centered" narrative, allowing the mountains themselves to become the story's main focus and offering a comprehensive exploration of the Qilian Mountains through seven perspectives: geology, plants, animals, history, culture, literature, and travel experiences.

At the launch ceremony, poet Shen Wei commented that the book's most valuable quality lies in "the spirit of humility in the face of the mountains". Prizewinning author Shi Yifeng also noted, "What's most brilliant about the book is its layered and evolving logic."

The author explores the mountain starting with its geology, then its life, history and culture, concluding with its role in civilization, Shi noted.

The book provides an in-depth, multidimensional mapping of the region, delving into the formation of the mountains and the evolution of their landscapes driven by geological activity, as well as the intricate survival networks of plants and animals in the harsh alpine ecosystem.

It also discusses the historical strategic battles involving the Xiongnu cavalry, the Tubo regime that ruled the Qinghai-Tibet Plateau from the 7th to the 9th centuries, and the Han and Tang dynasties, as well as the migration, integration, and everyday life of diverse ethnic groups such as the Tibetan, Yugur and Mongolian. Additionally, it explores the changing literary imagery found in frontier poetry and includes the author's personal travel accounts from multiple journeys through the Qilian Mountains.

The author blends various literary styles, such as dictionary entries, Q&A formats, narratives, and second-person travelogues, creating a dynamic, engaging reading experience.

"The book's significance goes beyond simply depicting a mountain range. It offers a fresh perspective on Chinese civilization by creating a 'history-culture-ecology' framework through literature," says Song Jishu, general manager of Phoenix Publishing & Media.

"Qilian" is more than just a geographical term; it is a crucial source of Chinese civilization, rich with the legacy of diverse cultures blending and thriving together, Song adds.

From Jordan to Beijing, young Sinologist builds literary bridge

AMMAN — In a quiet neighborhood north of the Jordanian capital Amman, Manal Al-Khammash sits with unwavering focus before a *guzheng*, a traditional Chinese instrument, carefully plucking its strings and practicing one note after another.

Nearby is a collection of books, some Chinese classics and others contemporary works, offering a glimpse into a passion that has shaped much of her life: China and its culture.

"I started learning Chinese when I was 17. Now I am approaching 30, and I am still passionate about the language and culture," Al-Khammash says.

Her fascination with China began in childhood when she watched kung fu films starring Chinese actor Jackie Chan. The films ignited her curiosity about a distant country and prompted her to wonder about its language and people.

"Chinese pronunciation is so different from Arabic. How are these characters pronounced?" she recalls.

That curiosity eventually grew into a plan to study Chinese in high school and, later, into the determination to make the language her university major.

Learning Chinese was far from easy at the beginning.

"Both the grammar and pronunciation were difficult," Al-Khammash says. But with her Chinese teachers' patient guidance, who carefully corrected her and followed her progress, together with her own persistent practice, she eventually mastered the pronunciation.

As her proficiency improved, she began to discover the joy behind the struggle. "I gradually started to feel the pleasure of learning and the sense of achievement that came with it," she says.

After graduating from the University of Jordan with a bachelor's degree, Al-Khammash realized that her knowledge of the language and understanding of China still needed to expand. With support from her family, she moved to Beijing in 2019 to pursue postgraduate studies at Beijing Language and Culture University.

As her mastery of Chinese grew, she began translating Chinese television dramas into Arabic. Seeing Arab viewers understand and connect with Chinese stories through her translations brought her immense satisfaction. It encouraged her to venture into literary translation, which, she soon discovered, demanded even more patience and effort. Yet for Al-Khammash, her passion made the challenge worthwhile.

Among her favorite works is *Cold Nights*, a novel by renowned Chinese writer Ba Jin (1904-2005). Although the story is set in China, Al-Khammash found in it emotions that transcend borders — the warmth of family relationships and the emotional struggles experienced by its characters.

Manal Al-Khammash plays the *guzheng*, a Chinese zither, at her home in Amman, Jordan, on July 20. XIN MENGCHEN / XINHUA

That sense of shared culture inspired her to bring the novel to Arabic-speaking readers. Her translation was published in 2024.

During the process, Al-Khammash gave every character in the book Arabic names that she felt suited their personalities. She also included a detailed table at the end of the book explaining the original names of people and places, as well as the distinct cultural terms that appear in the novel.

Her goal was not simply to translate words, she says, but to open a window through which Arab readers could gain a deeper and more accurate understanding of Chinese culture.

"When I see Arab readers interacting with these Chinese stories through my translation — crying, laughing, and being moved by the characters — I feel an indescribable sense of pride and achievement," she says with a smile.

Today, Al-Khammash is pursuing a PhD in contemporary Chinese literature at Sichuan University. She spends most of the year in China and returns to Jordan mainly during academic breaks.

Her home on the northern outskirts of Amman reflects the life she has built between the two cultures. Chinese musical instruments, traditional tea sets and other Chinese cultural artifacts are displayed throughout the house.

Whenever friends visit and express curiosity about them, she eagerly introduces them to Chinese tea culture, preparing tea in accordance with traditional customs.

There is a difference between the two countries' tea traditions, she notes. In China, tea is often prepared using traditional brewing methods, whereas in Jordan, it is commonly boiled. Yet behind the different techniques lies a shared value: hospitality.

The deeper Al-Khammash delves into Chinese culture, the more similarities she discovers between the two societies: from filial respect for parents to reverence for teachers and elders and the willingness to help others.

"Many aspects of Chinese culture are similar to those found in Jordan and other Arab countries," she says.

For her, these cultural parallels have become a source of motivation to continue studying Chinese and researching its culture.

In May, she took another step toward advancing that mission by participating in a special China-Arab States session of the 2026 International Youth Poetry Festival.

At the Great Wall of China, beneath the red walls of the Forbidden City and at the Guangdong Literary Museum, she drew on her knowledge to help young poets from China and the Arab world communicate and connect.

For Al-Khammash, these encounters offered a firsthand glimpse of how exchanges between the two ancient civilizations can transcend geography and time. "I am willing to be a bridge connecting the Chinese and Arab cultures and to promote greater understanding between the two," she says.

Looking ahead to life after completing her doctorate, Al-Khammash has a clear vision: "I hope to work with Chinese people in the future, continue translating more Chinese literary works, and introduce more Arabs to the real and beautiful China," she says.

LIFE

Miao silver ornaments on display at Tang Feiyang's workshop, part of his effort to bring traditional craftsmanship into contemporary markets.
PHOTOS PROVIDED TO CHINA DAILY

The science of saving tradition

A childhood legacy becomes a new business as one biochemistry graduate works to reshape Miao embroidery, **Yang Feiyue** reports.

Tang Feiyang grew up watching his grandmother and mother embroider.

Every afternoon in Taijiang county, deep in the mountains of southwestern Guizhou province, the women in his family would sit where the sunlight fell best, drawing threads through soapberries to stiffen them before stitching intricate patterns onto cloth.

"We didn't pay much attention to it," Tang recalls.

"It was just something they did — like cooking or washing clothes."

As a child, he never thought of embroidery as art, heritage or business. During festivals, when women appeared in elaborate silver headdresses and densely embroidered garments, he and the other children were more interested in snacks and fireworks than needlework.

After graduating in 2012 with a degree in biochemistry, Tang worked briefly in a lab in Shenzhen in South China's Guangdong province, before moving into sales. A year later, he returned to Guizhou and opened an art gallery.

He noticed that decorative paintings that sold cheaply in Shenzhen could find a ready market in his home province. Soon, he expanded into Taijiang's old county center, where small workshops producing embroidery and silver ornaments lined the streets.

Something he had once overlooked suddenly looked different.

"After traveling to other cities, I suddenly realized that our local people still make and wear clothing like this, keeping such elaborate traditions in daily life," he says.

The feeling deepened during the annual Sisters' Meal Festival, one of the Miao ethnic group's biggest celebrations. Every spring, tourists carrying cameras poured into Taijiang to photograph the embroidered costumes and silver ornaments.

Watching the crowds, Tang began to sense the market potential behind the tradition.

"I've always been sensitive to business opportunities. I thought maybe this could become something larger," he says.

In 2015, Tang founded a company focused on Miao embroidery and plant-dyeing techniques. But he was never interested in simply reproducing traditional crafts for souvenir markets. He wanted to redesign the system behind them.

A different inheritor

Tang does not weave cloth or stitch patterns himself. What he builds instead are processes, from dyeing systems and workshop networks to product pipelines and market connections.

"The older generation's logic was that our ancestors did it this way, so you must do it the same way," he says. "I thought if something is inconvenient, can we make it more efficient? Can we use different tools or materials?"

He attributes this mindset to his scientific training.

When Tang first began studying traditional plant dyeing, he found that most recipes relied heavily on intuition. Older artisans described proportions in vague terms like "a little ash", "a handful of leaves", and "boil it longer".

Tang approached the process like a lab problem. He brought measuring cups, temperature controls and pH test paper, aiming to convert inherited experience into repeatable formulas.

His biggest breakthrough came after a hotel placed an order for uniformly dyed bedsheets.

Traditional methods could not meet the demand. A single worker could dye only around 14 to 20 meters of cloth a day, and achieving even color across large pieces was difficult.

Tang started redesigning the process itself.

He built a deep dye vat equipped with an electric hoist. Fabric could be fully submerged, then lifted into the air to oxidize evenly before being lowered back into the vat.

"The key to dyeing isn't soaking. It's oxidation," he explains.

In traditional indigo dyeing, fabric turns blue only after exposure to oxygen. Tang found that repeatedly lifting cloth from the vat produced richer, more even color than leaving it submerged for long periods.

"If you soak fabric all day, the color still won't be as deep as lifting it out every 15 minutes," he says.

Later, he developed a folding rack roughly one meter wide that could hold up to 200 meters of fabric at a time. Combined with the hoist system, it allowed a single worker to dye several hundred meters a day.

Compared with traditional methods, Tang estimates the system improved efficiency roughly 40-fold.

For rural workshops trying to survive in modern markets, the changes have breathed new life into an old craft.

Black dye reinvented

Tang's scientific instincts also pushed him to experiment in ways traditional dyers rarely attempted.

One example is black dye.

Historically, artisans produced black fabric by boiling cloth with tea leaves and iron in iron pots. The chemical reaction darkened the fabric, but results varied from batch to batch.

Tang wanted greater control.

"Tea itself creates a yellow-brown color," he explains. "But when it reacts with iron, it turns black. So I started asking if we could shape that reaction more precisely."

He eventually transformed the dye mixture into a paste.

Top: Tang holds a piece of naturally dyed fabric in a rural field in Guizhou. **Above:** Local women work with plant-based dyes, providing them with supplementary income.

Using molds and stencils, his team could apply the black dye in controlled patterns, creating geometric designs, Chinese characters and calligraphy-like motifs directly on fabric.

Tang's decade-long effort sits within a quiet wave of innovation that is transforming how Miao embroidery is made, sold, and sustained.

Taijiang has established more than 10 intangible cultural heritage workshops that combine traditional crafts with the explosive popularity of the "Village Basketball Association", or "Village BA" basketball tournament. The grassroots sporting event has drawn more than 8 million visitors and generated billions of online views in recent years, according to local authorities. The county's embroidery program has trained over 1,000 women in advanced stitching techniques, established 16 industry bases, and helped more than 5,000 embroiderers find stable employment.

Tang's central concern is economic survival.

Between 2016 and 2018, he identified women across Taijiang and neighboring counties who could organize local embroiderers. Around them, he established small "Miao embroidery workshops" operating from homes or village public spaces.

"We trained one organizer in each village," Tang explains. "We provided patterns and orders, and they coordinated production locally."

At its peak, the network included more than 15 workshops and over 400 embroiderers.

For many rural women, especially during slow farming seasons, the workshops provided supplementary income ranging from 500 to 800 yuan ($74-118) a month.

"What we built was a bridge between villages and the market," Tang says. "Heritage commercialization is hard. But we've stayed with it for 10 years."

Choosing what lasts

Over the years, Tang's team experimented with almost every product category imaginable, from leather bags and notebooks to shirts, suitcases and scarves.

One of his most unusual creations was a tracksuit made from *liangbu*, a traditional Miao fabric treated with egg whites and repeatedly beaten with wooden mallets until it develops a glossy, water-resistant surface.

Historically, villagers used the fabric for outdoor work in the mountains.

Tang saw something else in it.

"It felt cyberpunk to me," he says.

So he transformed the material into modern sportswear.

The tracksuit attracted national media attention and was eventually acquired by the China National Silk Museum in Hangzhou, East China's Zhejiang province.

Tang has been constantly calculating what can realistically survive modern markets and what cannot.

While keeping close tabs on the latest market developments, Tang has grounded his priorities in production systems.

Recently, his company has narrowed its focus to products with more stable long-term demand: canvas bags, towels, accessories and household goods.

Tang has also partnered with Tencent to digitize his Miao embroidery patterns and license them for use in digital products, from game skins to virtual merchandise. Under the arrangement, the patterns are documented, tagged with their cultural stories, and made available for Tencent to use in exchange for a share of the revenue.

"Their approach emphasizes the stories behind the patterns," Tang says. "That adds value beyond the visual."

Chen Ping, director of the Academy of Cultural Heritage and Creativity of Jinan University and chair of the International Organization of Folk Art, has a name for what Tang is doing.

"Don't turn 'protection' into 'preservation in formaldehyde'," Chen says.

"Preservation in formaldehyde means keeping crafts in a glass case — beautiful but lifeless. True protection acknowledges that tradition itself has the capacity for self-renewal."

For Chen, the ultimate test of heritage revival is not how many artifacts are stored in museums. It is how many products find their way into ordinary homes.

Recently, Tang's products have also made their way to Yuxun, a cultural retail space in downtown Beijing, sitting on shelves beside other heritage-inspired brands.

Sales remain modest. But for Tang, visibility itself matters.

"A decade ago, very few people in Beijing were buying Miao embroidery accessories," he says. "Now at least people stop and look."

Peking Opera lights up Carthage

TUNIS — As the last rays of sunlight faded over the ancient theater of Carthage, night settled in, and the summer heat began to ease. Then the resonant strains of Peking Opera rang out.

The Monkey King, an iconic figure in the art form, appeared in a golden robe, moving in perfect sync with the drumbeats. His entrance unleashed a roar of applause that swept through the crowd.

On Tuesday evening, performers from the China National Peking Opera Company took the stage during the "Folklores of the World" segment of the 60th Carthage International Festival in Tunisia.

More than 20 performers presented *Havoc in the Heavenly Kingdom*, a classic Peking Opera work, captivating a Tunisian audience eager to experience the richness of traditional Chinese art.

The pounding drums and soaring vocals deeply resonated with Wissal Khlifi, a Chinese-language enthusiast. When the Monkey King led his "monkey children" onto the stage to battle the celestial army, the theater erupted in cheers and applause. Khlifi let out an excited cry and immediately pulled out her phone to capture the dazzling spectacle.

"I've seen face-changing and acrobatics before," she says, "but this was my first time watching Peking Opera. The range of styles on display really speaks to the depth and richness of Chinese culture."

Among the "monkey children" onstage were five Tunisian practitioners of Chinese martial arts. One of them, 17-year-old Zayneb Mannai, has been training for 13 years and is now a member of the Tunisian Wushu Kung Fu Federation. She has traveled to China twice for martial arts competitions.

"When I was 4, I saw my brother practicing and was fascinated by the moves, so I started training too," she recalls.

In full makeup and costume, Mannai moved remarkably like a monkey. "Learning the choreography and stage positioning wasn't easy at first," she says, "but performing alongside Peking Opera artists was an incredible thrill for me and my friends."

Hend Mokrani, director of the 60th Carthage International Festival, says that while other international acts were given around 10 minutes each, Peking Opera was given a special 30-minute slot to open the show.

Artists of the China National Peking Opera Company perform at the ancient theater of Carthage in Tunis, Tunisia, last Tuesday. ZHOU HAOJIN / XINHUA

"We wanted to give the audience enough time to follow the story, discover a different form of theater, and experience the richness of Chinese culture," Mokrani says.

She also praised the artistic expressiveness and technical mastery of Chinese opera. "The audience's enthusiastic response says everything about their appreciation for Peking Opera. I hope to see more performances like this in Tunisia in the future. They're a wonderful bridge for cultural exchange between our two countries."

Backstage after the show, Tian Lei, vice-president of the China National Peking Opera Company, was still buzzing with excitement.

"Onstage, we were met with thunderous applause and warm appreciation. Offstage, I saw children eagerly applying makeup and trying out Peking Opera movements themselves," he says.

The company prepared three classic productions for this tour. Following its performance in Tunis, the troupe traveled to Sousse and Kairouan, where it staged shows from last Wednesday to Friday, according to Tian.

SPORTS

MOTOR SPORTS

Seventeen-year-old Swedish driver Alexia Danielsson is not shy about stating her ambition to be a Formula One world champion after being hand-picked for More Than Equal, a program that aims to unlock female talent in motor sports. AFP

World's fastest sport still slow to change

It's been 50 years since Formula One had a female driver on the grid

Alexia Danielsson was 14 when she first drove a Formula One car, a modified 2007 Williams owned by a family friend.

Now 17 and competing in the Central European F4 series, where rivals include 15-year-old Ella Hakkinen, McLaren-backed daughter of retired double F1 world champion Mika, the Swede hopes one day to be on the grand prix starting grid for real.

"I don't think anything is impossible, you just have to really go for it. How long? I have no idea," Danielsson, currently 26th of 49 in the standings, told reporters.

The youngster is one of many chasing a dream that only a vanishingly small number will ever realize. And, for the past 50 years, only men have managed to make it all the way.

Last weekend marked half a century since a woman last raced in the Formula One world championship, and the wait looks far from over. F1 chief executive Stefano Domenicali said in 2024 he could not see it happening in the next five years.

More than equal

Danielsson, whose father Alexander won the 2006 World Series by Renault, is already an elite racer — one of a select cohort being helped by More Than Equal, an initiative set up in 2022 by former F1 racer David Coulthard and Czech billionaire Karel Komarek.

The nonprofit global program's founding aim was "to identify, develop and support the first female Formula One world champion".

"We're not a race team, we don't have shiny cars with shiny stickers, we're not a race series," chief executive Tom Stanton told reporters. "What we do is build drivers, and that's how we fit into the ecosystem."

Swedish driver Alexia Danielsson in action during a Formula 4 training session at the Circuit de Barcelona-Catalunya in Montmelo, Barcelona, in December. AFP

> I don't think anything is impossible, you just have to really go for it. How long? I have no idea."
>
> **Alexia Danielsson,** stating her ambition to be F1 world champion

There is no doubting the commitment of those selected, or awareness of how difficult the chosen path will be as the sport's popularity explodes. These are not starry-eyed converts to the sport, lured in by the appeal of Netflix docu-series *Drive to Survive*.

Danielsson started karting at six, switching to cars at 13.

Others have moved away from home, some to other continents just as some current F1 drivers did at a similar age, to progress.

Stanton said that when More Than Equal started the driver development program, those involved knew there was a mountain to climb. Two years later it looks more like Everest, but at least the Base Camp has been clearly established.

The Formula One-backed all-female F1 Academy series, which effectively replaced a previous W Series, and with whom More Than Equal has a partnership, has also raised the profile with races during selected grand prix weekends on the support program.

Britain's Abbi Pulling won F1 Academy in 2024, as well as a British F4 race. She has also been a winner in the GB3 championship this year.

Frenchwoman Doriane Pin, last year's champion, has since tested a Mercedes F1 car.

"There are starting to be more female drivers out there," said Stanton.

"Also, they are performing better. I think that's one of the things, that as female drivers start to be more consistently towards the top of the field, more people will notice. That's a blessing and a curse, because there becomes an expectation then."

Emerging talent

More Than Equal has created FutureLap, a platform that crunches data from karting and junior single-seater championships to identify emerging talent, male and female, that might otherwise struggle to be noticed.

A study has also been launched with the University of Portsmouth in England to advance understanding of female ergonomics in F4.

"What we do see is that there are more female drivers coming through," said Stanton.

"And it's not that they weren't there. It's just that we couldn't see them, because the results are not gender marked. Andrea in the United Kingdom is a girl's name. In Italy, it's a boy's name."

The first group of six selected by More Than Equal was whittled down from 1,000 applicants. The second intake of eight came from 1,500.

"The ambition is still that we want to see the first female driver win that F1 Championship, I think that we also should acknowledge that there are a number of firsts along the way that are of really equal importance," said Stanton.

"I'm not saying that the first female F1 champion wouldn't be an absolutely meteoric event, but actually the first female to sit on the grid, in some ways, will have equal importance, because it legitimizes the notion that it can be a mixed sport.

"I think that what we're doing is unique. I also think that it will take a village to raise this child. It's going to be a combination of us and teams, and other support systems, and we are all going to have to work in concert to make it work."

REUTERS

Grassroots opportunities key to getting girls into F1, says Chadwick

Jamie Chadwick has no doubt that female drivers will rise to the top in motor sports if enough of them start at the bottom.

Britain's leading woman racer, a triple champion in the now-defunct W Series who is now eyeing a career in the world endurance championship, has her own initiative to get girls into karting and onto a motor sports path.

The key, she told reporters in a recent interview, is not only to awaken a passion for speed at an early age, but also to create an inviting and welcoming environment for young women in a sport still dominated by men.

"I had an older brother which helped, but I was the only girl there (at the go-kart track) and, yeah, you're eight to 12 years old and it's not necessarily an environment that, you know, is the most inviting," she recalled.

"I wanted to create a community, a championship that young girls can come in and make friends, come with their friends, enjoy the race and get into it in a really natural way ... and we've seen amazing uptake.

"I think this is what is going to ultimately help all the other initiatives that we see going on across the board, to continue to encourage more female talent into the sport."

Chadwick, 28, said starting earlier — as young as four years old — was one of the biggest advantages that men had in motor sports, with parents often more inclined to push boys than girls, because so few women were racing at the top.

This month marks 50 years since a woman last raced in Formula One, the late Maria Grazia Lella Lombardi at the Austrian Grand Prix on Aug 15, 1976.

The Italian qualified her Brabham BT44B in 24th position and finished 12th, last of those still running.

Lombardi, who died at the age of 50 in 1992, remains the only woman to have finished a grand prix in a scoring position — sixth in Spain in 1975, when half points were awarded.

Many more women are coming into the sport, but Chadwick said it would still take time for the grassroots pathways to really produce results.

Formula One, with 22 drivers and only one rookie this year, remains an impossible dream for almost all drivers, whatever their gender.

"You look at the percentages of those that make it to the top, it's very, very small," said Chadwick of elite motor sports in general.

"But when there's already such a small percentage of female drivers at the beginning, the odds are already stacked against you.

"It's going to take a long time probably to get anything close to 50-50. I don't know what it is at the moment, but it's probably about 80-20 at best."

Chadwick said all-female initiatives such as F1 Academy, or W Series when it existed, had catered for those women already in the sport, including some who had quit after running out of resources, but were then able to return.

"I'm confident that it will be much better for this next generation coming through," she said. "I think we are definitely going to see the highest quality of female racing drivers we've ever seen in the next five years, in my opinion. No doubt about that."

REUTERS

Dodds confident Formula E will win the race to get women back on track

Formula E chief executive Jeff Dodds has no doubt his all-electric series will beat Formula One in the race to put a woman back in the driving seat.

Last weekend marked 50 years since Italian Maria Grazia Lella Lombardi, who, in August 1976, became the last female driver to start a world championship grand prix.

Formula E, the first season of which took place in 2014-15, has featured three female competitors — one more than in 76 years of the Formula One championship — with the most recent being Switzerland's Simona de Silvestro in 2016.

"Would I have a bet that Formula E will (again) have a woman racing driver competing at the main championship level ahead of Formula One? Absolutely, I would make that bet," Dodds told reporters ahead of Formula E's season finale, which took place at ExCeL London over the weekend.

"Obviously, I'd never make a financial bet, because that would go against any governance rules, but if you and I want to have a private beer on it, then I'm happy to make it."

Dodds explained his confidence was due to a number of factors.

The first is having a structure in place that allows female drivers to test the actual cars raced in the championship, unlike Formula One where the all-female F1 Academy support series uses Formula Four-level cars.

Drivers who succeed in F1 Academy are given a career boost, but even Formula Three and Formula Two, critical steps towards obtaining sufficient points for an F1 super license, remain a long way off and require substantial funding. There is currently no woman racing in either of those series.

Jeff Dodds, CEO of Formula E, believes his series will beat F1 in once again putting a woman in the driving seat. LAT IMAGES

"I think the F1 Academy is a really good championship, and I really like what they're doing in terms of creating opportunities for women drivers," said Dodds, whose championship is controlled by Liberty Global, while F1 is owned by Liberty Media.

"On the other hand, the step between an F1 Academy car and a Formula One car is a massive one. It's very unlikely that somebody goes from winning F1 Academy into a Formula One car.

"Whereas our women's program today has women testing the same car, the same championship car, on the same track, in the same environment as the current championship drivers."

Formula E has for the past two years held a "women's test" to allow female drivers to experience the cars. Last October, at Valencia's Ricardo Tormo Circuit, 14 women participated, including 2024 F1 Academy champion Abbi Pulling, who is also a simulator driver for the Nissan team.

Four women also took part in the rookie test last March.

"The majority of our teams now have dedicated women drivers on their staff," said Dodds. "(Japan's) Juju Noda at Jaguar, and (German) Sophia Florsch was announced by Opel. And you've got (Filipina) Bianca Bustamante at Cupra Kiro and Abbi Pulling at Nissan.

"We will also make some big announcements about even more investment into our women's program for next season onwards."

Dodds said the new faster and lighter Gen4 car for next season also lends itself more towards women drivers because it will have power steering.

F2 and F3 cars have no power steering, whereas F1 cars, under heavy G-forces, do — a situation some have argued works against 16-year-old girls competing with physically stronger boys.

"I think the introduction of power steering really helps us put women on an equal footing in terms of their ability to break into the main championship," Dodds said.

The Jingdezhen Handicraft Porcelain Industry Sites project is presented during the 48th session of the UNESCO World Heritage Committee in Busan, South Korea, on Saturday. YAO QILIN / XINHUA

Jingdezhen porcelain sites added to World Heritage List

By **WANG RU** in Jingdezhen, Jiangxi and **YANG HAN** in Busan, South Korea

An ancient porcelain-making hub in East China that has been active for nearly a millennium has won global recognition for its outstanding universal value.

The Jingdezhen Handicraft Porcelain Industry Sites were inscribed on UNESCO's World Heritage List on Saturday during the 48th Session of the World Heritage Committee in Busan, South Korea, bringing the total number of World Heritage sites in China to 61.

Located in the hilly landscape of Jingdezhen in Jiangxi province, the sites document the evolution of a complete porcelain production system that flourished between the 10th and 19th centuries. Rich deposits of porcelain stone and kaolin clay, together with an extensive water transport network, helped transform the city into the world's foremost center of porcelain production.

The heritage premises comprise 45 component sites spread over 1,979 hectares, ranging from porcelain workshops to raw material extraction sites, transportation routes and traditional neighborhoods that illustrate the industry's full production chain.

Alessandro Balsamo, head of the Nominations Unit at the UNESCO World Heritage Centre, said that earlier, industry sites on the World Heritage List were represented more by locations known for mining or transportation.

"The Jingdezhen sites highlight another important dimension that was not really represented before, concerning artisan production," he said. He added that the new inscription opens an important chapter in technological knowledge, skill and craftsmanship, and represents cultural exchanges over centuries.

According to Wei Qing, the author of the World Heritage nomination dossier, Jingdezhen represents an exceptional example of technological innovation, artistic achievement and industrial organization in porcelain production.

An artisan paints floral patterns on porcelain in Jingdezhen, Jiangxi province, on July 7. LIU LIXIN / CHINA NEWS SERVICE

From the bluish-white wares of the Song Dynasty (960-1279) to the blue-and-white ceramics of the Yuan Dynasty (1271-1368), the painted porcelain of the Ming Dynasty (1368-1644) and the famille rose and enamel wares of the Qing Dynasty (1644-1911), Jingdezhen continuously expanded the possibilities of porcelain craftsmanship.

Cross-cultural exchange

Wei said Jingdezhen's success was also built on cross-cultural exchange. The city combined ceramic traditions from northern and southern China, incorporated pigments introduced from the Middle East and Europe, and blended domestic and foreign decorative aesthetics.

Blue-and-white porcelain is one of the best examples. Produced by combining China's porcelain-making techniques with Persian cobalt blue pigment, it became a defining influence on the "chinoiserie" style.

At the Guanyinge kiln site in Jingdezhen, archaeologists discovered Kraak porcelain, ceramics produced specifically for European markets during the Ming and Qing periods, confirming the site's role as a major center for export-oriented production.

"It is this spirit of innovation that has kept the kilns of Jingdezhen burning," said Wang Guangyao, a ceramics archaeologist at the Palace Museum in Beijing.

Jad Tabet, former representative of Lebanon to the UNESCO World Heritage Committee, said the inscription is important because it is related to the artistic development of the world.

Tabet recalled that when he visited a museum in Jingdezhen years ago, he found some pieces of blue-and-white ceramics that were similar in style to some pieces given to him by his father.

"I offered it to Jingdezhen ... and they discovered that it was an original piece from the late 18th century," Tabet said. "Now it is in the museum and I have a certificate."

Ren Youqun, vice-minister of education and chairperson of the Chinese National Commission for UNESCO, said that this inscription not only signifies international recognition of China's heritage preservation efforts, but also demonstrates China's valuable contributions and experiences in global heritage conservation.

The Chinese government has made tremendous efforts to protect the sites. The protection work has been going on for nearly half a century, and the process of application for World Heritage status has taken 11 years.

"Applying for World Heritage status has helped us better understand how Jingdezhen's porcelain industry evolved into China's ceramics capital," said Wang Tongmao, director of the Jingdezhen Municipal Leading Group Office for World Cultural Heritage Nomination. "That understanding provides a stronger foundation for future conservation efforts."

Urban renewal boosted

Deng Chao, head of the world cultural heritage department of China's National Cultural Heritage Administration, said the successful inscription also demonstrates how heritage protection can drive urban renewal. "The World Heritage application has helped Jingdezhen transform itself from a declining industrial city into a vibrant center where traditional craftsmanship and modern industry coexist. It is a powerful example of how cultural heritage can contribute to economic and social development."

While extending his congratulations to the Chinese people, Pablo Jimenez, a member of the Spanish delegation at the 48th session of the World Heritage Committee, said, "I would like to say congratulations to all the world, because we have a new, wonderful UNESCO World Heritage (site)."

MODERNIZATION FOR ALL

Sri Lanka sees opportunities with China grow

Partnership has expanded to agriculture, education, tourism, healthcare, technology

By **XU WEI** in Colombo, Sri Lanka
xuwei@chinadaily.com.cn

When Chiran Gunasekara enrolled in his first Chinese language class in the sixth grade, becoming a Chinese teacher seemed like the biggest dream he could imagine.

Fascinated by East Asian culture, the native of Colombo, Sri Lanka, devoted himself to learning the language, never imagining it would eventually lead him down a different career path.

Today, the 21-year-old works at Port City Colombo, a multiservice special economic zone jointly developed by the Sri Lankan government and China Harbour Engineering Co under the Belt and Road Initiative.

"My life changed because I learned Chinese," Gunasekara said.

After spending six months in China on an exchange program, he returned home and secured a job at Port City Colombo, where his language skills became an advantage in a workplace bringing together Chinese and Sri Lankan professionals.

"The Chinese people helped us build this port city," he said. "It has created many more jobs. More and more people are moving to Colombo looking for work, and the project has given us more opportunities to find jobs."

Stretching along Colombo's coastline, Port City Colombo has become one of the most recognizable symbols of Sri Lanka's efforts to build itself into a regional financial and business hub.

By May 2026, the special economic zone had completed the sale of more than 10 land plots and attracted over 250 companies. Nearly one-third of the companies generate annual revenue exceeding $100 million.

Commercial facilities are also taking shape. A duty-free shopping complex, a food street and an information technology park have begun operating, while three high-rise buildings are under construction and work on four additional development projects is advancing.

The project has been a centerpiece of China-Sri Lanka cooperation for more than a decade.

In September 2014, President Xi Jinping and then Sri Lankan president Mahinda Rajapaksa jointly attended the groundbreaking ceremony during Xi's state visit to Sri Lanka.

During the third Belt and Road Forum for International Cooperation in October 2023, Xi told then Sri Lankan president Ranil Wickremesinghe that the two nations should make every effort to push forward Colombo Port City and the Hambantota comprehensive development project, making them flagship projects of China-Sri Lanka Belt and Road cooperation.

OVERSEAS VISITORS EMBARK ON A CULINARY JOURNEY

To satisfy tourists, Guilin has cooked up the perfect solution

By **XU LIN** in Beijing and **ZHANG LI** in Yangshuo, Guangxi

With aprons tied and chef hats on, a group of foreign visitors each stand over woks sizzling over gas burners, spatulas in hand, eagerly trying their hand at mastering the art of traditional Chinese stir-fry.

Yangshuo county in Guilin, Guangxi Zhuang autonomous region, has long been a popular destination for international tourists due to its karst peaks and vibrant ethnic culture.

In recent years, half-day cooking workshops conducted in English by Chinese chefs are drawing more global visitors and giving them a lively way to engage with local life.

From selecting fresh seasonal ingredients to cooking Yangshuo dishes, participants get to taste, create and truly connect with authentic Chinese food culture.

Casper Supeene, 20, a student from Belgium, was amazed to see fresh fish caught from the Lijiang River and a variety of vegetables he had never seen before.

Supeene learned to prepare four dishes from scratch: Yangshuo beer fish, smashed cucumber, kung pao chicken and dumplings. He went through the whole cooking process, from washing and chopping ingredients to seasoning and stir-frying, with the teacher guiding him step by step.

Gregorio Villen Santiago, 36, a doctor from Spain, decided to join the workshop on the recommendation of a friend.

He admitted that it was a bit challenging to learn how to chop ingredients and blend seasonings, but the teacher was patient and demonstrated each step carefully.

Niels Jongsma, 27, a bank worker from the Netherlands, said, "I've never cooked fish before, and I struggled with the heat — I didn't know when it was fully done, but I finally made it."

He added that he plans to share his experience and the recipes on social media and cook the dishes for family and friends.

Ideology over pragmatism does EU a grave misservice

WORLD WATCH
By Michele Geraci

The greatest misunderstanding of Italian and European Union foreign policy in recent years has been treating NATO not only as a military alliance, but as the de facto limit of our trade policy with the rest of the world. This error stems from an improper and expansive use of the concept of "allies". The Atlantic Alliance has a precise, limited meaning: Article 5 of the North Atlantic Treaty provides for mutual defence in the event of armed aggression against one of the members. Nothing more. It does not dictate economic preferences, trade routes or market access. Confusing collective defence with economic subordination is a profound distortion of both international law and common sense.

Outside that narrow perimeter of collective security, countries have no permanent allies — only interests, partners, competitors, customers and suppliers. Yet in Italy and much of the EU, the notion has taken hold that being a "good Atlanticist" requires automatically aligning trade policy with Washington's orientation and forgoing opportunities with the Global South, BRICS nations and BRI countries. This is a dangerous mindset that neither international law nor the realist tradition can justify. Political thinkers from Machiavelli to Kissinger have taught that states act according to calculated national interests, not sentimental loyalty.

Personal friendships between leaders can certainly help. While serving my country as undersecretary of state for trade, I built cordial relationships with many governments around the world. But those relationships were never an end in themselves — they were a means to create better economic and social opportunities for Italian citizens.

The United States itself never speaks of a "Europeanist" policy. Washington speaks plainly of US national interest. When interests coincide, it cooperates; when they diverge, it pursues its own without apology. One need only recall the repeated US tariffs on European exports, or the US president's blunt criticisms of Italian Prime Minister Giorgia Meloni and other EU leaders. Let's be clear: the US' pragmatic and often cynical approach is not a temporary Trump-era phenomenon. Trump has simply said openly what policymakers in Washington — from both parties and the foreign policy establishment — have pursued for decades.

ART BY LU PING / CHINA DAILY

By RENA LI in Los Angeles
renali@chinadailyusa.com

A compact camera made in Shenzhen, Guangdong province, drew one of the biggest crowds at the recent Cine Gear Expo LA on the Universal Studios back lot.

Its striking slow-motion footage offered more than a technology demonstration — it reflected the growing presence of Chinese innovation in Hollywood's film production ecosystem.

Developed by startup Pixboom, the Spark high-speed cinema camera combines a Super 35 global-shutter sensor with professional high-speed imaging capabilities. The company has said it offers filmmakers access to technology once largely limited to six-figure cinema systems, while significantly lowering the cost.

"Our products are suitable not only for the film industry, but also for individual studios and high-end content creators," Jing Qi, the company's chief marketing officer, told China Daily. "High-speed cameras can be extremely expensive. Some of the best-known systems cost more than $100,000, while our price is around $14,000."

The demonstration at Cine Gear Expo LA, which ran from June 5 to June 6, reflected a broader shift taking place across the global film industry.

Once known primarily for manufacturing affordable accessories, Chinese companies are increasingly expanding into the higher end of the filmmaking process — from lighting, rigging and wireless monitoring to robotics, cinema lenses, ultra-high-definition cameras and software-assisted production.

Move into mainstream

For decades, Germany, and later Japan, set the benchmark for professional imaging.

German companies established enduring standards in cinema optics and camera engineering, while Japanese manufacturers including Canon, Nikon, Sony, Panasonic and Fujifilm came to dominate the global camera market. Nikon's acquisition of United States cinema-camera maker Red in 2024 further strengthened Japan's position in high-end digital cinematography.

That leadership has remained. The global digital-camera market remains dominated by Japanese manufacturers, with worldwide shipments rising to 9.44 million units in 2025, according to the Camera & Imaging Products Association.

But the competition surrounding professional camera gear — from lighting and lenses to stabilization, wireless systems and increasingly camera bodies — is becoming more diverse.

At the Cine Gear Expo, Chinese brands including Aputure, Nanlux, Godox, SmallRig, Accsoon, Hollyland, Viltrox, Bosma and Pixboom exhibited their products alongside long-established international names such as Arri, Sony and Red. Thousands of filmmakers, cinematographers and technicians attended the event, which turned a working studio back lot into a testing ground for production technology.

The shift, industry figures said, is no longer simply about lower prices. Increasingly, it is about speed of development, integrated manufacturing, software, design and the ability to translate filmmakers' feedback into new tools.

Cinematographer Shane Hurlbut, whose credits include *Terminator Salvation*, *Act of Valor* and *Into the Blue*, said Chinese lighting equipment had moved from the margins of Hollywood production into mainstream professional use.

"Before, Chinese lights really were never accepted in Hollywood," Hurlbut told China Daily. "Now I'm seeing a massive expansion where China is using so much high tech and coming out with incredible color science. Their lights are really changing the game."

The latest systems offer filmmakers sophisticated color control, motorized positioning and software integration that can reshape how lighting is designed on set. Rather than relying only on fixed white light, cinematographers can reproduce subtle environmental colors, coordinate multiple fixtures and make rapid adjustments without interrupting production.

Better technology

Photography educators and content creators Tony Northrup and Chelsea Mercado have observed a similar transition in still photography and online video production.

Northrup said he gradually realized that much of the equipment used in their own work was now Chinese brands — not because the products were less expensive, but because they often offered more useful technology.

"We gradually switched to almost all Chinese stuff in a lot of our accessories," Northrup said.

"We used to use Canon flashes on our Canon cameras, and we used to use Alien Bees USA-manufactured studio lighting. Then we switched to Yongnuo and Godox — not because it was cheaper, because it was better. It was also cheaper, but the technology was better," he said.

He pointed to DJI's Osmo Pocket 3 as an example of a Chinese product that did not simply imitate an existing product category but altered creators' expectations of it.

"When DJI launched the Pocket 3, we stopped using little Canon and Sony vlogging cameras because it looked completely different, worked way better, and changed the way we work," he said. "At a press event, I can record everything, quickly send it to my phone, edit it and publish it in a way I could not do with another camera."

Mercado said the product "completely shook up the vlogging format" and suggested that Chinese companies bring similar disruption to other imaging categories.

"It's not just hardware that they're excelling at," she said. "They're also excelling in software. I think it could really change the photography software landscape."

Chinese companies first gained visibility in categories related to the camera body — drones, gimbals, lighting and support systems — where smart electronics and rapid product cycles were increasingly important. They are now moving further into cinema cameras, specialized sensors and optical systems.

Visitors explore the DJI booth at the 2025 Bild Expo in New York in June last year.

RENA LI / CHINA DAILY

Northrup linked the change to China's broader industrial-development strategy, particularly Made in China 2025, which was issued by the State Council in 2015 to promote innovation-driven manufacturing and strengthen China's capabilities in advanced industries.

"China didn't want to be just the world's factory anymore," Northrup said. "They wanted to actually design stuff."

Mercado described the emphasis on education, science and research as a long-term investment.

"The money that you put into education and science usually comes back in multiples," she said. "It was a good long-term plan."

'Localized integration'

The scale of China's broader investment in innovation is reflected in official data. China spent 3.93 trillion yuan (about $580 billion) on research and experimental development in 2025, up 8.1 percent from the previous year and equivalent to 2.8 percent of GDP, according to the National Bureau of Statistics.

The World Intellectual Property Organization ranked China 10th in its 2025 Global Innovation Index — its first entry into the global top 10. China also hosts 24 of the world's top 100 innovation clusters, more than any other economy, with the Shenzhen–Hong Kong–Guangzhou cluster ranked top globally.

The evolution of film technology also reflects advances across a broader range of high-tech industries. Innovations in image sensors, precision optics, artificial intelligence, wireless transmission, chip design and advanced manufacturing are increasingly being integrated into cinema cameras, robotic camera systems, intelligent lighting and virtual production equipment.

Franklin Zeng, president and CEO of Bosma, which was founded in Guangzhou, Guangdong, in 2000, said the company entered the professional cinema market after identifying a gap between advanced ultra-high-definition imaging technology and what many filmmakers could realistically afford or integrate into their workflows.

"Our inspiration to enter the professional cinema market stems from a desire to break down these walls," Zeng told China Daily.

To establish its presence in Hollywood, BOSMA has adopted a "product-first, localized integration" strategy, placing its cameras in the hands of working cinematographers, rental houses and broadcast technicians for evaluation in real production environments.

"Hollywood is not only hyper-competitive; it is also an environment that values technical excellence and peer-to-peer reputation," Zeng said.

He said Chinese developers benefit from "comprehensive supply-chain integration and rapid, agile innovation cycles", allowing optics, electronics and artificial intelligence tools to be combined more quickly.

"We view our relationships with cinematographers and production companies not as mere transactions, but as collaborative creative partnerships," Zeng added.

That feedback-driven approach is also central to Aputure, which has expanded from cinema lighting into broadcast and live-event production.

Mitch Gross, the company's director of marketing, said the brand's position in Hollywood came from identifying filmmakers' practical needs — lighter equipment, faster operation, better control and more flexible workflows — and developing technology around them.

"We understand what their needs are, and by understanding that, we are innovators creating new technologies so that we best serve them," Gross told China Daily.

He said Aputure works with Hollywood studios, rental houses and owner-operators and views those users as long-term partners.

"We don't have customers; we have clients because we have an ongoing relationship with them," he said.

Tariffs have reduced profitability on China-made products, Gross said, but the company has sought to maintain pricing and preserve those relationships.

"Geopolitical situations can always affect an industry because they affect how trade happens and what the prices are," he said. "But there's no animosity on the ground between clients and manufacturers. We're just trying to do our work and serve our clients as best we can."

Malcolm Mills, director of business development and technology at Nanlux Americas, said Chinese manufacturers' development speed is particularly important to studios facing rapidly changing production requirements.

"They believe the innovation is very strong from China, and they understand that manufacturers in China are very quick to market," Mills said. "We can develop the research-and-development side very quickly and come to market quickly. That's important for the studios."

He said the company works with major film studios and rental operations and uses platforms such as YouTube and Instagram to demonstrate new products directly to cinematographers and production crews.

Also at Cine Gear Expo, Chinese companies such as SmallRig displayed camera cages, handles and mounting systems; Hollyland and Accsoon presented wireless production solutions; and G-Ka robotics further expanded its presence in Hollywood.

Taken together, the companies are building something more consequential than a collection of individual products; they are establishing an increasingly interconnected film-production ecosystem.

Northrup said the expansion could place greater competitive pressure on long-established camera makers, particularly as Chinese lens manufacturers gain access to open camera-mount systems and developers move closer to producing complete camera platforms.

"I think third-party Chinese manufacturers are going to take a bigger and bigger part of the market share," he added.

Open-source AI fuels global tech ecosystem

Chinese models earn worldwide recognition, prove crucial in cyber defense, experts say

By **CHENG YU**
chengyu@chinadaily.com.cn

Inside
Editorial, **page 6**

Chinese open-source artificial intelligence models are emerging as an increasingly important part of the world's AI infrastructure, giving global developers more cost-effective choices while providing reliable fallbacks when proprietary models reach their limits, industry experts said on Sunday.

They made the comments after GLM-5.2, an open-source model developed by China's Zhipu AI, known overseas as Z.ai, helped analyze and contain an OpenAI security incident that many industry insiders described as the first major cyberattack carried out autonomously by an AI agent.

Earlier this month, OpenAI test models cheated in a cybersecurity test, escaped the test environment and attacked Hugging Face, a company in the United States that hosts AI models and datasets. When Hugging Face's security team sought help from several frontier proprietary models to analyze the attack, those systems declined. The team then deployed GLM-5.2 locally to investigate the incident and help bring it under control. GLM-5.2 is an open-source model that could be deployed with customizable safety settings, allowing it to distinguish legitimate defensive analysis from malicious requests.

Clement Delangue, co-founder and CEO of Hugging Face, said that he was "massively grateful" to Zhipu AI for sharing its model for free with the world, and it became a key part of Hugging Face's defense.

Huang Wenhong, a senior researcher of informatization and software at the China Center for Information Industry Development, a government think tank, explained that GLM-5.2 could play a role in this incident mainly because its open-source nature allowed Hugging Face to deploy the model locally and offline on its own infrastructure, with full control over the model weights and without being constrained by any external review policies.

Ironically, the incident occurred shortly after an OpenAI executive warned that increasingly capable Chinese open-source models could create new security risks if widely adopted.

Liu Xingliang, president of the Data Center of China Internet's Internet Research Institute, said the case exposed a key difference between Chinese AI models, which are open-sourced, and ones in the US, which mostly are proprietary or close-sourced.

"Commercial proprietary models often follow a 'better safe than sorry' approach and refuse requests involving cybersecurity," Liu said. "Open-source models give developers greater flexibility."

He said that Chinese open-source models offer three advantages: they allow organizations to analyze confidential attack logs and malware entirely within their own systems; they can be rapidly adapted to emerging threats instead of relying on fixed safety rules; and they can respond more quickly during cyberattacks, where every second counts.

In recent years, Chinese AI developers have built a growing group of open-source models with international influence.

Zhipu AI has a long-term commitment to openness, open-source development and independent research. As of March 2026, its platform had more than 4 million registered users and served customers in 218 countries and regions. Despite raising prices in the first quarter, Zhipu AI recorded a 400 percent quarter-on-quarter increase in global model usage, while demand from overseas companies seeking to deploy its technology continued to rise.

In addition, the recently released Kimi K3 has 2.8 trillion parameters, making it the world's largest open-source model by parameter count. Alibaba is also preparing to open source its 2.4-trillion-parameter Qwen3.8-Max model, while DeepSeek is expected to launch the full version of DeepSeek-V4 soon.

Zhang Yue, a professor at Shandong University's School of Computer Science and Technology, said: "The key question for the world is no longer whether AI will become more capable. It is whether the increasingly autonomous AI systems can still be fully understood, tested and supervised.

"By developing open-source AI, China is not only offering another technology alternative, but also helping the world build a more diverse global AI ecosystem."

Fleeing flames

A man who had to flee home because of wildfires holds his dogs close on Saturday at a temporary evacuation center in Bordeaux, France, where about 7,000 people are being sheltered. More than 300,000 people in France and Spain have fled wildfires that have been raging for days with strong winds and high temperatures hampering firefighting efforts. PROVIDED TO CHINA DAILY

Sri Lanka: Enduring friendship draws praise

From page 1

According to project estimates, once fully operational, the city is expected to create around 200,000 direct and indirect jobs, attract about $1 billion in foreign direct investment annually and contribute approximately $15 billion to Sri Lanka's gross domestic product each year.

Gunasekara said the opportunities created by new investment have taken on added significance following Sri Lanka's economic crisis. "I think with more Chinese investment, the recovery will happen faster," he said.

Like many Sri Lankans, he said his family experienced the hardships brought by the country's financial turmoil. "Everyone in Sri Lanka went through it," he said.

For Vraie Cally Balthazaar, mayor of Colombo, the city's transformation reflects broader opportunities ahead.

"I think there's great potential for our cities to work together," she said, adding that Colombo hopes to attract investment from China as well as from around the world as the city continues to grow.

She also praised China's long-standing support for Sri Lanka. "Whether in good times or difficult times, China has always been there," she said. "That is something we hold very dear, and perhaps one of the reasons why our friendship is so strong."

The economic partnership between China and Sri Lanka stretches back much further than the BRI.

Modern bilateral economic cooperation began with the Rubber-Rice Pact signed in 1952, an agreement widely regarded as laying the foundation for the two countries' modern economic relationship. The partnership has since expanded from trade into infrastructure, education, tourism, healthcare and cultural exchanges.

According to China's General Administration of Customs, bilateral trade reached $6.16 billion in 2025, an increase of 15 percent from the previous year.

Speaking at a forum in July, Jagath Wickramaratne, speaker of the Parliament of Sri Lanka, said that bilateral relations have continued to deepen on the basis of mutual trust, respect for sovereignty and practical cooperation.

He described China as "a valued development partner" that has supported Sri Lanka in infrastructure, trade, education, tourism, healthcare and cultural exchange.

"As the Belt and Road Initiative advances into a new stage of high-quality development, Sri Lanka looks forward to strengthening cooperation with China in a manner that is sustainable, mutually beneficial and responsive to the development aspirations of both our peoples," he said.

Expanded cooperation

The cooperation has also expanded beyond large-scale infrastructure.

In March 2023, China, the Food and Agriculture Organization of the United Nations and Sri Lanka launched a South-South Cooperation project to strengthen the country's tropical fruit industry.

Over the following two-and-a-half years, a team of 12 Chinese agricultural experts worked with local partners to improve the production and sales of bananas, mangoes and pineapples.

The experts introduced technologies including tissue culture propagation, integrated water and fertilizer management, intensive pruning, pest management and fruit bagging, while establishing a banana tissue culture facility and 10 demonstration orchards across Sri Lanka.
